METHOD_OPT	<p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> <p>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name : name of a column - extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 186-129 (Cont.) Statistics Preferences

Preference	Description
OPTIONS	<p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> • <code>GATHER</code> — Gathers statistics for all objects in the table. This is the default. • <code>GATHER AUTO</code> — Oracle recommends using <code>GATHER AUTO</code> to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using <code>INCREMENTAL</code> statistics. <p>For partitioned tables using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> • <code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference. • <code>FALSE</code> — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>
PUBLISH	<p>Determines whether newly gathered statistics will be published after the statistics gathering job completes. In releases before Oracle Database 11g Release 1 (11.1), when a statistic gathering job completed, the new statistics were automatically published in the dictionary tables. In subsequent releases, you can gather statistics without publishing them immediately. Thus, you can test new statistics before publishing them.</p>
STALE_PERCENT	<p>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10%. Note that if you set <code>stale_percent</code> to zero the <code>AUTO STATS</code> gathering job will gather statistics for this table every time a row in the table is modified.</p>
TABLE_CACHED_BLOCKS	<p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p>

Security Model

To run this procedure, you must be the schema owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Usage Notes

Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH','ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH','DEGREE','99');
```

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

186.7.120 SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
  pname          VARCHAR2,
  pvalue         NUMBER,
  statab        IN  VARCHAR2 DEFAULT NULL,
  statid        IN  VARCHAR2 DEFAULT NULL,
  statown       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-130 SET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> iotfrspeed—I/O transfer speed in bytes for each millisecond ioseektim - Seek time + latency time + operating system overhead time, in milliseconds sreadtim - Average time to read single block (random read), in milliseconds mreadtim - Average time to read an mbrc block at once (sequential read), in milliseconds cpuspeed - Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) cpuspeednw - Average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option. mbrc - Average multiblock read count for sequential read, in blocks maxthr - Maximum I/O system throughput, in bytes/second slavethr - Average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to set system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

186.7.121 SET_TABLE_PREFS Procedure

This procedure sets the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.SET_TABLE_PREFS (  
    ownname    IN  VARCHAR2,  
    tablename  IN  VARCHAR2,  
    pname      IN  VARCHAR2,  
    pvalue     IN  VARCHAR2);
```

Parameters

Table 186-131 SET_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tablename	Table name
pname	Preference name. You can set the default value for following preferences: <ul style="list-style-type: none">• APPROXIMATE_NDV_ALGORITHM• AUTO_STAT_EXTENSIONS• CASCADE• DEGREE• ESTIMATE_PERCENT• GRANULARITY• INCREMENTAL• INCREMENTAL_LEVEL• INCREMENTAL_STALENESS• METHOD_OPT• NO_INVALIDATE• OPTIONS• PREFERENCE_OVERRIDES_PARAMETER• PUBLISH• STALE_PERCENT• TABLE_CACHED_BLOCKS
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.

Table 186-132 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	<p>Determines whether to collect index statistics as part of gathering table statistics.</p>

Table 186-132 (Cont.) Statistics Preferences

Preference	Description
CONCURRENT	<p>This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time:</p> <ul style="list-style-type: none">'MANUAL' - Concurrency will be turned on only for manual statistics gathering.'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering.'ALL': Concurrency will be turned on for both manual and automatic statistics gathering.'OFF': Concurrency will be turned off for both manual and automatic statistics
DEGREE	<p>Determines degree of parallelism used for gathering statistics.</p>
ESTIMATE_PERCENT	<p>Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>
GLOBAL_TEMP_TABLE_STATS	<p>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values:</p> <ul style="list-style-type: none">SHARED - All sessions see the same set of statisticsSESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.

Table 186-132 (Cont.) Statistics Preferences

Preference	Description
GRANULARITY	<p>Determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>
INCREMENTAL	<p>Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> • INCREMENTAL value for the partitioned table is set to TRUE; • PUBLISH value for the partitioned table is set to TRUE; • User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>

Table 186-132 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	<p>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE It takes two values:</p> <ul style="list-style-type: none">• TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures.• PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.

Table 186-132 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.

Table 186-132 (Cont.) Statistics Preferences

Preference	Description
	<p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>
METHOD_OPT	<p>The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name: name of a column - extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>

Table 186-132 (Cont.) Statistics Preferences

Preference	Description
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
OPTIONS	<p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics for all objects in the table. This is the default. GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. <p>For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>

Table 186-132 (Cont.) Statistics Preferences

Preference	Description
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered. The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you must connect as owner of the table or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

Example 186-18 Overriding Statistics Preferences

In this example, legacy scripts set `ESTIMATE_PERCENT` explicitly rather than using the recommended `AUTO_SAMPLE_SIZE`. Your goal is to prevent users from using these scripts to set preferences on the `sh.costs` table.

No preference for `ESTIMATE_PERCENT` is set for `sh.costs` or at the global level, so the preference defaults to `AUTO_SAMPLE_SIZE`:

```
SELECT DBMS_STATS.GET_PREFS ('ESTIMATE_PERCENT', 'sh','costs') AS
"STAT_PREFS" FROM DUAL;
```

```
STAT_PREFS
-----
DBMS_STATS.AUTO_SAMPLE_SIZE
```

By default, Oracle Database accepts preferences that are passed to the statistics gathering procedures. To override these parameters, use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to `TRUE` for the `costs` table only:

```
EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'costs',
'PREFERENCE_OVERRIDES_PARAMETER', 'TRUE');
```

A user-created script attempts to set `estimate_percent` to 100 when gathering statistics for `sh.costs`.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS('sh', 'costs',
ESTIMATE_PERCENT=>100);
```

However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, Oracle Database gathers statistics using `AUTO_SAMPLE_SIZE`, which is the default, rather than the specified value of 100.

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

186.7.122 SET_TABLE_STATS Procedure

This procedure creates artificial table statistics for testing purposes.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  numrows          NUMBER   DEFAULT NULL,
  numblks          NUMBER   DEFAULT NULL,
  avgrlen          NUMBER   DEFAULT NULL,
  flags            NUMBER   DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  cachedblk        NUMBER   DEFAULT NULL,
  cachehit         NUMBER   DEFAULT NULL,
  force            BOOLEAN   DEFAULT FALSE,
  im_imcu_count    NUMBER   DEFAULT NULL,
  im_block_count  NUMBER   DEFAULT NULL,
  scanrate         NUMBER   DEFAULT NULL);
```

Parameters

Table 186-133 SET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tablename	Name of the table.
partname	Name of the table partition in which to store the statistics. If the table is partitioned and <code>partname</code> is NULL, then the statistics are stored at the global table level.
stattab	Table in which to store the statistics. If <code>stattab</code> is NULL, then the database stores the statistics in the data dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> . This identifier is only relevant if <code>stattab</code> is not NULL.
numrows	Number of rows in the table or partition.
numblks	Number of blocks that the table or partition occupies.
avgrlen	Average row length for the table or partition.
flags	For internal use only. Do not set.
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>).
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
cachedblk	For internal use only. Do not set.
cachehit	For internal use only. Do not set.
force	A flag that determines the behavior when statistics are locked. If TRUE, then the procedure sets the values even if the table statistics are locked. By default, the setting is FALSE.
im_imcu_count	The number of In-Memory Compression Units (IMCUs) in the table or partition.
im_block_count	The number of In-Memory blocks in the table or partition.
scanrate	The rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.

Security Model

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to upgrade it

ORA-20005: Object statistics are locked

Usage Notes

For testing purposes, you can manually create artificial statistics for a table, index, or the system using the `DBMS_STATS.SET_*_STATS` procedures. These procedures insert the artificial statistics into the data dictionary directly (when `stattab` is null) or into a user-created table.

Note:

The `DBMS_STATS.SET_*_STATS` procedures are intended for development testing only. Do not use them in a production database. If you set statistics in the data dictionary, then Oracle Database considers the set statistics as the “real” statistics, which means that statistics gathering jobs may not re-gather artificial statistics when they do not meet the criteria for staleness.

The most typical use cases for the `DBMS_STATS.SET_*_STATS` procedures are showing how execution plans change as the numbers of rows or blocks in a table change, or creating realistic statistics for temporary tables.

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
 - When not enough data has been analyzed, such as when an object has been recently created

- When the database does not have one major workload, resulting in averages that do not correspond to real values

Oracle Database SQL Tuning Guide to learn how to set artificial statistics

186.7.123 SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    extension  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 186-134 SHOW_EXTENDED_STATS_NAME Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column <i>c1</i> , <i>c2</i> . An example column group can be "(<i>c1</i> , <i>c2</i>)" and an example expression can be "(<i>c1</i> + <i>c2</i>)".

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.124 TRANSFER_STATS Procedure

This procedure transfers statistics for specified table(s) from a remote database specified by `dblink` to the local database.

The statistics at the source database are retained. It likewise transfers statistics-related structures such as synopses and DML monitoring information.

Syntax

```
DBMS_STATS.TRANSFER_STATS (
  ownname      IN      VARCHAR2,
  tablename    IN      VARCHAR2,
  dblink       IN      VARCHAR2,  options      IN      NUMBER DEFAULT NULL);
```

Parameters**Table 186-135 TRANSFER_STATS Procedure Parameters**

Parameter	Description
ownname	Owner name of a table. If NULL all schemas in the database. If NULL, the procedure will transfer global preferences as well.
tablename	Name of the table. If NULL, all tables in OWNNAME.
dblink	Database link name
options	By default the procedure does not transfer the global preferences. Specifying ADD_GLOBAL_PREFS copies global preferences.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.125 UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (
  ownname      VARCHAR2,
  tablename    VARCHAR2,
  partname     VARCHAR2);
```

Parameters**Table 186-136 UNLOCK_PARTITION_STATS Procedure Parameters**

Parameter	Description
ownname	Name of the schema to unlock
tablename	Name of the table
partname	[Sub]Partition name

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.126 UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (  
    ownname    VARCHAR2);
```

Parameters

Table 186-137 UNLOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

186.7.127 UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2);
```

Parameters

Table 186-138 UNLOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

186.7.128 UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (
    ownname    VARCHAR2,
    stattab    VARCHAR2);
```

Parameters

Table 186-139 UPGRADE_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	Name of the table

Exceptions

ORA-20000: Unable to upgrade table

Usage Notes

To invoke this procedure you need the privileges to drop and create a table.

DBMS_STORAGE_MAP

With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of DBMS_STORAGE_MAP Subprograms](#)

187.1 DBMS_STORAGE_MAP Overview

This terminology and descriptions will help you understand the `DBMS_STORAGE_MAP` API.

- Mapping libraries

Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in `filemap.ora`.

- Mapping files

A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

See Also:

- *Oracle Database Administrator's Guide* for more information
- *Oracle Database Reference* for `V$MAP` views, including `V$MAP_FILE`, `V$MAP_ELEMENT`, `V$MAP_SUBELEMENT`, `V$MAP_FILE_EXTENT`

187.2 DBMS_STORAGE_MAP Operational Notes

Invoking the `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL` functions when mapping information already exists will refresh the mapping, if configuration IDs are supported. If configuration IDs are not supported, invoking these functions again will rebuild the mapping.

See Also:

Oracle Database Administrator's Guide for a discussion of the configuration ID, an attribute of the element or file that is changed.

187.3 Summary of DBMS_STORAGE_MAP Subprograms

This table lists the `DBMS_STORAGE_MAP` subprograms and briefly describes them.

Table 187-1 DBMS_STORAGE_MAP Package Subprograms

Subprogram	Description
DROP_ALL Function	Drops all mapping information in the shared memory of the instance
DROP_ELEMENT Function	Drops the mapping information for the element defined by <code>elemname</code>
DROP_FILE Function	Drops the file mapping information defined by <code>filename</code>
LOCK_MAP Procedure	Locks the mapping information in the shared memory of the instance
MAP_ALL Function	Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements
MAP_ELEMENT Function	Builds mapping information for the element identified by <code>elemname</code>
MAP_FILE Function	Builds mapping information for the file identified by <code>filename</code>
MAP_OBJECT Function	Builds the mapping information for the Oracle object identified by the object name, owner, and type
RESTORE Function	Loads the entire mapping information from the data dictionary into the shared memory of the instance
SAVE Function	Saves information needed to regenerate the entire mapping into the data dictionary
UNLOCK_MAP Procedure	Unlocks the mapping information in the shared memory of the instance.

187.3.1 DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 187-2 DROP_ALL Function Parameters

Parameter	Description
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

187.3.2 DROP_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(
    elemname          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 187-3 DROP_ELEMENT Function Parameters

Parameter	Description
elemname	The element for which mapping information is dropped.
cascade	If TRUE, then DROP_ELEMENT is invoked recursively on all elements of the DAG defined by elemname, if possible.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

187.3.3 DROP_FILE Function

This function drops the file mapping information defined by `filename`.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(
    filename          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 187-4 DROP_FILE Function Parameters

Parameter	Description
filename	The file for which file mapping information is dropped.
cascade	If TRUE, then the mapping DAGs for the elements where the file resides are also dropped, if possible.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

187.3.4 LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance.

This is useful when you need a consistent snapshot of the V\$MAP tables. Without locking the mapping information, V\$MAP_ELEMENT and V\$MAP_SUBELEMENT, for example, may be inconsistent.

Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

187.3.5 MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(  
    max_num_fileext IN NUMBER DEFAULT 100,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 187-5 MAP_ALL Function Parameters

Parameter	Description
max_num_fileext	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

Usage Notes

You must explicitly call `MAP_ALL` in a cold startup scenario.

187.3.6 MAP_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT (
  elemname          IN VARCHAR2,
  cascade           IN BOOLEAN,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 187-6 MAP_ELEMENT Function Parameters

Parameter	Description
<code>elemname</code>	The element for which mapping information is built.
<code>cascade</code>	If <code>TRUE</code> , all elements within the <code>elemname</code> I/O stack DAG are mapped.
<code>dictionary_update</code>	If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.

187.3.7 MAP_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```
DBMS_STORAGE_MAP.MAP_FILE (
  filename          IN VARCHAR2,
  filetype          IN VARCHAR2,
  cascade           IN BOOLEAN,
  max_num_fileextent IN NUMBER DEFAULT 100,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 187-7 MAP_FILE Function Parameters

Parameter	Description
<code>filename</code>	The file for which mapping information is built.

Table 187-7 (Cont.) MAP_FILE Function Parameters

Parameter	Description
filetype	Defines the type of the file to be mapped. It can be "DATAFILE", "SPFILE", "TEMPFILE", "CONTROLFILE", "LOGFILE", or "ARCHIVEFILE".
cascade	Should be TRUE only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an ALTER SYSTEM command or DML operations on extended files), cascade can be set to FALSE because the mapping changes are limited to the file extents only. If TRUE, mapping DAGs are also built for the elements where the file resides.
max_num_fileextent	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if cascade is TRUE), is owned by a library that must be explicitly synchronized.

187.3.8 MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(
  objname IN VARCHAR2,
  owner   IN VARCHAR2,
  objtype IN VARCHAR2);
```

Parameters

Table 187-8 MAP_OBJECT Function Parameters

Parameter	Description
objname	The name of the object.
owner	The owner of the object.
objtype	The type of the object.

187.3.9 RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance.

You can invoke `RESTORE` only after a `SAVE` operation. You must explicitly call `RESTORE` in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

187.3.10 SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

187.3.11 UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

DBMS_SYNC_REFRESH

The `DBMS_SYNC_REFRESH` package provides an interface to perform a synchronous refresh of materialized views.

See Also:

Oracle Database Data Warehousing Guide for more information on using `DBMS_SYNC_REFRESH`

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_SYNC_REFRESH Subprograms](#)

188.1 DBMS_SYNC_REFRESH Overview

Synchronous refresh is a refresh method introduced in Oracle Database Release 12c, which enables you to keep a set of tables and the materialized views defined on them to be always in sync.

See Also:

Oracle Database Data Warehousing Guide for more information about using synchronous refresh

188.2 DBMS_SYNC_REFRESH Security Model

The execute privilege for this package is granted to `PUBLIC`, so all users can execute the procedures in this package to perform synchronous refresh on objects owned by them. The database administrator can perform synchronous refresh operations on all tables and materialized views in the database.

In general, if a user without the `DBA` privilege wants to use synchronous refresh on another user's table, he must complete privileges to read from and write to that table, that is, the user must have the `SELECT` or `READ`, `INSERT`, `UPDATE`, and `DELETE` privileges on that table or materialized view. A couple of exceptions are:

- `PURGE_REFRESH_STATS` and `ALTER_REFRESH_STATS_RETENTION` Functions

These two functions implement the purge policy and can be used to change the default retention period. These functions can be only be executed by the database administrator.

- The `CAN_SYNCREF_TABLE` Function
This is an advisory function which examines the eligibility for sync refresh of all the materialized views associated with a specified table. Hence, this function requires the `SELECT` or `READ` privilege on all materialized views associated with the specified table.

188.3 Summary of DBMS_SYNC_REFRESH Subprograms

This table lists and briefly describes the `DBMS_SYNC_REFRESH` package subprograms.

Table 188-1 DBMS_SYNC_REFRESH Package Subprograms

Subprogram	Description
ABORT_REFRESH Procedure	Aborts a refresh.
ALTER_REFRESH_STATS_RETENTION Procedure	Alters the refresh history retention value, specified in days.
CAN_SYNCREF_TABLE Procedure	Advises on whether a table and its dependent materialized views are eligible for synchronous refresh.
EXECUTE_REFRESH Procedure	Executes synchronous refresh on the synchronous refresh groups.
GET_ALL_GROUP_IDS Function	Returns the group IDs of all the synchronous refresh groups in the database.
GET_GROUP_ID Function	Returns the group ID of a table or materialized view.
GET_GROUP_ID_LIST Function	Returns the group IDs of the tables in a given list of objects (tables or materialized views).
PREPARE_REFRESH Procedure	Prepares the sync refresh groups for refresh.
PREPARE_STAGING_LOG Procedure	Validates and collects statistics on the data in the staging log.
PURGE_REFRESH_STATS Procedure	Purges the refresh history of sync refreshes that took place within a time specified by a timestamp parameter.
REGISTER_MVIEWS	Registers materialized views for synchronous refresh.
REGISTER_PARTITION_OPERATION Procedure	Registers a partition maintenance operation on a partition of a base table.
UNREGISTER_MVIEWS	Unregisters materialized views from synchronous refresh.
UNREGISTER_PARTITION_OPERATION Procedure	Unregisters a partition maintenance operation on a partition of a base table.

188.3.1 ABORT_REFRESH Procedure

This procedure undoes all the changes made by `PREPARE_REFRESH` or `EXECUTE_REFRESH` for the specified sync refresh groups. It helps you to recover to a state where the tables and materialized views are usable and consistent in case they encounter unexpected errors.

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.ABORT_REFRESH (
    group_id      IN NUMBER);

DBMS_SYNC_REFRESH.ABORT_REFRESH (
    group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters**Table 188-2 ABORT_REFRESH Procedure Parameters**

Parameter	Description
group_id	The group ID of a sync refresh group.
group_id_list	An array of group IDs of the sync refresh groups to be aborted for sync refresh.

Usage Notes

If called after `PREPARE_REFRESH`, this procedure drops the outside tables created by it and unlocks the tables and materialized views in the sync refresh group.

If called after `EXECUTE_REFRESH` fails, this procedure restores the state of tables to before `EXECUTE_REFRESH` by undoing any partition exchanges which successfully finished.

This procedure releases the locks placed on the tables in the sync refresh group which were placed on them by the `PREPARE_REFRESH` procedure. See "[PREPARE_REFRESH Procedure](#)" for a description of these locks.

`ABORT_REFRESH` will work only if a `PREPARE_REFRESH` or `EXECUTE_REFRESH` statement has failed. It cannot be used after successful runs of those commands, and throws an error in such cases.

188.3.2 ALTER_REFRESH_STATS_RETENTION Procedure

This procedure alters the refresh history retention value, specified in days. It is intended for use in conjunction with `PURGE_REFRESH_HISTORY`. It also requires the `SYSDBA` privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.ALTER_REFRESH_STATS_RETENTION (
    retention    IN NUMBER);
```

Parameters

Table 188-3 ALTER_REFRESH_STATS_RETENTION Procedure Parameters

Parameter	Description
retention	<p>The retention time in days. The refresh history will be retained for at least these many number of days. The valid range is 1 to 365,000.</p> <p>You can use the following values for special purposes:</p> <ul style="list-style-type: none"> • -1 - Refresh history is never purged by PREPARE_REFRESH. • 0 - Old refresh history is never saved. PREPARE_REFRESH will delete all refresh history. • NULL - Change refresh history retention to default value.

188.3.3 CAN_SYNCREF_TABLE Procedure

This procedure advises on whether a table and its dependent materialized views are eligible for sync refresh. It provides an explanation of its analysis. If not eligible, you can examine the reasons and take appropriate action if possible.

This procedure lists all of the table's dependent materialized views and whether they qualify for sync refresh. Note that a materialized view may qualify for sync refresh even though the base table may not.

The eligibility rules for materialized views for synchronous refresh are discussed in detail in *Oracle Database Data Warehousing Guide*.

You can invoke `CAN_SYNCREF_TABLE` in two ways. The first is to use a table, while the second is to create a VARRAY.

Syntax

```
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    statement_id   IN VARCHAR2);

DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    output_array   IN OUT Sys.CanSyncRefTypeArray);
```

Note that only one of `statement_id` or `output_array` need be provided to `CAN_SYNCREF_TABLE`.

Parameters

Table 188-4 CAN_SYNCREF_TABLE Procedure Parameters

Parameter	Description
schema_name	The name of the schema of the base table.
table_name	The name of the base table.

Table 188-4 (Cont.) CAN_SYNCREF_TABLE Procedure Parameters

Parameter	Description
statement_id	A string (VARCHAR2 (30)) to identify the rows pertaining to an invocation of CAN_SYNCREF_TABLE when the output is directed to a table named SYNCREF_TABLE in the user's schema.
output_array	The output array into which CAN_SYNCREF_TABLE records the information on the eligibility of the base table and its dependent materialized views for synchronous refresh.

Using SYNCREF_TABLE

The output of CAN_SYNCREF_TABLE can be directed to a table named SYNCREF_TABLE. The user is responsible for creating the SYNCREF_TABLE; it can be dropped when it is no longer needed. Its structure is as follows:

```
CREATE TABLE SYNCREF_TABLE (
  statement_id  VARCHAR2(30),
  schema_name  VARCHAR2(30),
  table_name   VARCHAR2(30),
  mv_schema_name VARCHAR2(30),
  mv_name      VARCHAR2(30),
  eligible     VARCHAR2(1),
  seq_num      NUMBER,
  msg_number   NUMBER,
  message      VARCHAR2(4000));
```

Using a VARRAY

You can save the output of CAN_SYNCREF_TABLE in a PL/SQL VARRAY. The elements of this array are of type CanSyncRefMessage, which is predefined in the SYS schema, as shown in the following:

```
TYPE CanSyncRefMessage IS OBJECT (
  schema_name  VARCHAR2(30),
  table_name   VARCHAR2(30),
  mv_schema_name VARCHAR2(30),
  mv_name      VARCHAR2(30),
  eligible     VARCHAR2(1),
  seq_num      NUMBER,
  msg_number   NUMBER,
  message      VARCHAR2(4000));
```

The array type CanSyncRefArrayType, which is a varray of CanSyncRefMessage objects, is predefined in the SYS schema as follows:

```
TYPE CanSyncRefArrayType AS VARRAY(256) OF CanSyncRefMessage;
```

Each CanSyncRefMessage record provides a message concerning the eligibility of the base table or a dependent materialized view for synchronous refresh. The semantics of the fields is the same as that of the corresponding fields in the SYNCREF_TABLE. However, the SYNCREF_TABLE has a statement_id field which is absent in CanSyncRefMessage because no statement_id is supplied (because it is not required) when CAN_SYNCREF_TABLE is called with a VARRAY parameter.

188.3.4 EXECUTE_REFRESH Procedure

This procedure executes sync refresh on the sync refresh groups prepared by `DBMS_SYNC_REFRESH.PREPARE_REFRESH`. These groups are identified by their group IDs.

Note this procedure will only perform the refresh on those materialized views that have been registered for synch refresh; any other materialized views will become stale once this procedure completes.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide*.

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
    group_id    IN NUMBER);

DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
    group_id_list  IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters

Table 188-5 EXECUTE_REFRESH Procedure Parameters

Parameter	Description
<code>group_id</code>	The group ID of a sync refresh group.
<code>group_id_list</code>	An array of group IDs of the sync refresh groups to be executed for sync refresh.

Usage Notes

This procedure also releases the locks placed on the tables in the sync refresh group that were placed on them by the `PREPARE_REFRESH` procedure. See "[PREPARE_REFRESH Procedure](#)" for a description of these locks and *Oracle Database Reference* for information regarding the status of the refresh operation after `DBMS_SYNC_REFRESH.EXECUTE_REFRESH`.

188.3.5 GET_ALL_GROUP_IDS Function

This function returns the group IDs of all the sync refresh groups in the database.

Syntax

```
FUNCTION DBMS_SYNC_REFRESH.GET_ALL_GROUP_IDS
    RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 188-6 GET_ALL_GROUP_IDS Function Parameter

Parameter	Description
<code>get_all_group_ids</code>	Returns the group IDs of all the sync refresh groups in the database.

188.3.6 GET_GROUP_ID Function

This function returns the group ID of a materialized view. The group ID identifies the sync refresh group the table belongs to. A sync refresh group is a group of related tables and their dependent materialized views which must be all refreshed together jointly to ensure consistency and correctness.

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID (
    object_name_list IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 188-7 GET_GROUP_ID Function Parameter

Parameter	Description
<code>object_name_list</code>	The name of the materialized view. The name can be schema-qualified.

188.3.7 GET_GROUP_ID_LIST Function

This function returns the group IDs of the tables in a given list of objects (materialized views).

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID_LIST (
    object_name_list IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 188-8 GET_GROUP_ID_LIST Function Parameter

Parameter	Description
<code>object_name_list</code>	A comma-separated list of object names (materialized views). Each name can be schema-qualified.

188.3.8 PREPARE_REFRESH Procedure

This procedure prepares for refresh the sync refresh groups identified by the group ID in the input.

A sync refresh group consists of a set of related tables and all materialized views dependent on those base tables. Note this procedure will only prepare for refresh those dependent materialized views that have been registered for synchronous refresh.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide*.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_REFRESH (
    group_id IN NUMBER)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 188-9 PREPARE_REFRESH Procedure Parameters

Parameter	Description
<code>group_id</code>	The group ID of the sync refresh group to be prepared for sync refresh.

Usage Notes

This procedure plans the three phases of the sync refresh operation and executes the steps associated with the prepare phase itself. These steps include identifying the partitions of the fact tables and materialized views that have been changed, and computing their new values as a result of the changes. The new values of the partitions are stored in tables called outside tables that are exchanged into their corresponding partitions at the time of the `EXECUTE_REFRESH`.

Before running this procedure, the user must run `PREPARE_STAGING_LOG` on all tables in the group. This is required even for staging logs that do not have changes in them. The user must also register any partition operations on the tables in the group using the `REGISTER_PARTITION_OPERATION`.

One of the side effects of this procedure is that the tables being prepared are locked in this sense: the staging logs of the tables will be locked to prevent any DMLs from occurring and the registration of partition operations will be disabled. These locks will be in effect until you issue an `EXECUTE_REFRESH` statement. Alternatively, you can issue an `ABORT_REFRESH` operation to release these locks. Another side effect of this procedure is that it purges from the catalog records of earlier sync refresh operations; if they are older than the retention period, they are purged.

The degree of parallelism of the prepare refresh job is inherited from the session parameters which you can control with an `ALTER SESSION` statement.

The group ID of a table can be found using `GET_GROUP_ID(table_name)`. The group IDs of a list of tables can be found with `GET_GROUP_ID_LIST(table_name_list)`. The group IDs of all the lists of tables can be retrieved with `GET_ALL_GROUP_IDS`.

By default, synchronous refresh does not maintain global indexes belonging to the tables and materialized views in the sync refresh group. If you wish to do so, you can set event 31904, level 64 before executing `PREPARE_REFRESH`. This will cause the partition exchange DDL statements generated by `PREPARE_REFRESH` to have the `UPDATE INDEXES` clause appended to them, and when they are executed by `EXECUTE_REFRESH`, the global indexes will be maintained.

188.3.9 PREPARE_STAGING_LOG Procedure

This procedure collects statistics on the data in the staging log of the base table and validates the data in the log.

It can be run in several different modes ranging from the enforced mode in which strict checking of the data is done to trusted mode in which no checking is done. You should run this procedure after loading the staging log and before running `PREPARE_REFRESH`.

In the enforced mode, which is the default, this procedure will fill in the missing values of the columns of the rows being deleted or updated. An error is thrown if any violations of the staging-log rules are found. You can query the view `USER_SR_STLOG_EXCEPTIONS` to get details on the exceptions.

The notion of the staging log key is described in *Oracle Database Data Warehousing Guide*.

In the enforced mode, this procedure processes each delete/update row in the staging log as follows:

- It verifies the existence of the row in the base table using the key.
- For the rows being deleted (`DMLTYPE$$` is 'D'), it verifies a row with this key exists in the base table; if non-null non-key values are supplied in the staging log, it verifies the values match the corresponding columns in the base table; else an exception is logged in the exceptions table. If the values of any of the non-key columns are missing, it fills in those values from the row in the base table.
- For the rows being updated (`DMLTYPE$$` is 'UO' or 'UN'), it verifies a row with this key exists in the base table. In the old values row (`DMLTYPE$$` is 'UO'), it makes the same check and does the same processing as with rows being deleted. In the new values row (`DMLTYPE$$` is 'UN'), it checks that at least the value of one the columns differs from its old value; else an exception is logged.
- In the new values row (`DMLTYPE$$` is 'UN'), a null value in a column is interpreted as having the same value as the old value of the column except if the old value is non-null and the new value is null in which case, the new value of the column is interpreted as being null. This requires that the user must provide the old value of columns which are being updated to `NULL`.

In the default enforced mode, this procedure verifies that each key is specified for at most once for a delete or update operation. This means that the user, when doing the change consolidation, must consolidate delete-insert of the same row into an update operation with rows 'UO' and 'UN;' multiple updates must be consolidated into a single update; and null changes such as an insert-update-delete of the same row must not appear in the staging log.

The checking done in the enforced mode can be time-consuming. If you are confident in the integrity of the data, you can choose a lower level of checking. You can choose to:

- trust all the insert rows (DMLTYPE\$\$ is 'I') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.INSERT_TRUSTED`
- trust all the delete rows (DMLTYPE\$\$ is 'D') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.DELETE_TRUSTED`
- trust all the update rows (DMLTYPE\$\$ is 'UO' or 'UN') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.UPDATE_TRUSTED`
- trust all three types of DMLs by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.TRUSTED`.

In addition, you can specify the `psl_mode` as a bitmask of the flags described above. For example, `DBMS_SYNC_REFRESH.INSERT_TRUSTED + DBMS_SYNC_REFRESH.DELETE_TRUSTED` will treat inserts and deletes to be trusted but not updates.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG (
    schema_name      IN VARCHAR2,
    base_table_name  IN VARCHAR2,
    psl_mode         IN NUMBER DEFAULT
    DBMS_SYNC_REFRESH.ENFORCED);
```

Parameters

Table 188-10 PREPARE_STAGING_LOG Procedure Parameters

Parameter	Description
<code>schema_name</code>	The name of the schema of the base table.
<code>base_table_name</code>	The name of the base table.
<code>psl_mode</code>	The mode in which staging log preparation should be done. The possible values are: <ul style="list-style-type: none"> • <code>DBMS_SYNC_REFRESH.ENFORCED</code> (the default) • <code>DBMS_SYNC_REFRESH.INSERT_TRUSTED</code> • <code>DBMS_SYNC_REFRESH.DELETE_TRUSTED</code> • <code>DBMS_SYNC_REFRESH.UPDATE_TRUSTED</code> • <code>DBMS_SYNC_REFRESH.TRUSTED</code>

188.3.10 PURGE_REFRESH_STATS Procedure

This procedure purges the refresh history of sync refreshes that took place before the value specified by the `BEFORE_TIMESTAMP` parameter.

This procedure requires the `SYSDBA` privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.PURGE_REFRESH_STATS (
    before_timestamp IN TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 188-11 PURGE_REFRESH_STATS Procedure Parameter

Parameter	Description
<code>before_timestamp</code>	Records of sync refreshes saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than (current time - refresh - history retention). The refresh history retention value can be changed using <code>ALTER_REFRESH_STATS_RETENTION</code> . The default is 31 days.

188.3.11 REGISTER_MVIEWS

This procedure registers a list of materialized views for synchronous refresh.

It checks each materialized view in the list for eligibility and places it in the sync refresh group it belongs to. A sync refresh group is a set of related tables and materialized views defined on top of them. Two tables are considered related if there is a referential constraint between them.

The eligibility rules of materialized views for synchronous refresh are described in detail in *Oracle Database Data Warehousing Guide*. The principal requirements are that the materialized view must be partitioned and its partition key must be derivable from the partition key of its fact table. The materialized view definition must specify the `USING TRUSTED CONSTRAINTS` clause because sync refresh trusts the foreign key and primary key relationships to perform various refresh optimizations. The materialized view's refresh policy must be specified as `ON DEMAND`.

You have an option to register only some of the materialized views associated with a table, and leave some unregistered. Oracle Corporation does not recommend this, and in such a case, the user has to maintain the unregistered ones using the PCT or complete refresh methods.

A staging table must have been created for each base table of each materialized view in the materialized view list (`mv_list`), or else an error is thrown.

If any of the materialized views are not eligible for sync refresh, an error is thrown and the registration of all materialized views in the materialized view list fails.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_MVIEWS (
    mv_list IN VARCHAR2);
```

Parameter

Table 188-12 REGISTER_MVIEWS Procedure Parameter

Parameter	Description
<code>mv_list</code>	A comma-delimited list of materialized views to register. These names are optionally schema-qualified.

188.3.12 REGISTER_PARTITION_OPERATION Procedure

This procedure registers a partition-maintenance operation (PMOP) on a partition of a base table.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_PARTITION_OPERATION (
    partition_op          IN VARCHAR2,
    schema_name          IN VARCHAR2,
    base_table_name      IN VARCHAR2,
    partition_name       IN VARCHAR2,
    outside_partn_table_schema IN VARCHAR2,
    outside_partn_table_name IN VARCHAR2);
```

Parameters

Table 188-13 REGISTER_PARTITION_OPERATION Procedure Parameters

Parameter	Description
partition_op	The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
partition_name	The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.
outside_partn_table_schema	The name of the schema of the outside partition table (required for EXCHANGE only).
outside_partn_table_name	The name of the outside partition table (required for EXCHANGE only).

Usage Notes

The three kinds of change operations that may be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

If DROP is specified, then the partition will be dropped from the base table at the time of EXECUTE_REFRESH. If TRUNCATE is specified, then the data from the partition will be deleted but the partition itself will not be dropped. These operations provide a more efficient way of specifying the deletes of all the rows in a partition than specifying them individually in the staging log.

If EXCHANGE is specified, then the contents of the outside table is exchanged with contents of the specified partition of EXECUTE_REFRESH. This provides an alternative method to the user of providing the changes to the base tables instead of populating the staging log.

188.3.13 UNREGISTER_MVIEWS

This procedure unregisters a list of materialized views from synchronous refresh. Once a materialized view is unregistered, it can be maintained by the user with any of the traditional refresh methods, such as complete or PCT, refresh.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_MVIEWS (
    mv_list    IN VARCHAR20;
```

Parameter

Table 188-14 UNREGISTER_MVIEWS Parameter

Parameter	Description
mv_list	A comma-delimited list of materialized views to unregister. These names are optionally schema-qualified.

188.3.14 UNREGISTER_PARTITION_OPERATION Procedure

This procedure unregisters a partition-maintenance operation (PMOP) that had been previously registered with REGISTER_PARTITION_OPERATION on a base table. The three kinds of change operations that can be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_PARTITION_OPERATION (
    partition_op    IN VARCHAR2,
    schema_name     IN VARCHAR2,
    base_table_name IN VARCHAR2,
    partition_name  IN VARCHAR2);
```

Parameters

Table 188-15 UNREGISTER_PARTITION_OPERATION Procedure Parameters

Parameter	Description
partition_op	The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
partition_name	The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.

DBMS_TABLE_DATA

The `DBMS_TABLE_DATA` package provides procedures that can be used to retrieve the byte value of a single column, or a series of columns, in any table. These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the row content for row data on which the hash or user signature is computed.

This chapter contains the following topics:

- [DBMS_TABLE_DATA Overview](#)
- [DBMS_TABLE_DATA Security Model](#)
- [Summary of DBMS_TABLE_DATA Subprograms](#)

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*

189.1 DBMS_TABLE_DATA Overview

The `DBMS_TABLE_DATA` package can be used to retrieve the byte value of a single column, or a series of columns, in any table.

These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the `row content` for row data on which the hash or user signature is computed.

The procedures provide platform-neutral binary values for columns.

The procedures give you fine-grained control over the scope of a digital signature or cryptographic hash in terms of the columns you extract and the order in which you assemble the results.

189.2 DBMS_TABLE_DATA Security Model

The `DBMS_TABLE_DATA` package is owned by `SYS` and is installed as part of database installation. The routines in the package are run with invokers' rights (run with the privileges of the current user). The current user needs `SELECT` privileges on the table to extract column data.

189.3 Summary of DBMS_TABLE_DATA Subprograms

The DBMS_TABLE_DATA package uses GET_BYTES_FOR_COLUMN, GET_BYTES_FOR_COLUMNS, and GET_BYTES_FOR_ROW subprograms to perform various functions.

Table 189-1 DBMS_TABLE_DATA Package Subprograms

Subprogram	Description
GET_BYTES_FOR_COLUMN Procedure	Returns the <code>column_data</code> in bytes for the particular column with name <code>column_name</code> for <code>row_id</code> row in the particular table identified by <code>schema_name.table_name</code> .
GET_BYTES_FOR_COLUMNS Procedure	Returns a concatenated array of column byte values in <code>column_data</code> in the order of columns specified in the <code>column_names</code> array.
GET_BYTES_FOR_ROW Procedure	Returns a concatenated array of column byte values in <code>column_data</code> in the order of column positions for the particular row identified by <code>row_id</code> .

189.3.1 GET_BYTES_FOR_COLUMN Procedure

This procedure returns the `column_data` in bytes for the particular column with name `column_name` for `row_id` row in the particular table identified by `schema_name.table_name`.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMN(
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  row_id           IN ROWID,
  column_name      IN VARCHAR2,
  column_data      IN OUT BLOB);
```

Parameters

Table 189-2 GET_BYTES_FOR_COLUMN Procedure Parameters

Parameter	Description
<code>schema_name</code>	The name of the schema.
<code>table_name</code>	The name of the table.
<code>row_id</code>	The row id.
<code>column_name</code>	The column name.
<code>column_data</code>	The data in the column.

Usage Notes

All arguments are required.

189.3.2 GET_BYTES_FOR_COLUMNS Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of columns specified in the `column_names` array.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMNS (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  row_id           IN ROWID,
  column_names     IN VARCHAR2,
  column_data      IN OUT BLOB);
```

Parameters

Table 189-3 GET_BYTES_FOR_COLUMNS Procedure Parameters

Parameter	Description
<code>schema_name</code>	The name of the schema.
<code>table_name</code>	The name of the table.
<code>row_id</code>	The row id.
<code>column_names</code>	The names of the columns.
<code>column_data</code>	The data in the columns.

Usage Notes

All arguments are required.

189.3.3 GET_BYTES_FOR_ROW Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of column positions for the particular row identified by `row_id`.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_ROW (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  row_id           IN ROWID,
  column_data      IN OUT BLOB);
```

Parameters

Table 189-4 GET_BYTES_FOR_ROW Procedure Parameters

Parameter	Description
<code>schema_name</code>	The name of the schema.
<code>table_name</code>	The name of the table.
<code>row_id</code>	The row id.
<code>column_data</code>	The data in the row.

Usage Notes

All arguments are required.

DBMS_TDB

The `DBMS_TDB` package reports whether a database can be transported between platforms using the `RMAN CONVERT DATABASE` command.

The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

See Also:

Oracle Database Backup and Recovery User's Guide regarding database transport using `CONVERT DATABASE`

This chapter contains the following topics:

- [Overview](#)
- [DBMS_TDB Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS_TDB Subprograms](#)

190.1 DBMS_TDB Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The `DBMS_TDB` package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the `DBMS_TDB` subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

190.2 DBMS_TDB Security Model

Use of this package requires the `DBA` privilege.

190.3 DBMS_TDB Constants

The `DBMS_TDB` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, `DBMS_TDB.SKIP_NONE`.

The `DBMS_TDB` package uses the constants shown in [Table 190-1](#).

Table 190-1 DBMS_TDB Constants

Name	Type	Value	Description
<code>SKIP_NONE</code>	NUMBER	0	Check all files when checking whether a database is ready for transport.
<code>SKIP_OFFLINE</code>	NUMBER	2	Skip files in offline tablespaces when checking whether a database is ready for transport.
<code>SKIP_READONLY</code>	NUMBER	3	Skip files in read-only tablespaces when checking whether a database is ready for transport.

190.4 DBMS_TDB Views

The `DBMS_TDB` package uses the `V$DB_TRANSPORTABLE_PLATFORM` view.

This view is described in *Oracle Database Reference*.

- `V$DB_TRANSPORTABLE_PLATFORM`, which specifies which combinations of source and target platforms support database transport

190.5 DBMS_TDB Operational Notes

The following notes apply to `DBMS_TDB`.

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple `TRUE` or `FALSE` results to indicate whether database transport is possible. Use the subprograms with `SERVEROUTPUT ON` for informative messages about why transport is not possible.

190.6 Summary of DBMS_TDB Subprograms

This table lists the `DBMS_TDB` subprograms and briefly describes them.

Table 190-2 DBMS_TDB Package Subprograms

Subprogram	Description
CHECK_DB Function	Checks whether a database can be transported to a target platform
CHECK_EXTERNAL Function	Checks whether a database has external tables, directory or BFILES

190.6.1 CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```
DBMS_TDB.CHECK_DB (
    target_platform_name  IN VARCHAR2,
    skip_option           IN  NUMBER)
RETURN BOOLEAN;
```

```
DBMS_TDB.CHECK_DB (
    target_platform_name  IN VARCHAR2)
RETURN BOOLEAN;
```

```
DBMS_TDB.CHECK_DB
RETURN BOOLEAN;
```

Parameters

Table 190-3 CHECK_DB Function Parameters

Parameter	Description
target_platform_name	The name of the destination platform, as it appears in V\$DB_TRANSPORTABLE_PLATFORM.
skip_option	Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 190-1 .

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns `FALSE`. If the database is ready for transport, returns `TRUE`.

Usage Notes

- If `SERVEROUTPUT` is `ON`, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see [Table 190-4](#).

Table 190-4 Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Unrecognized target platform name.	Check <code>V\$DB_TRANSPORTABLE_PLATFORM</code> for recognized platform names.
Target platform has a different endian format.	Conversion is not supported.
Database is not open read-only.	Open database read-only and retry.
There are active or in-doubt transactions in the database.	Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.
Deferred transaction rollback needs to be done.	Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.
Database compatibility version is below 10.0.0.	Change the <code>COMPATIBLE</code> initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.
Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.	Change the <code>COMPATIBLE</code> initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.

Examples

This example illustrates the use of `CHECK_DB` with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
    db_ready BOOLEAN;
BEGIN
    db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
END;
/
```

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.

190.6.2 CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

```
DBMS_TDB.CHECK_EXTERNAL  
    RETURN BOOLEAN;
```

Return Values

If the database has external tables, directories, or BFILEs, return `TRUE`. Otherwise, return `FALSE`.

Usage Notes

- If `SERVEROUTPUT` is ON, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of `CHECK_EXTERNAL` with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON  
SQL> DECLARE  
    external BOOLEAN;  
BEGIN  
    external := DBMS_TDB.CHECK_EXTERNAL;  
END;  
/
```

The following external tables exist in the database:

SH.SALES_TRANSACTIONS_EXT

The following directories exist in the database:

SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR

The following BFILEs exist in the database:

PM.PRINT_MEDIA

PL/SQL procedure successfully completed.

DBMS_TF

The DBMS_TF package contains utilities for Polymorphic Table Functions (PTF) implementation. You can use DBMS_TF subprograms to consume and produce data, and get information about its execution environment.

You must be familiar with the Polymorphic Table Function (PTF) concepts, syntax and semantics.

See Also:

- *Oracle Database PL/SQL Language Reference* for an overview of Polymorphic Table Function (PTF) concepts
- *Oracle Database PL/SQL Language Reference* for more information about `CREATE FUNCTION PIPELINED` clause syntax and semantics

This chapter contains the following topics:

- [DBMS_TF Overview](#)
- [DBMS_TF Security Model](#)
- [DBMS_TF Constants](#)
- [DBMS_TF Operational Notes](#)
- [DBMS_TF Execution Flow](#)
- [DBMS_TF Restrictions](#)
- [DBMS_TF Examples](#)
- [DBMS_TF Data Structures](#)
- [Summary of DBMS_TF Subprograms](#)

191.1 DBMS_TF Overview

The DBMS_TF package contains types, constants, and subprograms that can be used by Polymorphic Table Functions (PTFs).

Polymorphic Table Functions (PTFs) need various services from the database to implement their functionality. PTFs need a mechanism to get rows from the database and send back new rows, for instance. The DBMS_TF package provides these server and client interfaces utilities.

191.2 DBMS_TF Security Model

PUBLIC is granted the EXECUTE privilege on package DBMS_TF. Its subprograms execute with invoker's rights privileges.

191.3 DBMS_TF Constants

This topic describes useful constants defined in the DBMS_TF package.

The DBMS_TF package defines several enumerated constants that should be used for specifying parameter values or types. Enumerated constants must be prefixed with the package name, for example, DBMS_TF.TYPE_DATE.

Table 191-1 DBMS_TF Supported Types

Name	Description
TYPE_BINARY_DOUBLE	Type code for BINARY_DOUBLE
TYPE_BINARY_FLOAT	Type code for BINARY_FLOAT
TYPE_BLOB	Type code for BLOB
TYPE_BOOLEAN	Type code for BOOLEAN
TYPE_CHAR	Type code for CHAR
TYPE_CLOB	Type code for CLOB
TYPE_DATE	Type code for DATE
TYPE_INTERVAL_DS	Type code for INTERVAL_DS
TYPE_INTERVAL_YM	Type code for INTERVAL_YM
TYPE_NUMBER	Type code for NUMBER
TYPE_ROWID	Type code for ROWID
TYPE_RAW	Type code for RAW
TYPE_TIMESTAMP	Type code for TIMESTAMP
TYPE_TIMESTAMP_TZ	Type code for TIMESTAMP_TZ
TYPE_VARCHAR2	Type code for VARCHAR2

Additional constants are defined for use with specific subprograms.

See Also:

- [Table 191-3](#) for more information about CSTORE related constants
- [Table 191-4](#) for more information about predefined PTF method names
- [Table 191-6](#) for more information about XSTORE related constants
- [Supported Types Collections](#) for more information about predefined collections of supported types

191.4 DBMS_TF Operational Notes

These operational notes describe the client and the server-side interfaces, and detail the compilation and execution statement management of Polymorphic Table Functions (PTF).

191.4.1 PTF Client Interface

The Polymorphic Table Function (PTF) implementation client interface is a set of subprograms with fixed names that every PTF must provide.

The PTF client interface can have up to four subprograms as follow :

- `DESCRIBE` function (Required)
- `OPEN` procedure (Optional)
- `FETCH_ROWS` procedure (Optional)
- `CLOSE` procedure (Optional)

The function `DESCRIBE` is invoked during SQL cursor compilation.

The procedures `OPEN`, `FETCH_ROWS`, and `CLOSE` are invoked during query execution.

The arguments to the implementation functions must match the PTF function with the following modifications:

1. Arguments of the type `TABLE` and `COLUMNS` are skipped for the execution procedures `OPEN`, `FETCH_ROWS`, and `CLOSE`.
2. The `TABLE` and `COLUMNS` arguments have descriptor types for the `DESCRIBE` function.
3. Scalar arguments that are not available during compilation are passed as `NULL` values (when using bind variables for instance). During execution, the actual values are passed in.

DESCRIBE Function

The `DESCRIBE` function is invoked to determine the type of rows (row shape) produced by the Polymorphic Table Function (PTF). It returns a `DBMS_TF.DESCRIBE_T` table.

The function `DESCRIBE` is invoked during SQL cursor compilation when a SQL query references a PTF. The SQL compiler locates the `DESCRIBE` function defined in the PTF implementation package. All the argument values from the query calling the PTF are passed to the `DESCRIBE` function. Like any PLSQL function, the `DESCRIBE` function can be overloaded and can have arguments default values.

The arguments of the PTF function and `DESCRIBE` function must match, but with the type of any `TABLE` argument replaced with the `DBMS_TF.TABLE_T` descriptor type, and the type of any `COLUMNS` argument replaced with `DBMS_TF.COLUMN_T` descriptor.

The `DESCRIBE` function indicates which columns must be kept by the database and passed unchanged as the PTF output (Pass-Through columns). In addition, the `DESCRIBE` function indicates any input columns that the PTF will use for its computation (Read columns).

Finally, the `DESCRIBE` function returns the list of any new columns that the PTF will create (or `NULL` if no new columns are being produced) using the `DBMS_TF.DESCRIBE_T` descriptor.

OPEN Procedure

The `OPEN` procedure purpose is to initialize and allocate any execution specific state. The `OPEN` procedure is most useful when you implement a Table Semantics PTF. The function typically calls the `GET_XID` function to get a unique ID for managing the execution state.

`OPEN` procedure is generally invoked before calling the `FETCH_ROWS` procedure.

FETCH_ROWS Procedure

The `FETCH_ROWS` procedure produces an output rowset that it sends to the database. The number of invocations of this function and the size of each rowset are data dependent and determined during query execution.

CLOSE Procedure

The `CLOSE` procedure is called at the end of the PTF execution. The procedure releases resources associated with the PTF execution state.

Example 191-1 Noop Polymorphic Table Function Example

This example creates a PTF called `noop`. This PTF returns the input rows as the output rows without any modification or filtering. `Noop` is one of the smallest PTF you can write.

Live SQL:

You can view and run this example on Oracle Live SQL at [Noop Polymorphic Table Function](#)

To implement the `noop` PTF, you first create the implementation package `noop_package`.

```
CREATE PACKAGE noop_package AS
  FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
    RETURN DBMS_TF.DESCRIBE_T;

  PROCEDURE fetch_rows;
END noop_package;
```

The `DESCRIBE` function does not produce any new columns and hence, returns `NULL`. Executing `FETCH_ROWS` also results in `NULL`.

```
CREATE PACKAGE BODY noop_package AS
  FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
    RETURN DBMS_TF.DESCRIBE_T AS
  BEGIN
    RETURN NULL;
  END;

  PROCEDURE fetch_rows AS
```

```

BEGIN
    RETURN;
END;
END noop_package;

```

The noop PTF is defined to execute the noop_package when it is invoked.

```

CREATE FUNCTION noop (t TABLE)
    RETURN TABLE PIPELINED ROW POLYMORPHIC USING noop_package;

```

The PTF can be invoked in queries. For example:

```

SELECT *
FROM   NOOP(emp)
WHERE  deptno = 10;

```

7782	CLARK	MANAGER	7839	09-JUN-81	2450	10
7839	KING	PRESIDENT		17-NOV-81	5000	10
7934	MILLER	CLERK	7782	23-JAN-82	1300	10

```

WITH e
    AS (SELECT *
        FROM   emp
            NATURAL JOIN dept
            WHERE dname = 'SALES')
SELECT t.*
FROM   NOOP(e) t;

```

191.4.1.1 DESCRIBE Only Polymorphic Table Function

A Polymorphic Table Function (PTF) can have a DESCRIBE function only.

A PTF which does not have any runtime methods (Open/Fetch_Rows/Close) is used only at cursor compilation time with no runtime row source allocated. The explain plan output of a Describe-Only PTF will not show any rows for the PTF.

191.4.2 PTF Server Side Interface

The DBMS_TF package provides the server side interface needed for Polymorphic Table Functions (PTFs) implementation to read and write information in the database.

This topic contains a partial list of types and subprograms used for the PTF server side implementation.

Table 191-2 Summary of Commonly Used Types and Subprograms in PTF Server Side Interface

NAME	DESCRIPTION
COLUMN_METADATA_T	Column metadata record
COLUMN_T	Column descriptor record
TABLE_T	Table descriptor record
COLUMNS_T	Collection containing column names
COLUMNS_NEW_T	Collection for new columns
TAB_<typ>_T	Collection for each supported types, where <typ> is described in " Supported Types Collections "
ROW_SET_T	Data for a rowset record
GET_COL Procedure	Fetches data for a specified (input) column
PUT_COL Procedure	Returns data for a specified (new) column
GET_ROW_SET Procedure	Fetches the input rowset of column values
PUT_ROW_SET Procedure	Returns data for ALL (new) columns
SUPPORTED_TYPE Function	Verifies if a type is supported by DBMS_TF subprograms
GET_XID Function	Returns a unique execution ID to index PTF state in a session

See Also:

- [DBMS_TF Data Structures](#) for the complete list of types
- [Summary of DBMS_TF Subprograms](#) for the complete list of subprograms

191.4.3 Read Columns

Read columns are a set of table columns that the Polymorphic Table Function (PTF) processes when executing the `FETCH_ROWS` procedure.

The PTF indicates the read columns inside `DESCRIBE` by annotating them in the input table descriptor, `TABLE_T`. Only the indicated read columns will be fetched and thus available for processing during `FETCH_ROWS`.

The PTF invocation in a query will typically use the `COLUMNS` operator to indicate which columns the query wants the PTF to read, and this information is passed to the `DESCRIBE` function which then in turn sets the `COLUMN_T.FOR_READ` boolean flag.

Only scalar SQL data types are allowed for the read columns.

The [Echo Polymorphic Table Function Example](#) takes a table and a list of columns and produces new columns with the same values.

191.4.4 Pass-Through Columns

Pass-through columns are passed from the input table of the Polymorphic Table Function (PTF) to the output, without any modifications.

The `DESCRIBE` function indicates the pass-through columns by setting the `COLUMN_T.PASS_THROUGH` boolean flag on the input table descriptor, `DBMS_TF.TABLE_T`.

All columns in the `Row Semantics` PTF are marked as pass-through by default. For `Table Semantics` PTF, the default value for pass-through is set to `false`. For the `Table Semantics` PTF, the partitioning columns are always pass-through and this cannot be changed by the `DESCRIBE` function.

Note, the notions of Pass-Through and Read are orthogonal, and indicating a column as one has no implication for the other.

191.4.5 State Management

The database manages the compilation and execution states of the polymorphic table functions (PTF).

The database fulfills the PTF conductor role. As such, it is responsible for the PTF compilation state and execution state.

1. **Compilation State** : This is the immutable state that is generated by `DESCRIBE` which is needed before execution.
2. **Execution State**: This is the state used by the execution time procedures (`OPEN`, `FETCH_ROWS`, and `CLOSE`) of a `Table semantics` PTF.

The most common use of compilation state is to keep track of the columns to be read and the new columns that are to be produced. The PTF Server interface provides functions that can be used to achieve this: `GET_ENV`, and `GET_ROW_SET`. The PTF author who defines, documents, and implements the PTF can rely on the database to manage the PTF states. The PTF author should not attempt to use the session state (such as PL/SQL package global variables) to store any compilation state. Problems can arise because in a given session all cursors using the PTF will share that state, and other sessions executing the PTF cursor will not see the original compilation state.

Since the execution state is session and cursor private, a `Table Semantics` PTF can use package globals for storing execution state, but with the provision that the PTF uses the database provided unique execution ID to identify that state. The `GET_XID` function guarantees to provide an execution unique ID for the PTF's execution procedures, where this ID remains constant for all the execution functions of a PTF.

191.4.5.1 CSTORE Compilation State Management

The CSTORE is the PTF compilation state management interface.

The CSTORE enables Polymorphic Table Functions (PTF) to store the compilation state in the SQL cursor.

The CSTORE interface is used to store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE_T` record.

The compilation state information is retrieved during execution procedures such as OPEN, FETCH_ROWS and CLOSE.

CSTORE Subprograms

The CSTORE interface consists of the following subprograms.

Name	Description
CSTORE_GET procedure	Fetches item of specified type. If not found, the OUT value remains unchanged.
CSTORE_EXISTS function	If an item with the given key exists in the CSTORE, this function returns TRUE.

CSTORE Supported Types

The DBMS_TF.DESCRIBE_T supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Table 191-3 DBMS_TF CSTORE Scalar Supported Types

Name	Description
CSTORE_TYPE_VARCHAR2	CSTORE VARCHAR2 type code
CSTORE_TYPE_NUMBER	CSTORE NUMBER type code
CSTORE_TYPE_DATE	CSTORE DATE type code
CSTORE_TYPE_BOOLEAN	CSTORE BOOLEAN type code

Collections For Compilation Storage

These predefined collection types are used for compilation state management.

```
TYPE CSTORE_CHR_T IS TABLE OF VARCHAR2(32767) INDEX BY VARCHAR2(32767);
TYPE CSTORE_NUM_T IS TABLE OF NUMBER INDEX BY VARCHAR2(32767);
TYPE CSTORE_BOL_T IS TABLE OF BOOLEAN INDEX BY VARCHAR2(32767);
TYPE CSTORE_DAT_T IS TABLE OF DATE INDEX BY VARCHAR2(32767);
```

DBMS_TF Method Names

The method names are also stored in the DBMS_TF.DESCRIBE_T record. These predefined values for the method names can be customized by the PTF author.

See [Method Name Overrides](#) for more information about changing the default method names

Table 191-4 DBMS_TF Method Names Constants

Name	Type	Value	Description
CLOSE	DBMS_QUOTED_ID	'CLOSE'	Predefined index value for the method named CLOSE

Table 191-4 (Cont.) DBMS_TF Method Names Constants

Name	Type	Value	Description
FETCH_ROWS	DBMS_QUOTED_ID	'FETCH_ROWS'	Predefined index value for the method named FETCH_ROWS
OPEN	DBMS_QUOTED_ID	'OPEN'	Predefined index value for the method named OPEN

191.4.5.2 XSTORE Execution State Management

XSTORE is the PTF execution state management interface.

The XSTORE key-value interface simplifies the implementation of Table Semantics PTFs by providing automatic state management capabilities when the keys are strings and values are of commonly used scalar types.

The database automatically manages the deletion of all execution states allocated using this interface.

XSTORE Subprograms

The execution state management interface consists of the following subprograms.

Table 191-5 DBMS_TF XSTORE Subprograms

Name	Description
XSTORE_CLEAR procedure	Removes all key-value pairs from the XSTORE execution state
XSTORE_EXISTS function	Returns TRUE if an item with a given key exists in the XSTORE
XSTORE_GET procedure	Gets the associated value for a given key stored in the XSTORE
XSTORE_REMOVE procedure	Removes an item associated with the given key and key_type
XSTORE_SET procedure	Sets the value for the given key for PTF Execution State Management

XSTORE Predefined Types

The XSTORE supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, and BOOLEAN.

Table 191-6 DBMS_TF XSTORE Scalar Supported Types

Name	Description
XSTORE_TYPE_VARCHAR2	XSTORE VARCHAR2 type code
XSTORE_TYPE_NUMBER	XSTORE NUMBER type code

Table 191-6 (Cont.) DBMS_TF XSTORE Scalar Supported Types

Name	Description
XSTORE_TYPE_DATE	XSTORE DATE type code
XSTORE_TYPE_BOOLEAN	XSTORE BOOLEAN type code

191.4.6 Method Name Overrides

When multiple polymorphic table function (PTF) implementations are in the same package, you can override the default runtime method names (`OPEN`, `FETCH_ROWS`, and `CLOSE`) with your PTF specific names.

To override a method name, the application can specify the new method names using `DBMS_TF.METHOD_NAMES` collection (see [DESCRIBE_T Record Type](#)).

See Also:

[Table 191-4](#)

Example 191-2 DBMS_TF Method Name Overrides

This example shows how to change the default method name of the `noop_p` PTF `fetch_rows` method to `noop_fetch`.

Live SQL:

You can view and run this example on Oracle Live SQL at [DBMS_TF Method Name Overrides](#)

Create the PTF implementation package `noop_p`.

```
CREATE PACKAGE noop_p AS
  FUNCTION describe(tab IN OUT DBMS_TF.table_t)
    RETURN DBMS_TF.describe_t;
  PROCEDURE noop_fetch;
END noop_p;
```

To provide a method name override, you can specify the new method names using `DBMS_TF.Method_Names` collection. The `FETCH_ROWS` method name is changed to `'Noop_Fetch'`. The procedure `noop_fetch` to implement this method is defined in the package.

```
CREATE OR replace PACKAGE BODY noop_p
AS
  FUNCTION describe(tab IN OUT DBMS_TF.table_t)
    RETURN DBMS_TF.describe_t AS
```

```

        methods DBMS_TF.methods_t := DBMS_TF.methods_t(DBMS_TF.fetch_rows =>
'Noop_Fetch');
    BEGIN
        RETURN DBMS_TF.describe_t(method_names => methods);
    END;
    PROCEDURE noop_fetch AS
    BEGIN
        RETURN;
    END;
END noop_p;

```

The noop PTF is defined to execute the noop_p when it is invoked.

```

CREATE FUNCTION noop (t TABLE) RETURN TABLE PIPELINED ROW POLYMORPHIC USING
noop_p;

```

The PTF is invoked in the FROM clause of a query block.

```

SELECT *
FROM noop(scott.emp)
WHERE deptno =10;

```

191.4.7 Using the COLUMNS Pseudo-Operator

The COLUMNS pseudo-operator is an addition to the SQL expression language.

Use the COLUMNS pseudo-operator to specify the arguments when invoking a Polymorphic Table Function (PTF) in the FROM clause. The COLUMNS pseudo-operator arguments specify the list of column names, or the list of column names with associated types.

See Also:

Oracle Database PL/SQL Language Reference for more information about the COLUMNS pseudo-operator syntax and semantics

191.4.8 Query Transformations

About predicate, projection and partitioning.

The pass-through columns of a Row Semantics PTF, and the PARTITION BY key columns of a Table Semantics PTF can be used for projection and predicate pushdown.

Example 191-3 Query Transformations

This example illustrates the predicate and projection pushdown for a Row Semantics PTF.

This query calls the echo PTF created in [Echo Polymorphic Table Function Example](#).

```

SELECT empno, ename, sal, comm, echo_sal
FROM echo(emp, COLUMNS(sal,comm))

```

```
WHERE deptno = 30
      AND echo_sal > 1000;
```

EMPNO	ENAME	SAL	COMM	ECHO_SAL
7499	ALLEN	1600	300	1600
7521	WARD	1250	500	1250
7654	MARTIN	1250	1400	1250
7698	BLAKE	2850		2850
7844	TURNER	1500	0	1500

Conceptually, this query will get rewritten as:

```
WITH t AS (SELECT empno, ename, sal, comm
FROM emp
WHERE deptno=30)
SELECT empno, ename, sal, comm, echo_sal
FROM echo(t, COLUMNS(sal, comm))
WHERE echo_sal > 1000;
```

191.4.9 Parallel Execution

A key benefit of Polymorphic Table Functions (PTFs) is that their execution can be parallelized.

Row and table semantic PTFs execute in parallel differently.

Row Semantics PTF

Under `Row Semantics` PTF, the parallel query executes with the same degree of parallelism (DOP) as it would if the PTF were not present. The DOP is driven by the child row source.

Provided that the DOP on table `emp` has been set to 5, the following is an example that shows this parallelization:

```
EXPLAIN PLAN FOR
SELECT * FROM echo(emp, COLUMNS(ename, job))
WHERE deptno != 20;
```

Id	Operation	Name
0	SELECT STATEMENT	
1	PX COORDINATOR	
2	PX SEND QC (RANDOM)	:TQ10000
3	POLYMORPHIC TABLE FUNCTION	ECHO
6	PX BLOCK ITERATOR	
* 7	TABLE ACCESS FULL	EMP

```

Predicate Information (identified by operation id):
5 - filter("EMP"."DEPTNO"<>20)
```

Table Semantics PTF

Table Semantics PTF requires its input table rows to be redistributed using the `PARTITION BY` key. The parallel execution is determined by the `PARTITION BY` clause specified in the query.

191.5 DBMS_TF Execution Flow

Query executions invoking Polymorphic Table Functions (PTF) follow this execution model and data transfers flow.

The PTF execution procedures (`OPEN`, `FETCH_ROWS` and `CLOSE`) are called by the database during query execution.

The PTF execution follows this flow :

1. `OPEN` (if present)
2. `FETCH_ROWS` (can be invoked multiple times)
3. `CLOSE` (if present)

The `FETCH_ROWS` procedure reads the data for a rowset (collection of rows), and produces an output rowset.

Each call to `FETCH_ROWS` is associated with a rowset which is a data collection of input rows that is expected to be processed by the PTF.

The `GET_ROW_SET` or `GET_COL` is used to read the input rowset.

The `PUT_ROW_SET` or `PUT_COL` is used to produce an output rowset, that is written back to the database.

`PUT_ROW_SET` is used to set all the new columns in a single call.

The `ROWSET_T` record holds data for multiple columns. When the PTF algorithm is more suited toward producing a single output column at a time, you can use `PUT_COL` to produce a single column. A given column can only be produced once within a call to `FETCH_ROWS`.

For a Row Semantics PTF, the `FETCH_ROWS` procedure will return the new rows using the PTF Server interface before returning back to the database.

191.6 DBMS_TF Restrictions

These restrictions apply to Polymorphic Table Functions (PTFs) and using the `DBMS_TF` package.

Type Restrictions

A Polymorphic Table Function (PTF) can operate on a table with columns of any SQL types. However, read and new columns are restricted to scalar types. The read and new columns are used in the `PUT_ROW_SET`, `PUT_COL`, `GET_ROW_SET` and `GET_COL` procedures. All SQL types can be used with pass-through columns. The `DESCRIBE` function can determine the supported types using the `DBMS_TF.SUPPORTED_TYPE` function.

PTF Invocation and Execution Restrictions

Polymorphic table functions cannot be nested in the `FROM` clause of a query. Nesting PTF is only allowed using `WITH` clause.

Nesting table function with polymorphic table function is only allowed using `CURSOR` expressions. A PTF cannot be specified as an argument of a table function.

You cannot select a rowid from a Polymorphic Table Function (PTF).

The `PARTITION BY` and the `ORDER BY` clause can only be specified on an argument of a Table Semantics PTF.

The PTF execution methods `OPEN`, `FETCH_ROWS`, and `CLOSE` must be invoked in the polymorphic table function execution context only.

You cannot invoke the `DESCRIBE` method directly.

This example shows ten PTF nested invocation.

```
WITH t0
  AS (SELECT /*+ parallel */ *
      FROM   noop(dept)),
```

```
t1
AS (SELECT *
    FROM noop(t0)),
t2
AS (SELECT *
    FROM noop(t1)),
t3
AS (SELECT *
    FROM noop(t2)),
t4
AS (SELECT *
    FROM noop(t3)),
t5
AS (SELECT *
    FROM noop(t4)),
t6
AS (SELECT *
    FROM noop(t5)),
t7
AS (SELECT *
    FROM noop(t6)),
t8
AS (SELECT *
    FROM noop(t7)),
t9
AS (SELECT *
    FROM noop(t8))
SELECT *
FROM noop(t9)
WHERE deptno = 10;
```

10 ACCOUNTING NEW YORK

191.7 DBMS_TF Examples

These examples use DBMS_TF subprograms.

Summary of DBMS_TF Examples

These examples are incomplete and for demonstration purpose only.

- *Oracle PL/SQL Language Reference*, "To_doc Polymorphic Table Function Example"

191.7.1 Echo Polymorphic Table Function Example

The echo PTF takes in a table and a list of columns and produces new columns with same values.

This PTF returns all the columns in the input table `tab`, and adds to it the columns listed in `cols` but with the column names prefixed with "ECHO_".

Live SQL:

You can view and run this example on Oracle Live SQL at [Echo Polymorphic Table Function](#)

The echo PTF can appear in the FROM clause of the query. The COLUMNS operator is used to specify columns, for example:

```
SELECT *
FROM echo(scott.dept, COLUMNS(dname, loc));
```

DEPTNO	DNAME	LOC	ECHO_DNAME	ECHO_LOC
10	ACCOUNTING	NEW YORK	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS	RESEARCH	DALLAS
30	SALES	CHICAGO	SALES	CHICAGO
40	OPERATIONS	BOSTON	OPERATIONS	BOSTON

A PTF consists of the following :

- PTF implementation package specification : The specification must have the DESCRIBE method. The OPEN, FETCH_ROWS and CLOSE methods are optional.

- PTF implementation package body: The DESCRIBE method may have a new-columns parameter (the additional columns created by this PTF), which is followed by the PTF functions parameters.
- PTF Function: The PTF function has a reference to the implementation package.

The echo_package package specification defines the DESCRIBE and FETCH_ROWS methods.

```
CREATE PACKAGE echo_package
AS
  prefix DBMS_ID := 'ECHO_';
  FUNCTION describe(
    tab IN OUT DBMS_TF.TABLE_T,
    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T;
  PROCEDURE fetch_rows;
END echo_package;
```

The echo_package package body contains the PTF implementation.

```
CREATE PACKAGE BODY echo_package
AS
  FUNCTION describe(tab IN OUT DBMS_TF.TABLE_T,
    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T
  AS
    new_cols DBMS_TF.COLUMNS_NEW_T;
    col_id PLS_INTEGER := 1;
  BEGIN
    FOR I IN 1 .. tab.COLUMN.COUNT LOOP
      FOR J IN 1 .. cols.COUNT LOOP
        IF ( tab.COLUMN(i).description.name = cols(j) ) THEN
          IF ( NOT
DBMS_TF.SUPPORTED_TYPE(tab.COLUMN(i).description.TYPE) )
          THEN
            RAISE_APPLICATION_ERROR(-20102, 'Unsupported column
type [' ||
          TAB.COLUMN(i).description.TYPE||']');
          END IF;

          TAB.COLUMN(i).for_read := TRUE;
          NEW_COLS(col_id) := TAB.COLUMN(i).description;
          NEW_COLS(col_id).name := prefix ||
TAB.COLUMN(i).description.name;
          col_id := col_id + 1;

          EXIT;
        END IF;
      END LOOP;
    END LOOP;

    /* Verify all columns were found */
    IF ( col_id - 1 != cols.COUNT ) THEN
      RAISE_APPLICATION_ERROR(-20101, 'Column mismatch ['||col_id -
```

```

1||'], ['||cols.COUNT||']');
    END IF;

    RETURN DBMS_TF.DESCRIBE_T(new_columns => new_cols);
END;
PROCEDURE FETCH_ROWS
AS
    ROWSET DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);
END;
END echo_package;

```

The PTF echo references the implementation package echo_package.

```

CREATE FUNCTION echo(tab TABLE,
                    cols COLUMNS)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING echo_package;

```

Example 191-4 Using the Echo PTF in Queries

This example selects all employees in department 20. The resulting rows have three new columns ECHO_ENAME, ECHO_HIREDATE, and ECHO_SAL.

```

SELECT *
FROM   echo(scott.emp, COLUMNS(ename, sal, hiredate))
WHERE  deptno = 20;

```

EMPNO	ENAME	JOB	MGR	HIREDATE	SAL	COMM	DEPTNO	ECHO_ENAME	ECHO_HIRE	ECHO_SAL
7369	SMITH	CLERK	7902	17-DEC-80	800		20	SMITH	17-DEC-80	800
7566	JONES	MANAGER	7839	02-APR-81	2975		20	JONES	02-APR-81	2975
7788	SCOTT	ANALYST	7566	19-APR-87	3000		20	SCOTT	19-APR-87	3000
7876	ADAMS	CLERK	7788	23-MAY-87	1100		20	ADAMS	23-MAY-87	1100
7902	FORD	ANALYST	7566	03-DEC-81	3000		20	FORD	03-DEC-81	3000

Using subquery w, display ENAME, ECHO_LOC and DNAME columns for all employees in department 30 with a salary greater than 1000.

```

WITH w
AS (SELECT e.*,
         dname,
         loc
    FROM   scott.emp e,
         scott.dept d
   WHERE  e.deptno = d.deptno)
SELECT  ename,
        echo_loc,
        dname
FROM    echo(w, COLUMNS(sal, dname, loc, hiredate))

```

```
WHERE deptno = 30
       AND echo_sal > 1000;
```

ENAME	ECHO_LOC	DNAME
ALLEN	CHICAGO	SALES
WARD	CHICAGO	SALES
MARTIN	CHICAGO	SALES
BLAKE	CHICAGO	SALES
TURNER	CHICAGO	SALES

Using subquery w, display ENAME and DNAME columns for all employees with a salary greater than 1000.

```
WITH w
     AS (SELECT e.*,
              dname,
              loc
          FROM   scott.emp e,
              scott.dept d
          WHERE  e.deptno = d.deptno)
SELECT echo_ename,
       dname
FROM   echo(w, COLUMNS(loc, deptno, dname, ename)) e
WHERE  ename IN (SELECT echo_ename
                FROM   echo(scott.emp, COLUMNS(sal, deptno, ename,
                hiredate))
                WHERE  deptno = e.echo_deptno
                AND sal > 1000);
```

ECHO_ENAME	DNAME
ALLEN	SALES
MILLER	ACCOUNTING
CLARK	ACCOUNTING
WARD	SALES
ADAMS	RESEARCH
TURNER	SALES
SCOTT	RESEARCH
BLAKE	SALES
JONES	RESEARCH
KING	ACCOUNTING
FORD	RESEARCH
MARTIN	SALES

191.8 DBMS_TF Data Structures

The DBMS_TF package defines these RECORD types, TABLE types and subtype.

RECORD Types

- [COLUMN_DATA_T Record Type](#)
- [COLUMN_METADATA_T Record Type](#)
- [COLUMN_T Record Type](#)

- [DESCRIBE_T Record Type](#)
- [ENV_T Record Type](#)
- [PARALLEL_ENV_T Record Type](#)
- [TABLE_T Record Type](#)

TABLE Types

- [Supported Types Collections \(TAB_<typ>_T\)](#)
- [COLUMNS_NEW_T Table Type](#)
- [COLUMNS_T Table Type](#)
- [COLUMNS_WITH_TYPE_T Table Type](#)
- [TABLE_COLUMNS_T Table Type](#)
- [ROW_SET_T Table Type](#)

Types

- [XID_T Subtype](#)

CSTORE and XSTORE Data Structures

The compilation and execution state management interfaces use data structures internally.

See [Collections For Compilation Storage](#) for more information.

191.8.1 Supported Types Collections

Each supported type has a corresponding predefined collection defined.

Syntax

```

TYPE TAB_BOOLEAN_T          IS TABLE OF BOOLEAN          INDEX BY PLS_INTEGER;
TYPE TAB_BINARY_FLOAT_T     IS TABLE OF BINARY_FLOAT     INDEX BY PLS_INTEGER;
TYPE TAB_BINARY_DOUBLE_T    IS TABLE OF BINARY_DOUBLE    INDEX BY PLS_INTEGER;
TYPE TAB_BLOB_T             IS TABLE OF BLOB              INDEX BY PLS_INTEGER;
TYPE TAB_CHAR_T             IS TABLE OF CHAR(32767)       INDEX BY PLS_INTEGER;
TYPE TAB_CLOB_T             IS TABLE OF CLOB              INDEX BY PLS_INTEGER;
TYPE TAB_DATE_T             IS TABLE OF DATE              INDEX BY PLS_INTEGER;
TYPE TAB_INTERVAL_YM_T      IS TABLE OF YMINTERVAL_UNCONSTRAINED  INDEX BY PLS_INTEGER;
TYPE TAB_INTERVAL_DS_T      IS TABLE OF DSINTERVAL_UNCONSTRAINED  INDEX BY PLS_INTEGER;
TYPE TAB_NATURALN_T         IS TABLE OF NATURALN         INDEX BY PLS_INTEGER;
TYPE TAB_NUMBER_T           IS TABLE OF NUMBER           INDEX BY PLS_INTEGER;
TYPE TAB_RAW_T              IS TABLE OF RAW(32767)       INDEX BY PLS_INTEGER;
TYPE TAB_ROWID_T            IS TABLE OF ROWID            INDEX BY PLS_INTEGER;

```

```

TYPE TAB_VARCHAR2_T      IS TABLE OF VARCHAR2(32767) INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_T    IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY
PLS_INTEGER;

TYPE TAB_TIMESTAMP_TZ_T IS TABLE OF TIMESTAMP_TZ_UNCONSTRAINED INDEX BY
PLS_INTEGER;

TYPE TAB_TIMESTAMP_LTZ_T IS TABLE OF TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY
PLS_INTEGER;

```

See Also:

[Table 191-1](#) for more information about the DBMS_TF supported types

191.8.2 COLUMN_DATA_T Record Type

Data for a single column (variant record).

Exactly one variant field is active in the record. The description includes information about the column type that is active.

See [Table 191-1](#) for the list of supported types.

Syntax

```

TYPE COLUMN_DATA_T IS RECORD
( description          COLUMN_METADATA_T,
  tab_varchar2        TAB_VARCHAR2_T,
  tab_number          TAB_NUMBER_T,
  tab_date            TAB_DATE_T,
  tab_binary_float    TAB_BINARY_FLOAT_T,
  tab_binary_double   TAB_BINARY_DOUBLE_T,
  tab_raw             TAB_RAW_T,
  tab_char            TAB_CHAR_T,
  tab_clob            TAB_CLOB_T,
  tab_blob            TAB_BLOB_T,
  tab_timestamp       TAB_TIMESTAMP_T,
  tab_timestamp_tz    TAB_TIMESTAMP_TZ_T,
  tab_interval_ym     TAB_INTERVAL_YM_T,
  tab_interval_ds     TAB_INTERVAL_DS_T,
  tab_timestamp_ltz   TAB_TIMESTAMP_LTZ_T,
  tab_rowid           TAB_ROWID_T,
  tab_boolean         TAB_BOOLEAN_T);

```

Fields

Table 191-7 COLUMN_DATA_T Fields

Field	Description
description	The tag defines the metadata for the column indicating which variant field is active.

Table 191-7 (Cont.) COLUMN_DATA_T Fields

Field	Description
tab_varchar2	Variant field
tab_number	Variant field
tab_date	Variant field
tab_binary_float	Variant field
tab_binary_double	Variant field
tab_raw	Variant field
tab_char	Variant field
tab_clob	Variant field
tab_blob	Variant field
tab_timestamp	Variant field
tab_timestamp_tz	Variant field
tab_interval_ym	Variant field
tab_interval_ds	Variant field
tab_timestamp_ltz	Variant field
tab_rowid	Variant field
tab_boolean_t	Variant field

191.8.3 COLUMN_METADATA_T Record Type

This type contains metadata about an existing table column or a new column produced by PTF.

Syntax

```
TYPE COLUMN_METADATA_T IS RECORD
( type          PLS_INTEGER,
  max_len       PLS_integer DEFAULT -1,
  name          VARCHAR2(32767),
  name_len      PLS_INTEGER,
  precision     PLS_INTEGER,
  scale         PLS_INTEGER,
  charsetid     PLS_INTEGER,
  charsetform   PLS_INTEGER,
  collation     PLS_INTEGER );
```

Fields

Table 191-8 COLUMN_METADATA_T Fields

Field	Description
type	Internal Oracle typecode for the column's type

Table 191-8 (Cont.) COLUMN_METADATA_T Fields

Field	Description
max_len	Maximum length of a column. If it is less than the maximum allowed length then that value will be used, if it is NULL or zero, zero will be used. If it is less than zero, then maximum allowed length will be used. If types (like date,float), does not care about length, then this value will be ignored.
name	Name of the column
name_len	Length of the name
precision	The precision, or the maximum number of significant decimal digits (for numeric data types)
scale	Scale, or the number of digits from the decimal point to the least significant digit (for numeric data types)
charsetid	Character set id (internal Oracle code, applies to string types)
charsetform	Character set form (internal Oracle code, applies to string types)
collation	Collation id (internal Oracle code, applies to string types)

191.8.4 COLUMN_T Record Type

The column descriptor record for the type COLUMN_METADATA_T that contains PTF specific attributes.

Syntax

```
TYPE column_t IS RECORD (
    description          COLUMN_METADATA_T,
    pass_through        BOOLEAN,
    for_read            BOOLEAN);
```

Fields

Table 191-9 COLUMN_T Fields

Field	Description
description	Column metadata
pass_through	Is this a pass through column
for_read	Is this column read by the PTF

191.8.5 DESCRIBE_T Record Type

The return type from the DESCRIBE method of PTF.

Syntax

```
TYPE DESCRIBE_T          IS RECORD
( NEW_COLUMNS           COLUMNS_NEW_T DEFAULT COLUMNS_NEW_T(),
  CSTORE_CHR            CSTORE_CHR_T  DEFAULT CSTORE_CHR_T(),
  CSTORE_NUM           CSTORE_NUM_T   DEFAULT CSTORE_NUM_T(),
```

```

CSTORE_BOL          CSTORE_BOL_T  DEFAULT CSTORE_BOL_T(),
CSTORE_DAT          CSTORE_DAT_T  DEFAULT CSTORE_DAT_T(),
METHOD_NAMES       METHODS_T      DEFAULT METHODS_T();

```

Fields

Table 191-10 DESCRIBE_T Fields

Field	Description
NEW_COLUMNS	New columns description that will be produced by the PTF
CSTORE_CHR	CStore array key type : VARCHAR2 (optional)
CSTORE_NUM	CStore array key type : NUMBER (optional)
CSTORE_BOL	CStore array key type : BOOLEAN (optional)
CSTORE_DAT	CStore array key type : DATE (optional)
METHOD_NAMES	Method names, if user wants to override OPEN, FETCH_ROWS, CLOSE methods

191.8.6 ENV_T Record Type

This record contains metadata about the polymorphic table function execution state.

Syntax

```

TYPE ENV_T IS RECORD (
  get_columns      TABLE_METADATA_T,
  put_columns      TABLE_METADATA_T,
  ref_put_col      REFERENCED_COLS_T,
  parallel_env     PARALLEL_ENV_T,
  query_optim      BOOLEAN,
  row_count        PLS_INTEGER,
  row_replication  BOOLEAN,
  row_insertion    BOOLEAN);

```

Fields

Table 191-11 ENV_T Fields

Field	Description
get_columns	Metadata about the columns read by PTF GET_COL procedure
put_columns	Metadata about columns sent back to database by PUT_COL procedure
ref_put_col	TRUE if the put column was referenced in the query
parallel_env	Parallel execution information (when a query runs in parallel)
query_optim	Is this execution for query optimization? TRUE, if the query was running on behalf of optimizer
row_count	Number of rows in current row set
row_replication	Is Row Replication Enabled?
row_insertion	Is Row Insertion Enabled?

191.8.7 PARALLEL_ENV_T Record Type

The record contains metadata specific to polymorphic table functions parallel execution.

Syntax

```
TYPE PARALLEL_ENV_T          IS RECORD
( instance_id                PLS_INTEGER,
  session_id                 PLS_INTEGER,
  server_grp                 PLS_INTEGER,
  server_set_no              PLS_INTEGER,
  no_slocal_servers          PLS_INTEGER,
  global_server_no           PLS_INTEGER,
  no_local_servers           PLS_INTEGER,
  local_server_no            PLS_INTEGER );
```

Fields

Table 191-12 PARALLEL_ENV_T Fields

Field	Description
instance_id	QC instance ID
session_id	QC session ID
server_grp	Server group
server_set_no	Server set number
no_slocal_servers	Number of sibling servers (including self)
global_server_no	Global server number (base 0)
no_local_servers	Number of sibling servers running on instance
local_server_no	Local server number (base 0)

191.8.8 TABLE_T Record Type

The DESCRIBE function input table descriptor argument is of TABLE_T record type.

Syntax

```
TYPE TABLE_T IS RECORD(
  column                    TABLE_COLUMNS_T,
  schema_name                DBMS_id,
  package_name               DBMS_id,
  ptf_name                   DBMS_id);
```

Fields

Table 191-13 TABLE_T Fields

Field	Description
column	Column information

Table 191-13 (Cont.) TABLE_T Fields

Field	Description
schema_name	The PTF schema name
package_name	The PTF implementation package name
ptf_name	The PTF name invoked

191.8.9 COLUMNS_NEW_T Table Type

Collection for new columns

Syntax

```
TYPE COLUMNS_NEW_T IS TABLE OF COLUMN_METADATA_T INDEX BY PLS_INTEGER;
```

191.8.10 COLUMNS_T Table Type

Collection containing column names

Syntax

```
TYPE COLUMNS_T IS TABLE OF DBMS_QUOTED_ID;
```

191.8.11 COLUMNS_WITH_TYPE_T Table Type

Collection containing columns metadata

Syntax

```
TYPE COLUMNS_WITH_TYPE_T IS TABLE OF COLUMN_METADATA_T;
```

191.8.12 TABLE_COLUMNS_T Table Type

A collection of columns(COLUMN_T)

Syntax

```
TYPE TABLE_COLUMNS_T IS TABLE OF COLUMN_T;
```

191.8.13 ROW_SET_T Table Type

Data for a rowset

Syntax

```
TYPE ROW_SET_T IS TABLE OF COLUMN_DATA_T INDEX BY PLS_INTEGER;
```

191.8.14 XID_T Subtype

The XID_T subtype is defined to store the execution unique ID returned by function GET_XID.

Syntax

```
SUBTYPE XID_T IS VARCHAR2(1024);
```

191.9 Summary of DBMS_TF Subprograms

This summary briefly describes the DBMS_TF package subprograms.

Table 191-14 DBMS_TF Subprograms

Subprogram	Description
COLUMN_TYPE_NAME Function	Returns the type name of the specified column type
COL_TO_CHAR Function	Returns the string representation of the specified column
CSTORE_EXISTS Function	Returns TRUE if an item with a given key exists in the PTF Compilation State management Store
CSTORE_GET Procedure	Gets item(s) of specified type from the PTF Compilation State management Store
GET_COL Procedure	Gets read column values
GET_ENV Function	Returns information about the PTF runtime environment
GET_ROW_SET Procedure	Gets read set of column values in the collection
GET_XID Function	Returns a unique execution id that can be used by the PTF to index any cursor execution specific runtime state
PUT_COL Procedure	Puts column values in the database
PUT_ROW_SET Procedure	Puts the collection read set of column values in the database
ROW_REPLICATION Procedure	Sets the row replication factor
ROW_TO_CHAR Function	Returns the string representation of a row in a rowset
SUPPORTED_TYPE Function	Returns TRUE if a specified type is supported by PTF infrastructure
TRACE Procedure	Prints data structures to help development and problem diagnosis
XSTORE_CLEAR Procedure	Removes all key-value pairs from XStore
XSTORE_EXISTS Procedure	Returns TRUE if the key has an associated value
XSTORE_GET Procedure	Gets a key-value store for PTF Execution State Management
XSTORE_REMOVE Procedure	Removes any value associated with the given key
XSTORE_SET Procedure	Sets the value for the given key store for PTF Execution State Management

191.9.1 COLUMN_TYPE_NAME Function

Returns the type name for the specified column type.

Syntax

```
FUNCTION COLUMN_TYPE_NAME(
    col COLUMN_METADATA_T)
RETURN VARCHAR2;
```

Parameters

Table 191-15 DBMS_TF.COLUMN_TYPE_NAME Function Parameters

Parameter	Description
col	The column metadata. See COLUMN_METADATA_T Record Type

Return Values

Returns the column type converted as text.

Example 191-5 DBMS_TF.COLUMN_TYPE_NAME Example

This example shows an application type check that invokes `COLUMN_TYPE_NAME` to compare the column type and raise an application error if the column type is not `VARCHAR2`.

```
FUNCTION describe(
    tab IN OUT DBMS_TF.table_t,
    cols IN DBMS_TF.columns_t)
RETURN DBMS_TF.describe_t
AS
    new_cols DBMS_TF.columns_new_t;
    col_id PLS_INTEGER := 1;
BEGIN
    FOR i IN 1 .. tab.count LOOP
        FOR j IN 1 .. cols.count LOOP
            IF (tab(i).description.name = cols(j)) THEN
                IF (DBMS_TF.column_type_name(tab(i).description.type) != 'VARCHAR2')
THEN
                    raise_application_error(-20102,
                        'Unsupported column type ['||tab(i).description.type||']');
                END IF;
                tab(i).for_read := true;
                new_cols(col_id) := tab(i).description;
                new_cols(col_id).name := 'ECHO_'|| tab(i).description.name;
                col_id := col_id + 1;
                EXIT;
            END IF;
        END LOOP;
    END LOOP;

    -- Verify all columns were found
    IF (col_id - 1 != cols.count) THEN
        raise_application_error(-20101,
            'Column mismatch ['||col_id-1||'], ['||cols.count||']');
    END IF;
```

```

        RETURN DBMS_TF.describe_t(new_columns => new_cols);
    END;

```

191.9.2 COL_TO_CHAR Function

Returns the string representation of the specified column.

Syntax

```

FUNCTION COL_TO_CHAR(
    col    COLUMN_DATA_T,
    rid    PLS_INTEGER,
    quote  VARCHAR2 DEFAULT '')
RETURN VARCHAR2;

```

Parameters

Table 191-16 DBMS_TF.COL_TO_CHAR Function Parameters

Parameter	Description
col	The column whose value is to be converted
rid	Row number
quote	Quotation mark to use for non-numeric values

Return Values

The string representation of a column data value.

Example 191-6 DBMS_TF.COL_TO_CHAR Example

```

PROCEDURE Fetch_Rows AS
    rowset DBMS_TF.rROW_SET_T;
    str    VARCHAR2(32000);
BEGIN
    DBMS_TF.GET_ROW_SET(rowset);
    str := DBMS_TF.COL_TO_CHAR(rowset(1), 1)
END;

```

191.9.3 CSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the Store PTF Compilation State.

Syntax

```

FUNCTION CSTORE_EXISTS
(key    IN VARCHAR2,
 key_type IN PLS_INTEGER default NULL)
return BOOLEAN;

```

Parameters

Table 191-17 CSTORE_EXISTS Function Parameters

Parameter	Description
key	A unique character key
key_type	The type of key (optional) Default : NULL

Return Values

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

Example 191-7 DBMS_TF.CSTORE_EXISTS Example

This code excerpt checks if an item with the key exists before reading it from the compilation store.

```
IF (DBMS_TF.CSTORE_EXISTS('min'||j)) THEN
    DBMS_TF.CSTORE_GET('min'||j, min_col);
END IF;
```

191.9.4 CSTORE_GET Procedure

You can use the CSTORE_GET procedure to get the associated value for a given key stored for PTF Compilation State.

CSTORE is the PTF compilation state management interface. The CSTORE interface is used to set and store key-value pairs during cursor compilation through the DBMS_TF.DESCRIBE function.

You can get the PTF compilation state during runtime procedures such as OPEN, FETCH_ROWS and CLOSE.

This procedure is overloaded. The DESCRIBE_T supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See [Table 191-3](#) for more information.

Syntax

Get the value associated with the key in the value out variable. The value type returned is one of the supported scalar types.

```
PROCEDURE CSTORE_GET(
    key    IN    VARCHAR2,
    value IN OUT VARCHAR2);
```

```
PROCEDURE CSTORE_GET(
```

```

key    IN    VARCHAR2,
value  IN OUT NUMBER);

PROCEDURE CSTORE_GET(
key    IN    VARCHAR2,
value  IN OUT DATE);

PROCEDURE CSTORE_GET(
key    IN    VARCHAR2,
value  IN OUT BOOLEAN);

```

When no specific key is passed as an input parameter, the entire collection of key values for that type that exist in the CSTORE is returned.

```

PROCEDURE CSTORE_GET(key_value OUT CSTORE_CHR_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_NUM_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_BOL_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_DAT_T);

```

Parameters

Table 191-18 DBMS_TF.CSTORE_GET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types
key_value	Key value

191.9.5 GET_COL Procedure

Get Read Column Values

Syntax

```

PROCEDURE GET_COL(
columnId NUMBER,
collection IN OUT NOCOPY <datatype>);

```

Where <datatype> can be any one of the supported types.

See [Table 191-1](#) for the list of supported types.

Parameters

Table 191-19 GET_COL Procedure Parameters

Parameter	Description
columnid	The id for the column

Table 191-19 (Cont.) GET_COL Procedure Parameters

Parameter	Description
collection	The data for the column

Usage Notes

This procedure is used to get the read column values in the collection of scalar type.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same ColumnId, GET_COL and PUT_COL may correspond to different column.

Example 191-8 DBMS_TF.GET_COL Example

This example is an excerpt of a fetch_rows procedure defined in the PTF implementation package.

```
PROCEDURE fetch_rows
IS
  col1 DBMS_TF.TAB_CLOB_T;
  col2 DBMS_TF.TAB_CLOB_T;
  out1 DBMS_TF.TAB_CLOB_T;
  out2 DBMS_TF.TAB_CLOB_T;
BEGIN
  DBMS_TF.GET_COL(1, col1);
  DBMS_TF.GET_COL(2, col2);

  FOR I IN 1 .. col1.COUNT LOOP
    out1(i) := 'ECHO-' || col1(i);
  END LOOP;

  FOR I IN 1 .. col2.COUNT LOOP
    out2(i) := 'ECHO-' || col2(i);
  END LOOP;

  DBMS_TF.PUT_COL(1, out1);
  DBMS_TF.PUT_COL(2, out2);
END;
```

Note, invoking the DBMS_TF APIs directly is not allowed. An error is raised if an attempt is made to execute these procedures out of context.

```
exec fetch_rows
```

```
ERROR at line 1:
ORA-62562: The API Get_Col can be called only during execution time of a polymorphic
table function.
```

191.9.6 GET_ENV Function

Returns information about the PTF runtime environment

Syntax

```
FUNCTION GET_ENV
    RETURN ENV_T;
```

Return Values

Returns information about the PTF runtime environment.

Example 191-9 DBMS_TF.GET_ENV Example

This line shows how you could initialize a local variable `env` of type `ENV_T` with the PTF execution information in a `FETCH_ROWS` implementation procedure.

```
env          DBMS_TF.ENV_T := DBMS_TF.GET_ENV();
```

191.9.7 GET_ROW_SET Procedure

Get Read Column Values

The `FETCH_ROW` procedure can call the `GET_ROW_SET` procedure to read the input rowset set of column values in the collection of supported scalar type. This procedure is overloaded.

Syntax

```
PROCEDURE GET_ROW_SET(
    rowset      OUT NOCOPY ROW_SET_T);

PROCEDURE GET_ROW_SET(
    rowset      OUT NOCOPY ROW_SET_T,
    row_count   OUT          PLS_INTEGER);

PROCEDURE GET_ROW_SET(
    rowset      OUT NOCOPY ROW_SET_T,
    row_count   OUT          PLS_INTEGER,
    col_count   OUT          PLS_INTEGER);
```

Parameters

Table 191-20 GET_ROW_SET Procedure Parameters

Parameter	Description
<code>rowset</code>	The collection of data and metadata
<code>row_count</code>	The number of rows in the columns
<code>col_count</code>	The number of columns

Example 191-10 DBMS_TF.GET_ROW_SET Example

This example is an excerpt from a PTF implementation package for demonstration purpose.

```
PROCEDURE fetch_rows(new_name IN VARCHAR2 DEFAULT 'PTF_CONCATENATE')
AS
```

```

rowset      DBMS_TF.ROW_SET_T;
accumulator DBMS_TF.TAB_VARCHAR2_T;
row_count   PLS_INTEGER;

FUNCTION get_value(col  PLS_INTEGER,
                  ROW  PLS_INTEGER)
RETURN VARCHAR2
AS
  col_type PLS_INTEGER := rowset(col).description.TYPE;
BEGIN
  CASE col_type
    WHEN DBMS_TF.TYPE_VARCHAR2 THEN
      RETURN NVL(rowset(col).TAB_VARCHAR2 (ROW), 'empty');
    ELSE
      RAISE_APPLICATION_ERROR(-20201, 'Non-Varchar Type='||col_type);
  END CASE;
END;

BEGIN
  DBMS_TF.GET_ROW_SET(rowset, row_count);

  IF ( rowset.count = 0 ) THEN
    RETURN;
  END IF;

  FOR row_num IN 1 .. row_count LOOP
    accumulator(row_num) := 'empty';
  END LOOP;

  FOR col_num IN 1 .. rowset.count LOOP
    FOR row_num IN 1 .. row_count LOOP
      accumulator(row_num) := accumulator(row_num) ||
get_value(col_num, row_num);
    END LOOP;
  END LOOP;
  -- Pushout the accumulator
  DBMS_TF.PUT_COL(1, accumulator);
END;

```

191.9.7.1 Stack Polymorphic Table Function Example

The stack PTF example unpivots the non-null values of the specified numeric columns by converting each column value into a new row.

Example 191-11 Stack Polymorphic Table Function Example

Live SQL:

You can view and run this example on Oracle Live SQL at [Stack Polymorphic Table Function](#)

Create the PTF implementation package `stack_p`.

The parameters are :

- **tab** - Input table
- **col** - The names of numeric (input) table columns to stack

```
CREATE PACKAGE stack_p AS

    FUNCTION describe(tab IN OUT dbms_tf.table_t,
                     col      dbms_tf.columns_t)
        RETURN dbms_tf.describe_t;

    PROCEDURE fetch_rows;

END stack_p;
```

Create the PTF implementation package body `stack_p`.

This PTF produces two new columns, `COLUMN_NAME` and `COLUMN_VALUE`, where the former contains the name of the unpivoted column and the latter contains the numeric value of that column. Additionally, the unpivoted columns are removed from the PTF's output.

```
CREATE PACKAGE BODY stack_p AS

    FUNCTION describe(tab IN OUT dbms_tf.table_t,
                     col      dbms_tf.columns_t)
        RETURN dbms_tf.describe_t AS
    BEGIN
        FOR i IN 1 .. tab.column.count LOOP
            FOR j IN 1 .. col.count LOOP
                IF (tab.column(i).description.name = col(j) AND
                    tab.column(i).description.TYPE = dbms_tf.type_number) THEN
                    tab.column(i).pass_through := false;
                    tab.column(i).for_read    := true;
                END IF;
            END LOOP;
        END LOOP;

        RETURN dbms_tf.describe_t(
            new_columns => dbms_tf.columns_new_t(
                1 => dbms_tf.column_metadata_t(name => 'COLUMN_NAME',
                                              TYPE =>
dbms_tf.type_varchar2),
                2 => dbms_tf.column_metadata_t(name => 'COLUMN_VALUE',
                                              TYPE =>
dbms_tf.type_number)),
            row_replication => true);
    END;

    PROCEDURE fetch_rows AS
        env      dbms_tf.env_t := dbms_tf.get_env();
        rowset   dbms_tf.row_set_t;
        colcnt   PLS_INTEGER;
        rowcnt   PLS_INTEGER;
```

```

    repfac dbms_tf.tab_naturaln_t;
    namcol dbms_tf.tab_varchar2_t;
    valcol dbms_tf.tab_number_t;
BEGIN
    dbms_tf.get_row_set(rowset, rowcnt, colcnt);

    FOR i IN 1 .. rowcnt LOOP
        repfac(i) := 0;
    END LOOP;

    FOR r IN 1 .. rowcnt LOOP
        FOR c IN 1 .. colcnt LOOP
            IF rowset(c).tab_number(r) IS NOT NULL THEN
                repfac(r) := repfac(r) + 1;
                namcol(nvl(namcol.last+1,1)) :=
                    INITCAP(regex_replace(env.get_columns(c).name, '^"|"$'));
                valcol(NVL(valcol.last+1,1)) := rowset(c).tab_number(r);
            END IF;
        END LOOP;
    END LOOP;

    dbms_tf.row_replication(replication_factor => repfac);
    dbms_tf.put_col(1, namcol);
    dbms_tf.put_col(2, valcol);

END;

END stack_p;

```

Create the standalone PTF named `stack`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `stack_p`.

```

CREATE FUNCTION stack(tab TABLE,
                    col columns)
    RETURN TABLE
PIPELINED ROW POLYMORPHIC USING stack_p;

```

For all employees in departments 10 and 30, report values of columns `MGR`, `SAL`, and `COMM` ordered by department number and employee name.

```

SELECT deptno, ename, column_name, column_value
FROM    stack(scott.emp, COLUMNS(mgr, sal, comm))
WHERE   deptno IN (10, 30)
ORDER BY deptno, ename;

```

DEPTNO	ENAME	COLUMN_NAME	COLUMN_VALUE
10	CLARK	Mgr	7839
10	CLARK	Sal	2450
10	KING	Sal	5000
10	MILLER	Sal	1300
10	MILLER	Mgr	7782

30 WARD	Mgr	7698
30 WARD	Sal	1250

191.9.8 GET_XID Function

Returns a unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Syntax

```
FUNCTION GET_XID  
    RETURN XID_T;
```

Return Values

A unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Example 191-12 DBMS_TF.GET_XID Example

This is an excerpt of code showing an invocation of GET_XID to initialize a local variable indexed using the execution id to a zero value.

```
PROCEDURE open IS  
BEGIN  
    xst(DBMS_TF.GET_XID()) := 0;  
END;
```

191.9.9 PUT_COL Procedure

Put Column Values

Syntax

```
PROCEDURE PUT_COL(  
    columnid NUMBER,  
    collection IN <datatype>);
```

Where <datatype> can be any one of the supported types.

See [Table 191-1](#) for the list of supported types.

Parameters

Table 191-21 PUT_COL Procedure Parameters

Parameter	Description
columnid	The id for the column
collection	The data for the column

Usage Notes

This procedure is used to put the read column values in the collection of scalar type.

The collection of scalar type should be of supported type only.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same columnid, GET_COL and PUT_COL may correspond to different column.

191.9.9.1 Rand_col Polymorphic Table Function Example

The rand_col PTF appends specified number of random-valued columns to the output.

Example 191-13 Rand_col Polymorphic Table Function Example

Live SQL:

You can view and run this example on Oracle Live SQL at [Rand_col Polymorphic Table Function](#)

This rand_col PTF example appends col_count number of random-valued columns to the output. Optionally, the caller can restrict the random values to a numeric range by specifying [low, high]. The new columns are named "RAND_<n>"

Create the PTF implementation package rand_col_p.

The parameters are :

- tab : Input table
- col_count (optional) : Number of random-valued columns to generate [Default = 1]
- low (optional) : Lower bound for the random numbers [Default = Null]
- high (optional) : Upper bound for the random numbers [Default = Null]

```
CREATE PACKAGE rand_col_p AS

    FUNCTION describe(tab          IN OUT DBMS_TF.table_t,
                     col_count    NATURALN DEFAULT 1,
                     low          NUMBER   DEFAULT NULL,
                     high         NUMBER   DEFAULT NULL)
    RETURN DBMS_TF.describe_t;
```

```

PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                    low         NUMBER   DEFAULT NULL,
                    high        NUMBER   DEFAULT NULL);

END rand_col_p;

```

Create the PTF implementation package body `rand_col_p`.

The parameter `col_count` is a 'shape-determining' parameter and thus must be a constant (no binds, correlations, or expressions). By defining the type of `col_count` to be `NATURALN`, which has an implicit `NOT NULL` constraint, we guarantee that a cursor with non-constant value for this parameter will get a compilation error.

```

CREATE PACKAGE BODY rand_col_p AS
  col_name_prefix CONSTANT dbms_id := 'RAND_';

  FUNCTION describe(tab          IN OUT DBMS_TF.table_t,
                   col_count    NATURALN DEFAULT 1,
                   low          NUMBER   DEFAULT NULL,
                   high         NUMBER   DEFAULT NULL)
    RETURN DBMS_TF.describe_t
  AS
    cols DBMS_TF.columns_new_t;
  BEGIN
    FOR i IN 1 .. col_count LOOP
      cols(i) := DBMS_TF.column_metadata_t(name=>col_name_prefix||i,
TYPE=>DBMS_TF.type_number);
    END LOOP;

    RETURN DBMS_TF.describe_t(new_columns => cols);
  END;

  PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                      low        NUMBER   DEFAULT NULL,
                      high       NUMBER   DEFAULT NULL)
  AS
    row_count CONSTANT PLS_INTEGER := DBMS_TF.get_env().row_count;
    col       DBMS_TF.tab_number_t;
  BEGIN
    FOR c IN 1 .. col_count LOOP
      FOR i IN 1 .. row_count LOOP
        col(i) := CASE WHEN (low IS NULL OR high IS NULL)
                      THEN dbms_random.VALUE
                      ELSE dbms_random.VALUE(low,
high)
        END;
      END LOOP;
      DBMS_TF.put_col(c, col);
    END LOOP;
  END;

END rand_col_p;

```

Create the standalone `rand_col` PTF. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `rand_col_p`.

```
CREATE FUNCTION rand_col(tab TABLE,
                        col_count NATURALN DEFAULT 1,
                        low        NUMBER   DEFAULT NULL,
                        high       NUMBER   DEFAULT NULL)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING rand_col_p;
```

Invoke the `rand_col` PTF to display all columns of table `SCOTT.DEPT` with one produced `RAND_1` column.

```
SELECT *
FROM rand_col(scott.dept);
```

DEPTNO	DNAME	LOC	RAND_1
10	ACCOUNTING	NEW YORK	.738666262
20	RESEARCH	DALLAS	.093256312
30	SALES	CHICAGO	.992944835
40	OPERATIONS	BOSTON	.397948124

Invoke the `rand_col` PTF to display all columns of table `SCOTT.DEPT` with two produced `RAND_1` and `RAND_2` columns.

```
SELECT *
FROM rand_col(scott.dept, col_count => 2);
```

DEPTNO	DNAME	LOC	RAND_1	RAND_2
10	ACCOUNTING	NEW YORK	.976521361	.209802028

```

191.9.10 PUT_ROW_SET Procedure

Writes a collection of new column values in the database.

You can use this procedure to write all new columns in a collection of rows in the database.

This procedure is overloaded. Rows are not replicated by default. You can use the `ROW_REPLICATION` procedure to set the replication factor.

Syntax

This syntax is used when rows are not replicated.

```
PROCEDURE PUT_ROW_SET(
    rowset IN ROW_SET_T);
```

This syntax is used when the replication factor is a constant.

```
PROCEDURE PUT_ROW_SET(
    rowset          IN  ROW_SET_T,
    replication_factor IN NATURALN);
```

This syntax is used when the replication factor is specified as an array with multiple values.

```
PROCEDURE PUT_ROW_SET(
    rowset          IN  ROW_SET_T,
    replication_factor IN TAB_NATURALN_T);
```

Parameters

Table 191-22 PUT_ROW_SET Procedure Parameters

Parameter	Description
rowset	The collection of data and metadata
replication_factor	The replication factor per row

Example 191-14

 DBMS_TF.PUT_ROW_SET Example

This code excerpt fetches a collection of rows and writes all new columns back to the database without any processing.

```
PROCEDURE fetch_rows
AS
    rowset DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);
END;
```

191.9.10.1 Split Polymorphic Table Function Example

The split PTF example splits each row of the input table into specified pieces.

Example 191-15 Split Polymorphic Table Function Example

This PTF example splits each row of the input table into cnt pieces dividing the values of the split columns.

Live SQL:

You can view and run this example on Oracle Live SQL at [Split Polymorphic Table Function](#)

Create the PTF implementation package split_p.

The parameters are :

- tab - Input table
- col - The names of numeric (input) table columns to split
- cnt - The number of times each input row is to be split

```
CREATE PACKAGE split_p AS

    FUNCTION describe(tab IN OUT DBMS_TF.table_t,
                     col      DBMS_TF.columns_t,
                     cnt      NATURALN)
        RETURN DBMS_TF.describe_t;

    PROCEDURE fetch_rows(cnt NATURALN);

END split_p;
```

Create the PTF implementation package body split_p. Each row of the input table is split into cnt pieces dividing the values of the split columns.

```
CREATE PACKAGE BODY split_p AS

    FUNCTION describe(tab IN OUT DBMS_TF.Table_t,
                     col      DBMS_TF.Columns_t,
                     cnt      NATURALN)
        RETURN DBMS_TF.describe_t
    AS
        new_cols DBMS_TF.columns_new_t;
        col_id   PLS_INTEGER := 1;
    BEGIN
        FOR i IN 1 .. tab.column.count LOOP
            FOR j IN 1 .. col.count LOOP
                IF (tab.column(i).description.name = col(j) AND
                    tab.column(i).description.TYPE = DBMS_TF.type_number) THEN
                    tab.column(i).pass_through := FALSE;
                END IF;
            END LOOP;
        END LOOP;
    END describe;

    PROCEDURE fetch_rows(cnt NATURALN)
    AS
    BEGIN
    END fetch_rows;

END split_p;
```

```

        tab.column(i).for_read      := TRUE;
        new_cols(col_id) := tab.column(i).description;
        col_id := col_id + 1;
    END IF;
END LOOP;
END LOOP;

RETURN DBMS_TF.describe_t(new_columns=>new_cols,
row_replication=>true);
END;
PROCEDURE fetch_rows(cnt NATURALN)
AS
    inp_rs DBMS_TF.row_set_t;
    out_rs DBMS_TF.row_set_t;
    rows   PLS_INTEGER;
BEGIN
    DBMS_TF.get_row_set(inp_rs, rows);

    FOR c IN 1 .. inp_rs.count() LOOP
        FOR r IN 1 .. rows LOOP
            FOR i IN 1 .. cnt LOOP
                out_rs(c).tab_number((r-1)*cnt+i) := inp_rs(c).tab_number(r)/
cnt;
            END LOOP;
        END LOOP;
    END LOOP;

    DBMS_TF.put_row_set(out_rs, replication_factor => cnt);
END;

END split_p;

```

Create the standalone PTF named `split`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `split_p`.

```

CREATE FUNCTION split(tab TABLE, col columns, cnt NATURALN)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING split_p;

```

For all employees in department 30, display the `ENAME`, `SAL`, and `COMM` columns. Invoke the `split` PTF with the `COLUMNS` pseudo-operator to divide the value of `SAL` and `COMM` by 2 for each replicated row returned by the query. Each row is replicated twice.

```

SELECT ename, sal, comm
FROM   split(scott.emp, COLUMNS(sal, comm), cnt => 2)
WHERE  deptno=30;

```

ENAME	SAL	COMM
ALLEN	800	150

JAMES	475	

191.9.11 ROW_REPLICATION Procedure

Sets the row replication factor either as a fixed value or as a value per row.

This procedure is overloaded. A `Row Semantics` polymorphic table function will either produce a single output row for a given input row (one-to-one), or it can produce more output rows for a given input rows (one-to-many), or it can produce no output rows (one-to-none).

Syntax

Sets the row replication factor as a fixed value.

```
PROCEDURE ROW_REPLICATION(
    replication_factor IN NATURALN);
```

Sets the row replication factor as a value per row.

```
PROCEDURE ROW_REPLICATION(
    replication_factor IN TAB_NATURALN_T);
```

Parameters

Table 191-23 ROW_REPLICATION Procedure Parameters

Parameter	Description
<code>replication_factor</code>	The replication factor per row

Example 191-16 Replicate Polymorphic Table Function Example

This example creates a PTF that replicates each input row by the `replication_factor` that is given as a parameter.

Live SQL:

You can view and run this example on Oracle Live SQL at [Replicate Polymorphic Table Function](#)

Create the PTF implementation package `replicate_p`.

```
CREATE PACKAGE replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.TABLE_T,
        replication_factor NATURAL)
        RETURN DBMS_TF.describe_t;
```

```

PROCEDURE Fetch_Rows(replication_factor NATURALN);

END replicate_p;

```

Create the PTF implementation package body replicate_p. The PTF replicates each input row by the replication_factor that is given as a parameter.

```

CREATE PACKAGE body replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.Table_t
                      , replication_factor NATURAL)
        RETURN DBMS_TF.describe_t AS
    BEGIN
        RETURN DBMS_TF.describe_t(row_replication => True);
    END;

    PROCEDURE Fetch_Rows(replication_factor NATURALN)
    AS
    BEGIN
        DBMS_TF.ROW_REPLICATION(replication_factor);
    END;
END replicate_p;

```

Create a standalone PTF named replicate. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is replicate_p.

```

CREATE FUNCTION replicate(tab TABLE,
                          replication_factor NATURAL)
    RETURN TABLE PIPELINED ROW POLYMORPHIC USING replicate_p;

```

This example sets the replication_factor to 2 which results in doubling the number of rows.

```

SELECT *
FROM replicate(dept, replication_factor => 2);

```

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
20	RESEARCH	DALLAS
30	SALES	CHICAGO
30	SALES	CHICAGO
40	OPERATIONS	BOSTON
40	OPERATIONS	BOSTON

This example sets the `replication_factor` to zero.

```
SELECT *
FROM replicate(dept, replication_factor => 0);
```

no rows selected

Count the number of employees in each department. Invoke the replicate PTF to report from the `SCOTT.EMP` table to set the `replication_factor` to 1000000.

```
SELECT deptno, COUNT(*)
FROM replicate(scott.emp, 1e6)
GROUP BY deptno;
```

```
DEPTNO  COUNT(*)
-----  -
        30  6000000
        10  3000000
        20  5000000
```

This sets the `replication_factor` to 1000000000.

```
SELECT COUNT(*)
FROM replicate(dual, 1e9);
```

```
COUNT(*)
-----
1000000000
```

191.9.12 ROW_TO_CHAR Function

The `ROW_TO_CHAR` function converts a row data value to a string representation.

Syntax

```
FUNCTION ROW_TO_CHAR(
    rowset ROW_SET_T,
    rid    PLS_INTEGER,
    format PLS_INTEGER DEFAULT FORMAT_JSON)
RETURN VARCHAR2;
```

Parameters

Table 191-24 DBMS_TF.ROW_TO_CHAR Function Parameters

Parameter	Description
<code>rowset</code>	The rowset whose value is to be converted
<code>rid</code>	Row number
<code>format</code>	The string format (default is <code>FORMAT_JSON</code>)

Usage Notes

Only the JSON format is supported.

Return Values

The string representation in JSON format.

Example 191-17 DBMS_TF.ROW_TO_CHAR Example

```
PROCEDURE Fetch_Rows as
  rowset DBMS_TF.ROW_SET_T;
  str    VARCHAR2(32000);
BEGIN
  DBMS_TF.GET_ROW_SET(rowset);
  str := DBMS_TF.ROW_TO_CHAR(rowset, 1)
END;
```

191.9.13 SUPPORTED_TYPE Function

This function tests if a specified type is supported with polymorphic table functions.

Syntax

```
FUNCTION SUPPORTED_TYPE(
  type_id PLS_INTEGER)
RETURN BOOLEAN;
```

Parameters

Table 191-25 DBMS_TF.SUPPORTED_TYPE Function Parameters

Parameter	Description
type_id	The type

Return Values

Returns TRUE if the type_id is a scalar supported by PUT_COL and GET_COL.

See Also:

[Echo Polymorphic Table Function Example](#) for an example of DBMS_TF.SUPPORTED_TYPE use.

191.9.14 TRACE Procedure

Prints data structures to help development and problem diagnosis.

This procedure is overloaded.

Syntax

```
PROCEDURE TRACE(
  msg          VARCHAR2,
  with_id     BOOLEAN   DEFAULT FALSE,
  separator    VARCHAR2  DEFAULT NULL,
  prefix      VARCHAR2  DEFAULT NULL);
```

```

PROCEDURE TRACE(
    rowset      IN ROW_SET_T);

PROCEDURE TRACE(
    env         IN ENV_T);

PROCEDURE TRACE(
    columns_new IN COLUMNS_NEW_T);

PROCEDURE trace(
    cols        IN COLUMNS_T);

PROCEDURE trace(
    columns_with_type IN COLUMNS_WITH_TYPE_T);

PROCEDURE trace(
    tab         IN TABLE_T);

PROCEDURE trace(
    col         IN COLUMN_METADATA_T);

```

Parameters

Table 191-26 TRACE Procedure Parameters

Parameter	Description
msg	Custom user tracing message
with_id	Include the unique execution ID in the trace?
separator	Specify a string to use to separate values
prefix	Specify a string to prefix the actual values
rowset	Data for a rowset
env	Metadata about the polymorphic table function execution state
columns_new	Collection for new columns
cols	Collection containing column names
columns_with_type	Collection containing columns metadata
tab	Table descriptor
col	Metadata about an existing table column or a new column produced

Example 191-18 DBMS_TF.TRACE Example

This example adds tracing to a fetch_rows procedure.

```

PROCEDURE fetch_rows
AS
    rowset DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.TRACE('IDENTITY_PACKAGE.Fetch_Rows()', with_id => TRUE);
    DBMS_TF.TRACE(rowset);
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.TRACE(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);

```

```
DBMS_TF.TRACE(DBMS_TF.GET_ENV);
END;
```

191.9.15 XSTORE_CLEAR Procedure

Removes all key-value pairs from the XSTORE execution state.

Syntax

```
PROCEDURE XSTORE_CLEAR;
```

191.9.16 XSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the XSTORE.

Syntax

```
FUNCTION XSTORE_EXISTS(
    key      IN VARCHAR2,
    key_type IN PLS_INTEGER DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 191-27 DBMS_TF.XSTORE_EXISTS Function Parameters

Parameter	Description
key	A unique character key
key_type	The type of key (optional). Default : NULL

Return Values

Returns TRUE if the key has an associated value. When the `key_type` is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a `key_type` parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

See Also:

[Table 191-6](#) for more information about supported key types.

191.9.17 XSTORE_GET Procedure

You can use the XSTORE_GET procedure to get the associated value for a given key stored for PTF Execution State Management.

XStore is the PTF execution state management interface. The XStore interface is used to set and store key-value pairs during PTF execution.

This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See [Table 191-6](#) for more information about supported key types.

Syntax

```
PROCEDURE XSTORE_GET (
    key   IN VARCHAR2,
    value IN OUT VARCHAR2);
```

```
PROCEDURE XSTORE_GET (
    key   IN VARCHAR2,
    value IN OUT NUMBER);
```

```
PROCEDURE XSTORE_GET (
    key   IN VARCHAR2,
    value IN OUT DATE);
```

```
PROCEDURE XSTORE_GET (
    key   IN VARCHAR2,
    value IN OUT BOOLEAN);
```

Parameters

Table 191-28 DBMS_TF.XSTORE_GET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types

Usage Notes

If the key is not found, the value is unchanged.

191.9.17.1 Row_num Polymorphic Table Function Example

The row_num PTF example appends a sequence column to a table.

Example 191-19 Row_num Polymorphic Table Function Example

Live SQL:

You can view and run this example on Oracle Live SQL at [Row_num Polymorphic Table Function](#)

Create the PTF implementation package row_num_p.

The parameters are :

- tab - The input table
- ini - The initial value (Default = 1)

- `inc` - The amount to increment (Default = 1)

```
CREATE PACKAGE row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
                   ini NUMBER DEFAULT 1,
                   inc NUMBER DEFAULT 1)
    RETURN dbms_tf.describe_t;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1);
END;
```

This PTF accepts any input table and appends the sequence column `ROW_ID` to the table. The sequence values start with the specified value (`ini`) and each time it is incremented by the specified value (`inc`).

```
CREATE PACKAGE BODY row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
                   ini NUMBER DEFAULT 1,
                   inc NUMBER DEFAULT 1)
    RETURN dbms_tf.describe_t AS
  BEGIN
    RETURN dbms_tf.describe_t(new_columns =>
                              dbms_tf.columns_new_t(1 =>
                                                    dbms_tf.column_metadata_t(name => 'ROW_ID',
                                                                                TYPE =>
dbms_tf.type_number)));
  END;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1) IS
    row_cnt CONSTANT PLS_INTEGER := dbms_tf.get_env().row_count;
    rid      NUMBER              := ini;
    col      dbms_tf.tab_number_t;
  BEGIN
    dbms_tf.xstore_get('rid', rid);
    FOR i IN 1 .. row_cnt LOOP col(i) := rid + inc*(i-1); END LOOP;
    dbms_tf.put_col(1, col);
    dbms_tf.xstore_set('rid', rid + inc*row_cnt);
  END;
END;
```

Create a standalone polymorphic table function named `row_num`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Table Semantics PTF type, and indicate the PTF implementation package to use is `row_num_p`.

```
CREATE FUNCTION row_num(tab TABLE,
                       ini NUMBER DEFAULT 1,
                       inc NUMBER DEFAULT 1)
  RETURN TABLE
PIPELINED TABLE POLYMORPHIC USING row_num_p;
```

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 1 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept);
```

DEPTNO	DNAME	LOC	ROW_ID
10	ACCOUNTING	NEW YORK	1
20	RESEARCH	DALLAS	2
30	SALES	CHICAGO	3
40	OPERATIONS	BOSTON	4

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 100 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, 100);
```

DEPTNO	DNAME	LOC	ROW_ID
10	ACCOUNTING	NEW YORK	100
20	RESEARCH	DALLAS	101
30	SALES	CHICAGO	102
40	OPERATIONS	BOSTON	103

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 0 and decremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, ini => 0, inc => -1);
```

DEPTNO	DNAME	LOC	ROW_ID
10	ACCOUNTING	NEW YORK	0
20	RESEARCH	DALLAS	-1
30	SALES	CHICAGO	-2
40	OPERATIONS	BOSTON	-3

The `row_num` PTF invocation reporting from the `SCOTT.EMP` table produces a new column `ROW_ID` with value starting at 0 and incremented by 0.25 in the row set which is partitioned by department number and ordered by employee name.

```
SELECT deptno, ename, job, sal, row_id
   FROM row_num(scott.emp PARTITION BY deptno ORDER BY ename, ini => 0, inc
=> 0.25)
 WHERE deptno IN (10, 30);
```

DEPTNO	ENAME	JOB	SAL	ROW_ID
10	CLARK	MANAGER	2450	0
10	KING	PRESIDENT	5000	.25
10	MILLER	CLERK	1300	.5
30	ALLEN	SALESMAN	1600	0
30	BLAKE	MANAGER	2850	.25
30	JAMES	CLERK	950	.5
30	MARTIN	SALESMAN	1250	.75

```

30 TURNER      SALESMAN      1500      1
30 WARD       SALESMAN      1250     1.25

```

191.9.18 XSTORE_REMOVE Procedure

Removes an item associated with the given key and key_type.

Syntax

```

PROCEDURE XSTORE_REMOVE (
    key      IN VARCHAR2,
    key_type IN PLS_INTEGER DEFAULT NULL);

```

Parameters

Table 191-29 DBMS_TF.XSTORE_REMOVE Function Parameters

Parameter	Description
key	A unique character key
key_type	The type of key to remove (optional)

Usage Notes

When a key_type parameter value is passed, it removes the associated item for the key and specified type of key.

191.9.19 XSTORE_SET Procedure

Sets the value for the given key for PTF Execution State Management.

You can use this procedure to store an item key-value pair in the XStore. This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Syntax

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN VARCHAR2);

```

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN NUMBER);

```

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN DATE);

```

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN BOOLEAN);

```

Parameters

Table 191-30 DBMS_TF.XSTORE_SET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types

Usage Notes

If an item for a given key already exists, the value is replaced.

DBMS_TNS

The `DBMS_TNS` package provides the `RESOLVE_TNSNAME` function to resolve a TNS name and return the corresponding Oracle Net8 connection string.

This chapter contains the following topics:

- [DBMS_TNS Overview](#)
- [DBMS_TNS Security Model](#)
- [Summary of DBMS_TNS Subprograms](#)

192.1 DBMS_TNS Overview

The `DBMS_TNS` package contains one function, `RESOLVE_TNSNAME`, which returns the resolved connect string from configured sources that have been defined in the `names.directory_path` parameter in the `sqlnet.ora` file.

The `RESOLVE_TNSNAME` function in this package helps you to identify interconnected databases and trace the system change number (SCN) flow across distributed databases.

See Also:

- *Oracle Database Administrator's Guide* for more information about finding database link information
- *Oracle Database Reference* for information about the `ALL_DB_LINKS` data dictionary view

192.2 DBMS_TNS Security Model

You must be granted the `EXECUTE` privilege on the `DBMS_TNS` package.

192.3 Summary of DBMS_TNS Subprograms

This table lists the `DBMS_TNS` subprograms and briefly describes them.

Table 192-1 DBMS_TNS Parameters

Subprogram	Description
RESOLVE_TNSNAME Function	Returns the resolved connect string from any configured source (tnsnames, LDAP, Easy Connect) as indicated in the <code>sqlnet.ora</code> <code>names.directory_path</code> parameter)

192.3.1 RESOLVE_TNSNAME Function

This function returns the resolved connect string from any configured source (for example, TNS names, Lightweight Directory Access Protocol (LDAP), or Oracle Easy Connect) as indicated in the `sqlnet.ora` `names.directory_path` parameter.

Syntax

```
DBMS_TNS.RESOLVE_TNSNAME (
    tns_name VARCHAR2)
RETURN VARCHAR2;
```

RESOLVE_TNSNAME Function Parameters

Parameter	Description
<code>tns_name</code>	Database address for establishing the connection

Usage Notes

- Database administrators and system management tools can explicitly call the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve a `tns_name`:
- Because the resolved value can change over time, Oracle does not recommend storing or caching this value, because these kinds of values can become invalid over time.
- You can use the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve TNS names that were referred to by other data dictionary views such as `ALL_DB_LINKS` and `USER_DB_LINKS`. In addition, you can use it to find any TNS name entry in the `tnsnames.ora` file.

Example

```
SELECT DB_LINK, DBMS_TNS.RESOLVE_TNSNAME(HOST) FROM DBA_DB_LINKS;

DB_LINK
-----
-----
DBMS_TNS.RESOLVE_TNSNAME(HOST)
-----
-----
US.EXAMPLE.COM
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=may))
(CONNECT_DATA=(SERVICE_NAME=us.example.com)(CID=(PROGRAM=oracle)
(HOST=juno)(USER=psmith)
))
```

DBMS_TRACE

The `DBMS_TRACE` package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Operational Notes](#)
- [Summary of DBMS_TRACE Subprograms](#)

193.1 DBMS_TRACE Overview

`DBMS_TRACE` provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

1. (Optional) Limit tracing to specific subprograms and choose a tracing level.
Tracing all subprograms and exceptions in a large program can produce huge amounts of data that are difficult to manage.
2. Starting PL/SQL tracing in session (`DBMS_TRACE.SET_PLSQL_TRACE`).
3. Running an application to be traced.
4. Stopping PL/SQL tracing in session (`DBMS_TRACE.CLEAR_PLSQL_TRACE`).

After you have collected data with Trace, you can query the database tables that contain the performance data and analyze it in the same way that you analyze the performance data from Profiler.

193.2 DBMS_TRACE Security Model

This package must be created under `SYS`.

193.3 DBMS_TRACE Constants

`DBMS_TRACE` defines constants to use when specifying parameter values.

These constants are shown in the following table.

Table 193-1 DBMS_TRACE Event Constants

Name	Type	Value	Description
TRACE_ALL_CALLS	INTEGER	1	Traces calls or returns
TRACE_ENABLED_CALLS	INTEGER	2	
TRACE_ALL_EXCEPTIONS	INTEGER	4	Traces exceptions
TRACE_ENABLED_EXCEPTIONS	INTEGER	8	Traces exceptions and handlers
TRACE_LIMIT	INTEGER	16	Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag.
TRACE_ALL_SQL	INTEGER	32	Traces SQL statements
TRACE_ENABLED_SQL	INTEGER	64	Traces SQL statements at PL/SQL level. This does not invoke SQL Trace
TRACE_ALL_LINES	INTEGER	128	Traces each line
TRACE_ENABLED_LINES	INTEGER	256	
TRACE_PAUSE	INTEGER	4096	Pauses tracing
TRACE_RESUME	INTEGER	8192	Resume tracing
TRACE_STOP	INTEGER	16384	Stops tracing
NO_TRACE_ADMINISTRATIVE	INTEGER	32768	Prevents tracing of 'administrative events such as <ul style="list-style-type: none"> • PL/SQL Trace Tool started • Trace flags changed • PL/SQL Virtual Machine started • PL/SQL Virtual Machine stopped
NO_TRACE_HANDLED_EXCEPTIONS	INTEGER	65536	Prevents tracing of handled exceptions

Table 193-2 DBMS_TRACE Version Constants

Name	Type	Value	Description
TRACE_MINOR_VERSION	INTEGER	0	
TRACE_MAJOR_VERSION	INTEGER	1	

Oracle recommends using the symbolic form for all these constants.

193.4 DBMS_TRACE Restrictions

You cannot use PL/SQL tracing in a shared server environment.

193.5 DBMS_TRACE Operational Notes

Certain operational notes apply to `DBMS_TRACE`.

These are described in the following sections:

- [Controlling Data Volume](#)
- [Creating Database Tables to Collect DBMS_TRACE Output](#)
- [Collecting Trace Data](#)
- [Collected Data](#)
- [Trace Control](#)

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be
generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

Note:

You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the `DBMS_TRACE` package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by `SYS`.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMS_PBT.SQL`. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.
- Level 2: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

Note:

For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller is enabled, the caller's name will also be output. If the callee is enabled, the callee's name will also be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled. Enabling `NO_TRACE_HANDLED_EXCEPTIONS` limits data collection to unhandled exceptions

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level n changes the record limit to $1024 * n$.

Enabling `NO_TRACE_ADMINISTRATIVE` prevents the generation of such administrative event records as PL/SQL Trace Tool started, Trace flags changed, PL/SQL Virtual Machine started, and PL/SQL Virtual Machine stopped.

193.6 Summary of DBMS_TRACE Subprograms

This table lists the `DBMS_TRACE` subprograms and briefly describes them.

Table 193-3 DBMS_TRACE Package Subprograms

Subprogram	Description
<code>CLEAR_PLSQL_TRACE</code> Procedure	Stops trace data dumping in session
<code>GET_PLSQL_TRACE_LEVEL</code> Function	Gets the trace level

Table 193-3 (Cont.) DBMS_TRACE Package Subprograms

Subprogram	Description
PLSQL_TRACE_VERSION Procedure	Gets the version number of the trace package
SET_PLSQL_TRACE Procedure	Starts tracing in the current session

193.6.1 CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

193.6.2 GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as the sum of one or more DBMS_TRACE constants.

See [Table 193-1](#) for a list of the constants.

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL  
RETURN BINARY_INTEGER;
```

193.6.3 PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (  
  major OUT BINARY_INTEGER,  
  minor OUT BINARY_INTEGER);
```

Parameters

Table 193-4 PLSQL_TRACE_VERSION Procedure Parameters

Parameter	Description
major	Major version number of DBMS_TRACE.
minor	Minor version number of DBMS_TRACE.

193.6.4 SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (  
    trace_level INTEGER);
```

Parameters

Table 193-5 *SET_PLSQL_TRACE Procedure Parameters*

Parameter	Description
trace_level	You must supply one or more of the constants as listed in Table 193-1 . By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "TRACE_PAUSE", "TRACE_RESUME" and "TRACE_STOP" should not be used in combination with other constants. Also see DBMS_TRACE Operational Notes: Collecting Trace Data for more information.

DBMS_TRANSACTION

The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

See Also:

Oracle Database SQL Language Reference

This chapter contains the following topics:

- [DBMS_TRANSACTION Security Model](#)
- [Summary of DBMS_TRANSACTION Subprograms](#)

194.1 DBMS_TRANSACTION Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

194.2 Summary of DBMS_TRANSACTION Subprograms

This table lists the DBMS_TRANSACTION subprograms and briefly describes them.

Table 194-1 DBMS_TRANSACTION Package Subprograms

Subprogram	Description
ADVISE_COMMIT Procedure	Equivalent to the SQL statement: ALTER SESSION ADVISE COMMIT
ADVISE_NOTHING Procedure	Equivalent to the SQL statement: ALTER SESSION ADVISE NOTHING
ADVISE_ROLLBACK Procedure	Equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK
COMMIT Procedure	Equivalent to the SQL statement: COMMIT
COMMIT_COMMENT Procedure	Equivalent to the SQL statement: COMMIT COMMENT <text>
COMMIT_FORCE Procedure	Equivalent to the SQL statement: COMMIT FORCE <text>, <number>"
LOCAL_TRANSACTION_ID Function	Returns the local (to instance) unique identifier for the current transaction

Table 194-1 (Cont.) DBMS_TRANSACTION Package Subprograms

Subprogram	Description
PURGE_LOST_DB_ENTRY Procedure	Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes
PURGE_MIXED Procedure	Deletes information about a given mixed outcome transaction
READ_ONLY Procedure	Equivalent to the SQL statement: SET TRANSACTION READ ONLY
READ_WRITE Procedure	equivalent to the SQL statement: SET TRANSACTION READ WRITE
ROLLBACK Procedure	Equivalent to the SQL statement: ROLLBACK
ROLLBACK_FORCE Procedure	Equivalent to the SQL statement: ROLLBACK FORCE <text>
ROLLBACK_SAVEPOINT Procedure	Equivalent to the SQL statement: ROLLBACK TO SAVEPOINT <savepoint_name>
SAVEPOINT Procedure	Equivalent to the SQL statement: SAVEPOINT <savepoint_name>
STEP_ID Function	Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction
USE_ROLLBACK_SEGMENT Procedure	Equivalent to the SQL statement: SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>

194.2.1 ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE COMMIT

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

194.2.2 ADVISE_NOTHING Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE NOTHING

Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

194.2.3 ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

194.2.4 COMMIT Procedure

This procedure is equivalent to the SQL statement: COMMIT

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.COMMIT;
```

194.2.5 COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement: COMMIT COMMENT <text>

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (  
    cmnt VARCHAR2);
```

Parameters

Table 194-2 COMMIT_COMMENT Procedure Parameters

Parameter	Description
cmnt	Comment to associate with this commit.

194.2.6 COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement: COMMIT FORCE <text>, <number>

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (  
    xid VARCHAR2,  
    scn VARCHAR2 DEFAULT NULL);
```

Parameters

Table 194-3 COMMIT_FORCE Procedure Parameters

Parameter	Description
xid	Local or global transaction ID.

Table 194-3 (Cont.) COMMIT_FORCE Procedure Parameters

Parameter	Description
scn	System change number.

194.2.7 LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (
    create_transaction BOOLEAN := FALSE)
RETURN VARCHAR2;
```

Parameters

Table 194-4 LOCAL_TRANSACTION_ID Function Parameters

Parameter	Description
create_transaction	If true, then start a transaction if one is not currently active.

194.2.8 PURGE_LOST_DB_ENTRY Procedure

Procedure `PURGE_LOST_DB_ENTRY` purges entries that control database recovery from a local site.

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in `DBA_2PC_PENDING` and associated tables are never removed, and recovery will periodically retry. Procedure `PURGE_LOST_DB_ENTRY` enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
    xid VARCHAR2);
```

Parameters

Table 194-5 PURGE_LOST_DB_ENTRY Procedure Parameters

Parameter	Description
xid	Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table.

Usage Notes

⚠ WARNING:

PURGE_LOST_DB_ENTRY should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA_2PC_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure PURGE_LOST_DB_ENTRY to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

Table 194-6 PURGE_LOST_DB_ENTRY Procedure States

State of Column	State of Global Transaction	State of Local Transaction	Normal DBA Action	Alternative DBA Action
Collecting	Rolled back	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Committed	Committed	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Prepared	Unknown	Prepared	None	FORCE COMMIT or ROLLBACK
Forced commit	Unknown	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced rollback	Unknown	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced commit (mixed)	Mixed	Committed	(See Note 2)	
Forced rollback (mixed)	Mixed	Rolled back	(See Note 2)	

 **Note:**

Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

 **Note:**

Examine and take any manual action to remove inconsistencies; then use the procedure `PURGE_MIXED`.

194.2.9 PURGE_MIXED Procedure

This procedure deletes information about a given mixed outcome transaction

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome; some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle. However, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (
    xid VARCHAR2);
```

Parameters

Table 194-7 PURGE_MIXED Procedure Parameters

Parameter	Description
<code>xid</code>	Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table.

194.2.10 READ_ONLY Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION READ ONLY`.

Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

194.2.11 READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

194.2.12 ROLLBACK Procedure

This procedure is equivalent to the SQL statement `ROLLBACK`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

194.2.13 ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement `ROLLBACK FORCE <text>`.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (  
    xid VARCHAR2);
```

Parameters

Table 194-8 ROLLBACK_FORCE Procedure Parameters

Parameter	Description
<code>xid</code>	Local or global transaction ID.

194.2.14 ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `ROLLBACK TO SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (  
    savept VARCHAR2);
```

Parameters

Table 194-9 ROLLBACK_SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

194.2.15 SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (
    savept VARCHAR2);
```

Parameters

Table 194-10 SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

194.2.16 STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

Syntax

```
DBMS_TRANSACTION.STEP_ID
RETURN NUMBER;
```

194.2.17 USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`.

Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (
    rb_name VARCHAR2);
```

Parameters

Table 194-11 USE_ROLLBACK_SEGMENT Procedure Parameters

Parameter	Description
<code>rb_name</code>	Name of rollback segment to use.

DBMS_TRANSFORM

The `DBMS_TRANSFORM` package provides an interface to the message format transformation features of Oracle Advanced Queuing.

This chapter contains the following topic:

- [Summary of DBMS_TRANSFORM Subprograms](#)

See Also:

Oracle Database Advanced Queuing User's Guide for more on message format transformations.

195.1 Summary of DBMS_TRANSFORM Subprograms

This table lists the `DBMS_TRANSFORM` subprograms and briefly describes them.

Table 195-1 DBMS_TRANSFORM Package Subprograms

Subprograms	Description
CREATE_TRANSFORMATION Procedure	Creates a transformation that maps an object of the source type to an object of the destination type
DROP_TRANSFORMATION Procedure	Drops the given transformation
MODIFY_TRANSFORMATION Procedure	Modifies an existing transformation

195.1.1 CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
  schema          VARCHAR2 (30),
  name            VARCHAR2 (30),
  from_schema     VARCHAR2 (30),
  from_type       VARCHAR2 (30),
  to_schema       VARCHAR2 (30),
  to_type         VARCHAR2 (30),
  transformation   VARCHAR2 (4000));
```

Parameters

Table 195-2 CREATE_TRANSFORM Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
from_schema	Specifies the schema of the source type.
from_type	Specifies the source type.
to_schema	Specifies the target type schema.
to_type	Specifies the target type.
transformation	Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using <code>MODIFY_TRANSFORM</code> .

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on `DBMS_TRANSFORM`. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form `source.user_data`.
- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

195.1.2 DROP_TRANSFORM Procedure

This procedure drops the given transformation.

Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORM (
  schema VARCHAR2(30),
```

```
name          VARCHAR2(30);
```

Parameters

Table 195-3 DROP_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.

195.1.3 MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
  schema          VARCHAR2(30),
  name            VARCHAR2(30),
  attribute_number INTEGER,
  transformation  VARCHAR2(4000));
```

Parameters

Table 195-4 MODIFY_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
attribute_number	The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.
transformation	The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an `attribute_number` of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

DBMS_TSDP_MANAGE

The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

`DBMS_TSDP_MANAGE` is available with the Enterprise Edition only.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_TSDP_MANAGE Subprograms](#)

Related Topics

- [DBMS_TSDP_PROTECT](#)
The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

See Also:

Oracle Database Security Guide

196.1 DBMS_TSDP_MANAGE Overview

The `DBMS_TSDP_MANAGE` package lets you manage sensitive columns and sensitive types in the Oracle database.

The identified sensitive columns are classified based on the sensitive types. By Using the [DBMS_TSDP_PROTECT](#) package to create a policy that protects data for a given class based on a column type rather than the data itself, you can then manage security for these types in a uniform fashion and modify the settings to accommodate changing compliance regulations.

You also can export the policies to other databases, when you perform a full export using Data Pump. You cannot export the policy itself, but an export of the database will include the TSDP policies.

196.2 DBMS_TSDP_MANAGE Security Model

All procedures are executed with invoker's rights. The `DBMS_TSDP_MANAGE` package is owned by `SYS`.

The `EXECUTE` privilege on this package should be granted as appropriate. Typically, an application database administrator should be granted the `EXECUTE` privilege for this package, while the `DBMS_TSDP_PROTECT` package would be governed by a security administrator.

196.3 Summary of DBMS_TSDP_MANAGE Subprograms

This table lists the `DBMS_TSDP_MANAGE` subprograms and briefly describes them.

Table 196-1 DBMS_TSDP_MANAGE Package Subprograms

Subprogram	Description
<code>ADD_SENSITIVE_COLUMN Procedure</code>	Adds a column to the sensitive column list
<code>ADD_SENSITIVE_TYPE Procedure</code>	Creates and adds a sensitive column type to the list of sensitive column types in the database
<code>ALTER_SENSITIVE_COLUMN Procedure</code>	Alters the sensitive type and/or the comment of a column in the sensitive column list.
<code>DROP_SENSITIVE_COLUMN Procedure</code>	Removes columns from the sensitive column list
<code>DROP_SENSITIVE_TYPE Procedure</code>	Drops a sensitive column type from the list sensitive column types in the database
<code>DROP_SENSITIVE_TYPE_SOURCE Procedure</code>	Drops sensitive column types corresponding to a source from the list sensitive column types in the database
<code>IMPORT_DISCOVERY_RESULT Procedure</code>	Imports sensitive columns from an external source. This can be an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance
<code>IMPORT_SENSITIVE_TYPES Procedure</code>	Imports a list of sensitive column types from a source
<code>REMOVE_DISCOVERY_RESULT Procedure</code>	Removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

196.3.1 ADD_SENSITIVE_COLUMN Procedure

This procedure adds a column to the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  column_name      IN VARCHAR2,
  sensitive_type   IN VARCHAR2,
  user_comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 196-2 *ADD_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name
sensitive_type	Identifier of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Add a column SAL in SCOTT.EMP:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
  schema_name      => 'SCOTT',
  table_name       => 'EMP',
  column_name      => 'SAL',
  sensitive_type   => 'SALARY_TYPE',
  user_comment     => 'Salary column');
```

196.3.2 ALTER_SENSITIVE_COLUMN Procedure

This procedure alters the Sensitive Type and/or the Comment of a Column in the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  column_name      IN VARCHAR2,
  sensitive_type   IN VARCHAR2,
  user_comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 196-3 *ALTER_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name
sensitive_type	Identifier of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Alter the column SAL in SCOTT.EMP that is listed in the sensitive column list:

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
  schema_name      => 'SCOTT',
  table_name       => 'EMP',
  column_name      => 'SAL',
  sensitive_type   => 'FINANCE_Type',
  user_comment     => 'Finance Type. Earlier categorized as Salary Type');
```

196.3.3 ADD_SENSITIVE_TYPE Procedure

This procedure creates and adds a sensitive column type to the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type   IN VARCHAR2,
  user_comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 196-4 *ADD_SENSITIVE_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Add a sensitive column type called SALARY_TYPE that is intended to be associated with columns containing salary data:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type   => 'SALARY_TYPE',
  user_comment     => 'Salary data');
```

196.3.4 DROP_SENSITIVE_COLUMN Procedure

This procedure removes columns from the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name      IN VARCHAR2 DEFAULT '%',
  table_name       IN VARCHAR2 DEFAULT '%',
  column_name      IN VARCHAR2 DEFAULT '%');
```

Parameters

Table 196-5 *DROP_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column

Table 196-5 (Cont.) DROP_SENSITIVE_COLUMN Procedure Parameters

Parameter	Description
column_name	Sensitive column name

Examples

Remove column SAL in SCOTT.EMP from the sensitive column list:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name   => 'SCOTT',
  table_name    => 'EMP',
  column_name   => 'SAL');
```

196.3.5 DROP_SENSITIVE_TYPE Procedure

This procedure drops a sensitive column type from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type IN VARCHAR2);
```

Parameters**Table 196-6 DROP_SENSITIVE_TYPE Procedure Parameters**

Parameter	Description
sensitive_type	Name of the sensitive column type to be dropped

Examples

To drop SALARY_TYPE:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type => 'SALARY_TYPE');
```

196.3.6 DROP_SENSITIVE_TYPE_SOURCE Procedure

This procedure drops sensitive column types corresponding to a source from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
  source IN VARCHAR2);
```

Parameters

Table 196-7 *DROP_SENSITIVE_TYPE_SOURCE Procedure Parameters*

Parameter	Description
source	Name of the source

Examples

To drop all sensitive column types corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, ADM_DEMO:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
    source      => 'ADM_DEMO');
```

196.3.7 IMPORT_DISCOVERY_RESULT Procedure

This procedure can be used to import sensitive columns, along with the associated sensitive types, from an external source. The external source can be an Application Data Model (ADM) instance from Oracle Enterprise Manager Cloud Control.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
    discovery_result      IN CLOB,
    discovery_source      IN VARCHAR2,
    force                 IN FORCE DEFAULT FALSE);

DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
    discovery_result      IN XMLTYPE,
    discovery_source      IN VARCHAR2,
    force                 IN FORCE DEFAULT FALSE);
```

Parameters

Table 196-8 *IMPORT_DISCOVERY_RESULT Procedure Parameters*

Parameter	Description
discovery_result	List of sensitive columns, along with the optional list of (the definitions of) the sensitive column types in XML format (possibly as a CLOB).
discovery_source	Source of the import. The discovery_sourcename identifies the list of imported sensitive columns. In case of ADM, this should be the ADM name.

Table 196-8 (Cont.) IMPORT_DISCOVERY_RESULT Procedure Parameters

Parameter	Description
force	<p>Specifies if the discovery result should be imported or not when the discovery result contains columns sensitive columns that are already identified as sensitive by another source.</p> <ul style="list-style-type: none"> FALSE (default) - the discovery result will not be imported in case of conflicting columns. None of the columns and the sensitive types are imported. TRUE - the discovery result is imported and the attributes of the conflicting columns is set based on the incoming discovery result

Examples

Import the list of sensitive columns of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
    discovery_results => xml_adm_result,
    discovery_source => 'ADM_Demo');
```

196.3.8 IMPORT_SENSITIVE_TYPES Procedure

This procedure imports a list of sensitive column types from a source.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
    sensitive_types IN CLOB,
    source          IN VARCHAR2);
```

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
    sensitive_types IN XMLTYPE,
    source          IN VARCHAR2);
```

Parameters

Table 196-9 IMPORT_SENSITIVE_TYPES Procedure Parameters

Parameter	Description
sensitive_types	List of sensitive column types in XML Format (possibly as a CLOB)
source	Source of the import. The source identifies the list of imported sensitive column types. In case of Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, this should be the ADM name.

Examples

Import the list of sensitive column types of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
    sensitive_types => xml_adm_result,
    source          => 'ADM_Demo');
```

196.3.9 REMOVE_DISCOVERY_RESULT Procedure

This procedure removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

Syntax

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
  discovery_source IN VARCHAR2);
```

Parameters

Table 196-10 REMOVE_DISCOVERY_RESULT Procedure Parameters

Parameter	Description
discovery_source	Source of the import. In case of ADM, this should be the ADM name, the results of which is to be removed.

Examples

Remove the sensitive columns corresponding to ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
  discovery_source => 'ADM_Demo');
```

DBMS_TSDP_PROTECT

The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

`DBMS_TSDP_PROTECT` is available with the Enterprise Edition only.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Data Structures](#)
- [Summary of DBMS_TSDP_PROTECT Subprograms](#)

Related Topics

- [DBMS_TSDP_MANAGE](#)
The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

See Also:

Oracle Database Security Guide

197.1 DBMS_TSDP_PROTECT Overview

Use the `DBMS_TSDP_PROTECT` package to create transparent sensitive data protection policies, configure protection by associating the policies with sensitive types, and to enable and disable the configured protection.

Sensitive types can be added using the `DBMS_TSDP_MANAGE` package.

197.2 DBMS_TSDP_PROTECT Security Model

All procedures are executed with invoker's rights. Typically, a security administrator should have the `EXECUTE` privilege for this package.

197.3 DBMS_TSDP_PROTECT Constants

DBMS_TSDP_PROTECT defines the TSDP_PARAM_MAX constant for use when specifying parameter values.

This constant is described in the following table.

Table 197-1 DBMS_TSDP_PROTECT Constants - Compression Types

Constant	Type	Value	Description
TSDP_PARAM_MAX	INTEGER	4000	Maximum length of the parameter value that can be specified in FEATURE_OPTIONS

197.4 DBMS_TSDP_PROTECT Data Structures

The DBMS_TSDP_PROTECT package defines two TABLE types.

Table Types

- [FEATURE_OPTIONS Table Type](#)
- [POLICY_CONDITIONS Table Type](#)

197.4.1 FEATURE_OPTIONS Table Type

The following type is an associative array of VARCHAR2 (TSDP_PARAM_MAX) that is indexed by VARCHAR2 (M_IDEN).

Syntax

```
TYPE FEATURE_OPTIONS IS TABLE OF VARCHAR2 (TSDP_PARAM_MAX)
INDEX BY VARCHAR2 (M_IDEN);
```

197.4.2 POLICY_CONDITIONS Table Type

The following type is an associative array of VARCHAR2 (TSDP_PARAM_MAX) that is indexed by PLS_INTEGER.

Syntax

```
TYPE POLICY_CONDITIONS IS TABLE OF VARCHAR2 (TSDP_PARAM_MAX)
INDEX BY PLS_INTEGER;
```

197.5 Summary of DBMS_TSDP_PROTECT Subprograms

This table lists the DBMS_TSDP_PROTECT subprograms and briefly describes them.

Table 197-2 DBMS_TSDP_PROTECT Package Subprograms

Subprogram	Description
ADD_POLICY Procedure	Creates a TSDP policy
ALTER_POLICY Procedure	Alters a TSDP policy
ASSOCIATE_POLICY Procedure	Associates or disassociates a TSDP policy with a sensitive column type
DISABLE_PROTECTION_COLUMN Procedure	Disables protection for columns
DISABLE_PROTECTION_SOURCE Procedure	Disables protection based on the source of truth for the sensitive columns
DISABLE_PROTECTION_TYPE Procedure	Disables protection for a sensitive column type
DROP_POLICY Procedure	Removes a TSDP policy
ENABLE_PROTECTION_COLUMN Procedure	Enables protection for columns
ENABLE_PROTECTION_SOURCE Procedure	Enables protection based on the source of truth for the sensitive columns
ENABLE_PROTECTION_TYPE Procedure	Enables protection for a sensitive column type

197.5.1 ADD_POLICY Procedure

This procedure creates a TSDP policy.

Syntax

```
DBMS_TSDP_PROTECT.ADD_POLICY (
  policy_name          IN VARCHAR2,
  security_feature     IN PLS_INTEGER,
  policy_enable_options IN FEATURE_OPTIONS,
  policy_apply_condition IN POLICY_CONDITION DEFAULT TSDP$default_condition);
```

Parameters

Table 197-3 ADD_POLICY Procedure Parameters

Parameter	Description
<code>policy_name</code>	Name of the policy being created. The maximum length for this identifier is <code>M_IDEN</code> . This follows the Oracle naming convention.
<code>security_feature</code>	Oracle security feature with which the policy is associated. Allowed values: <ul style="list-style-type: none"> <code>DBMS_TSDP_PROTECT.REDACT</code> <code>DBMS_TSDP_PROTECT.VPD</code> <code>DBMS_TSDP_PROTECT.UNIFIED_AUDIT</code> <code>DBMS_TSDP_PROTECT.FINE_GRAINED_AUDIT</code> <code>DBMS_TSDP_PROTECT.COLUMN_ENCRYPTION</code>
<code>policy_enable_options</code>	Initialized with the parameter-value pairs corresponding to the <code>security_feature</code> setting

Table 197-3 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
policy_apply_condition	<p>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER).</p> <p>Example: example_policy_condition(Property)=property_value. Permissible values for Property:</p> <ul style="list-style-type: none"> • DBMS_TSDP_PROPERTY.DATATYPE • DBMS_TSDP_PROPERTY.LENGTH • DBMS_TSDP_PROPERTY.PARENT_SCHEMA • DBMS_TSDP_PROPERTY.PARENT_TABLE

Usage Notes

To create the TDSP policy, you must include the procedure in an anonymous block that defines the type of security feature that will use the policy and conditions to test when the policy is enabled. For more information, see *Oracle Database Security Guide*.

Examples

Create a policy PARTIAL_MASK_POLICY:

```

DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
    'SYS_CONTEXT(''USERENV'', ''SESSION_USER'')          =' 'APPUSER'';
  redact_feature_options ('function_type')              := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters')        := 'STR, VVVVVVVVV, VVVVVVVVV,
*, 1, 6';
  policy_conditions(DBMS_TSDP_PROTECT.DATATYPE)        := 'VARCHAR2';
  DBMS_TSDP_PROTECT.ADD_POLICY
    ('PARTIAL_MASK_POLICY', DBMS_TSDP_PROTECT.REDACT, redact_feature_options,
policy_conditions);
END;

```

197.5.2 ALTER_POLICY Procedure

This procedure alters an existing TDSP policy

Syntax

```

DBMS_TSDP_PROTECT.ALTER_POLICY (
  policy_name           IN VARCHAR2,
  policy_enable_options IN FEATURE_OPTIONS,
  policy_apply_condition IN POLICY_CONDITION default TSDP$default_condition);

```

Parameters

Table 197-4 ALTER_POLICY Procedure Parameters

Parameter	Description
<code>policy_name</code>	Name of the policy to alter
<code>policy_enable_options</code>	Initialized with the parameter-value pairs corresponding to the security feature
<code>policy_apply_condition</code>	<p>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding <code>policy_enable_options</code>. This is an associative array with <code>Property</code> as the key (<code>PLS_INTEGER</code>).</p> <p>Example: <code>example_policy_condition(Property)=property_value</code>. Permissible values for <code>Property</code>:</p> <ul style="list-style-type: none"> • <code>DBMS_TSDP_PROPERTY.DATATYPE</code> • <code>DBMS_TSDP_PROPERTY.LENGTH</code> • <code>DBMS_TSDP_PROPERTY.PARENT_SCHEMA</code> • <code>DBMS_TSDP_PROPERTY.PARENT_TABLE</code>

Usage Notes

- If the `policy_apply_condition` matches an existing condition for the policy, then the corresponding enable options are updated with `policy_enable_options`.
- If the `policy_apply_condition` does not match any existing condition for the policy, the combination of `policy_enable_options` and `policy_apply_condition` is added to the policy.

Examples

Add a new combination of `policy_apply_condition` and `policy_enable_options` to an existing policy `PARTIAL_MASK_POLICY`:

```
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
    'SYS_CONTEXT(''USERENV'', 'SESSION_USER')='APPUSER'';
  redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters') := 'STR, VVVVVVVV, VVVVVVVV, *,
    1, 6';
  policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
  DBMS_TSDP_PROTECT.ALTER_POLICY ('PARTIAL_MASK_POLICY', redact_feature_options,
  policy_conditions);
END;
```

197.5.3 ASSOCIATE_POLICY Procedure

This procedure associates or disassociates a TSDP policy with a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY (
  policy_name          IN VARCHAR2,
```

```
sensitive_type    IN VARCHAR2,
associate        IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 197-5 ASSOCIATE_POLICY Procedure Parameters

Parameter	Description
policy_name	Name of the TDSP policy
sensitive_type	Name of the sensitive column type:
associate	Associate or Disassociate. TRUE implies Associate

Usage Notes

Both the policy and the sensitive column type should exist in the database.

Examples

Associate PARTIAL_MASK_POLICY with SSN_TYPE:

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY ('PARTIAL_MASK_POLICY', 'SSN_TYPE');
```

197.5.4 DISABLE_PROTECTION_COLUMN Procedure

This procedure disables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN (
  schema_name    IN VARCHAR2 DEFAULT '%',
  table_name     IN VARCHAR2 DEFAULT '%',
  column_name    IN VARCHAR2 DEFAULT '%',
  policy_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 197-6 DISABLE_PROTECTION_COLUMN Procedure Parameters

Parameter	Description
schema_name	Name of the schema containing the column
table_name	Table containing the column
column_name	Column name
policy_name	Optional policy name. If given, only this policy is disabled.

Examples

Disable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
EXEC DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

197.5.5 DISABLE_PROTECTION_SOURCE Procedure

This procedure disables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE (
    discovery_sourcename    IN VARCHAR2);
```

Parameters

Table 197-7 *DISABLE_PROTECTION_SOURCE Procedure Parameters*

Parameter	Description
discovery_sourcename	Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.

Examples

Disable protection for all columns corresponding to ADM_Demo:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE ('ADM_Demo');
```

197.5.6 DISABLE_PROTECTION_TYPE Procedure

This procedure disables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE (
    sensitive_type    IN VARCHAR2);
```

Parameters

Table 197-8 *DISABLE_PROTECTION_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type

Examples

Disable protection for all columns identified by SSN_TYPE:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE ('SSN_TYPE');
```

197.5.7 DROP_POLICY Procedure

This procedure removes a TDSP policy or one of its condition-enable_options combinations.

Syntax

```
DBMS_TSDP_PROTECT.DROP_POLICY (
    policy_name    IN VARCHAR2,
```

```

policy_apply_condition IN POLICY_CONDITIONS);

DBMS_TSDP_PROTECT.DROP_POLICY (
  policy_name          IN VARCHAR2);

```

Parameters

Table 197-9 DROP_POLICY Procedure Parameters

Parameter	Description
policy_name	Name of the policy to drop
policy_apply_condition	To be initialized with the relevant condition

Usage Notes

- The combination of `policy_conditions` and `policy_enable_options` can be dropped from a TSDP policy by giving the `policy_apply_condition` parameter. The default condition-default options combination can also be dropped (if it exists for the policy) by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITION`.
- If the condition-enable_options combination that is being dropped is the last condition-enable_options combination for the policy, the policy itself is dropped.
- A policy can be completely dropped by using the overloaded of the procedure that takes only `policy_name`.
- A policy or one of its conditions can be dropped only if the policy is not associated with any sensitive column type. This also means that a policy that is being dropped is not enabled on any column (object).

Examples

Dropping the condition-enable_options combination based on a specific condition:

```

DECLARE
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
  DBMS_TSDP_PROTECT.DROP_POLICY ('PARTIAL_MASK_POLICY', policy_conditions);
END;

```

The default condition-enable_options combination can be dropped by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITIONS` for the `policy_apply_condition` parameter:

```

DECLARE
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  DBMS_TSDP_PROTECT.DROP_POLICY ('redact_partial_cc', policy_conditions);
END;

```

Dropping a TSDP policy:

```

BEGIN
  DBMS_TSDP_PROTECT.DROP_POLICY (
    policy_name => 'PARTIAL_MASK_POLICY');
END;

```

197.5.8 ENABLE_PROTECTION_COLUMN Procedure

This procedure enables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN (
  schema_name      IN VARCHAR2 DEFAULT '%',
  table_name       IN VARCHAR2 DEFAULT '%',
  column_name      IN VARCHAR2 DEFAULT '%',
  policy_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 197-10 *ENABLE_PROTECTION_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Name of the schema containing the column
table_name	Table containing the column
column_name	Column name
policy_name	Optional policy name. If given, only this policy is enabled.

Usage Notes

- Only a TSDP Policy that is associated with the sensitive column type of the sensitive column can be enabled using this Procedure.
- LIKE condition is used for schema_name, table_name and column_name. AND semantics is followed.

Examples

Enable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

197.5.9 ENABLE_PROTECTION_SOURCE Procedure

This procedure enables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE (
  discovery_sourcename IN VARCHAR2);
```

Parameters

Table 197-11 *ENABLE_PROTECTION_SOURCE Procedure Parameters*

Parameter	Description
discovery_sourcename	Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.

Examples

Enable protection for all columns corresponding to ADM_Demo:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE ('ADM_Demo');
```

197.5.10 ENABLE_PROTECTION_TYPE Procedure

This procedure enables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE (
    sensitive_type      IN VARCHAR2);
```

Parameters

Table 197-12 *ENABLE_PROTECTION_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type

Examples

Enable protection for all columns identified by SSN_TYPE:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE ('SSN_TYPE');
```

DBMS_TTS

The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view TRANSPORT_SET_VIOLATIONS.

This chapter contains the following topics:

- [Security Model](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Summary of DBMS_TTS Subprograms](#)

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Upgrade Guide*

198.1 DBMS_TTS Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

198.2 DBMS_TTS Exceptions

The DBMS_TTS package creates exceptions for missing or invalid transportable tablespaces.

```
ts_not_found EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

198.3 DBMS_TTS Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently.

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

198.4 Summary of DBMS_TTS Subprograms

The two procedures listed in the table are designed to be called by database administrators.

Table 198-1 DBMS_TTS Package Subprograms

Subprogram	Description
DOWNGRADE Procedure	Downgrades transportable tablespace-related data
TRANSPORT_SET_CHECK Procedure	Checks if a set of tablespaces (to be transported) is self-contained

198.4.1 DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

Syntax

```
DBMS_TTS.DOWNGRADE;
```

198.4.2 TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
    ts_list          IN CLOB,
    incl_constraints IN BOOLEAN DEFAULT FALSE,
    full_check       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 198-2 TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
<code>ts_list</code>	List of one or more tablespaces, separated by comma.

Table 198-2 (Cont.) TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
<code>incl_constraints</code>	TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The <code>incl_constraints</code> parameter is a default so that <code>TRANSPORT_SET_CHECK</code> will work if it is called with only the <code>ts_list</code> argument.)
<code>full_check</code>	Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to FALSE. It will only consider OUT pointers as violations.

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);  
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

DBMS_TYPES

The `DBMS_TYPES` package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- [Constants](#)
- [Exceptions](#)

199.1 DBMS_TYPES Constants

The `DBMS_TYPES` package defines several constants to use when specifying parameter values.

These constants are listed in following table .

Table 199-1 *DBMS_TYPES Constants*

Constant	Description
<code>NO_DATA</code>	Is only relevant if PieceWise is called, for a collection or any dataset. Denotes the end of collection/any dataset when all the elements have been accessed
<code>SUCCESS</code>	The operation succeeded
<code>TYPECODE_BDOUBLE</code>	A <code>NUMBER</code> type
<code>TYPECODE_BFILE</code>	A <code>BFILE</code> type
<code>TYPECODE_BFLOAT</code>	A <code>NUMBER</code> type
<code>TYPECODE_BLOB</code>	A <code>BLOB</code> type
<code>TYPECODE_CFILE</code>	A <code>CFILE</code> type
<code>TYPECODE_CHAR</code>	A <code>CHAR</code> type
<code>TYPECODE_CLOB</code>	A <code>CLOB</code> type
<code>TYPECODE_DATE</code>	A <code>DATE</code> type
<code>TYPECODE_INTERVAL_DS</code>	An <code>INTERVAL_DS</code> type
<code>TYPECODE_INTERVAL_YM</code>	A <code>INTERVAL_YM</code> type
<code>TYPECODE_MLSLABEL</code>	An <code>MLSLABEL</code> type
<code>TYPECODE_NAMEDCOLLECTION</code>	A named collection (<code>VARRAY</code> /nested table) type
<code>TYPECODE_NCHAR</code>	A <code>NCHAR</code> type
<code>TYPECODE_NCLOB</code>	A <code>NCLOB</code> type
<code>TYPECODE_NUMBER</code>	A <code>NUMBER</code> type
<code>TYPECODE_NVARCHAR2</code>	A <code>NVARCHAR2</code> type
<code>TYPECODE_OBJECT</code>	An <code>OBJECT</code> type

Table 199-1 (Cont.) DBMS_TYPES Constants

Constant	Description
TYPECODE_OPAQUE	An OPAQUE type
TYPECODE_RAW	A RAW type
TYPECODE_REF	A REF type
TYPECODE_TABLE	A nested table collection type
TYPECODE_TIMESTAMP	A TIMESTAMP type
TYPECODE_TIMESTAMP_LTZ	A TIMESTAMP_LTZ type
TYPECODE_TIMESTAMP_TZ	A TIMESTAMP_TZ type
TYPECODE_UROWID	A UROWID type
TYPECODE_VARCHAR2	A VARCHAR2 type
TYPECODE_VARCHAR	A VARCHAR type
TYPECODE_VARRAY	A VARRAY collection type

199.2 DBMS_TYPES Exceptions

DBMS_TYPES throws these exceptions.

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH

DBMS_UMF

The `DBMS_UMF` package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.

See Also:

Oracle Database Performance Tuning Guide for more information about configuring the RMF for an Oracle Database.

This chapter contains the following topic:

- [Summary of DBMS_UMF Subprograms](#)

200.1 Summary of DBMS_UMF Subprograms

This topic lists the `DBMS_UMF` subprograms in alphabetical order and briefly describes them.

Table 200-1 DBMS_UMF Package Subprograms

Subprogram	Description
CONFIGURE_NODE Procedure	Configures a node in the RMF topology
CREATE_LINK Procedure	Creates a database link between two nodes in the RMF topology
CREATE_TOPOLOGY Procedure	Creates the RMF topology
DROP_LINK Procedure	Removes a database link between two nodes in the RMF topology
DROP_TOPOLOGY Procedure	Deletes the RMF topology
ENABLE_SERVICE Procedure	Enables a service on a node in the RMF topology
GET_NODE_ID_LOCAL Function	Returns the node ID of a node in the RMF topology
GET_NODE_NAME_LOCAL Function	Returns the node name of a node in the RMF topology
GET_TARGET_ID Function	Returns the destination ID in the RMF topology
GET_TOPOLOGY_NAME_LOCAL Function	Returns the RMF topology name of the local node
QUERY_LINK_INFO Procedure	Returns the information about a database link in the RMF topology
QUERY_NODE_INFO Procedures	Returns the information about a node in the RMF topology
REGISTER_NODE Function and Procedure	Registers a node in the RMF topology

Table 200-1 (Cont.) DBMS_UMF Package Subprograms

Subprogram	Description
SWITCH_DESTINATION Procedure	Designates a source node as a destination node in the RMF topology
UNCONFIGURE_NODE Procedure	Resets the configuration of a node in the RMF topology
UNREGISTER_NODE Procedure	Removes the registration of a node in the RMF topology

200.1.1 CONFIGURE_NODE Procedure

This procedure configures a node that needs to be registered with the RMF topology. This procedure must be executed on the node that needs to be configured.

Syntax

```
DBMS_UMF.CONFIGURE_NODE (
    node_name          IN VARCHAR2 DEFAULT NULL,
    dblink_to_target  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 200-2 CONFIGURE_NODE Procedure Parameters

Parameter	Description
node_name	Name of the node. Each node in the RMF topology must be assigned a unique name. If a name is not provided for a node in this procedure, then the value of the initialization parameter <code>DB_UNIQUE_NAME</code> is assigned as the name for the node by default.
dblink_to_target	Database link from this node to the destination node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.2 CREATE_LINK Procedure

This procedure creates database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.CREATE_LINK (
    topology_name     IN VARCHAR2,
    node_a_name       IN VARCHAR2,
```

```

node_b_name      IN VARCHAR2,
dblink_a_to_b    IN VARCHAR2,
dblink_b_to_a    IN VARCHAR2);

```

Parameters

Table 200-3 CREATE_LINK Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_a_name	Name of the first node.
node_b_name	Name of the second node.
dblink_a_to_b	Database link from the first node to the second node.
dblink_b_to_b	Database link from the second node to the first node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.3 CREATE_TOPOLOGY Procedure

This procedure creates the RMF topology and designates the node on which it is executed as the destination node for that topology.

Syntax

```

DBMS_UMF.CREATE_TOPOLOGY(
  topology_name IN VARCHAR2);

```

Parameters

Table 200-4 CREATE_TOPOLOGY Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.4 DROP_LINK Procedure

This procedure removes the database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.DROP_LINK(  
    topology_name IN VARCHAR2,  
    node_a_name   IN VARCHAR2,  
    node_b_name   IN VARCHAR2);
```

Parameters

Table 200-5 DROP_LINK Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_a_name	Name of the first node.
node_b_name	Name of the second node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.5 DROP_TOPOLOGY Procedure

This procedure deletes the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.DROP_TOPOLOGY(  
    topology_name IN VARCHAR2);
```

Parameters

Table 200-6 DROP_TOPOLOGY Procedure Parameters

Parameter	Description
topology_name	Name of the topology to delete.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.6 ENABLE_SERVICE Procedure

This procedure enables a service, such as the AWR service, on a node in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.ENABLE_SERVICE(  
    topology_name    IN VARCHAR2,  
    node_name        IN VARCHAR2,  
    service_type     IN NUMBER);
```

Parameters

Table 200-7 ENABLE_SERVICE Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_name	Name of the node on which a specific service needs to be enabled.
service_type	Numeric constant identifying the service. The only allowed value for this parameter is UMF_SERVICE_TYPE_AWR, which is Automatic Workload Repository (AWR) service.

Security Model

Only the database users SYS and SYS\$UMF can execute this procedure.

200.1.7 GET_NODE_ID_LOCAL Function

This function returns the node ID of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_ID_LOCAL(  
    topology_name    IN VARCHAR2 DEFAULT NULL)  
    RETURN NUMBER;
```

Parameters

Table 200-8 GET_NODE_ID_LOCAL Function Parameters

Parameter	Description
topology_name	Name of the RMF topology with which the node is registered.

Return Value

Returns the node ID of the node in the RMF topology on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this function.

200.1.8 GET_NODE_NAME_LOCAL Function

This function returns the name of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the node in the RMF topology on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.9 GET_TARGET_ID Function

This function returns the ID of the destination node in the RMF topology. This function can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.GET_TARGET_ID(  
    topology_name IN VARCHAR2)  
RETURN NUMBER;
```

Parameters

Table 200-9 GET_TARGET_ID Function Parameters

Parameter	Description
<code>topology_name</code>	Name of the RMF topology.

Return Value

Returns the ID of the destination node in the RMF topology.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.10 GET_TOPOLOGY_NAME_LOCAL Function

This function returns the name of the active RMF topology of the node on which this function is executed.

Syntax

```
DBMS_UMF.GET_TOPOLOGY_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the active RMF topology of the node on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.11 QUERY_LINK_INFO Procedure

This procedure returns the name of the database link between two nodes in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.QUERY_LINK_INFO(  
    topology_name    IN    VARCHAR2,  
    from_node_id     IN    NUMBER,  
    to_node_id       IN    NUMBER,  
    link_name        OUT   VARCHAR2);
```

Parameters

Table 200-10 QUERY_LINK_INFO Procedure Parameters

Parameter	Description
<code>topology_name</code>	Name of the RMF topology.
<code>from_node_id</code>	Node ID of the first node.
<code>to_node_id</code>	Node ID of the second node.
<code>link_name</code>	Name of the database link from the first node to the second node returned by the procedure.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.12 QUERY_NODE_INFO Procedures

This procedure returns information about a node in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.QUERY_NODE_INFO (
  topology_name      IN   VARCHAR2  DEFAULT NULL,
  node_name          IN   VARCHAR2,
  node_id            OUT  NUMBER);
```

```
DBMS_UMF.QUERY_NODE_INFO (
  node_id            IN   NUMBER,
  topology_name      OUT  VARCHAR2,
  node_name          OUT  VARCHAR2);
```

Parameters

Table 200-11 QUERY_NODE_INFO Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology with which the node is registered.
node_name	Name of the node.
node_id	Identifier of the node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.13 REGISTER_NODE Function and Procedure

This function and procedure registers a node with the RMF topology. This procedure and function must be executed only on the destination node in the RMF topology.

Syntax

```
DBMS_UMF.REGISTER_NODE (
  topology_name      IN   VARCHAR2,
  node_name          IN   VARCHAR2,
  dblink_to_node     IN   VARCHAR2  DEFAULT NULL,
  dblink_from_node   IN   VARCHAR2  DEFAULT NULL,
  as_source           IN   VARCHAR2  DEFAULT 'TRUE',
  as_candidate_target IN   VARCHAR2  DEFAULT 'FALSE');
```

```
DBMS_UMF.REGISTER_NODE (
  topology_name      IN   VARCHAR2,
  node_name          IN   VARCHAR2,
  dblink_to_node     IN   VARCHAR2  DEFAULT NULL,
  dblink_from_node   IN   VARCHAR2  DEFAULT NULL,
```

```

as_source          IN VARCHAR2 DEFAULT 'TRUE',
as_candidate_target IN VARCHAR2 DEFAULT 'FALSE');
node_id           OUT VARCHAR2);

DBMS_UMF.REGISTER_NODE(
  topology_name    IN VARCHAR2,
  node_name        IN VARCHAR2,
  dblink_to_node   IN VARCHAR2 DEFAULT NULL,
  dblink_from_node IN VARCHAR2 DEFAULT NULL,
  as_source        IN VARCHAR2 DEFAULT 'TRUE',
  as_candidate_target IN VARCHAR2 DEFAULT 'FALSE')
RETURN NUMBER;
```

Parameters

Table 200-12 REGISTER_NODE Function and Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_name	Name of the node to register.
dblink_to_node	Name for the database link from the destination to the node.
dblink_from_node	Name for the database link from the node to the destination.
as_source	Set to TRUE, if the node is a source, else set to FALSE.
as_candidate_target	Set to TRUE, if the node is a candidate destination, else set to FALSE.
node_id	Node ID returned by the procedure.

Return Value

Returns the node ID of the registered node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.14 SWITCH_DESTINATION Procedure

This procedure makes the candidate destination as the new destination in the RMF topology. This procedure must be executed only on the candidate destination node.

Syntax

```

DBMS_UMF.SWITCH_DESTINATION(
  topology_name    IN VARCHAR2,
  force_switch     IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 200-13 SWITCH_DESTINATION Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
force_switch	<p>If set to <code>FALSE</code>, the execution of this procedure fails in the following situations:</p> <ul style="list-style-type: none">• Candidate destination is a read-only database, and hence it cannot become the new destination.• Candidate destination does not have database links to one or more sources in the topology.• Candidate destination is unable to get the latest AWR data from the old destination. <p>If set to <code>TRUE</code>, the execution of this procedure fails in the following situation:</p> <ul style="list-style-type: none">• Candidate destination is a read-only database, and hence it cannot become the new destination.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.15 UNCONFIGURE_NODE Procedure

This procedure removes the configuration details of the node on which this procedure is executed.

Syntax

```
DBMS_UMF.UNCONFIGURE_NODE;
```

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

200.1.16 UNREGISTER_NODE Procedure

This procedure removes a node for the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.UNREGISTER_NODE(  
    topology_name    IN VARCHAR2,  
    node_name        IN VARCHAR2);
```

Parameters

Table 200-14 UNREGISTER_NODE Procedure Parameters

Parameter	Description
<code>topology_name</code>	Name of the RMF topology.
<code>node_name</code>	Name of the node which needs to be removed from the topology.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

DBMS_UNDO_ADV

The Undo Advisor assists in correctly sizing the undo tablespace and sets the low threshold value of the Undo Retention Period for any Oracle Flashback requirements. The Undo Advisor can also be used to estimate the undo tablespace required for migration from manual to automatic undo management before actually creating the new undo tablespace.

The `DBMS_UNDO_ADVISOR` package provides subprograms to manage the execution of the Undo Advisor feature.

The Undo Advisor relies for its analysis on data collected in the Automatic Workload Repository (AWR). Thus, it is important that the AWR have adequate workload statistics available so that the Undo Advisor can make accurate recommendations. For newly created databases, adequate statistics may not be available immediately. In such cases, continue to use the default auto-extending undo tablespace until at least one workload cycle completes.

This chapter contains the following topic:

- [Summary of DBMS_UNDO_ADV Subprograms](#)

201.1 Summary of DBMS_UNDO_ADV Subprograms

This topic lists the `DBMS_UNDO_ADV` subprograms in alphabetical order and briefly describes them.

Table 201-1 DBMS_UNDO_ADV Package Subprograms

Subprogram	Description
BEST_POSSIBLE_RETENTION Function	Returns the best possible value for the <code>undo_retention</code> parameter that the current undo tablespace can satisfy in order to maximize the usage of the current undo tablespace based on the historical information of the given period.
LONGEST_QUERY Function	This function returns the duration of the longest query, in seconds, for a given period.
RBU_MIGRATION Function	Estimates the undo tablespace needed for migration from manual to automatic undo management.
REQUIRED_RETENTION Function	Returns the required value for the <code>undo_retention</code> parameter to satisfy the longest query based on undo statistics available for a given period.
REQUIRED_UNDO_SIZE Function	Returns the required undo tablespace size in MB to satisfy a certain undo retention value based on undo statistics available for a given period.
UNDO_ADVISOR Function	Uses the advisor framework to check if there is any problem with the current instance. It also provides recommendations.

Table 201-1 (Cont.) DBMS_UNDO_ADV Package Subprograms

Subprogram	Description
UNDO_AUTOTUNE Function	Determines whether auto-tuning of undo retention is enabled for the current undo tablespace.
UNDO_HEALTH Function	Checks whether there is any problem with the current setting of undo retention and undo tablespace size based on the historical information of a given period and provides recommendations to fix the problem.
UNDO_INFO Function	Retrieves information about the undo tablespace of the current instance.

201.1.1 BEST_POSSIBLE_RETENTION Function

This function returns the best possible value for the `undo_retention` parameter that the current undo tablespace can satisfy in order to maximize the usage for the current undo tablespace based on the historical information of a given period.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION()
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION(
    start_time IN DATE,
    end_time   IN DATE)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION(
    begin_snap IN NUMBER,
    end_snap   IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 201-2 BEST_POSSIBLE_RETENTION Function Parameters

Parameter	Description
<code>start_time</code>	Start time of the given period.
<code>end_time</code>	End time of the given period.

Table 201-2 (Cont.) BEST_POSSIBLE_RETENTION Function Parameters

Parameter	Description
<code>begin_snap</code>	Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier.
<code>end_snap</code>	End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier.

201.1.2 RBU_MIGRATION Function

This function estimates the undo tablespace needed for migration from manual to automatic undo management.

If you are currently using manual undo management (rollback segments) to manage undo space, then Oracle recommends migrating to automatic undo management. You must first create an undo tablespace, before opening a newly upgraded database. The required size of undo tablespace depends on the system workload and Flashback requirements.

Note:

The `RBU_MIGRATION` function should be called only when `undo_management = manual`.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.RBU_MIGRATION ()
RETURN NUMBER;
```

Viewing the output using the Start Time and End Time:

```
DBMS_UNDO_ADV.RBU_MIGRATION (
    START_TIME IN DATE,
    END_TIME   IN DATE)
RETURN NUMBER;
```

Parameters

Table 201-3 RBU_MIGRATION Function Parameters

Parameter	Description
<code>START_TIME</code>	Start time of the given period.
<code>END_TIME</code>	End time of the given period.

201.1.3 LONGEST_QUERY Function

This function returns the duration of the longest query, in seconds, for a given period.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.LONGEST_QUERY ()
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.LONGEST_QUERY (
    start_time IN DATE,
    end_time   IN DATE)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.LONGEST_QUERY (
    begin_snap IN NUMBER,
    end_snap   IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 201-4 LONGEST_QUERY Function Parameters

Parameter	Description
start_time	Start time for the specified period.
end_time	End time for the specified period.
begin_snap	Begin snapshot identifier. It is based on historical information in AWR from the begin_snap identifier.
end_snap	End snapshot identifier. It is based on historical information in AWR until the end_snap identifier.

201.1.4 REQUIRED_RETENTION Function

This function returns the required value for the `undo_retention` parameter to satisfy the longest query based on undo statistics available for a given period.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION()
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION(
    start_time IN DATE,
    end_time   IN DATE)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION(
    begin_snap IN NUMBER,
    end_snap   IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 201-5 REQUIRED_RETENTION Function Parameters

Parameter	Description
<code>start_time</code>	Start time of the given period.
<code>end_time</code>	End time of the given period.
<code>begin_snap</code>	Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier.
<code>end_snap</code>	End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier.

201.1.5 REQUIRED_UNDO_SIZE Function

This function returns the required undo tablespace size (in MB) to satisfy certain undo retention value based on undo statistics available for a given period.

Note:

Zero will be returned if the information about the given period is not available.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(
    retention IN NUMBER)
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(
    retention IN NUMBER,
    start_time IN DATE,
    end_time IN DATE)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(
    retention IN NUMBER,
    begin_snap IN NUMBER,
    end_snap IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 201-6 REQUIRED_UNDO_SIZE Function Parameters

Parameter	Description
retention	Retention value you want to set for the <code>undo_retention init.ora</code> parameter.
start_time	Start time of the given period.
end_time	End time of the given period.
begin_snap	Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier.
end_snap	End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier.

201.1.6 UNDO_ADVISOR Function

This function uses the advisor framework to check if there is any problem with the current instance and provide recommendations.

Note:

This function should be used when `undo_management` is set to `auto`.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(  
    instance_id IN NUMBER)  
RETURN VARCHAR2;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(  
    start_time IN DATE,  
    end_time   IN DATE,  
    instance_id IN NUMBER)  
RETURN VARCHAR2;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(  
    begin_snap IN NUMBER,  
    end_snap   IN NUMBER,  
    instance_id IN NUMBER)  
RETURN VARCHAR2;
```

Parameters

Table 201-7 UNDO_ADVISOR Function Parameters

Parameter	Description
<code>start_time</code>	Start time of the given period.
<code>end_time</code>	End time of the given period.
<code>begin_snap</code>	Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier.
<code>end_snap</code>	End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier.
<code>instance_id</code>	Instance ID of the current instance.

201.1.7 UNDO_AUTOTUNE Function

This function finds out whether the auto-tuning of undo retention is enabled for the current undo tablespace.

Syntax

```
DBMS_UNDO_ADV.UNDO_AUTOTUNE (
    chk OUT BOOLEAN)
RETURN BOOLEAN;
```

Parameters

Table 201-8 UNDO_AUTOTUNE Function Parameters

Parameter	Description
chk	TRUE if auto-tuning of undo retention is enabled, FALSE otherwise.

201.1.8 UNDO_HEALTH Function

Checks whether there is any problem with the current setting of undo retention and undo tablespace size based on the historical information of a given period and provides recommendations to fix the problem.

If the return value is 0, no problem is found. Otherwise, parameter `prob` and `reco` are the problem and recommendation on fixing the problem.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.UNDO_HEALTH (
    prob OUT VARCHAR2,
    reco OUT VARCHAR2,
    rtn1 OUT VARCHAR2,
    retn OUT NUMBER,
    utbs OUT NUMBER);
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.UNDO_HEALTH (
    prob OUT VARCHAR2,
    reco OUT VARCHAR2,
    rtn1 OUT VARCHAR2,
    retn OUT NUMBER,
    utbs OUT NUMBER)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.UNDO_HEALTH (
  begin_snap IN NUMBER,
  end_snap   IN NUMBER,
  prob       OUT VARCHAR2,
  reco       OUT VARCHAR2,
  rtn1       OUT VARCHAR2,
  retn       OUT NUMBER,
  utbs       OUT NUMBER)
RETURN NUMBER;
```

Parameters

Table 201-9 UNDO_HEALTH Function Parameters

Parameter	Description
start_time	Start time of the given period.
end_time	End time of the given period.
begin_snap	Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier.
end_snap	End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier.
prob	Problem that is being diagnosed. For example, long running query may fail or undo tablespace cannot satisfy <code>undo_retention</code> .
reco	Recommendation for fixing the problem.
rtn1	Rationale for the recommendation.
retn	The numerical value of retention if the recommendation is to change retention.
utbs	The numerical value of undo tablespace size (in MB) if the recommendation is to change undo tablespace size.

201.1.9 UNDO_INFO Function

This function retrieves information about the undo tablespace of the current instance.

This function returns the undo tablespace name, maximum possible size for the undo tablespace, current undo retention value, and boolean values to verify if it is auto-extensible or if the undo tablespace has guaranteed undo retention.

Syntax

```
DBMS_UNDO_ADV.UNDO_INFO (
  tbs_name       OUT VARCHAR2,
  tbs_size       OUT NUMBER,
  tbs_autoextend OUT BOOLEAN,
  tbs_retention  OUT NUMBER,
```

```

    tbs_guarantee OUT BOOLEAN)
RETURN BOOLEAN;

```

Parameters

Table 201-10 UNDO_INFO Function Parameters

Parameter	Description
tbs_name	Name of the current undo tablespace the instance is using.
tbs_size	The size of the undo tablespace in MB, if the undo tablespace is <i>fixed-sized</i> . If the tablespace is <i>auto_extensible</i> , it is the maximum possible size of the undo tablespace in MB.
tbs_autoextend	TRUE if the undo tablespace is extensible, FALSE otherwise.
tbs_retention	The value of the <code>undo_retentioninit.ora</code> parameter.
tbs_guarantee	TRUE if the undo tablespace has guaranteed retention, FALSE otherwise.

DBMS_USER_CERTS

The `DBMS_USER_CERTS` package allows you add and delete certificates.

This chapter contains the following topics:

- [DBMS_USER_CERTS Overview](#)
- [DBMS_USER_CERTS Security Model](#)
- [Summary of DBMS_USER_CERTS Subprograms](#)

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*
- For information on hidden columns in blockchain tables, see *Hidden Columns in Blockchain Tables*

202.1 DBMS_USER_CERTS Overview

The `DBMS_USER_CERTS` package allows you add and delete certificates.

The `DBMS_USER_CERTS` package allows you to:

- add certificates
- delete certificates

One use case is to attach a digital signature to a row in a blockchain table and be able to verify the digital signature later. A certificate used to sign one or more rows in blockchain tables and which has since expired should remain in the database until all those rows have been deleted from the blockchain tables.

202.2 DBMS_USER_CERTS Security Model

The `DBMS_USER_CERTS` package is owned by `SYS` and is installed as part of database installation.

- Both `ADD_CERTIFICATE()` and `DROP_CERTIFICATE()` sub-programs can be executed by any database user. The `EXECUTE` privilege on `DBMS_USER_CERTS` package is granted to `PUBLIC` role.

- Using `ADD_CERTIFICATE()`, a database user can add multiple certificates, each one would be identified uniquely using a GUID.
- Only SYSDBA or the user who owns the certificate, can drop it using `DROP_CERTIFICATE()`.

202.3 Summary of DBMS_USER_CERTS Subprograms

The `DBMS_USER_CERTS` package uses `ADD_CERTIFICATE`, `ADD_COPY`, and `DROP_CERTIFICATE` subprograms to add, copy, and delete X.509 certificates which are used for signature verification for blockchain tables by the current user.

Table 202-1 DBMS_USER_CERTS Package Subprograms

Subprogram	Description
ADD_CERTIFICATE Procedure	Adds X.509 certificates which are used for signature verification of blockchain tables.
ADD_COPY Procedure	Adds a certificate to the database and assign the certificate a specific global unique identifier (GUID).
DROP_CERTIFICATE Procedure	Drops a certificate that is used for signature verification of blockchain tables.

202.3.1 ADD_CERTIFICATE Procedure

This procedure can be used by the current user to add an X.509 certificate that is used for signature verification of blockchain tables.

Syntax

```
DBMS_USER_CERTS.ADD_CERTIFICATE(
    x509_cert      IN BLOB,
    cert_id        OUT RAW);
```

Parameters

Table 202-2 ADD_CERTIFICATE Procedure Parameters

Parameter	Description
<code>x509_cert</code>	The X.509 certificate used for signature verification of blockchain tables.
<code>cert_id</code>	The Global Unique Identifier (GUID) for the certificate.

202.3.2 ADD_COPY Procedure

This procedure enables you add a certificate to the database and assign the certificate a specific global unique identifier (GUID).

This procedure is used when a user needs to make a copy of the certificate that was previously created in one database and add the copy to another database while preserving its GUID. When recording blockchain table signatures in one database and verifying the signatures in another, the certificate GUID must be preserved. One scenario is when you use Oracle Data Pump to copy a blockchain table between

databases. Another scenario is when you use Oracle GoldenGate to replicate rows in a blockchain table between databases.

Syntax

```
DBMS_USER_CERTS.ADD_COPY(  
    x509_cert IN BLOB,  
    cert_id IN RAW,  
    username IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 202-3 ADD_COPY Procedure Parameters

Parameter	Description
x509_cert	The X.509 certificate used for signature verification of blockchain tables.
cert_id	The Global Unique Identifier (GUID) for the certificate.
username	The name of the user who will own the certificate. A NULL value defaults to the current user.

Usage Note

If `username` is not NULL, either `username` must refer to the current user, or the current user must be SYSDBA.

202.3.3 DROP_CERTIFICATE Procedure

This procedure can be used by the current user to drop a certificate that is used for signature verification of blockchain tables.

Syntax

```
DBMS_USER_CERTS.DROP_CERTIFICATE(  
    cert_id IN RAW);
```

Parameters

Table 202-4 DROP_CERTIFICATE Procedure Parameters

Parameter	Description
cert_id	The Global Unique Identifier (GUID) of the certificate.

DBMS_USERDIAG

The `DBMS_USERDIAG` package allows you to perform a limited set of diagnosis operations on the PDB.

This chapter contains the following topics:

- [DBMS_USERDIAG Overview](#)
- [Summary of DBMS_USERDIAG Subprograms](#)

Enabling traces on cloud requires additional configuration as documented here: [Perform SQL Tracing on Autonomous Database](#).

203.1 DBMS_USERDIAG Overview

The `DBMS_USERDIAG` package is for diagnosis and allows you to set up a trace within a PDB.

The `DBMS_USERDIAG` package utilizes underneath `DBMS_SYSTEM` functionality but with a narrow set of definitions which restrict arbitrary event settings.

For a given PDB, the `DBMS_USERDIAG` package allows you:

- to enable the SQL trace at a given level.
- to disable the SQL trace.
- to check the SQL trace.

Most of the regular diagnostic mechanisms have been restricted outside of a given PDB using lockdown profiles, so that arbitrary events cannot be enabled from user sessions in a shared tenancy in CBD deployments in cloud instances. In particular, "alter session set events" statement is blocked in cloud deployments, because it can be misused to set events/actions which may change code-path execution or simulate errors.

203.2 Summary of DBMS_USERDIAG Subprograms

The `DBMS_USERDIAG` package uses `ENABLE_SQL_TRACE_EVENT` and `CHECK_SQL_TRACE_EVENT` subprograms to enable, disable, and monitor `sql_trace` events.

Table 203-1 DBMS_USERDIAG Package Subprograms

Subprogram	Description
CHECK_SQL_TRACE_EVENT Procedure	Checks the current <code>sql_trace</code> event and retrieves the level.
ENABLE_SQL_TRACE_EVENT Procedure	Enables <code>sql_trace</code> event at a given level in user session, and generates SQL traces into respective process trace files.
GET_CALL_ERROR_MSG Function	Obtains the error message if the last call to <code>DBMS_USERDIAG</code> API returned an error.
GET_CALL_STATUS Function	Obtains the status of the last call to the <code>DBMS_USERDIAG</code> API.

Table 203-1 (Cont.) DBMS_USERDIAG Package Subprograms

Subprogram	Description
SET_EXCEPTION_MODE Procedure	Raises an exception on any error or silently ignores the same (default).
SET_TRACEFILE_IDENTIFIER Procedure	Sets a custom trace file identifier for the active trace file in the current ADR home.
TRACE Procedure	Traces message to the trace file or alert log.

203.2.1 CHECK_SQL_TRACE_EVENT Procedure

This procedure can be used by the current user to check the current `sql_trace` event and retrieves the level.

Syntax

```
DBMS_USERDIAG.CHECK_SQL_TRACE_EVENT (
  sql_id          IN VARCHAR2          DEFAULT NULL
  sys             IN BINARY_INTEGER  DEFAULT NULL
  level          OUT BINARY_INTEGER);
```

Parameters

Table 203-2 CHECK_SQL_TRACE_EVENT Procedure Parameters

Parameter	Description
<code>level</code>	Required. Output of the current level at which <code>sql_trace</code> event is enabled.
<code>sql_id</code>	<code>sql_trace</code> in scope of a given <code>sql_id</code> alone. This is currently ignored.
<code>sys</code>	Optional. Set event instance-wide or PDB-wide. Default 0. This is currently ignored.

203.2.2 ENABLE_SQL_TRACE_EVENT Procedure

This procedure enables `sql_trace` event (`sql_trace/10046`) at a given `level` in user session, and generates SQL traces into respective process trace files.

Optionally a `sql_id` can also be specified in which case tracing is enabled for that `sql_id` alone. Default is to enable events without `sql` scope. Default is to set event in current session alone. Event can be disabled by setting `disable` to non-zero value (default zero).

Syntax

```
DBMS_USERDIAG.ENABLE_SQL_TRACE_EVENT (
  level          IN BINARY_INTEGER  DEFAULT 1,
  sid            IN BINARY_INTEGER  DEFAULT 0,
  ser           IN BINARY_INTEGER  DEFAULT 0,
  binds         IN BINARY_INTEGER  DEFAULT 0,
```

```

waits          IN  BINARY_INTEGER DEFAULT 0,
plan_stat     IN  VARCHAR2         DEFAULT NULL,
sql_id        IN  VARCHAR2         DEFAULT NULL,
disable       IN  BINARY_INTEGER DEFAULT 0,
sys           IN  BINARY_INTEGER DEFAULT 0);

```

Parameters

Table 203-3 ENABLE_SQL_TRACE_EVENT Procedure Parameters

Parameter	Description
level	Optional. Specifies the level associated with <code>sql_trace</code> event. Other settings augment the level value. For example, <code>binds=>true</code> adds to whatever level value has been provided by the user. This is kept for ease of usage.
sid	Optional. Target session identifier. <code>sid, ser</code> pair must be validated to be within current PDB id.
ser	Optional. Target serial number.
binds	Optional. A non-zero value traces bind values. Maps to level 4.
waits	Optional. A non-zero value traces waits. Maps to level 8.
plan_stat	Optional. Allowed values: <code>FIRST_EXECUTION</code> (default), <code>NEVER</code> , <code>ALL_EXECUTIONS</code> , and <code>ADAPTIVE</code>
sql_id	Enable <code>sql_trace</code> in scope of a given <code>sql_id</code> alone
disable	Optional. Non-zero value disables the already set <code>sql_trace</code> event.
sys	Optional. Set event instance-wide or PDB-wide. Default 0.

203.2.3 GET_CALL_ERROR_MSG Function

This function is used to obtain the error message if the last call to `DBMS_USERDIAG` API returned an error.

Syntax

```
DBMS_USERDIAG.GET_CALL_ERROR_MSG RETURN VARCHAR2;
```

Return Value

If the previous call to `DBMS_USERDIAG` was unsuccessful, the `VARCHAR2` contains the error message associated with it.

If the previous call to `DBMS_USERDIAG` was successful, the value returned is `NULL`.

203.2.4 GET_CALL_STATUS Function

This function is used to obtain the status of the last call to the `DBMS_USERDIAG` API.

Syntax

```
DBMS_USERDIAG.GET_CALL_STATUS RETURN NUMBER;
```

Return Value

Returns a number for the status of the last call to the DBMS_USERDIAG API.

If the previous call was successful, the value of this call is NOERROR(0).

If the previous call was unsuccessful, the value of this call is the error code number.

203.2.5 SET_EXCEPTION_MODE Procedure

This procedure raises an exception on any error or silently ignores the same (default).

Syntax

```
DBMS_USERDIAG.SET_EXCEPTION_MODE(  
    exc_mode IN BOOLEAN DEFAULT FALSE);
```

Parameters**Table 203-4 SET_EXCEPTION_MODE Procedure Parameters**

Parameter	Description
exc_mode	When TRUE, an exception is raised on any error. When FALSE (default), errors are ignored.

203.2.6 SET_TRACEFILE_IDENTIFIER Procedure

This procedure is used to set a custom trace file identifier for the active trace file in the current ADR home.

Syntax

```
DBMS_USERDIAG.SET_TRACEFILE_IDENTIFIER(  
    trc_identifier IN VARCHAR2);
```

Parameters**Table 203-5 SET_TRACEFILE_IDENTIFIER Procedure Parameters**

Parameter	Description
trc_identifier	Specifies the trace identifier for the active trace file in the current ADR home.

203.2.7 TRACE Procedure

This procedure is used to trace message to the trace file or alert log.

Syntax

```
DBMS_USERDIAG.TRACE (  
    message IN VARCHAR2,  
    alert    IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 203-6 TRACE Procedure Parameters

Parameter	Description
message	Specifies the text or message to be traced.
alert	When TRUE , the alert logs are included with the trace file for the trace operation. When FALSE (default), the alert logs are ignored and only the trace file is used for the trace operation.

DBMS_UTILITY

The `DBMS_UTILITY` package provides various utility subprograms.

This chapter contains the following topics:

- [DBMS_UTILITY Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Data Structures](#)
- [Summary of DBMS_UTILITY Subprograms](#)

204.1 DBMS_UTILITY Deprecated Subprograms

These `DBMS_UTILITY` subprograms are deprecated in Oracle Database 12c release 12.2.

Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- [GET_PARAMETER_VALUE Function](#)
Query `v$_parameter` directly to find the value of an `init.ora` parameter.
- [ANALYZE_PART_OBJECT Procedure](#)
Use `DBMS_STATS` to gather statistics.
- [GET_DEPENDENCY Procedure](#)
There is no replacement for this subprogram. However, you can directly query the dictionary views.

There are no replacements for these subprograms.

204.2 DBMS_UTILITY Security Model

`DBMS_UTILITY` runs with the privileges of the calling user for the `NAME_RESOLVE` procedure and the `COMPILE_SCHEMA` procedure. This is necessary so that the SQL works correctly.

The package does not run as `SYS`. The privileges are checked using `DBMS_DDL`.

Related Topics

- [NAME_RESOLVE Procedure](#)
This procedure resolves the given name, including synonym translation and authorization checking as necessary.
- [COMPILE_SCHEMA Procedure](#)
This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

204.3 DBMS_UTILITY Constants

The `DBMS_UTILITY` package defines one constant to use when specifying parameter values.

This constant is shown in the following table.

Table 204-1 DBMS_UTILITY Constants

Name	Type	Value	Description
<code>INV_ERROR_ON_RESTRICTIONS</code>	<code>PLS_INTEGER</code>	1	This constant is the only legal value for the <code>p_option_flags</code> parameter of the <code>INVALIDATE</code> subprogram

204.4 DBMS_UTILITY Exceptions

This table lists the exceptions raised by `DBMS_UTILITY`.

Table 204-2 Exceptions Raised by DBMS_UTILITY

Exception	Error Code	Description
<code>INV_NOT_EXIST_OR_NO_PRIV</code>	-24237	Raised by the <code>INVALIDATE</code> subprogram when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated
<code>INV_MALFORMED_SETTINGS</code>	-24238	Raised by the <code>INVALIDATE</code> subprogram if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter
<code>INV_RESTRICTED_OBJECT</code>	-24239	Raised by the <code>INVALIDATE</code> subprogram when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened

204.5 DBMS_UTILITY Data Structures

The `DBMS_UTILITY` package defines a single `RECORD` type and `TABLE` types.

Record Types

- [INSTANCE_RECORD Record Type](#)

Table Types

- [DBLINK_ARRAY TABLE Type](#)
- [INDEX_TABLE_TYPE Table Type](#)
- [INSTANCE_TABLE Table Type](#)
- [LNAME_ARRAY Table Type](#)
- [NAME_ARRAY Table Type](#)
- [NUMBER_ARRAY Table Type](#)
- [UNCL_ARRAY Table Type](#)

204.5.1 DBMS_UTILITY INSTANCE_RECORD Record Type

This type describes a list of active instance number-name pairs.

Syntax

```
TYPE INSTANCE_RECORD IS RECORD (  
    inst_number    NUMBER,  
    inst_name      VARCHAR2(60));
```

Fields

Table 204-3 INSTANCE_RECORD Record Type Fields

Field	Description
inst_number	Active instance number
inst_name	Instance name

204.5.2 DBMS_UTILITY DBLINK_ARRAY TABLE Type

This type stores a list of database links.

Syntax

```
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

204.5.3 DBMS_UTILITY INDEX_TABLE_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

Syntax

```
TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

204.5.4 DBMS_UTILITY INSTANCE_TABLE Table Type

This type describes a table of `INSTANCE_RECORD` Record Type.

Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

Usage Notes

The starting index of `INSTANCE_TABLE` is 1; `INSTANCE_TABLE` is Dense.

Related Topics

- [DBMS_UTILITY INSTANCE_RECORD Record Type](#)
This type describes a list of active instance number-name pairs.

204.5.5 DBMS_UTILITY LNAME_ARRAY Table Type

This type stores lists of `LONG NAME` including fully qualified attribute names.

Syntax

```
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

204.5.6 DBMS_UTILITY NAME_ARRAY Table Type

This type stores lists of `NAME`.

Syntax

```
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

204.5.7 DBMS_UTILITY NUMBER_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

Syntax

```
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

204.5.8 DBMS_UTILITY UNCL_ARRAY Table Type

This type stores lists of `"user"."name"."column"@link`

Syntax

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

204.6 Summary of DBMS_UTILITY Subprograms

This table lists the `DBMS_UTILITY` subprograms and briefly describes them.

Table 204-4 DBMS_UTILITY Package Subprograms

Subprogram	Description
ACTIVE_INSTANCES Procedure	Returns the active instance
ANALYZE_DATABASE Procedure	Analyzes all the tables, clusters and indexes in a database
ANALYZE_PART_OBJECT Procedure	Analyzes the given tables and indexes This procedure is deprecated from the <code>DBMS_UTILITY</code> package with Oracle Database 12c release 12.2 and later. Use <code>DBMS_STATS</code> to gather statistics.
ANALYZE_SCHEMA Procedure	Analyzes all the tables, clusters and indexes in a schema
CANONICALIZE Procedure	Canonicalizes a given string
COMMA_TO_TABLE Procedures	Converts a comma-delimited list of names into a PL/SQL table of names
COMPILE_SCHEMA Procedure	Compiles all procedures, functions, packages, views and triggers in the specified schema
CREATE_ALTER_TYPE_ERROR_TABLE Procedure	Creates an error table to be used in the <code>EXCEPTION</code> clause of the <code>ALTER TYPE</code> statement
CURRENT_INSTANCE Function	Returns the current connected instance number
DATA_BLOCK_ADDRESS_BLOCK Function	Gets the block number part of a data block address
DATA_BLOCK_ADDRESS_FILE Function	Gets the file number part of a data block address
DB_VERSION Procedure	Returns version information for the database
EXEC_DDL_STATEMENT Procedure	Executes the DDL statement in <code>parse_string</code>
EXPAND_SQL_TEXT Procedure	Recursively replaces any view references in the input SQL query with the corresponding view subquery
FORMAT_CALL_STACK Function	Formats the current call stack
FORMAT_ERROR_BACKTRACE Function	Formats the backtrace from the point of the current error to the exception handler where the error has been caught
FORMAT_ERROR_STACK Function	Formats the current error stack
GET_CPU_TIME Function	Returns the current CPU time in 100th's of a second
GET_DEPENDENCY Procedure	Shows the dependencies on the object passed in. This procedure is deprecated from the <code>DBMS_UTILITY</code> package with Oracle Database 12c release 12.2 and later. There is no replacement for this subprogram.
GET_ENDIANNESNESS Function	Gets the endianness of the database platform
GET_HASH_VALUE Function	Computes a hash value for the given string
GET_PARAMETER_VALUE Function	Gets the value of specified <code>init.ora</code> parameter. This function is deprecated from the <code>DBMS_UTILITY</code> package with Oracle Database 12c release 12.2 and later. You can query <code>v\$_parameter</code> directly.
GET_SQL_HASH Function	Computes a hash value for the given string using MD5 algorithm
GET_TIME Function	Returns the current time in 100th's of a second
GET_TZ_TRANSITIONS Procedure	Returns time zone transitions by <code>regionid</code> from the <code>timezone.dat</code> file

Table 204-4 (Cont.) DBMS_UTILITY Package Subprograms

Subprogram	Description
INVALIDATE Procedure	Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings
IS_BIT_SET Function	Checks the bit setting for the given bit in the given RAW value
IS_CLUSTER_DATABASE Function	Determines if the database is running in cluster database mode
MAKE_DATA_BLOCK_ADDRESS Function	Creates a data block address given a file number and a block number
NAME_RESOLVE Procedure	Resolves the given name
NAME_TOKENIZE Procedure	Calls the parser to parse the given name
OLD_CURRENT_SCHEMA Function	Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA')
OLD_CURRENT_USER Function	Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_USER')
PORT_STRING Function	Returns a string that uniquely identifies the version of Oracle and the operating system
SQLID_TO_SQLHASH Function	Converts a SQL ID into a hash value
TABLE_TO_COMMA Procedures	Converts a PL/SQL table of names into a comma-delimited list of names
VALIDATE Procedure	Makes invalid database objects valid
WAIT_ON_PENDING_DML Function	Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back

204.6.1 ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
    instance_table OUT INSTANCE_TABLE,
    instance_count OUT NUMBER);
```

Parameters

Table 204-5 ACTIVE_INSTANCES Procedure Parameters

Procedure	Description
instance_table	Contains a list of the active instance numbers and names. When no instance is up, the list is empty.
instance_count	Number of active instances

204.6.2 ANALYZE_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (
  method          IN VARCHAR2,
  estimate_rows   IN NUMBER DEFAULT NULL,
  estimate_percent IN NUMBER DEFAULT NULL,
  method_opt      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 204-6 ANALYZE_DATABASE Procedure Parameters

Parameter	Description
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.
method_opt	Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]

Exceptions

ORA-20000: Insufficient privileges for some object in this database

204.6.3 ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL: "ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>] [<command_opt>] [<sample_clause>]"

Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can use [DBMS_STATS](#) to gather statistics.

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
  schema          IN VARCHAR2 DEFAULT NULL,
  object_name     IN VARCHAR2 DEFAULT NULL,
  object_type     IN CHAR      DEFAULT 'T',
  command_type    IN CHAR      DEFAULT 'E',
```

```
command_opt IN VARCHAR2 DEFAULT NULL,
sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

Parameters

Table 204-7 ANALYZE_PART_OBJECT Procedure Parameters

Parameter	Description
schema	Schema of the object_name
object_name	Name of object to be analyzed, must be partitioned
object_type	Type of object, must be T (table) or I (index)
command_type	Must be V (validate structure)
command_opt	Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T.
sample_clause	Sample clause to use when command_type is 'E'

Usage Notes

For each partition of the object, run in parallel using job queues.

204.6.4 ANALYZE_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

Syntax

```
DBMS_UTILITY.ANALYZE_SCHEMA (
  schema          IN VARCHAR2,
  method          IN VARCHAR2,
  estimate_rows   IN NUMBER DEFAULT NULL,
  estimate_percent IN NUMBER DEFAULT NULL,
  method_opt     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 204-8 ANALYZE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.

Table 204-8 (Cont.) ANALYZE_SCHEMA Procedure Parameters

Parameter	Description
method_opt	Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]

Exceptions

ORA-20000: Insufficient privileges for some object in this schema

204.6.5 CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE (
    name          IN   VARCHAR2,
    canon_name    OUT  VARCHAR2,
    canon_len     IN   BINARY_INTEGER);
```

Parameters**Table 204-9 CANONICALIZE Procedure Parameters**

Parameter	Description
name	String to be canonicalized
canon_name	Canonicalized string
canon_len	Length of the string (in bytes) to canonicalize

Return Values

Returns the first canon_len bytes in canon_name.

Usage Notes

- If name is NULL, canon_name becomes NULL.
- If name is not a dotted name, and if name begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If name is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such

a case, each canonicalized component will be concatenated together in the input position, separated by ".".

- Any other character after a[b]* will be ignored.
- The procedure does not handle cases like 'A B.'

Examples

- a becomes A
- "a" becomes a
- "a".b becomes "a"."B"
- "a".b,c.f becomes "a"."B" with ",c.f" ignored.

204.6.6 COMMA_TO_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
  list  IN  VARCHAR2,
  tablen OUT BINARY_INTEGER,
  tab   OUT uncl_array);
```

```
DBMS_UTILITY.COMMA_TO_TABLE (
  list  IN  VARCHAR2,
  tablen OUT BINARY_INTEGER,
  tab   OUT lname_array);
```

Parameters

Table 204-10 COMMA_TO_TABLE Procedure Parameters

Parameter	Description
list	Comma separated list of list of 'names', where a name should have the following format for the first overloading: a [. b [. c]][@ d] and the following format for the second overloading: a [. b]* where a, b, c, d are simple identifiers (quoted or unquoted).
tablen	Number of tables in the PL/SQL table
tab	PL/SQL table which contains list of names

Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

Usage Notes

- The list must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.

- The values in `tab` are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.

204.6.7 COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
    schema          IN VARCHAR2,
    compile_all     IN BOOLEAN DEFAULT TRUE,
    reuse_settings  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 204-11 COMPILE_SCHEMA Procedure Parameters

Parameter	Description
<code>schema</code>	Name of the schema
<code>compile_all</code>	If <code>TRUE</code> , will compile everything within the schema regardless of whether it is <code>VALID</code> If <code>FALSE</code> , will compile only <code>INVALID</code> objects
<code>reuse_settings</code>	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 204-12 COMPILE_SCHEMA Procedure Exceptions

Exception	Description
ORA-20000	Insufficient privileges for some object in this schema
ORA-20001	Cannot recompile <code>SYS</code> objects
ORA-20002	Maximum iterations exceeded. Some objects may not have been recompiled.

Usage Notes

- Note that this subprogram is a wrapper for the [RECOMP_SERIAL Procedure](#) included with the [UTL_RECOMP](#) package.
- After calling this procedure, you should select from view `ALL_OBJECTS` for items with status of `INVALID` to see if all objects were successfully compiled.
- To see the errors associated with `INVALID` objects, you may use the Enterprise Manager command:

```
SHOW ERRORS <type> <schema>.<name>
```

204.6.8 CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(  
    schema_name    IN    VARCHAR2,  
    table_name     IN    VARCHAR2);
```

Parameters

Table 204-13 CREATE_ALTER_TYPE_ERROR_TABLE Procedure Parameters

Parameter	Description
schema_name	Name of the schema
table_name	Name of the table created

Exceptions

An error is returned if the table already exists.

204.6.9 CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns `NULL` when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE  
    RETURN NUMBER;
```

204.6.10 DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (  
    dba NUMBER)  
    RETURN NUMBER;
```

Parameters

Table 204-14 DATA_BLOCK_ADDRESS_BLOCK Function Parameters

Parameter	Description
dba	Data block address

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

204.6.11 DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (  
    dba NUMBER)  
    RETURN NUMBER;
```

Parameters**Table 204-15 DATA_BLOCK_ADDRESS_FILE Function Parameters**

Parameter	Description
dba	Data block address

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

204.6.12 DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```
DBMS_UTILITY.DB_VERSION (  
    version      OUT VARCHAR2,  
    compatibility OUT VARCHAR2);
```

Parameters

Table 204-16 DB_VERSION Procedure Parameters

Parameter	Description
<code>version</code>	A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.
<code>compatibility</code>	The compatibility setting of the database determined by the "compatible" <code>init.ora</code> parameter. If the parameter is not specified in the <code>init.ora</code> file, then NULL is returned.

204.6.13 EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (
    parse_string IN VARCHAR2);
```

Parameters

Table 204-17 EXEC_DDL_STATEMENT Procedure Parameters

Parameter	Description
<code>parse_string</code>	DDL statement to be executed

204.6.14 EXPAND_SQL_TEXT Procedure

This procedure recursively replaces any view references in the input SQL query with the corresponding view subquery.

Syntax

```
DBMS_UTILITY.EXPAND_SQL_TEXT (
    input_sql_text    IN          CLOB,
    output_sql_text   OUT NOCOPY CLOB);
```

Parameters

Table 204-18 EXPAND_SQL_TEXT Procedure Parameters

Parameter	Description
<code>input_sql_text</code>	Input SQL query text
<code>output_sql_text</code>	View-expanded query text

Exceptions

Table 204-19 EXPAND_SQL_TEXT Procedure Exceptions

Exception	Description
ORA-00942	Current user does not have select privileges on all the views and tables recursively referenced in the <code>input_sql_text</code>
ORA-24251	<code>input_sql_text</code> is not a <code>SELECT</code> statement
ORA-00900	Input is not valid
ORA-29477	Input LOB size exceeds maximum size of 4GB -1

Usage Notes

The expanded and merged SQL statement text is copied to `output_sql_text` on successful completion. The resulting query text only contains references to underlying tables and is semantically equivalent with some caveats:

- If there are invoker rights functions called from any of the views, they may be called as a different user in the resulting query text if the view owner is different from the user who will eventually compile/run the expanded SQL text.
- The VPD policy expands differently if there is a function supplied to generate the dynamic `WHERE` clause. This function would return differently, for example, if the `userid` caused the expansion to be different.
- If there are references to remote objects, results are undetermined.

204.6.15 FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.

204.6.16 FORMAT_ERROR_BACKTRACE Function

This function displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope.

The output is similar to the output of the `SQLERRM` function, but not subject to the same size limitation.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE  
    RETURN VARCHAR2;
```

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS  
    g_start_pos integer := 1;  
    g_end_pos integer;  
  
    FUNCTION Output_One_Line RETURN BOOLEAN IS  
    BEGIN  
        g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );  
  
        CASE g_end_pos > 0  
            WHEN true THEN  
                DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,  
g_end_pos-g_start_pos ) );  
                g_start_pos := g_end_pos+1;  
                RETURN TRUE;  
  
            WHEN FALSE THEN  
                DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,  
(Length(i_buff)-g_start_pos)+1 ) );  
                RETURN FALSE;  
            END CASE;  
        END Output_One_Line;  
  
    BEGIN  
        WHILE Output_One_Line() LOOP NULL;  
        END LOOP;  
    END Log_Errors;  
/

*/
```

204.6.17 FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

204.6.18 GET_CPU_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

Syntax

```
DBMS_UTILITY.GET_CPU_TIME
RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

204.6.19 GET_DEPENDENCY Procedure

This **deprecated procedure** shows the dependencies on the object passed in.

Note:

This subprogram has been deprecated and replaced in Oracle Database 12c release 12.2 and later. Oracle recommends that you do not use deprecated subprograms. It is maintained only for purposes of backward compatibility.

Syntax

```
DBMS_UTILITY.GET_DEPENDENCY
type          IN      VARCHAR2,
schema       IN      VARCHAR2,
name         IN      VARCHAR2);
```

Parameters

Table 204-20 GET_DEPENDENCY Procedure Parameters

Parameter	Description
type	Type of the object, for example if the object is a table give the type as 'TABLE'
schema	Schema name of the object
name	Name of the object

Usage Notes

This procedure uses the [DBMS_OUTPUT](#) package to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`.

204.6.20 GET_ENDIANNESS Function

This function gets the endianness of the database platform.

Syntax

```
DBMS_UTILITY.GET_ENDIANNESS
RETURN NUMBER;
```

Return Values

A `NUMBER` value indicating the endianness of the database platform: 1 for big-endian or 2 for little-endian.

204.6.21 GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (
    name      VARCHAR2,
    base      NUMBER,
    hash_size NUMBER)
RETURN NUMBER;
```

Parameters**Table 204-21** GET_HASH_VALUE Function Parameters

Parameter	Description
name	String to be hashed.
base	Base value for the returned hash value at which to start
hash_size	Desired size of the hash table

Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the `hash_size` value. Using a power of 2 for the `hash_size` parameter works best.

204.6.22 GET_PARAMETER_VALUE Function

This deprecated function gets the value of specified `init.ora` parameter.

 **Note:**

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can query `v$_parameter` directly.

Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
    parnam    IN      VARCHAR2,
```

```

    intval    IN OUT    BINARY_INTEGER,
    strval    IN OUT    VARCHAR2,
    listno    IN        BINARY_INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;

```

Parameters

Table 204-22 GET_PARAMETER_VALUE Function Parameters

Parameter	Description
parnam	Parameter name
intval	Value of an integer parameter or the value length of a string parameter
strval	Value of a string parameter
listno	List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.

Return Values

Parameter type:

- 0 if parameter is an INTEGER/BOOLEAN parameter
- 1 if parameter is a string/file parameter

Usage Notes

- To execute the this function, you must have the SELECT privilege on the V\$PARAMETER dynamic view.

Examples

```

DECLARE
    parnam VARCHAR2(256);
    intval BINARY_INTEGER;
    strval VARCHAR2(256);
    partyp BINARY_INTEGER;
BEGIN
    partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                              intval, strval);

    dbms_output.put('parameter value is: ');
    IF partyp = 1 THEN
        dbms_output.put_line(strval);
    ELSE
        dbms_output.put_line(intval);
    END IF;
    IF partyp = 1 THEN
        dbms_output.put('parameter value length is: ');
        dbms_output.put_line(intval);
    END IF;
    dbms_output.put('parameter type is: ');
    IF partyp = 1 THEN
        dbms_output.put_line('string');
    ELSE
        dbms_output.put_line('integer');
    END IF;
END;

```

204.6.23 GET_SQL_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

Syntax

```
Dbms_utility.get_sql_hash (
    name          IN   VARCHAR2,
    hash          OUT  RAW,
    pre10ihash    OUT  NUMBER)
RETURN NUMBER;
```

Pragmas

Pragma Restrict_references(Get_sql_hash, Wnds, Rnds, Wnps, Rnps);

Parameters

Table 204-23 GET_SQL_HASH Procedure Parameters

Parameter	Description
name	String to be hashed
hash	Stores all 16 bytes of returned hash value
pre10ihash	Stores the pre 10i database version hash value

Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. Use the `hash` parameter to get all 16 bytes and `pre10i` hash parameter to store the pre 10i hash value of 4 bytes.

204.6.24 GET_TIME Function

This function determines the current time in hundredths of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME
RETURN NUMBER;
```

Return Values

Time is the number of hundredths of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers,

application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

204.6.25 GET_TZ_TRANSITIONS Procedure

This procedure returns time zone transitions by `regionid` from the `timezone.dat` file.

Syntax

```
DBMS_UTILITY.GET_TZ_TRANSITIONS  
  regionid      IN      NUMBER,  
  transitions   OUT    MAXRAW);
```

Parameters

Table 204-24 GET_TZ_TRANSITIONS Procedure Parameters

Parameter	Description
<code>regionid</code>	Number corresponding to the region
<code>transitions</code>	Raw bytes from the <code>timezone.dat</code> file

Exceptions

Table 204-25 GET_TZ_TRANSITIONS Procedure Exceptions

Exception	Description
ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR	For an invalid <code>regionid</code>

204.6.26 INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```
DBMS_UTILITY.INVALIDATE (  
  p_object_id      NUMBER,  
  p_plsql_object_settings VARCHAR2 DEFAULT NULL,  
  p_option_flags   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 204-26 INVALIDATE Procedure Parameters

Parameter	Description
<code>p_object_id</code>	ID number of object to be invalidated. This is the same as the value of the <code>OBJECT_ID</code> column from <code>ALL_OBJECTS</code> . If the <code>object_id</code> argument is <code>NULL</code> or invalid then the exception <code>inv_not_exist_or_no_priv</code> is raised. The caller of this procedure must have create privileges on the object being invalidated else the <code>inv_not_exist_or_no_priv</code> exception is raised.
<code>p_plsql_object_settings</code>	Optional parameter that ignored if the object specified by <code>p_object_id</code> is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to <code>REUSE SETTINGS</code> . If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else <code>inv_malformed_settings</code> exception will be raised. The setting values are changed only for the object specified by <code>p_object_id</code> and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and <code>REUSE SETTINGS</code> is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and <code>REUSE SETTINGS</code> was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.
<code>p_option_flags</code>	Optional parameter defaults to zero (no flags). Option flags supported by <code>invalidate</code> . <ul style="list-style-type: none"> <code>inv_error_on_restrictions</code> (see Constants): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by <code>p_object_id</code> cannot be a table. By default, <code>invalidate</code> quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception <code>inv_restricted_object</code> is raised.

Exceptions

Table 204-27 INVALIDATE Exceptions

Exception	Description
<code>INV_NOT_EXIST_OR_NO_PRIV</code>	Raised when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated
<code>INV_MALFORMED_SETTINGS</code>	Raised if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter
<code>INV_RESTRICTED_OBJECT</code>	Raised when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened

Usage Notes

The object type (`object_type` column from `ALL_OBJECTS`) of the object specified by `p_object_id` must be a `PROCEDURE`, `FUNCTION`, `PACKAGE`, `PACKAGE BODY`, `TRIGGER`, `TYPE`, `TYPE BODY`, `LIBRARY`, `VIEW`, `OPERATOR`, `SYNONYM`, or `JAVA CLASS`. If the object is not one of these types and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is the package specification of `STANDARD`, `DBMS_STANDARD`, or specification or body of `DBMS_UTILITY` and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is an object type specification and there exist tables which depend on the type and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

Examples

Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the `object_id` 1232 refers to the procedure `remove_emp` in the `HR` schema. Then the above call will mark the `remove_emp` procedure invalid and change its `PLSQL_OPTIMIZE_LEVEL` compiler setting to 2. The values of other compiler settings will remain unchanged since `REUSE SETTINGS` is specified.

Objects that depend on `hr.remove_emp` will also get marked invalid. Their compiler parameters will not be changed.

Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the `object_id` 40775 refers to the type body `leaf_category_typ` in the `OE` schema. Then the above call will mark the type body invalid and change its `PLSQL_CODE_TYPE` compiler setting to `NATIVE`. The values of other compiler settings will be picked up from the current session environment since `REUSE SETTINGS` has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the `OE` schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

204.6.27 IS_BIT_SET Function

This function checks the bit setting for the given bit in the given RAW value.

Syntax

```
DBMS_UTILITY.IS_BIT_SET (
    r      IN RAW,    n      IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 204-28 IS_BIT_SET Function Parameters

Parameter	Description
r	RAW source
n	Bit in r to check

Return Values

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.

204.6.28 IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

Return Values

This function returns TRUE if this instance was started in cluster database mode; FALSE otherwise.

204.6.29 MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number.

A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
    file NUMBER,
    block NUMBER)
RETURN NUMBER;
```

Parameters

Table 204-29 MAKE_DATA_BLOCK_ADDRESS Function Parameters

Parameter	Description
file	File that contains the block
block	Offset of the block within the file in terms of block increments

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.

204.6.30 NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
  name          IN VARCHAR2,
  context       IN NUMBER,
  schema        OUT VARCHAR2,
  part1         OUT VARCHAR2,
  part2         OUT VARCHAR2,
  dblink        OUT VARCHAR2,
  part1_type    OUT NUMBER,
  object_number OUT NUMBER);
```

Parameters

Table 204-30 NAME_RESOLVE Procedure Parameters

Parameter	Description
name	<p>Name of the object.</p> <p>This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in.</p> <p>a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).</p>

Table 204-30 (Cont.) NAME_RESOLVE Procedure Parameters

Parameter	Description
context	Must be an integer between 0 and 9. <ul style="list-style-type: none"> • 0 - table • 1 - PL/SQL (for 2 part names) • 2 - sequences • 3 - trigger • 4 - Java Source • 5 - Java resource • 6 - Java class • 7 - type • 8 - Java shared data • 9 - index
schema	Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.
part1	First part of the name. The type of this name is specified part1_type (synonym or package).
part2	If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram.
dblink	If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.
part1_type	Type of part1 is: <ul style="list-style-type: none"> • 5 - synonym • 7 - procedure (top level) • 8 - function (top level) • 9 - package
object_number	Object identifier

Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

204.6.31 NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as a [. b [. c]][@ dblink].

It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (
    name      IN  VARCHAR2,
    a         OUT VARCHAR2,
    b         OUT VARCHAR2,
```

```

c      OUT VARCHAR2,
dblink OUT VARCHAR2,
nextpos OUT BINARY_INTEGER);

```

Parameters

Table 204-31 NAME_RESOLVE Procedure Parameters

Parameter	Description
name	Input name, consisting of SQL identifiers (for example, scott.foo@dblink)
a	Output for the first token of the name
b	Output for the second token of the name (if applicable)
c	Output for the third token of the name (if applicable)
dblink	Output for the dblink of the name
nextpos	Next position after parsing the input name

204.6.32 OLD_CURRENT_SCHEMA Function

This function returns the session value from `sys_context('userenv', 'current_schema')`.

Syntax

```

DBMS_UTILITY.OLD_CURRENT_SCHEMA
RETURN VARCHAR2;

```

204.6.33 OLD_CURRENT_USER Function

This function returns the session value from `sys_context('userenv', 'current_user')`.

Syntax

```

DBMS_UTILITY.OLD_CURRENT_USER
RETURN VARCHAR2;

```

204.6.34 PORT_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

Syntax

```

DBMS_UTILITY.PORT_STRING
RETURN VARCHAR2;

```

Pragmas

```

pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);

```

204.6.35 SQLID_TO_SQLHASH Function

This function converts a SQL ID into a hash value.

Syntax

```
DBMS_UTILITY.SQLID_TO_SQLHASH (
    sql_id    IN    VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 204-32 SQLID_TO_SQLHASH Function Parameters

Parameter	Description
sql_id	SQL ID of a SQL statement. Must be VARCHAR2 (13).

204.6.36 TABLE_TO_COMMA Procedures

This procedure converts a PL/SQL table of names into a comma-delimited list of names.

This takes a PL/SQL table, 1..n, terminated with n+1 null. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (
    tab    IN    UNCL_ARRAY,
    tablen OUT BINARY_INTEGER,
    list   OUT VARCHAR2);
```

```
DBMS_UTILITY.TABLE_TO_COMMA (
    tab    IN    lname_array,
    tablen OUT BINARY_INTEGER,
    list   OUT VARCHAR2);
```

Parameters

Table 204-33 TABLE_TO_COMMA Procedure Parameters

Parameter	Description
tab	PL/SQL table which contains list of table names
tablen	Number of tables in the PL/SQL table
list	Comma separated list of tables

Return Values

A comma-delimited list and the number of elements found in the table.

204.6.37 VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```
DBMS_UTILITY.VALIDATE (
    object_id      NUMBER);

DBMS_UTILITY.VALIDATE (
    owner          VARCHAR2,
    objname        VARCHAR2,
    namespace      NUMBER,  edition_name  := SYS_CONTEXT ('USERENV',
    'CURRENT_EDITION'));
```

Parameters

Table 204-34 VALIDATE Procedure Parameters

Parameter	Description
owner	Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.
objname	Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.
namespace	Namespace of the object. Same as the namespace field in obj\$. Equivalent numeric values are as follows: <ul style="list-style-type: none"> • 1 — TABLE/PROCEDURE/TYPE • 2 — BODY • 3 — TRIGGER • 4 — INDEX • 5 — CLUSTER • 8 — LOB • 9 — DIRECTORY • 10 — QUEUE • 11 — REPLICATION OBJECT GROUP • 12 — REPLICATION PROPAGATOR • 13 — JAVA SOURCE • 14 — JAVA RESOURCE • 58 — (Data Mining) MODEL
edition_name	[Note: Currently not operable. Reserved for future use]

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.
- The [INVALIDATE Procedure](#) invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its

`object_id`. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to `INVALIDATE` will not actualize the object in the current edition.

204.6.38 WAIT_ON_PENDING_DML Function

This function waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified `scn` have either committed or been rolled back.

Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (
    tables      IN      VARCHAR2,
    timeout     IN      BINARY_INTEGER,
    scn         IN OUT  NUMBER)
RETURN BOOLEAN;
```

Parameters

Table 204-35 WAIT_ON_PENDING_DML Function Parameters

Parameter	Description
<code>tables</code>	Comma-separated list of one or more table names. The list must be valid for COMMA_TO_TABLE Procedure , and each item valid to the NAME_RESOLVE Procedure . Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.
<code>timeout</code>	Maximum number of seconds to wait, totalled across all tables/transactions. A <code>NULL</code> or negative value will cause a very long wait.
<code>scn</code>	SCN prior to which transactions must have begun to be considered relevant to this request. If the value is <code>NULL</code> or not recognized as a meaningful <code>scn</code> on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output.

Return Values

`TRUE` if all relevant transactions have committed or been rolled back, `FALSE` if the timeout occurred prior to all relevant transactions committing or being rolled back

DBMS_VECTOR

The `DBMS_VECTOR` package simplifies common operations with Oracle AI Vector Search, such as chunking and embedding data, generating text for prompts, or creating vector indexes.

These functions accept their respective input parameters in JSON format.

Related Topics

- *Oracle Database AI Vector Search User's Guide*

205.1 Summary of DBMS_VECTOR Subprograms

This table lists the `DBMS_VECTOR` subprograms and briefly describes them.

Table 205-1 DBMS_VECTOR Package Subprograms

Subprogram	Description
ONNX Model Related Procedures:	
These procedure enables you to load an ONNX model into Oracle Database and drop the ONNX model.	
LOAD_ONNX_MODEL	Loads an ONNX model into the database
DROP_ONNX_MODEL Procedure	Drops the ONNX model
Chainable Utility (UTL) Functions:	
These functions are a set of modular and flexible functions within vector utility PL/SQL packages. You can chain these together to automate end-to-end data transformation and similarity search operations.	
UTL_TO_CHUNKS	Splits data into smaller pieces or chunks
UTL_TO_EMBEDDING and UTL_TO_EMBEDDINGS	Converts data to one or more vector embeddings
UTL_TO_GENERATE_TEXT	Generates text for a prompt or input string
Credential Helper Procedures:	
These procedures enable you to securely manage authentication credentials in the database. You require these credentials to enable access to third-party service providers for making REST calls.	
CREATE_CREDENTIAL	Creates a credential name
DROP_CREDENTIAL	Drops an existing credential name
Data Access Functions:	
These functions enable you to retrieve data, create index, and perform simple similarity search operations.	
CREATE_INDEX	Creates a vector index
REBUILD_INDEX	Rebuilds a vector index
QUERY	Perform a similarity search query
Accuracy Reporting Function:	
This function enables you to determine the accuracy of existing search indexes and advise recalibration.	

Table 205-1 (Cont.) DBMS_VECTOR Package Subprograms

Subprogram	Description
INDEX_ACCURACY_QUERY	Verifies the accuracy of a vector index

205.1.1 CREATE_CREDENTIAL

Use the `DBMS_VECTOR.CREATE_CREDENTIAL` credential helper procedure to create a credential name for storing user authentication details in Oracle Database.

Purpose

To securely manage authentication credentials in the database. You require these credentials to enable access during REST API calls to your chosen third-party service provider, such as Cohere, Google AI, Hugging Face, Oracle Cloud Infrastructure (OCI) Generative AI, OpenAI, or Vertex AI.

A credential name holds authentication parameters, such as user name, password, access token, private key, or fingerprint.

Note:

If you are using Oracle Database as the service provider, then you do not need to create a credential.

Syntax

```
DBMS_VECTOR.CREATE_CREDENTIAL (
    CREDENTIAL_NAME    IN VARCHAR2,
    PARAMS              IN JSON DEFAULT NULL
);
```

CREDENTIAL_NAME

Specify a name of the credential that you want to create for holding authentication parameters.

PARAMS

Specify authentication parameters in JSON format, based on your chosen service provider.

Generative AI requires the following authentication parameters:

```
{
  "user_ocid": "<user ocid>",
  "tenancy_ocid": "<tenancy ocid>",
  "compartment_ocid": "<compartment ocid>",
  "private_key": "<private key>",
  "fingerprint": "<fingerprint>"
}
```

Cohere, Google AI, Hugging Face, OpenAI, and Vertex AI require the following authentication parameter:

```
{ "access_token": "<access token>" }
```

Table 205-2 Parameter Details

Parameter	Description
user_ocid	Oracle Cloud Identifier (OCID) of the user, as listed on the User Details page in the OCI console.
tenancy_ocid	OCID of your tenancy, as listed on the Tenancy Details page in the OCI console.
compartment_ocid	OCID of your compartment, as listed on the Compartments information page in the OCI console.
private_key	OCI private key. Note: The generated private key may appear as: <pre>-----BEGIN RSA PRIVATE KEY----- <private key string> -----END RSA PRIVATE KEY-----</pre> <p>You pass the <i><private key string></i> value (excluding the BEGIN and END lines), either as a single line or as multiple lines.</p>
fingerprint	Fingerprint of the OCI profile key, as listed on the User Details page under API Keys in the OCI console.
access_token	Access token obtained from your third-party service provider.

Required Privilege

You need the `CREATE CREDENTIAL` privilege to call this API.

Examples

- For Generative AI:

```
declare
  jo json_object_t;
begin
  jo := json_object_t();

  jo.put('user_ocid','ocid1.user.oc1..aabbalbbaa1112233aabbaabb1111222aa1111bb');

  jo.put('tenancy_ocid','ocid1.tenancy.oc1..aaaaalbbbbb1112233aaaabbaa1111222aa1111a');

  jo.put('compartment_ocid','ocid1.compartment.oc1..ababalabab1112233abababab1111222ab1111ab');
  jo.put('private_key','AAAAaaBBB11112222333...AAA111AAABBB222aaa1a/+');
  jo.put('fingerprint','01:1a:a1:aa:12:a1:12:1a:ab:12:01:ab:a1:12:ab:1a');
  dbms_output.put_line(jo.to_string);
  dbms_vector.create_credential(
```

```

        credential_name => 'OCI_CRED',
        params          => json(jo.to_string);
end;
/

```

- For Cohere:

```

declare
    jo json_object_t;
begin
    jo := json_object_t();
    jo.put('access_token', 'A1Aa0abA1AB1a1Abc123ab1A123ab123AbcA12a');
    dbms_vector.create_credential(
        credential_name => 'COHERE_CRED',
        params          => json(jo.to_string));
end;
/

```

To run an end-to-end example scenario using this function, see [Directly Convert Text String to Embedding in Oracle Database AI Vector Search User's Guide](#).

205.1.2 CREATE_INDEX

Use the `DBMS_VECTOR.CREATE_INDEX` procedure to create an index.

Syntax

```

DBMS_VECTOR.CREATE_INDEX (
    IDX_NAME           IN VARCHAR2,
    TABLE_NAME       IN VARCHAR2,
    IDX_VECTOR_COL     IN VARCHAR2,
    IDX_INCLUDE_COLS   IN VARCHAR2,
    IDX_PARTITIONING_SCHEME IN VARCHAR2,
    IDX_ORGANIZATION   IN VARCHAR2,
    IDX_DISTANCE_METRIC IN VARCHAR2,
    IDX_ACCURACY       IN NUMBER,
    IDX_PARAMETERS     IN CLOB,
    IDX_PARALLEL_CREATION IN NUMBER,
    IDX_DDL            IN CLOB
);

```

Parameters

Specify the input parameters in JSON format.

Table 205-3 CREATE_INDEX (IN) Parameters of DBMS_VECTOR

Parameter	Description
<code>table_name</code>	Table on which to create the index.
<code>idx_name</code>	Name of the index.
<code>idx_vector_col</code>	Vector column on which to create the index.

Table 205-3 (Cont.) CREATE_INDEX (IN) Parameters of DBMS_VECTOR

Parameter	Description
idx_partitioning_scheme	Partitioning scheme. LOCAL or GLOBAL.
idx_organization	Index organization. Either NEIGHBOR PARTITIONS or INMEMORY NEIGHBOR GRAPH.
idx_distance_metric	Distance computation metric. Defaults to COSINE. Can also be MANHATTAN, HAMMING, DOT, EUCLIDEAN, L2_SQUARED, EUCLIDEAN_SQUARED.
idx_accuracy	Target accuracy.
idx_parameters	Takes in CLOB with type of index and associated parameters. Type, neighbor partitions for IVF, neighbors/efConstruction for HNSW)
idx_parallel_creation	Number of parallel threads used for index construction.
idx_dd	Defaults to NULL. Only passed by rebuild_index() to rebuild the index.

205.1.3 DROP_CREDENTIAL

Use the DBMS_VECTOR.DROP_CREDENTIAL credential helper procedure to drop an existing credential name from the data dictionary.

Syntax

```
DBMS_VECTOR.DROP_CREDENTIAL (
    CREDENTIAL_NAME      IN VARCHAR2
);
```

CREDENTIAL_NAME

Specify the credential name that you want to drop.

Examples

- For Generative AI:

```
exec dbms_vector.drop_credential('OCI_CRED');
```

- For Cohere:

```
exec dbms_vector.drop_credential('COHERE_CRED');
```

205.1.4 DROP_ONNX_MODEL Procedure

This procedure deletes the specified ONNX model.

Syntax

```
DBMS_VECTOR.DROP_ONNX_MODEL (model_name IN VARCHAR2,
                             force       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 205-4 DROP_ONNX_MODEL Procedure Parameters

Parameter	Description
model_name	Name of the machine learning ONNX model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, then your own schema is used.
force	Forces the machine learning ONNX model to be dropped even if it is invalid. An ONNX model may be invalid if a serious system error interrupted the model build process.

Usage Note

To drop a machine learning model, you must be the owner or you must have the `DROP ANY MINING MODEL` privilege. See *Oracle Data Mining User's Guide* for information about privileges for Oracle Machine Learning for SQL.

Example

You can use the following command to delete a valid ONNX model named `doc_model` that exists in your schema.

```
BEGIN
  DBMS_VECTOR.DROP_ONNX_MODEL(model_name => 'doc_model');
END;
/
```

205.1.5 INDEX_ACCURACY_QUERY

Use the `DBMS_VECTOR.INDEX_ACCURACY_QUERY` function to verify the accuracy of a vector index for a given query vector, top-K, and target accuracy.

Syntax

```
DBMS_VECTOR.INDEX_ACCURACY_QUERY (
  OWNER_NAME      IN VARCHAR2,
  INDEX_NAME      IN VARCHAR2,
  QV              IN VECTOR,
  TOP_K          IN NUMBER,
  TARGET_ACCURACY IN NUMBER
) return VARCHAR2;
```

```
DBMS_VECTOR.INDEX_ACCURACY_QUERY (
  OWNER_NAME      IN VARCHAR2,
```

```

INDEX_NAME      IN VARCHAR2,
QV              IN VECTOR,
TOP_K          IN NUMBER,
QUERY_PARAM    IN JSON
) return VARCHAR2;
```

DATA

This function accepts the input data type as `VARCHAR2`, `VECTOR`, or `NUMBER`.

It returns a brief report on the achieved accuracy for a given target accuracy.

```
{
}
```

For example:

Where,

- `owner_name` specifies the name of the vector index owner.
- `index_name` specifies the name of the vector index.
- `qv` specifies the query vector.
- `top_k` the `top_k` value for accuracy computation.
- `target_accuracy` the target accuracy value for the vector index.

For information about determining the accuracy of your vector indexes, see *Index Accuracy Report* in *Oracle Database AI Vector Search User's Guide*.

PARAMS

Specify the input parameters in JSON format:

Example

205.1.6 INDEX_ACCURACY_REPORT

Use the `DBMS_VECTOR.INDEX_ACCURACY_REPORT` function to...

Syntax

```

DBMS_VECTOR.INDEX_ACCURACY_REPORT (
  OWNER_NAME      IN VARCHAR2,
  INDEX_NAME      IN VARCHAR2,
  START_TIME      IN TIMESTAMP WITH TIME ZONE,
  END_TIME        IN TIMESTAMP WITH TIME ZONE
) return NUMBER;
```

DATA

This function accepts the input data type as VARCHAR2, VECTOR, or NUMBER.

It returns a brief report on the achieved accuracy for a given target accuracy.

```
{  
  
}
```

For example:

Where,

- `owner_name` specifies the name of the vector index owner.
- `index_name` specifies the name of the vector index.

For information about determining the accuracy of your vector indexes, see Index Accuracy Report in *Oracle Database AI Vector Search User's Guide*.

PARAMS

Specify the input parameters in JSON format:

Example

205.1.7 LOAD_ONNX_MODEL

This procedure enables you to load an ONNX model into the Database.

Syntax

```
DBMS_VECTOR.LOAD_ONNX_MODEL (  
    directory VARCHAR2,  
    file_name  VARCHAR2,  
    model_name VARCHAR2,  
    metadata   JSON);
```

```
DBMS_VECTOR.LOAD_ONNX_MODEL (  
model_name IN VARCHAR2,  
model_data IN BLOB,  
metadata   IN JSON);
```

Parameters

Table 205-5 LOAD_ONNX_MODEL Procedure Parameters

Parameter	Description
directory	The directory name of the data dump. For example, DM_DUMP.
file_name	A VARCHAR2 type parameter that specifies the name of the ONNX model.
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.
model_data	It is a BLOB holding the ONNX representation of the model. The BLOB contains the identical byte sequence as the one stored in an ONNX file.
metadata	A JSON description of the metadata describing the model. The metadata at minimum must describe the machine learning function supported by the model. The model's metadata parameters are described in JSON Metadata Parameters for ONNX Models .

Examples

The following examples illustrates a code snippet of using the DBMS_VECTOR.LOAD_ONNX_MODEL procedure. The complete step-by-step example is illustrated in [Import ONNX Models and Generate Embeddings](#).

```
EXECUTE DBMS_VECTOR.LOAD_ONNX_MODEL (
    'DM_DUMP',
    'my_embedding_model.onnx',
    'doc_model',
    JSON('{"function" : "embedding", "embeddingOutput" : "embedding", "input": {"input":
["DATA"]}}'));
```

```
DBMS_VECTOR.LOAD_ONNX_MODEL('my_embedding_model.onnx',
                             'doc_model',
                             JSON('{"function" :
"embedding",
                                     "embeddingOutput" :
"embedding" ,
                                     "input":{"input":
["DATA"]}}'));
```

Usage Notes

The name of the model follows the same restrictions as those used for other machine learning models, namely:

- The schema name, if provided, is limited to 128 characters.
- The model name is limited to 123 characters and must follow the rules of unquoted identifiers: they contain only alphanumeric characters, the underscore (_), dollar sign (\$), and pound sign (#). The initial character must be alphabetic.
- The model size is limited to 1 gigabyte.
- The model must not depend on external initializers. To know more about initializers and other ONNX concepts, see <https://onnx.ai/onnx/intro/concepts.html>.

- There are default input and output names for input and output attributes for models that are prepared by the Python utility. You can load those models without the JSON parameters. For example:

```
EXECUTE DBMS_VECTOR.LOAD_ONNX_MODEL('DM_DUMP',
'my_embedding_model.onnx', 'doc_model');
```

205.1.7.1 JSON Metadata Parameters for ONNX Models

When importing models using the `DBMS_DATA_MINING.IMPORT_ONNX_MODEL` procedure, you supply metadata as JSON parameters.

Parameters

Field	Value Type	Description
function	String	Specify regression, classification, clustering, or embedding. This is a mandatory setting. NOTE: The only JSON parameter required when importing the model is the machine learning function.
input	NA	Describes the model input mapping. See "Input" in Usage Notes.
regressionOutput	String	The name of the regression model output that stores the regression results. The output is expected to be a tensor of supported shape of any supported regression output type. See "Output" in Usage Notes.
classificationProbOutput	String	The name of the classification model output storing probabilities. The output is expected to be a tensor value of type float (width 32/64) of supported shape. See "Automatic normalization of output probabilities" in Usage Notes.
clusteringDistanceOutput	String	The name of the clustering model output storing distances. The output is of type float (width 16/32/64) of supported shape.
clusteringProbOutput	String	The name of the clustering model output storing probabilities. The output is of type float (width 16/32/64) of supported shape.

Field	Value Type	Description
classificationLabelOutput	String	<p>The name of the model output holding label information.</p> <p>You have the following metadata parameters to specify the labels for classification:</p> <ul style="list-style-type: none"> labels: specify the labels directly in the JSON metadata classificationLabelOutput: specify the model output that provides labels <p>If you do not specify any value for this parameter or the function of the model is not classification, you will receive an error.</p> <p>The user can specify to use labels from the model directly by setting classificationLabelOutput to the model output holding the label information. The tensor output holding the label information must be the same size as the number of classes and must be of integer or string type. If the tensor that holds the labels is of string type, the returned type of the PREDICTION operator is VARCHAR2. If the tensor that holds the labels is of integer type, the returned type of the PREDICTION operator is NUMBER.</p>
normalizeProb	String	<p>Describes automatic normalization of output probabilities. See "Automatic normalization of output probabilities" in Usage Notes.</p>
labels	NA	<p>The labels used for classification.</p> <p>If you want to use custom labels, specify the labels using the labels field in the JSON metadata. The field can be set to an array of length equal to the number of classes. The labels for the class i must be stored at index i of the label array. If an array of strings is used, the returned type of the PREDICTION operator is VARCHAR2. The size of the string labels specified by the user cannot exceed 4000 bytes. If an array of numbers is used, the returned type of the PREDICTION operator is NUMBER.</p> <p>If you do not specify labels or classificationLabelOutput, classes are identified by integers in the range 1 to N where N is the number of classes. In this case, the returned type of the PREDICTION operator is NUMBER.</p>
embeddingOutput	String	<p>The model output that holds the generated embeddings.</p>
suitableDistanceMetrics	String	<p>An array of names of suitable distance metrics for the model. The names must be the names of the distance metrics used for the Oracle VECTOR_DISTANCE operator. To know the supported distance metrics, see Vector Distance Metrics.</p>

Field	Value Type	Description
normalization	Boolean	A boolean value indicates if normalization is applied to the output vector. The value 1 means normalization is applied. Normalization is process of converting an embedding vector so that it's norm or length equals 1. A normalized vector maintains its direction but its length becomes 1. The resulting vector is often called a unit vector.
maxSequenceLength	Number	The maximum length of the token (input) sequence that is meaningful for the model. This parameter sets a limit on the number of tokens, words, or elements in each input sequence that the model will process. This ensures uniform input size for the model. For example, the value could be 128, or 512 to 4096 depending on the task for which the parameter is used. A machine translation model might have a <code>maxSequenceLength</code> of 512, accommodating sentences or paragraphs up to 512 tokens for translation tasks.
pooling	String	Indicates the pooling function performed on the output vector.
modelDescription	Object	A JSON object that allows users to add additional descriptions to the models complementing the existing ONNX metadata for model description.
languages	String	A comma-separated list of language name or abbreviation, as described in " A.1 Languages " of <i>Oracle Database Globalization Support Guide</i> . If you import multi-lingual embedding model, specify the language or the language abbreviation as the metadata.
tokenizer	String	Tokenizers help in transforming text into words. There are several tokenizers available, including: bert, gpt2, bpe, wordpiece, sentencepiece, and clip.
embeddingLayer	String	An identifier for the embedding layer. An embedding layer, serving as a hidden layer in neural networks, transforms input data from high to lower dimensions, enhancing the network's understanding of input relationships and data processing efficiency. Embedding layer helps in processing and analyzing categorical or discrete data. It achieves this by transforming categories into continuous embeddings, capturing the essential semantic relationships and similarities between them. For example the last hidden state in some transformer, or a layer in a resnet network.

Field	Value Type	Description
defaultOnNull	NA	Specify the replacement of missing values in the JSON using the <code>defaultOnNull</code> field. If <code>defaultOnNull</code> is not specified, the replacement of missing values is not performed. The <code>defaultOnNull</code> sets the missing values to NULL by default. You can override the default value of NULL by providing meaningful default values to substitute for NULL. The field must be a JSON object literal, whose fields are the input attribute names and whose values are the default values for the input. Note that the default value is of type string and must be a valid Oracle PL/SQL NVL value for the given datatype.

Note: The parameters are case-sensitive. A number of default conventions for output parameter names and default values allows to minimize the information that you may have to provide. The parameters such as `suitableDistanceMetrics` are informational only and you are not expected to provide this information while importing the model. The JSON descriptor may specify only one input attribute. If more are specified, you will receive an error. You will receive an error if the `normalizeProb` field is specified as the JSON metadata parameter.

Usage Notes

The name of the model follows the same restrictions as those used for other machine learning models, namely:

- **Input**

When importing a model from an ONNX representation, you must specify the name of the attribute used for scoring and how it maps to actual ONNX inputs. A scoring operator uses these attribute names to identify the columns to be used. (For example, `PREDICTION`). Follow these conventions to specify the attribute names using the input field:

not specified: When the field input is not specified, attribute names are mapped directly to model inputs by name. That is, if the attribute name is not specified in the JSON metadata, then the name of the input tensor is used as an attribute name. Each model input must have dimension `[batch_size, value]`. If you do not specify `input` in the JSON metadata, the value must be 1. You don't have to specify extra metadata if the input of the model already conforms to the format. For an embedding model, a single input is provided that may be used in batches. Here, if the `input` parameter is not specified in the JSON metadata, the valid model will have `[batch_size, 1]`.

You must ensure that all attribute names, whether implied by the model or explicitly set by you through the input field, are valid Oracle Database identifiers for column names. Each attribute name within a model must be unique, ensuring no duplicates exist.

You can explicitly specify attribute name for model that use input tensors that have a dimension larger than 1 (for example, `(batch_size, 2)`). In this case, you must specify a name for each of these values for them to be interpreted as independent attribute name. This can be done for regression, classification, clustering which are models whose scoring operation can take multiple input attributes.

- **Output**

As models might have multiple outputs, you can specify which output is of interest for a specific machine learning technique. You have the following ways to specify model outputs:

- Specify the output name of interest in the JSON during model import. If the specified name is not a valid model output (see the table with valid outputs for a given machine learning function), you will receive an error.
- If the model produces an output that matches the expected output name for the given machine learning technique (for example, `classificationProbOutput`) and you didn't explicitly specify it, the output is automatically assumed.
- If you do not specify any output name and the model has a single output, the system assumes that the single output corresponds to a default specific to the machine learning technique. For an embedding machine learning function, the default value is `embeddingOutput`.

The system reports an error if you do not specify model outputs or if you supply outputs that the specified machine learning function does not support. The following table displays supported outputs for a specific machine learning function:

Mach ine learni ng functi on	Output
regres sion	<code>regressionOutput</code>
classif ication	<code>classificationProbOutput</code>
cluste ring	<code>clusteringDistanceOutput</code>
embe dding	<code>embeddingOutput</code>

If none of the mentioned model outputs are specified, or if you supply outputs that are not supported by the specified machine learning function, you will receive an error.

- **Automatic Normalization of Output Probabilities**

Many users widely employ the softmax function to normalize the output of multi-class classification models, as it enables to easily interpret the results of these models. The **softmax function** is a mathematical function that converts a vector of real numbers into a probability distribution. It is also known as the softargmax, or normalized exponential function. This function is available to you to specify at the model import-time that a softmax normalization must be applied to the tensor holding output probabilities such as `classificationProbOutput` and `clusteringProbOutput`. Specify `normalizeProb` to define the normalization that must be applied for softmax normalization. The default setting is `none`, indicating that no normalization is applied. You can choose `softmax` to apply a softmax function to the probability output. Specifying any other value for this field will result

in an error during import. Additionally, specifying this field for models other than classification and clustering will also lead to an error.

Example: Specifying JSON Metadata Parameters for Embedding Models

The following example illustrates a simple case of how you can specify JSON metadata parameters while importing an ONNX embedding model into the Database using the `DBMS_DATA_MINING.IMPORT_ONNX_MODEL` procedure.

```
DBMS_DATA_MINING.IMPORT_ONNX_MODEL('my_embedding_model.onnx', 'doc_model',
    JSON('{"function" : "embedding",
        "embeddingOutput" : "embedding" ,
        "input":{"input": ["DATA"]}}'));
```

Example: Specifying Complete JSON Metadata Parameters for Embedding Models

The following example illustrates how to provide a complete JSON metadata parameters, with an exception of `embeddingLayer`, for importing embedding models.

```
DECLARE
    metadata JSON;
    mdtxt varchar2(4000);
BEGIN
    metadata := JSON(q'#
        {
            "function"                : "embedding",
            "embeddingOutput"         : "embedding",
            "input"                   : { "input" : ["txt"]},
            "maxSequenceLength"       : 512,
            "tokenizer"                : "bert",
            "suitableDistanceMetrics" : [ "DOT", "COSINE", "EUCLIDEAN"],
            "pooling"                  : "Mean Pooling",
            "normalization"            : true,
            "languages"                : ["US"],
            "modelDescription"         : {
                "description" : "This model was tuned for semantic search:
                Given a query/question, if can find relevant passages. It was trained on a
                large and diverse set of (question, a
                nswer) pairs.",
                "url" : "https://example.co/sentence-transformers/
my_embedding_model"
            }
        }
    #');
    -- load the onnx model
    DBMS_DATA_MINING.IMPORT_ONNX_MODEL('my_embedding_model.onnx',
'doc_model', metadata);
END;
/
```

 **See Also:**

Oracle Machine Learning for SQL User's Guide for examples of using ONNX models for machine learning tasks

205.1.8 QUERY

Use the `DBMS_VECTOR.QUERY` function to perform a similarity search operation which returns the top-k results as a JSON array.

Syntax

Query is overloaded and supports a version with `query_vector` passed in as a `VECTOR` type in addition to `CLOB`.

```
DBMS_VECTOR.QUERY (
    TAB_NAME           IN VARCHAR2,
    VEC_COL_NAME       IN VARCHAR2,
    QUERY_VECTOR       IN CLOB,
    TOP_K              IN NUMBER,
    VEC_PROJ_COLS      IN JSON_ARRAY_T DEFAULT NULL,
    IDX_NAME           IN VARCHAR2 DEFAULT NULL,
    DISTANCE_METRIC    IN VARCHAR2 DEFAULT 'EUCLIDEAN',
    USE_INDEX          IN BOOLEAN DEFAULT 'TRUE',
    ACCURACY           IN NUMBER DEFAULT '95',
    IDX_PARAMETERS     IN CLOB DEFAULT NULL,
) return JSON_ARRAY_T;
```

Parameters

Specify the input parameters in JSON format.

Table 205-6 DBMS_VECTOR.QUERY Parameters

Parameter	Description
<code>tab_name</code>	Table name to query
<code>vec_col_name</code>	Vector column name
<code>query_vector</code>	Query vector passed in as <code>CLOB</code> or <code>VECTOR</code> .
<code>top_k</code>	Number of results to be returned.
<code>vec_proj_cols</code>	Columns to be projected as part of the result.
<code>idx_name</code>	Name of the index queried.
<code>distance_metric</code>	Distance computation metric. Defaults to <code>COSINE</code> . Can also be <code>MANHATTAN</code> , <code>HAMMING</code> , <code>DOT</code> , <code>EUCLIDEAN</code> , <code>L2_SQUARED</code> , <code>EUCLIDEAN_SQUARED</code> .
<code>use_index</code>	Specifies whether the search is an approximate search or exact search. Defaults to <code>TRUE</code> (that is, approximate).
<code>accuracy</code>	Specifies the minimum desired query accuracy.

Table 205-6 (Cont.) DBMS_VECTOR.QUERY Parameters

Parameter	Description
idx_parameters	Specifies values of efsearch and neighbor partition probes passed in, formatted as JSON

DATA

This function accepts the input data type as VARCHAR2, NUMBER, JSON, BOOLEAN or CLOB.

205.1.9 REBUILD_INDEX

Use the DBMS_VECTOR.REBUILD_INDEX function to rebuild an index.

Syntax

This API rebuilds an index. In case only the idx_name is provided, it rebuilds the index using get_ddl. When all params are provided, it performs a drop index followed by a call to dbms_vector.create_index().

```
DBMS_VECTOR.REBUILD_INDEX (
    IDX_NAME                IN VARCHAR2,
    TABLE_NAME             IN VARCHAR2 DEFAULT NULL,
    IDX_VECTOR_COL          IN VARCHAR2 DEFAULT NULL,
    IDX_INCLUDE_COLS       IN VARCHAR2 DEFAULT NULL,
    IDX_PARTITIONING_SCHEME IN VARCHAR2 DEFAULT NULL,
    IDX_ORGANIZATION        IN VARCHAR2 DEFAULT NULL,
    IDX_DISTANCE_METRICS   IN VARCHAR2 DEFAULT 'EUCLIDEAN',
    IDX_ACCURACY            IN NUMBER DEFAULT 95,
    IDX_PARAMETERS         IN CLOB DEFAULT NULL,
    IDX_PARALLEL_CREATION  IN NUMBER DEFAULT 4,
);
```

Parameters

Specify the input parameters in JSON format.

Table 205-7 REBUILD_INDEX (IN) Parameters of DBMS_VECTOR

Parameter	Description
table_name	Table on which to create the index.
idx_name	Name of the index.
idx_vector_col	Vector column on which to rebuild the index.
idx_partitioning_scheme	Partitioning scheme. LOCAL or GLOBAL.
idx_organization	Index organization. Either NEIGHBOR PARTITIONS or INMEMORY NEIGHBOR GRAPH.
idx_distance_metric	Distance computation metric. Defaults to COSINE. Can also be MANHATTAN, HAMMING, DOT, EUCLIDEAN, L2_SQUARED, EUCLIDEAN_SQUARED.

Table 205-7 (Cont.) REBUILD_INDEX (IN) Parameters of DBMS_VECTOR

Parameter	Description
<code>idx_accuracy</code>	Target accuracy.
<code>idx_parameters</code>	Takes in CLOB with type of index and associated parameters. Type, neighbor partitions for IVF, neighbors/efConstruction for HNSW)
<code>idx_parallel_creation</code>	Number of parallel threads used for index construction.

DATA

This function accepts the input data type as `VARCHAR2`, `NUMBER`, or `CLOB`.

If you specify only the `idx_name` value, then the function rebuilds the index using `get_ddl`. If you specify all the parameter values, then the function first performs a drop index operation and then calls the `DBMS_VECTOR.CREATE_INDEX()` function.

205.1.10 UTL_TO_CHUNKS

Use the `DBMS_VECTOR.UTL_TO_CHUNKS` chainable utility function to split a larger plain text document into smaller chunks (pieces of words, sentences, or paragraphs).

Purpose

To perform a text to chunks transformation, by internally calling the `VECTOR_CHUNKS` SQL function for the operation.

Syntax

```
DBMS_VECTOR.UTL_TO_CHUNKS (
    DATA          IN CLOB | VARCHAR2
    PARAMS        IN JSON default NULL
) return VECTOR_ARRAY_T;
```

DATA

This function accepts the input data type as `CLOB` or `VARCHAR2`.

It returns an array of `CLOB`s, where each `CLOB` contains a chunk along with its metadata in JSON format, as follows:

```
{
  "chunk_id":NUMBER,
  "chunk_offset":NUMBER,
  "chunk_length":NUMBER,
  "chunk_data": "VARCHAR2(4000)"
}
```

For example:

```
{"chunk_id":1,"chunk_offset":1,"chunk_length":6,"chunk_data":"sample"}
```

Where,

- `chunk_id` specifies the chunk ID for each chunk.
- `chunk_offset` specifies the original position of each chunk in the source document, relative to the start of document which has a position of 1.
- `chunk_length` specifies the character length of each chunk.
- `chunk_data` displays text pieces from each chunk.

PARAMS

Specify the input parameters in JSON format:

```
{
  "by"           : mode,
  "max"         : max,
  "overlap"     : overlap,
  "split"       : split_condition,
  "custom_list" : [ split_chars1, ... ],
  "vocabulary"  : vocabulary_name,
  "language"    : nls_language,
  "normalize"   : normalize_mode,
  "norm_options": [ normalize_option1, ... ],
  "extended"    : boolean
}
```

For example:

```
JSON('{"by":"vocabulary",
      "vocabulary":"myvocab",
      "max":"100",
      "overlap":"0",
      "split":"custom",
      "custom_list": [ "<p>" , "<s>" ],
      "language":"american",
      "normalize":"options",
      "norm_options": [ "WHITESPACE" ] }')
```

All these parameters are aligned with the `VECTOR_CHUNKS` SQL function, as follows:

- `by`, `max`, `overlap`, `split`, `language`, and `extended` specify the same values as that of `VECTOR_CHUNKS`.
- `vocabulary` is the name of the custom vocabulary; same as the vocabulary name that you specify when using the `by vocabulary` mode.
- `custom_list` is an array of the custom split characters; same as the `split by custom condition`.
- `norm_options` is an array of normalization options; same as the `normalize` parameter.

For a complete description of these parameters, see VECTOR_CHUNKS in *Oracle Database SQL Language Reference*.

Example

```
SELECT D.id doc,
       JSON_VALUE(C.column_value, '$.chunk_id' RETURNING NUMBER) AS id,
       JSON_VALUE(C.column_value, '$.chunk_offset' RETURNING NUMBER) AS
pos,
       JSON_VALUE(C.column_value, '$.chunk_length' RETURNING NUMBER) AS
siz,
       JSON_VALUE(C.column_value, '$.chunk_data') AS txt
FROM docs D,
     dbms_vector.utl_to_chunks(D.text,
     JSON('{ "by": "words",
             "max": "100",
             "overlap": "0",
             "split": "recursively",
             "language": "american",
             "normalize": "all" }')) C;
```

To run an end-to-end example scenario using this function, see Convert Text to Chunks With Custom Chunking Specifications in *Oracle Database AI Vector Search User's Guide*.

205.1.11 UTL_TO_EMBEDDING and UTL_TO_EMBEDDINGS

Use the DBMS_VECTOR.UTL_TO_EMBEDDING and DBMS_VECTOR.UTL_TO_EMBEDDINGS chainable utility functions to convert plain text to one or more vector embeddings.

Purpose

To perform a text to embedding transformation by accessing:

- Oracle Database as the service provider: Calls the pretrained ONNX format embedding model that you have loaded into the database (default setting)
- Third-party embedding model: Makes a REST call to your chosen third-party service provider, such as Cohere, Google AI, Hugging Face, Oracle Cloud Infrastructure (OCI) Generative AI, OpenAI, or Vertex AI

Syntax

```
DBMS_VECTOR.UTL_TO_EMBEDDING (
    DATA           IN CLOB,
    PARAMS          IN JSON default NULL
) return VECTOR;
```

```
DBMS_VECTOR.UTL_TO_EMBEDDINGS (
    DATA           IN VECTOR_ARRAY_T,
    PARAMS          IN JSON default NULL
) return VECTOR_ARRAY_T;
```

DATA

UTL_TO_EMBEDDING converts text (CLOB) to a single embedding (VECTOR).

UTL_TO_EMBEDDINGS convert an array of chunks (VECTOR_ARRAY_T) to an array of embeddings (VECTOR_ARRAY_T).

The embedding output includes:

```
{
  "embed_id":NUMBER,
  "embed_data":"VARCHAR2(4000)",
  "embed_vector":"CLOB"
}
```

Where,

- embed_id displays the ID number of each embedding.
- embed_data displays the input text that is transformed into embeddings.
- embed_vector displays the generated vector representations.

PARAMS

Specify input parameters in JSON format, depending on the service provider that you want to use.

If using Oracle Database as the provider:

```
{
  "provider": "database",
  "model": "<pretrained ONNX embedding model file name>"
}
```

Table 205-8 Database Provider Parameter Details

Parameter	Description
provider	Specify DATABASE (default setting) to use Oracle Database as the provider. With this setting, you must load pretrained ONNX embedding model into the database.
model	User-specified name under which the imported pretrained ONNX embedding model is stored in Oracle Database. If you do not have pretrained embedding model in ONNX format, then perform the steps listed in <i>Oracle Database AI Vector Search User's Guide</i> .

If using a third-party provider:

Set the following parameters along with additional embedding parameters specific to your provider:

- For UTL_TO_EMBEDDING:

```
{
  "provider": "<AI service provider>",
```

```
"credential_name": "<credential name>",
"url": "<REST endpoint URL for embedding service>",
"model": "<REST provider embedding model name>",
"transfer_timeout": <maximum wait time for the request to
complete>,
"<REST provider parameter>": "<additional REST provider
parameters>"
}
```

- For UTL_TO_EMBEDDINGS:

```
{
  "provider": "<AI service provider>",
  "credential_name": "<credential name>",
  "url": "<REST endpoint URL for embedding service>",
  "model": "<REST provider embedding model name>",
  "transfer_timeout": <maximum wait time for the request to
complete>,
  "batch size": "<number of vectors to request at a time>",
  "<REST provider parameter>": "<additional REST provider
parameters>"
}
```

Table 205-9 Third-Party Provider Parameter Details

Parameter	Description
provider	<p>Third-party service provider that you want to access for this operation. A REST call is made to the specified provider to access its embedding model.</p> <p>Specify one of the following values:</p> <ul style="list-style-type: none"> • Cohere • GoogleAI • HuggingFace • OCI GenAI • OpenAI • VertexAI
credential_name	<p>Name of the credential in the form: <i>schema.credential_name</i></p> <p>A credential name holds authentication credentials to enable access to your provider for making REST API calls.</p> <p>You need to first set up your credential by calling the <code>DBMS_VECTOR.CREATE_CREDENTIAL</code> helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL.</p>
url	URL of the API endpoint for each REST call.
model	<p>Name of the third-party embedding model in the form: <i>schema.model_name</i></p> <p>If you do not specify a schema, then the schema of the procedure invoker is used.</p> <p>Note: For accurate results, ensure that the chosen model matches the vocabulary file used for chunking. If you are not using a vocabulary file, then ensure that the input length is defined within the token limits of your model.</p>

Table 205-9 (Cont.) Third-Party Provider Parameter Details

Parameter	Description
<code>transfer_timeout</code>	Maximum time to wait for the request to complete. The default value is 60 seconds. You can increase this value for busy web servers.
<code>batch_size</code>	Maximum number of vectors to request at a time. For example, for a batch size of 50, if 100 chunks are passed, then this API sends two requests with an array of 50 strings each. If 30 chunks are passed (which is lesser than the defined batch size), then the API sends those in a single request. For REST calls, it is more efficient to send a batch of inputs at a time rather than requesting a single input per call. Increasing the batch size can provide better performance, whereas reducing the batch size may reduce memory and data usage, especially if your provider has a rate limit. The default or maximum allowed value depends on the third-party provider settings.

Additional REST provider parameters:

Cohere example:

```
{
  "provider": "cohere",
  "credential_name": "COHERE_CRED",
  "url": "https://api.cohere.example.com/embed",
  "model": "embed-model",
  "input_type": "search_query"
}
```

Google AI example:

```
{
  "provider": "googleai",
  "credential_name": "GOOGLEAI_CRED",
  "url": "https://googleapis.example.com/models/",
  "model": "embed-model"
}
```

Hugging Face example:

```
{
  "provider": "huggingface",
  "credential_name": "HF_CRED",
  "url": "https://api.huggingface.example.com/",
  "model": "embed-model",
  "wait_for_model": "true"
}
```

Generative AI example:

```
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/embedText",
  "model": "embed-model",
  "batch_size": 10
}
```

OpenAI example:

```
{
  "provider": "openai",
  "credential_name": "OPENAI_CRED",
  "url": "https://api.openai.example.com/embeddings",
  "model": "embed-model"
}
```

Vertex AI example:

```
{
  "provider": "vertexai",
  "credential_name": "VERTEXAI_CRED",
  "url": "https://googleapis.example.com/models/",
  "model": "embed-model"
}
```

Table 205-10 Additional REST Provider Parameter Details

Parameter	Description
input_type	Type of input to vectorize.
wait_for_model	Whether to wait for the model when it is not ready, as TRUE or FALSE.

For more information on additional parameters, refer to your third-party provider's documentation.

 **Note:**

The generated embedding results may be different between requests for the same input and configuration, depending on your embedding model or floating point precision. However, this does not affect your queries (and provides semantically correct results) because the vector distance will be similar.

Examples

You can use `UTL_TO_EMBEDDING` in a `SELECT` clause and `UTL_TO_EMBEDDINGS` in a `FROM` clause, as follows:

- The following examples use `UTL_TO_EMBEDDING` to generate a vector embedding with Hello world as the input, by accessing the Generative AI embedding model:

```
-- select example

var params clob;
exec :params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/embedText",
  "model": "embed.modelname",
  "batch_size": 10
}';

select dbms_vector.utl_to_embedding('Hello world', json(:params)) from
dual;

-- PL/SQL example

declare
  input clob;
  params clob;
  v vector;
begin
  input := 'Hello world';

  params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/embedText",
  "model": "embed.modelname"
}';

  v := dbms_vector.utl_to_embedding(input, json(params));
  dbms_output.put_line(vector_serialize(v));
exception
  when OTHERS THEN
    DBMS_OUTPUT.PUT_LINE (SQLERRM);
    DBMS_OUTPUT.PUT_LINE (SQLCODE);
end;
/
```

To run an end-to-end example scenario using `UTL_TO_EMBEDDING`, see [Directly Convert Text String to Embedding in Oracle Database AI Vector Search User's Guide](#).

- The following example uses `UTL_TO_EMBEDDINGS` to generate vector embeddings with a PDF document (stored in the `documentation_tab` table) as the input, by calling pretrained ONNX model:

```
SELECT et.* from documentation_tab
dt,dbms_vector.utl_to_embeddings(dbms_vector.utl_to_chunks(dbms_vector.utl
```

```
_to_text(dt.data),
json(:embed_params)) et;
```

To run an end-to-end example scenario using `UTL_TO_EMBEDDINGS`, see *Step By Step Convert File to Text to Chunks to Embeddings* in *Oracle Database AI Vector Search User's Guide*.

205.1.12 UTL_TO_GENERATE_TEXT

Use the `DBMS_VECTOR.UTL_TO_GENERATE_TEXT` chainable utility function to generate text for a given prompt.

Purpose

To generate text using a prompt, by accessing third-party text generation models.

This API makes a REST call to your specified third-party service provider, such as Cohere, Google AI, Hugging Face, Oracle Cloud Infrastructure (OCI) Generative AI, OpenAI, or Vertex AI.

A prompt can be an input string, such as a question that you ask a Large Language Model (LLM). For example, "What is Oracle Text?". A prompt can also be a command, such as "Summarize the following ...", "Draft an email asking for ...", or "Rewrite the following ...", and can include results from a search.

Syntax

```
DBMS_VECTOR.UTL_TO_GENERATE_TEXT (
    DATA          IN CLOB,
    PARAMS        IN JSON default NULL
) return CLOB;
```

DATA

This function accepts the input data type as `CLOB`, and returns the output as `CLOB`.

PARAMS

Specify the following input parameters in JSON format, depending on the service provider that you want to access for text generation:

```
{
  "provider": "<AI service provider>",
  "credential_name": "<credential name>",
  "url": "<REST endpoint URL for text generation service>",
  "model": "<text generation model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,
  "<REST provider parameter>": "<additional REST provider parameters>"
}
```

Table 205-11 UTL_TO_GENERATE_TEXT Parameter Details

Parameter	Description
<code>provider</code>	Service provider that you want to access to generate the text: <ul style="list-style-type: none"> • Cohere • GoogleAI • HuggingFace • OCI GenAI • OpenAI • VertexAI
<code>credential_name</code>	Name of the credential in the form: <i>schema.credential_name</i> A credential name holds authentication credentials to enable access to your provider for making REST API calls. You need to first set up your credential by calling the <code>DBMS_VECTOR.CREATE_CREDENTIAL</code> helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL .
<code>url</code>	URL of the API endpoint for each REST call.
<code>model</code>	Name of the third-party text generation model in the form: <i>schema.model_name</i> If the model name is not schema-qualified, then the schema of the procedure invoker is used.
<code>transfer_timeout</code>	Maximum time to wait for the request to complete. The default value is 60 seconds. You can increase this value for busy web servers.

Additional REST provider parameters:

Cohere example:

```
{
  "provider": "Cohere",
  "credential_name": "COHERE_CRED",
  "url": "https://api.cohere.example.com/generateText",
  "model": "generate-text-model"
}
```

Google AI example:

```
{
  "provider": "googleai",
  "credential_name": "GOOGLEAI_CRED",
  "url": "https://googleapis.example.com/models/",
  "model": "generate-text-model"
}
```

Hugging Face example:

```
{
  "provider": "huggingface",
  "credential_name": "HF_CRED",
  "url": "https://api.huggingface.example.com/models/",
  "model": "generate-text-model",
  "wait_for_model": "true"
}
```

Generative AI example:

```
{
  "provider": "OCIGenAI",
  "credential_name": "GENAI_CRED",
  "url": "https://generativeai.oci.example.com/generateText",
  "model": "generate-text-model",
  "inferenceRequest": {
    "maxTokens": 300,
    "temperature": 1
  }
}
```

OpenAI example:

```
{
  "provider": "openai",
  "credential_name": "OPENAI_CRED",
  "url": "https://api.openai.example.com",
  "model": "generate-text-model",
  "max_tokens": 60,
  "temperature": 1.0
}
```

Vertex AI example:

```
{
  "provider": "vertexai",
  "credential_name": "VERTEXAI_CRED",
  "url": "https://googleapis.example.com/models/",
  "model": "generate-text-model",
  "generation_config": {
    "temperature": 0.9,
    "topP": 1,
    "candidateCount": 1,
    "maxOutputTokens": 256
  }
}
```

Table 205-12 Additional REST Provider Parameter Details

Parameter	Description
wait_for_model	Whether to wait for the model when it is not ready, as TRUE or FALSE.
max_tokens	Maximum number of tokens in the output text.
temperature	Degree of randomness used when generating the output text, in the range of 0.0–5.0. To generate the same output for a prompt, use 0. To generate a random new text for that prompt, increase the temperature. Note: Start with the temperature set to 0. If you do not require random results, a recommended temperature value is between 0 and 1. A higher value is not recommended because a high temperature may produce creative text, which might also include hallucinations.
topP	Probability of tokens in the output, in the range of 0.0–1.0. A lower value provides less random responses and a higher value provides more random responses.
candidateCount	Number of response variations to return, in the range of 1–4.
maxOutputTokens	Maximum number of tokens to generate for each response.

For more information on additional parameters, refer to your third-party provider's documentation.

Examples

These statements generate text using "What is Oracle Text?" as the prompt, by making a REST call to Generative AI.

```
-- select example

var params clob;
exec :params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/generateText",
  "model": "generate.modelname"
}';

select dbms_vector.utl_to_generate_text(
  'What is Oracle Text?',
  json(:params)) from dual;

-- PL/SQL example

declare
  input clob;
  params clob;
  output clob;
begin
  input := 'What is Oracle Text?';
```

```
params := '  
{  
  "provider": "ocigenai",  
  "credential_name": "OCI_CRED",  
  "url": "https://generativeai.oci.example.com/generateText",  
  "model": "generate.modelname"  
}';  
  
output := dbms_vector.utl_to_generate_text(input, json(params));  
dbms_output.put_line(output);  
if output is not null then  
  dbms_lob.freetemporary(output);  
end if;  
exception  
  when OTHERS THEN  
    DBMS_OUTPUT.PUT_LINE (SQLERRM);  
    DBMS_OUTPUT.PUT_LINE (SQLCODE);  
end;  
/
```

To run an end-to-end example scenario using this function, see [Generate Text for a Prompt: PL/SQL Example](#) in *Oracle Database AI Vector Search User's Guide*.

DBMS_VECTOR_CHAIN

The `DBMS_VECTOR_CHAIN` package enables advanced operations with Oracle AI Vector Search, such as chunking and embedding data along with text generation and summarization capabilities. It is more suitable for text processing with similarity search, using functionality that can be pipelined together for an end-to-end search.

These functions accept their respective input parameters in JSON format.

- [Oracle Database AI Vector Search User's Guide](#)

206.1 Summary of DBMS_VECTOR_CHAIN Subprograms

This table lists the `DBMS_VECTOR_CHAIN` subprograms and briefly describes them.

Table 206-1 DBMS_VECTOR_CHAIN Package Subprograms

Subprogram	Description
Chainable Utility (UTL) Functions:	
These functions are a set of modular and flexible functions within vector utility PL/SQL packages. You can chain these together to automate end-to-end data transformation and similarity search operations.	
UTL_TO_TEXT	Extracts plain text data from documents
UTL_TO_CHUNKS	Splits data into smaller pieces or chunks
UTL_TO_EMBEDDING and UTL_TO_EMBEDDINGS	Converts data to one or more vector embeddings
UTL_TO_SUMMARY	Extracts a summary from documents
UTL_TO_GENERATE_TEXT	Generates text for a prompt or input string
Credential Helper Procedures:	
These procedures enable you to securely manage authentication credentials in the database. You require these credentials to enable access to third-party service providers for making REST calls.	
CREATE_CREDENTIAL	Creates a credential name
DROP_CREDENTIAL	Drops an existing credential name
Chunker Helper Procedures:	
These procedures enable you to configure vocabulary and language data (abbreviations), to be used with the <code>VECTOR_CHUNKS</code> SQL function or <code>UTL_TO_CHUNKS</code> PL/SQL function.	
CREATE_VOCABULARY	Loads your token vocabulary file into the database
DROP_VOCABULARY	Removes existing vocabulary data
CREATE_LANG_DATA	Loads your language data file into the database
DROP_LANG_DATA	Removes existing abbreviation data

206.1.1 CREATE_CREDENTIAL

Use the `DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL` credential helper procedure to create a credential name for storing user authentication details in Oracle Database.

Purpose

To securely manage authentication credentials in the database. You require these credentials to enable access during REST API calls to your chosen third-party service provider, such as Cohere, Google AI, Hugging Face, Oracle Cloud Infrastructure (OCI) Generative AI, OpenAI, or Vertex AI.

A credential name holds authentication parameters, such as user name, password, access token, private key, or fingerprint.

 **Note:**

If you are using Oracle Database as the service provider, then you do not need to create a credential.

Syntax

```
DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL (  
    CREDENTIAL_NAME      IN VARCHAR2,  
    PARAMS                IN JSON DEFAULT NULL  
);
```

CREDENTIAL_NAME

Specify a name of the credential that you want to create for holding authentication parameters.

PARAMS

Specify authentication parameters in JSON format, based on your chosen service provider.

Generative AI requires the following authentication parameters:

```
{  
  "user_oci": "<user oci>",  
  "tenancy_oci": "<tenancy oci>",  
  "compartment_oci": "<compartment oci>",  
  "private_key": "<private key>",  
  "fingerprint": "<fingerprint>"  
}
```

Cohere, Google AI, Hugging Face, OpenAI, and Vertex AI require the following authentication parameter:

```
{ "access_token": "<access token>" }
```

Table 206-2 Parameter Details

Parameter	Description
user_ocid	Oracle Cloud Identifier (OCID) of the user, as listed on the User Details page in the OCI console.
tenancy_ocid	OCID of your tenancy, as listed on the Tenancy Details page in the OCI console.
compartment_ocid	OCID of your compartment, as listed on the Compartments information page in the OCI console.
private_key	OCI private key. Note: The generated private key may appear as: -----BEGIN RSA PRIVATE KEY----- <private key string> -----END RSA PRIVATE KEY----- You pass the <private key string> value (excluding the BEGIN and END lines), either as a single line or as multiple lines.
fingerprint	Fingerprint of the OCI profile key, as listed on the User Details page under API Keys in the OCI console.
access_token	Access token obtained from your third-party service provider.

Required Privilege

You need the `CREATE CREDENTIAL` privilege to call this API.

Examples

- For Generative AI:

```

declare
  jo json_object_t;
begin
  jo := json_object_t();

  jo.put('user_ocid','ocid1.user.oc1..aabbalbbaa1112233aabbaabb1111222aa1111
bb');

  jo.put('tenancy_ocid','ocid1.tenancy.oc1..aaaaalbbbbb1112233aaaabbaa1111222
aa111a');

  jo.put('compartment_ocid','ocid1.compartment.oc1..ababalabab1112233abababa
b111222ab111ab');
  jo.put('private_key','AAAaaaBBB11112222333...AAA111AAABBB222aaa1a/+');
  jo.put('fingerprint','01:1a:a1:aa:12:a1:12:1a:ab:12:01:ab:a1:12:ab:1a');
  dbms_output.put_line(jo.to_string);
  dbms_vector_chain.create_credential(
    credential_name => 'OCI_CRED',
    params          => json(jo.to_string));
end;
/

```

- For Cohere:

```
declare
  jo json_object_t;
begin
  jo := json_object_t();
  jo.put('access_token', 'A1Aa0abA1AB1a1Abc123ab1A123ab123AbcA12a');
  dbms_vector_chain.create_credential(
    credential_name => 'COHERE_CRED',
    params          => json(jo.to_string));
end;
/
```

To run an end-to-end example scenario using this procedure, see Convert Text String to Summary in *Oracle Database AI Vector Search User's Guide*.

206.1.2 CREATE_LANG_DATA

Use the `DBMS_VECTOR_CHAIN.CREATE_LANG_DATA` chunker helper procedure to load your own language data file into the database.

Purpose

To create custom language data for your chosen language (specified using the `LANGUAGE` chunking parameter).

A language data file contains language-specific abbreviation tokens. You can supply this data to the chunker to help in accurately determining sentence boundaries of chunks, by using knowledge of the input language's end-of-sentence (EOS) punctuations, abbreviations, and contextual rules.

Usage Notes

- All supported languages are distributed with the default language-specific abbreviation dictionaries. You can create a language data based on the abbreviation tokens loaded in the `schema.table.column`, using a user-specified language data name (`PREFERENCE_NAME`).
- After loading your language data, you can use language-specific chunking by specifying the `LANGUAGE` chunking parameter with `VECTOR_CHUNKS` or `UTL_TO_CHUNKS`.
- You can query these data dictionary views to access existing language data:
 - `ALL_VECTOR_LANG` displays all available languages data.
 - `USER_VECTOR_LANG` displays languages data from the schema of the current user.
 - `ALL_VECTOR_ABBREV_TOKENS` displays abbreviation tokens from all available language data.
 - `USER_VECTOR_ABBREV_TOKENS` displays abbreviation tokens from the language data owned by the current user.

Syntax

```
DBMS_VECTOR_CHAIN.CREATE_LANG_DATA (
    PARAMS          IN JSON default NULL
);
```

PARAMS

Specify the input parameters in JSON format:

```
{
    TABLE_NAME,
    COLUMN_NAME,
    LANGUAGE,
    PREFERENCE_NAME
}
```

Table 206-3 Parameter Details

Parameter	Description	Required	Default Value
TABLE_NAME	Name of the table (along with the optional table owner) in which you want to load the language data	Yes	No value
COLUMN_NAME	Column name in the language data table in which you want to load the language data	Yes	No value
LANGUAGE	Any supported language name, as listed in Supported Languages and Data File Locations	Yes	No value
PREFERENCE_NAME	User-specified preference name for this language data	Yes	No value

Example

```
declare
    params CLOB := '{"TABLE_NAME"      : "eos_data_1",
                  "COLUMN_NAME"     : "TOKEN",
                  "LANGUAGE"        : "INDONESIAN",
                  "PREFERENCE_NAME" : "my_lang_1"}';
begin
    DBMS_VECTOR_CHAIN.CREATE_LANG_DATA(
        JSON (params));
end;
/
```

To run an end-to-end example scenario using this procedure, see *Create and Use Custom Language Data in Oracle Database AI Vector Search User's Guide*.

Related Topics

- VECTOR_CHUNKS

- **UTL_TO_CHUNKS**
Use the `DBMS_VECTOR_CHAIN.UTL_TO_CHUNKS` chainable utility function to split a larger plain text document into smaller chunks (pieces of words, sentences, or paragraphs).
- Vector Utilities-Related Views

206.1.3 CREATE_VOCABULARY

Use the `DBMS_VECTOR_CHAIN.CREATE_VOCABULARY` chunker helper procedure to load your own token vocabulary file into the database.

Purpose

To create custom token vocabulary that is recognized by the tokenizer used by your vector embedding model.

A vocabulary contains a set of tokens (words and word pieces) that are collected during a model's statistical training process. You can supply this data to the chunker to help in accurately selecting the text size that approximates the maximum input limit imposed by the tokenizer of your embedding model.

Usage Notes

- Usually, the supported vocabulary files (containing recognized tokens) are included as part of a model's distribution. Oracle recommends to use the vocabulary files associated with your model.

If a vocabulary file is not available, then you may download one of the following files depending on the tokenizer type:

- **WordPiece:**

Vocabulary file (`vocab.txt`) for the "bert-base-uncased" (English) or "bert-base-multilingual-cased" model

- **Byte-Pair Encoding (BPE):**

Vocabulary file (`vocab.json`) for the "GPT2" model

Use the following python script to extract the file:

```
import json
import sys

with open(sys.argv[1], encoding="utf-8") as f:
    d = json.load(f)
    for term in d:
        print(term)
```

- **SentencePiece:**

Vocabulary file (`tokenizer.json`) for the "xlm-roberta-base" model

Use the following python script to extract the file:

```
import json
import sys
```

```
with open(sys.argv[1], encoding="utf-8") as f:
    d = json.load(f)
    for entry in d["model"]["vocab"]:
        print(entry[0])
```

Ensure to save your vocabulary files in UTF-8 encoding.

- You can create a vocabulary based on the tokens loaded in the `schema.table.column`, using a user-specified vocabulary name (`VOCABULARY_NAME`).

After loading your vocabulary data, you can use the `BY VOCABULARY` chunking mode (with `VECTOR_CHUNKS` or `UTL_TO_CHUNKS`) to split input data by counting the number of tokens.

- You can query these data dictionary views to access existing vocabulary data:
 - `ALL_VECTOR_VOCAB` displays all available vocabularies.
 - `USER_VECTOR_VOCAB` displays vocabularies from the schema of the current user.
 - `ALL_VECTOR_VOCAB_TOKENS` displays a list of tokens from all available vocabularies.
 - `USER_VECTOR_VOCAB_TOKENS` displays a list of tokens from the vocabularies owned by the current user.

Syntax

```
DBMS_VECTOR_CHAIN.CREATE_VOCABULARY (
    PARAMS          IN JSON default NULL
);
```

PARAMS

Specify the input parameters in JSON format:

```
{
    TABLE_NAME,
    COLUMN_NAME,
    VOCABULARY_NAME,
    FORMAT,
    CASED
}
```

Table 206-4 Parameter Details

Parameter	Description	Required	Default Value
TABLE_NAME	Name of the table (along with the optional table owner) in which you want to load the vocabulary file	Yes	No value
COLUMN_NAME	Column name in the vocabulary table in which you want to load the vocabulary file	Yes	No value
VOCABULARY_NAME	User-specified name of the vocabulary, along with the optional owner name (if other than the current owner)	Yes	No value

Table 206-4 (Cont.) Parameter Details

Parameter	Description	Required	Default Value
FORMAT	<ul style="list-style-type: none"> • XLM for SentencePiece tokenization • BERT for WordPiece tokenization • GPT2 for BPE tokenization 	Yes	No value
CASED	Character-casing of the vocabulary, that is, vocabulary to be treated as cased or uncased	No	FALSE

Example

```

DECLARE
  params clob := '{"table_name"      : "doc_vocabtab",
                 "column_name"     : "token",
                 "vocabulary_name" : "doc_vocab",
                 "format"          : "bert",
                 "cased"           : false}';

BEGIN
  dbms_vector_chain.create_vocabulary(json(params));
END;
/

```

To run an end-to-end example scenario using this procedure, see *Create and Use Custom Vocabulary in Oracle Database AI Vector Search User's Guide*.

Related Topics

- VECTOR_CHUNKS
- [UTL_TO_CHUNKS](#)
Use the DBMS_VECTOR_CHAIN.UTL_TO_CHUNKS chainable utility function to split a larger plain text document into smaller chunks (pieces of words, sentences, or paragraphs).
- Vector Utilities-Related Views

206.1.4 DROP_CREDENTIAL

Use the DBMS_VECTOR_CHAIN.DROP_CREDENTIAL credential helper procedure to drop an existing credential name from the data dictionary.

Syntax

```

DBMS_VECTOR_CHAIN.DROP_CREDENTIAL (
  CREDENTIAL_NAME      IN VARCHAR2
);

```

CREDENTIAL_NAME

Specify the credential name that you want to drop.

Examples

- For Generative AI:

```
exec dbms_vector_chain.drop_credential('OCI_CRED');
```

- For Cohere:

```
exec dbms_vector_chain.drop_credential('COHERE_CRED');
```

206.1.5 DROP_LANG_DATA

Use the `DBMS_VECTOR_CHAIN.DROP_LANG_DATA` chunker helper procedure to remove abbreviation data from the data dictionary.

Syntax

```
DBMS_VECTOR_CHAIN.DROP_LANG_DATA(  
    PREF_NAME      IN VARCHAR2  
);
```

LANG

Specify the name of the language data that you want to drop for a given language.

Example

```
DBMS_VECTOR_CHAIN.DROP_LANG_DATA(  
    'INDONESIAN'  
);
```

206.1.6 DROP_VOCABULARY

Use the `DBMS_VECTOR_CHAIN.DROP_VOCABULARY` chunker helper procedure to remove vocabulary data from the data dictionary.

Syntax

```
DBMS_VECTOR_CHAIN.DROP_VOCABULARY(  
    VOCABULARY_NAME  IN VARCHAR2  
);
```

VOCAB_NAME

Specify the name of the vocabulary that you want to drop, in the form:

vocabulary_name

or

owner.vocabulary_name

Example

```
DBMS_VECTOR_CHAIN.DROP_VOCABULARY (  
    'MY_VOCAB_1'  
);
```

206.1.7 UTL_TO_CHUNKS

Use the `DBMS_VECTOR_CHAIN.UTL_TO_CHUNKS` chainable utility function to split a larger plain text document into smaller chunks (pieces of words, sentences, or paragraphs).

Purpose

To perform a text to chunks transformation, by internally calling the `VECTOR_CHUNKS` SQL function for the operation.

Syntax

```
DBMS_VECTOR_CHAIN.UTL_TO_CHUNKS (  
    DATA          IN CLOB | VARCHAR2  
    PARAMS        IN JSON default NULL  
) return VECTOR_ARRAY_T;
```

DATA

This function accepts the input data type as `CLOB` or `VARCHAR2`.

It returns an array of `CLOBs`, where each `CLOB` contains a chunk along with its metadata in JSON format, as follows:

```
{  
    "chunk_id":NUMBER,  
    "chunk_offset":NUMBER,  
    "chunk_length":NUMBER,  
    "chunk_data":"VARCHAR2(4000)"  
}
```

For example:

```
{"chunk_id":1,"chunk_offset":1,"chunk_length":6,"chunk_data":"sample"}
```

Where,

- `chunk_id` specifies the chunk ID for each chunk.
- `chunk_offset` specifies the original position of each chunk in the source document, relative to the start of document which has a position of 1.
- `chunk_length` specifies the character length of each chunk.
- `chunk_data` displays text pieces from each chunk.

PARAMS

Specify the input parameters in JSON format.

```

{
  "by"           : mode,
  "max"          : max,
  "overlap"      : overlap,
  "split"        : split_condition,
  "custom_list"  : [ split_chars1, ... ],
  "vocabulary"   : vocabulary_name,
  "language"     : nls_language,
  "normalize"    : normalize_mode,
  "norm_options" : [ normalize_option1, ... ],
  "extended"     : boolean
}

```

For example:

```

JSON(' { "by": "vocabulary",
         "vocabulary": "myvocab",
         "max": "100",
         "overlap": "0",
         "split": "custom",
         "custom_list": [ "<p>" , "<s>" ],
         "language": "american",
         "normalize": "options",
         "norm_options": [ "WHITESPACE" ] } ')

```

All these parameters are aligned with the `VECTOR_CHUNKS` SQL function, as follows:

- `by`, `max`, `overlap`, `split`, `language`, and `extended` specify the same values as that of `VECTOR_CHUNKS`.
- `vocabulary` is the name of the custom vocabulary; same as the vocabulary name that you specify when using the `by vocabulary` mode.
- `custom_list` is an array of the custom split characters; same as the `split by custom condition`.
- `norm_options` is an array of normalization options; same as the `normalize` parameter.

For a complete description of these parameters, see `VECTOR_CHUNKS` in *Oracle Database SQL Language Reference*.

Example

```

SELECT D.id doc,
       JSON_VALUE(C.column_value, '$.chunk_id' RETURNING NUMBER) AS id,
       JSON_VALUE(C.column_value, '$.chunk_offset' RETURNING NUMBER) AS pos,
       JSON_VALUE(C.column_value, '$.chunk_length' RETURNING NUMBER) AS siz,
       JSON_VALUE(C.column_value, '$.chunk_data') AS txt
FROM docs D,
     dbms_vector_chain.utl_to_chunks(D.text,
     JSON(' { "by": "words",

```

```
"max": "100",  
"overlap": "0",  
"split": "recursively",  
"language": "american",  
"normalize": "all" }')) C;
```

To run end-to-end example scenarios using this function, see *Convert Text to Chunks With Custom Chunking Specifications* and *Step By Step Convert File to Text to Chunks to Embeddings* in *Oracle Database AI Vector Search User's Guide*.

206.1.8 UTL_TO_EMBEDDING and UTL_TO_EMBEDDINGS

Use the `DBMS_VECTOR_CHAIN.UTL_TO_EMBEDDING` and `DBMS_VECTOR_CHAIN.UTL_TO_EMBEDDINGS` chainable utility functions to convert plain text to one or more vector embeddings.

Purpose

To perform a text to embedding transformation by accessing:

- Oracle Database as the service provider: Calls the pretrained ONNX format embedding model that you have loaded into the database (default setting)
- Third-party embedding model: Makes a REST call to your chosen third-party service provider, such as Cohere, Google AI, Hugging Face, Oracle Cloud Infrastructure (OCI) Generative AI, OpenAI, or Vertex AI

Syntax

```
DBMS_VECTOR_CHAIN.UTL_TO_EMBEDDING (  
    DATA          IN CLOB,  
    PARAMS         IN JSON default NULL  
) return VECTOR;
```

```
DBMS_VECTOR_CHAIN.UTL_TO_EMBEDDINGS (  
    DATA          IN VECTOR_ARRAY_T,  
    PARAMS         IN JSON default NULL  
) return VECTOR_ARRAY_T;
```

DATA

`UTL_TO_EMBEDDING` converts text (CLOB) to a single embedding (VECTOR).

`UTL_TO_EMBEDDINGS` convert an array of chunks (VECTOR_ARRAY_T) to an array of embeddings (VECTOR_ARRAY_T).

The embedding output includes:

```
{  
    "embed_id": NUMBER,  
    "embed_data": "VARCHAR2(4000)",  
    "embed_vector": "CLOB"  
}
```

Where,

- `embed_id` displays the ID number of each embedding.
- `embed_data` displays the input text that is transformed into embeddings.
- `embed_vector` displays the generated vector representations.

PARAMS

Specify input parameters in JSON format, depending on the service provider that you want to use.

If using Oracle Database as the provider:

```
{
  "provider": "database",
  "model": "<pretrained ONNX embedding model file name>"
}
```

Table 206-5 Database Provider Parameter Details

Parameter	Description
<code>provider</code>	Specify DATABASE (default setting) to use Oracle Database as the provider. With this setting, you must load pretrained ONNX embedding model into the database.
<code>model</code>	User-specified name under which the imported pretrained ONNX embedding model is stored in Oracle Database. If you do not have pretrained embedding model in ONNX format, then perform the steps listed in <i>Oracle Database AI Vector Search User's Guide</i> .

If using a third-party provider:

Set the following parameters along with additional embedding parameters specific to your provider:

- For `UTL_TO_EMBEDDING`:

```
{
  "provider": "<AI service provider>",
  "credential_name": "<credential name>",
  "url": "<REST endpoint URL for embedding service>",
  "model": "<REST provider embedding model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,
  "<REST provider parameter>": "<additional REST provider parameters>"
}
```

- For `UTL_TO_EMBEDDINGS`:

```
{
  "provider": "<AI service provider>",
  "credential_name": "<credential name>",
  "url": "<REST endpoint URL for embedding service>",
  "model": "<REST provider embedding model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,

```

```
"batch size": "<number of vectors to request at a time>",
"<REST provider parameter>": "<additional REST provider
parameters>"
}
```

Table 206-6 Third-Party Provider Parameter Details

Parameter	Description
provider	<p>Third-party service provider that you want to access for this operation. A REST call is made to the specified provider to access its embedding model.</p> <p>Specify one of the following values:</p> <ul style="list-style-type: none"> • Cohere • GoogleAI • HuggingFace • OCIGenAI • OpenAI • VertexAI
credential_name	<p>Name of the credential in the form: <i>schema.credential_name</i></p> <p>A credential name holds authentication credentials to enable access to your provider for making REST API calls.</p> <p>You need to first set up your credential by calling the <code>DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL</code> helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL.</p>
url	URL of the API endpoint for each REST call.
model	<p>Name of the third-party embedding model in the form: <i>schema.model_name</i></p> <p>If you do not specify a schema, then the schema of the procedure invoker is used.</p> <p>Note: For accurate results, ensure that the chosen model matches the vocabulary file used for chunking. If you are not using a vocabulary file, then ensure that the input length is defined within the token limits of your model.</p>
transfer_timeout	<p>Maximum time to wait for the request to complete.</p> <p>The default value is 60 seconds. You can increase this value for busy web servers.</p>
batch_size	<p>Maximum number of vectors to request at a time.</p> <p>For example, for a batch size of 50, if 100 chunks are passed, then this API sends two requests with an array of 50 strings each. If 30 chunks are passed (which is lesser than the defined batch size), then the API sends those in a single request.</p> <p>For REST calls, it is more efficient to send a batch of inputs at a time rather than requesting a single input per call. Increasing the batch size can provide better performance, whereas reducing the batch size may reduce memory and data usage, especially if your provider has a rate limit.</p> <p>The default or maximum allowed value depends on the third-party provider settings.</p>

Additional REST provider parameters:

Cohere example:

```
{
  "provider": "cohere",
  "credential_name": "COHERE_CRED",
  "url": "https://api.cohere.example.com/embed",
  "model": "embed-model",
  "input_type": "search_query"
}
```

Google AI example:

```
{
  "provider": "googleai",
  "credential_name": "GOOGLEAI_CRED",
  "url": "https://googleapis.example.com/models/",
  "model": "embed-model"
}
```

Hugging Face example:

```
{
  "provider": "huggingface",
  "credential_name": "HF_CRED",
  "url": "https://api.huggingface.example.com/",
  "model": "embed-model",
  "wait_for_model": "true"
}
```

Generative AI example:

```
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/embedText",
  "model": "embed-model",
  "batch_size": 10
}
```

OpenAI example:

```
{
  "provider": "openai",
  "credential_name": "OPENAI_CRED",
  "url": "https://api.openai.example.com/embeddings",
  "model": "embed-model"
}
```

Vertex AI example:

```
{
  "provider": "vertexai",
```

```

    "credential_name": "VERTEXAI_CRED",
    "url": "https://googleapis.example.com/models/",
    "model": "embed-model"
  }

```

Table 206-7 Additional REST Provider Parameter Details

Parameter	Description
input_type	Type of input to vectorize.
wait_for_model	Whether to wait for the model when it is not ready, as TRUE or FALSE.

For more information on additional parameters, refer to your third-party provider's documentation.

 **Note:**

The generated embedding results may be different between requests for the same input and configuration, depending on your embedding model or floating point precision. However, this does not affect your queries (and provides semantically correct results) because the vector distance will be similar.

Examples

You can use `UTL_TO_EMBEDDING` in a `SELECT` clause and `UTL_TO_EMBEDDINGS` in a `FROM` clause, as follows:

- The following examples use `UTL_TO_EMBEDDING` to generate a vector embedding with `Hello world` as the input, by accessing the Generative AI embedding model:

```

-- select example

var params clob;
exec :params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/embedText",
  "model": "embed.modelname",
  "batch_size": 10
}';

select dbms_vector_chain.utl_to_embedding('Hello world',
json(:params)) from dual;

-- PL/SQL example

declare
  input clob;
  params clob;
  v vector;

```

```

begin
  input := 'Hello world';

  params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/embedText",
  "model": "embed.modelname"
}';

  v := dbms_vector_chain.utl_to_embedding(input, json(params));
  dbms_output.put_line(vector_serialize(v));
exception
  when OTHERS THEN
    DBMS_OUTPUT.PUT_LINE (SQLERRM);
    DBMS_OUTPUT.PUT_LINE (SQLCODE);
end;
/

```

To run an end-to-end example scenario using `UTL_TO_EMBEDDING`, see *Directly Convert Text String to Embedding in Oracle Database AI Vector Search User's Guide*.

- The following example uses `UTL_TO_EMBEDDINGS` to generate vector embeddings with a PDF document (stored in the `documentation_tab` table) as the input, by calling the pretrained ONNX model `my_embedding_model.onnx`:

```

SELECT et.* from documentation_tab
dt,dbms_vector_chain.utl_to_embeddings(dbms_vector_chain.utl_to_chunks(dbm
s_vector_chain.utl_to_text(dt.data)),
json(:embed_params)) et;

```

To run an end-to-end example scenario using `UTL_TO_EMBEDDINGS`, see *Step By Step Convert File to Text to Chunks to Embeddings in Oracle Database AI Vector Search User's Guide*.

206.1.9 UTL_TO_GENERATE_TEXT

Use the `DBMS_VECTOR_CHAIN.UTL_TO_GENERATE_TEXT` chainable utility function to generate text for a given prompt.

Purpose

To generate text using a prompt, by accessing third-party text generation models.

This API makes a REST call to your specified third-party service provider, such as Cohere, Google AI, Hugging Face, Oracle Cloud Infrastructure (OCI) Generative AI, OpenAI, or Vertex AI.

A prompt can be an input string, such as a question that you ask a Large Language Model (LLM). For example, "What is Oracle Text?". A prompt can also be a command, such as "Summarize the following ...", "Draft an email asking for ...", or "Rewrite the following ...", and can include results from a search.

Syntax

```
DBMS_VECTOR_CHAIN.UTL_TO_GENERATE_TEXT (
    DATA          IN CLOB,
    PARAMS        IN JSON default NULL
) return CLOB;
```

DATA

This function accepts the input data type as CLOB, and returns the output as CLOB.

PARAMS

Specify the following input parameters in JSON format, depending on the service provider that you want to access for text generation:

```
{
  "provider": "<AI service provider>",
  "credential_name": "<credential name>",
  "url": "<REST endpoint URL for text generation service>",
  "model": "<text generation model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,
  "<REST provider parameter>": "<additional REST provider parameters>"
}
```

Table 206-8 UTL_TO_GENERATE_TEXT Parameter Details

Parameter	Description
provider	Service provider that you want to access to generate the text: <ul style="list-style-type: none"> • Cohere • GoogleAI • HuggingFace • OCIGenAI • OpenAI • VertexAI
credential_name	Name of the credential in the form: <i>schema.credential_name</i> A credential name holds authentication credentials to enable access to your provider for making REST API calls. You need to first set up your credential by calling the <code>DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL</code> helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL .
url	URL of the API endpoint for each REST call.

Table 206-8 (Cont.) UTL_TO_GENERATE_TEXT Parameter Details

Parameter	Description
model	Name of the third-party text generation model in the form: <i>schema.model_name</i> If the model name is not schema-qualified, then the schema of the procedure invoker is used.
transfer_timeout	Maximum time to wait for the request to complete. The default value is 60 seconds. You can increase this value for busy web servers.

Additional REST provider parameters:

Cohere example:

```
{
  "provider": "Cohere",
  "credential_name": "COHERE_CRED",
  "url": "https://api.cohere.example.com/generateText",
  "model": "generate-text-model"
}
```

Google AI example:

```
{
  "provider": "googleai",
  "credential_name": "GOOGLEAI_CRED",
  "url": "https://googleapis.example.com/models/",
  "model": "generate-text-model"
}
```

Hugging Face example:

```
{
  "provider": "huggingface",
  "credential_name": "HF_CRED",
  "url": "https://api.huggingface.example.com/models/",
  "model": "generate-text-model",
  "wait_for_model": "true"
}
```

Generative AI example:

```
{
  "provider": "OCI GenAI",
  "credential_name": "GENAI_CRED",
  "url": "https://generativeai.oci.example.com/generateText",
  "model": "generate-text-model",
  "inferenceRequest": {
```

```

    "maxTokens": 300,
    "temperature": 1
  }
}

```

OpenAI example:

```

{
  "provider": "openai",
  "credential_name": "OPENAI_CRED",
  "url": "https://api.openai.example.com",
  "model": "generate-text-model",
  "max_tokens": 60,
  "temperature": 1.0
}

```

Vertex AI example:

```

{
  "provider": "vertexai",
  "credential_name": "VERTEXAI_CRED",
  "url": "https://googleapis.example.com/models/",
  "model": "generate-text-model",
  "generation_config": {
    "temperature": 0.9,
    "topP": 1,
    "candidateCount": 1,
    "maxOutputTokens": 256
  }
}

```

Table 206-9 Additional REST Provider Parameter Details

Parameter	Description
wait_for_model	Whether to wait for the model when it is not ready, as TRUE or FALSE.
max_tokens	Maximum number of tokens in the output text.
temperature	Degree of randomness used when generating the output text, in the range of 0.0-5.0. To generate the same output for a prompt, use 0. To generate a random new text for that prompt, increase the temperature. Note: Start with the temperature set to 0. If you do not require random results, a recommended temperature value is between 0 and 1. A higher value is not recommended because a high temperature may produce creative text, which might also include hallucinations.
topP	Probability of tokens in the output, in the range of 0.0-1.0. A lower value provides less random responses and a higher value provides more random responses.
candidateCount	Number of response variations to return, in the range of 1-4.
maxOutputTokens	Maximum number of tokens to generate for each response.

For more information on additional parameters, refer to your third-party provider's documentation.

Examples

These statements generate text using "What is Oracle Text?" as the prompt, by making a REST call to Generative AI.

```
-- select example

var params clob;
exec :params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/generateText",
  "model": "generate.modelname"
}';

select dbms_vector_chain.utl_to_generate_text(
  'What is Oracle Text?',
  json(:params)) from dual;

-- PL/SQL example

declare
  input clob;
  params clob;
  output clob;
begin
  input := 'What is Oracle Text?';

  params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/generateText",
  "model": "generate.modelname"
}';

  output := dbms_vector_chain.utl_to_generate_text(input, json(params));
  dbms_output.put_line(output);
  if output is not null then
    dbms_lob.freetemporary(output);
  end if;
exception
  when OTHERS THEN
    DBMS_OUTPUT.PUT_LINE (SQLERRM);
    DBMS_OUTPUT.PUT_LINE (SQLCODE);
end;
/
```

To run an end-to-end example scenario using this function, see [Generate Text for a Prompt: PL/SQL Example](#) in *Oracle Database AI Vector Search User's Guide*.

206.1.10 UTL_TO_TEXT

Use the `DBMS_VECTOR_CHAIN.UTL_TO_TEXT` chainable utility function to convert an input document (for example, PDF, DOC, JSON, XML, or HTML) to plain text.

Purpose

To perform a file to text transformation by using the Oracle Text component (`CONTEXT`) of Oracle Database.

Syntax

```
DBMS_VECTOR_CHAIN.UTL_TO_TEXT (
    DATA          IN CLOB | BLOB,
    PARAMS        IN JSON default NULL
) return CLOB;
```

DATA

This function accepts the input data type as `CLOB` or `BLOB`.

It returns a plain text version of the document as `CLOB`.

You can either pass the input document directly to the API or specify a file stored in Oracle Database.

For a complete list of all the supported document formats, see *Oracle Text Reference*.

PARAMS

Specify the following input parameter in JSON format:

```
{
  "plaintext": "true or false",
  "charset": "UTF8"
}
```

Table 206-10 Parameter Details

Parameter	Description
<code>plaintext</code>	Plain text output. The default value for this parameter is <code>TRUE</code> , that is, by default the output format is plain text. If you do not want to return the document as plain text, then set this parameter to <code>FALSE</code> .
<code>charset</code>	Character set encoding. Currently, only <code>UTF8</code> is supported.

Example

```
select DBMS_VECTOR_CHAIN.UTL_TO_TEXT (
    t.blobdata,
```

```

        json('{
            "plaintext": "true",
            "charset": "UTF8"
        }')
    ) from tab t;

```

To run an end-to-end example scenario using this function, see Step By Step Convert File to Text to Chunks to Embeddings in *Oracle Database AI Vector Search User's Guide*.

206.1.11 UTL_TO_SUMMARY

Use the `DBMS_VECTOR_CHAIN.UTL_TO_SUMMARY` chainable utility function to convert plain text to a summary.

Purpose

To perform a text to summary transformation by accessing:

- Oracle Database as the AI service provider: Uses a document gist (or summary) generated by Oracle Text (default setting)
- Third-party summarization model: Makes a REST API call to your chosen third-party AI service provider, such as Cohere, Google AI, Hugging Face, Oracle Cloud Infrastructure (OCI) Generative AI, OpenAI, or Vertex AI

A summary is a short and concise extract with key features of a document that best represents what the document is about as a whole. A summary can be free-form paragraphs or bullet points based on the format that you specify.

Syntax

```

DBMS_VECTOR_CHAIN.UTL_TO_SUMMARY (
    DATA          IN CLOB,
    PARAMS        IN JSON default NULL
) return CLOB;

```

DATA

This function accepts the input data type as `CLOB`.

It returns a summary of the input document in plain text as `CLOB`.

PARAMS

Specify input parameters in JSON format, depending on the service provider that you want to use for text summarization.

If using Oracle Database as the provider:

```

{
    "provider": "database",
    "glevel": "<summary format>",
    "numParagraphs": <number in the range 1-16>,
    "maxPercent": <number in the range 1-100>,
    "num_themes": <number in the range 1-50>,
}

```

```

    "language": "<name of the language>"
  }

```

Table 206-11 Database Provider Parameter Details

Parameter	Description
provider	Specify DATABASE (default setting) to access Oracle Database as the provider. Oracle Text is internally used to extract a document gist or summary from user data.
glevel	Format to display the summary: <ul style="list-style-type: none"> SENTENCE S: As a list of sentences PARAGRAPH P: In a free-form paragraph
numParagraphs	Maximum number of document paragraphs (or sentences) selected for the summary. The default value is 16. The numParagraphs parameter is used only when this parameter yields a smaller summary size than the summary size yielded by the maxPercent parameter, because the function always returns the smallest size summary.
maxPercent	Maximum number of document paragraphs (or sentences) selected for the summary, as a percentage of the total paragraphs (or sentences) in the document. The default value is 10. The maxPercent parameter is used only when this parameter yields a smaller summary size than the summary size yielded by the numParagraphs parameter, because the function always returns the smallest size summary.
num_themes	Number of theme summaries to produce. For example, if you specify 10, then this function returns the top 10 theme summaries. If you specify 0 or NULL, then this function returns all themes in a document. The default value is 50. If the document contains more than 50 themes, only the top 50 themes show conceptual hierarchy.
language	Language name of your summary text, as listed in Supported Languages and Data File Locations .

If using a third-party provider:

Set the following parameters along with additional summarization parameters specific to your provider:

```

{
  "provider": "<AI service provider>",
  "credential_name": "<credential name>",
  "url": "<REST endpoint URL for summarization service>",
  "model": "<REST provider summarization model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,
  "<REST provider parameter>": "<additional REST provider parameters>"
}

```

Table 206-12 Third-Party Provider Parameter Details

Parameter	Description
<code>provider</code>	<p>Third-party service provider that you want to access to get the summary. A REST call is made to the specified provider to access its text summarization model.</p> <p>Specify one of the following values:</p> <ul style="list-style-type: none"> • Cohere • GoogleAI • HuggingFace • OCIGenAI • OpenAI • VertexAI
<code>credential_name</code>	<p>Name of the credential in the form: <i>schema.credential_name</i></p> <p>A credential name holds authentication credentials to enable access to your provider for making REST API calls.</p> <p>You need to first set up your credential by calling the <code>DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL</code> helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL.</p>
<code>url</code>	URL of the API endpoint for each REST call.
<code>model</code>	<p>Name of the third-party text summarization model in the form: <i>schema.model_name</i></p> <p>If the model name is not schema-qualified, then the schema of the procedure invoker is used.</p> <p>Note: For Generative AI, you must specify <i>schema.model_name</i>.</p>
<code>transfer_timeout</code>	<p>Maximum time to wait for the request to complete.</p> <p>The default value is 60 seconds. You can increase this value for busy web servers.</p>

Additional REST provider parameters:

Cohere example:

```
{
  "provider": "cohere",

  "url": "https://api.cohere.example.com/summarize",
  "model": "summarize-model",
  "length": "medium",
  "format": "paragraph",
  "temperature": 1.0
}
```

Google AI example:

```
{
  "provider": "googleai",
  "credential_name": "GOOGLEAI_CRED",
}
```

```

    "url": "https://googleapis.example.com/models/",
    "model": "summarize-model",
    "generation_config": {
      "temperature": 0.9,
      "topP": 1,
      "candidateCount": 1,
      "maxOutputTokens": 256
    }
  }
}

```

Hugging Face example:

```

{
  "provider": "huggingface",
  "credential_name": "HF_CRED",
  "url": "https://api.huggingface.example.co/models/",
  "model": "summarize-model",
  "wait_for_model": "true"
}

```

Generative AI example:

```

{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/summarizeText",
  "model": "summarize-model",
  "length": "medium",
  "format": "paragraph"
}

```

OpenAI example:

```

{
  "provider": "openai",
  "credential_name": "OPENAI_CRED",
  "url": "https://api.openai.example.com",
  "model": "summarize-model",
  "max_tokens": 256,
  "temperature": 1.0
}

```

Vertex AI example:

```

{
  "provider": "vertexai",
  "credential_name": "VERTEXAI_CRED",
  "url": "https://googleapis.example.com/models/",
  "model": "summarize-model",
  "generation_config": {
    "temperature": 0.9,
    "topP": 1,

```

```

        "candidateCount": 1,
        "maxOutputTokens": 256
    }
}

```

Table 206-13 Additional REST Provider Parameter Details

Parameter	Description
length	<p>Approximate length of the summary text:</p> <ul style="list-style-type: none"> SHORT: Roughly up to 2 sentences MEDIUM: Between 3 and 5 sentences LONG: 6 or more sentences AUTO: The model chooses a length based on the input size <p>Note: For Generative AI, you must enter this value in uppercase.</p>
format	<p>Format to display the summary:</p> <ul style="list-style-type: none"> PARAGRAPH: In a free-form paragraph BULLETS: In bullet points <p>Note: For Generative AI, you must enter this value in uppercase.</p>
temperature	<p>Degree of randomness used when generating output text, in the range of 0.0–5.0.</p> <p>To generate the same output for a prompt, use 0. To generate a random new text for that prompt, increase the temperature.</p> <p>Default temperature is 1 and the maximum temperature is 5.</p> <p>Note: To summarize a text, start with the temperature set to 0. If you do not require random results, a recommended temperature value is 0.2 for Generative AI and between 0 and 1 for Cohere. Use a higher value if for example you plan to perform a selection of the various summaries afterward. Do not use a high temperature for summarization because a high temperature encourages the model to produce creative text, which might also include hallucinations.</p>
extractiveness	<p>How much to reuse the input in the summary:</p> <ul style="list-style-type: none"> LOW: Summaries with low extractiveness tend to paraphrase. HIGH: Summaries with high extractiveness lean toward reusing sentences verbatim. <p>Note: For Generative AI, you must enter this value in uppercase.</p>
max_tokens	Maximum number of tokens in the output text.
topP	<p>Probability of tokens in the output, in the range of 0.0–1.0.</p> <p>A lower value provides less random responses and a higher value provides more random responses.</p>
candidateCount	Number of response variations to return, in the range of 1–4.
maxOutputTokens	Maximum number of tokens to generate for each response.
wait_for_model	Whether to wait for the model when it is not ready, as TRUE or FALSE.

Note:

When you enter the length, format, and extractiveness values for Generative AI, ensure to enter them in uppercase letters.

For more information on additional parameters, refer to your third-party provider's documentation.

Examples

These statements generate a summary from an extract on "Transactions", by accessing the Generative AI summarization model.

```
-- select example

var params clob;
exec :params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/summarizeText",
  "model": "summarize.modelname",
  "temperature": "0.0",
  "extractiveness": "LOW"
}';

select dbms_vector_chain.utl_to_summary(
  'A transaction is a logical, atomic unit of work that contains one or
  more SQL statements. An RDBMS must be able to group SQL statements so
  that they are either all committed, which means they are applied to
  the database, or all rolled back, which means they are undone. An
  illustration of the need for transactions is a funds transfer from a
  savings account to a checking account. The transfer consists of the
  following separate operations:
    1. Decrease the savings account.
    2. Increase the checking account.
    3. Record the transaction in the transaction journal.
  Oracle Database guarantees that all three operations succeed or
  fail as a unit. For example, if a hardware failure prevents a
  statement in the transaction from executing, then the other statements
  must be rolled back.
  Transactions set Oracle Database apart from a file system. If you
  perform an atomic operation that updates several files, and if the
  system fails halfway through, then the files will not be consistent.
  In contrast, a transaction moves an Oracle database from one
  consistent state to another. The basic principle of a transaction is
  "all or nothing": an atomic operation succeeds or fails as a whole.',
  json(:params)) from dual;

-- PL/SQL example

declare
  input clob;
  params clob;
  output clob;
begin
  input := 'A transaction is a logical, atomic unit of work that

Related Topics

- [CREATE_LANG_DATA](#)
Use the `DBMS_VECTOR_CHAIN.CREATE_LANG_DATA` chunker helper procedure to load your own language data file into the database.

DBMS_WARNING

The `DBMS_WARNING` package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the `PLSQL_WARNINGS` initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_WARNING Subprograms](#)

207.1 DBMS_WARNING Security Model

Note that for all the following interfaces, if value of the scope parameter is `SYSTEM`, then the user must have `ALTER SYSTEM` privilege.

207.2 Summary of DBMS_WARNING Subprograms

This table lists the `DBMS_WARNING` subprograms and briefly describes them.

Table 207-1 *DBMS_WARNING Package Subprograms*

Subprogram	Description
ADD_WARNING_SETTING_CAT Procedure	Modifies the current <code>session</code> or <code>system</code> warning settings of the <code>warning_category</code> previously supplied
ADD_WARNING_SETTING_NUM Procedure	Modifies the current <code>session</code> or <code>system</code> warning settings of the or <code>warning_number</code> previously supplied
GET_CATEGORY Function	Returns the category name, given the message number
GET_WARNING_SETTING_CAT Function	Returns the specific warning category in the session
GET_WARNING_SETTING_NUM Function	Returns the specific warning number in the session
GET_WARNING_SETTING_STRING Function	Returns the entire warning string for the current session
SET_WARNING_SETTING_STRING Procedure	Replaces previous settings with the new value

207.2.1 ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied in this procedure. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE/DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
    warning_category  IN   VARCHAR2,
    warning_value     IN   VARCHAR2,
    scope             IN   VARCHAR2);
```

Parameters

Table 207-2 ADD_WARNING_SETTING_CAT Procedure Parameters

Parameter	Description
<code>warning_category</code>	Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.
<code>warning_value</code>	Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.
<code>scope</code>	Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.

207.2.2 ADD_WARNING_SETTING_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied in this procedure. If the value was already set, you will override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE / DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
    warning_number    IN   NUMBER,
    warning_value     IN   VARCHAR2,
    scope             IN   VARCHAR2);
```

Parameters

Table 207-3 ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
<code>warning_number</code>	The warning number. Allowed values are all valid warning numbers.

Table 207-3 (Cont.) ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
warning_value	Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.
scope	Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.

Example 207-1 Enabling the Deprecation Warnings

This example shows how to enable the DEPRECATE pragma warnings using the DBMS_WARNING package for the session.

```
BEGIN
  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6019,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6020,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6021,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6022,
                                         'ENABLE',
                                         'SESSION');
END;
```

207.2.3 GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

```
DBMS_WARNING.GET_CATEGORY (
  warning_number IN pls_integer)
RETURN VARCHAR2;
```

Parameters**Table 207-4 GET_CATEGORY Function Parameters**

Parameter	Description
warning_number	The warning message number.

207.2.4 GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (  
    warning_category IN VARCHAR2)  
RETURN warning_value;
```

Parameters

Table 207-5 GET_WARNING_SETTING_CAT Function Parameters

Parameter	Description
warning_category	Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).

207.2.5 GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (  
    warning_number IN NUMBER)  
RETURN warning_value;
```

Parameters

Table 207-6 GET_WARNING_SETTING_NUM Function Parameters

Parameter	Description
warning_number	Warning number. Allowed values are all valid warning numbers.

207.2.6 GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING  
RETURN VARCHAR2;
```

Usage Notes

Use this function when you do not have `SELECT` or `READ` privilege on `v$parameter` or `v$parameter2` fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using `SET_WARNING_SETTING_STRING`.

207.2.7 SET_WARNING_SETTING_STRING Procedure

This procedure replaces previous settings with the new value.

The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an ALTER SESSION or SYSTEM SET PLSQL_WARNINGS command. This will have same effect as ALTER SESSION or ALTER SYSTEM command.

Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (  
    warning_value  IN  VARCHAR2,  
    scope         IN  VARCHAR2);
```

Parameters

Table 207-7 SET_WARNING_SETTING_STRING Procedure Parameters

Parameter	Description
warning_value	The new string that will constitute the new value.
scope	This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM.

DBMS_WM

The `DBMS_WM` package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

For a complete description of this package, see `DBMS_WM` in the *Oracle Database Workspace Manager Developer's Guide*.

DBMS_WORKLOAD_CAPTURE

The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

Replay of this capture is implemented by way of the `DBMS_WORKLOAD_REPLAY` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_WORKLOAD_CAPTURE Subprograms](#)

See Also:

Oracle Database Testing Guide for more information about database replay

209.1 DBMS_WORKLOAD_CAPTURE Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.

209.2 DBMS_WORKLOAD_CAPTURE Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_CAPTURE`.

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;
```

```
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
```

```
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
```

```
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrcc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

209.3 Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table lists the DBMS_WORKLOAD_CAPTURE package subprograms in alphabetical order.

Table 209-1 DBMS_WORKLOAD_CAPTURE Package Subprograms

Subprogram	Description
ADD_FILTER Procedure	Adds a specified filter
DECRYPT_CAPTURE Procedure	This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.
DELETE_CAPTURE_INFO Procedure	Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID
DELETE_FILTER Procedure	Deletes a specified filter
ENCRYPT_CAPTURE Procedure	This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256.
EXPORT_AWR Procedure	Exports the AWR snapshots associated with a given capture ID
FINISH_CAPTURE Procedure	Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured
GET_CAPTURE_INFO Function	Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID
IMPORT_AWR Function	Imports the AWR snapshots associated with a given capture ID
REPORT Function	Returns a report on the workload capture under consideration using one or more different sources
START_CAPTURE Procedure	Initiates workload capture on all instances

209.3.1 ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
    fname          IN   VARCHAR2 NOT NULL,
    fattribute     IN   VARCHAR2 NOT NULL,
    fvalue        IN   VARCHAR2 NOT NULL);
```

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
    fname          IN   VARCHAR2 NOT NULL,
    fattribute     IN   VARCHAR2 NOT NULL,
    fvalue        IN   NUMBER NOT NULL);
```

Parameters

Table 209-2 ADD_FILTER Procedure Parameters

Parameter	Description
fname	Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: <ul style="list-style-type: none"> INSTANCE_NUMBER - type NUMBER USER - type STRING MODULE - type STRING ACTION - type STRING PROGRAM - type STRING SERVICE - type STRING PDB_NAME - type STRING
fvalue	Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory).

Usage Notes

- The workload capture filters work in either the `DEFAULT INCLUSION` or the `DEFAULT EXCLUSION` mode as determined by the `default_action` input to the [START_CAPTURE Procedure](#).
- `ADD_FILTER` adds a new filter that affects the next workload capture, and whether the filters are considered as `INCLUSION` filters or `EXCLUSION` filters depends on the value of the `default_action` input to [START_CAPTURE Procedure](#).
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the [START_CAPTURE Procedure](#) is executed.
- All the filters are listed in the `DBA_WORKLOAD_FILTERS` view.

- You can capture the workload for a particular PDB by specifying a filter of PDB type.

Examples

- By default, a capture works in an `INCLUSION` mode, which records everything except for those requests that satisfy conditions of specified filters. For example, if you want to exclude all requests from `SCOTT`, you can add the following filter before starting a capture.

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user1', 'USER', 'SCOTT');
```

- Multiple filters are evaluated according to the logical disjunction operator `OR`. Therefore, if you want to record workload for both `SCOTT` and `JOHN`, you add an additional filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user2', 'USER', 'JOHN');
```

- In a CDB, you exclude the workload of a particular PDB by the filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter pdb workload', 'PDB_NAME',  
'CDB1_PDB1');
```

- To use [DBMS_APPLICATION_INFO](#) to identify workload that is issued to the database:

```
DBMS_APPLICATION_INFO.SET_MODULE('ORDER_ENTRY', NULL);  
-- run some SQL here  
DBMS_APPLICATION_INFO.SET_ACTION('ORDER_ENTRY_LOG');  
-- run logging SQL
```

- If having captured workload, you want to exclude the logging SQL from the captured, specify a filter for capture:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter logging operations', 'ACTION',  
'ORDER_ENTRY_LOG');
```

- To filter out the full order entry transaction, define a filter:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter order entry', 'MODULE',  
'ORDER_ENTRY');
```

209.3.2 DECRYPT_CAPTURE Procedure

This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DECRYPT_CAPTURE (  
  src_dir          IN  VARCHAR2,  
  dst_dir          IN  VARCHAR2);
```

Parameters

Table 209-3 DECRYPT_CAPTURE Procedure Parameters

Parameter	Description
src_dir	A directory object pointing to the workload capture to be decrypted. This parameter is case sensitive.
dst_dir	A directory object pointing to an OS path that has write permissions. The decrypted capture files will be written to this directory This parameter is case sensitive.

Usage Notes

This procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

209.3.3 DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views that corresponds to the given workload capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
  (capture_id IN NUMBER);
```

Parameters

Table 209-4 DELETE_CAPTURE_INFO Procedure Parameters

Parameter	Description
capture_id	ID of the workload capture that needs to be deleted. Corresponds to <code>DBA_WORKLOAD_CAPTURES.ID</code> . (Mandatory)

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

209.3.4 DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
  filter_name IN VARCHAR2(40) NOT NULL);
```

Parameters

Table 209-5 DELETE_FILTER Procedure Parameters

Parameter	Description
filter_name	Filter to be deleted

Usage Notes

The `DELETE_FILTER` Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the [ADD_FILTER Procedures](#) after any capture has been completed. Filters that have been added using `ADD_FILTER` before a `START_CAPTURE` and `FINISH_CAPTURE` cannot be deleted anymore using this subprogram.

209.3.5 ENCRYPT_CAPTURE Procedure

This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256. To encrypt capture on the fly, use encryption parameter in `START_CAPTURE` procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ENCRYPT_CAPTURE
  src_dir      IN VARCHAR2,
  dst_dir      IN VARCHAR2,
  encryption   IN VARCHAR2 DEFAULT 'AES256');
```

Parameters

Table 209-6 ENCRYPT_CAPTURE Procedure Parameters

Parameter	Description
src_dir	A directory object pointing to the workload capture to be encrypted. The parameter value is case sensitive.
dst_dir	A directory object pointing to an OS path that has write permissions. The encrypted capture files will be written to this directory. The parameter value is case sensitive.
encryption	Specifies if sensitive data in workload capture is encrypted or not. The possible values are: AES128, AES192, and AES256. The default value is AES256.

Usage Notes

For encrypted capture, the `ENCRYPT_CAPTURE` Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

209.3.6 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
    capture_id    IN NUMBER);
```

Parameters

Table 209-7 EXPORT_AWR Procedure Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots are to be exported. (Mandatory)

Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_CAPTURES` was not created by calling the [GET_CAPTURE_INFO Function](#)) and the AWR snapshots that correspond to the original capture time period are still available.

209.3.7 FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
    timeout    IN    NUMBER    DEFAULT 30
    reason     IN    VARCHAR2  DEFAULT NULL);
```

Parameters

Table 209-8 FINISH_CAPTURE Procedure Parameters

Parameter	Description
timeout	Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush its capture buffers. Default value: 30 seconds
reason	Specifies a reason for calling the procedure. The reason appears in the column <code>ERROR_MESSAGE</code> of the view <code>DBA_WORKLOAD_CAPTURES</code> .

Usage Notes

- By default, `FINISH_CAPTURE` waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.

- All sessions that either were in the middle of executing a user request or received a new user request, while `FINISH_CAPTURE` was waiting for acknowledgements, flush their buffers and send back their acknowledgement to `FINISH_CAPTURE`.
- If a database session remains idle (waiting for the next user request) throughout the duration of `FINISH_CAPTURE`, the session might have unflushed capture buffers and does not send its acknowledgement to `FINISH_CAPTURE`.

To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking `FINISH_CAPTURE`. Either close the database session(s) before running `FINISH_CAPTURE` or send new database requests to those sessions during `FINISH_CAPTURE`.

209.3.8 GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views, and returns the appropriate `DBA_WORKLOAD_CAPTURES.ID`

Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
  dir      IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 209-9 GET_CAPTURE_INFO Function Parameters

Parameter	Description
dir	Name of the <code>DIRECTORY</code> object (case sensitive) where all the workload capture files are located (Mandatory)

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in `DBA_WORKLOAD_CAPTURES`, the [GET_CAPTURE_INFO Function](#) simply returns that row's `DBA_WORKLOAD_CAPTURES.ID`. If no existing row matches the capture present in the stipulated directory a new row is inserted to `DBA_WORKLOAD_CAPTURES` and that row's `ID` is returned.

209.3.9 IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the `EXPORT_AWR` procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
  capture_id      IN  NUMBER,
  staging_schema  IN  VARCHAR2,
  force_cleanup   IN  BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 209-10 IMPORT_AWR Function Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots should be imported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory, Case sensitive).
force_cleanup	<p>Values:</p> <ul style="list-style-type: none"> TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL: <pre>SELECT table_name FROM dba_tables WHERE owner = staging_schema AND table_name like 'WR_\$%';</pre> <p>Use this option only if you are sure that there are no important data in any such tables in the staging_schema.</p> FALSE - (default) no tables dropped from the staging_schema prior to the import operation

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

IMPORT_AWR fails if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$_SNAPSHOT or WRH\$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

Related Topics

- [EXPORT_AWR Procedure](#)
This procedure exports the AWR snapshots associated with a given capture ID.

209.3.10 REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
  capture_id      IN   NUMBER,
  format          IN   VARCHAR2)
RETURN CLOB;
```

Parameters

Table 209-11 REPORT Function Parameters

Parameter	Description
capture_id	ID of the workload capture whose capture report is required. (Mandatory) This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)

Return Values

The report body in the desired format returned as a CLOB.

Table 209-12 Constants Used by Report Function

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2 (4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2 (4)	'TEXT'	Used as input to the format argument to generate the text version of the report

209.3.11 START_CAPTURE Procedure

This procedure initiates workload capture on all instances.

Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
  name           IN  VARCHAR2,
  dir            IN  VARCHAR2,
  duration       IN  NUMBER   DEFAULT NULL,
  default_action IN  VARCHAR2 DEFAULT 'INCLUDE',
  auto_unrestrict IN BOOLEAN DEFAULT TRUE,
  capture_sts    IN  BOOLEAN DEFAULT FALSE,
  sts_cap_interval IN NUMBER  DEFAULT 300,
  plsqli_mode    IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
  encryption     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 209-13 START_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)
duration	Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.
default_action	Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. <ul style="list-style-type: none"> If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.) If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured.
auto_unrestrict	Can be either TRUE or FALSE. <ul style="list-style-type: none"> If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT) If FALSE, no database instance is automatically unrestricted.
capture_sts	If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context. Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE. The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Table 209-13 (Cont.) START_CAPTURE Procedure Parameters

Parameter	Description
plsql_mode	<p>Specifies the PL/SQL capture mode:</p> <ul style="list-style-type: none"> • TOP_LEVEL — only top-level PL/SQL calls are captured • EXTENDED — both top-level PL/SQL calls and SQL called from PL/SQL are captured
encryption	<p>Specify if sensitive data in workload capture is encrypted or not. The possible values are:</p> <ul style="list-style-type: none"> • NULL — capture files are not encrypted • AES128 — capture files are encrypted using AES128 • AES192 — capture files are encrypted using AES192 • AES256 — capture files is encrypted using AES256 <p>The default value is NULL.</p>

Usage Notes

- All user requests sent to database after a successful invocation of `START_CAPTURE` are recorded in the given `dir` directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the [FINISH_CAPTURE Procedure](#) is executed.
- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until `FINISH_CAPTURE` is executed, whichever occurs first.
- One can use workload filters (as described with regard to the [ADD_FILTER Procedures](#)) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.
- Workload that is initiated from Oracle Database background processes (such as `SMON`, `PMON`, `MMON`) and Oracle Database Scheduler Jobs (as detailed in the [DBMS_SCHEDULER](#) package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in `RESTRICTED` mode using `STARTUP RESTRICT` are `UNRESTRICTED` upon a successful invocation of `START_CAPTURE`. Use `FALSE` for the `auto_unrestrict` input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when `START_CAPTURE` is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after `START_CAPTURE` are replayed.
- For encrypted capture, the `START_CAPTURE` Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).
- You must configure a software keystore in `auto-login` mode. Otherwise, if the database is bounced during capture, the capture is automatically terminated.

210

DBMS_WORKLOAD_REPLAY

The `DBMS_WORKLOAD_REPLAY` package provides an interface to replay a workload capture.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_WORKLOAD_REPLAY Subprograms](#)

See Also:

Oracle Database Testing Guide for more information about database replay

210.1 DBMS_WORKLOAD_REPLAY Overview

The `DBMS_WORKLOAD_REPLAY` package provides an interface to replay a workload capture that was originally created by way of the `DBMS_WORKLOAD_CAPTURE` package.

Typically, the `DBMS_WORKLOAD_CAPTURE` package is used in the production system to capture a production workload, and the `DBMS_WORKLOAD_REPLAY` package is subsequently used in a test system to replay the captured production workload for testing purposes.

Related Topics

- [DBMS_WORKLOAD_CAPTURE](#)
The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

210.2 DBMS_WORKLOAD_REPLAY Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_REPLAY`.

The following code sample shows the minimum set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;  
CREATE USER rom1 IDENTIFIED BY rom1;
```

```
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;  
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
```

```
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. The Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running.

The replay client is a multithreaded program (an executable named `wrc` located in the `$ORACLE_HOME/bin` directory) where each thread submits a workload from a captured session. The OS user performing the replay must be able to execute `wrc` on hosts that are used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

210.3 Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table lists the `DBMS_WORKLOAD_REPLAY` package subprograms in alphabetical order.

Table 210-1 DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
ADD_CAPTURE Function	Adds the given capture to the current schedule
ADD_FILTER Procedure	Adds a filter to replay only a subset of the captured workload
ADD_SCHEDULE_ORDERING Function	Adds a schedule order between two captures
ASSIGN_GROUP_TO_INSTANCE Procedure	Modifies the view <code>DBA_WORKLOAD_GROUP_ASSIGNMENTS</code>
BEGIN_REPLAY_SCHEDULE Procedure	Initiates the creation of a reusable replay schedule
CALIBRATE Function	Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload
CANCEL_REPLAY Procedure	Cancels the workload replay in progress
COMPARE_PERIOD_REPORT Procedure	Generates a report comparing a replay to its capture or to another replay of the same capture
COMPARE_SQLSET_REPORT Function	Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture
CREATE_FILTER_SET Procedure	Uses the replay filters added to create a set of filters to use against the replay in <code>replay_dir</code>
DELETE_FILTER Procedure	Deletes the named filter
DELETE_REPLAY_INFO Procedure	Deletes the rows in <code>DBA_WORKLOAD_REPLAYS</code> that corresponds to the given workload replay ID
END_REPLAY_SCHEDULE Procedure	Wraps up the creation of the current schedule

Table 210-1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
EXPORT_AWR Procedure	Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
GENERATE_CAPTURE_SUBSET Procedure	Creates a new capture from an existing workload capture
GET_DIVERGING_STATEMENT Function	Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
GET_REPLAY_DIRECTORY Function	Returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure .
GET_REPLAY_INFO Function	Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory
GET_REPLAY_TIMEOUT Procedure	Retrieves the replay timeout setting
IMPORT_AWR Function	Imports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
INITIALIZE_CONSOLIDATED_REPLAY Procedure	Puts the database state in <code>INIT</code> for a multiple-capture replay
INITIALIZE_REPLAY Procedure	Initializes replay, and loads specific data produced during processing into the database
IS_REPLAY_PAUSED Function	Reports whether the replay is currently paused
LOAD_LONG_SQLTEXT Procedure	Loads the captured SQL statements that are longer than 1000 characters to the <code>DBA_WORKLOAD_LONG_SQLTEXT</code> view
PAUSE_REPLAY Procedure	Pauses the in-progress workload replay
POPULATE_DIVERGENCE Procedure	Precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls
PREPARE_CONSOLIDATED_REPLAY Procedure	Puts the database in a special "Prepare" mode for a multiple-capture replay
PREPARE_REPLAY Procedure	Puts the database in a special "Prepare" mode
PROCESS_CAPTURE Procedure	Processes the workload capture found in <code>capture_dir</code> in place
REMAP_CONNECTION Procedure	Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay
REMOVE_CAPTURE Procedure	Removes the given capture from the current schedule
REMOVE_SCHEDULE_ORDERING Procedure	Removes an existing schedule order from the current replay schedule
REPORT Function	Generates a report on the given workload replay
RESUME_REPLAY Procedure	Resumes a paused workload replay
REUSE_REPLAY_FILTER_SET Procedure	Reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function

Table 210-1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
SET_ADVANCED_PARAMETER Procedure	Sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure
SET_REPLAY_DIRECTORY Procedure	Sets a directory that contains multiple workload captures as the current replay directory
SET_REPLAY_TIMEOUT Procedure	Sets the replay timeout setting
SET_SQL_MAPPING Procedure	Specifies SQL statements to be skipped or replaced during a database replay operation
SET_USER_MAPPING Procedure	Sets a new schema or user name to be used during replay instead of the captured user
START_CONSOLIDATED_REPLAY Procedure	Starts the replay of a multiple-capture capture
START_REPLAY Procedure	Starts the workload replay
USE_FILTER_SET Procedure	Uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay

210.3.1 ADD_CAPTURE Function

This function adds the given capture to the current schedule. The directory has to be a valid capture processed in the current database's version. It returns a unique ID that identifies this capture within this schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
    capture_dir_name      IN    VARCHAR2,
    start_delay_seconds   IN    NUMBER DEFAULT 0,
    stop_replay          IN    BOOLEAN FALSE,
    take_begin_snapshot  IN    BOOLEAN TRUE,
    take_end_snapshot    IN    BOOLEAN TRUE,
    query_only           IN    BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
    capture_dir_name      IN    VARCHAR2,
    start_delay_seconds   IN    NUMBER DEFAULT 0,
    stop_replay          IN    BOOLEAN FALSE,
    take_begin_snapshot  IN    BOOLEAN TRUE,
    take_end_snapshot    IN    BOOLEAN TRUE,
    query_only           IN    VARCHAR2 DEFAULT 'N')
RETURN NUMBER;
```

Parameters

Table 210-2 ADD_CAPTURE Function Parameters

Parameter	Description
capture_dir_name	Name of the OS directory containing the capture under the replay top-level directory
start_delay_seconds	Delay time in seconds before the replay of this capture starts
stop_replay	Stop the replay after it finishes
take_begin_snapshot	Take an AWR snapshot when the replay of this capture starts
take_end_snapshot	Take an AWR snapshot when the replay of this capture finishes
query_only	Replay only the read-only queries of this workload capture

Usage Notes

The [SET_REPLAY_DIRECTORY Procedure](#) must have already been called.

210.3.2 ADD_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the [CREATE_FILTER_SET Procedure](#). This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to `CREATE_FILTER_SET` when creating the filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
    fname          IN VARCHAR2,
    fattribute     IN VARCHAR2,
    fvalue         IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
    fname          IN VARCHAR2,
    fattribute     IN VARCHAR2,
    fvalue         IN NUMBER);
```

Parameters

Table 210-3 ADD_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter. Can be used to delete the filter later if it is not required.

Table 210-3 (Cont.) ADD_FILTER Procedure Parameters

Parameter	Description
fattribute	(Mandatory) Specifies the attribute on which the filter is defined as one of the following values of type <code>STRING</code> : <ul style="list-style-type: none"> • <code>USER</code> • <code>MODULE</code> • <code>ACTION</code> • <code>PROGRAM</code> • <code>SERVICE</code> • <code>CONNECTION_STRING</code>
fvalue	(Mandatory) Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type <code>STRING</code> . Currently all the listed values of <code>fattribute</code> are of type <code>STRING</code> . <code>INSTANCE_NUMBER</code> is a <code>NUMBER</code> attribute. It is currently only supported for capture.

210.3.3 ADD_SCHEDULE_ORDERING Function

This function adds a schedule order between two captures.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD_SCHEDULE_ORDERING Function](#). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_SCHEDULE_ORDERING (
    schedule_capture_id    IN VARCHAR2,
    waitfor_capture_id     IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 210-4 ADD_SCHEDULE_ORDERING Function Parameters

Parameter	Description
<code>schedule_capture_id</code>	Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, its replay will not start until the replay of another capture specified by <code>waitfor_capture_id</code> runs to completion.
<code>waitfor_capture_id</code>	Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, the replay of capture specified by <code>schedule_capture_id</code> will not start until the replay of this capture runs to completion.

Return Values

Returns a non-zero error code if the constraint cannot be added

Usage Notes

The two captures must have already been added to the replay schedule.

210.3.4 ASSIGN_GROUP_TO_INSTANCE Procedure

This procedure modifies the view `DBA_WORKLOAD_GROUP_ASSIGNMENTS`.

Syntax

```
DBMS_WORKLOAD_REPLAY.ASSIGN_GROUP_TO_INSTANCE (
    group_id          IN INTEGER,
    instance_number  IN INTEGER);
```

Parameters

Table 210-5 ASSIGN_GROUP_TO_INSTANCE Procedure Parameters

Parameter	Description
<code>group_id</code>	The identifier of the specified group of capture files
<code>instance_number</code>	The number used for instance registration. It is equivalent to the <code>INSTANCE_NUMBER</code> column in <code>V\$INSTANCE</code> .

See Also:

- `DBA_WORKLOAD_GROUP_ASSIGNMENTS` in *Oracle Database Reference*
- `V$INSTANCE` in *Oracle Database Reference*

210.3.5 BEGIN_REPLAY_SCHEDULE Procedure

This procedure initiates the creation of a reusable replay schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.BEGIN_REPLAY_SCHEDULE (
    replay_dir_obj  IN  VARCHAR2,
    schedule_name  IN  VARCHAR2);
```

Parameters

Table 210-6 BEGIN_REPLAY_SCHEDULE Procedure Parameters

Parameter	Description
replay_dir_obj	Directory object that points to the replay directory that contains all the capture directories involved in the schedule
schedule_name	Name of the schedule to be replayed

Usage Notes

- Only one schedule can be in creation mode at a time. Calling the subprogram again before `end_replay_schedule` will raise an error.
- Prerequisites:
 - The workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
 - The user must have copied the capture directory appropriately.
 - The database is not in replay mode.
 - The [SET_REPLAY_DIRECTORY Procedure](#) has already been called.

210.3.6 CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
    capture_dir          IN VARCHAR2,
    process_per_cpu     IN BINARY_INTEGER DEFAULT 4,
    threads_per_process IN BINARY_INTEGER DEFAULT 50)
RETURN CLOB;
```

Parameters

Table 210-7 CALIBRATE Function Parameters

Parameter	Description
capture_dir	Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data
process_per_cpu	Maximum number of processes allowed for each CPU (default is 4)
threads_per_process	Maximum number of threads allowed for each process (default is 50)

Return Values

Returns a CLOB formatted as XML that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

210.3.7 CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
    error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 210-8 CANCEL_REPLAY Procedure Parameters

Parameter	Description
error_msg	An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE.

Usage Notes

Prerequisite: A call to the [INITIALIZE_REPLAY Procedure](#), or [PREPARE_REPLAY Procedure](#), or [START_REPLAY Procedure](#) was already issued.

210.3.8 COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
    replay_id1   IN   NUMBER,
    replay_id2   IN   NUMBER,
    format       IN   VARCHAR2,
    result       OUT  CLOB );
```

Parameters

Table 210-9 COMPARE_PERIOD_REPORT Procedure Parameters

Parameter	Description
replay_id1	First ID of the workload replay whose report is requested
replay_id2	Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.
result	Output of the report (CLOB)

210.3.9 COMPARE_SQLSET_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (
    replay_id1    IN NUMBER,
    replay_id2    IN NUMBER,
    format        IN VARCHAR2,
    r_level       IN VARCHAR2 DEFAULT 'ALL',
    r_sections    IN VARCHAR2 DEFAULT 'ALL',
    result        OUT CLOB )
RETURN VARCHAR2;
```

Parameters

Table 210-10 COMPARE_SQLSET_REPORT Function Parameters

Parameter	Description
replay_id1	First ID of the workload replay after a change
replay_id2	Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT.
r_level	See level parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package
r_sections	See section parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package
result	Output of the report (CLOB)

210.3.10 CREATE_FILTER_SET Procedure

This procedure creates a new filter set for the replays at `replay_dir`.

It includes all the replay filters that have already been added by the [ADD_FILTER Procedure](#). After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in `replay_dir` by calling the [USE_FILTER_SET Procedure](#).

Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET (
    replay_dir      IN  VARCHAR2,
    filter_set      IN  VARCHAR2,
    default_action  IN  VARCHAR2 DEFAULT 'INCLUDE');
```

Parameters

Table 210-11 CREATE_FILTER_SET Procedure Parameters

Parameter	Description
<code>replay_dir</code>	Object directory of the replay to be filtered
<code>filter_set</code>	Name of the filter set to create (to use in USE_FILTER_SET Procedure)
<code>default_action</code>	<p>Can be either <code>INCLUDE</code> or <code>EXCLUDE</code>. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as <code>INCLUSION</code> filters or <code>EXCLUSION</code> filters.)</p> <p>If it is <code>INCLUDE</code>, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as <code>EXCLUSION</code> filters, and will determine the workload that will not be replayed.</p> <p>If it is <code>EXCLUDE</code>, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as <code>INCLUSION</code> filters, and will determine the workload that is replayed.</p> <p>Default: <code>INCLUDE</code> and all the filters specified are assumed to be <code>EXCLUSION</code> filters</p>

Usage Notes

This operation must be invoked when no replay is initialized, prepared, or in progress.

210.3.11 DELETE_FILTER Procedure

This procedure deletes the named filter.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER (
    fname  IN  VARCHAR2);
```

Parameters

Table 210-12 DELETE_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter that must be deleted

Usage Notes

The `DELETE_FILTER` Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the [ADD_FILTER Procedures](#) after any capture has been completed. Filters that have been added using `ADD_FILTER` before a `START_CAPTURE` and `FINISH_CAPTURE` cannot be deleted anymore using this subprogram.

210.3.12 DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in `DBA_WORKLOAD_REPLAYS` that correspond to the given workload replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (
    replay_id    IN NUMBER);
```

Parameters

Table 210-13 DELETE_REPLAY_INFO Procedure Parameters

Parameter	Description
replay_id	(Mandatory) ID of the workload replay that must be deleted. Corresponds to <code>DBA_WORKLOAD_REPLAYS.ID</code>

210.3.13 END_REPLAY_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

Usage Notes

The [BEGIN_REPLAY_SCHEDULE Procedure](#) must have already been called.

210.3.14 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
    replay_id    IN NUMBER);
```

Parameters

Table 210-14 EXPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots are to be exported

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic `EXPORT_AWR` invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_REPLAYS` was not created by calling the [GET_REPLAY_INFO Function](#)) and the AWR snapshots that correspond to that replay time period are still available.

210.3.15 GENERATE_CAPTURE_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (
    input_capture_dir    IN VARCHAR2,
    output_capture_dir   IN VARCHAR2,
    new_capture_name     IN VARCHAR2,
    begin_time           IN NUMBER,
    begin_include_incomplete IN BOOLEAN DEFAULT TRUE,
    end_time             IN NUMBER,
    end_include_incomplete IN BOOLEAN DEFAULT FALSE,
    parallel_level       IN NUMBER DEFAULT NULL);
```

Parameters

Table 210-15 GENERATE_CAPTURE_SUBSET Procedure Parameters

Parameter	Description
input_capture_dir	(Mandatory) Name of the directory object that points to an existing workload capture
output_capture_dir	(Mandatory) Name of the directory object that points to the new capture

Table 210-15 (Cont.) GENERATE_CAPTURE_SUBSET Procedure Parameters

Parameter	Description
<code>new_capture_name</code>	(Mandatory) Name of new capture
<code>begin_time</code>	Start of the time range - time offset in seconds from the start of a workload capture
<code>begin_include_incomplete</code>	Column to include incomplete calls caused by <code>begin_time</code>
<code>end_time</code>	End of the time range - time offset in seconds from the start of a workload capture. If <code>end_time</code> is zero or <code>end_time</code> is less or equal than <code>begin_time</code> , the time range is invalid. The new capture will use the whole duration of the input capture.
<code>end_include_incomplete</code>	Column to include incomplete calls caused by <code>end_time</code>
<code>parallel_level</code>	Number of Oracle processes used to process the input captures in a parallel fashion. The <code>NULL</code> default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution.

210.3.16 GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
    replay_id    IN NUMBER,
    stream_id    IN NUMBER,
    call_counter IN NUMBER)
RETURN CLOB;
```

Parameters

Table 210-16 GET_DIVERGING_STATEMENT Function Parameters

Parameter	Description
<code>replay_id</code>	ID of the replay in which that call diverged
<code>stream_id</code>	Stream ID of the diverging call
<code>call_counter</code>	Call counter of the diverging call

Usage Notes

- Returns a `CLOB` formatted as XML that contains:
 - SQL ID
 - SQL Text
 - Bind information: position, name and value
- This function will silently invoke the [POPULATE_DIVERGENCE Procedure](#) to read the information from the capture files. Therefore, if divergence has not been

populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.

210.3.17 GET_REPLAY_DIRECTORY Function

This function returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure. It returns NULL if no replay directory has been set.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY
RETURN VARCHAR2;
```

Related Topics

- [SET_REPLAY_DIRECTORY Procedure](#)
This procedure sets a directory that contains multiple workload captures as the current replay directory.

210.3.18 GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
    replay_dir    IN VARCHAR2,
    load_details  IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 210-17 GET_REPLAY_INFO Function Parameters

Parameter	Description
replay_dir	(Mandatory) Name of the workload replay directory object (case sensitive).
load_details	Load the divergence and tracked commits data. The default value is FALSE.

Return Values

The procedure returns the CAPTURE_ID, which can be associated with both DBA_WORKLOAD_CAPTURES.ID and DBA_WORKLOAD_REPLAYS.CAPTURE_ID to access the imported information.

Usage Notes

- The procedure first imports a row into DBA_WORKLOAD_CAPTURES which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into DBA_WORKLOAD_REPLAYS.

- The procedure will not insert new rows to DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_REPLAYS if these views already contain rows describing the capture and replay history present in the given directory.

210.3.19 GET_REPLAY_TIMEOUT Procedure

This procedure gets the replay timeout setting.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
    enabled      OUT  BOOLEAN,
    min_delay    OUT  NUMBER,
    max_delay    OUT  NUMBER,
    delay_factor OUT  NUMBER);
```

Parameters

Table 210-18 GET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
enabled	TRUE if the timeout action is enabled, FALSE otherwise.
min_delay	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay.
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor.

Usage Notes

This procedure can be called anytime during replay.

210.3.20 IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
    replay_id      IN  NUMBER,
    staging_schema IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 210-19 IMPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots must be imported
staging_schema	(Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input.

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the [EXPORT_AWR Procedure](#).
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$_SNAPSHOT or WRH\$_PARAMETER. Drop any such tables in the staging_schema before invoking IMPORT_AWR.

210.3.21 INITIALIZE_CONSOLIDATED_REPLAY Procedure

This procedure puts the database state in INIT for a multiple-capture replay.

It uses the replay_dir which has already been defined by the [SET_REPLAY_DIRECTORY Procedure](#), pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule schedule_name from the directory, and loads required connection data into the replay system.

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONSOLIDATED_REPLAY (
    replay_name      IN    VARCHAR2,
    schedule_name    IN    VARCHAR2,
    plsqli_mode      IN    VARCHAR2 DEFAULT 'TOP_LEVEL');
```

Parameters

Table 210-20 INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
schedule_name	Name of the schedule to be replayed. It must have been created through the BEGIN_REPLAY_SCHEDULE Procedure for the replay directory replay_dir.

Table 210-20 (Cont.) INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
plsql_mode	Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> • TOP_LEVEL — only top-level PL/SQL calls are replayed • EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.

Usage Notes

Prerequisites:

- Workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The [SET_REPLAY_DIRECTORY Procedure](#) has been called.

210.3.22 INITIALIZE_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
    replay_name      IN  VARCHAR2,
    replay_dir       IN  VARCHAR2,
    plsqli_mode      IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
    rac_inst_list    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 210-21 INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
replay_dir	Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data
plsqli_mode	Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> • TOP_LEVEL — only top-level PL/SQL calls are replayed • EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.

Table 210-21 (Cont.) INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
<code>rac_inst_list</code>	Specifies a list of Oracle Real Application Clusters (Oracle RAC) instances that will be used for replay. The parameter is a string of instance numbers that are separated by commas. For example: <code>rac_inst_list='1,3,5'</code>

Usage Notes

- Prerequisites:
 - Workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
 - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the `PAUSE_REPLAY` Procedure.

For instance, during capture the user may record the connection string each session used to connect to the server. The `INITIALIZE_REPLAY` Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

Elaborating on the example described in the `PROCESS_CAPTURE` Procedure, the user could invoke the following:

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
```

This command will load up the connection map and by default will set all replay time connection strings to be equal to `NULL`. A `NULL` replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the `REMAP_CONNECTION` Procedure.

- For encrypted capture, the `INITIALIZE_REPLAY` Procedure relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

Related Topics

- [PAUSE_REPLAY Procedure](#)
This procedure pauses the in-progress workload replay.
- [INITIALIZE_REPLAY Procedure](#)
This procedure puts the database state in `INIT` for `REPLAY` mode, and loads data into the replay system that is required before preparing for the replay (by executing the `PAUSE_REPLAY` Procedure).
- [PROCESS_CAPTURE Procedure](#)
This procedure processes the workload capture found in `capture_dir` in place.
- [REMAP_CONNECTION Procedure](#)
This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

210.3.23 IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED  
    RETURN BOOLEAN;
```

Return Values

Returns `TRUE` if the [PAUSE_REPLAY Procedure](#) has been called successfully and the [RESUME_REPLAY Procedure](#) has not been called yet.

Usage Notes

A call to the [START_REPLAY Procedure](#) must have already been issued as a prerequisite.

210.3.24 LOAD_LONG_SQLTEXT Procedure

This procedure loads the captured SQL statements that are longer than 1000 characters to the `DBA_WORKLOAD_LONG_SQLTEXT` view.

Syntax

```
DBMS_WORKLOAD_REPLAY.LOAD_LONG_SQLTEXT (  
    capture_id    IN NUMBER);
```

Parameters

Table 210-22 LOAD_LONG_SQLTEXT Procedure Parameters

Parameter	Description
capture_id	Internal key for the workload capture

Note:

This procedure is available starting with Oracle Database Release 18c.

See Also:

`DBA_WORKLOAD_LONG_SQLTEXT` in *Oracle Database Reference*

210.3.25 PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay.

All subsequent user calls from the replay clients will be stalled until either a call to the [RESUME_REPLAY Procedure](#) is issued or the replay is cancelled.

Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

Usage Notes

- Prerequisite: A call to the [START_REPLAY Procedure](#) must have already been issued.
- User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.

210.3.26 POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the [GET_DIVERGING_STATEMENT](#) Function returns as quickly as possible for the precomputed calls.

Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (  
    replay_id    IN    NUMBER,  
    stream_id    IN    NUMBER DEFAULT NULL,  
    call_counter IN    NUMBER DEFAULT NULL);
```

Parameters

Table 210-23 POPULATE_DIVERGENCE Procedure Parameters

Parameter	Description
replay_id	ID of the replay
stream_id	Stream ID of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given replay.
call_counter	Call counter of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given stream.

Related Topics

- [GET_DIVERGING_STATEMENT Function](#)
This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

210.3.27 PREPARE_CONSOLIDATED_REPLAY Procedure

Similar to the `PREPARE_REPLAY` Procedure, this procedure puts the database in a special "Prepare" mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
    synchronization          IN BOOLEAN,
    connect_time_scale      IN NUMBER    DEFAULT 100,
    think_time_scale        IN NUMBER    DEFAULT 100,
    think_time_auto_correct IN BOOLEAN   DEFAULT TRUE,
    capture_sts             IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval        IN NUMBER    DEFAULT 300);
```

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
    synchronization          IN VARCHAR2  DEFAULT 'SCN',
    connect_time_scale      IN NUMBER    DEFAULT 100,
    think_time_scale        IN NUMBER    DEFAULT 100,
    think_time_auto_correct IN BOOLEAN   DEFAULT TRUE,
    capture_sts             IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval        IN NUMBER    DEFAULT 300);
```

Parameters

Table 210-24 PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
<code>synchronization</code>	<p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> <code>'TIME'</code> — The synchronization will be based on the time the action took place during capture (clock-based time). <code>'SCN'</code> — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. <code>'OBJECT_ID'</code> — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses <code>BOOLEAN</code> for this parameter:</p> <ul style="list-style-type: none"> <code>TRUE</code> means <code>'SCN'</code> <code>FALSE</code> means <code>'TIME'</code>

Table 210-24 (Cont.) PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
<code>connect_time_scale</code>	Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See " Example 210-1 ".
<code>think_time_scale</code>	Scales the time elapsed between two successive user calls " Example 210-1 " from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See " Example 210-2 ".
<code>think_time_auto_correct</code>	Auto corrects the think time between calls appropriately when user calls takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See " Example 210-3 ".
<code>capture_sts</code>	If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the Automatic Workload Repository (AWR) data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.
<code>sts_cap_interval</code>	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Usage Notes

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.

Related Topics

- [PREPARE_REPLAY Procedure](#)
This procedure puts the database state in `PREPARE FOR REPLAY` mode.

210.3.28 PREPARE_REPLAY Procedure

This procedure puts the database state in `PREPARE FOR REPLAY` mode.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
  synchronization          IN BOOLEAN,
  connect_time_scale       IN NUMBER    DEFAULT 100,
  think_time_scale        IN NUMBER    DEFAULT 100,
  think_time_auto_correct  IN BOOLEAN   DEFAULT TRUE,
  scale_up_multiplier      IN NUMBER    DEFAULT 1,
```

```

capture_sts           IN BOOLEAN  DEFAULT FALSE,
sts_cap_interval      IN NUMBER   DEFAULT 300,
rac_mode              IN NUMBER   DEFAULT GLOBAL_SYNC,
query_only            IN BOOLEAN  DEFAULT FALSE);

DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
synchronization      IN VARCHAR2  DEFAULT 'SCN',
connect_time_scale    IN NUMBER   DEFAULT 100,
think_time_scale     IN NUMBER   DEFAULT 100,
think_time_auto_correct IN BOOLEAN  DEFAULT TRUE,
scale_up_multiplier   IN NUMBER   DEFAULT 1,
capture_sts           IN BOOLEAN  DEFAULT FALSE,
sts_cap_interval      IN NUMBER   DEFAULT 300),
rac_mode              IN NUMBER   DEFAULT GLOBAL_SYNC,
query_only            IN BOOLEAN  DEFAULT FALSE);

```

Parameters

Table 210-25 PREPARE_REPLAY Procedure Parameters

Parameter	Description
synchronization	<p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> 'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time). 'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. 'OBJECT_ID' — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter:</p> <ul style="list-style-type: none"> TRUE means 'SCN' FALSE means 'TIME'
connect_time_scale	<p>Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 210-1".</p>
think_time_scale	<p>Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 210-2".</p>

Table 210-25 (Cont.) PREPARE_REPLAY Procedure Parameters

Parameter	Description
<code>think_time_auto_correct</code>	Auto corrects the think time between calls appropriately when a user call takes longer to complete during replay than during the original capture. <code>DEFAULT</code> is <code>TRUE</code> which is to reduce think time if replay goes slower than capture. See "Example 210-3".
<code>scale_up_multiplier</code>	Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the <code>scale_up_multiplier</code> . However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.
<code>capture_sts</code>	If this parameter is <code>TRUE</code> , then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges (<code>ADMINISTER SQL TUNING SET</code>). The default value is <code>FALSE</code> .
<code>sts_cap_interval</code>	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.
<code>rac_mode</code>	Specifies replay options in an Oracle Real Application Cluster (Oracle RAC) environment. This parameter accepts the following values: <ul style="list-style-type: none"> <code>GLOBAL_SYNC</code> — Synchronization across all Oracle RAC instances. This is the default value. <code>PER_INSTANCE_CLIENT</code> — Synchronization is global and each WRC client handles part of the workload that is sent to only one instance. <code>PER_INSTANCE_SYNC</code> — Synchronization is local (within each instance only) and each WRC client handles part of the workload that is sent to only one instance
<code>query_only</code>	Replays only the read-only queries of the workload capture. The default value is <code>FALSE</code> .

Usage Notes

- Prerequisites:
 - The database has been initialized for replay using the [INITIALIZE_REPLAY Procedure](#).
 - Any capture time connection strings that require remapping have been already done using the [REMAP_CONNECTION Procedure](#).
- One or more external replay clients (WRC) can be started once the `PREPARE_REPLAY` procedure has been executed.
- With regard to `scale_up_multiplier`:
 - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.

- The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. `SELECT FOR UPDATE` statements are also skipped.
- Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by `think_time_scale`, `connect_time_scale`, and `think_time_auto_correct`. Also, the queries are made to wait for the appropriate commits.
- No replay data or error divergence records are generated for the scale-up sessions.
- All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

Example 210-1 Application of the `connect_time_scale` Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect (42m after)
```

If the `connect_time_scale` is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect (21m after)
```

If the `connect_time_scale` is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect (84m after)
```

Example 210-2 Application of the `think_time_scale` Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the `think_time_scale` is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
        previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
        call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min (50% of 2m) after the completion of prev
```

```

call
12:35 : Third user call completes in 9m (takes a minute longer)

```

Example 210-3 Application of the think_time_auto_correct Parameter

If the following was observed during the original workload capture:

```

12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m

```

If the think_time_scale is 100 and the think_time_auto_correct is TRUE during the workload replay, then the user calls will look something like below:

```

12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
call took) after the completion of prev call
12:52 : Third user call completes in 8m

```

210.3.29 PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in capture_dir in place.

Syntax

```

DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
capture_dir          IN   VARCHAR2,
parallel_level      IN   NUMBER DEFAULT NULL,
synchronization    IN   VARCHAR2 DEFAULT 'SCN',
plsqli_mode        IN   VARCHAR2 DEFAULT 'TOP_LEVEL');

```

Parameters

Table 210-26 PROCESS_CAPTURE Procedure Parameters

Parameter	Description
capture_dir	(Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory.
parallel_level	Number of Oracle processes used to process the capture in parallel. The NULL default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution.

Table 210-26 (Cont.) PROCESS_CAPTURE Procedure Parameters

Parameter	Description
synchronization	<p>Determines the synchronization mode that the user will be able to use for replay:</p> <ul style="list-style-type: none"> 'TIME' — When 'TIME' is selected, the replay can use 'TIME' synchronization mode only. When 'TIME' synchronization mode is used for replay, the synchronization will be based on the time the action took place during capture (clock-based time). 'SCN' — When 'SCN' is selected, the replay can use the 'TIME' or 'SCN' synchronization mode. This is the default. When 'SCN' synchronization mode is used for replay, the synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. 'OBJECT_ID' — When 'OBJECT_ID' is selected, replay can use the 'TIME', 'SCN', or 'OBJECT_ID' synchronization mode. When 'OBJECT_ID' synchronization mode is used for replay, every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This synchronization mode is deprecated.
plsql_mode	<p>Specifies the processing mode for PL/SQL:</p> <ul style="list-style-type: none"> 'TOP_LEVEL' — metadata is generated for top-level PL/SQL calls only; 'TOP_LEVEL' will be the only option for replay. 'EXTENDED' — metadata is generated for both top-level PL/SQL calls and the SQL called from PL/SQL. A new directory ppe_X.X.X.X (where the Xs represent the current Oracle version) is created under the capture root directory. Capture must have been done with this same value for the plsql_mode parameter. Replay can use either 'TOP_LEVEL' or 'EXTENDED'.

Usage Notes

- This subprogram analyzes the workload capture found in the `capture_dir` and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the `capture_dir` can be used as input to the [INITIALIZE_REPLAY Procedure](#) in order to replay the captured workload present in `capture_dir`.

- Before a workload capture can be replayed in a particular database version, the capture must be processed using `PROCESS_CAPTURE` in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory `rec_dir`:

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
```

Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.

- For encrypted capture, the `PROCESS_CAPTURE` procedure relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

210.3.30 REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    connection_id      IN NUMBER,
    replay_connection  IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    capture_number     IN VARCHAR2,
    connection_id      IN NUMBER,
    replay_connection  IN VARCHAR2);
```

Parameters

Table 210-27 REMAP_CONNECTION Procedure Parameters

Parameter	Description
<code>capture_number</code>	Pointing to a capture of the current replay schedule
<code>connection_id</code>	ID of the connection to be remapped. Corresponds to <code>DBA_WORKLOAD_CONNECTION_MAP.CONN_ID</code> .
<code>replay_connection</code>	New connection string to be used during replay

Usage Notes

- Prior to calling `REMAP_CONNECTION` all replay connection strings are set to `NULL` by default. If a `replay_connection` is `NULL`, then the replay sessions will connect as determined by the replay client's runtime environment. For example, if the environment variable `TNS_ADMIN` is defined and the user does not call the [REMAP_CONNECTION Procedure](#), then the `wrc` executable will connect to the server specified in the `tnsnames.ora` file pointed to by `TNS_ADMIN`.
- A valid `replay_connection` must specify a connect identifier or a service point. See the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as

net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.

- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

210.3.31 REMOVE_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
    schedule_capture_number    IN    NUMBER);
```

Parameters

Table 210-28 REMOVE_CAPTURE Procedure Parameters

Parameter	Description
<code>schedule_capture_number</code>	Unique ID that identifies this capture within this schedule

210.3.32 REMOVE_SCHEDULE_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD_SCHEDULE_ORDERING Function](#) (`schedule_capture_id, waitfor_capture_id`). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waitfor_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (
    schedule_capture_id    IN    NUMBER,
    waitfor_capture_id    IN    NUMBER);
```

Parameters

Table 210-29 REMOVE_SCHEDULE_ORDERING Procedure Parameters

Parameter	Description
<code>schedule_capture_id</code>	Points to a capture that has been added to the current replay schedule (see procedure description).
<code>waitfor_capture_id</code>	Points to a capture that has been added to the current replay schedule.

Usage Notes

Prerequisites:

- The [BEGIN_REPLAY_SCHEDULE Procedure](#) must have been called.
- The replay schedule order should have already been added using the [ADD_SCHEDULE_ORDERING Function](#).

210.3.33 REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
    replay_id          IN NUMBER,
    format             IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 210-30 REPORT Function Parameters

Parameter	Description
replay_id	(Mandatory) Specifies the ID of the workload replay whose report is requested.
format	(Mandatory) Specifies the report format. Valid values: <ul style="list-style-type: none"> • HTML - Generates the HTML version of the report • XML - Generates the XML version of the report • TEXT - Generates the text version of the report

Return Values

The report body in the desired format returned as a CLOB

210.3.34 RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the [PAUSE_REPLAY Procedure](#) must have already been issued.

210.3.35 REUSE_REPLAY_FILTER_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the [ADD_SCHEDULE_ORDERING Function](#).

Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the [CREATE_FILTER_SET Procedure](#) to create a new filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET (
    replay_dir IN VARCHAR2,
    filter_set IN VARCHAR2);
```

Parameters

Table 210-31 REUSE_REPLAY_FILTER_SET Procedure Parameters

Parameter	Description
replay_dir	Capture ID of the existing filter set with which it is associated
filter_set	Name of the filter set to be reused

Related Topics

- [ADD_SCHEDULE_ORDERING Function](#)
This function adds a schedule order between two captures.

210.3.36 SET_ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure.

The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
    pname IN VARCHAR2,
    pvalue IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
    pname IN VARCHAR2,
    pvalue IN NUMBER);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
    pname IN VARCHAR2,
    pvalue IN BOOLEAN);
```

Parameters

Table 210-32 SET_ADVANCED_PARAMETER Procedure Parameters

Parameter	Description
pname	Name of the parameter (case insensitive)
pvalue	Value of the parameter

Usage Notes

The current parameters and values that can be used are:

'DO_NO_WAIT_COMMITS': (default: FALSE)

This parameter controls whether the `COMMIT` issued by replay sessions is `NOWAIT`. The default value for this parameter is `FALSE`. In this case all the `COMMITs` are issued with the mode they were captured (`wait`, `no-wait`, `batch`, `no-batch`). If the parameter is set to `TRUE`, then all `COMMITs` are issued in `no-wait` mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent `COMMITs`. Setting the parameter to `TRUE` will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

Related Topics

- [PREPARE_REPLAY Procedure](#)
This procedure puts the database state in `PREPARE FOR REPLAY` mode.

210.3.37 SET_REPLAY_DIRECTORY Procedure

This procedure sets a directory that contains multiple workload captures as the current replay directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (
    replay_dir IN VARCHAR2);
```

Parameters

Table 210-33 SET_REPLAY_DIRECTORY Procedure Parameters

Parameter	Description
<code>replay_dir</code>	Name of the OS directory containing the captures for a workload consolidation

210.3.38 SET_REPLAY_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
    enabled OUT BOOLEAN DEFAULT TRUE,
    min_delay OUT NUMBER DEFAULT 10,
    max_delay OUT NUMBER DEFAULT 120,
    delay_factor OUT NUMBER DEFAULT 8);
```

Parameters

Table 210-34 SET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
<code>enabled</code>	<code>TRUE</code> to enable the timeout action, and <code>FALSE</code> to disable.
<code>min_delay</code>	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than <code>min_delay</code> . Default = 10.

Table 210-34 (Cont.) SET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8.

Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
 - The timeout action has no effect if it is not enabled.
 - If the call delay in minutes is less than a lower bound specified by parameter min_delay, then the timeout action is non-operational.
 - If the delay in minutes is more than an upper bound specified by parameter max_delay, the timeout action will abort the user call and throw ORA-15569.
 - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter delay_factor.

210.3.39 SET_SQL_MAPPING Procedure

This procedure specifies SQL statements to be skipped or replaced during a database replay operation.

Syntax

```
PROCEDURE SET_SQL_MAPPING (
  schedule_cap_id    IN NUMBER,
  sql_id             IN VARCHAR2,
  operation          IN VARCHAR2,
  replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

```
PROCEDURE SET_SQL_MAPPING (
  sql_id             IN VARCHAR2,
  operation          IN VARCHAR2,
  replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 210-35 SET_SQL_MAPPING Procedure Parameters

Parameter	Description
<code>schedule_cap_id</code>	ID of a capture in the schedule
<code>sql_id</code>	SQL identifier of the SQL statement at the time of capture
<code>operation</code>	Directs that one of the following actions be performed for the specified statement during database replay: <ul style="list-style-type: none"> 'SKIP' — Skip the SQL statement identified by <code>sql_id</code> 'REPLACE' — Replace this SQL statement identified by <code>sql_id</code> with the SQL statement in the <code>replacement_sql_text</code> parameter

Usage Notes

- `replacement_sql_text`: When 'SKIP' is specified for the `operation` parameter, this parameter is NULL. When 'REPLACE' is specified for the `operation` parameter, this parameter's value is the SQL statement to be used.
- `schedule_cap_id` is used for consolidated replay.

210.3.40 SET_USER_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
  schedule_cap_id  IN NUMBER,
  capture_user     IN VARCHAR2,
  replay_user      IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
  capture_user     IN VARCHAR2,
  replay_user      IN VARCHAR2);
```

Parameters

Table 210-36 SET_USER_MAPPING Procedure Parameters

Parameter	Description
<code>schedule_cap_id</code>	ID of the a capture in the schedule
<code>capture_user</code>	User name during the time of the workload capture
<code>replay_user</code>	User name to which captured user is remapped during replay.

Usage Notes

- A `schedule_cap_id` of NULL is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.

- If `replay_user` is set to `NULL`, then the mapping is disabled.
- After multiple calls with the same `capture_user`, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:

```
SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP
```

- The overloaded version without the `schedule_cap_id` calls the one with the `schedule_cap_id` argument by passing in `NULL`.
- Mappings are stored in a table made public through the view `DBA_WORKLOAD_USER_MAP`. To remove old mappings execute

```
DELETE * FROM DBA_WORKLOAD_USER_MAP
```

210.3.41 START_CONSOLIDATED_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;
```

Usage Notes

Prerequisites:

- The call to the [PREPARE_REPLAY Procedure](#) was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.

210.3.42 START_REPLAY Procedure

This procedure starts the workload replay.

All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

Usage Notes

- Prerequisites:
 - The call to the [PREPARE_REPLAY Procedure](#) was already issued.
 - A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

```
$ wrc mode=calibrate replaydir=.
```

210.3.43 USE_FILTER_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule.

The filter set must have been created by calling the [CREATE_FILTER_SET Procedure](#).

Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(  
    capture_number IN VARCHAR2,  
    filter_set     IN  VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(  
    filter_set     IN  VARCHAR2);
```

Parameters

Table 210-37 USE_FILTER_SET Procedure Parameters

Parameter	Description
capture_number	Pointing to a capture of the current replay schedule
filter_set	Name of the filter set

Usage Notes

The filter set must have been created by calling the [CREATE_FILTER_SET Procedure](#).

DBMS_WORKLOAD_REPOSITORY

The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Automatic Workload Repository (AWR) by performing operations, such as, managing snapshots and baselines.

The chapter contains the following topics:

- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_WORKLOAD_REPOSITORY Subprograms](#)

See Also:

Oracle Database Performance Tuning Guide for more information about the Automatic Workload Repository

211.1 DBMS_WORKLOAD_REPOSITORY Examples

This example shows how to generate an AWR text report with the `DBMS_WORKLOAD_REPOSITORY` package for database ID 1557521192, instance ID 1, snapshot IDs 5390 and 5391, and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
  DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
    1557521192, 1, 5390, 5392) );
```

You can call the `DBMS_WORKLOAD_REPOSITORY` packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (`awrrpt.sql` in this case) for the packaged function, which prompts the user for required information.

211.2 DBMS_WORKLOAD_REPOSITORY Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table types.

OBJECT Types

- [AWR_BASELINE_METRIC_TYPE](#) Object Type

TABLE Types

- [AWR_BASELINE_METRIC_TYPE_TABLE](#) Table Type
- [AWRRPT_INSTANCE_LIST_TYPE](#) Table Type

211.2.1 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE awr_baseline_metric_type AS OBJECT (
  baseline_name      VARCHAR2(64),
  dbid               NUMBER NOT NULL,
  instance_number    NUMBER NOT NULL,
  beg_time           DATE NOT NULL,
  end_time           DATE NOT NULL,
  metric_id          NUMBER NOT NULL,
  metric_name        VARCHAR2(64) NOT NULL,
  metric_unit        VARCHAR2(64) NOT NULL,
  num_interval       NUMBER NOT NULL,
  interval_size      NUMBER NOT NULL,
  average            NUMBER NOT NULL,
  minimum            NUMBER NOT NULL,
  maximum            NUMBER NOT NULL);
```

Fields

Table 211-1 AWR_BASELINE_METRIC_TYPE Fields

Field	Description
baseline_name	Name of the Baseline
dbid	Database ID for the snapshot
instance_number	Instance number for the snapshot
beg_time	Begin time of the interval
end_time	End time of the interval
metric_id	Metric ID
metric_name	Metric name
metric_unit	Unit of measurement
num_interval	Number of intervals observed
interval_size	Interval size (in hundredths of a second)
average	Average over the period
minimum	Minimum value observed
maximum	Maximum value observed

211.2.2 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRIC Function.

Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

Related Topics

- [SELECT_BASELINE_METRIC Function](#)
This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

211.2.3 DBMS_WORKLOAD_REPOSITORY AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

211.3 Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

This table lists the DBMS_WORKLOAD_REPOSITORY subprograms and briefly describes them.

Table 211-2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
ADD_COLORED_SQL Procedure	Adds a colored SQL ID
ASH_GLOBAL_REPORT_HTML Function	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.
ASH_GLOBAL_REPORT_TEXT Function	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.
ASH_REPORT_ANALYTICS Function	Displays the ASH Analytics active report
ASH_REPORT_HTML Function	Displays the ASH report in HTML
ASH_REPORT_TEXT Function	Displays the ASH report in text
AWR_DIFF_REPORT_HTML Function	Displays the AWR Diff-Diff report in HTML
AWR_DIFF_REPORT_TEXT Function	Displays the AWR Diff-Diff report in text
AWR_GLOBAL_DIFF_REPORT_HTML Functions	Displays the Global AWR Compare Periods Report in HTML

Table 211-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
AWR_GLOBAL_DIFF_REPORT_TEXT Functions	Displays the Global AWR Compare Periods Report in text
AWR_EXP Procedure	Extracts AWR data from the AWR schema into a dump file.
AWR_GLOBAL_REPORT_HTML Functions	Displays the Global AWR report in HTML
AWR_GLOBAL_REPORT_TEXT Functions	Displays the Global AWR report in text
AWR_IMP Procedure	Loads the AWR data from a dump file into the SYS schema.
AWR_REPORT_HTML Function	Displays the AWR report in HTML
AWR_REPORT_TEXT Function	Displays the AWR report in text
AWR_SET_REPORT_THRESHOLD S Procedure	Configures specified report thresholds, including the number of rows in the report
AWR_SQL_REPORT_HTML Function	Displays the AWR SQL Report in HTML format
AWR_SQL_REPORT_TEXT Function	Displays the AWR SQL Report in text format
CONTROL_RESTRICTED_SNAPSHOT Procedure	Controls the AWR snapshot creation for a database in the <i>restricted session</i> mode.
CREATE_BASELINE Functions & Procedures	Creates a single baseline
CREATE_BASELINE_TEMPLATE Procedures	Creates a baseline template
CREATE_REMOTE_SNAPSHOT Function and Procedure	Creates a manual <i>remote</i> snapshot immediately using the Remote Management Framework (RMF)
CREATE_SNAPSHOT Function and Procedure	Creates a manual <i>local</i> snapshot immediately
DROP_BASELINE Procedure	Drops a previously-defined baseline
DROP_BASELINE_TEMPLATE Procedure	Removes a baseline template that is no longer needed
DROP_SNAPSHOT_RANGE Procedure	Drops a range of snapshots
LOCAL_AWR_DBID Function	Returns the database identifier for the local AWR database
MODIFY_BASELINE_WINDOW_SIZE Procedure	Modifies the window size for the Default Moving Window Baseline
MODIFY_SNAPSHOT_SETTINGS Procedures	Modifies the snapshot settings
PURGE_SQL_DETAILS Procedure	Purges SQL details, specifically rows from <code>WRH\$_SQLTEXT</code> and <code>WRH\$_SQL_PLAN</code> that do not have corresponding rows (DBID, SQL_ID) in <code>WRH\$_SQLSTAT</code> .
REGISTER_REMOTE_DATABASE Procedures	Registers a remote database in the AWR using the Remote Management Framework (RMF)
REMOVE_COLORED_SQL Procedure	Removes a colored SQL ID
RENAME_BASELINE Procedure	Renames a baseline

Table 211-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
SELECT_BASELINE_DETAILS Function	Shows the values of the metrics corresponding to a baseline for a range of snapshots
SELECT_BASELINE_METRIC Function	Shows the values of the metrics corresponding to a baseline for all the snapshots
UNREGISTER_REMOTE_DATABASE Procedures	Removes all the statistics, metadata, and partitions of a remote database from the AWR using the Remote Management Framework (RMF)
UPDATE_DATAFILE_INFO Procedure	Updates the data file and tablespace information stored in the AWR with the current information in the database
UPDATE_OBJECT_INFO Procedure	Updates rows of WRH\$_SEG_STAT_OBJ table that represent objects in the local database

211.3.1 ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID.

If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a *TOP SQL*). Capture occurs if the SQL is found in the cursor cache at snapshot time. To uncolor the SQL, invoke the [REMOVE_COLORED_SQL Procedure](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL (
    sql_id          IN VARCHAR2,
    dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 211-3 ADD_COLORED_SQL Procedure Parameters

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional DBID, defaults to Local DBID

211.3.2 ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML (
    l_dbid          IN NUMBER,
    l_inst_num      IN VARCHAR2 ((1023)),
    l_btime         IN DATE,
    l_etime         IN DATE,
    l_options       IN NUMBER    DEFAULT 0,
```

```

l_slot_width    IN NUMBER    DEFAULT 0,
l_sid           IN NUMBER    DEFAULT NULL,
l_sql_id        IN VARCHAR2  DEFAULT NULL,
l_wait_class    IN VARCHAR2  DEFAULT NULL,
l_service_hash  IN NUMBER    DEFAULT NULL,
l_module        IN VARCHAR2  DEFAULT NULL,
l_action        IN VARCHAR2  DEFAULT NULL,
l_client_id     IN VARCHAR2  DEFAULT NULL,
l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
l_data_src      IN NUMBER    DEFAULT 0,
l_container     IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 211-4 *ASH_GLOBAL_REPORT_HTML Parameters*

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	List of instances (such as '1, 2, 3'), or NULL to report on all instances in the database
<code>l_btime</code>	The 'begin time'
<code>l_etime</code>	The 'end time'
<code>l_options</code>	Report level (currently not used)
<code>l_slot_width</code>	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.
<code>l_sid</code>	Session ID (see Usage Notes)
<code>l_sql_id</code>	SQL ID (see Usage Notes)
<code>l_wait_class</code>	Wait class name (see Usage Notes)
<code>l_service_hash</code>	Service name hash (see Usage Notes)
<code>l_module</code>	Module name (see Usage Notes)
<code>l_action</code>	Action name (see Usage Notes)
<code>l_client_id</code>	Client ID for end-to-end backtracing (see Usage Notes)
<code>l_plsql_entry</code>	PL/SQL entry point (see Usage Notes)
<code>l_data_src</code>	Ignored since the report works off of data on disk only
<code>l_container</code>	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of VARCHAR2 (1500).

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 211-5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>)	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>)	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code>)	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code>)	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>)	Yes
<code>l_data_src</code>	Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype	No

211.3.3 ASH_GLOBAL_REPORT_TEXT Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
  l_dbid          IN VARCHAR2(1023),
  l_inst_num     IN NUMBER,
```

```

l_btime      IN DATE,
l_etime      IN DATE,
l_options    IN NUMBER    DEFAULT 0,
l_slot_width IN NUMBER    DEFAULT 0,
l_sid        IN NUMBER    DEFAULT NULL,
l_sql_id     IN VARCHAR2  DEFAULT NULL,
l_wait_class IN VARCHAR2  DEFAULT NULL,
l_service_hash IN NUMBER   DEFAULT NULL,
l_module     IN VARCHAR2  DEFAULT NULL,
l_action     IN VARCHAR2  DEFAULT NULL,
l_client_id  IN VARCHAR2  DEFAULT NULL,
l_plsql_entry IN VARCHAR2  DEFAULT NULL,
l_data_src   IN NUMBER    DEFAULT 0,
l_container  IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;

```

Parameters

Table 211-6 ASH_GLOBAL_REPORT_TEXT Parameters

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
<code>l_btime</code>	The 'begin time'
<code>l_etime</code>	The 'end time'
<code>l_options</code>	Report level (currently not used)
<code>l_slot_width</code>	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.
<code>l_sid</code>	Session ID (see Usage Notes)
<code>l_sql_id</code>	SQL ID (see Usage Notes)
<code>l_wait_class</code>	Wait class name (see Usage Notes)
<code>l_service_hash</code>	Service name hash (see Usage Notes)
<code>l_module</code>	Module name (see Usage Notes)
<code>l_action</code>	Action name (see Usage Notes)
<code>l_client_id</code>	Client ID for end-to-end backtracing (see Usage Notes)
<code>l_plsql_entry</code>	PL/SQL entry point (see Usage Notes)
<code>l_data_src</code>	Ignored since the report works off of data on disk only

Table 211-6 (Cont.) ASH_GLOBAL_REPORT_TEXT Parameters

Parameter	Description
<code>l_container</code>	<p>Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code>. Behavior is as follows:</p> <ul style="list-style-type: none"> • If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of `VARCHAR2 (320)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Table 211-7 ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>)	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>)	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code>)	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code>)	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>)	Yes

Table 211-7 (Cont.) ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_plsql_entry</code>	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes
<code>l_data_src</code>	Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

211.3.4 ASH_REPORT_ANALYTICS Function

This function returns the ASH Analytics active report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_ANALYTICS(
  dbid          IN NUMBER DEFAULT NULL,
  inst_id       IN NUMBER DEFAULT NULL,
  begin_time    IN DATE,
  end_time      IN DATE,
  report_level  IN VARCHAR2 DEFAULT NULL,
  filter_list   IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 211-8 ASH_REPORT_ANALYTICS Parameters

Parameter	Description
<code>dbid</code>	Database identifier. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.
<code>inst_id</code>	Instance number of the database for which the statistics are required. If its value is set to NULL, then the statistics for the local database are returned. Its default value is NULL.
<code>begin_time</code>	The start time of the interval for which the ASH report is required.
<code>end_time</code>	The end time of the interval for which the ASH report is required.
<code>report_level</code>	Describes the list of components to build.
<code>filter_list</code>	Describes the list of filters to apply. Its default value is NULL (no filters to apply).

Return Values

Returns the ASH Analytics active report.

211.3.5 ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
    l_dbid          IN NUMBER,
    l_inst_num      IN NUMBER,
    l_btime         IN DATE,
    l_etime         IN DATE,
    l_options       IN NUMBER    DEFAULT 0,
    l_slot_width    IN NUMBER    DEFAULT 0,
    l_sid           IN NUMBER    DEFAULT NULL,
    l_sql_id        IN VARCHAR2  DEFAULT NULL,
    l_wait_class    IN VARCHAR2  DEFAULT NULL,
    l_service_hash  IN NUMBER    DEFAULT NULL,
    l_module        IN VARCHAR2  DEFAULT NULL,
    l_action        IN VARCHAR2  DEFAULT NULL,
    l_client_id     IN VARCHAR2  DEFAULT NULL,
    l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
    l_data_src      IN NUMBER    DEFAULT 0,
    l_container     IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 211-9 *ASH_REPORT_HTML Parameters*

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	Instance number
<code>l_btime</code>	The 'begin time'
<code>l_etime</code>	The 'end time'
<code>l_options</code>	Report level (currently not used)
<code>l_slot_width</code>	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.
<code>l_sid</code>	Session ID (see Usage Notes)
<code>l_sql_id</code>	SQL ID (see Usage Notes)
<code>l_wait_class</code>	Wait class name (see Usage Notes)
<code>l_service_hash</code>	Service name hash (see Usage Notes)
<code>l_module</code>	Module name (see Usage Notes)
<code>l_action</code>	Action name (see Usage Notes)
<code>l_client_id</code>	Client ID for end-to-end backtracing (see Usage Notes)
<code>l_plsql_entry</code>	PL/SQL entry point (see Usage Notes)

Table 211-9 (Cont.) ASH_REPORT_HTML Parameters

Parameter	Description
<code>l_data_src</code>	<p>Can be used to specify a data source (see Usage Notes)</p> <ul style="list-style-type: none"> • 1 => memory (V\$ACTIVE_SESSION_HISTORY) • 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
<code>l_container</code>	<p>Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V\$CONTAINERS. Behavior is as follows:</p> <ul style="list-style-type: none"> • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to

generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 211-10 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V\$SESSION.SID)	No
l_sql_id	SQL ID (for example, V\$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V\$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V\$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V\$SESSION.MODULE)	Yes
l_action	Action name (for example, V\$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V\$SESSION.CLIENT_IDENTIFIER)	Yes

211.3.6 ASH_REPORT_TEXT Function

This table function displays the ASH Spot report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT (
  l_dbid          IN NUMBER,
  l_inst_num      IN NUMBER,
  l_btime         IN DATE,
  l_etime        IN DATE,
  l_options       IN NUMBER      DEFAULT 0,
  l_slot_width   IN NUMBER      DEFAULT 0,
  l_sid          IN NUMBER      DEFAULT NULL,
  l_sql_id       IN VARCHAR2    DEFAULT NULL,
  l_wait_class   IN VARCHAR2    DEFAULT NULL,
  l_service_hash IN NUMBER      DEFAULT NULL,
  l_module       IN VARCHAR2    DEFAULT NULL,
  l_action       IN VARCHAR2    DEFAULT NULL,
  l_client_id    IN VARCHAR2    DEFAULT NULL,
  l_plsql_entry  IN VARCHAR2    DEFAULT NULL,
  l_data_src     IN NUMBER      DEFAULT 0,
  l_container    IN VARCHAR2    DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 211-11 ASH_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier

Table 211-11 (Cont.) ASH_REPORT_TEXT Parameters

Parameter	Description
<code>l_inst_num</code>	Instance number
<code>l_btime</code>	The 'begin time'
<code>l_etime</code>	The 'end time'
<code>l_options</code>	Report level (currently not used)
<code>l_slot_width</code>	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.
<code>l_sid</code>	Session ID (see Usage Notes)
<code>l_sql_id</code>	SQL ID (see Usage Notes)
<code>l_wait_class</code>	Wait class name (see Usage Notes)
<code>l_service_hash</code>	Service name hash (see Usage Notes)
<code>l_module</code>	Module name (see Usage Notes)
<code>l_action</code>	Action name (see Usage Notes)
<code>l_client_id</code>	Client ID for end-to-end backtracing (see Usage Notes)
<code>l_plsql_entry</code>	PL/SQL entry point (see Usage Notes)
<code>l_data_src</code>	Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> • 1 => memory (<code>V\$ACTIVE_SESSION_HISTORY</code>) • 2 => disk (<code>DBA_HIST_ACTIVE_SESS_HISTORY</code>) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
<code>l_container</code>	Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> • If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of `VARCHAR2 (80)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or

disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Table 211-12 ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>)	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>)	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code>)	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code>)	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>)	Yes
<code>l_plsql_entry</code>	PL/SQL entry point (for example, <code>"SYS.DBMS_LOB.*"</code>)	Yes
<code>l_data_src</code>	Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, `AND` conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

211.3.7 AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
  dbid1      IN NUMBER,
  inst_num1  IN NUMBER,
  bid1       IN NUMBER,
  eid1       IN NUMBER,
  dbid2      IN NUMBER,
  inst_num2  IN NUMBER,
  bid2       IN NUMBER,
  eid2       IN NUMBER)
RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 211-13 AWR_DIFF_REPORT_HTML Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrddrpt.sql script which prompts users for the required information.

211.3.8 AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
  dbid1      IN NUMBER,
  inst_num1  IN NUMBER,
  bid1       IN NUMBER,
  eid1       IN NUMBER,
  dbid2      IN NUMBER,
```

```

inst_num2 IN NUMBER,
bid2      IN NUMBER,
eid2      IN NUMBER)
RETURN awrrpt_text_type_table PIPELINED;

```

Parameters

Table 211-14 *AWR_DIFF_REPORT_TEXT* Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrdrpt.sql` script which prompts users for the required information.

211.3.9 AWR_EXP Procedure

This procedure extracts AWR data from the AWR schema and dump the information into a file. You can specify the snapshot range for the data that you want to extract.

Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_EXP (
  dmpfile      IN   VARCHAR2  DEFAULT 'awrdat',
  dmpdir       IN   VARCHAR2  DEFAULT 'DATA_PUMP_DIR',
  dbid         IN   NUMBER     DEFAULT NULL,
  bid         IN   NUMBER     DEFAULT 1,
  eid         IN   NUMBER     DEFAULT 1000000);

```

Parameters

Table 211-15 *AWR_EXP* Procedure Parameters

Parameter	Description
dmpfile	The prefix for the name of the extract dump file and log file. The name of the dump file where all the data from the AWR table will be written is <code>dmpfile.dmp</code> . The <code>dmpfile.log</code> log file shows the status of the export job. The default value for the prefix is <code>awrdat</code> .

Table 211-15 (Cont.) AWR_EXP Procedure Parameters

Parameter	Description
dmpdir	Name of the Directory Object for the file system directory where the extract dump file will be written. The list of Directory Objects can be queried using the DBA_DIRECTORIES view, and a new directory object can be created using the following command: create directory dmpdir as '/directory/path'. The default value is DATA_PUMP_DIR.
dbid	The database ID for the snapshots that you want to export. The default value is NULL, for the local database ID.
bid	The begin snapshot ID for snapshots to be exported. The default value is 1.
eid	The end Snapshot Id for snapshots to be exported. The default value is 10000000.

211.3.10 AWR_GLOBAL_DIFF_REPORT_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1      IN      NUMBER,
    inst_num1  IN      AWRRPT_INSTANCE_LIST_TYPE,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      AWRRPT_INSTANCE_LIST_TYPE,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1      IN      NUMBER,
    inst_num1  IN      VARCHAR2,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      VARCHAR2,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 211-16 *AWR_GLOBAL_DIFF_REPORT_HTML Function Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2 (1500).

211.3.11 AWR_GLOBAL_DIFF_REPORT_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for inst_num1 and inst_num2. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
    dbid1      IN      NUMBER,
    inst_num1  IN      AWRRPT_INSTANCE_LIST_TYPE,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      AWRRPT_INSTANCE_LIST_TYPE,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
    dbid1      IN      NUMBER,
    inst_num1  IN      VARCHAR2,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      VARCHAR2,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awdrpt_text_type_table PIPELINED;
```

Parameters

Table 211-17 AWR_GLOBAL_DIFF_REPORT_TEXT Functions Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2 (320).

211.3.12 AWR_GLOBAL_REPORT_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
    l_dbid          IN    NUMBER,
    l_inst_num      IN    AWRRPT_INSTANCE_LIST_TYPE,
    l_bid           IN    NUMBER,
    l_eid           IN    NUMBER,
    l_options       IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
    l_dbid          IN    NUMBER,
    l_inst_num      IN    VARCHAR2,
    l_bid           IN    NUMBER,
    l_eid           IN    NUMBER,
    l_options       IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 211-18 *AWR_GLOBAL_REPORT_HTML Function Parameters*

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	List of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID
<code>l_options</code>	Report level (currently not used)

Return Values

The output will be one column of `VARCHAR2(1500)`.

211.3.13 AWR_GLOBAL_REPORT_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
    l_dbid          IN    NUMBER,
    l_inst_num      IN    AWRRPT_INSTANCE_LIST_TYPE,
    l_bid           IN    NUMBER,
    l_eid           IN    NUMBER,
    l_options       IN    NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
    l_dbid          IN    NUMBER,
    l_inst_num      IN    VARCHAR2,
    l_bid           IN    NUMBER,
    l_eid           IN    NUMBER,
    l_options       IN    NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

Parameters

Table 211-19 *AWR_GLOBAL_REPORT_TEXT Function Parameters*

Parameter	Description
<code>l_dbid</code>	Database identifier

Table 211-19 (Cont.) AWR_GLOBAL_REPORT_TEXT Function Parameters

Parameter	Description
<code>l_inst_num</code>	List of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID
<code>l_options</code>	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of `VARCHAR2 (320)`.

211.3.14 AWR_IMP Procedure

This procedure loads the AWR data from a dump file into the `SYS` schema.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_IMP (
    dmpfile      IN  VARCHAR2  DEFAULT 'awrdat',
    dmpdir       IN  VARCHAR2  DEFAULT 'DATA_PUMP_DIR',
    new_dbid     IN  NUMBER     DEFAULT NULL);
```

Parameters

Table 211-20 AWR_IMP Procedure Parameters

Parameter	Description
<code>dmpfile</code>	The prefix for the name of the dump file and log file. This file will be the source of the imported AWR data. The default value is <code>awrdat</code> .
<code>dmpdir</code>	The name of the Directory Object for the file system directory where the load dump file is located. The default value is <code>DATA_PUMP_DIR</code> .
<code>new_dbid</code>	The database ID to be used instead of existing database ID.

211.3.15 AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML (
    l_dbid      IN  NUMBER,
    l_inst_num  IN  NUMBER,
    l_bid       IN  NUMBER,
    l_eid       IN  NUMBER,
```

```

l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;

```

Parameters

Table 211-21 *AWR_REPORT_HTML Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2 (1500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

211.3.16 AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT (
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;

```

Parameters

Table 211-22 *AWR_REPORT_TEXT Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID

Table 211-22 (Cont.) AWR_REPORT_TEXT Parameters

Parameter	Description
<code>l_options</code>	A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> <code>l_options - 8</code>. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of `VARCHAR2 (80)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

211.3.17 AWR_SET_REPORT_THRESHOLDS Procedure

This procedure configure specified report thresholds, including the number of rows in the report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (
  top_n_events      IN  NUMBER DEFAULT NULL,
  top_n_files       IN  NUMBER DEFAULT NULL,
  top_n_segments    IN  NUMBER DEFAULT NULL,
  top_n_services    IN  NUMBER DEFAULT NULL,
  top_n_sql          IN  NUMBER DEFAULT NULL,
  top_n_sql_max     IN  NUMBER DEFAULT NULL,
  top_sql_pct       IN  NUMBER DEFAULT NULL,
  shmem_threshold   IN  NUMBER DEFAULT NULL,
  versions_threshold IN  NUMBER DEFAULT NULL,
  top_n_disks       IN  NUMBER DEFAULT NULL,
  outlier_pct       IN  NUMBER DEFAULT NULL,
  outlier_cpu_pct   IN  NUMBER DEFAULT NULL);
```

Parameters

Table 211-23 AWR_SET_REPORT_THRESHOLDS Procedure Parameters

Parameter	Description
<code>top_n_events</code>	Number of most significant wait events to be included
<code>top_n_files</code>	Number of most active files to be included
<code>top_n_segments</code>	Number of most active segments to be included
<code>top_n_services</code>	Number of most active services to be included
<code>top_n_sql</code>	Number of most significant SQL statements to be included
<code>top_n_sql_max</code>	Number of SQL statements to be included if their activity is greater than that specified by <code>top_sql_pct</code>

Table 211-23 (Cont.) AWR_SET_REPORT_THRESHOLDS Procedure Parameters

Parameter	Description
top_sql_pct	Significance threshold for SQL statements between top_n_sql and top_n_sql_max
shmem_threshold	Shared memory low threshold
versions_threshold	Plan version count low threshold
top_n_disks	Number of cell disks with most I/O
outlier_pct	Percentage of maximum capacity before displaying outliers for Exadata sections
outlier_cpu_pct	Threshold for mean percentage CPU to display outliers

User Notes

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the AWR_SET_REPORT_THRESHOLDS procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
```

211.3.18 AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML (
    l_dbid      IN    NUMBER,
    l_inst_num  IN    NUMBER,
    l_bid       IN    NUMBER,
    l_eid       IN    NUMBER,
    l_sqlid     IN    VARCHAR2,
    l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 211-24 AWR_SQL_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_sqlid	SQL ID of statement to be analyzed

Table 211-24 (Cont.) AWR_SQL_REPORT_HTML Parameters

Parameter	Description
<code>l_options</code>	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of `VARCHAR2 (500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

211.3.19 AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT (
    l_dbid      IN    NUMBER,
    l_inst_num  IN    NUMBER,
    l_bid       IN    NUMBER,
    l_eid       IN    NUMBER,
    l_sqlid     IN    VARCHAR2,
    l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 211-25 AWR_SQL_REPORT_TEXT Parameters

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	Instance number
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID
<code>l_sqlid</code>	SQL ID of statement to be analyzed
<code>l_options</code>	Flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of `VARCHAR2 (120)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

211.3.20 CONTROL_RESTRICTED_SNAPSHOT Procedure

This procedure controls the AWR snapshot creation for a database in the *restricted session* mode. If this procedure is not used, then by default, the AWR snapshots cannot be created for a database in the *restricted session* mode. This procedure affects the local database on which it is executed.

Note:

To enable AWR snapshot creation for an Oracle RAC in the *restricted session* mode, this procedure must be executed on every database instance in the Oracle RAC.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CONTROL_RESTRICTED_SNAPSHOT (
    allow IN BOOLEAN);
```

Parameters

Table 211-26 CONTROL_RESTRICTED_SNAPSHOT Parameters

Parameter	Description
allow	This parameter can have one of the following values: <ul style="list-style-type: none"> TRUE: AWR snapshots can be created for the database in the <i>restricted session</i> mode. FALSE: AWR snapshots cannot be created for the database in the <i>restricted session</i> mode.

211.3.21 CREATE_BASELINE Functions and Procedures

This function and procedure creates a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (
    start_snap_id    IN    NUMBER,
    end_snap_id      IN    NUMBER,
    baseline_name    IN    VARCHAR2,
    dbid             IN    NUMBER DEFAULT NULL,
    expiration       IN    NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (
    start_snap_id    IN    NUMBER,
    end_snap_id      IN    NUMBER,
    baseline_name    IN    VARCHAR2,
    dbid             IN    NUMBER DEFAULT NULL,
    expiration       IN    NUMBER DEFAULT NULL)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (
    start_time       IN    DATE,
```

```

end_time          IN DATE,
baseline_name    IN VARCHAR2,
dbid              IN NUMBER DEFAULT NULL,
expiration       IN NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
start_time       IN DATE,
end_time         IN DATE,
baseline_name    IN VARCHAR2,
dbid             IN NUMBER DEFAULT NULL,
expiration       IN NUMBER DEFAULT NULL);
RETURN NUMBER;

```

Parameters

Table 211-27 CREATE_BASELINE Function & Procedure Parameters

Parameter	Description
start_snap_id	Start snapshot sequence number for the baseline.
end_snap_id	End snapshot sequence number for the baseline.
start_time	Start time for the baseline.
end_time	End time for the baseline.
baseline_name	Name of baseline.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.

Exceptions

- An error will be returned if this baseline name already exists in the system.
- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```

EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
                                                    end_snap_id   => 107,
                                                    baseline_name =>
'oltp_peakload_bl');

```

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

211.3.22 CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (
    start_time          IN DATE,
    end_time            IN DATE,
    baseline_name       IN VARCHAR2,
    template_name       IN VARCHAR2,
    expiration          IN NUMBER,
    dbid                IN NUMBER   DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (
    day_of_week         IN VARCHAR2,
    hour_in_day         IN NUMBER,
    duration            IN NUMBER,
    start_time          IN DATE,
    end_time            IN DATE,
    baseline_name_prefix IN VARCHAR2,
    template_name       IN VARCHAR2,
    expiration          IN NUMBER,
    dbid                IN NUMBER   DEFAULT NULL);
```

Parameters

Table 211-28 CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
start_time	Start Time for the baseline to be created'
end_time	End Time for the baseline to be created
baseline_name	Name of baseline to be created
template_name	Name for the template
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL
dbid	Database ID for which the baseline template needs to be used. If NULL, this takes the database identifier of the local database. Defaults to NULL.
day_of_week	Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.
hour_in_day	Value of 0-23 to specify the Hour in the Day the baseline should start
duration	Duration (in number of hours) after hour in the day that the baseline should last
baseline_name_prefix	Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.

211.3.23 CREATE_REMOTE_SNAPSHOT Function and Procedure

This function and procedure create a remote snapshot using the Remote Management Framework (RMF). The function returns the snapshot ID.

Note:

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_id      IN NUMBER,
    flush_level  IN VARCHAR2 DEFAULT 'BESTFIT');
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_id      IN NUMBER,
    flush_level  IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_name     IN VARCHAR2,
    topology_name IN VARCHAR2 DEFAULT NULL,
    flush_level   IN VARCHAR2 DEFAULT 'BESTFIT');
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_name     IN VARCHAR2,
    topology_name IN VARCHAR2 DEFAULT NULL,
    flush_level   IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

Parameters

Table 211-29 CREATE_REMOTE_SNAPSHOT Parameters

Parameter	Description
node_id	RMF node identifier of the database for which the snapshot needs to be created.
node_name	RMF node name of the database for which the snapshot needs to be created.
topology_name	RMF topology name of the database for which the snapshot needs to be created.

Table 211-29 (Cont.) CREATE_REMOTE_SNAPSHOT Parameters

Parameter	Description
flush_level	<p>The flush level can be one of the following:</p> <ul style="list-style-type: none"> • BESTFIT: Uses the default value depending on the type of snapshot being taken. • LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. • TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. • ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.

Examples

This example creates a remote snapshot of the database having the RMF node identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(10);
```

If you query the `DBA_HIST_SNAPSHOT` view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

211.3.24 CREATE_SNAPSHOT Function and Procedure

This function and procedure create a snapshot. The function returns the snapshot ID. If both, the database ID and the database name are not specified in this subprogram, then the snapshot is created for the local database on which the subprogram is executed.

Note:

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
  flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
  dbid        IN NUMBER   DEFAULT NULL,
  source_name IN VARCHAR2 DEFAULT NULL);
```

```

DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
    dbid        IN NUMBER   DEFAULT NULL,
    source_name IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;

```

Parameters

Table 211-30 CREATE_SNAPSHOT Parameters

Parameter	Description
flush_level	<p>The flush level can be one of the following:</p> <ul style="list-style-type: none"> • BESTFIT: Uses the default value depending on the type of snapshot being taken. • LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. • TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. • ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.
dbid	Database ID of the database for which the snapshot needs to be created.
source_name	Name of the database for which the snapshot needs to be created.

Examples

This example creates a snapshot of the local database with the flush level of `ALL`:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT('ALL');
```

If you query the `DBA_HIST_SNAPSHOT` view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

211.3.25 DROP_BASELINE Procedure

This procedure drops a previously-defined baseline.

Syntax

```

DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
    baseline_name IN VARCHAR2,
    cascade       IN BOOLEAN  DEFAULT FALSE,
    dbid          IN NUMBER   DEFAULT NULL);

```

Parameters

Table 211-31 DROP_BASELINE Parameters

Parameter	Description
baseline_name	Name of baseline to drop from the system
cascade	If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.
dbid	Database ID for which the baseline needs to be dropped (defaults to local DBID).

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
    baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

211.3.26 DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE (
    template_name    IN VARCHAR2,
    dbid             IN NUMBER    DEFAULT NULL);
```

Parameters

Table 211-32 DROP_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
template_name	Name of the template to remove
dbid	Database ID for which the baseline template needs to be dropped. If NULL, this takes the database identifier of the local database. Defaults to NULL.

211.3.27 DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE (
    low_snap_id     IN NUMBER,
```

```
high_snap_id IN NUMBER,
dbid         IN NUMBER  DEFAULT NULL);
```

Parameters

Table 211-33 DROP_SNAPSHOT_RANGE Procedure Parameters

Parameter	Description
low_snap_id	Low snapshot id of snapshots to drop.
high_snap_id	High snapshot id of snapshots to drop.
dbid	Database id (defaults to local DBID).

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

211.3.28 LOCAL_AWR_DBID Function

This function returns the database identifier for the local AWR database.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.LOCAL_AWR_DBID()
RETURN NUMBER;
```

211.3.29 MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(
    window_size IN NUMBER,
    dbid        IN NUMBER  DEFAULT NULL);
```

Parameters

Table 211-34 MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

Parameter	Description
window_size	New Window size for the default Moving Window Baseline, in number of days.
dbid	Database ID (defaults to local DBID).

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the [MODIFY_SNAPSHOT_SETTINGS Procedures](#) can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

211.3.30 MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The `INTERVAL` setting affects how often snapshots are automatically captured.
- The `RETENTION` setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a `NUMBER` and the second takes a `VARCHAR2` for the `topnsql` argument. The differences are described under the Parameters description.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
    retention      IN NUMBER      DEFAULT NULL,
    interval       IN NUMBER      DEFAULT NULL,
    topnsql        IN NUMBER      DEFAULT NULL,
    dbid           IN NUMBER      DEFAULT NULL,
    tablespace_name IN VARCHAR2   DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
    retention      IN NUMBER      DEFAULT NULL,
    interval       IN NUMBER      DEFAULT NULL,
    topnsql        IN VARCHAR2,
    dbid           IN NUMBER      DEFAULT NULL,
    tablespace_name IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 211-35 MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
retention	<p>New retention time (in minutes). The specified value must be in the range of <code>MIN_RETENTION</code> (1 day) to <code>MAX_RETENTION</code> (100 years).</p> <p>If <code>ZERO</code> is specified, snapshots will be retained forever. A large system-defined value will be used as the interval setting.</p> <p>If <code>NULL</code> is specified, the old value for retention is preserved.</p> <p>NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.</p>

Table 211-35 (Cont.) MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
interval	New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year). If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting. If NULL is specified, the current value is preserved.
topnsql	<ul style="list-style-type: none"> If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting. If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.
dbid	Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.
tablespace_name	Specify a user-defined tablespace for storing AWR data (snapshot data). If this parameter is not used, then AWR data is stored in the SYSAUX tablespace by default.

Examples

This example changes the `interval` setting to one hour and the `retention` setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
  interval => 60,
  retention => 20160);
```

If you query the `DBA_HIST_WR_CONTROL` table after this procedure is executed, you will see the changes to these settings.

211.3.31 PURGE_SQL_DETAILS Procedure

This procedure purges SQL details, specifically rows from `WRH$_SQLTEXT`, `WRH$_SQL_PLAN`, and `WRH$_SQL_BIND_METADATA` that do not have corresponding rows (`DBID`, `SQL_ID`) in `WRH$_SQLSTAT`.

The subprogram calls for the `DBID` for which to run the purge. If the `DBID` is not specified, the database `DBID` is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.PURGE_SQL_DETAILS (
    numrows IN NUMBER DEFAULT NULL,
    dbid    IN NUMBER DEFAULT NULL);
```

Parameters

Table 211-36 PURGE_SQL_DETAILS Procedure Parameters

Parameter	Description
numrows	Number of rows
dbid	Database ID (default to local DBID)

211.3.32 REGISTER_REMOTE_DATABASE Procedures

This procedure registers a remote database in the Automatic Workload Repository (AWR) using the Remote Management Framework (RMF).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE (
    node_id IN NUMBER);
```

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE (
    node_name      IN VARCHAR2,
    topology_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 211-37 REGISTER_REMOTE_DATABASE Parameters

Parameter	Description
node_id	RMF node identifier of the database that needs to be registered in the AWR.
node_name	RMF node name of the database that needs to be registered in the AWR.
topology_name	RMF topology name of the database that needs to be registered in the AWR.

Examples

This example registers the remote database having the RMF node identifier of 10 in the AWR:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(10);
```

211.3.33 REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(
    sql_id      IN VARCHAR2,
    dbid        IN NUMBER DEFAULT NULL);
```

Parameters

Table 211-38 REMOVE_COLORED_SQL Procedure Parameters

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional dbid, defaults to Local DBID

211.3.34 RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
    old_baseline_name  IN VARCHAR2,
    new_baseline_name  IN VARCHAR2,
    dbid                IN NUMBER  DEFAULT NULL);
```

Parameters

Table 211-39 RENAME_BASELINE Procedure Parameters

Parameter	Description
old_baseline_name	Old baseline name.
new_baseline_name	New baseline name.
dbid	Database ID for which the baseline needs to be renamed (defaults to local DBID).

211.3.35 SELECT_BASELINE_DETAILS Function

This table function shows the values of the metrics corresponding to a baseline for a range of snapshots.

This table function returns an object of [AWR_BASELINE_METRIC_TYPE Object Type](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_DETAILS(
    l_baseline_id    IN NUMBER,
    l_begin_snap     IN NUMBER DEFAULT NULL,
    l_end_snap       IN NUMBER DEFAULT NULL,
    l_dbid           IN NUMBER DEFAULT NULL)
RETURN awrbl_details_type_table PIPELINED;
```

Parameters

Table 211-40 SELECT_BASELINE_DETAILS Function Parameters

Parameter	Description
l_baseline_id	ID of the baseline for which the statistics need to be retrieved. Specifying the value 0 returns the statistics for the moving window baseline.
l_begin_snap	Start snapshot sequence number for the baseline.
l_end_snap	End snapshot sequence number for the baseline.
l_dbid	Database identifier for the baseline. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.

211.3.36 SELECT_BASELINE_METRIC Function

This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

This table function returns an object of [AWR_BASELINE_METRIC_TYPE Object Type](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC(
    l_baseline_name  IN VARCHAR2,
    l_dbid           IN NUMBER DEFAULT NULL,
    l_instance_num   IN NUMBER DEFAULT NULL)
RETURN awr_metric_type_table PIPELINED;
```

Parameters

Table 211-41 SELECT_BASELINE_METRIC Function Parameters

Parameter	Description
l_baseline_name	Name of the baseline for which the metrics need to be viewed.
l_dbid	Database identifier for the baseline. If set to NULL, the database identifier for the local database is used. Default is NULL.
l_instance_num	The instance number for which the metrics need to be viewed. If set to NULL, metrics for the local database instance are shown. Default is NULL.

211.3.37 UNREGISTER_REMOTE_DATABASE Procedures

This procedure removes all the statistics, metadata, partitions, and so on of a remote database from the Automatic Workload Repository (AWR). After executing this procedure, the remote database cannot be used for any AWR operations, such as creating remote snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE (
    node_id          IN NUMBER,
    remote_check     IN BOOLEAN  DEFAULT TRUE);
```

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE (
    node_name        IN VARCHAR2,
    topology_name    IN VARCHAR2 DEFAULT NULL,
    remote_check     IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 211-42 UNREGISTER_REMOTE_DATABASE Parameters

Parameter	Description
node_id	Identifier of the remote database whose data needs to be removed from the AWR.
node_name	Name of the remote database whose data needs to be removed from the AWR.
topology_name	RMF topology name of the remote database.
remote_check	If set to TRUE, the remote database's metadata is validated before removing its data from the AWR. This option requires the remote database to be available. If set to FALSE, the remote database's data is removed from the AWR without validating its metadata. This option must be selected to unregister a remote database that is not available (it is offline or there is a network outage).

Examples

This example removes the AWR data related to the remote database having the database identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(10);
```

211.3.38 UPDATE_DATAFILE_INFO Procedure

This procedure updates the data file and tablespace information stored in the Automatic Workload Repository (AWR) with the current information in the database. This procedure is useful when a data file or a tablespace has been moved or renamed. As this change is not always captured in the next snapshot, AWR report may not show the most current information.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_DATAFILE_INFO();
```

211.3.39 UPDATE_OBJECT_INFO Procedure

This procedure updates rows of WRH\$_SEG_STAT_OBJ table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with 'MISSING' and/or 'TRANSIENT' values in the name columns.

The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_OBJECT_INFO(  
    maxrows IN NUMBER DEFAULT 0);
```

Parameters

Table 211-43 UPDATE_OBJECT_INFO Procedure Parameters

Parameter	Description
maxrows	Maximum number of rows to be updated. Default= 0, meaning there is no limit.

DBMS_XDB

The `DBMS_XDB` package supports the following features:

**Note:**

The Oracle XML DB Repository is deprecated with Oracle Database 23ai.

Oracle recommends that you replace any functionality used in XML DB Repository with alternative technologies.

The `DBMS_XDB` package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

This chapter contains the following topics:

- [DBMS_XDB Overview](#)
- [DBMS_XDB Security Model](#)
- [DBMS_XDB Constants](#)
- [Summary of DBMS_XDB Subprograms](#)

**See Also:**

- *Oracle XML DB Developer's Guide*

212.1 DBMS_XDB Overview

`DBMS_XDB` provides a range of management functions.

The `DBMS_XDB` package supports the following features:

- The Resource Management functionality provides [LINK Procedures](#), [EXISTSRESOURCE Function](#), [LOCKRESOURCE Function](#), [GETLOCKTOKEN Procedure](#), [UNLOCKRESOURCE Function](#), [CREATERESOURCE Functions](#), [RENAMERESOURCE Procedure](#), [DELETERESOURCE Procedure](#), [GETRESOID Function](#), [CREATEOIDPATH Function](#), and [CREATEFOLDER Function](#) subprograms which complement Resource Views.

- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use [CHECKPRIVILEGES Function](#), [GETACLDOCUMENT Function](#), and [CHANGEPRIVILEGES Function](#) for Oracle Resources. [ACLCHECKPRIVILEGES Function](#) provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.
- The XDB username is created during XDB installation. This user owns a set of default tables and packages. [GETXDB_TABLESPACE Function](#) and the `DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE` Procedure enable movement of schemas to a specified tablespace, and support the default `SYSAUX` tablespace introduction

212.2 DBMS_XDB Security Model

Owned by XDB, the `DBMS_XDB` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is `SYS` or `XDB`, or the current user has the `XDBADMIN` or `DBA` role.

212.3 DBMS_XDB Constants

All constants described in the following table are deprecated in Oracle Release 12c.

They are relocated to either the [DBMS_XDB_CONFIG](#) package or the [DBMS_XDB_REPOS](#) package. The specifics of transference in each case are detailed in the **Relocated** column.

Oracle recommends that you do not use constants in their `DBMS_XDB` context in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

Table 212-1 DBMS_XDB Constants

Constant	Type	Value	Description	Relocated
<code>DELETE_RESOURCE</code>	NUMBER	1	Deletes a resource; fails if the resource has children.	<code>DBMS_XDB_REPOS</code>
<code>DELETE_RECURSIVE</code>	NUMBER	2	Deletes a resource and its children, if any.	<code>DBMS_XDB_REPOS</code>
<code>DELETE_FORCE</code>	NUMBER	3	Deletes the resource, even if the object it contains is invalid.	<code>DBMS_XDB_REPOS</code>
<code>DELETE_RECURSIVE_FORCE</code>	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid.	<code>DBMS_XDB_REPOS</code>
<code>DELETE_RES_METADATA_CASCADE</code>	NUMBER	1	Deletes the corresponding row in the metadata table	<code>DBMS_XDB_REPOS</code>
<code>DELETE_RES_METADATA_NOCASCADE</code>	NUMBER	2	Does not delete the row in the metadata table	<code>DBMS_XDB_REPOS</code>

Table 212-1 (Cont.) DBMS_XDB Constants

Constant	Type	Value	Description	Relocated
DEFAULT_LOCK_TIMEOUT CONSTANT	PLS_INTEGER	(60*60)	Default time (in seconds) after which lock will expire	DBMS_XDB_REPOS
LINK_TYPE_HARD	NUMBER	1	Type of link to be created (default)	DBMS_XDB_REPOS
LINK_TYPE_WEAK	NUMBER	2	Type of link to be created	DBMS_XDB_REPOS
LINK_TYPE_SYMBOLIC	NUMBER	3	Type of link to be created	DBMS_XDB_REPOS
ON_DENY_NEXT_CUSTOM	NUMBER	1	If access denied, the next custom authorization is tried	DBMS_XDB_CONFIG
ON_DENY_BASIC	NUMBER	2	If access denied, basic authentication is used	DBMS_XDB_CONFIG

212.4 Summary of DBMS_XDB Subprograms

This table lists the DBMS_XDB subprograms and briefly describes them.

Table 212-2 DBMS_XDB Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
APPENDRESOURCEMETADATA Procedure	Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource
CHANGEOWNER Procedure	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions	Creates a new resource
DELETERESOURCE Procedure	Deletes a resource from the hierarchy
DELETERESOURCEMETADATA Procedures	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
ENABLEDIGESTAUTHENTICATION Procedure	Enables digest authentication
EXISTSRESOURCE Function	Determines if a resource is in the hierarchy, based on its absolute path
GETACLDOCUMENT Function	Retrieves ACL document that protects resource given its path name

Table 212-2 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
GETCONTENTBLOB Function	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function	Retrieves the contents of a resource returned as a REF to an XMLTYPE
GETCONTENTXMLTYPE Function	Retrieves the contents of a resource returned as an XMLTYPE
GETHTTPREQUESTHEADER Function	Gets the values of the passed header
GETLOCKTOKEN Procedure	Returns that resource's lock token for the current user given a path to a resource
GETPRIVILEGES Function	Gets all privileges granted to the current user on a specified resource
GETRESOID Function	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function	Returns TRUE if the resource has BLOB content
HASCHARCONTENT Function	Returns TRUE if the resource has character content
HASXMLCONTENT Function	Returns TRUE if the resource has XML content
HASXMLREFERENCE Function	Returns TRUE if the resource has REF to XML content
ISFOLDER Function	Returns TRUE if the resource is a folder or container
LINK Procedures	Creates a link to an existing resource
LOCKRESOURCE Function	Gets a WebDAV-style lock on that resource given a path to that resource
PROCESSLINKS Procedure	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure	Deletes all user metadata from a resource
RENAMERESOURCE Procedure	Renames the XDB resource
SETACL Procedure	Sets the ACL on a specified resource
SPLITPATH Procedure	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure	Changes the modification time of the resource to the current time
UNLOCKRESOURCE Function	Unlocks the resource given a lock token and resource path
UPDATERESOURCEMETADATA Procedures	Updates metadata for a resource

212.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the [ACLCHECKPRIVILEGES Function](#).

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES (
  acl_path IN VARCHAR2,
  owner    IN VARCHAR2,
  privs    IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 212-3 *ACLCHECKPRIVILEGES Function Parameters*

Parameter	Description
<code>acl_path</code>	Absolute path in the Hierarchy for ACL document
<code>owner</code>	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
<code>privs</code>	An <code>XMLType</code> instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function .

212.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the [APPENDRESOURCEMETADATA Procedure](#).

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
  abspath IN VARCHAR2,
  metadata IN XMLTYPE);

DBMS_XDB.APPENDRESOURCEMETADATA (
```

```

abspath  IN  VARCHAR2,
metadata IN  REF SYS.XMLTYPE);

```

Parameters

Table 212-4 APPENDRESOURCEMETADATA Procedure

Parameter	Description
abspath	Absolute path of the resource
metadata	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a `REF` is passed in, the procedure stores the `REF` in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the `RESID` column for the metadata table. Note that the `REF` passed in must be unique. In other words, there must not be a `REF` with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a `REF` that already exists.
- In the case where the `XMLTYPE` is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

212.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner. This procedure is deprecated in Release 12c.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the [CHANGEOWNER Procedure](#).

Syntax

```

DBMS_XDB.CHANGEOWNER (
  abspath  IN  VARCHAR2,
  owner    IN  VARCHAR2,
  recurse  IN  BOOLEAN := FALSE);

```

Parameters

Table 212-5 CHANGEOWNER Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
owner	New owner for the resource
recurse	If <code>TRUE</code> , recursively change owner of all resources in the folder tree

212.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL. This procedure is deprecated in Release 12c.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [CHANGEPRIVILEGES Function](#).

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES (  
    res_path  IN    VARCHAR2,  
    ace       IN    xmltype)  
RETURN PLS_INTEGER;
```

Parameters

Table 212-6 CHANGEPRIVILEGES Function Parameters

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (*grant/deny*) already exists in the ACL, the new ACE is added at the end of the ACL.

212.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [CHECKPRIVILEGES Function](#).

Syntax

```
DBMS_XDB.CHECKPRIVILEGES (
    res_path  IN VARCHAR2,
    privs     IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 212-7 CHECKPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
privs	An XMLType instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

212.4.6 CREATEFOLDER Function

This deprecated function creates a new folder resource in the hierarchy.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [CREATEFOLDER Function](#).

Syntax

```
DBMS_XDB.CREATEFOLDER (
    path  IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 212-8 CREATEFOLDER Function Parameters

Parameter	Description
path	Path name for the new folder

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

212.4.7 CREATEOIDPATH Function

This deprecated function creates a virtual path to the resource based on object ID.

Note:

This function is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [CREATEOIDPATH Function](#).

Syntax

```
DBMS_XDB.CREATEOIDPATH(  
    oid IN RAW)  
RETURN VARCHAR2;
```

Parameters

Table 212-9 CREATEOIDPATH Function Parameters

Parameter	Description
oid	Object ID of the resource

212.4.8 CREATERESOURCE Functions

The deprecated function creates a new resource. The description of the overload options precede each version of the syntax

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [CREATERESOURCE Functions](#).

Syntax

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE(  
    abspath IN VARCHAR2,  
    datarow IN REF SYS.XMLTYPE,
```

```

    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN BLOB,
    csid         IN NUMBER :=0,
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN BFILE,
    csid         IN NUMBER :=0,
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Creates a resource with a specified CLOB as its contents:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN CLOB,
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN VARCHAR2,
    schemaurl    IN VARCHAR2 := NULL,
    elem        IN VARCHAR2 := NULL)
RETURN BOOLEAN;

```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN SYS.XMLTYPE,
    schemaurl    IN VARCHAR2 := NULL,
    elem        IN VARCHAR2 := NULL)
RETURN BOOLEAN;

```

Parameters

Table 212-10 CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.

Table 212-10 (Cont.) CREATERESOURCE Function Parameters

Parameter	Description
data	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
datarow	REF to an XMLType row to be used as the contents
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> From the abspath extension, determine the resource's MIME type. If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; Otherwise, it is defaulted to the database character set.
createfolders	If TRUE, create the parent folders if they do not exist
schemaur1	For XML data, schema URL data conforms to (default NULL)
elem	Element name (default NULL)

Return Values

TRUE if operation successful; FALSE, otherwise.

212.4.9 DELETERESOURCE Procedure

This **deprecated procedure** deletes a resource from the hierarchy.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [DELETERESOURCE Procedure](#).

Syntax

```
DBMS_XDB.DELETERESOURCE (
    path          IN          VARCHAR2,
    delete_option IN          PLS_INTEGER);
```

Parameters**Table 212-11 DELETERESOURCE Procedure Parameters**

Parameter	Description
path	Path name of the resource to delete

Table 212-11 (Cont.) DELETERESOURCE Procedure Parameters

Parameter	Description
delete_option	The option that controls how a resource is deleted; defined in Table 212-1 : <ul style="list-style-type: none"> DELETE_RESOURCE DELETE_RECURSIVE DELETE_FORCE DELETE_RECURSIVE_FORCE

212.4.10 DELETERESOURCEMETADATA Procedures

This **deprecated procedure** takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [DELETERESOURCEMETADATA Procedures](#).

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
    abspath      IN  VARCHAR2,
    metadata     IN  REF SYS.XMLTYPE,
    delete_option IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
    abspath      IN  VARCHAR2,
    metadatans   IN  VARCHAR2,
    metadataname IN  VARCHAR2,
    delete_option IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 212-12 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
metadata	REF to the piece of metadata (schema based) to be deleted

Table 212-12 (Cont.) DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
mettadatans	Namespace of the metadata fragment to be removed
mettadataname	Local name of the metadata fragment to be removed
delete_option	Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"> DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table

212.4.11 ENABLEDIGESTAUTHENTICATION Procedure

This deprecated procedure enabling digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) package - the [ENABLEDIGESTAUTHENTICATION Procedure](#).

Syntax

```
DBMS_XDB.ENABLEDIGESTAUTHENTICATION;
```

212.4.12 EXISTSRESOURCE Function

This deprecated function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [EXISTSRESOURCE Function](#).

Syntax

```
DBMS_XDB.EXISTSRESOURCE (
    abspath    IN    VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 212-13 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

212.4.13 GETACLDOCUMENT Function

This deprecated function retrieves ACL document that protects resource given its path name.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETACLDOCUMENT Function](#).

Syntax

```
DBMS_XDB.GETACLDOCUMENT(
    abspath IN VARCHAR2)
RETURN sys.xmltype;
```

Parameters

Table 212-14 GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The XMLType for ACL document.

212.4.14 GETCONTENTBLOB Function

This deprecated function retrieves the contents of a resource returned as a BLOB.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETCONTENTBLOB Function](#).

Syntax

```
DBMS_XDB.GETCONTENTBLOB(  
    abspath    IN    VARCHAR2,  
    csid       OUT   PLS_INTEGER,  
    locksrc    IN    BOOLEAN := FALSE)  
RETURN BLOB;
```

Parameters

Table 212-15 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

212.4.15 GETCONTENTCLOB Function

This deprecated function gets the contents of a resource returned as a CLOB.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETCONTENTCLOB Function](#).

Syntax

```
DBMS_XDB.GETCONTENTCLOB(  
    abspath    IN    VARCHAR2,  
    RETURN CLOB;
```

Parameters

Table 212-16 GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

212.4.16 GETCONTENTVARCHAR2 Function

This deprecated function gets the contents of a resource returned as a string.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETCONTENTVARCHAR2 Function](#).

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2 (
    abspath    IN    VARCHAR2,
    RETURN BLOB;
```

Parameters

Table 212-17 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

212.4.17 GETCONTENTXMLREF Function

This deprecated function retrieves the contents of a resource returned as a `REF` to an `XMLTYPE`.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the [GETCONTENTXMLREF Function](#).

Syntax

```
DBMS_XDB.GETCONTENTXMLREF (  
    abspath    IN    VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

Parameters

Table 212-18 GETCONTENTXMLREF Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a `REF` to an `XMLTYPE`.

212.4.18 GETCONTENTXMLTYPE Function

This deprecated function retrieves the contents of a resource returned as an `XMLTYPE`.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the [GETCONTENTXMLTYPE Function](#).

Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE (  
    abspath    IN    VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

Parameters

Table 212-19 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

212.4.19 GETHTTPREQUESTHEADER Function

This deprecated function, if called during an HTTP request serviced by XDB, returns the values of the passed header. It is used by routines that implement custom authentication.

Note:

This procedure is deprecated in Release 12c.

Syntax

```
DBMS_XDB.GETHTTPREQUESTHEADER(
    header_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 212-20 GETHTTPREQUESTHEADER Function Parameters

Parameter	Description
header_name	Passed header

Return Values

Returns NULL in case the header is not present in the request, or for AUTHENTICATION, for security reasons.

212.4.20 GETLOCKTOKEN Procedure

Given a path to a resource, this deprecated procedure returns that resource's lock token for the current user.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETLOCKTOKEN Procedure](#).

Syntax

```
DBMS_XDB.GETLOCKTOKEN (  
    path          IN    VARCHAR2,  
    locktoken     OUT   VARCHAR2);
```

Parameters

Table 212-21 GETLOCKTOKEN Procedure Parameters

Parameter	Description
path	Path name to the resource
locktoken	Logged-in user's lock token for the resource

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

212.4.21 GETPRIVILEGES Function

This deprecated function gets all privileges granted to the current user on a specified resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETPRIVILEGES Function](#).

Syntax

```
DBMS_XDB.GETPRIVILEGES (  
    res_path      IN    VARCHAR2)  
RETURN sys.xmltype;
```

Parameters

Table 212-22 GETPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

212.4.22 GETRESOID Function

This deprecated procedure returns the object ID of the resource from its absolute path.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETRESOID Function](#).

Syntax

```
DBMS_XDB.GETRESOID(
    abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 212-23 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

212.4.23 GETXDB_TABLESPACE Function

This deprecated function returns the current tablespace of the XDB (user).

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETXDB_TABLESPACE](#) Function.

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE  
RETURN VARCHAR2;
```

212.4.24 HASBLOBCONTENT Function

This deprecated function returns `TRUE` if the resource has BLOB content.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [HASBLOBCONTENT](#) Function.

Syntax

```
DBMS_XDB.HASBLOBCONTENT  
  (abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 212-24 HASBLOBCONTENT Function Parameters

Parameter	Description
<code>abspath_path</code>	Absolute path of the resource

Return Values

`TRUE` if the resource has BOB content.

212.4.25 HASCHARCONTENT Function

This deprecated function returns `TRUE` if the resource has character content.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [HASCHARCONTENT Function](#).

Syntax

```
DBMS_XDB.HASCHARCONTENT  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

Parameters

Table 212-25 HASCHARCONTENT Function Parameters

Parameter	Description
<code>abspath_path</code>	Absolute path of the resource

Return Values

`TRUE` if the resource has character content.

212.4.26 HASXMLCONTENT Function

This deprecated function returns `TRUE` if the resource has XML content.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [HASXMLCONTENT Function](#).

Syntax

```
DBMS_XDB.HASXMLCONTENT  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

Parameters

Table 212-26 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has XML content.

212.4.27 HASXMLREFERENCE Function

This deprecated function returns TRUE if the resource has a REF to XML content.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [HASXMLREFERENCE Function](#).

Syntax

```
DBMS_XDB.HASXMLREFERENCE
  (abspath IN VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 212-27 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE resource has a REF to XML content.

212.4.28 ISFOLDER Function

This deprecated function returns `TRUE` if the resource is a folder or container.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [ISFOLDER Function](#).

Syntax

```
DBMS_XDB.ISFOLDER
  abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 212-28 DBMS_XDB.ISFOLDER Function Parameters

Parameter	Description
<code>abspath_path</code>	Absolute path of the resource

Return Values

`TRUE` if the resource is a folder or container.

212.4.29 LINK Procedures

This deprecated procedure creates a link from a specified folder to a specified resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [LINK Procedures](#).

Syntax

```
DBMS_XDB.LINK(
  srcpath IN VARCHAR2,
  linkfolder IN VARCHAR2,
  linkname IN VARCHAR2);

DBMS_XDB.LINK(
  srcpath IN VARCHAR2,
  linkfolder IN VARCHAR2,
```

```

linkname    IN    VARCHAR2,
linktype    IN    PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);

```

Parameters

Table 212-29 LINK Procedure Parameters

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link
linktype	Type of link to be created: <ul style="list-style-type: none"> • DBMS_XDB.LINK_TYPE_HARD (default) • DBMS_XDB.LINK_TYPE_WEAK • DBMS_XDB.LINK_TYPE_SYMBOLIC

212.4.30 LOCKRESOURCE Function

Given a path to a resource, this deprecated function gets a WebDAV-style lock on that resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [LOCKRESOURCE Function](#).

Syntax

```

DBMS_XDB.LOCKRESOURCE (
  path      IN  VARCHAR2,
  depthzero IN  BOOLEAN,
  shared    IN  boolean)
RETURN BOOLEAN;

```

Parameters

Table 212-30 LOCKRESOURCE Function Parameters

Parameter	Description
path	Path name of the resource to lock.
depthzero	Currently not supported
shared	Passing TRUE obtains a shared write lock

Return Values

TRUE if successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

212.4.31 PROCESSLINKS Procedure

This deprecated procedure processes document links in the specified resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [PROCESSLINKS Procedure](#).

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA (
  abspath IN VARCHAR2,
  recurse IN BOOLEAN := FALSE);
```

Parameters

Table 212-31 PROCESSLINKS Procedure Parameters

Parameter	Description
<code>abspath</code>	Absolute path of the resource. If the path is a folder, use the <code>recurse</code> flag.
<code>recurse</code>	Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code> , process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code> , process links of all documents in this folder only.

212.4.32 PURGERESOURCEMETADATA Procedure

This deprecated procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [PURGERESOURCEMETADATA Procedure](#).

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA (
  abspath IN VARCHAR2);
```

Parameters

Table 212-32 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource

212.4.33 RENAMERESOURCE Procedure

This deprecated procedure renames the XDB resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [RENAMERESOURCE Procedure](#).

Syntax

```
DBMS_XDB.RENAMERESOURCE (
  srcpath   IN VARCHAR2,
  destfolder IN CARCHAR2,
  newname   IN VARCHAR2);
```

Parameters

Table 212-33 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

212.4.34 SETACL Procedure

This deprecated procedure set the ACL on a specified resource to be the ACL specified by path.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [SETACL Procedure](#).

Syntax

```
DBMS_XDB.SETACL(
  res_path  IN  VARCHAR2,
  acl_path  IN  VARCHAR2);
```

Parameters**Table 212-34 SETACL Procedure Parameters**

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have `<write-acl>` privileges on the resource.

212.4.35 SPLITPATH Procedure

This deprecated procedure splits the path into a parentpath and childpath.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [SPLITPATH Procedure](#).

Syntax

```
DBMS_XDB.SPLITPATH(
  abspath      IN  VARCHAR2,
  parentpath   OUT VARCHAR2,
  childpath    OUT VARCHAR2);
```

Parameters**Table 212-35 SPLITPATH Procedure Parameters**

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

212.4.36 TOUCHRESOURCE Procedure

This **deprecated procedure** changes the modification time of the resource to the current time.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [TOUCHRESOURCE Procedure](#).

Syntax

```
DBMS_XDB.TOUCHRESOURCE
  (abspath IN VARCHAR2);
```

Parameters

Table 212-36 DBMS_XDB.TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

212.4.37 UNLOCKRESOURCE Function

This deprecated function unlocks the resource given a lock token and a path to the resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [UNLOCKRESOURCE Function](#).

Syntax

```
DBMS_XDB.UNLOCKRESOURCE (
  path IN VARCHAR2,
  deltoken IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 212-37 UNLOCKRESOURCE Function Parameters

Parameter	Description
path	Path name to the resource

Table 212-37 (Cont.) UNLOCKRESOURCE Function Parameters

Parameter	Description
deltoken	Lock token to be removed

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

212.4.38 UPDATERESOURCEMETADATA Procedures

This deprecated procedure updates metadata for a resource.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [UPDATERESOURCEMETADATA Procedures](#).

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
  abspath IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
  abspath IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
  abspath IN VARCHAR2,
  oldns IN VARCHAR2,
  oldname IN VARCHAR,
```

```
newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (  
  abspath      IN   VARCHAR2,  
  oldns        IN   VARCHAR2,  
  oldname      IN   VARCHAR,  
  newmetadata  IN   REF SYS.XMLTYPE);
```

Parameters

Table 212-38 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
oldmetadata	REF to the old of metadata
newmetadata	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

DBMS_XA

The `DBMS_XA` package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_XA Subprograms](#)

See Also:

Oracle Database Advanced Application Developer's Guide for more information about "Developing Applications with Oracle XA"

213.1 DBMS_XA Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (`XID`) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

213.2 DBMS_XA Security Model

This package is created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`. Any `DBMS_XA` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_XA` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

`SELECT` or `READ` privilege on `SYS.DBA_PENDING_TRANSACTIONS` is required for users who need to execute `XA_RECOVER` subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.

213.3 DBMS_XA Constants

The DBMS_XA package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in [Table 213-1](#) for use in the flag field of the [XA_START Function](#) and the [XA_END Function](#).

Table 213-1 DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

Name	Type	Value	Description
TMNOFLAGS	PLS_INTEGER	00000000	Indicates no flag value is selected.
TMSUCCESS	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('04000000')	Dissociates caller from transaction branch
TMJOIN	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('00200000')	Caller is joining existing transaction branch.
TMSUSPEND	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('02000000')	Caller is suspending, not ending, association
TMRESUME	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('08000000')	Caller is resuming association with suspended transaction branch.

The DBMS_XA package uses the constants shown in [Table 213-2](#) for Possible Return Values

Table 213-2 DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBBASE	PLS_INTEGER	100	Inclusive lower bound of the rollback codes
XA_RBROLLBACK	PLS_INTEGER	XA_RBBASE	Rollback was caused by an unspecified reason
XA_RBCOMMFAIL	PLS_INTEGER	XA_RBBASE+1	Rollback was caused by a communication failure
XA_RBDEADLOCK	PLS_INTEGER	XA_RBBASE+2	Deadlock was detected
XA_RBINTEGRITY	PLS_INTEGER	XA_RBBASE+3	Condition that violates the integrity of the resources was detected
XA_RBOTHER	PLS_INTEGER	XA_RBBASE+4	Resource manager rolled back the transaction for an unlisted reason

Table 213-2 (Cont.) DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBPROTO	PLS_INTEGER	XA_RBBASE+5	Protocol error occurred in the resource manager
XA_RBTIMEOUT	PLS_INTEGER	XA_RBBASE+6	transaction branch took long
XA_RBTRANSIENT	PLS_INTEGER	XA_RBBASE+7	May retry the transaction branch
XA_RBEND	PLS_INTEGER	XA_RBTRANSIENT	Inclusive upper bound of the rollback codes
XA_NOMIGRATE	PLS_INTEGER	9	Transaction branch may have been heuristically completed
XA_HEURHAZ	PLS_INTEGER	8	Transaction branch may have been heuristically completed
XA_HEURCOM	PLS_INTEGER	7	Transaction branch has been heuristically committed
XA_HEURRB	PLS_INTEGER	6	Transaction branch has been heuristically rolled back
XA_HEURMIX	PLS_INTEGER	5	Some of the transaction branches have been heuristically committed, others rolled back
XA_RETRY	PLS_INTEGER	4	Routine returned with no effect and may be re-issued
XA_RDONLY	PLS_INTEGER	3	Transaction was read-only and has been committed
XA_OK	PLS_INTEGER	0	Normal execution
XAER_ASYNC	PLS_INTEGER	-2	Asynchronous operation already outstanding
XAER_RMERR	PLS_INTEGER	-3	Resource manager error occurred in the transaction branch
XAER_NOTA	PLS_INTEGER	-4	XID is not valid
XAER_INVALID	PLS_INTEGER	-5	Invalid arguments were given
XAER_PROTO	PLS_INTEGER	-6	Routine invoked in an improper context
XAER_RMFAIL	PLS_INTEGER	-7	Resource manager unavailable
XAER_DUPID	PLS_INTEGER	-8	XID already exists
XAER_OUTSIDE	PLS_INTEGER	-9	Resource manager doing work outside global transaction

213.4 DBMS_XA Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, `XA_PREPARE/COMMIT/ROLLBACK/FORGET` may not be called when the transaction is still associated with the current session. Only after `XA_END` has been called so

that there is not any transaction associated with the current session, the application may call `XA_PREPARE/COMMIT/ROLLBACK/FORGET`.

`XAER_PROTO` error is returned from `XA_PREPARE/COMMIT/ROLLBACK/FORGET` if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

213.5 DBMS_XA Data Structures

The `DBMS_XA` package uses this `OBJECT` type and associated `TABLE` type.

OBJECT Types

- [DBMS_XA_XID Object Type](#)

TABLE Types

- [DBMS_XA_XID_ARRAY Table Type](#)

213.5.1 DBMS_XA DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

Note:

For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```
TYPE DBMS_XA_XID IS OBJECT (
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual        RAW(64),
  constructor function DBMS_XA_XID(
    gtrid      IN  NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
    gtrid      IN  RAW,
    bqual      IN  RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
    formatid  IN  NUMBER,
```

```

gtrid      IN  RAW,
bqual     IN  RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
RETURN SELF AS RESULT)

```

Attributes

Table 213-3 DBMS_XA_XID Object Type

Attribute	Description
formatid	Format identifier, a number identifying different transaction managers (TM)
gtrid	Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes
bqual	Branch qualifier, of which the maximum size is 64 bytes

213.5.2 DBMS_XA DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

213.6 Summary of DBMS_XA Subprograms

This table lists the DBMS_XA subprograms and briefly describes them.

Table 213-4 DBMS_XA Package Subprograms

Subprogram	Description
DIST_TXN_SYNC Procedure	Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)
XA_COMMIT Function	Commits the global transaction specified by <code>xid</code>
XA_END Function	Disassociates the current session from the transaction branch specified by <code>xid</code>
XA_FORGET Function	Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.
XA_GETLASTOER Function	Obtains the last Oracle error code, in case of failure of previous XA calls.
XA_PREPARE Function	Prepares the transaction branch specified in <code>xid</code> for committing the transaction subsequently if possible
XA_RECOVER Function	Obtains a list of prepared or heuristically completed transaction branches from a resource manager
XA_ROLLBACK Function	Informs the resource manager to roll back work done on behalf of a transaction branch
XA_SETTIMEOUT Function	Sets the transaction timeout in seconds for the current session
XA_START Function	Associates the current session with the transaction branch specified by <code>xid</code>

213.6.1 DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

213.6.2 XA_COMMIT Function

This function commits the global transaction specified by `xid`.

Syntax

```
DBMS_XA.XA_COMMIT (
    xid          IN DBMS_XA_XID,
    onePhase     IN BOOLEAN)
RETURN PLS_INTEGER;
```

Parameters

Table 213-5 XA_COMMIT Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type
<code>onePhase</code>	If <code>TRUE</code> , apply single phase commit

Return Values

See [Table 213-2](#). Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is `TRUE`, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.
- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

213.6.3 XA_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

Syntax

```
DBMS_XA.XA_END (  
    xid    IN  DBMS_XA_XID,  
    flag   IN  PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 213-6 XA_END Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type
<code>flag</code>	See Table 213-1 .

Return Values

See [Table 213-2](#). Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVAL`, `XAER_PROTO`, or `XA_RB*`.

Usage Notes

- `TMSUCCESS` or `TMSUSPEND` may be specified in `flag`, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by `xid` from the current session.
- `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.
- Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.
- Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089: COMMIT is not allowed in a subordinate session`.
- Executing a `COMMIT` or a `ROLLBACK` statement after `XA_END` has no effect on the transaction identified by `xid`, since this transaction is no longer associated with the current session.

213.6.4 XA_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

Syntax

```
DBMS_XA.XA_FORGET (  
    xid      IN DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

Parameters

Table 213-7 XA_FORGET Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type

Return Values

See [Table 213-2](#). Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

213.6.5 XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```
DBMS_XA.XA_GETLASTOER  
RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.

213.6.6 XA_PREPARE Function

This function prepares the transaction branch specified in xid for committing the transaction subsequently if possible.

Syntax

```
DBMS_XA.XA_PREPARE (  
    xid      IN DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

Parameters

Table 213-8 XA_PREPARE Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type

Return Values

See [Table 213-2](#). Possible return codes include: XA_OK, XA_RDONLY, XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`.

213.6.7 XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```
DBMS_XA.XA_RECOVER
RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See [DBMS_XA_XID_ARRAY Table Type](#)

Usage Notes

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`.

213.6.8 XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```
DBMS_XA.XA_ROLLBACK (
xid          IN DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 213-9 XA_ROLLBACK Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type

Return Values

See [Table 213-2](#). Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege `FORCE ANY TRANSACTION` must be granted to the user.

213.6.9 XA_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

Syntax

```
DBMS_XA.XA_SETTIMEOUT (
    seconds IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 213-10 XA_SETTIMEOUT Function Parameters

Parameter	Description
seconds	The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.

Return Values

See [Table 213-2](#). Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, or XAER_INVAL.

Usage Notes

Only if return value is XA_OK, is the timeout value successfully set.

213.6.10 XA_START Function

This function associates the current session with a transaction branch specified by the `xid`.

Syntax

```
DBMS_XA.XA_START (  
    xid IN DBMS_XA_XID,    flag IN PLS_INTEGER) RETURN PLS_INTEGER;
```

Parameters

Table 213-11 XA_START Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type
<code>flag</code>	See Table 213-1 .

Return Values

See [Table 213-2](#)

Usage Notes

- If `TMJOIN` or `TMRESUME` is specified in `flag`, the start is for joining an existing transaction branch identified by the `xid`. `TMJOIN` flag should be used when the transaction is detached with `TMSUCCESS` flag. `TMRESUME` should be used when the transaction branch is detached with `TMSUSPEND` flag. `XA_START` may be called with either flag to join an existing transaction branch.
- If `TMNOFLAGS` is specified in `flag`, and neither `TMJOIN` nor `TMRESUME` is specified, a new transaction branch is to be started. If the transaction branch specified in `xid` already exists, `XA_START` returns an `XAER_DUPID` error code.
- Possible return values in error include: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_DUPID`, `XAER_OUTSIDE`, `XAER_NOTA`, `XAER_INVAL`, and `XAER_PROTO`.
- `XA_OK` is returned if `XA_START` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the PL/SQL application should proceed for other normal operations. Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. `XAER_PROTO` will be returned if `XA_START` is called with an active global transaction branch associated with the session. `XAER_OUTSIDE` will be returned if `XA_START` is called with a local transaction associated with the current session.

DBMS_XDB_ADMIN

The `DBMS_XDB_ADMIN` package provides an interface to manage the Oracle XML DB repository.

This chapter contains the following topics:

- [DBMS_XDB_ADMIN Security Model](#)
- [Summary of DBMS_XDB_ADMIN Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for information about Oracle XML DB Repository

214.1 DBMS_XDB_ADMIN Security Model

Owned by `XDB`, the `DBMS_XDB_ADMIN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `SYS` or `XDB` or `DBA`. Subprograms in this package are executed using the privileges of the current user.

214.2 Summary of DBMS_XDB_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

Table 214-1 DBMS_XDB_ADM Package Subprograms

Subprogram	Description
CREATENONCEKEY Procedure	Generates a nonce value for use in digest authentication
INSTALLDEFAULTWALLET Procedure	Installs the default XDB wallet in the default XDB wallet directory
MOVEXDB_TABLESPACE Procedure	Moves the XDB (user) to the specified tablespace
REBUILDHIERARCHICALINDEX Procedure	Rebuilds the hierarchical index after import or export operations

214.2.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDB_ADMIN.CREATENONCEKEY;
```

214.2.2 INSTALLDEFAULTWALLET Procedure

This procedure installs the default XDB wallet in the default XDB wallet directory.

The directory name where the XDB wallet is stored is prefixed either by `ORACLE_BASE` when it is defined, or `ORACLE_HOME`. It is then followed by `/admin/db_name/xdb_wallet` where `db_name` is the unique database name.

Syntax

```
DBMS_XDB_ADMIN.INSTALLDEFAULTWALLET;
```

Usage Notes

Only `SYS` can install or replace the default wallet.

214.2.3 MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE(  
    new_tablespace IN VARCHAR2);
```

Parameters

Table 214-2 MOVEXDB_TABLESPACE Procedure Parameters

Parameter	Description
<code>new_tablespace</code>	Name of the tablespace to where the XDB is moved

Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If `MOVEXDB_TABLESPACE` fails, the user should restart the database before issuing any further command. Failure to do so will result into unexpected behavior from the database.
- The XDB repository by default resides in the `SYSAUX` tablespace. Using this procedure it can be moved to another tablespace. As a best practice we recommend to create a dedicated tablespace for the XDB repository only and not share it with other objects (such as tables). The tablespace containing the XDB repository should never be set to `READ ONLY` because this might affect various XML operations being executed.

214.2.4 REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

```
DBMS_XDB_ADMIN.REBUILDHIERARCHICALINDEX;
```

DBMS_XDB_CONFIG

The `DBMS_XDB_CONFIG` package provides an interface for configuring Oracle XML DB and its repository.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_XDB_CONFIG Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

215.1 DBMS_XDB_CONFIG Overview

PL/SQL package `DBMS_XDB_CONFIG` is the Oracle XML DB resource application program interface (API) for PL/SQL for DBAs to configure their system.

This API provides functions and procedures to access and manage Oracle XML DB Repository resources using PL/SQL. It includes methods for managing resource security and Oracle XML DB configuration.

Note:

The Oracle XML DB Repository is deprecated with Oracle Database 23ai.

Oracle recommends that you replace any functionality used in XML DB Repository with alternative technologies.

Oracle XML DB Repository is modeled on XML, and provides a database file system for any data. The repository maps path names (or URLs) onto database objects of XMLType and provides management facilities for these objects.

PL/SQL package `DBMS_XDB_CONFIG` is an API that you can use to manage all of the following:

- Oracle XML DB resources
- Oracle XML DB security based on access control lists (ACLs). An ACL is a list of access control entries (ACEs) that determines which principals (users and roles) have access to which resources.

- Oracle XML DB configuration

215.2 DBMS_XDB_CONFIG Security Model

Owned by XDB, the DBMS_XDB_CONFIG package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

215.3 DBMS_XDB_CONFIG Constants

The DBMS_XDB_CONFIG package defines several enumerated constants that should be used for specifying parameter values.

These constants are shown in the following table.

Table 215-1 DBMS_XDB_CONFIG Constants

Constant	Type	Value	Description
XDB_ENDPOINT_HTTP	NUMBER	1	Defining listener for first HTTP port
XDB_ENDPOINT_HTTP2	NUMBER	2	Defining listener for second HTTP port
XDB_ENDPOINT_RHTTP	NUMBER	3	Defining listener for a remote HTTP port
XDB_ENDPOINT_RHTTPS	NUMBER	4	Defining listener for a remote HTTPS port
XDB_PROTOCOL_TCP	NUMBER	1	Defining listener for HTTP protocol
XDB_PROTOCOL_TCPS	NUMBER	2	Defining listener for HTTPS protocol

215.4 Summary of DBMS_XDB_CONFIG Subprograms

The DBMS_XDB_CONFIG package uses subprograms for configuring Oracle XML DB and its repository.

These subprograms are listed in the following table.

Table 215-2 DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
ADDHTTPEXPIREMAPPING Procedure	Adds to XDB\$CONFIG a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.
ADDMIMEMAPPING Procedure	Adds a mime mapping to XDB configuration
ADDSCHEMALOCMAPPING Procedure	Adds a schema location mapping to the XDB configuration
ADDSERVLET Procedure	Adds a servlet to XDB configuration
ADDSERVLETMAPPING Procedure	Adds a servlet mapping to XDB configuration

Table 215-2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
ADDSERVLETSECROLE Procedure	Adds a security role REF to a specified servlet in XDB configuration
ADDXMLEXTENSION Procedure	Adds adds the following XML extension to the XDB configuration under <code><xml-extensions></code> : <code><extension>extension</extension></code>
CFG_GET Function	Retrieves the session's configuration information as an <code>XMLType</code> instance
CFG_REFRESH Procedure	Refreshes the session's configuration information to the latest configuration
CFG_UPDATE Procedure	Updates the configuration information and commits the change.
DELETEHTTPEXPIREMAPPING Procedure	Deletes from <code>XDB\$CONFIG</code> all mappings of the URL pattern to an expiration date
DELETEMIMEMAPPING Procedure	Deletes the mime mapping for a specified extension from the XDB configuration
DELETESCHEMALOCMAPPING Procedure	Deletes the schema location mapping for a specified schema URL from the XDB configuration
DELETESERVLET Procedure	Deletes a servlet from the XDB configuration
DELETESERVLETMAPPING Procedure	Deletes the servlet mapping for a specified servlet name from the XDB configuration
DELETESERVLETSECROLE Procedure	Deletes the specified role from a servlet in the XDB configuration
DELETEXMLEXTENSION Procedure	Deletes the specified XML extension from the XDB configuration
ENABLEDIGESTAUTHENTICATION Procedure	Enables enables digest authentication
GETFTPSPORT Function	Gets the value of the current FTP port
GETHTTPSPORT Function	Gets the value of the current HTTP port
GETHTTPCONFIGREALM Function	Gets the realm name
GETHTTPSSPORT Function	Gets the value of the current HTTPS port
GETLISTENERENDPOINT Procedure	Gets the parameters of a listener end point corresponding to the XML DB HTTP server
GETREMOTEHTTPSPORT Function	Gets the value of a remote HTTP port
GETREMOTEHTTPSSPORT Function	Gets the value of a remote HTTPS port
ISGLOBALPORTENABLED Function	Returns the value of the <code>DBMS_XDB_CONFIG.SETGLOBALPORTENABLED</code> procedure setting
SETFTPSPORT Procedure	Sets the FTP port to a new value
SETHTTPSPORT Procedure	Sets the HTTP port to a new value
SETHTTPCONFIGREALM Procedure	Sets the realm to a new value

Table 215-2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
SETHTTSPORT Procedure	Sets the HTTPS port to a new value
SETLISTENERENDPOINT Procedure	Sets the parameters of a listener end point corresponding to the XML DB HTTP server
SETLISTENERLOCALACCESS Procedure	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when <code>l_access</code> is set to <code>TRUE</code>) or to listen on both localhost and non-localhost interfaces (when <code>l_access</code> is set to <code>FALSE</code>)
SETREMOTEHTTPPORT Procedure	Sets the remote HTTP port to a new value
SETREMOTEHTTSPORT Procedure	Sets the remote HTTPS port to a new value
USEDPORT Procedure	Obtains the port numbers used by other pluggable databases in the same consolidation database

215.4.1 ADDHTTPEXPIREMAPPING Procedure

This procedure adds to `XDB$CONFIG` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

Syntax

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
    pattern    IN    VARCHAR2,
    expire     IN    VARCHAR2);
```

Parameters

Table 215-3 ADDHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
<code>pattern</code>	URL pattern (only * accepted as wildcards)
<code>expire</code>	Expiration directive, follows the <code>ExpireDefault</code> in Apache's <code>mod_expires</code> : <code>base [plus] (num type)*</code> <code>-- base: now modification</code> <code>-- type: year years month months week weeks day days </code> <code>minute minutess second seconds</code>

Examples

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
    '/public/test2/*', 'modification plus 1 day 30 seconds');
```

215.4.2 ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
  <extension>extension</extension>
  <mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDMIMEMAPPING (
  extension IN VARCHAR2,
  mimetype  IN VARCHAR2);
```

Parameters

Table 215-4 *ADDMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is being added
mimetype	Mime type

215.4.3 ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
  <namespace>namespace</namespace>
  <element>element</element>
  <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSCHEMALOCMAPPING (
  namespace IN VARCHAR2,
  element   IN VARCHAR2,
  schemaURL IN VARCHAR2);
```

Parameters

Table 215-5 *ADDSCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
namespace	Namespace
element	Element
schemaURL	Schema URL

215.4.4 ADDSERVLET Procedure

This procedure adds a servlet to XDB configuration.

IT adds the following servlet:

```
<servlet>
  <servlet-name>name</servlet-name>      <servlet-language>language</servlet-
language>
  <display-name>dispname</display-name>
  <description>descript</description>
  <servlet-class>class</servlet-class>
  <servlet-schema>schema</servlet-schema>
</servlet>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLET (
  name          IN  VARCHAR2,
  language      IN  VARCHAR2,
  dispname     IN  VARCHAR2,
  icon         IN  VARCHAR2 := NULL,
  descript     IN  VARCHAR2 := NULL,
  class        IN  VARCHAR2 := NULL,
  jspfile      IN  VARCHAR2 := NULL,
  plsql        IN  VARCHAR2 := NULL,
  schema       IN  VARCHAR2 := NULL);
```

Parameters

Table 215-6 ADDSERVLET Procedure Parameters

Parameter	Description
name	Servlet name
language	Must be one of "C", "Java", "PL/SQL"
dispname	Display name
icon	Icon
descript	Description
class	The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
jspfile	This parameter is not supported. Always provide NULL value for this parameter. System throws an error if the value is not NULL.
plsql	The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
schema	Schema is used to specify <code>servlet-schema</code> xml element name in <code>xdbconfig.xml</code> . It indicates the Oracle schema in which the Java class is loaded. If you do not specify any value, then the schema is searched using the default resolver specification.

215.4.5 ADDSERVLETMAPPING Procedure

This procedure adds a servlet mapping to XDB configuration.

It adds the following servlet mapping:

```
<servlet-mapping>
  <servlet-pattern>pattern</servlet-pattern>
  <servlet-name>name</servlet-name>
</servlet-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETMAPPING(
  pattern IN VARCHAR2, name IN VARCHAR2);
```

Parameters

Table 215-7 *ADDSERVLETMAPPING Procedure Parameters*

Parameter	Description
pattern	Sservlet pattern
name	Servlet name

215.4.6 ADDSERVLETSECROLE Procedure

This procedure adds the security role `REF` to a specified servlet in XDB configuration.

It adds the following security role as shown in the following:

```
<security-role-ref>
  <role-name>rolename</role-name>
  <role-link>rolelink</role-link>
  <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETSECROLE(
  servname IN VARCHAR2, rolename IN VARCHAR2, rolelink IN
  VARCHAR2, descript IN VARCHAR2 := NULL);
```

Parameters

Table 215-8 *ADDSERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Sservlet name
rolename	Role name
rolelink	Role link
descript	Description

215.4.7 ADDXMLEXTENSION Procedure

This procedure adds an XML extension to the XDB configuration under `<xml-extensions>`.

It adds the following XML extension to the XDB configuration, under `<xml-extensions>`:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB_CONFIG.ADDXMLEXTENSION(  
    extension IN VARCHAR2);
```

Parameters

Table 215-9 *ADDXMLEXTENSION Procedure Parameters*

Parameter	Description
extension	XML extension to be added

215.4.8 CFG_GET Function

This function retrieves the session's configuration information as an `XMLType` instance.

Syntax

```
DBMS_XDB_CONFIG.CFG_GET  
RETURN SYS.XMLType;
```

215.4.9 CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```
DBMS_XDB_CONFIG.CFG_REFRESH;
```

215.4.10 CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB_CONFIG.CFG_UPDATE(  
    xdbconfig IN SYS.XMLTYPE);
```

Parameters

Table 215-10 CFG_UPDATE Procedure Parameters

Parameter	Description
xdbconfig	The new configuration data

215.4.11 DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from XDB\$CONFIG all mappings of the URL pattern to an expiration date.

Syntax

```
DBMS_XDB_REPOS.DELETEHTTPEXPIREMAPPING(
    pattern IN VARCHAR2);
```

Parameters

Table 215-11 DELETEHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
pattern	URL pattern (only * accepted as wildcards)

215.4.12 DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEMIMEMAPPING(
    extension IN VARCHAR2);
```

Parameters

Table 215-12 DELETEMIMEMAPPING Procedure Parameters

Parameter	Description
extension	Extension for which a mime type is to be deleted

215.4.13 DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESCHEMALOCMAPPING(
    schemaURL IN VARCHAR2);
```

Parameters**Table 215-13** *DELETESCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
schemaURL	Schema URL

215.4.14 DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLET(
    name          IN  VARCHAR2);
```

Parameters**Table 215-14** *DELETESERVLET Procedure Parameters*

Parameter	Description
name	Servlet name

215.4.15 DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETMAPPING(
    name          IN  VARCHAR2);
```

Parameters**Table 215-15** *DELETESERVLETMAPPING Procedure Parameters*

Parameter	Description
name	Servlet name

215.4.16 DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETSECROLE(
    servname      IN  VARCHAR2,    rolename        IN  VARCHAR2);
```

Parameters

Table 215-16 *DELETESERVLETSECCROLE Procedure Parameters*

Parameter	Description
servname	Servlet name
rolename	Name of the role to be deleted

215.4.17 DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEXMLEXTENSION(  
    extension IN VARCHAR2);
```

Parameters

Table 215-17 *DELETEXMLEXTENSION Procedure Parameters*

Parameter	Description
extension	XML extension to be deleted

215.4.18 ENABLEDIGESTAUTHENTICATION Procedure

This procedure enables digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Syntax

```
DBMS_XDB_CONFIG.ENABLEDIGESTAUTHENTICATION;
```

215.4.19 GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB_CONFIG.GETFTPPORT  
RETURN NUMBER;
```

215.4.20 GETHTTPCONFIGREALM Function

This function gets the realm name. Definition of a realm is referenced in IETF's RFC2617.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPCONFIGREALM  
RETURN VARCHAR2;
```

215.4.21 GETHTTPPORT Function

This function gets the value of the current HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPPORT  
RETURN NUMBER;
```

215.4.22 GETHTTPSPORT Function

This procedure gets the value of the current HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT  
RETURN NUMBER;
```

Usage Notes

Returns `NULL` if no port has been configured

215.4.23 GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.GETLISTENERENDPOINT (  
    endpoint IN NUMBER,  
    host     OUT VARCHAR2,    port     OUT NUMBER,  
    protocol OUT NUMBER);
```

Parameters

Table 215-18 GETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be retrieved. Its value can be <code>XDB_ENDPOINT_HTTP</code> or <code>XDB_ENDPOINT_HTTP2</code> .
host	Interface on which the listener end point listens
port	Port on which the listener end point listens
protocol	Transport protocol accepted by the listener end point

215.4.24 GETREMOTEHTTPPORT Function

This function gets the value of a remote HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPPORT
RETURN NUMBER;
```

215.4.25 GETREMOTEHTTPSPORT Function

This function gets the value of a remote HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPSPORT
RETURN NUMBER;
```

215.4.26 ISGLOBALPORTENABLED Function

This procedure returns the value of the GlobalPortEnabled setting.

Syntax

```
DBMS_XDB_CONFIG.ISGLOBALPORTENABLED RETURN BOOLEAN;
```

Usage Notes

- This procedure returns `TRUE` if `GlobalPortEnabled` has been set to `TRUE`; otherwise it returns `FALSE`.
- In a multitenant environment, you can execute this function in both the CDB root and PDBs.

215.4.27 SETFTPSPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETFTPSPORT (
    new_port IN NUMBER);
```

Parameters

Table 215-19 SETFTPSPORT Procedure Parameters

Parameter	Description
<code>new_port</code>	Value to which the FTP port is set

215.4.28 SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPPORT(  
    new_port IN NUMBER);
```

Parameters

Table 215-20 SETHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTP port is set

215.4.29 SETHTTPCONFIGREALM Procedure

This procedure modifies the realm value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPCONFIGREALM(  
    realm IN VARCHAR2);
```

Parameters

Table 215-21 SETHTTPPORT Procedure Parameters

Parameter	Description
realm	Realm as defined in IETF's RFC2617

215.4.30 SETHTTPSPORT Procedure

This procedure sets the HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPSPORT(  
    new_port IN NUMBER);
```

Parameters

Table 215-22 SETHTTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTPS port is set

215.4.31 SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server.

Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERENDPOINT (
    endpoint IN NUMBER,
    host      IN VARCHAR2,    port      IN NUMBER,
    protocol  IN NUMBER);
```

Parameters

Table 215-23 SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

215.4.32 SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERLOCALACCESS (
    l_access  BOOLEAN);
```

Parameters

Table 215-24 SETLISTENERLOCALACCESS Procedure Parameters

Parameter	Description
<code>l_access.</code>	<code>TRUE</code> or <code>FALSE</code> .

215.4.33 SETREMOTEHTTPPORT Procedure

This procedure sets a remote HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPPORT (
    new_port IN NUMBER);
```

Parameters

Table 215-25 SETREMOTEHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the remote HTTP port is set

215.4.34 SETREMOTEHTTPSPORT Procedure

This procedure sets a remote HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPSPORT (
    new_port IN NUMBER);
```

Parameters

Table 215-26 SETREMOTEHTTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the remote HTTPS port is set

215.4.35 USEDPORT Function

This function obtains the port numbers used by other pluggable databases in the same consolidation database.

Syntax

```
DBMS_XDB_CONFIG.USEDPORT RETURN XMLTYPE;
```

DBMS_XDB_CONSTANTS

The `DBMS_XDB_CONSTANTS` package provides an interface to commonly used constants. Users should use constants instead of dynamic strings to avoid typographical errors.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_XDB_CONSTANTS Subprograms](#)

216.1 DBMS_XDB_CONSTANTS Security Model

Owned by `XDB`, the `DBMS_XDB_CONSTANTS` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

216.2 Summary of DBMS_XDB_CONSTANTS Subprograms

This table lists the `DBMS_XDB_CONSTANTS` subprograms and briefly describes them.

Table 216-1 DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
ENCODING_DEFAULT Function	Returns 'AL32UTF8'
ENCODING_ISOLATIN1 Function	Returns 'WE8ISO8859P1'
ENCODING_UTF8 Function	Returns 'AL32UTF8'
ENCODING_WIN1252 Function	Returns 'WE8MSWIN1252'
NAMESPACE_ACL Function	Returns 'http://xmlns.oracle.com/xdb/acl.xsd'
NAMESPACE_METADATA Function	Returns 'http://xmlns.oracle.com/xdbuserMetaData'
NAMESPACE_ORACLE Function	Returns 'http://xmlns.oracle.com'
NAMESPACE_ORACLE_XDB Function	Returns 'http://xmlns.oracle.com/xdb'
NAMESPACE_RESOURCE Function	Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'
NAMESPACE_RESOURCE_EVENT Function	Returns 'http://xmlns.oracle.com/resourceEvent'
NAMESPACE_RESOURCE_CONFIG Function	Returns 'http://xmlns.oracle.com/XDBResConfig.xsd'
NAMESPACE_XDBSCHEMA Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
NAMESPACE_XMLDIFF Function	Returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'

Table 216-1 (Cont.) DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
NAMESPACE_XMLINSTANCE Function	Returns 'http://www.w3.org/2001/XMLSchema-instance'
NAMESPACE_XMLSCHEMA Function	Returns 'http://www.w3.org/2001/XMLSchema'
NSPREFIX_ACL_ACL Function	Returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'
NSPREFIX_RESCONFIG_RC Function	Returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'
NSPREFIX_RESOURCE_R Function	Returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'
NSPREFIX_XDB_XDB Function	Returns 'http://xmlns.oracle.com/xdb'
NSPREFIX_XMLINSTANCE_XSI Function	Returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'
NSPREFIX_XMLDIFF_XD Function	Returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'
NSPREFIX_XMLSCHEMA_XSD Function	Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'
SCHEMAURL_ACL Function	Returns 'http://xmlns.oracle.com/xdb/acl.xsd'
SCHEMAELEM_RES_ACL Function	Returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'
SCHEMAELEM_RESCONTENT_BINARY Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'
SCHEMAELEM_RESCONTENT_TEXT Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'
SCHEMAURL_RESOURCE Function	Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'
SCHEMAURL_XDBSCHEMA Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
XDBSCHEMA_PREFIXES Function	Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'
XSD_ATTRIBUTE Function	Returns 'attribute'
XSD_COMPLEX_TYPE Function	Returns 'complexType'
XSD_ELEMENT Function	Returns 'element'
XSD_GROUP Function	Returns 'group'

216.2.1 ENCODING_DEFAULT Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_DEFAULT
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

216.2.2 ENCODING_ISOLATIN1 Function

This function returns 'WE8ISO8859P1'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_ISOLATIN1  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8ISO8859P1'

216.2.3 ENCODING_UTF8 Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_UTF8  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

216.2.4 ENCODING_WIN1252 Function

This function returns 'WE8MSWIN1252'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_WIN1252  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8MSWIN1252'

216.2.5 NAMESPACE_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

216.2.6 NAMESPACE_METADATA Function

This function returns 'http://xmlns.oracle.com/xduserMetaData'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_METADATA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xduserMetaData'

216.2.7 NAMESPACE_ORACLE Function

This function returns 'http://xmlns.oracle.com'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com'

216.2.8 NAMESPACE_ORACLE_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE_XDB  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb'

216.2.9 NAMESPACE_RESOURCE Function

This function returns '/XDBResource.xsd'

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

216.2.10 NAMESPACE_RESOURCE_EVENT Function

This function returns 'http://xmlns.oracle.com/resourceEvent'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_EVENT  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/resourceEvent'

216.2.11 NAMESPACE_RESOURCE_CONFIG Function

This function returns 'http://xmlns.oracle.com/XDBResConfig.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_CONFIG  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/XDBResConfig.xsd'

216.2.12 NAMESPACE_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XDBSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

216.2.13 NAMESPACE_XMLDIFF Function

This function returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLDIFF  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/xdiff.xsd'

216.2.14 NAMESPACE_XMLINSTANCE Function

This function returns 'http://www.w3.org/2001/XMLSchema-instance'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLINSTANCE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://www.w3.org/2001/XMLSchema-instance'

216.2.15 NAMESPACE_XMLSCHEMA Function

This function returns 'http://www.w3.org/2001/XMLSchema'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://www.w3.org/2001/XMLSchema'

216.2.16 NSPREFIX_ACL_ACL Function

This function returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_ACL_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'

216.2.17 NSPREFIX_RESCONFIG_RC Function

This function returns ''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'.
'

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESCONFIG_RC  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

Returns ''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'

216.2.18 NSPREFIX_RESOURCE_R Function

This function returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd"'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESOURCE_R  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd"'

216.2.19 NSPREFIX_XDB_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XDB_XDB  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb'

216.2.20 NSPREFIX_XMLINSTANCE_XSI Function

This function returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLINSTANCE_XSI  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'

216.2.21 NSPREFIX_XMLDIFF_XD Function

This function returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLDIFF_XD  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'

216.2.22 NSPREFIX_XMLSCHEMA_XSD Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLSCHEMA_XSD  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '

216.2.23 SCHEMAURL_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

216.2.24 SCHEMAELEM_RES_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RES_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd#acl'

216.2.25 SCHEMAELEM_RESCONTENT_BINARY Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_BINARY  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'

216.2.26 SCHEMAELEM_RESCONTENT_TEXT Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_TEXT  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'

216.2.27 SCHEMAURL_RESOURCE Function

This function returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_RESOURCE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

216.2.28 SCHEMAURL_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_XDBSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

216.2.29 XDBSCHEMA_PREFIXES Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns:xdb="http://xmlns.oracle.com/xdb".'

Syntax

```
DBMS_XDB_CONSTANTS.XDBSCHEMA_PREFIXES  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://
xmlns.oracle.com/xdb"'

216.2.30 XSD_ATTRIBUTE Function

This function returns 'attribute'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_ATTRIBUTE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'attribute'

216.2.31 XSD_COMPLEX_TYPE Function

This function returns 'complexType'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_COMPLEX_TYPE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'complexType'

216.2.32 XSD_ELEMENT Function

This function returns 'element'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_ELEMENT  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'element'

216.2.33 XSD_GROUP Function

This function returns 'group'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_GROUP  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'group'

DBMS_XDB_REPOS

The `DBMS_XDB_REPOS` package provides an interface to operate on the Oracle XML database Repository.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_XDB_REPOS Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for more information regarding:

- Using and managing repository resources
- ACL-based security management (controlling access to repository resources)
- Managing XLink and XInclude links
- Loading documents into the repository
- Creating, deleting, and managing resource metadata

217.1 DBMS_XDB_REPOS Overview

The `DBMS_XDB_REPOS` package lets you operate on the Oracle XML DB Repository to create, modify and delete resources, including managing security based on access control lists (ACLs). The interface provides both query and DML functions.

Using a combination of PL/SQL packages - `DBMS_XDB_REPOS`, [DBMS_XDBZ](#), and [DBMS_XDB_VERSION](#) - you can create, delete, and rename documents and folders, move a file or folder within the folder hierarchy, set and change the access permissions on a file or folder, and initiate and manage versioning.

217.2 DBMS_XDB_REPOS Security Model

Owned by XDB, the `DBMS_XDB_REPOS` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is `SYS` or `XDB`, or the current user has the `XDBADMIN` or `DBA` role.

217.3 DBMS_XDB_REPOS Constants

The `DBMS_XDB_REPOS` package defines several constants that can be used for specifying parameter values.

These constants are shown in the following table.

Table 217-1 DBMS_XDB_REPOS Constants

Constant	Type	Value	Description
<code>DELETE_RESOURCE</code>	NUMBER	1	Deletes a resource; fails if the resource has children.
<code>DELETE_RECURSIVE</code>	NUMBER	2	Deletes a resource and its children, if any.
<code>DELETE_FORCE</code>	NUMBER	3	Deletes the resource, even if the object it contains is invalid
<code>DELETE_RECURSIVE_FORCE</code>	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid
<code>DELETE_RES_METADATA_CASCADE</code>	NUMBER	1	Deletes the row in the metadata
<code>DELETE_RES_METADATA_NOCASCADE</code>	NUMBER	2	Does not delete the row
<code>DEFAULT_LOCK_TIMEOUT</code>	PLS_INTEGER	(60*60)	Timeout value (in seconds) of the webdav lock
<code>LINK_TYPE_HARD</code>	NUMBER	1	Hard link of a folder to a resource
<code>LINK_TYPE_WEAK</code>	NUMBER	2	Weak link of a folder to a resource
<code>LINK_TYPE_SYMBOLIC</code>	NUMBER	3	Symbolic link of a folder to a resource

217.4 Summary of DBMS_XDB_REPOS Subprograms

This table lists the `DBMS_XDB_REPOS` subprograms and briefly describes them.

Table 217-2 DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
APPENDRESOURCEMETADATA Procedure	Takes in user-defined metadata either as a <code>REF</code> to <code>XMLTYPE</code> or an <code>XMLTYPE</code> and adds it to the desired resource
CHANGEOWNER Procedure	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function	Creates a new folder resource in the hierarchy

Table 217-2 (Cont.) DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
CREATEOIDPATH Function	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions	Creates a new resource
DELETERESOURCE Procedure	Deletes a resource from the hierarchy
DELETERESOURCEMETADATA Procedures	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
EXISTSRESOURCE Function	Determines if a resource is in the hierarchy, based on its absolute path
GETACLDOCUMENT Function	Retrieves ACL document that protects resource given its path name
GETCONTENTBLOB Function	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function	Retrieves the contents of a resource returned as a REF to an XMLTYPE
GETCONTENTXMLTYPE Function	Retrieves the contents of a resource returned as an XMLTYPE
GETLOCKTOKEN Procedure	Returns that resource's lock token for the current user given a path to a resource
GETPRIVILEGES Function	Gets all privileges granted to the current user on a specified resource
GETRESOID Function	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function	Returns TRUE if the resource has BLOB content
HASCHARCONTENT Function	Returns TRUE if the resource has character content
HASXMLCONTENT Function	Returns TRUE if the resource has XML content
HASXMLREFERENCE Function	Returns TRUE if the resource has REF to XML content
ISFOLDER Function	Returns TRUE if the resource is a folder or container
LINK Procedures	Creates a link to an existing resource
LOCKRESOURCE Function	Gets a WebDAV-style lock on that resource given a path to that resource
PROCESSLINKS Procedure	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure	Deletes all user metadata from a resource
RENAMERESOURCE Procedure	Renames the XDB resource
SETACL Procedure	Sets the ACL on a specified resource
SPLITPATH Procedure	Splits the path into a parentpath and childpath

Table 217-2 (Cont.) DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
TOUCHRESOURCE Procedure	Changes the modification time of the resource to the current time
UNLOCKRESOURCE Function	Unlocks the resource given a lock token and resource path
UPDATERESOURCEMETADATA Procedures	Updates metadata for a resource

217.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB_REPOS.ACLCHECKPRIVILEGES (
    acl_path IN VARCHAR2,
    owner    IN VARCHAR2,
    privs    IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 217-3 ACLCHECKPRIVILEGES Function Parameters

Parameter	Description
<code>acl_path</code>	Absolute path in the Hierarchy for ACL document
<code>owner</code>	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
<code>privs</code>	An <code>XMLType</code> instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function .

217.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

Syntax

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
    abspath IN VARCHAR2,
    metadata IN XMLTYPE);

DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
    abspath IN VARCHAR2,
    metadata IN REF SYS.XMLTYPE);
```

Parameters

Table 217-4 APPENDRESOURCEMETADATA Procedure

Parameter	Description
abspath	Absolute path of the resource
metadata	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that the REF passed in must be unique. In other words, there must not be a REF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

217.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB_REPOS.CHANGEOWNER (
  abspath  IN  VARCHAR2,
  owner    IN  VARCHAR2,
  recurse  IN  BOOLEAN := FALSE);
```

Parameters

Table 217-5 CHANGEOWNER Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
owner	New owner for the resource
recurse	If TRUE, recursively change owner of all resources in the folder tree

217.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB_REPOS.CHANGEPRIVILEGES (
  res_path  IN  VARCHAR2,
  ace       IN  xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 217-6 CHANGEPRIVILEGES Function Parameters

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (*grant/deny*) already exists in the ACL, the new ACE is added at the end of the ACL.

217.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB_REPOS.CHECKPRIVILEGES (
    res_path IN VARCHAR2,
    privs    IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 217-7 CHECKPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
privs	An XMLType instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

217.4.6 CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB_REPOS.CREATEFOLDER (
    path IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 217-8 CREATEFOLDER Function Parameters

Parameter	Description
path	Path name for the new folder

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

217.4.7 CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```
DBMS_XDB_REPOS.CREATEOIDPATH(
    oid IN RAW)
RETURN VARCHAR2;
```

Parameters

Table 217-9 CREATEOIDPATH Function Parameters

Parameter	Description
oid	Object ID of the resource

217.4.8 CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath IN VARCHAR2,
    data IN VARCHAR2)
RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath IN VARCHAR2,
    data IN SYS.XMLTYPE)
RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    datarow     IN  REF SYS.XMLTYPE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  BLOB,
    csid         IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  BFILE,
    csid         IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  CLOB)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  VARCHAR2,
    schemaurl    IN  VARCHAR2 := NULL,
    elem         IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  SYS.XMLTYPE,
    schemaurl    IN  VARCHAR2 := NULL,
    elem         IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Parameters

Table 217-10 CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist.
data	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
datarow	REF to an <code>XMLType</code> row to be used as the contents
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> From the abspath extension, determine the resource's MIME type. If the MIME type is <code>*/*xml</code>, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; Otherwise, it is defaulted to the database character set.
schemaur1	For XML data, schema URL data conforms to (default NULL)
elem	Element name (default NULL)

Return Values

TRUE if operation successful; FALSE, otherwise.

217.4.9 DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB_REPOS.DELETERESOURCE (
    path          IN      VARCHAR2,
    delete_option IN      PLS_INTEGER);
```

Parameters

Table 217-11 DELETERESOURCE Procedure Parameters

Parameter	Description
path	Path name of the resource to delete
delete_option	The option that controls how a resource is deleted: <ul style="list-style-type: none"> DELETE_RESOURCE DELETE_RECURSIVE DELETE_FORCE DELETE_RECURSIVE_FORCE

217.4.10 DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
    abspath          IN VARCHAR2,
    metadata         IN REF SYS.XMLTYPE,
    delete_option   IN pls_integer :=
DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
    abspath          IN VARCHAR2,
    metadatans       IN VARCHAR2,
    metadataname     IN VARCHAR2,
    delete_option   IN pls_integer :=
DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 217-12 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
metadata	REF to the piece of metadata (schema based) to be deleted
mettadatans	Namespace of the metadata fragment to be removed
mettadataname	Local name of the metadata fragment to be removed
delete_option	Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"> DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table

217.4.11 EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. It matches the resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB_REPOS.EXISTSRESOURCE(  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 217-13 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

217.4.12 GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB_REPOS.GETACLDOCUMENT(  
    abspath IN VARCHAR2)  
RETURN sys.xmltype;
```

Parameters

Table 217-14 GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The XMLType for ACL document.

217.4.13 GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTBLOB(  
    abspath IN VARCHAR2,  
    csid OUT PLS_INTEGER,
```

```
locksrc IN BOOLEAN := FALSE)
RETURN BLOB;
```

Parameters

Table 217-15 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

217.4.14 GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTCLOB(
    abspath IN VARCHAR2,
    RETURN CLOB;
```

Parameters

Table 217-16 GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

217.4.15 GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTVARCHAR2(
    abspath IN VARCHAR2,
    RETURN BLOB;
```

Parameters**Table 217-17** GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

217.4.16 GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a REF to an XMLTYPE.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLREF (
    abspath IN VARCHAR2,
    RETURN SYS.XMLTYPE;
```

Parameters**Table 217-18** GETCONTENTXMLREF Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a REF to an XMLTYPE.

217.4.17 GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLTYPE (
    abspath IN VARCHAR2,
    RETURN SYS.XMLTYPE;
```

Parameters**Table 217-19** GETCONTENTXMLTYPE Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

217.4.18 GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```
DBMS_XDB_REPOS.GETLOCKTOKEN (
    path          IN      VARCHAR2,
    locktoken     OUT     VARCHAR2);
```

Parameters

Table 217-20 GETLOCKTOKEN Procedure Parameters

Parameter	Description
path	Path name to the resource
locktoken	Logged-in user's lock token for the resource

Usage Notes

The user must have READPROPERTIES privilege on the resource.

217.4.19 GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```
DBMS_XDB_REPOS.GETPRIVILEGES (
    res_path      IN      VARCHAR2)
RETURN sys.xmltype;
```

Parameters

Table 217-21 GETPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

217.4.20 GETRESOID Function

The `GETRESOID` function returns the object ID of the resource from its absolute path.

Syntax

```
DBMS_XDB_REPOS.GETRESOID(  
    abspath IN VARCHAR2)  
RETURN RAW;
```

Parameters

Table 217-22 GETRESOID Function Parameters

Parameter	Description
<code>abspath_path</code>	Absolute path of the resource

Return Values

`NULL` if the resource is not present.

217.4.21 GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB_REPOS.GETXDB_TABLESPACE  
RETURN VARCHAR2;
```

217.4.22 HASBLOBCONTENT Function

This function returns `TRUE` if the resource has BLOB content.

Syntax

```
DBMS_XDB_REPOS.HASBLOBCONTENT  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 217-23 HASBLOBCONTENT Function Parameters

Parameter	Description
<code>abspath_path</code>	Absolute path of the resource

Return Values

`TRUE` if the resource has BOB content.

217.4.23 HASCHARCONTENT Function

This function returns `TRUE` if the resource has character content.

Syntax

```
DBMS_XDB_REPOS.HASCHARCONTENT  
  abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 217-24 HASCHARCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` if the resource has character content.

217.4.24 HASXMLCONTENT Function

This function returns `TRUE` if the resource has XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLCONTENT  
  abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 217-25 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` if the resource has XML content.

217.4.25 HASXMLREFERENCE Function

This function returns `TRUE` if the resource has a `REF` to XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLREFERENCE  
  abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 217-26 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE resource has a REF to XML content.

217.4.26 ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

Syntax

```
DBMS_XDB_REPOS.ISFOLDER
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 217-27 ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource is a folder or container.

217.4.27 LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```
DBMS_XDB_REPOS.LINK(
    srcpath IN VARCHAR2,
    linkfolder IN VARCHAR2,
    linkname IN VARCHAR2);

DBMS_XDB_REPOS.LINK(
    srcpath IN VARCHAR2,
    linkfolder IN VARCHAR2,
    linkname IN VARCHAR2,
    linktype IN PLS_INTEGER := DBMS_XDB_REPOS.LINK_TYPE_HARD);
```

Parameters

Table 217-28 LINK Procedure Parameters

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link
linktype	Type of link to be created: <ul style="list-style-type: none"> • DBMS_XDB.LINK_TYPE_HARD (default) • DBMS_XDB.LINK_TYPE_WEAK • DBMS_XDB.LINK_TYPE_SYMBOLIC

217.4.28 LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB_REPOS.LOCKRESOURCE (
    path      IN  VARCHAR2,
    depthzero IN  BOOLEAN,
    shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 217-29 LOCKRESOURCE Function Parameters

Parameter	Description
path	Path name of the resource to lock.
depthzero	Currently not supported
shared	Passing TRUE obtains a shared write lock

Return Values

TRUE if successful.

Usage Notes

The user must have UPDATE privileges on the resource.

217.4.29 PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA (
  abspath IN VARCHAR2,
  recurse IN BOOLEAN := FALSE);
```

Parameters

Table 217-30 PROCESSLINKS Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource. If the path is a folder, use the <code>recurse</code> flag.
recurse	Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code> , process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code> , process links of all documents in this folder only.

217.4.30 PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA (
  abspath IN VARCHAR2);
```

Parameters

Table 217-31 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource

217.4.31 RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```
DBMS_XDB_REPOS.RENAMERESOURCE (
  srcpath IN VARCHAR2,
  destfolder IN CARCHAR2,
  newname IN VARCHAR2);
```

Parameters

Table 217-32 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

217.4.32 SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```
DBMS_XDB_REPOS.SETACL(
    res_path IN VARCHAR2,
    acl_path IN VARCHAR2);
```

Parameters

Table 217-33 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have <write-acl> privileges on the resource.

217.4.33 SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB_REPOS.SPLITPATH(
    abspath IN VARCHAR2,
    parentpath OUT VARCHAR2,
    childpath OUT VARCHAR2);
```

Parameters

Table 217-34 SPLITPATH Procedure Parameters

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath

Table 217-34 (Cont.) SPLITPATH Procedure Parameters

Parameter	Description
childpath	Childpath

217.4.34 TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

```
DBMS_XDB_REPOS.TOUCHRESOURCE
    (abspath IN VARCHAR2);
```

Parameters

Table 217-35 TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

217.4.35 UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB_REPOS.UNLOCKRESOURCE (
    path IN VARCHAR2,
    deltoken IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 217-36 UNLOCKRESOURCE Function Parameters

Parameter	Description
path	Path name to the resource
deltoken	Lock token to be removed

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

217.4.36 UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldmetadata IN REF SYS.XMLTYPE,
    newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldmetadata IN REF SYS.XMLTYPE,
    newmetadata IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldns IN VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldns IN VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN REF SYS.XMLTYPE);
```

Parameters

Table 217-37 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
oldmetadata	REF to the old of metadata
newmetadata	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)

Table 217-37 (Cont.) UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

Usage Notes

In the case of `REF`, it stores the `REF` in the resource and the metadata is stored in a separate table. Uniqueness of `REFs` is enforced. In the case where the `XMLTYPE` is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

DBMS_XDB_VERSION

Oracle XML DB versioning interfaces are found in the `DBMS_XDB_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

Note:

The Oracle XML DB Repository is deprecated with Oracle Database 23ai.

Oracle recommends that you replace any functionality used in XML DB Repository with alternative technologies.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_XDB_VERSION Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

218.1 DBMS_XDB_VERSION Security Model

Owned by `XDB`, the `DBMS_XDB_VERSION` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

218.2 Summary of DBMS_XDB_VERSION Subprograms

This table lists the `DBMS_XDB_VERSION` subprograms and briefly describes them.

Table 218-1 *DBMS_XDB_VERSION Package Subprograms*

Method	Description
CHECKIN Function	Checks in a checked-out VCR and returns the resource id of the newly-created version
CHECKOUT Procedure	Checks out a VCR before updating or deleting it
GETCONTENTS BLOB BY RESID Function	Obtain contents as a BLOB

Table 218-1 (Cont.) DBMS_XDB_VERSION Package Subprograms

Method	Description
GETCONTENTSLOBBYRESID Function	Obtain contents as a CLOB
GETCONTENTSXMLBYRESID Function	Obtain contents as an XMLType
GETPREDECESSORS Function	Retrieves the list of predecessors by path name
GETPREDSBYRESID Function	Retrieves the list of predecessors by resource id
GETRESOURCEBYRESID Function	Obtains the resource as an XMLType, given the resource object ID
GETSUCCESSORS Function	Retrieves the list of successors by path name
GETSUCCSBYRESID Function	Retrieves the list of successors by resource id
MAKEVERSIONED Function	Turns a regular resource whose path name is given into a version-controlled resource
UNCHECKOUT Function	Checks in a checked-out resource, returns the resource id of the version before the resource is checked out

218.2.1 CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```
DBMS_XDB_VERSION.CHECKIN(
    pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 218-2 CHECKIN Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. [CHECKIN Function](#) doesn't have to take the same path name that was passed to [CHECKOUT Procedure](#) operation. However, the [CHECKIN Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [CHECKIN Function](#) because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to [CHECKIN Function](#) the resource.

218.2.2 CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```
DBMS_XDB_VERSION.Checkout (
    pathname    VARCHAR2);
```

Parameters

Table 218-3 CHECKOUT Procedure Parameters

Parameter	Description
pathname	The path name of the VCR to be checked out.

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot [CHECKOUT Procedure](#) the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the [CHECKOUT Procedure](#) operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

218.2.3 GETCONTENTSbloobyresid Function

This function obtain contents as a BLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSbloobyresid (
    resid    DBMS_XDB.resid_type)
RETURN BLOB;
```

Parameters

Table 218-4 GETCONTENTSbloobyresid Function Parameters

Parameter	Description
resid	The resource id.

218.2.4 GETCONTENTScloobyresid Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTScloobyresid (
    resid    DBMS_XDB.resid_type)
RETURN CLOB;
```

Parameters

Table 218-5 GETCONTENTSCLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

218.2.5 GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
    resid      DBMS_XDB.resid_type)
RETURN XMLType;
```

Parameters

Table 218-6 GETCONTENTSXMLBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Return Values

If the contents are not valid XML, returns NULL.

218.2.6 GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
    pathname  VARCHAR2)
RETURN resid_list_type;
```

Parameters

Table 218-7 GETPREDECESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Return Values

An exception is raised if `pathname` is illegal.

218.2.7 GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(  
    resid      resid_type)  
RETURN resid_list_type;
```

Parameters

Table 218-8 GETPREDSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting predecessors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the RESID is illegal.

218.2.8 GETRESOURCEBYRESID Function

This function obtains the resource as an XMLType, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(  
    resid      resid_type)  
RETURN XMLType;
```

Parameters

Table 218-9 GETRESOURCEBYRESID Function Parameters

Parameter	Description
resid	The resource id.

218.2.9 GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS (  
    pathname VARCHAR2)  
RETURN resid_list_type;
```

Parameters

Table 218-10 GETSUCCESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Usage Notes

Getting successors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the pathname is illegal.

218.2.10 GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(  
    resid    resid_type)  
RETURN resid_list_type;
```

Parameters

Table 218-11 GETSUCCSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting successors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the pathname is illegal.

218.2.11 MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
    pathname  VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 218-12 MAKEVERSIONED Function Parameters

Parameter	Description
pathname	The path name of the resource to be put under version control.

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

218.2.12 UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(
    pathname  VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 218-13 UNCHECKOUT Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. The [UNCHECKOUT Function](#) does not have to take the same path name that was passed to the operation by the [CHECKOUT Procedure](#). However, the [UNCHECKOUT Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [UNCHECKOUT Function](#), because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to [UNCHECKOUT Function](#) the resource.

Exceptions

An exception is raised if the path name doesn't exist.

DBMS_XDBRESOURCE

The `DBMS_XDBRESOURCE` package provides the interface to operate on the resource's metadata and contents.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_XDBRESOURCE Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for examples of "Using `DBMS_XDBRESOURCE`"

219.1 DBMS_XDBRESOURCE Overview

The `DBMS_XDBRESOURCE` package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in `DBMS_XMLDOM` package, an `XDBResource` instance could be converted to a `DOMDocument` type by using `DBMS_XDBRESOURCE.MAKEDOCUMENT` routine.

219.2 DBMS_XDBRESOURCE Security Model

Owned by `XDB`, the `DBMS_XDBRESOURCE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

219.3 Summary of DBMS_XDBRESOURCE Subprograms

This table lists the `DBMS_XDBRESOURCE` subprograms and briefly describes them.

Table 219-1 *DBMS_XDBRESOURCE Package Subprograms*

Subprogram	Description
FREERESOURCE Procedure	Frees any memory associated with an <code>XDBResource</code>
GETACL Function	Given an <code>XDBResource</code> , returns its ACL as string
GETACLDOCFROMRES Function	Returns the ACL Document for the given resource as <code>XMLType</code>
GETAUTHOR Function	Given an <code>XDBResource</code> , returns its author

Table 219-1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
GETCHARACTERSET Function	Given an XDBResource, returns its character set
GETCOMMENT Function	Given an XDBResource, returns its comment
GETCONTENTBLOB Function	Returns the contents of the resource as a BLOB
GETCONTENTCLOB Function	Returns the contents of the resource as a CLOB
GETCONTENTREF Function	Returns the contents of the resource as an XMLTypeRef
GETCONTENTTYPE Function	Given an XDBResource, returns its content-type
GETCONTENTXML Function	Returns the contents of the resource as XML
GETCONTENTVARCHAR2 Function	Returns the contents of the resource as a string
GETCREATIONDATE Function	Given an XDBResource, returns its creation date
GETCREATOR Function	Given an XDBResource, returns its creator
GETCUSTOMMETADATA Function	Returns the requested custom metadata given the xpath and namespace to the metadata
GETDISPLAYNAME Function	Given an XDBResource, returns its display name
GETLANGUAGE Function	Given an XDBResource, returns its language
GETLASTMODIFIER Function	Given an XDBResource, returns its last modifier
GETMODIFICATIONDATE Function	Given an XDBResource, returns its modification date
GETOWNER Function	Given an XDBResource, returns its owner.
GETREFCOUNT Function	Given an XDBResource, returns its reference count
GETVERSIONID Function	Given an XDBResource, returns its version ID.
HASACLCHANGED Function	Returns TRUE if the ACL of the given resource has changed, FALSE otherwise
HASAUTHORCHANGED Function	Returns TRUE if the ACL of the given resource has changed FALSE otherwise
HASCHANGED Function	Returns TRUE if the element or attribute represented by the given XPath has changed, FALSE otherwise
HASCHARACTERSETCHANGED Function	Returns TRUE if the character set of the given resource has changed, FALSE otherwise
HASCOMMENTCHANGED Function	Returns TRUE if the comment of the given resource has changed, FALSE otherwise
HASCONTENTCHANGED Function	Returns TRUE if the contents of the given resource has changed, FALSE otherwise
HASCONTENTTYPECHANGED Function	Returns TRUE if the content-type of the given resource has changed, FALSE otherwise
HASCREATIONDATECHANGED Function	Returns TRUE if the creation date of the given resource has changed, FALSE otherwise
HASCREATORCHANGED Function	Returns TRUE if the creator of the given resource has changed, FALSE otherwise
HASCUSTOMMETADATACHANGED Function	Returns TRUE if custom-metadata for this XPath has changed, FALSE otherwise

Table 219-1 (Cont.) *DBMS_XDBRESOURCE Package Subprograms*

Subprogram	Description
HASDISPLAYNAMECHANGED Function	Returns <code>TRUE</code> if the display name of the given resource has changed, <code>FALSE</code> otherwise
HASLANGUAGECHANGED Function	Returns <code>TRUE</code> if the language of the given resource has changed, <code>FALSE</code> otherwise
HASLASTMODIFIERCHANGED Function	Returns <code>TRUE</code> if the last modifier of the given resource has changed, <code>FALSE</code> otherwise
HASMODIFICATIONDATECHANGED Function	Returns <code>TRUE</code> if the modification date of the given resource has changed, <code>FALSE</code> otherwise
HASOWNERCHANGED Function	Returns <code>TRUE</code> if the owner of the given resource has changed, <code>FALSE</code> otherwise
HASREFCOUNTCHANGED Function	Returns <code>TRUE</code> if the reference count of the given resource has changed, <code>FALSE</code> otherwise
HASVERSIONIDCHANGED Function	Returns <code>TRUE</code> if the version ID of the given resource has changed, <code>FALSE</code> otherwise
ISFOLDER Function	Returns <code>TRUE</code> if the given resource is a folder, <code>FALSE</code> otherwise
ISNULL Function	Returns <code>TRUE</code> if input resource is <code>NULL</code> , <code>FALSE</code> otherwise
MAKEDOCUMENT Function	Converts the <code>XDBResource</code> to a <code>DOMDocument</code> which can be operated on using the <code>XMLDOM</code> interface
SAVE Procedure	Updates the resource with any modifications
SETACL Procedure	Sets the ACL of the given <code>XDBResource</code> to the path specified
SETAUTHOR Procedure	Sets the author of the given <code>XDBResource</code> to the specified string
SETCHARACTERSET Procedure	Sets the character set of the given <code>XDBResource</code> to a specified character set
SETCOMMENT Procedure	Sets a comment associated with the given <code>XDBResource</code>
SETCONTENT Procedures	Replaces the contents of the given resource with the given <code>CLOB</code>
SETCONTENTTYPE Procedure	Sets the content-type of the given <code>XDBResource</code>
SETCUSTOMMETADATA Procedure	Sets the custom metadata specified by the XPath and namespace to new data
SETDISPLAYNAME Procedure	Sets the display name of the given <code>XDBResource</code>
SETLANGUAGE Procedure	Sets the language of the given <code>XDBResource</code>
SETOWNER Procedure	Sets the owner of the given <code>XDBResource</code>

219.3.1 FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```
DBMS_XDBRESOURCE.FREERESOURCE (
    res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

Table 219-2 FREERESOURCE Procedure Parameters

Parameter	Description
res	XDBResource to free

219.3.2 GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```
DBMS_XDBRESOURCE.GETACL (
    res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

Table 219-3 GETACL Function Parameters

Parameter	Description
res	XDBResource

219.3.3 GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as XMLType.

Syntax

```
DBMS_XDBRESOURCE.GETACLDOCFROMRES (
    res IN XDBResource)
RETURN SYS.XMLTYPE;
```

Parameters

Table 219-4 GETACLDOCFROMRES Function Parameters

Parameter	Description
res	XDBResource

219.3.4 GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```
DBMS_XDBRESOURCE.GETAUTHOR (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 219-5 GETAUTHOR Function Parameters

Parameter	Description
res	XDBResource

219.3.5 GETCHARACTERSET Function

Given an XDBResource, this function returns its character set.

Syntax

```
DBMS_XDBRESOURCE.GETCHARACTERSET (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 219-6 GETCHARACTERSET Function Parameters

Parameter	Description
res	XDBResource

219.3.6 GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```
DBMS_XDBRESOURCE.GETCOMMENT (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 219-7 GETCOMMENT Function Parameters

Parameter	Description
res	XDBResource

219.3.7 GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTBLOB (
    res    IN    XDBResource,
    csid   OUT   PLS_INTEGER)
RETURN BLOB;
```

Parameters

Table 219-8 GETCONTENTBLOB Function Parameters

Parameter	Description
res	XDBResource
csid	Character set ID of the BLOB returned

219.3.8 GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTCLOB (
    res    IN    XDBResource)
RETURN CLOB;
```

Parameters

Table 219-9 GETCONTENTCLOB Function Parameters

Parameter	Description
res	XDBResource

219.3.9 GETCONTENTREF Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTREF (
    res    IN    XDBResource)
RETURN VARCHAR2;
```

Parameters

Table 219-10 GETCONTENTREF Function Parameters

Parameter	Description
res	XDBResource

219.3.10 GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTTYPE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 219-11 GETCONTENTTYPE Function Parameters

Parameter	Description
res	XDBResource

219.3.11 GETCONTENTXML Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTXML (  
    res IN XDBResource)  
RETURN XMLType;
```

Parameters

Table 219-12 GETCONTENTXML Function Parameters

Parameter	Description
res	XDBResource

219.3.12 GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTVARCHAR2 (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 219-13 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
res	XDBResource

219.3.13 GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```
DBMS_XDBRESOURCE.GETCREATIONDATE (
    res IN XDBResource)
RETURN TIMESTAMP;
```

Parameters

Table 219-14 GETCREATIONDATE Function Parameters

Parameter	Description
res	XDBResource

219.3.14 GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```
DBMS_XDBRESOURCE.GETCREATOR (
    res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

Table 219-15 GETCREATOR Function Parameters

Parameter	Description
res	XDBResource

219.3.15 GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```
DBMS_XDBRESOURCE.GETCUSTOMMETADATA (
    res IN XDBResource,
```

```

    xpath    IN    VARCHAR2,    namespace IN    VARCHAR2)
RETURN XMLType;

```

Parameters

Table 219-16 GETCUSTOMMETADATA Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath for custom metadata
namespace	Namespace

Usage Notes

The first component of the XPath expression must be "Resource".

219.3.16 GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```

DBMS_XDBRESOURCE.GETDISPLAYNAME (
    res    IN    XDBResource)
RETURN VARCHAR2;

```

Parameters

Table 219-17 GETDISPLAYNAME Function Parameters

Parameter	Description
res	XDBResource

219.3.17 GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```

DBMS_XDBRESOURCE.GETLANGUAGE (
    res    IN    XDBResource)
RETURN VARCHAR2;

```

Parameters

Table 219-18 GETLANGUAGE Function Parameters

Parameter	Description
res	XDBResource

219.3.18 GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

```
DBMS_XDBRESOURCE.GETLASTMODIFIER (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 219-19 GETLASTMODIFIER Function Parameters

Parameter	Description
res	XDBResource

219.3.19 GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESOURCE.GETMODIFICATIONDATE (  
    res IN XDBResource)  
RETURN TIMESTAMP;
```

Parameters

Table 219-20 GETMODIFICATIONDATE Function Parameters

Parameter	Description
res	XDBResource

219.3.20 GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESOURCE.GETOWNER (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 219-21 GETOWNER Function Parameters

Parameter	Description
res	XDBResource

219.3.21 GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```
DBMS_XDBRESOURCE.GETREFCOUNT (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

Table 219-22 GETREFCOUNT Function Parameters

Parameter	Description
res	XDBResource

219.3.22 GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```
DBMS_XDBRESOURCE.GETVERSIONID (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

Table 219-23 GETVERSIONID Function Parameters

Parameter	Description
res	XDBResource

219.3.23 HASACLCHANGED Function

This function returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASACLCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 219-24 HASACLCHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.24 HASAUTHORCHANGED Function

This function returns `TRUE` if the author of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASAUTHORCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 219-25 HASAUTHORCHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.25 HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```
DBMS_XDBRESOURCE.HASCHANGED (
    res IN XDBResource,
    xpath IN VARCHAR2,
    namespace IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 219-26 HASCHANGED Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath to check
bnamespace	Namespace to use

219.3.26 HASCHARACTERSETCHANGED Function

This function returns `TRUE` if the character set of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCHARACTERSETCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters**Table 219-27 HASCHARACTERSETCHANGED Function Parameters**

Parameter	Description
res	XDBResource

219.3.27 HASCOMMENTCHANGED Function

This function returns `TRUE` if the comment of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCOMMENTCHANGED (
  res IN XDBResource)
RETURN BOOLEAN;
```

Parameters**Table 219-28 HASCOMMENTCHANGED Function Parameters**

Parameter	Description
res	XDBResource

219.3.28 HASCONTENTCHANGED Function

This function returns `TRUE` if the contents of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTCHANGED (
  res IN XDBResource)
RETURN BOOLEAN;
```

Parameters**Table 219-29 HASCONTENTCHANGED Function Parameters**

Parameter	Description
res	XDBResource

219.3.29 HASCONTENTTYPECHANGED Function

This function returns `TRUE` if the content-type of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTTYPECHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 219-30 HASCONTENTTYPECHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.30 HASCREATIONDATECHANGED Function

This function returns `TRUE` if the creation date of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCREATIONDATECHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 219-31 HASCREATIONDATECHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.31 HASCREATORCHANGED Function

This function returns `TRUE` if the creator of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCREATORCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 219-32 HASCREATORCHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.32 HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```
DBMS_XDBRESOURCE.HASCUSTOMMETADATACHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 219-33 HASCUSTOMMETADATACHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.33 HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASDISPLAYNAMECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 219-34 HASDISPLAYNAMECHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.34 HASLANGUAGECHANGED Function

This function returns `TRUE` if the language of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASLANGUAGECHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 219-35 HASLANGUAGECHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.35 HASLASTMODIFIERCHANGED Function

This function returns `TRUE` if the last modifier of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASLASTMODIFIERCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 219-36 HASLASTMODIFIERCHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.36 HASMODIFICATIONDATECHANGED Function

This function returns `TRUE` if the modification date of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASMODIFICATIONDATECHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 219-37 HASMODIFICATIONDATECHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.37 HASOWNERCHANGED Function

This function returns `TRUE` if the owner of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASOWNERCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 219-38 HASOWNERCHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.38 HASREFCOUNTCHANGED Function

This function returns `TRUE` if the reference count of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASREFCOUNTCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 219-39 HASREFCOUNTCHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.39 HASVERSIONIDCHANGED Function

This function returns `TRUE` if the version ID of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASVERSIONIDCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 219-40 HASVERSIONIDCHANGED Function Parameters

Parameter	Description
res	XDBResource

219.3.40 ISFOLDER Function

This function returns `TRUE` if the given resource is a folder, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.ISFOLDER (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 219-41 ISFOLDER Function Parameters

Parameter	Description
res	XDBResource

219.3.41 ISNULL Function

This function returns `TRUE` if input resource is `NULL`.

Syntax

```
DBMS_XDBRESOURCE.ISNULL (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 219-42 ISNULL Function Parameters

Parameter	Description
res	Input resource

219.3.42 MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

See Also:

The [DBMS_XMLDOM](#) package

Syntax

```
DBMS_XDBRESOURCE.MAKEDOCUMENT (
    res IN XDBResource)
RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

Table 219-43 MAKEDOCUMENT Function Parameters

Parameter	Description
res	XDBResource

219.3.43 SAVE Procedure

This procedure updates the resource with any modifications.

Syntax

```
DBMS_XDBRESOURCE.SAVE (
    res IN XDBResource);
```

Parameters

Table 219-44 SAVE Procedure Parameters

Parameter	Description
res	XDBResource

219.3.44 SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

```
DBMS_XDBRESOURCE.SETACL (
    res      IN OUT  XDBResource,
    ACLPath  IN      VARCHAR2);
```

Parameters

Table 219-45 SETACL Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	Absolute path of the new ACL

219.3.45 SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESOURCE.SETAUTHOR (
    res      IN OUT  XDBResource,
    author  IN      VARCHAR2);
```

Parameters

Table 219-46 SETAUTHOR Procedure Parameters

Parameter	Description
res	XDBResource
author	Author

219.3.46 SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```
DBMS_XDBRESOURCE.SETCHARACTERSET (
    res      IN OUT  XDBResource,
    charSet  IN      VARCHAR2);
```

Parameters

Table 219-47 SETCHARACTERSET Procedure Parameters

Parameter	Description
res	XDBResource
charset	New character set

219.3.47 SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETCOMMENT (
    res      IN OUT XDBResource,
    comment  IN      VARCHAR2);
```

Parameters

Table 219-48 SETCOMMENT Procedure Parameters

Parameter	Description
res	XDBResource
comment	New comment

219.3.48 SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

Syntax

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT XDBResource,
    data     IN      BFILE,
    csid     IN      NUMBER);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT XDBResource,
    data     IN      BLOB,
    csid     IN      PLS_INTEGER);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT XDBResource,
    data     IN      CLOB);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT XDBResource,
    data     IN      REF SYS.XMLType,
    sticky   IN      BOOLEAN := TRUE);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT XDBResource,
```

```

data      IN      VARCHAR2);

DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      SYS.XMLType);

```

Parameters

Table 219-49 SETCONTENT Procedure Parameters

Parameter	Description
res	XDBResource
data	Data input as BFILE, BLOB, CLOB, string, XMLType
csid	Character set ID of the BFILE, BLOB
sticky	If TRUE creates a sticky REF, otherwise non-sticky

219.3.49 SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```

DBMS_XDBRESOURCE.SETCONTENTTYPE (
  res      IN OUT  XDBResource,
  conttype IN      VARCHAR2);

```

Parameters

Table 219-50 SETCONTENTTYPE Procedure Parameters

Parameter	Description
res	XDBResource
conttype	New content-type

219.3.50 SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```

DBMS_XDBRESOURCE.SETCUSTOMMETADATA (
  res      IN OUT  XDBResource,
  xpath    IN      VARCHAR2,
  namespace IN      VARCHAR2,
  newMetadata IN    XMLType);

```

Parameters

Table 219-51 SETCUSTOMMETADATA Procedure Parameters

Parameter	Description
res	XDBResource
xpath	XPath to change
namespace	Namespace to use
newMetadata	New data that should replace the metadata at the given XPath

Usage Notes

The first component of the XPath expression must be "Resource".

219.3.51 SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETDISPLAYNAME (
    res      IN OUT XDBResource,
    name     IN     VARCHAR2);
```

Parameters

Table 219-52 SETDISPLAYNAME Procedure Parameters

Parameter	Description
res	XDBResource
name	New display name

219.3.52 SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETLANGUAGE (
    res      IN OUT XDBResource,
    ACLPath IN     VARCHAR2);
```

Parameters

Table 219-53 SETLANGUAGE Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	New path

219.3.53 SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETOWNER (  
    res      IN OUT XDBResource,  
    owner    IN     VARCHAR2);
```

Parameters

Table 219-54 SETOWNER Procedure Parameters

Parameter	Description
res	XDBResource
owner	New owner

Usage Notes

The user must have the `XDBADMIN` privilege to call this subprogram.

DBMS_XDBZ

The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_XDBZ Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

220.1 DBMS_XDBZ Security Model

Owned by XDB, the DBMS_XDBZ package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

220.2 DBMS_XDBZ Constants

The DBMS_XDBZ package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in following tables.

Table 220-1 DBMS_XDBZ Constants - Name Format

Constant	Type	Value	Description
NAME_FORMAT_SHORT	PLS_INTEGER	1	DB user name or LDAP nickname
NAME_FORMAT_DISTINGUISHED	PLS_INTEGER	2	LDAP distinguished name

Table 220-2 DBMS_XDBZ Constants - Enable Option

Constant	Type	Value	Description
ENABLE_CONTENTS	PLS_INTEGER	1	Enables hierarchy for contents and is used by users when calling the ENABLE_HIERARCHY Procedure

Table 220-2 (Cont.) DBMS_XDBZ Constants - Enable Option

Constant	Type	Value	Description
ENABLE_RESMETADATA	PLS_INTEGER	2	Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources

Table 220-3 DBMS_XDBZ Constants - Enable Option Exercised

Constant	Type	Value	Description
IS_ENABLED_CONTENTS	PLS_INTEGER	1	If hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code>
IS_ENABLED_RESMETADATA	PLS_INTEGER	2	If hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code>

220.3 Summary of DBMS_XDBZ Subprograms

This table lists the DBMS_XDBZ subprograms and briefly describes them.

Table 220-4 DBMS_XDBZ Package Subprograms

Method	Description
DISABLE_HIERARCHY Procedure	Disables repository support for the specified XMLTYPE table or view
ENABLE_HIERARCHY Procedure	Enables repository support for the specified XMLType table or view
GET_ACLOID Function	Retrieves the ACL Object ID for the specified resource
GET_USERID Function	Retrieves the user ID for the specified user
IS_HIERARCHY_ENABLED Function	Determines if repository support for the specified XMLType table or view is enabled
PURGELDAPCACHE Function	Purges the LDAP nickname cache

220.3.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDBZ.CREATENONCEKEY;
```

220.3.2 DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(  
    object_schema IN VARCHAR2,  
    object_name   IN VARCHAR2);
```

Parameters

Table 220-5 DISABLE_HIERARCHY Procedure Parameters

Parameter	Description
object_schema	Schema name of the XMLType table or view
object_name	Name of the XMLType table or view

220.3.3 ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

See Also:

Oracle XML DB Developer's Guide for more information about

Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(  
    object_schema IN VARCHAR2,  
    object_name   IN VARCHAR2,  
    hierarchy_type IN PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

Table 220-6 ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
object_schema	Schema name of the XMLType table or view
object_name	Name of the XMLType table or view

Table 220-6 (Cont.) ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
hierarchy_type	<p>How to enable the hierarchy.</p> <ul style="list-style-type: none"> ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources <p>If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.</p>

220.3.4 GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```
DBMS_XDBZ.GET_ACLOID(
  aclpath IN VARCHAR2,
  acloid  OUT RAW)
RETURN BOOLEAN;
```

Parameters

Table 220-7 GET_ACLOID Function Parameters

Parameter	Description
aclpath	ACL resource path for the repository
acloid	Returned Object ID

Return Values

Returns `TRUE` if successful.

220.3.5 GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the `USERID` is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the `USERID` is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(
  username IN VARCHAR2,
  userid  OUT RAW,
  format  IN BINARY_INTEGER := NAME_FORMAT_SHORT)
RETURN BOOLEAN;
```

Parameters

Table 220-8 GET_USERID Function Parameters

Parameter	Description
username	Name of the database or LDAP user.
userid	Return parameter for the matching user id.
format	Format of the specified user name; valid options are: <ul style="list-style-type: none"> DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname DBMS_XDBZ.NAME_FORMAT_DISTINGUISHED -- LDAP distinguished name.

Return Values

Returns `TRUE` if successful.

220.3.6 IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified `XMLType` table or view is enabled.

Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  hierarchy_type IN PLS_INTEGER := IS_ENABLED_CONTENTS)
RETURN BOOLEAN;
```

Parameters

Table 220-9 IS_HIERARCHY_ENABLED Function Parameters

Parameter	Description
object_schema	Schema name of the <code>XMLType</code> table or view
object_name	Name of the <code>XMLType</code> table or view
hierarchy_type	Type of hierarchy to check for: <ul style="list-style-type: none"> <code>IS_ENABLED_CONTENTS</code> - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code> <code>IS_ENABLED_RESMETADATA</code> - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code>

Return Values

Returns `TRUE` if the given `XMLTYPE` table or view has the XDB Hierarchy enabled with the specified type.

220.3.7 PURGELDAPCACHE Function

This function purges the LDAP nickname cache.

It returns `TRUE` if successful.

Syntax

```
DBMS_XDBZ.PURGELDAPCACHE  
RETURN BOOLEAN;
```

DBMS_XEVENT

The `DBMS_XEVENT` package provides event-related types and supporting subprograms.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Subprogram Groups](#)
- [Summary of DBMS_XEVENT Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for more information about "Oracle XML DB Repository Events"

221.1 DBMS_XEVENT Security Model

Owned by `XDB`, the `DBMS_XEVENT` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

221.2 DBMS_XEVENT Constants

The `DBMS_XEVENT` package defines several constants that can be used for specifying parameter values.

The constants are defined in the following table.

Table 221-1 DBMS_XEVENT Constants

Name	Type	Value	Description
<code>RENDER_EVENT</code>	<code>PLS_INTEGER</code>	1	
<code>PRE_CREATE_EVENT</code>	<code>PLS_INTEGER</code>	2	
<code>POST_CREATE_EVENT</code>	<code>PLS_INTEGER</code>	3	
<code>PRE_DELETE_EVENT</code>	<code>PLS_INTEGER</code>	4	
<code>POST_DELETE_EVENT</code>	<code>PLS_INTEGER</code>	5	
<code>PRE_UPDATE_EVENT</code>	<code>PLS_INTEGER</code>	6	
<code>POST_UPDATE_EVENT</code>	<code>PLS_INTEGER</code>	7	
<code>PRE_LOCK_EVENT</code>	<code>PLS_INTEGER</code>	8	

Table 221-1 (Cont.) DBMS_XEVENT Constants

Name	Type	Value	Description
POST_LOCK_EVENT	PLS_INTEGER	9	
PRE_UNLOCK_EVENT	PLS_INTEGER	10	
POST_UNLOCK_EVENT	PLS_INTEGER	11	
PRE_LINKIN_EVENT	PLS_INTEGER	12	
POST_LINKIN_EVENT	PLS_INTEGER	13	
PRE_LINKTO_EVENT	PLS_INTEGER	14	
POST_LINKTO_EVENT	PLS_INTEGER	15	
PRE_UNLINKIN_EVENT	PLS_INTEGER	16	
POST_UNLINKIN_EVENT	PLS_INTEGER	17	
PRE_UNLINKFROM_EVENT	PLS_INTEGER	18	
POST_UNLINKFROM_EVENT	PLS_INTEGER	19	
PRE_CHECKIN_EVENT	PLS_INTEGER	20	
POST_CHECKIN_EVENT	PLS_INTEGER	21	
PRE_CHECKOUT_EVENT	PLS_INTEGER	22	
POST_CHECKOUT_EVENT	PLS_INTEGER	23	
PRE_UNCHECKOUT_EVENT	PLS_INTEGER	24	
POST_UNCHECKOUT_EVENT	PLS_INTEGER	25	
PRE_VERSIONCONTROL_EVENT	PLS_INTEGER	26	
POST_VERSIONCONTROL_EVENT	PLS_INTEGER	27	
PRE_OPEN_EVENT	PLS_INTEGER	28	
POST_OPEN_EVENT	PLS_INTEGER	29	
PRE_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	30	
POST_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	21	
POST_CHECKIN_EVENT	PLS_INTEGER	21	

221.3 Subprogram Groups

The subprograms in the `DBMS_XEVENT` package can be divided in groups.

- [XDBEvent Type Subprograms](#)
- [XDBRepositoryEvent Type Subprograms](#)
- [XDBHandlerList Type Subprograms](#)
- [XDBHandler Type Subprograms](#)
- [XDBPath Type Subprograms](#)
- [XDBLink Type Subprograms](#)

221.3.1 DBMS_XEVENT XDBEvent Type Subprograms

This subprogram group provides an interface for use with the XDBEvent type.

Table 221-2 XDBEvent Subprograms

Subprogram	Description
GETCURRENTUSER Function	Returns the name of the user executing the operation that triggers the event
GETEVENT Function	Returns a value identifying the triggering event
ISNULL Functions	Returns <code>TRUE</code> if input argument is <code>NULL</code>

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

221.3.2 DBMS_XEVENT XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

Table 221-3 XDBRepositoryEvent Subprograms

Subprogram	Description
GETAPPLICATIONDATA Function	Returns the <code><applicationData></code> element extracted from the resource configuration that defines the invoking handler
GETHANDLERLIST Function	Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler
GETINTERFACE Function	Returns the top-level interface used to initiate the operation that triggered the event
GETLINK Function	Returns an <code>XDBLink</code> object for the target resource
GETLOCK Function	Returns the lock object corresponding to the current operation
GETOLDRESOURCE Function	Returns the original <code>XDBResource</code> object before the operation was executed
GETOPENACCESSMODE Function	Returns the access mode for the open operation
GETOPENDENYMODE Function	Returns the deny mode for the open operation
GETOUTPUTSTREAM Function	Returns the output BLOB in which the handler can write the rendered data
GETPARAMETER Function	Returns the value of a request or session-specific parameter
GETPARENT Function	Returns the resource object corresponding to a parent folder of the target resource
GETPATH Function	Returns the <code>XDBPath</code> object representing the path of the resource for which the event was fired

Table 221-3 (Cont.) XDBRepositoryEvent Subprograms

Subprogram	Description
GETRESOURCE Function	Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource
GETUPDATEBYTECOUNT Function	If the current operation is a byte-range write, returns the byte count
GETUPDATEBYTEOFFSET Function	If the current operation is a byte-range write, function returns the byte offset at which the range begins
GETXDBeVENT Function	Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type
ISNULL Functions	Returns <code>TRUE</code> if input argument is <code>NULL</code>
SETRENDERPATH Procedure	Specifies the path of the resource that contains the rendered contents
SETRENDERSTREAM Procedure	sets the <code>BLOB</code> from which the rendered contents can be read

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

221.3.3 DBMS_XEVENT XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBHandlerList` type.

Table 221-4 XDBHandlerList Subprograms

Subprogram	Description
CLEAR Procedure	Clears the handler list
GETFIRST Function	Returns the first handler in the list
GETNAME Function	Returns the next handler in the list
ISNULL Functions	Returns <code>TRUE</code> if input argument is <code>NULL</code>
REMOVE Procedure	Removes the specified handler from the handler list

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

221.3.4 DBMS_XEVENT XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBHandler` type.

Table 221-5 XDBHandler Type Subprograms

Subprogram	Description
GETLANGUAGE Function	Returns the implementation language of the handler

Table 221-5 (Cont.) XDBHandler Type Subprograms

Subprogram	Description
GETSCHEMA Function	Returns the schema of the handler's source
GETSOURCE Function	Returns the name of the Java class, PL/SQL package or object type implementing the handler
ISNULL Functions	Returns <code>TRUE</code> if input argument is <code>NULL</code>

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

221.3.5 DBMS_XEVENT XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 221-6 XDBPath Type Subprograms

Subprogram	Description
GETNAME Function	Returns the string representation of the path
GETPARENTPATH Function	Returns the parent's path
ISNULL Functions	Returns <code>TRUE</code> if input argument is <code>NULL</code>

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

221.3.6 DBMS_XEVENT XDblink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDblink type.

Table 221-7 XDblink Type Subprograms

Subprogram	Description
GETCHILDROID Function	Returns the OID of the resource to which the link is pointing
GETPARENTNAME Function	Returns the link's parent folder's name
GETPARENTOID Function	Returns the link's parent folder's OID
ISNULL Functions	Returns <code>TRUE</code> if input argument is <code>NULL</code>

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

221.4 Summary of DBMS_XEVENT Subprograms

This table lists the DBMS_XEVENT subprograms and briefly describes them.

Table 221-8 DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
CLEAR Procedure	Clears the handler list	XDBHandlerList Type Subprograms
GETAPPLICATIONDATA Function	Returns the <applicationData> element extracted from the resource configuration that defines the invoking handler	XDBRepositoryEvent Type Subprograms
GETCHILDROID Function	Returns the OID of the resource to which the link is pointing	XDBLink Type Subprograms
GETCURRENTUSER Function	Returns the name of the user executing the operation that triggers the event	XDBEvent Type Subprograms
GETEVENT Function	Returns a value identifying the triggering event	XDBEvent Type Subprograms
GETFIRST Function	Returns the first handler in the list	XDBHandlerList Type Subprograms
GETHANDLERLIST Function	Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler	XDBRepositoryEvent Type Subprograms
GETINTERFACE Function	Returns the top-level interface used to initiate the operation that triggered the event	XDBRepositoryEvent Type Subprograms
GETLANGUAGE Function	Returns the implementation language of the handler	XDBHandler Type Subprograms
GETLINK Function	Returns an <code>XDBLink</code> object for the target resource	XDBRepositoryEvent Type Subprograms
GETLOCK Function	Returns the lock object corresponding to the current operation	XDBRepositoryEvent Type Subprograms
GETNAME Function	Returns the string representation of the path	XDBPath Type Subprograms
GETNAME Function	Returns the next handler in the list	XDBHandlerList Type Subprograms
GETOLDRESOURCE Function	Returns the original <code>XDBResource</code> object before the operation was executed	XDBRepositoryEvent Type Subprograms
GETOPENACCESSMODE Function	Returns the access mode for the open operation	XDBRepositoryEvent Type Subprograms
GETOPENDENYMODE Function	Returns the deny mode for the open operation	XDBRepositoryEvent Type Subprograms
GETOUTPUTSTREAM Function	Returns the output BLOB in which the handler can write the rendered data	XDBRepositoryEvent Type Subprograms
GETPARAMETER Function	Returns the value of a request or session-specific parameter	XDBRepositoryEvent Type Subprograms
GETPARENT Function	Returns the resource object corresponding to a parent folder of the target resource	XDBRepositoryEvent Type Subprograms

Table 221-8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
GETPARENTNAME Function	Returns the link's parent folder's name	XDBLink Type Subprograms
GETPARENTOID Function	Returns the link's parent folder's OID	XDBLink Type Subprograms
GETPARENTNAME Function	Returns the parent's path	XDBPath Type Subprograms
GETPATH Function	Returns the <code>XDBPath</code> object representing the path of the resource for which the event was fired	XDBRepositoryEvent Type Subprograms
GETRESOURCE Function	Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource	XDBRepositoryEvent Type Subprograms
GETSCHEMA Function	Returns the schema of the handler's source	XDBHandler Type Subprograms
GETSOURCE Function	Returns the name of the Java class, PL/SQL package or object type implementing the handler	XDBHandler Type Subprograms
GETUPDATEBYTECOUNT Function	If the current operation is a byte-range write, returns the byte count	XDBRepositoryEvent Type Subprograms
GETUPDATEBYTEOFFSET Function	If the current operation is a byte-range write, function returns the byte offset at which the range begins	XDBRepositoryEvent Type Subprograms
GETXDBEVENT Function	Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type	XDBRepositoryEvent Type Subprograms
ISNULL Functions	Returns <code>TRUE</code> if input argument is <code>NULL</code>	XDBEvent Type Subprograms XDBRepositoryEvent Type Subprograms XDBHandlerList Type Subprograms XDBHandler Type Subprograms XDBPath Type Subprograms
REMOVE Procedure	Removes the specified handler from the handler list	XDBHandlerList Type Subprograms
SETRENDERPATH Procedure	Specifies the path of the resource that contains the rendered contents	XDBRepositoryEvent Type Subprograms
SETRENDERSTREAM Procedure	sets the <code>BLOB</code> from which the rendered contents can be read	XDBRepositoryEvent Type Subprograms

221.4.1 CLEAR Procedure

This procedure clears the handler list.

See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.CLEAR (
    hl          IN OUT  XDBHandlerList);
```

Parameters

Table 221-9 CLEAR Procedure Parameters

Parameter	Description
hl	Handler list

221.4.2 GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (
    ev  IN  XDBRepositoryEvent)
RETURN XMLType;
```

Parameters

Table 221-10 GETAPPLICATIONDATA Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.3 GETCHILDROID Function

This function returns the OID of the resource to which the link is pointing.

See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCHILDROID (  
    link IN XDBLink)  
    RETURN RAW;
```

Parameters

Table 221-11 GETCHILDROID Function Parameters

Parameter	Description
link	Link

221.4.4 GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

See Also:

[XDBEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCURRENTUSER (  
    ev IN XDBEvent)  
    RETURN VARCHAR2;
```

Parameters

Table 221-12 GETCURRENTUSER Function Parameters

Parameter	Description
ev	Event of XDBEvent type

221.4.5 GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

See Also:

[XDBEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETEVENT (
    ev    IN    XDBEvent)
RETURN XDBEventID;
```

Parameters

Table 221-13 GETEVENT Function Parameters

Parameter	Description
ev	Event of XDBEvent type

221.4.6 GETFIRST Function

This function returns the first handler in the list.

See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETFIRST (
    hl    IN    XDBHandlerList)
RETURN XDBHandler;
```

Parameters

Table 221-14 GETFIRST Function Parameters

Parameter	Description
hl	Handler list

221.4.7 GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler.

The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETHANDLERLIST (  
    ev IN XDBRepositoryEvent)  
    RETURN XDBHandlerList;
```

Parameters

Table 221-15 GETHANDLERLIST Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.8 GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETINTERFACE (  
    ev IN XDBRepositoryEvent)  
    RETURN VARCHAR2;
```

Parameters

Table 221-16 GETINTERFACE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.9 GETLANGUAGE Function

This function returns the implementation language of the handler.

**See Also:**

[XDBHandler Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 221-17 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

221.4.10 GETLINK Function

This function returns an `XDBLink` object for the target resource.

For a `link*` or `unlink*` event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINK (
    ev IN XDBRepositoryEvent)
RETURN XDBLink;
```

Parameters

Table 221-18 GETLINK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.11 GETLINKNAME Function

This function returns the name of the link.

**See Also:**

[XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINKNAME (
    link IN XDBLink)
RETURN VARCHAR2;
```

Parameters

Table 221-19 GETLINKNAME Function Parameters

Parameter	Description
link	Link

221.4.12 GETLOCK Function

This function returns the lock object corresponding to the current operation. It is only valid for lock and unlock events.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLOCK (
    ev IN XDBRepositoryEvent)
RETURN XDBLock;
```

Parameters

Table 221-20 GETLOCK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.13 GETLANGUAGE Function

This function returns the implementation language of the handler.

See Also:

[XDBHandler Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 221-21 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

221.4.14 GETNAME Function

This function returns the string representation of the path.

See Also:

[XDBPath Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (
    path IN XDBPath)
RETURN VARCHAR2;
```

Parameters

Table 221-22 GETNAME Function Parameters

Parameter	Description
path	Path

221.4.15 GETNEXT Function

This function returns the next handler in the list.

**See Also:**

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (
    hl IN XDBHandlerList)
RETURN XDBHandler;
```

Parameters

Table 221-23 GETNEXT Function Parameters

Parameter	Description
hl	Handler list

221.4.16 GETOLDRESOURCE Function

This function returns the original `XDBResource` object before the operation was executed.

This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
    ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

Parameters

Table 221-24 GETOLDRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.17 GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (
    ev IN XDBRepositoryEvent)
RETURN PLS_INTEGER;
```

Parameters

Table 221-25 GETOPENACCESSMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_ACCESS_READ (value 1)
- XDBRepositoryEvent.OPEN_ACCESS_WRITE (value 2)
- XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE (value 3)

221.4.18 GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENENYMODE (
    ev IN XDBRepositoryEvent)
RETURN PLS_INTEGER;
```

Parameters**Table 221-26** GETOPENENYMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)

221.4.19 GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (
    ev IN XDBRepositoryEvent)
RETURN BLOB;
```

Parameters**Table 221-27** GETOUTPUTSTREAM Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.20 GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARAMETER (  
    ev    IN    XDBRepositoryEvent,  
    key   IN    VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 221-28 GETPARAMETER Function Parameters

Parameter	Description
<code>ev</code>	Event of XDBRepositoryEvent type
<code>key</code>	Supported parameters: <ul style="list-style-type: none">• ACCEPT• ACCEPT-LANGUAGE• ACCEPT-CHARSET• ACCEPT_ENCODING

221.4.21 GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a `link*` or `unlink*` event, this method returns the link's parent folder.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENT (  
    ev    IN    XDBRepositoryEvent)  
RETURN XDBResource;
```

Parameters

Table 221-29 GETPARENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.22 GETPARENTNAME Function

This function returns the link's parent folder's name.

See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTNAME (  
    link IN XDBLink)  
    RETURN VARCHAR2;
```

Parameters

Table 221-30 GETPARENTNAME Function Parameters

Parameter	Description
link	Link

221.4.23 GETPARENTOID Function

This function returns the link's parent folder's OID.

See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (  
    link IN XDBLink)  
    RETURN RAW;
```

Parameters

Table 221-31 GETPARENTOID Function Parameters

Parameter	Description
link	Link

221.4.24 GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a `NULL` is returned.

**See Also:**

[XDBPath Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTPATH (
    path IN XDBPath,
    level IN INTEGER)
RETURN XDBPath;
```

Parameters

Table 221-32 GETPARENTPATH Function Parameters

Parameter	Description
path	Path
level	Number of levels up the hierarchy

221.4.25 GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPATH (
    ev IN XDBRepositoryEvent)
RETURN XDBPath;
```

Parameters**Table 221-33** GETPATH Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.26 GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a `link*` or `unlink*` event, this method returns the resource that the link is pointing to. For a `create` event, this method returns the resource that is being created.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETRESOURCE (
    ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

Parameters**Table 221-34** GETRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.27 GETSCHEMA Function

This function returns the schema of the handler's source.

**See Also:**

[XDBHandler Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSCHEMA (  
    handler IN XDBHandler)  
    RETURN VARCHAR2;
```

Parameters**Table 221-35 GETSCHEMA Function Parameters**

Parameter	Description
handler	Handler

221.4.28 GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

**See Also:**

[XDBHandler Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSOURCE (  
    handler IN XDBHandler)  
    RETURN VARCHAR2;
```

Parameters**Table 221-36 GETSOURCE Function Parameters**

Parameter	Description
handler	Handler

221.4.29 GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the `GETUPDATEBYTECOUNT` function returns the byte count. It is only valid for the inconsistent-update event.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (
  ev IN XDBRepositoryEvent)
RETURN NUMBER;
```

Parameters**Table 221-37** GETUPDATEBYTECOUNT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.30 GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, the `GETUPDATEBYTEOFFSET` function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (
  ev IN XDBRepositoryEvent)
RETURN NUMBER;
```

Parameters**Table 221-38** GETUPDATEBYTEOFFSET Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.31 GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETXDBEVENT (
  ev IN XDBRepositoryEvent)
  RETURN XDBEvent;
```

Parameters**Table 221-39 GETXDBEVENT Function Parameters**

Parameter	Description
ev	Event of XDBRepositoryEvent type

221.4.32 ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

 **See Also:**

- [XDBEvent Type Subprograms](#) for other subprograms in this group
- [XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group
- [XDBHandlerList Type Subprograms](#) for other subprograms in this group
- [XDBHandler Type Subprograms](#) for other subprograms in this group
- [XDBPath Type Subprograms](#) for other subprograms in this group
- [XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.ISNULL (
  ev IN XDBEvent)
  RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
  ev IN XDBRepositoryEvent)
  RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
  hl IN XDBHandlerList)
  RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
  handler IN XDBHandler)
  RETURN BOOLEAN;
RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
  path IN XDBPath)
  RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
    link      IN  XDBLink)
RETURN BOOLEAN;
```

Parameters

Table 221-40 ISNULL Function Parameters

Parameter	Description
ev	Event of specified type
hl	Handler list
handler	Handler
path	Path

221.4.33 REMOVE Procedure

This procedure removes the specified handler from the handler list.

See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.REMOVE (
    hl      IN OUT  XDBHandlerList,
    handler IN      XDBHandler);
```

Parameters

Table 221-41 REMOVE Procedure Parameters

Parameter	Description
hl	Handler list
handler	Handler

221.4.34 SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents.

This should not be called after the stream returned by [GETOUTPUTSTREAM Function](#) is written to or after the [SETRENDERSTREAM Procedure](#) is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERPATH (
    ev      IN  XDBRepositoryEvent,
    path    IN  VARCHAR2);
```

Parameters

Table 221-42 SETRENDERPATH Procedure Parameters

Parameter	Description
ev	XDB Repository Event object
path	Path of the resource containing the rendered contents

221.4.35 SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read.

This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (
    ev    IN    XDBRepositoryEvent,
    istr  IN    BLOB);
```

Parameters

Table 221-43 SETRENDERSTREAM Procedure Parameters

Parameter	Description
ev	XDBRepositoryEvent object
istr	Input stream from which to get the rendered contents

DBMS_XMLDOM

The `DBMS_XMLDOM` package is used to access `XMLType` objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Exceptions](#)
- [Subprogram Groups](#)
- [Subprogram Groups](#)
- [Summary of DBMS_XMLDOM Subprograms](#)

See Also:

Oracle XML Developer's Kit Programmer's Guide

222.1 DBMS_XMLDOM Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated.

In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

Note:

Read-from and write-to files must be on the server file system.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform [APPENDCHILD Function](#) on a `DOMNode` `n`, the [APPENDCHILD Function](#) PL/SQL function is provided.
- To perform `setAttribute` on a `DOMElement` `elem` [SETATTRIBUTE Procedures](#), use PL/SQL procedure .

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see [Figure 222-1](#)). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `makeXXX` functions, where `DOMXXX` is the desired DOM type.

Figure 222-1 Inheritance Diagram for DOM Types

The implementation of this interface follows the REC-DOM-Level-1-19981001.

222.2 DBMS_XMLDOM Security Model

Owned by XDB, the DBMS_XMLDOM package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

222.3 DBMS_XMLDOM Constants

The DBMS_XMLDOM package defines several constants that can be used for specifying parameter values.

These constants are listed in the following table.

Table 222-1 Defined Constants for DBMS_XMLDOM

Constant	Type	Value	Description
ELEMENT_NODE	PLS_INTEGER	1	The Node is an Element.
ATTRIBUTE_NODE	PLS_INTEGER	2	The Node is an Attribute.
TEXT_NODE	PLS_INTEGER	3	The Node is a Text node.
CDATA_SECTION_NODE	PLS_INTEGER	4	The Node is a CDATASection.
ENTITY_REFERENCE_NODE	PLS_INTEGER	5	The Node is an Entity Reference.
ENTITY_NODE	PLS_INTEGER	6	The Node is an Entity.
PROCESSING_INSTRUCTION_NODE	PLS_INTEGER	7	The Node is a Processing Instruction.
COMMENT_NODE	PLS_INTEGER	8	The Node is a Comment.
DOCUMENT_NODE	PLS_INTEGER	9	The Node is a Document.
DOCUMENT_TYPE_NODE	PLS_INTEGER	10	The Node is a Document Type Definition.
DOCUMENT_FRAGMENT_NODE	PLS_INTEGER	11	The Node is a Document fragment.
NOTATION_NODE	PLS_INTEGER	12	The Node is a Notation.

222.4 DBMS_XMLDOM Types

This table lists and briefly describes the types for the DBMS_XMLDOM, DOMTYPE package.

Table 222-2 XDB_XMLDOM Types

Type	Description
DOMATTR	Implements the DOM Attribute interface.
DOMCDATASECTION	Implements the DOM CDATASection interface.
DOMCHARACTERDATA	Implements the DOM Character Data interface.
DOMCOMMENT	Implements the DOM Comment interface.

Table 222-2 (Cont.) XDB_XMLDOM Types

Type	Description
DOMDOCUMENT	Implements the DOM Document interface.
DOMDOCUMENTFRAGMENT	Implements the DOM DocumentFragment interface.
DOMDOCUMENTTYPE	Implements the DOM Document Type interface.
DOMELEMENT	Implements the DOM Element interface.
DOMENTITY	Implements the DOM Entity interface.
DOMENTITYREFERENCE	Implements the DOM EntityReference interface.
DOMIMPLEMENTATION	Implements the DOM Implementation interface.
DOMNAMEDNODEMAP	Implements the DOM Named Node Map interface.
DOMNODE	Implements the DOM Node interface.
DOMNODELIST	Implements the DOM NodeList interface.
DOMNOTATION	Implements the DOM Notation interface.
DOMPROCESSINGINSTRUCTION	Implements the DOM Processing instruction interface.
DOMTEXT	Implements the DOM Text interface.

222.5 DBMS_XMLDOM Exceptions

DBMS_XMLDOM generates an exception when it encounters an issue.

This table lists the exceptions defined for DBMS_XMLDOM:

Table 222-3 Exceptions for DBMS_XMLDOM

Exception	Description
DOMSTRING_SIZE_ERR	If the specified range of text does not fit into a DOMString.
HIERARCHY_REQUEST_ERR	If any node is inserted somewhere it doesn't belong.
INDEX_SIZE_ERR	If index or size is negative, or greater than the allowed value.
INUSE_ATTRIBUTE_ERR	If an attempt is made to add an attribute that is already in use elsewhere.
INVALID_CHARACTER_ERR	If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.
NO_DATA_ALLOWED_ERROR	If data is specified for a node that does not support data.
NOT_FOUND_ERR	If an attempt is made to reference a node in a context where it does not exist.
NO_MODIFICATION_ALLOWED_ERR	If an attempt is made to modify an object where modifications are not allowed.
NOT_SUPPORTED_ERR	If the implementation does not support the requested type of object or operation.
WRONG_DOCUMENT_ERR	If a node is used in a different document than the one that created it (that doesn't support it).

222.6 DBMS_XMLDOM Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- [DOMNode Subprograms](#)
- [DOMAttr Subprograms](#)
- [DOMCDATASection Subprograms](#)
- [DOMCharacterData Subprograms](#)
- [DOMComment Subprograms](#)
- [DOMDocument Subprograms](#)
- [DOMDocumentFragment Subprograms](#)
- [DOMDocumentType Subprograms](#)
- [DOMElement Subprograms](#)
- [DOMEntity Subprograms](#)
- [DOMEntityReference Subprograms](#)
- [DOMImplementation Subprograms](#)
- [DOMNamedNodeMap Subprograms](#)
- [DOMNodeList Subprograms](#)
- [DOMNotation Subprograms](#)
- [DOMProcessingInstruction Subprograms](#)
- [DOMText Subprograms](#)

222.6.1 DBMS_XMLDOM DOMNode Subprograms

This table lists and briefly describes the `DOMNode` subprograms of `DBMS_XMLDOM`.

Table 222-4 Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
ADOPTNODE Function	Adopts a node from another document
APPENDCHILD Function	Appends a new child to the node
CLONENODE Function	Clones the node
FREENODE Procedure	Frees all resources associated with the node
GETATTRIBUTES Function	Retrieves the attributes of the node
GETCHILDNODES Function	Retrieves the children of the node
GETEXPANDEDNAME Procedure and Functions	Retrieves the expanded name of the node
GETFIRSTCHILD Function	Retrieves the first child of the node
GETLASTCHILD Function	Retrieves the last child of the node
GETLOCALNAME Procedure and Functions	Retrieves the local part of the qualified name
GETNAMESPACE Procedure and Functions	Retrieves the node's namespace URI

Table 222-4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
GETNEXTSIBLING Function	Retrieves the next sibling of the node
GETNODENAME Function	Retrieves the Name of the Node
GETNODETYPE Function	Retrieves the Type of the node
GETNODEVALUE Function	Retrieves the Value of the Node
GETNODEVALUEASBINARYSTREAM Function & Procedure	Retrieves Node Value as binary stream
GETNODEVALUEASCHARACTERSTREAM Function & Procedure	Retrieves Node Value as character stream
GETOWNERDOCUMENT Function	Retrieves the owner document of the node
GETPARENTNODE Function	Retrieves the parent of this node
GETPREFIX Function	Retrieves the namespace prefix
GETPREVIOUSIBLING Function	Retrieves the previous sibling of the node
GETSCHEMANODE Function	Retrieves the associated schema URI
HASATTRIBUTES Function	Tests if the node has attributes
HASCHILDNODES Function	Tests if the node has child nodes
IMPORTNODE Function	Imports a node from another document
INSERTBEFORE Function	Inserts a child before the reference child
ISNULL Functions	Tests if the node is NULL
MAKEATTR Function	Casts the node to an Attribute
MAKECDATASECTION Function	Casts the node to a CData Section
MAKECHARACTERDATA Function	Casts the node to Character Data
MAKECOMMENT Function	Casts the node to a Comment
MAKEDOCUMENT Function	Casts the node to a DOM Document
MAKEDOCUMENTFRAGMENT Function	Casts the node to a DOM Document Fragment
MAKEDOCUMENTTYPE Function	Casts the node to a DOM Document Type
MAKEELEMENT Function	Casts the node to a DOM Element
MAKEENTITY Function	Casts the node to a DOM Entity
MAKEENTITYREFERENCE Function	Casts the node to a DOM Entity Reference
MAKENOTATION Function	Casts the node to a DOM Notation
MAKEPROCESSINGINSTRUCTION Function	Casts the node to a DOM Processing Instruction
MAKETEXT Function	Casts the node to a DOM Text
REMOVECHILD Function	Removes a specified child from a node
REPLACECHILD Function	Replaces the old child with a new child
SETNODEVALUE Procedure	Sets the Value of the node
SETNODEVALUEASBINARYSTREAM Function & Procedure	Sets the Node Value as binary stream
SETNODEVALUEASCHARACTERSTREAM Function & Procedure	Sets the Node Value as a character stream
SETPREFIX Procedure	Sets the namespace prefix

Table 222-4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
USEBINARYSTREAM Function	Establishes that the stream is valid
WRITETOBUFFER Procedures	Writes the contents of the node to a buffer
WRITETOCLOB Procedures	Writes the contents of the node to a CLOB
WRITETOFILE Procedures	Writes the contents of the node to a file

222.6.2 DBMS_XMLDOM DOMAttr Subprograms

This table lists the DOMAttr subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 222-5 Summary of DOMAttr Subprograms; DBMS_XMLDOM

Method	Description
GETEXPANDEDNAME Procedure and Functions	Retrieves the expanded name of the attribute
GETLOCALNAME Procedure and Functions	Retrieves the local name of the attribute
GETNAME Functions	Retrieves the name of the attribute
GETNAMESPACE Procedure and Functions	Retrieves the NS URI of the attribute
GETOWNERELEMENT Function	Retrieves the Element node, parent of the attribute
GETQUALIFIEDNAME Functions	Retrieves the Qualified Name of the attribute
GETSPECIFIED Function	Tests if attribute was specified in the element
GETVALUE Function	Retrieves the value of the attribute
ISNULL Functions	Tests if the Attribute node is NULL
MAKENODE Functions	Casts the Attribute to a node
SETVALUE Procedure	Sets the value of the attribute

222.6.3 DBMS_XMLDOM DOMCDataSection Subprograms

This table lists the DOMCdata subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 222-6 Summary of DOMCdata Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the CDataSection is NULL
MAKENODE Functions	Casts the CDataSection to a node

222.6.4 DBMS_XMLDOM DOMCharacterData Subprograms

This table lists the DOMCharacterData subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 222-7 Summary of DOMCharacterData Subprograms; DBMS_XMLDOM

Method	Description
APPENDDATA Procedure	Appends the specified data to the node data
DELETEDATA Procedure	Deletes the data from the specified offSets
GETDATA Functions	Retrieves the data of the node
GETLENGTH Functions	Retrieves the length of the data
INSERTDATA Procedure	Inserts the data in the node at the specified offSets
ISNULL Functions	Tests if the CharacterData is NULL
MAKENODE Functions	Casts the CharacterData to a node
REPLACEDATA Procedure	Changes a range of characters in the node
SETDATA Procedures	Sets the data to the node
SUBSTRINGDATA Function	Retrieves the substring of the data

222.6.5 DBMS_XMLDOM DOMComment Subprograms

The table lists the DOMComment subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 222-8 Summary of DOMComment Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the comment is NULL
MAKENODE Functions	Casts the Comment to a node

222.6.6 DBMS_XMLDOM DOMDocument Subprograms

This table lists the DOMDocument subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 222-9 Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
CREATEATTRIBUTE Functions	Creates an Attribute
CREATECDATASECTION Function	Creates a CDataSection node
CREATECOMMENT Function	Creates a Comment node
CREATEDOCUMENT Function	Creates a new Document
CREATEDOCUMENTFRAGMENT Function	Creates a new Document Fragment
CREATEELEMENT Functions	Creates a new Element

**Table 222-9 (Cont.) Summary of DOMDocument Subprograms;
DBMS_XMLDOM**

Method	Description
CREATEENTITYREFERENCE Function	Creates an Entity reference
CREATEPROCESSINGINSTRUCTION Function	Creates a Processing Instruction
CREATETEXTNODE Function	Creates a Text node
FREEDOCFRAG Procedure	Frees the document fragment
FREEDOCUMENT Procedure	Frees the document
GETCHARSET Function	Retrieves the character set of the DOM document
GETDOCTYPE Function	Retrieves the DTD of the document
GETDOCUMENTELEMENT Function	Retrieves the root element of the document
GETELEMENTSBYTAGNAME Functions	Retrieves <ul style="list-style-type: none"> the elements in the DOMNODELIST by tag name elements in the subtree of a DOMNODELIST by tagname
GETIMPLEMENTATION Function	Retrieves the DOM implementation
GETSTANDALONE Function	Retrieves the standalone property of the document
GETVERSION Function	Retrieves the version of the document
GETXMLTYPE Function	Retrieves the XMLType associated with the DOM Document
ISNULL Functions	Tests if the document is NULL
MAKENODE Functions	Casts the document to a node
NEWDOMDOCUMENT Functions	Creates a new document
SETCHARSET Procedure	Sets the character set of the DOM document
SETDOCTYPE Procedure	Sets the DTD of the document
SETSTANDALONE Procedure	Sets the standalone property of the document
SETVERSION Procedure	Sets the version of the document
WRITETOBUFFER Procedures	Writes the document to a buffer
WRITETOCLOB Procedures	Writes the document to a CLOB
WRITETOFILE Procedures	Writes the document to a file

222.6.7 DBMS_XMLDOM DOMDocumentFragment Subprograms

This table lists the DOMDocumentFragment subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

**Table 222-10 Summary of DOMDocumentFragment Subprograms;
DBMS_XMLDOM**

Method	Description
FREEDOCFRAG Procedure	Frees the specified document fragment
ISNULL Functions	Tests if the DocumentFragment is <code>NULL</code>
MAKENODE Functions	Casts the Document Fragment to a node
WRITETOBUFFER Procedures	Writes the contents of a document fragment into a buffer

222.6.8 DBMS_XMLDOM DOMDocumentType Subprograms

This table lists the DOMDocumentType subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 222-11 Summary of DOMDocumentType Subprograms; DBMS_XMLDOM

Method	Description
FINDENTITY Function	Finds the specified entity in the document type
FINDNOTATION Function	Finds the specified notation in the document type
GETENTITIES Function	Retrieves the nodemap of entities in the Document type
GETNAME Functions	Retrieves the name of the Document type
GETNOTATIONS Function	Retrieves the nodemap of the notations in the Document type
GETPUBLICID Functions	Retrieves the public ID of the document type
GETSYSTEMID Functions	Retrieves the system ID of the document type
ISNULL Functions	Tests if the Document Type is <code>NULL</code>
MAKENODE Functions	Casts the document type to a node

222.6.9 DBMS_XMLDOM DOMEElement Subprograms

This table lists the DOMEElement subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 222-12 Summary of DOMEElement Subprograms; DBMS_XMLDOM

Method	Description
FREEELEMENT Procedure	Frees memory allocated to a DOMEElement handle
GETATTRIBUTE Functions	Retrieves the attribute node by name
GETATTRIBUTENODE Functions	Retrieves the attribute node by name
GETCHILDRENBYTAGNAME Functions	Retrieves children of the element by tag name

Table 222-12 (Cont.) Summary of DOMElement Subprograms; DBMS_XMLDOM

Method	Description
GETELEMENTSBYTAGNAME Functions	Retrieves <ul style="list-style-type: none"> the elements in the DOMNODELIST by tag name elements in the subtree of a DOMNODELIST by tagname
GETEXPANDEDNAME Procedure and Functions	Retrieves the expanded name of the element
GETLOCALNAME Procedure and Functions	Retrieves the local name of the element
GETNAMESPACE Procedure and Functions	Retrieves the NS URI of the element
GETQUALIFIEDNAME Functions	Retrieves the qualified name of the element
GETTAGNAME Function	Retrieves the Tag name of the element
HASATTRIBUTE Functions	Tests if an attribute exists
ISNULL Functions	Tests if the Element is NULL
MAKENODE Functions	Casts the Element to a node
NORMALIZE Procedure	Normalizes the text children of the element
REMOVEATTRIBUTE Procedures	Removes the attribute specified by the name
REMOVEATTRIBUTENODE Function	Removes the attribute node in the element
RESOLVENAMESPACEPREFIX Function	Resolve the prefix to a namespace URI
SETATTRIBUTE Procedures	Sets the attribute specified by the name
SETATTRIBUTENODE Functions	Sets the attribute node in the element

222.6.10 DBMS_XMLDOM DOMEntity Subprograms

This table lists and briefly describes the `DOMEntity` subprograms of `DBMS_XMLDOM`.

Table 222-13 Summary of DOMEntity Subprograms; DBMS_XMLDOM

Method	Description
GETNOTATIONNAME Function	Retrieves the notation name of the entity
GETPUBLICID Functions	Retrieves the public Id of the entity
GETSYSTEMID Functions	Retrieves the system Id of the entity
ISNULL Functions	Tests if the Entity is NULL
MAKENODE Functions	Casts the Entity to a node

222.6.11 DBMS_XMLDOM DOMEntityReference Subprograms

This table lists and briefly describes the `DOMEntityReference` subprograms of `DBMS_XMLDOM`.

Table 222-14 Summary of DOMEntityReference Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the <code>DOMEntityReference</code> is NULL
MAKENODE Functions	Casts the <code>DOMEntityReference</code> to NULL

222.6.12 DBMS_XMLDOM DOMImplementation Subprograms

This table lists and briefly describes the `DOMImplementation` subprograms of `DBMS_XMLDOM`.

Table 222-15 Summary of DOMImplementation Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the <code>DOMImplementation</code> node is NULL
HASFEATURE Function	Tests if the <code>DOMImplementation</code> implements a feature

222.6.13 DBMS_XMLDOM DOMNamedNodeMap Subprograms

This table lists and briefly describes the `DOMNamedNodeMap` subprograms of `DBMS_XMLDOM`.

Table 222-16 Summary of DOMNamedNodeMap Subprograms; DBMS_XMLDOM

Method	Description
GETLENGTH Functions	Retrieves the number of items in the map
GETNAMEDITEM Function	Retrieves the item specified by the name
ISNULL Functions	Tests if the <code>NamedNodeMap</code> is NULL
ITEM Functions	Retrieves the item given the index in the map
REMOVENAMEDITEM Function	Removes the item specified by name
SETNAMEDITEM Function	Sets the item in the map specified by the name

222.6.14 DBMS_XMLDOM DOMNodeList Subprograms

This table lists and briefly describes the `DOMNodeList` subprograms of `DBMS_XMLDOM`.

Table 222-17 Summary of DOMNodeList Subprograms; DBMS_XMLDOM

Method	Description
FREENODELIST Procedure	Frees all resources associated with a nodelist
GETLENGTH Functions	Retrieves the number of items in the list
ISNULL Functions	Tests if the <code>NodeList</code> is NULL
ITEM Functions	Retrieves the item given the index in the list

222.6.15 DBMS_XMLDOM DOMNotation Subprograms

This table lists and briefly describes the `DOMNotation` subprograms of `DBMS_XMLDOM`.

Table 222-18 Summary of DOMNotation Subprograms; DBMS_XMLDOM

Method	Description
GETPUBLICID Functions	Retrieves the public Id of the notation
GETSYSTEMID Functions	Retrieves the system Id of the notation
ISNULL Functions	Tests if the Notation is <code>NULL</code>
MAKENODE Functions	Casts the notation to a node

222.6.16 DBMS_XMLDOM DOMProcessingInstruction Subprograms

This table lists and briefly describes the `DOMProcessingInstruction` subprograms of `DBMS_XMLDOM`.

Table 222-19 Summary of DOMProcessingInstruction Subprograms; DBMS_XMLDOM

Method	Description
GETDATA Functions	Retrieves the data of the processing instruction
GETTARGET Function	Retrieves the target of the processing instruction
ISNULL Functions	Tests if the Processing Instruction is <code>NULL</code>
MAKENODE Functions	Casts the Processing Instruction to a node
SETDATA Procedures	Sets the data of the processing instruction

222.6.17 DBMS_XMLDOM DOMText Subprograms

This table lists and briefly describes the `DOMText` subprograms of `DBMS_XMLDOM`.

Table 222-20 Summary of DOMText Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the text is <code>NULL</code>
MAKENODE Functions	Casts the text to a node
SPLITTEXT Function	Splits the contents of the text node into 2 text nodes

222.7 Summary of DBMS_XMLDOM Subprograms

This table lists the `DBMS_XMLDOM` subprograms and briefly describes them.

Table 222-21 Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ADOPTNODE Function	Adopts a node from another document	DOMNode Subprograms
APPENDCHILD Function	Appends a new child to the node	DOMNode Subprograms
APPENDDATA Procedure	Appends the specified data to the node data	DOMCharacterData Subprograms
CLONENODE Function	Clones the node	DOMNode Subprograms
CREATEATTRIBUTE Functions	Creates an Attribute	DOMDocument Subprograms
CREATECDATASECTION Function	Creates a <code>CDataSection</code> node	DOMDocument Subprograms
CREATECOMMENT Function	Creates a Comment node	DOMDocument Subprograms
CREATEDOCUMENT Function	Creates a new Document	DOMDocument Subprograms
CREATEDOCUMENTFRAGMENT Function	Creates a new Document Fragment	DOMDocument Subprograms
CREATEELEMENT Functions	Creates a new Element	DOMDocument Subprograms
CREATEENTITYREFERENCE Function	Creates an Entity reference	DOMDocument Subprograms
CREATEPROCESSINGINSTRUCTION Function	Creates a Processing Instruction	DOMDocument Subprograms
CREATETEXTNODE Function	Creates a Text node	DOMDocument Subprograms
DELETEDATA Procedure	Deletes the data from the specified <code>offsets</code>	DOMCharacterData Subprograms
FINDENTITY Function	Finds the specified entity in the document type	DOMDocumentType Subprograms
FINDNOTATION Function	Finds the specified notation in the document type	DOMDocumentType Subprograms
FREEDOCFRAG Procedure	Frees the document fragment	DOMDocument Subprograms and DOMDocumentFragment Subprograms
FREEDOCUMENT Procedure	Frees the document	DOMDocument Subprograms
FREEELEMENT Procedure	Frees memory allocated to a <code>DOMElement</code> handle	DOMElement Subprograms
FREENODE Procedure	Frees all resources associated with the node	DOMNode Subprograms
FREENODELIST Procedure	Frees all resources associated with a nodelist	DOMNodeList Subprograms
GETATTRIBUTE Functions	Retrieves the attribute node by name	DOMElement Subprograms
GETATTRIBUTENODE Functions	Retrieves the attribute node by name	DOMElement Subprograms

Table 222-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETATTRIBUTES Function	Retrieves the attributes of the node	DOMNode Subprograms
GETCHARSET Function	Retrieves the character set of the DOM document	DOMDocument Subprograms
GETCHILDNODES Function	Retrieves the children of the node	DOMNode Subprograms
GETCHILDRENBYTAGNAME Functions	Retrieves children of the element by tag name	DOMCharacterData Subprograms
GETDATA Functions	Retrieves <ul style="list-style-type: none"> the data of the node the data of the processing instruction 	<ul style="list-style-type: none"> DOMCharacterData Subprograms DOMProcessingInstruction Subprograms
GETDOCTYPE Function	Retrieves the DTD of the document	DOMDocument Subprograms
GETDOCUMENTELEMENT Function	Retrieves the root element of the document	DOMDocument Subprograms
GETELEMENTSBYTAGNAME Functions	Retrieves <ul style="list-style-type: none"> the elements in the DOMNODELIST by tag name elements in the subtree of a DOMNODELIST by tagname 	<ul style="list-style-type: none"> DOMDocument Subprograms DOMElement Subprograms
GETENTITIES Function	Retrieves the nodemap of entities in the Document type	DOMDocumentType Subprograms
GETEXPANDEDNAME Procedure and Functions	Retrieves <ul style="list-style-type: none"> the expanded name of the node the expanded name of the attribute the expanded name of the element 	<ul style="list-style-type: none"> DOMNode Subprograms DOMAttr Subprograms DOMElement Subprograms
GETFIRSTCHILD Function	Retrieves the first child of the node	DOMNode Subprograms
GETIMPLEMENTATION Function	Retrieves the DOM implementation	DOMDocument Subprograms
GETLASTCHILD Function	Retrieves the last child of the node	DOMNode Subprograms
GETLENGTH Functions	Retrieves <ul style="list-style-type: none"> the length of the data the number of items in the map the number of items in the list 	<ul style="list-style-type: none"> DOMCharacterData Subprograms DOMNamedNodeMap Subprograms DOMNodeList Subprograms

Table 222-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETLOCALNAME Procedure and Functions	Retrieves <ul style="list-style-type: none"> the local part of the qualified name the local name of the attribute the local name of the element 	<ul style="list-style-type: none"> DOMNode Subprograms DOMAttr Subprograms DOMElement Subprograms
GETNAME Functions	Retrieves <ul style="list-style-type: none"> the name of the attribute the name of the Document type 	<ul style="list-style-type: none"> DOMAttr Subprograms DOMDocumentType Subprograms
GETNAMEDITEM Function	Retrieves <ul style="list-style-type: none"> an item specified by name and namespace URI) 	<ul style="list-style-type: none"> DOMNamedNodeMap Subprograms DOMNamedNodeMap Subprograms
GETNAMESPACE Procedure and Functions	Retrieves <ul style="list-style-type: none"> the node's namespace URI the NS URI of the attribute the NS URI of the element 	<ul style="list-style-type: none"> DOMNode Subprograms DOMAttr Subprograms DOMElement Subprograms
GETNEXTSIBLING Function	Retrieves the next sibling of the node	DOMNode Subprograms
GETNODENAME Function	Retrieves the Name of the Node	DOMNode Subprograms
GETNODETYPE Function	Retrieves the Type of the node	DOMNode Subprograms
GETNODEVALUE Function	Retrieves the Value of the Node	DOMNode Subprograms
GETNODEVALUEASBINARYSTREAM Function & Procedure	Retrieves the Node Value as binary stream	DOMNode Subprograms
GETNODEVALUEASCHARACTERSTREAM Function & Procedure	Retrieves the Node Value as character stream	DOMNode Subprograms
GETNOTATIONNAME Function	Retrieves the notation name of the entity	DOMEntity Subprograms
GETNOTATIONS Function	Retrieves the nodemap of the notations in the Document type	DOMDocumentType Subprograms
GETTARGET Function	Retrieves the target of the processing instruction	DOMProcessingInstruction Subprograms
GETOWNERDOCUMENT Function	Retrieves the owner document of the node	DOMNode Subprograms
GETOWNERELEMENT Function	Retrieves the Element node, parent of the attribute	DOMAttr Subprograms
GETPARENTNODE Function	Retrieves the parent of this node	DOMNode Subprograms
GETPREFIX Function	Retrieves the namespace prefix)	DOMNode Subprograms
GETPREVIOUSIBLING Function	Retrieves the previous sibling of the node	DOMNode Subprograms

Table 222-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETPUBLICID Functions	Retrieves <ul style="list-style-type: none"> the public ID of the document type the public Id of the entity the public Id of the notation 	<ul style="list-style-type: none"> DOMDocumentType Subprograms DOMEntity Subprograms DOMNotation Subprograms
GETQUALIFIEDNAME Functions	Retrieves <ul style="list-style-type: none"> the Qualified Name of the attribute the qualified name of the element 	<ul style="list-style-type: none"> DOMAttr Subprograms DOMElement Subprograms
GETSCHEMANODE Function	Retrieves the associated schema URI	DOMNode Subprograms
GETSPECIFIED Function	Tests if attribute was specified in the element.	DOMAttr Subprograms
GETSTANDALONE Function	Retrieves the standalone property of the document	DOMDocument Subprograms
GETSYSTEMID Functions	Retrieves <ul style="list-style-type: none"> the system ID of the document type the system Id of the entity the system Id of the notation 	<ul style="list-style-type: none"> DOMDocumentType Subprograms DOMEntity Subprograms DOMNotation Subprograms
GETTAGNAME Function	Retrieves the Tag name of the element	DOMElement Subprograms
GETVALUE Function	Retrieves the value of the attribute	DOMAttr Subprograms
GETVERSION Function	Retrieves the version of the document	DOMDocument Subprograms)
GETXMLTYPE Function	Retrieves the XMLType associated with the DOM Document	DOMDocument Subprograms
HASATTRIBUTES Function	Tests if the node has attributes	DOMNode Subprograms
HASATTRIBUTE Functions	Tests if an attribute exists	DOMElement Subprograms
HASCHILDNODES Function	Tests if the node has child nodes	DOMNode Subprograms
HASFEATURE Function	Tests if the DOMImplementation implements a feature	DOMImplementation Subprograms
IMPORTNODE Function	Imports a node from another document	DOMNode Subprograms
INSERTBEFORE Function	Inserts a child before the reference child	DOMNode Subprograms
INSERTDATA Procedure	Inserts the data in the node at the specified offSets	DOMCharacterData Subprograms

Table 222-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ISNULL Functions	Tests <ul style="list-style-type: none"> • if the node is NULL • if the Attribute node is NULL • if the CDataSection is NULL • if the CharacterData is NULL • if the comment is NULL • if the document is NULL • if the DocumentFragment is NULL • if the Document Type is NULL • if the Element is NULL • if the Entity is NULL • if the DOMEntityReference is NULL • if the DOMImplementation node is NULL • if the NamedNodeMap is NULL • if the NodeList is NULL • if the Notation is NULL • if the Processing Instruction is NULL • if the text is NULL 	<ul style="list-style-type: none"> • DOMNode Subprograms • DOMAttr Subprograms • DOMCDataSection Subprograms • DOMCharacterData Subprograms • DOMComment Subprograms • DOMDocument Subprograms • DOMDocumentFragment Subprograms • DOMDocumentType Subprograms • DOMELEMENT Subprograms • DOMEntity Subprograms • DOMEntityReference Subprograms • DOMImplementation Subprograms • DOMNamedNodeMap Subprograms • DOMNodeList Subprograms • DOMNotation Subprograms • DOMProcessingInstruction Subprograms • DOMText Subprograms

MAKEATTR Function	Casts the node to an Attribute	DOMNode Subprograms
MAKECDATASECTION Function	Casts the node to a CData Section	DOMNode Subprograms
MAKECHARACTERDATA Function	Casts the node to Character Data	DOMNode Subprograms
MAKECOMMENT Function	Casts the node to a Comment	DOMNode Subprograms
MAKEDOCUMENT Function	Casts the node to a DOM Document	DOMNode Subprograms
MAKEDOCUMENTFRAGMENT Function	Casts the node to a DOM Document Fragment	DOMNode Subprograms)

Table 222-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
MAKEDOCUMENTTYPE Function	Casts the node to a DOM Document Type	DOMNode Subprograms
MAKEELEMENT Function	Casts the node to a DOM Element	DOMNode Subprograms
MAKEENTITY Function	Casts the node to a DOM Entity	DOMNode Subprograms
MAKEENTITYREFERENCE Function	Casts the node to a DOM Entity Reference	DOMNode Subprograms
MAKENODE Functions	Casts <ul style="list-style-type: none"> • the Attribute to a node • the CDatasection to a node • the CharacterData to a node • the Comment to a node • the document to a node • the Document Fragment to a node • the document type to a node • the Element to a node • the Entity to a node • • the DOMEntityReference to NULL • the notation to a node • the Processing Instruction to a node • the text to a node 	<ul style="list-style-type: none"> • DOMAttr Subprograms • DOMCDataSection Subprograms • DOMCharacterData Subprograms • DOMComment Subprograms • DOMDocument Subprograms • DOMDocumentFragment Subprograms • DOMDocumentType Subprograms • DOMElement Subprograms • DOMEntity Subprograms • DOMEntityReference Subprograms • DOMNotation Subprograms • DOMProcessingInstruction Subprograms • DOMText Subprograms
MAKENOTATION Function	Casts the node to a DOM Notation	DOMNode Subprograms
MAKEPROCESSINGINSTRUCTION Function	Casts the node to a DOM Processing Instruction	DOMNode Subprograms
MAKETEXT Function	Casts the node to a DOM Text	DOMNode Subprograms
NEWDOMDOCUMENT Functions	Creates a new document	DOMDocument Subprograms
NORMALIZE Procedure	Normalizes the text children of the element	DOMElement Subprograms
REMOVEATTRIBUTE Procedures	Removes the attribute specified by the name	DOMElement Subprograms
REMOVEATTRIBUTENODE Function	Removes the attribute node in the element	DOMElement Subprograms
REMOVECHILD Function	Removes a specified child from a node	DOMNode Subprograms

Table 222-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
REMOVENAMEITEM Function	Removes the item specified by name	DOMNamedNodeMap Subprograms
REPLACECHILD Function	Replaces the old child with a new child	DOMNode Subprograms
REPLACEDATA Procedure	Changes a range of characters in the node	DOMCharacterData Subprograms
RESOLVENAMESPACEPREFIX Function	Resolve the prefix to a namespace URI	DOMElement Subprograms
SETATTRIBUTE Procedures	Sets the attribute specified by the name	DOMElement Subprograms
SETATTRIBUTENODE Functions	Sets the attribute node in the element	DOMElement Subprograms
SETCHARSET Procedure	Sets the character set of the DOM document	DOMDocument Subprograms
SETDATA Procedures	Sets <ul style="list-style-type: none"> the data to the node the data of the processing instruction 	<ul style="list-style-type: none"> DOMCharacterData Subprograms DOMProcessingInstruction Subprograms
SETDOCTYPE Procedure	Sets the DTD of the document.	DOMDocument Subprograms
SETNAMEITEM Function	Sets the item in the map specified by the name	DOMNamedNodeMap Subprograms
SETNODEVALUE Procedure	Sets the Value of the node	DOMNode Subprograms
SETNODEVALUEASBINARYSTREAM Function & Procedure	Sets the Node Value as a binary stream	DOMNode Subprograms
SETNODEVALUEASCHARACTERSTREAM Function & Procedure	Sets the Node Value as a character stream	DOMNode Subprograms
SETPREFIX Procedure	Sets the namespace prefix	DOMNode Subprograms
SETSTANDALONE Procedure	Sets the standalone property of the document	DOMDocument Subprograms
SETVALUE Procedure	Sets the value of the attribute	DOMAttr Subprograms
SETVERSION Procedure	Sets the version of the document	DOMDocument Subprograms
SPLITTEXT Function	Splits the contents of the text node into 2 text nodes	DOMText Subprograms
SUBSTRINGDATA Function	Retrieves the substring of the data	DOMCharacterData Subprograms
USEBINARYSTREAM Function	Strabismus that the stream is valid for use	DOMNode Subprograms

Table 222-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
WRITETOBUFFER Procedures	Writes <ul style="list-style-type: none"> the contents of the node to a buffer the document to a buffer the contents of a document fragment into a buffer 	<ul style="list-style-type: none"> DOMNode Subprograms DOMDocument Subprograms DOMDocumentFragment Subprograms
WRITETOCLOB Procedures	Writes <ul style="list-style-type: none"> the contents of the node to a CLOB the document to a CLOB 	<ul style="list-style-type: none"> DOMNode Subprograms DOMDocument Subprograms
WRITETOFILE Procedures	Writes <ul style="list-style-type: none"> the contents of the node to a file the document to a file 	<ul style="list-style-type: none"> DOMNode Subprograms DOMDocument Subprograms

222.7.1 ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

See Also:

[DOMNode Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XMLDOM.ADOPTNODE (
    doc          IN  DOMDocument,
    importedNode IN  DOMNode)
RETURN DOMNODE;
```

Parameters

Table 222-22 ADOPTNODE Function Parameters

Parameter	Description
doc	Document that is adopting the node
importedNode	Node to adopt

Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

222.7.2 APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.APPENDCHILD(
  n          IN      DOMNode,
  newchild  IN      DOMNode)
RETURN DOMNODE;
```

Parameters

Table 222-23 APPENDCHILD Function Parameters

Parameter	Description
<code>n</code>	DOMNode
<code>newchild</code>	The child to be appended to the list of children of node <code>n</code>

222.7.3 APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

See Also:

[DOMCharacterData Subprograms](#)

Syntax

```
DBMS_XMLDOM.APPENDDATA(
  cd      IN      DOMCHARACTERDATA,
  arg     IN      VARCHAR2);
```

Parameters

Table 222-24 APPENDDATA Procedure Parameters

Parameter	Description
<code>cd</code>	DOMCHARACTERDATA

Table 222-24 (Cont.) APPENDDATA Procedure Parameters

Parameter	Description
arg	The data to append to the existing data

222.7.4 CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is `NULL`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.CLONENODE (
    n          IN    DOMNODE,
    deep      IN    BOOLEAN)
RETURN DOMNODE;
```

Parameters

Table 222-25 CLONENODE Function Parameters

Parameter	Description
n	DOMNODE
deep	Determines if children are to be cloned

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is `TRUE`).
- Cloning any other type of node simply returns a copy of this node.

222.7.5 CREATEATTRIBUTE Functions

This function creates a `DOMATTR` node.

See Also:

[DOMDocument Subprograms](#)

Syntax

Creates a `DOMATTR` with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE (
  doc      IN      DOMDOCUMENT,
  name     IN      VARCHAR2)
RETURN DOMATTR;
```

Creates a `DOMATTR` with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE (
  doc      IN      DOMDOCUMENT,
  qname    IN      VARCHAR2,
  ns       IN      VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 222-26 CREATEATTRIBUTE Function Parameters

Parameter	Description
<code>doc</code>	DOMDOCUMENT
<code>qname</code>	New attribute qualified name
<code>ns</code>	Namespace

222.7.6 CREATECDATASECTION Function

This function creates a `DOMCDATASECTION` node.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATECDATASECTION (
  doc      IN      DOMDOCUMENT,
  data     IN      VARCHAR2)
RETURN DOMCDATASECTION;
```

Parameters

Table 222-27 CREATECDATASECTION Function Parameters

Parameter	Description
<code>doc</code>	DOMDOCUMENT
<code>data</code>	Content of the DOMCDATASECTION node

222.7.7 CREATECOMMENT Function

This function creates a `DOMCOMMENT` node.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATECOMMENT (  
    doc      IN      DOMDOCUMENT,  
    data     IN      VARCHAR2)  
RETURN DOMCOMMENT;
```

Parameters

Table 222-28 CREATECOMMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the <code>DOMComment</code> node

222.7.8 CREATEDOCUMENT Function

This function creates a `DOMDOCUMENT` with specified namespace URI, root element name, DTD.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT (  
    namespaceURI  IN  VARCHAR2,  
    qualifiedName IN  VARCHAR2,  
    doctype       IN  DOMTYPE := NULL)  
RETURN DOMDOCUMENT;
```

Parameters

Table 222-29 CREATEDOCUMENT Function Parameters

Parameter	Description
namespaceURI	Namespace URI

Table 222-29 (Cont.) CREATEDOCUMENT Function Parameters

Parameter	Description
qualifiedName	Root element name
doctype	Document type

222.7.9 CREATEDOCUMENTFRAGMENT Function

This function creates a `DOMDOCUMENTFRAGMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT (
    doc      IN      DOMDOCUMENT)
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 222-30 CREATEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
doc	DOMDocument

222.7.10 CREATEELEMENT Functions

This function creates a `DOMELEMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

Creates a `DOMElement` with specified name:

```
DBMS_XMLDOM.CREATEELEMENT (
    doc      IN      DOMDOCUMENT,
    tagName  IN      VARCHAR2)
RETURN DOMELEMENT;
```

Creates a `DOMElement` with specified name and namespace URI:

```

DBMS_XMLDOM.CREATEELEMENT (
    doc          IN    DOMDOCUMENT,
    tagName     IN    VARCHAR2,
    ns          IN    VARCHAR2)
RETURN DOMELEMENT;

```

Parameters

Table 222-31 CREATEELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagName	Tagname for new DOMELEMENT
ns	Namespace

222.7.11 CREATEENTITYREFERENCE Function

This function creates a DOMENTITYREFERENCE node.

See Also:

[DOMDocument Subprograms](#)

Syntax

```

DBMS_XMLDOM.CREATEENTITYREFERENCE (
    doc          IN    DOMDOCUMENT,
    name        IN    VARCHAR2)
RETURN DOMENTITYREFERENCE;

```

Parameters

Table 222-32 CREATEENTITYREFERENCE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
name	New entity reference name

222.7.12 CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION (
    doc      IN      DOMDocument,
    target   IN      VARCHAR2,
    data     IN      VARCHAR2)
RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 222-33 CREATEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
target	Target of the new processing instruction
data	Content data of the new processing instruction

222.7.13 CREATETEXTNODE Function

This function creates a DOMTEXT node.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE (
    doc      IN      DOMDocument,
    data     IN      VARCHAR2)
RETURN DOMTEXT;
```

Parameters

Table 222-34 CREATETEXTNODE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMText node

222.7.14 DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

See Also:

[DOMCharacterData Subprograms](#)

Syntax

```
DBMS_XMLDOM.DELETEDATA (  
    cd          IN      DOMCHARACTERDATA,  
    offset      IN      NUMBER,  
    cnt         IN      NUMBER);
```

Parameters

Table 222-35 DELETEDATA PROCEDURE Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset from which to delete the data
cnt	The number of characters (starting from offset) to delete

222.7.15 FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

See Also:

[DOMDocumentType Subprograms](#)

Syntax

```
DBMS_XMLDOM.FINDENTITY (  
    dt          IN      DOMDOCUMENTTYPE,  
    name        IN      VARCHAR2,  
    par         IN      BOOLEAN)  
RETURN DUMENTITY;
```

Parameters

Table 222-36 FINDENTITY Function Parameters

Parameter	Description
dt	The DTD
name	Entity to find
par	Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity

222.7.16 FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

 **See Also:**
[DOMDocumentType Subprograms](#)

Syntax

```
DBMS_XMLDOM.FINDNOTATION (
    dt          IN      DOMDocumentType,
    name       IN      VARCHAR2)
RETURN DOMNOTATION;
```

Parameters

Table 222-37 FINDNOTATION Function Parameters

Parameter	Description
dt	The DTD
name	The notation to find

222.7.17 FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

 **See Also:**
[DOMDocument Subprograms](#) and [DOMDocumentFragment Subprograms](#)

Syntax

```
DBMS_XMLDOM.FREEDOCFRAG (
    df      IN      DOMDOCUMENTFRAGMENT);
```

Parameters

Table 222-38 FREEDOCFRAG Procedure Parameters

Parameter	Description
df	DOM document fragment

222.7.18 FREEDOCUMENT Procedure

This procedure frees `DOMDOCUMENT` object.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(  
    doc      IN      DOMDOCUMENT);
```

Parameters

Table 222-39 FREEDOCUMENT Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT

222.7.19 FREEELEMENT Procedure

This procedure frees memory allocated to a `DOMElement` handle.

See Also:

[DBMS_XMLDOM DOMElement Subprograms](#)

Syntax

```
DBMS_XMLDOM.FREEELEMENT(  
    elem IN DOMELEMENT);
```

Parameters

Table 222-40 FREEELEMENT Procedure Parameters

Parameter	Description
elem	Of type <code>DOMELEMENT</code>

222.7.20 FREENODE Procedure

This procedure frees all resources associated with a `DOMNODE`.

**See Also:**

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.FREENODE (
    n          IN      DOMNODE);
```

Parameters

Table 222-41 FREENODE Procedure Parameters

Parameter	Description
n	<code>DOMNODE</code>

222.7.21 FREENODELIST Procedure

This procedure frees all resources associated with a `nodelist`.

**See Also:**

[DBMS_XMLDOM DOMNodeList Subprograms](#)

Syntax

```
DBMS_XMLDOM.FREENODELIST (
    n1 IN DOMNodeList);
```

Parameters

Table 222-42 FREENODELIST Procedure Parameters

Parameter	Description
nl	Of type DOMNODELIST

222.7.22 GETATTRIBUTE Functions

This function returns the value of an attribute of an `DOMELEMENT` by name.

See Also:

[DOMElement Subprograms](#)

Syntax

Returns the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE (
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2)
RETURN VARCHAR2;
```

Returns the value of a `DOMELEMENT`'s attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE (
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2,
    ns        IN      VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 222-43 GETATTRIBUTE Function Parameters

Parameter	Description
elem	The <code>DOMELEMENT</code>
name	Attribute name
ns	Namespace

222.7.23 GETATTRIBUTENODE Functions

This function returns an attribute node from the `DOMELEMENT` by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

See Also:

[DOMElement Subprograms](#)

Syntax

Returns an attribute node from the `DOMELEMENT` by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE (
  elem      IN      DOMELEMENT,
  name      IN      VARCHAR2)
RETURN DOMATTR;
```

Returns an attribute node from the `DOMELEMENT` by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE (
  elem      IN      DOMELEMENT,
  name      IN      VARCHAR2,
  ns        IN      VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 222-44 GETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The <code>DOMELEMENT</code>
name	Attribute name; * matches any attribute
ns	Namespace

222.7.24 GETATTRIBUTES Function

This function retrieves a `NAMEDNODEMAP` containing the attributes of this node (if it is an Element) or `NULL` otherwise.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETATTRIBUTES (
    n          IN          DOMNode)
RETURN DOMNAMEDNODEMAP;
```

Parameters**Table 222-45** GETATTRIBUTES Function Parameters

Parameter	Description
n	DOMNode

222.7.25 GETCHARSET Function

This function retrieves the character set of the DOM document.

**See Also:**

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETCHARSET (
    doc IN    DOMDocument)
RETURN VARCHAR2;
```

Parameters**Table 222-46** GETCHARSET Function Parameters

Parameter	Description
doc	DOM document

Usage Notes

For a newly parsed document, we return the database character set. Once the `SETCHARSET` Procedure is called with a non-NULL value for `charset`, that `charset` is returned.

222.7.26 GETCHILDNODES Function

This function retrieves a `DOMNODELIST` that contains all children of this node. If there are no children, this is a `DOMNODELIST` containing no nodes.

**See Also:**

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETCHILDNODES (
  n          IN      DOMNode)
RETURN DOMNodeList;
```

Parameters**Table 222-47** GETCHILDNODES Function Parameters

Parameter	Description
n	DOMNode

222.7.27 GETCHILDRENBYTAGNAME Functions

This function returns the children of the `DOMELEMENT`.

**See Also:**

[DOMElement Subprograms](#)

Syntax

Returns children of the `DOMELEMENT` given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (
  elem      IN      DOMELEMENT,
  name      IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns children of the `DOMELEMENT` given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (
  elem      IN      DOMELEMENT,
  name      IN      VARCHAR2,
  ns        IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters**Table 222-48** GETCHILDRENBYTAGNAME Function Parameters

Parameter	Description
elem	DOMELEMENT
name	Tag name
ns	Namespace

222.7.28 GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.GETDATA (
    cd      IN      DOMCHARACTERDATA)
RETURN VARCHAR2;
```

Returns the content data of the `DOMProcessingInstruction` (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.GETDATA (
    pi      IN      DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

Parameters

Table 222-49 GETDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
pi	The DOMPROCESSINGINSTRUCTION

222.7.29 GETDOCTYPE Function

This function returns the DTD associated to the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETDOCTYPE (
    doc      IN      DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 222-50 GETDOCTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

222.7.30 GETDOCUMENTELEMENT Function

This function returns the root element of the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT (
    doc      IN      DOMDOCUMENT)
RETURN DOMELEMENT;
```

Parameters

Table 222-51 GETDOCUMENTELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT

222.7.31 GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a `DOMNODELIST` of all the elements with a specified tagname (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    doc      IN      DOMDOCUMENT,
    tagname  IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name (See Also: [DOMEElement Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    elem     IN      DOMELEMENT,
    name     IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name and namespace (See Also: [DOMEElement Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    elem     IN      DOMELEMENT,
    name     IN      VARCHAR2,
    ns       IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 222-52 GETELEMENTSBYTAGNAME Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagname	Name of the tag to match on
elem	The DOMELEMENT
name	Tag name; using a wildcard(*) would match any tag
ns	Namespace

222.7.32 GETENTITIES Function

This function retrieves a `DOMNAMEDNODEMAP` containing the general entities, both external and internal, declared in the DTD.

See Also:

[DOMDocumentType Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETENTITIES (
    dt      IN      DOMDocumentType)
RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 222-53 GETENTITIES Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

222.7.33 GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the `Node` if it is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: [DOMNode Subprograms](#))

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    n      IN      DOMNODE
    data   OUT     VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    a          IN      DOMAttr)
RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    elem      IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 222-54 GETEXPANDEDNAME Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned expanded name of the Node
a	DOMATTR
elem	DOMELEMENT

222.7.34 GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns NULL.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD (
    n          IN      DOMNODE)
RETURN DOMNODE;
```

Parameters

Table 222-55 GETFIRSTCHILD Function Parameters

Parameter	Description
n	DOMNODE

222.7.35 GETIMPLEMENTATION Function

This function returns the `DOMIMPLEMENTATION` object that handles this `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION (  
    doc      IN      DOMDOCUMENT)  
RETURN DOMIMPLEMENTATION;
```

Parameters

Table 222-56 GETIMPLEMENTATION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

222.7.36 GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns `NULL`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETLASTCHILD (  
    n      IN      DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 222-57 GETLASTCHILD Function Parameters

Parameter	Description
n	DOMNODE

222.7.37 GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because `CharacterData` nodes may be empty (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH (
    cd      IN      DOMCHARACTERDATA)
RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to `length-1`, inclusive (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH (
    nnm     IN      DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to `length-1`, inclusive (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH (
    nl      IN      DOMNODELIST)
RETURN NUMBER;
```

Parameters

Table 222-58 GETLENGTH Function Parameters

Parameter	Description
<code>cd</code>	<code>DOMCHARACTERDATA</code>
<code>nnm</code>	<code>DOMNAMEDNODEMAP</code>
<code>nl</code>	<code>DOMNODELIST</code>

222.7.38 GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.GETLOCALNAME (
    n       IN      DOMNODE,
    data    OUT     VARCHAR2);
```

Returns the local name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETLOCALNAME (
    a          IN      DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the `DOMElement` (See Also: [DOMElement Subprograms](#))

```
DBMS_XMLDOM.GETLOCALNAME (
    elem      IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 222-59 GETLOCALNAME Procedure and Function Parameters

Parameter	Description
n	DOMNode
data	Returned local name.
a	DOMAttr.
elem	DOMElement.

222.7.39 GETNAME Functions

This function is overloaded. The specific forms of functionality are described with the syntax declarations.

Syntax

Returns the name of this attribute (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETNAME (
    a          IN      DOMATTR)
RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the `DOCTYPE` keyword (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETNAME (
    dt        IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Parameters

Table 222-60 GETNAME Function Parameters

Parameter	Description
a	DOMATTR
dt	DOMDOCUMENTTYPE

222.7.40 GETNAMEDITEM Function

GETNAMEDITEM retrieves a node specified by name.

See Also:

[DOMNamedNodeMap Subprograms](#)

Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(  
  nnm    IN  DOMNAMEDNODEMAP,  
  name   IN  VARCHAR2)  
RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(  
  nnm    IN  DOMNAMEDNODEMAP,  
  name   IN  VARCHAR2,  
  ns     IN  VARCHAR2)  
RETURN DOMNODE;
```

Parameters

Table 222-61 GETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
name	Name of the item to be retrieved
ns	Namespace

222.7.41 GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE(  
  n      IN  DOMNODE,  
  data   OUT VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE (
    a          IN      DOMATTR)
RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE (
    elem      IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 222-62 GETNAMESPACE Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned namespace URI
a	DOMATTR
elem	DOMELEMENT

222.7.42 GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns NULL.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING (
    n          IN      DOMNODE)
RETURN DOMNode;
```

Parameters

Table 222-63 GETNEXTSIBLING Function Parameters

Parameter	Description
n	DOMNODE

222.7.43 GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNODETYPE (
    n          IN      DOMNODE)
RETURN NUMBER;
```

Parameters

Table 222-64 GETNODETYPE Function Parameters

Parameter	Description
n	DOMNODE

222.7.44 GETNODENAME Function

This function gets the name of the node depending on its type.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNODENAME (
    n          IN      DOMNODE)
RETURN VARCHAR2;
```

Parameters

Table 222-65 GETNODENAME Function Parameters

Parameter	Description
n	DOMNODE

222.7.45 GETNODEVALUE Function

This function gets the value of this node, depending on its type.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNODEVALUE (
    n          IN      DOMNODE)
RETURN VARCHAR2;*
```

Parameters

Table 222-66 GETNODEVALUE Function Parameters

Parameter	Description
n	DOMNODE

222.7.46 GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also:

[DOMNode Subprograms](#)

Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node datatype must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The datatype of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n          in      DOMNODE,
    value      in      SYS.UTL_BINARYOUTPUTSTREAM);
```

Parameters

Table 222-67 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYOUTPUTSTREAM

222.7.47 GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also:

[DOMNode Subprograms](#)

Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE,
    value      IN      SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

Table 222-68 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTEROUTPUTSTREAM

222.7.48 GETNOTATIONNAME Function

This function returns the notation name of the `DOENTITY`.

See Also:

[DOMEntity Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME (  
    ent      IN      DOENTITY)  
RETURN VARCHAR2;
```

Parameters

Table 222-69 GETNOTATIONNAME Function Parameters

Parameter	Description
ent	DOENTITY

222.7.49 GETNOTATIONS Function

This function retrieves a `DOMNAMEDNODEMAP` containing the notations declared in the DTD.

See Also:

[DOMDocumentType Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNOTATIONS (  
    dt      IN      DOMDOCUMENTTYPE)  
RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 222-70 GETNOTATIONS Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

222.7.50 GETTARGET Function

This function returns the target of the `DOMPROCESSINGINSTRUCTION`.

See Also:

[DOMProcessingInstruction Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETTARGET (  
    pi          IN      DOMPROCESSINGINSTRUCTION)  
RETURN VARCHAR2;
```

Parameters

Table 222-71 GETTARGET Function Parameters

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION

222.7.51 GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is `NULL`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENT;
```

Parameters

Table 222-72 GETOWNERDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE

222.7.52 GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

See Also:

[DOMAttr Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT (  
    a          IN      DOMATTR)  
RETURN DOMELEMENT;
```

Parameters

Table 222-73 GETOWNERELEMENT Function Parameters

Parameter	Description
a	Attribute

222.7.53 GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETPARENTNODE (  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 222-74 GETPARENTNODE Function Parameters

Parameter	Description
n	DOMNODE

222.7.54 GETPREFIX Function

This function retrieves the namespace prefix of the node.

 **See Also:**
[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETPREFIX (  
    n          IN      DOMNODE)  
RETURN VARCHAR2;
```

Parameters

Table 222-75 GETPREFIX Function Parameters

Parameter	Description
n	DOMNODE

222.7.55 GETPREVIOUSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns `NULL`.

 **See Also:**
[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETPREVIOUSIBLING (  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 222-76 GETPREVIOUSIBLING Function Parameters

Parameter	Description
n	DOMNODE

222.7.56 GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the specified DTD (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID (
    dt          IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the public identifier of the `DOMENTITY` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID (
    ent        IN      DOMENTITY)
RETURN VARCHAR2;
```

Returns the public identifier of the `DOMNOTATION` (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID (
    n          IN      DOMNOTATION)
RETURN VARCHAR2;
```

Parameters

Table 222-77 GETPUBLICID Function Parameters

Parameter	Description
dt	The DTD
ent	DOMENTITY
n	DOMNOTATION

222.7.57 GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the qualified name of the `DOMATTR` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETQUALIFIEDNAME (
    a          IN      DOMATTR)
RETURN VARCHAR2;
```

Returns the qualified name of the `DOMELEMENT` (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETQUALIFIEDNAME (
    elem      IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 222-78 GETQUALIFIEDNAME Functions Parameters

Parameter	Description
a	DOMATTR
elem	DOMELEMENT

222.7.58 GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE (
  n      IN  DOMNODE)
RETURN DOMNODE;
```

Parameters

Table 222-79 GETSCHEMANODE Function Parameters

Parameter	Description
n	DOMNODE

222.7.59 GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

See Also:

[DOMAttr Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETSPECIFIED (
  a      IN  DOMATTR)
RETURN BOOLEAN;
```

Parameters

Table 222-80 GETSPECIFIED Function Parameters

Parameter	Description
a	DOMATTR

222.7.60 GETSTANDALONE Function

This function returns the standalone property associated with the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETSTANDALONE (
    doc      IN      DOMDOCUMENT)
RETURN VARCHAR2;
```

Parameters

Table 222-81 GETSTANDALONE Function Parameters

Parameter	Description
doc	DOMDOCUMENT.

222.7.61 GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the specified DTD (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID (
    dt      IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the system identifier of the `DOMENTITY` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID (
    ent     IN      DOMENTITY)
RETURN VARCHAR2;
```

Returns the system identifier of the `DOMNOTATION` (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID (
    n          IN    DOMNOTATION)
RETURN VARCHAR2;
```

Parameters

Table 222-82 GETSYSTEMID Function Parameters

Parameter	Description
dt	The DTD.
ent	DOMEntity.
n	DOMNotation.

222.7.62 GETTAGNAME Function

This function returns the name of the `DOMELEMENT`.

See Also:

[DOMElement Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETTAGNAME (
    elem      IN    DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 222-83 GETTAGNAME Function Parameters

Parameter	Description
elem	The <code>DOMELEMENT</code>

222.7.63 GETVALUE Function

This function retrieves the value of the attribute.

See Also:

[DOMAttr Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETVALUE (
    a        IN    DOMATTR)
RETURN VARCHAR2;
```

Parameters

Table 222-84 GETVALUE Function Parameters

Parameter	Description
a	DOMATTR

222.7.64 GETVERSION Function

This function returns the version of the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETVERSION (
    doc      IN      DOMDOCUMENT)
RETURN VARCHAR2;
```

Parameters

Table 222-85 GETVERSION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

222.7.65 GETXMLTYPE Function

This function returns the `XMLType` associated with the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETXMLTYPE (
    doc      IN      DOMDOCUMENT)
RETURN SYS.XMLTYPE;
```

Parameters

Table 222-86 GETXMLTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

222.7.66 HASATTRIBUTE Functions

Verifies whether an attribute has been defined for `DOMELEMENT`, or has a default value.

See Also:

[DOMElement Subprograms](#)

Syntax

Verifies whether an attribute with the specified name has been defined for `DOMElement`:

```
DBMS_XMLDOM.HASATTRIBUTE (
    elem      IN  DOMELEMENT,
    name      IN  VARCHAR2)
RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for `DOMELEMENT`; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE (
    elem      IN  DOMELEMENT,
    name      IN  VARCHAR2,
    ns        IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 222-87 HASATTRIBUTE Function Parameters

Parameter	Description
elem	The <code>DOMELEMENT</code>
name	Attribute name; * matches any attribute
ns	Namespace

222.7.67 HASATTRIBUTES Function

This function returns whether this node has any attributes.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.HASATTRIBUTES (  
    n          IN      DOMNODE)  
RETURN BOOLEAN;
```

Parameters

Table 222-88 HASATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

222.7.68 HASCHILDNODES Function

This function determines whether this node has any children.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.HASCHILDNODES (  
    n          IN      DOMNODE)  
RETURN BOOLEAN;
```

Parameters

Table 222-89 HASCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

222.7.69 HASFEATURE Function

This function tests if the `DOMIMPLEMENTATION` implements a specific feature.

See Also:

[DOMImplementation Subprograms](#)

Syntax

```
DBMS_XMLDOM.HASFEATURE (  
    di          IN      DOMIMPLEMENTATION,  
    feature     IN      VARCHAR2,  
    version     IN      VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 222-90 HASFEATURE Function Parameters

Parameter	Description
di	DOMIMPLEMENTATION
feature	The feature to check for
version	The version of the DOM to check in

222.7.70 IMPORTNODE Function

This function imports a node from an external document and returns this new node.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.IMPORTNODE (  
    doc          IN      DOMDOCUMENT,  
    importedNode IN      DOMNODE,  
    deep         IN      BOOLEAN)  
RETURN DOMNODE;
```

Parameters

Table 222-91 IMPORTNODE Function Parameters

Parameter	Description
doc	Document from which the node is imported
importedNode	Node to import
deep	Setting for recursive import. <ul style="list-style-type: none"> If this value is <code>TRUE</code>, the entire subtree of the node will be imported with the node. If this value is <code>FALSE</code>, only the node itself will be imported.

Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

222.7.71 INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is `NULL`, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.INSERTBEFORE (
  n          IN      DOMNODE,
  newchild  IN      DOMNODE,
  refchild  IN      DOMNODE)
RETURN DOMNode;
```

Parameters

Table 222-92 INSERTBEFORE Function Parameters

Parameter	Description
n	DOMNODE
newChild	The child to be inserted in the DOMNODE
refChild	The reference node before which the <code>newchild</code> is to be inserted

222.7.72 INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also:

[DOMCharacterData Subprograms](#)

Syntax

```
DBMS_XMLDOM.INSERTDATA (
  cd      IN      DOMCHARACTERDATA,
  offset  IN      NUMBER,
  arg     IN      VARCHAR2);
```

Parameters

Table 222-93 INSERTDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to insert the data
arg	The value to be inserted

222.7.73 ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the specified `DOMNODE` is `NULL`. Returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
  n      IN      DOMNODE)
RETURN BOOLEAN;
```

Checks that the specified `DOMATTR` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
  a      IN      DOMATTR)
RETURN BOOLEAN;
```

Checks that the specified `DOMCDATASECTION` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: [DOMCDATASection Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
  cds   IN      DOMCDATASECTION)
RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    cd      IN      DOMCHARACTERDATA)  
RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMComment Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    com     IN      DOMCOMMENT)  
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    doc     IN      DOMDOCUMENT)  
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    df      IN      DOMDOCUMENTFRAGMENT)  
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    dt      IN      DOMDOCUMENTTYPE)  
RETURN BOOLEAN;
```

Checks that the specified DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    elem   IN      DOMELEMENT)  
RETURN BOOLEAN;
```

Checks that the specified DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    ent    IN      DOMENTITY)  
RETURN BOOLEAN;
```

Checks that the specified DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntityReference Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    EREF   IN      DOMENTITYREFERENCE)  
RETURN BOOLEAN;
```

Checks that the specified DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: [DOMImplementation Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    di          IN      DOMIMPLEMENTATION)
RETURN BOOLEAN;
```

Checks that the specified DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    nnm        IN      DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    nl         IN      DOMNODELIST)
RETURN BOOLEAN;
```

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    n          IN      DOMNOTATION)
RETURN BOOLEAN;
```

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    pi        IN      DOMPROCESSINGINSTRUCTION)
RETURN BOOLEAN;
```

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMText Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    t         IN      DOMTEXT)
RETURN BOOLEAN;
```

Parameters

Table 222-94 ISNULL Function Parameters

Parameter	Description
n	DOMNODE to check
a	DOMATTR to check
cds	DOMCDATASECTION to check
cd	DOMCHARACTERDATA to check
com	DOMCOMMENT to check
doc	DOMDOCUMENT to check
dF	DOMDOCUMENTFRAGMENT to check
dt	DOMDOCUMENTTYPE to check
elem	DOMELEMENT to check
ent	DOMENTITY to check

Table 222-94 (Cont.) ISNULL Function Parameters

Parameter	Description
eref	DOMENTITYREFERENCE to check
di	DOMIMPLEMENTATION to check
nnm	DOMNAMENODEMAP to check
nl	DOMNODELIST to check
n	DOMNOTATION to check
pi	DOMPROCESSINGINSTRUCTION to check
t	DOMTEXT to check

222.7.74 ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL` (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.ITEM(
    nnm      IN      DOMNAMEDNODEMAP,
    index    IN      NUMBER)
RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If `index` is greater than or equal to the number of nodes in the list, this returns `NULL` (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.ITEM(
    nl       IN      DOMNODELIST,
    index    IN      NUMBER)
RETURN DOMNODE;
```

Parameters

Table 222-95 ITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
index	The index in the node map at which the item is to be retrieved
nl	DOMNODELIST
index	The index in the <code>NodeList</code> used to retrieve the item

222.7.75 MAKEATTR Function

This function casts a specified DOMNODE to a DOMATTR, and returns the DOMATTR.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEATTR (  
    n          IN      DOMNODE)  
RETURN DOMATTR;
```

Parameters

Table 222-96 MAKEATTR Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.76 MAKECDATASECTION Function

This function casts a specified DOMNODE to a DOMCDATASECTION.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKECDATASECTION (  
    n          IN      DOMNODE)  
RETURN DOMCDATASECTION;
```

Parameters

Table 222-97 MAKECDATASECTION Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.77 MAKECHARACTERDATA Function

This function casts a specified DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA (  
    n          IN      DOMNode)  
RETURN DOMCharacterData;
```

Parameters

Table 222-98 MAKECHARACTERDATA Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.78 MAKECOMMENT Function

This function casts a specified DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKECOMMENT (  
    n          IN      DOMNODE)  
RETURN DOMCOMMENT;
```

Parameters

Table 222-99 MAKECOMMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.79 MAKEDOCUMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENT`, and returns the `DOMDOCUMENT`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT (  
    n          IN      DOMNODE)  
RETURN DOMDocument;
```

Parameters

Table 222-100 MAKEDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.80 MAKEDOCUMENTFRAGMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTFRAGMENT`, and returns the `DOMDOCUMENTFRAGMENT`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 222-101 MAKEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.81 MAKEDOCUMENTTYPE Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTTYPE` and returns the `DOMDOCUMENTTYPE`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 222-102 MAKEDOCUMENTTYPE Function Parameters

Parameter	Description
n	DOMNODE to cast.

222.7.82 MAKEELEMENT Function

This function casts a specified `DOMNODE` to a `DOMELEMENT`, and returns the `DOMELEMENT`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEELEMENT (  
    n          IN      DOMNODE)  
RETURN DOMELEMENT;
```

Parameters

Table 222-103 MAKEELEMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.83 MAKEENTITY Function

This function casts a specified `DOMNODE` to a `DOMENTITY`, and returns the `DOMENTITY`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEENTITY (  
    n          IN      DOMNODE)  
RETURN DOENTITY;
```

Parameters

Table 222-104 MAKEENTITY Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.84 MAKEENTITYREFERENCE Function

This function casts a specified `DOMNODE` to a `DOENTITYREFERENCE`, and returns the `DOENTITYREFERENCE`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE (  
    n          IN      DOMNODE)  
RETURN DOENTITYREFERENCE;
```

Parameters

Table 222-105 MAKEENTITYREFERENCE Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.85 MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts specified DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    a          IN      DOMATTR)  
RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: [DOMCDATASection Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    cds        IN      DOMCDATASECTION)  
RETURN DOMNODE;
```

Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    cd         IN      DOMCHARACTERDATA)  
RETURN DOMNODE;
```

Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMComment Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    com        IN      DOMCOMMENT)  
RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    doc        IN      DOMDOCUMENT)  
RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    df         IN      DOMDOCUMENTFRAGMENT)  
RETURN DOMNode;
```

Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    dt         IN      DOMDOCUMENTTYPE)  
RETURN DOMNODE;
```

Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    elem      IN      DOMELEMENT)
RETURN DOMNODE;
```

Casts specified `DOMENTITY` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    ent      IN      DOMENTITY)
RETURN DOMNODE;
```

Casts the `DOMENTITYREFERENCE` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntityReference Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    eref     IN      DOMENTITYREFERENCE)
RETURN DOMNODE;
```

Casts the `DOMNOTATION` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    n      IN      DOMNOTATION)
RETURN DOMNODE;
```

Casts the `DOMPROCESSINGINSTRUCTION` to a `DOMNODE`, and returns the `DOMNODE` (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    pi      IN      DOMPROCESSINGINSTRUCTION)
RETURN DOMNODE;
```

Casts the `DOMTEXT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMText Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    t      IN      DOMTEXT)
RETURN DOMNODE;
```

Parameters

Table 222-106 MAKENODE Function Parameters

Parameter	Description
a	DOMATTR to cast
cds	DOMCDATASECTION to cast
cd	DOMCHARACTERDATA to cast
com	DOMCOMMENT to cast
doc	DOMDOCUMENT to cast
df	DOMDOCUMENTFRAGMENT to cast
dt	DOMDOCUMENTTYPE to cast
elem	DOMELEMENT to cast
ent	DOMENTITY to cast
eref	DOMENTITYREFERENCE to cast

Table 222-106 (Cont.) MAKENODE Function Parameters

Parameter	Description
n	DOMNOTATION to cast
pi	DOMPROCESSINGINSTRUCTION to cast
t	DOMTEXT to cast

222.7.86 MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKENOTATION (
    n          IN      DOMNODE)
RETURN DOMNOTATION;
```

Parameters

Table 222-107 MAKENOTATION Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.87 MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION (
    n          IN      DOMNODE)
RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 222-108 MAKEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.88 MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKETEXT (
    n          IN      DOMNODE)
RETURN DOMTEXT;
```

Parameters

Table 222-109 MAKETEXT Function Parameters

Parameter	Description
n	DOMNODE to cast

222.7.89 NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

See Also:

[DOMDocument Subprograms](#)

Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT (
    xmldoc    IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```
DBMS_XMLDOM.NEWDOMDOCUMENT (
    clob      IN    CLOB)
RETURN DOMDOCUMENT;
```

Parameters

Table 222-110 NEWDOMDOCUMENT Function Parameters

Parameter	Description
xmldoc	XMLType source for the DOMDOCUMENT
clob	CLOB source for the DOMDOCUMENT

222.7.90 NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

See Also:

[DOMELEMENT Subprograms](#)

Syntax

```
DBMS_XMLDOM.NORMALIZE (
    elem      IN    DOMELEMENT);
```

Parameters

Table 222-111 NORMALIZE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT

222.7.91 REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

See Also:

[DOMELEMENT Subprograms](#)

Syntax

Removes the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE (
  elem      IN   DOMELEMENT,
  name      IN   VARCHAR2);
```

Removes the value of a `DOMELEMENT`'s attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE (
  elem      IN   DOMELEMENT,
  name      IN   VARCHAR2,
  ns        IN   VARCHAR2);
```

Parameters

Table 222-112 REMOVEATTRIBUTE Procedure Parameters

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>name</code>	Attribute name
<code>ns</code>	Namespace

222.7.92 REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the `DOMELEMENT`. The method returns the removed node.

See Also:

[DOMELEMENT Subprograms](#)

Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE (
  elem      IN   DOMELEMENT,
  oldAttr   IN   DOMATTR)
RETURN DOMATTR;
```

Parameters

Table 222-113 REMOVEATTRIBUTENODE Function Parameters

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code> .
<code>oldAttr</code>	The old <code>DOMATTR</code> .

222.7.93 REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.REMOVECHILD(  
    n            IN      DOMNode,  
    oldchild    IN      DOMNode)  
RETURN DOMNODE;
```

Parameters

Table 222-114 REMOVECHILD Function Parameters

Parameter	Description
<code>n</code>	DOMNODE
<code>oldChild</code>	The child of the node <code>n</code> to be removed

222.7.94 REMOVENAMEDITEM Function

This function removes a node, specified by name, from the map and returns this node.

When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

See Also:

[DOMNamedNodeMap Subprograms](#)

Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM(  
    nnm        IN      DOMNamedNodeMap,  
    name       IN      VARCHAR2)  
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM(  
    nnm        IN      DOMNamedNodeMap,
```

```

name      IN      VARCHAR2,
ns        IN      VARCHAR2)
RETURN DOMNode;

```

Parameters

Table 222-115 REMOVE_NAMED_ITEM Function Parameters

Parameter	Description
nnm	DOMNamedNodeMap
name	The name of the item to be removed from the map
ns	Namespace

222.7.95 REPLACE_CHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node.

If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

See Also:

[DOMNode Subprograms](#)

Syntax

```

DBMS_XMLDOM.REPLACE_CHILD(
  n          IN      DOMNode,
  newchild   IN      DOMNode,
  oldchild   IN      DOMNode)
RETURN DOMNode;

```

Parameters

Table 222-116 REPLACE_CHILD Function Parameters

Parameter	Description
n	DOMNode
newchild	The new child which is to replace the old child
oldchild	The child of the node n which is to be replaced

222.7.96 REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

See Also:

[DOMCharacterData Subprograms](#)

Syntax

```
DBMS_XMLDOM.REPLACEDATA (  
    cd          IN      DOMCHARACTERDATA,  
    offset      IN      NUMBER,  
    cnt         IN      NUMBER,  
    arg         IN      VARCHAR2);
```

Parameters

Table 222-117 REPLACEDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to replace
cnt	The number of characters to replace
arg	The value to replace with

222.7.97 RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

See Also:

[DOMElement Subprograms](#)

Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX (  
    elem        IN      DOMELEMENT,  
    prefix      IN      VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 222-118 RESOLVENAMESPACEPREFIX Function Parameters

Parameter	Description
elem	The DOMELEMENT
prefix	Namespace prefix

222.7.98 SETATTRIBUTE Procedures

This procedure sets the value of a DOMELEMENT's attribute by name.

See Also:

[DOMELEMENT Subprograms](#)

Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE (
  elem      IN  DOMELEMENT,
  name      IN  VARCHAR2,
  newvalue  IN  VARCHAR2);
```

Sets the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE (
  elem      IN  DOMELEMENT,
  name      IN  VARCHAR2,
  newvalue  IN  VARCHAR2,
  ns        IN  VARCHAR2);
```

Parameters

Table 222-119 SETATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
newvalue	Attribute value
ns	Namespace

222.7.99 SETATTRIBUTENODE Functions

This function adds a new attribute node to the `DOMELEMENT`.

See Also:

[DOMElement Subprograms](#)

Syntax

Adds a new attribute node to the `DOMELEMENT`:

```
DBMS_XMLDOM.SETATTRIBUTENODE (
  elem      IN  DOMELEMENT,
  newAttr   IN  DOMATTR)
RETURN DOMATTR;
```

Adds a new attribute node to the `DOMElement`; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE (
  elem      IN  DOMELEMENT,
  newAttr   IN  DOMATTR,
  ns        IN  VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 222-120 SETATTRIBUTENODE Function Parameters

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>newAttr</code>	The new <code>DOMATTR</code>
<code>ns</code>	The namespace

222.7.100 SETCHARSET Procedure

This function sets the character set of the DOM document.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETCHARSET (
  doc      IN  DOMDocument,
  charset  IN  VARCHAR2);
```

Parameters

Table 222-121 SETCHARSET Procedure Parameters

Parameter	Description
doc	DOM document
charset	Character set

Usage Notes

This is used for [WRITETOFILE Procedures](#) if not explicitly specified at that time.

222.7.101 SETDATA Procedures

This overloaded procedure sets character data or `DOMPROCESSINGINSTRUCTION` content data. The specific functionality is described in the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.SETDATA (
    cd      IN      DOMCHARACTERDATA,
    data    IN      VARCHAR2);
```

Sets the content data of the `DOMPROCESSINGINSTRUCTION` (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.SETDATA (
    pi      IN      DOMPROCESSINGINSTRUCTION,
    data    IN      VARCHAR2);
```

Parameters

Table 222-122 SETDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
data	The data to which the node is set
pi	DOMPROCESSINGINSTRUCTION
data	New processing instruction content data

222.7.102 SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document.

This DTD can later be retrieved using the [GETDOCTYPE Function](#).

Syntax

```
DBMS_XMLDOM.SETDOCTYPE (
  doc      IN   DOMDocument,
  name     IN   VARCHAR2,
  sysid   IN   VARCHAR2,
  pubid   IN   VARCHAR2);
```

Parameters

Table 222-123 SETDOCTYPE Procedure Parameters

Parameter	Description
doc	The document whose DTD has to be set
name	The name that the doctype needs to be initialized with
sysid	The system ID that the doctype needs to be initialized with
pubid	The public ID that the doctype needs to be initialized with

222.7.103 SETNAMEDITEM Function

This function adds a node using its `nodeName` attribute.

If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, `NULL` is returned.

As the `nodeName` attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

See Also:

[DOMNamedNodeMap Subprograms](#)

Syntax

Adds a node using its `nodeName` attribute:

```
DBMS_XMLDOM.SETNAMEDITEM (
  nnm      IN   DOMNAMEDNODEMAP,
  arg      IN   DOMNODE)
RETURN DOMNode;
```

Adds a node using its `nodeName` attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM (
  nnm      IN   DOMNAMEDNODEMAP,
  arg      IN   DOMNODE,
  ns       IN   VARCHAR2)
RETURN DOMNode;
```

Parameters

Table 222-124 SETNAMEDITEM Function Parameters

Parameter	Description
nrm	DOMNAMEDNODEMAP
arg	The Node to be added using its <code>nodeName</code> attribute
ns	Namespace

222.7.104 SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be `NULL`, setting it has no effect.

**See Also:**[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETNODEVALUE (
    n          IN      DOMNODE,
    nodeValue IN      VARCHAR2);
```

Parameters

Table 222-125 SETNODEVALUE Procedure Parameters

Parameter	Description
n	DOMNode
nodeValue	The value to which node is set

222.7.105 SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

**See Also:**[DOMNode Subprograms](#)

Syntax

This function returns an instance of the PL/SQL `XMLBINARYOUTPUTSTREAM` into which the caller can write the node value. The datatype of the node must be `RAW` or `BLOB` – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
  n      IN      DOMNODE)
RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The datatype of the node must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
  n      in      DOMNODE,
  value  in      SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

Table 222-126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYINPUTSTREAM

222.7.106 SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

See Also:

[DOMNode Subprograms](#)

Syntax

This function returns an instance of the PL/SQL `XMLCHARACTEROUTPUTSTREAM` type into which the caller can write the node value. The datatype of the node can be any valid XDB datatype. If the type is not `character` or `CLOB`, the character data written to the stream is converted to the node datatype. If the datatype of the node is `character` or `CLOB`, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
  n      IN      DOMNODE)
RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `SYS.UTL_CHARACTERINPUTSTREAM` from which XDB reads to populate the node. The datatype of

the node may be any valid type supported by XDB. If a non-character datatype, the character data read from the stream is converted to the datatype of the node. If the datatype of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
  n          IN    DOMNODE,
  value      IN    SYS.UTL_CHARACTERINPUTSTREAM);
```

Parameters

Table 222-127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTERINPUTSTREAM

222.7.107 SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETPREFIX (
  n          IN    DOMNODE,
  prefix    IN    VARCHAR2);
```

Parameters

Table 222-128 SETPREFIX Procedure Parameters

Parameter	Description
n	DOMNODE
prefix	The value for the namespace prefix of the node

222.7.108 SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETSTANDALONE (
  doc          IN    DOMDOCUMENT,
  newvalue     IN    VARCHAR2);
```

Parameters**Table 222-129 SETSTANDALONE Procedure Parameters**

Parameter	Description
doc	DOMDOCUMENT
newvalue	Value of the standalone property of the document

222.7.109 SETVALUE Procedure

This procedure sets the value of the attribute.

**See Also:**

[DOMAttr Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETVALUE (
  a          IN    DOMATTR,
  value     IN    VARCHAR2);
```

Parameters**Table 222-130 SETVALUE Procedure Parameters**

Parameter	Description
a	DOMATTR
value	The value to which to set the attribute

222.7.110 SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

**See Also:**

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETVERSION (
  doc      IN   DOMDOCUMENT,
  version  IN   VARCHAR2);
```

Parameters**Table 222-131 SETVERSION Procedure Parameters**

Parameter	Description
doc	DOMDOCUMENT
version	The version of the document

222.7.111 SPLITTEXT Function

This function breaks this `DOMTEXT` node into two `DOMTEXT` nodes at the specified offset.

**See Also:**

[DBMS_XMLDOM DOMText Subprograms](#)

Syntax

```
DBMS_XMLDOM.SPLITTEXT (
  t      IN   DOMTEXT,
  offset IN   NUMBER)
RETURN DOMText;
```

Parameters**Table 222-132 SPLITTEXT Function Parameters**

Parameter	Description
t	DOMTEXT
offset	Offset at which to split

222.7.112 SUBSTRINGDATA Function

This function extracts a range of data from the node.

**See Also:**

[DOMCharacterData Subprograms](#)

Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA (
  cd          IN      DOMCHARACTERDATA,
  offset     IN      NUMBER,
  cnt        IN      NUMBER)
RETURN VARCHAR2;
```

Parameters**Table 222-133 SUBSTRINGDATA Function Parameters**

Parameter	Description
cd	DOMCHARACTERDATA
offset	The starting offset of the data from which to get the data
cnt	The number of characters (from the offset) of the data to get

222.7.113 USEBINARYSTREAM Function

This function returns `TRUE` if the datatype of the node is `RAW` or `BLOB`, so that the node value may be read or written using an `UTL_BINARYINPUTSTREAM` or `UTL_BINARYOUTPUTSTREAM`.

If a value of `FALSE` is returned, the node value may only be accessed through an `UTL_CHARACTERINPUTSTREAM` or `UTL_CHARACTEROUTPUTSTREAM`.

**See Also:**[DOMNode Subprograms](#)**Syntax**

```
DBMS_XMLDOM.USEBINARYSTREAM (
  n          IN      DOMNODE)
RETURN BOOLEAN;
```

Parameters**Table 222-134 USEBINARYSTREAM Function Parameters**

Parameter	Description
n	DOMNODE

222.7.114 WRITETOBUFFER Procedures

`WRITETOBUFFER` is an overloaded procedure that writes an XML node, XML document, or a document fragment to a specified buffer.

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER (
  n          IN          DOMNODE,
  buffer     IN OUT     VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER (
  doc        IN          DOMDOCUMENT,
  buffer     IN OUT     VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER (
  df         IN          DOMDOCUMENTFRAGMENT,
  buffer     IN OUT     VARCHAR2);
```

Parameters**Table 222-135 WRITETOBUFFER Procedure Parameters**

Parameter	Description
n	DOMNODE
buffer	Buffer to which to write
doc	DOMDOCUMENT
df	DOM document fragment

222.7.115 WRITETOCLOB Procedures

WRITETOCLOB is an overloaded procedure that writes an XML node or document to a specified CLOB.

The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified CLOB using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOCLOB (
  n          IN          DOMNODE,
  cl         IN OUT     CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOCLOB (
  doc        IN          DOMDOCUMENT,
  cl         IN OUT     CLOB);
```

Parameters

Table 222-136 WRITETOCLOB Procedure Parameters

Parameter	Description
n	DOMNODE
clob	CLOB to which to write
doc	DOMDOCUMENT

222.7.116 WRITETOFILE Procedures

This overloaded procedure writes an XML node or XML document to a specified node.

The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  n          IN      DOMNODE,
  fileName  IN      VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  n          IN      DOMNODE,
  fileName  IN      VARCHAR2,
  charset   IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  doc       IN      DOMDOCUMENT,
  filename  IN      VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  doc       IN      DOMDOCUMENT,
  fileName  IN      VARCHAR2,
  charset   IN      VARCHAR2);
```

Parameters

Table 222-137 WRITETOFILE Procedure Parameters

Parameter	Description
n	DOMNODE

Table 222-137 (Cont.) WRITETOFILE Procedure Parameters

Parameter	Description
fileName	File to which to write. The filename should be in the format of database_directory_object_name/filename, for example mydir/filename (on windows, use \ instead of /).
charset	specified character set
doc	DOMDOCUMENT
charset	Character set

DBMS_XMLGEN

The `DBMS_XMLGEN` package converts the results of a SQL query to a canonical XML format.

Note:

The PL/SQL package `DBMS_XMLGEN` is deprecated in Oracle Database 23ai.

`DBMS_XMLGEN` is a non-standard Oracle-proprietary package that is provided to generate and convert XML documents from SQL queries or with PL/SQL. This package is deprecated, and can be desupported in a future release. Oracle recommends that you use SQL/XML operators to generate XML from relational columns instead. Using ANSI SQL/XML operators for any generation and modification of XML documents provides a standardized and future-proof way to work with XML documents.

The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a `CLOB`. This package is similar to the `DBMS_XMLQUERY` package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- [Security Model](#)
- [Summary of DBMS_XMLGEN Subprograms](#)

See Also:

Oracle XML DB Developer's Guide, or more information on XML support and on examples of using `DBMS_XMLGEN`

223.1 DBMS_XMLGEN Security Model

Owned by `XDB`, the `DBMS_XMLGEN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

223.2 Summary of DBMS_XMLGEN Subprograms

This table lists the `DBMS_XMLGEN` subprograms and briefly describes them.

Table 223-1 Summary of DBMS_XMLGEN Package Subprograms

Subprogram	Description
CLOSECONTEXT Procedure	Closes the context and releases all resources
CONVERT Functions	Converts the XML into the escaped or unescaped XML equivalent
GETNUMROWSPROCESSED Function	Gets the number of SQL rows that were processed in the last call to GETXML Functions
GETXML Functions	Gets the XML document
GETXMLTYPE Functions	Gets the XML document and returns it as <code>XMLType</code>
NEWCONTEXT Functions	Creates a new context handle
NEWCONTEXTFROMHIERARCHY Function	Obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result
RESTARTQUERY Procedure	Restarts the query to start fetching from the beginning
SETCONVERTSPECIALCHARS Procedure	Sets whether special characters such as \$, which are non-XML characters, should be converted or not to their escaped representation
SETMAXROWS Procedure	Sets the maximum number of rows to be fetched each time
SETNULLHANDLING Procedure	Sets <code>NULL</code> handling options
SETROWSETTAG Procedure	Sets the name of the element enclosing the entire result
SETROWTAG Procedure	Sets the name of the element enclosing each row of the result
SETSKIPROWS Procedure	Sets the number of rows to skip every time before generating the XML.
USEITEMTAGSFORCOLL Procedure	Forces the use of the collection column name appended with the tag <code>_ITEM</code> for collection elements
USENULLATTRIBUTEINDICATOR Procedure	Specifies whether to use an XML attribute to indicate <code>NULL</code> ness, or to do it by omitting the inclusion of the particular entity in the XML document.

223.2.1 CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (
    ctx IN ctxHandle);
```

Parameters

Table 223-2 CLOSECONTEXT Procedure Parameters

Parameter	Description
<code>ctx</code>	The context handle to close.

223.2.2 CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (  
    xmlData IN VARCHAR2,  
    flag    IN NUMBER := ENTITY_ENCODE)  
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (  
    xmlData IN CLOB,  
    flag    IN NUMBER := ENTITY_ENCODE)  
RETURN CLOB;
```

Parameters

Table 223-3 CONVERT Function Parameters

Parameter	Description
xmlData	The XML CLOB data to be encoded or decoded.
flag	The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character < is <. Unescaping is the reverse transformation.

223.2.3 GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML.

Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (  
    ctx    IN    ctxHandle)  
RETURN NUMBER;
```

Parameters

Table 223-4 GETNUMROWSPROCESSED Function Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call.

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

Related Topics

- [GETXML Functions](#)
This function gets the XML document. The function is overloaded.

223.2.4 GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of [GETXML Functions](#) to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this [GETXML Functions](#) call is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
    ctx          IN ctxHandle,
    tmpclob      IN OUT NCOPY CLOB,
    dtdOrSchema IN number := NONE)
RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
    ctx          IN ctxHandle,
    dtdOrSchema IN number := NONE)
RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the

DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
    sqlQuery     IN VARCHAR2,
    dtdOrSchema  IN number := NONE)
RETURN CLOB;
```

Parameters

Table 223-5 GETXML Function Parameters

Parameter	Description
ctx	The context handle obtained from the <code>newContext</code> call.
tmpclob	The CLOB to which the XML document is appended.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only <code>NONE</code> is supported.

Usage Notes

When the rows indicated by the [SETSKIPROWS Procedure](#) call are skipped, the maximum number of rows as specified by the [SETMAXROWS Procedure](#) call (or the entire result if not specified) is fetched and converted to XML. Use the [GETNUMROWSPROCESSED Function](#) to check if any rows were retrieved.

223.2.5 GETXMLTYPE Functions

This function gets the XML document and returns it as an `XMLTYPE`. `XMLTYPE` operations can be performed on the results. This function is overloaded.

Syntax

Generates the XML document and returns it as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
    ctx             IN ctxhandle,
    dtdOrSchema    IN number := NONE)
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
    sqlQuery       IN VARCHAR2,
    dtdOrSchema    IN number := NONE)
RETURN sys.XMLType
```

Parameters

Table 223-6 GETXMLTYPE Function Parameters

Parameter	Description
ctx	The context handle obtained from the <code>newContext</code> call.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only <code>NONE</code> is supported.

223.2.6 NEWCONTEXT Functions

This function generates and returns a new context handle.

This context handle is used in [GETXML Functions](#) and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (  
    query      IN VARCHAR2)  
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (  
    queryString IN SYS_REFCURSOR)  
RETURN ctxHandle;
```

Parameters

Table 223-7 NEWCONTEXT Function Parameters

Parameter	Description
query	The query, in the form of a VARCHAR, the result of which must be converted to XML.
queryString	The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.

223.2.7 NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result.

Syntax

```
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (  
    queryString IN VARCHAR2)  
RETURN ctxHandle;
```

Parameters

Table 223-8 NEWCONTEXTFROMHIERARCHY Function Parameters

Parameter	Description
queryString	The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a <code>CONNECT BY</code> clause, and the result must have the same property as the result set generated by a <code>CONNECT BY</code> query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document.

Related Topics

- [GETXML Functions](#)
This function gets the XML document. The function is overloaded.

223.2.8 RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row.

It can be used to start executing the query again, without having to create a new context.

Syntax

```
DBMS_XMLGEN.RESTARTQUERY (
  ctx IN ctxHandle);
```

Parameters

Table 223-9 RESTARTQUERY Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the current query.

223.2.9 SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the `<` sign is converted to `<`.

The default is to perform conversions.

This function improves performance of XML processing when the input data cannot contain any special characters such as `<`, `>`, `"`, `'`, which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (
  ctx IN ctxHandle,
  conv IN BOOLEAN);
```

Parameters

Table 223-10 SETCONVERTSPECIALCHARS Procedure Parameters

Parameter	Description
ctx	The context handle obtained from one of the NEWCONTEXT Functions call.
conv	TRUE indicates that conversion is needed.

223.2.10 SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call.

It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxRows` parameter.

Syntax

```
DBMS_XMLGEN.SETMAXROWS (
  ctx      IN ctxHandle,
  maxRows  IN NUMBER);
```

Parameters

Table 223-11 SETMAXROWS Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the query executed.
maxRows	The maximum number of rows to get for each call to GETXML Functions

Related Topics

- [GETXML Functions](#)
This function gets the XML document. The function is overloaded.

223.2.11 SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the `flag` parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING (
  ctx IN ctx,
  flag IN NUMBER);
```

Parameters

Table 223-12 SETNULLHANDLING Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the query executed.
flag	The NULL handling option set. <ul style="list-style-type: none"> DROP_NULLS CONSTANT NUMBER:= 0; (Default) Leaves out the tag for NULL elements. NULL_ATTR CONSTANT NUMBER:= 1; Sets xsi:nil="true". EMPTY_TAG CONSTANT NUMBER:= 2; Sets, for example, <foo/>.

223.2.12 SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is ROWSET.

Syntax

```
DBMS_XMLGEN.SETROWSETTAG (
  ctx          IN ctxHandle,
  rowSetTagName IN VARCHAR2);
```

Parameters

Table 223-13 SETROWSETTAG Procedure Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call.
rowSetTagName	The name of the document element. Passing NULL indicates that you do not want the ROWSET element present.

Usage Notes

The user can set the rowSetTag to NULL to suppress the printing of this element. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

223.2.13 SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is ROW.

Syntax

```
DBMS_XMLGEN.SETROWTAG (
  ctx          IN ctxHandle,
  rowTagName IN VARCHAR2);
```

Parameters

Table 223-14 SETROWTAG Procedure Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call.
rowTagName	The name of the ROW element. Passing NULL indicates that you do not want the ROW element present.

Usage Notes

The user can set the name of the element to NULL to suppress the ROW element itself. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

223.2.14 SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility.

For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See [GETNUMROWSPROCESSED Function](#).

Syntax

```
DBMS_XMLGEN.SETSKIPROWS (
  ctx          IN ctxHandle,
  skipRows    IN NUMBER);
```

Parameters

Table 223-15 SETSKIPROWS Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the query executed.
skipRows	The number of rows to skip for each call to <code>getXML</code> .

Related Topics

- [GETXML Functions](#)
This function gets the XML document. The function is overloaded.

223.2.15 USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (
    ctx IN ctxHandle);
```

Parameters

Table 223-16 USEITEMTAGSFORCOLL Procedure Parameters

Parameter	Description
ctx	The context handle.

Usage Notes

Using this procedure, you can override the default to use the name of the column with the `_ITEM` tag appended to it. If there is a collection of `NUMBER`, the default tag name for the collection elements is `NUMBER`.

223.2.16 USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate `NULL`, or to do it by omitting the inclusion of the particular entity in the XML document.

It is used as a shortcut for the [SETNULLHANDLING Procedure](#).

Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR (
    ctx          IN    ctxType,
    attrind     IN    BOOLEAN := TRUE);
```

Parameters

Table 223-17 USENULLATTRIBUTEINDICATOR Procedure Parameters

Parameter	Description
ctx	Context handle.
attrind	Use attribute to indicate <code>NULL</code> ?

DBMS_XMLINDEX

The `DBMS_XMLINDEX` package provides an interface to implement asynchronous indexing.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_XMLINDEX Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for more information about "XMLIndex"

224.1 DBMS_XMLINDEX Overview

`DBMS_XMLINDEX` provides a mechanism for asynchronous index maintenance.

Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a more convenient time, for example when the load on the database is low. `DBMS_XMLINDEX` provides this mechanism.

224.2 DBMS_XMLINDEX Security Model

Owned by `XDB`, the `DBMS_XMLINDEX` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

224.3 Summary of DBMS_XMLINDEX Subprograms

This table lists the `DBMS_XMLINDEX` subprograms and briefly describes them.

Table 224-1 DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATEDATEINDEX Procedure	Creates a secondary index for date values in the <code>VALUE</code> column of a <code>PATH TABLE</code> which is the storage table of an XMLIndex

Table 224-1 (Cont.) DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATENUMBERINDEX Procedure	Creates a secondary index for number values in the <code>VALUE</code> column of a <code>PATH TABLE</code> which is the storage table of an <code>XMLIndex</code>
DROPPARAMETER Procedure	Drops the <code>XMLIndex</code> parameter string that is associated with a given parameter identifier.
MODIFYPARAMETER Procedure	Modifies the <code>XMLIndex</code> parameter string that is associated with a given parameter name
PROCESS_PENDING Procedure	Processes pending rows for a <code>NONBLOCKING ALTER INDEX OPERATION</code> on an <code>XMLIndex</code>
REGISTERPARAMETER Procedure	Registers a parameter string and <code>XMLIndex</code> parameter string pair in XDB
SYNCINDEX Procedure	Synchronizes the index manually

224.3.1 CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`. The second form of the procedure allows for the `date_index_clause` to be set to an empty string.

Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  date_index_name  IN VARCHAR2,
  xmltypename     IN VARCHAR2,
  date_index_clause IN VARCHAR2);
```

```
DBMS_XMLINDEX.CREATEDATEINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  date_index_name  IN VARCHAR2,
  xmltypename     IN VARCHAR2);
```

Parameters

Table 224-2 CREATEDATEINDEX Procedure Parameters

Parameter	Description
<code>xml_index_schema</code>	Name of the owner of the <code>XMLIndex</code>
<code>xml_index_name</code>	Name of the <code>XMLIndex</code>
<code>date_index_name</code>	Name of the secondary index to be created for date values in the <code>VALUE</code> column of the <code>PATH TABLE</code> of <code>XMLIndex</code> named <code>xml_index_name</code> and owned by <code>xml_index_schema</code>

Table 224-2 (Cont.) CREATDATEINDEX Procedure Parameters

Parameter	Description
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.
date_index_clause	Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index

224.3.2 CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex.

Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
  xml_index_schema  IN  VARCHAR2,
  xml_index_name    IN  VARCHAR2,
  num_index_name    IN  VARCHAR2,
  num_index_clause  IN  VARCHAR2,
  xmltypename       IN  VARCHAR2);
```

Parameters

Table 224-3 CREATENUMBERINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
num_index_name	Name of the secondary index to be created for number values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
num_index_clause	Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index.
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: FLOAT, DOUBLE, DECIMAL, INTEGER, NONPOSITIVEINTEGER, NEGATIVEINTEGER, LONG, INT, SHORT, BYTE, NONNEGATIVEINTEGER, UNSIGNEDLONG, UNSIGNEDINT, UNSIGNEDSHORT, UNSIGNEDBYTE, POSITIVEINTEGER.

224.3.3 DROPPARAMETER Procedure

This procedure drops the XMLIndex parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.DROPPARAMETER (
    name          IN          VARCHAR2);
```

Parameters

Table 224-4 DROPPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string

Examples

```
DBMS_XMLINDEX.DROPPARAMETER (
    'myIndexParam');
```

224.3.4 MODIFYPARAMETER Procedure

This procedure modifies the XMLIndex parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (
    name          IN          VARCHAR2,
    parameter     IN          CLOB);
```

Parameters

Table 224-5 MODIFYPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (
    'myIndexParam',
    'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx');
```

224.3.5 PROCESS_PENDING Procedure

This procedure processes executes DMLs required to complete a `NONBLOCKING ALTER INDEX ADD_GROUP/ADD_COLUMN` operation on an XMLIndex.

Syntax

```
DBMS_XMLINDEX.PROCESS_PENDING (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  pending_row_count OUT BINARY_INTEGER,
  error_row_count  OUT BINARY_INTEGER);
```

Parameters

Table 224-6 PROCESS_PENDING Procedure Parameters

Parameter	Description
<code>xml_index_schema</code>	Name of the owner of the XMLIndex
<code>xml_index_name</code>	Name of the XMLIndex to be altered using <code>NONBLOCKING ALTER INDEX OPERATION</code>
<code>pending_row_count</code>	Number of pending rows to be processed
<code>error_row_count</code>	Number of rows for which indexing may have failed because of an error

Usage Notes

- This procedure will iteratively attempt to index all necessary rows in small batches while skipping rows that are locked and rows for which index maintenance fails with an error. Therefore, it may have to be executed multiple times for an XMLIndex until all pending rows are processed. Once all pending rows are processed, user can complete the `NONBLOCKING ALTER INDEX OPERATION`.
- If it is not possible process all the pending rows after multiple trials, the user will have to manually triage the locking or error issues by examining unprocessed rows in `SYS_AIXSXI_#####_PENDINGTAB` and errors in `SYS_AIXSXI_#####_ERRORTAB`. Keeping track of rows and the errors is useful in triaging issues.

Examples

```
EXEC DBMS_XMLINDEX.PROCESS_PENDING(
  'SCOTT', 'PO_XMLINDEX_IX', out_param1, out_param2);
```

224.3.6 REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

Syntax

```
DBMS_XMLINDEX.REGISTERPARAMETER (
  name          IN VARCHAR2,
  parameter     IN CLOB);
```

Parameters

Table 224-7 REGISTERPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

Examples

```
DBMS_XMLINDEX.REGISTERPARAMETER (
  'myIndexParam',
  'PATH TABLE po_ptab
  PATH ID INDEX po_pidx
  ORDER KEY INDEX po_oidx
  VALUE INDEX po_vidx
  PATHS (NAMESPACE MAPPING(xmlns:p="http://www.example.com/IPO"))
  GROUP MASTERGROUP XMLTABLE PO_TAB
  ('/p:PurchaseOrder'
   COLUMNS
     REFERENCE VARCHAR2(30) PATH 'p:Reference',
     REQUESTOR VARCHAR2(30) PATH 'p:Requestor' )
  GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
  ('/p:PurchaseOrder/p:LineItems/p:LineItem'
   COLUMNS
     LINENUMBER NUMBER(38) PATH '@p:ItemNumber',
     QUANTITY NUMBER(38) PATH '@p:Quantity',
     DESCRIPTION VARCHAR2(256) PATH 'p:Description'));
```

224.3.7 SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex.

It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
  xml_index_schema    IN VARCHAR2,
  xml_index_name      IN VARCHAR2,
  partition_name      IN VARCHAR2 DEFAULT NULL,
  reindex             IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 224-8 SYNCINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
partition_name	[Currently not supported]

Table 224-8 (Cont.) SYNCINDEX Procedure Parameters

Parameter	Description
reindex	Default is FALSE. If set to TRUE, this drops the secondary indexes and recreates them later so that they can be bulk-loaded.

Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```

DBMS_XMLPARSER

Using `DBMS_XMLPARSER`, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_XMLPARSER Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

225.1 DBMS_XMLPARSER Security Model

Owned by `XDB`, the `DBMS_XMLPARSER` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

225.2 Summary of DBMS_XMLPARSER Subprograms

This table lists the `DBMS_XMLPARSER` subprograms and briefly describes them.

Table 225-1 DBMS_XMLPARSER Package Subprograms

Method	Description
FREEPARSER	Frees a parser object.
GETDOCTYPE	Gets parsed DTD.
GETDOCUMENT	Gets DOM document.
GETRELEASEVERSION	Returns the release version of Oracle XML Parser for PL/SQL.
GETVALIDATIONMODE	Returns validation mode.
NEWPARSER	Returns a new parser instance
PARSE	Parses XML stored in the given url/file.
PARSEBUFFER	Parses XML stored in the given buffer
PARSECLOB	Parses XML stored in the given clob
PARSEDTD	Parses DTD stored in the given url/file
PARSEDTDBUFFER	Parses DTD stored in the given buffer
PARSEDTDCLOB	Parses DTD stored in the given clob
SETBASEDIR	Sets base directory used to resolve relative URLs.
SETDOCTYPE	Sets DTD.
SETERRORLOG	Sets errors to be sent to the specified file
SETPRESERVEWHITESPACE	Sets white space preserve mode
SETVALIDATIONMODE	Sets validation mode.
SHOWWARNINGS	Turns warnings on or off.

225.2.1 FREEPARSER

This procedure frees a parser object.

Syntax

```
PROCEDURE freeParser(  
    p Parser);
```

Parameters

Table 225-2 FREEPARSER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

225.2.2 GETDOCTYPE

The `GETDOCTYPE` function returns the parsed DTD. This function must be called only after a DTD is parsed.

Syntax

```
FUNCTION getDoctype(  
    p Parser)  
RETURN DOMDocumentType;
```

Parameters

Table 225-3 GETDOCTYPE Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

225.2.3 GETDOCUMENT

`GETDOCUMENT` returns the document node of a DOM tree document built by the parser. This function must be called only after a document is parsed.

Syntax

```
FUNCTION GETDOCUMENT(  
    p Parser)  
RETURN DOMDocument;
```

Parameters

Table 225-4 GETDOCUMENT Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

225.2.4 GETRELEASEVERSION

`GETRELEASEVERSION` returns the release version of the Oracle XML parser for PL/SQL.

Syntax

```
FUNCTION getReleaseVersion  
RETURN VARCHAR2;
```

225.2.5 GETVALIDATIONMODE

The `GETVALIDATIONMODE` function retrieves the validation mode: `TRUE` for validating, `FALSE` otherwise.

Syntax

```
FUNCTION GETVALIDATIONMODE (  
    p Parser)  
RETURN BOOLEAN;
```

Parameters

Table 225-5 GETVALIDATIONMODE Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

225.2.6 NEWPARSER

This function returns a new parser instance.

This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

Syntax

```
FUNCTION newParser  
RETURN Parser;
```

225.2.7 PARSE

`PARSE` parses XML stored in the given URL or file. An application error is raised if parsing fails.

There are several versions of this method.

Syntax

Function. Use this when the default parser behavior is acceptable, and only a URL or file needs to be parsed. Returns the built DOM document.

```
FUNCTION parse(url VARCHAR2)  
RETURN DOMDocument;
```

Procedure. Any changes to the default parser behavior should be effected before calling this procedure.

```
PROCEDURE parse(
  p Parser,
  url VARCHAR2);
```

Parameters

Table 225-6 PARSE Subprogram Parameters

Parameter	IN / OUT	Description
url	(IN)	Complete path of the url/file to be parsed.
p	(IN)	Parser instance.

225.2.8 PARSEBUFFER

PARSEBUFFER parses XML stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEBUFFER (
  p Parser,
  doc VARCHAR2);
```

Parameters

Table 225-7 PARSEBUFFER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

225.2.9 PARSECLOB

PARSECLOB parses XML stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSECLOB (
  p Parser,
  doc CLOB);
```

Parameters

Table 225-8 PARSECLOB Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

225.2.10 PARSEDTD

PARSEDTD parses the DTD stored in the given URL or file.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTD(
  p      Parser,
  url    VARCHAR2,
  root   VARCHAR2);
```

Parameters

Table 225-9 PARSEDTD Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
url	(IN)	Complete path of the URL or file to be parsed.
root	(IN)	Name of the root element.

225.2.11 PARSEDTDBUFFER

PARSEDTDBUFFER parses the DTD stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDBUFFER(
  p      Parser,
  dtd    VARCHAR2,
  root   VARCHAR2);
```

Parameters

Table 225-10 PARSEDTDBUFFER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD buffer to parse.
root	(IN)	Name of the root element.

225.2.12 PARSEDTDCLOB

PARSEDTDCLOB parses the DTD stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDCLOB(  
  p    Parser,  
  dtd  CLOB,  
  root VARCHAR2);
```

Parameters

Table 225-11 PARSEDTDCLOB Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD Clob to parse.
root	(IN)	Name of the root element.

225.2.13 SETBASEDIR

This procedure sets the base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

```
PROCEDURE setBaseDir(  
  p    Parser,  
  dir  VARCHAR2);
```

Parameters**Table 225-12 SETBASEDIR Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dir	(IN)	Directory used as a base directory.

225.2.14 SETDOCTYPE Procedure

This procedure sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

Syntax

```
PROCEDURE setDoctype(
  p   Parser,
  dtd DOMDocumentType);
```

Parameters**Table 225-13 SETDOCTYPE Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD to set.

225.2.15 SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

Syntax

```
PROCEDURE setErrorLog(
  p           Parser,
  fileName VARCHAR2);
```

Parameters**Table 225-14 SETERRORLOG Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
fileName	(IN)	Complete path of the file to use as the error log.

225.2.16 SETPRESERVEWHITESPACE

This procedure sets whitespace preserving mode.

Syntax

```
PROCEDURE setPreserveWhitespace(  
    p Parser,  
    yes BOOLEAN);
```

Parameters

Table 225-15 SETPRESERVEWHITESPACE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - preserve, FALSE - don't preserve.

225.2.17 SETVALIDATIONMODE

This procedure sets the validation mode.

Syntax

```
PROCEDURE setValidationMode(  
    p Parser,  
    yes BOOLEAN);
```

Parameters

Table 225-16 SETVALIDATIONMODE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - validate, FALSE - don't validate.

225.2.18 SHOWWARNINGS

This procedure turns warnings on or off.

Syntax

```
PROCEDURE showWarnings(  
    p Parser,  
    yes BOOLEAN);
```

Parameters

Table 225-17 SHOWWARNINGS Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - show warnings, FALSE - don't show warnings.

DBMS_XMLSCHEMA

DBMS_XMLSCHEMA package provides procedures to manage XML schemas.

It is created by script `dbmsxsch.sql` during Oracle database installation.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS_XMLSCHEMA Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

226.1 DBMS_XMLSCHEMA Overview

The DBMS_XMLSCHEMA package uses subprograms to manage XML schemas.

These subprograms provide the following XML schema management::

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

226.2 DBMS_XMLSCHEMA Security Model

Owned by XDB, the DBMS_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

226.3 DBMS_XMLSCHEMA Constants

The `DBMS_XMLSCHEMA` package defines several constants to use when specifying parameter values.

These constants are shown in following tables.

- [Table 226-1](#)
- [Table 226-2](#)
- [Table 226-3](#)

Table 226-1 *DBMS_XMLSCHEMA Constants - Delete Option*

Constant	Type	Value	Description
<code>DELETE_RESTRICT</code>	NUMBER	1	Deletion of an XML schema fails if there are any tables or XML schemas that depend on it
<code>DELETE_INVALIDATE</code>	NUMBER	2	Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.
<code>DELETE_CASCADE</code>	NUMBER	3	Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if <code>gentypes</code> argument was set to <code>TRUE</code> during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.
<code>DELETE_CASCADE_FORCE</code>	NUMBER	4	This option is similar to <code>DELETE_CASCADE</code> except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.

Table 226-2 *DBMS_XMLSCHEMA Constants - Enable Hierarchy*

Constant	Type	Value	Description
<code>ENABLE_HIERARCHY_NONE</code>	PLS_INTEGER	1	The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will not be called on any tables created while registering that schema

Table 226-2 (Cont.) DBMS_XMLSCHEMA Constants - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_CONTENTS	PLS_INTEGER	2	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS
ENABLE_HIERARCHY_RESMETADATA	PLS_INTEGER	3	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

Table 226-3 DBMS_XMLSCHEMA Constants - Register CSID

Constant	Type	Value	Description
REGISTER_NODOCID	NUMBER	1	If a schema is registered for metadata use (using the value ENABLE_HIER_RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage
REGISTER_CSID_NULL	NUMBER	-1	If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter

226.4 Views

This table lists the views used by the DBMS_XMLSCHEMA package

The columns of these views are described in detail in the *Oracle Database Reference*

Table 226-4 Summary of Views used by DBMS_XMLSCHEMA

Schema	Description
USER_XML_SCHEMAS	All registered XML Schemas owned by the user
ALL_XML_SCHEMAS	All registered XML Schemas usable by the current user
DBA_XML_SCHEMAS	All registered XML Schemas in the database
DBA_XML_TABLES	All XMLType tables in the system
USER_XML_TABLES	All XMLType tables owned by the current user
ALL_XML_TABLES	All XMLType tables usable by the current user
DBA_XML_TAB_COLS	All XMLType table columns in the system
USER_XML_TAB_COLS	All XMLType table columns in tables owned by the current user
ALL_XML_TAB_COLS	All XMLType table columns in tables usable by the current user
DBA_XML_VIEWS	All XMLType views in the system
USER_XML_VIEWS	All XMLType views owned by the current user
ALL_XML_VIEWS	All XMLType views usable by the current user
DBA_XML_VIEW_COLS	All XMLType view columns in the system
USER_XML_VIEW_COLS	All XMLType view columns in views owned by the current user
ALL_XML_VIEW_COLS	All XMLType view columns in views usable by the current user

226.5 DBMS_XMLSCHEMA Operational Notes

There are guidelines for using in-place XML schema evolution.

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

226.6 Summary of DBMS_XMLSCHEMA Subprograms

This table lists the `DBMS_XMLSCHEMA` subprograms and briefly describes them.

Table 226-5 DBMS_XMLSCHEMA Package Subprograms

Method	Description
COMPILESCHEMA Procedure	Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.
COPYEVOLVE Procedure	Evolves registered schemas so that existing XML instances remain valid
DELETESCHEMA Procedure	Removes the schema from the database
INPLACEEVOLVE Procedure	Evolves registered schemas by propagating schema changes to object types and tables
PURGESCHEMA Procedure	Removes the XML schema
REGISTERSCHEMA Procedures	Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.
REGISTERURI Procedure	Registers an XML schema specified by a URI name

226.6.1 COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA (
    schemaur1 IN VARCHAR2);
```

Parameters

Table 226-6 COMPILESCHEMA Procedure Parameters

Parameter	Description
<code>schemaur1</code>	URL identifying the schema

226.6.2 COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based `XMLType` tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new `XMLType` tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved

- drops temporary tables

 **See Also:**

- "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
- *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE (
  schemaurls      IN  XDB$STRUBG_LIST_T,
  newschemas      IN  XMLSequenceType,
  transforms      IN  XMLSequenceType :=NULL,
  preserveolddocs IN  BOOLEAN :=FALSE,
  maptablename    IN  VARCHAR2 :=NULL,
  generatetables IN  BOOLEAN :=TRUE,
  force           IN  BOOLEAN :=FALSE,
  schemaowners   IN  XDB$STRING_LIST_T :=NULL
  parallelDegree IN  PLS_INTEGER := 0,
  options        IN  PLS_INTEGER := 0);
```

Parameters

Table 226-7 COPYEVOLVE Procedure Parameters

Parameter	Description
schemaurls	VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the FORCE parameter is TRUE, URLs should be in the order of dependency.
newschemas	VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.
transforms	VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.
preserveolddocs	Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete.

Table 226-7 (Cont.) COPYEVOLVE Procedure Parameters

Parameter	Description
maptabname	<p>Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are:</p> <ul style="list-style-type: none"> SCHEMA_URL - VARCHAR2 (700) - URL of schema to which this table conforms SCHEMA_OWNER - VARCHAR2 (30) - Owner of the schema ELEMENT_NAME - VARCHAR2 (256) - Element to which this table conforms TAB_NAME - VARCHAR2 (65) - Qualified table name: <code><owner_name>.<table_name></code> COL_NAME - VARCHAR2 (4000) - Name of the column (NULL for XMLType tables) TEMP_TABNAME - VARCHAR2 (30) - Name of temporary tables which holds data for this table.
generatetables	<p>Default is TRUE, and new tables will be generated.</p> <p>If FALSE:</p> <ul style="list-style-type: none"> new tables will not be generated after registration of new schemas preserveolddocs must be TRUE maptabname must be non-NULL
force	<p>Default is FALSE.</p> <p>If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.</p>
schemaowners	<p>VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.</p>
paralleldegree	<p>Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.</p>
options	<p>Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.</p>

Usage Notes

You should back up all schemas and documents prior to invocation because [COPYEVOLVE Procedure](#) deletes all conforming documents prior to implementing the schema evolution.

226.6.3 DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA (
    schemaurl      IN VARCHAR2,
    delete_option IN PLS_INTEGER := DELETE_RESTRICT);
```

See Also:

"XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Parameters

Table 226-8 DELETESCHEMA Procedure Parameters

Parameter	Description
schemaurl	URL identifying the schema to be deleted
delete_option	Delete options: <ul style="list-style-type: none"> DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects. DELETE_CASCADE - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema. DELETE_CASCADE_FORCE - Similar to DELETE_CASCADE except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.

Exceptions

Table 226-9 DELETESCHEMA Procedure Exceptions

Exception	Description
ORA-31001	Invalid resource handle or path name

226.6.4 INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE (
  schemaURL  IN  VARCHAR2,
  diffXML    IN  XMLType,
  flags      IN  NUMBER);
```

Parameters

Table 226-10 INPLACEEVOLVE Procedure Parameters

Parameter	Description
schemaurl	URL of the schema to evolve
diffXML	Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.
flags	<p>The following bits may be set in this parameter to control the behavior of this procedure:</p> <ul style="list-style-type: none"> INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new. INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file. <p>That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition:</p> <ul style="list-style-type: none"> Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new. Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPATH expressions and for XDIFF documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.

- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the [REGISTERSHEMA Procedures](#) and the [REGISTERURI Procedure](#) at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

226.6.5 PURGESHEMA Procedure

This procedure removes the XML schema.

See Also:

"XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.PURGESHEMA (
    schemaid IN RAW);
```

Parameters

Table 226-11 PURGESHEMA Procedure Parameters

Parameter	Description
schemaid	ID of the schema to be purged

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the `HIDE` mode.
- Once a schema has been deleted in `HIDE` mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

226.6.6 REGISTERSHEMA Procedures

This procedure registers the specified schema for use by the database.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

Note:

As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

See Also:

"XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Syntax

Registers a schema specified as a `VARCHAR2`:

```
DBMS_XMLSCHEMA.REGISTERSHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  VARCHAR2,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BFILE,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE` and identifies the character set id of the schema document:

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BFILE,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := TRUE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := TRUE,
  owner          IN  VARCHAR2 := '',
  csid           IN  NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);

```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BLOB,
  local          IN  BOOLEAN := TRUE,
  genTypes       IN  BOOLEAN := TRUE,
  genBean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);

```

Registers the schema specified as a BLOB and identifies the character set id of the schema document:

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BLOB,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := TRUE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := TRUE,
  owner          IN  VARCHAR2 := '',
  csid           IN  NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);

```

Registers the schema specified as a CLOB

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  CLOB,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  options        IN  PLS_INTEGER := 0);

```

Registers the schema specified as an XMLTYPE.

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN VARCHAR2,
  schemadoc      IN SYS.XMLTYPE,
  local          IN BOOLEAN := TRUE,
  gentypes       IN BOOLEAN := TRUE,
  genbean        IN BOOLEAN := FALSE,
  force          IN BOOLEAN := FALSE,
  owner          IN VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN VARCHAR2,
  schemadoc      IN SYS.URITYPE,
  local          IN BOOLEAN := TRUE,
  gentypes       IN BOOLEAN := TRUE,
  genbean        IN BOOLEAN := FALSE,
  force          IN BOOLEAN := FALSE,
  owner          IN VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN PLS_INTEGER := 0);
```

Parameters

Table 226-12 REGSITERSHEMA Procedure Parameters

Parameter	Description
schemaurl	URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside <code>schemalocation</code> attribute of XML Schema import element.
schemadoc	A valid XML schema document
local	Is this a local or global schema? <ul style="list-style-type: none"> By default, all schemas are registered as local schemas, under <code>/sys/schemas/<username>/...</code> If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> You need write privileges on the directory to be able to register a schema as global.
gentypes	Determines whether the schema compiler generates object types. By default, <code>TRUE</code> . If you use binary XML, you must be set <code>gentypes</code> to <code>FALSE</code> .
genbean	Determines whether the schema compiler generates Java beans. By default, <code>FALSE</code> . Oracle recommends that this parameter always be set to <code>FALSE</code> .
gentables	Determines whether the schema compiler generates default tables. By default, <code>TRUE</code>
force	If this parameter is set to <code>TRUE</code> , the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code> .

Table 226-12 (Cont.) REGSITERSchema Procedure Parameters

Parameter	Description
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
csid	Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.
enablehierarchy	<ul style="list-style-type: none"> ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with <code>hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS</code>. This is the default. ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with <code>hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA</code>. Users should pass in <code>DBMS_XMLSCHEMA.ENABLE_RESMETADATA</code> for schemas they intend to use as resource metadata tables.
options	<p>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a <code>BITOR</code> of the desired bits. Possible bits:</p> <ul style="list-style-type: none"> REGISTER_NODOCID - this will suppress the creation of the <code>DOCID</code> column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the <code>DOCID</code> column) REGISTER_BINARYXML - Register the schema for Binary XML REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables

226.6.7 REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

Note:

As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

Syntax

```
DBMS_XMLSCHEMA.REGISTERURI (
    schemaur1      IN  VARCHAR2,
    schemadocuri  IN  VARCHAR2,
```

```

local          IN BOOLEAN := TRUE,
gentypes      IN BOOLEAN := TRUE,
genbean       IN BOOLEAN := FALSE,
gentables     IN BOOLEAN := TRUE,
force         IN BOOLEAN := FALSE,
owner         IN VARCHAR2 := NULL,
options       IN PLS_INTEGER := 0);

```

Parameters

Table 226-13 REGISTERURI Procedure Parameters

Parameter	Description
schemaurl	Uniquely identifies the schema document. Can be used inside <code>schemaLocation</code> attribute of XML Schema import element.
schemadocuri	Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a <code>URIType</code> instance using the <code>urifactory</code> , and invokes the REGISTERSHEMA Procedures .
local	Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under <code>/sys/schemas/<username>/...</code> . If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> . The user needs write privileges on the directory to register a global schema.
gentypes	Determines whether the compiler generate object types. By default, TRUE.
genbean	Determines whether the compiler generate Java beans. By default, FALSE.
gentables	Determines whether the compiler generate default tables. TRUE by default.
force	TRUE: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
options	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a <code>BITOR</code> of the desired bits. Possible bits: <ul style="list-style-type: none"> REGISTER_NODOCID - this will suppress the creation of the <code>DOCID</code> column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the <code>DOCID</code> column)

DBMS_XMLSCHEMA_ANNOTATE

The `DBMS_XMLSCHEMA_ANNOTATE` package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

227.1 DBMS_XMLSCHEMA_ANNOTATE Overview

The `DBMS_XMLSCHEMA_ANNOTATE` package contains procedures to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

Schema annotations influence the way the XML data is stored. For example, the default table annotation assigns a user-provided name to an XML element instead of allowing the database to generate a system name. Consequently, query plans are more readable and it is easier to create constraints on that table.

227.2 DBMS_XMLSCHEMA_ANNOTATE Security Model

Owned by `XDB`, the `DBMS_XMLSCHEMA_ANNOTATE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

227.3 Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

This table lists and describes the `DBMS_XMLSCHEMA_ANNOTATE` package subprograms.

Table 227-1 DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
ADDXDBNAMESPACE Procedure	Adds the XDB namespace required for XDB annotation

Table 227-1 (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
DISABLEDEFAULTTABLECREATION Procedure	Prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element
DISABLEMAINTAINDOM Procedure	Sets the DOM fidelity attribute to <code>FALSE</code>
ENABLEDEFAULTTABLECREATION Procedure	Enables the creation of <code>ALL</code> top level tables by removing the empty default table name annotation
ENABLEMAINTAINDOM Procedure	Sets the DOM fidelity attribute to <code>TRUE</code>
GETSCHEMAANNOTATIONS Function	Creates a document containing the differences between the annotated XML schema and the original XML schema
GETSIDXDEFFROMVIEW Function	Takes a <code>XMLTABLE</code> view definition on a <code>xmltype</code> column or table and it returns a <code>CLOB</code> which can be used as parameter to create a structured <code>xmlindex</code> that backs up the <code>XMLTABLE</code> view as relational table
PRINTWARNINGS Procedure	Lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema
REMOVEANYSSTORAGE Procedure	Removes the setting of the SQL type from the <code>ANY</code> child of the complex type with the given name
REMOVEDEFAULTTABLE Procedure	Removes any default table attribute given for the element. After calling this procedure, the system generates table names
REMOVEMAINAINDOM Procedure	Removes all annotations used to maintain DOM from the given schema
REMOVEOUTOFFLINE Procedure	Removes any existing <code>SQLInline</code> attributes to prevent out-of-line storage
REMOVESQLCOLLTYPE Procedure	Removes a SQL collection type.
REMOVESQLNAME Procedure	Removes a <code>SQLNAME</code> from a global element
REMOVESQLTYPE Procedure	Removes a SQL type
REMOVESQLTYPE MAPPING Procedure	Removes the SQL type mapping for the given schema type.
REMOVETABLEPROPS Procedure	Removes the table storage properties from the <code>CREATE TABLE</code> statement
REMOVETIMESTAMPWITHTIMEZONE Procedure	Removes the setting of the <code>TimeStampWithTimeZone</code> datatype from all <code>dateTime</code> typed elements in the XML schema
SETANYSSTORAGE Procedure	Assigns a SQL datatype to the <code>ANY</code> child of the complex type with the given name
SETDEFAULTTABLE Procedure	Sets the name of the table for the specified global element
SETOUTOFFLINE Procedure	Sets the <code>SQLInline</code> attribute to <code>FALSE</code>
SETSCHEMAANNOTATIONS Procedure	Takes the annotated differences resulting from a call to <code>DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS</code> and patches them into the provided XML schema
SETSQLCOLLTYPE Procedure	Assigns a SQL type name for a collection
SETSQLNAME Procedure	Assigns a name to the SQL attribute that corresponds to an element defined in the XML schema
SETSQLTYPE Procedure	Assigns a SQL type to a global object

Table 227-1 (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
SETSQLYPEMAPPING Procedure	Defines a mapping of schema type and SQL type
SETTABLEPROPS Procedure	Specifies properties in the TABLE storage clause that is appended to the default CREATE TABLE statement
SETTIMESTAMPWITHTIMEZONE Procedure	Sets the TIMESTAMPWITHTIMEZONE datatype to all dateTime typed elements in the XML schema

227.3.1 ADDXDBNAMESPACE Procedure

This procedure adds the XDB namespace required for XDB annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ADDXDBNAMESPACE (
    xmlschema      IN OUT XMLTYPE);
```

Parameters

Table 227-2 ADDXDBNAMESPACE Procedure Parameters

Parameter	Description
xmlschema	Gets an XML Schema as XMLTYPE, performs the annotation and returns it

Usage Notes

This procedure is called implicitly by any other procedure that adds a schema annotation. Since there is no reason to add an XDB namespace without other annotations, this procedure is most likely called by other annotations procedures and not by the user directly.

227.3.2 DISABLEDEFAULTTABLECREATION Procedure

This procedure prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element. The first overload applies to a specified top-level element and the second applies to all top-level elements. The procedure always overwrites. This is equivalent to using the schema annotation `xdb:defaultTable=""` for the top-level element or elements.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
    xmlschema      IN OUT XMLType,
    globalElementName IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
    xmlschema      IN OUT XMLType);
```

Parameters

Table 227-3 DISABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema

Example

The purchaseOrder element will have an annotation similar to `xdb:defaultTable=""`.

```
DECLARE
    xml_schema    XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION(xml_schema,
                                                         'purchaseOrder');
    UPDATE annotation_tab SET out = xml_schema;
END;
/
```

227.3.3 DISABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to `FALSE`.

There are two overloads. The first sets DOM fidelity attribute to `FALSE` for all complex types, and the second sets it to `FALSE` for the named complex type. This is equivalent to adding `xdb:maintainDOM="false"` on all or specified complex types respectively.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
    xmlschema      IN OUT XMLType,
    overwrite      IN BOOLEAN default TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
    xmlschema      IN OUT XMLType,
    complexTypeName IN VARCHAR2,
    overwrite      IN BOOLEAN default TRUE);
```

Parameters

Table 227-4 DISABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code>

227.3.4 ENABLEDEFAULTTABLECREATION Procedure

This procedure enables the creation of ALL top level tables by removing the empty default table name annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
    xmlschema          IN OUT  XMLTYPE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
    xmlschema          IN OUT  XMLTYPE,
    globalelementName IN      VARCHAR2);;
```

Parameters

Table 227-5 ENABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
gloablElementName	Name of the global element in the schema

Usage Notes

This procedure does not affect elements that have a default table name.

227.3.5 ENABLEMAINTAINDOM Procedure

This overloaded procedure sets the DOM fidelity attribute to `TRUE`.

There are two overloads. The first sets DOM fidelity attribute to `TRUE` for all complex types, and the second sets it to `TRUE` for the named complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
    xmlschema          IN OUT XMLType,
    overwrite          IN BOOLEAN default TRUE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
    xmlschema          IN OUT XMLType,
    complexTypeName   IN VARCHAR2,
    overwrite          IN BOOLEAN default TRUE);;
```

Parameters

Table 227-6 ENABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type

Table 227-6 (Cont.) ENABLEMAINTAINDOM Procedure Parameters

Parameter	Description
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

227.3.6 GETSCHEMAANNOTATIONS Function

This function creates a document containing the differences between the annotated XML schema and the original XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS (
    xmlschema IN xmlType)
RETURN XMLType;
```

Parameters

Table 227-7 GETSCHEMAANNOTATIONS Function Parameters

Parameter	Description
xmlschema	The original XML schema

Return Values

This function returns the document `annotations.xml` as an XMLType.

Usage Notes

This function saves all annotations in one document, named `annotations`, and returns it. With this document, you can apply all annotations to a non-annotated schema, using `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`.

`DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

See Also:

[SETSCHEMAANNOTATIONS Procedure](#)

Example

For an example of `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`, see the example in [SETSCHEMAANNOTATIONS Procedure](#).

227.3.7 GETSIDXDEFFROMVIEW Function

This function takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSIDXDEFFROMVIEW (
    viewName    IN xmlType)
    RETURN CLOB;
```

Parameters

Table 227-8 GETSIDXDEFFROMVIEW Function Parameters

Parameter	Description
viewName	The original XML schema

Return Values

This function returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

227.3.8 PRINTWARNINGS Procedure

This procedure lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.PRINTWARNINGS (
    value      IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 227-9 PRINTWARNINGS Procedure Parameters

Parameter	Description
val	For the NO MATCHING ELEMENTS FOUND error message to be raised val must be set to TRUE. In cases in which user wishes to suppress this warning, set to FALSE.

Usage Notes

If an annotation maps to more than one node in the XML schema, this raise the error ANNOTATION MAPS TO MULTIPLE ELEMENTS. In this case no annotation is performed, and the user must correct the parameters to the procedure call to refer to a unique node in the XML schema.

227.3.9 REMOVEANYSTORAGE Procedure

This procedure removes the setting of the SQL type from the ANY child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEANYSTORAGE (
    xmlschema          IN OUT XMLType,
    complexTypeName IN VARCHAR2);
```

Parameters

Table 227-10 REMOVEANYSTORAGE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated.
complexTypeName	The name of the complex type.

Usage Notes

This procedure reverses the [SETANYSTORAGE Procedure](#).

227.3.10 REMOVEDEFAULTTABLE Procedure

This procedure removes any default table attribute given for the element.

After calling this procedure, the system generates table names. This procedure always overwrites.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE (
    xmlschema          IN OUT XMLTYPE,
    globalElementName IN VARCHAR2);
```

Parameters

Table 227-11 REMOVEDEFAULTTABLE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema

Example

Annotations can be verified anytime using "select out from annotation_tab".

```
--The purchaseOrder element will have no annotation for defaultTable.
DECLARE
    xml_schema XMLTYPE;
```

```

BEGIN
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE(xml_schema,
                                             'purchaseOrder');
  UPDATE annotation_tab SET out = xml_schema;
END;
/

```

227.3.11 REMOVEMAINTAINDOM Procedure

This procedure removes all annotations used to maintain DOM from the given schema.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEMAINTAINDOM (
  xmlschema      IN OUT XMLType);

```

Parameters

Table 227-12 REMOVEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated

227.3.12 REMOVEOUTOFLINE Procedure

This procedure removes any existing `SQLInline` attributes to prevent out-of-line storage.

There are three overloads.

Syntax

Removes the `SQLInline` attribute for the named element.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
  xmlschema      IN OUT XMLType,
  elementName    IN      VARCHAR2,
  elementType    IN      VARCHAR2,
  overwrite      IN      BOOLEAN default TRUE);

```

Removes the `SQLInline` attribute for the object specified by its global object and local element names.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
  xmlschema      IN OUT XMLType,
  globalObject    IN      VARCHAR2,
  globalObjectName IN     VARCHAR2,
  localElementName IN     VARCHAR2);

```

Removes the `SQLInline` attribute for the referenced global element.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
  xmlschema      IN OUT XMLType,
  reference      IN      VARCHAR2);

```

Parameters

Table 227-13 REMOVEOUTOFFLINE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
elementType	The element type
globalObject	The global object (global complex type or global element)
globalObjectName	The name of the global object
localElementName	The name of a local element that descends from the global element
reference	A reference to a global element
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

Usage Notes

This procedure reverses [SETOUTOFFLINE Procedure](#).

227.3.13 REMOVESQLCOLLTYPE Procedure

This procedure removes a SQL collection type.

The first overload removes the SQL collection type corresponding to the named element and the second overload removes the type from the XML element inside the complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
    xmlschema IN OUT XMLType,
    elementName IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
    xmlschema IN OUT XMLType,
    globalObject IN VARCHAR2,
    globalName IN VARCHAR2,
    localElementName IN VARCHAR2);
```

Parameters

Table 227-14 REMOVESQLCOLLTYPE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
globalObject	The global object (global complex type or global element)
globalName	The name of the global object

Table 227-14 (Cont.) REMOVESQLCOLLTYPE Procedure Parameters

Parameter	Description
localElementName	The name of a local element that descends from the global element

Usage Notes

This procedure reverses the [SETSQLCOLLTYPE Procedure](#).

227.3.14 REMOVESQLNAME Procedure

This procedure removes a `SQLNAME` from a global element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLNAME (
    xmlschema          IN OUT XMLType,
    globalObject       IN      VARCHAR2,
    globalObjectName   IN      VARCHAR2,
    localObject        IN      VARCHAR2,
    localObjectName    IN      VARCHAR2,
    sqlName            IN      VARCHAR2,
    overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters**Table 227-15 REMOVESQLNAME Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlName	Name of the SQL attribute that corresponds to the element defined in the XML schema
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```
DECLARE
    xml_schema XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                        'element', 'purchaseOrder',
                                        'element', 'shipTo',
                                        'SHIPTO_SQLNAME');
```

```

UPDATE annotation_tab SET out = xml_schema;
END;
/

```

227.3.15 REMOVESQLTYPE Procedure

This procedure removes a SQL type.

The first overload removes a SQL type from a global element and the second overload removes the type from a global element inside the complex type.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
  xmlschema in out XMLType,
  globalElementName IN VARCHAR2);

```

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
  xmlschema          IN OUT XMLType,
  globalObject       IN VARCHAR2,
  globalObjectName   IN VARCHAR2,
  localObject        IN VARCHAR2,
  localObjectName    IN VARCHAR2);

```

Parameters

Table 227-16 REMOVESQLTYPE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated.
globalObject	Global object (global complex type or global element)
globalElementName	Name of the global element.
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object

Usage Notes

This procedure reverses the [SETSQLTYPE Procedure](#).

227.3.16 REMOVESQLTYPEEMAPPING Procedure

This procedure removes the SQL type mapping for the given schema type.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPEEMAPPING (
  xmlschema          IN OUT XMLType,
  schemaTypeName     IN VARCHAR2);

```

Parameters

Table 227-17 REMOVESQLTYPE MAPPING Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Name of the schema type

Usage Notes

This procedure reverses the [SETSQLTYPE MAPPING Procedure](#).

227.3.17 REMOVETABLEPROPS Procedure

This procedure removes the table storage properties from the `CREATE TABLE` statement.

This procedure is overloaded. Each overload has different parameter requirements as indicated.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
  xmlschema          IN OUT XMLTYPE,
  globalElementName IN     VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
  xmlschema          IN OUT XMLTYPE,
  globalObject       IN     VARCHAR2,
  globalObjectName   IN     VARCHAR2,
  localElementName   IN     VARCHAR2);
```

Parameters

Table 227-18 REMOVETABLEPROPS Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localElementName	Name of a local element that descends from the global element

Usage Notes

This procedure reverses the [SETTABLEPROPS Procedure](#).

227.3.18 REMOVETIMESTAMPWITHTIMEZONE Procedure

This procedure removes the setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
    xmlschema          IN OUT  XMLTYPE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
    xmlschema          IN OUT  XMLTYPE,
    schemaTypeName     IN      VARCHAR2);
```

Parameters

Table 227-19 REMOVETIMESTAMPWITHTIMEZONE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	XML schema to be annotated
<code>schemaTypeName</code>	Name of the schema type

Usage Notes

This procedure reverses the [SETTIMESTAMPWITHTIMEZONE Procedure](#).

227.3.19 SETANYSTORAGE Procedure

This procedure assigns a SQL datatype to the `ANY` child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETANYSTORAGE (
    xmlschema          IN OUT  XMLType,
    complexTypeName   IN      VARCHAR2,
    sqlTypeName        IN      VARCHAR2,
    overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 227-20 SETANYSTORAGE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	XML schema to be annotated
<code>complexTypeName</code>	Name of the complex type
<code>sqlTypeName</code>	Name of the SQL type
<code>overwrite</code>	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

Example

The `xsd:any child of complex type Items` is assigned an annotation similar to `xdb:SQLType="VARCHAR"`.

```
DECLARE xml_schema XMLTYPE; BEGIN SELECT out INTO xml_schema FROM
annotation_tab; DBMS_XMLSCHEMA_ANNOTATE.setAnyStorage
(xml_schema,
'Items', 'VARCHAR'); UPDATE annotation_tab
SET out = xml_schema; END;
/
```

227.3.20 SETDEFAULTTABLE Procedure

This procedure sets the name of the table for the specified global element. This is equivalent to using the schema annotation `xdb:defaultTable="<default_table_name>"` for the top-level element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETDEFAULTTABLE (
xmlschema          IN OUT XMLTYPE,
globalElementName IN      VARCHAR2,
tableName          IN      VARCHAR2,
overwrite          IN      BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 227-21 SETDEFAULTTABLE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	XML schema to be annotated
<code>globalElementName</code>	Name of the global element in the schema
<code>tableName</code>	Name being assigned to the table
<code>overwrite</code>	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

227.3.21 SETOUTOFFLINE Procedure

This procedure sets the `SQLInline` attribute to `FALSE`, that is, it sets `xdb:SQLInLine=FALSE`.

This forces XDB to store the corresponding elements in the XML document out-of-line as rows in a separate `XMLType` table. XDB stores references to each row of the `XMLType` table in a link table that is maintained by the main table

This procedure can improve performance in some situations if the out-of-line table acts as the driver for the query. Storing elements in an out-of-line table also reduces the numbers of columns in the base table, thus avoiding '4096 column limit' errors during XML schema registration, when some elements have complex types with many elements.

Also See:

Oracle XML DB Developer's Guide

There are three overloads.

Syntax

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (
  xmlschema          IN OUT XMLType,
  elementName        IN      VARCHAR2,
  elementType        IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the element specified by its local and global name.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (
  xmlschema          IN OUT XMLType,
  globalObject       IN      VARCHAR2,
  globalObjectName   IN      VARCHAR2,
  localElementName   IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE` to force out-of-line storage and sets the default table name for all references to a particular global element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (
  xmlschema          IN OUT XMLType,
  reference          IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 227-22 SETOUTOFFLINE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	The XML schema to be annotated.
<code>elementName</code>	The element name
<code>elementType</code>	The element type
<code>defaultTableName</code>	The name of the default table.
<code>globalObject</code>	The global object (global complex type or global element)
<code>globalObjectName</code>	The name of the global object
<code>localElementName</code>	The name of a local element that descends from the global element.
<code>reference</code>	A reference to a global element

Table 227-22 (Cont.) SETOUTOFLINE Procedure Parameters

Parameter	Description
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Usage Notes

After XML schema registration and before loading XML instance data, use `DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES()` to make these references scope to the out-of-line table only. This ensures better query performance later on.

Example

The following example illustrates the third overloaded method. The element comment will have an annotation similar to `xdb:defaultTable="CMMNT_DEFAULT_TABLE"`

```
DECLARE
    xml_schema xmltype;
BEGIN
    SELECT OUT INTO xml_schema FROM annotation_tab;

    DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (xml_schema,
                                          'ipo:comment',
                                          'CMMNT_DEFAULT_TABLE');

    UPDATE annotation_tab SET OUT = xml_schema;
END;
/
```

227.3.22 SETSCHEMAANNOTATIONS Procedure

This procedure takes the annotated differences resulting from a call to `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` and patches them into the provided XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS (
    xmlschema      IN OUT xmlType,
    annotations    IN VARCHAR2);
```

Parameters

Table 227-23 SETSCHEMAANNOTATIONS Procedure Parameters

Parameter	Description
xmlschema	An XML schema to be patched.
annotations	The differences document produced by calling <code>DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS</code> on the original XML schema and an annotated XML schema.

Usage Notes

DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

See Also:

[GETSCHEMAANNOTATIONS Function](#)

Example

The following example illustrates DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS shown here and [GETSCHEMAANNOTATIONS Function](#).

```

-- test getannotations and apply them
declare
  xml_schema xmltype;
  xml_schema2 xmltype;
  annotations xmltype;
begin
  select out into xml_schema from annotation_tab;

  -- get the annotations from the schema
  annotations := DBMS_XMLSCHEMA_ANNOTATE.getSchemaAnnotations (xml_schema);

  -- apply the annotations to the schema
  select inp into xml_schema2 from annotation_tab;

  DBMS_XMLSCHEMA_ANNOTATE.setSchemaAnnotations(xml_schema2, annotations);

  update annotation_tab t set t.out = xml_schema2;
end;
/

```

227.3.23 SETSQLCOLLTYPE Procedure

This procedure assigns a SQL type name for a collection. A collection is a global or local element with `maxOccurs>1`.

Using this procedure, XDB creates SQLTypes with the user-defined names provided.

There are two overloads. The first sets the name of the SQL collection type corresponding to an XML element and the second to an XML element inside the specified complex type.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
  xmlschema          IN OUT  XMLTYPE,
  elementName       IN      VARCHAR2,
  sqlCollType       IN      VARCHAR2,
  overwrite         IN      BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
  xmlschema          IN OUT XMLType,
  globalObject       IN  VARCHAR2,

```

```

globalObjectName IN VARCHAR2,
localElementName IN VARCHAR2,
sqlCollType     IN VARCHAR2,
overwrite       IN BOOLEAN default TRUE );

```

Parameters

Table 227-24 SETSQLCOLLTYPE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
sqlCollType	The SQL collection type
globalObject	The global object (global complex type or global element)
globalObjectName	The name of the global object
localElementName	The name of a local element that descends from the global element
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The `item` element will have an annotation similar to `xdb:SQLCollType="ITEM_SQL_COL_TYPE"`.

```

declare
  xml_schema xmltype;
begin
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.setSQLCollType (xml_schema,
                                          'item',
                                          'ITEM_SQL_COL_TYPE',TRUE);
  UPDATE annotation_tab SET out = xml_schema;
end;

```

227.3.24 SETSQLNAME Procedure

This procedure assigns a name to the SQL attribute that corresponds to an element defined in the XML schema.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (
  xmlschema          IN OUT XMLType,
  globalObject       IN      VARCHAR2,
  globalObjectName   IN      VARCHAR2,
  localObject        IN      VARCHAR2,
  localObjectName    IN      VARCHAR2,
  sqlName            IN      VARCHAR2,
  overwrite          IN      BOOLEAN DEFAULT TRUE);

```

Parameters

Table 227-25 SETSQLNAME Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlName	Name of the SQL attribute that corresponds to the element defined in the XML schema
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```

DECLARE
    xml_schema    XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                        'element', 'purchaseOrder',
                                        'element', 'shipTo',
                                        'SHIPTO_SQLNAME');
    UPDATE annotation_tab SET out = xml_schema;
END;
/

```

227.3.25 SETSQLTYPE Procedure

This procedure assigns a SQL type to a global object.

There are two overloads. The first overload assigns a SQL Type to a global object, such as a global element or global complex type and the second to a local object.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
    xmlschema          IN OUT  XMLTYPE,
    globalElementName IN     VARCHAR2,
    sqlType            IN     VARCHAR2,
    overwrite          IN     BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
    xmlschema          IN OUT  XMLTYPE,
    globalObject       IN     VARCHAR2,
    globalObjectName   IN     VARCHAR2,
    localObject        IN     VARCHAR2,
    localObjectName    IN     VARCHAR2,

```

```

sqlType          IN      VARCHAR2,
overwrite        IN      BOOLEAN DEFAULT TRUE);

```

Parameters

Table 227-26 SETSQLTYPE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
globalElementName	Name of the global element
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlType	SQL type assigned to the named global element
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The `purchaseOrder` element will have an annotation similar to `xdb:SQLType="PO_SQLTYPE"` and the `shipTo` element has one similar to `xdb:SQLType="VARCHAR"`.

```

DECLARE
    xml_schema xmltype;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
                                        'purchaseOrder',
                                        'PO_SQLTYPE');

    UPDATE annotation_tab SET out = xml_schema;
END;
/

DECLARE xml_schema xmltype;BEGIN SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.setSQLType
(xml_schema,
'element','purchaseOrder',
'element','shipTo',
'VARCHAR'); UPDATE
annotation_tab SET out = xml_schema;END;
/

```

227.3.26 SETSQLTYPE MAPPING Procedure

This procedure defines a mapping of schema type and SQL type.

If you use this procedure, you do not need to call the `SETSQLTYPE` procedure on all instances of the schema type; instead the procedure traverses the schema and assigns the SQL type automatically.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE MAPPING (
    xmlschema          IN OUT  XMLType,

```

```

schemaTypeName    IN      VARCHAR2,
sqlTypeName       IN      VARCHAR2,
overwrite         IN      BOOLEAN DEFAULT TRUE);

```

Parameters

Table 227-27 SETSQLTYPE_MAPPING Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Schema type
sqlTypeName	Name of the SQL type
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

Example

The attribute `orderDate` will have an annotation similar to `xdb:SQLType="DATE"`.

```

declare  xml_schema xmltype;beginSELECT out INTO xml_schema FROM
annotation_tab;DBMS_XMLSCHEMA_ANNOTATE.setSQLTypeMapping
(xml_schema,
'date',
                                'DATE');UPDATE annotation_tab
SET out = xml_schema;end;
/

```

227.3.27 SETTABLEPROPS Procedure

This procedure specifies properties in the `TABLE` storage clause that is appended to the default `CREATE TABLE` statement.

There are two overloads with different parameter requirements, as indicated:

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
  xmlschema        IN OUT XMLType,
  globalelementName  IN   VARCHAR2,
  tableProps       IN   VARCHAR2,
  overwrite        IN   BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
  xmlschema        IN OUT XMLTYPE,
  globalObject     IN   VARCHAR2,
  globalObjectName IN   VARCHAR2,
  localelementName IN   VARCHAR2,
  tableProps       IN   VARCHAR2,
  overwrite        IN   BOOLEAN DEFAULT TRUE);

```

Parameters

Table 227-28 SETTABLEPROPS Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema
tableProps	Table properties
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localElementName	Name of a local element that descends from the global element
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The `purchaseOrder` element will have an annotation similar to `xdb:tableProps="CACHE"`.

```
DECLARE xml_schema XMLTYPE; BEGIN SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS(xml_schema,
'purchaseOrder' , 'CACHE'); UPDATE annotation_tab SET out = xml_schema; END;
/
```

227.3.28 SETTIMESTAMPWITHTIMEZONE Procedure

This procedure sets the `TIMESTAMPWITHTIMEZONE` datatype to all `dateTime` typed elements in the XML schema.

This is equivalent to adding `xdb:SQLType="TIMESTAMP WITH TIME ZONE"` to all `dateTime` objects.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTIMESTAMPWITHTIMEZONE (
xmlschema IN OUT XMLTYPE,
overwrite IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 227-29 SETTIMESTAMPWITHTIMEZONE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

DBMS_XMLSCHEMA_UTIL

The `DBMS_XMLSCHEMA_UTIL` package provides an interface for XML schema validation.

This chapter contains the following topics:

- [DBMS_XMLSCHEMA_UTIL Security Model](#)
- [Summary of DBMS_XMLSCHEMA_UTIL Subprograms](#)

See Also:

- *Oracle XML DB Developer's Guide*

228.1 DBMS_XMLSCHEMA_UTIL Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_XMLSCHEMA_UTIL` package

228.2 Summary of DBMS_XMLSCHEMA_UTIL Subprograms

This topic lists the `DBMS_XMLSCHEMA_UTIL` subprograms in alphabetical order and briefly describes them.

Table 228-1 *DBMS_XMLSCHEMA_UTIL Package Subprograms*

Subprogram	Description
CONFORMING Function	Validates an XML document against a schema
VALIDATE Procedure	Validates an XML document against a schema

228.2.1 CONFORMING Function

This function is used to validate an XML document against a schema.

Syntax

```
DBMS_XMLSCHEMA_UTIL.CONFORMING (
  doc          IN NUMBER,
  sch          IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 228-2 CONFORMING Function Parameters

Parameter	Description
doc	The XML instance
sch	The XML schema

Function Exceptions

The exceptions of DBMS_XMLSCHEMA_UTIL.CONFORMING function are as follows:

- The function returns zero if the schema is legal and the document conforms to the schema; otherwise it returns an LSX error code from the schema validation.

Note:

The function takes an xml data instance and xml schema instance. The user does not have to register the schema.

Example: The document conforms to the schema

```
SELECT DBMS_XMLSCHEMA_UTIL.CONFORMING(
    XMLType('<A/>'),
    XMLType(
        '<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
          <xs:element name="A" type="xs:string"/>
        </xs:schema>')) "LSX CODE"
FROM DUAL;
```

228.2.2 VALIDATE Procedure

This procedure is used to validate an XML document against a schema.

Syntax

```
DBMS_XMLSCHEMA_UTIL.VALIDATE (
    doc          IN XMLTYPE,
    sch          IN XMLTYPE);
```

Parameters

Table 228-3 VALIDATE Procedure Parameters

Parameter	Description
doc	The XML instance
sch	The XML schema

Procedure Exceptions

The exceptions of `DBMS_XMLSCHEMA_UTIL.VALIDATE` procedure are as follows:

- The procedure raises `ORA-31154` if either the schema is not legal, or the document does not conform to the schema.

 **Note:**

The procedure takes an xml data instance and xml schema instance. The user does not have to register the schema.

Example: The document conforms to the schema

```
BEGIN
  DBMS_XMLSCHEMA_UTIL.VALIDATE (
    XMLType ('<A/>'),
    XMLType (
      '<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
        <xs:element name="A" type="xs:string"/>
      </xs:schema>');
END;
/
```

DBMS_XMLSTORAGE_MANAGE

The `DBMS_XMLSTORAGE_MANAGE` package provides an interface to manage and modify XML storage after schema registration has been completed.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_XMLSTORAGE_MANAGE Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

229.1 DBMS_XMLSTORAGE_MANAGE Overview

`DBMS_XMLSTORAGE_MANAGE` contains procedures to manage and modify XML storage after schema registration has been completed.

Use subprograms from this package to improve the performance of bulk load operations. You can disable indexes and constraints before doing a bulk load process and to enable them afterwards.

229.2 DBMS_XMLSTORAGE_MANAGE Security Model

Owned by XDB, the `DBMS_XMLSTORAGE_MANAGE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

229.3 Summary of DBMS_XMLSTORAGE_MANAGE Subprograms

This table lists and describes the `DBMS_XML_STORAGE` package subprograms.

Table 229-1 DBMS_XMLSTORAGE_MANAGE Package Subprograms

Subprogram	Description
DISABLEINDEXESANDCONSTRAINTS Procedure	Disables the indexes and constraints for <code>XMLType</code> tables and <code>XMLType</code> columns

Table 229-1 (Cont.) DBMS_XMLSTORAGE_MANAGE Package Subprograms

Subprogram	Description
ENABLEINDEXESANDCONSTRAINTS Procedure	Rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables
EXCHANGEPOSTPROC Procedure	Enable constraints after exchange partition
EXCHANGEPREPROC Procedure	Disable constraints before exchange partition
INDEXXMLREFERENCES Procedure	Creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table
REFPARTITIONEXCHANGEIN Procedure	This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided the child table has an xmltype column with a local xmlindex.
REFPARTITIONEXCHANGEOUT Procedure	Auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.
RENAMECOLLECTIONTABLE Procedure	Renames a collection table to the given table name
SCOPEXMLREFERENCES Procedure	Scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types
XPATHT2TABCOLMAPPING Function	Maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name

229.3.1 DISABLEINDEXESANDCONSTRAINTS Procedure

This procedure disables the indexes and constraints for XMLType tables and XMLType columns.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS (
    owner_name    IN  VARCHAR2 DEFAULT USER,
    table_name    IN  VARCHAR2,
    column_name   IN  VARCHAR2 DEFAULT NULL,
    clear         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 229-2 DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
owner_name	Owner's name
table_name	Name of the XMLType table that the procedure is being performed on
column_name	XMLType column name

Table 229-2 (Cont.) DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
clear	Boolean that when set to TRUE clears all stored index and constraint data for the table before the procedure executes. The default is FALSE, which does not clear them.

Usage Notes

Passing XMLTYPE tables

For XMLType tables, you must pass the XMLType table name on which the bulk load operation is to be performed. For XMLType columns, you must pass the relational table name and the corresponding XMLType column name.

Using clear to Enable and Disable Indexes and Constraints

**Note:**

If the `DISABLEINDEXESANDCONSTRAINTS` procedure is called with `clear` set to `TRUE`, it removes any index or constraint information about the XMLTYPE table or column memorized during earlier executions of the procedure.

Therefore, you must ensure that all disabled indexes and constraints are re-enabled on the table or column before you call the `DISABLEINDEXESANDCONSTRAINTS` procedure with `clear` set to `TRUE`.

Ideally, it is recommended that you set `clear` set to `TRUE` for the first execution. For any subsequent executions (due to errors while disabling or enabling indexes) `clear` should be set to `FALSE`, the default value. Once you have successfully re-enabled all the indexes and constraints following the bulk load operation, you can call this procedure again with `clear` set to `TRUE` for the next bulk load operation.

Example

The following example illustrates the use of `clear` in the `DISABLEINDEXESANDCONSTRAINTS` procedure and the [ENABLEINDEXESANDCONSTRAINTS Procedure](#).

First, add a not-NULL constraint on `comment` element of the `PURCHASEORDER_TAB` table:

```
ALTER TABLE PURCHASEORDER_TAB ADD CONSTRAINT c1 check          ("XMLDATA"."comment"
IS NOT NULL);
```

Then, disable all the indexes and constraints by passing the `clear` as `TRUE`, by calling the `DISABLEINDEXESANDCONSTRAINTS` procedure:

```
BEGIN
  XDB.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB', NULL, TRUE );
END;
/
```

Next, perform a bulk load operation (such as datapump import) which violates constraint `c1` in the `ALTER` table statement. This does not raise an error because the constraint is disabled:

```
host impdp orexample/orexample directory=dir dumpfile=dmp.txt
  tables=OREXAMPLE.PURCHASEORDER_TAB content = DATA_ONLY;
```

NOTE: To view the disabled constraints and indexes use:

```
SELECT constraint_name,table_name,status FROM all_constraints
  WHERE owner = user;
```

Finally, try to enable the constraint using the `ENABLEINDEXESANDCONSTRAINTS` procedure. It raises an error because `c1`, the not null constraint, is violated by the bulk load operation:

```
BEGIN
  XDB.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB' );
END;
/
```

To disable all the indexes and constraints, again use `DISABLEINDEXESANDCONSTRAINTS`, but set `clear= FALSE` (because the `ENABLEINDEXESANDCONSTRAINTS` failed to complete successfully). Note: `clear = FALSE` by default, so we do not need to pass it explicitly in the next call.

```
BEGIN
  xdb.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB' );
END;
/
```

Then, delete the incorrect rows entered into the table

```
DELETE FROM purchaseorder_tab p
  WHERE p.xmldata."comment" IS NULL;
```

Re-enable the indexes and constraints using `ENABLEINDEXESANDCONSTRAINTS`, which completes successfully.

```
BEGIN
  xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB' );
END;
/
```

229.3.2 ENABLEINDEXESANDCONSTRAINTS Procedure

This procedure rebuilds all indexes and enables the constraints on an `XMLType` table including its child tables and out-of-line tables.

When `column_name` is passed, it does the same for this `XMLType` column.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS (
    owner_name    IN VARCHAR2 DEFAULT USER,
    table_name    IN VARCHAR2,
    column_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters**Table 229-3** ENABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from
column_name	Column name

Usage Notes

This procedure reverses [DISABLEINDEXESANDCONSTRAINTS Procedure](#).

Example

See [DISABLEINDEXESANDCONSTRAINTS Procedure](#)

229.3.3 EXCHANGEPOSTPROC Procedure

This procedure enable constraints after exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPOSTPROC (
    owner_name    IN VARCHAR2 DEFAULT USER,
    table_name    IN VARCHAR2);
```

Parameters**Table 229-4** EXCHANGEPOSTPROC Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

229.3.4 EXCHANGEPROC Procedure

This procedure disable constraints before exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPROC (
    owner_name IN VARCHAR2 DEFAULT USER,
    table_name IN VARCHAR2);
```

Parameters

Table 229-5 EXCHANGEPROC Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

229.3.5 INDEXXMLREFERENCES Procedure

This procedure creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table.

If the procedure creates multiple REF columns, it appends `_1`, `_2`, and so on to their names.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.INDEXXMLREFERENCES (
    owner_name IN VARCHAR2 DEFAULT USER,
    table_name IN VARCHAR2,
    column_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 229-6 INDEXXMLREFERENCES Procedure Parameters

Parameter	Description
owner_name	The owner's name
table_name	The table being indexed
column_name	A column name. Not needed for XML type tables.
index_name	The name of the newly created index

Usage Notes

This procedure is only used if the REFS are scoped. See [SCOPEXMLREFERENCES Procedure](#).

Indexed REFS lead to better performance when joins between the base table and a child table occur in the query plan.

- If the base table has a higher selectivity than the child table, there is no need to index the REFS.
- If the selectivity of the child table is higher than that of the base table and if no indexes are present, then the join of one row in the child table with the base table leads to a full table scan of the base table.

INDEXXMLREFERENCES does not index REFS recursively in child tables of a table it is called on. To do this, Oracle recommends calling the procedure from within a loop over the XML_OUT_OF_LINE_TABLES or XML_NESTED_TABLES view. This creates the index names from the current value of a column in the view.

 **Note:**

This procedure is limited to the structured storage model.

229.3.6 REFPARTITIONEXCHANGEIN Procedure

This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEIN (
  owner_name           IN VARCHAR2,
  parent_table_name    IN VARCHAR2,
  child_table_name     IN VARCHAR2,
  parent_exchange_table_name IN VARCHAR2,
  child_exchange_table_name IN VARCHAR2,
  parent_exchange_stmt IN CLOB,
  child_exchange_stmt  IN CLOB);
```

Parameters

Table 229-7 REFPARTITIONEXCHANGEIN Parameters

Parameter	Description
owner_name	owner's name
parent_table_name	the partitioned base table
child_table_name	a partitioned table with reference partitioning based on the table named parent_table_name
parent_exchange_table_name	an exchange table for the partitioned base table
child_exchange_table_name	an exchange table for the table named child_table_name
parent_exchange_stmt	SQL statement to execute exchange partition operation between the table named parent_table_name and the table named parent_exchange_table_name

Table 229-7 (Cont.) REFPARTITIONEXCHANGEIN Parameters

Parameter	Description
child_exchange_stmt	SQL statement to execute exchange partition operation between the table named child_table_name and the table named child_exchange_table_name

229.3.7 REFPARTITIONEXCHANGEOUT Procedure

This is an auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEOUT (
    owner_name           IN VARCHAR2,
    parent_table_name    IN VARCHAR2,
    child_table_name     IN VARCHAR2,
    parent_exchange_table_name IN VARCHAR2,
    child_exchange_table_name IN VARCHAR2,
    parent_exchange_stmt IN CLOB,
    child_exchange_stmt  IN CLOB);
```

Parameters

Table 229-8 REFPARTITIONEXCHANGEOUT Parameters

Parameter	Description
owner_name	owner's name
parent_table_name	the partitioned base table
child_table_name	a partitioned table with reference partitioning based on the table named parent_table_name
parent_exchange_table_name	an exchange table for the partitioned base table
child_exchange_table_name	an exchange table for the table named child_table_name
parent_exchange_stmt	SQL statement to execute exchange partition operation between the table named parent_table_name and the table named parent_exchange_table_name
child_exchange_stmt	SQL statement to execute exchange partition operation between the table named child_table_name and the table named child_exchange_table_name

229.3.8 RENAMECOLLECTIONTABLE Procedure

This procedure renames a collection table to the given table name.

An XPath expression specifies the collection table, starting from the `XMLType` base table or an `XMLType` column of the base table.

This procedure provides the only way to derive a collection table name from the corresponding collection type name because there is no direct schema annotation for the purpose.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
  owner_name          IN VARCHAR2 DEFAULT USER,
  table_name          IN VARCHAR2,
  column_name         IN VARCHAR2 DEFAULT NULL,
  xpath               IN VARCHAR2,
  collection_table_name IN VARCHAR2
  namespaces          IN VARCHAR2 default NULL); // For release 11.2 only
```

Parameters

Table 229-9 RENAMECOLLECTIONTABLE Procedure Parameters

Parameter	Description
<code>owner_name</code>	The name of the owner
<code>table_name</code>	The name of a base table that can be used as the starting point for specifying the collection table
<code>column_name</code>	An <code>XMLType</code> column that can be the starting point for specifying the collection table
<code>xpath</code>	The XPath expression that specifies the collection table
<code>collection_table_name</code>	The name of the collection table
<code>namespaces</code>	For Oracle Database 11g Release 2 (11.2) and higher. The namespaces used in XPath.

Usage Notes

Call this procedure after registering the XML schema.

The table name serves as a prefix to the index names.

Oracle recommends using this function because it makes query execution plans more readable.

Report errors that occur while this procedure runs to the user that called the procedure.

Note:

This procedure is limited to the structured storage model.

For Oracle Database 11g Release 2 (11.2) and higher, only, this function accepts XPath notation as well as DOT notation. If XPath notation is used, a `namespaces` parameter may also be required.

Example

The collection table name will be `EMP_TAB_NAMELIST`. You can verify this using `SELECT * FROM user_nested_tables`.

Using DOT Notation:

```
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
    USER,
    'EMP_TAB',
    NULL,
    '"XMLDATA"."EMPLOYEE"."NAME"',
    'EMP_TAB_NAMELIST);
```

Using XPath Notation:

XPath notation is available with Oracle Database 11g Release 2 (11.2) and higher.

```
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
    USER,
    'EMP_TAB',
    NULL,
    '/e:Employee/Name',
    'EMP_TAB_NAMELIST',
    '''http://www.oracle.com/emp.xsd'' as "e"');
```

229.3.9 SCOPEXMLREFERENCES Procedure

This procedure scopes all XML references. Scoped `REF` types require less storage space and allow more efficient access than unscoped `REF` types.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES;
```

Usage Notes

- If you have used [SETOUTOFFLINE Procedure](#) in the `DBMS_XMLSTORAGE_MANAGE` package to avoid raising '4096 column limit' errors during XML schema registration, you should also use [SCOPEXMLREFERENCES Procedure](#).
- Using `SCOPEXMLREFERENCES` after XML schema registration and before loading XML instance data, makes these reference scoped to the out-of-line table only.

Note:

This procedure is limited to the structured storage model.

229.3.10 XPATH2TABCOLMAPPING Function

This function maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name. This is necessary in cases in which the user wants to create an index on this table, or to add a constraint, or to rename a table to make query execution plans more readable.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
  owner_name  IN  VARCHAR2 DEFAULT USER,
  table_name  IN  VARCHAR2,
  column_name IN  VARCHAR2 DEFAULT NULL,
  xpath       IN  VARCHAR2,
  namespaces  IN  VARCHAR2 DEFAULT NULL)
RETURN XMLTYPE;
```

Parameters

Table 229-10 XPATH2TABCOLMAPPING Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the base table
column_name	Optional name of the XML type column if table_name is not an XMLtype table. If table_name refers to XMLtype table then column_name should be NULL.
xpath	Path expression in DOT notation or XPath notation (see examples below)
namespaces	Optional namespace definitions for path expression

Examples

XPath2TabColMapping evaluated on XMLType table with XPath Notation, namespaces provided

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
  USER, 'XML_TAB', '', '//n1:item/n1:location','xdbXmark' as "n1")
FROM DUAL;
```

This produces a result, for example:

```
<Result>
<Mapping TableName="SYS_NT12345" ColumnName="location"/>
</Result>
```

This allows us to define an index or constraint on table SYS_NT12345 and column location.

XPath2TabColMapping evaluated on table not of XMLType but with XMLType column by means of DOT notation

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
  USER, 'PurchaseOrderTab', 'XMLCOL', 'xmldata.LineItems.LineItem', '')
FROM DUAL;
```

DBMS_XMLSTORE

DBMS_XMLSTORE provides the ability to store XML data in relational tables.

Note:

The PL/SQL package DBMS_XMLSTORE is deprecated in Oracle Database 23ai.

DBMS_XMLSTORE is a non-standard Oracle-proprietary package that enables you to store and manipulate XML data in Oracle Database. This package is deprecated, and can be desupported in a future release. Oracle recommends that you use regular SQL DML and with standard XQuery and SQL/XML to store and manage XML data. Using standard functionality provides future-proof way to store and manipulate XML data.

This chapter contains the following sections:

- [Security Model](#)
- [Types](#)
- [Summary of DBMS_XMLSTORE Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

230.1 DBMS_XMLSTORE Security Model

Owned by XDB, the DBMS_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

230.2 Types

The DBMS_XMLSTORE subprograms use the ctxType Type.

Table 230-1 *Types of DBMS_XMLSTORE*

Type	Description
ctxType	The type of the query context handle. This is the return type of NEWCONTEXT .

230.3 Summary of DBMS_XMLSTORE Subprograms

This table lists the DBMS_XMLSTORE subprograms and briefly describes them.

Table 230-2 DBMS_XMLSTORE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST	Clears the key column list.
CLEARUPDATECOLUMNLIST	Clears the update column list.
CLOSECONTEXT	It closes/deallocates a particular save context.
DELETEXML	Deletes records specified by data from the XML document, from the table specified at the context creation time.
INSERTXML	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT	Creates a save context, and returns the context handle.
SETKEYCOLUMN	This method adds a column to the key column list.
SETROWTAG	Names the tag used in the XML document., to enclose the XML elements corresponding to the database.
SETUPDATECOLUMN	Adds a column to the "update column list".
UPDATERXML	Updates the table given the XML document.

230.3.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
    ctxHdl IN ctxType);
```

Table 230-3 CLEARKEYCOLUMNLIST Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

230.3.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
    ctxHdl IN ctxType);
```

Table 230-4 CLEARUPDATECOLUMNLIST Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

230.3.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(ctxHdl IN ctxType);
```

Table 230-5 CLOSECONTEXT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

230.3.4 DELETEXML

DELETEXML deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax

The following syntax uses a VARCHAR2 type for the xDoc parameter.

```
FUNCTION deleteXML(  
    ctxHdl IN ctxPType,  
    xDoc IN VARCHAR2)  
RETURN NUMBER;
```

The following syntax uses a CLOB type for the xDoc parameter.

```
FUNCTION deleteXML(  
    ctxHdl IN ctxType,  
    xDoc IN CLOB)  
RETURN NUMBER;
```

The following syntax uses an XMLType type for the xDoc parameter.

```
FUNCTION deleteXML(  
    ctxHdl IN ctxType,  
    xDoc IN XMLType)  
RETURN NUMBER;
```

Parameters

Table 230-6 DELETXML Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

230.3.5 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for `insertXML` to `DBMS_XMLSTORE` that contains extra elements (elements that do not match any columns in the table), Oracle tries to insert into those columns unless `SETUPDATECOLUMN` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN VARCHAR2)
RETURN NUMBER;
```

```
FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;
```

```
FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 230-7 INSERTXML Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

230.3.6 NEWCONTEXT

`NEWCONTEXT` creates a save context and returns the context handle.

Syntax

```
FUNCTION newContext(  
    targetTable IN VARCHAR2)  
RETURN ctxType;
```

Table 230-8 `NEWCONTEXT` Function Parameters

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

230.3.7 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be `NULL`. In case of update or delete, the columns in the key column list make up the `WHERE` clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

Syntax

```
PROCEDURE setKeyColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

Table 230-9 `SETKEYCOLUMN` Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be <code>NULL</code> .

230.3.8 SETROWTAG

This procedure names the tag used in the XML document, to enclose the XML elements corresponding to database records.

Syntax

```
PROCEDURE setRowTag(  
    ctxHdl IN ctxType,  
    tag IN VARCHAR2);
```

Table 230-10 `SETROWTAG` Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

Table 230-10 (Cont.) SETROWTAG Procedure Parameters

Parameter	IN / OUT	Description
tag	(IN)	Tag name.

230.3.9 SETUPDATECOLUMN

SETUPDATECOLUMN adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for `INSERTXML` to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless `setUpdateColumn` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
PROCEDURE setUpdateColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

Table 230-11 SETUPDATECOLUMN Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

230.3.10 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

Syntax

The following syntax passes the `xDoc` parameter as a `VARCHAR2`.

```
FUNCTION updateXML(
    ctxHdl IN ctxType,
    xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a CLOB.

```
FUNCTION updateXML(  
  ctxHdl IN ctxType,  
  xDoc IN CLOB)  
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a XMLType.

```
FUNCTION updateXML(  
  ctxHdl IN ctxType,  
  xDoc IN XMLType)  
RETURN NUMBER;
```

Parameters

Table 230-12 UPDATEXML Function Parameters

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>xDoc</code>	(IN)	String containing the XML document.

DBMS_XPLAN

The `DBMS_XPLAN` package provides an easy way to display the output of the `EXPLAIN PLAN` command in several, predefined formats.

You can also use the `DBMS_XPLAN` package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS_ALL` fixed views. Finally, it displays plans from a SQL plan baseline.

See Also:

- For more information on the `EXPLAIN PLAN` command, the AWR, and SQL tuning set, see *Oracle Database SQL Tuning Guide*.
- For more information on the `V$SQL_PLAN` fixed view, see *Oracle Database Reference*
- For more information on the `V$SQL_PLAN_STATISTICS` fixed view, see *Oracle Database Reference*

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Examples](#)
- [Summary of DBMS_XPLAN Subprograms](#)

231.1 DBMS_XPLAN Overview

The `DBMS_XPLAN` package supplies five table functions.

These functions are listed below:

- `DISPLAY` - to format and display the contents of a plan table.
- `DISPLAY_AWR` - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- `DISPLAY_CURSOR` - to format and display the contents of the execution plan of any loaded cursor.
- `DISPLAY_SQL_PLAN_BASELINE` - to display one or more execution plans for the SQL statement identified by SQL handle
- `DISPLAY_SQLSET` - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

231.2 DBMS_XPLAN Security Model

This package runs with the privileges of the calling user, not the package owner (`SYS`). The table function `DISPLAY_CURSOR` requires `SELECT` or `READ` privileges on the following fixed views: `V$SQL_PLAN`, `V$SESSION` and `V$SQL_PLAN_STATISTICS_ALL`. This function also requires `SELECT/READ` permissions on `V$SQL`.

`DISPLAY_AWR` Function requires the user to have `SELECT` or `READ` privileges on `DBA_HIST_SQL_PLAN`, `AWR_ROOT_SQL_PLAN`, `AWR_PDB_SQL_PLAN`, `AWR_ROOT_SQLTEXT`, `DBA_HIST_SQLTEXT`, `AWR_PDB_SQLTEXT`, and `V$DATABASE`.

`DISPLAY_SQLSET` Function requires the user to have the `SELECT` or `READ` privilege on `ALL_SQLSET_STATEMENTS` and `ALL_SQLSET_PLANS`.

`DISPLAY_SQL_PLAN_BASELINE` Function requires the user to have the `SELECT` or `READ` privilege on `DBA_SQL_PLAN_BASELINES` as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

The preceding privileges are granted automatically as part of `SELECT_CATALOG_ROLE`.

231.3 DBMS_XPLAN Data Structures

The `DBMS_XPLAN` package defines a `TABLE` type.

Table Types

- `DBMS_XPLAN PLAN_OBJECT_LIST` Table Type

231.3.1 DBMS_XPLAN PLAN_OBJECT_LIST Table Type

This type allows for a list of generic objects as input to the `COMPARE_PLANS` function.

Syntax

```
TYPE plan_object_list IS TABLE OF generic_plan_object;
```

The generic object abstracts the common attributes of plans from all plan sources. Every plan source is a subclass of the `plan_object_list` superclass. The following table summarizes the different plan sources. Note that when an optional parameter is null, it can correspond to multiple objects. For example, if you do not specify a child number for `cursor_cache_object`, then it matches all cursor cache statements with the specified SQL ID.

Table 231-1 Plan Sources for PLAN_OBJECT_LIST

Plan Source	Specification	Description
Plan table	<code>plan_table_object(owner, plan_table_name, statement_id, plan_id)</code>	The parameters are as follows: <ul style="list-style-type: none"> • <code>owner</code>—The owner of the plan table • <code>plan_table_name</code>—The name of the plan table • <code>statement_id</code>—The ID of the statement (optional) • <code>plan_id</code>—The ID of the plan (optional)
Cursor cache	<code>cursor_cache_object(sql_id, child_number)</code>	The parameters are as follows: <ul style="list-style-type: none"> • <code>sql_id</code>—The SQL ID of the plan • <code>child_number</code>—The child number of the plan in the cursor cache (optional)
AWR	<code>awr_object(sql_id, dbid, con_dbid, plan_hash_value)</code>	The parameters are as follows: <ul style="list-style-type: none"> • <code>sql_id</code>—The SQL ID of the plan • <code>dbid</code>—The database ID (optional) • <code>con_dbid</code>—The CDB ID (optional) • <code>plan_hash_value</code>—The hash value of the plan (optional)
SQL tuning set	<code>sqlset_object (sqlset_owner, sqlset_name, sql_id, plan_hash_value)</code>	The parameters are as follows: <ul style="list-style-type: none"> • <code>sqlset_owner</code>—The owner of the SQL tuning set • <code>sqlset_name</code>—The name of the SQL tuning set • <code>sql_id</code>—The SQL ID of the plan • <code>plan_hash_value</code>—The hash value of the plan (optional)
SQL plan management	<code>spm_object (sql_handle, plan_name)</code>	The parameters are as follows: <ul style="list-style-type: none"> • <code>sql_handle</code>—The SQL handle of plans protected by SQL plan management • <code>plan_name</code>—The name of the SQL plan baseline (optional)
SQL profile	<code>sql_profile_object (profile_name)</code>	The <code>profile_name</code> parameter specifies the name of the SQL profile.
Advisor	<code>advisor_object (task_name, execution_name, sql_id, plan_id)</code>	The parameters are as follows: <ul style="list-style-type: none"> • <code>task_name</code>—The name of the advisor task • <code>execution_name</code>—The name of the task execution • <code>sql_id</code>—The SQL ID of the plan • <code>plan_id</code>—The advisor plan ID (optional)

231.4 Examples

These examples show sample uses of DBMS_XPLAN.

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a SELECT statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
      WHERE e.deptno = d.deptno
      AND e.ename='benoit';
```

Display the plan using the DBMS_XPLAN.DISPLAY table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

Plan hash value: 3693697075

```
-----
| Id | Operation          | Name | Rows | Bytes | Cost (%CPU)| Time     |
-----
|  0 | SELECT STATEMENT   |      |      |      |  6  (34)| 00:00:01 |
|*  1 |  HASH JOIN         |      |      |      |  6  (34)| 00:00:01 |
|*  2 |    TABLE ACCESS FULL| EMP  |      |      |  3  (34)| 00:00:01 |
|  3 |    TABLE ACCESS FULL| DEPT |      |      |  3  (34)| 00:00:01 |
-----
```

Predicate Information (identified by operation id):

```
-----
  1 - access("E"."DEPTNO"="D"."DEPTNO")
  2 - filter("E"."ENAME"='benoit')
```

15 rows selected.

Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR

By default, the table function DISPLAY_CURSOR formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename FROM emp e, dept d
      WHERE e.deptno = d.deptno
      AND e.empno=7369;
```

```
ENAME
-----
SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR();
```

This query produces the following output:

Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0

```
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369
```

```
-----
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT					
* 1	HASH JOIN		1	16	6 (34)	00:00:01
* 2	TABLE ACCESS FULL	EMP	1	13	3 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	12	3 (34)	00:00:01

```
-----
```

```
Predicate Information (identified by operation id):
```

```
-----
```

- 1 - access("E"."DEPTNO"="D"."DEPTNO")
- 2 - filter("E"."EMPNO"=7369)

```
21 rows selected.
```

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';
```

```
SQL_ID          CHILD_NUMBER
-----
gwp663cqh5qbf    0
```

Display the execution plan for the cursor:

```
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0);
```

```
Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0
```

```
-----
```

```
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);
```

```
-----
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT				7 (100)	
1	SORT GROUP BY		4	64	7 (43)	00:00:01
* 2	HASH JOIN		14	224	6 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	44	3 (34)	00:00:01
4	TABLE ACCESS FULL	EMP	14	70	3 (34)	00:00:01

```
-----
```

```
Predicate Information (identified by operation id):
```

```
-----
```

- 2 - access("E"."DEPTNO"="D"."DEPTNO")

Instead of issuing two queries, one to get the `sql_id` and `child_number` pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number) t WHERE
sql_text LIKE '%TOTO%';
```

Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the `display` and `display_cursor` table functions. In [Displaying a Plan Table Using DBMS_XPLAN.DISPLAY](#), the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.ename = 'hermann'
ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY();
Plan hash value: 3693697345
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time	TQ	INOUT	PQ Distrib
0	SELECT STATEMENT		1	117	6 (50)	00:00:01			
1	PX COORDINATOR								
2	PX SEND QC (ORDER)	:TQ10003	1	117	6 (50)	00:00:01	Q1,03	P->S	QC (ORDER)
3	SORT ORDER BY		1	117	6 (50)	00:00:01	Q1,03	PCWP	
4	PX RECEIVE		1	117	5 (40)	00:00:01	Q1,03	PCWP	
5	PX SEND RANGE	:TQ10002	1	117	5 (40)	00:00:01	Q1,02	P->P	RANGE
* 6	HASH JOIN		1	117	5 (40)	00:00:01	Q1,02	PCWP	
7	PX RECEIVE		1	87	2 (50)	00:00:01	Q1,02	PCWP	
8	PX SEND HASH	:TQ10001	1	87	2 (50)	00:00:01	Q1,01	P->P	HASH
9	PX BLOCK ITERATOR		1	87	2 (50)	00:00:01	Q1,01	PCWC	
* 10	TABLE ACCESS FULL	EMP	1	87	2 (50)	00:00:01	Q1,01	PCWP	
11	BUFFER SORT						Q1,02	PCWC	
12	PX RECEIVE		4	120	3 (34)	00:00:01	Q1,02	PCWP	
13	PX SEND HASH	:TQ10000	4	120	3 (34)	00:00:01		S->P	HASH
14	TABLE ACCESS FULL	DEPT	4	120	3 (34)	00:00:01			

Predicate Information (identified by operation id):

```
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
```

When the query is parallel, information related to parallelism is reported: table queue number (TQ column), table queue type (INOUT) and table queue distribution method (PQ Distrib).

By default, if several plans in the plan table match the `statement_id` parameter passed to the display table function (default value is NULL), only the plan corresponding to the last EXPLAIN PLAN command is displayed. Hence, there is no

need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for individual users and preserves its content throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the `EXPLAIN PLAN` command:

Using a View to Display Last Explain Plan

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

231.5 Summary of DBMS_XPLAN Subprograms

This table lists the DBMS_XPLAN subprograms and briefly describes them.

Table 231-2 *DBMS_XPLAN Package Subprograms*

Subprogram	Description
COMPARE_PLANS Function	Compares each plan in a list with a reference plan and returns the report
DIFF_PLAN Function	Compares plans
DISPLAY Function	Displays the contents of the plan table
DISPLAY_AWR Function	Displays the contents of an execution plan stored in the AWR
DISPLAY_CURSOR Function	Displays the execution plan of any cursor in the cursor cache
DISPLAY_PLAN Function	Displays the contents of the plan table in a variety of formats with CLOB output type
DISPLAY_SQL_PLAN_BASELINE Function	Displays one or more execution plans for the specified SQL handle of a SQL plan baseline
DISPLAY_SQLSET Function	Displays the execution plan of a given statement stored in a SQL tuning set

231.5.1 COMPARE_PLANS Function

This function compares each plan in a list with a reference plan and returns the report.

Syntax

```
DBMS_XPLAN.COMPARE_PLANS (
  reference_plan    IN generic_plan_object,
  compare_plan_list IN plan_object_list,
  type              IN VARCHAR2 := 'TEXT',
  level            IN VARCHAR2 := 'TYPICAL',
  section          IN VARCHAR2 := 'ALL')
RETURN CLOB;
```

Parameters

Table 231-3 COMPARE_PLANS Function Parameters

Parameter	Description
reference_plan	The reference plan. This plan should always evaluate to a single plan.
compare_plan_list	List of plans to compare with reference plan. The compare_plan_list is a list of generic_object and each generic_object could correspond to one or more plans.
type	Type of the report. Possible values are: <ul style="list-style-type: none"> • TEXT • HTML • XML
level	Format of the report. Possible values are: <ul style="list-style-type: none"> • BASIC • TYPICAL • ALL
section	A particular section in the report. Possible values are: <ul style="list-style-type: none"> • SUMMARY • FINDINGS • PLANS • INFORMATION • ERRORS

Example 231-1 Examples

The following examples illustrate the usage of COMPARE_PLANS Function.

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0',
2),
- plan_object_list (cursor_cache_object('8mkxm7ur07za0', 4)));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the child cursor number 4 for the same SQL ID. Returns the report in the text format (default).

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0',
2),
plan_object_list( spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_sdfjkd')));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the plan baseline captured by SPM for query whose SQL handle is 'SQL_024d0f7d21351f5d' and plan name is 'SQL_PLAN_sdfjkd'. Returns the report in the text format (default).

```

var report clob;
exec :report = dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0', 2),
                                     plan_object_list(cursor_cache_object('8mkxm7ur07za0'),
                                     sqlset_object('SH', 'SQLT_WORKLOAD', '6vfvqav0rgyad'),
awr_object('6vfvqav0rgyad', 5), spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_
                                     sdfjkd'), plan_table_object('SH', 'plan_table', NULL, 38),
sql_profile_object('pe3r3ejsfd'), a
                                     dvisor_object('TASK_1228',
'EXEC_1928', '8mkxm7ur07za0')), type => 'XML',
                                     level => 'ALL', section => 'SUMMARY');

```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with each of the plans in the following list:

- cursor_cache_object('8mkxm7ur07za0'): All the plans in the cursor cache that are generated for the SQL ID '8mkxm7ur07za0'.
- sqlset_object('SH', 'SQLT_WORKLOAD', '6vfvqav0rgyad'): All the plans generated in the SQL tuning set SH. SQLT_WORKLOAD for the SQL ID '6vfvqav0rgyad'.
- awr_object('6vfvqav0rgyad', 5): All the plans in AWR that are captured for database ID 5 and SQL ID '6vfvqav0rgyad'.
- spm_object('SQL_024d0f7d21351f5d', 'SQL_PLAN_sdfjkd'): The plan baseline for the query with SQL handle 'SQL_024d0f7d21351f5d' with name 'SQL_PLAN_sdfjkd'.
- plan_table_object('SH', 'plan_table', NULL, 38): Plan stored in SH.plan_table identified by plan_id=38.
- sql_profile_object('pe3r3ejsfd'): Plan identified by the SQL profile name 'pe3r3ejsfd'.
- advisor_object('TASK_1228', 'EXEC_1928', '8mkxm7ur07za0'): All the plans stored in SQL advisor identified by task name 'TASK_1228', execution name 'EXEC_1928' and SQL ID '8mkxm7ur07za0'.

231.5.2 DIFF_PLAN Function

This function compares two sql plans, the reference plan and the target plan. This function returns a task_id that can be used to retrieve the report of findings.

Syntax

```

DBMS_XPLAN.DIFF_PLAN(
  sql_text      IN   CLOB,
  outline       IN   CLOB,
  user_name     IN   VARCHAR2 := 'NULL')
RETURN VARCHAR2;

```

Parameters

Table 231-4 DIFF_PLAN Function Parameters

Parameter	Description
sql_text	The text of the SQL statement.
outline	Used to generate the target plan.
user_name	The parsing schema name default to current user.

231.5.3 DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

Syntax

```
DBMS_XPLAN.DISPLAY(  
  table_name      IN  VARCHAR2  DEFAULT 'PLAN_TABLE',  
  statement_id   IN  VARCHAR2  DEFAULT NULL,  
  format         IN  VARCHAR2  DEFAULT 'TYPICAL',  
  filter_preds   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 231-5 DISPLAY Function Parameters

Parameter	Description
<code>table_name</code>	Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .
<code>statement_id</code>	Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement.

Table 231-5 (Cont.) DISPLAY Function Parameters

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts the following values:</p> <ul style="list-style-type: none"> • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS, and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V\$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS, and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).</p>

Table 231-5 (Cont.) DISPLAY Function Parameters

Parameter	Description
<code>filter_preds</code>	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=>'plan_id = 10'</code> Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see WARNING under Usage Notes)

Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'-BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

WARNING:

Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

Examples

To display the result of the last `EXPLAIN PLAN` command stored in the plan table:

```
SELECT * FROM TABLE (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my_plan_table":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as `statement_id='sales_query'`:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'sales_query'));
```

231.5.4 DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in AWR.

Note:

This function is deprecated. Use `DISPLAY_WORKLOAD_REPOSITORY` instead. `DISPLAY_AWR` only works with snapshots for the local DBID, whereas `DISPLAY_WORKLOAD_REPOSITORY` supports all snapshots inside AWR, including remote and imported snapshots.

Syntax

```
DBMS_XPLAN.DISPLAY_AWR (
  sql_id          IN      VARCHAR2,
  plan_hash_value IN      NUMBER DEFAULT NULL,
  db_id           IN      NUMBER DEFAULT NULL,
  format          IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

Table 231-6 DISPLAY_AWR Table Function Parameters

Parameter	Description
<code>sql_id</code>	Specifies the <code>SQL_ID</code> of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column <code>SQL_ID</code> in <code>DBA_HIST_SQLTEXT</code> .
<code>plan_hash_value</code>	Specifies the <code>PLAN_HASH_VALUE</code> of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given <code>SQL_ID</code> .
<code>db_id</code>	Specifies the <code>database_id</code> for which the plan of the SQL statement, identified by <code>SQL_ID</code> should be displayed. If not supplied, the <code>database_id</code> of the local database is used, as shown in <code>V\$DATABASE</code> .

Table 231-6 (Cont.) DISPLAY_AWR Table Function Parameters

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). <p>For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> ROWS - if relevant, shows the number of rows estimated by the optimizer BYTES - if relevant, shows the number of bytes estimated by the optimizer COST - if relevant, shows optimizer cost information PARTITION - if relevant, shows partition pruning information PARALLEL - if relevant, shows PX information (distribution method and table queue information) PREDICATE - if relevant, shows the predicate section PROJECTION -if relevant, shows the projection section ALIAS - if relevant, shows the "Query Block Name / Object Alias" section REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) NOTE - if relevant, shows the note section of the explain plan <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p>

Usage Notes

- To use the DISPLAY_AWR functionality, the calling user must have SELECT or READ privilege on DBA_HIST_SQL_PLAN, AWR_ROOT_SQL_PLAN, AWR_PDB_SQL_PLAN, DBA_HIST_SQLTEXT, AWR_ROOT_SQLTEXT, AWR_PDB_SQLTEXT, and V\$DATABASE, otherwise it shows an appropriate error message. By default, select privilege for these views is granted to the select_catalog role.
- The following examples show different ways of using the format parameter:
 - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.
 - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.

- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates and the predicate section.

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.*
FROM   DBA_HIST_SQLTEXT ht, table(DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null,
null, 'ALL' )) tf
WHERE  ht.sql_text like '%TOTO%';
```

231.5.5 DISPLAY_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as I/O, memory and timing) can be reported (based on the V\$SQL_PLAN_STATISTICS_ALL VIEWS).

Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
  sql_id          IN  VARCHAR2  DEFAULT NULL,
  cursor_child_no IN  NUMBER    DEFAULT 0,
  format         IN  VARCHAR2  DEFAULT 'TYPICAL');
```

Parameters

Table 231-7 DISPLAY_CURSOR Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V\$SQL or V\$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V\$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed.
cursor_child_no	Child number of the cursor to display. If not supplied, the execution plan of the child_number=0 cursor matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.

Table 231-7 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts five values:</p> <ul style="list-style-type: none"> • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). • ADAPTIVE: <ul style="list-style-type: none"> – Displays the final plan, or the current plan if the execution has not completed. This section includes notes about runtime optimizations that affect the plan, such as switching from a Nested Loops join to a Hash join. – Plan lineage. This section shows the plans that were run previously due to automatic reoptimization. It also shows the default plan, if the plan changed due to dynamic plans. – Recommended plan. In reporting mode, the plan is chosen based on execution statistics displayed. Note that displaying the recommended plan for automatic reoptimization requires re-compiling the query with the optimizer adjustments collected in the child cursor. Displaying the recommended plan for a dynamic plan does not require this. – Dynamic plans. This summarizes the portions of the plan that differ from the default plan chosen by the optimizer. <p>For finer control on the display output, you can add the following keywords to the preceding format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).</p> <p>Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan • IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the

Table 231-7 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
	<p><code>gather_plan_statistics</code> hint or by setting the parameter <code>statistics_level</code> to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor.</p> <ul style="list-style-type: none"> MEMSTATS - Assuming that PGA memory management is enabled (that is, <code>pga_aggregate_target</code> parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. ALLSTATS - A shortcut for 'IOSTATS MEMSTATS' LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution. <p>The following formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor. RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor <p>You can prefix format keywords with the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p>

Usage Notes

- To use the DISPLAY_CURSOR functionality, the calling user must have SELECT or READ privilege on the fixed views V\$SQL_PLAN_STATISTICS_ALL, V\$SQL and V\$SQL_PLAN, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:
 - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
 - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
 - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
 - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST'));
```

231.5.6 DISPLAY_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

Syntax

```
DBMS_XPLAN.DISPLAY_PLAN (
    table_name      IN    VARCHAR2    DEFAULT 'PLAN_TABLE',
    statement_id    IN    VARCHAR2    DEFAULT NULL,
    format          IN    VARCHAR2    DEFAULT 'TYPICAL',
    filter_preds    IN    VARCHAR2    DEFAULT NULL,
    type            IN    VARCHAR2    DEFAULT 'TEXT')
RETURN CLOB;
```

Parameters

Table 231-8 DISPLAY_PLAN Function Parameters

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .
statement_id	Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement.
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=>'plan_id = 10'</code> Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see WARNING under Usage Notes)

Table 231-8 (Cont.) DISPLAY_PLAN Function Parameters

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts five values:</p> <ul style="list-style-type: none"> BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). ADAPTIVE: Displays the default plan, and for each dynamic subplan (if stipulated): <ul style="list-style-type: none"> - A list of the rowsources from the original which may be replaced, and the rowsources to replace them - If outline display is specified in the format argument, the hints for each option in the dynamic subplan are displayed <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> ROWS - if relevant, shows the number of rows estimated by the optimizer BYTES - if relevant, shows the number of bytes estimated by the optimizer COST - if relevant, shows optimizer cost information PARTITION - if relevant, shows partition pruning information PARALLEL - if relevant, shows PX information (distribution method and table queue information) PREDICATE - if relevant, shows the predicate section PROJECTION -if relevant, shows the projection section ALIAS - if relevant, shows the "Query Block Name / Object Alias" section REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) NOTE - if relevant, shows the note section of the explain plan <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V\$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the</p>

Table 231-8 (Cont.) DISPLAY_PLAN Function Parameters

Parameter	Description
	DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).
type	Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE).

Return Values

Returns the requested report as CLOB

Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

WARNING:

Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

231.5.7 DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  format          IN VARCHAR2 := 'TYPICAL')
RETURN dbms_xplan_type_table;
```

Parameters

Table 231-9 DISPLAY_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies a SQL statement whose plans are to be displayed.

Table 231-9 (Cont.) DISPLAY_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
plan_name	Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.
format	Format string determines what information stored in the plan displayed. The following format values are possible, each representing a common use case: BASIC, TYPICAL, and ALL.

Return Values

A PL/SQL type table

Usage Notes

This function uses plan information stored in the plan baseline to explain and display the plans. The plan_id stored in the SQL management base may not match the plan_id of the generated plan. A mismatch between the stored plan_id and generated plan_id means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

Examples

Display all plans of a SQL statement identified by the SQL handle

SYS_SQL_b1d49f6074ab95af using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE('SYS_SQL_b1d49f6074ab95af'))
t;
```

Display all plans of one or more SQL statements containing the string HR2 using BASIC format:

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines WHERE sql_text
LIKE '%HR2%') pb,
TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
'BASIC')) t;
```

231.5.8 DISPLAY_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
    sqlset_name      IN VARCHAR2,
```

```

sql_id          IN VARCHAR2,
plan_hash_value IN NUMBER := NULL,
format         IN VARCHAR2 := 'TYPICAL',
sqlset_owner   IN VARCHAR2 := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;

```

Parameters

Table 231-10 DISPLAY_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the SQL Tuning Set
sql_id	Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function <code>DBMS_SQLTUNE.SELECT_SQLSET</code>
plan_hash_value	Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.

Table 231-10 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan • IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter STATISTICS_LEVEL to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor. • MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. • ALLSTATS - A shortcut for 'IOSTATS MEMSTATS'

Table 231-10 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
	<ul style="list-style-type: none"> LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution. <p>The following two formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor. RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p>
sqlset_owner	The owner of the SQL tuning set. The default is the current user.

Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID 'gwp663cqh5qbf' and PLAN HASH 3693697075 in the SQL Tuning Set called 'OLTP_optimization_0405':

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf',
3693697075));
```

To display all execution plans of the SQL ID 'atfwcg8anrykp' stored in the SQL tuning set:

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_SQLSET(
    'OLTP_optimization_0405', 'gwp663cqh5qbfb', NULL, 'ALLSTATS LAST');
```

231.5.9 DISPLAY_WORKLOAD_REPOSITORY Function

This table function displays the contents of an execution plan stored in AWR.

Note:

This function replaces `DISPLAY_AWR`, which is deprecated.

Syntax

```
DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY(
  sql_id          IN          VARCHAR2,
  plan_hash_value IN          NUMBER   DEFAULT NULL,
  format          IN          VARCHAR2 DEFAULT 'TYPICAL',
  dbid           IN          NUMBER   DEFAULT NULL,
  con_dbid       IN          NUMBER   DEFAULT NULL,
  awr_location   IN          VARCHAR2 DEFAULT 'AWR_ROOT'
);
```

Parameters

Table 231-11 DISPLAY_WORKLOAD_REPOSITORY Table Function Parameters

Parameter	Description
sql_id	Specifies the <code>SQL_ID</code> of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column <code>SQL_ID</code> in <code>DBA_HIST_SQLTEXT</code> .
plan_hash_value	Specifies the <code>PLAN_HASH_VALUE</code> of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given <code>SQL_ID</code> .

Table 231-11 (Cont.) DISPLAY_WORKLOAD_REPOSITORY Table Function Parameters

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). <p>For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> ROWS - if relevant, shows the number of rows estimated by the optimizer BYTES - if relevant, shows the number of bytes estimated by the optimizer COST - if relevant, shows optimizer cost information PARTITION - if relevant, shows partition pruning information PARALLEL - if relevant, shows PX information (distribution method and table queue information) PREDICATE - if relevant, shows the predicate section PROJECTION -if relevant, shows the projection section ALIAS - if relevant, shows the "Query Block Name / Object Alias" section REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) NOTE - if relevant, shows the note section of the explain plan <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p>
dbid	<p>Identifies the plans for a specific database.</p> <p>If this parameter is omitted, then the value defaults to the DBID of the AWR repository pointed to by the initialization parameter AWR_LOCATION. In a CDB, if AWR_LOCATION is set to AWR_ROOT, then the value is set to the DBID of the CDB root. If it is set to AWR_PDB, then the value is set to the DBID of the container.</p>
con_dbid	<p>Identifies the plans for a specific container.</p> <p>If this parameter is omitted, then the value defaults to SYS_CONTEXT('userenv', 'con_id').</p>
awr_location	<p>Specifies the location of the AWR repository. Supported values are:</p> <ul style="list-style-type: none"> AWR_ROOT when the AWR to be accessed is in the root container. This is the default. 'AWR_PDB', if the AWR to be accessed is in the local container.

Example 231-2 Querying an AWR Plan

Assume that you log in as an administrator and issue the following query:

```
select count(*) from sh.sAleS
```

You create an AWR snapshot as follows:

```
EXEC DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT;
```

You query joint DBA_HIST_SQLTEXT to the function output as follows:

```
SET LINESIZE 150
SET PAGESIZE 5000
```

```
SELECT t.*
FROM   DBA_HIST_SQLTEXT ht,
       TABLE(DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY
              (ht.sql_id, null, '-PREDICATE +ALIAS',null,null,'AWR_ROOT')) t
WHERE  ht.SQL_TEXT LIKE '%sAleS%';
```

```
SQL_ID 2f4cx9qjnqd70
-----
select count(*) from sh.sAleS
```

Plan hash value: 1123225294

```
-----
```

Id	Operation	Name	Rows	Cost
(%CPU)	Time	Pstart	Pstop	
0	SELECT STATEMENT			27
(100)				
1	SORT AGGREGATE		1	
2	PARTITION RANGE ALL		918K	27
(0)	00:00:01	1	28	
3	BITMAP CONVERSION COUNT		918K	27
(0)	00:00:01			
4	BITMAP INDEX FAST FULL SCAN	SALES_PROMO_BIX		
			1	28

```
-----
```

Query Block Name / Object Alias (identified by operation id):

```
-----
1 - SEL$1
3 - SEL$1 / "SALES"@"SEL$1"
```

DBMS_XSLPROCESSOR

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- [DBMS_XSLPROCESSOR Overview](#)
- [DBMS_XSLPROCESSOR Security Model](#)
- [Summary of DBMS_XSLPROCESSOR Subprograms](#)

 **See Also:**

- *Oracle XML DB Developer's Guide*

232.1 DBMS_XSLPROCESSOR Overview

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

232.2 DBMS_XSLPROCESSOR Security Model

Owned by XDB, the DBMS_XSLPROCESSOR package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

232.3 Summary of DBMS_XSLPROCESSOR Subprograms

This table lists the DBMS_XSLPROCESSOR subprograms and briefly describes them.

Table 232-1 DBMS_XSLPROCESSOR Package Subprograms

Method	Description
FREEPROCESSOR Procedure	Frees a processor object
FREESTYLESHEET Procedure	Frees a stylesheet object
NEWPROCESSOR Function	Returns a new processor instance
NEWSTYLESHEET Functions	Creates a new stylesheet from input and reference URLs
PROCESSXSL Functions and Procedures	Transforms an input XML document
REMOVEPARAM Procedure	Removes a top-level stylesheet parameter
RESETPARAMS Procedure	Resets the top-level stylesheet parameters
SELECTNODES Function	Selects nodes from a DOM tree that match a pattern
SELECTSINGLENODE Function	Selects the first node from the tree that matches a pattern
SETERRORLOG Procedure	Sets errors to be sent to the specified file
SETPARAM Procedure	Sets a top-level parameter in the stylesheet
SHOWWARNINGS Procedure	Turns warnings on or off
TRANSFORMNODE Function	Transforms a node in a DOM tree using a stylesheet
VALUEOF Function and Procedure	Gets the value of the first node that matches a pattern

232.3.1 FREEPROCESSOR Procedure

This procedure frees a Processor object.

Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
  p IN Processor);
```

Parameters

Table 232-2 FREEPROCESSOR Procedure Parameters

Parameter	Description
p	Processor

232.3.2 FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(  
    ss IN Stylesheet);
```

Parameters

Table 232-3 FREESTYLESHEET Procedure Parameters

Parameter	Description
ss	Stylesheet

232.3.3 NEWPROCESSOR Function

This function returns a new `Processor` instance.

The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR  
RETURN Processor;
```

232.3.4 NEWSTYLESHEET Functions

This function creates and returns a new `Stylesheet` instance.

The options are described in the following table.

Syntax

Creates and returns a new stylesheet instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(  
    xmldoc IN DOMDOCUMENT,  
    ref    IN VARCHAR2)  
RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(  
    inp    IN VARCHAR2,  
    ref    IN VARCHAR2)  
RETURN Stylesheet;
```

Parameters

Table 232-4 NEWSTYLESHEET Function Parameters

Parameter	Description
xmlDoc	DOMDocument to use for construction
inp	Input URL to use for construction
ref	Reference URL

232.3.5 PROCESSXSL Functions and Procedures

This function transforms input `XMLDocument`.

Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

Syntax

Transforms input `XMLDocument` using given `DOMDocument` and stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p      IN  Processor,
  ss     IN  Stylesheet,
  xmlDoc IN  DOMDOCUMENT),
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as URL and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p      IN  Processor,
  ss     IN  Stylesheet,
  url   IN  VARCHAR2,
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as `CLOB` and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p      IN  Processor,
  ss     IN  Stylesheet,
  clb   IN  CLOB)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the stylesheet, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
  p          IN  Processor,
  ss         IN  Stylesheet,
  xmlDoc     IN  DOMDOCUMENT,
  dir        IN  VARCHAR2,
  fileName   IN  VARCHAR2);
```

Transforms input `XMLDocument` using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  url        IN    VARCHAR2,  
  dir        IN    VARCHAR2,  
  fileName   IN    VARCHAR2);
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  xmldoc     IN    DOMDOCUMENT,  
  cl         IN OUT CLOB);
```

Transforms input `XMLDocument` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  xmldf      IN    DOMDOCUMENTFRAGMENT)  
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocumentFragment` using given `DOMDocumentFragment` and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  xmldf      IN    DOMDOCUMENTFRAGMENT,  
  dir        IN    VARCHAR2,  
  filename   IN    VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a buffer:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  xmldf      IN    DOMDOCUMENTFRAGMENT,  
  buf        IN OUT VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  xmldf      IN    DOMDOCUMENTFRAGMENT,  
  cl         IN OUT CLOB);
```

Parameters

Table 232-5 PROCESSXSL Function and Procedure Parameters

Parameter	Description
p	Processor instance
ss	Stylesheet instance
xml doc	XML document being transformed
url	URL for the information being transformed
clb	CLOB containing information to be transformed
dir	Directory where processing output file is saved
filename	Processing output file
cl	CLOB to which the processing output is saved
xml df	XMLDocumentFragment being transformed

232.3.6 REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(
    ss      IN  Stylesheet,
    name    IN  VARCHAR2);
```

Parameters

Table 232-6 REMOVEPARAM Procedure Parameters

Parameter	Description
ss	Stylesheet instance
name	Name of the parameter

232.3.7 RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(
    ss IN  Stylesheet);
```

Parameters

Table 232-7 RESETPARAMS Procedure Parameters

Parameter	Description
ss	Stylesheet instance

232.3.8 SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES (
  n          IN  DBMS_XMLDOM.DOMNODE,
  pattern    IN  VARCHAR2,
  namespace  IN  VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODELIST;
```

Parameters

Table 232-8 SELECTNODES Function Parameters

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

232.3.9 SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE (
  n          IN  DBMS_XMLDOM.DOMNODE,
  pattern    IN  VARCHAR2,
  namespace  IN  VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODE;
```

Parameters

Table 232-9 SELECTSINGLENODE Function Parameters

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use

Table 232-9 (Cont.) SELECTSINGLENODE Function Parameters

Parameter	Description
namespace	Namespace declared

232.3.10 SETERRORLOG Procedure

This deprecated procedure sets errors to be sent to the specified file.

Note:

This subprogram has been deprecated, and is included only for reasons of backward compatibility.

Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(
    p          IN  Processor,
    fileName  IN  VARCHAR2);
```

Parameters

Table 232-10 SETERRORLOG Procedure Parameters

Parameter	Description
p	Processor instance
fileName	Complete path of the file to use as the error log

232.3.11 SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet.

The parameter value must be a valid XPath expression. Literal string values must be quoted.

Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(
    ss      IN  Stylesheet,
    name   IN  VARCHAR2,
    value  IN  VARCHAR2);
```

Parameters

Table 232-11 SETPARAM Procedure Parameters

Parameter	Description
ss	Stylesheet instance

Table 232-11 (Cont.) SETPARAM Procedure Parameters

Parameter	Description
name	Name of the parameter
value	Value of the parameter

232.3.12 SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS (
  p      IN  Processor,
  yes    IN  BOOLEAN);
```

Parameters

Table 232-12 SHOWWARNINGS Procedure Parameters

Parameter	Description
p	Processor instance
yes	Mode to set: TRUE to show warnings, FALSE otherwise

232.3.13 TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a DOMDocumentFragment.

Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE (
  n      IN  DOMNODE,
  ss     IN  Stylesheet)
RETURN DOMDocumentFragment;
```

Parameters

Table 232-13 TRANSFORMNODE Function Parameters

Parameter	Description
n	DOMNode to transform
ss	Stylesheet to use

232.3.14 VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

```
DBMS_XSLPROCESSOR.VALUEOF (
  n          IN    DBMS_XMLDOM.DOMNODE,
  pattern    IN    VARCHAR2,
  namespace  IN    VARCHAR2 := NULL)
RETURN VARCHAR2;
```

```
DBMS_XSLPROCESSOR.VALUEOF (
  n          IN    DBMS_XMLDOM.DOMNODE,
  pattern    IN    VARCHAR2,
  val       OUT   VARCHAR2,
  namespace  IN    VARCHAR2 := NULL);
```

Parameters

Table 232-14 VALUEOF Function and Procedure Parameters

Parameter	Description
n	Node whose value is being retrieved
pattern	Pattern to use
val	Retrieved value
namespace	Namespace to use

DBMS_XSTREAM_ADM

This `DBMS_XSTREAM_ADM` package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.

This chapter contains the following topic:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS_XSTREAM_ADM Subprograms](#)

See Also:

- *Oracle Database XStream Guide*
- *Oracle Call Interface Programmer's Guide*
- *Oracle Database XStream Java API Reference*

233.1 DBMS_XSTREAM_ADM Overview

The package provides interfaces for configuring outbound servers that stream database changes from an Oracle database to other systems. The package also provides interfaces for configuring inbound servers that stream database changes from other systems to an Oracle database.

In both cases, the database changes are encapsulated in logical change records (LCRs). Also, the other systems can be Oracle systems or a non-Oracle systems, such as non-Oracle databases or file systems.

XStream outbound servers can stream out LCRs from an Oracle database programmatically using C or Java. After receiving the LCRs, the other system can process them in any customized way. For example, the other system can save the contents of the LCRs to a file, send the LCRs to an Oracle database through an XStream inbound server, or generate SQL statements and execute them on any Oracle or non-Oracle databases.

XStream inbound servers accept LCRs from another system and either apply them to an Oracle database or process them in a customized way using apply handlers.

XStream can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

 **See Also:**

- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

233.2 DBMS_XSTREAM_ADM Security Model

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an XStream administrator and connect as the XStream administrator when using this package.

An administrator must be granted the `DBA` role when the administrator is performing any of the following actions:

- Running the `ADD_OUTBOUND` procedure while connected as a user that is different from the configured connect user for an outbound server
- Running the `ALTER_OUTBOUND` procedure to change the capture user for a capture process or the connect user for an outbound server
- Running the `CREATE_OUTBOUND` procedure, because this procedure creates a capture process
- Running the `ALTER_INBOUND` procedure to change the apply user for an inbound server
- Running the `ADD_INBOUND` procedure while connected as a user that is different from the configured apply user for an inbound server

When the administrator does not need to perform the preceding tasks, the `DBA` role is not required.

 **See Also:**

- [GRANT_ADMIN_PRIVILEGE Procedure](#)
- *Oracle Database XStream Guide, Chapter 4, "XStream Out and Security"* for more information about XStream and security.

233.3 DBMS_XSTREAM_ADM Operational Notes

Some subprograms in the `DBMS_APPLY_ADM` package can manage XStream outbound servers, and some subprograms in the `DBMS_APPLY_ADM` package can manage XStream inbound servers.

See Also:

[DBMS_APPLY_ADM](#) for details about which subprograms can manage outbound servers and inbound servers

233.4 Summary of DBMS_XSTREAM_ADM Subprograms

This table lists the `DBMS_XSTREAM_ADM` subprograms and briefly describes them.

Table 233-1 DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
ADD_COLUMN Procedure	Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule
ADD_GLOBAL_PROPAGATION_RULES Procedure	Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_GLOBAL_RULES Procedure	Adds global rules to either the positive or negative rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist
ADD_OUTBOUND Procedure	Creates an XStream outbound server that dequeues LCRs from the specified queue
ADD_SCHEMA_PROPAGATION_RULES Procedure	Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SCHEMA_RULES Procedure	Adds rules to a rule set of XStream clients.
ADD_SUBSET_OUTBOUND_RULES Procedure	Adds subset rules to an outbound server configuration
ADD_SUBSET_PROPAGATION_RULES Procedure	Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SUBSET_RULES Procedure	Adds subset rules to the positive rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist

Table 233-1 (Cont.) DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
ADD_TABLE_PROPAGATION_RULES Procedure	Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_TABLE_RULES Procedure	This procedure adds rules to a rule set of an XStream client.
ALTER_INBOUND Procedure	Modifies an XStream inbound server
ALTER_OUTBOUND Procedure	Modifies an XStream outbound server
CREATE_INBOUND Procedure	Creates an XStream inbound server and its queue
CREATE_OUTBOUND Procedure	Creates an XStream outbound server, queue, and capture process to enable XStream client applications to stream out Oracle database changes encapsulated in LCRs
DELETE_COLUMN Procedure	Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule
DROP_INBOUND Procedure	Removes an inbound server configuration
DROP_OUTBOUND Procedure	Removes an outbound server configuration
ENABLE_GG_XSTREAM_FOR_STREAMS Procedure	Enables XStream performance optimizations for Oracle Replication components
GET_MESSAGE_TRACKING Function	Returns the tracking label for the current session
GET_TAG Function	Gets the binary tag for all redo entries generated by the current session
IS_GG_XSTREAM_FOR_STREAMS Function	Returns TRUE if XStream performance optimizations are enabled for Oracle Replication components, or returns FALSE if XStream performance optimizations are disabled for Oracle Replication components
KEEP_COLUMNS Procedure	Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule
MERGE_STREAMS Procedure	Merges a stream flowing from one capture process with a stream flowing from another capture process
MERGE_STREAMS_JOB Procedure	Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the <code>MERGE_STREAMS</code> procedure to merge the two streams
PURGE_SOURCE_CATALOG Procedure	Removes all Oracle Replication data dictionary information at the local database for the specified object
RECOVER_OPERATION Procedure	Provides options for a split and merge operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.
REMOVE_QUEUE Procedure	Removes the specified ANYDATA queue

Table 233-1 (Cont.) DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
REMOVE_RULE Procedure	Removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.
REMOVE_SUBSET_OUTBOUND_RULES Procedure	Removes subset rules from an outbound server configuration
REMOVE_XSTREAM_CONFIGURATION Procedure	Removes the XStream configuration at the local database
RENAME_COLUMN Procedure	Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule
RENAME_SCHEMA Procedure	Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule
RENAME_TABLE Procedure	Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule
SET_MESSAGE_TRACKING Procedure	Sets the tracking label for logical change records (LCRs) produced by the current session
SET_PARAMETER Procedure	Sets a parameter for an outbound server, an inbound server, or an outbound server's capture process
SET_TAG Procedure	Sets the binary tag for all redo entries subsequently generated by the current session
SET_UP_QUEUE Procedure	Creates a queue table and a queue for use with the capture, propagate, and apply functionality of XStream
SPLIT_STREAMS Procedure	Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process
START_OUTBOUND Procedure	Starts an XStream outbound server
STOP_OUTBOUND Procedure	Stops an XStream outbound server

**Note:**

All subprograms commit unless specified otherwise.

233.4.1 ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

 **Note:**

- `ADD_COLUMN` transformations cannot add columns of the following data types: BLOB, CLOB, NCLOB, BFILE, LONG, LONG RAW, ROWID, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

Oracle Database XStream Guide for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.ADD_COLUMN (
    rule_name      IN  VARCHAR2,
    table_name     IN  VARCHAR2,
    column_name    IN  VARCHAR2,
    column_value   IN  ANYDATA,
    value_type     IN  VARCHAR2      DEFAULT 'NEW',
    step_number    IN  NUMBER        DEFAULT 0,
    operation      IN  VARCHAR2      DEFAULT 'ADD');
```

```
DBMS_XSTREAM_ADM.ADD_COLUMN (
    rule_name      IN  VARCHAR2,
    table_name     IN  VARCHAR2,
    column_name    IN  VARCHAR2,
    column_function IN VARCHAR2,
    value_type     IN  VARCHAR2      DEFAULT 'NEW',
    step_number    IN  NUMBER        DEFAULT 0,
    operation      IN  VARCHAR2      DEFAULT 'ADD');
```

Parameters

Table 233-2 ADD_COLUMN Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
<code>table_name</code>	The name of the table to which the column is added in the row LCR, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.

Table 233-2 (Cont.) ADD_COLUMN Procedure Parameters

Parameter	Description
<code>column_name</code>	The name of the column added to each row LCR that satisfies the rule.
<code>column_value</code>	The value of the added column. Specify the appropriate <code>ANYDATA</code> function for the column datatype and the column value. For example, if the datatype of the column being added is <code>NUMBER</code> and the value is <code>NULL</code> , then specify the <code>ANYDATA.ConvertNumber(NULL)</code> function. This parameter cannot be specified if the <code>column_function</code> parameter is specified.
<code>column_function</code>	Either the <code>'SYSDATE'</code> or the <code>'SYSTIMESTAMP'</code> SQL function. The <code>'SYSDATE'</code> SQL function returns the current date and time. <code>'SYSDATE'</code> uses the time zone of either the database host system or the database, depending on the setting of the <code>TIME_AT_DBTIMEZONE</code> initialization parameter. The datatype of the returned value is <code>DATE</code> , and the format returned depends on the value of the <code>NLS_DATE_FORMAT</code> initialization parameter. The <code>'SYSTIMESTAMP'</code> SQL function returns the system date, including fractional seconds. <code>'SYSTIMESTAMP'</code> uses the time zone of either the database host system or the database, depending on the setting of the <code>TIME_AT_DBTIMEZONE</code> initialization parameter. The return type is <code>TIMESTAMP WITH TIME ZONE</code> . The function executes when the rule evaluates to <code>TRUE</code> . This parameter cannot be specified if the <code>column_value</code> parameter is specified. See Also: <i>Oracle Database Reference</i> for more information about the <code>TIME_AT_DBTIMEZONE</code> parameter.
<code>value_type</code>	Specify <code>'NEW'</code> to add the column to the new values in the row LCR. Specify <code>'OLD'</code> to add the column to the old values in the row LCR.
<code>step_number</code>	The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering
<code>operation</code>	Specify <code>'ADD'</code> to add the transformation to the rule. Specify <code>'REMOVE'</code> to remove the transformation from the rule.

Usage Notes

When `'REMOVE'` is specified for the `operation` parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `ADD_COLUMN` procedures when one or more of these parameters is `NULL`:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all add column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all add column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all add column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all add column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all add column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all add column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all add column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all add column transformations with the specified table_name, column_name, and step_number for the specified rule.

233.4.2 ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES (
    streams_name          IN  VARCHAR2  DEFAULT NULL,
    source_queue_name     IN  VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_dml           IN  BOOLEAN   DEFAULT TRUE,
    include_ddl           IN  BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr    IN  BOOLEAN   DEFAULT FALSE,
    source_database       IN  VARCHAR2  DEFAULT NULL,
    dml_rule_name         OUT VARCHAR2,
    ddl_rule_name         OUT VARCHAR2,
    inclusion_rule        IN  BOOLEAN   DEFAULT TRUE,
    and_condition         IN  VARCHAR2  DEFAULT NULL,
    queue_to_queue       IN  BOOLEAN   DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES (
    streams_name          IN  VARCHAR2  DEFAULT NULL,
```

```

source_queue_name      IN  VARCHAR2,
destination_queue_name IN  VARCHAR2,
include_dml            IN  BOOLEAN  DEFAULT TRUE,
include_ddl            IN  BOOLEAN  DEFAULT FALSE,
include_tagged_lcr     IN  BOOLEAN  DEFAULT FALSE,
source_database        IN  VARCHAR2  DEFAULT NULL,
inclusion_rule          IN  BOOLEAN  DEFAULT TRUE,
and_condition          IN  VARCHAR2  DEFAULT NULL,
queue_to_queue        IN  BOOLEAN  DEFAULT NULL);

```

Parameters

Table 233-3 ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
streams_name	<p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>
source_queue_name	<p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>

Table 233-3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p>
source_database	<p>The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is TRUE, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is FALSE, then this parameter contains a NULL.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is TRUE, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is FALSE, then this parameter contains a NULL.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is TRUE, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is FALSE, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

Table 233-3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
and_condition	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p>See Also: Logical Change Record TYPEs</p>
queue_to_queue	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence

number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

233.4.3 ADD_GLOBAL_RULES Procedure

This procedure adds rules to an XStream clients rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database.

This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying all logical change records (LCRs) it receives. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Note:

If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES (
  streams_type          IN  VARCHAR2,
  streams_name         IN  VARCHAR2 DEFAULT NULL,
  queue_name           IN  VARCHAR2 DEFAULT 'streams_queue',
  include_dml          IN  BOOLEAN  DEFAULT TRUE,
  include_ddl          IN  BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN  BOOLEAN  DEFAULT FALSE,
  source_database      IN  VARCHAR2 DEFAULT NULL,
  dml_rule_name        OUT  VARCHAR2,
  ddl_rule_name        OUT  VARCHAR2,
```

```

inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
and_condition          IN   VARCHAR2   DEFAULT NULL,
source_root_name      IN   VARCHAR2   DEFAULT NULL,
source_container_name IN   VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES (
  streams_type         IN   VARCHAR2,
  streams_name        IN   VARCHAR2   DEFAULT NULL,
  queue_name          IN   VARCHAR2   DEFAULT 'streams_queue',
  include_dml         IN   BOOLEAN   DEFAULT TRUE,
  include_ddl         IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
  source_database     IN   VARCHAR2   DEFAULT NULL,
  inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
  and_condition       IN   VARCHAR2   DEFAULT NULL,
  source_root_name    IN   VARCHAR2   DEFAULT NULL,
  source_container_name IN  VARCHAR2   DEFAULT NULL);

```

Parameters

Table 233-4 ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
streams_type	<p>The type of XStream client:</p> <ul style="list-style-type: none"> Specify <code>capture</code> for a capture process. Specify <code>apply</code> for an apply process.
streams_name	<p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If NULL, if <code>streams_type</code> is <code>capture</code>, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If NULL, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process. If <code>source_database</code> is NULL and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process. <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p>

Table 233-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
queue_name	<p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p>

Table 233-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>
dml_rule_name	<p>If include_dml is TRUE, then this parameter contains the DML rule name.</p> <p>If include_dml is FALSE, then this parameter contains a NULL.</p>
ddl_rule_name	<p>If include_ddl is TRUE, then this parameter contains the DDL rule name.</p> <p>If include_ddl is FALSE, then this parameter contains a NULL.</p>
inclusion_rule	<p>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

Table 233-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
and_condition	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p>See Also: Logical Change Record TYPES</p>
source_root_name	<p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p>Note: This parameter only applies to a CDB.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p>

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process or apply process uses the rules for filtering.

 **See Also:**

- "Operational Notes"
- "Security Model"

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

233.4.4 ADD_OUTBOUND Procedure

This procedure creates an XStream outbound server that dequeues LCRs from the specified queue. The outbound server streams out the LCRs to an XStream client application.

This procedure creates neither a capture process nor a queue. To create an outbound server, a capture process, and a queue with one procedure call, use the [CREATE_OUTBOUND Procedure](#).

To create the capture process individually, use one of the following packages:

- DBMS_XSTREAM_ADM
- DBMS_CAPTURE_ADM

To create a queue individually, use the `SET_UP_QUEUE` procedure in the `DBMS_XSTREAM_ADM` package.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the lists of tables and schemas in different ways and are mutually exclusive.

 **Note:**

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- This procedure enables the outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name`, `start_scn`, and `start_time` parameters are included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
  server_name          IN VARCHAR2,
  queue_name           IN VARCHAR2  DEFAULT NULL,
  source_database      IN VARCHAR2  DEFAULT NULL,
  table_names          IN DBMS_UTILITY.UNCL_ARRAY,
  schema_names         IN DBMS_UTILITY.UNCL_ARRAY,
  connect_user         IN VARCHAR2  DEFAULT NULL,
  comment              IN VARCHAR2  DEFAULT NULL,
  capture_name         IN VARCHAR2  DEFAULT NULL,
  start_scn            IN NUMBER     DEFAULT NULL,
  start_time           IN TIMESTAMP  DEFAULT NULL,
  include_dml          IN BOOLEAN    DEFAULT TRUE,
  include_ddl          IN BOOLEAN    DEFAULT FALSE,
  source_root_name     IN VARCHAR2  DEFAULT NULL,
  source_container_name IN VARCHAR2  DEFAULT NULL,
  lcr_version          IN NUMBER     DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
  server_name          IN VARCHAR2,
  queue_name           IN VARCHAR2  DEFAULT NULL,
  source_database      IN VARCHAR2  DEFAULT NULL,
  table_names          IN VARCHAR2  DEFAULT NULL,
  schema_names         IN VARCHAR2  DEFAULT NULL,
  connect_user         IN VARCHAR2  DEFAULT NULL,
  comment              IN VARCHAR2  DEFAULT NULL,
  capture_name         IN VARCHAR2  DEFAULT NULL,
  start_scn            IN NUMBER     DEFAULT NULL,
  start_time           IN TIMESTAMP  DEFAULT NULL,
  include_dml          IN BOOLEAN    DEFAULT TRUE,
  include_ddl          IN BOOLEAN    DEFAULT FALSE,
  source_root_name     IN VARCHAR2  DEFAULT NULL,
  source_container_name IN VARCHAR2  DEFAULT NULL,
  lcr_version          IN NUMBER     DEFAULT NULL);
```

Parameters

Table 233-5 ADD_OUTBOUND Procedure Parameters

Parameter	Description
server_name	<p>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p>Note: The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</p>
queue_name	<p>The name of the local queue from which the outbound server dequeues LCRs, specified as [<code>schema_name.</code>]<code>queue_name</code>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>If NULL, the procedure raises an error.</p>

Table 233-5 (Cont.) ADD_OUTBOUND Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>
table_names	<p>The tables for which data manipulation language (DML) and data definition language (DDL) changes are streamed out to the XStream client application. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type VARCHAR2. A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. <p>Each table should be specified as [schema_name.]table_name. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default.</p> <p>See Also: "Usage Notes" for more information about this parameter</p>
schema_names	<p>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type VARCHAR2. A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. <p>Note: This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (schema_name.table_name).</p> <p>See Also: "Usage Notes" for more information about this parameter</p>
connect_user	<p>The user who can attach to the specified outbound server to retrieve the LCR stream. The client application must attach to the outbound server as the specified connect user. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user.</p> <p>If NULL, then the current user is the default.</p>
comment	An optional comment associated with the outbound server.

Table 233-5 (Cont.) ADD_OUTBOUND Procedure Parameters

Parameter	Description
capture_name	<p>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.</p> <p>If the specified name matches the name of an existing capture process for another outbound server, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.</p> <p>If the specified name matches the name of an existing capture process for an apply process, then an error is raised.</p> <p>If the specified name does not match the name of an existing capture process, then an error is raised.</p> <p>If NULL, then the outbound server is created without a capture process.</p>
start_scn	<p>A valid system change number (SCN) for the database from which the capture process starts capturing changes.</p> <p>If the capture_name parameter is NULL, then this parameter is ignored.</p> <p>If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p>
start_time	<p>A valid time from which the capture process starts capturing changes.</p> <p>If the capture_name parameter is NULL, then this parameter is ignored.</p> <p>If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
source_root_name	<p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p>Note: This parameter only applies to a CDB.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p>

Table 233-5 (Cont.) ADD_OUTBOUND Procedure Parameters

Parameter	Description
<code>lcrld_version</code>	<p>The LCRID version for captured LCRs, either 1 or 2.</p> <p>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</p> <p>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</p> <p>If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the <code>lcrld_version</code> is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the <code>lcrld_version</code> is set to 1 internally.</p>

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the `table_names` and `schema_names` parameters:

- If both the `table_names` and `schema_names` parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.
This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to NULL. Do not specify NULL for both `table_names` and `schema_names` in the same call; otherwise, error PLS-00307 is returned.
- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is NULL or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schemas.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

 **Note:**

An empty array includes one NULL entry.

233.4.5 ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES (
  schema_name          IN   VARCHAR2,
  streams_name         IN   VARCHAR2 DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN VARCHAR2,
  include_dml          IN   BOOLEAN  DEFAULT TRUE,
  include_ddl          IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
  source_database      IN   VARCHAR2 DEFAULT NULL,
  dml_rule_name        OUT  VARCHAR2,
  ddl_rule_name        OUT  VARCHAR2,
  inclusion_rule       IN   BOOLEAN  DEFAULT TRUE,
  and_condition        IN   VARCHAR2 DEFAULT NULL,
  queue_to_queue       IN   BOOLEAN  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES (
  schema_name          IN   VARCHAR2,
  streams_name         IN   VARCHAR2 DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN VARCHAR2,
  include_dml          IN   BOOLEAN  DEFAULT TRUE,
  include_ddl          IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
  source_database      IN   VARCHAR2 DEFAULT NULL,
  inclusion_rule       IN   BOOLEAN  DEFAULT TRUE,
  and_condition        IN   VARCHAR2 DEFAULT NULL,
  queue_to_queue       IN   BOOLEAN  DEFAULT NULL);
```

Parameters

Table 233-6 ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
<code>schema_name</code>	The name of the schema. For example, <code>hr</code> .
<code>streams_name</code>	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If <code>NULL</code> and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If <code>NULL</code> and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
<code>source_queue_name</code>	The name of the source queue, specified as <code>[schema_name.]queue_name</code> . The current database must contain the source queue, and the queue must be <code>ANYDATA</code> type. For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.

Table 233-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
<code>destination_queue_name</code>	<p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>db2.net</code>, enter <code>strmadmin.streams_queue@db2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p>
<code>include_dml</code>	<p>If <code>TRUE</code>, then the procedure creates a rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</p>
<code>include_ddl</code>	<p>If <code>TRUE</code>, then the procedure creates a rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p>
<code>include_tagged_lcr</code>	<p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a logical change record (LCR) has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if an LCR has a <code>NULL</code> Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p>

Table 233-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

Table 233-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
<code>and_condition</code>	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the <code>include_dml</code> parameter and FALSE for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the <code>include_dml</code> parameter and TRUE for the <code>include_ddl</code> parameter.</p> <p>See Also: Logical Change Record TYPES</p>
<code>queue_to_queue</code>	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'  
and :dml.get_source_database_name() = 'DBS1.NET' )
```

233.4.6 ADD_SCHEMA_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema.

This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Note:

If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES (
    schema_name          IN   VARCHAR2,
    streams_type         IN   VARCHAR2,
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
    include_dml         IN   BOOLEAN  DEFAULT TRUE,
    include_ddl         IN   BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
    source_database     IN   VARCHAR2 DEFAULT NULL,
    dml_rule_name       OUT  VARCHAR2,
    ddl_rule_name       OUT  VARCHAR2,
    inclusion_rule      IN   BOOLEAN  DEFAULT TRUE,
    and_condition       IN   VARCHAR2 DEFAULT NULL,
    source_root_name    IN   VARCHAR2 DEFAULT NULL,
    source_container_name IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES (
    schema_name          IN   VARCHAR2,
    streams_type         IN   VARCHAR2,
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
    include_dml         IN   BOOLEAN  DEFAULT TRUE,
    include_ddl         IN   BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
    source_database     IN   VARCHAR2 DEFAULT NULL,
    inclusion_rule      IN   BOOLEAN  DEFAULT TRUE,
    and_condition       IN   VARCHAR2 DEFAULT NULL,
    source_root_name    IN   VARCHAR2 DEFAULT NULL,
    source_container_name IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 233-7 ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Oracle Replication does not validate the existence of the schema.
streams_type	The type of XStream client: <ul style="list-style-type: none"> Specify capture for a capture process. Specify apply for an apply process.

Table 233-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
streams_name	<p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error.</p> <p>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> • If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. • If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p>
queue_name	<p>The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>

Table 233-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	<p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry or LCR has a <code>NULL</code> Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p>
source_database	<p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>

Table 233-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
and_condition	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the schema rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p>See Also: Logical Change Record TYPES</p>
source_root_name	<p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p>Note: This parameter only applies to a CDB.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p>

Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the

sequence number is too long, then the schema name is truncated. A capture process or apply process uses the rules for filtering.

See Also:

- ["Operational Notes"](#)
- ["Security Model"](#)

Examples

The following is an example of a schema rule condition created for DML changes:

```
(:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

233.4.7 ADD_SUBSET_OUTBOUND_RULES Procedure

This procedure adds subset rules to an outbound server configuration. Subset rules instruct the outbound server to stream out a subset of the changes to the specified tables. Outbound servers can stream out a subset of both rows and columns.

This procedure is overloaded. One `column_list` parameter is type `VARCHAR2` and the other `column_list` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:

This procedure does not add rules to the outbound server's capture process.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES (
  server_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  condition        IN VARCHAR2  DEFAULT NULL,
  column_list      IN DBMS_UTILITY.LNAME_ARRAY,
  keep             IN BOOLEAN    DEFAULT TRUE,
  source_database  IN VARCHAR2  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES (
  server_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  condition        IN VARCHAR2  DEFAULT NULL,
  column_list      IN VARCHAR2  DEFAULT NULL,
  keep             IN BOOLEAN    DEFAULT TRUE,
  source_database  IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 233-8 ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

Parameter	Description
<code>server_name</code>	The name of the outbound server to which rules are being added. Specify an existing outbound server. Do not specify an owner.
<code>table_name</code>	<p>The name of the table specified as <code>[schema_name.]object_name</code>. For example, you can specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>If the outbound server configuration uses a local capture process, then the table must exist at the local source database. If the outbound server configuration uses a downstream capture process, then the table must exist at both the source database and at the downstream capture database.</p> <p>The specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.</p>
<code>condition</code>	<p>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.</p> <p>For example, to specify rows in the <code>hr.employees</code> table where the <code>salary</code> is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code>, enter the following as the condition:</p> <pre>' salary > 4000 and job_id = 'SA_MAN' '</pre> <p>If NULL, then the procedure raises an error.</p> <p>Note: The quotation marks in the preceding example are all single quotation marks.</p>
<code>column_list</code>	<p>The list of columns either to include in the outbound server configuration or to exclude from the outbound server configuration. Whether the columns are included or excluded depends on the setting for the <code>keep</code> parameter.</p> <p>The columns can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type <code>VARCHAR2</code>. A PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code>, where each element is the name of a column. Specify the first column in position 1. The last position must be NULL. <p>To include or exclude all of the columns in a table, specify each column in the table in the list or array.</p> <p>If NULL, then the procedure raises an error.</p>
<code>keep</code>	<p>If <code>TRUE</code>, then the columns specified in the <code>column_list</code> parameter are kept as part of the outbound server configuration. Therefore, changes to these columns that satisfy the condition in the <code>condition</code> parameter are streamed to the outbound server's client application.</p> <p>If <code>FALSE</code>, then the columns specified in the <code>column_list</code> parameter are excluded from the outbound server configuration. Therefore, changes to these columns are not streamed to the outbound server's client application.</p> <p>See Also: "Usage Notes"</p>

Table 233-8 (Cont.) ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

Parameter	Description
source_datab ase	<p>The global name of the container where the specified <code>table_names</code> and <code>schema_names</code> are located.</p> <p>If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p>

Usage Notes

When the `keep` parameter is set to `TRUE`, this procedure creates a keep columns declarative rule-based transformation for the columns listed in `column_list`.

When the `keep` parameter is set to `FALSE`, this procedure creates a delete column declarative rule-based transformation for each column listed in `column_list`.

See Also:

Oracle Database XStream Guide for information about declarative rule-based transformations

233.4.8 ADD_SUBSET_PROPAGATION_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES (
  table_name          IN   VARCHAR2,
  dml_condition       IN   VARCHAR2,
  streams_name        IN   VARCHAR2  DEFAULT NULL,
  source_queue_name   IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
  source_database     IN   VARCHAR2  DEFAULT NULL,
  insert_rule_name    OUT  VARCHAR2,
  update_rule_name    OUT  VARCHAR2,
```

```

delete_rule_name      OUT  VARCHAR2,
queue_to_queue        IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES (
  table_name           IN   VARCHAR2,
  dml_condition         IN   VARCHAR2,
  streams_name         IN   VARCHAR2   DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
  source_database      IN   VARCHAR2   DEFAULT NULL,
  queue_to_queue       IN   BOOLEAN   DEFAULT NULL);

```

Parameters

Table 233-9 ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
table_name	<p>The name of the table specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</p>
dml_condition	<p>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.</p> <p>For example, to specify rows in the <code>hr.employees</code> table where the <code>salary</code> is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code>, enter the following as the condition:</p> <pre>' salary > 4000 and job_id = 'SA_MAN' '</pre> <p>Note: The quotation marks in the preceding example are all single quotation marks.</p>
streams_name	<p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If <code>NULL</code> and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If <code>NULL</code> and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>
source_queue_name	<p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>

Table 233-9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
<code>destination_queue_name</code>	<p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p>
<code>include_tagged_lcr</code>	<p>If <code>TRUE</code>, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.</p> <p>If <code>FALSE</code>, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p>
<code>source_database</code>	<p>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
<code>insert_rule_name</code>	<p>Contains the system-generated <code>INSERT</code> rule name. This rule handles inserts and updates that must be converted into inserts.</p>
<code>update_rule_name</code>	<p>Contains the system-generated <code>UPDATE</code> rule name. This rule handles updates that remain updates.</p>
<code>delete_rule_name</code>	<p>Contains the system-generated <code>DELETE</code> rule name. This rule handles deletes and updates that must be converted into deletes</p>

Table 233-9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for **INSERT** statements, one for **UPDATE** statements, and one for **DELETE** statements. For **INSERT** and **DELETE** statements, only row LCRs that satisfy the condition specified for the `dml_condition` parameter are propagated. For **UPDATE** statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified `dml_condition`, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified `dml_condition`, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

Note:

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

233.4.9 ADD_SUBSET_RULES Procedure

This procedure adds rules to an XStream client.

It adds rules to a rule set of one of the following types of XStream clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table.
This procedure creates the specified capture process if it does not exist.
- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified streams_name. This procedure can add rules to

an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES (
    table_name          IN   VARCHAR2,
    dml_condition       IN   VARCHAR2,
    streams_type        IN   VARCHAR2 DEFAULT 'apply',
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
    include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
    source_database     IN   VARCHAR2 DEFAULT NULL,
    insert_rule_name    OUT  VARCHAR2,
    update_rule_name    OUT  VARCHAR2,
    delete_rule_name   OUT  VARCHAR2,
    source_root_name    IN   VARCHAR2  DEFAULT NULL,
    source_container_name IN VARCHAR2  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES (
    table_name          IN   VARCHAR2,
    dml_condition       IN   VARCHAR2,
    streams_type        IN   VARCHAR2 DEFAULT 'apply',
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
    include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,

```

Parameters

Table 233-10 ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process or apply process. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.
dml_condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the <code>hr.employees</code> table where the salary is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code> , enter the following as the condition: <code>' salary > 4000 and job_id = 'SA_MAN' '</code> Note: The quotation marks in the preceding example are all single quotation marks.
streams_type	The type of XStream client: <ul style="list-style-type: none"> Specify capture for a capture process. Specify apply for an apply process.

Table 233-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
streams_name	<p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>capture</code>, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If <code>NULL</code> and multiple XStream clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> • If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process. • If <code>source_database</code> is <code>NULL</code> and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process. <p>If <code>NULL</code> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If <code>NULL</code> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p>
queue_name	<p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>

Table 233-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	<p>If TRUE, then the XStream client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> • A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. • An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag. <p>If FALSE, then an XStream client performs its action only when the tag is NULL:</p> <ul style="list-style-type: none"> • A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. • An LCR is considered for apply by an apply process only if the LCR contains a NULL tag. <p>A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p>
source_database	<p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes

Table 233-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
source_root_name	<p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p>Note: This parameter only applies to a CDB.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p>

Usage Notes

Running this procedure generates three rules for the specified capture process or apply process: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured or applied. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name

plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

 **Note:**

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

233.4.10 ADD_TABLE_PROPAGATION_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES (
    table_name          IN   VARCHAR2,
    streams_name        IN   VARCHAR2  DEFAULT NULL,
    source_queue_name   IN   VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_dml         IN   BOOLEAN  DEFAULT TRUE,
    include_ddl         IN   BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
    source_database     IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name       OUT  VARCHAR2,
    ddl_rule_name       OUT  VARCHAR2,
    inclusion_rule      IN   BOOLEAN  DEFAULT TRUE,
    and_condition       IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue      IN   BOOLEAN  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES (
    table_name          IN   VARCHAR2,
    streams_name        IN   VARCHAR2  DEFAULT NULL,
    source_queue_name   IN   VARCHAR2,
    destination_queue_name IN  VARCHAR2,
```

```

include_dml          IN  BOOLEAN  DEFAULT TRUE,
include_ddl          IN  BOOLEAN  DEFAULT FALSE,
include_tagged_lcr   IN  BOOLEAN  DEFAULT FALSE,
source_database      IN  VARCHAR2  DEFAULT NULL,
inclusion_rule        IN  BOOLEAN  DEFAULT TRUE,
and_condition        IN  VARCHAR2  DEFAULT NULL,
queue_to_queue      IN  BOOLEAN  DEFAULT NULL);

```

Parameters

Table 233-11 ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as <code>[schema_name.]table_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as <code>[schema_name.]queue_name</code> . The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code> , if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code> , enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. Note: Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

Table 233-11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p> <p>The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.</p>
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p>
source_database	<p>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is TRUE, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is FALSE, then this parameter contains a NULL.</p>

Table 233-11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
and_condition	<p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the table rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p>See Also: Logical Change Record TYPES</p>
queue_to_queue	<p>If <code>TRUE</code> or <code>NULL</code>, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If <code>FALSE</code>, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> • If <code>TRUE</code> and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If <code>FALSE</code> and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If <code>NULL</code>, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a table rule condition created for filtering DML statements:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

233.4.11 ADD_TABLE_RULES Procedure

This procedure adds rules to an XStream client rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table.
 This procedure creates the specified capture process if it does not exist.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_RULES (
  table_name          IN   VARCHAR2,
  streams_type        IN   VARCHAR2,
  streams_name        IN   VARCHAR2 DEFAULT NULL,
  queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
  include_dml         IN   BOOLEAN  DEFAULT TRUE,
  include_ddl         IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
  source_database     IN   VARCHAR2 DEFAULT NULL,
  dml_rule_name       OUT  VARCHAR2,
  ddl_rule_name       OUT  VARCHAR2,
  inclusion_rule      IN   BOOLEAN  DEFAULT TRUE,
```

```

and_condition          IN   VARCHAR2  DEFAULT NULL,
source_root_name       IN   VARCHAR2  DEFAULT NULL,
source_container_name  IN   VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_RULES (
  table_name           IN   VARCHAR2,
  streams_type         IN   VARCHAR2,
  streams_name         IN   VARCHAR2  DEFAULT NULL,
  queue_name           IN   VARCHAR2  DEFAULT 'streams_queue',
  include_dml          IN   BOOLEAN   DEFAULT TRUE,
  include_ddl          IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
  source_database      IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
  and_condition        IN   VARCHAR2  DEFAULT NULL,
  source_root_name     IN   VARCHAR2  DEFAULT NULL,
  source_container_name IN   VARCHAR2  DEFAULT NULL);

```

Parameters

Table 233-12 ADD_TABLE_RULES Procedure Parameters

Parameter	Description
table_name	<p>The name of the table specified as <i>[schema_name.]object_name</i>. For example, <i>hr.employees</i>. If the schema is not specified, then the current user is the default.</p> <p>You can specify a table that does not yet exist, because Oracle Replication does not validate the existence of the table.</p>
streams_type	<p>The type of XStream client:</p> <ul style="list-style-type: none"> Specify <i>capture</i> for a capture process. Specify <i>apply</i> for an apply process.
streams_name	<p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If <i>NULL</i>, if <i>streams_type</i> is <i>capture</i>, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If <i>NULL</i> and multiple XStream clients of the specified <i>streams_type</i> for the queue exist, then the procedure raises an error.</p> <p>If <i>NULL</i>, if <i>streams_type</i> is <i>apply</i>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> If one existing apply process has the source database specified in <i>source_database</i> and uses the queue specified in <i>queue_name</i>, then the procedure uses this apply process. If <i>source_database</i> is <i>NULL</i> and one existing apply process is using the queue specified in <i>queue_name</i>, then the procedure uses this apply process. <p>If <i>NULL</i> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If <i>NULL</i> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p>

Table 233-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
queue_name	<p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>
include_dml	<p>If <code>TRUE</code>, then the procedure creates a DML rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</p>
include_ddl	<p>If <code>TRUE</code>, then the procedure creates a DDL rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p> <p>The generated rule evaluates to <code>TRUE</code> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <code>FALSE</code> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <code>FALSE</code> for changes that create synonyms or views based on the table. The rule also evaluates to <code>FALSE</code> for a change to a PL/SQL subprogram that refers to the table.</p>

Table 233-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the XStream client, then the XStream client performs its action regardless of the tag:</p> <ul style="list-style-type: none">• A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.• An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag. <p>If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the XStream client, then whether a database change is discarded does not depend on the tag.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry, session, or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for an XStream client, then the XStream client performs its action only when the tag is NULL:</p> <ul style="list-style-type: none">• A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag.• An LCR is considered for apply by an apply process only if the LCR contains a NULL tag. <p>If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the XStream client, then a database change can be discarded only if it has a NULL tag.</p> <p>A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p>

Table 233-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

Table 233-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
<code>and_condition</code>	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the <code>include_dml</code> parameter and FALSE for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the <code>include_dml</code> parameter and TRUE for the <code>include_ddl</code> parameter.</p> <p>See Also: Logical Change Record TYPES</p>
<code>source_root_name</code>	<p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p>Note: This parameter only applies to a CDB.</p>
<code>source_container_name</code>	<p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p>

Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process or apply process uses the rules for filtering.

 **See Also:**

- ["Operational Notes"](#)
- ["Security Model"](#)

Examples

The following is an example of a table rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

233.4.12 ALTER_INBOUND Procedure

This procedure modifies an XStream inbound server.

Syntax

```
DBMS_XSTREAM_ADM.ALTER_INBOUND(
    server_name IN VARCHAR2,
    apply_user  IN VARCHAR2  DEFAULT NULL,
    comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters**Table 233-13 ALTER_INBOUND Procedure Parameters**

Parameter	Description
server_name	The name of the inbound server being altered. Specify an existing inbound server. Do not specify an owner.
apply_user	The user who applies all DML and DDL changes that satisfy the inbound server rule sets, who runs user-defined apply handlers, and who runs custom rule-based transformations configured for inbound server rules. The client application must attach to the inbound server as the apply user. Specify a user to change the apply user. In this case, the user who invokes the ALTER_INBOUND procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS. If NULL, then the apply user is not changed. See "CREATE_INBOUND Procedure" for information about the required privileges for an apply user.
comment	An optional comment associated with the inbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed.

233.4.13 ALTER_OUTBOUND Procedure

This procedure modifies an XStream outbound server configuration.

This procedure always alters the specified outbound server. This procedure can also alter the outbound server's capture process when either of the following conditions is met:

- The capture process was created by the `CREATE_OUTBOUND` procedure in this package.
- The queue used by the capture process was created by the `CREATE_OUTBOUND` procedure.

To check whether this procedure can alter the outbound server's capture process, query the `CAPTURE_NAME` column in the `ALL_XSTREAM_OUTBOUND` view. When the name of the capture process appears in the `CAPTURE_NAME` column of this view, the `ALTER_OUTBOUND` procedure can manage the capture process's rules or change the capture user for the capture process. When the `CAPTURE_NAME` column of this view is `NULL`, the `ALTER_OUTBOUND` procedure cannot manage the capture process.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

Note:

Starting with Oracle Database 11g Release 2 (11.2.0.2), the `start_scn` and `start_time` parameters are included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
  server_name          IN VARCHAR2,
  table_names          IN DBMS_UTILITY.UNCL_ARRAY,
  schema_names        IN DBMS_UTILITY.UNCL_ARRAY,
  add                  IN BOOLEAN    DEFAULT TRUE,
  capture_user         IN VARCHAR2   DEFAULT NULL,
  connect_user        IN VARCHAR2   DEFAULT NULL,
  comment              IN VARCHAR2   DEFAULT NULL,
  inclusion_rule       IN BOOLEAN    DEFAULT TRUE,
  start_scn            IN NUMBER     DEFAULT NULL,
  start_time           IN TIMESTAMP  DEFAULT NULL,
  include_dml          IN BOOLEAN    DEFAULT TRUE,
  include_ddl         IN BOOLEAN    DEFAULT FALSE,
  source_database      IN VARCHAR2   DEFAULT NULL,
  source_container_name IN VARCHAR2  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
  server_name          IN VARCHAR2,
  table_names          IN VARCHAR2   DEFAULT NULL,
  schema_names        IN VARCHAR2   DEFAULT NULL,
  add                  IN BOOLEAN    DEFAULT TRUE,
  capture_user         IN VARCHAR2   DEFAULT NULL,
  connect_user        IN VARCHAR2   DEFAULT NULL,
  comment              IN VARCHAR2   DEFAULT NULL,
```

```

inclusion_rule          IN BOOLEAN          DEFAULT TRUE,
start_scn              IN NUMBER            DEFAULT NULL,
start_time            IN TIMESTAMP         DEFAULT NULL,
include_dml           IN BOOLEAN          DEFAULT TRUE,
include_ddl           IN BOOLEAN          DEFAULT FALSE,
source_database       IN VARCHAR2         DEFAULT NULL,
source_container_name IN VARCHAR2         DEFAULT NULL);

```

Parameters

Table 233-14 ALTER_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being altered. Specify an existing outbound server. Do not specify an owner.
table_names	<p>The tables that are either added to or removed from the XStream Out configuration. Whether the tables are added or removed depends on the setting for the <code>add</code> parameter.</p> <p>The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type <code>VARCHAR2</code>. A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a table. Specify the first table in position 1. The last position must be <code>NULL</code>. <p>Each table should be specified as <code>[schema_name.]table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>See Also: "Usage Notes" for more information about this parameter</p>
schema_names	<p>The schemas that are either added to or removed from the XStream Out configuration. Whether the schemas are added or removed depends on the setting for the <code>add</code> parameter.</p> <p>The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type <code>VARCHAR2</code>. A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a schema. Specify the first schema in position 1. The last position must be <code>NULL</code>. <p>Note: This procedure does not concatenate the <code>schema_names</code> parameter with the <code>table_names</code> parameter. To specify tables, enter fully qualified table names in the <code>table_names</code> parameter (<code>schema_name.table_name</code>).</p> <p>See Also: "Usage Notes" for more information about this parameter</p>
add	<p>If <code>TRUE</code>, then the procedure adds to the XStream Out configuration the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter.</p> <p>If <code>FALSE</code>, then the procedure removes from the XStream Out configuration the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter.</p>

Table 233-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
capture_user	<p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules.</p> <p>Specify a user to change the capture user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS.</p> <p>If NULL, then the capture user is not changed.</p> <p>If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user.</p> <p>Ensure that the capture user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a capture user.</p> <p>The capture process is stopped and restarted automatically when you change the value of this parameter.</p> <p>Note: If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.</p>
connect_user	<p>The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user.</p> <p>Specify a user to change the connect user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the connect_user to SYS.</p> <p>If NULL, then the connect user is not changed.</p> <p>If you change the connect user, then this procedure grants the new connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.</p> <p>Ensure that the connect user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user.</p>
comment	<p>An optional comment associated with the outbound server.</p> <p>If non-NULL, then the specified comment replaces the existing comment.</p> <p>If NULL, then the existing comment is not changed.</p>

Table 233-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
<code>inclusion_rule</code>	<p>If <code>TRUE</code> and the <code>add</code> parameter is set to <code>TRUE</code>, then the procedure adds rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter to the positive rule sets in the XStream Out configuration. When rules for tables and schemas are in positive rule sets, the XStream Out configuration streams DML and DDL changes to the tables and schemas out to the client application.</p> <p>If <code>TRUE</code> and the <code>add</code> parameter is set to <code>FALSE</code>, then the procedure removes rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter from the positive rule sets in the XStream Out configuration.</p> <p>If <code>FALSE</code> and the <code>add</code> parameter is set to <code>TRUE</code>, then the procedure adds rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter to the negative rule sets in the XStream Out configuration. When rules for tables and schemas are in negative rule sets, the XStream Out configuration does not stream changes to the tables and schemas out to the client application.</p> <p>If <code>FALSE</code> and the <code>add</code> parameter is set to <code>FALSE</code>, then the procedure removes rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter from the negative rule sets in the XStream Out configuration.</p>
<code>start_scn</code>	<p>A valid SCN for the database from which the capture process starts capturing changes. To be valid, the SCN value must be greater than or equal to the first SCN for the capture process.</p> <p>If a valid SCN is specified, then the capture process captures changes from the specified SCN when it is restarted.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>If <code>NULL</code> and the <code>start_time</code> parameter is <code>NULL</code>, then the start SCN is not changed.</p> <p>If <code>NULL</code> and the <code>start_time</code> parameter is non-<code>NULL</code>, then the start SCN is changed to match the specified start time.</p> <p>The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive.</p> <p>Note: If the capture process is enabled, then the <code>ALTER_OUTBOUND</code> procedure automatically stops and restarts the capture process when the <code>start_scn</code> parameter is non-<code>NULL</code>. If the capture process is disabled, then the <code>ALTER_OUTBOUND</code> procedure automatically starts the capture process when the <code>start_scn</code> parameter is non-<code>NULL</code>.</p>

Table 233-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
start_time	<p>A valid time from which the capture process starts capturing changes. To be valid, the time must correspond to an SCN value that is greater than or equal to the first SCN for the capture process.</p> <p>If a valid time is specified, then the capture process captures changes from the specified time when it is restarted.</p> <p>An error is returned if an invalid time is specified.</p> <p>If NULL and the start_scn parameter is NULL, then the start time is not changed.</p> <p>If NULL and the start_scn parameter is non-NULL, then the start time is changed to match the specified start SCN.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p> <p>Note: If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_time parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_time parameter is non-NULL.</p>
include_dml	<p>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
source_database	<p>The global name of the container where the specified table_names and schema_names are located.</p> <p>If source_database is non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p>

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then no rules are changed for the XStream Out configuration.

This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.
- If both the table_names and schema_names parameters are specified, then the rules for the tables and schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter.

- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the rules for the tables are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for schemas are not changed for the XStream Out configuration.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the rules for the schemas are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for tables are not changed for the XStream Out configuration.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

 **Note:**

An empty array includes one `NULL` entry.

233.4.14 CREATE_INBOUND Procedure

This procedure creates an XStream inbound server and its queue.

 **Note:**

A client application can create multiple sessions. Each session can attach to only one inbound server, and each inbound server can serve only one session at a time. However, different client application sessions can connect to different inbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an inbound server.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_INBOUND(  
    server_name IN VARCHAR2,  
    queue_name  IN VARCHAR2,  
    apply_user  IN VARCHAR2  DEFAULT NULL,  
    comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 233-15 CREATE_INBOUND Procedure Parameters

Parameter	Description
server_name	<p>The name of the inbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p>Note: The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the inbound server is created.</p>
queue_name	<p>The name of the local queue used by the inbound server, specified as <code>[schema_name.]queue_name</code>.</p> <p>If the specified queue exists, then it is used. If the specified queue does not exist, then the procedure creates it.</p> <p>For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>Note: An inbound server's queue is used only to store error transactions.</p>
apply_user	<p>The apply user. If NULL, then the current user is the default.</p> <p>The client application must attach to the inbound server as the apply user.</p> <p>The apply user is the user in whose security domain an inbound server evaluates whether LCRs satisfy its rule sets, applies DML and DDL changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to perform these actions. This procedure grants the apply user dequeue privileges on the queue used by the inbound server and configures the user as a secure queue user.</p> <p>In addition to the privileges granted by this procedure, you must grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> • The necessary privileges to perform DML and DDL changes on the apply objects • EXECUTE privilege on the rule sets used by the inbound server • EXECUTE privilege on all rule-based transformation functions used in the rule set • EXECUTE privilege on all apply handler procedures <p>You can grant these privileges directly to the apply user, or you can grant them through roles.</p> <p>In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the inbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p>Note: If the apply user for an inbound server is dropped using <code>DROP USER . . . CASCADE</code>, then the inbound server is also dropped automatically.</p>
comment	An optional comment associated with the inbound server.

Usage Notes

By default, an inbound server does not use rules or rule sets. Therefore, an inbound server applies all of the LCRs sent to it by an XStream client application. However, to filter the LCRs

sent to an inbound server, you can add rules and rule sets to an inbound server using the `DBMS_XSTREAM_ADM` and `DBMS_RULE_ADM` packages.

In a CDB, you can execute the `CREATE_INBOUND` procedure from either the root or a PDB. The inbound server is restricted to receiving LCRs from one source database and only applying the changes to its local container. If the inbound server is at the root level, then the apply user must be a common user.

 **See Also:**

Oracle Database XStream Guide

233.4.15 CREATE_OUTBOUND Procedure

This procedure creates an XStream outbound server, queue, and capture process to enable client applications to stream out Oracle database changes.

 **Note:**

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

 **Note:**

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See "OCIXStreamOutAttach()" in the *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- If the `capture_name` parameter is `NULL`, then this procedure automatically generates a name for the capture process that it creates.
- This procedure automatically generates a name for the queue that it creates.
- This procedure enables both the capture process and outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name` parameter is included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
  server_name          IN VARCHAR2,
  source_database      IN VARCHAR2  DEFAULT NULL,
  table_names          IN DBMS_UTILITY.UNCL_ARRAY,
  schema_names        IN DBMS_UTILITY.UNCL_ARRAY,
  capture_user         IN VARCHAR2  DEFAULT NULL,
  connect_user         IN VARCHAR2  DEFAULT NULL,
  comment              IN VARCHAR2  DEFAULT NULL,
  capture_name         IN VARCHAR2  DEFAULT NULL,
  include_dml          IN BOOLEAN   DEFAULT TRUE,
  include_ddl         IN BOOLEAN   DEFAULT FALSE,
  source_root_name     IN VARCHAR2  DEFAULT NULL,
  source_container_name IN VARCHAR2  DEFAULT NULL,
  lcrld_version        IN NUMBER    DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
  server_name          IN VARCHAR2,
  source_database      IN VARCHAR2  DEFAULT NULL,
  table_names          IN VARCHAR2  DEFAULT NULL,
  schema_names        IN VARCHAR2  DEFAULT NULL,
  capture_user         IN VARCHAR2  DEFAULT NULL,
  connect_user         IN VARCHAR2  DEFAULT NULL,
  comment              IN VARCHAR2  DEFAULT NULL,
  capture_name         IN VARCHAR2  DEFAULT NULL,
  include_dml          IN BOOLEAN   DEFAULT TRUE,
  include_ddl         IN BOOLEAN   DEFAULT FALSE,
  source_root_name     IN VARCHAR2  DEFAULT NULL,
  source_container_name IN VARCHAR2  DEFAULT NULL,
  lcrld_version        IN NUMBER    DEFAULT NULL);
```

Parameters

Table 233-16 CREATE_OUTBOUND Procedure Parameters

Parameter	Description
<code>server_name</code>	<p>The name of the outbound server being created. A <code>NULL</code> specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p>Note: The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</p>
<code>source_database</code>	<p>The global name of the source database. The source database is where the changes to be captured originated.</p> <p>If non-<code>NULL</code>, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>In a non-CDB, if non-<code>NULL</code> and the specified name is different from the global name of the current database, then downstream capture is assumed. In this case, configure the transmission of redo data from the source database to the downstream database before running the <code>CREATE_OUTBOUND</code> procedure. See <i>Oracle Database XStream Guide</i> for instructions.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p>
<code>table_names</code>	<p>The tables for which DML and DDL changes are streamed out to the XStream client application. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> • Comma-delimited list of type <code>VARCHAR2</code>. • A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a table. Specify the first table in position 1. The last position must be <code>NULL</code>. <p>Each table should be specified as <code>[schema_name.]table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>See Also: "Usage Notes" for more information about this parameter</p>

Table 233-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
schema_names	<p>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type <code>VARCHAR2</code>. A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a schema. Specify the first schema in position 1. The last position must be <code>NULL</code>. <p>Note: This procedure does not concatenate the <code>schema_names</code> parameter with the <code>table_names</code> parameter. To specify tables, enter fully qualified table names in the <code>table_names</code> parameter (<code>schema_name.table_name</code>).</p> <p>See Also: "Usage Notes" for more information about this parameter</p>
capture_user	<p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If <code>NULL</code>, then the current user is the default.</p> <p>This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user.</p> <p>In addition, ensure that the capture user has the following privileges:</p> <ul style="list-style-type: none"> <code>EXECUTE</code> privilege on the rule sets used by the capture process <code>EXECUTE</code> privilege on all rule-based transformation functions used in the positive rule set <p>You can grant these privileges directly to the apply user, or you can grant them through roles.</p> <p>In addition, the capture user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> <p>Only a user who is granted the <code>DBA</code> role can set a capture user. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p>A capture user does not require privileges on a database object to capture changes made to it. The capture process can pass these changes to a custom rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.</p>

Table 233-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
connect_user	<p>The user who can attach to the specified outbound server to retrieve the change stream. The client application must attach to the outbound server as the specified connect user.</p> <p>If NULL, then the current user is the default.</p> <p>The connect user is the user in whose security domain an outbound server evaluates LCRs against its rule sets and runs custom rule-based transformations configured for outbound server rules. This user must have the necessary privileges to perform these actions. This procedure grants the connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.</p> <p>In addition to the privileges granted by this procedure, grant the following privileges to the connect user:</p> <ul style="list-style-type: none"> EXECUTE privilege on the rule sets used by the outbound server EXECUTE privilege on all rule-based transformation functions used in the rule set <p>You can grant these privileges directly to the connect user, or you can grant them through roles.</p> <p>In addition, the connect user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the outbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p>
comment	<p>An optional comment associated with the outbound server.</p>
capture_name	<p>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.</p> <p>The capture process must not exist. If the specified name matches the name of an existing capture process, then an error is raised.</p> <p>If the name does not match the name of an existing capture process, then the procedure creates a new capture process with the specified name.</p> <p>If NULL, then the system creates a new capture process with a system-generated name.</p> <p>Note: The capture process name cannot be altered after the capture process is created.</p>
include_dml	<p>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>

Table 233-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
<code>source_root_name</code>	<p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-<code>NULL</code> value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p>Note: This parameter only applies to a CDB.</p>
<code>source_container_name</code>	<p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p>
<code>lcrld_version</code>	<p>The LCRID version for captured LCRs, either 1 or 2.</p> <p>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</p> <p>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</p> <p>If <code>NULL</code>, the default, and the database compatibility level is 12.2.0 or higher, then the <code>lcrld_version</code> is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the <code>lcrld_version</code> is set to 1 internally.</p>

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the `table_names` and `schema_names` parameters:

- If both the `table_names` and `schema_names` parameters are `NULL` or empty, then the outbound server streams all DML and DDL changes to the client application.
This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to `NULL`. Do not specify `NULL` for both `table_names` and `schema_names` in the same call; otherwise, error `PLS-00307` is returned.
- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schema.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

 **Note:**

An empty array includes one `NULL` entry.

233.4.16 DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

 **Note:**

- The `DELETE_COLUMN` procedure supports the same data types supported by Oracle Replication capture processes.
- The `DELETE_COLUMN` procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the `KEEP_COLUMNS` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by capture processes
- [KEEP_COLUMNS Procedure](#)

Syntax

```
DBMS_XSTREAM_ADM.DELETE_COLUMN (  
  rule_name      IN  VARCHAR2,  
  table_name     IN  VARCHAR2,  
  column_name    IN  VARCHAR2,  
  value_type     IN  VARCHAR2  DEFAULT '*',
```

```

step_number IN NUMBER DEFAULT 0,
operation   IN VARCHAR2 DEFAULT 'ADD');

```

Parameters

Table 233-17 DELETE_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as <code>[schema_name.] rule_name</code> . If NULL, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
table_name	The name of the table from which the column is deleted in the row LCR, specified as <code>[schema_name.] object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
column_name	The name of the column deleted from each row LCR that satisfies the rule.
value_type	Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.
step_number	The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `DELETE_COLUMN` procedure when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all delete column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all delete column transformations with the specified <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified <code>column_name</code> and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	Remove all delete column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	NULL	Remove all delete column transformations with the specified <code>column_name</code> for the specified rule.

table_name	column_name	step_number	Result
non-NULL	non-NULL	NULL	Remove all delete column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all delete column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule.

233.4.17 DROP_INBOUND Procedure

This procedure removes an inbound server configuration.

This procedure always removes the specified inbound server. This procedure also removes the queue for the inbound server if all of the following conditions are met:

- One call to the CREATE_INBOUND procedure created the queue.
- The inbound server is the only subscriber to the queue.

See Also:

"CREATE_INBOUND Procedure"

Syntax

```
DBMS_XSTREAM_ADM.DROP_INBOUND(
    server_name IN VARCHAR2);
```

Parameters

Table 233-18 DROP_INBOUND Procedure Parameters

Parameter	Description
server_name	The name of the inbound server being removed. Specify an existing inbound server. Do not specify an owner.

233.4.18 DROP_OUTBOUND Procedure

This procedure removes an outbound server configuration.

This procedure always drops the specified outbound server. This procedure also drops the queue used by the outbound server if both of the following conditions are met:

- The queue was created by the CREATE_OUTBOUND procedure in this package.
- The outbound server is the only subscriber to the queue.

If either one of the preceding conditions is not met, then the `DROP_OUTBOUND` procedure only drops the outbound server. It does not drop the queue.

This procedure also drops the capture process for the outbound server if both of the following conditions are met:

- The procedure can drop the outbound server's queue.
- The capture process was created by the `CREATE_OUTBOUND` procedure.

If the procedure can drop the queue but cannot manage the capture process, then it drops the queue without dropping the capture process.

See Also:

- ["ADD_OUTBOUND Procedure"](#)
- ["CREATE_OUTBOUND Procedure"](#)

Syntax

```
DBMS_XSTREAM_ADM.DROP_OUTBOUND (
    server_name IN VARCHAR2);
```

Parameters

Table 233-19 DROP_OUTBOUND Procedure Parameters

Parameter	Description
<code>server_name</code>	The name of the outbound server being removed. Specify an existing outbound server. Do not specify an owner.

233.4.19 ENABLE_GG_XSTREAM_FOR_STREAMS Procedure

This procedure enables XStream optimizations and performance optimizations for Oracle Replication components.

This procedure is intended for users of Oracle Replication who want to enable XStream optimizations and optimizations. For example, you can enable the optimizations for an Oracle Replication configuration that uses capture processes and apply processes to replicate changes between Oracle databases.

These capabilities and optimizations are enabled automatically for XStream components, such as outbound servers, inbound servers, and capture processes that send changes to outbound servers. It is not necessary to run this procedure for XStream components.

When XStream optimizations are enabled, Oracle Replication components can stream ID key LCRs and sequence LCRs. The XStream performance optimizations improve efficiency in various areas, including:

- LCR processing
- Handling large transactions
- DML execution during apply

- Dependency computation and scheduling
- Capture process parallelism

Syntax

```
DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS (
    enable IN BOOLEAN TRUE);
```

Parameters

Table 233-20 ENABLE_GG_XSTREAM_FOR_STREAMS Procedure Parameters

Parameter	Description
enable	If TRUE, then enable XStream performance optimizations for Oracle Replication components. If FALSE, then disable XStream performance optimizations for Oracle Replication components.

Usage Notes

The following usage notes apply to this procedure:

- When you run this procedure, all capture processes and apply processes are restarted.
- After you run this procedure, the `PURPOSE` column in the following views displays XStream Streams:
 - ALL_APPLY
 - DBA_APPLY
 - ALL_CAPTURE
 - DBA_CAPTURE
- A license for the Oracle GoldenGate product is required to enable XStream performance optimizations for Oracle Replication components.

See Also:

- [IS_GG_XSTREAM_FOR_STREAMS Function](#)
- *Oracle Database XStream Guide, Chapter 1, Prerequisites for XStream*

233.4.20 GET_MESSAGE_TRACKING Function

The `GET_MESSAGE_TRACKING` Function returns the tracking label for the current session.

See Also:

- [SET_MESSAGE_TRACKING Procedure](#)

Syntax

```
DBMS_XSTREAM_ADM.GET_MESSAGE_TRACKING  
RETURN VARCHAR2;
```

233.4.21 GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

See Also:

["SET_TAG Procedure"](#)

Syntax

```
DBMS_XSTREAM_ADM.GET_TAG  
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON  
DECLARE  
    raw_tag RAW(2000);  
BEGIN  
    raw_tag := DBMS_XSTREAM_ADM.GET_TAG();  
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));  
END;  
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_XSTREAM_ADM.GET_TAG FROM DUAL;
```

233.4.22 IS_GG_XSTREAM_FOR_STREAMS Function

This function returns `TRUE` if XStream performance optimizations are enabled for Oracle Replication components, or this function returns `FALSE` if XStream performance optimizations are disabled for Oracle Replication components.

See Also:

["ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"](#)

Syntax

```
DBMS_XSTREAM_ADM.IS_GG_XSTREAM_FOR_STREAMS  
RETURN BOOLEAN;
```

233.4.23 KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Replication capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes
- [DELETE_COLUMN Procedure](#)

Syntax

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS(  
  rule_name      IN  VARCHAR2,  
  table_name     IN  VARCHAR2,  
  column_list    IN  VARCHAR2,  
  value_type     IN  VARCHAR2 DEFAULT '*',  
  step_number    IN  NUMBER DEFAULT 0,  
  operation      IN  VARCHAR2 DEFAULT 'ADD');
```

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS(  
  rule_name      IN  VARCHAR2,  
  table_name     IN  VARCHAR2,  
  column_table   IN  DBMS_UTILITY.LNAME_ARRAY,  
  value_type     IN  VARCHAR2 DEFAULT '*',
```

```

step_number IN NUMBER DEFAULT 0,
operation   IN VARCHAR2 DEFAULT 'ADD');

```

Parameters

Table 233-21 KEEP_COLUMNS Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
table_name	The name of the table for which the columns are kept in the row LCR, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
column_list	The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type <code>VARCHAR2</code> . The transformation removes columns that are not in the list from the row LCR. If this parameter is set to NULL, and the <code>column_table</code> parameter is also set to NULL, then the procedure raises an error.
column_table	The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code> , where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the <code>column_list</code> parameter is also set to NULL, then the procedure raises an error.
value_type	Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_list`, `column_table`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `KEEP_COLUMNS` procedure when one or more of these parameters is NULL:

table_name	column_list/ column_table	step_number	Result
NULL	NULL	NULL	Remove all keep columns transformations for the specified rule.

table_name	column_list/ column_table	step_number	Result
NULL	NULL	non-NULL	Remove all keep columns transformations with the specified <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified <code>column_list/column_table</code> and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	Remove all keep columns transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	NULL	Remove all keep columns transformations with the specified <code>column_list/column_table</code> for the specified rule.
non-NULL	non-NULL	NULL	Remove all keep columns transformations with the specified <code>table_name</code> and <code>column_list/column_table</code> for the specified rule.
non-NULL	NULL	NULL	Remove all keep columns transformations with the specified <code>table_name</code> for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified <code>table_name</code> , <code>column_list/column_table</code> , and <code>step_number</code> for the specified rule.

233.4.24 MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the `MERGE_STREAMS_JOB` procedure. The `MERGE_STREAMS_JOB` procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the `MERGE_STREAMS_JOB` procedure does nothing. Typically, it is best to run the `MERGE_STREAMS_JOB` procedure instead of running the `MERGE_STREAMS` procedure directly.

However, you can choose to run the `MERGE_STREAMS` procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The `CAPTURE_MESSAGE_CREATE_TIME` in the `GV$XSTREAM_CAPTURE` view of the cloned capture process has caught up to, or nearly caught up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The `MERGE_STREAMS` procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
 - The acknowledged SCN of the cloned propagation.
 - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

[SPLIT_STREAMS Procedure](#)

Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS (
    cloned_propagation_name  IN  VARCHAR2,
    propagation_name        IN  VARCHAR2  DEFAULT NULL,
    queue_name               IN  VARCHAR2  DEFAULT NULL,
    perform_actions          IN  BOOLEAN   DEFAULT TRUE,
    script_name              IN  VARCHAR2  DEFAULT NULL,
    script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 233-22 MERGE_STREAMS Procedure Parameters

Parameter	Description
<code>cloned_propagation_name</code>	<p>The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.</p> <p>You must specify an existing propagation name. Do not specify an owner.</p>
<code>propagation_name</code>	<p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> • The queue specified in the <code>queue_name</code> parameter does not exist. • The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process.
<code>queue_name</code>	<p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If <code>NULL</code>, then the existing, original queue is the source queue for the propagation that is merged back. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.</p>
<code>perform_actions</code>	<p>If <code>TRUE</code>, then the procedure performs the necessary actions to merge the streams directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to merge the streams directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> • <code>script_name</code> • <code>script_directory_object</code>

Table 233-22 (Cont.) MERGE_STREAMS Procedure Parameters

Parameter	Description
<code>script_name</code>	<p>If non-NULL and the <code>perform_actions</code> parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script.</p> <p>If NULL and the <code>perform_actions</code> parameter is FALSE, then the procedure raises an error.</p>
<code>script_directory_object</code>	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p> <p>Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>

Usage Notes

You can use the `MERGE_STREAMS` procedure to merge two streams that were not split using the `SPLIT_STREAMS` procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

233.4.25 MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the `MERGE_STREAMS` procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

If the `auto_merge_threshold` parameter was set to a positive number in the `SPLIT_STREAMS` procedure that split the streams, then a merge job runs the `MERGE_STREAMS_JOB` procedure automatically according to its schedule. The schedule name is specified for the `schedule_name` parameter, and the merge job name is specified for the `merge_job_name`

parameter when the `MERGE_STREAMS_JOB` procedure is run automatically. The merge job and its schedule were created by the `SPLIT_STREAMS` procedure.

If the `auto_merge_threshold` parameter was set to `NULL` or 0 (zero) in the `SPLIT_STREAMS` procedure that split the streams, then you can run the `MERGE_STREAMS_JOB` procedure manually. In this case, it is not run automatically.

See Also:

- [MERGE_STREAMS Procedure](#)
- [SPLIT_STREAMS Procedure](#)

Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS_JOB (
    cloned_propagation_name IN VARCHAR2,
    propagation_name       IN VARCHAR2 DEFAULT NULL,
    queue_name              IN VARCHAR2 DEFAULT NULL,
    merge_threshold         IN NUMBER,
    schedule_name           IN VARCHAR2 DEFAULT NULL,
    merge_job_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 233-23 MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
<code>cloned_propagation_name</code>	<p>The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.</p> <p>You must specify an existing propagation name. Do not specify an owner.</p>
<code>propagation_name</code>	<p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> • The queue specified in the <code>queue_name</code> parameter does not exist. • The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process.

Table 233-23 (Cont.) MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
queue_name	<p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure.</p> <p>Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.</p>
merge_threshold	<p>The merge threshold in seconds.</p> <p>The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV\$XSTREAM_CAPTURE dynamic performance view determines whether the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.</p>
schedule_name	<p>The name of the schedule for the merge job.</p> <p>If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.</p> <p>Specify NULL if you run this procedure manually.</p>
merge_job_name	<p>The name of the job that merges the streams.</p> <p>If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.</p> <p>Specify NULL if you run this procedure manually.</p>

Usage Notes

You can use the MERGE_STREAMS_JOB procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

233.4.26 PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Replication data dictionary information at the local database for the specified object.

Note:

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

You can use this procedure to remove Oracle Replication metadata that is not needed currently and will not be needed in the future.

Syntax

```
DBMS_XSTREAM_ADM.PURGE_SOURCE_CATALOG (
    source_database    IN  VARCHAR2,
    source_object_name IN  VARCHAR2,
    source_object_type IN  VARCHAR2,
    source_root_name  IN  VARCHAR2);
```

Parameters

Table 233-24 PURGE_SOURCE_CATALOG Procedure Parameters

Parameter	Description
source_database	In a non-CDB, specify the global name of the source database containing the database object. In a CDB, specify the global name of the container containing the database object. The container can be the root or a PDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
source_object_name	The name of the object specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
source_object_type	Type of the object. Currently, <code>TABLE</code> is the only possible object type.

Table 233-24 (Cont.) PURGE_SOURCE_CATALOG Procedure Parameters

Parameter	Description
<code>source_root_name</code>	<p>The global name of the source root containing the object in a CDB. The source root is where the changes being captured originated in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p>If the <code>source_root_name</code> parameter is <code>NULL</code>, then the global name of the local root is the default.</p> <p>Note: This parameter only applies to a CDB.</p>

Usage Notes

The global name of the source database containing the object must be specified for the `source_database` parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the `hr.employees` table at the `dbs1.net` source database are being applied to the `hr.employees` table at the `dbs2.net` destination database. Also, suppose `hr.employees` at `dbs2.net` is not a source at all. In this case, specifying `dbs2.net` as the `source_database` for this table results in an error. However, specifying `dbs1.net` as the `source_database` for this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions is true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

Note:

These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

233.4.27 RECOVER_OPERATION Procedure

This procedure provides options for split and merge operations that stopped because they encountered an errors.

This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. Split and merge operations might be run in an XStream Out environment in which multiple outbound servers use the same capture process.

This procedure only can perform these actions for split and merge operations using the `split_threshold` and `merge_threshold` capture process parameters set to non-NULL values to enable automatic split and merge.

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

The data dictionary views are populated at the database that contains the capture process.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

Run the `RECOVER_OPERATION` procedure at the database that contains the capture process.

Note:

To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10g Release 2 or later databases.

See Also:

- ["SPLIT_STREAMS Procedure"](#)
- ["MERGE_STREAMS Procedure"](#)
- ["MERGE_STREAMS_JOB Procedure"](#)

Syntax

```
DBMS_XSTREAM_ADM.RECOVER_OPERATION(  
    script_id      IN RAW,  
    operation_mode IN VARCHAR2 DEFAULT 'FORWARD');
```

Parameters

Table 233-25 RECOVER_OPERATION Procedure Parameters

Parameter	Description
<code>script_id</code>	The operation id of the operation that is being rolled forward, rolled back, or purged. Query the <code>SCRIPT_ID</code> column of the <code>DBA_RECOVERABLE_SCRIPT</code> data dictionary view to determine the operation id.
<code>operation_mode</code>	<p>If <code>FORWARD</code>, then the procedure rolls forward the operation. Specify <code>FORWARD</code> to try to complete the operation.</p> <p>If <code>ROLLBACK</code>, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view. The other views retain information about the operation for 30 days.</p> <p>If <code>PURGE</code>, then the procedure moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view without rolling the operation back. The other views retain information about the operation for 30 days.</p>

233.4.28 REMOVE_QUEUE Procedure

This procedure removes the specified `ANYDATA` queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the `drop_unused_queue_table` parameter is set to `TRUE`, then drops the queue table if it is empty and no other queues are using it.
5. If the `cascade` parameter is set to `TRUE`, then drops all of the XStream clients that are using the queue.

 **Note:**

The specified queue must be a `ANYDATA` queue.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_QUEUE (
  queue_name          IN  VARCHAR2,
  cascade             IN  BOOLEAN  DEFAULT FALSE,
  drop_unused_queue_table IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 233-26 REMOVE_QUEUE Procedure Parameters

Parameter	Description
queue_name	The name of the queue to remove, specified as [<i>schema_name</i> .] <i>queue_name</i> . For example, <code>strmadmin.streams_queue</code> . If the schema is not specified, then the current user is the default.
cascade	If <code>TRUE</code> , then the procedure drops any XStream clients that use the queue. If <code>FALSE</code> , then the procedure raises an error if there are any XStream clients that use the queue. Before you run this procedure with the <code>cascade</code> parameter set to <code>FALSE</code> , make sure no XStream clients are using the queue currently.
drop_unused_queue_table	If <code>TRUE</code> and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If <code>FALSE</code> , then the procedure does not drop the queue table.

233.4.29 REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.

Note:

If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_RULE (
  rule_name          IN  VARCHAR2,
  streams_type       IN  VARCHAR2,
  streams_name       IN  VARCHAR2,
  drop_unused_rule   IN  BOOLEAN  DEFAULT TRUE,
  inclusion_rule     IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 233-27 REMOVE_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule to remove, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure removes all rules from the specified capture process, apply process, or propagation rule set. For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code> , enter <code>hr.prop_rule1</code> . If the schema is not specified, then the current user is the default.
<code>streams_type</code>	The type of XStream client: <ul style="list-style-type: none"> Specify <code>capture</code> for a capture process. Specify <code>propagation</code> for a propagation. Specify <code>apply</code> for an apply process.
<code>streams_name</code>	The name of the XStream client, which can be a capture process, propagation, or apply process. Do not specify an owner. If the specified XStream client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified XStream client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.
<code>drop_unused_rule</code>	If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database. If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database. If FALSE, then the procedure does not drop the rule from the database.
<code>inclusion_rule</code>	If <code>inclusion_rule</code> is TRUE, then the procedure removes the rule from the positive rule set for the XStream client. If <code>inclusion_rule</code> is FALSE, then the procedure removes the rule from the negative rule set for the XStream client.

233.4.30 REMOVE_SUBSET_OUTBOUND_RULES Procedure

This procedure removes subset rules from an outbound server configuration.

The names of the specified insert, update, and delete rules must match those generated by the `ADD_SUBSET_OUTBOUND_RULES` procedure. To view the rule names for subset rules, run the following query:

```
SELECT RULE_OWNER, SUBSETTING_OPERATION, RULE_NAME
FROM ALL_XSTREAM_RULES
WHERE SUBSETTING_OPERATION IS NOT NULL;
```

 **Note:**

- This procedure removes the declarative rule-based transformation associated with each rule it removes.
- This procedure does not remove rules from the outbound server's capture process.

 **See Also:**

"ADD_SUBSET_OUTBOUND_RULES Procedure"

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_SUBSET_OUTBOUND_RULES(
  server_name      IN VARCHAR2,
  insert_rule_name IN VARCHAR2,
  update_rule_name IN VARCHAR2,
  delete_rule_name IN VARCHAR2);
```

233.4.31 REMOVE_XSTREAM_CONFIGURATION Procedure

This procedure removes the XStream configuration at the local database.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_XSTREAM_CONFIGURATION(
  container IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 233-28 REMOVE_XSTREAM_CONFIGURATION Procedure Parameters

Parameter	Description
container	<p>If CURRENT, then the XStream configuration is removed from the current container. CURRENT can be specified while connected to the root or to a PDB in a CDB.</p> <p>If ALL, then the XStream configuration is removed from all of the containers in the CDB. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then the XStream configuration is removed from the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p>Note: This parameter only applies to a CDB.</p>

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes

- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_XSTREAM_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_XSTREAM_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_XSTREAM_ADM` package.
- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the `DBMS_RULE_ADM` package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

 **Note:**

Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire XStream configuration at a database. If an Oracle Replication configuration exists at the database, then this procedure also removes the entire Oracle Replication configuration.

 **Note:**

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

233.4.32 RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

 **Note:**

- The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Replication capture processes.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

Oracle Database XStream Guide for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes

Syntax

```
DBMS_XSTREAM_ADM.RENAME_COLUMN (  
    rule_name          IN  VARCHAR2,  
    table_name         IN  VARCHAR2,  
    from_column_name   IN  VARCHAR2,  
    to_column_name     IN  VARCHAR2,
```

```
value_type      IN VARCHAR2 DEFAULT '*',
step_number    IN NUMBER   DEFAULT 0,
operation      IN VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 233-29 RENAME_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
table_name	The name of the table in which the column is renamed in the row LCR, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
from_column_name	The name of the column to be renamed in each row LCR that satisfies the rule.
to_column_name	The new name of the column in each row LCR that satisfies the rule.
value_type	Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_COLUMN` procedure when one or more of these parameters is NULL:

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	NULL	NULL	Remove all rename column transformations for the specified rule.
NULL	NULL	NULL	non-NULL	Remove all rename column transformations with the specified <code>step_number</code> for the specified rule.

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>to_column_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.
NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>column_name</code> for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> and <code>column_name</code> for the specified rule.
NULL	non-NULL	NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> for the specified rule.
NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.

233.4.33 RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

Note:

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

Oracle Database XStream Guide for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.RENAME_SCHEMA (
  rule_name          IN  VARCHAR2,
  from_schema_name  IN  VARCHAR2,
  to_schema_name    IN  VARCHAR2,
  step_number       IN  NUMBER    DEFAULT 0,
  operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 233-30 RENAME_SCHEMA Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as <code>[schema_name.]rule_name</code> . If <code>NULL</code> , then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
from_schema_name	The name of the schema to be renamed in each row LCR that satisfies the rule.
to_schema_name	The new name of the schema in each row LCR that satisfies the rule.
step_number	The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering
operation	Specify <code>'ADD'</code> to add the transformation to the rule. Specify <code>'REMOVE'</code> to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified `from_schema_name`, `to_schema_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_SCHEMA` procedure when one or more of these parameters is `NULL`:

<code>from_schema_name</code>	<code>to_schema_name</code>	<code>step_number</code>	Result
NULL	NULL	NULL	Remove all rename schema transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename schema transformations with the specified <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified <code>to_schema_name</code> and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename schema transformations with the specified <code>from_schema_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	NULL	Remove all rename schema transformations with the specified <code>to_schema_name</code> for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename schema transformations with the specified <code>from_schema_name</code> and <code>to_schema_name</code> for the specified rule.
non-NULL	NULL	NULL	Remove all rename schema transformations with the specified <code>from_schema_name</code> for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified <code>from_schema_name</code> , <code>to_schema_name</code> , and <code>step_number</code> for the specified rule.

233.4.34 RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

Note:

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

Oracle Database XStream Guide for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.RENAME_TABLE(
  rule_name          IN VARCHAR2,
  from_table_name    IN VARCHAR2,
  to_table_name      IN VARCHAR2,
  step_number        IN NUMBER    DEFAULT 0,
  operation           IN VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 233-31 RENAME_TABLE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.]rule_name</code> . If <code>NULL</code> , then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
<code>from_table_name</code>	The name of the table to be renamed in each row LCR that satisfies the rule, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
<code>to_table_name</code>	The new name of the table in each row LCR that satisfies the rule, specified as <code>[schema_name.]object_name</code> . For example, <code>humres.staff</code> . The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.

Table 233-31 (Cont.) RENAME_TABLE Procedure Parameters

Parameter	Description
step_number	The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified `from_table_name`, `to_table_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_TABLE` procedure when one or more of these parameters is `NULL`:

from_table_name	to_table_name	step_number	Result
NULL	NULL	NULL	Remove all rename table transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename table transformations with the specified <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified <code>to_table_name</code> and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename table transformations with the specified <code>from_table_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	NULL	Remove all rename table transformations with the specified <code>to_table_name</code> for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename table transformations with the specified <code>from_table_name</code> and <code>to_table_name</code> for the specified rule.
non-NULL	NULL	NULL	Remove all rename table transformations with the specified <code>from_table_name</code> for the specified rule.

from_table_name	to_table_name	step_number	Result
non-NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule.

233.4.35 SET_MESSAGE_TRACKING Procedure

This procedure sets the tracking label for logical change records (LCRs) produced by the current session.

This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

Note:

The tracking label set by this procedure does not track non-LCR messages.

See Also:

KAWGET_MESSAGE_TRACKING

Syntax

```
DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING(
    tracking_label IN VARCHAR2 DEFAULT 'Streams_tracking',
    actions       IN NUMBER   DEFAULT DBMS_XSTREAM_ADM.ACTION_MEMORY);
```

Parameters

Table 233-32 SET_MESSAGE_TRACKING Procedure Parameters

Parameter	Description
tracking_label	The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session. The size limit for a label is 4,000 bytes.
actions	When DBMS_XSTREAM_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory. Currently, DBMS_XSTREAM_ADM.ACTION_MEMORY is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.

233.4.36 SET_PARAMETER Procedure

This procedure sets a parameter for an outbound server, an inbound server, or an outbound server's capture process.

Syntax

```
DBMS_XSTREAM_ADM.SET_PARAMETER (
    streams_name    IN  VARCHAR2,
    streams_type    IN  VARCHAR2,
    parameter       IN  VARCHAR2,
    value           IN  VARCHAR2  DEFAULT NULL,
    no_wait         IN  BOOLEAN   DEFAULT FALSE,
    source_database IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 233-33 SET_PARAMETER Procedure Parameters

Parameter	Description
streams_type	The type of XStream client: <ul style="list-style-type: none"> Specify <code>capture</code> for a capture process. Specify <code>apply</code> for an outbound server or inbound server.
streams_name	The name of the capture process, outbound server, or inbound server. Do not specify an owner.
parameter	The name of the parameter you are setting. See " Capture Process Parameters " for information about capture process parameters. See " Apply Component Parameters " for information about outbound server and inbound server parameters.
value	The value to which the parameter is set. If <code>NULL</code> , then the parameter is set to its default value.
no_wait	If <code>TRUE</code> , then the parameter is set immediately. If <code>FALSE</code> , then the parameter is set after synchronizing with the running capture process, inbound server, or outbound server. When you modify multiple parameters for the same process consecutively, setting this parameter to <code>TRUE</code> speeds up each call. However, if the process is currently running, you must set this parameter to <code>FALSE</code> in the last to the procedure to ensure that the process uses the modified parameter values. If the <code>no_wait</code> parameter is set to <code>TRUE</code> for the last call to the procedure, the running process might not detect the parameter changes.

Table 233-33 (Cont.) SET_PARAMETER Procedure Parameters

Parameter	Description
source_database	<p>If CURRENT, then the parameter is set only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.</p> <p>If ALL, then the parameter is set in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then the parameter is set in the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p>Note: This parameter only applies to CDBs. Also, a non-null value can be specified only for the following parameters:</p> <ul style="list-style-type: none"> include_objects capture parameter excludetag capture or apply parameter excludetrans capture or apply parameter excludeuser capture or apply parameter excludeuserid capture or apply parameter getreplicates capture or apply parameter getappls capture or apply parameter

233.4.37 SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session.

Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

Syntax

```
DBMS_XSTREAM_ADM.SET_TAG(
    tag IN RAW DEFAULT NULL);
```

Parameters

Table 233-34 SET_TAG Procedure Parameters

Parameter	Description
tag	<p>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits.</p> <p>By default, the tag for a session is NULL.</p> <p>The size limit for a tag value is 2000 bytes.</p>

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_XSTREAM_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also:

[BUILD Procedure](#)

233.4.38 SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```
DBMS_XSTREAM_ADM.SET_UP_QUEUE (
  queue_table      IN  VARCHAR2  DEFAULT 'streams_queue_table',
  storage_clause  IN  VARCHAR2  DEFAULT NULL,
  queue_name      IN  VARCHAR2  DEFAULT 'streams_queue',
  queue_user      IN  VARCHAR2  DEFAULT NULL,
  comment        IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 233-35 SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_table	The name of the queue table specified as <code>[schema_name.]queue_table_name</code> . For example, <code>strmadmin.streams_queue_table</code> . If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner. Queue table names can be a maximum of 24 bytes.

Table 233-35 (Cont.) SET_UP_QUEUE Procedure Parameters

Parameter	Description
storage_clause	<p>The storage clause for queue table</p> <p>The storage parameter is included in the <code>CREATE TABLE</code> statement when the queue table is created. You can specify any valid table storage clause.</p> <p>If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause.</p> <p>If <code>NULL</code>, then the procedure uses the storage characteristics of the tablespace in which the queue table is created.</p> <p>See Also: <i>Oracle Database SQL Language Reference</i> for more information about storage clauses</p>
queue_name	<p>The name of the queue that will function as the <code>ANYDATA</code> queue, specified as <code>[schema_name.]queue_name</code>. For example, <code>strmadmin.streams_queue</code>.</p> <p>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If the schema is not specified for this parameter, and the queue table owner is not specified in <code>queue_table</code>, then the current user is the default.</p> <p>Queue names can be a maximum of 24 bytes.</p>
queue_user	<p>The name of the user who requires <code>ENQUEUE</code> and <code>DEQUEUE</code> privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the <code>GRANT</code> option.</p> <p>If <code>NULL</code>, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the <code>DBMS_AQADM</code> package.</p>
comment	The comment for the queue

Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the `CREATE_QUEUE_TABLE` procedure in the `DBMS_AQADM` package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer `ANYDATA` queue that is both a secure queue and a transactional queue.

Also, if the database is Oracle Database 10g release 2 or later, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `commit_time`. If the database is a release before Oracle Database 10g release 2, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `enq_time`.

- If the specified queue table exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the `CREATE_QUEUE` procedure in the `DBMS_AQADM` package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants `ENQUEUE` and `DEQUEUE` privileges on the queue to the specified queue user.

To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. `SET_UP_QUEUE` then runs the `ENABLE_DB_ACCESS` procedure in the `DBMS_AQADM` package, specifying the agent and the user.

Note:

If the agent that `SET_UP_QUEUE` tries to create exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry `SET_UP_QUEUE`.

233.4.39 SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill LCRs to the hard disk, degrading the performance of the Oracle Replication environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates LCRs from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.

5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the queried acknowledged SCN. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

Note:

If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

See Also:

- ["MERGE_STREAMS Procedure"](#)
- ["MERGE_STREAMS_JOB Procedure"](#)

Syntax

```
DBMS_XSTREAM_ADM.SPLIT_STREAMS (
  propagation_name          IN          VARCHAR2,
  cloned_propagation_name   IN          VARCHAR2 DEFAULT NULL,
  cloned_queue_name        IN          VARCHAR2 DEFAULT NULL,
  cloned_capture_name       IN          VARCHAR2 DEFAULT NULL,
  perform_actions          IN          BOOLEAN  DEFAULT TRUE,
  script_name              IN          VARCHAR2 DEFAULT NULL,
  script_directory_object  IN          VARCHAR2 DEFAULT NULL,
  auto_merge_threshold     IN          NUMBER   DEFAULT NULL,
  schedule_name            IN OUT     VARCHAR2,
  merge_job_name           IN OUT     VARCHAR2);
```

Parameters

Table 233-36 SPLIT_STREAMS Procedure Parameters

Parameter	Description
<code>propagation_name</code>	The name of the propagation that cannot send LCRs to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.
<code>cloned_propagation_name</code>	The name of the new propagation created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a propagation name.
<code>cloned_queue_name</code>	The name of the new queue created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a queue name.
<code>cloned_capture_name</code>	The name of the new capture process created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a capture process name.
<code>perform_actions</code>	<p>If <code>TRUE</code>, then the procedure performs the necessary actions to split the stream directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to split the stream directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> <code>script_name</code> <code>script_directory_object</code>
<code>script_name</code>	<p>If non-<code>NULL</code> and the <code>perform_actions</code> parameter is <code>FALSE</code>, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-<code>NULL</code> and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If <code>NULL</code> and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure performs the actions to split the stream directly and does not generate a script.</p> <p>If <code>NULL</code> and the <code>perform_actions</code> parameter is <code>FALSE</code>, then the procedure raises an error.</p>

Table 233-36 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
<code>script_directory_object</code>	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is <code>NULL</code>, then the procedure ignores this parameter and does not generate a script.</p> <p>If <code>NULL</code> and the <code>script_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p> <p>Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>
<code>auto_merge_threshold</code>	<p>If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the <code>MERGE_STREAMS_JOB</code> procedure at set intervals according to its schedule. The value of the <code>CAPTURE_MESSAGE_CREATE_TIME</code> column for each capture process in the <code>GV\$XSTREAM_CAPTURE</code> dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process and the original capture process is less than or equal to the value specified for the <code>auto_merge_threshold</code> parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.</p> <p>If <code>NULL</code> or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the <code>MERGE_STREAM</code> procedure manually when the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process catches up to, or nearly catches up to, the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the original capture process.</p> <p>The <code>CAPTURE_MESSAGE_CREATE_TIME</code> records the time when a captured change was recorded in the redo log.</p>
<code>schedule_name</code>	<p>The Oracle Scheduler schedule name, specified as <code>[schema_name.]schedule_name</code>. For example, <code>strmadmin.merge_schedule</code>. If the schema is not specified, then the current user is the default.</p> <p>If <code>auto_merge_threshold</code> is a non-<code>NULL</code> positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily.</p> <p>If <code>NULL</code> and <code>auto_merge_threshold</code> is a non-<code>NULL</code> positive number, then the system generates a schedule name.</p> <p>If <code>auto_merge_threshold</code> is <code>NULL</code> or 0 (zero), then this parameter must be <code>NULL</code>.</p> <p>If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.</p> <p>If an existing schedule name is specified, an error is raised.</p>

Table 233-36 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
merge_job_name	<p>The Oracle Scheduler job name, specified as <code>[schema_name.]merge_job_name</code>. For example, <code>strmadmin.merge_job</code>. If the schema is not specified, then the current user is the default.</p> <p>If <code>auto_merge_threshold</code> is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily.</p> <p>If NULL and <code>auto_merge_threshold</code> is a non-NULL positive number, then the system generates a job name.</p> <p>If <code>auto_merge_threshold</code> is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If an existing job name is specified, an error is raised.</p>

See Also:

Oracle Database Administrator's Guide for information about Oracle Scheduler

233.4.40 START_OUTBOUND Procedure

This procedure starts an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.START_OUTBOUND(
    server_name      IN VARCHAR2);
```

Parameters

Table 233-37 START_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being started. A NULL specification is not allowed. Do not specify an owner.

233.4.41 STOP_OUTBOUND Procedure

This procedure stops an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.STOP_OUTBOUND(  
    server_name IN VARCHAR2,  
    force       IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 233-38 STOP_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being stopped. A NULL specification is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the outbound server and its capture process as soon as possible. If FALSE, then the procedure stops the outbound server after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter.

XSTREAM_CAPTURE

The `XSTREAM_CAPTURE` package provides subprograms for granting privileges to and revoking privileges from XStream administrators.

This chapter contains the following topic:

- [Overview](#)
- [Security Model](#)

234.1 XSTREAM_CAPTURE Overview

This package provides subprograms for granting privileges to XStream administrators and revoking privileges from XStream administrators.

234.2 XSTREAM_CAPTURE Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

The user executing the subprograms in the `XSTREAM_CAPTURE` package must have `SYSDBA` administrative privilege, and the user must exercise the privilege using `AS SYSDBA` at connect time.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

234.3 Summary of XSTREAM_CAPTURE Subprograms

This table lists the `XSTREAM_CAPTURE` subprograms and briefly describes them.

Table 234-1 XSTREAM_CAPTURE Package Subprograms

Subprogram	Description
GRANT_ADMIN_PRIVILEGE Procedure	Either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges
GRANT_REMOTE_ADMIN_ACCESS Procedure	Enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link

Table 234-1 (Cont.) XSTREAM_CAPTURE Package Subprograms

Subprogram	Description
REVOKE_ADMIN_PRIVILEGE Procedure	Either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges
REVOKE_REMOTE_ADMIN_ACCESS Procedure	Disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link

Note:

All subprograms commit unless specified otherwise.

234.3.1 XSTREAM_APPLY Procedure

This procedure either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.

See Also:

["XSTREAM_APPLY Procedure"](#)

Syntax

```
XSTREAM_CAPTURE.XSTREAM_APPLY(
  grantee           IN VARCHAR2,
  privilege_type    IN VARCHAR2 DEFAULT '*',
  grant_select_privileges IN BOOLEAN DEFAULT FALSE,
  do_grants         IN BOOLEAN DEFAULT TRUE,
  file_name         IN VARCHAR2 DEFAULT NULL,
  directory_name    IN VARCHAR2 DEFAULT NULL,
  grant_optional_privileges IN VARCHAR2 DEFAULT NULL,
  container         IN VARCHAR2 DEFAULT 'CURRENT');
```

Parameters

Table 234-2 XSTREAM_APPLY Procedure Parameters

Parameter	Description
grantee	The user to whom privileges are granted

Table 234-2 (Cont.) XSTREAM_APPLY Procedure Parameters

Parameter	Description
privilege_type	<p>Specify one of the following values:</p> <ul style="list-style-type: none"> • CAPTURE Specifying CAPTURE grants the minimum privileges required by the user to administer capture processes. • APPLY Specifying APPLY grants the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes. • * Specifying * grants the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.
grant_select_privileges	<p>If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user.</p> <p>If FALSE, then the procedure does not grant the set of privileges to the user.</p> <p>SELECT_CATALOG_ROLE enables the user to select from the data dictionary. Set this parameter to TRUE for the XStream trusted user model. Set this parameter to FALSE for the XStream untrusted user model.</p>
do_grants	<p>If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fails, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view.</p> <p>You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.</p>
file_name	<p>The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file.</p> <p>If NULL, then the procedure does not generate a file.</p>

Table 234-2 (Cont.) XSTREAM_APPLY Procedure Parameters

Parameter	Description
directory_name	<p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement <code>CREATE DIRECTORY</code>. If you specify a directory, then the user who invokes the procedure must have the <code>WRITE</code> privilege on the directory object.</p> <p>If the <code>file_name</code> parameter is <code>NULL</code>, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If <code>NULL</code> and the <code>file_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p>
grant_optional_privileges	<p>A comma-separated list of optional privileges to grant to the grantee, such as the <code>DV_XSTREAM_ADMIN</code> and <code>DV_GOLDENGATE_ADMIN</code> privileges</p>
container	<p>If <code>CURRENT</code>, then grants privileges to the grantee only in the container where the procedure is invoked. <code>CURRENT</code> can be specified while connected to the root or to a PDB.</p> <p>If <code>ALL</code>, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify <code>ALL</code>, the procedure must be invoked in the root.</p> <p>If a container name, then grants privileges to the grantee only in the specified container. To specify root, use <code>CDB\$ROOT</code> while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p>Note: This parameter only applies to CDBs.</p>

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The `RESTRICTED SESSION` system privilege
- `EXECUTE` on the following packages:
 - `DBMS_APPLY_ADM`
 - `DBMS_AQ`
 - `DBMS_AQADM`
 - `DBMS_AQIN`
 - `DBMS_AQELM`
 - `DBMS_CAPTURE_ADM`
 - `DBMS_FLASHBACK`
 - `DBMS_LOCK`
 - `DBMS_PROPAGATION_ADM`
 - `DBMS_RULE_ADM`

- DBMS_TRANSFORM
- DBMS_XSTREAM_ADM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
 - Evaluation contexts
 - Rule sets
 - Rules

In addition, the grantee can grant these privileges to other users.

- SELECT_CATALOG_ROLE
- SELECT or READ privilege on data dictionary views related to XStream and Oracle Replication
- The ability to allow a remote XStream administrator to perform administrative actions through a database link by connecting to the grantee

This ability is enabled by running the GRANT_REMOTE_ADMIN_ACCESS procedure in this package.

 **Note:**

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure grants only the privileges necessary to configure and administer an XStream environment. You can grant additional privileges to the grantee if necessary.

 **See Also:**

- ["GRANT_REMOTE_ADMIN_ACCESS Procedure"](#)
- *Oracle Database SQL Language Reference* for information about the CREATE DIRECTORY SQL statement

234.3.2 GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_XSTREAM_AUTH.GRANT_REMOTE_ADMIN_ACCESS (
  grantee IN VARCHAR2);
```

Parameters

Table 234-3 GRANT_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user who allows remote access. The procedure adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The XStream administrator at a downstream capture database administers the source database using this connection.

Note:

The XSTREAM_APPLY procedure in this package runs this procedure.

See Also:

"XSTREAM_APPLY Procedure"

234.3.3 REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.

Syntax

```
XSTREAM_CAPTURE.REVOKE_ADMIN_PRIVILEGE(
  grantee                IN  VARCHAR2,
  privilege_type         IN  VARCHAR2  DEFAULT '*',
  revoke_select_privileges IN  BOOLEAN  DEFAULT FALSE,
  do_revokes             IN  BOOLEAN  DEFAULT TRUE,
  file_name              IN  VARCHAR2  DEFAULT NULL,
  directory_name        IN  VARCHAR2  DEFAULT NULL,
  revoke_optional_privileges IN  VARCHAR2  DEFAULT NULL,
  container              IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 234-4 REVOKE_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user from whom privileges are revoked
privilege_type	Specify one of the following values: <ul style="list-style-type: none"> CAPTURE Specifying CAPTURE revokes the minimum privileges required by the user to administer capture processes. APPLY Specifying APPLY revokes the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes. * Specifying * revokes the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.
revoke_select_privileges	If TRUE, then the procedure revokes a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not revoke the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary.
do_revokes	If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.
file_name	The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.

Table 234-4 (Cont.) REVOKE_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
revoke_optional_privileges	A comma-separated list of optional privileges to revoke from the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges
container	<p>If CURRENT, then revokes privileges from the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.</p> <p>If ALL, then revokes privileges from the grantee in all containers in the CDB. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p>Note: This parameter only applies to CDBs.</p>

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the XSTREAM_APPLY procedure in this package.

Note:

To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

See Also:

- ["XSTREAM_APPLY Procedure"](#)
- *Oracle Database SQL Language Reference* for information about the CREATE DIRECTORY SQL statement

234.3.4 REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.

Note:

The REVOKE_ADMIN_PRIVILEGE procedure in this package runs this procedure.

**See Also:**

"REVOKE_ADMIN_PRIVILEGE Procedure"

Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_REMOTE_ADMIN_ACCESS (  
    grantee IN VARCHAR2);
```

Parameters**Table 234-5 REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter**

Parameter	Description
grantee	<p>The user for whom access from a remote XStream administrator is disabled.</p> <p>If a row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure updates the <code>ACCESS_FROM_REMOTE</code> column for the grantee to <code>NO</code>. If, after this update, both the <code>LOCAL_PRIVILEGES</code> column and the <code>ACCESS_FROM_REMOTE</code> column are <code>NO</code> for the grantee, then the procedure removes the grantee from the view.</p> <p>If no row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure does not update the view and does not raise an error.</p>

DEBUG_EXTPROC

The `DEBUG_EXTPROC` package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of `DEBUG_EXTPROC` Subprograms](#)

235.1 `DEBUG_EXTPROC` Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.

235.2 `DEBUG_EXTPROC` Operational Notes

These operational notes apply to `DEBUG_EXTPROC`.

To install the package, run the script `DBGEXTP.SQL`.

- Install/load this package in the Oracle `USER` where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package `DEBUG_EXTPROC`

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have `EXECUTE` privileges on the package.

 **Note:**

These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through `SQL*Plus` or `OCI` program by connecting to `ORACLE`.

- Execute procedure `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT` to startup the extproc agent in this session; for example, execute `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

235.3 Rules and Limits

`DEBUG_EXTPROC` works only on platforms with debuggers that can attach to a running process.

235.4 Summary of `DEBUG_EXTPROC` Subprograms

The `STARTUP_EXTPROC_AGENT` procedure is the only `DEBUG_EXTPROC` subprogram.

Table 235-1 `DEBUG_EXTPROC` Package Subprograms

Subprogram	Description
STARTUP_EXTPROC_AGENT Procedure	Starts up the extproc agent process in the session

235.4.1 `STARTUP_EXTPROC_AGENT` Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

236

HTF

The `HTF` (hypertext functions) and `HTP` (hypertext procedures) packages generate HTML tags. For example, the `HTF.ANCHOR` function generates the HTML anchor tag, `<A>`.

See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of Tags](#)
- [Summary of HTF Subprograms](#)

236.1 HTF Deprecated Subprograms

The `ESCAPE_URL` function is deprecated with Oracle Database 10g.

Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Related Topics

- [ESCAPE_URL Function](#)
This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

236.2 HTF Operational Notes

These operational notes apply to the HTF package.

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have HTF function equivalents. Use the [ESCAPE_SC Function](#) or the [ESCAPE_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE_URL Function](#).
- The [FORMAT_CELL Function](#) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an HTP equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.PRINT function. It then prints its parameters to the generated Web page.

236.3 Rules and Limits

If you use values of the LONG datatype in functions such as HTF.PRINT, HTF.PRN, HTF.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the function.

236.4 HTF Examples

The commands in this example generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.P (HTF.HTMLOPEN); -- generates <HTML>
    HTP.P (HTF.HEADOPEN); -- generates <HEAD>
    HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
    HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
    HTP.P (HTF.BODYOPEN); -- generates <BODY>
    HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
    HTP.P (HTF.BODYCLOSE); -- generates </BODY>
    HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

236.5 Summary of Tags

This list summarizes the HTML tags generated by the HTF package.

HTML, HEAD, and BODY Tags

[HTMLOPEN Function](#), [HTMLCLOSE Function](#) - generate <HTML> and </HTML>

[HEADOPEN Function](#), [HEADCLOSE Function](#) - generate <HEAD> and </HEAD>

[BODYOPEN Function](#), [BODYCLOSE Function](#) - generate <BODY> and </BODY>

Comment Tag

[COMMENT Function](#) - generates <!-- and -->

[http://www.w3.org.BASE Function](#) - generates <BASE>

[LINKREL Function](#) - generates <LINK> with the REL attribute

[LINKREV Function](#) - generates <LINK> with the REV attribute

[TITLE Function](#) - generates <TITLE>

[META Function](#) - generates <META>

[SCRIPT Function](#) - generates <SCRIPT>

[STYLE Function](#) - generates <STYLE>

[ISINDEX Function](#) - generates <ISINDEX>

Applet Tags

[APPLETOPEN Function](#), [APPLETCLOSE Function](#) - generate <APPLET> and </APPLET>

[PARAM Function](#) - generates <PARAM>

List Tags

[OLISTOPEN Function](#), [OLISTCLOSE Function](#) - generate and

[ULISTOPEN Function](#), [ULISTCLOSE Function](#) - generate and

[DLISTOPEN Function](#), [DLISTCLOSE Function](#) - generate <DL> and </DL>

[DLISTTERM Function](#) - generates <DT>

[DLISTDEF Function](#) - generates <DD>

[DIRLISTOPEN Function](#), [DIRLISTCLOSE Function](#) - generate <DIR> and </DIR>

[LISTHEADER Function](#) - generates <LH>

[LISTINGOPEN Function](#), [LISTINGCLOSE Function](#) - generate <LISTING> and </LISTING>

[MENULISTOPEN Function](#) - generate <MENU> and </MENU>

[LISTITEM Function](#) - generates

Form Tags

[FORMOPEN Function](#), [FORMCLOSE Function](#) - generate <FORM> and </FORM>

[FORMCHECKBOX Function](#) - generates <INPUT TYPE="CHECKBOX">

[FORMHIDDEN Function](#) - generates <INPUT TYPE="HIDDEN">

[FORMIMAGE Function](#) - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Function - generates `<INPUT TYPE="PASSWORD">`

FORMRADIO Function - generates `<INPUT TYPE="RADIO">`

FORMSELECTOPEN Function, FORMSELECTCLOSE Function - generate `<SELECT>`
and `</SELECT>`

FORMSELETOPTION Function - generates `<OPTION>`

FORMTEXT Function - generates `<INPUT TYPE="TEXT">`

FORMTEXTAREA Function - generate `<TEXTAREA>`

FORMTEXTAREAOPEN Function, FORMTEXTAREACLOSE Function - generate
`<TEXTAREA>` and `</TEXTAREA>`

FORMRESET Function - generates `<INPUT TYPE="RESET">`

FORMSUBMIT Function - generates `<INPUT TYPE="SUBMIT">`

Table Tags

TABLEOPEN Function, TABLECLOSE Function - generate `<TABLE>` and `</TABLE>`

TABLECAPTION Function - generates `<CAPTION>`

TBLEROWOPEN Function, TBLEROWCLOSE Function - generate `<TR>` and `</TR>`

TABLEHEADER Function - generates `<TH>`

TABLEDATA Function - generates `<TD>`

IMG, HR, and A Tags

HR Function, LINE Function - generate `<HR>`

IMG Function, IMG2 Function - generate ``

ANCHOR Function, ANCHOR2 Function - generate `<A>`

MAOPEN Function, MAPCLOSE Function - generate `<MAP>` and `</MAP>`

Paragraph Formatting Tags

HEADER Function - generates heading tags (`<H1>` to `<H6>`)

PARA Function, PARAGRAPH Function - generate `<P>`

PRN Functions, PRINT Functions - generate any text that is passed in

PRN Functions, S Function - generate any text that is passed in; special characters in
HTML are escaped

PREOPEN Function, PRECLOSE Function - generate `<PRE>` and `</PRE>`

BLOCKQUOTEOPEN Function, BLOCKQUOTECLOSE Function - generate
`<BLOCKQUOTE>` and `</BLOCKQUOTE>`

DIV Function - generates `<DIV>`

NL Function, BR Function - generate `
`

[NOBR Function](#) - generates <NOBR>

[WBR Function](#) - generates <WBR>

[PLAINTEXT Function](#) - generates <PLAINTEXT>

[ADDRESS Function](#) - generates <ADDRESS>

[MAILTO Function](#) - generates <A> with the MAILTO attribute

[AREA Function](#) - generates <AREA>

[BGSOUND Function](#) - generates <BGSOUND>

Character Formatting Tags

[BASEFONT Function](#) - generates <BASEFONT>

[BIG Function](#) - generates <BIG>

[BOLD Function](#) - generates

[CENTER Function](#) - generates <CENTER> and </CENTER>

[CENTEROPEN Function](#), [CENTERCLOSE Function](#) - generate <CENTER> and </CENTER>

[CITE Function](#) - generates <CITE>

[CODE Function](#) - generates <CODE>

[DFN Function](#) - generates <DFN>

[EM Function](#), [EMPHASIS Function](#) - generate

[FONTOPEN Function](#), [FONTCLOSE Function](#) - generate and

[ITALIC Function](#) - generates <I>

[KBD Function](#), [KEYBOARD Function](#) - generate <KBD> and </KBD>

[S Function](#) - generates <S>

[SAMPLE Function](#) - generates <SAMP>

[SMALL Function](#) - generates <SMALL>

[STRIKE Function](#) - generates <STRIKE>

[STRONG Function](#) - generates

[SUB Function](#) - generates <SUB>

[SUP Function](#) - generates <SUP>

[TELETYPE Function](#) - generates <TT>

[UNDERLINE Function](#) - generates <U>

[VARIABLE Function](#) - generates <VAR>

Frame Tags

[FRAME Function](#) - generates <FRAME>

[FRAMESETOPEN Function](#), [FRAMESETCLOSE Function](#) - generate `<FRAMESET>` and `</FRAMESET>`

[NOFRAMESOPEN Function](#), [NOFRAMESCLOSE Function](#) - generate `<NOFRAMES>` and `</NOFRAMES>`

236.6 Summary of HTF Subprograms

This table lists the HTF subprograms and briefly describes them.

Table 236-1 HTF Package Subprograms

Subprogram	Description
ADDRESS Function	Generates the <code><ADDRESS></code> and <code></ADDRESS></code> tags which specify the address, author and signature of a document
ANCHOR Function	Generates the <code><A></code> and <code></code> tags which specify the source or destination of a hypertext link
ANCHOR2 Function	Generates the <code><A></code> and <code></code> tags which specify the source or destination of a hypertext link
APPLETCLOSE Function	Closes the applet invocation with the <code></APPLET></code> tag
APPLETOPEN Function	Generates the <code><APPLET></code> tag which begins the invocation of a Java applet
AREA Function	Generates the <code><AREA></code> tag, which defines a client-side image map
BASE Function	Generates the <code><BASE></code> tag which records the URL of the document
BASEFONT Function	Generates the <code><BASEFONT></code> tag which specifies the base font size for a Web page
BGSOUND Function	Generates the <code><BGSOUND></code> tag which includes audio for a Web page
BIG Function	Generates the <code><BIG></code> and <code></BIG></code> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Function	Generates the <code></BLOCKQUOTE></code> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Function	Generates the <code><BLOCKQUOTE></code> tag, which marks the beginning of a section of quoted text
BODYCLOSE Function	Generates the <code></BODY></code> tag which marks the end of a body section of an HTML document
BODYOPEN Function	Generates the <code><BODY></code> tag which marks the beginning of the body section of an HTML document
BOLD Function	Generates the <code></code> and <code></code> tags which direct the browser to display the text in boldface
BR Function	Generates the <code>
</code> tag which begins a new line of text
CENTER Function	Generates the <code><CENTER></code> and <code></CENTER></code> tags which center a section of text within a Web page
CENTERCLOSE Function	Generates the <code></CENTER></code> tag which marks the end of a section of text to center

Table 236-1 (Cont.) HTF Package Subprograms

Subprogram	Description
CENTEROPEN Function	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Function	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Function	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
COMMENT Function	Generates the comment tags <!-- ctext -->
DFN Function	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Function	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Function	Generates the <DIR> which starts a directory list section
DIV Function	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Function	Generates the </DL> tag which ends a definition list
DLISTDEF Function	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Function	Generates the <DL> tag which starts a definition list
DLISTTERM Function	Generates the <DT> tag which defines a term in a definition list <DL>
EM Function	Generates the and tags, which define text to be emphasized
EMPHASIS Function	Generates the and tags, which define text to be emphasized
ESCAPE_SC Function	Replaces characters that have special meaning in HTML with their escape sequences
ESCAPE_URL Function	Replaces characters that have special meaning in HTML and HTTP with their escape sequences
FONTCLOSE Function	Generates the tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Function	Generates the which marks the beginning of section of text with the specified font characteristics
FORMAT_CELL Function	formats column values inside an HTML table using the TABLEDATA Function
FORMCHECKBOX Function	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Function	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMFILE Function	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Function	Generates the <INPUT> tag with TYPE="hidden" which inserts a hidden form element

Table 236-1 (Cont.) HTF Package Subprograms

Subprogram	Description
FORMIMAGE Function	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMOPEN Function	Generates the <FORM> tag which marks the beginning of a form section in an HTML document
FORMPASSWORD Function	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Function	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Function	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Function	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Function	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELETOPTION Function	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Function	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Function	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Function	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Function	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Function	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Function	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Function	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Function	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Function	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Function	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Function	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Function	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)

Table 236-1 (Cont.) HTF Package Subprograms

Subprogram	Description
HEADOPEN Function	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Function	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Function	Generates the </HTML> tag which marks the end of an HTML document
HTMLOPEN Function	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Function	Generates the tag which directs the browser to load an image onto the HTML page
IMG2 Function	Generates the tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Function	Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program
ITALIC Function	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Function	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Function	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Function	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Function	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Function	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Function	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Function	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Function	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Function	Generates the tag, which indicates a list item
MAILTO Function	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Function	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Function	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map

Table 236-1 (Cont.) HTF Package Subprograms

Subprogram	Description
MENULISTCLOSE Function	Generates the <code></MENU></code> tag which ends a list that presents one line for each item
MENULISTOPEN Function	Generates the <code><MENU></code> tag which begins a list that presents one line for each item
META Function	Generates the <code><META></code> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Function	Generates the <code>
</code> tag which begins a new line of text
NOBR Function	Generates the <code><NOBR></code> and <code></NOBR></code> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Function	Generates the <code></NOFRAMES></code> tag which marks the end of a no-frames section
NOFRAMESOPEN Function	Generates the <code><NOFRAMES></code> tag which mark the beginning of a no-frames section
OLISTCLOSE Function	Generates the <code></code> tag which defines the end of an ordered list
OLISTOPEN Function	Generates the <code></code> tag which marks the beginning of an ordered list
PARA Function	Generates the <code><P></code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Function	Adds attributes to the <code><P></code> tag
PARAM Function	Generates the <code><PARAM></code> tag which specifies parameter values for Java applets
PLAINTEXT Function	Generates the <code><PLAINTEXT></code> and <code></PLAINTEXT></code> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Function	Generates the <code></PRE></code> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Function	Generates the <code><PRE></code> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Functions	Generates the specified parameter as a string terminated with the <code>\n</code> newline character
PRN Functions	Generates the specified parameter as a string
S Function	Generates the <code><S></code> and <code></S></code> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Function	Generates the <code><SAMP></code> and <code></SAMP></code> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Function	Generates the <code><SCRIPT></code> and <code></SCRIPT></code> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Function	Generates the <code><SMALL></code> and <code></SMALL></code> tags, which direct the browser to render the text they surround using a small font

Table 236-1 (Cont.) HTF Package Subprograms

Subprogram	Description
STRIKE Function	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Function	Generates the and tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Function	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Function	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Function	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Function	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Function	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Function	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Function	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Function	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Function	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Function	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Function	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Function	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Function	Generates the tag which marks the end of an unordered list
ULISTOPEN Function	Generates the tag which marks the beginning of an unordered list
UNDERLINE Function	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Function	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Function	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

236.6.1 ADDRESS Function

This function generates the `<ADDRESS>` and `</ADDRESS>` tags which specify the address, author and signature of a document.

Syntax

```
HTF.ADDRESS (
  cvalue      IN      VARCHAR2
  cnowrap     IN      VARCHAR2  DEFAULT NULL
  cclear      IN      VARCHAR2  DEFAULT NULL
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-2 ADDRESS Function Parameters

Parameter	Description
<code>cvalue</code>	The string that goes between the <code><ADDRESS></code> and <code></ADDRESS></code> tags.
<code>cnowrap</code>	If the value for this parameter is not NULL, the <code>NOWRAP</code> attribute is included in the tag
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag

Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

236.6.2 ANCHOR Function

Like the `ANCHOR2` function, this function generates the `<A>` and `` HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the [ANCHOR2 Function](#) provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR (
  curl        IN      VARCHAR2,
  ctext       IN      VARCHAR2,
  cname       IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-3 ANCHOR Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
cctx	The string that goes between the <A> and tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>cctx</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

236.6.3 ANCHOR2 Function

Like the ANCHOR function, this function generates the <A> and HTML tags which specify the source or destination of a hypertext link.

The difference between this and the ANCHOR function is that this function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (
  curl          IN          VARCHAR2,
  cctx          IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  ctarget       IN          varchar2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-4 ANCHOR2 Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
cctx	The string that goes between the <A> and tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

236.6.4 APPLETCLOSE Function

This function closes the applet invocation with the `</APPLET>` tag.

You must first invoke the a Java applet using [APPLETOPEN Function](#)

Syntax

```
HTF.APPLETCLOSE  
RETURN VARCHAR2;
```

236.6.5 APPLETOPEN Function

This function generates the `<APPLET>` tag which begins the invocation of a Java applet.

You close the applet invocation with [APPLETCLOSE Function](#) which generates the `</APPLET>` tag.

Syntax

```
HTF.APPLETOPEN (  
    ccode          IN          VARCHAR2,  
    cheight        IN          NUMBER,  
    cwidth         IN          NUMBER,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 236-5 APPLETOPEN Function Parameters

Parameter	Description
ccode	The value for the <code>CODE</code> attribute which specifies the name of the applet class.
cheight	The value for the <code>HEIGHT</code> attribute.
cwidth	The value for the <code>WIDTH</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the [PARAM Function](#) function.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

236.6.6 AREA Function

This function generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

Syntax

```
HTF.AREA (
  ccoords      IN          VARCHAR2
  cshape       IN          VARCHAR2  DEFAULT NULL,
  chref        IN          VARCHAR2  DEFAULT NULL,
  cnohref      IN          VARCHAR2  DEFAULT NULL,
  ctargt       IN          VARCHAR2  DEFAULT NULL,
  cattributes  IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-6 AREA Function Parameters

Parameter	Description
<code>ccords</code>	The value for the <code>COORDS</code> attribute.
<code>cshape</code>	The value for the <code>SHAPE</code> attribute.
<code>chref</code>	The value for the <code>HREF</code> attribute.
<code>cnohref</code>	If the value for this parameter is not <code>NULL</code> , the <code>NOHREF</code> attribute is added to the tag.
<code>ctarget</code>	The value for the <code>TARGET</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```

236.6.7 BASE Function

This function generates the `<BASE>` tag which records the URL of the document.

Syntax

```
HTF.BASE (
  ctargt       IN          VARCHAR2  DEFAULT NULL,
```

```

    cattributes    IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 236-7 BASE Function Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

236.6.8 BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```

HTF.BASEFONT (
    nsize    IN    INTEGER)
RETURN VARCHAR2;

```

Parameters

Table 236-8 BASEFONT Function Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

236.6.9 BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```

HTF.BGSOUND (
    csrc          IN          VARCHAR2,
    cloop         IN          VARCHAR2    DEFAULT NULL,
    cattributes   IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 236-9 BGSOUND Function Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

236.6.10 BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTF.BIG (
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-10 BIG Function Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

236.6.11 BLOCKQUOTECLOSE Function

This function generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Function](#).

Syntax

```
HTF.BLOCKQUOTECLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</BLOCKQUOTE>
```

236.6.12 BLOCKQUOTEOPEN Function

This function generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Function](#).

Syntax

```
HTF.BLOCKQUOTEOPEN (
  cnowrap      IN          VARCHAR2  DEFAULT NULL,
  cclear       IN          VARCHAR2  DEFAULT NULL,
  cattributes  IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters**Table 236-11 BLOCKQUOTEOPEN Function Parameters**

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

236.6.13 BODYCLOSE Function

This function generates the `</BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the [BODYOPEN Function](#).

Syntax

```
HTF.BODYCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</BODY>
```

236.6.14 BODYOPEN Function

This function generates the <BODY> tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the [BODYCLOSE Function](#).

Syntax

```
HTF.BODYOPEN (  
    cbackground    IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 236-12 BODYOPEN Function Parameters

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')  
RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

236.6.15 BOLD Function

This function generates the and tags which direct the browser to display the text in boldface.

Syntax

```
HTF.BOLD (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 236-13 BOLD Function Parameters

Parameter	Description
c <code>text</code>	The text that goes between the tags.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<B cattributes>ctext</B>
```

236.6.16 BR Function

This function generates the `
` tag which begins a new line of text.

It performs the same operation as the [NL Function](#).

Syntax

```
HTF.BR(
  cclear          IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-14 BR Function Parameters

Parameter	Description
c <code>clear</code>	The value for the <code>CLEAR</code> attribute.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

236.6.17 CENTER Function

This function generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

Syntax

```
HTF.CENTER (
  ctext          IN          VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 236-15 CENTER Parameters

Parameter	Description
c text	The text that goes between the tags.

Examples

This function generates

```
<CENTER>ctext</CENTER>
```

236.6.18 CENTERCLOSE Function

This function generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the [CENTEROPEN Function](#).

Syntax

```
HTF.CENTERCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</CENTER>
```

236.6.19 CENTEROPEN Function

This function generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a section of text to center with the [CENTERCLOSE Function](#).

Syntax

```
HTF.CENTEROPEN  
RETURN VARCHAR2;
```

Examples

This function generates

```
<CENTER>
```

236.6.20 CITE Function

This function generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 236-16 CITE Function Parameters

Parameter	Description
<code>ctext</code>	The text to render as citation.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

236.6.21 CODE Function

This function generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTF.CODE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 236-17 CODE Function Parameters

Parameter	Description
<code>ctext</code>	The text to render as code.
<code>cattributes</code>	The other attributes to be included as-is in the tag

Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

236.6.22 COMMENT Function

This function generates the comment tags.

Syntax

```
HTF.COMMENT (  
    ctext          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 236-18 COMMENT Function Parameters

Parameter	Description
ctext	The comment.

Examples

This function generates

```
<!-- ctext -->
```

236.6.23 DFN Function

This function generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTF.DFN (  
    ctext          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 236-19 DFN Function Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This function generates

```
<DFN>ctext</DFN>
```

236.6.24 DIRLISTCLOSE Function

This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

Syntax

```
HTF.DIRLISTCLOSE  
    RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `` tag directly or invoke the [LISTITEM Function](#) so that the `` tag appears directly after the `</DIR>` tag to define the items as a list.

Examples

This function generates

```
</DIR>
```

Related Topics

- [DIRLISTOPEN Function](#)
This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

236.6.25 DIRLISTOPEN Function

This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

Syntax

```
HTF.DIRLISTOPEN  
    RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `` tag directly or invoke the [LISTITEM Function](#) so that the `` tag appears directly after the `</DIR>` tag to define the items as a list.

Examples

This function generates

```
<DIR>
```

Related Topics

- [DIRLISTCLOSE Function](#)
This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

236.6.26 DIV Function

This function generates the <DIV> tag which creates document divisions.

Syntax

```
HTF.DIV (  
    calign          IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 236-20 DIV Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

236.6.27 DLISTCLOSE Function

This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```
HTF.DLISTCLOSE  
RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

Examples

This function generates

```
</DL>
```

Related Topics

- [DLISTOPEN Function](#)
This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

236.6.28 DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTF.DLISTDEF (
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-21 DLISTDEF Function Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

236.6.29 DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

Syntax

```
HTF.DLISTOPEN (
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-22 DLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

Related Topics

- [DLISTCLOSE Function](#)
This function generates the `</DL>` tag which ends a definition list. You start a definition list by means of the [DLISTOPEN Function](#).

236.6.30 DLISTTERM Function

This function generates the `<DT>` tag which defines a term in a definition list `<DL>`.

Syntax

```
HTF.DLISTTERM (
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-23 DLISTTERM Function Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

236.6.31 EM Function

This function generates the `` and `` tags, which define text to be emphasized.

It performs the same task as the [EMPHASIS Function](#).

Syntax

```
HTF.EM(
  ctext          IN          VARCHAR2,
```

```

    cattributes    IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 236-24 EM Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

236.6.32 EMPHASIS Function

This function generates the `` and `` tags, which define text to be emphasized.

It performs the same task as the [EM Function](#).

Syntax

```

HTF.EMPHASIS(
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 236-25 EMPHASIS Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

236.6.33 ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&`
- `"` to `"`

- < to <
- > to >

This function performs the same operation as HTTP. [PRINTS Procedure](#) and HTTP. [PS Procedure](#).

Syntax

```
HTF.ESCAPE_SC (
    ctext          IN          VARCHAR2);
```

Parameters

Table 236-26 ESCAPE_SC Function Parameters

Parameter	Description
ctext	The text string to convert.

236.6.34 ESCAPE_URL Function

This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

Note:

This procedure, deprecated in Release 10g, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the [ESCAPE Function](#) in the [UTL_URL](#) package.

The following characters are converted:

- & to &
- " to "
- < to <
- > to >
- % to &25

Syntax

```
HTF.ESCAPE_URL (
    p_url          IN          VARCHAR2);
```

Parameters

Table 236-27 ESCAPE_URL Function Parameters

Parameter	Description
p_url	The string to convert.

236.6.35 FONTCLOSE Function

This function generates the `` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the [FONTOPEN Function](#).

Syntax

```
HTF.FONTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FONT>
```

236.6.36 FONTOPEN Function

This function generates the `` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the [FONTCLOSE Function](#).

Syntax

```
HTF.FONTOPEN(
  ccolor      IN      VARCHAR2  DEFAULT NULL,
  cface       IN      VARCHAR2  DEFAULT NULL,
  csize       IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 236-28 FONTOPEN Function Parameters

Parameter	Description
ccolor	The value for the <code>COLOR</code> attribute.
cface	The value for the <code>FACE</code> attribute
csize	The value for the <code>SIZE</code> attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

236.6.37 FORMAT_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

```
HTF.FORMAT_CELL(  
    columnValue      IN      VARCHAR2  
    format_numbers   IN      VARCHAR2  DEFAULT NULL  
    RETURN VARCHAR2;
```

Parameters

Table 236-29 FORMAT_CELL Function Parameters

Parameter	Description
columnValue	The value that needs to be formatted in an HTML table.
format_numbers	The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places.

Examples

This function generates

```
<TD >columnValue</TD>
```

Related Topics

- [TABLEDATA Function](#)
This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

236.6.38 FORMCHECKBOX Function

This function generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

Syntax

```
HTF.FORMCHECKBOX(  
    cname           IN      VARCHAR2,  
    cvalue          IN      VARCHAR2  DEFAULT 'ON',  
    cchecked        IN      VARCHAR2  DEFAULT NULL,  
    cattributes     IN      VARCHAR2  DEFAULT NULL)  
    RETURN VARCHAR2;
```

Parameters

Table 236-30 FORMCHECKBOX Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

236.6.39 FORMCLOSE Function

This function generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the [FORMOPEN Function](#).

Syntax

```
HTF.FORMCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FORM>
```

236.6.40 FORMFILE Function

This function generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTF.FORMFILE(
  cname          IN          VARCHAR2,
  caccept       IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 236-31 FORMFILE Function Parameters

Parameter	Description
cname	The value for the <code>NAME</code> attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

236.6.41 FORMHIDDEN Function

This function generates the `<INPUT>` tag with `TYPE="hidden"`, which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTF.FORMHIDDEN (
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-32 FORMHIDDEN Function Parameters

Parameter	Description
cname	The value for the <code>NAME</code> attribute.
cvalue	The value for the <code>VALUE</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

236.6.42 FORMIMAGE Function

This function generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name

of the field with `.x` appended, and the `y` coordinate with `.y` appended. Any `VALUE` attribute is ignored.

Syntax

```
HTF.FORMIMAGE (
  cname      IN      VARCHAR2,
  csrc       IN      VARCHAR2,
  calign     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-33 FORMIMAGE Function Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute that specifies the image file.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

236.6.43 FORMOPEN Function

This function generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the [FORMCLOSE Function](#).

Syntax

```
HTF.FORMOPEN (
  curl       IN      VARCHAR2,
  cmethod    IN      VARCHAR2  DEFAULT 'POST',
  ctarget    IN      VARCHAR2  DEFAULT NULL,
  cenctype   IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-34 FORMOPEN Function Parameters

Parameter	Description
<code>curl</code>	The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.
<code>cmethod</code>	The value for the <code>METHOD</code> attribute. The value can be "GET" or "POST".

Table 236-34 (Cont.) FORMOPEN Function Parameters

Parameter	Description
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

236.6.44 FORMPASSWORD Function

This function generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field.

When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTF.FORMPASSWORD(
  cname          IN          VARCHAR2,
  csize          IN          VARCHAR2,
  cmaxlength    IN          VARCHAR2  DEFAULT NULL,
  cvalue        IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters**Table 236-35 FORMPASSWORD Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"
cattributes>
```

236.6.45 FORMRADIO Function

This function generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTF.FORMRADIO (
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2,
  cchecked       IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-36 FORMRADIO Function Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

236.6.46 FORMRESET Function

This function generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTF.FORMRESET (
  cvalue         IN          VARCHAR2  DEFAULT 'Reset',
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-37 FORMRESET Function Parameters

Parameter	Description
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.

Table 236-37 (Cont.) FORMRESET Function Parameters

Parameter	Description
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

236.6.47 FORMSELECTCLOSE Function

This function generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Function](#). The values are inserted using [FORMSELETOPTION Function](#).

Syntax

```
HTF.FORMSELECTCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</SELECT>
```

as shown under [Examples](#) of the [FORMSELECTOPEN Function](#).

236.6.48 FORMSELECTOPEN Function

This function generates the `<SELECT>` tags which begins a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Function](#). The values are inserted using [FORMSELETOPTION Function](#).

Syntax

```
HTF.FORMSELECTOPEN(  
  cname          IN   VARCHAR2,  
  cprompt        IN   VARCHAR2  DEFAULT NULL,  
  nsize          IN   INTEGER    DEFAULT NULL,  
  cattributes    IN   VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 236-38 FORMSELECTOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
  'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

236.6.49 FORMSELETOPTION Function

This function generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELETOPTION(
  cvalue          IN          VARCHAR2,
  cselected       IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-39 FORMSELETOPTION Function Parameters

Parameter	Description
cvalue	The text for the option
cvalue	If the value for this parameter is not NULL, the <code>SELECTED</code> attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates `<OPTION SELECTED cattributes>cvalue` as shown under the Examples section of the [FORMSELECTOPEN Function](#).

236.6.50 FORMSUBMIT Function

This function generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTF.FORMSUBMIT (
    cname          IN          VARCHAR2   DEFAULT NULL,
    cvalue         IN          VARCHAR2   DEFAULT 'Submit',
    cattributes    IN          VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-40 FORMSUBMIT Function Parameters

Parameter	Description
cname	The value for the <code>NAME</code> attribute.
cvalue	The value for the <code>VALUE</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

236.6.51 FORMTEXT Function

This function generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT (
  cname          IN          VARCHAR2,
  csize          IN          VARCHAR2  DEFAULT NULL,
  cmaxlength     IN          VARCHAR2  DEFAULT NULL,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-41 FORMTEXT Function Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csize</code>	The value for the <code>SIZE</code> attribute.
<code>cmaxlength</code>	The value for the <code>MAXLENGTH</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength"
VALUE="cvalue" cattributes>
```

236.6.52 FORMTEXTAREA Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA (
  cname          IN          VARCHAR2,
  nrows         IN          INTEGER,
  ncolumns      IN          INTEGER,
  calign        IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-42 FORMTEXTAREA Function Parameters

Parameter	Description
cname	The value for the <code>NAME</code> attribute.
nrows	The value for the <code>ROWS</code> attribute. This is an integer.
ncolumns	The value for the <code>COLS</code> attribute. This is an integer.
calign	The value for the <code>ALIGN</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></
TEXTAREA>
```

236.6.53 FORMTEXTAREA2 Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA Function](#) except that in that case you cannot specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA2 (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns      IN          INTEGER,
  calign        IN          VARCHAR2  DEFAULT NULL,
  cwrap         IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-43 FORMTEXTAREA2 Function Parameters

Parameter	Description
cname	The value for the <code>NAME</code> attribute.
nrows	The value for the <code>ROWS</code> attribute. This is an integer.
ncolumns	The value for the <code>COLS</code> attribute. This is an integer.
calign	The value for the <code>ALIGN</code> attribute.
cwrap	The value for the <code>WRAP</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

236.6.54 FORMTEXTAREACLOSE Function

This function generates the </TEXTAREA> tag which ends a text area form element.

You open a text area element by means of either [FORMTEXTAREAOPEN Function](#) or [FORMTEXTAREAOPEN2 Function](#).

Syntax

```
HTF.FORMTEXTAREACLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</TEXTAREA>
```

236.6.55 FORMTEXTAREAOPEN Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

Syntax

```
HTF.FORMTEXTAREAOPEN (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns      IN          INTEGER,
  calign        IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-44 FORMTEXTAREAOPEN Function Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

236.6.56 FORMTEXTAREAOPEN2 Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN Function](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

Syntax

```
HTF.FORMTEXTAREAOPEN2 (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cwrap         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-45 FORMTEXTAREAOPEN2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

236.6.57 FRAME Function

This function generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTF.FRAME (
  csrc          IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  cmarginwidth IN          VARCHAR2  DEFAULT NULL,
  cmarginheight IN         VARCHAR2  DEFAULT NULL,
  cscrolling    IN          VARCHAR2  DEFAULT NULL,
  cnoresize     IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-46 FRAME Function Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

236.6.58 FRAMESETCLOSE Function

This function generates the </FRAMESET> tag which ends a frameset section.

You mark the beginning of a frameset section by means of the [FRAMESETOPEN Function](#).

Syntax

```
HTF.FRAMESETCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```

236.6.59 FRAMESETOPEN Function

This function generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the [FRAMESETCLOSE Function](#).

Syntax

```
HTF.FRAMESETOPEN (
    crows          IN          VARCHAR2  DEFAULT NULL,
    ccols          IN          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-47 FRAMESETOPEN Function Parameters

Parameter	Description
<code>crows</code>	The value for the <code>ROWS</code> attribute.
<code>ccols</code>	The value for the <code>COLS</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

236.6.60 HEADCLOSE Function

This function generates the `</HEAD>` tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the [HEADOPEN Function](#).

Syntax

```
HTF.HEADCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</HEAD>
```

236.6.61 HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTF.HEADER(
  nsize      IN      INTEGER,
  cheader    IN      VARCHAR2,
  calign     IN      VARCHAR2  DEFAULT NULL,
  cnowrap    IN      VARCHAR2  DEFAULT NULL,
  cclear     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-48 HEADER Function Parameters

Parameter	Description
nsize	The heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTF.header (1, 'Overview')
  RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

236.6.62 HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the [HEADCLOSE Function](#).

Syntax

```
HTF.HEADOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

<HEAD>

236.6.63 HR Function

This function generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [LINE Function](#).

Syntax

```
HTF.HR (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-49 HR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

236.6.64 HTMLCLOSE Function

This function generates the </HTML> tag which marks the end of an HTML document.

You use the [HTMLOPEN Function](#) to mark the beginning of an HTML document.

Syntax

```
HTF.HTMLCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</HTML>
```

236.6.65 HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Function](#) to mark the end of the an HTML document.

Syntax

```
HTF.HTMLOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HTML>
```

236.6.66 IMG Function

This function generates the `` tag which directs the browser to load an image onto the HTML page.

The [IMG2 Function](#) performs the same operation but additionally uses the `cusemap` parameter.

Syntax

```
HTF.IMG (
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters**Table 236-50 IMG Function Parameters**

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

236.6.67 IMG2 Function

This function generates the tag, which directs the browser to load an image onto the HTML page.

The [IMG Function](#) performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTF.IMG2(
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2  DEFAULT NULL,
  cusemap       IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-51 IMG2 Function Parameters

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cusemap</code>	The value for the USEMAP attribute which specifies a client-side image map.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

236.6.68 ISINDEX Function

This function creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program.

Syntax

```
HTF.ISINDEX(
  cprompt       IN          VARCHAR2  DEFAULT NULL,
  curl          IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-52 ISINDEX Function Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

236.6.69 ITALIC Function

This function generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

Syntax

```
HTF.ITALIC(
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-53 ITALIC Function Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<I cattributes>ctext</I>
```

236.6.70 KBD Function

This function generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KEYBOARD Function](#).

Syntax

```
HTF.KBD(
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-54 KBD Function Parameters

Parameter	Description
c <code>text</code>	The text to be rendered in monospace.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

236.6.71 KEYBOARD Function

This function generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KBD Function](#).

Syntax

```
HTF.KEYBOARD (
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-55 KEYBOARD Function Parameters

Parameter	Description
c <code>text</code>	The text to be rendered in monospace.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

236.6.72 LINE Function

This function generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [HR Function](#).

Syntax

```
HTF.LINE (
  cclear         IN          VARCHAR2  DEFAULT NULL,
  csrc           IN          VARCHAR2  DEFAULT NULL,
```

```

    cattributes    IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 236-56 LINE Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

236.6.73 LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of [LINKREV Function](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Function](#).

Syntax

```

HTF.LINKREL (
    crel          IN          VARCHAR2,
    curl         IN          VARCHAR2,
    cttitle      IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 236-57 LINKREL Function Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

236.6.74 LINKREV Function

This function generates the `<LINK>` tag with the `REV` attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the [LINKREL Function](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Function](#).

Syntax

```
HTF.LINKREV (
  crev          IN          VARCHAR2,
  curl          IN          VARCHAR2,
  ctitle        IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-58 LINKREV Function Parameters

Parameter	Description
<code>crev</code>	The value for the <code>REV</code> attribute.
<code>curl</code>	The value for the <code>URL</code> attribute.
<code>ctitle</code>	The value for the <code>TITLE</code> attribute.

Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

236.6.75 LISTHEADER Function

This function generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

Syntax

```
HTF.LISTHEADER (
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-59 LISTHEADER Function Parameters

Parameter	Description
<code>ctext</code>	The text to place between <code><LH></code> and <code></LH></code> .
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LH cattributes>ctext</LH>
```

236.6.76 LISTINGCLOSE Function

This function generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Function](#).

Syntax

```
HTF.LISTINGCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</LISTING>
```

236.6.77 LISTINGOPEN Function

This function generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Function](#).

Syntax

```
HTF.LISTINGOPEN  
RETURN VARCHAR2;
```

Examples

This function generates

```
<LISTING>
```

236.6.78 LISTITEM Function

This function generates the `` tag, which indicates a list item.

Syntax

```
HTF.LISTITEM(  
  ctext          IN          VARCHAR2  DEFAULT NULL,  
  cclear         IN          VARCHAR2  DEFAULT NULL,  
  cdingbat       IN          VARCHAR2  DEFAULT NULL,  
  csrc           IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 236-60 LISTITEM Function Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

236.6.79 MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTF.MAILTO(
  caddress      IN          VARCHAR2,
  ctext         IN          VARCHAR2,
  cname         IN          VARCHAR2,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-61 MAILTO Function Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

236.6.80 MAPCLOSE Function

This function generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map

. To mark the beginning of a set of regions in a client-side image map, use the [MAOPEN Function](#).

Syntax

```
HTF.MAPCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MAP>
```

236.6.81 MAOPEN Function

This function generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Function](#).

Syntax

```
HTF.MAOPEN (
  cname          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 236-62 MAOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

236.6.82 MENULISTCLOSE Function

This function generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the [MENULISTOPEN Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

Syntax

```
HTF.MENULISTCLOSE  
    RETURN VARCHAR2;
```

Examples

This function generates

```
</MENU>
```

236.6.83 MENULISTOPEN Function

This function generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the [MENULISTCLOSE Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

Syntax

```
HTF.MENULISTOPEN  
    RETURN VARCHAR2;
```

Examples

This function generates

```
<MENU>
```

236.6.84 META Function

This function generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(  
    chttp_equiv    IN    VARCHAR2,  
    cname          IN    VARCHAR2,  
    ccontent       IN    VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 236-63 META Function Parameters

Parameter	Description
chttp_equiv	The value for the <code>CHTTP_EQUIV</code> attribute.
cname	The value for the <code>NAME</code> attribute.
ccontent	The value for the <code>CONTENT</code> attribute.

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

236.6.85 NL Function

This function generates the `
` tag which begins a new line of text.

It performs the same operation as the [BR Function](#).

Syntax

```
HTF.NL(
  cclear          IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-64 NL Function Parameters

Parameter	Description
cclear	The value for the <code>CLEAR</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

236.6.86 NOBR Function

This function generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR (  
  ctext          IN          VARCHAR2)  
  RETURN VARCHAR2;
```

Parameters

Table 236-65 NOBR Function Parameters

Parameter	Description
<code>ctext</code>	The text that is to be rendered on one line.

Examples

This function generates

```
<NOBR>ctext</NOBR>
```

236.6.87 NOFRAMESCLOSE Function

This function generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the [FRAMESETOPEN Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

Syntax

```
HTF.NOFRAMESCLOSE  
  RETURN VARCHAR2;
```

Examples

This function generates

```
</NOFRAMES>
```

236.6.88 NOFRAMESOPEN Function

This function generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the [FRAMESETCLOSE Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

Syntax

```
HTF.NOFRAMESOPEN  
  RETURN VARCHAR2;
```

Examples

This function generates

```
<NOFRAMES>
```

236.6.89 OLISTCLOSE Function

This function generates the `` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the [OLISTOPEN Function](#). Numbered items are added using [LISTITEM Function](#).

Syntax

```
HTF.OLISTCLOSE  
  RETURN VARCHAR2;
```

Examples

This function generates

```
</OL>
```

236.6.90 OLISTOPEN Function

This function generates the `` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the [OLISTCLOSE Function](#). Numbered items are added using [LISTITEM Function](#).

Syntax

```
HTF.OLISTOPEN(  
  cclear          IN          VARCHAR2  DEFAULT NULL,  
  cwrap           IN          VARCHAR2  DEFAULT NULL,  
  cattributes     IN          VARCHAR2  DEFAULT NULL)  
  RETURN VARCHAR2;
```

Parameters

Table 236-66 OLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

236.6.91 PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the [PARAGRAPH Function](#).

Syntax

```
HTF.PARA
  RETURN VARCHAR2;
```

Examples

This function generates

```
<P>
```

236.6.92 PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

Syntax

```
HTF.PARAGRAPH(
  calign          IN          VARCHAR2  DEFAULT NULL,
  cnowrap         IN          VARCHAR2  DEFAULT NULL,
  cclear          IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 236-67 PARAGRAPH Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

Related Topics

- [PARA Function](#)
This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

236.6.93 PARAM Function

This function generates the `<PARAM>` tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Function](#) to begin the invocation. Use one [PARAM Function](#) for each desired name-value pair, and use [APPLETCLOSE Function](#) to end the applet invocation.

Syntax

```
HTF.PARAM(  
    cname          IN          VARCHAR2  
    cvalue         IN          VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 236-68 PARAM Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

236.6.94 PLAINTEXT Function

This function generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTF.PLAINTEXT(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 236-69 PLAINTEXT Function Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

236.6.95 PRECLOSE Function

This function generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Function](#).

Syntax

```
HTF.PRECLOSE  
    RETURN VARCHAR2;
```

Examples

This function generates

```
</PRE>
```

236.6.96 PREOPEN Function

This function generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Function](#).

Syntax

```
HTF.PREOPEN (  
    cclear          IN          VARCHAR2  DEFAULT NULL,  
    cwidth          IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL)  
    RETURN VARCHAR2;
```

Parameters

Table 236-70 PREOPEN Function Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwidth</code>	The value for the <code>WIDTH</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

236.6.97 PRINT Functions

These functions generate the specified parameter as a string terminated with the `\n` newline character.

The [PRN Functions](#) performs the same operation but does not terminate with a newline character.

Syntax

```
HTF.PRINT (  
    cbuf      IN      VARCHAR2)  
    RETURN VARCHAR2;
```

```
HTF.PRINT (  
    dbuf      IN      DATE)  
    RETURN VARCHAR2;
```

```
HTF.PRINT (  
    nbuf      IN      NUMBER)  
    RETURN VARCHAR2;
```

Parameters

Table 236-71 PRINT Function Parameters

Parameter	Description
<code>cbuf</code>	The string to generate terminated by a newline.
<code>dbuf</code>	The string to generate terminated by a newline.
<code>nbuf</code>	The string to generate terminated by a newline.

Usage Notes

- The `\n` character is not the same as `
`. The `\n` character formats the HTML source but it does not affect how the browser renders the HTML source. Use `
` to control how the browser renders the HTML source.
- These functions do not have function equivalents.

236.6.98 PRN Functions

These functions generate the specified parameter as a string.

Unlike the [PRINT Functions](#) the string is not terminated with the `\n` newline character.

Syntax

```
HTF.PRN (  
    cbuf      IN      VARCHAR2)  
    RETURN VARCHAR2;
```

```
HTF.PRN (  
    dbuf      IN      DATE)  
    RETURN VARCHAR2;
```

```
HTF.PRN (
  nbuf      IN      NUMBER)
RETURN VARCHAR2;
```

Parameters

Table 236-72 PRN Function Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These functions do not have function equivalents.

236.6.99 S Function

This function generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [STRIKE Function](#).

Syntax

```
HTF.S (
  ctext      IN      VARCHAR2,
  cattributes IN      VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-73 S Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<S cattributes>ctext</S>
```

236.6.100 SAMPLE Function

This function generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTF.SAMPLE (
    ctext          IN          VARCHAR2,
    cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-74 SAMPLE Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

236.6.101 SCRIPT Function

This function generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (
    cscript       IN          VARCHAR2,
    clanguage     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-75 SCRIPT Function Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

236.6.102 SMALL Function

This function generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTF.SMALL (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-76 SMALL Function Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

236.6.103 STRIKE Function

This function generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [S Function](#).

Syntax

```
STRIKE (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-77 STRIKE Function Parameters

Parameter	Description
<code>c_{text}</code>	The text to be rendered in strikethrough type.
<code>c_{attributes}</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

236.6.104 STRONG Function

This function generates the `` and `` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

Syntax

```
HTF.STRONG(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
  RETURN VARCHAR2;
```

Parameters

Table 236-78 STRONG Function Parameters

Parameter	Description
<code>c_{text}</code>	The text to be emphasized.
<code>c_{attributes}</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```

236.6.105 STYLE Function

This function generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTF.STYLE (
    cstyle          IN          VARCHAR2)
RETURN VARCHAR2;
```

Parameters**Table 236-79** STYLE Function Parameters

Parameter	Description
cstyle	The style information to include.

Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

236.6.106 SUB Function

This function generates the `_{` and `}` tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTF.SUB (
    ctext          IN          VARCHAR2,
    calign         in          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters**Table 236-80** SUB Function Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the <code>ALIGN</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

236.6.107 SUP Function

This function generates the `^{` and `}` tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTF.SUP (
  ctext          IN          VARCHAR2,
  calign         in          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-81 SUP Function Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the <code>ALIGN</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

236.6.108 TABLECAPTION Function

This function generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```
HTF.TABLECAPTION (
  ccaption       IN          VARCHAR2,
  calign         in          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-82 TABLECAPTION Function Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the <code>ALIGN</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

236.6.109 TABLECLOSE Function

This function generates the `</TABLE>` tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the [TABLEOPEN Function](#).

Syntax

```
HTF.TABLECLOSE  
    RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

236.6.110 TABLEDATA Function

This function generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

Syntax

```
HTF.TABLEDATA (  
    cvalue          IN          VARCHAR2  DEFAULT NULL,  
    calign          IN          VARCHAR2  DEFAULT NULL,  
    cdp            IN          VARCHAR2  DEFAULT NULL,  
    cnowrap        IN          VARCHAR2  DEFAULT NULL,  
    crowspan       IN          VARCHAR2  DEFAULT NULL,  
    ccolspan       IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
    RETURN VARCHAR2;
```

Parameters

Table 236-83 TABLEDATA Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the <code>ALIGN</code> attribute.
cdp	The value for the <code>DP</code> attribute.
cnowrap	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
ccolspan	The value for the <code>COLSPAN</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

236.6.111 TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table.

The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTF.TABLEHEADER(
    cvalue      IN          VARCHAR2  DEFAULT NULL,
    calign      IN          VARCHAR2  DEFAULT NULL,
    cdp         IN          VARCHAR2  DEFAULT NULL,
    cnowrap     IN          VARCHAR2  DEFAULT NULL,
    crowspan    IN          VARCHAR2  DEFAULT NULL,
    ccolspan    IN          VARCHAR2  DEFAULT NULL,
    cattributes IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-84 TABLEHEADER Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

236.6.112 TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the [TABLECLOSE Function](#).

Syntax

```
HTF.TABLEOPEN (
  cborder      IN      VARCHAR2  DEFAULT NULL
  calign       IN      VARCHAR2  DEFAULT NULL,
  cnowrap      IN      VARCHAR2  DEFAULT NULL,
  cclear       IN      VARCHAR2  DEFAULT NULL
  cattributes  IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-85 TABLEOPEN Function Parameters

Parameter	Description
border	The value for the <code>BORDER</code> attribute.
calign	The value for the <code>ALIGN</code> attribute.
cnowrap	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
cclear	The value for the <code>CLEAR</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

236.6.113 TABLEROWCLOSE Function

This function generates the </TR> tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the [TABLEROWOPEN Function](#).

Syntax

```
HTF.TABLEROWCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

236.6.114 TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the [TABLEROWCLOSE Function](#).

Syntax

```
HTF.TABLEROWOPEN (
  calign          IN          VARCHAR2  DEFAULT NULL,
  cvalign         IN          VARCHAR2  DEFAULT NULL,
  cdp             IN          VARCHAR2  DEFAULT NULL,
  cnowrap         IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-86 TABLEROWOPEN Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

236.6.115 TELETYPE Function

This function generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTF.TELETYPE (
  ctext          IN          VARCHAR2,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-87 TELETYPE Function Parameters

Parameter	Description
<code>c_{text}</code>	The text to render in a fixed width typewriter font.
<code>c_{attributes}</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TT cattributes>ctext</TT>
```

236.6.116 TITLE Function

This function generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTF.TITLE(  
    ctitle          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 236-88 TITLE Function Parameters

Parameter	Description
<code>c_{title}</code>	The text to display in the titlebar of the browser window.

Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

236.6.117 ULISTCLOSE Function

This function generates the `` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the [ULISTOPEN Function](#). Add list items with [LISTITEM Function](#).

Syntax

```
HTF.ULISTCLOSE  
    RETURN VARCHAR2;
```

Examples

This function generates

```
</UL>
```

236.6.118 ULISTOPEN Function

This function generates the `` tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the [ULISTCLOSE Function](#). Add list items with [LISTITEM Function](#).

Syntax

```
HTF.ULISTOPEN(
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cwrap       IN      VARCHAR2  DEFAULT NULL,
  cdingbat    IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters**Table 236-89** ULISTOPEN Function Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cdingbat</code>	The value for the <code>DINGBAT</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

236.6.119 UNDERLINE Function

This function generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTF.UNDERLINE(
  ctext      IN      VARCHAR2,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-90 UNDERLINE Function Parameters

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<U cattributes>ctext</U>
```

236.6.120 VARIABLE Function

This function generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTF.VARIABLE(
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 236-91 VARIABLE Function Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

236.6.121 WBR Function

This function generates the `<WBR>` tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTF.WBR
RETURN VARCHAR2;
```

Examples

This function generates

<WBR>

237

HTP

The `HTP` (hypertext procedures) and `HTF` (hypertext functions) packages generate HTML tags. For example, the `HTP.ANCHOR` procedure generates the HTML anchor tag, `<A>`.

This chapter contains the following topics:

- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of Tags](#)
- [Summary of HTP Subprograms](#)

See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

237.1 HTP Operational Notes

Certain operational notes apply to the `HTP` package.

For every `HTP` procedure that generates one or more HTML tags, there is a corresponding `HTF` function with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have `HTF` function equivalents. Use the [ESCAPE_SC Function](#) or the [ESCAPE_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE_URL Function](#).
- The [FORMAT_CELL Function](#) does not have an `HTP` equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an `HTP` equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of `HTF` functions, call the functions from within the `HTP.PRINT` procedure. It then prints its parameters to the generated Web page.

237.2 HTP Rules and Limits

If you use values of the LONG datatype in procedures such as HTP.PRINT, HTP.PRN, HTP.PRINTS, HTP.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the procedure.

237.3 HTP Examples

These commands generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
  HTP.HTMLOPEN;           -- generates <HTML>
  HTP.HEADOPEN;          -- generates <HEAD>
  HTP.TITLE('Hello');    -- generates <TITLE>Hello</TITLE>
  HTP.HEADCLOSE;        -- generates </HEAD>
  HTP.BODYOPEN;         -- generates <BODY>
  HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
  HTP.BODYCLOSE;        -- generates </BODY>
  HTP.HTMLCLOSE;        -- generates </HTML>
END;
```

237.4 HTP Summary of Tags

HTP tags can be grouped by type, to make understanding them easier.

HTML, HEAD, and BODY Tags

[HTMLOPEN Procedure](#), [HTMLCLOSE Procedure](#) - generate <HTML> and </HTML>

[HEADOPEN Procedure](#), [HEADCLOSE Procedure](#) - generate <HEAD> and </HEAD>

[BODYOPEN Procedure](#), [BODYCLOSE Procedure](#) - generate <BODY> and </BODY>

Comment Tag

[COMMENT Procedure](#) - generates <!-- and -->

Tags in the <HEAD> Area

[BASE Procedure](#) - generates <BASE>

[LINKREL Procedure](#) - generates <LINK> with the REL attribute

[LINKREV Procedure](#) - generates <LINK> with the REV attribute

[TITLE Procedure](#) - generates <TITLE>

[META Procedure](#) - generates <META>

[SCRIPT Procedure](#) - generates <SCRIPT>

[STYLE Procedure](#) - generates <STYLE>

[ISINDEX Procedure](#) - generates <ISINDEX>

Applet Tags

[APPLETOPEN Procedure](#), [APPLETCLOSE Procedure](#) - generate `<APPLET>` and `</APPLET>`

[PARAM Procedure](#) - generates `<PARAM>`

List Tags

[OLISTOPEN Procedure](#), [OLISTCLOSE Procedure](#) - generate `` and ``

[ULISTOPEN Procedure](#), [ULISTCLOSE Procedure](#) - generate `` and ``

[DLISTOPEN Procedure](#), [DLISTCLOSE Procedure](#) - generate `<DL>` and `</DL>`

[DLISTTERM Procedure](#) - generates `<DT>`

[DLISTDEF Procedure](#) - generates `<DD>`

[DIRLISTOPEN Procedure](#), [DIRLISTCLOSE Procedure](#) - generate `<DIR>` and `</DIR>`

[LISTHEADER Procedure](#) - generates `<LH>`

[LISTINGOPEN Procedure](#), [LISTINGCLOSE Procedure](#) - generate `<LISTING>` and `</LISTING>`

[MENULISTOPEN Procedure](#) - generate `<MENU>` and `</MENU>`

[LISTITEM Procedure](#) - generates ``

Form Tags

[FORMOPEN Procedure](#), [FORMCLOSE Procedure](#) - generate `<FORM>` and `</FORM>`

[FORMCHECKBOX Procedure](#) - generates `<INPUT TYPE="CHECKBOX">`

[FORMHIDDEN Procedure](#) - generates `<INPUT TYPE="HIDDEN">`

[FORMIMAGE Procedure](#) - generates `<INPUT TYPE="IMAGE">`

[FORMPASSWORD Procedure](#) - generates `<INPUT TYPE="PASSWORD">`

[FORMRADIO Procedure](#) - generates `<INPUT TYPE="RADIO">`

[FORMSELECTOPEN Procedure](#), [FORMSELECTCLOSE Procedure](#) - generate `<SELECT>` and `</SELECT>`

[FORMSELETOPTION Procedure](#) - generates `<OPTION>`

[FORMTEXT Procedure](#) - generates `<INPUT TYPE="TEXT">`

[FORMTEXTAREA Procedure](#) - generate `<TEXTAREA>`

[FORMTEXTAREAOPEN Procedure](#), [FORMTEXTAREACLOSE Procedure](#) - generate `<TEXTAREA>` and `</TEXTAREA>`

[FORMRESET Procedure](#) - generates `<INPUT TYPE="RESET">`

[FORMSUBMIT Procedure](#) - generates `<INPUT TYPE="SUBMIT">`

Table Tags

[TABLEOPEN Procedure](#), [TABLECLOSE Procedure](#) - generate `<TABLE>` and `</TABLE>`

[TABLECAPTION Procedure](#) - generates `<CAPTION>`

[TABLEROWOPEN Procedure](#), [TABLEROWCLOSE Procedure](#) - generate `<TR>` and `</TR>`

[TABLEHEADER Procedure](#) - generates `<TH>`

[TABLEDATA Procedure](#) - generates `<TD>`

IMG, HR, and A Tags

[HR Procedure](#), [LINE Procedure](#) - generate `<HR>`

[IMG Procedure](#), [IMG2 Procedure](#) - generate ``

[ANCHOR Procedure](#), [ANCHOR2 Procedure](#) - generate `<A>`

[MAOPEN Procedure](#), [MAPCLOSE Procedure](#) - generate `<MAP>` and `</MAP>`

Paragraph Formatting Tags

[HEADER Procedure](#) - generates heading tags (`<H1>` to `<H6>`)

[PARA Procedure](#), [PARAGRAPH Procedure](#) - generate `<P>`

[PRN Procedures](#), [PRINT Procedures](#) - generate any text that is passed in

[PRINTS Procedure](#), [PS Procedure](#) - generate any text that is passed in; special characters in HTML are escaped

[PREOPEN Procedure](#), [PRECLOSE Procedure](#) - generate `<PRE>` and `</PRE>`

[BLOCKQUOTEOPEN Procedure](#), [BLOCKQUOTECLOSE Procedure](#) - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`

[DIV Procedure](#) - generates `<DIV>`

[NL Procedure](#), [BR Procedure](#) - generate `
`

[NOBR Procedure](#) - generates `<NOBR>`

[WBR Procedure](#) - generates `<WBR>`

[PLAINTEXT Procedure](#) - generates `<PLAINTEXT>`

[ADDRESS Procedure](#) - generates `<ADDRESS>`

[MAILTO Procedure](#) - generates `<A>` with the `MAILTO` attribute

[AREA Procedure](#) - generates `<AREA>`

[BGSOUND Procedure](#) - generates `<BGSOUND>`

Character Formatting Tags

[BASEFONT Procedure](#) - generates `<BASEFONT>`

BIG Procedure - generates <BIG>

BOLD Procedure - generates

CENTER Procedure - generates <CENTER> and </CENTER>

CENTEROPEN Procedure, CENTERCLOSE Procedure - generate <CENTER> and </CENTER>

CITE Procedure - generates <CITE>

CODE Procedure - generates <CODE>

DFN Procedure - generates <DFN>

EM Procedure, EMPHASIS Procedure - generate

FONTOPEN Procedure, FONTCLOSE Procedure - generate and

ITALIC Procedure - generates <I>

KBD Procedure, KEYBOARD Procedure - generate <KBD> and </KBD>

S Procedure - generates <S>

SAMPLE Procedure - generates <SAMP>

SMALL Procedure - generates <SMALL>

STRIKE Procedure - generates <STRIKE>

STRONG Procedure - generates

SUB Procedure - generates <SUB>

SUP Procedure - generates <SUP>

TELETYPE Procedure - generates <TT>

UNDERLINE Procedure - generates <U>

VARIABLE Procedure - generates <VAR>

Frame Tags

FRAME Procedure - generates <FRAME>

FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate <NOFRAMES> and </NOFRAMES>

237.5 Summary of HTP Subprograms

This table lists the HTP subprograms and briefly describes them.

Table 237-1 HTP Package Subprograms

Subprogram	Description
ADDRESS Procedure	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Procedure	Generates the <A> and tags which specify the source or destination of a hypertext link
ANCHOR2 Procedure	Generates the <A> and tags which specify the source or destination of a hypertext link
APPLETCLOSE Procedure	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Procedure	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Procedure	Generates the <AREA> tag, which defines a client-side image map
BASE Procedure	Generates the <BASE> tag which records the URL of the document
BASEFONT Procedure	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Procedure	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Procedure	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Procedure	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Procedure	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Procedure	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Procedure	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Procedure	Generates the and tags which direct the browser to display the text in boldface
BR Procedure	Generates the tag which begins a new line of text
CENTER Procedure	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Procedure	Generates the </CENTER> tag which marks the end of a section of text to center
CENTEROPEN Procedure	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Procedure	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Procedure	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
COMMENT Procedure	Generates procedure generates the comment tags <!-- ctext -->

Table 237-1 (Cont.) HTP Package Subprograms

Subprogram	Description
DFN Procedure	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Procedure	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Procedure	Generates the <DIR> which starts a directory list section
DIV Procedure	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Procedure	Generates the </DL> tag which ends a definition list
DLISTDEF Procedure	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Procedure	Generates the <DL> tag which starts a definition list
DLISTTERM Procedure	Generates the <DT> tag which defines a term in a definition list <DL>
EM Procedure	Generates the and tags, which define text to be emphasized
EMPHASIS Procedure	Generates the and tags, which define text to be emphasized
ESCAPE_SC Procedure	Replaces characters that have special meaning in HTML with their escape sequences
FONTCLOSE Procedure	Generates the tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Procedure	Generates the which marks the beginning of section of text with the specified font characteristics
FORMCHECKBOX Procedure	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Procedure	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMOPEN Procedure	Generates the <FORM> tag which marks the beginning of a form section in an HTML document
FORMFILE Procedure	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Procedure	Generates the <INPUT> tag with TYPE="hidden" which inserts a hidden form element
FORMIMAGE Procedure	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMPASSWORD Procedure	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Procedure	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Procedure	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values

Table 237-1 (Cont.) HTP Package Subprograms

Subprogram	Description
FORMSELECTCLOSE Procedure	Generates the <code></SELECT></code> tag which marks the end of a Select form element
FORMSELECTOPEN Procedure	Generates the <code></SELECT></code> tag which marks the beginning of a Select form element
FORMSELECTOPTION Procedure	Generates the <code><OPTION></code> tag which represents one choice in a Select element
FORMSUBMIT Procedure	Generates the <code><INPUT></code> tag with <code>TYPE="submit"</code> which creates a button that, when clicked, submits the form
FORMTEXT Procedure	Generates the <code><INPUT></code> tag with <code>TYPE="text"</code> , which creates a field for a single line of text
FORMTEXTAREA Procedure	Generates the <code><TEXTAREA></code> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Procedure	Generates the <code><TEXTAREA></code> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Procedure	Generates the <code></TEXTAREA></code> tag which ends a text area form element
FORMTEXTAREAOPEN Procedure	Generates the <code><TEXTAREA></code> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Procedure	Generates the <code><TEXTAREA></code> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Procedure	Generates the <code><FRAME></code> tag which begins the characteristics of a frame created by a <code><FRAMESET></code> tag
FRAMESETCLOSE Procedure	Generates the <code></FRAMESET></code> tag which ends a frameset section
FRAMESETOPEN Procedure	Generates the <code></FRAMESET></code> tag which begins a frameset section
HEADCLOSE Procedure	Generates the <code></HEAD></code> tag which marks the end of an HTML document head section
HEADER Procedure	Generates opening heading tags (<code><H1></code> to <code><H6></code>) and their corresponding closing tags (<code></H1></code> to <code></H6></code>)
HEADOPEN Procedure	Generates the <code><HEAD></code> tag which marks the beginning of the HTML document head section
HR Procedure	Generates the <code><HR></code> tag, which generates a line in the HTML document
HTMLCLOSE Procedure	Generates the <code></HTML></code> tag which marks the end of an HTML document
HTMLOPEN Procedure	Generates the <code><HTML></code> tag which marks the beginning of an HTML document
IMG Procedure	Generates the <code></code> tag which directs the browser to load an image onto the HTML page
IMG2 Procedure	Generates the <code></code> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the <code>USEMAP</code> attribute

Table 237-1 (Cont.) HTP Package Subprograms

Subprogram	Description
ISINDEX Procedure	Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program
ITALIC Procedure	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Procedure	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Procedure	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Procedure	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Procedure	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Procedure	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Procedure	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Procedure	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Procedure	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Procedure	Generates the tag, which indicates a list item
MAILTO Procedure	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Procedure	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAOPEN Procedure	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Procedure	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Procedure	Generates the <MENU> tag which begins a list that presents one line for each item
META Procedure	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Procedure	Generates the tag which begins a new line of text
NOBR Procedure	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Procedure	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Procedure	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section

Table 237-1 (Cont.) HTP Package Subprograms

Subprogram	Description
OLISTCLOSE Procedure	Generates the <code></code> tag which defines the end of an ordered list
OLISTOPEN Procedure	Generates the <code></code> tag which marks the beginning of an ordered list
PARA Procedure	Generates the <code><P></code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Procedure	Adds attributes to the <code><P></code> tag
PARAM Procedure	Generates the <code><PARAM></code> tag which specifies parameter values for Java applets
PLAINTEXT Procedure	Generates the <code><PLAINTEXT></code> and <code></PLAINTEXT></code> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Procedure	Generates the <code></PRE></code> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Procedure	Generates the <code><PRE></code> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Procedures	Generates the specified parameter as a string terminated with the <code>\n</code> newline character
PRINTS Procedure	Generates a string and replaces the following characters with the corresponding escape sequence
PRN Procedures	Generates the specified parameter as a string
PS Procedure	Generates a string and replaces the following characters with the corresponding escape sequence.
S Procedure	Generates the <code><S></code> and <code></S></code> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Procedure	Generates the <code><SAMP></code> and <code></SAMP></code> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Procedure	Generates the <code><SCRIPT></code> and <code></SCRIPT></code> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Procedure	Generates the <code><SMALL></code> and <code></SMALL></code> tags, which direct the browser to render the text they surround using a small font
STRIKE Procedure	Generates the <code><STRIKE></code> and <code></STRIKE></code> tags which direct the browser to render the text they surround in strikethrough type
STRONG Procedure	Generates the <code></code> and <code></code> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Procedure	Generates the <code><STYLE></code> and <code></STYLE></code> tags which include a style sheet in a Web page
SUB Procedure	Generates the <code><SUB></code> and <code></SUB></code> tags which direct the browser to render the text they surround as subscript
SUP Procedure	Generates the <code><SUP></code> and <code></SUP></code> tags which direct the browser to render the text they surround as superscript

Table 237-1 (Cont.) HTP Package Subprograms

Subprogram	Description
TABLECAPTION Procedure	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Procedure	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Procedure	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Procedure	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Procedure	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Procedure	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Procedure	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Procedure	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Procedure	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Procedure	Generates the tag which marks the end of an unordered list
ULISTOPEN Procedure	Generates the tag which marks the beginning of an unordered list
UNDERLINE Procedure	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Procedure	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Procedure	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

237.5.1 ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTP.ADDRESS (
    cvalue          IN          VARCHAR2
    cnowrap         IN          VARCHAR2  DEFAULT NULL
    cclear          IN          VARCHAR2  DEFAULT NULL
    cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-2 ADDRESS Procedure Parameters

Parameter	Description
<code>cvalue</code>	The string that goes between the <code><ADDRESS></code> and <code></ADDRESS></code> tags.
<code>cnowrap</code>	If the value for this parameter is not NULL, the <code>NOWRAP</code> attribute is included in the tag
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

237.5.2 ANCHOR Procedure

Like the `ANCHOR2` procedure, this procedure generates the `<A>` and `` HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the [ANCHOR2 Procedure](#) provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR (
  curl          IN          VARCHAR2,
  ctext         IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-3 ANCHOR Procedure Parameters

Parameter	Description
<code>curl</code>	The value for the <code>HREF</code> attribute.
<code>ctext</code>	The string that goes between the <code><A></code> and <code></code> tags.
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either `HREF` or `NAME` is required. `HREF` specifies to where to link. `NAME` allows this tag to be a target of a hypertext link.

237.5.3 ANCHOR2 Procedure

Like the `ANCHOR` procedure, this procedure generates the `<A>` and `` HTML tags which specify the source or destination of a hypertext link.

The difference between this procedure and the `ANCHOR` procedure is that this procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (
    curl          IN          VARCHAR2,
    ctext         IN          VARCHAR2,
    cname         IN          VARCHAR2  DEFAULT NULL,
    ctarget       in          varchar2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-4 ANCHOR2 Procedure Parameters

Parameter	Description
<code>curl</code>	The value for the <code>HREF</code> attribute.
<code>ctext</code>	The string that goes between the <code><A></code> and <code></code> tags.
<code>cname</code>	The value for the <code>NAME</code> attribute
<code>ctarget</code>	The value for the <code>TARGET</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

237.5.4 APPLETCLOSE Procedure

This procedure closes the applet invocation with the `</APPLET>` tag.

You must first invoke the a Java applet using [APPLETOPEN Procedure](#).

Syntax

```
HTP.APPLETCLOSE;
```

237.5.5 APPLETOPEN Procedure

This procedure generates the `<APPLET>` tag which begins the invocation of a Java applet.

You close the applet invocation with [APPLETCLOSE Procedure](#) which generates the `</APPLET>` tag.

Syntax

```
HTP.APPLETOPEN (  
    ccode          IN          VARCHAR2,  
    cheight       IN          NUMBER,  
    cwidth        IN          NUMBER,  
    cattributes   IN          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 237-5 APPLETOPEN Procedure Parameters

Parameter	Description
<code>ccode</code>	The the value for the <code>CODE</code> attribute which specifies the name of the applet class.
<code>cheight</code>	The value for the <code>HEIGHT</code> attribute.
<code>cwidth</code>	The value for the <code>WIDTH</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the [PARAM Procedure](#).
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

237.5.6 AREA Procedure

This procedure generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTP.AREA (
  ccoords          IN          VARCHAR2
  cshape           IN          VARCHAR2  DEFAULT NULL,
  chref            IN          VARCHAR2  DEFAULT NULL,
  cnohref          IN          VARCHAR2  DEFAULT NULL,
  ctarger          IN          VARCHAR2  DEFAULT NULL,
  cattributes      IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-6 AREA Procedure Parameters

Parameter	Description
ccords	The the value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarger	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarger" cattributes>
```

237.5.7 BASE Procedure

This procedure generates the <BASE> tag which records the URL of the document.

Syntax

```
HTP.BASE (
  ctarger          IN          VARCHAR2  DEFAULT NULL,
  cattributes      IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-7 BASE Procedure Parameters

Parameter	Description
ctarger	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.

Table 237-7 (Cont.) BASE Procedure Parameters

Parameter	Description
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

237.5.8 BASEFONT Procedure

This procedure generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

Syntax

```
HTP.BASEFONT (
    nsize    IN    INTEGER);
```

Parameters**Table 237-8 BASEFONT Procedure Parameters**

Parameter	Description
<code>nsize</code>	The value for the <code>SIZE</code> attribute.

Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

237.5.9 BGSOUND Procedure

This procedure generates the `<BGSOUND>` tag which includes audio for a Web page.

Syntax

```
HTP.BGSOUND (
    csrc          IN    VARCHAR2,
    cloop         IN    VARCHAR2  DEFAULT NULL,
    cattributes   IN    VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-9 BGSOUND Procedure Parameters**

Parameter	Description
<code>csrc</code>	The value for the <code>SRC</code> attribute.

Table 237-9 (Cont.) BGSOUND Procedure Parameters

Parameter	Description
<code>cloop</code>	The value for the <code>LOOP</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

237.5.10 BIG Procedure

This procedure generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-10 BIG Procedure Parameters**

Parameter	Description
<code>ctext</code>	The the text that goes between the tags.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

237.5.11 BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Procedure](#).

Syntax

```
HTP.BLOCKQUOTECLOSE;
```

Examples

This procedure generates

`</BLOCKQUOTE>`

237.5.12 BLOCKQUOTEOPEN Procedure

This procedure generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Procedure](#).

Syntax

```
HTP.BLOCKQUOTEOPEN (
  cnowrap      IN      VARCHAR2  DEFAULT NULL,
  cclear       IN      VARCHAR2  DEFAULT NULL,
  cattributes  IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-11 BLOCKQUOTEOPEN Procedure Parameters

Parameter	Description
<code>cnowrap</code>	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

237.5.13 BODYCLOSE Procedure

This procedure generates the `</BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the [BODYOPEN Procedure](#).

Syntax

```
HTP.BODYCLOSE;
```

Examples

This procedure generates

```
</BODY>
```

237.5.14 BODYOPEN Procedure

This procedure generates the `<BODY>` tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the [BODYCLOSE Procedure](#).

Syntax

```
HTP.BODYOPEN (
    cbackground IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 237-12 BODYOPEN Procedure Parameters

Parameter	Description
<code>cbackground</code>	The value for the <code>BACKGROUND</code> attribute which specifies a graphic file to use for the background of the document.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

237.5.15 BOLD Procedure

This procedure generates the `` and `` tags which direct the browser to display the text in boldface.

Syntax

```
HTP.BOLD (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 237-13 BOLD Procedure Parameters

Parameter	Description
<code>ctext</code>	The text that goes between the tags.

Table 237-13 (Cont.) BOLD Procedure Parameters

Parameter	Description
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<B cattributes>ctext</B>
```

237.5.16 BR Procedure

This procedure generates the `
` tag which begins a new line of text.

It performs the same operation as the [NL Procedure](#).

Syntax

```
HTP.BR (
  cclear          IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-14 BR Procedure Parameters**

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

237.5.17 CENTER Procedure

This procedure generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

Syntax

```
HTP.CENTER (
  ctext          IN          VARCHAR2);
```

Parameters

Table 237-15 CENTER Parameters

Parameter	Description
<code>c</code> <code>text</code>	The text that goes between the tags.

Examples

This procedure generates

```
<CENTER>c
```

`text`

```
</CENTER>
```

237.5.18 CENTERCLOSE Procedure

This procedure generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the [CENTEROPEN Procedure](#).

Syntax

```
HTP.CENTERCLOSE;
```

Examples

This procedure generates

```
</CENTER>
```

237.5.19 CENTEROPEN Procedure

This procedure generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a of a section of text to center by means of the [CENTERCLOSE Procedure](#).

Syntax

```
HTP.CENTEROPEN;
```

Examples

This procedure generates

```
<CENTER>
```

237.5.20 CITE Procedure

This procedure generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```
HTP.CITE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-16 CITE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render as citation.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

237.5.21 CODE Procedure

This procedure generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-17 CODE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render as code.
<code>cattributes</code>	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```

237.5.22 COMMENT Procedure

This procedure generates the comment tags.

Syntax

```
HTP.COMMENT (  
    ctext          IN          VARCHAR2);
```

Parameters

Table 237-18 COMMENT Procedure Parameters

Parameter	Description
ctext	The comment.

Examples

This procedure generates

```
<!-- ctext -->
```

237.5.23 DFN Procedure

This procedure generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (  
    ctext          IN          VARCHAR2);
```

Parameters

Table 237-19 DFN Procedure Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This procedure generates

```
<DFN>ctext</DFN>
```

237.5.24 DIRLISTCLOSE Procedure

This procedure generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

```
HTP.DIRLISTCLOSE;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the tag directly or invoke the [LISTITEM Procedure](#) so that the tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
</DIR>
```

Related Topics

- [DIRLISTOPEN Procedure](#)
This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

237.5.25 DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

Syntax

```
HTP.DIRLISTOPEN;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the tag directly or invoke the [LISTITEM Procedure](#) so that the tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
<DIR>
```

Related Topics

- [DIRLISTCLOSE Procedure](#)
This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

237.5.26 DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```
HTP.DIV (  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 237-20 DIV Procedure Parameters

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

237.5.27 DLISTCLOSE Procedure

This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the [DLISTOPEN Procedure](#).

Syntax

```
HTP.DLISTCLOSE;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

Examples

This procedure generates

```
</DL>
```

Related Topics

- [DLISTOPEN Procedure](#)
This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the [DLISTCLOSE Procedure](#).

237.5.28 DLISTDEF Procedure

This procedure generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

Syntax

```
HTP.DLISTDEF (
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear        IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-21 DLISTDEF Procedure Parameters

Parameter	Description
<code>c_{text}</code>	The definition of the term.
<code>c_{clear}</code>	The value for the <code>CLEAR</code> attribute.
<code>c_{attributes}</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

237.5.29 DLISTOPEN Procedure

This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the `DLISTCLOSE` Procedure.

Syntax

```
HTP.DLISTOPEN (
  cclear          IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-22 DLISTOPEN Procedure Parameters

Parameter	Description
<code>c_{clear}</code>	The value for the <code>CLEAR</code> attribute.
<code>c_{attributes}</code>	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

Related Topics

- [DLISTCLOSE Procedure](#)
This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the `DLISTOPEN` Procedure.

237.5.30 DLISTTERM Procedure

This procedure generates the `<DT>` tag which defines a term in a definition list `<DL>`.

Syntax

```
HTP.DLISTTERM (
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-23 DLISTTERM Procedure Parameters

Parameter	Description
<code>ctext</code>	The term.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

237.5.31 EM Procedure

This procedure generates the `` and `` tags, which define text to be emphasized.

It performs the same task as the [EMPHASIS Procedure](#).

Syntax

```
HTP.EM(
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-24 EM Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to emphasize.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

237.5.32 EMPHASIS Procedure

This procedure generates the `` and `` tags, which define text to be emphasized.

It performs the same task as the [EM Procedure](#).

Syntax

```
HTP.EMPHASIS (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-25 EMPHASIS Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to emphasize.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

237.5.33 ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&`;
- `"` to `"`;
- `<` to `<`;
- `>` to `>`;

This procedure performs the same operation as [PRINTS Procedures](#) and [PS Procedure](#).

Syntax

```
HTP.ESCAPE_SC (  
    ctext          IN          VARCHAR2);
```

Parameters

Table 237-26 ESCAPE_SC Procedure Parameters

Parameter	Description
c <code>text</code>	The text string to convert.

237.5.34 FONTCLOSE Procedure

This procedure generates the `` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the [FONTOPEN Procedure](#).

Syntax

```
HTP.FONTCLOSE;
```

Examples

This procedure generates

```
</FONT>
```

237.5.35 FONTOPEN Procedure

This procedure generates the `` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the [FONTCLOSE Procedure](#).

Syntax

```
HTP.FONTOPEN(
  ccolor      IN      VARCHAR2  DEFAULT NULL,
  cface       IN      VARCHAR2  DEFAULT NULL,
  csize       IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-27 FONTOPEN Procedure Parameters

Parameter	Description
c <code>color</code>	The value for the <code>COLOR</code> attribute.
c <code>face</code>	The value for the <code>FACE</code> attribute
c <code>size</code>	The value for the <code>SIZE</code> attribute
c <code>attributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

237.5.36 FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

Syntax

```
HTP.FORMCHECKBOX (
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2  DEFAULT 'ON',
  cchecked       IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-28 FORMCHECKBOX Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

237.5.37 FORMCLOSE Procedure

This procedure generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the [FORMOPEN Procedure](#).

Syntax

```
HTP.FORMCLOSE;
```

Examples

This procedure generates

```
</FORM>
```

237.5.38 FORMOPEN Procedure

This procedure generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the [FORMCLOSE Procedure](#).

Syntax

```
HTP.FORMOPEN (
    curl           IN          VARCHAR2,
    cmethod       IN          VARCHAR2  DEFAULT 'POST',
    ctarget       IN          VARCHAR2  DEFAULT NULL,
    cenctype      IN          VARCHAR2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-29 FORMOPEN Procedure Parameters

Parameter	Description
<code>curl</code>	The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.
<code>cmethod</code>	The value for the <code>METHOD</code> attribute. The value can be "GET" or "POST".
<code>ctarget</code>	The value for the <code>TARGET</code> attribute.
<code>cenctype</code>	The value for the <code>ENCTYPE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

237.5.39 FORMFILE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE (
    cname         IN          VARCHAR2,
    caccept       IN          VARCHAR2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-30 FORMFILE Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.

Table 237-30 (Cont.) FORMFILE Procedure Parameters

Parameter	Description
<code>caccept</code>	A comma-delimited list of MIME types for upload.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

237.5.40 FORMHIDDEN Procedure

This procedure generates the `<INPUT>` tag with `TYPE="hidden"`, which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN (
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-31 FORMHIDDEN Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

237.5.41 FORMIMAGE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with `.x` appended, and the y coordinate with `.y` appended. Any `VALUE` attribute is ignored.

Syntax

```
HTP.FORMIMAGE (
  cname      IN      VARCHAR2,
  csrc       IN      VARCHAR2,
  calign     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-32 FORMIMAGE Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

237.5.42 FORMPASSWORD Procedure

This procedure generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD (
  cname      IN      VARCHAR2,
  csize      IN      VARCHAR2,
  cmaxlength IN      VARCHAR2  DEFAULT NULL,
  cvalue     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-33 FORMPASSWORD Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
ctime	The value for the SIZE attribute.
cmmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"  
VALUE="cvalue" cattributes>
```

237.5.43 FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTP.FORMRADIO(  
  cname          IN          VARCHAR2,  
  cvalue         IN          VARCHAR2,  
  cchecked       IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-34 FORMRADIO Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

237.5.44 FORMRESET Procedure

This procedure generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTP.FORMRESET(  
  cvalue         IN          VARCHAR2  DEFAULT 'Reset',  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-35 FORMRESET Procedure Parameters

Parameter	Description
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

237.5.45 FORMSELECTCLOSE Procedure

This procedure generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Procedure](#). The values are inserted using [FORMSELETOPTION Procedure](#).

Syntax

```
HTP.FORMSELECTCLOSE;
```

Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#).

237.5.46 FORMSELECTOPEN Procedure

This procedure generates the `<SELECT>` tags which creates a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Procedure](#). The values are inserted using [FORMSELETOPTION Procedure](#).

Syntax

```
FORMSELECTOPEN (
  cname          IN          VARCHAR2,
  cprompt        IN          VARCHAR2  DEFAULT NULL,
  nsize          IN          INTEGER   DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-36 FORMSELECTOPEN Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cprompt</code>	The string preceding the list box.
<code>nsize</code>	The value for the <code>SIZE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
  'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

237.5.47 FORMSELECTOPTION Procedure

This procedure generates the `<OPTION>` tag which represents one choice in a Select element.

Syntax

```
HTP.FORMSELECTOPTION (
  cvalue          IN          VARCHAR2,
  cselected       IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-37 FORMSELECTOPTION Procedure Parameters

Parameter	Description
<code>cvalue</code>	The text for the option.

Table 237-37 (Cont.) FORMSELETOPTION Procedure Parameters

Parameter	Description
<code>cvalue</code>	If the value for this parameter is not NULL, the <code>SELECTED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the [FORMSELETOPTION Procedure](#).

237.5.48 FORMSUBMIT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTP.FORMSUBMIT (
    cname          IN          VARCHAR2  DEFAULT NULL,
    cvalue         IN          VARCHAR2  DEFAULT 'Submit',
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-38 FORMSUBMIT Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

237.5.49 FORMTEXT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTP.FORMTEXT (
    cname          IN          VARCHAR2,
```

```

csize          IN          VARCHAR2  DEFAULT NULL,
cmaxlength     IN          VARCHAR2  DEFAULT NULL,
cvalue        IN          VARCHAR2  DEFAULT NULL,
cattributes    IN          VARCHAR2  DEFAULT NULL);

```

Parameters

Table 237-39 FORMTEXT Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```

<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>

```

237.5.50 FORMTEXTAREA Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA2 Procedure](#) which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```

HTP.FORMTEXTAREA (
  cname          IN          VARCHAR2,
  nrows         IN          INTEGER,
  ncolumns      IN          INTEGER,
  calign        , IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);

```

Parameters

Table 237-40 FORMTEXTAREA Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></TEXTAREA>
```

237.5.51 FORMTEXTAREA2 Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA Procedure](#) except that in that case you cannot specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA2 (
    cname          IN          VARCHAR2,
    nrows          IN          INTEGER,
    ncolumns       IN          INTEGER,
    calign         IN          VARCHAR2  DEFAULT NULL,
    cwrap         IN          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-41 FORMTEXTAREA2 Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap" cattributes></TEXTAREA>
```

237.5.52 FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either [FORMTEXTAREAOPEN Procedure](#) or [FORMTEXTAREAOPEN2 Procedure](#).

Syntax

```
HTP.FORMTEXTAREACLOSE;
```

Examples

This procedure generates

```
</TEXTAREA>
```

237.5.53 FORMTEXTAREAOPEN Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN2 Procedure](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

Syntax

```
HTP.FORMTEXTAREAOPEN (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-42 FORMTEXTAREAOPEN Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

237.5.54 FORMTEXTAREAOPEN2 Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN Procedure](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

Syntax

```
HTP.FORMTEXTAREAOPEN2 (
  cname          IN          VARCHAR2,
```

```

nrows          IN          INTEGER,
ncolumns       IN          INTEGER,
calign         IN          VARCHAR2  DEFAULT NULL,
cwrap         IN          VARCHAR2  DEFAULT NULL,
cattributes    IN          VARCHAR2  DEFAULT NULL);

```

Parameters

Table 237-43 FORMTEXTAREAOPEN2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```

<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>

```

237.5.55 FRAME Procedure

This procedure generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```

HTP.FRAME (
  csrc          IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  cmarginwidth  IN          VARCHAR2  DEFAULT NULL,
  cmarginheight IN          VARCHAR2  DEFAULT NULL,
  cscrolling    IN          VARCHAR2  DEFAULT NULL,
  cnoresize     IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);

```

Parameters

Table 237-44 FRAME Procedure Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.

Table 237-44 (Cont.) FRAME Procedure Parameters

Parameter	Description
<code>cnoresize</code>	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

237.5.56 FRAMESETCLOSE Procedure

This procedure generates the `</FRAMESET>` tag which ends a frameset section.

You mark the beginning of a frameset section by means of the [FRAMESETOPEN Procedure](#).

Syntax

```
HTP.FRAMESETCLOSE;
```

Examples

This procedure generates

```
</FRAMESET>
```

237.5.57 FRAMESETOPEN Procedure

This procedure generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the [FRAMESETCLOSE Procedure](#).

Syntax

```
HTP.FRAMESETOPEN (
    crows          IN          VARCHAR2   DEFAULT NULL,
    ccols          IN          VARCHAR2   DEFAULT NULL,
    cattributes    IN          VARCHAR2   DEFAULT NULL);
```

Parameters**Table 237-45 FRAMESETOPEN Procedure Parameters**

Parameter	Description
<code>crows</code>	The value for the ROWS attribute.
<code>ccols</code>	The value for the COLS attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAMESET ROWS="rows" COLS="cols" cattributes>
```

237.5.58 HEADCLOSE Procedure

This procedure generates the `</HEAD>` tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the [HEADOPEN Procedure](#).

Syntax

```
HTP.HEADCLOSE;
```

Examples

This procedure generates

```
</HEAD>
```

237.5.59 HEADER Procedure

This procedure generates opening heading tags (`<H1>` to `<H6>`) and their corresponding closing tags (`</H1>` to `</H6>`).

Syntax

```
HTP.HEADER(  
  nsize          IN          INTEGER,  
  cheader        IN          VARCHAR2,  
  calign         IN          VARCHAR2  DEFAULT NULL,  
  cnowrap        IN          VARCHAR2  DEFAULT NULL,  
  cclear         IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-46 HEADER Procedure Parameters

Parameter	Description
<code>nsize</code>	The the heading level. This is an integer between 1 and 6.
<code>cheader</code>	The text to display in the heading.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cnowrap</code>	The value for the <code>NOWRAP</code> attribute.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

```
HTP.header (1, 'Overview');
```

produces:

```
<H1>Overview</H1>
```

237.5.60 HEADOPEN Procedure

This procedure generates the `<HEAD>` tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the [HEADCLOSE Procedure](#).

Syntax

```
HTP.HEADOPEN;
```

Examples

This procedure generates

```
<HEAD>
```

237.5.61 HR Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [LINE Procedure](#).

Syntax

```
HTP.HR (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-47 HR Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute which specifies a custom image as the source of the line.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

237.5.62 HTMLCLOSE Procedure

This procedure generates the `</HTML>` tag which marks the end of an HTML document.

You use the [HTMLOPEN Procedure](#) to mark the beginning of an HTML document.

Syntax

```
HTP.HTMLCLOSE;
```

Examples

This procedure generates

```
</HTML>
```

237.5.63 HTMLOPEN Procedure

This procedure generates the `<HTML>` tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Procedure](#) to mark the end of the an HTML document.

Syntax

```
HTP.HTMLOPEN;
```

Examples

This procedure generates

```
<HTML>
```

237.5.64 IMG Procedure

This procedure generates the `` tag which directs the browser to load an image onto the HTML page.

The [IMG2 Procedure](#) performs the same operation but additionally uses the `cusemap` parameter.

Syntax

```
HTP.IMG(  
    curl           IN          VARCHAR2  DEFAULT NULL,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    calt           IN          VARCHAR2  DEFAULT NULL,  
    cismap         IN          VARCHAR2  DEFAULT NULL,  
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-48 IMG Procedure Parameters

Parameter	Description
<code>curl</code>	The value for the SRC attribute.

Table 237-48 (Cont.) IMG Procedure Parameters

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>calt</code>	The value for the <code>ALT</code> attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not <code>NULL</code> , the <code>ISMAP</code> attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

237.5.65 IMG2 Procedure

This procedure generates the `` tag, which directs the browser to load an image onto the HTML page.

The [IMG Procedure](#) performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTP.IMG2(
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2  DEFAULT NULL,
  cusemap       IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-49 IMG2 Procedure Parameters**

Parameter	Description
<code>curl</code>	The value for the <code>SRC</code> attribute.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>calt</code>	The value for the <code>ALT</code> attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not <code>NULL</code> , the <code>ISMAP</code> attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cusemap</code>	The value for the <code>USEMAP</code> attribute which specifies a client-side image map.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

237.5.66 ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX(
  cprompt      IN      VARCHAR2      DEFAULT NULL,
  curl         IN      VARCHAR2      DEFAULT NULL);
```

Parameters

Table 237-50 ISINDEX Procedure Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

237.5.67 ITALIC Procedure

This procedure generates the <I> and </I> tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(
  ctext        IN      VARCHAR2,
  cattributes  IN      VARCHAR2      DEFAULT NULL);
```

Parameters

Table 237-51 ITALIC Procedure Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<I cattributes>ctext</I>
```

237.5.68 KBD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KEYBOARD Procedure](#).

Syntax

```
HTP.KBD (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-52 KBD Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

237.5.69 KEYBOARD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KBD Procedure](#).

Syntax

```
HTP.KEYBOARD (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-53 KEYBOARD Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

237.5.70 LINE Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [HR Procedure](#).

Syntax

```
HTP.LINE (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-54 LINE Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute which specifies a custom image as the source of the line.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

237.5.71 LINKREL Procedure

This procedure generates the `<LINK>` tag with the `REL` attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the `HREF` attribute is present.

This is the opposite of [LINKREV Procedure](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Procedure](#).

Syntax

```
HTP.LINKREL (
  crel        IN      VARCHAR2,
  curl        IN      VARCHAR2,
  ctitle      IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-55 LINKREL Procedure Parameters

Parameter	Description
<code>crel</code>	The value for the <code>REL</code> attribute.
<code>curl</code>	The value for the <code>URL</code> attribute.

Table 237-55 (Cont.) LINKREL Procedure Parameters

Parameter	Description
<code>ctitle</code>	The value for the <code>TITLE</code> attribute.

Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

237.5.72 LINKREV Procedure

This procedure generates the `<LINK>` tag with the `REV` attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the [LINKREL Procedure](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Procedure](#).

Syntax

```
HTP.LINKREV(
  crev      IN      VARCHAR2,
  curl      IN      VARCHAR2,
  ctitle    IN      VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-56 LINKREV Procedure Parameters**

Parameter	Description
<code>crel</code>	The value for the <code>REV</code> attribute.
<code>curl</code>	The value for the <code>URL</code> attribute.
<code>ctitle</code>	The value for the <code>TITLE</code> attribute.

Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

237.5.73 LISTHEADER Procedure

This procedure generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER(
  ctext      IN      VARCHAR2,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-57 LISTHEADER Procedure Parameters

Parameter	Description
<code>c_{text}</code>	The text to place between <code><LH></code> and <code></LH></code> .
<code>c_{attributes}</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```

237.5.74 LISTINGCLOSE Procedure

This procedure generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Procedure](#).

Syntax

```
HTP.LISTINGCLOSE;
```

Examples

This procedure generates

```
</LISTING>
```

237.5.75 LISTINGOPEN Procedure

This procedure generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Procedure](#).

Syntax

```
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```
<LISTING>
```

237.5.76 LISTITEM Procedure

This procedure generates the tag, which indicates a list item.

Syntax

```
HTP.LISTITEM(
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cdingbat       IN          VARCHAR2  DEFAULT NULL,
  csrc           IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-58 LISTITEM Procedure Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

237.5.77 MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
  caddress       IN          VARCHAR2,
  ctext          IN          VARCHAR2,
  cname          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-59 MAILTO Procedure Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.

Table 237-59 (Cont.) MAILTO Procedure Parameters

Parameter	Description
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

237.5.78 MAPCLOSE Procedure

This procedure generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map.

To mark the beginning of a set of regions in a client-side image map, use the [MAPOPEN Procedure](#).

Syntax

```
HTP.MAPCLOSE;
```

Examples

This procedure generates

```
</MAP>
```

237.5.79 MAPOPEN Procedure

This procedure generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Procedure](#).

Syntax

```
HTP.MAPOPEN (
  cname          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-60 MAPOPEN Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

237.5.80 MENULISTCLOSE Procedure

This procedure generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the [MENULISTOPEN Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

Syntax

```
HTP.MENULISTCLOSE;
```

Examples

This procedure generates

```
</MENU>
```

237.5.81 MENULISTOPEN Procedure

This procedure generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the [MENULISTCLOSE Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

Syntax

```
HTP.MENULISTOPEN;
```

Examples

This procedure generates

```
<MENU>
```

237.5.82 META Procedure

This procedure generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTP.META(  
  chttp_equiv   IN      VARCHAR2,  
  cname         IN      VARCHAR2,  
  ccontent      IN      VARCHAR2);
```

Parameters

Table 237-61 META Procedure Parameters

Parameter	Description
<code>chttp_equiv</code>	The value for the <code>CHTTP_EQUIV</code> attribute.
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>ccontent</code>	The value for the <code>CONTENT</code> attribute.

Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

237.5.83 NL Procedure

This procedure generates the `
` tag which begins a new line of text.

It performs the same operation as the [BR Procedure](#).

Syntax

```
HTP.NL(  
  cclear        IN      VARCHAR2  DEFAULT NULL,  
  cattributes   IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-62 NL Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

237.5.84 NOBR Procedure

This procedure generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```
HTP.NOBR(  
  ctext          IN          VARCHAR2);
```

Parameters

Table 237-63 NOBR Procedure Parameters

Parameter	Description
<code>ctext</code>	The text that is to be rendered on one line.

Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```

237.5.85 NOFRAMESCLOSE Procedure

This procedure generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the [FRAMESETOPEN Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

Syntax

```
HTP.NOFRAMESCLOSE;
```

Examples

This procedure generates

```
</NOFRAMES>
```

237.5.86 NOFRAMESOPEN Procedure

This procedure generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the [FRAMESETCLOSE Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

Syntax

```
HTP.NOFRAMESOPEN;
```

Examples

This procedure generates

```
<NOFRAMES>
```

237.5.87 OLISTCLOSE Procedure

This procedure generates the `` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the [OLISTOPEN Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

Syntax

```
HTP.OLISTCLOSE;
```

Examples

This procedure generates

```
</OL>
```

237.5.88 OLISTOPEN Procedure

This procedure generates the `` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the [OLISTCLOSE Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

Syntax

```
HTP.OLISTOPEN(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  cwrap       IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-64 OLISTOPEN Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

237.5.89 PARA Procedure

This procedure generates the `<P>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the [PARAGRAPH Procedure](#).

Syntax

```
HTP.PARA;
```

Examples

This procedure generates

```
<P>
```

237.5.90 PARAGRAPH Procedure

You can use this procedure to add attributes to the `<P>` tag created by the `PARA` Procedure.

Syntax

```
HTP.PARAGRAPH (
    calign          IN          VARCHAR2  DEFAULT NULL,
    cnowrap         IN          VARCHAR2  DEFAULT NULL,
    cclear          IN          VARCHAR2  DEFAULT NULL,
    cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-65 PARAGRAPH Procedure Parameters

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.

Table 237-65 (Cont.) PARAGRAPH Procedure Parameters

Parameter	Description
<code>cnowrap</code>	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

Related Topics

- [PARA Procedure](#)
This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

237.5.91 PARAM Procedure

This procedure generates the <PARAM> tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Procedure](#) to begin the invocation. Use one [PARAM Procedure](#) for each desired name-value pair, and use [APPLETCLOSE Procedure](#) to end the applet invocation.

Syntax

```
HTP.PARAM(  
  cname          IN          VARCHAR2  
  cvalue         IN          VARCHAR2);
```

Parameters**Table 237-66 PARAM Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the NAME attribute.
<code>cvalue</code>	The value for the VALUE attribute.

Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

237.5.92 PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-67 PLAINTEXT Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to be rendered in fixed-width font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

237.5.93 PRECLOSE Procedure

This procedure generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Procedure](#).

Syntax

```
HTP.PRECLOSE;
```

Examples

This procedure generates

```
</PRE>
```

237.5.94 PREOPEN Procedure

This procedure generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Procedure](#).

Syntax

```
HTP.PREOPEN (  
    cclear          IN          VARCHAR2  DEFAULT NULL,
```

```

cwidth      IN      VARCHAR2  DEFAULT NULL,
cattributes IN      VARCHAR2  DEFAULT NULL);

```

Parameters

Table 237-68 PREOPEN Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwidth</code>	The value for the <code>WIDTH</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

237.5.95 PRINT Procedures

These procedures generate the specified parameter as a string terminated with the `\n` newline character.

The [PRN Procedures](#) performs the same operation but does not terminate with a newline character.

Syntax

```
HTP.PRINT (
  cbuf      IN      VARCHAR2);
```

```
HTP.PRINT (
  dbuf      IN      DATE);
```

```
HTP.PRINT (
  nbuf      IN      NUMBER);
```

Parameters

Table 237-69 PRINT Procedure Parameters

Parameter	Description
<code>cbuf</code>	The string to generate terminated by a newline.
<code>dbuf</code>	The string to generate terminated by a newline.
<code>nbuf</code>	The string to generate terminated by a newline.

Usage Notes

- The `\n` character is not the same as `
`. The `\n` character formats the HTML source but it does not affect how the browser renders the HTML source. Use `
` to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

237.5.96 PRINTS Procedure

This procedure generates a string and replaces certain characters with a corresponding escape sequence.

The following characters are replaced with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

Syntax

```
HTP.PRINTS (
    ctext      IN      VARCHAR2);
```

Parameters

Table 237-70 PRINTS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) for the HTF implementation).

237.5.97 PRN Procedures

These procedures generate the specified parameter as a string.

Unlike the [PRINT Procedures](#) the string is not terminated with the \n newline character.

Syntax

```
HTP.PRN (
    cbuf      IN      VARCHAR2);
```

```
HTP.PRN (
    dbuf      IN      DATE);
```

```
HTP.PRN (
    nbuf      IN      NUMBER);
```

Parameters

Table 237-71 PRN Procedure Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These procedures do not have function equivalents.

237.5.98 PS Procedure

This procedure generates a string and replaces certain characters with the corresponding escape sequence.

This procedure replaces the following characters with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PRINTS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

Syntax

```
HTP.PS (
    ctext      IN      VARCHAR2);
```

Parameters

Table 237-72 PS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) for the HTF implementation).

237.5.99 S Procedure

This procedure generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [STRIKE Procedure](#).

Syntax

```
HTP.S (
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-73 S Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<S cattributes>ctext</S>
```

237.5.100 SAMPLE Procedure

This procedure generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTP.SAMPLE (
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-74 SAMPLE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

237.5.101 SCRIPT Procedure

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (  
    cscript          IN          VARCHAR2,  
    clanguage        IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-75 SCRIPT Procedure Parameters

Parameter	Description
<code>cscript</code>	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
<code>clanguage</code>	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

237.5.102 SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-76 SMALL Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to be rendered in small font.

Table 237-76 (Cont.) SMALL Procedure Parameters

Parameter	Description
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

237.5.103 STRIKE Procedure

This procedure generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [S Procedure](#).

Syntax

```
HTP.STRIKE (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-77 STRIKE Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

237.5.104 STRONG Procedure

This procedure generates the `` and `` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

Syntax

```
HTP.STRONG (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-78 STRONG Procedure Parameters

Parameter	Description
<code>c_{text}</code>	The text to be emphasized.
<code>c_{attributes}</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRONG cattributes>ctext</STRONG>
```

237.5.105 STYLE Procedure

This procedure generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(  
    cstyle          IN          VARCHAR2);
```

Parameters

Table 237-79 STYLE Procedure Parameters

Parameter	Description
<code>c_{style}</code>	The the style information to include.

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

237.5.106 SUB Procedure

This procedure generates the `_{` and `}` tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTP.SUB(  
    ctext          IN          VARCHAR2,  
    calign         in          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-80 SUB Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render in subscript.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

237.5.107 SUP Procedure

This procedure generates the `^{` and `}` tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTP.SUP (
    ctext          IN          VARCHAR2,
    calign         in          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-81 SUP Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render in superscript.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

237.5.108 TABLECAPTION Procedure

This procedure generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```
HTP.TABLECAPTION (
    ccaption      IN          VARCHAR2,
```

```

calign      in      VARCHAR2  DEFAULT NULL,
cattributes IN      VARCHAR2  DEFAULT NULL);

```

Parameters

Table 237-82 TABLECAPTION Procedure Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

237.5.109 TABLECLOSE Procedure

This procedure generates the </TABLE> tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the [TABLEOPEN Procedure](#).

Syntax

```
HTP.TABLECLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

237.5.110 TABLEDATA Procedure

This procedure generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```

HTP.TABLEDATA (
  cvalue      IN      VARCHAR2  DEFAULT NULL,
  calign      IN      VARCHAR2  DEFAULT NULL,
  cdp         IN      VARCHAR2  DEFAULT NULL,
  cnowrap     IN      VARCHAR2  DEFAULT NULL,
  crowspan    IN      VARCHAR2  DEFAULT NULL,
  ccolspan    IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);

```

Parameters

Table 237-83 TABLEDATA Procedure Parameters

Parameter	Description
<code>cvalue</code>	The data for the cell in the table.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>ccolspan</code>	The value for the <code>COLSPAN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

237.5.111 TABLEHEADER Procedure

This procedure generates the `<TH>` and `</TH>` tags which insert a header cell in an HTML table.

The `<TH>` tag is similar to the `<TD>` tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTP.TABLEHEADER (
  cvalue      IN          VARCHAR2  DEFAULT NULL,
  calign      IN          VARCHAR2  DEFAULT NULL,
  cdp         IN          VARCHAR2  DEFAULT NULL,
  cnowrap     IN          VARCHAR2  DEFAULT NULL,
  crowspan    IN          VARCHAR2  DEFAULT NULL,
  ccolspan    IN          VARCHAR2  DEFAULT NULL,
  cattributes IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-84 TABLEHEADER Procedure Parameters

Parameter	Description
<code>cvalue</code>	The data for the cell in the table.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>crispen</code>	The value for the <code>ROWSPAN</code> attribute.

Table 237-84 (Cont.) TABLEHEADER Procedure Parameters

Parameter	Description
<code>c colspan</code>	The value for the <code>COLSPAN</code> attribute.
<code>c attributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

237.5.112 TABLEOPEN Procedure

This procedure generates the `<TABLE>` tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the [TABLECLOSE Procedure](#).

Syntax

```
HTP.TABLEOPEN (
  cborder          IN          VARCHAR2          DEFAULT NULL
  calign           IN          VARCHAR2          DEFAULT NULL,
  cnowrap         IN          VARCHAR2          DEFAULT NULL,
  cclear          IN          VARCHAR2          DEFAULT NULL
  cattributes     IN          VARCHAR2          DEFAULT NULL);
```

Parameters**Table 237-85 TABLEOPEN Procedure Parameters**

Parameter	Description
<code>border</code>	The value for the <code>BORDER</code> attribute.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

237.5.113 TABLEROWCLOSE Procedure

This procedure generates the `</TR>` tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the [TABLEROWOPEN Procedure](#).

Syntax

```
HTP.TABLEROWCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

237.5.114 TABLEROWOPEN Procedure

This procedure generates the `<TR>` tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the [TABLEROWCLOSE Procedure](#).

Syntax

```
HTP.TABLEROWOPEN (
  calign          IN          VARCHAR2  DEFAULT NULL,
  cvalign         IN          VARCHAR2  DEFAULT NULL,
  cdp             IN          VARCHAR2  DEFAULT NULL,
  cnowrap         IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-86 TABLEROWOPEN Procedure Parameters**

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cvalign</code>	The value for the <code>VALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

237.5.115 TELETYPE Procedure

This procedure generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTP.TELETYPE (
  ctext          IN          VARCHAR2,
  cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-87 TELETYPE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render in a fixed width typewriter font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

237.5.116 TITLE Procedure

This procedure generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTP.TITLE(  
    ctitle          IN          VARCHAR2);
```

Parameters

Table 237-88 TITLE Procedure Parameters

Parameter	Description
<code>ctitle</code>	The text to display in the titlebar of the browser window.

Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

237.5.117 ULISTCLOSE Procedure

This procedure generates the `` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the [ULISTOPEN Procedure](#). Add list items with [LISTITEM Procedure](#).

Syntax

```
HTP.ULISTCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

237.5.118 ULISTOPEN Procedure

This procedure generates the tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the [ULISTCLOSE Procedure](#). Add list items with [LISTITEM Procedure](#).

Syntax

```
HTP.ULISTOPEN (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cwrap       IN      VARCHAR2  DEFAULT NULL,
  cdingbat    IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-89 ULISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

237.5.119 UNDERLINE Procedure

This procedure generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTP.UNDERLINE (
  ctext      IN      VARCHAR2,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 237-90 UNDERLINE Procedure Parameters

Parameter	Description
ctext	The text to render with an underline.

Table 237-90 (Cont.) UNDERLINE Procedure Parameters

Parameter	Description
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<U cattributes>ctext</U>
```

237.5.120 VARIABLE Procedure

This procedure generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTP.VARIABLE (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 237-91 VARIABLE Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to render in italics.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

237.5.121 WBR Procedure

This procedure generates the `<WBR>` tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTP.WBR;
```

Examples

This procedure generates

```
<WBR>
```

OWA_CACHE

The `OWA_CACHE` package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

The chapter contains the following topics:

- [Constants](#)
- [Summary of OWA_CACHE Subprograms](#)

238.1 OWA_CACHE Constants

`OWA_CACHE` defines several constants to use when specifying parameter values.

- `system_level` CONSTANT VARCHAR(6) := 'SYSTEM';
- `user_level` CONSTANT VARCHAR(4) := 'USER';

238.2 Summary of OWA_CACHE Subprograms

This table lists the `OWA_CACHE` subprograms and briefly describes them.

Table 238-1 OWA_CACHE Package Subprograms

Subprogram	Description
DISABLE Procedure	Disables the cache for this particular request
GET_ETAG Function	Returns the tag associated with the cached content (used in the Validation technique model only)
GET_LEVEL Function	Returns the caching level (used in the Validation technique model only)
SET_CACHE Procedure	Sets up the cache headers for validation model cache type
SET_EXPIRES Procedure	Sets up the cache headers for expires model cache type
SET_NOT_MODIFIED Procedure	Sets up the headers for a not modified cache hit (used in the Validation technique model only)
SET_SURROGATE_CONTROL Procedure	Sets up the headers for a surrogate-control header for Web cache

238.2.1 DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

```
OWA_CACHE.DISABLE;
```

238.2.2 GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.GET_ETAG  
RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise NULL.

238.2.3 GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL  
RETURN VARCHAR2;
```

Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.

238.2.4 SET_CACHE Procedure

This procedure sets up the cache headers for validation model cache type.

Syntax

```
OWA_CACHE.SET_CACHE(  
  p_etag      IN      VARCHAR2,  
  p_level     IN      VARCHAR2);
```

Parameters

Table 238-2 *SET_CACHE Procedure Parameters*

Parameter	Description
p_etag	The etag associated with this content
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'

238.2.5 SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

```
OWA_CACHE.SET_EXPIRES(  
    p_expires    IN      NUMBER,  
    p_level      IN      VARCHAR2);
```

Parameters

Table 238-3 SET_EXPIRES Procedure Parameters

Parameter	Description
p_expires	The number of minutes this content is valid.
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)

238.2.6 SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

Exceptions

VALUE_ERROR is thrown if the etag was not passed in

238.2.7 SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(  
    p_value      IN      VARCHAR2);
```

Parameters

Table 238-4 SET_SURROGATE_CONTROL Procedure Parameters

Parameter	Description
p_value	The value to be passed as the Surrogate-Control header.

Exceptions

VALUE_ERROR is thrown if p_value is greater than 55 in length.

OWA_COOKIE

The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

The chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Rules and Limits](#)
- [Summary of OWA_COOKIE Subprograms](#)

239.1 OWA_CUSTOM Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.

239.2 OWA_COOKIE Types

This datatype contains cookie name-value pairs.

Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL RECORD holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.
```

```
TYPE COOKIE IS RECORD (
  name      VARCHAR2(4000),
  vals      vc_arr,
  num_vals  INTEGER);
```

239.3 OWA_COOKIE Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

239.4 Summary of OWA_COOKIE Subprograms

This table lists the OWA_COOKIE subprograms and briefly describes them.

Table 239-1 OWA_COOKIE Package Subprograms

Subprogram	Description
GET Function	Gets the value of the specified cookie
GET_ALL Procedure	Gets all cookie name-value pairs
REMOVE Procedure	Removes the specified cookie
SEND procedure	Generates a "Set-Cookie" line in the HTTP header

239.4.1 GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA_COOKIE.COOKIE DATA TYPE .

Syntax

```
OWA_COOKIE.GET(  
    name          IN          VARCHAR2)  
    RETURN COOKIE;
```

Parameters

Table 239-2 GET Function Parameters

Parameter	Description
name	The name of the cookie.

Return Values

OWA_COOKIE.COOKIE DATA TYPE.

239.4.2 GET_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

Syntax

```
OWA_COOKIE.GET_ALL(  
    names      OUT          vc_arr,  
    vals       OUT          vc_arr,  
    num_vals   OUT          INTEGER);
```

Parameters

Table 239-3 GET_ALL Procedure Parameters

Parameter	Description
names	The names of the cookies.
vals	The values of the cookies.
num_vals	The number of cookie-value pairs.

239.4.3 REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990".

This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE (
  name          IN          VARCHAR2,
  val           IN          VARCHAR2,
  path          IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-4 REMOVE Procedure Parameters

Parameter	Description
name	The name of the cookie to expire.
val	The value of the cookie.
path	[Currently unused]

239.4.4 SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client.

This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.SEND (
  name          in          varchar2,
  value         in          varchar2,
  expires       in          date      DEFAULT NULL,
  path          in          varchar2  DEFAULT NULL,
  domain        in          varchar2  DEFAULT NULL,
  secure        in          varchar2  DEFAULT NULL);
```

Parameters

Table 239-5 SEND Procedure Parameters

Parameter	Description
name	The name of the cookie.
value	The value of the cookie.
expires	The date at which the cookie will expire
path	The value for the path field.
domain	The value for the domain field.
secure	If the value of this parameter is not NULL, the "secure" field is added to the line.

OWA_CUSTOM

The `OWA_CUSTOM` package provides a Global PLSQL Agent Authorization callback function.

It is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for `mod_plsql`](#)

The chapter contains the following topics:

- [Constants](#)
- [Summary of `OWA_CUSTOM` Subprograms](#)

240.1 `OWA_CUSTOM` Constants

`OWA_CUSTOM` defines several constants to use when specifying parameter values.

- `dbms_server_timezone` CONSTANT VARCHAR2(3) := 'PST';
- `dbms_server_gmtdiff` CONSTANT NUMBER := NULL;

240.2 Summary of `OWA_CUSTOM` Subprograms

The `AUTHORIZE` function is the only subprogram in the `OWA_CUSTOM` package.

Table 240-1 *`OWA_CUSTOM` Package Subprograms*

Subprogram	Description
AUTHORIZE Function	Provides a Global PLSQL Agent Authorization callback function

240.2.1 `AUTHORIZE` Function

This function is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

Syntax

```
OWA_CUSTOM.AUTHORIZE
RETURN BOOLEAN;
```

OWA_IMAGE

The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

The chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Variables](#)
- [Examples](#)
- [Summary of OWA_IMAGE Subprograms](#)

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

241.1 OWA_IMAGE Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

241.2 OWA_IMAGE Types

This datatype (`point`) contain the X and Y values of a coordinate, and so provides the coordinates of a user's click on an imagemap.

It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

241.3 OWA_IMAGE Variables

This package variable (`null_point`) of `TYPE POINT` is used to default point parameters. Both the X and the Y fields of this variable are `NULL`.

241.4 OWA_IMAGE Examples

This example shows use of OWA_IMAGE.

```
CREATE OR REPLACE PROCEDURE process_image
  (my_img in OWA_IMAGE.POINT)
  AS
  x integer := OWA_IMAGE.GET_X(my_img);
  y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
  /* process the coordinate */
END
```

241.5 Summary of OWA_IMAGE Subprograms

This table lists the OWA_IMAGE subprograms and briefly describes them.

Table 241-1 OWA_IMAGE Package Subprograms

Subprogram	Description
GET_X Function	Gets the X value of a point type
GET_Y Function	Gets the Y value of a point type

241.5.1 GET_X Function

This function returns the X coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_X(
  p          IN          point)
RETURN INTEGER;

OWA_IMAGE.GET_X(
  p          IN          point)
RETURN INTEGER PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 241-2 GET_X Function Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The X coordinate as an integer.

241.5.2 GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_Y(  
  p          IN          point)  
  RETURN INTEGER;  
  
OWA_IMAGE.GET_Y(  
  p          IN          point)  
  RETURN INTEGER PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 241-3 GET_Y Function Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The Y coordinate as an integer.

OWA_OPT_LOCK

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

This chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Summary of OWA_OPT_LOCK Subprograms](#)

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

242.1 OWA_OPT_LOCK Overview

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The `OWA_OPT_LOCK` package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the `owa_opt_lock.store_values` procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the `owa_opt_lock.checksum` function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

242.2 OWA_TEXT Types

This datatype is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR` DATA TYPE.

242.3 Summary of OWA_OPT_LOCK Subprograms

This table lists the `OWA_OPT_LOCK` subprograms and briefly describes them.

Table 242-1 OWA_OPT_LOCK Package Subprograms

Subprogram	Description
CHECKSUM Functions	Returns the checksum value
GET_ROWID Function	Returns the ROWID value
STORE_VALUES Procedure	Stores unmodified values in hidden fields for later verification
VERIFY_VALUES Function	Verifies the stored values against modified values

242.3.1 CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit `checksum` based on the Internet 1 protocol.

Syntax

```
OWA_OPT_LOCK.CHECKSUM(
  p_buff      IN      VARCHAR2)
RETURN NUMBER;
```

```
OWA_OPT_LOCK.CHECKSUM(
  p_buff      IN      VARCHAR2)
RETURN NUMBER PARALLEL_ENABLE DETERMINISTIC;
```

```
OWA_OPT_LOCK.CHECKSUM(
  p_owner     IN      VARCHAR2,
  p_tname     IN      VARCHAR2,
  p_rowid     IN      ROWID)
RETURN NUMBER;
```

Parameters

Table 242-2 CHECKSUM Function Parameters

Parameter	Description
<code>p_buff</code>	The nstring where you want to calculate the <code>checksum</code> .
<code>p_owner</code>	The owner of the table.
<code>p_tname</code>	The table name.

Table 242-2 (Cont.) CHECKSUM Function Parameters

Parameter	Description
p_rowid	The row in p_tname where you want to calculate the checksum value. Use the GET_ROWID Function to convert VCARRAY values to proper rowids.

242.3.2 GET_ROWID Function

This function returns the ROWID datatype from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

Syntax

```
OWA_OPT_LOCK.GET_ROWID(
  p_old_values      IN      vccarray)
RETURN ROWID;
```

```
OWA_OPT_LOCK.GET_ROWID(
  p_old_values      IN      vccarray)
RETURN ROWID PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 242-3 GET_ROWID Function Parameters

Parameter	Description
p_old_values	This parameter is usually passed in from an HTML form.

242.3.3 STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```
OWA_OPT_LOCK.STORE_VALUES (
  p_owner          IN      VARCHAR2,
  p_tname          IN      VARCHAR2,
  p_rowid          IN      ROWID);
```

Parameters

Table 242-4 STORE_VALUES Procedure Parameters

Parameter	Description
p_owner	The owner of the table.
p_tname	The name of the table.
p_rowid	The row where you want to store values.

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the [VERIFY_VALUES Function](#).

242.3.4 VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query.

Use this function with the [STORE_VALUES Procedure](#).

Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(  
    p_old_values IN varray)  
RETURN BOOLEAN;
```

Parameters

Table 242-5 VERIFY_VALUES Function Parameters

Parameter	Description
p_old_values	<p>A PL/SQL table containing the following information:</p> <ul style="list-style-type: none"> • p_old_values(1) specifies the owner of the table. • p_old_values(2) specifies the table. • p_old_values(3) specifies the rowid of the row to verify. <p>The remaining indexes contain values for the columns in the table.</p> <p>Typically, this parameter is passed in from the HTML form, where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements.</p>

Return Values

TRUE if no other update has been performed, otherwise FALSE.

OWA_PATTERN

The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

See Also:

For more information about implementation of this package, see the following:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

The chapter contains the following topics:

- [Types](#)
- [Operational Notes](#)
- [Summary of OWA_PATTERN Subprograms](#)

243.1 OWA_PATTERN Types

You can use a pattern as both an input and output parameter. Because of this, you can pass the same regular expression to OWA_PATTERN function calls, and it only has to be parsed once.

- `OWA_PATTERN.PATTERN`

243.2 OWA_PATTERN Operational Notes

The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of `MATCH`, and four each of `AMATCH` and `CHANGE`.

The subprograms use the following parameters:

- `line` - This is the target to be examined for a match. It can be more than one line of text or a `owa_text.multi_line` datatype.
- `pat` - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the `owa_pattern.change` function and procedure, this parameter is called `from_str`.
- `flags` - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- [Wildcards](#)

- [Quantifiers](#)
- [Flags](#)

243.2.1 OWA_PATTERN Wildcards

Wildcard tokens match something other than themselves.

Table 243-1 *Wildcard tokens recognized by OWA_PATTERN package*

Token	Description
<code>^</code>	Matches newline or the beginning of the target
<code>\$</code>	Matches newline or the end of the target
<code>\n</code>	Matches newline
<code>.</code>	Matches any character except newline
<code>\t</code>	Matches tab
<code>\d</code>	Matches digits [0-9]
<code>\D</code>	Matches non-digits [not 0-9]
<code>\w</code>	Matches word characters (0-9, a-z, A-Z, or <code>_</code>)
<code>\W</code>	Matches non-word characters (not 0-9, a-z, A-Z, or <code>_</code>)
<code>\s</code>	Matches whitespace characters (blank, tab, or newline).
<code>\S</code>	Matches non-whitespace characters (not blank, tab, or newline)
<code>\b</code>	Matches "word" boundaries (between <code>\w</code> and <code>\W</code>)
<code>\x<HEX></code>	Matches the value in the current character set of the two hexadecimal digits
<code>\<OCT></code>	Matches the value in the current character set of the two or three octal digits
<code>\</code>	Followed by any character not covered by another case matches that character
<code>&</code>	Applies only to <code>CHANGE</code> . This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under CHANGE Functions and Procedures .

243.2.2 OWA_PATTERN Quantifiers

Any tokens except `&` can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals.

Table 243-2 **Quantifiers**

Quantifier	Description
<code>?</code>	0 or 1 occurrence(s)
<code>*</code>	0 or more occurrences
<code>+</code>	1 or more occurrence(s)
<code>{n}</code>	Exactly <i>n</i> occurrences
<code>{n,}</code>	At least <i>n</i> occurrences

Table 243-2 (Cont.) Quantifiers

Quantifier	Description
{ <i>n</i> , <i>m</i> }	At least <i>n</i> , but not more than <i>m</i> , occurrences

243.2.3 OWA_PATTERN Flags

In addition to targets and regular expressions, the OWA_PATTERN functions and procedures use flags to affect how they are interpreted.

Table 243-3 Flags

Flag	Description
i	This indicates a case-insensitive search.
g	This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.

243.3 Summary of OWA_PATTERN Subprograms

This table lists the OWA_PATTERN subprograms and briefly describes them.

Table 243-4 OWA_PATTERN Package Subprograms

Subprogram	Description
AMATCH Function	Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur
CHANGE Functions and Procedures	Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced
GETPAT Procedure	Generates a pattern datatype from a VARCHAR2 type
MATCH Function	Determines if a string contains the specified pattern

243.3.1 AMATCH Function

This function specifies if a pattern occurs in a particular location in a string.

There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.

 **Note:**

If multiple overlapping strings match the regular expression, this function takes the longest match.

Syntax

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2,
  from_loc      IN          INTEGER,
  pat           IN          VARCHAR2,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2,
  from_loc      IN          INTEGER,
  pat           IN OUT     PATTERN,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2
  from_loc      IN          INTEGER
  pat           in          varchar2
  backrefs      OUT         owa_text.vc_arr
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2
  from_loc      IN          INTEGER
  pat           IN OUT     PATTERN
  backrefs      OUT         owa_text.vc_arr
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

Parameters

Table 243-5 AMATCH Function Parameters

Parameter	Description
line	The text to search in.
from_loc	The location (in number of characters) in line where the search is to begin.
pat	The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

The index of the character after the end of the match, counting from the beginning of `line`. If there was no match, the function returns 0.

243.3.2 CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` datatype. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```
OWA_PATTERN.CHANGE (
    line           IN OUT  VARCHAR2,
    from_str       IN      VARCHAR2,
    to_str         IN      VARCHAR2,
    flags          IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE (
    line           IN OUT  VARCHAR2,
    from_str       IN      VARCHAR2,
    to_str         IN      VARCHAR2,
    flags          IN      VARCHAR2  DEFAULT NULL);
```

```
owa_pattern.change(
    mline         IN OUT  owa_text.multi_line,
    from_str      IN      VARCHAR2,
    to_str        IN      VARCHAR2,
    flags         IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE (
    mline         IN OUT  owa_text.multi_line,
    from_str      IN      VARCHAR2,
    to_str        IN      VARCHAR2,
    flags         IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 243-6 CHANGE Procedure Parameters

Parameter	Description
<code>line</code>	The text to search in. The output value of this parameter is the altered string.
<code>mline</code>	The text to search in. This is a <code>owa_text.multi_line</code> datatype. The output value of this parameter is the altered string.
<code>from_str</code>	The regular expression to replace.
<code>to_str</code>	The substitution pattern.
<code>flags</code>	Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If "i" is specified, the search is case-insensitive. If "g" is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.

Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red" If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found      INTEGER;
BEGIN
    theline := 'what is the goal?';
    num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
    HTP.PRINT(num_found); -- num_found is 1
    HTP.PRINT(theline); -- theline is 'what is the idea?'
END;
/
SHOW ERRORS
```

243.3.3 GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA_PATTERN.PATTERN DATA TYPE.

Syntax

```
OWA_PATTERN.GETPAT(
    arg      IN      VARCHAR2,
    pat      IN OUT  pattern);
```

Parameters

Table 243-7 GETPAT Procedure Parameters

Parameter	Description
arg	The string to convert.
pat	the OWA_PATTERN.PATTERN DATA TYPE initialized with arg.

243.3.4 MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

```
owa_pattern.match(
  line      IN      VARCHAR2,
  pat       IN      VARCHAR2,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  line      IN      VARCHAR2,
  pat       IN OUT  PATTERN,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  line      IN      VARCHAR2,
  pat       IN      VARCHAR2,
  backrefs  OUT     owa_text.vc_arr,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
  line      IN      VARCHAR2,
  pat       IN OUT  PATTERN,
  backrefs  OUT     owa_text.vc_arr,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  mline     IN      owa_text.multi_line,
  pat       IN      VARCHAR2,
  rlist     OUT     owa_text.row_list,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
  mline     IN      owa_text.multi_line,
  pat       IN OUT  pattern,
  rlist     OUT     owa_text.row_list,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 243-8 MATCH Function Parameters

Parameter	Description
line	The line to search in.
mline	The text to search in. This is a <code>owa_text.multi_line</code> datatype..

Table 243-8 (Cont.) MATCH Function Parameters

Parameter	Description
pat	The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. It is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
rlist	An output parameter containing a list of matches.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

TRUE if a match was found, FALSE otherwise.

Examples

KAZOO is the target where it is searching for the zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

```
sometext VARCHAR2(256);
pat      VARCHAR2(256);

sometext := 'what is the goal?';
pat      := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
THEN
    HTP.PRINT('Match found');
ELSE
    HTP.PRINT('Match not found');
END IF;
```

Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create an OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.

- Create a `MULTI_LINE` DATA TYPE from a long string using the `OWA_TEXT.STREAM2MULTI` procedure. If a `multi_line` is used, the `rlist` parameter specifies a list of chunks where matches were found.
- If the line is a string and not a `multi_line`, you can add an optional output parameter called `backrefs`. This parameter is a `row_list` that holds each string in the target that was matched by a sequence of tokens in the regular expression.

OWA_SEC

The `OWA_SEC` package provides an interface for custom authentication.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for `mod_plsql`](#)

The chapter contains the following topics:

- [Operational Notes](#)
- [Summary of OWA_SEC Subprograms](#)

244.1 OWA_SEC Operational Notes

Parameters that have default values are optional.

244.2 Summary of OWA_SEC Subprograms

This table lists the `OWA_SEC` subprograms in alphabetical order and briefly describes them.

Table 244-1 OWA_SEC Package Subprograms

Subprogram	Description
GET_CLIENT_HOSTNAME Function	Returns the client's hostname
GET_CLIENT_IP Function	Returns the client's IP address
GET_PASSWORD Function	Returns the password that the user entered
GET_USER_ID Function	Returns the username that the user entered
SET_AUTHORIZATION Procedure	Enables the PL/SQL application to use custom authentication
SET_PROTECTION_REALM Procedure	Defines the realm that the page is in

244.2.1 GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME  
RETURN VARCHAR2;
```

Return Values

The hostname.

244.2.2 GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```
OWA_SEC.GET_CLIENT_IP  
RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address` datatype is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is 123.45.67.89 and the variable `ipaddr` is of the `owa_util.ip_address` datatype, the variable would contain the following values:

```
ipaddr(1) = 123  
ipaddr(2) = 45  
ipaddr(3) = 67  
ipaddr(4) = 89
```

244.2.3 GET_PASSWORD Function

This function returns the password that the user used to log in.

Syntax

```
OWA_SEC.GET_PASSWORD  
RETURN VARCHAR2;
```

Return Values

The password.

Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

244.2.4 GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```
OWA_SEC.GET_USER_ID  
RETURN VARCHAR2;
```

Return Values

The username.

244.2.5 SET_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway.

This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

Syntax

```
OWA_SEC.SET_AUTHORIZATION(  
    scheme          IN          INTEGER);
```

Parameters

Table 244-2 SET_AUTHORIZATION Procedure Parameters

Parameter	Description
scheme	<p>The authorization scheme. It is one of the following schemes for SET_AUTHORIZATION:</p> <ul style="list-style-type: none"> OWA_SEC.NO_CHECK - Specifies that the PL/SQL application is not to do any custom authentication. This is the default. OWA_SEC.GLOBAL - Defines an authorize function that is called for all users and all procedures. This is the OWA_CUSTOM.AUTHORIZE Function in the "sys" schema. OWA_SEC.PER_PACKAGE - Define an authorize function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.AUTHORIZE function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous authorize function in the user's schema is called. OWA_SEC.CUSTOM - Implements different authorize functions for each user. The function OWA_CUSTOM.AUTHORIZE Function in the user's schema is called to authorize the user. If the user's schema does not contain an OWA_CUSTOM.AUTHORIZE Function, the PL/SQL Gateway looks for it in the "sys" schema. <p>The custom authorize function has the following signature:</p> <pre>FUNCTION AUTHORIZE RETURN BOOLEAN;</pre> <p>If the function returns TRUE, authentication succeeded. If it returns FALSE, authentication failed. If the authorize function is not defined, the Gateway returns an error and fails.</p>

Related Topics

- [OWA_CUSTOM](#)
The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function.

244.2.6 SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

```
OWA_SEC.SET_PROTECTION_REALM(
    realm          IN          VARCHAR2);
```

Parameters

Table 244-3 SET_PROTECTION_REALM Procedure Parameters

Parameter	Description
realm	The realm where the page belongs. This string is displayed to the user.

OWA_TEXT

The `OWA_TEXT` package contains subprograms used by `OWA_PATTERN` for manipulating strings. They are externalized so you can use them directly.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for `mod_plsql`](#)

The chapter contains the following topics:

- [Types](#)
- [Summary of `OWA_TEXT` Subprograms](#)

245.1 OWA_OPT_LOCK Types

There are three `OWA_OPT_LOCK` lock types.

- [MULTI_LINE DATA TYPE](#)
- [ROW_LIST DATA TYPE](#)
- [VC_ARR DATA TYPE](#)

245.1.1 MULTI_LINE DATA TYPE

This datatype is a PL/SQL record that holds large amounts of text. The `rows` field, of type `OWA_TEXT.VC_ARR DATA TYPE`, contains the text data in the record.

```
TYPE multi_line IS RECORD (
    rows          vc_arr,
    num_rows      INTEGER,
    partial_row    BOOLEAN);
```

245.1.2 ROW_LIST DATA TYPE

This is the datatype for holding data to be processed.

```
TYPE row_list IS RECORD (
    rows          int_arr,
    num_rows      INTEGER);
```

```
int_arr IS DEFINED AS:
```

```
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

245.1.3 VC_ARR DATA TYPE

This is a component of the MULTI_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Related Topics

- [MULTI_LINE DATA TYPE](#)

This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type OWA_TEXT.VC_ARR DATA TYPE, contains the text data in the record.

245.2 Summary of OWA_TEXT Subprograms

This table lists the OWA_TEXT subprograms and briefly describes them.

Table 245-1 OWA_TEXT Package Subprograms

Subprogram	Description
ADD2MULTI Procedure	Adds text to an existing multi_line type
NEW_ROW_LIST Function and Procedure	Creates a new row_list
PRINT_MULTI Procedure	Prints out the contents of a multi_list
PRINT_ROW_LIST Procedure	Prints out the contents of a row_list
STREAM2MULTI Procedure	Converts a varchar2 to a multi_line type

245.2.1 ADD2MULTI Procedure

This procedure adds content to an existing Multi_Line Data Type

Syntax

```
OWA_TEXT.ADD2MULTI (
    stream          IN          VARCHAR2,
    mline          IN OUT    multi_line,

    continue       IN          BOOLEAN DEFAULT TRUE);
```

Parameters

Table 245-2 ADD2MULTI Procedure Parameters

Parameter	Description
stream	The text to add.
mline	The OWA_TEXT.MULTI_LINE DATA TYPE. The output of this parameter contains <i>stream</i> .

Table 245-2 (Cont.) ADD2MULTI Procedure Parameters

Parameter	Description
continue	If TRUE, the procedure appends <i>stream</i> within the previous final row (assuming it is less than 32K). If FALSE, the procedure places <i>stream</i> in a new row.

245.2.2 NEW_ROW_LIST Function and Procedure

This function or procedure creates a new `OWA_TEX.ROW_LIST DATA TYPE`.

The function version uses no parameters and returns a new empty `row_list`. The procedure version creates the `row_list` datatype as an output parameter.

Syntax

```
OWA_TEXT.NEW_ROW_LIST
  RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist   OUT   row_list);
```

Parameters

Table 245-3 NEW_ROW_LIST Procedure Parameters

Parameter	Description
rlist	This is an output parameter containing the new <code>row_list</code> datatype

Return Values

The function version returns the new `row_list` datatype.

245.2.3 PRINT_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.MULTI_LINE DATA TYPE`.

Syntax

```
OWA_TEXT.PRINT_MULTI(
  mline   IN   multi_line);
```

Parameters

Table 245-4 PRINT_MULTI Procedure Parameters

Parameter	Description
mline	The <code>multi_line</code> datatype to print.

Return Values

The contents of the `multi_line`.

Related Topics

- [PRINT Procedures](#)
These procedures generate the specified parameter as a string terminated with the `\n` newline character.
- [PRN Procedures](#)
These procedures generate the specified parameter as a string.

245.2.4 PRINT_ROW_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.ROW_LIST` DATA TYPE.

Syntax

```
OWA_TEXT.PRINT_ROW_LIST(  
    rlist      IN      multi_line);
```

Parameters**Table 245-5 PRINT_ROW_LIST Procedure Parameters**

Parameter	Description
<code>rlist</code>	The <code>row_list</code> datatype to print.

Return Values

The contents of the `row_list`.

Related Topics

- [PRINT Procedures](#)
These procedures generate the specified parameter as a string terminated with the `\n` newline character.
- [PRN Procedures](#)
These procedures generate the specified parameter as a string.

245.2.5 STREAM2MULTI Procedure

This procedure converts a string to a `multi_line` datatype.

Syntax

```
OWA_TEXT.STREAM2MULTI(  
    stream      IN      VARCHAR2  
    mline      OUT     multi_line);
```

Parameters

Table 245-6 STREAM2MULTI Procedure Parameters

Parameter	Description
stream	The string to convert.
mline	The stream in OWA_TEXT.MULTI_LINE DATA TYPE format

OWA_UTIL

The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for `mod_plsql`](#)

This chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Summary of OWA_UTIL Subprograms](#)

246.1 OWA_UTIL Overview

The `OWA_UTIL` package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a datatype by the Oracle database.

246.2 OWA_UTIL Types

`OWA_UTIL` uses Types to specify creating information.

- [DATATYPE Datatype](#)
- [IDENT_ARR Datatype](#)
- [IP_ADDRESS Datatype](#)

246.2.1 DATETYPE Datatype

The TODATE Function converts an item of this type to the type `DATE`, which is understood and properly handled as data by the database. The procedure `CHOOSE_DATE` Procedure enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

Related Topics

- [TODATE Function](#)
This function converts the DATETYPE Datatype to the standard Oracle `DATE` type.
- [CHOOSE_DATE Procedure](#)
This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

246.2.2 IDENT_ARR Datatype

This datatype is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

246.2.3 IP_ADDRESS Datatype

This datatype is used by the `GET_CLIENT_IP` Function in the `OWA_SEC` package.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

Related Topics

- [GET_CLIENT_IP Function](#)
This function returns the IP address of the client.
- [OWA_SEC](#)
The `OWA_SEC` package provides an interface for custom authentication.

246.3 Summary of OWA_UTIL Subprograms

This table lists the `OWA_UTIL` subprograms and briefly describes them.

Table 246-1 *OWA_UTIL Package Subprograms*

Subprogram	Description
BIND_VARIABLES Function	Prepares a SQL query and binds variables to it
CALENDARPRINT Procedures	Prints a calendar
CELLSPRINT Procedures	Prints the contents of a query in an HTML table
CHOOSE_DATE Procedure	Generates HTML form elements that allow the user to select a date
GET_CGI_ENV Function	Returns the value of the specified CGI environment variable
GET_OWA_SERVICE_PATH Function	Returns the full virtual path for the PL/SQL Gateway

Table 246-1 (Cont.) OWA_UTIL Package Subprograms

Subprogram	Description
GET_PROCEDURE Function	Returns the name of the procedure that is invoked by the PL/SQL Gateway
HTTP_HEADER_CLOSE Procedure	Closes the HTTP header
LISTPRINT Procedure	Generates a HTML form element that contains data from a query
MIME_HEADER Procedure	Generates the Content-type line in the HTTP header
PRINT_CGI_ENV Procedure	Generates a list of all CGI environment variables and their values
REDIRECT_URL Procedure	Generates the Location line in the HTTP header
SHOWPAGE Procedure	Prints a page generated by the HTP and HTF packages in SQL*Plus
SHOWSOURCE Procedure	Prints the source for the specified subprogram
SIGNATURE procedure	Prints a line that says that the page is generated by the PL/SQL Agent
STATUS_LINE Procedure	Generates the Status line in the HTTP header
TABLEPRINT Function	Prints the data from a table in the database as an HTML table
TODATE Function	Converts dateType data to the standard PL/SQL date type
WHO_CALLED_ME Procedure	Returns information on the caller of the procedure.

246.3.1 BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```
OWA_UTIL.BIND_VARIABLES (
  theQuery      IN      VARCHAR2  DEFAULT NULL,
  bv1Name       IN      VARCHAR2  DEFAULT NULL,
  bv1Value      IN      VARCHAR2  DEFAULT NULL,
  bv2Name       IN      VARCHAR2  DEFAULT NULL,
  bv2Value      IN      VARCHAR2  DEFAULT NULL,
  bv3Name       IN      VARCHAR2  DEFAULT NULL,
  bv3Value      IN      VARCHAR2  DEFAULT NULL,
  ...
  bv25Name      IN      VARCHAR2  DEFAULT NULL,
  bv25Value     IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

Parameters

Table 246-2 BIND_VARIABLES Function Parameters

Parameter	Description
theQuery	The SQL query statement which must be a SELECT statement
bv1Name	The name of the variable
bv1Value	The value of the variable

Return Values

An integer identifying the opened cursor.

246.3.2 CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the [BIND_VARIABLES Function](#).

Syntax

```
OWA_UTIL.CALENDARPRINT (
  p_query      IN      VARCHAR2,
  p_mf_only    IN      VARCHAR2  DEFAULT 'N');
```

```
OWA_UTIL.CALENDARPRINT (
  p_cursor     IN      INTEGER,
  p_mf_only    IN      VARCHAR2  DEFAULT 'N');
```

Parameters

Table 246-3 CALENDARPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_cursor	A PL/SQL cursor containing the same format as p_query.
p_mf_only	If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.

Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.

- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

246.3.3 CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table.

There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the [FORMAT_CELL Function](#) in the "HTF" package.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```
OWA_UTIL.CELLSPRINT (
  p_colCnt      IN    INTEGER,
  p_resultTbl   IN    vc_arr,

  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theQuery    IN    VARCHAR2,
  p_max_rows    IN    NUMBER      DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theCursor   IN    INTEGER,
  p_max_rows    IN    NUMBER      DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theQuery    IN    VARCHAR2,
  p_max_rows    IN    NUMBER      DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL,
  p_skip_rec    IN    NUMBER      DEFAULT 0,
  p_more_data   OUT   BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT (
  p_theCursor   IN    INTEGER,
  p_max_rows    IN    NUMBER      DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL,
  p_skip_rec    IN    NUMBER      DEFAULT 0,
  p_more_data   OUT   BOOLEAN);
```

```

OWA_UTIL.CELLSPRINT (
  p_theQuery      IN   VARCHAR2,
  p_max_rows      IN   NUMBER      DEFAULT 100,
  p_format_numbers IN   VARCHAR2    DEFAULT NULL,
  p_reccnt        OUT  NUMBER);

OWA_UTIL.CELLSPRINT (
  p_theCursor     IN   INTEGER,
  p_max_rows      IN   NUMBER      DEFAULT 100,
  p_format_numbers IN   VARCHAR2    DEFAULT NULL,
  p_reccnt        OUT  NUMBER);

OWA_UTIL.CELLSPRINT (
  p_theQuery      IN   VARCHAR2,
  p_max_rows      IN   NUMBER      DEFAULT 100,
  p_format_numbers IN   VARCHAR2    DEFAULT NULL,
  p_skip_rec      IN   NUMBER      DEFAULT 0,
  p_more_data     OUT  BOOLEAN,
  p_reccnt        OUT  NUMBER);

OWA_UTIL.CELLSPRINT (
  p_theCursor     IN   INTEGER,
  p_max_rows      IN   NUMBER      DEFAULT 100,
  p_format_numbers IN   VARCHAR2    DEFAULT NULL,
  p_skip_rec      IN   NUMBER      DEFAULT 0,
  p_more_data     OUT  BOOLEAN,
  p_reccnt        OUT  NUMBER);

```

Parameters

Table 246-4 CELLSPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_colCnt	The number of columns in the table.
p_theQuery	A SQL SELECT statement.
p_theCursor	A cursor ID. This can be the return value from the BIND_VARIABLES Function .
p_max_rows	The maximum number of rows to print.
p_format_numbers	If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.
p_skip_rec	The number of rows to exclude from the HTML table.
p_more_data	TRUE if there are more rows in the query or cursor, FALSE otherwise.
p_reccnt	The number of rows that have been returned by the query. This value does not include skipped rows (if any).
p_resultTbl	The index table which will contain the result of the query. Each entry in the query will correspond to one column value.

Examples

This procedure generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

246.3.4 CHOOSE_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

Syntax

```
OWA_UTIL.CHOOSE_DATE (
    p_name      IN      VARCHAR2,
    p_date      IN      DATE      DEFAULT SYSDATE);
```

Parameters

Table 246-5 CHOOSE_DATE Procedure Parameters

Parameter	Description
p_name	The name of the form elements.
p_date	The initial date that is selected when the HTML page is displayed.

Usage Notes

- The parameter in the procedure that receives the data from these elements must be a [GET_CGI_ENV Function](#).
- Use the [TODATE Function](#) to convert the [GET_CGI_ENV Function](#) value to the standard Oracle DATE datatype.

Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
...
<OPTION value="2002">2002
</SELECT>
```

246.3.5 GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```
OWA_UTIL.GET_CGI_ENV(  
    param_name    IN    VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 246-6 GET_CGI_ENV Function Parameters

Parameter	Description
param_name	The name of the CGI environment variable. It is case-insensitive.

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns `NULL`.

246.3.6 GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH  
    RETURN VARCHAR2;
```

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

246.3.7 GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

```
OWA_UTIL.GET_PROCEDURE  
    RETURN VARCHAR2;
```

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

246.3.8 HTTP_HEADER_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

Return Values

A newline character, which closes the HTTP header.

Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as [MIME_HEADER Procedure](#), [REDIRECT_URL Procedure](#), or [STATUS_LINE Procedure](#)
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

246.3.9 LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query.

There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the [BIND_VARIABLES Function](#).

Syntax

```
OWA_UTIL.LISTPRINT(
  p_theQuery    IN      VARCHAR2,
  p_cname       IN      VARCHAR2,
  p_nsize       IN      NUMBER,
  p_multiple    IN      BOOLEAN  DEFAULT FALSE);
```

```
OWA_UTIL.LISTPRINT(
  p_theCursor   IN      INTEGER,
  p_cname       IN      VARCHAR2,
  p_nsize       IN      NUMBER,
  p_multiple    IN      BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 246-7 LISTPRINT Procedure Parameters

Parameter	Description
<code>p_theQuery</code>	The SQL query.
<code>p_theCursor</code>	The cursor ID. This can be the return value from the BIND_VARIABLES Function .
<code>p_cname</code>	The name of the HTML form element.

Table 246-7 (Cont.) LISTPRINT Procedure Parameters

Parameter	Description
p_nsize	The size of the form element (this controls how many items the user can see without scrolling).
p_multiple	Whether multiple selection is permitted.

Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
...
</SELECT>
```

246.3.10 MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any HTP.PRINT or HTP.PRN calls to direct the script not to use the default MIME header.

Syntax

```
OWA_UTIL.MIME_HEADER(
  ccontent_type IN VARCHAR2 DEFAULT 'text/html',
  bclose_header IN BOOLEAN DEFAULT TRUE,
  ccharset IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 246-8 MIME_HEADER Procedure Parameters

Parameter	Description
ccontent_type	The MIME type to generate
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.
ccharset	The character set to use. The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.

Examples

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

246.3.11 PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

```
OWA_UTIL.PRINT_CGI_ENV;
```

Examples

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

246.3.12 REDIRECT_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

Syntax

```
OWA_UTIL.REDIRECT_URL(  
    curl          IN          VARCHAR2  
    bclose_header IN          BOOLEAN    DEFAULT TRUE);
```

Parameters**Table 246-9 REDIRECT_URL Procedure Parameters**

Parameter	Description
curl	The URL to visit.
bclose_header	Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Usage Notes

This procedure must come before any HTP procedure or HTF function call.

Examples

This procedure generates

Location: <curl>\n\n

246.3.13 SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus.

The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

```
OWA_UTIL.SHOWPAGE;
```

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the [DBMS_OUTPUT](#) package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

246.3.14 SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

```
OWA_UTIL.SHOWSOURCE (
    cname      IN      VARCHAR2);
```

Parameters

Table 246-10 SHOWSOURCE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

246.3.15 SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document.

If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the [SHOWSOURCE Procedure](#).

Syntax

```
OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (
    cname          IN          VARCHAR2);
```

Parameters

Table 246-11 SIGNATURE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30
View PL/SQL Source
```

246.3.16 STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client.

This procedure must come before any `http.print` or `http.prn` calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```
OWA_UTIL.STATUS_LINE (
    nstatus        IN          INTEGER,
    creason        IN          VARCHAR2  DEFAULT NULL,
    bclose_header  IN          BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 246-12 STATUS_LINE Procedure Parameters

Parameter	Description
nstatus	The status code.
creason	The string for the status code.

Table 246-12 (Cont.) STATUS_LINE Procedure Parameters

Parameter	Description
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Examples

This procedure generates

```
Status: <nstatus> <creason>\n\n
```

246.3.17 TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

Syntax

```
OWA_UTIL.TABLEPRINT(
  ctable          IN          VARCHAR2,
  cattributes     IN          VARCHAR2  DEFAULT NULL,
  ntable_type     IN          INTEGER   DEFAULT HTML_TABLE,
  ccolumns        IN          VARCHAR2  DEFAULT '*',
  cclauses        IN          VARCHAR2  DEFAULT NULL,
  ccol_aliases    IN          VARCHAR2  DEFAULT NULL,
  nrow_min        IN          NUMBER    DEFAULT 0,
  nrow_max        IN          NUMBER    DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 246-13 TABLEPRINT Function Parameters

Parameter	Description
ctable	The database table.
cattributes	Other attributes to be included as-is in the tag.
ntable_type	How to generate the table. Specify HTML_TABLE to generate the table using <TABLE> tags or PRE_TABLE to generate the table using the <PRE> tags. These are constants: <ul style="list-style-type: none"> HTML_TABLE CONSTANT INTEGER := 1; PRE_TABLE CONSTANT INTEGER := 2;
ccolumns	A comma-delimited list of columns from ctable to include in the generated table.
cclauses	WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.
ccol_aliases	A comma-delimited list of headings for the generated table.
nrow_min	The first row, of those retrieved, to display.
nrow_max	The last row, of those retrieved, to display.

Return Values

Returns `TRUE` if there are more rows beyond the `nrow_max` requested, `FALSE` otherwise.

Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, `cattributes` is the second rather than the last parameter.

Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
    ignore_more BOOLEAN;
BEGIN
    ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

`http://myhost:7777/pls/hr/showemps`

returns to the following to the client:

```
<PRE>
-----
| EMPNO |ENAME |JOB      |MGR  |HIREDATE  | SAL | COMM | DEPTNO |
-----|-----|-----|-----|-----|-----|-----|-----|
| 7369 | SMITH | CLERK   | 7902 | 17-DEC-80 | 800 |      | 20 |
| 7499 | ALLEN | SALESMAN| 7698 | 20-FEB-81 | 1600 | 300 | 30 |
| 7521 | WARD  | SALESMAN| 7698 | 22-FEB-81 | 1250 | 500 | 30 |
| 7566 | JONES | MANAGER | 7839 | 02-APR-81 | 2975 |      | 20 |
| 7654 | MARTIN | SALESMAN| 7698 | 28-SEP-81 | 1250 | 1400 | 30 |
| 7698 | BLAKE | MANAGER | 7839 | 01-MAY-81 | 2850 |      | 30 |
| 7782 | CLARK | MANAGER | 7839 | 09-JUN-81 | 2450 |      | 10 |
| 7788 | SCOTT | ANALYST | 7566 | 09-DEC-82 | 3000 |      | 20 |
| 7839 | KING  | PRESIDENT |      | 17-NOV-81 | 5000 |      | 10 |
| 7844 | TURNER | SALESMAN| 7698 | 08-SEP-81 | 1500 | 0 | 30 |
| 7876 | ADAMS | CLERK   | 7788 | 12-JAN-83 | 1100 |      | 20 |
| 7900 | JAMES | CLERK   | 7698 | 03-DEC-81 | 950 |      | 30 |
| 7902 | FORD  | ANALYST | 7566 | 03-DEC-81 | 3000 |      | 20 |
| 7934 | MILLER | CLERK   | 7782 | 23-JAN-82 | 1300 |      | 10 |
-----
</PRE>
```

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
    ignore_more BOOLEAN;
begin
    ignore_more := OWA_UTIL.TABLEPRINT
        ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
        'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
        'Employee Number, Name, Salary');
END;
```

A request for a URL like

http://myhost:7777/pls/hr/showemps_10

would return the following to the client:

```
<PRE>
-----
| Employee Number |Name      | Salary |
-----
| 7782             | CLARK    | 2450   |
| 7839             | KING     | 5000   |
| 7934             | MILLER   | 1300   |
-----
</PRE>
```

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

http://myhost:7777/pls/hr/showdept

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO

246.3.18 TODATE Function

This function converts the DATETYPE Datatype to the standard Oracle DATE type.

Syntax

```
OWA_UTIL.TODATE(
    p_dateArray    IN    dateType)
RETURN DATE;
```

Parameters

Table 246-14 TODATE Function Parameters

Parameter	Description
p_dateArray	The value to convert.

Related Topics

- [DATETYPE Datatype](#)
The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

246.3.19 WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```
OWA_UTIL.WHO_CALLED_ME (
    owner          OUT    VARCHAR2,
    name           OUT    VARCHAR2,
    lineno         OUT    NUMBER,
    caller_t       OUT    VARCHAR2);
```

Parameters

Table 246-15 WHO_CALLED_ME Procedure Parameters

Parameter	Description
owner	The owner of the program unit.

Table 246-15 (Cont.) WHO_CALLED_ME Procedure Parameters

Parameter	Description
name	The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.
lineno	The line number within the program unit where the call was made.
caller_t	The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.

SDO_CS

The `SDO_CS` package contains functions and procedures for working with coordinate systems.

You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CS` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_CSW_PROCESS

The `SDO_CSW_PROCESS` package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CSW_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_GCDR

The `SDO_GCDR` package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GCDR` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_GEOM

The `SDO_GEOM` package contains the geometry functions.

These can be grouped into the following categories (with examples of each):

- **Relationship (True/False) between two objects:** `RELATE`, `WITHIN_DISTANCE`
- **Validation:** `VALIDATE_GEOMETRY_WITH_CONTEXT`, `VALIDATE_LAYER_WITH_CONTEXT`
- **Single-object operations:** `SDO_ARC_DENSIFY`, `SDO_AREA`, `SDO_BUFFER`, `SDO_CENTROID`, `SDO_CONVEXHULL`, `SDO_LENGTH`, `SDO_MBR`, `SDO_POINTONSURFACE`
- **Two-object operations:** `SDO_DISTANCE`, `SDO_DIFFERENCE`, `SDO_INTERSECTION`, `SDO_UNION`, `SDO_XOR`

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOM` in the *Oracle Spatial and Graph Developer's Guide*.

251

SDO_GEOR

The `SDO_GEOR` package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

SDO_GEOR_ADMIN

The `SDO_GEOR_ADMIN` package contains subprograms for administrative operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_ADMIN` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

SDO_GEOR_AGGR

The `SDO_GEOR_AGGR` package provides an interface to the `SDO_GEOR_AGGR` package for performing aggregate operations on GeoRaster objects.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_AGGR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

SDO_GEOR_RA

The `SDO_GEOR_RA` package provides an interface to the `SDO_GEOR_RA` package for performing raster algebra and analytic operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_RA` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

255

SDO_GEOR_UTL

The `SDO_GEOR_UTL` package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_UTL` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

256

SDO_LRS

The `SDO_LRS` package contains functions that create, modify, query, and convert linear referencing elements.

For a complete description of this package within the context of Oracle Spatial, see `SDO_LRS` in the *Oracle Spatial and Graph Developer's Guide*.

257

SDO_MIGRATE

The `SDO_MIGRATE` package lets you upgrade geometry tables from previous releases of Oracle Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_MIGRATE` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_NET

The `SDO_NET` package contains functions and procedures for working with data modeled as nodes and links in a network.

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

259

SDO_NFE

The `SDO_NFE` package contains functions and procedures for performing network feature editing.

For a complete description of this package within the context of Oracle Spatial and Graph, see [SDO_NFE](#) in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

260

SDO_OLS

The `SDO_OLS` package contains subprograms for Spatial OpenLS support.

For a complete description of this package within the context of Oracle Spatial, see `SDO_OLS` in the *Oracle Spatial and Graph Developer's Guide*.

261

SDO_PC_PKG

The `SDO_PC_PKG` package contains subprograms to support the use of point clouds in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_PC_PKG` in the *Oracle Spatial and Graph Developer's Guide*.

262

SDO_SAM

The `SDO_SAM` package contains functions and procedures for spatial analysis and data mining.

For a complete description of this package within the context of Oracle Spatial, see `SDO_SAM` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_TIN_PKG

The `SDO_TIN_PKG` package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TIN_PKG` in the

SDO_TOPO

The `SDO_TOPO` package contains subprograms for creating and managing Oracle Spatial topologies.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

SDO_TOPO_MAP

The `SDO_TOPO_MAP` package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO_MAP` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

SDO_TUNE

The `SDO_TUNE` package contains Spatial tuning functions and procedures.

For complete description of this package within the context of Oracle Spatial, see `SDO_TUNE` in the *Oracle Spatial and Graph Developer's Guide*.

267

SDO_UTIL

The `SDO_UTIL` package contains the utility functions and procedures for Oracle Spatial.

For complete description of this package within the context of Oracle Spatial, see `SDO_UTIL` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_WFS_LOCK

The `SDO_WFS_LOCK` package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_LOCK` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_WFS_PROCESS

The `SDO_WFS_PROCESS` package contains subprograms for various processing operations related to support for Web Feature Services.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

270

SEM_APIS

The `SEM_APIS` package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_APIS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

271

SEM_OLS

The `SEM_OLS` package provides an interface to the `SEM_OLS` package for providing triple-level security to RDF data, using Oracle Label Security (OLS).

For a complete description of this package, see `SEM_OLS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

SEM_PERF

The `SEM_PERF` package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_PERF` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

SEM_RDFCTX

The `SEM_RDFCTX` package contains subprograms for managing extractor policies and semantic indexes created for documents.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFCTX` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*

SEM_RDFSA

The `SEM_RDFSA` package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFSA` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

UTL_CALL_STACK

The `UTL_CALL_STACK` package provides an interface to provide information about currently executing subprograms.

Functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. Other functions return error stack information.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [UTL_CALL_STACK Operational Notes](#)
- [UTL_CALL_STACK Exceptions](#)
- [Data Structures](#)
- [Summary of UTL_CALL_STACK Subprograms](#)

See Also:

- *Oracle Database PL/SQL Language Reference* regarding Conditional Compilation
- *Oracle Database Development Guide* regarding Using PL/Scope and Using the PL/SQL Hierarchical Profiler

275.1 UTL_CALL_STACK Overview

The `UTL_CALL_STACK` package provides an interface for PL/SQL programmers to obtain information about currently executing programs including the subprogram name from dynamic and lexical stacks and the depths of those stacks.

Individual functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. More functions return error stack information. Such information can be used to create more revealing error logs and application execution traces.

Dynamic Depth

The dynamic depth of an executing instance of a PL/SQL subprogram is defined recursively.

- The dynamic depth of the currently executing subprogram instance is one.
- Otherwise, the dynamic depth of the subprogram instance is one more than the dynamic depth of the subprogram it invoked.
- If there is a SQL, Java, or other non-PL/SQL context that invoked or was invoked by an executing subprogram, it occupies a level on the call stack as if it were a subprogram.

In the case of a call stack in which A calls B, which calls C, which calls D, which calls E, which calls F, which calls E, this stack can be written as a line with the dynamic depths underneath:

```
A B C D E F E
7 6 5 4 3 2 1
```

Lexical Depth

The lexical depth of a PL/SQL subprogram is defined recursively.

- The lexical depth of a unit, an anonymous block, trigger, or ADT is one (1).
- The lexical depth of a subprogram defined within another object is one plus the lexical depth of that object.

Blocks do not affect lexical depth.

Error Depth

The error depth is the number of errors on the error stack.

For example, consider the following anonymous block.

```
BEGIN
  BEGIN
    ... (1)
    raise zero_divide;
  EXCEPTION
    when others then
      raise no_data_found;
  END;
EXCEPTION
  WHEN others THEN
    ... (2)
END;
```

The error depth at (1) is zero and at (2) is two.

Backtrace

The backtrace is a trace from where the exception was thrown to where the backtrace was examined.

Consider a call stack in which A calls B which calls C and C raises an exception. If the backtrace was examined in C, the backtrace would have one unit, C, and the backtrace depth would be one. If it was examined in A, it would have three units, A, B and C, and backtrace depth would be three.

The depth of a backtrace is zero in the absence of an exception.

275.2 UTL_CALL_STACK Security Model

EXECUTE on UTL_CALL_STACK is granted to PUBLIC.

The UTL_CALL_STACK package does not show wrapped program units. For example, consider a call stack in which program unit A calls B, which calls C, and in turn calls UTL_CALL_STACK to determine the subprogram list. If program unit B is wrapped, then the subprogram list only shows program unit C.

275.3 UTL_CALL_STACK Operational Notes

Certain operational notes apply to UTL_CALL_STACK.

- Compiler optimizations can change lexical, dynamic and backtrace depth.
- UTL_CALL_STACK is not supported past RPC boundaries. For example, if A calls remote procedure B, B will not be able to obtain information about A using UTL_CALL_STACK.
- Lexical unit information is available through the PL/SQL conditional compilation feature and is therefore not exposed through UTL_CALL_STACK.

275.4 UTL_CALL_STACK Exceptions

This table lists the exceptions raised by UTL_CALL_STACK.

Table 275-1 Exceptions Raised by UTL_CALL_STACK

Exception	Error Code	Description
BAD_DEPTH_INDICATOR	64610	This exception is raised when a provided depth is out of bounds. Dynamic and lexical depth are positive integer values. Error and backtrace depths are non-negative integer values and are zero only in the absence of an exception.

275.5 UTL_CALL_STACK Data Structures

The UTL_CALL_STACK package defines a VARRAY type, UNIT_QUALIFIED_NAME.

VARRAY Type

- [UNIT_QUALIFIED_NAME](#)

275.5.1 UNIT_QUALIFIED_NAME

This data structure is a varray whose individual elements are, in order, the unit name, any lexical parents of the subprogram, and the subprogram name.

```
TYPE UNIT_QUALIFIED_NAME IS VARRAY(256) OF VARCHAR2(32767);
```

Example

Consider the following contrived PL/SQL procedure:

```
PROCEDURE topLevel IS
  FUNCTION localFunction(...) RETURNS VARCHAR2 IS
    FUNCTION innerFunction(...) RETURNS VARCHAR2 IS
      BEGIN
        DECLARE
          localVar PLS_INTEGER;
        BEGIN
          ... (1)
        END;
      END;
    END;
```

```
BEGIN
  ...
END;
```

The unit qualified name at (1) would be

```
["topLevel", "localFunction", "innerFunction"]
```

If the unit were an anonymous block, the unit name would be "__anonymous_block"

275.6 Summary of UTL_CALL_STACK Subprograms

This table lists the subprograms in the UTL_CALL_STACK package.

Table 275-2 UTL_CALL_STACK Package Subprograms

Subprogram	Description
BACKTRACE_DEPTH Function	Returns the number of backtrace items in the backtrace
BACKTRACE_LINE Function	Returns the line number of the unit at the specified backtrace depth
BACKTRACE_UNIT Function	Returns the name of the unit at the specified backtrace depth
CURRENT_EDITION Function	Returns the current edition name of the unit of the subprogram at the specified dynamic depth
CONCATENATE_SUBPROGRAM Function	Returns a concatenated form of a unit-qualified name
DYNAMIC_DEPTH Function	Returns the number of subprograms on the call stack
ERROR_DEPTH Function	Returns the number of errors on the error stack
ERROR_MSG Function	Returns the error message of the error at the specified error depth
ERROR_NUMBER Function	Returns the error number of the error at the specified error depth
LEXICAL_DEPTH Function	Returns the lexical nesting level of the subprogram at the specified dynamic depth
OWNER Function	Returns the owner name of the unit of the subprogram at the specified dynamic depth
UNIT_LINE Function	Returns the line number of the unit of the subprogram at the specified dynamic depth
SUBPROGRAM Function	Returns the unit-qualified name of the subprogram at the specified dynamic depth

275.6.1 BACKTRACE_DEPTH Function

This function returns the number of backtrace items in the backtrace.

Syntax

```
UTL_CALL_STACK.BACKTRACE_DEPTH
RETURN PLS_INTEGER;
```

Return Values

The number of backtrace items in the backtrace, zero in the absence of an exception.

275.6.2 BACKTRACE_LINE Function

This function returns the line number of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_LINE (  
    backtrace_depth IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 275-3 *BACKTRACE_LINE Function Parameters*

Parameter	Description
backtrace_depth	Depth in backtrace

Return Values

The line number of the unit at the specified backtrace depth

275.6.3 BACKTRACE_UNIT Function

This function returns the name of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_UNIT (  
    backtrace_depth IN PLS_INTEGER)  
RETURN VARCHAR2;
```

Parameters

Table 275-4 *BACKTRACE_UNIT Function Parameters*

Parameter	Description
backtrace_depth	Depth in backtrace

Return Values

The name of the unit at the specified backtrace depth

275.6.4 CURRENT_EDITION Function

This function returns the current edition name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.CURRENT_EDITION (  
    dynamic_depth    IN    PLS_INTEGER)  
    RETURN VARCHAR2;
```

Parameters

Table 275-5 *CURRENT_EDITION Function Parameters*

Parameter	Description
dynamic_depth	Depth in the error stack

Return Values

The current edition name of the unit of the subprogram at the specified dynamic depth

275.6.5 CONCATENATE_SUBPROGRAM Function

This function returns a concatenated form of a unit-qualified name.

Syntax

```
UTL_CALL_STACK.CONCATENATE_SUBPROGRAM (  
    qualified_name    IN    UNIT_QUALIFIED_NAME)  
    RETURN VARCHAR2;
```

Parameters

Table 275-6 *CONCATENATE_SUBPROGRAM Function Parameters*

Parameter	Description
qualified_name	A unit-qualified name

Return Values

A string of the form `UNIT.SUBPROGRAM.LOCAL_SUBPROGRAM`

275.6.6 DYNAMIC_DEPTH Function

This function returns the number of subprograms on the call stack.

Syntax

```
UTL_CALL_STACK.DYNAMIC_DEPTH  
    RETURN PLS_INTEGER;
```

Return Values

The number of subprograms on the call stack

275.6.7 ERROR_DEPTH Function

This function returns the number of errors on the error stack.

Syntax

```
UTL_CALL_STACK.ERROR_DEPTH  
RETURN PLS_INTEGER;
```

Return Values

The number of errors on the error stack

275.6.8 ERROR_MSG Function

This function returns the error message of the error at the specified error depth.

Syntax

```
UTL_CALL_STACK.ERROR_MSG (  
    error_depth IN PLS_INTEGER)  
RETURN VARCHAR2;
```

Parameters

Table 275-7 *ERROR_MSG Function Parameters*

Parameter	Description
error_depth	Depth in the error stack

Return Values

The error message of the error at the specified error depth.

275.6.9 ERROR_NUMBER Function

This function returns the error number of the error at the specified error depth.

Syntax

```
UTL_CALL_STACK.ERROR_NUMBER (  
    error_depth IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 275-8 *ERROR_NUMBER Function Parameters*

Parameter	Description
error_depth	Depth in the call stack

Return Values

The error number of the error at the specified error depth

275.6.10 LEXICAL_DEPTH Function

This function returns the lexical nesting level of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.LEXICAL_DEPTH (  
    dynamic_depth    IN    PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 275-9 *LEXICAL_DEPTH Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The lexical nesting level of the subprogram at the specified dynamic depth

275.6.11 OWNER Function

This function returns the owner name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.OWNER (  
    dynamic_depth    IN    PLS_INTEGER)  
RETURN VARCHAR2;
```

Parameters

Table 275-10 *OWNER Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The owner name of the unit of the subprogram at the specified dynamic depth

275.6.12 UNIT_LINE Function

This function returns the line number of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.UNIT_LINE (  
    dynamic_depth IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 275-11 *UNIT_LINE Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The line number of the unit of the subprogram at the specified dynamic depth

275.6.13 SUBPROGRAM Function

This function returns the unit-qualified name of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.SUBPROGRAM (  
    dynamic_depth IN PLS_INTEGER)  
RETURN UNIT_QUALIFIED_NAME;
```

Parameters

Table 275-12 *SUBPROGRAM Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

Returns the unit-qualified name of the subprogram at the specified dynamic depth

276

UTL_COLL

The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- [Summary of UTL_COLL Subprograms](#)

276.1 Summary of UTL_COLL Subprograms

The UTL_COLL package has one subprogram, the IS_LOCATOR function.

Table 276-1 UTL_COLL Package Subprograms

Subprogram	Description
IS_LOCATOR Function	Determines whether a collection item is actually a locator or not

276.1.1 IS_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

Syntax

```
UTL_COLL.IS_LOCATOR (  
    coln IN STANDARD)  
    RETURNS BOOLEAN;
```

Pragmas

Asserts WNDS, WNPS and RNPS pragmas

Parameters

Table 276-2 IS_LOCATOR Function Parameters

Parameter	Description
coln	Nested table or varray item.

Return Values

Table 276-3 IS_LOCATOR Function Return Values

Return Value	Description
1	Collection item is indeed a locator.
0	Collection item is not a locator.

Examples

```
CREATE OR REPLACE TYPE list_t AS TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
    pno number,
    ph list_t );
/

CREATE TABLE phone_book OF phone_book_t
    NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
    NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
    plist list_t;
    plist1 list_t;
BEGIN
    SELECT ph INTO plist FROM phone_book WHERE pno=1;

    SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

    IF (UTL_COLL.IS_LOCATOR(plist)) THEN
        DBMS_OUTPUT.PUT_LINE('plist is a locator');
    ELSE
        DBMS_OUTPUT.PUT_LINE('plist is not a locator');
    END IF;

    IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
        DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
    ELSE
        DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
    END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

277

UTL_COMPRESS

The `UTL_COMPRESS` package provides a set of data compression utilities.

This chapter contains the following topics:

- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Summary of UTL_COMPRESS Subprograms](#)

277.1 UTL_COMPRESS Constants

The maximum number of handles for piecewise operations can be defined by a constant.

```
UTLCOMP_MAX_HANDLE CONSTANT PLS_INTEGER := 5;
```

277.2 UTL_COMPRESS Exceptions

This table describes exceptions raised by `UTL_COMPRESS` subprograms.

Table 277-1 UTL_COMPRESS Exceptions

Exception	Description
<code>BUFFER_TOO_SMALL</code>	The compressed representation is too big.
<code>DATA_ERROR</code>	The input or output data stream was found to be an invalid format.
<code>INVALID_ARGUMENT</code>	One of the arguments was an invalid type or value.
<code>INVALID_HANDLE</code>	Invalid handle for piecewise compress or uncompress.
<code>STREAM_ERROR</code>	An error occurred during compression or uncompression of the data stream

277.3 UTL_COMPRESS Operational Notes

Certain operational notes apply to `UTL_COMPRESS`.

- It is the caller's responsibility to free the temporary `LOB` returned by the `LZ*` functions with `DBMS_LOB.FREETEMPORARY` call.
- A `BFILE` passed into `LZ_COMPRESS*` or `LZ_UNCOMPRESS*` has to be opened by `DBMS_LOB.FILEOPEN`.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the `UTL_COMPRESS` subprograms may be the same size, or even slightly larger than, the input.

- The output of the UTL_COMPRESS compressed data is compatible with gzip(with -n option)/gunzip on a single file.

277.4 Summary of UTL_COMPRESS Subprograms

This table lists the UTL_COMPRESS subprograms and briefly describes them.

Table 277-2 UTL_COMPRESS Package Subprograms

Subprogram	Description
ISOPEN Function	Checks to see if the handle to a piecewise (un)compress context is open or closed
LZ_COMPRESS Functions and Procedures	Compresses data using Lempel-Ziv compression algorithm
LZ_COMPRESS_ADD Procedure	Adds a piece of compressed data
LZ_COMPRESS_CLOSE	Closes and finishes piecewise compress operation
LZ_COMPRESS_OPEN	Initializes a piecewise context that maintains the compress state and data
LZ_UNCOMPRESS Functions and Procedures	Accepts compressed input, verifies it to be a valid and uncompresses it
LZ_UNCOMPRESS_EXTRACT Procedure	Extracts a piece of uncompressed data
LZ_UNCOMPRESS_OPEN Function	Initializes a piecewise context that maintains the uncompress state and data
LZ_UNCOMPRESS_CLOSE Procedure	Closes and finishes the piecewise uncompress

277.4.1 ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

```
UTL_COMPRESS.ISOPEN(  
    handle in binary_integer)  
RETURN BOOLEAN;
```

Parameters

Table 277-3 ISOPEN Function Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.

Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

Examples

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
    UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;
```

Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
    UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
```

277.4.2 LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      RAW,
    quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BLOB,
    quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BLOB,
    dst      IN OUT NOCOPY BLOB,
    quality  IN      BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BFILE,
    quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BFILE,
    dst      IN OUT NOCOPY BLOB,
    quality  IN      BINARY_INTEGER DEFAULT 6);
```

Parameters

Table 277-4 LZ_COMPRESS Function and Procedures Parameters

Parameter	Description
src	Data (RAW, BLOB or BFILE) to be compressed.
dst	Destination for compressed data
quality	An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6

Usage Notes

- `quality` is an optional compression tuning value. It allows the `UTL_COMPRESS` user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

277.4.3 LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (
    handle IN          BINARY_INTEGER,
    dst    IN OUT NOCOPY BLOB,
    src    IN          RAW);
```

Parameters

Table 277-5 LZ_COMPRESS_ADD Procedure Parameters

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from <code>LZ_COMPRESS_OPEN</code> to store compressed data.
src	The input data to be compressed.

Exceptions

- `invalid_handle` - out of range invalid or unopened handle.
- `invalid_argument` - NULL handle, src, dst, or invalid dst.

277.4.4 LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
    handle IN          BINARY_INTEGER,
    dst     IN OUT NOCOPY BLOB);
```

Parameters

Table 277-6 LZ_COMPRESS_CLOSE Procedure Parameters

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle, dst, or invalid dst.

277.4.5 LZ_COMPRESS_OPEN

This function initializes a piecewise context that maintains the compress state and data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (
    dst     IN OUT NOCOPY BLOB,
    quality IN          BINARY_INTEGER DEFAULT 6)
RETURN BINARY_INTEGER;
```

Parameters

Table 277-7 LZ_COMPRESS_OPEN Function Parameters

Parameter	Description
dst	User supplied LOB to store compressed data.
quality	Speed versus efficiency of resulting compressed output. <ul style="list-style-type: none"> • Valid values are the range 1..9, with a default value of 6. • 1=fastest compression, 9=slowest compression and best compressed file size.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.

- `invalid_argument` - NULL `dst` or invalid quality specified.

Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
 - in the event of an exception in the middle of process
- because lack of doing so will cause these handles to leak.

277.4.6 LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a `RAW`, `BLOB` or `BFILE` compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed `RAW` or `BLOB` result.

Syntax

This function returns uncompressed data as `RAW`:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN RAW)
RETURN RAW;
```

This function returns uncompressed data as a temporary `BLOB`:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BLOB)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing `BLOB(dst)`, which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BLOB,
    dst IN OUT NOCOPY BLOB);
```

This function returns a temporary `BLOB` for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BFILE)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing `BLOB(dst)`. The original `dst` data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BFILE,
    dst IN OUT NOCOPY BLOB);
```

Parameters

Table 277-8 LZ_UNCOMPRESS Function and Procedures Parameters

Parameter	Description
<code>src</code>	Compressed data.

Table 277-8 (Cont.) LZ_UNCOMPRESS Function and Procedures Parameters

Parameter	Description
dst	Destination for uncompressed data.

277.4.7 LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT (
  handle IN          BINARY_INTEGER,
  dst     OUT NOCOPY RAW);
```

Parameters

Table 277-9 LZ_UNCOMPRESS_EXTRACT Function Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.
dst	The uncompressed data.

Exceptions

- `no_data_found` - finished uncompress.
- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

277.4.8 LZ_UNCOMPRESS_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN (
  src IN BLOB)
RETURN BINARY_INTEGER;
```

Parameters

Table 277-10 LZ_UNCOMPRESS_OPEN Function Parameters

Parameter	Description
src	The input data to be uncompressed.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL src.

Usage Notes

Close the opened handle with `LZ_UNCOMPRESS_CLOSE`

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process because lack of doing so will cause these handles to leak.

277.4.9 LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE (
    handle IN BINARY_INTEGER);
```

Parameters

Table 277-11 LZ_UNCOMPRESS_CLOSE Procedure Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

UTL_ENCODE

The `UTL_ENCODE` package provides functions that encode `RAW` data into a standard encoded format so that the data can be transported between hosts.

You can use `UTL_ENCODE` functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- [Summary of UTL_ENCODE Subprograms](#)

278.1 Summary of UTL_ENCODE Subprograms

This table lists the `UTL_ENCODE` subprograms and briefly describes them.

Table 278-1 UTL_ENCODE Package Subprograms

Subprogram	Description
BASE64_DECODE Function	Reads the base 64-encoded <code>RAW</code> input string and decodes it to its original <code>RAW</code> value
BASE64_ENCODE Function	Encodes the binary representation of the <code>RAW</code> value into base 64 elements and returns it in the form of a <code>RAW</code> string
MIMEHEADER_DECODE Function	Decodes a string from mime header format
MIMEHEADER_ENCODE Function	Encodes a string into mime header format
QUOTED_PRINTABLE_DECODE Function	Reads the <code>varchar2</code> quoted printable format input string and decodes it to the corresponding <code>RAW</code> string
QUOTED_PRINTABLE_ENCODE Function	Reads the <code>RAW</code> input string and encodes it to the corresponding quoted printable format string
TEXT_DECODE Function	Decodes a character set sensitive text string
TEXT_ENCODE Function	Encodes a character set sensitive text string
UUDECODE Function	Reads the <code>RAW</code> uuencode format input string and decodes it to the corresponding <code>RAW</code> string
UUENCODE Function	Reads the <code>RAW</code> input string and encodes it to the corresponding uuencode format string

278.1.1 BASE64_DECODE Function

This function reads the base 64-encoded `RAW` input string and decodes it to its original `RAW` value.

Syntax

```
UTL_ENCODE.BASE64_DECODE (  
    r IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 278-2 BASE64_DECODE Function Parameters

Parameter	Description
r	The RAW string containing base 64-encoded data. There are no defaults or optional parameters.

Return Values

Table 278-3 BASE64_DECODE Function Return Values

Return	Description
RAW	Contains the decoded string

278.1.2 BASE64_ENCODE Function

This function encodes the binary representation of the `RAW` value into base 64 elements and returns it in the form of a `RAW` string.

Syntax

```
UTL_ENCODE.BASE64_ENCODE (  
    r IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 278-4 BASE64_ENCODE Function Parameters

Parameter	Description
r	The RAW value to be encoded. There are no defaults or optional parameters.

Return Values

Table 278-5 BASE64_ENCODE Function Return Values

Return	Description
RAW	Contains the encoded base 64 elements

278.1.3 MIMEHEADER_DECODE Function

This function accepts as input an "encoded word."

It uses the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The <encoded text> is encapsulated in mime header tags which give the `MIMEHEADER_DECODE` function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a `VARCHAR2` string.

Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
    buf    IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 278-6 MIMEHEADER_DECODE Function Parameters

Parameter	Description
buf	The encoded text data with mime header format tags.

Return Values

Table 278-7 MIMEHEADER_DECODE Function Return Values

Return	Description
data	The encoded text data with mime header format tags

Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?');
```

278.1.4 MIMEHEADER_ENCODE Function

This function returns as an output an "encoded word".

The output is in the following form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=-
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The `<encoding>` value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The `ENCODING` input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
    buf          IN  VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN VARCHAR2 DEFAULT NULL,
    encoding     IN  PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 278-8 MIMEHEADER_ENCODE Function Parameters

Parameter	Description
buf	The text data.
encode_charset	The target character set.
encoding	The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL

Return Values

Table 278-9 MIMEHEADER_ENCODE Function Return Values

Return	Description
string	A VARCHAR2 encoded string with mime header format tags.

278.1.5 QUOTED_PRINTABLE_DECODE Function

This function reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 278-10 QUOTED_PRINTABLE_DECODE Function Parameters

Parameters	Description
r	The RAW string containing a quoted printable data string. There are no defaults or optional parameters.

Return Values

Table 278-11 QUOTED_PRINTABLE_DECODE Function Return Values

Return	Description
RAW	The decoded string

278.1.6 QUOTED_PRINTABLE_ENCODE Function

This function reads the RAW input string and encodes it to the corresponding quoted printable format string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 278-12 QUOTED_PRINTABLE_ENCODE Function Parameters

Parameter	Description
r	The RAW string. There are no defaults or optional parameters.

Return Values

Table 278-13 QUOTED_PRINTABLE_ENCODE Function Return Values

Return	Description
RAW	Contains the quoted printable string

278.1.7 TEXT_DECODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL.

The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each encoding parameter. If NULL, quoted-printable is selected as a default decoding format. If `encode_charset` is not NULL, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_DECODE (
    buf          IN  VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN VARCHAR2 DEFAULT NULL,
```

```
encoding          IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 278-14 TEXT_DECODE Function Parameters

Parameter	Description
buf	The encoded text data.
encode_charset	The source character set.
encoding	The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL.

Return Values

Table 278-15 TEXT_DECODE Function Return Values

Return	Description
string	A VARCHAR2 decoded text string.

Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
    'Here is some text',
    WE8ISO8859P1,
    UTL_ENCODE.BASE64);
```

278.1.8 TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL.

The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if ENCODING is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_ENCODE (
    buf          IN VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN VARCHAR2 DEFAULT NULL,
    encoding     IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 278-16 TEXT_ENCODE Function Parameters

Parameter	Description
buf	The text data.
encode_charset	The target character set.
encoding	The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL

Return Values

Table 278-17 TEXT_ENCODE Function Return Values

Return	Description
string	A VARCHAR2 encoded string with mime header format tags.

Examples

```
v2:=utl_encode.text_encode(
    'Here is some text',
    'WE8ISO8859P1',
    UTL_ENCODE.BASE64);
```

278.1.9 UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string.

See "[UUENCODE Function](#)" for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

Syntax

```
UTL_ENCODE.UUDECODE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 278-18 UUDECODE Function Parameters

Parameter	Description
r	The RAW string containing the uuencoded data string. There are no defaults or optional parameters.

Return Values

Table 278-19 UUECODE Function Return Values

Return	Description
RAW	The decoded RAW string

278.1.10 UUECODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string.

The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

Syntax

```
UTL_ENCODE.UUECODE (
  r          IN RAW,
  type       IN PLS_INTEGER DEFAULT 1,
  filename   IN VARCHAR2 DEFAULT NULL,
  permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 278-20 UUECODE Function Parameters

Parameter	Description
r	RAW string
type	Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece
filename	Optional varchar2 parameter containing the uuencode filename; the default is uuencode.txt
permission	Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero).

Return Values

Table 278-21 UUECODE Function Return Values

Return	Description
RAW	Contains the uuencode format string

UTL_FILE

With the `UTL_FILE` package, PL/SQL programs can read and write operating system text files. `UTL_FILE` provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Exceptions](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of UTL_FILE Subprograms](#)

279.1 UTL_FILE Security Model

The set of files and directories that are accessible to the user through `UTL_FILE` is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user.

The nature of directory objects is discussed in the *Oracle Database SQL Language Reference*.

Assuming the user has both `READ` and `WRITE` access to the directory object `USER_DIR`, the user can open a file located in the operating system directory described by `USER_DIR`, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

`UTL_FILE` provides file access both on the client side and on the server side. When run on the server, `UTL_FILE` provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, `UTL_FILE` provides access to operating system files that are accessible from the client.

Directory objects offer more flexibility and granular control to the `UTL_FILE` application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. `CREATE ANY DIRECTORY` privilege is granted only to `SYS` and `SYSTEM` by default.

Note:

Use the `CREATE DIRECTORY` feature for directory access verification.

Note that neither hard nor symbolic links are supported.

On UNIX systems, the owner of a file created by the `FOPEN` function is the owner of the shadow process running the instance. Normally, this owner is `ORACLE`. Files created using `FOPEN` are always writable and readable using the `UTL_FILE` subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

 **WARNING:**

The privileges needed to access files in a directory object are operating system specific. `UTL_FILE` directory object privileges give you read and write access to all files within the specified directory.

279.2 UTL_FILE Operational Notes

Keep these notes in mind when using `UTL_FILE`.

The file location and file name parameters are supplied to the `FOPEN` function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an `ALL_DIRECTORIES` object.

`UTL_FILE` implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a `GET_LINE` call. For example, the `len` parameter of `UTL_FILE.GET_LINE` specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The `GET_LINE len` parameter, or
- The number of bytes until the next line terminator character, or
- The `max_linesize` parameter specified by `UTL_FILE.FOPEN`

The `FOPEN max_linesize` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The `GET_LINE len` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of `max_linesize`. If `max_linesize` and `len` are defined to be different values, then the lesser value takes precedence.

`UTL_FILE.GET_RAW` ignores line terminators.

`UTL_FILE` expects that files opened by `UTL_FILE.FOPEN` in text mode are encoded in the database character set. It expects that files opened by `UTL_FILE.FOPEN_NCHAR` in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of `NLS_LANG`) that it is encoded in another character set, the result is indeterminate. If `NLS_LANG` is set, it should therefore be the same as the database character set.

279.3 UTL_FILE Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

Note:

The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

279.4 UTL_FILE Exceptions

This table describes exceptions raised by UTL_FILE subprograms.

Table 279-1 UTL_FILE Package Exceptions

Exception Name	Description
INVALID_PATH	File location is invalid.
INVALID_MODE	The open_mode parameter in FOPEN is invalid.
INVALID_FILEHANDLE	File handle is invalid.
INVALID_OPERATION	File could not be opened or operated on as requested.
READ_ERROR	Destination buffer too small, or operating system error occurred during the read operation
WRITE_ERROR	Operating system error occurred during the write operation.
INTERNAL_ERROR	Unspecified PL/SQL error
CHARSETMISMATCH	A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.
FILE_OPEN	The requested operation failed because the file is open.
INVALID_MAXLINESIZE	The MAX_LINESIZE value for FOPEN () is invalid; it should be within the range 1 to 32767.
INVALID_FILENAME	The filename parameter is invalid.
ACCESS_DENIED	Permission to access to the file location is denied.
INVALID_OFFSET	Causes of the INVALID_OFFSET exception: <ul style="list-style-type: none"> • ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or • ABSOLUTE_OFFSET < 0, or • Either offset caused a seek past the end of the file

Table 279-1 (Cont.) UTL_FILE Package Exceptions

Exception Name	Description
DELETE_FAILED	The requested file delete operation failed.
RENAME_FAILED	The requested file rename operation failed.

Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.

279.5 UTL_FILE Examples

These two examples show use of the procedure.

Example 1

Note:

The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

File Location	Filename	READ and WRITE
/appl/gl/log	L12345.log	Users with DBA privilege
/appl/gl/user	u12345.tmp	All users

The following file locations and filenames are invalid:

File Location	Filename	Invalid Because
/appl/gl/log/backup	L12345.log	# subdirectories are not accessible
/APPL/gl/log	L12345.log	# directory strings must follow case sensitivity rules as required by the O/S
/appl/gl/log	backup/L1234.log	# filenames may not include portions of directory paths

File Location	Filename	Invalid Because
/user/tmp	L12345.log	# no corresponding CREATE DIRECTORY command has been issued

Example 2

```

DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is seen.
  F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R', 256);
  UTL_FILE.GET_LINE(F1, V1, 32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is
  -- seen.
  F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
  UTL_FILE.GET_LINE(F1, V1, 32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, GET_LINE doesn't specify a number of bytes, so it defaults to
  -- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and defaults to
  -- 1024.
  -- So the number of bytes returned will be 1024 or less if a line terminator is
  -- seen.
  F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
  UTL_FILE.GET_LINE(F1, V1);
  UTL_FILE.FCLOSE(F1);
END;

```

279.6 UTL_FILE Data Structures

The UTL_FILE package defines a RECORD type.

Record Types

- [FILETYPE Record Type](#)

279.6.1 FILETYPE Record Type

The contents of FILE_TYPE are private to the UTL_FILE package. You should not reference or change components of this record.

```

TYPE file_type IS RECORD (
  id          BINARY_INTEGER,
  datatype    BINARY_INTEGER,
  byte_mode   BOOLEAN);

```

Fields

Table 279-2 FILE_TYPE Fields

Field	Description
id	A numeric value indicating the internal file handle number
datatype	Indicates whether the file is a CHAR file, Nchar file or other (binary)
byte_mode	Indicates whether the file was open as a binary file, or as a text file

▲ Caution:

Oracle does not guarantee the persistence of `FILE_TYPE` values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have indeterminate outcomes.

279.7 Summary of UTL_FILE Subprograms

This table lists the `UTL_FILE` subprograms and briefly describes them.

Table 279-3 UTL_FILE Subprograms

Subprogram	Description
FCLOSE Procedure	Closes a file
FCLOSE_ALL Procedure	Closes all open file handles
FCOPY Procedure	Copies a contiguous portion of a file to a newly created file
FFLUSH Procedure	Physically writes all pending output to a file
FGETATTR Procedure	Reads and returns the attributes of a disk file
FGETPOS Function	Returns the current relative offset position within a file, in bytes
FOPEN Function	Opens a file for input or output
FOPEN_NCHAR Function	Opens a file in Unicode for input or output
FREMOVE Procedure	Deletes a disk file, assuming that you have sufficient privileges
FRENAME Procedure	Renames an existing file to a new name, similar to the UNIX <code>mv</code> function
FSEEK Procedure	Adjusts the file pointer forward or backward within the file by the number of bytes specified
GET_LINE Procedure	Reads text from an open file
GET_LINE_NCHAR Procedure	Reads text in Unicode from an open file
GET_RAW Procedure	Reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read
IS_OPEN Function	Determines if a file handle refers to an open file

Table 279-3 (Cont.) UTL_FILE Subprograms

Subprogram	Description
NEW_LINE Procedure	Writes one or more operating system-specific line terminators to a file
PUT Procedure	Writes a string to a file
PUT_LINE Procedure	Writes a line to a file, and so appends an operating system-specific line terminator
PUT_LINE_NCHAR Procedure	Writes a Unicode line to a file
PUT_NCHAR Procedure	Writes a Unicode string to a file
PUTF Procedure	A <code>PUT</code> procedure with formatting
PUTF_NCHAR Procedure	A <code>PUT_NCHAR</code> procedure with formatting, and writes a Unicode string to a file, with formatting
PUT_RAW Procedure	Accepts as input a <code>RAW</code> data value and writes the value to the output buffer

279.7.1 FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

```
UTL_FILE.FCLOSE (
    file IN OUT FILE_TYPE);
```

Parameters

Table 279-4 FCLOSE Procedure Parameters

Parameter	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call

Usage Notes

If there is buffered data yet to be written when `FCLOSE` runs, then you may receive a `WRITE_ERROR` exception when closing a file.

Exceptions

```
WRITE_ERROR
INVALID_FILEHANDLE
```

279.7.2 FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

```
UTL_FILE.FCLOSE_ALL;
```

Usage Notes

Note:

`FCLOSE_ALL` does not alter the state of the open file handles held by the user. This means that an `IS_OPEN` test on a file handle after an `FCLOSE_ALL` call still returns `TRUE`, even though the file has been closed. No further read or write operations can be performed on a file that was open before an `FCLOSE_ALL`.

Exceptions

```
WRITE_ERROR
```

279.7.3 FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file.

By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

```
UTL_FILE.FCOPY (
    src_location    IN VARCHAR2,
    src_filename    IN VARCHAR2,
    dest_location   IN VARCHAR2,
    dest_filename   IN VARCHAR2,
    start_line      IN BINARY_INTEGER DEFAULT 1,
    end_line        IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 279-5 FCOPY Procedure Parameters

Parameters	Description
<code>src_location</code>	Directory location of the source file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive)
<code>src_filename</code>	Source file to be copied

Table 279-5 (Cont.) FCOPY Procedure Parameters

Parameters	Description
dest_location	Destination directory where the destination file is created
dest_filename	Destination file created from the source file
start_line	Line number at which to begin copying. The default is 1 for the first line
end_line	Line number at which to stop copying. The default is NULL, signifying end of file

Exceptions

INVALID_FILENAME
 INVALID_PATH
 INVALID_OPERATION
 INVALID_OFFSET
 READ_ERROR
 WRITE_ERROR

279.7.4 FFLUSH Procedure

FFLUSH physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The FFLUSH procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

Syntax

```
UTL_FILE.FFLUSH (
    file IN FILE_TYPE);
```

Parameters

Table 279-6 FFLUSH Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

Exceptions

INVALID_FILENAME
 INVALID_MAXLINESIZE
 INVALID_OPERATION
 WRITE_ERROR

279.7.5 FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```
UTL_FILE.FGETATTR(  
    location    IN VARCHAR2,  
    filename    IN VARCHAR2,  
    fexists     OUT BOOLEAN,  
    file_length OUT NUMBER,  
    block_size  OUT BINARY_INTEGER);
```

Parameters

Table 279-7 FGETATTR Procedure Parameters

Parameters	Description
location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
filename	Name of the file to be examined
fexists	A BOOLEAN for whether or not the file exists
file_length	Length of the file in bytes. NULL if file does not exist.
block_size	File system block size in bytes. NULL if the file does not exist.

Exceptions

```
INVALID_PATH  
INVALID_FILENAME  
INVALID_OPERATION  
READ_ERROR  
ACCESS_DENIED
```

279.7.6 FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```
UTL_FILE.FGETPOS (  
    file IN FILE_TYPE)  
RETURN PLS_INTEGER;
```

Parameters

Table 279-8 FGETPOS Parameters

Parameters	Description
file	Directory location of the source file

Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

READ_ERROR

Usage Notes

If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

279.7.7 FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously.

See also [FOPEN_NCHAR Function](#).

Syntax

```
UTL_FILE.FOPEN (
    location      IN VARCHAR2,
    filename      IN VARCHAR2,
    open_mode     IN VARCHAR2,
    max_linesize  IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

Parameters

Table 279-9 FOPEN Function Parameters

Parameter	Description
location	Directory location of file. This string is a directory object name and must be specified in upper case. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.
filename	File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.

Table 279-9 (Cont.) FOPEN Function Parameters

Parameter	Description
<code>open_mode</code>	<p>Specifies how the file is opened. Modes include:</p> <ul style="list-style-type: none"> • <code>r</code> -- read text • <code>w</code> -- write text • <code>a</code> -- append text • <code>rb</code> -- read byte mode • <code>wb</code> -- write byte mode • <code>ab</code> -- append byte mode <p>If you try to open a file specifying 'a' or 'ab' for <code>open_mode</code> but the file does not exist, the file is created in <code>write</code> mode.</p>
<code>max_linesize</code>	<p>Maximum number of bytes for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.</p>

Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Table 279-10 FOPEN Function Return Values

Return	Description
<code>FILE_TYPE</code>	Handle to open file

Exceptions

- INVALID_MAXILINESIZE
- INVALID_MODE
- INVALID_OPERATION
- INVALID_PATH
- INVALID_FILENAME

Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects.

279.7.8 FOPEN_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. With this function, you can read or write a text file in Unicode instead of in the database character set.

You can have a maximum of 50 files open simultaneously.

Even though the contents of an `NVARCHAR2` buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. `UTL_FILE` converts between UTF8 and AL16UTF16 as necessary.

See also [FOPEN Function](#).

Syntax

```
UTL_FILE.FOPEN_NCHAR (
    location      IN VARCHAR2,
    filename      IN VARCHAR2,
    open_mode     IN VARCHAR2,
    max_linesize  IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

Parameters

Table 279-11 FOPEN_NCHAR Function Parameters

Parameter	Description
location	Directory location of file
filename	File name (including extension)
open_mode	Open mode (r,w,a,rb,wb,ab)
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767)

Return Values

`FOPEN_NCHAR` returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the `UTL_FILE` package, and individual components should not be referenced or changed by the `UTL_FILE` user.

Table 279-12 FOPEN_NCHAR Function Return Values

Return	Description
FILE_TYPE	Handle to open file

Exceptions

```
INVALID_MAXILINESIZE
INVALID_MODE
INVALID_OPERATION
```

INVALID_PATH

279.7.9 FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

```
UTL_FILE.FREMOVE (  
    location IN VARCHAR2,  
    filename IN VARCHAR2);
```

Parameters

Table 279-13 FREMOVE Procedure Parameters

Parameters	Description
location	Directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive)
filename	Name of the file to be deleted

Exceptions

ACCESS_DENIED

DELETE_FAILED

INVALID_FILENAME

INVALID_OPERATION

INVALID_PATH

Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

279.7.10 FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX mv function.

Syntax

```
UTL_FILE.FRENAME (  
    src_location    IN    VARCHAR2,  
    src_filename    IN    VARCHAR2,  
    dest_location   IN    VARCHAR2,  
    dest_filename   IN    VARCHAR2,  
    overwrite       IN    BOOLEAN DEFAULT FALSE);
```

Parameters

Table 279-14 FRENAME Procedure Parameters

Parameters	Description
src_location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
src_filename	Source file to be renamed
dest_location	Destination directory of the destination file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
dest_filename	New name of the file
overwrite	Default is FALSE. Permission on both the source and destination directories must be granted. You can use the overwrite parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is FALSE for no overwrite.

Exceptions

ACCESS_DENIED
INVALID_FILENAME
INVALID_PATH
RENAME_FAILED

279.7.11 FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

Syntax

```
UTL_FILE.FSEEK (
    file           IN OUT  UTL_FILE.FILE_TYPE,
    absolute_offset IN      PL_INTEGER DEFAULT NULL,
    relative_offset IN      PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 279-15 FSEEK Procedure Parameters

Parameters	Description
file	File handle
absolute_offset	Absolute location to which to seek; default = NULL
relative_offset	Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL

Exceptions

INVALID_FILEHANDLE

```
INVALID_OFFSET
INVALID_OPERATION
READ_ERROR
```

Usage Notes

- Using `FSEEK`, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If `relative_offset`, the procedure seeks forward. If `relative_offset > 0`, or backward, if `relative_offset < 0`, the procedure seeks through the file by the number of `relative_offset` bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an `INVALID_OFFSET` error is raised.
- If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

279.7.12 GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the file, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

Syntax

```
UTL_FILE.GET_LINE (
    file          IN FILE_TYPE,
    buffer        OUT VARCHAR2,
    len           IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 279-16 GET_LINE Procedure Parameters

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> call. The file must be open for reading (mode <code>r</code>); otherwise an <code>INVALID_OPERATION</code> exception is raised.
<code>buffer</code>	Data buffer to receive the line read from the file
<code>len</code>	The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> .

Exceptions

```
INVALID_FILEHANDLE
```

```
INVALID_OPERATION
NO_DATA_FOUND
READ_ERROR
```

Usage Notes

If the line does not fit in the buffer, a `READ_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. See also "[GET_LINE_NCHAR Procedure](#)".

279.7.13 GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype, such as `NCHAR`, `NCLOB`, or `VARCHAR2` is specified, PL/SQL will perform standard implicit conversion from `NVARCHAR2` after the text is read.

See also [GET_LINE Procedure](#)

Syntax

```
UTL_FILE.GET_LINE_NCHAR (
    file          IN FILE_TYPE,
    buffer        OUT NVARCHAR2,
    len           IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 279-17 GET_LINE_NCHAR Procedure Parameters

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for reading (mode <code>r</code>). If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.
<code>buffer</code>	Data buffer to receive the line read from the file
<code>len</code>	The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> .

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
```

NO_DATA_FOUND

READ_ERROR

279.7.14 GET_RAW Procedure

This procedure reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL_FILE.GET_RAW ignores line terminators.

Syntax

```

UTL_FILE.GET_RAW (
    file      IN          UTL_FILE.FILE_TYPE,
    buffer    OUT NOCOPY RAW,
    len       IN          PLS_INTEGER DEFAULT NULL);

```

Parameters

Table 279-18 GET_RAW Procedure Parameters

Parameters	Description
file	File handle
buffer	RAW data
len	The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

LENGTH_MISMATCH

NO_DATA_FOUND

READ_ERROR

Usage Notes

The subprogram will raise `No_Data_Found` when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```

PROCEDURE Sys.p (n IN VARCHAR2) IS
    h      UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
    Buf    RAW(32767);
    Amnt   CONSTANT PLS_INTEGER := 32767;
BEGIN
    LOOP
        BEGIN
            Utl_File.Get_Raw(h, Buf, Amnt);
            -- Do something with this chunk
        EXCEPTION WHEN No_Data_Found THEN EXIT; END;
    END LOOP;
    UTL_FILE.FCLOSE (h);
END;

```

279.7.15 IS_OPEN Function

This function tests a file handle to see if it identifies an open file.

IS_OPEN reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

```
UTL_FILE.IS_OPEN (  
    file IN FILE_TYPE)  
    RETURN BOOLEAN;
```

Parameters

Table 279-19 IS_OPEN Function Parameters

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

Return Values

TRUE or FALSE

Exceptions

INVALID_FILEHANDLE

279.7.16 NEW_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle.

This procedure is separate from PUT because the line terminator is a platform-specific character or sequence of characters.

Syntax

```
UTL_FILE.NEW_LINE (  
    file IN FILE_TYPE,  
    lines IN BINARY_INTEGER := 1);
```

Parameters

Table 279-20 NEW_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call
lines	Number of line terminators to be written to the file

Exceptions

INVALID_FILEHANDLE
 INVALID_OPERATION
 WRITE_ERROR

279.7.17 PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle.

The file must be open for write operations. No line terminator is appended by PUT; use NEW_LINE to terminate the line or use PUT_LINE to write a complete line with a line terminator. See also "[PUT_NCHAR Procedure](#)".

Syntax

```
UTL_FILE.PUT (
    file      IN FILE_TYPE,
    buffer    IN VARCHAR2);
```

Parameters**Table 279-21 PUT Procedure Parameters**

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

INVALID_FILEHANDLE
 INVALID_OPERATION
 WRITE_ERROR

279.7.18 PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

The file must be open for write operations. PUT_LINE terminates the line with the platform-specific line terminator character or characters.

See also "[PUT_LINE_NCHAR Procedure](#)".

Syntax

```
UTL_FILE.PUT_LINE (  
    file      IN FILE_TYPE,  
    buffer    IN VARCHAR2,  
    autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 279-22 PUT_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN call
buffer	Text buffer that contains the lines to be written to the file
autoflush	Flushes the buffer to disk after the WRITE

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

279.7.19 PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set.

This procedure is equivalent to the [PUT_NCHAR Procedure](#), except that the line separator is appended to the written text. See also [PUT_LINE Procedure](#).

Syntax

```
UTL_FILE.PUT_LINE_NCHAR (  
    file      IN FILE_TYPE,  
    buffer    IN NVARCHAR2);
```

Parameters

Table 279-23 PUT_LINE_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.
buffer	Text buffer that contains the lines to be written to the file

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

279.7.20 PUT_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before writing the text.

Syntax

```
UTL_FILE.PUT_NCHAR (
    file      IN FILE_TYPE,
    buffer    IN NVARCHAR2);
```

Parameters

Table 279-24 PUT_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.

Table 279-24 (Cont.) PUT_NCHAR Procedure Parameters

Parameters	Description
<code>buffer</code>	Buffer that contains the text to be written to the file. User must have opened the file using mode <code>w</code> or mode <code>a</code> ; otherwise, an <code>INVALID_OPERATION</code> exception is raised.

Exceptions`INVALID_FILEHANDLE``INVALID_OPERATION``WRITE_ERROR`**Usage Notes**

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

Related Topics

- [PUT Procedure](#)
`PUT` writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

279.7.21 PUTF Procedure

This procedure is a formatted `PUT` procedure.

It works like a limited `printf()`.

Syntax

```
UTL_FILE.PUTF (
    file      IN FILE_TYPE,
    format    IN VARCHAR2,
    [arg1     IN VARCHAR2 DEFAULT NULL,
    . . .
    arg5      IN VARCHAR2 DEFAULT NULL]);
```

Parameters**Table 279-25 PUTF Procedure Parameters**

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> call
<code>format</code>	Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code>

Table 279-25 (Cont.) PUTF Procedure Parameters

Parameters	Description
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

Usage Notes

- If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
- The format string can contain any text, but the character sequences %s and \n have special meaning.

Character Sequence	Meaning
%s	Substitute this sequence with the string value of the next argument in the argument list.
\n	Substitute with the appropriate platform-specific line terminator.

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR

Examples

The following example writes the lines:

```
Hello, world!
I come from Zork with greetings for all earthlings.

my_world varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
      my_world,
      'greetings for all earthlings');
```

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.

Related Topics

- [PUTF_NCHAR Procedure](#)
This procedure is a formatted version of a PUT_NCHAR Procedure.

279.7.22 PUTF_NCHAR Procedure

This procedure is a formatted version of a PUT_NCHAR Procedure.

Using `PUTF_NCHAR`, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements `\n` and `%s`, and up to five arguments to be substituted for consecutive instances of `%s` in the format string. The expected datatype of the format string and the arguments is `NVARCHAR2`.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

Syntax

```
UTL_FILE.PUTF_NCHAR (
    file      IN FILE_TYPE,
    format    IN NVARCHAR2,
    [arg1     IN NVARCHAR2  DEFAULT NULL,
    . . .
    arg5      IN NVARCHAR2  DEFAULT NULL]);
```

Parameters

Table 279-26 PUTF_NCHAR Procedure Parameters

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for reading (mode <code>r</code>). If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.
<code>format</code>	Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code>
<code>arg1..arg5</code>	From one to five operational argument strings. Argument strings are substituted, in order, for the <code>%s</code> formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each <code>%s</code> for which there is no argument.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

Related Topics

- [PUT_NCHAR Procedure](#)
This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

279.7.23 PUT_RAW Procedure

This procedure accepts as input a `RAW` data value and writes the value to the output buffer.

Syntax

```
UTL_FILE.PUT_RAW (  
    file           IN      UTL_FILE.FILE_TYPE,  
    buffer         IN      RAW,  
    autoflush      IN      BOOLEAN DEFAULT FALSE);
```

Parameters

Table 279-27 PUT_RAW Procedure Parameters

Parameters	Description
<code>file</code>	File handle
<code>buffer</code>	The <code>RAW</code> data written to the buffer
<code>autoflush</code>	If <code>TRUE</code> , then performs a flush after writing the value to the output buffer; default is <code>FALSE</code> .

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to `TRUE`.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

UTL_HTTP

The `UTL_HTTP` package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet which can be created by `orapki` utility. Non-HTTPS fetches do not require an Oracle wallet.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Examples](#)
- [Data Structures](#)
- [Operations](#)
- [Subprogram Groups](#)
- [Summary of UTL_HTTP Subprograms](#)

See Also:

- [UTL_URL](#)
- [UTL_SMTP](#)
- *Oracle Database Enterprise User Security Administrator's Guide* for more information on Wallet Manager

280.1 UTL_HTTP Overview

With the `UTL_HTTP` package, you can write PL/SQL programs that communicate with Web (HTTP) servers. `UTL_HTTP` also contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

280.2 UTL_HTTP Security Model

This package is an invoker's rights package. The invoking user will need the `connect` privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the `use-client-certificates` or the `use-passwords` privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

Note:

For more information about managing fine-grained access, see *Oracle Database Security Guide*

280.3 UTL_HTTP Constants

The `UTL_HTTP` package defines several constants to use when specifying parameter values.

These are shown in following tables.

- [Table 280-1](#)
- [Table 280-2](#)
- [Table 280-3](#)

Table 280-1 UTL_HTTP Constants - HTTP Versions

Name	Type	Value	Description
HTTP_VERSION_1_0	VARCHAR2(10)	'HTTP/1.0'	Denotes HTTP version 1.0 that can be used in the function <code>BEGIN_REQUEST</code> .
HTTP_VERSION_1_1	VARCHAR2(10)	'HTTP/1.1'	Denotes HTTP version 1.1 that can be used in the function <code>BEGIN_REQUEST</code> .

Table 280-2 UTL_HTTP Constants - Default Ports

Name	Type	Value	Description
DEFAULT_HTTP_PORT	PLS_INTEGER	80	The default TCP/IP port (80) at which a Web server or proxy server listens
DEFAULT_HTTPS_PORT	PLS_INTEGER	443	The default TCP/IP port (443) at which an HTTPS Web server listens

Table 280-3 UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_CONTINUE	PLS_INTEGER	100	The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.
HTTP_SWITCHING_PROTOCOLS	PLS_INTEGER	101	The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.
HTTP_OK	PLS_INTEGER	200	The request has succeeded. The information returned with the response is dependent on the method used in the request
HTTP_CREATED_CONSTANT	PLS_INTEGER	201	The request has been fulfilled and resulted in a new resource being created.
HTTP_ACCEPTED	PLS_INTEGER	202	The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.
HTTP_NON_AUTHORITATIVE_INFO	PLS_INTEGER	203	The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.
HTTP_NO_CONTENT	PLS_INTEGER	204	The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.
HTTP_RESET_CONTENT	PLS_INTEGER	205	The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.
HTTP_PARTIAL_CONTENT	PLS_INTEGER	206	The server has fulfilled the partial GET request for the resource.
HTTP_MULTIPLE_CHOICES	PLS_INTEGER	300	The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.
HTTP_MOVED_PERMANENTLY	PLS_INTEGER	301	The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.
HTTP_FOUND_CONSTANT	PLS_INTEGER	302	The requested resource resides temporarily under a different URI.

Table 280-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_SEE_OTHER	PLS_INTEGER	303	The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.
HTTP_NOT_MODIFIED	PLS_INTEGER	304	If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.
HTTP_USE_PROXY	PLS_INTEGER	305	The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.
HTTP_TEMPORARY_REDIRECT	PLS_INTEGER	307	The requested resource resides temporarily under a different URI.
HTTP_BAD_REQUEST	PLS_INTEGER	400	The request could not be understood by the server due to malformed syntax.
HTTP_UNAUTHORIZED	PLS_INTEGER	401	The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.
HTTP_PAYMENT_REQUIRED	PLS_INTEGER	402	This code is reserved for future use.
HTTP_FORBIDDEN	PLS_INTEGER	403	The server understood the request, but is refusing to fulfill it.
HTTP_NOT_FOUND	PLS_INTEGER	404	The server has not found anything matching the Request-URI.
HTTP_NOT_ACCEPTABLE	PLS_INTEGER	406	The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.
HTTP_PROXY_AUTH_REQUIRED	PLS_INTEGER	407	This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.
HTTP_REQUEST_TIMEOUT	PLS_INTEGER	408	The client did not produce a request within the time that the server was prepared to wait.
HTTP_CONFLICT	PLS_INTEGER	409	The request could not be completed due to a conflict with the current state of the resource.
HTTP_GONE	PLS_INTEGER	410	The requested resource is no longer available at the server and no forwarding address is known.
HTTP_LENGTH_REQUIRED	PLS_INTEGER	411	The server refuses to accept the request without a defined Content-Length.
HTTP_PRECONDITION_FAILED	PLS_INTEGER	412	The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.

Table 280-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_REQUEST_ENTITY_TOO_LARGE_CONSTANT	PLS_INTEGER	413	The server is refusing to process a request because the request entity is larger than the server is willing or able to process.
HTTP_REQUEST_URI_TOO_LARGE	PLS_INTEGER	414	The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.
HTTP_UNSUPPORTED_MEDIA_TYPE	PLS_INTEGER	415	The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.
HTTP_REQUEST_RANGE_NOT_SATISFIABLE	PLS_INTEGER	416	A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.
HTTP_EXPECTATION_FAILED	PLS_INTEGER	417	The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.
HTTP_NOT_IMPLEMENTED	PLS_INTEGER	501	The server does not support the functionality required to fulfill the request.
HTTP_BAD_GATEWAY	PLS_INTEGER	502	The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request.
HTTP_SERVICE_UNAVAILABLE	PLS_INTEGER	503	The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.
HTTP_GATEWAY_TIMEOUT	PLS_INTEGER	504	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.
HTTP_VERSION_NOT_SUPPORTED	PLS_INTEGER	505	The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.

280.4 UTL_HTTP Exceptions

Exceptions indicate that the UTL_HTTP package encountered issues.

The following table lists these exceptions. By default, UTL_HTTP raises the exception `request_failed` when a request fails to execute. If the package is set to raise a detailed exception by `set_detailed_excp_support`, the rest of the exceptions will be raised directly

(except for the exception `end_of_body`, which will be raised by `READ_TEXT`, `READ_LINE`, and `READ_RAW` regardless of the setting).

Table 280-4 UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
<code>BAD_ARGUMENT</code>	29261	The argument passed to the interface is bad	Any HTTP request or response interface when <code>detailed_exception</code> is enabled
<code>BAD_URL</code>	29262	The requested URL is badly formed	<code>BEGIN_REQUEST</code> , when <code>detailed_exception</code> is enabled
<code>END_OF_BODY</code>	29266	The end of HTTP response body is reached	<code>READ_RAW</code> , <code>READ_TEXT</code> , and <code>READ_LINE</code> , when <code>detailed_exception</code> is enabled
<code>HEADER_NOT_FOUND</code>	29265	The header is not found	<code>GET_HEADER</code> , <code>GET_HEADER_BY_NAME</code> , when <code>detailed_exception</code> is enabled
<code>HTTP_CLIENT_ERROR</code>	29268	From <code>GET_RESPONSE</code> , the response status code indicates that a client error has occurred (status code in 4xx range). Or from <code>begin_request</code> , the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.	<code>GET_RESPONSE</code> , <code>BEGIN_REQUEST</code> when <code>detailed_exception</code> is enabled
<code>HTTP_SERVER_ERROR</code>	29269	From <code>GET_RESPONSE</code> , the response status code indicates that a client error has occurred (status code in 5xx range). Or from <code>begin_request</code> , the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.	<code>GET_RESPONSE</code> , <code>BEGIN_REQUEST</code> when <code>detailed_exception</code> is enabled
<code>NETWORK_ACCESS_DENIED</code>	24247	Access to the remote network host or credentials in an Oracle wallet is denied	<code>BEGIN_REQUEST</code> and <code>SET_AUTHENTICATION_FROM_WALLET</code> when <code>detailed_exception</code> is enabled
<code>ILLEGAL_CALL</code>	29267	The call to <code>UTL_HTTP</code> is illegal at the current state of the HTTP request	<code>SET_HEADER</code> , <code>SET_AUTHENTICATION</code> , and <code>SET_PERSISTENT_CONN_SUPPORT</code> , when <code>detailed_exception</code> is enabled
<code>PARTIAL_MULTIBYTE_EXCEPTION</code>	29275	No complete character is read and a partial multibyte character is found at the end of the response body	<code>READ_TEXT</code> and <code>READ_LINE</code> , when <code>detailed_exception</code> is enabled
<code>PROTOCOL_ERROR</code>	29263	An HTTP protocol error occurs when communicating with the Web server	<code>SET_HEADER</code> , <code>GET_RESPONSE</code> , <code>READ_RAW</code> , <code>READ_TEXT</code> , and <code>READ_LINE</code> , when <code>detailed_exception</code> is enabled
<code>REQUEST_FAILED</code>	29273	The request fails to execute	Any HTTP request or response interface when <code>detailed_exception</code> is disabled
<code>TOO_MANY_REQUESTS</code>	29270	Too many requests or responses are open	<code>BEGIN_REQUEST</code> , when <code>detailed_exception</code> is enabled

Table 280-4 (Cont.) UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
TRANSFER_TIMEOUT	29276	No data is read and a read timeout occurred	READ_TEXT and READ_LINE, when detailed_exception is enabled
UNKNOWN_SCHEME	29264	The scheme of the requested URL is unknown	BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled

 **Note:**

The `partial_multibyte_char` and `transfer_timeout` exceptions are duplicates of the same exceptions defined in `UTL_TCP`. They are defined in this package so that the use of this package does not require the knowledge of the `UTL_TCP`. As those exceptions are duplicates, an exception handle that catches the `partial_multibyte_char` and `transfer_timeout` exceptions in this package also catch the exceptions in the `UTL_TCP`.

For `REQUEST` and `REQUEST_PIECES`, the `request_failed` exception is raised when any exception occurs and `detailed_exception` is disabled.

280.5 UTL_HTTP Examples

These five examples demonstrate how to use `UTL_HTTP`.

- [General Usage](#)
- [Retrieving HTTP Response Headers](#)
- [Handling HTTP Authentication](#)
- [Retrieving and Restoring Cookies](#)
- [Making HTTP Request with Private Wallet and Cookie Table](#)

280.5.1 UTL_HTTP General Usage

This is an general example of `UTL_HTTP` usage.

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req    UTL_HTTP.REQ;
    resp  UTL_HTTP.RESP;
    value VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    LOOP
        UTL_HTTP.READ_LINE(resp, value, TRUE);
```

```

        DBMS_OUTPUT.PUT_LINE(value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
    WHEN UTL_HTTP.END_OF_BODY THEN
        UTL_HTTP.END_RESPONSE(resp);
END;
```

280.5.2 UTL_HTTP Retrieving HTTP Response Headers

This example shows how UTL_HTTP retrieves HTTP response headers.

```

SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req    UTL_HTTP.REQ;
    resp   UTL_HTTP.RESP;
    name   VARCHAR2(256);
    value  VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
    DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;
```

280.5.3 UTL_HTTP Handling HTTP Authentication

This code sample indicates how UTL_HTTP handles HTTP authentication.

```

SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url          IN VARCHAR2,
                                       username    IN VARCHAR2 DEFAULT NULL,
                                       password    IN VARCHAR2 DEFAULT NULL,
                                       realm       IN VARCHAR2 DEFAULT NULL) AS

    req    UTL_HTTP.REQ;
    resp   UTL_HTTP.RESP;
    my_scheme VARCHAR2(256);
    my_realm VARCHAR2(256);
    name    VARCHAR2(256);
    value   VARCHAR2(256);
BEGIN
    -- Turn off checking of status code. We will check it by ourselves.
    UTL_HTTP.SET_RESPONSE_ERROR_CHECK(FALSE);
    req := UTL_HTTP.BEGIN_REQUEST(url);
    IF (username IS NOT NULL) THEN
        UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic
Authen. Scheme
    END IF;
    resp := UTL_HTTP.GET_RESPONSE(req);
    IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
        UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, FALSE);
    END IF;
END;
```

```

        DBMS_OUTPUT.PUT_LINE('Web proxy server is protected.');
```

```

        DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
        for the proxy server.');
```

```

        UTL_HTTP.END_RESPONSE(resp);
        RETURN;
    ELSIF (resp.status_code = UTL_HTTP.HTTP_PROXY_AUTH_REQUIRED) THEN
        UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, TRUE);
        DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected.');
```

```

        DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
        for the Web page.');
```

```

        UTL_HTTP.END_RESPONSE(resp);
        RETURN;
    END IF;
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;
```

280.5.4 UTL_HTTP Handling HTTP Digest Authentication

This code sample indicates how UTL_HTTP handles HTTP digest authentication.

```

declare
    url varchar2(32767);
    q utl_http.req;
    p utl_http.resp;
    pstatus pls_integer;
begin
    url := 'http://slc10tzv.us.oracle.com:3000/digest.html';
    q := utl_http.begin_request(url);
    utl_http.set_authentication(q,
                                username => 'utlhttp_user',
                                password => 'welcome',
                                scheme   => 'Digest');
    p := utl_http.get_response(q);
    pstatus := p.status_code;

    -- status code returned from get_response should be 200
    dbms_output.put_line('-- response status: ' || p.status_code);
    utl_http.end_response(p);
    utl_http.end_request(q);
EXCEPTION WHEN OTHERS THEN
    utl_http.end_request(q);
end;
/
-- response status: 200"
```

280.5.5 UTL_HTTP Retrieving and Restoring Cookies

This example show how UTL_HTTP can be used to retrieve and restore cookies.

```

CREATE TABLE my_cookies (
    session_id INTEGER,
    name       VARCHAR2(256),
    value      VARCHAR2(1024),
    domain     VARCHAR2(256),
```

```
        expire      DATE,
        path        VARCHAR2(1024),
        secure      VARCHAR2(1),
        version     INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
    cookies          UTL_HTTP.COOKIE_TABLE;
    my_session_id    PLS_INTEGER;
    secure           VARCHAR2(1);
BEGIN
    /* assume that some cookies have been set in previous HTTP requests. */
    UTL_HTTP.GET_COOKIES(cookies);
    SELECT session_id.nextval INTO my_session_id FROM DUAL;
    FOR i in 1..cookies.count LOOP
        IF (cookies(i).secure) THEN
            secure := 'Y';
        ELSE
            secure := 'N';
        END IF;
        INSERT INTO my_cookies
        VALUES (my_session_id, cookies(i).name, cookies(i).value,
                cookies(i).domain,
                cookies(i).expire, cookies(i).path, secure, cookies(i).version);
    END LOOP;
    RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER)
AS
    cookies          UTL_HTTP.COOKIE_TABLE;
    cookie           UTL_HTTP.COOKIE;
    i                PLS_INTEGER := 0;
    CURSOR c (c_session_id PLS_INTEGER) IS
        SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
    FOR r IN c(this_session_id) LOOP
        i := i + 1;
        cookie.name      := r.name;
        cookie.value     := r.value;
        cookie.domain    := r.domain;
        cookie.expire    := r.expire;
        cookie.path      := r.path;
        IF (r.secure = 'Y') THEN
            cookie.secure := TRUE;
        ELSE
            cookie.secure := FALSE;
        END IF;
        cookie.version := r.version;
        cookies(i) := cookie;
    END LOOP;
    UTL_HTTP.CLEAR_COOKIES;
    UTL_HTTP.ADD_COOKIES(cookies);
END;
/
```

280.5.6 UTL_HTTP Making HTTP Request with Private Wallet and Cookie Table

This example shows how UTL_HTTP creates a request context with a wallet and cookie table, then makes an HTTP Request using that wallet and cookie table.

```
SET SERVEROUTPUT ON SIZE 40000

CREATE OR REPLACE PROCEDURE DISPLAY_PAGE(url IN VARCHAR2) AS
  request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
  req             UTL_HTTP.REQ;
  resp           UTL_HTTP.RESP;
  data           VARCHAR2(1024);

BEGIN

  -- Create a request context with its wallet and cookie table
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
    wallet_path      => 'file:/oracle/wallets/test/wallet',
    wallet_password  => '*****',
    enable_cookies   => TRUE,
    max_cookies      => 300,
    max_cookies_per_site => 20);

  -- Make a HTTP request using the private wallet and cookie
  -- table in the request context
  req := UTL_HTTP.BEGIN_REQUEST(
    url              => url,
    request_context => request_context);
  resp := UTL_HTTP.GET_RESPONSE(req);

  BEGIN
    LOOP
      UTL_HTTP.READ_TEXT(resp, data);
      DBMS_OUTPUT.PUT(data);
    END LOOP;
  EXCEPTION
    WHEN UTL_HTTP.END_OF_BODY THEN
      UTL_HTTP.END_RESPONSE(resp);
  END;

  -- Destroy the request context
  UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);

END;

BEGIN
  DISPLAY_PAGE('https://www.example.com/');
END;
/
```

280.5.7 UTL_HTTP Using a Proxy Server

This example shows using a proxy server for an Oracle Database connection.

The `UTL_HTTP.REQUEST` procedure uses the proxy server host name and the port number to access the HTTPS URL from within the Oracle Database.

```
SELECT UTL_HTTP.REQUEST('<URL>',  
'<proxy_hostname>:<proxy_port_number>', '<wallet_directory>',  
'<wallet_password>') FROM DUAL;
```

Note:

By default, the `UTL_HTTP.REQUEST` procedure enables you to omit or set the "proxy" argument as `NULL`.

280.6 UTL_HTTP Data Structures

Data structures are used to represent requests, responses, cookies, connections, and request context.

- [REQ Type](#)
- [RESP Type](#)
- [COOKIE and COOKIE_TABLE Types](#)
- [CONNECTION Type](#)
- [REQUEST_CONTEXT_KEY Type](#)

280.6.1 REQ Type

Use this PL/SQL record type to represent an HTTP request.

Syntax

```
TYPE req IS RECORD (  
    url          VARCHAR2(32767),  
    method      VARCHAR2(64),  
    http_version VARCHAR2(64));
```

Parameters

Table 280-5 REQ Type Parameters

Parameter	Description
<code>url</code>	The URL of the HTTP request. It is set after the request is created by <code>BEGIN_REQUEST</code> .
<code>method</code>	The method to be performed on the resource identified by the URL. It is set after the request is created by <code>BEGIN_REQUEST</code> .

Table 280-5 (Cont.) REQ Type Parameters

Parameter	Description
<code>http_version</code>	The HTTP protocol version used to send the request. It is set after the request is created by <code>BEGIN_REQUEST</code> .

Usage Notes

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

280.6.2 REQUEST_CONTEXT_KEY Type

This type is used to represent the key to a request context.

A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

Syntax

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

Usage Notes

To provide enhanced security, `UTL_HTTP` allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

280.6.3 RESP Type

This PL/SQL record type is used to represent an HTTP response.

Syntax

```
TYPE resp IS RECORD (  
    status_code    PLS_INTEGER,  
    reason_phrase  VARCHAR2(256),  
    http_version   VARCHAR2(64));
```

Parameters

Table 280-6 RESP Type Parameters

Parameter	Description
status_code	The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
reason_phrase	The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
http_version	The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE.

Usage Notes

The information returned in `RESP` from the interface `GET_RESPONSE` is read-only. There are other fields in the `RESP` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

280.6.4 COOKIE and COOKIE_TABLE Types

The `COOKIE` type is the PL/SQL record type that represents an HTTP cookie. The `COOKIE_TABLE` type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

Syntax

```
TYPE cookie IS RECORD (
    name  VARCHAR2(256),
    value VARCHAR2(1024),
    domain VARCHAR2(256),
    expire TIMESTAMP WITH TIME ZONE,
    path  VARCHAR2(1024),
    secure BOOLEAN,
    version PLS_INTEGER,
    comment VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

Fields of COOKIE Record Type

[Table 280-7](#) shows the fields for the `COOKIE` and `COOKIE_TABLE` record types.

Table 280-7 Fields of COOKIE and COOKIE_TABLE Type

Field	Description
name	The name of the HTTP cookie
value	The value of the cookie

Table 280-7 (Cont.) Fields of COOKIE and COOKIE_TABLE Type

Field	Description
domain	The domain for which the cookie is valid
expire	The time by which the cookie will expire
path	The subset of URLs to which the cookie applies
secure	Should the cookie be returned to the Web server using secured means only.
version	The version of the HTTP cookie specification the cookie conforms. This field is <code>NULL</code> for Netscape cookies.
comment	The comment that describes the intended use of the cookie. This field is <code>NULL</code> for Netscape cookies.

Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the `UTL_HTTP` package. The cookies are maintained by the package transparently. They are maintained inside the `UTL_HTTP` package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using `GET_COOKIES`, store them persistently in a database table, and re-store the cookies back in the package using `ADD_COOKIES` in the next database session. All the fields in the `cookie` record, except for the `comment` field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "[Retrieving and Restoring Cookies](#)".

280.6.5 CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. `connection_table` is a PL/SQL table of `connection`.

For a direct HTTP persistent connection to a Web server, the `host` and `port` fields contain the host name and TCP/IP port number of the Web server. The `proxy_host` and `proxy_port` fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the `proxy_host` and `proxy_port` fields contain the host name and TCP/IP port number of the proxy server. The `host` and `port` fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The `SSL` field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the `host` and `port` fields contain the host name and TCP/IP port number of the target HTTPS Web server and the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

Syntax

```
TYPE connection IS RECORD (  
    host VARCHAR2(256),  
    port PLS_INTEGER,  
    proxy_host VARCHAR2(256),  
    proxy_port PLS_INTEGER,  
    ssl BOOLEAN);
```

```
TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

280.7 UTL_HTTP Operations

These topics provide information about how UTL_HTTP makes HTTP requests from SQL and PL/SQL.

- [Operational Flow](#)
- [Simple HTTP Fetches](#)
- [HTTP Requests](#)
- [HTTP Responses](#)
- [HTTP Persistent Connections](#)
- [Error Conditions](#)
- [Session Settings](#)
- [Request Context](#)
- [External Password Store](#)

280.7.1 UTL_HTTP Operational Flow

The UTL_HTTP package provides access to the HTTP protocol.

The interfaces must be called in the order shown in the following illustration, or an exception will be raised.

Figure 280-1 Flow of the Core UTL_HTTP Package

illustration: arpls006
release: 9
caption: The flow of the core UTL_HTTP Package API
date: 9/5/01
platform: pc

The following can be called at any time:

- **Non-protocol interfaces that manipulate cookies**
 - GET_COOKIE_COUNT
 - GET_COOKIES
 - ADD_COOKIES
 - CLEAR_COOKIES
- **Persistent connections**
 - GET_PERSISTENT_CONN_COUNT
 - GET_PERSISTENT_CONNS
 - CLOSE_PERSISTENT_CONN
 - CLOSE_PERSISTENT_CONNS
- **Interfaces that manipulate attributes and configurations of the UTL_HTTP package in the current session**
 - SET_PROXY
 - GET_PROXY
 - SET_COOKIE_SUPPORT
 - GET_COOKIE_SUPPORT
 - SET_FOLLOW_REDIRECT
 - GET_FOLLOW_REDIRECT
 - SET_BODY_CHARSET
 - GET_BODY_CHARSET
 - SET_PERSISTENT_CONN_SUPPORT
 - GET_PERSISTENT_CONN_SUPPORT
 - SET_DETAILED_EXCP_SUPPORT
 - GET_DETAILED_EXCP_SUPPORT
 - SET_WALLET
 - SET_TRANSFER_TIMEOUT
 - GET_TRANSFER_TIMEOUT
- **Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session**
 - GET_DETAILED_SQLCODE
 - GET_DETAILED_SQLERRM

 **Note:**

Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

280.7.2 UTL_HTTP Simple HTTP Fetches

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect `REQUEST` or `REQUEST_PIECES` to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If `REQUEST` or `REQUEST_PIECES` fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each `REQUEST` or `REQUEST_PIECES` call using the optional `proxy` parameter.

 **Note:**

`UTL_HTTP` can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable `http_proxy` to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable `no_proxy` to a domain name does not use the HTTP proxy server for URLs in that domain. When the `UTL_HTTP` package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

[Simple HTTP Fetches in a Single Call Subprograms](#)

280.7.3 UTL_HTTP HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-

connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

**See Also:**

[HTTP Requests Subprograms](#)

280.7.4 UTL_HTTP HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET_RESPONSE and receive response information from the Web server.

When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

**See Also:**

[HTTP Responses Subprograms](#)

280.7.5 UTL_HTTP HTTP Cookies

The UTL_HTTP package provides subprograms to manipulate HTTP cookies.

**See Also:**

[HTTP Cookies Subprograms](#)

280.7.6 UTL_HTTP HTTP Persistent Connections

The UTL_HTTP package provides subprograms to manipulate persistent connections.

**See Also:**

[HTTP Persistent Connections Subprograms](#)

280.7.7 UTL_HTTP Error Conditions

The `UTL_HTTP` package provides subprograms to retrieve error information.

See Also:

[Error Conditions Subprograms](#)

280.7.8 UTL_HTTP Session Settings

Session settings manipulate the configuration and default behavior of `UTL_HTTP` when HTTP requests are executed within a database user session.

When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

See Also:

[Session Settings Subprograms](#)

280.7.9 UTL_HTTP Request Context

The `UTL_HTTP` package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

See Also:

[HTTP Requests Subprograms](#)

280.7.10 UTL_HTTP External Password Store

The `UTL_HTTP` package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage

for passwords and frees the application developers from the need to maintain their own storage.

[SET_AUTHENTICATION_FROM_WALLET Procedure](#)

280.8 UTL_HTTP Subprogram Groups

This section describes the `UTL_HTTP` subprograms. They are grouped by function.

- [Simple HTTP Fetches in a Single Call Subprograms](#)
- [Session Settings Subprograms](#)
- [HTTP Requests Subprograms](#)
- [HTTP Request Contexts Subprograms](#)
- [HTTP Responses Subprograms](#)
- [HTTP Cookies Subprograms](#)
- [HTTP Persistent Connections Subprograms](#)
- [Error Conditions Subprograms](#)

280.8.1 UTL_HTTP Simple HTTP Fetches in a Single Call Subprograms

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

Table 280-8 UTL_HTTP Subprograms—Simple HTTP Fetches in a Single Call

Subprogram	Description
REQUEST Function	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.
REQUEST_PIECES Function	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.

280.8.2 UTL_HTTP Session Settings Subprograms

This table lists and briefly describes the `UTL_HTTP` Session Settings Subprograms.

Table 280-9 UTL_HTTP Subprograms—Session Settings

Subprogram	Description
GET_BODY_CHARSET Procedure	Retrieves the default character set of the body of all future HTTP requests
GET_COOKIE_SUPPORT Procedure	Retrieves the current cookie support settings

Table 280-9 (Cont.) UTL_HTTP Subprograms—Session Settings

Subprogram	Description
GET_DETAILED_EXCP_SUPPORT Procedure	Checks if the UTL_HTTP package will raise a detailed exception or not
GET_FOLLOW_REDIRECT Procedure	Retrieves the follow-redirect setting in the current session
GET_PERSISTENT_CONN_SUPPORT Procedure	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session
GET_PROXY Procedure	Retrieves the current proxy settings
GET_RESPONSE_ERROR_CHECK Procedure	Checks if the response error check is set or not
GET_TRANSFER_TIMEOUT Procedure	Retrieves the current network transfer timeout value
SET_TRANSFER_TIMEOUT Procedure	Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header
SET_COOKIE_SUPPORT Procedures	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session
SET_DETAILED_EXCP_SUPPORT Procedure	Sets the UTL_HTTP package to raise a detailed exception
SET_FOLLOW_REDIRECT Procedures	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the <code>GET_RESPONSE</code> function
SET_PERSISTENT_CONN_SUPPORT Procedure	Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session
SET_PROXY Procedure	Sets the proxy to be used for requests of HTTP or other protocols
SET_RESPONSE_ERROR_CHECK Procedure	Sets whether or not <code>GET_RESPONSE</code> raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges
SET_TRANSFER_TIMEOUT Procedure	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server
SET_WALLET Procedure	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS

280.8.3 UTL_HTTP HTTP Requests Subprograms

This table lists and briefly describes the UTL_HTTP HTTP Requests.

Table 280-10 UTL_HTTP Subprograms—HTTP Requests

Subprogram	Description
BEGIN_REQUEST Function	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.
SET_HEADER Procedure	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

Table 280-10 (Cont.) UTL_HTTP Subprograms—HTTP Requests

Subprogram	Description
SET_AUTHENTICATION Procedure	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.
SET_AUTHENTICATION_FROM_WALLET Procedure	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.
SET_BODY_CHARSET Procedures	Sets the character set of the request body when the media type is text but the character set is not specified in the Content-Type header
SET_COOKIE_SUPPORT Procedures	Enables or disables support for the HTTP cookies in the request
SET_FOLLOW_REDIRECT Procedures	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE Function
SET_PERSISTENT_CONN_SUPPORT Procedure	Enables or disables support for the HTTP 1.1 persistent-connection in the request
SET_PROXY Procedure	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP)
WRITE_RAW Procedure	Writes some binary data in the HTTP request body
WRITE_TEXT Procedure	Writes some text data in the HTTP request body

280.8.4 UTL_HTTP HTTP Request Contexts Subprograms

UTL_HTTP HTTP Request Contexts subprograms create or destroy a request context.

The following table lists and briefly describes the UTL_HTTP HTTP Request Contexts.

Table 280-11 UTL_HTTP Subprograms—HTTP Request Contexts

Subprogram	Description
CREATE_REQUEST_CONTEXT Function	Creates a request context in UTL_HTTP for a wallet and a cookie table
DESTROY_REQUEST_CONTEXT Procedure	Destroys a request context in UTL_HTTP

280.8.5 UTL_HTTP HTTP Responses Subprograms

This table lists and briefly describes the HTTP Responses Subprograms of UTL_HTTP.

Table 280-12 UTL_HTTP Subprograms—HTTP Responses

Subprogram	Description
END_RESPONSE Procedure	Ends the HTTP response. It completes the HTTP request and response.
GET_AUTHENTICATION Procedure	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header

Table 280-12 (Cont.) UTL_HTTP Subprograms—HTTP Responses

Subprogram	Description
GET_HEADER Procedure	Returns the n th HTTP response header name and value returned in the response
GET_HEADER_BY_NAME Procedure	Returns the HTTP response header value returned in the response given the name of the header
GET_HEADER_COUNT Function	Returns the number of HTTP response headers returned in the response
GET_RESPONSE Function	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.
READ_LINE Procedure	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer
READ_RAW Procedure	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer
READ_TEXT Procedure	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer
SET_BODY_CHARSET Procedures	Sets the character set of the response body when the media type is "text" but the character set is not specified in the <code>Content-Type</code> header

280.8.6 UTL_HTTP HTTP Cookies Subprograms

The HTTP cookies subprograms manages cookies in the `UTL_HTTP` package.

The following table lists and briefly describes the HTTP cookies subprograms of `UTL_HTTP`.

Table 280-13 UTL_HTTP Subprograms—HTTP Cookies

Subprogram	Description
ADD_COOKIES Procedure	Add the cookies either to a request context or to the <code>UTL_HTTP</code> package's session state
CLEAR_COOKIES Procedure	Clears all the cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session state
GET_COOKIE_COUNT Function	Returns the number of cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session states
GET_COOKIES Function	Returns all the cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session state.

280.8.7 UTL_HTTP HTTP Persistent Connections Subprograms

This table lists and briefly describes the `UTL_HTTP` HTTP Persistent Connections subprograms.

Table 280-14 UTL_HTTP Subprograms—HTTP Persistent Connections

Subprogram	Description
CLOSE_PERSISTENT_CONN Procedure	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session
CLOSE_PERSISTENT_CONNS Procedure	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session
GET_PERSISTENT_CONN_COUNT Function	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers
GET_PERSISTENT_CONNS Procedure	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers

280.8.8 UTL_HTTP Error Conditions Subprograms

This table lists and briefly describes error conditions subprograms of UTL_HTTP .

Table 280-15 UTL_HTTP Subprograms—Error Conditions

Subprogram	Description
GET_DETAILED_SQLCODE Function	Retrieves the detailed SQLCODE of the last exception raised
GET_DETAILED_SQLERRM Function	Retrieves the detailed SQLERRM of the last exception raised

280.9 Summary of UTL_HTTP Subprograms

This table lists the UTL_HTTP subprograms and briefly describes them.

Table 280-16 UTL_HTTP Package Subprograms

Subprogram	Description	Group
ADD_COOKIES Procedure	Add the cookies either to a request context or to the UTL_HTTP package's session state	HTTP Cookies Subprograms
BEGIN_REQUEST Function	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line	HTTP Requests Subprograms
CLEAR_COOKIES Procedure	Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state	HTTP Cookies Subprograms
CLOSE_PERSISTENT_CONN Procedure	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms

Table 280-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
CLOSE_PERSISTENT_CONNECTIONS Procedure	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms
CREATE_REQUEST_CONTEXT Function	Creates a request context in UTL_HTTP for a wallet and a cookie table	HTTP Requests Subprograms
DESTROY_REQUEST_CONTEXT Procedure	Destroys a request context in UTL_HTTP for a wallet and a cookie table	HTTP Requests Subprograms
END_REQUEST Procedure	Ends the HTTP request	HTTP Requests Subprograms
END_RESPONSE Procedure	Ends the HTTP response. It completes the HTTP request and response	HTTP Responses Subprograms
GET_AUTHENTICATION Procedure	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header	HTTP Responses Subprograms
GET_BODY_CHARSET Procedure	Retrieves the default character set of the body of all future HTTP requests	Session Settings Subprograms
GET_COOKIE_COUNT Function	Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms
GET_COOKIE_SUPPORT Procedure	Retrieves the current cookie support settings	Session Settings Subprograms
GET_COOKIES Function	Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms
GET_DETAILED_EXCP_SUPPORT Procedure	Checks if the UTL_HTTP package will raise a detailed exception or not	Session Settings Subprograms
GET_DETAILED_SQLCODE Function	Retrieves the detailed SQLCODE of the last exception raised	Error Conditions Subprograms
GET_DETAILED_SQLERRM Function	Retrieves the detailed SQLERRM of the last exception raised	Error Conditions Subprograms
GET_FOLLOW_REDIRECT Procedure	Retrieves the follow-redirect setting in the current session	Session Settings Subprograms
GET_HEADER Procedure	Returns the n th HTTP response header name and value returned in the response	HTTP Responses Subprograms

Table 280-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_HEADER_BY_NAME Procedure	Returns the HTTP response header value returned in the response given the name of the header	HTTP Responses Subprograms
GET_HEADER_COUNT Function	Returns the number of HTTP response headers returned in the response	HTTP Responses and HTTP Responses Subprograms
GET_PERSISTENT_CONNECTION_COUNT Function	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers	HTTP Persistent Connections Subprograms
GET_HEADER_COUNT Function	Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session	Session Settings Subprograms
GET_PERSISTENT_CONNECTION_SUPPORT Procedure	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see Session Settings Subprograms)	HTTP Persistent Connections Subprograms
GET_PERSISTENT_CONNS Procedure	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers	HTTP Persistent Connections Subprograms
GET_PROXY Procedure	Retrieves the current proxy settings	Session Settings Subprograms
GET_RESPONSE Function	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed	HTTP Responses Subprograms
GET_RESPONSE_ERROR_CHECK Procedure	Checks if the response error check is set or no	Session Settings Subprograms
GET_TRANSFER_TIMEOUT Procedure	Retrieves the current network transfer timeout value	Session Settings Subprograms
READ_LINE Procedure	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer	HTTP Responses Subprograms
READ_RAW Procedure	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms

Table 280-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
READ_TEXT Procedure	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms
REQUEST Function	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.	Simple HTTP Fetches in a Single Call Subprograms
REQUEST_PIECES Function	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL	Simple HTTP Fetches in a Single Call Subprograms
SET_AUTHENTICATION Procedure	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.	HTTP Requests Subprograms
SET_AUTHENTICATION_FROM_WALLET Procedure	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.	HTTP Requests Subprograms
SET_BODY_CHARSET Procedures	Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header	Session Settings Subprograms
SET_BODY_CHARSET Procedures	Sets the character set of the request body when the media type is <code>text</code> but the character set is not specified in the <code>Content-Type</code> header	HTTP Requests Subprograms
SET_BODY_CHARSET Procedures	Sets the character set of the response body when the media type is "text" but the character set is not specified in the <code>Content-Type</code> header	HTTP Responses Subprograms and Session Settings Subprograms
SET_COOKIE_SUPPORT Procedures	Enables or disables support for the HTTP cookies in the request	HTTP Requests Subprograms
SET_DETAILED_EXCP_SUPPORT Procedure	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session	Session Settings Subprograms
SET_DETAILED_EXCP_SUPPORT Procedure	Sets the UTL_HTTP package to raise a detailed exception	Session Settings Subprograms

Table 280-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
SET_FOLLOW_REDIRECT Procedures	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE function	HTTP Requests Subprograms
SET_HEADER Procedure	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function	Session Settings Subprograms
SET_HEADER Procedure	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.	HTTP Requests Subprograms
SET_PERSISTENT_CONN_SUPPORT Procedure	Enables or disables support for the HTTP 1.1 persistent-connection in the request	HTTP Requests Subprograms
SET_PROXY Procedure	Sets the proxy to be used for requests of HTTP or other protocols	Session Settings and Session Settings Subprograms
SET_RESPONSE_ERROR_CHECK Procedure	Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges	Session Settings Subprograms
SET_TRANSFER_TIMEOUT Procedure	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server	Session Settings and Session Settings Subprograms
SET_WALLET Procedure	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS	Session Settings Subprograms
WRITE_LINE Procedure	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF) as defined in UTL_TCP	HTTP Requests Subprograms
WRITE_RAW Procedure	Writes some binary data in the HTTP request body	HTTP Requests Subprograms
WRITE_TEXT Procedure	Writes some text data in the HTTP request body	HTTP Requests Subprograms

280.9.1 ADD_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL_HTTP package's session state.

See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

Syntax

```
UTL_HTTP.ADD_COOKIES (  
    cookies          IN  cookie_table,  
    request_context IN  request_context_key DEFAULT NULL);
```

Parameters

Table 280-17 ADD_COOKIES Procedure Parameters

Parameter	Description
cookies	The cookies to be added
request_context	Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead.

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

280.9.2 BEGIN_REQUEST Function

This function begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request.

The URL may contain the username and password needed to authenticate the request to the server. The format is:

```
scheme://[user[:password]@]host[:port]/[...]
```

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.BEGIN_REQUEST (  
    url          IN  VARCHAR2,
```

```

method          IN  VARCHAR2 DEFAULT 'GET',
http_version    IN  VARCHAR2 DEFAULT NULL,
request_context IN  request_context_key DEFAULT NULL,
https_host      IN  VARCHAR2 DEFAULT NULL)
RETURN req;

```

Parameters

Table 280-18 BEGIN_REQUEST Function Parameters

Parameter	Description
url	The URL of the HTTP request
method	The method performed on the resource identified by the URL
http_version	The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.
request_context	Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is NULL, the wallet and cookie table shared in the current database session will be used instead.
https_host	A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI.

Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the `UTL_URL` package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See [UTL_URL](#) for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- `BEGIN_REQUEST` can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of the [GET_RESPONSE Function](#) will raise the `PROTOCOL_ERROR` exception.

A URL will be long when its `QUERY_STRING` (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the `POST` method.

```

req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r      => req,
                    name   => 'Content-Type',
                    value  => 'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r      => req,
                    name   => 'Content-Length',
                    value  => '<length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r      => req,
                    data   => 'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
      (r      => req);
...

```

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the [SET_WALLET Procedure](#) procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the `use-client-certificates` privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.
- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the `UTL_HTTP` must have the `connect` ACL privilege to the remote Web server host or the proxy host respectively.

280.9.3 CLEAR_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

Syntax

```

UTL_HTTP.CLEAR_COOKIES (
    request_context IN request_context_key DEFAULT NULL);

```

Parameters

Table 280-19 CLEAR_COOKIES Procedure Parameters

Parameter	Description
<code>request_context</code>	Request context to clear the cookies. If <code>NULL</code> , the cookies maintained in the <code>UTL_HTTP</code> package's session state will be cleared instead.

280.9.4 CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session.

See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (  
    conn IN connection);
```

Parameters

Table 280-20 CLOSE_PERSISTENT_CONN Procedure Parameters

Parameter	Description
conn	The HTTP persistent connection to close

280.9.5 CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the `UTL_HTTP` package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters `NULL`. If a particular parameter is set to `NULL` when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the foobar at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',  
                                proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

**See Also:**[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)**Syntax**

```

UTL_HTTP.CLOSE_PERSISTENT_CONNS (
  host          IN VARCHAR2 DEFAULT NULL,
  port          IN PLS_INTEGER DEFAULT NULL,
  proxy_host    IN VARCHAR2 DEFAULT NULL,
  proxy_port    IN PLS_INTEGER DEFAULT NULL,
  ssl           IN BOOLEAN DEFAULT NULL);

```

Parameters**Table 280-21 CLOSE_PERSISTENT_CONNS Procedure Parameters**

Parameter	Description
host	The host for which persistent connections are to be closed
port	The port number for which persistent connections are to be closed
proxy_host	The proxy host for which persistent connections are to be closed
proxy_port	The proxy port for which persistent connections are to be closed
ssl	Close persistent SSL connection

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a NULL value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a NULL value in a parameter to match only a NULL value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the `CLOSE_PERSISTENT_CONN` procedure that closes a specific persistent connection.

280.9.6 CREATE_REQUEST_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

**See Also:**[Request Context](#) and [HTTP Request Contexts Subprograms](#)

Syntax

```
UTL_HTTP.CREATE_REQUEST_CONTEXT (
  wallet_path          IN VARCHAR2 DEFAULT NULL,
  wallet_password     IN VARCHAR2 DEFAULT NULL,
  enable_cookies      IN BOOLEAN  DEFAULT TRUE,
  max_cookies         IN PLS_INTEGER DEFAULT 300,
  max_cookies_per_site IN PLS_INTEGER DEFAULT 20)
RETURN request_context_key;
```

Parameters

Table 280-22 CREATE_REQUEST_CONTEXT Function Parameters

Parameter	Description
wallet_path	Directory path that contains the Oracle wallet. The format is <i>file:directory-path</i>
wallet_password	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See the <i>Oracle Database Enterprise User Security Administrator's Guide</i> for detailed information about wallets.
enable_cookies	Sets whether HTTP requests using this request context should support HTTP cookies or not: TRUE to enable the support, FALSE to disable it.
max_cookies	Sets the maximum total number of cookies that will be maintained in this request context
max_cookies_per_site	Sets the maximum number of cookies per each Web site that will be maintained in this request context

Return Values

The request context created.

Examples

```
DECLARE
  request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
  req            utl_http.req;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
    wallet_path          => 'file:/oracle/wallets/test_wallets',
    wallet_password     => NULL,
    enable_cookies      => TRUE,
    max_cookies         => 300,
    max_cookies_per_site => 20);
  req := UTL_HTTP.BEGIN_REQUEST(
    url                 => 'http://www.example.com/',
    request_context     => request_context);
END;
```

280.9.7 DESTROY_REQUEST_CONTEXT Procedure

This procedure destroys a request context in `UTL_HTTP`. A request context cannot be destroyed when it is in use by a HTTP request or response.

See Also:

[Request Context](#) and [HTTP Request Contexts Subprograms](#)

Syntax

```
UTL_HTTP.DESTROY_REQUEST_CONTEXT (  
    request_context    request_context_key);
```

Parameters

Table 280-23 DESTROY_REQUEST_CONTEXT Procedure Parameters

Parameter	Description
<code>request_context</code>	Request context to destroy

Examples

```
DECLARE  
    request_context    UTL_HTTP.REQUEST_CONTEXT_KEY;  
BEGIN  
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(...);  
    ...  
    UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);  
END;
```

280.9.8 END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.END_REQUEST (  
    r IN OUT NOCOPY req);
```

Parameters

Table 280-24 END_REQUEST Procedure Parameters

Parameter	Description
r	The HTTP request

280.9.9 END_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

**See Also:**

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.END_RESPONSE (  
    r IN OUT NOCOPY resp);
```

Parameters

Table 280-25 END_RESPONSE Procedure Parameters

Parameter	Description
r	The HTTP response

280.9.10 GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

**See Also:**

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(  
    r          IN OUT NOCOPY resp,  
    scheme    OUT VARCHAR2,  
    realm     OUT VARCHAR2,  
    for_proxy IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 280-26 GET_AUTHENTICATION Procedure Parameters

Parameter	Description
r	The HTTP response
scheme	The scheme for the required HTTP authentication
realm	The realm for the required HTTP authentication
for_proxy	Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling `GET_AUTHENTICATION`. The Web client makes the second request and supplies the required authentication information with `SET_AUTHORIZATION`. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

280.9.11 GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_BODY_CHARSET (
    charset OUT NOCOPY VARCHAR2);
```

Parameters

Table 280-27 GET_BODY_CHARSET Procedure Parameters

Parameter	Description
charset	The default character set of the body of all future HTTP requests

280.9.12 GET_COOKIE_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session state.

See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (  
    request_context IN request_context_key DEFAULT NULL)  
    RETURN PLS_INTEGER;
```

Parameters

Table 280-28 GET_COOKIE_COUNT Function Parameters

Parameter	Description
request_context	Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead.

280.9.13 GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (  
    enable          OUT BOOLEAN,  
    max_cookies     OUT PLS_INTEGER,  
    max_cookies_per_site OUT PLS_INTEGER);
```

Parameters

Table 280-29 GET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
enable	Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE)

Table 280-29 (Cont.) GET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
max_cookies	Indicates the maximum total number of cookies maintained in the current session
max_cookies_per_site	Indicates the maximum number of cookies maintained in the current session for each Web site

280.9.14 GET_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

Syntax

```
UTL_HTTP.GET_COOKIES (
    cookies          IN OUT NOCOPY cookie_table,
    request_context IN          request_context_key DEFAULT NULL);
```

Parameters

Table 280-30 GET_COOKIES Function Parameters

Parameter	Description
cookies	The cookies returned
request_context	Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead.

280.9.15 GET_DETAILED_EXCP_SUPPORT Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (
    enable OUT BOOLEAN);
```

Parameters

Table 280-31 GET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE

280.9.16 GET_DETAILED_SQLCODE Function

This function retrieves the detailed `SQLCODE` of the last exception raised.

See Also:

[Error Conditions](#) and [Error Conditions Subprograms](#)

Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE  
RETURN PLS_INTEGER;
```

280.9.17 GET_DETAILED_SQLERRM Function

This function retrieves the detailed `SQLERRM` of the last exception raised.

See Also:

[Error Conditions](#) and [Error Conditions Subprograms](#)

Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM  
RETURN VARCHAR2;
```

280.9.18 GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (  
    max_redirects OUT PLS_INTEGER);
```

Parameters

Table 280-32 GET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
<code>max_redirects</code>	The maximum number of redirections for all future HTTP requests

280.9.19 GET_HEADER Procedure

This procedure returns the n^{th} HTTP response header name and value returned in the response.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.GET_HEADER (  
    r      IN OUT NOCOPY resp,  
    n      IN PLS_INTEGER,  
    name   OUT NOCOPY VARCHAR2,  
    value  OUT NOCOPY VARCHAR2);
```

Parameters

Table 280-33 GET_HEADER Procedure Parameters

Parameter	Description
<code>r</code>	The HTTP response
<code>n</code>	The n^{th} header to return
<code>name</code>	The name of the HTTP response header
<code>value</code>	The value of the HTTP response header

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

280.9.20 GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(  
  r      IN OUT NOCOPY resp,  
  name   IN VARCHAR2,  
  value  OUT NOCOPY VARCHAR2,  
  n      IN PLS_INTEGER DEFAULT 1);
```

Parameters

Table 280-34 GET_HEADER_BY_NAME Procedure Parameters

Parameter	Description
r	The HTTP response
name	The name of the HTTP response header for which the value is to return
value	The value of the HTTP response header
n	The n^{th} occurrence of an HTTP response header by the specified name to return. The default is 1.

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

280.9.21 GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.GET_HEADER_COUNT (  
    r IN OUT NOCOPY resp)  
RETURN PLS_INTEGER;
```

Parameters

Table 280-35 GET_HEADER_COUNT Function Parameters

Parameter	Description
r	The HTTP response

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

280.9.22 GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT  
RETURN PLS_INTEGER;
```

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

280.9.23 GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks if the persistent connection support is enabled, and gets the maximum number of persistent connections in the current session.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (  
    enable      OUT BOOLEAN,  
    max_conns  OUT PLS_INTEGER);
```

Parameters

Table 280-36 GET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
enable	TRUE if persistent connection support is enabled; otherwise FALSE
max_conns	the maximum number of persistent connections maintained in the current session

280.9.24 GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

Syntax

```
UTL_HTTP.get_persistent_conns (  
    connections IN OUT NOCOPY connection_table);
```

Parameters

Table 280-37 GET_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
connections	The network connections kept persistent

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

280.9.25 GET_PROXY Procedure

This procedure retrieves the current proxy settings.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_PROXY (  
    proxy          OUT NOCOPY VARCHAR2,  
    no_proxy_domains OUT NOCOPY VARCHAR2);
```

Parameters

Table 280-38 GET_PROXY Procedure Parameters

Parameter	Description
proxy	The proxy (host and an optional port number) currently used by the UTL_HTTP package
no_proxy_domains	The list of hosts and domains for which no proxy is used for all requests

280.9.26 GET_RESPONSE Function

This function reads the HTTP response.

When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.GET_RESPONSE (  
    r          IN OUT NOCOPY req,
```

```

    return_info_response    IN BOOLEAN DEFAULT FALSE)
RETURN resp;

```

Parameters

Table 280-39 GET_RESPONSE Function Parameters

Parameter	Description
r	The HTTP response
return_info_response	Return 100 informational response or not. <ul style="list-style-type: none"> TRUE means <code>get_response</code> should return 100 informational response when it is received from the HTTP server. The request will not be ended if a 100 response is returned. FALSE means the API should ignore any 100 informational response received from the HTTP server and should return the following non-100 response instead. The default is FALSE.

Exceptions

- When detailed-exception is disabled:
 - ORA-29273 REQUEST_FAILED - the request fails to execute. Use the [GET_DETAILED_EXCP_SUPPORT Procedure](#) and the [GET_DETAILED_SQLERRM Function](#) to get the detailed error message.
- When detailed-exception is enabled:
 - ORA-29261 BAD_ARGUMENT - some arguments passed are not valid
- When response error check is enabled:
 - ORA-29268 HTTP_CLIENT_ERROR - the response code is in 400 range
 - ORA-29269 HTTP_SERVER_ERROR - the response code is in 500 range

Usage Notes

- The request will be ended when this functions returns regardless of whether an exception is raised or not. There is no need to invoke the [END_REQUEST Procedure](#).
- If URL redirection occurs, the URL and method fields in the `req` record will be updated to the last redirected URL and the method used to access the URL.

Examples

In certain situations (initiated by the HTTP client or not), the HTTP server may return a 1xx informational response. The user who does not expect such a response may indicate to `GET_RESPONSE` to ignore the response and proceed to receive the regular response. In the case when the user expects such a response, the user can indicate to `GET_RESPONSE` to return the response.

For example, when a user is issuing a HTTP POST request with a large request body, the user may want to check with the HTTP server to ensure that the server will accept the request before sending the data. To do so, the user will send the additional `EXPECT: 100-CONTINUE` request header, and check for 100 CONTINUE response from

the server before proceeding to send the request body. Then, the user will get the regular HTTP response.

The following code example illustrates this:

```

DECLARE
  data  VARCHAR2(1024) := '...';
  req   utl_http.req;
  resp  utl_http.resp;
BEGIN

  req := utl_http.begin_request('http://www.acme.com/receiver', 'POST');
  utl_http.set_header(req, 'Content-Length', length(data));
  -- Ask HTTP server to return "100 Continue" response
  utl_http.set_header(req, 'Expect', '100-continue');
  resp := utl_http.get_response(req, TRUE);

  -- Check for and dispose "100 Continue" response
  IF (resp.status_code <> 100) THEN
    utl_http.end_response(resp);
    raise_application_error(20000, 'Request rejected');
  END IF;
  utl_http.end_response(resp);

  -- Now, send the request body
  utl_http.write_text(req, data);

  -- Get the regular response
  resp := utl_http.get_response(req);
  utl_http.read_text(resp, data);

  utl_http.end_response(resp);

END;
```

280.9.27 GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```

UTL_HTTP.GET_RESPONSE_ERROR_CHECK (
  enable OUT BOOLEAN);
```

Parameters

Table 280-40 GET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
enable	TRUE if the response error check is set; otherwise FALSE

280.9.28 GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (  
    timeout OUT PLS_INTEGER);
```

Parameters

Table 280-41 GET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds

280.9.29 READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer.

The end of line is as defined in the function `read_line` of `UTL_TCP`. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.READ_LINE (  
    r          IN OUT NOCOPY resp,  
    data      OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,  
    remove_crlf IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 280-42 READ_LINE Procedure Parameters

Parameter	Description
r	The HTTP response

Table 280-42 (Cont.) READ_LINE Procedure Parameters

Parameter	Description
<code>data</code>	The HTTP response body in text form
<code>remove_crlf</code>	Removes the newline characters if set to <code>TRUE</code>

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

280.9.30 READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached.

**See Also:**

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.READ_RAW(
  r          IN OUT NOCOPY resp,
```

```
data OUT NOCOPY RAW,
len IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 280-43 READ_RAW Procedure Parameters

Parameter	Description
r	The HTTP response
data	The HTTP response body in binary form
len	The number of bytes of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

280.9.31 READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.READ_TEXT(
r IN OUT NOCOPY resp,
data OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
len IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 280-44 READ_TEXT Procedure Parameters

Parameter	Description
<code>r</code>	The HTTP response
<code>data</code>	The HTTP response body in text form
<code>len</code>	The maximum number of characters of data to read. If <code>len</code> is NULL, this procedure will read as much input as possible to fill the buffer allocated in <code>data</code> . The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is NULL.

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

280.9.32 REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL.

This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

See Also:

[Simple HTTP Fetches](#) and [Simple HTTP Fetches in a Single Call Subprograms](#)

Syntax

```
UTL_HTTP.REQUEST (
    url          IN VARCHAR2,
    proxy        IN VARCHAR2 DEFAULT NULL,
    wallet_path  IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL,
    https_host   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

Parameters

Table 280-45 REQUEST Function Parameters

Parameter	Description
url	Uniform resource locator
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See <code>SET_PROXY</code> for the full format of the proxy setting.
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of <code>wallet_path</code> on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code> , and in Unix is, for example, <code>file:/home/username/wallets</code> When the <code>UTL_HTTP</code> package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See <code>SET_WALLET</code> for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
wallet_password	(Optional) Specifies the password required to open the wallet
https_host	A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI.

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com') FROM DUAL;
```

280.9.33 REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

See Also:

[Simple HTTP Fetches](#) and [Simple HTTP Fetches in a Single Call Subprograms](#)

Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
    url            IN VARCHAR2,
    max_pieces    IN NATURAL DEFAULT 32767,
    proxy         IN VARCHAR2 DEFAULT NULL,
    wallet_path   IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL,
    https_host    IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 280-46 REQUEST_PIECES Function Parameters

Parameter	Description
url	Uniform resource locator
max_pieces	(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.

Table 280-46 (Cont.) REQUEST_PIECES Function Parameters

Parameter	Description
wallet_path	<p>(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request.</p> <p>The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.</p> <p>See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</p>
wallet_password	(Optional) Specifies the password required to open the wallet
https_host	<p>A string representing the host name.</p> <p>If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI).</p> <p>If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request.</p> <p>If NULL, the host name in the given URL will be used for SNI.</p>

Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```

<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>

```

Examples

```

SET SERVEROUTPUT ON

DECLARE
    x    UTL_HTTP.HTML_PIECES;
    len  PLS_INTEGER;
BEGIN
    x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
    DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved. ');
    DBMS_OUTPUT.PUT_LINE('with total length ');
    IF x.count < 1 THEN
        DBMS_OUTPUT.PUT_LINE('0');
    ELSE
        len := 0;
        FOR i in 1..x.count LOOP
            len := len + length(x(i));
        END LOOP;
        DBMS_OUTPUT.PUT_LINE(len);
    END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687

```

280.9.34 SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

UTL_HTTP Authentication Scheme

The following is the challenge and response work flow:

1. Client sends a HTTP request to the server.
2. The server responds to the client with a 401 (Unauthorized) response status. It also provides information on how to authorize using a WWW-Authenticate response header that contains at least one authentication scheme challenge.

 **Note:**

When server responds with multiple challenges, it will be in the order of preference, starting with the most preferred algorithm followed by the less preferred algorithm.

3. Client authenticates itself with the server by issuing the request that includes an Authorization request header along with the credentials build by using the values from challenge headers, such as algorithm, realm, and nonce.

 **Note:**

UTL_HTTP supports digest SHA-256 algorithm.

Digest Authentication

An authentication scheme is set in the HTTP request header that is authorized by the Web server using the UTL_HTTP.SET_AUTHENTICATION call. Digest is one of the authentication schemes that UTL_HTTP supports. The other authentication schemes are basic, AWS,AWS4, BMC, and AZURE.

The following is the UTL_HTTP request and response flow using the digest authentication scheme:

1. UTL_HTTP.BEGIN_REQUEST- This function sends an HTTP request to the Web server.
2. UTL_HTTP.SET_AUTHENTICATION- This function sets authentication information in the HTTP request header
3. UTL_HTTP.GET_RESPONSE- This function gets the response from the Web server
 - a. Server replies “401 Unauthorized” along with the challenge headers.
 - b. Build digests credentials with values from the challenge headers using the SHA 256 algorithm.
 - c. Resend request includes an authorization request header with the digest credentials.
 - d. Server processes request and replies (typically 200-OK).

Syntax

```
UTL_HTTP.SET_AUTHENTICATION(  
  r          IN OUT NOCOPY req,  
  username  IN VARCHAR2,  
  password  IN VARCHAR2,  
  scheme    IN VARCHAR2 DEFAULT 'Basic',  
  for_proxy IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 280-47 SET_AUTHENTICATION Procedure Parameters

Parameter	Description
r	HTTP request
username	Username for the HTTP authentication
password	Password for the HTTP authentication
scheme	HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or <code>AWS</code> for Amazon S3 authentication scheme. Default is <code>basic</code> .
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is <code>FALSE</code> .

Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

280.9.35 SET_AUTHENTICATION_FROM_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

See Also:

[External Password Store](#) on [Oracle Database](#), and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET (
    r          IN OUT NOCOPY req,
    alias      IN VARCHAR2,
    scheme     IN VARCHAR2 DEFAULT 'Basic',
    for_proxy  IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 280-48 SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

Parameter	Description
r	The HTTP request
alias	Alias to identify and retrieve the username and password credential stored in the Oracle wallet
scheme	HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or <code>AWS</code> for Amazon S3 authentication scheme. Default is <code>basic</code> .

Table 280-48 (Cont.) SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

Parameter	Description
<code>for_proxy</code>	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.

Usage Notes

- To use the password credentials in a wallet, the UTL_HTTP user must have the `use-passwords` privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

Examples**Creating a wallet and entering username and password in the wallet**

```
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: *****
Enter password again: *****
> mkstore -wrl /oracle/wallets/test_wallet -createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: *****
```

Granting the use-passwords privilege on the wallet to a user by the database administrator

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl          => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal    => 'SCOTT',
    is_grant     => TRUE,
    privilege    => 'use-passwords');
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
    acl          => 'wallet-acl.xml',
    wallet_path  => 'file:/oracle/wallets/test_wallet');
END;
```

Using username and password from the wallet

```
DECLARE
  req UTL_HTTP.req;
BEGIN
  UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
  req := UTL_HTTP.BEGIN_REQUEST(...);
  UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
  ...
END;
```

280.9.36 SET_BODY_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

See Also:

- [HTTP Responses](#) and [HTTP Responses Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is `ISO-8859-1` in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (  
    charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET (  
    r          IN OUT NOCOPY req,  
    charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET (  
    r          IN OUT NOCOPY resp,  
    charset IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 280-49 SET_BODY_CHARSET Procedure Parameters

Parameter	Description
r	The HTTP response.
charset	The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If <code>charset</code> is <code>NULL</code> , the database character set is assumed.

280.9.37 SET_COOKIE_SUPPORT Procedures

This overloaded procedure handles cookie support. The description of different functionality is located alongside the syntax declarations.

 **See Also:**

- [HTTP Requests](#) and [HTTP Requests Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
    r          IN OUT NOCOPY REQ,
    enable     IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
    enable     IN BOOLEAN,
    max_cookies IN PLS_INTEGER DEFAULT 300,
    max_cookies_per_site IN PLS_INTEGER DEFAULT 20);
```

Parameters

Table 280-50 SET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
r	The HTTP request
enable	Set <code>enable</code> to <code>TRUE</code> to enable HTTP cookie support; <code>FALSE</code> to disable
max_cookies	Sets the maximum total number of cookies maintained in the current session

Table 280-50 (Cont.) SET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
<code>max_cookies_per_site</code>	Sets the maximum number of cookies maintained in the current session for each Web site

Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the `Set-Cookie` HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "[Examples](#)" for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

280.9.38 SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the `UTL_HTTP` package to raise a detailed exception.

By default, `UTL_HTTP` raises the `request_failed` exception when an HTTP request fails. Use `GET_DETAILED_SQLCODE` and `GET_DETAILED_SQLERRM` for more detailed information about the error.

**See Also:**

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
    enable IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 280-51 SET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE

280.9.39 SET_FOLLOW_REDIRECT Procedures

This procedure sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET_RESPONSE function.

See Also:

- [HTTP Requests](#) and [HTTP Requests Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

Syntax

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT(
    r IN OUT NOCOPY req,
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

Parameters

Table 280-52 SET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
r	The HTTP request
max_redirects	The maximum number of redirects. Set to zero to disable redirects.

Usage Notes

If `max_redirects` is set to a positive number, the [GET_RESPONSE Function](#) will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the `REQ` record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function `FOLLOW_REDIRECT` and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The `SET_FOLLOW_REDIRECT` procedure must be called before `GET_RESPONSE` for any redirection to take effect.

280.9.40 SET_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.SET_HEADER (
  r          IN OUT NOCOPY req,
  name      IN VARCHAR2,
  value     IN VARCHAR2);
```

Parameters

Table 280-53 SET_HEADER Procedure Parameters

Parameter	Description
<code>r</code>	The HTTP request
<code>name</code>	The name of the HTTP request header
<code>value</code>	The value of the HTTP request header

Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, `UTL_HTTP` sets the Host header automatically for you.

When you set the `Content-Type` header with this procedure, `UTL_HTTP` looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the `SET_BODY_CHARSET` procedure.

When you set the `Transfer-Encoding` header with the value `chunked`, `UTL_HTTP` automatically encodes the request body written by the `WRITE_TEXT`, `WRITE_LINE` and `WRITE_RAW` procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

280.9.41 SET_PERSISTENT_CONN_SUPPORT Procedure

This overloaded procedure provides persistent connection support. Descriptions of the different functionality are given in the syntax declarations.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

Sets whether future HTTP requests should support the HTTP 1.1 persistent connection or not, and the maximum numbers of persistent connections to be maintained in the current database user session.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
  enable      IN BOOLEAN DEFAULT FALSE,
  max_conns   IN PLS_INTEGER DEFAULT 0);
```

Enables or disables support for the HTTP 1.1 persistent-connection in the request.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
  r           IN OUT NOCOPY req,
  enable      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 280-54 SET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
<code>enable</code>	TRUE to keep the network connection persistent. FALSE otherwise.
<code>maximum_conns</code>	Maximum number of connections
<code>r</code>	The HTTP request

Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in `UTL_HTTP` may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "Examples".

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Note that if you want to use persistent connections, you must call the overload that takes the `maximum_conns` parameter prior to calling the [BEGIN_REQUEST Function](#), otherwise persistent connections will not be enabled for the current request even if the other form of `SET_PERSISTENT_CONN_SUPPORT` is called.

Examples

Using `SET_PERSISTENT_CONN_SUPPORT` in http requests at the session level, showing the active persistent connection after each request

```
DECLARE
  pieces utl_http.html_pieces;
  conns utl_http.connection_table;
BEGIN

  -- Turns on persistent connection support for the request_pieces call.
  utl_http.set_persistent_conn_support(true, 1);

  FOR i IN 1..10 LOOP
```

```

pieces := utl_http.request_pieces('http://www.example.com/');

-- Shows the active persistent connection
utl_http.get_persistent_conns(conns);
FOR j IN 1..conns.count LOOP
    dbms_output.put_line('Persistent connection ' || j || ': ' || conns(j).host || ':' ||
conns(j).port);
END LOOP;

END LOOP;

-- Turns off persistent connection support. Set active max persistent connection to
0 to close all active connections.
utl_http.set_persistent_conn_support(false, 0);

END;
/

```

Using SET_PERSISTENT_CONN_SUPPORT in HTTP requests showing how to use persistent connection individually in each request to fetch multiple URLs at the same host

```

DECLARE
-- Table to store the URLs
TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
paths VC2_TABLE;

PROCEDURE fetch_pages(paths IN vc2_table) AS
    req UTL_HTTP.REQ;
    resp UTL_HTTP.RESP;
    data VARCHAR2(1024);

BEGIN
    -- Set the proxy server
    UTL_HTTP.SET_PROXY('www-proxy.example.com:80', '');

    FOR i IN 1..paths.count LOOP

        req := UTL_HTTP.BEGIN_REQUEST(paths(i));

        -- Use persistent connections except for the last request
        IF (i < paths.count) THEN
            -- Use a persistent connection for the current request
            UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
        END IF;

        resp := UTL_HTTP.GET_RESPONSE(req);

        -- Display the results of the response
        DBMS_OUTPUT.PUT_LINE('-');
        DBMS_OUTPUT.PUT_LINE('URL: ' || paths(i));
        DBMS_OUTPUT.PUT_LINE('HTTP Response Status Code: ' || resp.status_code);
        DBMS_OUTPUT.PUT_LINE('HTTP Response Reason Phrase: ' || resp.reason_phrase);
        DBMS_OUTPUT.PUT_LINE('HTTP Response Version: ' || resp.http_version);

    BEGIN
        LOOP
            UTL_HTTP.READ_TEXT(resp, data);
            -- do something with the data
        END LOOP;
    END LOOP;

```

```

EXCEPTION
  WHEN UTL_HTTP.END_OF_BODY THEN
    NULL;
END;
UTL_HTTP.END_RESPONSE(resp);
END LOOP;
END;

BEGIN
-- Set a maximum of 1 persistent connection, but start with persistent
connections
-- off
  UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);

  -- Create a list of URLs
  paths(1) := 'http://www.example.com/technetwork/index.html';
  paths(2) := 'http://www.example.com/us/products/index.html';

  fetch_pages(paths);
END;
/

```

280.9.42 SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`.

`no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```

UTL_HTTP.SET_PROXY (
  proxy          IN VARCHAR2,
  no_proxy_domains IN VARCHAR2);

```

Parameters

Table 280-55 SET_PROXY Procedure Parameters

Parameter	Description
<code>proxy</code>	The proxy (host and an optional port number) to be used by the UTL_HTTP package
<code>no_proxy_domains</code>	The list of hosts and domains for which no proxy should be used for all requests

Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com`, `eng.my-company.com:80`. When `no_proxy_domains` is `NULL` and the proxy is set, all requests go through the proxy. When the proxy is not set, `UTL_HTTP` sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

280.9.43 SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges.

For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
    enable IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 280-56 SET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
<code>enable</code>	TRUE to check for response errors; otherwise FALSE

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, `GET_RESPONSE` will raise the `HTTP_CLIENT_ERROR` or `HTTP_SERVER_ERROR` exception. If `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`, `GET_RESPONSE` will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The `GET_RESPONSE` function can raise other exceptions when `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`.

280.9.44 SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the `UTL_HTTP` package should attempt while reading the HTTP response from the Web server or proxy server.

This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (  
    timeout IN PLS_INTEGER DEFAULT 60);
```

Parameters

Table 280-57 SET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds.

Usage Notes

The default value of the time out is 60 seconds.

280.9.45 SET_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS.

When the `UTL_HTTP` package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the `UTL_HTTP` package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the `UTL_HTTP` package. An Oracle wallet is required to make an HTTPS request.

 See Also:

- [Session Settings and Session Settings Subprograms](#)
- *Oracle Database Security Guide* managing fine-grained access

Syntax

```
UTL_HTTP.SET_WALLET (
    path          IN VARCHAR2,
    password     IN VARCHAR2 DEFAULT NULL);
```

Parameters**Table 280-58 SET_WALLET Procedure Parameters**

Parameter	Description
path	<p>The directory path that contains the Oracle wallet. The format is <code>file:directory-path</code>.</p> <p>The format of <code>wallet_path</code> on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code>, and in Unix is, for example, <code>file:/home/username/wallets</code>. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.</p> <p>If you want to use the operating system certificate store to act in place of the Oracle wallet, then set the <code>path</code> parameter to <code>system:</code> (include the colon). Doing so greatly improves performance in the database.</p>
password	<p>The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to <code>NULL</code>. See <i>Oracle Database Security Guide</i> for information about using the <code>orapki</code> utility to create an auto-login wallet.</p> <p>If you set <code>path</code> to <code>system:</code>, then omit the password by setting it to <code>NULL</code>.</p>

Usage Notes

To set up an Oracle wallet, use the `ORAPKI` utility to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet.

 See Also:

Oracle Database Advanced Security Guide for more information on Wallet Manager

280.9.46 WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`).

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.WRITE_LINE(  
  r      IN OUT NOCOPY req,  
  data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 280-59 WRITE_LINE Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text line to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The `UTL_HTTP` package performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the

HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

280.9.47 WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.WRITE_RAW(  
    r      IN OUT NOCOPY REQ,  
    data  IN          RAW);
```

Parameters

Table 280-60 WRITE_RAW Procedure Parameters

Parameter	Description
<code>r</code>	The HTTP request
<code>data</code>	The binary data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding:chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

280.9.48 WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body.

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

**See Also:**[HTTP Requests](#) and [HTTP Requests Subprograms](#)**Syntax**

```
UTL_HTTP.WRITE_TEXT(  
    r      IN OUT NOCOPY REQ,  
    data  IN          VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters**Table 280-61** WRITE_TEXT Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

UTL_I18N

UTL_I18N is a set of services that provides additional globalization functionality for applications written in PL/SQL.

See Also:

Oracle Database Globalization Support Guide

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Data Structures](#)
- [Summary of UTL_I18N Subprograms](#)

281.1 UTL_I18N Overview

UTL_I18N services provide additional globalization functionality for applications written in PL/SQL.

The UTL_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that returns the maximum number of bytes for a character of an Oracle character set.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.

- A function that returns a listing of the most commonly used time zones.
- Procedures that detect the most likely Oracle character sets and Oracle languages for a given data sample.

281.2 UTL_I18N Security Model

The functions and procedures of the `UTL_I18N` package neither read database contents nor modify them. They operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to `PUBLIC` by default.

281.3 UTL_I18N Constants

`UTL_I18N` defines constants to use when specifying parameter values.

These constants are shown in the following table.

Table 281-1 UTL_I18N Constants

Constant	Type	Value	Description
<code>GENERIC_CONTEXT</code>	<code>PLS_INTEGER</code>	0	Returns the default character set for general cases.
<code>MAIL_GENERIC</code>	<code>PLS_INTEGER</code>	0	Map from an Oracle character set name to an email safe character set name on a non-Windows platform.
<code>ORACLE_TO_IANA</code>	<code>PLS_INTEGER</code>	0	Map from an Oracle character set name to an IANA character set name.
<code>SHIFT_IN</code>	<code>PLS_INTEGER</code>	0	Used with <code>shift_status</code> . Must be set the first time it is called in piecewise conversion.
<code>IANA_TO_ORACLE</code>	<code>PLS_INTEGER</code>	1	Map from an IANA character set name to an Oracle character set name.
<code>MAIL_CONTEXT</code>	<code>PLS_INTEGER</code>	1	The mapping is between an Oracle character set name and an email safe character set name.
<code>MAIL_WINDOWS</code>	<code>PLS_INTEGER</code>	1	Map from an Oracle character set name to an email safe character set name on a Windows platform.
<code>SHIFT_OUT</code>	<code>PLS_INTEGER</code>	1	
<code>FWKATAKANA_HIRA GANA</code>	<code>VARCHAR2(30)</code>	'fwkatakana_hi ragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
<code>FWKATAKANA_HWKA TAKANA</code>	<code>VARCHAR2(30)</code>	'fwkatakana_hw katakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
<code>HIRAGANA_FWKATA KANA</code>	<code>VARCHAR2(30)</code>	'hiragana_fwka takana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.

Table 281-1 (Cont.) UTL_I18N Constants

Constant	Type	Value	Description
HIRAGANA_HWKATA KANA	VARCHAR2(30)	'hiragana_hwka takana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.
HWKATAKANA_FWKA TAKANA	VARCHAR2(30)	'hwkatakana_fw katakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRA GANA	VARCHAR2(30)	'hwkatakana_hi ragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
KANA_FWKATAKANA	VARCHAR2(30)	'kana_fwkatata na'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HIRAGANA	VARCHAR2(30)	'kana_hiragana '	Converts any type of Kana character to a fullwidth Hiragana character.
KANA_HWKATAKANA	VARCHAR2(30)	'kana_hwkatata na'	Converts any type of Kana character to a halfwidth Katakana character.
LATIN_ASCII_DIN 91379	VARCHAR2(30)	'latin_ascii_d in91379'	Converts Latin characters to ASCII characters.
CYRILLIC_LATIN_ ISO9	VARCHAR2(30)	'cyrillic_lati n_iso9'	Converts Cyrillic characters to Latin characters.
GREEK_LATIN_ISO 843	VARCHAR2(30)	'greek_latin_i so843'	Converts Greek characters to Latin characters.
ARABIC_LATIN_IS O233	VARCHAR2(30)	'arabic_latin_ iso233'	Converts Arabic characters to Latin characters.
HEBREW_LATIN_IS O259	VARCHAR2(30)	'hebrew_latin_ iso259'	Converts Hebrew characters to Latin characters.
MODERN_HEBREW_L ATIN_ISO259_2	VARCHAR2(30)	'modern_hebrew _latin_iso259_ 2'	Converts Modern Hebrew characters to Latin characters.
CYR_ASCII_ICAO9 303	VARCHAR2(30)	'cyr_ascii_ICA O9303'	Converts Cyrillic characters to ASCII characters.
CYR_BY_ASCII_IC AO9303	VARCHAR2(30)	'cyr_by_ascii_ ICA09303'	Converts Cyrillic Belarus characters to ASCII characters.
CYR_UA_ASCII_IC AO9303	VARCHAR2(30)	'cyr_ua_ascii_ ICA09303'	Converts Cyrillic Ukraine characters to ASCII characters.
CYR_RS_ASCII_IC AO9303	VARCHAR2(30)	'cyr_rs_ascii_ ICA09303'	Converts Cyrillic Serbia characters to ASCII characters.
CYR_BG_ASCII_IC AO9303	VARCHAR2(30)	'cyr_bg_ascii_ ICA09303'	Converts Cyrillic Bulgaria characters to ASCII characters.
CYR_MK_ASCII_IC AO9303	VARCHAR2(30)	'cyr_mk_ascii_ ICA09303'	Converts Cyrillic North Macedonia characters to ASCII characters.

281.4 UTL_I18N Data Structures

The `UTL_I18N` package defines `RECORD` types and `TABLE` types.

RECORD Types

- [CHARSET_RESULT_RECORD Record Type](#)
- [LANGUAGE_CHARSET_RESULT_RECORD Record Type](#)
- [LANGUAGE_RESULT_RECORD Record Type](#)

TABLE Types

- [CHARSET_RESULT_TABLE Table Type](#)
- [LANGUAGE_CHARSET_RESULT_TABLE Table Type](#)
- [LANGUAGE_RESULT_TABLE Table Type](#)

281.4.1 CHARSET_RESULT_RECORD Record Type

This record type contains information returned by the `DETECT_CHARSET` procedure in the `UTL_I18N` package.

Syntax

```
TYPE CHARSET_RESULT_RECORD IS RECORD (  
  charset      VARCHAR2(28),  
  score        NUMBER);
```

Fields

Table 281-2 CHARSET_RESULT_RECORD Fields

Field	Description
<code>charset</code>	Oracle character set
<code>score</code>	A numeric value representing the likelihood that <code>charset</code> is the Oracle character set for the given data sample. The value is between 0 (least likely) and 1 (most likely).

281.4.2 LANGUAGE_CHARSET_RESULT_RECORD Record Type

This record type contains information returned by the `DETECT_LANGUAGE_CHARSET` procedure in the `UTL_I18N` package.

Syntax

```
TYPE LANGUAGE_CHARSET_RESULT_RECORD IS RECORD (  
  language     VARCHAR2(28),  
  charset      VARCHAR2(28),  
  score        NUMBER);
```

Fields

Table 281-3 LANGUAGE_CHARSET_RESULT_RECORD Fields

Field	Description
language	Oracle language
charset	Oracle character set
score	A numeric value representing the likelihood that <code>language</code> is the Oracle language and <code>charset</code> is the Oracle character set for the given data sample. The value is between 0 (least likely) and 1 (most likely).

281.4.3 LANGUAGE_RESULT_RECORD Record Type

This record type contains information returned by the `DETECT_LANGUAGE` procedure in the `UTL_I18N` package.

Syntax

```
TYPE LANGUAGE_RESULT_RECORD IS RECORD (
  language    VARCHAR2(28),
  score       NUMBER);
```

Fields

Table 281-4 LANGUAGE_RESULT_RECORD Fields

Field	Description
language	Oracle language
score	A numeric value representing the likelihood that <code>language</code> is the Oracle language for the given data sample. The value is between 0 (least likely) and 1 (most likely).

281.4.4 CHARSET_RESULT_TABLE Table Type

This is a table of `CHARSET_RESULT_RECORD` Record Type.

Syntax

```
TYPE charset_result_table IS TABLE OF charset_result_record;
```

Related Topics

- [CHARSET_RESULT_RECORD Record Type](#)
This record type contains information returned by the `DETECT_CHARSET` procedure in the `UTL_I18N` package.

281.4.5 LANGUAGE_CHARSET_RESULT_TABLE Table Type

This is a table of LANGUAGE_CHARSET_RESULT_RECORD Record Type.

Syntax

```
TYPE language_charset_result_table IS TABLE OF language_charset_result_record;
```

Related Topics

- [LANGUAGE_CHARSET_RESULT_RECORD Record Type](#)
This record type contains information returned by the DETECT_LANGUAGE_CHARSET procedure in the UTL_I18N package.

281.4.6 LANGUAGE_RESULT_TABLE Table Type

This is a table of LANGUAGE_RESULT_RECORD Record Type.

Syntax

```
TYPE language_result_table IS TABLE OF language_result_record;
```

Related Topics

- [LANGUAGE_RESULT_RECORD Record Type](#)
This record type contains information returned by the DETECT_LANGUAGE procedure in the UTL_I18N package.

281.5 Summary of UTL_I18N Subprograms

This table lists the UTL_I18N subprograms and briefly describes them.

Table 281-5 UTL_I18N Package Subprograms

Procedure	Description
DETECT_CHARSET Procedure	Detects the most likely Oracle character sets for a given data sample.
DETECT_LANGUAGE Procedure	Detects the most likely Oracle languages for a given data sample.
DETECT_LANGUAGE_CHARSET Procedure	Detects the most likely Oracle languages and Oracle character sets for a given data sample.
ESCAPE_REFERENCE Function	Converts a given text string to its character reference counterparts, for characters that fall outside the document character set.
GET_COMMON_TIME_ZONES Function	Returns the list of common time zone IDs that are independent of the locales.
GET_DEFAULT_CHARSET Function	Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.
GET_DEFAULT_ISO_CURRENCY Function	Returns the default ISO 4217 currency code for the specified territory.

Table 281-5 (Cont.) UTL_I18N Package Subprograms

Procedure	Description
GET_DEFAULT_LINGUISTIC_SORT Function	Returns the default linguistic sort name for the specified language.
GET_LOCAL_LANGUAGES Function	Returns the local language names for the specified territory.
GET_LOCAL_LINGUISTIC_SORTS Function	Returns the local linguistic sort names for the specified language.
GET_LOCAL_TERRITORIES Function	Returns the local territory names for the specified language.
GET_LOCAL_TIME_ZONES Function	Returns the local time zone IDs for the specified territory.
GET_MAX_CHARACTER_SIZE Function	Returns the maximum character size of a given character set.
GET_TRANSLATION Function	Returns the translation of the language and territory name in the specified translation language.
MAP_CHARSET Function	<ul style="list-style-type: none"> • Maps an Oracle character set name to an IANA character set name. • Maps an IANA character set name to an Oracle character set name. • Maps an Oracle character set name to an e-mail safe character set name.
MAP_FROM_SHORT_LANGUAGE Function	Maps an Oracle short language name to an Oracle language name.
MAP_LANGUAGE_FROM_ISO Function	Returns an Oracle language name from an ISO locale name.
MAP_LOCALE_TO_ISO Function	Returns an ISO locale name from the Oracle language and territory name.
MAP_TERRITORY_FROM_ISO Function	Returns an Oracle territory name from an ISO locale name.
MAP_TO_SHORT_LANGUAGE Function	Maps an Oracle language name to an Oracle short language name.
RAW_TO_CHAR Functions	Converts RAW data that is not encoded in the database character set into a VARCHAR2 string
RAW_TO_NCHAR Functions	Converts RAW data that is not encoded in the national character set into an NVARCHAR2 string
STRING_TO_RAW Function	Converts a VARCHAR2 or NVARCHAR2 string to another character set. The result is returned as a RAW datatype.
TRANSLITERATE Function	Performs script transliteration.
UNESCAPE_REFERENCE Function	Converts an input string that contains character references to a text string.
VALIDATE_CHARACTER_ENCODING Function	Validates the character encoding of VARCHAR2, NVARCHAR2, CLOB, and NCLOB data.

281.5.1 DETECT_CHARSET Procedure

This procedure detects the most likely Oracle character sets for a given data sample.

The procedure is overloaded to accept data of type BFILE, BLOB, CLOB, VARCHAR2, or NVARCHAR2. The procedure analyzes the data and returns its possible Oracle character sets, ranked by likelihood. It stores the results in a table of type `CHARSET_RESULT_TABLE`.

Syntax

This procedure analyzes BFILE data:

```
UTL_I18N.DETECT_CHARSET (  
    result          OUT charset_result_table,  
    src             IN BFILE,  
    profile         IN BINARY_INTEGER DEFAULT 1,  
    num_results     IN BINARY_INTEGER DEFAULT NULL,  
    sample_size     IN BINARY_INTEGER DEFAULT NULL  
);
```

This procedure analyzes BLOB data:

```
UTL_I18N.DETECT_CHARSET (  
    result          OUT charset_result_table,  
    src             IN BLOB,  
    profile         IN BINARY_INTEGER DEFAULT 1,  
    num_results     IN BINARY_INTEGER DEFAULT NULL,  
    sample_size     IN BINARY_INTEGER DEFAULT NULL  
);
```

This procedure analyzes CLOB data:

```
UTL_I18N.DETECT_CHARSET (  
    result          OUT charset_result_table,  
    src             IN CLOB,  
    profile         IN BINARY_INTEGER DEFAULT 1,  
    num_results     IN BINARY_INTEGER DEFAULT NULL,  
    sample_size     IN BINARY_INTEGER DEFAULT NULL  
);
```

This procedure analyzes VARCHAR2 or NVARCHAR2 data:

```
UTL_I18N.DETECT_CHARSET (  
    result          OUT charset_result_table,  
    src             IN VARCHAR2,  
    profile         IN BINARY_INTEGER DEFAULT 1,  
    num_results     IN BINARY_INTEGER DEFAULT NULL,  
    sample_size     IN BINARY_INTEGER DEFAULT NULL  
);
```

Parameters

Table 281-6 DETECT_CHARSET Procedure Parameters

Parameter	Description
result	Result table of type <code>CHARSET_RESULT_TABLE</code> . Each result row consists of an Oracle character set name and its score. The rows are ordered by score in descending order, that is, the character set with the highest score (most likely) is listed first, and the character set with the lowest score (least likely) is listed last.
src	Data sample whose character set is to be detected.
profile	Language and character set detection profile identifier: <ul style="list-style-type: none"> 1 - Supports the languages and character sets supported by LCSSCAN and GDK. When this profile is used and the given sample data is binary data, the procedure does not return a reasonable result. 2 - Supports the languages and character sets supported by LCSSCAN and GDK, as well as the pseudo BINARY language and the pseudo BINARY character set. This profile does not support the AL16UTF16 character set. <p>The default profile identifier is 1.</p> <p>See Also: <i>Oracle Database Globalization Support Guide</i> for the list of languages and character sets supported by LCSSCAN and GDK</p>
num_results	Number of result rows to store in the result table. The default is NULL, meaning the procedure stores all result rows in the result table.
sample_size	Sampling size of the data (in bytes). If this value is greater than the length of the data, then the data length is used. The default is NULL, meaning the full length of the data is used.

Usage Notes

If the given data sample is NULL, then the procedure returns a result table with no rows.

Example

Create a table that contains a data sample of type VARCHAR2.

```
CREATE TABLE src_data (sample VARCHAR2(40));
INSERT INTO src_data VALUES ('Hello! How are you?');
```

Use the `DETECT_CHARSET` procedure to analyze the data sample.

```
VAR l_char VARCHAR2(40)
EXEC SELECT sample INTO :l_char FROM src_data;

VAR l_cur REFCURSOR

DECLARE
    l_result    UTL_I18N.CHARSET_RESULT_TABLE;
BEGIN
    UTL_I18N.DETECT_CHARSET(l_result, :l_char, 1, 5);
    OPEN :l_cur FOR SELECT * FROM TABLE(l_result);
```

```
END;
/

PRINT l_cur
```

The result table displays the top five likeliest Oracle character sets for the given data sample.

CHARSET	SCORE
US7ASCII	.853497
EE8ISO8859P2	.0933974
NEE8ISO8859P4	.0224543
AL16UTF16	.0100793
WE8ISO8859P9	.00778038

281.5.2 DETECT_LANGUAGE Procedure

This procedure detects the most likely Oracle languages for a given data sample.

The procedure is overloaded to accept data of type BFILE, BLOB, CLOB, VARCHAR2, or NVARCHAR2. The procedure analyzes the data and returns its possible Oracle languages, ranked by likelihood. It stores the results in a table of type LANGUAGE_RESULT_TABLE.

Syntax

This procedure analyzes BFILE data:

```
UTL_I18N.DETECT_LANGUAGE (
    result      OUT language_result_table,
    src         IN BFILE,
    profile     IN BINARY_INTEGER DEFAULT 1,
    num_results IN BINARY_INTEGER DEFAULT NULL,
    sample_size IN BINARY_INTEGER DEFAULT NULL
);
```

This procedure analyzes BLOB data:

```
UTL_I18N.DETECT_LANGUAGE (
    result      OUT language_result_table,
    src         IN BLOB,
    profile     IN BINARY_INTEGER DEFAULT 1,
    num_results IN BINARY_INTEGER DEFAULT NULL,
    sample_size IN BINARY_INTEGER DEFAULT NULL
);
```

This procedure analyzes CLOB data:

```
UTL_I18N.DETECT_LANGUAGE (
    result      OUT language_result_table,
    src         IN CLOB,
    profile     IN BINARY_INTEGER DEFAULT 1,
    num_results IN BINARY_INTEGER DEFAULT NULL,
    sample_size IN BINARY_INTEGER DEFAULT NULL
);
```

This procedure analyzes VARCHAR2 or NVARCHAR2 data:

```
UTL_I18N.DETECT_LANGUAGE (
    result      OUT language_result_table,
    src         IN VARCHAR2,
    profile     IN BINARY_INTEGER DEFAULT 1,
    num_results IN BINARY_INTEGER DEFAULT NULL,
    sample_size IN BINARY_INTEGER DEFAULT NULL
);
```

Parameters

Table 281-7 DETECT_LANGUAGE Procedure Parameters

Parameter	Description
result	Result table of type <code>LANGUAGE_RESULT_TABLE</code> . Each result row consists of an Oracle language name and its score. The rows are ordered by score in descending order, that is, the language with the highest score (most likely) is listed first, and the language with the lowest score (least likely) is listed last.
src	Data sample whose language is to be detected.
profile	Language and character set detection profile identifier: <ul style="list-style-type: none"> 1 - Supports the languages and character sets supported by LCSSCAN and GDK. When this profile is used and the given sample data is binary data, the procedure does not return a reasonable result. 2 - Supports the languages and character sets supported by LCSSCAN and GDK, as well as the pseudo BINARY language and the pseudo BINARY character set. This profile does not support the AL16UTF16 character set. <p>The default profile identifier is 1.</p> <p>See Also: <i>Oracle Database Globalization Support Guide</i> for the list of languages and character sets supported by LCSSCAN and GDK</p>
num_results	Number of result rows to store in the result table. The default is NULL, meaning the procedure stores all result rows in the result table.
sample_size	Sampling size of the data (in bytes). If this value is greater than the length of the data, then the data length is used. The default is NULL, meaning the full length of the data is used.

Usage Notes

If the given data sample is NULL, then the procedure returns a result table with no rows.

Examples

Create a table that contains a data sample of type VARCHAR2.

```
CREATE TABLE src_data (sample VARCHAR2(40));
INSERT INTO src_data VALUES ('Hello! How are you?');
```

Use the `DETECT_LANGUAGE` procedure to analyze the data sample.

```

VAR l_char VARCHAR2(40)
EXEC SELECT sample INTO :l_char FROM src_data;

VAR l_cur REFCURSOR

DECLARE
  l_result      UTL_I18N.LANGUAGE_RESULT_TABLE;
BEGIN
  UTL_I18N.DETECT_LANGUAGE(l_result, :l_char, 1, 5);
  OPEN :l_cur FOR SELECT * FROM TABLE(l_result);
END;
/

PRINT l_cur

```

The result table displays the top five likeliest Oracle languages for the given data sample.

LANGUAGE	SCORE
-----	-----
ENGLISH	.245638
ITALIAN	.0876835
POLISH	.0758762
FRENCH	.0744972
INDONESIAN	.0538222

281.5.3 DETECT_LANGUAGE_CHARSET Procedure

This procedure detects the most likely Oracle languages and Oracle character sets for a given data sample.

The procedure is overloaded to accept data of type `BFILE`, `BLOB`, `CLOB`, `VARCHAR2`, or `NVARCHAR2`. The procedure analyzes the data and returns its possible Oracle languages and Oracle character sets, ranked by likelihood. It stores the results in a table of type `LANGUAGE_CHARSET_RESULT_TABLE`.

Syntax

This procedure analyzes `BFILE` data:

```

UTL_I18N.DETECT_LANGUAGE_CHARSET (
  result      OUT language_charset_result_table,
  src         IN BFILE,
  profile     IN BINARY_INTEGER DEFAULT 1,
  num_results IN BINARY_INTEGER DEFAULT NULL,
  sample_size IN BINARY_INTEGER DEFAULT NULL
);

```

This procedure analyzes `BLOB` data:

```

UTL_I18N.DETECT_LANGUAGE_CHARSET (
  result      OUT language_charset_result_table,
  src         IN BLOB,

```

```

profile          IN BINARY_INTEGER DEFAULT 1,
num_results     IN BINARY_INTEGER DEFAULT NULL,
sample_size     IN BINARY_INTEGER DEFAULT NULL
);

```

This procedure analyzes CLOB data:

```

UTL_I18N.DETECT_LANGUAGE_CHARSET (
  result         OUT language_charset_result_table,
  src            IN CLOB,
  profile        IN BINARY_INTEGER DEFAULT 1,
  num_results    IN BINARY_INTEGER DEFAULT NULL,
  sample_size    IN BINARY_INTEGER DEFAULT NULL
);

```

This procedure analyzes VARCHAR2 or NVARCHAR2 data:

```

UTL_I18N.DETECT_LANGUAGE_CHARSET (
  result         OUT language_charset_result_table,
  src            IN VARCHAR2,
  profile        IN BINARY_INTEGER DEFAULT 1,
  num_results    IN BINARY_INTEGER DEFAULT NULL,
  sample_size    IN BINARY_INTEGER DEFAULT NULL
);

```

Parameters

Table 281-8 DETECT_LANGUAGE_CHARSET Procedure Parameters

Parameter	Description
result	Result table of type LANGUAGE_CHARSET_RESULT_TABLE. Each result row consists of an Oracle language, an Oracle character set name, and their score. The rows are ordered by score in descending order, that is, the language and character set with the highest score (most likely) is listed first, and the language and character set with the lowest score (least likely) is listed last.
src	Data sample whose language and character set are to be detected.
profile	Language and character set detection profile identifier: <ul style="list-style-type: none"> 1 - Supports the languages and character sets supported by LCSSCAN and GDK. When this profile is used and the given sample data is binary data, the procedure does not return a reasonable result. 2 - Supports the languages and character sets supported by LCSSCAN and GDK, as well as the pseudo BINARY language and the pseudo BINARY character set. This profile does not support the AL16UTF16 character set. <p>The default profile identifier is 1.</p> <p>See Also: <i>Oracle Database Globalization Support Guide</i> for the list of languages and character sets supported by LCSSCAN and GDK</p>
num_results	Number of result rows to store in the result table. The default is NULL, meaning the procedure stores all result rows in the result table.
sample_size	Sampling size of the data (in bytes). If this value is greater than the length of the data, then the data length is used. The default is NULL, meaning the full length of the data is used.

Usage Notes

If the given data sample is NULL, then the procedure returns a result table with no rows.

Examples

Create a table that contains a data sample of type VARCHAR2.

```
CREATE TABLE src_data (sample VARCHAR2(40));
INSERT INTO src_data VALUES ('Hello! How are you?');
```

Use the DETECT_LANGUAGE_CHARSET procedure to analyze the data sample.

```
VAR l_char VARCHAR2(40)
EXEC SELECT sample INTO :l_char FROM src_data;

VAR l_cur REFCURSOR

DECLARE
    l_result      UTL_I18N.LANGUAGE_CHARSET_RESULT_TABLE;
BEGIN
    UTL_I18N.DETECT_LANGUAGE_CHARSET(l_result, :l_char, 1, 5);
    OPEN :l_cur FOR SELECT * FROM TABLE(l_result);
END;
/

PRINT l_cur
```

The result table displays the top five likeliest Oracle languages and Oracle character sets for the given data sample.

LANGUAGE	CHARSET	SCORE
ENGLISH	US7ASCII	.245023
ITALIAN	US7ASCII	.0873574
FRENCH	US7ASCII	.0741715
INDONESIAN	US7ASCII	.0534795
POLISH	EE8ISO8859P2	.0380973

281.5.4 ESCAPE_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document.

Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document. Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `å` is the numeric character reference for the small letter "a" with a

ring above, whereas `å` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `<` represents the `<` (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

Syntax

```
UTL_I18N.ESCAPE_REFERENCE(  
    str          IN VARCHAR2 CHARACTER SET ANY_CS,  
    page_cs_name IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 281-9 ESCAPE_REFERENCE Function Parameters

Parameter	Description
<code>str</code>	Specifies the input string
<code>page_cs_name</code>	Specifies the character set of the document. If <code>page_cs_name</code> is <code>NULL</code> , then the database character set is used for <code>CHAR</code> data and the national character set is used for <code>NCHAR</code> data.

Usage Notes

If the user specifies an invalid character set or a `NULL` string, then the function returns a `NULL` string.

Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns `'hello < å'`.

281.5.5 GET_COMMON_TIME_ZONES Function

This function returns a listing of the most coemmonly used time zones. This list contains a subset of the time zones that are supported in the database.

Syntax

```
UTL_I18N.GET_COMMON_TIME_ZONES  
RETURN STRING_ARRAY;
```

Examples

Returns the list of the most commonly used time zones.

```
DECLARE  
    retval UTL_I18N.STRING_ARRAY;  
BEGIN  
    retval := UTL_I18N.GET_COMMON_TIME_ZONES;  
END;  
/
```

281.5.6 GET_DEFAULT_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

See Also:

"[MAP_CHARSET Function](#)" for an explanation of an e-mail safe character set

Syntax

```
UTL_I18N.GET_DEFAULT_CHARSET(
    language IN VARCHAR2,
    context  IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    iswindows IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

Table 281-10 GET_DEFAULT_CHARSET Function Parameters

Parameter	Description
language	Specifies a valid Oracle language
context	GENERIC_CONTEXT MAIL_CONTEXT GENERIC_CONTEXT: Returns the default character set for general cases MAIL_CONTEXT: Returns the default e-mail safe character set name
iswindows	If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE. iswindows has no effect if context is set as GENERIC_CONTEXT.

Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

Examples

GENERIC_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

MAIL_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

```
MAIL_CONTEXT, iswindows=FALSE
```

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

281.5.7 GET_DEFAULT_ISO_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (  
    territory IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

Table 281-11 GET_DEFAULT_ISO_CURRENCY Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Displays the default ISO currency code for China.

```
DECLARE  
    retval VARCHAR2(50);  
BEGIN  
    retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');  
    DBMS_OUTPUT.PUT_LINE(retval);  
END;  
/
```

281.5.8 GET_DEFAULT_LINGUISTIC_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (  
    language IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

Table 281-12 GET_DEFAULT_LINGUISTIC_SORT Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```
DECLARE
    retval VARCHAR2(50);
BEGIN
    SELECT value INTO retval FROM nls_database_parameters
    WHERE parameter = 'NLS_LANGUAGE';
    retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
    DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

281.5.9 GET_LOCAL_LANGUAGES Function

This function returns the local language names for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_LANGUAGES (
    territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 281-13 GET_LOCAL_LANGUAGES Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

Examples

Returns the list of local languages used in Belgium.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
```

```

    retval := UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/
...
Count = 2
DUTCH
FRENCH

```

281.5.10 GET_LOCAL_LINGUISTIC_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A `BINARY` sort is included for all languages.

Syntax

```

UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
    language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;

```

Parameters

Table 281-14 GET_LOCAL_LINGUISTIC_SORTS Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Displays the local linguistic sort names for `JAPANESE`.

```

DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.COUNT);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/
...
Count = 2

```

```
JAPANESE_M  
BINARY
```

281.5.11 GET_LOCAL_TERRITORIES Function

This function returns the local territory names for the specified language.

Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (  
    language IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN STRING_ARRAY;
```

Parameters

Table 281-15 GET_LOCAL_TERRITORIES Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE  
    retval UTL_I18N.STRING_ARRAY;  
    cnt    INTEGER;  
BEGIN  
    retval := UTL_I18N.GET_LOCAL_TERRITORIES('GERMAN');  
    DBMS_OUTPUT.PUT('Count = ');  
    DBMS_OUTPUT.PUT_LINE(retval.LAST);  
    cnt := retval.FIRST;  
    WHILE cnt IS NOT NULL LOOP  
        DBMS_OUTPUT.PUT_LINE(retval(cnt));  
        cnt := retval.NEXT(cnt);  
    END LOOP;  
END;  
/  
...  
Count = 4  
GERMANY  
AUSTRIA  
LUXEMBOURG  
SWITZERLAND
```

281.5.12 GET_LOCAL_TIME_ZONES Function

This function returns the local time zone IDs for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
    territory      IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

Parameters

Table 281-16 GET_LOCAL_TIME_ZONES Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Creates a function that returns the list of time zones locally used in the territory `AZERBAIJAN` followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
    retval  utl_i18n.string_array;
    retval2 utl_i18n.string_array;
    stpos   INTEGER;
BEGIN
    retval := utl_i18n.get_local_time_zones(
        territory);
    retval2 := utl_i18n.get_common_time_zones;
    stpos := retval.LAST + 1;
    retval(stpos) := '-----'; -- a separator
    FOR i IN retval2.FIRST..retval2.LAST LOOP
        stpos := stpos + 1;
        retval(stpos) := retval2(i);
    END LOOP;
    RETURN retval;
END;
```

Returns the list of local time zones for `AZERBAIJAN` followed by the common time zones with a separator string of five dashes (-----).

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt   INTEGER;
BEGIN
    DBMS_OUTPUT.ENABLE(100000);
```

```

    retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
    cnt := retval.FIRST;
WHILE cnt IS NOT NULL LOOP
    DBMS_OUTPUT.PUT_LINE(retval(cnt));
    cnt := retval.NEXT(cnt);
END LOOP;
END;
/

```

281.5.13 GET_MAX_CHARACTER_SIZE Function

This function returns the maximum character size of a given character set.

Syntax

```

UTL_I18N.GET_MAX_CHARACTER_SIZE(
    charset_name      IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;

```

Parameters

Table 281-17 GET_MAX_CHARACTER_SIZE Function Parameters

Parameter	Description
charset_name	Specifies a valid character set name. It is case-insensitive.

Usage Notes

For shift-sensitive character sets, the returned maximum character size will include the possible extra shift characters.

Examples

```

UTL_I18N.GET_MAX_CHARACTER_SIZE('AL32UTF8');

```

This returns 4.

281.5.14 GET_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

Syntax

```
UTL_I18N.GET_TRANSLATION (
    parameter          IN VARCHAR2 CHARACTER SET ANY_CS,
    trans_language     IN VARCHAR2 'AMERICAN',
    flag               IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

Parameters

Table 281-18 GET_TRANSLATION Function Parameters

Parameter	Description
parameter	Specifies a valid language name, territory name, or a combined string in the form of <i>language_territory</i> . It is case-insensitive.
trans_language	Specifies a translation language name. For example, ITALIAN is for the Italian language. The default is AMERICAN, which indicates American English.
flag	Specifies the translation type: <ul style="list-style-type: none"> LANGUAGE_TRANS: The function returns the language translation. TERRITORY_TRANS: The function returns the territory translation. LANGUAGE_TERRITORY_TRANS: The function returns the language and territory translation. The default translation type is LANGUAGE_TRANS.

Usage Notes

If VARCHAR2 is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using NVARCHAR2 as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide GUJARATI translations, so the returned translation would be in American English.

Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
    CURSOR c1 IS
        SELECT value FROM V$NLS_VALID_VALUES
        WHERE parameter = 'LANGUAGE'
        ORDER BY value;
    retval NVARCHAR2(100);
BEGIN
    FOR item IN c1 LOOP
        retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
```

```

        END LOOP;
    END;

```

281.5.15 MAP_CHARSET Function

This function maps a character set to another character set.

It maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

Syntax

```

UTL_I18N.MAP_CHARSET(
    charset    IN VARCHAR2,
    context    IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    flag       IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;

```

Parameters

Table 281-19 MAP_CHARSET Function Parameters

Parameter	Description
charset	Specifies the character set name to be mapped. The mapping is case-insensitive.
context	<p>GENERIC_CONTEXT MAIL_CONTEXT</p> <p>GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value.</p> <p>MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.</p>
flag	<ul style="list-style-type: none"> • ORACLE_TO_IANA IANA_TO_ORACLE if GENERIC_CONTEXT is set <ul style="list-style-type: none"> ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default. IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name. • MAIL_GENERIC MAIL_WINDOWS if MAIL_CONTEXT is set <ul style="list-style-type: none"> MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform. MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.

Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the `MAP_CHARSET` function with the `ORACLE_TO_IANA` option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP_CHARSET function with the MAIL_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the MAP_CHARSET function with the MAIL_CONTEXT | MAIL_GENERIC option with the database character set name, WE8DEC. The result is WE8ISO8859P1.
2. Convert the contents stored in the database to WE8ISO8859P1.
3. Call the MAP_CHARSET function with the ORACLE_TO_IANA | GENERIC_CONTEXT option with the e-mail safe character set, WE8ISO8859P1. The result is ISO-8859-1.
4. Specify ISO-8859-1 in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns NULL.

Note:

Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

Examples

Generic Context

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_ORACLE)
```

This returns 'WE8ISO8859P1'.

Context

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context, utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

See Also:

Oracle Database Globalization Support Guide for a list of valid Oracle character sets

281.5.16 MAP_FROM_SHORT_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (
    language          IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 281-20 MAP_FROM_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid short language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table `customers` is from the `oe` user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the `GET_DEFAULT_LINGUISTIC_SORT` procedure.

```
DECLARE
  short_n VARCHAR2(10);
  ling_n VARCHAR2(50);
BEGIN
  SELECT nls_language INTO short
  FROM customers WHERE customer_id = 9000;
  ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
  UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
  DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
```

281.5.17 MAP_LANGUAGE_FROM_ISO Function

This function returns an Oracle language name from an ISO locale name.

Syntax

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
  isocale IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 281-21 MAP_LANGUAGE_FROM_ISO Function Parameters

Parameter	Description
isocale	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the language (for example, `en_` instead of `en_US`), then the function returns the default language name for the specified language (for example, `American`).

Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

See Also:

Oracle Database Globalization Support Guide for a list of valid Oracle languages

281.5.18 MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name.

A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (
    ora_language  IN VARCHAR2,
    ora_territory IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 281-22 MAP_LOCALE_TO_ISO Function Parameters

Parameter	Description
<code>ora_language</code>	Specifies an Oracle language name. It is case-insensitive.
<code>ora_territory</code>	Specifies an Oracle territory name. It is case-insensitive.

Usage Notes

If the user specifies an invalid string, then the function returns a `NULL` string.

Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns 'en_US'.

 **See Also:**

Oracle Database Globalization Support Guide for a list of valid Oracle languages and territories

281.5.19 MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (  
    isolocale IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 281-23 MAP_TERRITORY_FROM_ISO Function Parameters

Parameter	Description
isolocale	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the territory (for example, `_fr` instead of `fr_fr`), then the function returns the default territory name for the specified territory (for example, `France`).

Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

 **See Also:**

Oracle Database Globalization Support Guide for a list of valid Oracle territories

281.5.20 MAP_TO_SHORT_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (  
    language IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

Table 281-24 MAP_TO_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid full language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the short language name for the language.

```
DECLARE retval VARCHAR2(100);BEGIN retval :=
UTL_I18N.MAP_TO_SHORT_LANGUAGE('american'); DBMS_OUTPUT.PUT_LINE(retval);END;/US
```

281.5.21 RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL,
    scanned_length OUT PLS_INTEGER,
    shift_status  IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 281-25 RAW_TO_CHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to a VARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned

Table 281-25 (Cont.) RAW_TO_CHAR Function Parameters

Parameter	Description
<code>shift_status</code>	<p>Specifies the shift status at the end of the scan. The user must set it to <code>SHIFT_IN</code> the first time it is called in piecewise conversion.</p> <p>Note: ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. <code>shift_status</code> cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.</p>

Usage Notes

If the user specifies an invalid character set, `NULL` data, or data whose length is 0, then the function returns a `NULL` string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde' || chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde' || chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
nvalue VARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                remote_port => 2000);

LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
```

```

    then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
    else
        rtemp := '';
    end if;
    /* do anything you want with nvalue */
    /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
    WHEN utl_tcp.end_of_input THEN
        utl_tcp.close_connection(conn);
END;
```

281.5.22 RAW_TO_NCHAR Functions

This function converts **RAW** data from a valid Oracle character set to an **NVARCHAR2** string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```

UTL_I18N.RAW_TO_NCHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```

UTL_I18N.RAW_TO_NCHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL,
    scanned_length OUT PLS_INTEGER,
    shift_status  IN OUT PLS_INTEGER)
RETURN NVARCHAR2;
```

Parameters

Table 281-26 RAW_TO_NCHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to an NVARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned

Table 281-26 (Cont.) RAW_TO_NCHAR Function Parameters

Parameter	Description
<code>shift_status</code>	<p>Specifies the shift status at the end of the scan. The user must set it to <code>SHIFT_IN</code> the first time it is called in piecewise conversion.</p> <p>Note: ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. <code>shift_status</code> cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.</p>

Usage Notes

If the user specifies an invalid character set, `NULL` data, or data whose length is 0, then the function returns a `NULL` string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:

```
'abcde' || chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde' || chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
nvalue NVARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                remote_port => 2000);

LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
```

```

then
    rtemp := utl_raw.substr(rvalue, converted_len+1);
else
    rtemp := '';
end if;
/* do anything you want with nvalue */
/* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
WHEN utl_tcp.end_of_input THEN
    utl_tcp.close_connection(conn);
END;

```

281.5.23 STRING_TO_RAW Function

This function converts a `VARCHAR2` or `NVARCHAR2` string to another valid Oracle character set and returns the result as `RAW` data.

Syntax

```

UTL_I18N.STRING_TO_RAW(
    data          IN VARCHAR2 CHARACTER SET ANY_CS,
    dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;

```

Parameters

Table 281-27 STRING_TO_RAW Function Parameters

Parameter	Description
<code>data</code>	Specifies the <code>VARCHAR2</code> or <code>NVARCHAR2</code> string to convert.
<code>dst_charset</code>	Specifies the destination character set. If <code>dst_charset</code> is <code>NULL</code> , then the database character set is used for <code>CHAR</code> data and the national character set is used for <code>NCHAR</code> data.

Usage Notes

If the user specifies an invalid character set, a `NULL` string, or a string whose length is 0, then the function returns a `NULL` string.

Examples

```

DECLARE
    r raw(50);
    s varchar2(20);
BEGIN
    s:='abcdef'||chr(170);
    r:=utl_i18n.string_to_raw(s,'utf8');
    dbms_output.put_line(rawtohex(r));
end;
/

```

This returns a hex value of '6162636465666C2AA'.

281.5.24 TRANSLITERATE Function

This function performs script transliteration.

Syntax

```
UTL_I18N.TRANSLITERATE (
  data IN VARCHAR2 CHARACTER SET ANY_CS,
  name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

Parameters

Table 281-28 TRANSLITERATE Function Parameters

Parameter	Description
data	Specifies the data to be converted. Either CHAR or NCHAR datatype can be specified.
name	Specifies the transliteration name string. For a list of valid names, see Table 281-29 .

Constants

Table 281-29 TRANSLITERATE Function Constants

Constant Name	Value	Description
ARABIC_LATIN_ISO233	'arabic_latin_iso233'	Converts Arabic characters to Latin characters.
CYR_ASCII_ICA093	'cyr_ascii_ICA093'	Converts Cyrillic characters to ASCII characters.
CYR_BG_ASCII_ICA09303	'cyr_bg_ascii_ICA09303'	Converts Cyrillic Bulgaria characters to ASCII characters.
CYR_BY_ASCII_ICA09303	'cyr_by_ascii_ICA09303'	Converts Cyrillic Belarus characters to ASCII characters.
CYR_MK_ASCII_ICA09303	'cyr_mk_ascii_ICA09303'	Converts Cyrillic North Macedonia characters to ASCII characters.
CYR_RS_ASCII_ICA09303	'cyr_rs_ascii_ICA09303'	Converts Cyrillic Serbia characters to ASCII characters.
CYR_UA_ASCII_ICA09303	'cyr_ua_ascii_ICA09303'	Converts Cyrillic Ukraine characters to ASCII characters.
CYRILLIC_LATIN_ISO9	'cyrillic_latin_iso9'	Converts Cyrillic characters to Latin characters.
FWKATAKANA_HIRAGANA	'fwkatakana_hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
FWKATAKANA_HWKATAKANA	'fwkatakana_hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
GREEK_LATIN_ISO843	'greek_latin_iso843'	Converts Greek characters to Latin characters.

Table 281-29 (Cont.) TRANSLITERATE Function Constants

Constant Name	Value	Description
HEBREW_LATIN_ISO259	'hebrew_latin_iso259'	Converts Hebrew characters to Latin characters.
HIRAGANA_FWKATAANA	'hiragana_fwkataana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_HWKATAANA	'hiragana_hwkataana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.
HWKATAKANA_FWKATAKANA	'hwkatakana_fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRAGANA	'hwkatakana_hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
KANA_FWKATAKANA	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HIRAGANA	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.
KANA_HWKATAKANA	'kana_hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.
LATIN_ASCII_DIN91379	'latin_ascii_din91379'	Converts Latin characters to ASCII characters.
MODERN_HEBREW_LATIN_ISO259_2	'modern_hebrew_latin_iso259_2'	Converts Modern Hebrew characters to Latin Characters.

Usage Notes

- The user must provide the input data for transliteration in NFC form.
- The function returns the converted string.

Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
   SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

The following figure shows how this output might look.

Figure 281-1 Loading Locale-Specific Data to the Database

The following statement normalizes one kana name to hiragana:

```

DECLARE
  Name  japanese_emp.ename%TYPE;
  Eno   CONSTANT NUMBER(4) := 1;
BEGIN
  SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
  name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
  UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
  WHEN UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
    DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/

```

281.5.25 UNESCAPE_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

See Also:

"[ESCAPE_REFERENCE Function](#)" for more information about escape sequences

Syntax

```

UTL_I18N.UNESCAPE_REFERENCE (
  str IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;

```

Parameters

Table 281-30 UNESCAPE_REFERENCE Function Parameters

Parameter	Description
str	Specifies the input string

Usage Notes

If the user specifies a `NULL` string or a string whose length is 0, then the function returns a `NULL` string. If the function fails, then it returns the original string.

Examples

```

UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &#xe5;')

```

This returns 'hello <' || chr(229).

281.5.26 VALIDATE_CHARACTER_ENCODING Functions

This function validates the character encoding of `VARCHAR2`, `NVARCHAR2`, `CLOB`, and `NCLOB` data. The validation is based on the database character set for

VARCHAR2 and CLOB data and national character set for NVARCHAR2 and NCLOB data.

For Unicode character sets, such as AL32UTF8, AL16UTF16, AL16UTF16LE, UTF8, and UTFE, any byte sequences mapped to the following Unicode code points are considered invalid:

- Unpaired surrogate code point
- Non-character code point

In addition, any irregular or illegal UTF-8 byte sequence is considered invalid for AL32UTF8 and UTF8 character sets.

The `VALIDATE_CHARACTER_ENCODING` function is overloaded. One function is for validating VARCHAR2 and NVARCHAR2 data, while the other function is for validating CLOB and NCLOB data.

- **Validating VARCHAR2 and NVARCHAR2 data**

A VARCHAR2 or NVARCHAR2 byte or its byte sequence is considered invalid for a character set, if it does not map to any of the characters defined in the character set.

- **Validating CLOB and NCLOB data**

A LOB character is considered invalid for a character set if a byte (in case of a single-byte database character set) or a byte pair (in case of UTF-16 encoding used with a multibyte database character set) corresponding to the encoding of the LOB character does not map to any of the characters defined in the character set.

Syntax

This function validates VARCHAR2 and NVARCHAR2 data:

```
UTL_I18N.VALIDATE_CHARACTER_ENCODING (
    data IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

This function validates CLOB and NCLOB data:

```
UTL_I18N.VALIDATE_CHARACTER_ENCODING (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 281-31 VALIDATE_CHARACTER_ENCODING Function Parameters

Parameter	Description
<code>data</code>	VARCHAR2 or NVARCHAR2 data to validate.
<code>lob_loc</code>	CLOB or NCLOB data to validate.

Usage Notes

This function returns the offset of the first invalid byte for the VARCHAR2 or NVARCHAR2 data. It returns the offset of the first invalid character for the CLOB or NCLOB data. It returns 0, if all the bytes in the character data are valid. It returns `NULL`, if the value of the parameter `data` or `lob_loc` is `NULL`.

Examples

This example validates the character encoding of NVARCHAR2 and CLOB data where the database character set is AL32UTF8 while the national character set is AL16UTF16.

```
CREATE TABLE temp(col1 NVARCHAR2(20), col2 CLOB);
INSERT INTO temp VALUES(UNISTR('foo\D800bar'), UNISTR('foo\D800bar'));
COMMIT;
SELECT UTL_I18N.VALIDATE_CHARACTER_ENCODING(col1) invalid_offset_column1,
       UTL_I18N.VALIDATE_CHARACTER_ENCODING(col2) invalid_offset_column2
FROM temp;
```

The query returns:

```
INVALID_OFFSET_COLUMN1  INVALID_OFFSET_COLUMN2
-----
                        7                      4
```

Here, the surrogate code point U+D800 is invalid. The number 7 is returned as INVALID_OFFSET_COLUMN1, because for col1, 'foo' is encoded in 6 bytes in NVARCHAR2 and the invalid code point U+D800 starts at offset 7. The number 4 is returned as INVALID_OFFSET_COLUMN2, because for col2, 'foo' is encoded in 3 UTF-16 code points in CLOB and the invalid code point U+D800 starts at offset 4.

282

UTL_IDENT

The `UTL_IDENT` package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)

282.1 UTL_IDENT Overview

The `UTL_IDENT` package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.

282.2 UTL_IDENT Security Model

The `UTL_IDENT` package runs as the package owner `SYS`. The public synonym `UTL_IDENT`, and `EXECUTE` permission on this package is granted to `PUBLIC`.

282.3 UTL_IDENT Constants

The `UTL_IDENT` package defines several constants to use when specifying parameter values.

These constants are shown in the following table.

Table 282-1 UTL_IDENT Constants

Constant	Type	Value	Description
<code>IS_ORACLE_SERVER</code>	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Server or not
<code>IS_ORACLE_CLIENT</code>	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Client or not
<code>IS_TIMESTEN</code>	BOOLEAN	TRUE/FALSE	Stipulates if TimesTen or not
<code>IS_ORACLE_FORMS</code>	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Forms or not

UTL_INADDR

The `UTL_INADDR` package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- [Security Model](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of UTL_INADDR Subprograms](#)

283.1 UTL_INADDR Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the `connect` privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

Note:

For more information about managing fine-grained access, see *Oracle Database Security Guide*.

283.2 UTL_INADDR Exceptions

This table describes exceptions raised by `UTL_INADDR` subprograms.

Table 283-1 *Exception - Internet Address Package*

Number	Exception	Description
ORA-24247	NETWORK_ACCESS_DENIED	Access to network is denied.
ORA-29257	UNKNOWN_HOST	The host is unknown.

283.3 UTL_INADDR Examples

This `UTL_INADDR` example retrieves the local host name and IP address.

```
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME); -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS); -- get local IP addr
END;
/
```

283.4 Summary of UTL_INADDR Subprograms

This table lists the UTL_INADDR subprograms and briefly describes them.

Table 283-2 UTL_INADDR Package Subprograms

Subprogram	Description
GET_HOST_ADDRESS Function	Retrieves the IP address of the local or remote host given its name
GET_HOST_NAME Function	Retrieves the name of the local or remote host given its IP address

283.4.1 GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (  
    host IN VARCHAR2 DEFAULT NULL)  
RETURN host_address VARCHAR2;
```

Parameters

Table 283-3 GET_HOST_ADDRESS Function Parameters

Parameter	Description
host	The name of the host to retrieve the IP address.

Return Values

Table 283-4 GET_HOST_ADDRESS Function Return Values

Parameter	Description
host_address	The IP address of the specified host, or that of the local host if host is NULL.

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege on `LOCALHOST`.

283.4.2 GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```
UTL_INADDR.GET_HOST_NAME (  
    ip IN VARCHAR2 DEFAULT NULL)  
RETURN host_name VARCHAR2;
```

Parameters

Table 283-5 GET_HOST_NAME Function Parameters

Parameter	Description
ip	The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.

Return Values

Table 283-6 GET_HOST_NAME Function Return Values

Parameter	Description
host_name	The name of the local or remote host of the specified IP address.

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege granted through `DBMS_NETWORK_ACL_ADMIN` on `LOCALHOST`.

UTL_LMS

UTL_LMS retrieves and formats error messages in different languages.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of UTL_LMS Subprograms](#)

See Also:

Oracle Database Globalization Support Guide

284.1 UTL_LMS Security Model

This package must be created as the user SYS.

284.2 Summary of UTL_LMS Subprograms

This table lists the UTL_LMS subprograms and briefly describes them.

Table 284-1 UTL_LMS Package Subprograms

Function	Description
FORMAT_MESSAGE Function	Formats a retrieved error message
GET_MESSAGE Function	Retrieves an error message based on error number, product, facility, language, and message specified

284.2.1 FORMAT_MESSAGE Function

This function formats a message retrieved by the GET_MESSAGE function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

Special Character	Description
'%s'	Substitute the next string argument
'%d'	Substitute the next integer argument
'%%'	Represents the special character %

Syntax

```

UTL_LMS.FORMAT_MESSAGE (
    format IN VARCHAR2 CHARACTER SET ANY_CS,
    args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET format%CHARSET;

```

Parameters

Table 284-2 FORMAT_MESSAGE Procedure Parameters

Parameter	Description
format	Specifies the string to format
args	Specifies the list of arguments

Examples

```

DECLARE
    s varchar2(200);
    i pls_integer;
BEGIN
    i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
    dbms_output.put_line('before format, message is: '||s);
    dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
'my_column_name');
END;
/

```

The following is an unformatted message:

```
Type %d non pris en charge pour l'expression SQL sur la colonne %s.
```

The following is the formatted message:

```
Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
```

284.2.2 GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns 0 when it is successful. It returns -1 when it fails.

See Also:

Oracle Database Globalization Support Guide for more information about the `lmsgen` utility

Syntax

```

UTL_LMS.GET_MESSAGE (
    errnum   IN PLS_INTEGER,
    product  IN VARCHAR2,

```

```

    facility IN VARCHAR2,
    language IN VARCHAR2,
    message  OUT NOCOPY VARCHAR2CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;

```

Parameters

Table 284-3 GET_MESSAGE Function Parameters

Parameter	Description
errnum	Specifies the error number. Example: '972' (for ORA-00972)
product	Specifies the product to which the error message applies Example: 'rdbms'
facility	Specifies the error message prefix Example: 'ora'
language	Specifies the language of the message. The parameter is case-insensitive. The default is NULL, which causes GET_MESSAGE to use the value of the NLS_LANGUAGE session parameter.
message	Specifies the output buffer for the retrieved message

Usage Notes

If the `language` parameter is set to `NULL`, then the value of the `NLS_LANGUAGE` session parameter is used as the default.

Examples

```

DECLARE
    s varchar2(200);
    i pls_integer;
BEGIN
    i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
    dbms_output.put_line('OCI--00601 is: '||s);
END
/

```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

UTL_MAIL

The `UTL_MAIL` package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of UTL_MAIL Subprograms](#)

285.1 UTL_MAIL Security Model

`UTL_MAIL` is not installed by default because of the `SMTP_OUT_SERVER` configuration requirement and the security exposure this involves. In installing `UTL_MAIL`, you should take steps to prevent the port defined by `SMTP_OUT_SERVER` being swamped by data transmissions.

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note:

For more information about managing fine-grained access, see *Oracle Database Security Guide*.

285.2 UTL_MAIL Operational Notes

You must both install `UTL_MAIL` and define the `SMTP_OUT_SERVER`.

- To install `UTL_MAIL`:

```
sqlplus sys/<pwd>
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```

- You define the `SMTP_OUT_SERVER` parameter in the `init.ora` `rdbms` initialization file. However, if `SMTP_OUT_SERVER` is not defined, this invokes a default of `DB_DOMAIN` which is guaranteed to be defined to perform appropriately.

285.3 UTL_MAIL Rules and Limits

Use `UTL_MAIL` only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

285.4 Summary of UTL_MAIL Subprograms

This table lists the `UTL_MAIL` subprograms and briefly describes them.

Table 285-1 UTL_MAIL Package Subprograms

Subprogram	Description
SEND Procedure	Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients
SEND_ATTACH_RAW Procedure	Represents the <code>SEND</code> Procedure overloaded for <code>RAW</code> attachments
SEND_ATTACH_VARCHAR2 Procedure	Represents the <code>SEND</code> Procedure overloaded for <code>VARCHAR2</code> attachments

285.4.1 SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients.

It hides the SMTP API and exposes a one-line email facility for ease of use.

Syntax

```
UTL_MAIL.SEND (
  sender      IN  VARCHAR2 CHARACTER SET ANY_CS,
  recipients  IN  VARCHAR2 CHARACTER SET ANY_CS,
  cc          IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc        IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject     IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message    IN  VARCHAR2 CHARACTER SET ANY_CS,
  mime_type   IN  VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
  priority    IN  PLS_INTEGER DEFAULT 3,
  replyto    IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 285-2 SEND Procedure Parameters

Parameter	Description
<code>sender</code>	Email address of the sender
<code>recipients</code>	Email addresses of the recipient(s), separated by commas

Table 285-2 (Cont.) SEND Procedure Parameters

Parameter	Description
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
replyto	Defines to whom the reply email is to be sent

285.4.2 SEND_ATTACH_RAW Procedure

This procedure is the `SEND` Procedure overloaded for `RAW` attachments.

Syntax

```

UTL_MAIL.SEND_ATTACH_RAW (
  sender          IN  VARCHAR2 CHARACTER SET ANY_CS,
  recipients      IN  VARCHAR2 CHARACTER SET ANY_CS,
  cc              IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc             IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject        IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message        IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  mime_type      IN  VARCHAR2 DEFAULT CHARACTER SET ANY_CS
                  DEFAULT 'text/plain; charset=us-ascii',
  priority       IN  PLS_INTEGER DEFAULT 3,
  attachment     IN  RAW,
  att_inline     IN  BOOLEAN DEFAULT TRUE,
  att_mime_type  IN  VARCHAR2 CHARACTER SET ANY_CS
                  DEFAULT 'text/plain; charset=us-ascii',
  att_filename   IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  replyto       IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);

```

Parameters

Table 285-3 SEND_ATTACH_RAW Procedure Parameters

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL

Table 285-3 (Cont.) SEND_ATTACH_RAW Procedure Parameters

Parameter	Description
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	RAW attachment
att_inline	Specifies whether the attachment is viewable inline with the message body, default is TRUE
att_mime_type	Mime type of the attachment, default is 'application/octet'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

285.4.3 SEND_ATTACH_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
  sender          IN   VARCHAR2 CHARACTER SET ANY_CS,
  recipients      IN   VARCHAR2 CHARACTER SET ANY_CS,
  cc              IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc             IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject         IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message        IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  mime_type      IN   VARCHAR2 CHARACTER SET ANY_CS
                    DEFAULT 'text/plain; charset=us-
ascii',
  priority        IN   PLS_INTEGER DEFAULT 3,
  attachment      IN   VARCHAR2 CHARACTER SET ANY_CS, ,
  att_inline      IN   BOOLEAN DEFAULT TRUE,
  att_mime_type   IN   VARCHAR2 CHARACTER SET ANY_CS
                    DEFAULT 'text/plain; charset=us-ascii',
  att_filename    IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  replyto        IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 285-4 SEND_ATTACH_VARCHAR2 Procedure Parameters

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL

Table 285-4 (Cont.) SEND_ATTACH_VARCHAR2 Procedure Parameters

Parameter	Description
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	Text attachment
att_inline	Specifies whether the attachment is inline, default TRUE
att_mime_type	Mime type of the attachment, default is 'text/plain; charset=us-ascii'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

UTL_MATCH

The `UTL_MATCH` package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of UTL_MATCH Subprograms](#)

286.1 UTL_MATCH Overview

`UTL_MATCH` can use either the Edit Distance algorithm or Jaro-Winkler algorithm when determining matches.

Edit Distance, also known as Levenshtein Distance (named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of similarity between two strings, `s1` and `s2`. The distance is the number of insertions, deletions or substitutions required to transform `s1` to `s2`.

The Edit Distance between strings `shackleford` and `shackelford` = 2.

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

The following table shows similarity values returned by Jaro-Winkler and Edit Distance

Table 286-1 Comparison between normalized values returned by Jaro-Winkler and Edit Distance algorithms

String 1	String 2	Jaro Winkler	Edit Distance
Dunningham	Cunnigham	89	80
Abroms	Abrams	92	83
Lampley	Campley	90	86
Marhta	Martha	96	67
Jonathon	Jonathan	95	88
Jeraldine	Geraldine	92	89

286.2 UTL_MATCH Security Model

The `UTL_MATCH` package runs with definer's rights. `UTL_MATCH` must be created under `SYS`. Operations provided by this package are performed with `SYS` privileges.

286.3 Summary of UTL_MATCH Subprograms

This table lists the UTL_MATCH subprograms and briefly describes them.

Table 286-2 UTL_MATCH Package Subprograms

Subprogram	Description
EDIT_DISTANCE Function	Calculates the number of changes required to transform string-1 into string-2
EDIT_DISTANCE_SIMILARITY Function	Calculates the number of changes required to transform string-1 into string-2, returning a value between 0 (no match) and 100 (perfect match)
JARO_WINKLER Function	Calculates the measure of agreement between string-1 and string-2
JARO_WINKLER_SIMILARITY Function	Calculates the measure of agreement between string-1 and string-2, returning a value between 0 (no match) and 100 (perfect match)

286.3.1 EDIT_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

Syntax

```
UTL_MATCH.EDIT_DISTANCE (
  s1 IN VARCHAR2,
  s2 IN VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

Table 286-3 EDIT_DISTANCE Function Parameters

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;
-----
returns 2
```

286.3.2 EDIT_DISTANCE_SIMILARITY Function

This function calculates the number of insertions, deletions or substations required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two strings.

The value is typically between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.EDIT_DISTANCE_SIMILARITY (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN PLS_INTEGER;
```

Parameters

Table 286-4 EDIT_DISTANCE_SIMILARITY Function Parameters

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 82
```

286.3.3 JARO_WINKLER Function

This function calculates the measure of agreement between two strings.

Syntax

```
UTL_MATCH.JARO_WINKLER (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN BINARY_DOUBLE;
```

Parameters

Table 286-5 JARO_WINKLER Function Parameters

Parameter	Description
s1	Input
s2	input

Examples

```
SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 9.818E-001
```

286.3.4 JARO_WINKLER_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.JARO_WINKLER_SIMILARITY (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN PLS_INTEGER;
```

Parameters

Table 286-6 JARO_WINKLER_SIMILARITY Function Parameters

Parameter	Description
s1	Input
s2	input

Examples

```
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 98
```

UTL_NLA

The `UTL_NLA` package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as `VARRAYS`.

This chapter contains the following topics:

- [Overview](#)
- [Rules and Limits](#)
- [Security Model](#)
- [Subprogram Groups](#)
 - [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#)
 - [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#)
 - [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#)
 - [LAPACK Driver Routines \(Linear Equations\) Subprograms](#)
 - [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#)
- [Summary of UTL_NLA Subprograms](#)

287.1 UTL_NLA Overview

The `UTL_NLA` package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage) (Version 3.0) operations on vectors and matrices represented as `VARRAYS`.

Standards

For more information on the BLAS and LAPACK standards see

<http://www.netlib.org/blas/>

<http://www.netlib.org/lapack/>

Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the `BLAS_` prefix (for example, the [BLAS_ASUM Functions](#)). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.

- All LAPACK functions have the `LAPACK_` prefix (for example, the [LAPACK_GBSV Procedures](#)). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all `/work/` arguments have been removed. The `UTL_NLA` package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, `pack`, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

287.2 UTL_NLA Rules and Limits

Vectors and matrices are stored in `VARRAYS` with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size $R \times C \leq 1,000,000$.

287.3 UTL_NLA Security Model

The `UTL_NLA` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

287.4 Subprogram Groups

The `UTL_NLA` package contains subprogram groups for BLAS and LAPACK operations.

- [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#)
- [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#)
- [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#)
- [LAPACK Driver Routines \(Linear Equations\) Subprograms](#)
- [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#)

287.4.1 UTL_NLA BLAS Level 1 (Vector-Vector Operations) Subprograms

This table lists and briefly describes the `UTL_NLA` BLAS Level 1 Vector-Vector Operations subprograms.

Table 287-1 BLAS Level 1 (Vector-Vector Operations) Subprograms

Subprogram	Description
BLAS_ASUM Functions	Computes the sum of the absolute values of the vector components

Table 287-1 (Cont.) BLAS Level 1 (Vector-Vector Operations) Subprograms

Subprogram	Description
BLAS_AXPY Procedures	Copies $\alpha X + Y$ into vector Y
BLAS_COPY Procedures	Copies the contents of vector X to vector Y
BLAS_DOT Functions	Returns the dot (scalar) product of two vectors X and Y
BLAS_IAMAX Functions	Computes the index of the first element of a vector that has the largest absolute value
BLAS_NRM2 Functions	Computes the vector 2-norm (Euclidean norm)
BLAS_ROT Procedures	Returns the plane rotation of points
BLAS_ROTG Procedures	Returns the Givens rotation of points
BLAS_SCAL Procedures	Scales a vector by a constant
BLAS_SWAP Procedures	Swaps the contents of two vectors each of size n

287.4.2 UTL_NLA BLAS Level 2 (Matrix-Vector Operations) Subprograms

This table lists and briefly describes the UTL_NLA BLAS Level 2 Matrix-Vector Operations subprograms.

Table 287-2 BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_GBMV Procedures	Performs the matrix-vector operation $y := \alpha A^*x + \beta y$ or $y := \alpha A^T x + \beta y$ where α and β are scalars, x and y are vectors and A is an m by n band matrix, with k_l sub-diagonals and k_u super-diagonals
BLAS_GEMV Procedures	Performs the matrix-vector operations $y := \alpha A^*x + \beta y$ or $y := \alpha A^T x + \beta y$ where α and β are scalars, x and y are vectors and A is an m by n matrix
BLAS_GER Procedures	Performs a rank 1 operation $A := \alpha x x^T + A$ where α is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix
BLAS_SBMV Procedures	Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric band matrix, with k super-diagonals
BLAS_SPMV Procedures	Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix, supplied in packed form
BLAS_SPR Procedures	Performs a symmetric rank 1 operation $A := \alpha x x^T + A$ where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix, supplied in packed form
BLAS_SPR2 Procedures	Performs a symmetric rank 2 operation $A := \alpha x x^T + \alpha y y^T + A$ where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix, supplied in packed form

Table 287-2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_SBMV Procedures	Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric band matrix, with k super-diagonals
BLAS_SYMV Procedures	Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix
BLAS_SYR Procedures	Performs a symmetric rank 1 operation $A := \alpha x x^* + A$ where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix
BLAS_SYR2 Procedures	Performs a symmetric rank 2 operation $A := \alpha x y^* + \alpha y x^* + A$ where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix
BLAS_TBMV Procedures	Performs a matrix-vector operation $x := A^*x$ or $A^*x = b$ where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals
BLAS_TBSV Procedures	Solves one of the systems of equation $A^*x = b$ or $A^*x = b$ where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals
BLAS_TPMV Procedures	Performs a matrix-vector operation $x := A^*x$ or $x := A^*x$ where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TPSV Procedures	Solves one of the systems of equation $A^*x = b$ or $A^*x = b$ where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TRMV Procedures	Performs a matrix-vector operation $x := A^*x$ or $x := A^*x$ where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix
BLAS_TRSV Procedures	Solves one of the systems of equation $A^*x = b$ or $A^*x = b$ where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix

287.4.3 UTL_NLA BLAS Level 3 (Matrix-Matrix Operations) Subprograms

This table lists and briefly describes the UTL_NLA BLAS Level 3 Matrix-Matrix Operations subprograms.

Table 287-3 BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Subprogram	Description
BLAS_GEMM Procedures	Performs one of the matrix-vector operations $C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$ where $\text{op}(X)$ is one of $\text{op}(X) = X$ or $\text{op}(X) = X'$ where α and β are scalars, and A , B and C are matrices, with $\text{op}(A)$ an m by k matrix, $\text{op}(B)$ a k by n matrix and C an m by n matrix
BLAS_SYMM Procedures	Performs one of the matrix-vector operations $C := \alpha * A * B + \beta * C$ or $C := \alpha * B * A + \beta * C$ where α and β are scalars, A is a symmetric matrix, and B and C are m by n matrices
BLAS_SYR2K Procedures	Performs one of the symmetric rank2 k operations $C := \alpha * A * B' + \alpha * B * A' + \beta * C$ or $C := \alpha * A' * B + \alpha * B' * A + \beta * C$ where α and β are scalars, C is an n by n symmetric matrix and A and B are n by k matrices in the first case and k by n matrices in the second case
BLAS_SYRK Procedures	Performs one of the symmetric rank k operations $C := \alpha * A * A' + \beta * C$ or $C := \alpha * A' * A + \beta * C$ where α and β are scalars, C is an n by n symmetric matrix and A is an n by k matrix in the first case and a k by n matrix in the second case
BLAS_TRMM Procedures	Performs one of the matrix-vector operations $B := \alpha * \text{op}(A) * B$ or $B := \alpha * B * \text{op}(A)$ where α is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and $\text{op}(A)$ is one of two alternatives
BLAS_TRSM Procedures	Performs one of the matrix-vector operations $\text{op}(A) * X = \alpha * B$ or $X * \text{op}(A) = \alpha * B$ where α is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix, $\text{op}(A)$ is one of two alternatives. The matrix X is overwritten on B

287.4.4 UTL_NLA LAPACK Driver Routines (Linear Equations) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (Linear Equations) subprograms.

Table 287-4 LAPACK Driver Routines (Linear Equations) Subprograms

Subprogram	Description
LAPACK_GBSV Procedures	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A .
LAPACK_GESV Procedures	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A .

Table 287-4 (Cont.) LAPACK Driver Routines (Linear Equations) Subprograms

Subprogram	Description
LAPACK_GTSV Procedures	This procedure solves the equation $a * x = b$ where a is an n by n tridiagonal matrix, by Gaussian elimination with partial pivoting.
LAPACK_PBSV Procedures	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite band matrix and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A .
LAPACK_POSV Procedures	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A .
LAPACK_PPSV Procedures	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A .
LAPACK_PTSV Procedures	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by $nrhs$ matrices.
LAPACK_SPSV Procedures	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric matrix stored in packed format, and x and b are n by $nrhs$ matrices. The diagonal pivoting method is used to factor A .
LAPACK_SYSV Procedures	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric matrix, and x and b are n by $nrhs$ matrices. The diagonal pivoting method is used to factor A .

287.4.5 UTL_NLA LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (LLS and Eigenvalue) subprograms.

Table 287-5 LAPACK Driver Routines (LLS and Eigenvalue Problems)

Subprogram	Description
LAPACK_GEES Procedures	Computes for an n by n real nonsymmetric matrix A , the eigenvalues, the real Schur form T , and, optionally, the matrix of Schur vectors Z . This gives the Schur factorization $A = Z * T * (Z ** T)$.
LAPACK_GEEV Procedures	Computes for an n by n real nonsymmetric matrix A , the eigenvalues and, optionally, the left and/or right eigenvectors.
LAPACK_GELS Procedures	Solves overdetermined or underdetermined real linear systems involving an m by n matrix A , or its transpose, using a QR or LQ factorization of A . It is assumed that A has full rank.

Table 287-5 (Cont.) LAPACK Driver Routines (LLS and Eigenvalue Problems)

Subprogram	Description
LAPACK_GESDD Procedures	Computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_GESVD Procedures	Computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * \text{transpose}(V)$.
LAPACK_SBEV Procedures	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A
LAPACK_SBEVD Procedures	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SPEV Procedures	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage
LAPACK_SPEVD Procedures	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_STEV Procedures	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A
LAPACK_STEVD Procedures	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SYEV Procedures	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A
LAPACK_SYEVD Procedures	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

287.5 Summary of UTL_NLA Subprograms

This table lists the UTL_NLA subprograms and briefly describes them.

Table 287-6 UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_ASUM Functions	Computes the sum of the absolute values of the vector components	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_AXPY Procedures	Copies $\alpha * X + Y$ into vector Y	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_COPY Procedures	Copies the contents of vector X to vector Y	BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 287-6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_DOT Functions	Returns the dot (scalar) product of two vectors X and Y	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_GBMV Procedures	Performs the matrix-vector operation $y := \alpha * A * x + \beta * y$ or $y := \alpha * A' * x + \beta * y$ where alpha and beta are scalars, x and y are vectors and A is an m by n band matrix, with kl sub-diagonals and ku super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GEMM Procedures	Performs one of the matrix-matrix operations where alpha and beta are scalars, and A, B and C are matrices, with op(A) an m by k matrix, op(B) a k by n matrix and C an m by n matrix	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_GEMV Procedures	Performs the matrix-vector operations $y := \alpha * A * x + \beta * y$ or $y := \alpha * A' * x + \beta * y$ where alpha and beta are scalars, x and y are vectors and A is an m by n matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GER Procedures	Performs a rank 1 operation $A := \alpha * x * y' + A$ where alpha is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_IAMAX Functions	Computes the index of the first element of a vector that has the largest absolute value	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_NRM2 Functions	Computes the vector 2-norm (Euclidean norm)	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROT Procedures	Returns the plane rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROTG Procedures	Returns the Givens rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SBMV Procedures	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where alpha and beta are scalars, x and y are n element vectors and A is an n by n symmetric band matrix, with k super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SCAL Procedures	Scales a vector by a constant	BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 287-6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_SPMV Procedures	Performs a matrix-vector operation $y := \alpha A x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR Procedures	Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR2 Procedures	Performs a symmetric rank 2 operation where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SWAP Procedures	Swaps the contents of two vectors each of size n	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SYMM Procedures	Performs one of the matrix-vector operations where α and β are scalars, A is a symmetric matrix, and B and C are m by n matrices	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_SYMV Procedures	Performs a matrix-vector operation where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR Procedures	Performs a symmetric rank 1 operation where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2 Procedures	Performs a symmetric rank 2 operation where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2K Procedures	Performs one of the symmetric rank2 k operations where α and β are scalars, C is an n by n symmetric matrix and A and B are n by k matrices in the first case and k by n matrices in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Table 287-6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_SYRK Procedures	Performs one of the symmetric rank k operations where α and β are scalars, C is an n by n symmetric matrix and A is an n by k matrix in the first case and a k by n matrix in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_TBMV Procedures	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TBSV Procedures	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPMV Procedures	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPSV Procedures	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMM Procedures	Performs one of the matrix-vector operations where α is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and $op(A)$ is one of two alternatives	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMV Procedures	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRSM Procedures	Performs one of the matrix-vector operations $op(A) * X = \alpha * B$ or $X * op(A) = \alpha * B$ where α is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix, $op(A)$ is one of two alternatives. The matrix X is overwritten on B	BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Table 287-6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_TRSV Procedures	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
LAPACK_GBSV Procedures	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A .	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_GEES Procedures	Computes for an n by n real nonsymmetric matrix A , the eigenvalues, the real Schur form T , and, optionally, the matrix of Schur vectors Z . This gives the Schur factorization $A = Z * T * (Z ** T)$.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

287.5.1 BLAS_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

Syntax

```

UTL_NLA.BLAS_ASUM (
  n      IN      POSITIVEN,
  x      IN      UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVEN)
RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_ASUM (
  n      IN      POSITIVEN,
  alpha  IN      SCALAR_DOUBLE,
  x      IN      UTL_NLA_ARRAY_FLT)
RETURN BINARY_FLOAT

```

Parameters

Table 287-7 BLAS_ASUM Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs (incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

287.5.2 BLAS_AXPY Procedures

This procedure copies $\alpha * X + Y$ into vector Y.

See Also:

incy   IN      POSITIVEN,
pack   IN      flag DEFAULT 'C');

```

Parameters

Table 287-11 BLAS_GBMV Procedure Parameters

Parameter	Description
trans	<p>Specifies the operation to be performed:</p> <ul style="list-style-type: none"> trans = 'N' or 'n': $y := \alpha * A * x + \beta * y$ trans = 'T' or 't': $y := \alpha * A^T * x + \beta * y$ trans = 'C' or 'c': $y := \alpha * A^H * x + \beta * y$
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
kl	Specifies the number of sub-diagonals of the matrix A. kl must satisfy $0 \leq kl$.
ku	Specifies the number of super-diagonals of the matrix A. ku must satisfy $0 \leq ku$.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	<p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n).</p> <p>Before entry, the leading (kl + ku + 1) by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (ku+1) of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row (ku+2), and so on.</p> <p>Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.</p>
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (kl+ku+1).
x	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> $(1 + (n - 1) * \text{abs}(incx))$ <p>when trans = 'N' or 'n' and at least</p> $(1 + (m - 1) * \text{abs}(incx))$ <p>otherwise. Before entry, the incremented array X must contain the vector x.</p>

Table 287-11 (Cont.) BLAS_GBMV Procedure Parameters

Parameter	Description
incx	Specifies the increment for the elements of <i>x</i> . Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then <i>y</i> need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (m - 1) * \text{abs}(\text{incy}))$ when <i>trans</i> = 'N' or 'n' and at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ otherwise. Before entry with beta nonzero, the incremented array <i>Y</i> must contain the vector <i>y</i> . On exit, <i>Y</i> is overwritten by the updated vector <i>y</i> .
incy	Specifies the increment for the elements of <i>y</i> . Must not be zero.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major

287.5.6 BLAS_GEMM Procedures

This procedure performs one of the matrix-matrix operations.

$$C := \text{alpha} * \text{op}(A) * \text{op}(B) + \text{beta} * C$$

where *op*(*X*) is one of

$$\text{op}(X) = X$$

or

$$\text{op}(X) = X'$$

where *alpha* and *beta* are scalars, and *A*, *B* and *C* are matrices, with *op*(*A*) an *m* by *k* matrix, *op*(*B*) a *k* by *n* matrix and *C* an *m* by *n* matrix.

Parameters

Table 287-12 BLAS_GEMM Procedure Parameters

Parameter	Description
transa	Specifies the form of $op(A)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> transa = 'N' or 'n': $op(A) = 'A'$ transa = 'T' or 't': $op(A) = 'A'$ transa = 'C' or 'c': $op(A) = 'A'$
transb	Specifies the form of $op(B)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> transb = 'N' or 'n': $op(B) = B$ transb = 'T' or 't': $op(B) = B'$ transb = 'C' or 'c': $op(B) = B'$
m	Specifies the number of rows of the matrix $op(A)$ and of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix $op(B)$ and of the matrix C. n must be at least zero.
k	Specifies the rows of the matrix $op(A)$ and the number of columns of the matrix $op(B)$. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A.

Table 287-12 (Cont.) BLAS_GEMM Procedure Parameters

Parameter	Description
lda	Specifies the first dimension of <i>a</i> as declared in the calling (sub) program. When <i>transa</i> = 'N' or 'n', <i>lda</i> must be at least $\max(1, k)$.
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (<i>lda</i> , <i>kb</i>) where <i>kb</i> is <i>n</i> when <i>transb</i> = 'N' or 'n', and is <i>k</i> otherwise. Before entry with <i>transb</i> = 'N' or 'n', the leading <i>k</i> by <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> , otherwise the leading <i>n</i> by <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> .
ldb	Specifies the first dimension of <i>b</i> as declared in the calling (sub) program. When <i>transb</i> = 'N' or 'n', <i>ldb</i> must be at least $\max(1, n)$.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar <i>beta</i> . When <i>beta</i> is supplied as zero then <i>c</i> need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (<i>ldc</i> , <i>n</i>). Before entry, the leading <i>m</i> by <i>n</i> part of the array <i>C</i> must contain the matrix <i>C</i> , except when <i>beta</i> is zero, in which case <i>C</i> need not be set on entry. On exit, the array <i>C</i> is overwritten by the <i>m</i> by <i>n</i> matrix $(\alpha * \text{op}(A) * \text{op}(B) + \beta * C)$.
ldc	Specifies the first dimension of <i>C</i> as declared in the calling (sub) program. <i>ldc</i> must be at least $\max(1, m)$.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major

287.5.7 BLAS_GEMV Procedures

This procedure performs one of the matrix-vector operations: $y := \alpha * A * x + \beta * y$ or $y := \alpha * A' * x + \beta * y$ where α and β are scalars, x and y are vectors and A is an m by n matrix.

Parameters

Table 287-13 BLAS_GEMV Procedure Parameters

Parameter	Description
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> trans = 'N' or 'n', $y := \alpha * A * x + \beta * y$ trans = 'T' or 't', $y := \alpha * A^T * x + \beta * y$ trans = 'C' or 'c', $y := \alpha * A^H * x + \beta * y$
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $\max(1, m)$.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ when trans = 'N' or 'n' and at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.

Table 287-13 (Cont.) BLAS_GEMV Procedure Parameters

Parameter	Description
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (m - 1) * \text{abs}(incy))$ when trans = 'N' or 'n' and at least $(1 + (n - 1) * \text{abs}(incy))$ otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major

287.5.8 BLAS_GER Procedures

This procedure performs the rank 1 operation: $A := \alpha * x * y' + A$ where alpha is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix.

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

287.5.29 BLAS_TRMM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the following matrix-matrix operations:

```
B := alpha*op( A )*B
```

or

```
B := alpha*B*op( A )
```

where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

Parameters

Table 287-35 BLAS_TRMM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> side = 'L' or 'l' : B := alpha*op(A)*B side = 'R' or 'r' : B := alpha*B*op(A)
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> uplo = 'U' or 'u' : A is an upper triangular matrix. uplo = 'L' or 'l' : A is a lower triangular matrix.
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> transa = 'N' or 'n' : op(A) = A transa = 'T' or 't' : op(A) = A' transa = 'C' or 'c' : op(A) = A'
diag	Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> diag = 'U' or 'u' . A is assumed to be unit triangular. diag = 'N' or 'n' . A is not assumed to be unit triangular.
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'. Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the transformed matrix.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).

287.5.31 BLAS_TRSM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the matrix-matrix operations:

$$\text{op}(A) * X = \alpha * B$$

or

$$X * \text{op}(A) = \alpha * B$$

where alpha is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of

$$\text{op}(A) = A$$

or

$$\text{op}(A) = A^T$$

The matrix X is overwritten on B.

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

287.5.33 LAPACK_GBSV Procedures

This procedure computes the solution to a real system of linear equations $a * x = b$, where `a` is a band matrix of order `n` with `kl` sub diagonals and `ku` superdiagonals, and `x` and `b` are `n` by `nrhs` matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor `A` as

$$a = L * U$$

where `L` is a product of permutation and unit lower triangular matrices with `kl` sub diagonals, and `U` is upper triangular with `kl+ku` superdiagonals. The factored form of `a` is then used to solve the system of equations

$$a * x = b$$

287.5.34 LAPACK_GEES Procedures

This procedure computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z.

This gives the Schur factorization $A = Z^*T^*(Z^{**T})$.

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

$$\begin{bmatrix} a & b \\ c & a \end{bmatrix}$$

where $b^*c < 0$. The eigenvalues of such a block are $a \pm \sqrt{bc}$.

287.5.35 LAPACK_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an m by n matrix A , or its transpose, using a QR or LQ factorization of A . It is assumed that A has full rank.

The following options are provided:

- If TRANS = 'N' and $m \geq n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem

$$\text{minimize } || B - A * X ||$$
- If TRANS = 'N' and $m < n$: find the minimum norm solution of an underdetermined system $A * X = B$.
- If TRANS = 'T' and $m \geq n$: find the minimum norm solution of an undetermined system $A^{**T} * X = B$.
- If TRANS = 'T' and $m < n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem $\text{minimize } || B - A^{**T} * X ||$.

287.5.36 LAPACK_GESDD Procedures

This procedure computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

$$A = U * \text{SIGMA} * \text{transpose}(V)$$

where SIGMA is an m by n matrix which is zero except for its $\min(m, n)$ diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A , they are real and non-negative, and are returned in descending order. The first $\min(m, n)$ columns of U and V are the left and right singular vectors of A .

Note that the routine returns V^{*T} , not V .

287.5.37 LAPACK_GESV Procedure

This procedure computes the solution to a real system of linear equations $a * x = b$, where a is an n by n matrix and x and b are n by $nrhs$ matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

$$a = P * L * U$$

where P is a permutation matrix, L is unit lower triangular, and U is upper triangular. The factored form of a is then used to solve the system of equations

$$a * x = b$$

287.5.38 LAPACK_GESVD Procedures

This procedure computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and/or right singular vectors.

The SVD is written

$$A = U * \text{SIGMA} * \text{transpose}(V)$$

where SIGMA is an m by n matrix which is zero except for its $\min(m, n)$ diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A , they are real and non-negative, and are returned in descending order. The first $\min(m, n)$ columns of U and V are the left and right singular vectors of A .

Note that the routine returns V^{*T} , not V .

287.5.39 LAPACK_GEEV Procedures

This procedure computes for an n by n real nonsymmetric matrix A , the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector $v(j)$ of A satisfies $A * v(j) = \text{lambda}(j) * v(j)$ where $\text{lambda}(j)$ is its eigenvalue.
- The left eigenvector $u(j)$ of A satisfies $u(j)**H * A = \text{lambda}(j) * u(j)**H$ where $u(j)**H$ denotes the conjugate transpose of $u(j)$.

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

$$A = U^{**T} * U \text{ if uplo} = 'U'$$

or

$A = L * L^{**T}$ if `UPLO = 'L'`

where `U` is an upper triangular matrix and `L` is a lower triangular matrix. The factored form of `A` is then used to solve the system of equations $A * X = B$.

287.5.43 LAPACK_PPSV Procedures

This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by nrhs matrices.

The Cholesky decomposition is used to factor A as

$$A = U^{**T} * U \text{ if UPLO} = 'U'$$

or

$$A = L * L^{**T} \text{ if UPLO} = 'L'$$

where **U** is an upper triangular matrix and **L** is a lower triangular matrix. The factored form of A is then used to solve the system of equations $A * X = B$.

287.5.44 LAPACK_PTSV Procedures

This procedure computes the solution to a real system of linear equations $a * x = b$, where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by nrhs matrices.

a is factored as $A = L * D * L^{**T}$, and the factored form of a is then used to solve the system of equations.

287.5.49 LAPACK_SPSV Procedures

This procedure computes the solution to a real system of linear equations $a * x = b$, where a is an n by n symmetric matrix stored in packed format, and x and b are n by nrhs matrices.

The diagonal pivoting method is used to factor A as

$$A = U * D * U^{**T}, \text{ if UPLO} = 'U'$$

or

$$A = L * D * L^{**T}, \text{ if UPLO} = 'L'$$

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations $A * X = B$.

UTL_RAW

The `UTL_RAW` package provides SQL functions for manipulating `RAW` datatypes.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of UTL_RAW Subprograms](#)

288.1 UTL_RAW Overview

This package is necessary because normal SQL functions do not operate on `RAW`s, and PL/SQL does not allow overloading between a `RAW` and a `CHAR` datatype. `UTL_RAW` also includes subprograms that convert various COBOL number formats to, and from, `RAW`s.

`UTL_RAW` is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix `UTL` has been given to the package, instead of `DBMS`.

288.2 UTL_RAW Operational Notes

`UTL_RAW` allows a `RAW` "record" to be composed of many elements. By using the `RAW` datatype, character set conversion will not be performed, keeping the `RAW` in its original format when being transferred through remote procedure calls.

With the `RAW` functions, you can manipulate binary data that was previously limited to the `hexoraw` and `rawtohex` functions.

Note:

Notes on datatypes:

- The `PLS_INTEGER` and `BINARY_INTEGER` datatypes are identical. This document uses `BINARY_INTEGER` to indicate datatypes in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.
- The `INTEGER` and `NUMBER(38)` datatypes are also identical. This document uses `INTEGER` throughout.

288.3 Summary of UTL_RAW Subprograms

This table lists the `UTL_RAW` subprograms and briefly describes them.

Table 288-1 UTL_RAW Package Subprograms

Subprogram	Description
BIT_AND Function	Performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW
BIT_COMPLEMENT Function	Performs bitwise logical "complement" of the values in RAW r and returns the "complement'ed" result RAW
BIT_OR Function	Performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the "or'd" result RAW
BIT_XOR Function	Performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the "xor'd" result RAW
CAST_FROM_BINARY_DOUBLE Function	Returns the RAW binary representation of a BINARY_DOUBLE value
CAST_FROM_BINARY_FLOAT Function	Returns the RAW binary representation of a BINARY_FLOAT value
CAST_FROM_BINARY_INTEGER Function	Returns the RAW binary representation of a BINARY_INTEGER value
CAST_FROM_NUMBER Function	Returns the RAW binary representation of a NUMBER value
CAST_TO_BINARY_DOUBLE Function	Casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE
CAST_TO_BINARY_FLOAT Function	Casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT
CAST_TO_BINARY_INTEGER Function	Casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER
CAST_TO_NUMBER Function	Casts the RAW binary representation of a NUMBER into a NUMBER
CAST_TO_NVARCHAR2 Function	Converts a RAW value into a VARCHAR2 value
CAST_TO_RAW Function	Converts a VARCHAR2 value into a RAW value
CAST_TO_VARCHAR2 Function	Converts a RAW value into a VARCHAR2 value
COMPARE Function	Compares RAW r1 against RAW r2
CONCAT Function	Concatenates up to 12 RAWs into a single RAW
CONVERT Function	Converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW
COPIES Function	Returns n copies of r concatenated together
LENGTH Function	Returns the length in bytes of a RAW r
OVERLAY Function	Overlays the specified portion of target RAW with overlay RAW, starting from byte position pos of target and proceeding for len bytes
REVERSE Function	Reverses a byte sequence in RAW r from end to end
SUBSTR Function	Returns len bytes, starting at pos from RAW r
TRANSLATE Function	Translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set

Table 288-1 (Cont.) UTL_RAW Package Subprograms

Subprogram	Description
TRANSLITERATE Function	Converts the bytes in the input RAW <i>r</i> according to the bytes in the transliteration RAWs <i>from_set</i> and <i>to_set</i>
XRANGE Function	Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value <i>start_byte</i> and ending with the value <i>end_byte</i>

288.3.1 BIT_AND Function

This function performs bitwise logical "and" of the values in RAW *r1* with RAW *r2* and returns the "anded" result RAW.

Syntax

```
UTL_RAW.BIT_AND (
    r1 IN RAW,
    r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-2 BIT_AND Function Parameters

Parameter	Description
<i>r1</i>	RAW to "and" with <i>r2</i>
<i>r2</i>	RAW to "and" with <i>r1</i>

Return Values

Table 288-3 BIT_AND Function Return Values

Return	Description
RAW	Containing the "and" of <i>r1</i> and <i>r2</i>
NULL	Either <i>r1</i> or <i>r2</i> input parameter was NULL

Usage Notes

If *r1* and *r2* differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

288.3.2 BIT_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW *r* and returns the complemented result RAW. The result length equals the input RAW *r* length.

Syntax

```
UTL_RAW.BIT_COMPLEMENT (  
    r IN RAW)  
    RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-4 BIT_COMPLEMENT Function Parameters

Parameter	Description
<i>r</i>	RAW to perform "complement" operation

Return Values

Table 288-5 BIT_COMPLEMENT Function Return Values

Return	Description
RAW	The "complement" of <i>r1</i>
NULL	If <i>r</i> input parameter was NULL

288.3.3 BIT_OR Function

This function performs bitwise logical "or" of the values in RAW *r1* with RAW *r2* and returns the or'd result RAW.

Syntax

```
UTL_RAW.BIT_OR (  
    r1 IN RAW,  
    r2 IN RAW)  
    RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-6 BIT_OR Function Parameters

Parameters	Description
r1	RAW to "or" with r2
r2	RAW to "or" with r1

Return Values

Table 288-7 BIT_OR Function Return Values

Return	Description
RAW	Containing the "or" of r1 and r2
NULL	Either r1 or r2 input parameter was NULL

Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

288.3.4 BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

Syntax

```
UTL_RAW.BIT_XOR (
    r1 IN RAW,
    r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (bit_xor, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-8 BIT_XOR Function Parameters

Parameter	Description
r1	RAW to "xor" with r2
r2	RAW to "xor" with r1

Return Values

Table 288-9 BIT_XOR Function Return Values

Return	Description
RAW	Containing the "xor" of r1 and r2
NULL	If either r1 or r2 input parameter was NULL

Usage Notes

If r1 and r2 differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

288.3.5 CAST_FROM_BINARY_DOUBLE Function

This function returns the RAW binary representation of a BINARY_DOUBLE value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE (
    n          IN BINARY_DOUBLE,
    endianness IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-10 CAST_FROM_BINARY_DOUBLE Function Parameters

Parameter	Description
n	BINARY_DOUBLE value
endianness	A BINARY_INTEGER value indicating the endianness. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
```

```
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit 8
byte 7: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

endianess	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
<code>big_endian</code>	db0	db1	db2	db3	db4	db5	db6	db7
<code>little_endian</code>	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the `BINARY_DOUBLE` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

288.3.6 CAST_FROM_BINARY_FLOAT Function

This function returns the `RAW` binary representation of a `BINARY_FLOAT` value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_FLOAT(
    n          IN BINARY_FLOAT,
    endianess  IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-11 CAST_FROM_BINARY_FLOAT Function Parameters

Parameter	Description
<code>n</code>	<code>BINARY_FLOAT</code> value
<code>endianess</code>	A <code>BINARY_INTEGER</code> value indicating the endianess. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine.

Return Values

The binary representation (`RAW`) of the `BINARY_FLOAT` value, or `NULL` if the input is `NULL`.

Usage Notes

- A 4-byte `binary_float` value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit 8
byte 3: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_FLOAT` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb3` refer to the bytes in `RAW` and `fb0 ~ fb3` refer to the bytes in `BINARY_FLOAT`.

Endianess	rb0	rb1	rb2	rb3
<code>big_endian</code>	fb0	fb1	fb2	fb3
<code>little_endian</code>	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the `BINARY_FLOAT` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

288.3.7 CAST_FROM_BINARY_INTEGER Function

This function returns the `RAW` binary representation of a `BINARY_INTEGER` value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (
    n          IN BINARY_INTEGER
    endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-12 CAST_FROM_BINARY_INTEGER Function Parameters

Parameter	Description
<code>n</code>	<code>BINARY_INTEGER</code> value.
<code>endianess</code>	A <code>BINARY_INTEGER</code> value indicating the endianess. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine.

Return Values

The binary representation of the `BINARY_INTEGER` value.

288.3.8 CAST_FROM_NUMBER Function

This function returns the RAW binary representation of a NUMBER value.

Syntax

```
UTL_RAW.CAST_FROM_NUMBER (  
    n IN NUMBER)  
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-13 CAST_FROM_NUMBER Function Parameters

Parameter	Description
n	NUMBER value

Return Values

The binary representation of the NUMBER value.

288.3.9 CAST_TO_BINARY_DOUBLE Function

This function casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE.

Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (  
    r IN RAW  
    endianness IN PLS_INTEGER DEFAULT 1)  
RETURN BINARY_DOUBLE;
```

Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-14 CAST_TO_BINARY_DOUBLE Function Parameters

Parameter	Description
r	Binary representation of a BINARY_DOUBLE
endianness	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_DOUBLE value.

Usage Notes

- If the `RAW` argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is `-0`, `+0` is returned. If the result is `NaN`, the value `BINARY_DOUBLE_NAN` is returned.
- If the `RAW` argument is less than 8 bytes, a `VALUE_ERROR` exception is raised.
- An 8-byte `binary_double` value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit 8
byte 7: bit 7 ~ bit 0
```
- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

Architecture	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
<code>big_endian</code>	db0	db1	db2	db3	db4	db5	db6	db7
<code>little_endian</code>	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the `RAW` argument are copied straight across into the `BINARY_DOUBLE` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

288.3.10 CAST_TO_BINARY_FLOAT Function

This function casts the `RAW` binary representation of a `BINARY_FLOAT` into a `BINARY_FLOAT`.

Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
    r          IN RAW
    endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-15 CAST_TO_BINARY_FLOAT Function Parameters

Parameter	Description
<code>r</code>	Binary representation of a <code>BINARY_FLOAT</code>

Table 288-15 (Cont.) CAST_TO_BINARY_FLOAT Function Parameters

Parameter	Description
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_FLOAT value.

Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_FLOAT_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE_ERROR exception is raised.
- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:
 - byte 0: bit 31 ~ bit 24
 - byte 1: bit 23 ~ bit 16
 - byte 2: bit 15 ~ bit 8
 - byte 3: bit 7 ~ bit 0
- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

Endianness	rb0	rb1	rb2	rb3
big_endian	fb0	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY_FLOAT return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

288.3.11 CAST_TO_BINARY_INTEGER Function

This function casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER.

Syntax

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
  r          IN RAW
  endianess IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-16 CAST_TO_BINARY_INTEGER Function Parameters

Parameter	Description
<code>r</code>	Binary representation of a <code>BINARY_INTEGER</code>
<code>endianess</code>	A <code>PLS_INTEGER</code> representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The `BINARY_INTEGER` value

288.3.12 CAST_TO_NUMBER Function

This function casts the `RAW` binary representation of a `NUMBER` into a `NUMBER`.

Syntax

```
UTL_RAW.CAST_TO_NUMBER (
    r IN RAW)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-17 CAST_TO_NUMBER function Parameters

Parameter	Description
<code>r</code>	Binary representation of a <code>NUMBER</code>

Return Values

The `NUMBER` value.

288.3.13 CAST_TO_NVARCHAR2 Function

This function converts a `RAW` value represented using some number of data bytes into an `NVARCHAR2` value with that number of data bytes.

Note:

When casting to a `NVARCHAR2`, the current Globalization Support character set is used for the characters within that `NVARCHAR2` value.

Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (
    r IN RAW)
RETURN NVARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters**Table 288-18 CAST_TO_NVARCHAR2 Function Parameters**

Parameter	Description
r	RAW (without leading length field) to be changed to a NVARCHAR2)

Return Values**Table 288-19 CAST_TO_NVARCHAR2 Function Return Values**

Return	Description
NVARCHAR2	Containing having the same data as the input RAW
NULL	If r input parameter was NULL

288.3.14 CAST_TO_RAW Function

This function converts a VARCHAR2 value represented using some number of data bytes into a RAW value with that number of data bytes. The data itself is not modified in any way, but its datatype is recast to a RAW datatype.

Syntax

```
UTL_RAW.CAST_TO_RAW (
    c IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

Parameters**Table 288-20 CAST_TO_RAW Function Parameters**

Parameter	Description
c	VARCHAR2 to be changed to a RAW

Return Values

Table 288-21 CAST_TO_RAW Function Return Values

Return	Description
RAW	Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field
NULL	If <i>c</i> input parameter was NULL

288.3.15 CAST_TO_VARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into a VARCHAR2 value with that number of data bytes.

Note:

When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (
  r IN RAW)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-22 CAST_TO_VARCHAR2 Function Parameters

Parameter	Description
<i>r</i>	RAW (without leading length field) to be changed to a VARCHAR2

Return Values

Table 288-23 CAST_TO_VARCHAR2 Function Return Values

Return	Description
VARCHAR2	Containing having the same data as the input RAW
NULL	If <i>r</i> input parameter was NULL

288.3.16 COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional `pad` parameter.

Syntax

```
UTL_RAW.COMPARE (
  r1 IN RAW,
  r2 IN RAW,
  pad IN RAW DEFAULT NULL)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-24 COMPARE Function Parameters

Parameter	Description
<code>r1</code>	1st RAW to be compared, may be NULL or 0 length
<code>r2</code>	2nd RAW to be compared, may be NULL or 0 length
<code>pad</code>	This is an optional parameter. Byte to extend whichever of <code>r1</code> or <code>r2</code> is shorter. The default: <code>x'00'</code>

Return Values

Table 288-25 COMPARE Function Return Values

Return	Description
NUMBER	Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte

288.3.17 CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

Syntax

```
UTL_RAW.CONCAT (
  r1 IN RAW DEFAULT NULL,
  r2 IN RAW DEFAULT NULL,
  r3 IN RAW DEFAULT NULL,
  r4 IN RAW DEFAULT NULL,
  r5 IN RAW DEFAULT NULL,
  r6 IN RAW DEFAULT NULL,
  r7 IN RAW DEFAULT NULL,
  r8 IN RAW DEFAULT NULL,
  r9 IN RAW DEFAULT NULL,
```

```
r10 IN RAW DEFAULT NULL,
r11 IN RAW DEFAULT NULL,
r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

Parameters

r1....r12 are the RAW items to concatenate.

Return Values

Table 288-26 CONCAT Function Return Values

Return	Description
RAW	Containing the items concatenated

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

288.3.18 CONVERT Function

This function converts RAW *r* from character set *from_charset* to character set *to_charset* and returns the resulting RAW.

Both *from_charset* and *to_charset* must be supported character sets defined to the Oracle server.

Syntax

```
UTL_RAW.CONVERT (
  r          IN RAW,
  to_charset IN VARCHAR2,
  from_charset IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-27 CONVERT Function Parameters

Parameter	Description
<i>r</i>	RAW byte-string to be converted
<i>to_charset</i>	Name of the character set to which <i>r</i> is converted
<i>from_charset</i>	Name of the character set in which <i>r</i> is supplied

Return Values

Table 288-28 CONVERT Function Return Values

Return	Description
RAW	Byte string <i>r</i> converted according to the specified character sets.

Exceptions

Table 288-29 CONVERT Function Exceptions

Error	Description
ORA-06502	PL/SQL: numeric or value error
ORA-12703	This character set conversion is not supported
ORA-12705	Cannot access NLS data files or invalid environment specified

Usage Notes

- The NLS_LANG parameter form *language_territory.character set* is also accepted for *to_charset* and *from_charset*. However, this form is deprecated and should be avoided. Note that *language* and *territory* are ignored by this subprogram.
- The converted value is silently truncated if it exceeds the maximum length of a RAW value, which is 32767 bytes. Do not convert values longer than $\text{floor}(32767/4) = 8191$ bytes if you want to avoid this truncation for all possible combinations of *to_charset* and *from_charset*. You can use the maximum character width of the target character set *to_charset*, if known, to expand the limit to a less pessimistic value. For example, if the target character set is ZHS16GBK, the maximum safe source string length is $\text{floor}(32767/2) = 16383$ bytes. For single-byte target character sets, no truncation is ever necessary.

288.3.19 COPIES Function

This function returns *n* copies of *r* concatenated together.

Syntax

```
UTL_RAW.COPIES (
  r IN RAW,
  n IN NUMBER)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-30 COPIES Function Parameters

Parameters	Description
r	RAW to be copied
n	Number of times to copy the RAW (must be positive)

Return Values

This returns the RAW copied n times.

Exceptions

Table 288-31 COPIES Function Exceptions

Error	Description
VALUE_ERROR	Either: - r is missing, NULL or 0 length - n < 1 - Length of result exceeds maximum length of a RAW

288.3.20 LENGTH Function

This function returns the length in bytes of a RAW r.

Syntax

```
UTL_RAW.LENGTH (
    r IN RAW)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-32 LENGTH Function Parameters

Parameter	Description
r	RAW byte stream to be measured

Return Values

Table 288-33 LENGTH Function Return Values

Return	Description
NUMBER	Current length of the RAW

288.3.21 OVERLAY Function

This function overlays the specified portion of `target RAW` with `overlay_str RAW`, starting from byte position `pos` of `target` and proceeding for `len` bytes.

Syntax

```
UTL_RAW.OVERLAY (
  overlay_str IN RAW,
  target      IN RAW,
  pos        IN BINARY_INTEGER DEFAULT 1,
  len        IN BINARY_INTEGER DEFAULT NULL,
  pad        IN RAW              DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-34 OVERLAY Function Parameters

Parameters	Description
<code>overlay_str</code>	Byte-string used to overlay target
<code>target</code>	Byte-string which is to be overlaid
<code>pos</code>	Position in target (numbered from 1) to start overlay
<code>len</code>	The number of target bytes to overlay
<code>pad</code>	Pad byte used when <code>overlay len</code> exceeds <code>overlay_str length</code> or <code>pos</code> exceeds <code>target length</code>

Defaults and Optional Parameters

Table 288-35 OVERLAY Function Optional Parameters

Optional Parameter	Description
<code>pos</code>	1
<code>len</code>	To the length of <code>overlay_str</code>
<code>pad</code>	<code>x'00'</code>

Return Values

Table 288-36 OVERLAY Function Return Values

Return	Description
<code>RAW</code>	The target <code>byte_string</code> overlaid as specified.

Usage Notes

If `overlay_str` has less than `len` bytes, then it is extended to `len` bytes using the `pad` byte. If `overlay_str` exceeds `len` bytes, then the extra bytes in `overlay_str` are ignored. If `len` bytes beginning at position `pos` of `target` exceeds the length of `target`, then `target` is extended to contain the entire length of `overlay_str`.

If `len` is specified, it must be greater than or equal to 0. If `pos` is specified, it must be greater than or equal to 1. If `pos` exceeds the length of `target`, then `target` is padded with `pad` bytes to position `pos`, and `target` is further extended with `overlay_str` bytes.

Exceptions

Table 288-37 OVERLAY Function Exceptions

Error	Description
VALUE_ERROR	Either: <ul style="list-style-type: none"> - <code>Overlay_str</code> is NULL or has 0 length - <code>Target</code> is missing or undefined - Length of <code>target</code> exceeds maximum length of a RAW - <code>len < 0</code> - <code>pos < 1</code>

288.3.22 REVERSE Function

This function reverses a byte sequence in RAW `r` from end to end.

For example, `x'0102F3'` would be reversed to `x'F30201'`, and `'xyz'` would be reversed to `'zyx'`. The result length is the same as the input RAW length.

Syntax

```
UTL_RAW.REVERSE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-38 REVERSE Function Parameters

Parameter	Description
<code>r</code>	RAW to reverse

Return Values

Table 288-39 REVERSE Function Return Values

Return	Description
RAW	Containing the "reverse" of <i>r</i>

Exceptions

Table 288-40 REVERSE Function Exceptions

Error	Description
VALUE_ERROR	<i>R</i> is NULL or has 0 length

288.3.23 SUBSTR Function

This function returns *len* bytes, starting at *pos* from RAW *r*.

Syntax

```
UTL_RAW.SUBSTR (
  r    IN RAW,
  pos  IN BINARY_INTEGER,
  len  IN BINARY_INTEGER DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-41 SUBSTR Function Parameters

Parameter	Description
<i>r</i>	RAW byte-string from which a portion is extracted
<i>pos</i>	Byte position in <i>r</i> at which to begin extraction
<i>len</i>	Number of bytes from <i>pos</i> to extract from <i>r</i> (optional)

Defaults and Optional Parameters

Table 288-42 SUBSTR Function Optional Parameter

Optional Parameter	Description
<i>len</i>	Position <i>pos</i> through to the end of <i>r</i>

Return Values

Table 288-43 SUBSTR Function Return Values

Return	Description
portion of <i>r</i>	Beginning at <i>pos</i> for <i>len</i> bytes long
NULL	<i>r</i> input parameter was NULL

Usage Notes

- If *pos* is positive, then `SUBSTR` counts from the beginning of *r* to find the first byte. If *pos* is negative, then `SUBSTR` counts backward from the end of the *r*. The value *pos* cannot be 0.
- If *len* is omitted, then `SUBSTR` returns all bytes to the end of *r*. The value *len* cannot be less than 1.

Exceptions

Table 288-44 SUBSTR Function Exceptions

Error	Description
VALUE_ERROR	VALUE_ERROR is returned if: <ul style="list-style-type: none"> • <i>pos</i> = 0 or > length of <i>r</i> • <i>len</i> < 1 or > length of <i>r</i> - (<i>pos</i>-1)

288.3.24 TRANSLATE Function

This function translates the bytes in the input RAW *r* according to the bytes in the translation RAWs *from_set* and *to_set*.

If a byte in *r* has a matching byte in *from_set*, then it is replaced by the byte in the corresponding position in *to_set*, or deleted.

Bytes in *r*, but undefined in *from_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from_set* is used. Subsequent duplicates are not scanned and are ignored.

Syntax

```
UTL_RAW.TRANSLATE (
    r          IN RAW,
    from_set  IN RAW,
    to_set    IN RAW)
RETURN RAW;
```

Note:

Be aware that *to_set* and *from_set* are reversed in the calling sequence compared to `TRANSLITERATE`.

Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-45 TRANSLATE Function Parameters

Parameter	Description
<code>r</code>	RAW source byte-string to be translated
<code>from_set</code>	RAW byte-codes to be translated, if present in <code>r</code>
<code>to_set</code>	RAW byte-codes to which corresponding <code>from_str</code> bytes are translated

Return Values

Table 288-46 TRANSLATE Function Return Values

Return	Description
RAW	Translated byte-string

Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding translation bytes. Bytes from the input RAW that match any such `from_set` bytes are not translated or included in the result. They are effectively translated to NULL.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

Note:

Differences from the [TRANSLITERATE Function](#):

- The `from_set` parameter comes before the `to_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are not translated or included in the result.
- The resulting RAW value may be shorter than the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

Exceptions

Table 288-47 TRANSLATE Function Exceptions

Error	Description
VALUE_ERROR	Either: - <i>r</i> is NULL or has 0 length - <i>from_set</i> is NULL or has 0 length - <i>to_set</i> is NULL or has 0 length

288.3.25 TRANSLITERATE Function

This function converts the bytes in the input RAW *r* according to the bytes in the transliteration RAWs *from_set* and *to_set*.

Successive bytes in *r* are looked up in the *from_set*, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the *to_set*, or the *pad* byte when no correspondence exists.

Bytes in *r*, but undefined in *from_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from_set* is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as *r*.

Syntax

```
UTL_RAW.TRANSLITERATE (
    r          IN RAW,
    to_set     IN RAW DEFAULT NULL,
    from_set   IN RAW DEFAULT NULL,
    pad       IN RAW DEFAULT NULL)
RETURN RAW;
```

Note:

Be aware that *to_set* and *from_set* are reversed in the calling sequence compared to TRANSLATE.

Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-48 TRANSLITERATE Function Parameters

Parameter	Description
<i>r</i>	RAW input byte-string to be converted
<i>to_set</i>	RAW byte-codes to which corresponding <i>from_set</i> bytes are converted (any length)

Table 288-48 (Cont.) TRANSLITERATE Function Parameters

Parameter	Description
<code>from_set</code>	RAW byte-codes to be converted, if presenting <code>r</code> (any length)
<code>pad</code>	1 byte used when <code>to_set</code> is shorter than the <code>from_set</code>

Defaults and Optional Parameters

Table 288-49 TRANSLITERATE Function Optional Parameters

Optional Parameter	Description
<code>to_set</code>	To the NULL string and effectively extended with <code>pad</code> to the length of <code>from_set</code> as necessary
<code>from_set</code>	x'00' through x'fff'
<code>pad</code>	x'00'

Return Values

Table 288-50 TRANSLITERATE Function Return Values

Return	Description
RAW	Converted byte-string.

Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding conversion bytes. Bytes from the input RAW that match any such `from_set` bytes are converted in the result to the `pad` byte instead.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

Note:

Differences from the [TRANSLATE Function](#):

- The `to_set` parameter comes before the `from_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are replaced by `pad` in the result.
- The resulting RAW value always has the same length as the input RAW value.

Note that TRANSLATE and TRANSLITERATE only differ in functionality when `to_set` has fewer bytes than `from_set`.

Exceptions

Table 288-51 TRANSLITERATE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length

288.3.26 XRANGE Function

This function returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte RAW values. If the `start_byte` value is greater than the `end_byte` value, then the succession of resulting bytes begins with `start_byte`, wraps through `x'FF'` back to `x'00'`, then ends at `end_byte`.

Syntax

```
UTL_RAW.XRANGE (
    start_byte IN RAW DEFAULT NULL,
    end_byte   IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 288-52 XRANGE Function Parameters

Parameters	Description
<code>start_byte</code>	Beginning byte-code value of resulting sequence. The default is <code>x'00'</code> .
<code>end_byte</code>	Ending byte-code value of resulting sequence. The default is <code>x'FF'</code> .

Return Values

Table 288-53 XRANGE Function Return Values

Return	Description
RAW	Containing succession of 1-byte hexadecimal encodings

UTL_RECOMP

The UTL_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of UTL_RECOMP Subprograms](#)

289.1 UTL_RECOMP Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to [RECOMP_PARALLEL Procedure](#).

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

289.2 UTL_RECOMP Operational Notes

UTL_RECOMP has several operational notes.

- This package uses the job queue for parallel recompilation.
- This package must be run using `SQL*PLUS`.
- You must be connected `AS SYSDBA` to run this script.
- This package expects the following packages to have been created with `VALID` status:
 - `STANDARD` (`standard.sql`)
 - `DBMS_STANDARD` (`dbmsstdx.sql`)
 - `DBMS_JOB` (`dbmsjob.sql`)
 - `DBMS_RANDOM` (`dbmsrand.sql`)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

289.3 UTL_RECOMP Examples

These examples show various ways that UTL_RECOMP can recompile objects.

- Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

- Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

- Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

- Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

289.4 Summary of UTL_RECOMP Subprograms

This table lists the UTL_RECOMP subprograms and briefly describes them.

Table 289-1 UTL_RECOMP Package Subprograms

Subprogram	Description
RECOMP_PARALLEL Procedure	Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel
RECOMP_SERIAL Procedure	Recompiles invalid objects in a given schema or all invalid objects in the database

289.4.1 RECOMP_PARALLEL Procedure

This procedure uses the information exposed in the DBA_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(
  threads IN PLS_INTEGER DEFAULT NULL,
  schema  IN VARCHAR2     DEFAULT NULL,
  flags   IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 289-2 RECOMP_PARALLEL Procedure Parameters

Parameter	Description
threads	The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.

Table 289-2 (Cont.) RECOMP_PARALLEL Procedure Parameters

Parameter	Description
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

Usage Notes

The `UTL_RECOMP_COMPILED` table is updated with objects that `RECOMP_PARALLEL` has attempted to compile, or that it has compiled so far. If you monitor the progress of the recompilation, then the number of objects should increase with time. These tables are used internally by `RECOMP_PARALLEL` to prevent an object from being compiled more than once.

Table 289-3 Tables Generated by UTL_RECOMP.RECOMP_PARALLEL

Table	Purpose
<code>UTL_RECOMP_ERRORS</code>	A table of objects that are sorted into groups, based on dependencies. It is used internally by <code>RECOMP_PARALLEL</code> to guide parallel recompilation.
<code>UTL_RECOMP_COMPILED</code>	A table of objects that <code>RECOMP_PARALLEL</code> has attempted to compile. It is used internally by <code>recomp_parallel</code> to prevent an object from being compiled more than once.
<code>UTL_RECOMP_COMP_IDX1</code>	An index created on <code>UTL_RECOMP_COMPILED</code> , which uses object number as the primary key.
<code>UTL_RECOMP_SKIP_LIST</code>	A table of objects that <code>RECOMP_PARALLEL</code> will not attempt to compile. Typical usage is for <code>RECOMP_PARALLEL</code> to call <code>UTL_RECOMP.POPULATE_UTL_RECOMP_SKIP_LIST</code> before the update starts so that this table is filled with previously identified invalid objects. Afterward, when <code>RECOMP_PARALLEL</code> is run after upgrade, it will not attempt to compile those previously identified invalid objects.

Table 289-4 Views Generated by UTL_RECOMP.RECOMP_PARALLEL

View	Purpose
<code>UTL_RECOMP_ALL_OBJECTS</code>	A view that includes all objects that can be compiled.
<code>UTL_RECOMP_INVALID_ALL</code>	A view that selects invalid objects from <code>UTL_RECOMP_ALL_OBJECTS</code> that have not been compiled and are not on the skip list.
<code>UTL_RECOMP_INVALID_SEQ</code>	A view that selects objects from <code>UTL_RECOMP_INVALID_ALL</code> that must be compiled sequentially.
<code>UTL_RECOMP_INVALID_PARALLEL</code>	A view that selects objects from <code>UTL_RECOMP_INVALID_ALL</code> that can be compiled in parallel.
<code>UTL_RECOMP_INVALID_JAVA_SYN</code>	A view that selects from <code>UTL_RECOMP_ALL_OBJECTS</code> objects that are invalid JAVA synonyms.

Table 289-4 (Cont.) Views Generated by UTL_RECOMP.RECOMP_PARALLEL

View	Purpose
UTL_RECOMP_CIRCULAR_MV	A view that selects from UTL_RECOMP_ALL_OBJECTS materialized view objects that have a circular dependency chain.
UTL_RECOMP_INVALID_MV	A view that selects from UTL_RECOMP_ALL_OBJECTS materialized view objects that are invalid but don't have a circular dependency chain.
UTL_RECOMP_ALL_STUBS	A view that includes all stub objects that have not been compiled, and are not on the skip list. When this view is used in RECOMP_PARALLEL, it is restricted to show only stubs in the current edition.

289.4.2 RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```
UTL_RECOMP.RECOMP_SERIAL(
    schema IN VARCHAR2 DEFAULT NULL,
    flags  IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 289-5 RECOMP_SERIAL Procedure Parameters

Parameter	Description
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

290

UTL_REF

The `UTL_REF` package provides PL/SQL procedures to support reference-based operations. Unlike SQL, `UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Summary of UTL_REF Subprograms](#)

290.1 UTL_REF Overview

`UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

290.2 UTL_REF Security Model

The procedural option is needed to use this package. This package must be created under `SYS` (`CONNECT /AS SYSDBA`). Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

You can use the `UTL_REF` package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, `UTL_REF` verifies that the invoker has the appropriate privileges to access the object pointed to by the `REF`.

 **Note:**

This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if `UTL_REF` is defined under user `SYS`, and user `A` invokes `UTL_REF.SELECT` to select an object from a reference, then user `A` (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, `UTL_REF` operates with the privileges of the client session under which the PL/SQL execution is being done.

290.3 UTL_REF Types

An object type is a composite datatype defined by the user or supplied as a library type.

You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (  
    name    VARCHAR2(20),  
    id      NUMBER,  
  
    member function GET_ID  
        (name VARCHAR2)  
        RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID()`.

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

290.4 UTL_REF Exceptions

Exceptions can be returned during execution of `UTL_REF` functions for various reasons.

For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
 1. The object has been deleted, or the given reference is dangling (invalid).
 2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the `UTL_REF` subprogram must have the proper privilege on the object that is being selected or modified.

Table 290-1 UTL_REF Exceptions

Exceptions	Description
errnum == 942	Insufficient privileges.
errnum == 1031	Insufficient privileges.
errnum == 8177	Unable to serialize, if in a serializable transaction.
errnum == 60	Deadlock detected.
errnum == 1403	No data found (if the REF is NULL, and so on.).

The UTL_REF package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

290.5 Summary of UTL_REF Subprograms

This table lists the UTL_REF subprograms and briefly describes them.

Table 290-2 UTL_REF Package Subprograms

Subprogram	Description
DELETE_OBJECT Procedure	Deletes an object given a reference
LOCK_OBJECT Procedure	Locks an object given a reference
SELECT_OBJECT Procedure	Selects an object given a reference
UPDATE_OBJECT Procedure	Updates an object given a reference

290.5.1 DELETE_OBJECT Procedure

This procedure deletes an object given a reference.

The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.DELETE_OBJECT (
    reference IN REF "<typename>");
```

Parameters

Table 290-3 DELETE_OBJECT Procedure Parameters

Parameter	Description
reference	Reference of the object to delete.

Exceptions

May be raised.

Examples

The following example illustrates usage of the `UTL_REF` package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of `Address_t` and others...

```
CREATE OR REPLACE TYPE Person_t (
    name    VARCHAR2(64),
    gender  CHAR(1),
    address Address_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t)
);

CREATE OR REPLACE TYPE BODY Person_t (
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
    BEGIN
        address := addr;
    END;
);

CREATE OR REPLACE TYPE Employee_t (
```

Under `Person_t`: Simulate implementation of inheritance using a `REF` to `Person_t` and delegation of `setAddress` to it.

```
    thePerson REF Person_t,
    empno     NUMBER(5),
    deptREF   Department_t,
    mgrREF    Employee_t,
    reminders StringArray_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t),
    MEMBER procedure addReminder(reminder VARCHAR2);
);

CREATE TYPE BODY Employee_t (
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
        myMgr Employee_t;
        meAsPerson Person_t;
    BEGIN
```

Update the address by delegating the responsibility to `thePerson`. Lock the `Person` object from the reference, and also select it:

```
    UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
    meAsPerson.setAddress(addr);
```

Delegate to `thePerson`:

```
    UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
    if mgr is NOT NULL THEN
```

Give the manager a reminder:

```

        UTL_REF.LOCK_OBJECT(mgr);
        UTL_REF.SELECT_OBJECT(mgr, myMgr);
        myMgr.addReminder
        ('Update address in the employee directory for' ||
         thePerson.name || ', new address: ' || addr.asString);
        UTL_REF.UPDATE_OBJECT(mgr, myMgr);
    END IF;
EXCEPTION
    WHEN OTHERS THEN
        errnum := SQLCODE;
        errmsg := SUBSTR(SQLERRM, 1, 200);

```

290.5.2 LOCK_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object.

The semantic of this subprogram is similar to the following SQL statement:

```

SELECT VALUE(t)
  INTO object
  FROM object_table t
 WHERE REF(t) = reference
 FOR UPDATE;

```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

Syntax

```

UTL_REF.LOCK_OBJECT (
    reference IN REF "<typename>");

UTL_REF.LOCK_OBJECT (
    reference IN REF "<typename>",
    object    IN OUT "<typename>");

```

Parameters

Table 290-4 LOCK_OBJECT Procedure Parameters

Parameter	Description
reference	Reference of the object to lock.
object	The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.

Exceptions

May be raised.

290.5.3 SELECT_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.SELECT_OBJECT (
    reference IN REF "<typename>",
    object    IN OUT "<typename>");
```

Parameters

Table 290-5 SELECT_OBJECT Procedure Parameters

Parameter	Description
reference	Reference to the object to select or retrieve.
object	The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.

Exceptions

May be raised.

290.5.4 UPDATE_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.UPDATE_OBJECT (
    reference IN REF "<typename>",
    object    IN    "<typename>");
```

Parameters

Table 290-6 UPDATE_OBJECT Procedure Parameters

Parameter	Description
reference	Reference of the object to update.
object	The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.

Exceptions

May be raised.

UTL_RPADV

The `UTL_RPADV` package provides subprograms to collect and analyze statistics for the Oracle Replication components in a distributed database environment. This package uses the Oracle Replication Performance Advisor to gather statistics.

This chapter contains the following topic:

- [UTL_RPADV Overview](#)
- [DBMS_COMPARISON Security Model](#)
- [UTL_RPADV Operational Notes](#)
- [Summary of UTL_RPADV Subprograms](#)

291.1 UTL_RPADV Overview

This package enables you to collect and analyze statistics about the performance of Oracle Replication components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Replication performance.

When this package is used on an Oracle Database 11g Release 2 (11.2) database, it can monitor Oracle Database 10g Release 2 (10.2) and later databases. It cannot monitor databases before release 10.2.

291.2 DBMS_COMPARISON Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Replication administrator and connect as the Oracle Replication administrator when using this package.

291.3 UTL_RPADV Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Replication administrator and run the `utlrpadv.sql` script in the `rdbms/admin` directory in `ORACLE_HOME`.

The `utlrpadv.sql` script creates the following tables:

- [STREAMS\\$_PA_COMPONENT Table](#)
- [STREAMS\\$_PA_COMPONENT_LINK Table](#)
- [STREAMS\\$_PA_COMPONENT_PROP Table](#)

- STREAMS\$_PA_COMPONENT_STAT Table
- STREAMS\$_PA_CONTROL Table
- STREAMS\$_PA_DATABASE Table
- STREAMS\$_PA_DATABASE_PROP Table
- STREAMS\$_PA_MONITORING Table
- STREAMS\$_PA_PATH_BOTTLENECK Table
- STREAMS\$_PA_PATH_STAT Table
- STREAMS\$_PA_SHOW_COMP_STAT Table
- STREAMS\$_PA_SHOW_PATH_STAT Table

The Oracle Replication Performance Advisor populates these tables when it is run.

STREAMS\$_PA_COMPONENT Table

The STREAMS\$_PA_COMPONENT table displays information about the Oracle Replication components at each database.

Table 291-1 STREAMS\$_PA_COMPONENT Table

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Replication Performance Advisor
COMPONENT_NAME	VARCHAR2 (194)		Name of the component
COMPONENT_DB	VARCHAR2 (128)		Name of the database that contains the component
COMPONENT_TYPE	VARCHAR2 (20)		Type of the component The following types are possible: <ul style="list-style-type: none"> • CAPTURE for a capture process • PROPAGATION SENDER for a propagation sender • PROPAGATION RECEIVER for a propagation receiver • APPLY for an apply process • QUEUE for a queue
COMPONENT_CHANGED_TIME	DATE		Time when the component was last changed

STREAMS\$_PA_COMPONENT_LINK Table

The STREAMS\$_PA_COMPONENT_LINK table displays information about how information flows between Oracle Replication components.

Table 291-2 STREAMS\$_PA_COMPONENT_LINK Table

Column	Datatype	NULL	Description
PATH_ID	NUMBER	NOT NULL	Identification number assigned to the path by the Oracle Replication Performance Advisor
PATH_KEY	VARCHAR2 (4000)		Unique key assigned to the path by the Oracle Replication Performance Advisor
SOURCE_COMPONENT_ID	NUMBER	NOT NULL	Source component ID for the path The path starts with this component.
DESTINATION_COMPONENT_ID	NUMBER	NOT NULL	Destination component ID for the path The path ends with this component.
POSITION	NUMBER		Position of the component in the path

STREAMS\$_PA_COMPONENT_PROP Table

The `STREAMS$_PA_COMPONENT_PROP` table displays information about capture processes and apply processes necessary for analysis by the Replication Performance Advisor.

Table 291-3 STREAMS\$_PA_COMPONENT_PROP Table

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Replication Performance Advisor

Table 291-3 (Cont.) STREAMS\$_PA_COMPONENT_PROP Table

Column	Datatype	NULL	Description
PROP_NAME	VARCHAR2 (30)		Property name For a capture process, the component properties include the following: <ul style="list-style-type: none"> • SOURCE_DATABASE - The source database for the changes captured by the capture process • PARALLELISM - The setting for the parallelism capture process parameter • OPTIMIZATION_MODE - Indicates whether the capture process uses combined capture and apply (greater than zero) or does not use combined capture and apply (0) For an apply process, the component properties include the following: <ul style="list-style-type: none"> • SOURCE_DATABASE - The source database for the messages applied by the apply process • PARALLELISM - The setting for the parallelism apply process parameter • APPLY_CAPTURED - Indicates whether the apply process applies captured messages (YES) persistent messages (NO) • MESSAGE_DELIVERY_MODE - Either buffered or persistent
PROP_VALUE	VARCHAR2 (30)		Property value

STREAMS\$_PA_COMPONENT_STAT Table

The STREAMS\$_PA_COMPONENT_STAT table displays performance statistics and session statistics about each Oracle Replication component.

Table 291-4 STREAMS\$_PA_COMPONENT_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run

Table 291-4 (Cont.) STREAMS\$_PA_COMPONENT_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was run for the advisor run ID
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Replication Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2 (64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2 (64)		Unit of measurement for the statistic
SUB_COMPONENT_TYP E	VARCHAR2 (64)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: <ul style="list-style-type: none"> LOGMINER READER for a builder server of a capture process LOGMINER PREPARER for a preparer server of a capture process LOGMINER BUILDER for a reader server of a capture process CAPTURE SESSION for a capture process session The following apply process subcomponent types are possible: <ul style="list-style-type: none"> PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database APPLY READER for a reader server of an apply process APPLY COORDINATOR for a coordinator process of an apply process APPLY SERVER for a reader server of an apply process
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V\$SESSION view for information about the session.

Table 291-4 (Cont.) STREAMS\$_PA_COMPONENT_STAT Table

Column	Datatype	NULL	Description
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V\$SESSION view for information about the session.

STREAMS\$_PA_CONTROL Table

The STREAMS\$_PA_CONTROL table displays the parameters set for the COLLECT_STATS procedure in this package. The parameters control the monitoring behavior.

Table 291-5 STREAMS\$_PA_CONTROL Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
PARAM_NAME	VARCHAR2 (30)		The name of the parameter
PARAM_VALUE	VARCHAR2 (4000)		The value set for the parameter
PARAM_UNIT	VARCHAR2 (30)		The unit of the parameter

STREAMS\$_PA_DATABASE Table

The STREAMS\$_PA_DATABASE table displays information about each database that contains Oracle Replication components.

Table 291-6 STREAMS\$_PA_DATABASE Table

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2 (128)	NOT NULL	Global name of the database analyzed by the Oracle Replication Performance Advisor
LAST_QUERIED	DATE		The time when the Performance Advisor successfully collected information from a database in its last run
ERROR_NUMBER	NUMBER		The error number of the error encountered when the database was last queried
ERROR_MESSAGE	VARCHAR2 (4000)		The error message of the error encountered when the database was last queried

STREAMS\$_PA_DATABASE_PROP Table

The STREAMS\$_PA_DATABASE_PROP table displays Oracle Replication database property information necessary for analysis by the Replication Performance Advisor.

Table 291-7 STREAMS\$_PA_DATABASE_PROP Table

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2 (128)	NOT NULL	Global name of the database analyzed by the Oracle Replication Performance Advisor
PROP_NAME	VARCHAR2 (30)		Property name The database properties include the following: <ul style="list-style-type: none"> • VERSION • COMPATIBILITY • MANAGEMENT_PACK_ACCESS • DB_UNIQUE_NAME
PROP_VALUE	VARCHAR2 (30)		Property value

STREAMS\$_PA_MONITORING Table

The `STREAMS$_PA_MONITORING` table displays information about each monitoring job running in a database.

Table 291-8 STREAMS\$_PA_MONITORING Table

Column	Datatype	NULL	Description
JOB_NAME	VARCHAR2 (30)	NOT NULL	Name of the monitoring job
CLIENT_NAME	VARCHAR2 (30)		Name of the client that submitted the job See Also: "Full Monitoring Job Names"
QUERY_USER_NAME	VARCHAR2 (30)		User granted privileges to view the monitoring results
SHOW_STATS_TABLE	VARCHAR2 (30)		Name of the table used by the <code>SHOW_STATS</code> procedure to display statistics
STARTED_TIME	TIMESTAMP		Time the monitoring job started
STOPPED_TIME	TIMESTAMP		Time the monitoring job last stopped
ALTERED_TIME	TIMESTAMP		Time the monitoring job was last altered
STATE	VARCHAR2 (30)		State of the monitoring job, either <code>ENABLED</code> or <code>STOPPED</code>

STREAMS\$_PA_PATH_BOTTLENECK Table

The `STREAMS$_PA_PATH_BOTTLENECK` table displays information about Oracle Replication components that might be slowing down the flow of messages.

Table 291-9 STREAMS\$_PA_PATH_BOTTLENECK Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run

Table 291-9 (Cont.) STREAMS\$_PA_PATH_BOTTLENECK Table

Column	Datatype	NULL	Description
ADVISOR_RUN_REASON	VARCHAR2 (4000)		Reason for the bottleneck
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
PATH_KEY	VARCHAR2 (4000)		Unique key assigned to the path by the Oracle Replication Performance Advisor
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Replication Performance Advisor
TOP_SESSION_ID	NUMBER		Session ID of the top component. Query the V\$SESSION view for information about the session.
TOP_SESSION_SERIAL#	NUMBER		Session serial number of the top component. Query the V\$SESSION view for information about the session.
ACTION_NAME	VARCHAR2 (32)		Action name for the top session
BOTTLENECK_IDENTIFIED	VARCHAR2 (30)		Whether a bottleneck was identified

STREAMS\$_PA_PATH_STAT Table

The STREAMS\$_PA_PATH_STAT table displays performance statistics about each stream path.

Table 291-10 STREAMS\$_PA_PATH_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was run for the advisor run ID
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
PATH_KEY	VARCHAR2 (4000)		Unique key assigned to the path by the Oracle Replication Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2 (64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2 (64)		Unit of measurement for the statistic

STREAMS\$_PA_SHOW_COMP_STAT Table

The `STREAMS$_PA_SHOW_COMP_STAT` table displays statistics for Oracle Replication components.

Table 291-11 STREAMS\$_PA_SHOW_COMP_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
POSITION	NUMBER		Position of the component in the path
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Replication Performance Advisor
COMPONENT_NAME	VARCHAR2 (194)		Name of the component
COMPONENT_TYPE	VARCHAR2 (30)		Type of the component The following types are possible: <ul style="list-style-type: none">• CAPTURE for a capture process• PROPAGATION SENDER for a propagation sender• PROPAGATION RECEIVER for a propagation receiver• APPLY for an apply process• QUEUE for a queue

Table 291-11 (Cont.) STREAMS\$_PA_SHOW_COMP_STAT Table

Column	Datatype	NULL	Description
SUB_COMPONENT_TYPE	VARCHAR2 (30)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: <ul style="list-style-type: none"> LOGMINER READER for a builder server of a capture process LOGMINER PREPARER for a preparer server of a capture process LOGMINER BUILDER for a reader server of a capture process CAPTURE SESSION for a capture process session The following apply process subcomponent types are possible: <ul style="list-style-type: none"> PROPAGATION_SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database APPLY READER for a reader server of an apply process APPLY COORDINATOR for a coordinator process of an apply process APPLY SERVER for a reader server of an apply process
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V\$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V\$SESSION view for information about the session.
STATISTIC_ALIAS	VARCHAR2 (30)		Name of the statistic
STATISTIC_NAME	VARCHAR2 (128)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2 (128)		Unit of measurement for the statistic

STREAMS\$_PA_SHOW_PATH_STAT Table

The STREAMS\$_PA_SHOW_PATH_STAT table displays statistics for the stream paths in an Oracle Replication configuration. A monitoring job uses this table as the default table for the statistics collected for stream paths.

Table 291-12 STREAMS\$_PA_SHOW_PATH_STAT Table

Column	Datatype	NULL	Description
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
SETTING	VARCHAR2 (2000)		Setting for the Oracle Replication Performance Advisor Run
STATISTICS	VARCHAR2 (4000)		Component-level statistics
SESSION_STATISTICS	VARCHAR2 (4000)		Session-level statistics
OPTIMIZATION	NUMBER		Whether the path uses the combined capture and apply optimization 0 (zero) means that the path does not use the combined capture and apply optimization. 1 means that the path uses the combined capture and apply optimization.

291.4 Summary of UTL_RPADV Subprograms

This table lists the UTL_RPADV subprograms and briefly describes them.

Table 291-13 UTL_RPADV Package Subprograms

Subprogram	Description
ALTER_MONITORING Procedure	Alters the monitoring job submitted by the current user.
COLLECT_STATS Procedure	Uses the Oracle Replication Performance Advisor to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.
IS_MONITORING Function	Checks whether a monitoring job is currently running.
SHOW_STATS Procedure	Generates output that includes the statistics gathered by the COLLECT_STATS procedure.
SHOW_STATS_HTML Procedure	Generates HTML output that includes the statistics gathered by the COLLECT_STATS procedure.
START_MONITORING Procedure	Starts a monitoring job.
STOP_MONITORING Procedure	Stops a monitoring job.

291.4.1 ALTER_MONITORING Procedure

This procedure alters the monitoring job submitted by the current user.

Syntax

```
UTL_RPADV.ALTER_MONITORING(
    interval                IN NUMBER  DEFAULT NULL,
    top_event_threshold     IN NUMBER  DEFAULT NULL,
    bottleneck_idle_threshold IN NUMBER  DEFAULT NULL,
    bottleneck_flowctrl_threshold IN NUMBER  DEFAULT NULL,
    retention_time         IN NUMBER  DEFAULT NULL);
```

Parameters

Table 291-14 ALTER_MONITORING Procedure Parameters

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. If NULL, then the current value is not changed.
top_event_threshold	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected. If NULL, then the current value is not changed.
bottleneck_idle_threshold	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed.

Table 291-14 (Cont.) ALTER_MONITORING Procedure Parameters

Parameter	Description
<code>retention_time</code>	The number of hours to retain monitoring results. If NULL, then the current value is not changed.

Exceptions**Table 291-15 ALTER_MONITORING Procedure Exceptions**

Exception	Description
ORA-20113	no active monitoring job found

291.4.2 COLLECT_STATS Procedure

This procedure uses the Oracle Replication Performance Advisor to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.

**Note:**

This procedure commits.

Syntax

```
UTL_RPADV.COLLECT_STATS (
    interval                IN NUMBER    DEFAULT 60,
    num_runs                IN NUMBER    DEFAULT 10,
    comp_stat_table         IN VARCHAR2  DEFAULT 'STREAMS$$_ADVISOR_COMP_STAT',
    path_stat_table         IN VARCHAR2  DEFAULT 'STREAMS$$_ADVISOR_PATH_STAT',
    top_event_threshold     IN NUMBER    DEFAULT 15,
    bottleneck_idle_threshold IN NUMBER  DEFAULT 50,
    bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50);
```

Parameters**Table 291-16 COLLECT_STATS Procedure Parameters**

Parameter	Description
<code>interval</code>	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.
<code>num_runs</code>	The number of times that the Oracle Replication Performance Advisor is run by the procedure.

Table 291-16 (Cont.) COLLECT_STATS Procedure Parameters

Parameter	Description
comp_stat_table	<p>The name of the table that stores the statistics collected for Oracle Replication components and subcomponents. Specify the table name as <i>[schema_name.]object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>The procedure creates the specified table if it does not exist.</p> <p>Oracle recommends that you use the default table <code>STREAMS\$_ADVISOR_COMP_STAT</code>.</p> <p>See "Usage Notes" for more information about this parameter.</p>
path_stat_table	<p>The name of the table that stores the statistics collected for stream paths. Specify the table name as <i>[schema_name.]object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>The procedure creates the specified table if it does not exist.</p> <p>Oracle recommends that you use the default table <code>STREAMS\$_ADVISOR_PATH_STAT</code>.</p> <p>See "Usage Notes" for more information about this parameter.</p>
top_event_threshold	<p>A percentage that determines whether a top wait event statistic is collected.</p> <p>The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.</p>
bottleneck_idle_threshold	<p>A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its <code>IDLE</code> percentage.</p> <p>The <code>IDLE</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</p>
bottleneck_flowctrl_threshold	<p>A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its <code>FLOW CONTROL</code> percentage.</p> <p>The <code>FLOW CONTROL</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</p>

Usage Notes

The table specified in the `path_stat_table` parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the `comp_stat_table` parameter. The `SHOW_STATS` procedure in this package shows only the statistics stored in the table specified in the `path_stat_table` parameter.

291.4.3 IS_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns `TRUE` if a monitoring job is currently running or `FALSE` if a monitoring job is not currently running.

A monitoring job is submitted using the `START_MONITORING` procedure.

See Also:

["START_MONITORING Procedure"](#)

Syntax

```
UTL_RPADV.IS_MONITORING(  
    job_name      IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',  
    client_name   IN VARCHAR2  DEFAULT NULL)  
RETURN BOOLEAN;
```

Parameters

Table 291-17 IS_MONITORING Function Parameters

Parameter	Description
<code>job_name</code>	The name of the job for which to check.
<code>client_name</code>	The name of the client that submitted the job.

291.4.4 SHOW_STATS Procedure

This procedure generates output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

Note:

This procedure does not commit.

 **See Also:**

- ["COLLECT_STATS Procedure"](#)
- ["START_MONITORING Procedure"](#)

Syntax

```
UTL_RPADV.SHOW_STATS(
  path_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
  path_id         IN NUMBER   DEFAULT NULL,
  bgn_run_id     IN NUMBER   DEFAULT -1,
  end_run_id     IN NUMBER   DEFAULT -10,
  show_path_id   IN BOOLEAN  DEFAULT TRUE,
  show_run_id    IN BOOLEAN  DEFAULT TRUE,
  show_run_time  IN BOOLEAN  DEFAULT TRUE,
  show_optimization IN BOOLEAN DEFAULT TRUE,
  show_setting   IN BOOLEAN  DEFAULT FALSE,
  show_stat      IN BOOLEAN  DEFAULT TRUE,
  show_sess     IN BOOLEAN  DEFAULT FALSE,
  show_legend    IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 291-18 *SHOW_STATS Procedure Parameters*

Parameter	Description
path_stat_table	<p>The name of the table that contains the stream path statistics. Specify the table name as <i>[schema_name.]object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>When you gather statistics using the COLLECT_STATS procedure, this table is specified in the path_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS\$_ADVISOR_PATH_STAT.</p> <p>When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS\$_PA_MONITORING view. The default table for a monitoring job is STREAMS\$_PA_SHOW_PATH_STAT.</p>
path_id	<p>A stream path ID.</p> <p>If non-NULL, then the procedure shows output for the specified stream path only.</p> <p>If NULL, then the procedure shows output for all active stream paths.</p>
bgn_run_id	<p>The first Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "Usage Notes" for more information about this parameter.</p>
end_run_id	<p>The last Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "Usage Notes" for more information about this parameter.</p>

Table 291-18 (Cont.) SHOW_STATS Procedure Parameters

Parameter	Description
show_path_id	If TRUE, then the path ID for each stream path is included in the output. If FALSE, then the path ID for each stream path is not included in the output.
show_run_id	If TRUE, then the Oracle Replication Performance Advisor run ID is included in the output. If FALSE, then the Oracle Replication Performance Advisor run ID is not included in the output.
show_run_time	If TRUE, then the Oracle Replication Performance Advisor run time is included in the output. If FALSE, then the Oracle Replication Performance Advisor run time is not included in the output.
show_optimization	If TRUE, then path output includes information pertaining to the combined capture and apply optimization. If FALSE, then path output does not include information pertaining to the combined capture and apply optimization.
show_setting	If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the <code>top_event_threshold</code> , <code>bottleneck_idle_threshold</code> , and <code>bottleneck_flowctrl_threshold</code> parameters in the <code>COLLECT_STATS</code> procedure. If FALSE, then the settings for the threshold parameters are not included in the output.
show_stat	If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes. If FALSE, then the component-level and subcomponent-level statistics are not included in the output.
show_sess	If TRUE, then the session-level statistics are included in the output. Session-level statistics include <code>IDLE</code> , <code>FLOW CONTROL</code> , and <code>EVENT</code> statistics. If FALSE, then the session-level statistics are not included in the output.
show_legend	If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output. If FALSE, then the legend is not included in the output.

Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Replication Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Replication Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Replication Performance Advisor runs.

291.4.5 SHOW_STATS_HTML Procedure

This procedure generates HTML output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

Note:

This procedure does not commit.

See Also:

- ["COLLECT_STATS Procedure"](#)
- ["START_MONITORING Procedure"](#)

Syntax

```
UTL_RPADV.SHOW_STATS_HTML (
  directory          IN VARCHAR2,
  reportname        IN VARCHAR2  DEFAULT 'RPADVREPORT.HTML',
  comp_stat_table   IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
  path_id           IN NUMBER     DEFAULT NULL,
  bgn_run_id        IN NUMBER     DEFAULT -1,
  end_run_id        IN NUMBER     DEFAULT -10,
  detailed          IN BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 291-19 SHOW_STATS_HTML Procedure Parameters

Parameter	Description
<code>directory</code>	The directory object for the directory on the local computer system into which the generated HTML report is placed The specified directory object must be created using the SQL statement <code>CREATE DIRECTORY</code> , and the user who invokes the procedure must have <code>READ</code> and <code>WRITE</code> privilege on each one.
<code>reportname</code>	The name of the HTML report

Table 291-19 (Cont.) SHOW_STATS_HTML Procedure Parameters

Parameter	Description
comp_stat_table	<p>The name of the table that stores the statistics collected for Oracle Replication components and subcomponents. Specify the table name as <i>[schema_name.]object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>When you gather statistics using the <code>COLLECT_STATS</code> procedure, this table is specified in the <code>comp_stat_table</code> parameter in the <code>COLLECT_STATS</code> procedure. The default table is <code>STREAMS\$_ADVISOR_COMP_STAT</code>.</p> <p>When you gather statistics using the <code>START_MONITORING</code> procedure, you can determine the name for this table by querying the <code>SHOW_STATS_TABLE</code> column in the <code>STREAMS\$_PA_MONITORING</code> view. The default table for a monitoring job is <code>STREAMS\$_PA_SHOW_PATH_STAT</code>.</p> <p>Oracle recommends that you start a monitoring job with the <code>START_MONITORING</code> procedure in this package and use the appropriate the <code>STREAMS\$_PA_SHOW_PATH_STAT</code> table.</p>
path_id	<p>A stream path ID.</p> <p>If non-NULL, then the procedure shows output for the specified stream path only.</p> <p>If NULL, then the procedure shows output for all active stream paths.</p>
bgn_run_id	<p>The first Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "Usage Notes" for more information about this parameter.</p>
end_run_id	<p>The last Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "Usage Notes" for more information about this parameter.</p>
detailed	<p>If TRUE, then the procedure generates component-level statistics.</p> <p>If FALSE, then the procedure does not generate component-level statistics.</p>

Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Replication Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Replication Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Replication Performance Advisor runs.

291.4.6 START_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the `COLLECT_STATS` procedure to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.

**Note:**

This procedure commits.

**See Also:**

- ["COLLECT_STATS Procedure"](#)

Syntax

```
UTL_RPADV.START_MONITORING(
    job_name           IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
    client_name        IN VARCHAR2  DEFAULT NULL,
    query_user_name    IN VARCHAR2  DEFAULT NULL,
    interval           IN NUMBER     DEFAULT 60,
    top_event_threshold IN NUMBER     DEFAULT 15,
    bottleneck_idle_threshold IN NUMBER DEFAULT 50,
    bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50,
    retention_time     IN NUMBER     DEFAULT 24);
```

Parameters**Table 291-20 START_MONITORING Procedure Parameters**

Parameter	Description
job_name	The name of the monitoring job to create.
client_name	The name of the client.
query_user_name	The user who will query the result tables. This procedure grants privileges to the specified user to enable the user to query the result tables.
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. The specified interval is used for the interval parameter in the COLLECT_STATS procedure.
top_event_threshold	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.

Table 291-20 (Cont.) START_MONITORING Procedure Parameters

Parameter	Description
bottleneck_idle_threshold	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.
retention_time	The number of hours to retain monitoring results.

Exceptions

Table 291-21 START_MONITORING Procedure Exceptions

Exception	Description
ORA-20111	cannot start monitoring due to active EM monitoring job Stop the Oracle Enterprise Manager (EM) monitoring job, and run the START_MONITORING procedure again.
ORA-20112	cannot start monitoring due to active Replication monitoring job Stop the Replication monitoring job, and run the START_MONITORING procedure again.

Usage Notes

The following are usage notes for the START_MONITORING procedure:

- [Requirements for the User Running the Procedure](#)
- [Full Monitoring Job Names](#)
- [Restrictions on Monitoring Jobs](#)

Requirements for the User Running the Procedure

The user who runs the START_MONITORING procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Replication components.

- The user must have been granted privileges using the `DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE` procedure, and each database link must connect to a user at the remote database that has been granted privileges using the `DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE` procedure.

Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table show examples of full monitoring job names:

Setting for <code>client_name</code> Parameter	Setting for <code>job_name</code> parameter	Full Monitoring Job Name
<code>NULL</code>	<code>STREAMS\$_MONITORING_JOB</code>	<code>STREAMS\$_MONITORING_JOB</code>
<code>EM</code>	<code>STREAMS\$_MONITORING_JOB</code>	<code>EMSTREAMS\$_MONITORING_JOB</code>
<code>strm</code>	<code>STREAMS\$_MONITORING_JOB</code>	<code>strmSTREAMS\$_MONITORING_JOB</code>
<code>strm</code>	<code>mjob1</code>	<code>strmmjob1</code>

Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$_MONITORING_JOB` and `STRMSTREAMS$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.

291.4.7 STOP_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

Syntax

```
UTL_RPADV.STOP_MONITORING(
    purge IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 291-22 STOP_MONITORING Procedure Parameters

Parameter	Description
purge	If <code>TRUE</code> , then the procedure purges information about the monitoring job from the result tables. If <code>FALSE</code> , then the procedure retains information about the monitoring job in the result tables.

UTL_SMTP

The `UTL_SMTP` package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Reply Codes](#)
- [UTL_SMTP Operational Notes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of UTL_SMTP Subprograms](#)

See Also:

Oracle Database Development Guide

292.1 UTL_SMTP Overview

The `UTL_SMTP` protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The `UTL_SMTP` package provides interfaces to the SMTP commands.

For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using `UTL_SMTP`, all text data (in other words, those in `VARCHAR2`) is converted to US7ASCII before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the `DATA` command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte `VARCHAR2` data to `RAW` and use the `WRITE_RAW_DATA` subprogram to send multibyte data using 8-bit MIME encoding.

UTL_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, UTL_SMTP does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.

292.2 UTL_SMTP Security Model

This package is an invoker's rights package. The invoking user must have the `connect` privilege granted in the access control list assigned to the remote network host to which the user must connect.

Note:

For more information on managing fine-grained access, see *Oracle Database Security Guide*

292.3 UTL_SMTP Constants

UTL_SMTP defines several constants to use when specifying parameter values.

These are shown in the following table.

Table 292-1 UTL_SMTP Constants

Name	Type	Value	Description
ALL_SCHEMES	VARCHAR2 (256)	'CRAM-MD5 PLAIN LOGIN'	List of all authentication schemes UTL_SMTP supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, PLAIN and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS).
NON_CLEARTEXT_PASSWORD_SCHEMES	VARCHAR2 (256)	'CRAM-MD5'	List of authentication schemes that UTL_SMTP supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection.

292.4 UTL_SMTP Types

UTL_SMTP uses a CONNECTION record type and REPLY_REPLIES record types.

CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

Syntax

```
TYPE connection IS RECORD (
    host          VARCHAR2(255),
    port          PLS_INTEGER,
    tx_timeout    PLS_INTEGER,
    private_tcp_con utl_tcp.connection,
    private_state PLS_INTEGER);
```

Fields

Table 292-2 CONNECTION Record Type Fields

Field	Description
host	Name of the remote host when connection is established. NULL when no connection is established.
port	Port number of the remote SMTP server connected. NULL when no connection is established.
tx_timeout	Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
private_tcp_con	Private, for implementation use only. You should not modify this field.
private_state	Private, for implementation use only. You should not modify this field.

Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the [OPEN_CONNECTION Functions](#). Changing the values of these fields has no effect on the connection. The fields `private_tcp_con` and `private_state` for implementation use only. You should not modify these fields.

REPLY_REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

Syntax

```
TYPE reply IS RECORD (
  code    PLS_INTEGER,
  text    VARCHAR2(508));
```

```
TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;
```

Fields**Table 292-3 REPLY, REPLIES Record Type Fields**

Field	Description
code	3-digit reply code
text	Text message of the reply

292.5 UTL_SMTP Reply Codes

SMTP servers send reply codes that indicate message or server status.

The following is a list of the SMTP reply codes.

Table 292-4 SMTP Reply Codes

Reply Code	Meaning
211	System status, or system help reply
214	Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]
220	<domain> Service ready
221	<domain> Service closing transmission channel
250	Requested mail action okay, completed
251	User not local; forwards to <forward-path>
252	OK, pending messages for node <node> started. Cannot VRFY user (for example, info is not local), but takes message for this user and attempts delivery.
253	OK, <messages> pending messages for node <node> started
354	Start mail input; end with <CRLF.CRLF>
355	Octet-offset is the transaction offset
421	<domain> Service not available, closing transmission channel (This can be a reply to any command if the service knows it must shut down.)
450	Requested mail action not taken: mailbox unavailable [for example, mailbox busy]
451	Requested action terminated: local error in processing
452	Requested action not taken: insufficient system storage
453	You have no mail.

Table 292-4 (Cont.) SMTP Reply Codes

Reply Code	Meaning
454	TLS not available due to temporary reason. Encryption required for requested authentication mechanism.
458	Unable to queue messages for node <node>
459	Node <node> not allowed: reason
500	Syntax error, command unrecognized (This may include errors such as command line too long.)
501	Syntax error in parameters or arguments
502	Command not implemented
503	Bad sequence of commands
504	Command parameter not implemented
521	<Machine> does not accept mail.
530	Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.
534	Authentication mechanism is too weak.
538	Encryption required for requested authentication mechanism.
550	Requested action not taken: mailbox unavailable [for, mailbox not found, no access]
551	User not local; please try <forward-path>
552	Requested mail action terminated: exceeded storage allocation
553	Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]
554	Transaction failed

292.6 UTL_SMTP Operational Notes

An SMTP connection is initiated by a call to `OPEN_CONNECTION` Functions which returns a SMTP connection.

After a connection is established, the following calls are required to send a mail:

[HELO Function and Procedure](#) - identify the domain of the sender

[MAIL Function and Procedure](#)- start a mail, specify the sender

[RCPT Function](#) - specify the recipient

[OPEN_DATA Function and Procedure](#)- start the mail body

[WRITE_RAW_DATA Procedure](#) - write the mail body (multiple calls allowed)

[CLOSE_DATA Function and Procedure](#) - close the mail body and send the mail

The SMTP connection is closed by calling the `QUIT` Function and Procedure.

Related Topics

- [OPEN_CONNECTION Functions](#)
These functions open a connection to an SMTP server.
- [QUIT Function and Procedure](#)
This subprogram terminates an SMTP session and disconnects from the server.

292.7 UTL_SMTP Exceptions

This table lists the exceptions that can be raised by the interface of the UTL_SMTP package.

The network error is transferred to a reply code of 421- service not available.

Table 292-5 UTL_SMTP Exceptions

Exception	Description
INVALID_OPERATION	Raised when an invalid operation is made. In other words, calling API other than the WRITE_DATA Procedure , the WRITE_RAW_DATA Procedure or the CLOSE_DATA Function and Procedure after the OPEN_DATA Function and Procedure is called, or calling <code>WRITE_DATA</code> , <code>WRITE_RAW_DATA</code> or <code>CLOSE_DATA</code> without first calling <code>OPEN_DATA</code> .
TRANSIENT_ERROR	Raised when receiving a reply code in 400 range
PERMANENT_ERROR	Raised when receiving a reply code in 500 range

292.8 UTL_SMTP Rules and Limits

The API imposes no imitation or range-checking. However, you must be aware of the limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

The following table describes the size limitations encountered by the UTL_SMTP subprograms.

Table 292-6 SMTP Size Limitation

Element	Size Limitation
user	Maximum total length of a user name is 64 characters
domain	Maximum total length of a domain name or number is 64 characters
path	Maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators)
command line	Maximum total length of a command line including the command word and the <CRLF> is 512 characters
reply line	Maximum total length of a reply line including the reply code and the <CRLF> is 512 characters
text line	Maximum total length of a text line including the <CRLF> is 1000 characters (but not counting the leading dot duplicated for transparency)

Table 292-6 (Cont.) SMTP Size Limitation

Element	Size Limitation
recipients buffer	Maximum total number of recipients that must be buffered is 100 recipients

292.9 UTL SMTP Examples

This example illustrates how UTL SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```

DECLARE
  c UTL SMTP.CONNECTION;

  PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
  BEGIN
    UTL SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
  END;

BEGIN
  c := UTL SMTP.OPEN_CONNECTION('smtp-server.acme.com');
  UTL SMTP.HELO(c, 'foo.com');
  UTL SMTP.MAIL(c, 'sender@foo.com');
  UTL SMTP.RCPT(c, 'recipient@foo.com');
  UTL SMTP.OPEN_DATA(c);
  send_header('From',      '"Sender" <sender@foo.com>');
  send_header('To',       '"Recipient" <recipient@foo.com>');
  send_header('Subject', 'Hello');
  UTL SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
  UTL SMTP.CLOSE_DATA(c);
  UTL SMTP.QUIT(c);
EXCEPTION
  WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
  BEGIN
    UTL SMTP.QUIT(c);
  EXCEPTION
    WHEN UTL SMTP.TRANSIENT_ERROR OR UTL SMTP.Permanent_Error THEN
    NULL; -- When the SMTP server is down or unavailable, we don't have
    -- a connection to the server. The QUIT call raises an
    -- exception that we can ignore.
  END;
  raise_application_error(-20000,
    'Failed to send mail due to the following error: ' || sqlerrm);
END;

```

292.10 Summary of UTL SMTP Subprograms

This table lists the UTL SMTP subprograms and briefly describes them.

Table 292-7 UTL SMTP Package Subprograms

Subprogram	Description
AUTH Function and Procedure	Sends the AUTH command to authenticate to the SMTP server

Table 292-7 (Cont.) UTL_SMTP Package Subprograms

Subprogram	Description
CLOSE_CONNECTION Procedure	Closes the SMTP connection, causing the current SMTP operation to terminate
CLOSE_DATA Function and Procedure	Closes the data session
COMMAND Function and Procedure	Performs a generic SMTP command
COMMAND_REPLIES Function	Performs a generic SMTP command and retrieves multiple reply lines
DATA Function and Procedure	Sends the e-mail body
EHLO Function and Procedure	Performs the initial handshake with SMTP server using the <code>EHLO</code> command
HELO Function and Procedure	Performs the initial handshake with SMTP server using the <code>HELO</code> command
HELP Function	Sends <code>HELP</code> command
MAIL Function and Procedure	Initiates an e-mail transaction with the server, the destination is a mailbox
NOOP Function and Procedure	<code>NULL</code> command
OPEN_CONNECTION Functions	Opens a connection to an SMTP server
OPEN_DATA Function and Procedure	Sends the <code>DATA</code> command
QUIT Function and Procedure	Terminates an SMTP session and disconnects from the server
RCPT Function	Specifies the recipient of an e-mail message
RSET Function and Procedure	Terminates the current e-mail transaction
STARTTLS Function and Procedure	Sends <code>STARTTLS</code> command to secure the SMTP connection using SSL/TLS
VRFY Function	Verifies the validity of a destination e-mail address
WRITE_DATA Procedure	Writes a portion of the e-mail message
WRITE_RAW_DATA Procedure	Writes a portion of the e-mail message with <code>RAW</code> data

292.10.1 AUTH Function and Procedure

This subprogram sends the `AUTH` command to authenticate to the SMTP server. The `UTL_SMTP` package goes through the user's choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported.

To determine the schemes the SMTP server supports from its `EHLO` reply, the user must call the [EHLO Function and Procedure](#). Otherwise, `UTL_SMTP` uses the first scheme in the list.

Syntax

```

UTL_SMTP.AUTH (
  c          IN OUT NOCOPY connection,
  username   IN          VARCHAR2,
  password   IN          VARCHAR2,
  schemes    IN          VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES)
RETURN reply;

```

```

UTL_SMTP.AUTH (
  c          IN OUT NOCOPY connection,
  username   IN          VARCHAR2,
  password   IN          VARCHAR2,
  schemes    IN          VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES);

```

Parameters

Table 292-8 AUTH Function and Procedure Parameters

Parameter	Description
c	SMTP connection
username	Username
password	Password
schemes	Space-separated list of authentication schemes UTL_SMTP is allowed to use in the preferred order. See the ALL_SCHEMES and NON_CLEARTEXT_PASSWORD_SCHEMES constants for suggestions.

Return Values

Table 292-9 AUTH Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- Currently only PLAIN, LOGIN and CRAM-MD5 authentication schemes are supported by UTL_SMTP.
- Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the STARTTLS command (for example, adding PLAIN and LOGIN), the caller must call the [EHLO Function and Procedure](#) again for UTL_SMTP to update the list after the [STARTTLS Function and Procedure](#) is called.

Examples

```

DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
    host => 'smtp.example.com',
    port => 25,

```

```

        wallet_path => 'file:/oracle/wallets/smtp_wallet',
        wallet_password => 'password',
        secure_connection_before_smtp => FALSE);
UTL_SMTP.STARTTLS(c);
UTL_SMTP.AUTH(
    c => c,
    username => 'scott',
    password => 'password'
    schemes => utl_smtp.all_schemes);
END;
```

292.10.2 CLOSE_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session.

To end the SMTP connection properly, use the [QUIT Function and Procedure](#).

Syntax

```
UTL_SMTP.CLOSE_CONNECTION (
    c      IN OUT NOCOPY connection);
```

Parameters

Table 292-10 CLOSE_CONNECTION Procedure Parameters

Parameter	Description
c	SMTP connection

292.10.3 CLOSE_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

Syntax

```
UTL_SMTP.CLOSE_DATA (
    c      IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.CLOSE_DATA (
    c      IN OUT NOCOPY connection);
```

Parameters

Table 292-11 CLOSE_DATA Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Return Values

Table 292-12 CLOSE_DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

CLOSE_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

292.10.4 COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

Syntax

```
UTL_SMTP.COMMAND (
  c      IN OUT NOCOPY   connection,
  cmd    IN              VARCHAR2,
  arg    IN              VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.COMMAND (
  c      IN OUT NOCOPY   connection,
  cmd    IN              VARCHAR2,
  arg    IN              VARCHAR2 DEFAULT NULL);
```

Parameters

Table 292-13 COMMAND Function and Procedure Parameters

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between cmd and arg.

Return Values

Table 292-14 COMMAND Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

292.10.5 COMMAND_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

Syntax

```
UTL_SMTP.COMMAND_REPLIES (
  c      IN OUT NOCOPY  connection,
  cmd    IN              VARCHAR2,
  arg    IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 292-15 COMMAND_REPLIES Function Parameters

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between <code>cmd</code> and <code>arg</code> .

Return Values

Table 292-16 COMMAND_REPLIES Function Return Values

Return Value	Description
replies	Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types)

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

292.10.6 DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

Syntax

```
UTL_SMTP.DATA (
    c      IN OUT NOCOPY connection
    body  IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;
```

```
UTL_SMTP.DATA (
    c      IN OUT NOCOPY connection
    body  IN  VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 292-17 DATA Function and Procedure Parameters

Parameter	Description
c	SMTP Connection
body	Text of the message to be sent, including headers, in [RFC822] format

Return Values

Table 292-18 DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in body to `<CR><LF>..<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The `DATA` subprogram must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL` and `RCPT` have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial `DATA` command is not returned to the caller.

292.10.7 EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `EHLO` command.

Syntax

```
UTL_SMTP.EHLO (
    c          IN OUT NOCOPY connection,
    domain IN)
RETURN replies;

UTL_SMTP.EHLO (
    c          IN OUT NOCOPY connection,
    domain IN);
```

Parameters

Table 292-19 EHLO Function and Procedure Parameters

Parameter	Description
<code>c</code>	SMTP connection
<code>domain</code>	Domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 292-20 EHLO Function and Procedure Return Values

Return Value	Description
<code>replies</code>	Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types).

Usage Notes

The `EHLO` interface is identical to `HELO` except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with `HELO`, each line of text returned by the server begins with status code 250.

Related Functions

[HELO Function and Procedure](#)

292.10.8 HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `HELO` command.

Syntax

```
UTL_SMTP.HELO (
    c          IN OUT NOCOPY  connection,
    domain    IN              VARCHAR2)
RETURN reply;
```

```
UTL_SMTP.HELO (
    c          IN OUT NOCOPY  connection,
    domain    IN              VARCHAR2);
```

Parameters

Table 292-21 HELO Function and Procedure Parameters

Parameter	Description
<code>c</code>	SMTP connection
<code>domain</code>	Domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 292-22 HELO Function and Procedure Return Values

Return Value	Description
<code>reply</code>	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to [OPEN_CONNECTION Functions](#) before calling this routine.

The expected response from the server is a message beginning with status code 250.

Related Functions

[EHLO Function and Procedure](#)

292.10.9 HELP Function

This function sends the `HELP` command.

Syntax

```
UTL_SMTP.HELP (
    c          IN OUT NOCOPY  connection,
```

```

    command IN          VARCHAR2 DEFAULT NULL)
RETURN replies;

```

Parameters

Table 292-23 HELP Function Parameters

Parameter	Description
c	SMTP connection
command	Command to get the help message

Return Values

Table 292-24 HELP Function Return Values

Return Value	Description
replies	Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types)

292.10.10 MAIL Function and Procedure

This subprogram initiate a mail transaction with the server. The destination is a mailbox.

Syntax

```

UTL_SMTP.MAIL (
    c          IN OUT NOCOPY  connection,
    sender     IN             VARCHAR2,
    parameters IN             VARCHAR2 DEFAULT NULL)
RETURN reply;

```

```

UTL_SMTP.MAIL (
    c          IN OUT NOCOPY  connection,
    sender     IN             VARCHAR2,
    parameters IN             VARCHAR2 DEFAULT NULL);

```

Parameters

Table 292-25 MAIL Function and Procedure Parameters

Parameter	Description
c	SMTP connection
sender	E-mail address of the user sending the message.
parameters	Additional parameters to mail command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ...)".

Return Values

Table 292-26 MAIL Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to `RCPT` and `DATA` to complete the transaction. The connection to the SMTP server must be open and a `HELO` or `EHLO` command must have already been sent.

The expected response from the server is a message beginning with status code 250.

292.10.11 NOOP Function and Procedure

This subprogram issues the `NULL` command.

Syntax

```
UTL_SMTP.NOOP (
    c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.NOOP (
    c IN OUT NOCOPY connection);
```

Parameter

Table 292-27 NOOP Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Return Values

Table 292-28 NOOP Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with `OPEN_CONNECTION`. The `NOOP` command can be used to verify that the server is still connected and is listening properly.

- This command replies with a single line beginning with status code 250.

292.10.12 OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

Syntax

```
UTL_SMTP.OPEN_CONNECTION (
    host                IN VARCHAR2,
    port                IN PLS_INTEGER DEFAULT 25,
    c                   OUT connection,
    tx_timeout          IN PLS_INTEGER DEFAULT NULL,
    wallet_path         IN VARCHAR2 DEFAULT NULL,
    wallet_password     IN VARCHAR2 DEFAULT NULL,
    secure_connection_before_smtp IN BOOLEAN DEFAULT FALSE,
    secure_host         IN VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.OPEN_CONNECTION (
    host                IN VARCHAR2,
    port                IN PLS_INTEGER DEFAULT 25,
    tx_timeout          IN PLS_INTEGER DEFAULT NULL,
    wallet_path         IN VARCHAR2 DEFAULT NULL,
    wallet_password     IN VARCHAR2 DEFAULT NULL,
    secure_connection_before_smtp IN BOOLEAN DEFAULT FALSE,
    secure_host         IN VARCHAR2 DEFAULT NULL)
RETURN connection;
```

Parameters

Table 292-29 OPEN_CONNECTION Functions Parameters

Parameter	Description
host	Name of the SMTP server host
port	Port number on which SMTP server is listening (usually 25)
c	SMTP connection
tx_timeout	Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
wallet_path	Directory path that contains the Oracle wallet for SSL/TLS. The format is file: <directory-path> If you want to use the operating system certificate store to act in place of the Oracle wallet, then set the path parameter to system: (include the colon). Doing so greatly improves performance in the database.
wallet_password	Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL. If you set path to system:, then omit the password by setting it to NULL.

Table 292-29 (Cont.) OPEN_CONNECTION Functions Parameters

Parameter	Description
<code>secure_connection_before_smtp</code>	If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made.
<code>secure_host</code>	The host name to be matched against the common name (CN) of the SMTP server's certificate when a secure connection is used. It can also be a domain name like <code>"*.example.com"</code> . If NULL, the SMTP host name to connect to will be used.

Return Values**Table 292-30 OPEN_CONNECTION Functions Return Values**

Return Value	Description
<code>reply</code>	Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of `OPEN_CONNECTION` that returns `UTL_SMTP.CONNECTION` record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of `OPEN_CONNECTION` that returns `REPLY`.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := UTL_SMTP.OPEN_CONNECTION(
    host => 'smtp.example.com',
    port => 465,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => TRUE);
END;
```

292.10.13 OPEN_DATA Function and Procedure

This subprogram sends the `DATA` command after which you can use `WRITE_DATA` and `WRITE_RAW_DATA` to write a portion of the e-mail message.

Syntax

```
UTL_SMTP.OPEN_DATA (
  c      IN OUT NOCOPY connection)
```

```

RETURN reply;

UTL_SMTP.OPEN_DATA (
    c      IN OUT NOCOPY connection);

```

Parameters

Table 292-31 OPEN_DATA Function and Procedure Parameters

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in RFC822 format.

Return Values

Table 292-32 OPEN_DATA Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.
- OPEN_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

292.10.14 QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

Syntax

```

UTL_SMTP.QUIT (
    c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.QUIT (
    c IN OUT NOCOPY connection);

```

Parameter

Table 292-33 QUIT Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Return Values

Table 292-34 QUIT Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The `QUIT` command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by `OPEN_CONNECTION` which must have been called before executing this command. If a mail transaction is in progress when `QUIT` is issued, it is canceled in the same manner as `RSET`.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields `REMOTE_HOST` and `REMOTE_PORT` of `c` are reset.

Related Functions

[RSET Function and Procedure](#)

292.10.15 RCPT Function

This subprogram specifies the recipient of an e-mail message.

Syntax

```
UTL_SMTP.RCPT (
    c          IN OUT NOCOPY    connection,
    recipient  IN              VARCHAR2,
    parameters IN              VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
    c          IN OUT NOCOPY    connection,
    recipient  IN              VARCHAR2,
    parameters IN              VARCHAR2 DEFAULT NULL);
```

Table 292-35 RCPT Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Table 292-35 (Cont.) RCPT Function and Procedure Parameters

Parameter	Description
recipient	E-mail address of the user to which the message is being sent
parameters	Additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX)".

Return Values

Table 292-36 RCPT Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.

292.10.16 RSET Function and Procedure

This subprogram terminates the current mail transaction.

Syntax

```
UTL_SMTP.RSET (
    c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET (
    c IN OUT NOCOPY connection);
```

Parameters

Table 292-37 RSET Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Return Values

Table 292-38 RSET Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call `RSET` at any time after the connection to the SMTP server has been opened by means of `OPEN_CONNECTION` until `DATA` or `OPEN_DATA` is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.
- The server responds to `RSET` with a message beginning with status code 250.

Related Functions

[QUIT Function and Procedure](#)

292.10.17 STARTTLS Function and Procedure

This subprogram sends the `STARTTLS` command to secure the SMTP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN_CONNECTION Functions](#).

Syntax

```
UTL_SMTP.STARTTLS (
    c          IN OUT NOCOPY connection,
    secure_host IN    VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.STARTTLS (
    c          IN OUT NOCOPY connection,
    secure_host IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 292-39 STARTTLS Function and Procedure Parameters

Parameter	Description
c	SMTP connection
secure_host	The host name to be matched against the common name (CN) of the SMTP server's certificate. It can also be a domain name like <code>"*.example.com"</code> . If NULL, the SMTP host name to connect to will be used.

Return Values

Table 292-40 STARTTLS Function and Procedure Return Values

Return Value	Description
reply	SMTP reply

Usage Notes

The `STARTTLS` command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the `EHLO` command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the `OPEN_CONNECTION` function.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
    host => 'smtp.example.com',
    port => 25,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => FALSE);
  utl_smtp.starttls(c);
END
```

292.10.18 VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```
UTL_SMTP.VRFY (
  c          IN OUT NOCOPY connection
  recipient IN VARCHAR2)
RETURN reply;
```

Parameters

Table 292-41 VRFY Function Parameters

Parameter	Description
c	SMTP connection
recipient	E-mail address to be verified

Return Values

Table 292-42 VRFY Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of `OPEN_CONNECTION` and `HELO` or `EHLO` before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

292.10.19 WRITE_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to `WRITE_DATA` appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_DATA (
    c      IN OUT NOCOPY connection,
    data   IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 292-43 WRITE_DATA Procedure Parameters

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

Usage Notes

- The calls to the [OPEN_DATA Function and Procedure](#), [WRITE_DATA Procedure](#), [WRITE_RAW_DATA Procedure](#) and [CLOSE_DATA Function and Procedure](#) must be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in the

body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

- The [OPEN_DATA Function and Procedure](#), [WRITE_DATA Procedure](#), [WRITE_RAW_DATA Procedure](#) and [CLOSE_DATA Function and Procedure](#) must be called only after [OPEN_CONNECTION Functions](#), [HELO Function and Procedure](#), or [EHLO Function and Procedure](#), [MAIL Function and Procedure](#), and [RCPT Function](#) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE_DATA Procedure](#) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE_DATA Function and Procedure](#).
- Text (VARCHAR2) data sent using [WRITE_DATA](#) is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension is negotiated with the SMTP server using the [EHLO](#) subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the [UTL_RAW](#) package, and then sending the RAW data using [WRITE_RAW_DATA](#).

292.10.20 WRITE_RAW_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to [WRITE_RAW_DATA](#) appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_RAW_DATA (
    c      IN OUT NOCOPY connection
    data  IN RAW);
```

Parameters

Table 292-44 WRITE_RAW_DATA Procedure Parameters

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

Usage Notes

- The calls to the [OPEN_DATA Function and Procedure](#), [WRITE_DATA Procedure](#), [WRITE_RAW_DATA Procedure](#) and [CLOSE_DATA Function and Procedure](#) must be made in the correct order. A program calls [OPEN_DATA](#) to send the DATA command to the SMTP server. After that, it can call [WRITE_DATA](#) or [WRITE_RAW_DATA](#) repeatedly to send the actual data. The data is terminated by calling [CLOSE_DATA](#). After [OPEN_DATA](#) is called, the only subprograms that can be called are [WRITE_DATA](#), [WRITE_RAW_DATA](#), or [CLOSE_DATA](#). A call to other subprograms results in an [INVALID_OPERATION](#) exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The [DATA](#) routine terminates the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as

required by RFC821. It also translates any sequence of <CR><LF>.<CR><LF> (single period) in the body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

- The [OPEN_DATA Function and Procedure](#), [WRITE_DATA Procedure](#), [WRITE_RAW_DATA Procedure](#) and [CLOSE_DATA Function and Procedure](#) must be called only after [OPEN_CONNECTION Functions](#), [HELO Function and Procedure](#), or [EHLO Function and Procedure](#), [MAIL Function and Procedure](#), and [RCPT Function](#) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE_DATA Procedure](#) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE_DATA Function and Procedure](#).

UTL_TCP

With the `UTL_TCP` package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of UTL_TCP Subprograms](#)

293.1 UTL_TCP Overview

The `UTL_TCP` package provides TCP/IP client-side access functionality in PL/SQL.

293.2 UTL_TCP Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

**Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*

293.3 UTL_TCP Types

The `UTL_TCP` package includes a `CONNECTION` type and a carriage-return line-feed (CRLF) type.

CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.

Syntax

```

TYPE connection IS RECORD (
    remote_host    VARCHAR2(255),
    remote_port    PLS_INTEGER,
    local_host     VARCHAR2(255),
    local_port     PLS_INTEGER,
    charset        VARCHAR2(30),
    newline        VARCHAR2(2),
    tx_timeout     PLS_INTEGER,
    private_sd     PLS_INTEGER);

```

Fields

Table 293-1 Connection Record Type Fields

Field	Description
remote_host	Name of the remote host when connection is established. NULL when no connection is established.
remote_port	Port number of the remote host connected. NULL when no connection is established.
local_host	Name of the local host used to establish the connection. NULL when no connection is established.
local_port	Port number of the local host used to establish the connection. NULL when no connection is established.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network.
newline	Newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API.
tx_timeout	Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using `OPEN_CONNECTION`. Changing the values of those fields has no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the UTL_TCP package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields are not set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the UTL_TCP package.

CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

293.4 UTL_TCP Exceptions

UTL_TCP will raise an exception when it encounters a processing issue.

The exceptions raised by the TCP/IP package are listed in the following table.

Table 293-2 TCP/IP Exceptions

Exception	Description
BUFFER_TOO_SMALL	Buffer is too small for input that requires look-ahead
END_OF_INPUT	Raised when no more data is available to read from the connection
NETWORK_ERROR	Generic network error
BAD_ARGUMENT	Bad argument passed in an API call (for example, a negative buffer size)
TRANSFER_TIMEOUT	No data is read and a read time out occurred
PARTIAL_MULTIBYTE_CHAR	No complete character is read and a partial multibyte character is found at the end of the input

293.5 UTL_TCP Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

293.6 UTL_TCP Examples

Some possible uses for `UTL_TCP` include retrieving a Web page over HTTP or sending an e-mail.

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```
DECLARE
  c      utl_tcp.connection;  -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                              remote_port => 80,
                              charset    => 'US7ASCII');  -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0');  -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  BEGIN
    LOOP
      dbms_output.put_line(utl_tcp.get_line(c, TRUE));  -- read result
    END LOOP;
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      NULL;  -- end of input
  END;
  utl_tcp.close_connection(c);
END;
```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```
PROCEDURE send_mail (sender      IN VARCHAR2,
                    recipient IN VARCHAR2,
                    message   IN VARCHAR2) IS
  mailhost  VARCHAR2(30) := 'mailhost.mydomain.com';
  smtp_error EXCEPTION;
  mail_conn utl_tcp.connection;
  PROCEDURE smtp_command(command IN VARCHAR2,
                          ok      IN VARCHAR2 DEFAULT '250')
  IS
    response varchar2(3);
    len pls_integer;
  BEGIN
    len := utl_tcp.write_line(mail_conn, command);
    response := substr(utl_tcp.get_line(mail_conn), 1, 3);
    IF (response <> ok) THEN
      RAISE smtp_error;
    END IF;
  END;
END;

BEGIN
  mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                      remote_port => 25,
                                      charset    => 'US7ASCII');
  smtp_command('HELO ' || mailhost);
  smtp_command('MAIL FROM: ' || sender);
  smtp_command('RCPT TO: ' || recipient);
```

```

smtp_command('DATA', '354');
smtp_command(message);
smtp_command('QUIT', '221');
utl_tcp.close_connection(mail_conn);
EXCEPTION
  WHEN OTHERS THEN
    -- Handle the error
END;
```

293.7 Summary of UTL_TCP Subprograms

This table lists the UTL_TCP subprograms and briefly describes them.

Table 293-3 UTL_TCP Package Subprograms

Subprogram	Description
AVAILABLE Function	Determines the number of bytes available for reading from a TCP/IP connection
CLOSE_ALL_CONNECTIONS Procedure	Closes all open TCP/IP connections
CLOSE_CONNECTION Procedure	Closes an open TCP/IP connection
FLUSH Procedure	Transmits immediately to the server all data in the output buffer, if a buffer is used
GET_LINE Function	Returns the line of data read
GET_LINE_NCHAR Function	Returns the line of data read in NCHAR form
GET_RAW Function	Return the data read instead of the amount of data read
GET_TEXT Function	Returns the text data read
GET_TEXT_NCHAR Function	Returns the text data read in NCHAR form
OPEN_CONNECTION Function	Opens a TCP/IP connection to a specified service
READ_LINE Function	Receives a text line from a service on an open connection
READ_RAW Function	Receives binary data from a service on an open connection
READ_TEXT Function	Receives text data from a service on an open connection
SECURE_CONNECTION Procedure	Secures a TCP/IP connection using SSL/TLS
WRITE_LINE Function	Transmits a text line to a service on an open connection
WRITE_RAW Function	Transmits a binary message to a service on an open connection
WRITE_TEXT Function	Transmits a text message to a service on an open connection

293.7.1 AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```

UTL_TCP.AVAILABLE (
  c          IN OUT NOCOPY connection,
```

```

    timeout IN PLS_INTEGER DEFAULT 0)
RETURN PLS_INTEGER;

```

Parameters

Table 293-4 AVAILABLE Function Parameters

Parameter	Description
c	TCP connection to determine the amount of data that is available to be read
timeout	Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Return Values

The number of bytes available for reading without blocking

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the `END_OF_INPUT` exception.

The following example illustrates using this function in a portable manner:

```

DECLARE
    c    utl_tcp.connection
    data VARCHAR2(256);
    len  PLS_INTEGER;
BEGIN
    c := utl_tcp.open_connection(...);
    LOOP
        IF (utl_tcp.available(c) > 0) THEN
            len := utl_tcp.read_text(c, data, 256);
        ELSE
            ---do some other things
            . . . .
        END IF
    END LOOP;
END;

```

293.7.2 CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

Usage Notes

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.

293.7.3 CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

```
UTL_TCP.CLOSE_CONNECTION (  
    c IN OUT NOCOPY connection);
```

Parameters

Table 293-5 CLOSE_CONNECTION Procedure Parameters

Parameter	Description
c	TCP connection to close

Usage Notes

Connection must have been opened by a previous call to `OPEN_CONNECTION`. The fields `remote_host`, `remote_port`, `local_host`, `local_port` and `charset` of `c` are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

293.7.4 FLUSH Procedure

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

Syntax

```
UTL_TCP.FLUSH (  
    c IN OUT NOCOPY connection);
```

Parameters

Table 293-6 FLUSH Procedure Parameters

Parameter	Description
c	TCP connection to which to send data

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

293.7.5 GET_LINE Function

This function returns the line of data read.

Syntax

```
UTL_TCP.GET_LINE (
  c          IN OUT NOCOPY connection,
  remove_crlf IN          BOOLEAN DEFAULT FALSE,
  peek      IN          BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

Table 293-7 GET_LINE Function Parameters

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

293.7.6 GET_LINE_NCHAR Function

This function returns the line of data read in NCHAR form.

Syntax

```
UTL_TCP.GET_LINE_NCHAR (
  c          IN OUT NOCOPY connection,
  remove_crlf IN          BOOLEAN DEFAULT FALSE,
  peek       IN          BOOLEAN DEFAULT FALSE)
RETURN NVARCHAR2;
```

Parameters

Table 293-8 GET_LINE_NCHAR Function Parameters

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

293.7.7 GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```
UTL_TCP.GET_RAW (
  c          IN OUT NOCOPY connection,
  len       IN          PLS_INTEGER DEFAULT 1,
  peek      IN          BOOLEAN     DEFAULT FALSE)
RETURN RAW;
```

Parameters

Table 293-9 GET_RAW Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.

Return Values

The binary data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

293.7.8 GET_TEXT Function

This function returns the text data read.

Syntax

```
UTL_TCP.GET_TEXT (
  c      IN OUT NOCOPY connection,
  len   IN          PLS_INTEGER DEFAULT 1,
  peek  IN          BOOLEAN     DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

Table 293-10 GET_TEXT Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	Number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.

Table 293-10 (Cont.) GET_TEXT Function Parameters

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If <code>TRUE</code> , then one ore more trailing CRLF characters are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `READ_*` API for character set conversion, buffer size, and multibyte character issues.

293.7.9 GET_TEXT_NCHAR Function

This function returns the text data read in NCHAR form.

Syntax

```
UTL_TCP.GET_TEXT_NCHAR (
    c    IN OUT NOCOPY connection,
    len  IN          PLS_INTEGER DEFAULT 1,
    peek IN          BOOLEAN      DEFAULT FALSE)
RETURN NVARCHAR2;
```

Parameters

Table 293-11 GET_TEXT_NCHAR Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for <code>VARCHAR2</code>) of data to receive. Default is 1.

Table 293-11 (Cont.) GET_TEXT_NCHAR Function Parameters

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `READ_*` API for character set conversion, buffer size, and multibyte character issues.

293.7.10 OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

Syntax

```
UTL_TCP.OPEN_CONNECTION (
    remote_host      IN VARCHAR2,
    remote_port      IN PLS_INTEGER,
    local_host       IN VARCHAR2 DEFAULT NULL,
    local_port       IN PLS_INTEGER DEFAULT NULL,
    in_buffer_size   IN PLS_INTEGER DEFAULT NULL,
    out_buffer_size  IN PLS_INTEGER DEFAULT NULL,
    charset          IN VARCHAR2 DEFAULT NULL,
    newline          IN VARCHAR2 DEFAULT CRLF,
    tx_timeout       IN PLS_INTEGER DEFAULT NULL,
    wallet_path      IN VARCHAR2 DEFAULT NULL,
    wallet_password  IN VARCHAR2 DEFAULT NULL,
    RETURN connection;
```

Parameters

Table 293-12 OPEN_CONNECTION Function Parameters

Parameter	Description
remote_host	Name of the host providing the service. When <code>remote_host</code> is <code>NULL</code> , it connects to the local host.

Table 293-12 (Cont.) OPEN_CONNECTION Function Parameters

Parameter	Description
<code>remote_port</code>	Port number on which the service is listening for connections
<code>local_host</code>	Name of the host providing the service. <code>NULL</code> means does not care.
<code>local_port</code>	Port number on which the service is listening for connections. <code>NULL</code> means don't care.
<code>in_buffer_size</code>	The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A <code>NULL</code> value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.
<code>out_buffer_size</code>	The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A <code>NULL</code> value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.
<code>charset</code>	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network using <code>READ_TEXT</code> , <code>READ_LINE</code> , <code>WRITE_TEXT</code> and <code>WRITE_LINE</code> . Set this parameter to <code>NULL</code> when no conversion is needed.
<code>newline</code>	Newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API.
<code>tx_timeout</code>	Time in seconds that the <code>UTL_TCP</code> package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. <code>NULL</code> indicates to wait forever.
<code>wallet_path</code>	Directory path that contains the Oracle wallet for SSL/TLS. The format is <code>file:directory-path</code> . If you want to use the operating system certificate store to act in place of the Oracle wallet, then set the <code>path</code> parameter to <code>system:</code> (include the colon). Doing so greatly improves performance in the database.
<code>wallet_password</code>	Password to open the wallet. When the wallet is auto-login enabled, the password may be set to <code>NULL</code> . If you set <code>path</code> to <code>system:</code> , then omit the password by setting it to <code>NULL</code> .

Return Values

A connection to the targeted TCP/IP service

Usage Notes

- Note that connections opened by this UTL_TCP package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.
- In the current release of the UTL_TCP package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields is not set in the connection record returned by the function.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

Examples

```
DECLARE
  c UTL_TCP.CONNECTION;
BEGIN
  c := UTL_TCP.OPEN_CONNECTION (
    host      => 'www.example.com',
    port      => 443,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => '****');
  UTL_TCP.SECURE_CONNECTION (c => c);
END;
```

293.7.11 READ_LINE Function

This function receives a text line from a service on an open connection.

A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

Syntax

```
UTL_TCP.READ_LINE (
  c          IN OUT NOCOPY connection,
  data      IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
  peek      IN          BOOLEAN DEFAULT FALSE)
RETURN PLS_INTEGER;
```

Parameters

Table 293-13 READ_LINE Function Parameters

Parameter	Description
c	TCP connection from which to receive data
data	Data received.
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

293.7.12 READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```
UTL_TCP.READ_RAW (
  c      IN OUT NOCOPY connection,
  data   IN OUT NOCOPY RAW,
  len    IN          PLS_INTEGER DEFAULT 1,
```

```

    peek IN          BOOLEAN          DEFAULT FALSE)
RETURN PLS_INTEGER;

```

Parameters

Table 293-14 READ_RAW Function Parameters

Parameter	Description
c	TCP connection from which to receive data
data (IN OUT COPY)	Data received
len	Number of bytes of data to receive
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of bytes of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

293.7.13 READ_TEXT Function

This function receives text data from a service on an open connection.

Syntax

```

UTL_TCP.READ_TEXT (
    c      IN OUT NOCOPY connection,
    data  IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
    len   IN          PLS_INTEGER DEFAULT 1,
    peek  IN          BOOLEAN      DEFAULT FALSE)
RETURN PLS_INTEGER;

```

Parameters

Table 293-15 READ_TEXT Function Parameters

Parameter	Description
<code>c</code>	TCP connection from which to receive data
<code>data</code>	Data received
<code>len</code>	Number of characters of data to receive
<code>peek</code>	Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a `VARCHAR2` buffer is specified in terms of bytes, while the parameter `len` refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the `VARCHAR2` buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

293.7.14 SECURE_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN_CONNECTION Function](#).

Syntax

```
UTL_TCP.SECURE_CONNECTION (  
    c    IN OUT NOCOPY connection);
```

Parameters

Table 293-16 SECURE_CONNECTION Procedure Parameters

Parameter	Description
c	TCP connection from which to receive data

293.7.15 WRITE_LINE Function

This function transmits a text line to a service on an open connection. The `newline` character sequence is appended to the message before it is transmitted.

Syntax

```
UTL_TCP.WRITE_LINE (  
    c    IN OUT NOCOPY connection,  
    data IN          VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

Parameters

Table 293-17 WRITE_LINE Function Parameters

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

293.7.16 WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```
UTL_TCP.WRITE_RAW (  
    c      IN OUT NOCOPY connection,  
    data  IN          RAW,  
    len   IN          PLS_INTEGER DEFAULT NULL)  
RETURN PLS_INTEGER;
```

Parameters

Table 293-18 WRITE_RAW Function Parameters

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent
len	The number of bytes of data to transmit. When len is NULL, the whole length of data is written.

Return Values

The number of bytes of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

293.7.17 WRITE_TEXT Function

This function transmits a text message to a service on an open connection.

Syntax

```
UTL_TCP.WRITE_TEXT (  
    c      IN OUT NOCOPY connection,  
    data  IN          VARCHAR2 CHARACTER SET ANY_CS,  
    len   IN          PLS_INTEGER DEFAULT NULL)  
RETURN num_chars PLS_INTEGER;
```

Parameters

Table 293-19 WRITE_TEXT Function Parameters

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent

Table 293-19 (Cont.) WRITE_TEXT Function Parameters

Parameter	Description
<code>len</code>	The number of characters of data to transmit. When <code>len</code> is <code>NULL</code> , the whole length of data is written. The actual amount of data written may be less because of network condition.

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

UTL_URL

The `UTL_URL` package has two functions: `ESCAPE` and `UNESCAPE`.

This chapter contains the following topics:

- [Overview](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of UTL_URL Subprograms](#)

See Also:

[UTL_HTTP](#)

294.1 UTL_URL Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP).

For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign (\$), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis ((), right parenthesis ())

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), percentage sign (%), and comma (,)

The `UTL_URL` package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used fetch a

Web page by way of the UTL_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

`http://www.w3.org/TR/html`

294.2 UTL_URL Exceptions

UTL_URL raises an exception when it encounter a processing issue.

The following table lists the exceptions that can be raised when the UTL_URL package API is invoked.

Table 294-1 UTL_URL Exceptions

Exception	Error Code	Reason
BAD_URL	29262	The URL contains badly formed escape code sequences
BAD_FIXED_WIDT H_CHARSET	29274	Fixed-width multibyte character set is not allowed as a URL character set.

294.3 UTL_URL Examples

UTL_URL can be used for encoding and decoding.

You can implement the x-www-form-urlencoded encoding using the UTL_URL.ESCAPE function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (
    data    IN VARCHAR2,
    charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
    RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the form-URL-encode scheme, the following function implements the decoding scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode (
    data    IN VARCHAR2,
    charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
    RETURN utl_url.unescape(
        replace(data, '+', ' '),
        charset);
END;
```

294.4 Summary of UTL_URL Subprograms

This table lists and briefly describes the UTL_URL subprograms.

Table 294-2 UTL_URL Package Subprograms

Subprogram	Description
ESCAPE Function	Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format
UNESCAPE Function	Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters

294.4.1 ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

Syntax

```
UTL_URL.ESCAPE (
    url                IN VARCHAR2 CHARACTER SET ANY_CS,
    escape_reserved_chars IN BOOLEAN DEFAULT FALSE,
    url_charset        IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

Parameters

Table 294-3 ESCAPE Function Parameters

Parameter	Description
<code>url</code>	The original URL
<code>escape_reserved_chars</code>	Indicates whether the URL reserved characters should be escaped. If set to <code>TRUE</code> , both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is <code>FALSE</code> .
<code>url_charset</code>	When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If <code>url_charset</code> is <code>NULL</code> , the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the <code>UTL_HTTP</code> package, whose default value is <code>ISO-8859-1</code> . The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis ((), right parenthesis ())

The reserved characters consist of:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using `escape_url`. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An `escape_url` cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair `$logon=HR/<password>` into the query string of a URL, escape the `$` and `/` separately as `%24logon=HR%2F<password>` and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

```
http://www.acme.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape
('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (?), dollar sign (\$), and space characters in 'Is the use of the "\$" sign okay?' but not the ? after search in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

294.4.2 UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the `%XX` escape character sequences to the original characters.

Syntax

```
UTL_URL.UNESCAPE (
    url          IN VARCHAR2 CHARACTER SET ANY_CS,
    url_charset  IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

Parameters

Table 294-4 UNESCAPE Function Parameters

Parameter	Description
<code>url</code>	The URL to unescape
<code>url_charset</code>	After a character is unescaped, the character is assumed to be in the <code>source_charset</code> character set and it will be converted from the <code>source_charset</code> to the database character set before the URL is returned. If <code>source_charset</code> is NULL, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the <code>UTL_HTTP</code> package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using `US7ASCII` so that `%20` is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a `?` (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

WPG_DOCLOAD

The `WPG_DOCLOAD` package provides an interface to download files, BLOBs and BFILES.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

The chapter contains the following topics:

- [Constants](#)
- [Summary of WPG_DOCLOAD Subprograms](#)

295.1 WPG_DOCLOAD Constants

`WPG_DOCLOAD` defines several constants to use when specifying parameter values.

The `WPG_DOCLOAD` constants are listed below:

- `NAME_COL_LEN`
- `MIMET_COL_LEN`
- `MAX_DOCTABLE_NAME_LEN`

NAME_COL_LEN

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```
name_col_len CONSTANT pls_integer := 64;
```

MIMET_COL_LEN

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```
mimet_col_len CONSTANT pls_integer := 48;
```

MAX_DOCTABLE_NAME_LEN

The name length of your document table must be less than `max_doctable_name_len`.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

295.2 Summary of WPG_DOCLOAD Subprograms

The WPG_DOCLOAD package uses one subprogram, the `DOWNLOAD_FILE` procedure.

Table 295-1 WPG_DOCLOAD Package Subprograms

Subprogram	Description
DOWNLOAD_FILE Procedures	Downloads files, BLOBS and BFILES

295.2.1 DOWNLOAD_FILE Procedures

There are three versions of this download file procedure.

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE (
    p_filename      IN          VARCHAR2,
    p_bcaching      IN          BOOLEAN DEFAULT TRUE);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE (
    p_blob          IN OUT NOCOPY BLOB);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE (
    p_bfile         IN OUT      BFILE);
```

Parameters

Table 295-2 DOWNLOAD_FILE Procedure Parameters

Parameter	Description
<code>p_filename</code>	The file to download from the document table.
<code>p_blob</code>	The BLOB to download.
<code>p_bfile</code>	The BFILE to download (see Usage Notes).
<code>p_bcaching</code>	Whether browser caching is enabled (see Usage Notes).

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status

message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bcaching` parameter should be set to `FALSE` to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.

- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

ANYDATA TYPE

An `ANYDATA` TYPE contains an instance of a given type, plus a description of the type. In this sense, an `ANYDATA` is self-describing. An `ANYDATA` can be persistently stored in the database.

This chapter contains the following topics:

- [Restrictions](#)
- [Operational Notes](#)
- [Summary of ANYDATA Subprograms](#)

296.1 ANYDATA TYPE Restrictions

Persistent storage of `ANYDATA` instances whose type contains embedded LOBs other than `BFILES` is not currently supported.

296.2 ANYDATA TYPE Operational Notes

This section contains notes related to `ANYDATA` TYPE construction and access.

Construction

There are 2 ways to construct an `ANYDATA`. The `CONVERT*` calls enable construction of the `ANYDATA` in its entirety with a single call. They serve as explicit `CAST` functions from any type in the Oracle ORDBMS to `ANYDATA`.

```

STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(inv IN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return
ANYDATA,
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,

```

The second way to construct an ANYDATA is a piece by piece approach. The [BEGINCREATE Static Procedure](#) call begins the construction process and [ENDCREATE Member Procedure](#) call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET* calls. For piece by piece access of the attributes of objects and elements of collections, the [PIECEWISE Member Procedure](#) should be invoked prior to GET* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

```
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
    DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
    DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNvarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
    TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
    TIMEZONE,
MEMBER FUNCTION AccessUrowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
```

296.3 Summary of ANYDATA Subprograms

This table lists the ANYDATA subprograms in alphabetical order and briefly describes them.

Table 296-1 ANYDATA Type Subprograms

Subprogram	Description
BEGINCREATE Static Procedure	Begins creation process on a new ANYDATA
ENDCREATE Member Procedure	Ends creation of an ANYDATA
GET* Member Functions	Gets the current data value (which should be of appropriate type)
GETTYPE Member Function	Gets the Type of the ANYDATA
GETTYPENAME Member Function	Get the fully qualified type name for the ANYDATA
PIECEWISE Member Procedure	Sets the <code>MODE</code> of access of the current data value to be an attribute at a time (if the data value is of <code>TYPECODE_OBJECT</code>)
SET* Member Procedures	Sets the current data value.

296.3.1 BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```
STATIC PROCEDURE BeginCreate(
    dtype          IN OUT NOCOPY AnyType,
    adata         OUT NOCOPY ANYDATA);
```

Parameters

Table 296-2 BEGINCREATE Procedure Parameters

Parameter	Description
<code>dtype</code>	The type of the ANYDATA. (Should correspond to <code>OCI_TYPECODE_OBJECT</code> or a Collection typecode.)
<code>adata</code>	ANYDATA being constructed.

Exception

`DBMS_TYPES.INVALID_PARAMETERS`: `dtype` is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call `PIECEWISE` immediately after this call. The construction process begins in a piece-wise manner automatically.

296.3.2 ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE EndCreate(
    self          IN OUT NOCOPY ANYDATA);
```

Parameters

Table 296-3 ENDCREATE Procedure Parameter

Parameter	Description
self	An ANYDATA.

296.3.3 GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE by which it is accessed (depending on whether the PIECEWISE call is invoked).

If PIECEWISE has NOT been called, the ANYDATA is accessed in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, the ANYDATA is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GetBDouble(
    self          IN ANYDATA,
    dbl           OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBfile(
    self          IN ANYDATA,
    b             OUT NOCOPY BFILE)
RETURN          PLS_INTEGER;
```

```
MEMBER FUNCTION GetBFloat(
    self          IN ANYDATA,
    fl           OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBlob(
    self          IN ANYDATA,
    b             OUT NOCOPY BLOB)
RETURN          PLS_INTEGER;
```

```
MEMBER FUNCTION GetChar(
    self          IN ANYDATA,
    c             OUT NOCOPY CHAR)
```

```
        RETURN          PLS_INTEGER;

MEMBER FUNCTION GetClob(
    self          IN ANYDATA,
    c             OUT NOCOPY CLOB)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetCollection(
    self          IN ANYDATA,
    col          OUT NOCOPY "<collection_type>")
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetDate(
    self          IN ANYDATA,
    dat          OUT NOCOPY DATE)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
    self          IN ANYDATA,
    inv          OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetIntervalYM(
    self          IN ANYDATA,
    inv          OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNchar(
    self          IN ANYDATA,
    nc           OUT NOCOPY NCHAR)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNClob(
    self          IN ANYDATA,
    nc           OUT NOCOPY NCLOB)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNumber(
    self          IN ANYDATA,
    num          OUT NOCOPY NUMBER)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
    self          IN ANYDATA,
    nc           OUT NOCOPY NVARCHAR2)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetObject(
    self          IN ANYDATA,
    obj          OUT NOCOPY "<object_type>")
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetRaw(
    self          IN ANYDATA,
    r            OUT NOCOPY RAW)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetRef(
    self          IN ANYDATA,
    rf           OUT NOCOPY REF "<object_type>")
RETURN          PLS_INTEGER;
```

```

MEMBER FUNCTION GetTimestamp(
    self          IN ANYDATA,
    ts            OUT NOCOPY TIMESTAMP)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
    self          IN ANYDATA,
    ts            OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
    self          IN ANYDATA,
    ts            OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
    self          IN ANYDATA,
    c             OUT NOCOPY VARCHAR)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetVarchar2(
    self          IN ANYDATA,
    c             OUT NOCOPY VARCHAR2)
RETURN          PLS_INTEGER;

```

Parameters

Table 296-4 GET* Function Parameter

Parameter	Description
self	An ANYDATA.
num	The number to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.

296.3.4 GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

```
MEMBER FUNCTION GETTYPE (  
    self          IN ANYDATA,  
    typ           OUT NOCOPY AnyType)  
    RETURN        PLS_INTEGER;
```

Parameters

Table 296-5 GETTYPE Function Parameter

Parameter	Description
self	An ANYDATA.
typ	The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.

Return Values

The typecode corresponding to the type of the ANYDATA.

296.3.5 GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return *schema_name.type_name*, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETTYPENAME (  
    self          IN ANYDATA)  
    RETURN        VARCHAR2;
```

Parameters

Table 296-6 GETTYPENAME Function Parameter

Parameter	Description
self	An ANYDATA.

Return Values

Type name of the ANYDATA.

296.3.6 PIECEWISE Member Procedure

This procedure sets the **MODE** of access of the current data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the **MODE** of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to `SET*` and `GET*` will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE (
    self          IN OUT NOCOPY ANYDATA);
```

Parameters

Table 296-7 PIECEWISE Procedure Parameters

Parameter	Description
self	The current data value.

Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`
- `DBMS_TYPES.INCORRECT_USAGE`: On incorrect usage.

Usage Notes

The current data value must be of an `OBJECT` or `COLLECTION` type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

296.3.7 SET* Member Procedures

This procedure sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE (
    self          IN OUT NOCOPY ANYDATA,
    dbl           IN BINARY_DOUBLE,
    last_elem     IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFILE (
    self          IN OUT NOCOPY ANYDATA,
    b             IN BFILE,
    last_elem     IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFLOAT (
```

```
self          IN OUT NOCOPY ANYDATA,  
fl            IN              BINARY_FLOAT,  
last_elem    IN              boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETBLOB(  
self          IN OUT NOCOPY ANYDATA,  
b             IN BLOB,  
last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCHAR(  
self          IN OUT NOCOPY ANYDATA,  
c             IN CHAR,  
last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCLOB(  
self          IN OUT NOCOPY ANYDATA,  
c             IN CLOB,  
last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCOLLECTION(  
self          IN OUT NOCOPY ANYDATA,  
col           IN "<collection_type>",  
last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETDATE(  
self          IN OUT NOCOPY ANYDATA,  
dat           IN DATE,  
last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETINTERVALS(  
self          IN OUT NOCOPY ANYDATA,  
inv           IN INTERVAL DAY TO SECOND,  
last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETINTERVALYM(  
self          IN OUT NOCOPY ANYDATA,  
inv           IN INTERVAL YEAR TO MONTH,  
last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNCHAR(  
self          IN OUT NOCOPY ANYDATA,  
nc            IN NCHAR,  
last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNCLOB(  
self          IN OUT NOCOPY ANYDATA,  
nc            IN NClob,  
last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNUMBER(  
self          IN OUT NOCOPY ANYDATA,  
num           IN NUMBER,  
last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNVARCHAR2(  
self          IN OUT NOCOPY ANYDATA,  
nc            IN NVarchar2,  
last_elem    IN boolean DEFAULT FALSE),  
  
MEMBER PROCEDURE SETOBJECT(  
self          IN OUT NOCOPY ANYDATA,
```

```

obj          IN "<object_type>",
last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
  self       IN OUT NOCOPY ANYDATA,
  r          IN RAW,
  last_elem  IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
  self       IN OUT NOCOPY ANYDATA,
  rf         IN REF "<object_type>",
  last_elem  IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
  self       IN OUT NOCOPY ANYDATA,
  ts         IN TIMESTAMP,
  last_elem  IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPtz(self IN OUT NOCOPY ANYDATA,
  ts         IN TIMESTAMP WITH TIME ZONE,
  last_elem  IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPtz(
  self IN OUT NOCOPY ANYDATA,
  ts IN TIMESTAMP WITH LOCAL TIME ZONE,
  last_elem IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETVARCHAR(
  self       IN OUT NOCOPY ANYDATA,
  c          IN VARCHAR,
  last_elem  IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
  self       IN OUT NOCOPY ANYDATA,
  c          IN VARCHAR2,
  last_elem  IN boolean DEFAULT FALSE);

```

Parameters

Table 296-8 SET* Procedure Parameters

Parameter	Description
self	An ANYDATA.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

Usage Notes

When `BEGINCREATE` is called, construction has already begun in a piece-wise fashion. Subsequent calls to `SET*` will set the successive attribute values.

If the `ANYDATA` is a standalone collection, the `SET*` call will set the successive collection elements.

ANYDATASET TYPE

An `ANYDATASET TYPE` contains a description of a given type plus a set of data instances of that type. An `ANYDATASET` can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- [Construction](#)
- [Summary of ANYDATASET TYPE Subprograms](#)

297.1 ANYDATASET TYPE Construction

The `ANYDATASET` needs to be constructed value by value, sequentially.

For each data instance (of the type of the `ANYDATASET`), the `ADDINSTANCE` function must be invoked. This adds a new data instance to the `ANYDATASET`. Subsequently, `SET*` can be called to set each value in its entirety.

The `MODE` of construction/access can be changed to attribute/collection element wise by making calls to `PIECEWISE`.

- If the type of the `ANYDATASET` is `TYPECODE_OBJECT`, individual attributes will be set with subsequent `SET*` calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent `SET*` calls. Likewise on access. This call is very similar to `ANYDATA.PIECEWISE` call defined for the type `ANYDATA`.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

`ENDCREATE` should be called to finish the construction process (before which no access calls can be made).

297.2 Summary of ANYDATASET TYPE Subprograms

This table lists the `ANYDATASET` Type subprograms and briefly describes them.

Table 297-1 *ANYDATASET Type Subprograms*

Subprogram	Description
ADDINSTANCE Member Procedure	Adds a new data instance to an <code>ANYDATASET</code> .
BEGINCREATE Static Procedure	Creates a new <code>ANYDATASET</code> which can be used to create a set of data values of the given <code>ANYTYPE</code> .

Table 297-1 (Cont.) ANYDATASET Type Subprograms

Subprogram	Description
ENDCREATE Member Procedure	Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.
GET* Member Functions	Gets the current data value (which should be of appropriate type).
GETCOUNT Member Function	Gets the number of data instances in an ANYDATASET.
GETINSTANCE Member Function	Gets the next instance in an ANYDATASET.
GETTYPE Member Function	Gets the ANYTYPE describing the type of the data instances in an ANYDATASET. current data value (which should be of appropriate type).
GETTYPENAME Member Function	Gets the AnyType describing the type of the data instances in an ANYDATASET.
PIECEWISE Member Procedure	Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).
SET* Member Procedures	Sets the current data value.

297.2.1 ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

```
MEMBER PROCEDURE AddInstance(  
    self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 297-2 ADDINSTANCE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.invalid_parameters: Invalid parameters.
DBMS_TYPES.incorrect_usage: On incorrect usage.

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call `PIECEWISE` if a piece-wise construction of the instance is intended.

297.2.2 BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

Syntax

```
STATIC PROCEDURE BeginCreate(
    typecode    IN PLS_INTEGER,
    rtype       IN OUT NOCOPY AnyType,
    aset        OUT NOCOPY ANYDATASET);
```

Parameters

Table 297-3 BEGINCREATE Procedure Parameter

Parameter	Description
typecode	The typecode for the type of the ANYDATASET.
dtype	The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.
aset	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.invalid_parameters: dtype is invalid (not fully constructed, and like errors.)

297.2.3 ENDCREATE Member Procedure

This procedure ends creation of a ANYDATASET. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(
    self        IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 297-4 ENDCREATE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

297.2.4 GET* Member Functions

These functions get the current data value (which should be of the appropriate type).

The type of the current data value depends on the MODE used for accessing it (depending on how the PIECEWISE call is invoked). If PIECEWISE has not been called, the instance is

accessed in its entirety, and the type of the data value should match the type of the ANYDATASET.

If `PIECEWISE` has been called, the instance is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GETBDOUBLE(  
    self          IN ANYDATASET,  
    dbl          OUT NOCOPY BINARY_DOUBLE)  
    RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETBFLOAT(  
    self          IN ANYDATASET,  
    fl           OUT NOCOPY BINARY_FLOAT)  
    RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETBFILE(  
    self          IN ANYDATASET,  
    b            OUT NOCOPY BFILE)  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETBLOB(  
    self          IN ANYDATASET,  
    b            OUT NOCOPY BLOB)  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETCHAR(  
    self          IN ANYDATASET,  
    c            OUT NOCOPY CHAR)  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETCLOB(  
    self          IN ANYDATASET,  
    c            OUT NOCOPY CLOB)  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETCOLLECTION(  
    self          IN ANYDATASET,  
    col          OUT NOCOPY "<collection_type>")  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETDATE(  
    self          IN ANYDATASET,  
    dat          OUT NOCOPY DATE)  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALDS(  
    self          IN ANYDATASET,  
    inv          IN OUT NOCOPY INTERVAL DAY TO SECOND)  
    RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALYM(  
    self          IN ANYDATASET,  
    inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)  
    RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETNCHAR(  
    self          IN ANYDATASET,
```

```
nc          OUT NOCOPY NCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
  self      IN ANYDATASET,
  nc        OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
  self      IN ANYDATASET,
  num       OUT NOCOPY NUMBER)
RETURN     PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
  self      IN ANYDATASET,
  nc        OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
  self      IN ANYDATASET,
  obj       OUT NOCOPY "<object_type>")
RETURN     PLS_INTEGER;

MEMBER FUNCTION GETRAW(
  self      IN ANYDATASET,
  r         OUT NOCOPY RAW)
RETURN     PLS_INTEGER;

MEMBER FUNCTION GETREF(
  self      IN ANYDATASET,
  rf        OUT NOCOPY REF "<object_type>")
RETURN     PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
  self      IN ANYDATASET,
  RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPPLTZ(
  self      IN ANYDATASET,
  ts        OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPPTZ(
  self      IN ANYDATASET,
  ts        OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETUROWID(
  self      IN ANYDATASET,
  rid       OUT NOCOPY UROWID)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETVARIABLE(
  self      IN ANYDATASET,
  c         OUT NOCOPY VARCHAR)
RETURN     PLS_INTEGER;

MEMBER FUNCTION GETVARIABLE2(
  self      IN ANYDATASET,
  c         OUT NOCOPY VARCHAR2)
RETURN     PLS_INTEGER;
```

Parameters

Table 297-5 GET* Function Parameters

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information., that is to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

297.2.5 GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GetCount(
    self          IN ANYDATASET)
RETURN          PLS_INTEGER;
```

Parameter

Table 297-6 GETCOUNT Function Parameter

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

The number of data instances.

297.2.6 GETINSTANCE Member Function

This function gets the next instance in an `ANYDATASET`. Only sequential access to the instances in an `ANYDATASET` is allowed.

After this function has been called, the `GET*` functions can be invoked on the `ANYDATASET` to access the current instance. If `PIECEWISE` is called before doing the `GET*` calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the `ANYDATASET` is fully created.

Syntax

```
MEMBER FUNCTION GETINSTANCE (
    self          IN OUT NOCOPY ANYDATASET)
RETURN          PLS_INTEGER;
```

Parameters

Table 297-7 GETINSTANCE Function Parameter

Parameter	Description
<code>self</code>	The <code>ANYDATASET</code> being accessed.

Return Values

`DBMS_TYPES.SUCCESS` or `DBMS_TYPES.NO_DATA`

`DBMS_TYPES.NO_DATA` signifies the end of the `ANYDATASET` (all instances have been accessed).

Usage Notes

This function should be called even before accessing the first instance.

297.2.7 GETTYPE Member Function

This function gets the `AnyType` describing the type of the data instances in an `ANYDATASET`.

Syntax

```
MEMBER FUNCTION GETTYPE (
    self          IN ANYDATASET,
    typ           OUT NOCOPY AnyType)
RETURN          PLS_INTEGER;
```

Parameters

Table 297-8 GETTYPE Function Parameter

Parameter	Description
<code>self</code>	The <code>ANYDATASET</code> .
<code>typ</code>	The <code>ANYTYPE</code> corresponding to the <code>AnyData</code> . May be <code>NULL</code> if it does not represent a user-defined function.

Return Values

The typecode corresponding to the type of the `ANYDATA`.

297.2.8 GETTYPENAME Member Function

This procedure gets the fully qualified type name for the `ANYDATASET`.

If the `ANYDATASET` is based on a built-in, this function will return `NUMBER` and associated information.

If it is based on a user defined type, this function will return `schema_name.type_name`. for example, `SCOTT.FOO`.

If it is based on a transient anonymous type, this function will return `NULL`.

Syntax

```
MEMBER FUNCTION GETTYPENAME (
    self          IN ANYDATASET)
RETURN          VARCHAR2;
```

Parameter

Table 297-9 GETTYPENAME Function Parameter

Parameter	Description
<code>self</code>	The <code>ANYDATASET</code> being constructed.

Return Values

Type name of the `ANYDATASET`.

297.2.9 PIECEWISE Member Procedure

This procedure sets the `MODE` of construction, access of the data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the `MODE` of construction, access of the data value to be a collection element at a time (if the data value is of a collection `TYPE`). Once this call has been made, subsequent `SET*` and `GET*` calls will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE (
    self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 297-10 PIECEWISE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters.

DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

297.2.10 SET* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the `MODE` with which we are constructing (depending on how we have invoked the `PIECEWISE` call). The type of the current data should be the type of the `ANYDATASET` if `PIECEWISE` has NOT been called. The type should be the type of the attribute at the current position if `PIECEWISE` has been called.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
    self          IN OUT NOCOPY ANYDATASET,
    dbl           IN BINARY_DOUBLE,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
    self          IN OUT NOCOPY ANYDATASET,
    fl            IN BINARY_FLOAT,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self          IN OUT NOCOPY ANYDATASET,
    b             IN BFILE,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self          IN OUT NOCOPY ANYDATASET,
    b             IN BLOB,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self          IN OUT NOCOPY ANYDATASET,
    c             IN CHAR,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
```

```

self          IN OUT NOCOPY ANYDATASET,
c             IN CLOB,
last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
self          IN OUT NOCOPY ANYDATASET,
col           IN "<collection_type>",
last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
self          IN OUT NOCOPY ANYDATASET,
dat           IN DATE,
last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
self          IN OUT NOCOPY ANYDATASET,
inv           IN INTERVAL DAY TO SECOND,
last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
self          IN OUT NOCOPY ANYDATASET,
inv           IN INTERVAL YEAR TO MONTH,
last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
self          IN OUT NOCOPY ANYDATASET,
nc           IN NCHAR,
last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
self          IN OUT NOCOPY ANYDATASET,
nc           IN NCLOB,
last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
self          IN OUT NOCOPY ANYDATASET,
num          IN NUMBER,
last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
self          IN OUT NOCOPY ANYDATASET,
nc           IN NVARCHAR2,
last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
self          IN OUT NOCOPY ANYDATASET,
obj          IN "<object_type>",
last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
self          IN OUT NOCOPY ANYDATASET,
r            IN RAW,
last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
self          IN OUT NOCOPY ANYDATASET,
rf           IN REF "<object_type>",
last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
self          IN OUT NOCOPY ANYDATASET,

```

```

        ts                IN TIMESTAMP,
        last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPLTZ (
    self                IN OUT NOCOPY ANYDATASET,
    ts                IN TIMESTAMP WITH LOCAL TIME ZONE,
    last_elem          IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPTZ (
    self                IN OUT NOCOPY ANYDATASET,
    ts                IN TIMESTAMP WITH TIME ZONE,
    last_elem          IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID (
    self                IN OUT NOCOPY ANYDATASET,
    rid                IN UROWID,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARIABLE (
    self                IN OUT NOCOPY ANYDATASET,
    c                IN VARCHAR,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARIABLE2 (
    self                IN OUT NOCOPY ANYDATASET,
    c                IN VARCHAR2,
    last_elem BOOLEAN DEFAULT FALSE);

```

Parameters

Table 297-11 SET* Procedure Parameters

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if <code>PIECEWISE</code> has been already called (for a collection). Set to <code>TRUE</code> if it is the last element of the collection, <code>FALSE</code> otherwise.

Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

ANYTYPE TYPE

An `ANYTYPE TYPE` can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the `CREATE TYPE` statement. Only new transient types can be constructed using the `ANYTYPE` interfaces.

Starting with Oracle Database 19c, the `GETANYTYPEFROMPERSISTENT` function replaces the `GETPERSISTENT` static function.

This chapter discusses the following:

- [Summary of ANYTYPE Subprograms](#)

298.1 Summary of ANYTYPE Subprograms

This table lists the `ANYTYPE` subprograms in alphabetical order and briefly describes them.

Table 298-1 *ANYTYPE Subprograms*

Subprogram	Description
BEGINCREATE Static Procedure	Creates a new instance of <code>ANYTYPE</code> which can be used to create a transient type description.
SETINFO Member Procedure	Sets any additional information required for constructing a <code>COLLECTION</code> or builtin type.
ADDATTR Member Procedure	Adds an attribute to an <code>ANYTYPE</code> (of typecode <code>DBMS_TYPES.TYPECODE_OBJECT</code>).
ENDCREATE Member Procedure	Ends creation of a transient <code>ANYTYPE</code> . Other creation functions cannot be called after this call.
GETINFO Member Function	Gets the type information for the <code>ANYTYPE</code> .
GETATTRELEMINFO Member Function	Gets the type information for an attribute of the type (if it is of <code>TYPECODE_OBJECT</code>). Gets the type information for a collection's element type if the <i>self</i> parameter is of a collection type.
GETANYTYPEFROMPERSISTENT Function	This standalone function replaces the old static function <code>GETPERSISTENT</code> . This returns an <code>ANYTYPE</code> corresponding to a persistent type created earlier using the <code>CREATE TYPE SQL</code> statement.

298.1.1 BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```
STATIC PROCEDURE BEGINCREATE (
    typecode      IN          PLS_INTEGER,
    atype         OUT NOCOPY ANYTYPE);
```

Parameters

Table 298-2 BEGINCREATE Procedure Parameters

Parameter	Description
typecode	Use a constant from DBMS_TYPES package. Typecodes for user-defined type: <ul style="list-style-type: none"> DBMS_TYPES.TYPECODE_OBJECT DBMS_TYPES.TYPECODE_VARRAY or DBMS_TYPES.TYPECODE_TABLE Typecodes for builtin types: <ul style="list-style-type: none"> DBMS_TYPES.TYPECODE_NUMBER, and similar types.
atype	ANYTYPE for a transient type

298.1.2 SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

Syntax

```
MEMBER PROCEDURE SETINFO (
    self         IN OUT NOCOPY ANYTYPE,
    prec         IN PLS_INTEGER,
    scale        IN PLS_INTEGER,
    len          IN PLS_INTEGER,
    csid         IN PLS_INTEGER,
    csfrm        IN PLS_INTEGER,
    atype        IN ANYTYPE DEFAULT NULL,
    elem_tc      IN PLS_INTEGER DEFAULT NULL,
    elem_count   IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 298-3 SETINFO Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed.
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.

Table 298-3 (Cont.) SETINFO Procedure Parameters

Parameter	Description
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.
csfrm	Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.
atype	Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.

The Following Parameters Are Required For Collection Types

Table 298-4 SETINFO Procedure Parameters - Collection Types

Parameter	Description
elem_tc	Must be of the collection element's typecode (from DBMS_TYPES package).
elem_count	Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if self represents a VARRAY.

Exceptions

- DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.

298.1.3 ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

```
MEMBER PROCEDURE ADDATTR(
  self      IN OUT NOCOPY ANYTYPE,
  aname     IN VARCHAR2,
  typecode  IN PLS_INTEGER,
  prec      IN PLS_INTEGER,
  scale     IN PLS_INTEGER,
  len       IN PLS_INTEGER,
```

```

csid          IN PLS_INTEGER,
csfrm         IN PLS_INTEGER,
attr_type     IN ANYTYPE DEFAULT NULL);

```

Parameters

Table 298-5 ADDATTR Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.
aname	Optional. Attribute's name. Could be NULL.
typecode	Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.
csid	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.
csfrm	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.
attr_type	Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

298.1.4 ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

Syntax

```

MEMBER PROCEDURE ENDCREATE(
    self          IN OUT NOCOPY ANYTYPE);

```

Parameter

Table 298-6 ENDCREATE Procedure Parameter

Parameter	Description
self	The transient ANYTYPE that is being constructed.

298.1.5 GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

```
MEMBER FUNCTION GETINFO (
    self          IN ANYTYPE,
    prec          OUT PLS_INTEGER,
    scale        OUT PLS_INTEGER,
    len          OUT PLS_INTEGER,
    csid         OUT PLS_INTEGER,
    csfrm        OUT PLS_INTEGER,
    schema_name  OUT VARCHAR2,
    type_name    OUT VARCHAR2,
    version      OUT varchar2,
    numelems    OUT PLS_INTEGER)
RETURN         PLS_INTEGER;
```

Parameters

Table 298-7 GETINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
prec	If typecode represents a number. Gives precision and scale. Ignored otherwise.
scale	If typecode represents a number. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
schema_name	Type's schema (if persistent).
type_name	Type's typename.
version	Type's version.
numelems	If <i>self</i> is a TYPECODE_VARRAY, this gives the VARRAY count. If <i>self</i> is of TYPECODE_OBJECT, this gives the number of attributes.

Return Values

The typecode of *self*.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

298.1.6 GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of `TYPECODE_OBJECT`). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (
    self          IN ANYTYPE,
    pos           IN PLS_INTEGER,
    prec         OUT PLS_INTEGER,
    scale        OUT PLS_INTEGER,
    len          OUT PLS_INTEGER,
    csid         OUT PLS_INTEGER,
    csfrm        OUT PLS_INTEGER,
    attr_elt_type OUT ANYTYPE
    aname        OUT VARCHAR2)
RETURN         PLS_INTEGER;
```

Parameters

Table 298-8 GETATTRELEMINFO Function Parameters

Parameter	Description
<code>self</code>	The ANYTYPE.
<code>pos</code>	If <code>self</code> is of <code>TYPECODE_OBJECT</code> , this gives the attribute position (starting at 1). It is ignored otherwise.
<code>prec</code>	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
<code>scale</code>	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
<code>len</code>	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
<code>csid, csfrm</code>	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. Gives character set ID, character set form.
<code>attr_elt_type</code>	If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the <i>attr_elt_type</i> .
<code>aname</code>	Attribute name (if it is an attribute of an object type, NULL otherwise).

Return Values

The typecode of the attribute or collection element.

Exceptions

`DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).

298.1.7 GETANYTYPEFROMPERSISTENT Function

This standalone function returns an `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE SQL` statement. Starting with Oracle Database 19c, the `GETANYTYPEFROMPERSISTENT` function replaces the `GETPERSISTENT` static function.

Syntax

```
GETANYTYPEFROMPERSISTENT (  
    schema_name      IN VARCHAR2,  
    type_name        IN VARCHAR2)  
RETURN               ANYTYPE;
```

Parameters

Table 298-9 GETANYTYPEFROMPERSISTENT Function Parameters

Parameter	Description
<code>schema_name</code>	Schema name of the type.
<code>type_name</code>	Type name.

Return Values

An `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE SQL` statement.

Oracle Database Advanced Queuing (AQ) Types

This chapter describes the types used with Oracle Database Advanced Queuing (AQ) packages for PL/SQL, `DBMS_AQ`, and `DBMS_AQADM`.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of Types](#)

See Also:

Oracle Database Advanced Queuing User's Guide for information about using Oracle Database Advanced Queuing.

299.1 Advanced Queuing (AQ) Types Security Model

`PUBLIC` is granted `EXECUTE` privilege on the types described in this chapter.

299.2 Oracle Database Advanced Queuing (AQ) Types — Summary of Types

Oracle Database Advanced Queuing (AQ) uses types to specify certain types of information.

- [AQ\\$_AGENT](#) Type
- [AQ\\$_AGENT_LIST_T](#) Type
- [AQ\\$_DESCRIPTOR](#) Type
- [AQ\\$_NTFN_DESCRIPTOR](#) Type
- [AQ\\$_NTFN_MSGID_ARRAY](#) Type
- [AQ\\$_POST_INFO](#) Type
- [AQ\\$_POST_INFO_LIST](#) Type
- [AQ\\$_PURGE_OPTIONS_T](#) Type
- [AQ\\$_RECIPIENT_LIST_T](#) Type
- [AQ\\$_REG_INFO](#) Type
- [AQ\\$_REG_INFO_LIST](#) Type
- [AQ\\$_SUBSCRIBER_LIST_T](#) Type
- [DEQUEUE_OPTIONS_T](#) Type

- ENQUEUE_OPTIONS_T Type
- QUEUE_PROPS_T Type
- SEEK_INPUT_T Type
- SEEK_OUTPUT_T Type
- SYS.MSG_PROP_T Type
- MESSAGE_PROPERTIES_T Type
- MESSAGE_PROPERTIES_ARRAY_T Type
- MSGID_ARRAY_T Type

299.2.1 AQ\$_AGENT Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
  name      VARCHAR2(512),
  address   VARCHAR2(1024),
  protocol  NUMBER);
```

Attributes

Table 299-1 AQ\$_AGENT Attributes

Attribute	Description
name	Name of a producer or consumer of a message. The name must follow object name guidelines in the <i>Oracle Database SQL Language Reference</i> with regard to reserved characters.
address	Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form <code>[schema.] queue[@dblink]</code> . For example, a queue named <code>emp_messages</code> in the HR queue at the site <code>dbs1.net</code> has the address: <code>hr.emp_messages@dbs1.net</code>
protocol	Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Database Advanced Queuing.

299.2.2 AQ\$_AGENT_LIST_T Type

This type identifies the list of agents for which `DBMS_AQ.LISTEN` listens.

See Also:

"AQ\$_AGENT Type"

Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

299.2.3 AQ\$_DESCRIPTOR Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

**See Also:**

"MESSAGE_PROPERTIES_T Type"

Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
  queue_name      VARCHAR2(261),
  consumer_name   VARCHAR2(512),
  msg_id          RAW(16),
  msg_prop        MSG_PROP_T,
  gen_desc        AQ$_NTFN_DESCRIPTOR,
  msgid_array     SYS.AQ$_NTFN_MSGID_ARRAY,
  ntfnsRecdInGrp NUMBER);
```

Attributes**Table 299-2 AQ\$_DESCRIPTOR Attributes**

Attribute	Description
queue_name	Name of the queue in which the message was enqueued which resulted in the notification
consumer_name	Name of the consumer for the multiconsumer queue
msg_id	Identification number of the message
msg_prop	Message properties specified by the MSG_PROP_T type
gen_desc	Indicates the timeout specifications
msgid_array	Group notification message ID list
ntfnsRecdInGrp	Notifications received in group

299.2.4 AQ\$_NTFN_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT( ntfn_flags NUMBER)
```

Attributes

Table 299-3 AQ\$_NTFN_DESCRIPTOR Attributes

Attribute	Description
ntfn_flags	Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.

299.2.5 AQ\$_NTFN_MSGID_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value 2³⁰ which is the max varray size.

Syntax

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY AS VARRAY(1073741824) OF RAW(16);
```

299.2.6 AQ\$_POST_INFO Type

This type specifies anonymous subscriptions to which you want to post messages.

Syntax

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (
    name          VARCHAR2(512),
    namespace     NUMBER,
    payload       RAW(32767));
```

Attributes

Table 299-4 AQ\$_POST_INFO Attributes

Attribute	Description
name	Name of the anonymous subscription to which you want to post
namespace	To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ.NAMESPACE_ANONYMOUS
payload	The payload to be posted to the anonymous subscription

299.2.7 AQ\$_POST_INFO_LIST Type

This type identifies the list of anonymous subscriptions to which you want to post messages.

 **See Also:**
[AQ\\$_POST_INFO Type](#)

Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

299.2.8 AQ\$_PURGE_OPTIONS_T Type

This type specifies the options available for purging a queue table.

 **See Also:**
[PURGE_QUEUE_TABLE Procedure.](#)

Syntax

```
TYPE AQ$_PURGE_OPTIONS_T is RECORD (
    block          BOOLEAN          DEFAULT FALSE
    delivery_mode  PLS_INTEGER      DEFAULT PERSISTENT);
```

Table 299-5 AQ\$_PURGE_OPTIONS_T Type Attributes

Attribute	Description
block	TRUE/FALSE. <ul style="list-style-type: none"> If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.
delivery_mode	Kind of messages to purge, either DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT

299.2.9 AQ\$_RECIPIENT_LIST_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

 **See Also:**
"AQ\$_AGENT Type"

Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

299.2.10 AQ\$_REG_INFO Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
    name                VARCHAR2(512),
    namespace           NUMBER,
    callback            VARCHAR2(4000),
    context            RAW(2000) DEFAULT NULL,
    anyctx             ANYDATA,
    ctxtype            NUMBER,
    payloadcbk        VARCHAR2(4000),
    timeout            NUMBER,
    ntfn_grouping_class NUMBER,
    ntfn_grouping_value NUMBER DEFAULT 600,
    ntfn_grouping_type NUMBER,
    ntfn_grouping_start_time TIMESTAMP(6) WITH TIME ZONE,
    ntfn_grouping_repeat_count NUMBER);
```

Attributes

Table 299-6 AQ\$_REG_INFO Type Attributes

Attribute	Description
name	Specifies the name of the subscription. The subscription name is of the form <i>schema.queue</i> if the registration is for a single consumer queue or <i>schema.queue:consumer_name</i> if the registration is for a multiconsumer queues.

Table 299-6 (Cont.) AQ\$_REG_INFO Type Attributes

Attribute	Description
namespace	Specifies the namespace of the subscription. To receive notification from Oracle Database Advanced Queuing queues, the namespace must be <code>DBMS_AQ.NAMESPACE_AQ</code> . To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code> , the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code> .
callback	Specifies the action to be performed on message notification. For HTTP notifications, use <code>http://www.company.com:8080</code> . For e-mail notifications, use <code>mailto://xyz@company.com</code> . For raw message payload for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=0</code> . For user-defined type message payload converted to XML for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=1</code> .
context	Specifies the context that is to be passed to the callback function
anyctx	Specifies the <code>ANYDATA</code> type context that is passed to the callback function
ctxtype	Specifies the context type. Valid values are 0 (<code>RAW</code>) or 1 (<code>ANYDATA</code>)
payloadcbk	Specifies payload for the callback function
timeout	Specifies the time in seconds
ntfn_grouping_class	Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If <code>ntfn_grouping_class</code> is 0, all other notification grouping attributes must be 0. <ul style="list-style-type: none"> <code>NTFN_GROUPING_CLASS_TIME</code> - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.
ntfn_grouping_value	Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until <code>ntfn_grouping_repeat_count</code> is exhausted.
ntfn_grouping_type	<ul style="list-style-type: none"> <code>NTFN_GROUPING_TYPE_SUMMARY</code> - Summary of all notifications that occurred in the time interval. (Default) <code>NTFN_GROUPING_TYPE_LAST</code> - Last notification that occurred in the interval.

Table 299-6 (Cont.) AQ\$_REG_INFO Type Attributes

Attribute	Description
<code>ntfn_grouping_start_time</code>	Notification grouping start time. Notification grouping can start from a user-specified time that should be a valid timestamp with time zone. If <code>ntfn_grouping_start_time</code> is not specified when using grouping, the default is to current timestamp with time zone
<code>ntfn_grouping_repeat_count</code>	Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The <code>ntfn_grouping_repeat_count</code> , if not specified, will default to <ul style="list-style-type: none"> • <code>NTFN_GROUPING_FOREVER</code> - Keep sending grouping notifications forever.

Usage Notes

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

[Table 299-7](#) shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. [Table 299-8](#) shows the actions performed when XML presentation is specified.

Table 299-7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the RAW data in the payload.	Not supported	PL/SQL callback receives the RAW data in the payload.
Oracle object type	Not supported	Not supported	Not supported

Table 299-8 Actions Performed for Nonpersistent Queues When XML Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.
Oracle object type	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.

299.2.11 AQ\$_REG_INFO_LIST Type

Identifies the list of registrations to a queue.

 **See Also:**
"AQ\$_REG_INFO Type"

Syntax

```
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```

299.2.12 AQ\$_SUBSCRIBER_LIST_T Type

This type identifies the list of subscribers that subscribe to a queue.

 **See Also:**
"AQ\$_AGENT Type"

Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT  
INDEX BY BINARY_INTEGER;
```

299.2.13 DEQUEUE_OPTIONS_T Type

DEQUEUE_OPTIONS_T specifies the options available for the dequeue operation.

Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (  
    consumer_name    VARCHAR2(30)    DEFAULT NULL,  
    dequeue_mode     BINARY_INTEGER DEFAULT REMOVE,  
    navigation       BINARY_INTEGER DEFAULT NEXT_MESSAGE,  
    visibility       BINARY_INTEGER DEFAULT ON_COMMIT,  
    wait             BINARY_INTEGER DEFAULT FOREVER,  
    msgid            RAW(16)        DEFAULT NULL,  
    correlation      VARCHAR2(128)  DEFAULT NULL,  
    deq_condition    VARCHAR2(4000) DEFAULT NULL,  
    signature        aq$_sig_prop   DEFAULT NULL,  
    transformation   VARCHAR2(61)   DEFAULT NULL,  
    delivery_mode    PLS_INTEGER    DEFAULT PERSISTENT);
```

Attributes

Table 299-9 DEQUEUE_OPTIONS_T Attributes

Attribute	Description
consumer_name	<p>Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL.</p> <p>For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through dbms_aqadm.enable_db_access procedure call.</p>
dequeue_mode	<p>Specifies the locking behavior associated with the dequeue. Possible settings are:</p> <p>BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.</p> <p>LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement.</p> <p>REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.</p> <p>REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.</p>
navigation	<p>Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are:</p> <p>NEXT_MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default.</p> <p>NEXT_TRANSACTION: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue.</p> <p>FIRST_MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.</p> <p>FIRST_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</p> <p>NEXT_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</p>

Table 299-9 (Cont.) DEQUEUE_OPTIONS_T Attributes

Attribute	Description
visibility	<p>Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the <code>BROWSE</code> dequeue mode. Possible settings are:</p> <p><code>ON_COMMIT</code>: The dequeue will be part of the current transaction. This setting is the default.</p> <p><code>IMMEDIATE</code>: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.</p>
wait	<p>Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are:</p> <p><code>FOREVER</code>: Wait forever. This setting is the default.</p> <p><code>NO_WAIT</code>: Do not wait.</p> <p><code>NUMBER</code>: Wait time in seconds.</p>
msgid	Specifies the message identifier of the message to be dequeued.
correlation	<p>Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.</p>
deq_condition	<p>A conditional expression based on the message properties, the message data properties, and PL/SQL functions.</p> <p>A <code>deq_condition</code> is specified as a Boolean expression using syntax similar to the <code>WHERE</code> clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the <code>WHERE</code> clause of a SQL query). Message properties include <code>priority</code>, <code>corrid</code> and other columns in the queue table</p> <p>To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The <code>deq_condition</code> parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.</p>
signature	Currently not implemented
transformation	Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.
delivery_mode	The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be <code>BUFFERED</code> or <code>PERSISTENT</code> or <code>PERSISTENT_OR_BUFFERED</code> . The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.

299.2.14 ENQUEUE_OPTIONS_T Type

ENQUEUE_OPTIONS_T Type specifies the options available for the enqueue operation.

Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
  visibility          BINARY_INTEGER DEFAULT ON_COMMIT,
  relative_msgid     RAW(16)         DEFAULT NULL,
  sequence_deviation BINARY_INTEGER DEFAULT NULL,
  transformation     VARCHAR2(61)   DEFAULT NULL,
  delivery_mode      PLS_INTEGER    NOT NULL DEFAULT PERSISTENT);
```

Attributes

Table 299-10 ENQUEUE_OPTIONS_T Attributes

Attribute	Description
visibility	Specifies the transactional behavior of the enqueue request. Possible settings are: ON_COMMIT: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default. IMMEDIATE: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueueing to a non-persistent queue.
relative_msgid	Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if BEFORE is specified in sequence_deviation. This parameter is ignored if sequence deviation is not specified.
sequence_deviation	Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are: BEFORE: The message is enqueued ahead of the message specified by relative_msgid. TOP: The message is enqueued ahead of any other messages.
transformation	Specifies a transformation that will be applied before enqueueing the message. The return type of the transformation function must match the type of the queue.
delivery_mode	The enqueueer specifies the delivery mode of the messages it wishes to enqueue in the enqueue options. It can be BUFFERED or PERSISTENT. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'.

299.2.15 QUEUE_PROPS_T Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

Syntax

```
TYPE QUEUE_PROPS_T IS RECORD (
  retry_delay      NUMBER          DEFAULT 0,
  retention_time   NUMBER          DEFAULT 0,
  sort_list        VARCHAR2(30)    DEFAULT NULL,
  cache_hint       BINARY_INTEGER DEFAULT AUTO,
  retention_type   BINARY_INTEGER DEFAULT DBMS_AQ.DEQUEUE_TIME
);
```

Attributes

Table 299-11 QUEUE_PROPS_T Attributes

Attribute	Description
retry_delay	Specifies the number of seconds after which this message is scheduled for processing again after an application rollback
retention_time	Specifies the number of seconds a message is retained in the queue table after being dequeued from the queue
sort_list	Sharded queues can be sorted by ENQ_TIME or PRIORITY, ENQ_TIME .
cache_hint	Specifies a hint to sharded queue whether to cache messages or not. User can specify following: <ul style="list-style-type: none"> UNCACHED: Message cache will not cache messages CACHED: Message cache will cache messages and give preference to those queues with CACHED hint. AUTO: Message cache does best effort based on available memory
retention_type	Specifies the type of retention. DBMS_AQ.DEQUEUE_TIME (default): The retention time starts after a subshard is dequeued by all the subscribers. If a new subscriber seeks back before or to this subshard, then the retention clock is reset.

299.2.16 SEEK_INPUT_T Type

This type specifies the seek input per shard.

Syntax

```
TYPE SEEK_INPUT_T IS RECORD(
  shard              binary_integer DEFAULT DBMS_AQ.ALL_SHARDS,
  priority           binary_integer DEFAULT DBMS_AQ.ALL_PRIORITIES,
  seek_msgid         raw(16)        DEFAULT NULL,
  seek_time          TIMESTAMP WITH TIME ZONE DEFAULT NULL
);
```

Attributes

Table 299-12 SEEK_INPUT_T Attributes

Attribute	Description
shard	Shard identifier on which seek operation needs to be performed. Possible values are <code>DBMS_AQ.ALL_SHARDS</code> or a specific shard on which seek is to be performed If value is <code>DBMS_AQ.ALL_SHARDS</code> , then seek is performed on requested shards, otherwise it is performed on the specific shard mentioned in this field.
priority	Seek is performed on all priorities of the shard individually. If value is <code>DBMS_AQ.ALL_PRIORITIES</code> , then seek is performed on all priorities, otherwise it is performed on the specific priority mentioned in this field
seek_msgid	Input message id when <code>seek_type</code> is <code>DBMS_AQ.MESSAGE</code> .
seek_time	Specifies the input time when <code>seek_type</code> is <code>DBMS_AQ.TIME</code> .

299.2.17 SEEK_OUTPUT_T Type

This type specifies the seek output of a seek call.

Syntax

```
TYPE SEEK_OUTPUT_T IS RECORD(
    shard          binary_integer,
    priority       binary_integer,
    seeked_from    raw(16),
    seeked_to      raw(16));
```

Attributes

Table 299-13 SEEK_OUTPUT_T Attributes

Attribute	Description
shard	Specifies the shard identifier on which the seek operation is performed for the subscriber.
priority	Specifies the priority of the shard, which is applicable only for priority queues, else value is null.
seeked_from	Specifies the message id of dequeue position before seek. NULL value signifies seeking from end of shard.
seeked_to	Specifies the message id of dequeue position after seek. NULL value signifies seeking to end of shard.

299.2.18 SYS.MSG_PROP_T Type

This type is used in PL/SQL notification, as one field in `aq$_descriptor`, to pass message properties of an AQ message to the PL/SQL notification client callback.

Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
  priority          NUMBER,
  delay             NUMBER,
  expiration        NUMBER,
  correlation       VARCHAR2(128),
  attempts          NUMBER,
  exception_queue   VARCHAR2(51),
  enqueue_time     DATE,
  state             NUMBER,
  sender_id         aq$_agent,
  original_msgid    RAW(16),
  delivery_mode     NUMBER);
```

Parameters

Table 299-14 SYS.MSG_PROP_T Type Attributes

Parameter	Description
<code>priority</code>	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
<code>delay</code>	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: <code>NO_DELAY</code> : The message is available for immediate dequeuing number: The number of seconds to delay the message
<code>expiration</code>	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: <code>NEVER</code> : The message does not expire number: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state.
<code>correlation</code>	Returns the identifier supplied by the producer of the message at enqueue time.
<code>attempts</code>	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.

Table 299-14 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
exception_queue	<p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue.</p> <p>Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation. <p>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view.</p> <p>If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</p> <ul style="list-style-type: none"> A message was not dequeued before the expiration time elapsed. Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.</p>
enqueue_time	<p>Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</p>
state	<p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> DBMS_AQ.READY: The message is ready to be processed. DBMS_AQ.WAITING: The message delay has not yet been reached. DBMS_AQ.PROCESSED: The message has been processed and is retained. DBMSAQ.EXPIRED: The message has been moved to the exception queue.

Table 299-14 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Database Advanced Queuing for propagating messages.
delivery_mode	DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.

299.2.19 MESSAGE_PROPERTIES_T Type

This type is defined inside the DBMS_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.</p>
enqueue_time	<p>The enqueue_time attribute specifies the time the message was enqueued. This value is always in Universal Coordinated Time (UTC), and is determined by the system and cannot be set by the user at enqueue time.</p>
state	<p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> DBMS_AQ.READY: The message is ready to be processed. DBMS_AQ.WAITING: The message delay has not yet been reached. DBMS_AQ.PROCESSED: The message has been processed and is retained. DBMSAQ.EXPIRED: The message has been moved to the exception queue.

Table 299-15 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Database Advanced Queuing for propagating messages.
signature	Currently not implemented
transaction_group	Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls.
user_property	This optional attribute is used to store additional information about the payload.
delivery_mode	The message publisher specifies the delivery mode in the message_properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'.

299.2.20 MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by dbms_aq.enqueue_array and dbms_aq.dequeue_array calls to hold the set of message properties.

Each element in the payload_array should have a corresponding element in the MESSAGE_PROPERTIES_ARRAY_T VARRAY.

See Also:

"MESSAGE_PROPERTIES_T Type"

Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
OF MESSAGE_PROPERTIES_T;
```

299.2.21 MSGID_ARRAY_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

DBFS Content Interface Types

DBFS Content Interface Types are public types that support the `DBMS_DBFS_CONTENT` interface.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Data Structures](#)

Related Topics

- [DBMS_DBFS_CONTENT](#)
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

300.1 DDBFS Content Interface Types Overview

The type definitions described in this chapter support the `DBMS_DBFS_CONTENT` interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.

300.2 DBFS Content Interface Types Security Model

The user can access the content operational and administrative interfaces (packages, types, tables, and so on) with the `DBFS_ROLE`. This role can be granted to users as needed.

300.3 DBFS Content Interface Types —Data Structures

Types that support the `DBMS_DBFS_CONTENT` interface include both Object and Table types.

Object Types

- [DBMS_DBFS_CONTENT_CONTEXT_T](#) Object Type
- [DBMS_DBFS_CONTENT_LIST_ITEM_T](#) Object Type
- [DBMS_DBFS_CONTENT_PROPERTY_T](#) Object Type

Table Types

- [DBMS_DBFS_CONTENT_LIST_ITEMS_T](#) Table Type
- [DBMS_DBFS_CONTENT_PROPERTIES_T](#) Table Type
- [DBMS_DBFS_CONTENT_RAW_T](#) Table Type

300.3.1 DBMS_DBFS_CONTENT_CONTEXT_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing `asof` queries, and whether or not the item(s) are `read_only`. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
  AUTHID DEFINER
AS OBJECT (
  principal    VARCHAR2(32),
  acl          VARCHAR2(1024),
  owner        VARCHAR2(32),
  asof         TIMESTAMP,
  read_only    INTEGER);
```

Fields

Table 300-1 DBMS_DBFS_CONTENT_CONTEXT_T Fields

Field	Description
<code>principal</code>	File system user
<code>acl</code>	Access control list
<code>owner</code>	Path item owner
<code>asof</code>	Timestamp
<code>read_only</code>	Nonzero if the path item is read-only

300.3.2 DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type

This type describes a type to assist in listing the contents of a directory.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
  AUTHID DEFINER
AS OBJECT (
  path          VARCHAR2(1024),
  item_name     VARCHAR2(256),
  item_type     INTEGER);
```

Fields

Table 300-2 DBMS_DBFS_CONTENT_LIST_ITEM_T Fields

Field	Description
<code>path</code>	Path to the path item
<code>item_name</code>	Name of the path item

Table 300-2 (Cont.) DBMS_DBFS_CONTENT_LIST_ITEM_T Fields

Field	Description
item_type	Type of path item. (See Table 58-4)

300.3.3 DBMS_DBFS_CONTENT_PROPERTY_T Object Type

This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
  AUTHID DEFINER
AS OBJECT (
  propname      VARCHAR2(32),
  propvalue     VARCHAR2(1024),
  typecode      INTEGER);
```

Fields

Table 300-3 DBMS_DBFS_CONTENT_PROPERTY_T Fields

Field	Description
prop_name	Name of property
prop_value	Value of property
typecode	Property type (See Constants in DBMS_TYPES)

300.3.4 DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type

This type is a variable-sized array of DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS
  TABLE OF dbms_dbfs_content_list_item_t;
```

Related Topics

- [DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type](#)
This type describes a type to assist in listing the contents of a directory.
- [DBMS_DBFS_CONTENT](#)
The DBMS_DBFS_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

300.3.5 DBMS_DBFS_CONTENT_PROPERTIES_T Table Type

This type is a variable-sized array of property tuples of `DBMS_DBFS_CONTENT_PROPERTY_T` Object Type. It is used by both the client-facing interfaces and by store providers for the `DBMS_DBFS_CONTENT` interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS  
  TABLE OF dbms_dbfs_content_property_t;
```

Related Topics

- [DBMS_DBFS_CONTENT_PROPERTY_T Object Type](#)
This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

300.3.6 DBMS_DBFS_CONTENT_RAW_T Table Type

This type is an array of `RAW`. It is to enable `RAW` data transport for batch interfaces in the `DBMS_DBFS_CONTENT` interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS  
  TABLE OF RAW(32767);
```

Related Topics

- [DBMS_DBFS_CONTENT](#)
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

Database URI TYPEs

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE`, `XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- [Summary of URITYPE Supertype Subprograms](#)
- [Summary of HTTPURITYPE Subtype Subprograms](#)
- [Summary of DBURITYPE Subtype Subprograms](#)
- [Summary of XDBURITYPE Subtype Subprograms](#)
- [Summary of URIFACTORY Package Subprograms](#)

- *Oracle XML DB Developer's Guide*

301.1 Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

Table 301-1 URITYPE Type Subprograms

Method	Description
GETBLOB	Returns the BLOB located at the address specified by the URL.

Table 301-1 (Cont.) URITYPE Type Subprograms

Method	Description
GETCLOB	Returns the CLOB located at the address specified by the URL.
GETCONTENTTYPE	Returns the URL, in escaped format, stored inside the UriType instance.
GETEXTERNALURL	Returns the URL, in escaped format, stored inside the UriType instance.
GETURL	Returns the URL, in non-escaped format, stored inside the UriType instance.
GETXML	Returns the XMLType located at the address specified by the URL.

301.1.1 UriType Supertype GETBLOB

This function returns the BLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the BLOB located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getBlob()
    RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
    RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csid IN NUMBER)
    RETURN BLOB;
```

Table 301-2 UriType Supertype GETBLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error

301.1.2 UriType Supertype GETCLOB

This function returns the CLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described below.

This function returns the CLOB located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getClob()
  RETURN CLOB;
```

This function returns the CLOB located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
  RETURN CLOB;
```

Table 301-3 UriType Supertype GETCLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

301.1.3 UriType Supertype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

Syntax

```
MEMBER FUNCTION getContentType()
  RETURN VARCHAR2;
```

301.1.4 UriType Supertype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the UriType instance.

The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the UriType instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
  RETURN varchar2;
```

301.1.5 UriType Supertype GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

301.1.6 UriType Supertype GETXML

This function returns the `XMLType` located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the `XMLType` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()  
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)  
RETURN XMLType;
```

Table 301-4 UriType Supertype GETXML Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

301.2 Summary of HTTPURITYPE Subtype Subprograms

The `HTTPURITYPE` is a subtype of the `UriType` that provides support for the HTTP protocol. This uses the `UTL_HTTP` package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

Table 301-5 HTTPURITYPE Type Subprorgams

Method	Description
CREATEURI	Creates an instance of <code>HTTPURITYPE</code> from the given URI.
GETBLOB	Returns the <code>BLOB</code> located at the address specified by the URL.
GETCLOB	Returns the <code>CLOB</code> located at the address specified by the URL.
GETCONTENTTYPE	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL	Returns the URL, in escaped format, stored inside the <code>UriType</code> instance.
GETURL	Returns the URL, in non-escaped format, stored inside the <code>UriType</code> instance.
GETXML	Returns the <code>XMLType</code> located at the address specified by the URL.
HTTPURITYPE	Creates an instance of <code>HTTPURITYPE</code> from the given URI.

301.2.1 HttpUriType Subtype CREATEURI

This static function constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

Syntax

```
STATIC FUNCTION createUri(
    url IN varchar2)
RETURN HTTPURITYPE;
```

Table 301-6 HttpUriType Subtype CREATEURI Parameters

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string containing a valid HTTP URL; escaped format.

301.2.2 HttpUriType Subtype GETBLOB

This function returns the `BLOB` located at the address specified by the HTTP URL.

The subprograms of the URI Subtype `HTTPURITYPE` member subprogram `GETBLOB` are described below.

This function returns the `BLOB` located at the address specified by the HTTP URL.

Syntax

```
MEMBER FUNCTION getBlob()
RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the HTTP URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
    RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csid IN NUMBER)
    RETURN BLOB;
```

Table 301-7 HttpUriType Subtype GETBLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

301.2.3 HttpUriType Subtype GETCLOB

This function returns the `CLOB` located by the HTTP URL address. If a temporary `CLOB` is returned, it must be freed.

The subprograms of the URI Subtype HTTPURITYPE member subprogram GETCLOB are described below.

Returns the `CLOB` located at the address specified by the HTTP URL.

Syntax

```
MEMBER FUNCTION getClob()
    RETURN CLOB;
```

Returns the `CLOB` located at the address specified by the HTTP URL and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
    RETURN CLOB;
```

Table 301-8 HttpUriType Subtype GETCLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

301.2.4 HttpUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentTypes()  
RETURN VARCHAR2;
```

301.2.5 HttpUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the HTTPURITYPE instance. The subtype instances override this member function.

The HTTPURITYPE function does not store the prefix `http://`, but generates it for the external URL.

Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

301.2.6 HttpUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the HTTPURITYPE instance.

Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

301.2.7 HttpUriType Subtype GETXML

This function returns the XMLType located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

The subprograms of the URI Subtype HttpUriType member subprogram GETXML are described below.

This function returns the XMLType located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()  
RETURN XMLType;
```

This function returns the XMLType located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)  
RETURN XMLType;
```

Table 301-9 HttpUriType Subtype GETXML Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

301.2.8 HttpUriType Subtype HTTPURITYPE

This constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE (
    url IN VARCHAR2);
```

Table 301-10 HttpUriType Subtype HTTPURITYPE Parameters

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

301.3 Summary of DBURITYPE Subtype Subprograms

The `DBURITYPE` is a subtype of the `UriType` that provides support for `DBUri-refs`. A `DBUri-ref` is an intra-database URL that can be used to reference any row or row-column data in the database.

The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and views further contain the rows and columns inside them.

Table 301-11 DBURITYPE Type Subprograms

Method	Description
CREATEURI	Constructs a <code>DBURITYPE</code> instance.
DBURITYPE	Creates an instance of <code>DBURITYPE</code> from the given URI.
GETBLOB	Returns the <code>BLOB</code> located at the address specified by the <code>DBURITYPE</code> instance.
GETCLOB	Returns the <code>CLOB</code> located at the address specified by the <code>DBURITYPE</code> instance.
GETCONTENTTYPE	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL	Returns the URL, in escaped format, stored inside the <code>DBURITYPE</code> instance.
GETURL	Returns the URL, in non-escaped format, stored inside the <code>DBURITYPE</code> instance.

Table 301-11 (Cont.) DBURITYPE Type Subprograms

Method	Description
GETXML	Returns the <code>XMLType</code> located at the address specified by the URL

301.3.1 DBUriType Subtype CREATEURI

This static function constructs a `DBURITYPE` instance. Parses the URL given and creates a `DBURITYPE` instance.

Syntax

```
STATIC FUNCTION createUri(
    url IN varchar2)
RETURN DBURITYPE;
```

Table 301-12 DBUriType Subtype CREATEURI Parameters

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string, in escaped format, containing a valid <code>DBURITYPE</code> .

301.3.2 DBUriType Subtype DBURITYPE

This constructs a `DBURITYPE` instance.

Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(
    url IN varchar2);
```

Table 301-13 DBUriType Subtype DBURITYPE Parameters

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string containing a valid <code>DBURITYPE</code> . The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

301.3.3 DBUriType Subtype GETBLOB

This function returns the `BLOB` located at the address specified by the URL.

The subprograms of the URI Subtype `DBURITYPE` member subprogram `GETBLOB` are described below. The options are described in the following table.

This function returns the `BLOB` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getBlob()
    RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
    RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csid IN NUMBER)
    RETURN BLOB;
```

Table 301-14 DBUriType Subtype GETBLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

301.3.4 DBUriType Subtype GETCLOB

This function returns the `CLOB` located at the address specified by the `DBURITYPE` instance.

If a temporary `CLOB` is returned, it must be freed. The document returned may be an XML document or a text document. When the `DBUri-ref` identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described below.

The following function returns the `CLOB` located at the address specified by the `DBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getClob()
    RETURN CLOB;
```

The following function returns the `CLOB` located at the address specified by the `DBURITYPE` instance and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
    RETURN CLOB;
```

Table 301-15 DBUriType Subtype GETCLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

301.3.5 DBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

301.3.6 DBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `DBURITYPE` instance. The `DBUri` servlet URL that processes the `DBURITYPE` has to be appended before using the escaped URL in Web pages.

Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

301.3.7 DBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `DBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

301.3.8 DBUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL.

The subprograms of the URI Subtype `DBPURITYPE` member subprogram `GETXML` are described below. The options are described in the following table.

This function returns the `XMLType` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()  
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
  RETURN XMLType;
```

Table 301-16 DBUriType Subtype GETXML Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

301.4 Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URITYPE. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URITYPE column in a table.

The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

Table 301-17 XDBURITYPE Type Subprograms

Method	Description
CREATEURI	Returns the <code>UriType</code> corresponding to the specified URL.
GETBLOB	Returns the <code>BLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance.
GETCLOB	Returns the <code>CLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance.
GETCONTENTTYPE	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL	Returns the URL, in escaped format, stored inside the <code>XDBURITYPE</code> instance.
GETURL	Returns the URL, in non-escaped format, stored inside the <code>XDBURITYPE</code> instance.
GETXML	Returns the <code>XMLType</code> corresponding to the contents of the document specified by the URL.
XDBURITYPE	Creates an instance of <code>XDBURITYPE</code> from the given URI.

301.4.1 XDBUriType Subtype CREATEURI

This static function constructs a `XDBURITYPE` instance. It parses the given URL and creates a `XDBURITYPE` instance.

Syntax

```
STATIC FUNCTION createUri(
  url IN varchar2)
  RETURN XDBURITYPE
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid XDBURITYPE.

301.4.2 XDBUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETBLOB are described below. The options are described in the following table.

This function returns the BLOB located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getBlob()
  RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
  RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csId IN NUMBER)
  RETURN BLOB;
```

Table 301-18 XDBUriType Subtype GETBLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

301.4.3 XDBUriType Subtype GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETCLOB are described below. The options are described in the following table.

Returns the CLOB located at the address specified by the XDBUriType instance.

Syntax

```
MEMBER FUNCTION getClob()
  RETURN CLOB;
```

Returns the `CLOB` located at the address specified by the `XDBUriType` instance and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
  RETURN CLOB;
```

Table 301-19 XDBUriType Subtype GETCLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

301.4.4 XDBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as `VARCHAR2`.

Syntax

```
MEMBER FUNCTION getContentType()
  RETURN VARCHAR2;
```

301.4.5 XDBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
  RETURN varchar2;
```

301.4.6 XDBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()
  RETURN varchar2;
```

301.4.7 XDBUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL.

The subprograms of the URI Subtype `XDBURITYPE` member subprogram `GETXML` are described below. The options are described in the following table.

This function returns the `XMLType` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()
  RETURN XMLType;
```

This function returns the XMLType located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
  RETURN XMLType;
```

Table 301-20 XDBUriType Subtype GETXML Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

301.4.8 XDBUriType subtype XDBURITYPE

This constructs a XDBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(
  url      IN  VARCHAR2,
  flags    IN  RAW := NULL)
  RETURN self AS RESULT;
```

Table 301-21 XDBUriType subtype XDBURITYPE Parameters

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid XDBUriType. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.
flags	(IN)	Possible values are: <ul style="list-style-type: none"> • 1 - Expand all XInclude elements before returning the result contents. If any XInclude element cannot be successfully resolved according to the XInclude fallback semantics, then an error is raised. • 2 - Indicates that any errors during document retrieval should be suppressed • 3 - Both flag bits (1, 2) are enabled

301.5 Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

Table 301-22 URIFACTORY Type Subprograms

Method	Description
GETURI	Returns the correct URL handler for the given URL string.
ESCAPEURI	Returns a URL in escaped format.
UNESCAPEURI	Returns a URL in unescaped format.
REGISTERURLHANDLER	Registers a particular type name for handling a particular URL.
UNREGISTERURLHANDLER	Unregisters a URL handler.

301.5.1 UriFactory Package GETURI

This factory method returns the correct URI handler for the given URI string.

It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the [REGISTERURLHANDLER](#) function. If the prefix matches, [GETURI](#) would then use that subtype.

Syntax

```
FUNCTION getUri(
    url IN Varchar2)
RETURN UriType;
```

Table 301-23 UriFactory Package GETURI Parameters

Parameter	IN / OUT	Description
<code>uri</code>	(IN)	The URL string, in escaped format, containing a valid HTTP URL.

301.5.2 UriFactory Package ESCAPEURI

This function returns a URL in escaped format.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this

reason, use the [GETEXTERNALURL](#) function or the [GETURI](#) function to get to the URL value instead of using the attribute present in the `UriType`.

Syntax

```
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

Table 301-24 UriFactory Package ESCAPEURI Parameters

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string to be returned in escaped format.

301.5.3 UriFactory Package UNESCAPEURI

This function returns a URL in unescaped format.

This function is the reverse of the [ESCAPEURI](#) function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a `VARCHAR2`, the characters would be converted into the equivalent characters as defined by the database character set.

Syntax

```
FUNCTION unescapeUri()
RETURN varchar2;
```

Table 301-25 UriFactory Package UNESCAPEURI Parameters

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string to be returned in unescaped format.

301.5.4 UriFactory Package REGISTERURLHANDLER

This package registers a particular type name for handling a particular URL.

The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUri` static member function. This function is called by the [GETURI](#) function to generate an instance of the type. The `striprefix` parameter indicates that the prefix must be stripped off before calling this function.

Syntax

```
PROCEDURE registerUrlHandler(
    prefix IN varchar2,
    schemaName IN varchar2,
    typename IN varchar2,
    ignoreCase IN boolean := true,
    striprefix IN boolean := true);
```

Table 301-26 UriFactory Package REGISTERURLHANDLER Parameters

Parameter	IN / OUT	Description
prefix	(IN)	The prefix to handle; for example, <code>http://</code> .
schemaName	(IN)	Name of the schema where the type resides; case sensitive.
typename	(IN)	The name of the type to handle the URL; case sensitive.
ignoreCase	(IN)	Ignore case when matching prefixes.
stripprefix	(IN)	Strip prefix before generating the instance of the type.

301.5.5 UriFactory Package UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as `http://`.

Syntax

```
PROCEDURE unregisterUrlHandler(
    prefix IN VARCHAR2);
```

Table 301-27 UriFactory Package UNREGISTERURLHANDLER Parameters

Parameter	IN / OUT	Description
prefix	(IN)	The prefix to be unregistered.

JMS Types

PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues.

The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueueing or to interpret a dequeued JMS message.

This chapter contains these topics:

- [Overview](#)
- [Security Model](#)
- [Java Versus PL/SQL Datatypes](#)
- [More on Bytes_ Stream and Map Messages](#)
- [Upcasting and Downcasting Between General and Specific Messages](#)
- [JMS Types Error Reporting](#)
- [Oracle JMS Type Constants](#)
- [JMS Types Error Reporting](#)
- [Oracle JMS Type Constants](#)
- [CONVERT_JMS_SELECTOR](#)
- [Summary of JMS Types](#)

302.1 JMS Types Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Database Advanced Queuing offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Database Advanced Queuing offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Database Advanced Queuing rules

302.2 JMS Types Security Model

`PUBLIC` is granted `EXECUTE` privilege in these JMS types.

- `SYS.AQ$_JMS_MESSAGE` Type
- `SYS.AQ$_JMS_TEXT_MESSAGE` Type
- `SYS.AQ$_JMS_BYTES_MESSAGE` Type
- `SYS.AQ$_JMS_MAP_MESSAGE` Type
- `SYS.AQ$_JMS_STREAM_MESSAGE` Type
- `SYS.AQ$_JMS_OBJECT_MESSAGE` Type
- `SYS.AQ$_JMS_NAMEARRAY` Type
- `SYS.AQ$_JMS_VALUE` Type
- `SYS.AQ$_JMS_EXCEPTION` Type

302.3 Java Versus PL/SQL Datatypes

Datatypes do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving `TEXT` data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

See Also:

JMS specification 3.11.3, Conversion Provided by `StreamMessage` and `MapMessage`

New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new `AQ$_JMS_VALUE` ADT has been added in the `SYS` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object`

procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any datatype that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

302.4 More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionality that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses this common functionality.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages
- Initialize the `Jserv` Static Variable
- Get the Payload Data Back to PL/SQL
- Garbage Collect the Static Variable
- Use a Message Store: A Static Variable Collection
- Typical Calling Sequences
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the `Jserv` side it is stored as a static variable. (`Jserv` is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the `Jserv` side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the `Jserv` static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`

- `aq$_jms_stream_message`

Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

Note:

It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.

This call also gives you an operation ID if you do not specify one.

2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.

For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.

2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages

The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- Stream and bytes messages

The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the `Jserv` static variable.

The `prepare` procedure, on the other hand, overwrites the message payload in the `Jserv` static variable with the payload in the PL/SQL ADT.

Oracle provides member function `get_mode` for users to query the mode.

Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using `Java ObjectOutputStream` and bytes messages are encoded using `Java DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method

of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support utf-8 encoding.

Note:

All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation JavaSoft.com for details on how the data is encoded into bytes.

Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either `RAW` or `BLOB` in the database. In this release Oracle Database Advanced Queuing provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).

302.5 Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Database Advanced Queuing queue. Oracle Database Advanced Queuing supports retrieving and populating of `aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

302.6 JMS Types Error Reporting

This table lists Oracle JMS types related errors.

Table 302-1 Oracle JMS Types Errors

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24190	ERROR_DATA_OVERFLOW	The payload data exceeds the size that an out parameter can hold. For example, the <code>get_text</code> procedure with a <code>VARCHAR2</code> parameter of <code>aq\$_jms_text_message</code> or <code>get_bytes</code> procedure with a <code>RAW</code> parameter of <code>aq\$_jms_bytes_message</code> .
ORA-24191	ERROR_PROP_NAME_EXIST	Setting a property that is previous set
ORA-24192	ERROR_PROP_NAME_NULL	Occurs when setting a property with null property name.
ORA-24193	ERROR_EXCEED_RANGE	PL/SQL number type exceeds the valid range of the respective Java type. For example <code>set_byte_property</code> , <code>set_short_property</code> of <code>aq\$_jms_head</code> ADT; <code>set_byte</code> and <code>set_short</code> of <code>aq\$_jms_map_message</code> ADT; <code>write_byte</code> and <code>write_short</code> of <code>aq\$_jms_stream_message</code> and <code>aq\$_jms_bytes_message</code> ADT.
ORA-24194	ERROR_TYPE_MISMATCH	The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.
ORA-24195	ERROR_MAP_TOO_LARGE	The size of the map exceeds the <code>aq\$_jms_namearray</code> ADT capacity. The current size limit is 1024. You can use the <code>get_names</code> function with <code>offset</code> and <code>length</code> parameters to retrieve the name array in multiple small chunks.
ORA-24196	ERROR_WRONG_MODE	The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.
ORA-24197	ERROR_JAVA_EXCEPTION	ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the <code>get_exception</code> static procedure of <code>aq\$_jms_map_message</code> , <code>aq\$_jms_bytes_message</code> , and <code>aq\$_jms_stream_message</code> to retrieve the exception information last thrown by the Java stored procedure. A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT <code>aq\$_jms_exception</code> is created to represent the exception information on the PL/SQL side.
ORA-24198	ERROR_INVALID_ID	An invalid operation ID is being provided to access a message.
ORA-24199	ERROR_STORE_OVERFLOW	The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the <code>clean</code> procedure after using one message. The <code>clean</code> procedure frees the message slot for use by other messages attempting access.

302.7 Oracle JMS Type Constants

These constants can be useful when dealing with message type functions.

DBMS_AQ Package Constants

DBMS_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE      CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE     CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE       CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE    CONSTANT BINARY_INTEGER;
```

SYS.DBMS_JMS_PLSQL Package Constants

SYS.DBMS_JMS_PLSQL package constants are new in Oracle Database 10g.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

```
MESSAGE_ACCESS_READONLY  CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Database Advanced Queuing queue. They are useful during the conversion of JMS selectors to Oracle Database Advanced Queuing rules:

```
DESTPLOAD_JMSTYPE  CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT  CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA  CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

```
DATA_TYPE_BYTE          CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT         CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER       CONSTANT PLS_INTEGER;
DATA_TYPE_LONG          CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT         CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE        CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN       CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER     CONSTANT PLS_INTEGER;
DATA_TYPE_STRING        CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES         CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```
ERROR_DATA_OVERFLOW     CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST  CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL   CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE     CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH    CONSTANT PLS_INTEGER := -24194;
```

```
ERROR_MAP_TOO_LARGE    CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE       CONSTANT PLS_INTEGER := -24196;
ERROR_JAVA_EXCEPTION   CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID       CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW   CONSTANT PLS_INTEGER := -24199;
```

302.8 CONVERT_JMS_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Database Advanced Queuing rules. These rules can be used in `ADD_SUBSCRIBER` operations as subscriber rules or in `DEQUEUE` operations as dequeue conditions. These procedures are in the `SYS.dbms_jms_plsql` package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is `dbms_jms_plsql.DESTLOAD_JMSTYPE` and also assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: `dest_pload_type`. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if this parameter is `SYS.dbms_jms_plsql.DESTLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTLOAD_USERADT`. The function returns null if `dest_pload_type` parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(
    selector IN VARCHAR2,
    dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if the `dest_pload_type` parameter is

`SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

Syntax

```
Function convert_jms_selector(  
    selector          IN  VARCHAR2,  
    dest_pload_type  IN  PLS_INTEGER,  
    compliant        IN  BOOLEAN )
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

302.9 Summary of JMS Types

This lists shows the JMS types.

- [SYS.AQ\\$_JMS_MESSAGE](#) Type
- [SYS.AQ\\$_JMS_TEXT_MESSAGE](#) Type
- [SYS.AQ\\$_JMS_BYTES_MESSAGE](#) Type
- [SYS.AQ\\$_JMS_MAP_MESSAGE](#) Type
- [SYS.AQ\\$_JMS_STREAM_MESSAGE](#) Type
- [SYS.AQ\\$_JMS_OBJECT_MESSAGE](#) Type
- [SYS.AQ\\$_JMS_NAMEARRAY](#) Type
- [SYS.AQ\\$_JMS_VALUE](#) Type
- [SYS.AQ\\$_JMS_EXCEPTION](#) Type

302.9.1 SYS.AQ\$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

```

CONSTRUCT Static Functions

There are six `CONSTRUCT` static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq\$_jms_message

Creates an instance of `aq$_jms_message`, which can hold a specific type of JMS message (`TextMessage`, `BytesMessage`, `MapMessage`, `StreamMessage` or `ObjectMessage`). The message type of the created `aq$_jms_message` instance depends on the `mtype` parameter passed to the `construct` method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The `mtype` parameter must be one of the following constants described in "[Oracle JMS Type Constants](#)":

```

DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE

```

STATIC FUNCTION construct (text_msg IN aq\$_jms_text_message) RETURN aq\$_jms_message

Creates an `aq$_jms_message` from an `aq$_jms_text_message`.

STATIC FUNCTION construct (bytes_msg IN aq\$_jms_bytes_message) RETURN aq\$_jms_message;

Creates an `aq$_jms_message` from an `aq$_jms_bytes_message`.

STATIC FUNCTION construct (stream_msg IN aq\$_jms_stream_message) RETURN aq\$_jms_message;

Creates an `aq$_jms_message` from an `aq$_jms_stream_message`.

STATIC FUNCTION construct (map_msg IN aq\$_jms_map_message) RETURN aq\$_jms_message;

Creates an aq\$_jms_message from an aq\$_jms_map_message.

STATIC FUNCTION construct (object_msg IN aq\$_jms_object_message) RETURN aq\$_jms_message;

Creates an aq\$_jms_message from an aq\$_jms_object_message.

Cast Methods

cast_to_bytes_msg RETURN aq\$_jms_bytes_message

Casts an aq\$_jms_message to an aq\$_jms_bytes_message. Returns an aq\$_jms_bytes_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_BYTES_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_BYTES_MESSAGE.

cast_to_map_msg RETURN aq\$_jms_map_message

Casts an aq\$_jms_message to an aq\$_jms_map_message. Returns an aq\$_jms_map_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_MAP_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE.

cast_to_object_msg RETURN aq\$_jms_object_message

Casts an aq\$_jms_message to an aq\$_jms_object_message. Returns an aq\$_jms_object_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_OBJECT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE.

cast_to_stream_msg RETURN aq\$_jms_stream_message

Casts an aq\$_jms_message to an aq\$_jms_stream_message. Returns an aq\$_jms_stream_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_STREAM_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE.

cast_to_text_msg RETURN aq\$_jms_text_message

Casts an aq\$_jms_message to an aq\$_jms_text_message. Returns an aq\$_jms_text_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_TEXT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE.

JMS Header Methods

set_replyto (replyto IN sys.aq\$_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text and corresponds to JMSType.

get_type RETURN VARCHAR

Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)

Sets `userid`, which corresponds to `JMSXUserID`.

set_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID`.

set_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID`.

set_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

get_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN VARCHAR

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception `ORA-24191` if the property name exists, `ORA-24192` if the property name is null, or `ORA-24193` if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods**set_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB),

Sets the payload, a `CLOB` value, to an internal representation.

set_bytes (payload IN RAW)

Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload IN BLOB)

Sets the payload, a `BLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)

Puts the internal representation of the payload into a `CLOB` variable payload.

get_bytes (payload OUT RAW)

Puts the internal representation of the payload into a `RAW` variable payload.

get_bytes (payload OUT BLOB)

Puts the internal representation of the payload into a `BLOB` variable payload.

302.9.2 SYS.AQ\$_JMS_TEXT_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Database Advanced Queuing queue.

```

CONSTRUCT aq\$_jms_text_message Function**STATIC FUNCTION construct RETURN aq\$_jms_text_message**

Creates an empty aq\$_jms_text_message.

JMS Header Methods**set_replyto (replyto IN sys.aq\$_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR

Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN INT

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods**set_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB)

Sets the payload, a `CLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)

Puts the internal representation of the payload into a `CLOB` variable payload.

302.9.3 SYS.AQ\$_JMS_BYTES_MESSAGE Type

The `SYS.AQ$_JMS_BYTES_MESSAGE` type is the ADT used to store a `BytesMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

```

CONSTRUCT aq\$_jms_bytes_message Function

STATIC FUNCTION construct RETURN aq\$_jms_bytes_message

Creates an empty aq\$_jms_bytes_message.

JMS Header Methods

set_replyto (replyto IN sys.aq\$_agent)

Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq\$_agent

Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR

Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload in RAW)

Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload in BLOB)

Sets the payload, a `BLOB` value, to an internal representation.

get_bytes (payload out RAW)

Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

get_bytes (payload out BLOB)

Puts the internal representation of the payload into a BLOB variable payload.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER

Takes the byte array stored in `aq$_jms_bytes_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`.

Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)

Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

flush (id IN PLS_INTEGER)

Takes the static variable in Jserv and synchronizes the content back to the `aq$_jms_bytes_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER

Returns the current mode of this message. The return value is either `SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY` or `SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads a `BYTE` value from the bytes message and returns the `BYTE` value read. Null is returned if the end of the stream has been reached. Because there is no `BYTE` type in PL/SQL, Oracle Database uses `PLS_INTEGER` to represent a `BYTE`. Although PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER, value OUT NO COPY BLOB, length IN PLS_INTEGER) RETURN PLS_INTEGER

Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR

Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION

Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT

Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN INT

Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes

message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER

Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)

Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)

Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)

Writes a portion of a byte array to the bytes message stream. Parameter *offset* is the initial offset within the byte array. If the range [*offset*, *offset+length*] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)

Writes a portion of a byte array to the bytes message stream. Parameter *offset* is the initial offset within the byte array. If the range [*offset*, *offset+length*] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)

Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)

Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)

Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)

Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in

read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN VARCHAR2)

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN CLOB)

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

302.9.4 SYS.AQ\$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a `MapMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$_jms_map_message Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

Syntax

```
TYPE aq$_jms_map_message AS object(
  header      aq$_jms_header,

    RETURN BOOLEAN);

```

CONSTRUCT aq\$_jms_map_message Function

STATIC FUNCTION construct RETURN aq\$_jms_map_message

Creates an empty aq\$_jms_map_message object.

JMS Header Methods

set_replyto (replyto IN sys.aq\$_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR

Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)

Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)

Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)

Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)

Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR

Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because

neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods**set_bytes (payload IN RAW)**

Sets the internal payload as a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `RAW` variable without interpreting it.

set_bytes (payload IN BLOB)

Sets the internal payload as a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

get_bytes (payload OUT RAW)

Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions `ORA-24190` if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)

Puts the internal payload into a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER

Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises `ORA-24197` if the Java stored procedure throws an exception during execution, `ORA-24198` if the operation ID is invalid, or `ORA-24199` if the Java stored procedure message store overflows.

flush (id IN PLS_INTEGER)

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises `ORA-24197` if the Java stored procedure throws an exception during execution or `ORA-24198` if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises `ORA-24197` if the Java stored procedure throws an exception during execution, `ORA-24198` if the operation ID is invalid, or `ORA-24199` if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises `ORA-24197` if the Java stored procedure throws an exception during execution or `ORA-24198` if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises `ORA-24197` if the Java stored procedure throws an exception during execution.

set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)

Sets the Boolean value with the specified name in the map. Raises exception `ORA-24197` if the Java stored procedure throws an exception during execution or `ORA-24198` if the operation ID is invalid.

set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)

Sets the `BYTE` value with the specified name in the map. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW)

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT, length IN INT)

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)

Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)

Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)

This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)

Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)

Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)

Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN CLOB)

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN

Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER

Retrieves the `BYTE` value with the specified name. If there is no item by this name, then null is returned. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `set_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)

Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL `RAW` type, a `BLOB` is always returned here. The `BLOB` returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR

Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION

Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT

Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER

Retrieves the `INT` value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER

Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER

Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)

Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_names (id IN PLS_INTEGER) RETURN aq\$_jms_namearray

Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

get_names (id IN PLS_INTEGER, names OUT aq\$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER

Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length`

parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval `[offset, offset+length-1]` and interval `[0, size-1]` where `size` is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ\$_JMS_VALUE)

Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned. Users can use the `type` attribute of this ADT to interpret the data. See the map in the `AQ$_JMS_VALUE` ADT for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. Note this member procedure might bring additional overhead compared to other `get` member procedures or functions. It is used only if the user does not know the datatype of the fields within a message before hand. Otherwise it is a good idea to use a specific `get` member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER

Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN

Indicates that an item exists in this map message by returning `TRUE`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

302.9.5 SYS.AQ\$_JMS_STREAM_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT `aq\$_jms_stream_message` Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

Syntax

```
TYPE aq$_jms_stream_message AS object(
  header      aq$_jms_header,

```

CONSTRUCT aq\$_jms_stream_message Function**STATIC FUNCTION construct RETURN aq\$_jms_stream_message**

Creates an empty aq\$_jms_stream_message object.

JMS Header Methods**set_replyto (replyto IN sys.aq\$_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR

Returns type, which corresponds to JMSType.

System Properties Methods**set_userid (userid IN VARCHAR)**

Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)

Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)

Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)

Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR

Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods**clear_properties**

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the

property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

get_bytes (payload OUT RAW)

Puts the internal payload into a `RAW` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This

member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)

Puts the internal payload into a BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB variable without interpreting it.

set_bytes (payload IN RAW)

Sets the internal payload as the RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)

Sets the internal payload as the BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER

Takes the byte array stored in `aq$_jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`.

Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)

Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

flush (id IN PLS_INTEGER)

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_stream_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER

Returns the current mode of this message. The return value is either `SYS.dbms_aqjms.READ_ONLY` or `SYS.dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN

Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER) RETURN BLOB

Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)

Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR

Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION

Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT

Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER

Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_string RETURN CLOB

Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)

Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between

the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ\$_JMS_VALUE)

Returns a general value ADT AQ\$_JMS_VALUE. Users can use the type attribute of this ADT to interpret the data. See [Table 302-2](#) for the correspondence among `dbms_jms_plsql` package constants, Java datatype and AQ\$_JMS_VALUE attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the datatype of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)

Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN INT)

Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)

Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)

Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)

Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)

Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN VARCHAR2)

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN CLOB)

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

302.9.6 SYS.AQ\$_JMS_OBJECT_MESSAGE Type

This type is the ADT used to store an `ObjectMessage` in an Oracle Database Advanced Queuing queue.

Syntax

```
TYPE aq$_jms_object_message AS object(  
    header    aq$_jms_header,  
    bytes_len int,  
    bytes_raw raw(2000),  
    bytes_lob blob);
```

302.9.7 SYS.AQ\$_JMS_NAMEARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`.

The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMEARRAY AS VARRAY(1024) OF VARCHAR(100);
```

Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,  
    offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

302.9.8 SYS.AQ\$_JMS_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`.

The `type` field in this ADT is used to decide which type of data this object is really holding. The following table lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(  
    type        number(2),  
    num_val     number,  
    char_val    char(1),  
    text_val    clob,  
    bytes_val   blob);
```

Table 302-2 AQ\$_JMS_VALUE Type Fields and Java Fields

Type	Java Type	aq\$_jms_value Data Field
DBMS_JMS_PLSQL.DATA_TYPE_BYTE	byte	num_val
DBMS_JMS_PLSQL.DATA_TYPE_SHORT	short	num_val
DBMS_JMS_PLSQL.DATA_TYPE_INTEGER	int	num_val
DBMS_JMS_PLSQL.DATA_TYPE_LONG	long	num_val
DBMS_JMS_PLSQL.DATA_TYPE_FLOAT	float	num_val
DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE	double	num_val
DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN	boolean	num_val: 0 FALSE, 1 TRUE
DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER	char	char_val
DBMS_JMS_PLSQL.DATA_TYPE_STRING	java.lang.String	text_val
DBMS_JMS_PLSQL.DATA_TYPE_BYTES	byte[]	bytes_val

302.9.9 SYS.AQ\$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side.

The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
  id          number, -- Reserved and not used. Right now always return 0.
  exp_name    varchar(200),
  err_msg     varchar(500),
  stack       varchar(4000));
```

JSON Data Structures

To work with JSON data in PL/SQL, you can use these data structures.

- [JSON_ELEMENT_T Object Type](#)
- [JSON_OBJECT_T Object Type](#)
- [JSON_ARRAY_T Object Type](#)
- [JSON_SCALAR_T Object Type](#)
- [JSON_KEY_LIST Type](#)

 **Note:**

The time component in the `DATE` value of the `get_Date` function is truncated. If you want to preserve the time component, use `get_Timestamp` and then use `CAST AS DATE` to convert to a SQL date with the time component.

303.1 JSON_ELEMENT_T Object Type

`JSON_ELEMENT_T` is the supertype for the `JSON_OBJECT_T`, `JSON_SCALAR_T`, and `JSON_ARRAY_T` object types.

Description

Note the following:

- To create an instance of `JSON_ELEMENT_T`, use the `parse` or `load` function. See the “Constructors” section below for details.
- You cannot create an empty `JSON_ELEMENT_T` instance. To create an empty JSON container, create it based on one of the subtypes.
- To cast a `JSON_ELEMENT_T` into a subtype (for example, `JSON_OBJECT_T`), you need to perform an explicit cast using `TREAT AS`. For example:

```
TREAT (elem AS JSON_OBJECT_T)
```

Constructors

You create a `JSON_ELEMENT_T` instance using the `parse` or `load` function. The `parse` function takes as input `VARCHAR2`, `CLOB`, or `BLOB` data, and returns a `JSON_ELEMENT_T` instance. Similarly, the `load` function takes JSON type as an input.

```

STATIC FUNCTION parse(jsn VARCHAR2) RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(jsn CLOB)      RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(jsn BLOB)      RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(jsn BLOB, FORMAT IN VARCHAR2) RETURN JSON_ELEMENT_T
STATIC FUNCTION load(jsn JSON)       RETURN JSON_Element_T,

```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. Valid JSON has to pass the lax check of the “IS JSON” SQL condition. The input for the `load` function is a JSON type, therefore, no JSON syntax check is needed.

Serialization and Conversions

A `JSON_ELEMENT_T` instance (and all subtypes) can be serialized to a JSON string, converted to a JSON type or (if it is a scalar value) converted to a SQL value like `Date` or `Number`. Serialization is the inverse of the `parse` function: a string representation of the in-memory representation of the JSON data is being generated and returned as an appropriate SQL type.

The serialization and conversion functions are:

```

MEMBER FUNCTION to_String      RETURN VARCHAR2
MEMBER FUNCTION stringify     RETURN VARCHAR2

MEMBER FUNCTION to_Clob       RETURN CLOB
MEMBER FUNCTION to_Blob       RETURN BLOB
MEMBER PROCEDURE to_Clob(c IN OUT CLOB)
MEMBER PROCEDURE to_Blob(c IN OUT BLOB)

MEMBER FUNCTION to_Json       RETURN JSON

MEMBER FUNCTION to_Number     RETURN NUMBER
MEMBER FUNCTION to_Date       RETURN DATE
MEMBER FUNCTION to_Timestamp  RETURN TIMESTAMP
MEMBER FUNCTION to_Boolean    RETURN BOOLEAN

```

The FUNCTION `stringify` is synonym of `to_String`. It has the same functionality.

The `to_Clob` and `to_Blob` *procedures* accept a CLOB or BLOB input and enable you to provide a LOB to be used as the serialization destination. For instance, `EMPTY_LOB` can be provided. The input LOB cannot be `NULL`.

If the `to_Clob` *function* is used, then a new CLOB is created. If you do not want to create a CLOB first, then you can use the `to_Clob` or `to_Blob` *functions*, which take no parameter and generate a temp LOB.

`to_Blob` serializes to UTF8 format only.

Introspection

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```

MEMBER FUNCTION has(key VARCHAR2) RETURN BOOLEAN,

```

```

MEMBER FUNCTION is_Object          RETURN BOOLEAN
MEMBER FUNCTION is_Array          RETURN BOOLEAN
MEMBER FUNCTION is_Scalar         RETURN BOOLEAN
MEMBER FUNCTION is_String         RETURN BOOLEAN
MEMBER FUNCTION is_Number        RETURN BOOLEAN
MEMBER FUNCTION is_Boolean       RETURN BOOLEAN
MEMBER FUNCTION is_True          RETURN BOOLEAN
MEMBER FUNCTION is_False         RETURN BOOLEAN
MEMBER FUNCTION is_Null          RETURN BOOLEAN
MEMBER FUNCTION is_Date          RETURN BOOLEAN
MEMBER FUNCTION is_Timestamp     RETURN BOOLEAN
MEMBER FUNCTION get_Size         RETURN NUMBER

```

The `has` function checks if a given name exists in the `JSON_OBJECT_T` object.

The return value of the `get_size` function depends on the JSON type:

- For a scalar, it returns 1.
- For an object, it returns the number of keys.
- For an array, it returns the number of items.

Note that textual JSON does not support dates and timestamps natively. Instead they are typically modeled as strings. You can use the JSON type to preserve dates and timestamps natively. The Document Object Model (DOM) interface enables you to add dates and timestamps as scalar values and preserve them until serialization to JSON, where they are printed as string following the ISO 8601 format. If a SQL value of type date or timestamp has been added, then the `is_Date` and `is_Timestamp` functions return true. If a date has been added as a string (e.g. as ISO 8601), then the `is_Date` and `is_Timestamp` functions return false. You can use Oracle conversion function `to_Date` and `to_Timestamp` to convert a string representation of a date, and timestamp to the Oracle representation.

Error Handling

You can set the level of error handling for JSON processing. You might not want an error to be raised for every mismatch. The `on_Error` procedure enables you to specify when errors should be raised:

```
MEMBER PROCEDURE on_Error(value NUMBER)
```

The `on_Error` procedure defines what happens if an error is encountered during a PL/SQL operation, for instance, a `get` call.

The default is to not raise an error but to return NULL instead.

You invoke `On_error` on a `JSON_ELEMENT_T` instance and it sets the error behavior for all subsequent calls. To reset the behavior to the default, you can call `on_Error(0)`.

Values for the `value` parameter are:

Table 303-1 Values for the value Parameter in the ON_ERROR Procedure

Value	Description
0	Reset to the default behavior, which is to return NULL instead of raising an error.
1	Raise all errors.
2	Raise an error if no value is detected.

Table 303-1 (Cont.) Values for the value Parameter in the ON_ERROR Procedure

Value	Description
3	Raise an error if the data types do not match, for example, if you call GET_NUMBER on a string value.
4	Raise an error if the input is invalid, for example, if the array is out of bounds.

You can combine values. For example, you can specify 7 to indicate a combination of 3 and 4.

In the following example, an error is raised because the value of "a" is "xyz", which cannot be converted to a number. If the `on_error` procedure had not been called, then NULL would be returned, and no error would be raised.

```
declare
    jo JSON_OBJECT_T;
begin
    jo := JSON_OBJECT_T.parse('{a:"xyz"}');
    jo.on_error(1);
    dbms_output.put_line(jo.get_number('a'));
end;
/
```

303.2 JSON_OBJECT_T Object Type

JSON_OBJECT_T is a subtype of the JSON_ELEMENT_T object type. It corresponds to the JSON object structure.

Constructors

You can create an empty JSON_OBJECT_T instance using the following constructor.

```
CONSTRUCTOR FUNCTION JSON_OBJECT_T RETURN SELF AS RESULT
```

You can create a JSON_OBJECT_T instance using one of the following `parse` functions:

```
STATIC FUNCTION parse(jsn VARCHAR2) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(jsn CLOB) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(jsn BLOB) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(jsn BLOB, FORMAT IN VARCHAR2) RETURN JSON_OBJECT_T
```

You can also create a JSON_OBJECT_T instance using one of the following constructors:

```
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn CLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn BLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Object_T(jsn BLOB, FORMAT IN VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn JSON) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT
```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not a valid JSON object, then an error message is raised. The input has to specify a JSON object, not an array.

Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON object:

```
MEMBER FUNCTION get(key VARCHAR2) RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(key VARCHAR2) RETURN VARCHAR2
MEMBER FUNCTION get_Number(key VARCHAR2) RETURN NUMBER
MEMBER FUNCTION get_Date(key VARCHAR2) RETURN DATE
MEMBER FUNCTION get_Timestamp(key VARCHAR2) RETURN TIMESTAMP
MEMBER FUNCTION get_TimestampTZ(key VARCHAR2) RETURN TIMESTAMP WITH TIME ZONE
MEMBER FUNCTION get_Boolean(key VARCHAR2) RETURN BOOLEAN
MEMBER FUNCTION get_Clob(key VARCHAR2) RETURN CLOB
MEMBER FUNCTION get_Blob(key VARCHAR2) RETURN BLOB
MEMBER FUNCTION get_Object(key VARCHAR2) RETURN JSON_OBJECT_T
MEMBER FUNCTION get_Array(key VARCHAR2) RETURN JSON_ARRAY_T
MEMBER FUNCTION get_Json(key NUMBER) RETURN JSON

MEMBER PROCEDURE get_Json(key NUMBER, j OUT NOCOPY JSON)
MEMBER PROCEDURE get_Clob(key NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(key NUMBER, c IN OUT BLOB)
```

Note:

- The `get` function has reference semantics. This means that if the returned `JSON_ELEMENT_T` is modified, then the containing `JSON_ELEMENT_T` is also changed. See the [Reference Semantics](#) section below for details.
- The `GET_STRING` function converts the value to a string if it is not already a string. Thus, the `GET_STRING` function returns a non-null value even if `IS_STRING` returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new CLOB will be created implicitly. The input LOB cannot be NULL. If you do not want to create a BLOB or CLOB first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp LOB.

`GET_BLOB` serializes to UTF8 format only.

Set Procedures

The following procedures enable you to set the value of a JSON object. Existing values, if present, will be overwritten.

```
MEMBER PROCEDURE put(key VARCHAR2, val JSON_ELEMENT_T)
MEMBER PROCEDURE put(key VARCHAR2, val VARCHAR2)
MEMBER PROCEDURE put(key VARCHAR2, val NUMBER)
MEMBER PROCEDURE put(key VARCHAR2, val BOOLEAN)
MEMBER PROCEDURE put(key VARCHAR2, val DATE)
MEMBER PROCEDURE put(key VARCHAR2, val TIMESTAMP)
MEMBER PROCEDURE put_Null(key VARCHAR2)
MEMBER PROCEDURE put(key VARCHAR2, val JSON)
```

Introspection Functions

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

MEMBER FUNCTION has(key VARCHAR2)	RETURN BOOLEAN
MEMBER FUNCTION get_Type(key VARCHAR2)	RETURN VARCHAR2
MEMBER FUNCTION get_Keys	RETURN JSON_KEY_LIST

The get_Keys function returns an object type of JSON_KEY_LIST, which is a varray of VARCHAR2(4000). The varray contains the names of keys in the JSON object. The get_Keys function returns at most 32767 field names for a given JSON object. An error is raised if it is applied to an object with more than 32767 fields.

The example below walks through the items of the varray to build a JSON_ARRAY_T object that contains all key names.

```

declare
  jo JSON_OBJECT_T;
  ja JSON_ARRAY_T;
  keys JSON_KEY_LIST;
  keys_string VARCHAR2(100);

begin
  ja := new JSON_ARRAY_T;
  jo := JSON_OBJECT_T.parse('{"name":"fred",
                            "jobTitle":"codemonkey",
                            "projects":["json", "xml"]}');

  keys := jo.get_keys;
  for i in 1..keys.count loop
    ja.append(keys(i));
  end loop;

  keys_string := ja.to_string;
  dbms_output.put_line(keys_string);
end;
/

```

The output is:

```
["name","jobTitle","projects"]
```

Modification Procedures

The following procedures enable you to remove or rename keys in a JSON object.

MEMBER PROCEDURE remove(key VARCHAR2)
MEMBER PROCEDURE rename_Key(keyOld VARCHAR2, keyNew VARCHAR2)

Duplicate key names are not supported and will raise an error.

Clone Function

This function makes a copy of the JSON object. Reference semantics is changed to value semantics.

MEMBER FUNCTION clone RETURN JSON_OBJECT_T
--

Reference Semantics

Calling the `get` function that returns a `JSON_ELEMENT_T` object always returns a reference to the complex values instead of a copy. This means that changing the returned value affects its container. See the example below.

```
declare
  data      JSON_OBJECT_T;
  address   JSON_OBJECT_T;
  zip       number;

begin

  data := new JSON_OBJECT_T('{
    "first": "John",
    "last": "Doe",
    "address": {
      "country": "USA",
      "zip": "94065"
    }
  }');

  address := data.get_object('address');
  dbms_output.put_line(address.to_string);

  -- 1) VALUE SEMANTICS for scalar values
  -- (changing the value has no effect on container)
  zip := address.get_number('zip');
  dbms_output.put_line(zip);
  zip := 12345;
  dbms_output.put_line(zip);
  -- address is still the same
  dbms_output.put_line(address.to_string);

  -- 2) REFERENCE SEMANTICS for complex values
  -- 'address' is a reference to the complex address values inside 'data'
  address.put('zip', 12345);
  address.put('street', 'Detour Road');
  dbms_output.put_line(data.to_string);
end;
/
```

In cases where you do not want the reference semantics, you can use the `clone` function to create a copy of the returned object. This decouples the value from its container. In the example above, you can create a copy of the “address” object by replacing this line:

```
address := data.get_object('address');
```

with this line:

```
address := data.get_object('address').clone;
```

After this, changing the address will have no effect on the value of the ‘data’ containing object.

Update Example

The following example updates the price of an item by 10%.

```

WITH
  FUNCTION updatePrice(jsonTxt in VARCHAR2 ) RETURN VARCHAR2 IS
    jo JSON_OBJECT_T;
    oldPrice NUMBER;

  BEGIN
    jo := new JSON_OBJECT_T(jsonTxt);
    oldPrice := jo.get_number('price');
    jo.put('price', oldPrice * 1.1);
    RETURN jo.to_string();
  END;
SELECT updatePrice(col)
FROM   t1;

```

303.3 JSON_ARRAY_T Object Type

JSON_ARRAY_T is a subtype of the JSON_ELEMENT_T object type. JSON_ARRAY_T corresponds to the JSON array structure.

Constructors

You can create an empty JSON_ARRAY_T instance using the following constructor.

```
CONSTRUCTOR FUNCTION JSON_ARRAY_T RETURN SELF AS RESULT
```

You can create a JSON_ARRAY_T instance using one the following parse functions:

```

STATIC FUNCTION parse(jsn VARCHAR2)          RETURN JSON_ARRAY_T
STATIC FUNCTION parse(jsn CLOB)             RETURN JSON_ARRAY_T
STATIC FUNCTION parse(jsn BLOB)            RETURN JSON_ARRAY_T
STATIC FUNCTION parse(jsn BLOB, FORMAT IN VARCHAR2) RETURN JSON_ARRAY_T

```

You can also create a JSON_ARRAY_T instance using one the following constructors:

```

CONSTRUCTOR FUNCTION JSON_Array_T(jsn VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn CLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn BLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT

```

Only UTF8-encoded JSON is passed as a BLOB.

The parse function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. The input has to specify a JSON array, not an object.

Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON array:

```

MEMBER FUNCTION get(pos NUMBER)          RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(pos NUMBER)   RETURN VARCHAR2
MEMBER FUNCTION get_Number(pos NUMBER)   RETURN NUMBER
MEMBER FUNCTION get_Date(pos NUMBER)     RETURN DATE
MEMBER FUNCTION get_Timestamp(pos NUMBER) RETURN TIMESTAMP
MEMBER FUNCTION get_Boolean(pos NUMBER)  RETURN BOOLEAN
MEMBER FUNCTION get_Clob(pos NUMBER)     RETURN CLOB
MEMBER FUNCTION get_Blob(pos NUMBER)     RETURN BLOB

```

```
MEMBER FUNCTION get_Json(pos NUMBER)          RETURN JSON

MEMBER PROCEDURE get_Json(pos NUMBER, j IN OUT NOCOPY JSON)
MEMBER PROCEDURE get_Clob(pos NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(pos NUMBER, c IN OUT BLOB)
```

Note:

- The `get` function has reference semantics. This means that if the returned `JSON_ELEMENT_T` is modified, then the containing `JSON_ELEMENT_T` is changed too.
- The `GET_STRING` function converts the value to a string if it is not already a string. The function returns a non-null value even if `IS_STRING` returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a `CLOB` or `BLOB` as input, enable you to provide a `LOB` to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new `CLOB` will be created implicitly. The input `LOB` cannot be `NULL`. If you do not want to create a `BLOB` or `CLOB` first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp `LOB`.

`GET_BLOB` serializes to UTF8 format only.

Set Procedures

The following procedures enable you to set the value at the specified position in the JSON array. These procedures insert (not overwrite) at the specified position unless overwrite is requested.

```
MEMBER PROCEDURE put(pos NUMBER, val VARCHAR2, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val NUMBER, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val BOOLEAN, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val DATE, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val JSON_ELEMENT_T, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val JSON, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val TIMESTAMP, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put_Null(pos NUMBER, overwrite BOOLEAN DEFAULT FALSE)
```

The following procedures append the specified value to the end of the JSON array:

```
MEMBER PROCEDURE append(val JSON_ELEMENT_T)
MEMBER PROCEDURE append(val VARCHAR2)
MEMBER PROCEDURE append(val NUMBER)
MEMBER PROCEDURE append(val BOOLEAN)
MEMBER PROCEDURE append(val DATE)
MEMBER PROCEDURE append(val JSON)
MEMBER PROCEDURE append(val TIMESTAMP)
MEMBER PROCEDURE append_Null
```

Introspection Function

Introspection enables you to discover properties of the JSON array without modifying them.

```
MEMBER FUNCTION get_Type(pos NUMBER) RETURN VARCHAR2
```

Modification Procedure

The following procedure enables you to remove the value at the specified position in the JSON array.

```
MEMBER PROCEDURE remove(pos NUMBER)
```

Clone Function

This function makes a copy of the JSON array. Reference semantics is changed to value semantics.

```
MEMBER FUNCTION clone RETURN JSON_ARRAY_T
```

303.4 JSON_SCALAR_T Object Type

JSON_SCALAR_T is a subtype of the JSON_ELEMENT_T object type.

Description

A JSON_SCALAR_T instance captures one scalar values, for example, the string “fred” or the number 1. This type does not have any functions or procedures other than the ones inherited from JSON_ELEMENT_T. You cannot create an instance of this type directly.

303.5 JSON_KEY_LIST Type

JSON_KEY_LIST is a varray of VARCHAR2(4000).

Description

This type is used by the `get_Keys` function in the [JSON_OBJECT_T Object Type](#).

Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

- [Overview](#)
- [Security Model](#)
- [Summary of Logical Change Record Types](#)
- [Common Subprograms for LCR\\$_DDL_RECORD and LCR\\$_ROW_RECORD](#)

304.1 Logical Change Record TYPEs Overview

In Replication (Oracle GoldenGate and XStream), logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Replication (Oracle GoldenGate and XStream), the capture process captures changes in the form of LCRs and enqueues them into a queue. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueueing, and dequeuing LCRs manually.

304.2 Logical Change Record Types Security Model

`PUBLIC` is granted `EXECUTE` privilege on the types described in this chapter.

304.3 Summary of Logical Change Record Types

This table lists the Logical Change Record TYPEs and briefly describes them.

Table 304-1 Logical Change Record (LCR) Types

Type	Description
LCR\$_DDL_RECORD Type	Represents a data definition language (DDL) change to a database object
LCR\$_ROW_RECORD Type	Represents a data manipulation language (DML) change to a database object
LCR\$_ROW_LIST Type	Identifies a list of column values for a row in a table
LCR\$_ROW_UNIT Type	Identifies the value for a column in a row

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- `DBMS_APPLY_ADM`

- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM

304.3.1 LCR\$_DDL_RECORD Type

This type represents a data definition language (DDL) change to a database object.

 **Note:**

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This topic contains information about the constructor for row LCRs and information about the member subprograms for this type.

 **Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

LCR\$_DDL_RECORD Constructor

Creates a SYS.LCR\$_DDL_RECORD object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
    source_database_name IN VARCHAR2,
    command_type         IN VARCHAR2,
    object_owner         IN VARCHAR2,
    object_name          IN VARCHAR2,
    object_type          IN VARCHAR2,
    ddl_text              IN CLOB,
    logon_user           IN VARCHAR2,
    current_schema       IN VARCHAR2,
    base_table_owner     IN VARCHAR2,
    base_table_name      IN VARCHAR2,
    tag                  IN RAW          DEFAULT NULL,
    transaction_id       IN VARCHAR2   DEFAULT NULL,
    scn                  IN NUMBER     DEFAULT NULL,
    position             IN RAW          DEFAULT NULL,
    edition_name         IN VARCHAR2   DEFAULT NULL,
    root_name            IN VARCHAR2   DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;

```

LCR\$_DDL_RECORD Constructor Function Parameters

Table 304-2 Constructor Function Parameters for LCR\$_DDL_RECORD

Parameter	Description
source_database_name	<p>The database where the DDL statement occurred</p> <p>If the LCRs originated in a multitenant container database (CDB), then this field specifies the global name of the container where the DDL change occurred.</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.</p>

Table 304-2 (Cont.) Constructor Function Parameters for LCR\$_DDL_RECORD

Parameter	Description
command_type	<p>The type of command executed in the DDL statement Set this parameter to a non-NULL value.</p> <p>See Also: The "SQL Command Codes" table in the <i>Oracle Call Interface Programmer's Guide</i> for a complete list of command types The following command types <i>are not supported</i> in DDL LCRs:</p> <p>ALTER MATERIALIZED VIEW ALTER MATERIALIZED VIEW LOG ALTER SUMMARY CREATE SCHEMA CREATE MATERIALIZED VIEW CREATE MATERIALIZED VIEW LOG CREATE SUMMARY DROP MATERIALIZED VIEW DROP MATERIALIZED VIEW LOG DROP SUMMARY RENAME</p> <p>The snapshot equivalents of the materialized view command types are also not supported.</p>
object_owner	The user who owns the object on which the DDL statement was executed
object_name	The database object on which the DDL statement was executed
object_type	<p>The type of object on which the DDL statement was executed The following are valid object types:</p> <p>CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW</p> <p>LINK represents a database link. NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p>
ddl_text	<p>The text of the DDL statement Set this parameter to a non-NULL value.</p>
logon_user	The user whose session executed the DDL statement

Table 304-2 (Cont.) Constructor Function Parameters for LCR\$_DDL_RECORD

Parameter	Description
current_schema	The schema that is used if no schema is specified explicitly for the modified database objects in <code>ddl_text</code> If a schema is specified in <code>ddl_text</code> that differs from the one specified for <code>current_schema</code> , then the function uses the schema specified in <code>ddl_text</code> . Set this parameter to a non-NULL value.
base_table_owner	If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code>), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_owner</code> specifies the owner of the table involved. Otherwise, <code>base_table_owner</code> is NULL.
base_table_name	If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code>), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_name</code> specifies the name of the table involved. Otherwise, <code>base_table_name</code> is NULL.
tag	A binary tag that enables tracking of the LCR For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used.
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record for a captured LCR was written to the redo log The SCN value is meaningless for a user-created LCR.
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. See Also: <i>Oracle Database XStream Guide</i>
edition_name	The name of the edition in which the DDL statement was executed
root_name	If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.

Summary of LCR\$_DDL_RECORD Subprograms

Table 304-3 LCR\$_DDL_RECORD Type Subprograms

Subprogram	Description
EXECUTE Member Procedure	Executes the LCR under the security domain of the current user
GET_BASE_TABLE_NAME Member Function	Gets the base (dependent) table name
GET_BASE_TABLE_OWNER Member Function	Gets the base (dependent) table owner
GET_CURRENT_SCHEMA Member Function	Gets the default schema (user) name

Table 304-3 (Cont.) LCR\$_DDL_RECORD Type Subprograms

Subprogram	Description
GET_DDL_TEXT Member Procedure	Gets the DDL text in a CLOB
GET_EDITION_NAME Member Function	Gets the name of the edition in which the DDL statement was executed
GET_LOGON_USER Member Function	Gets the logon user name
GET_OBJECT_TYPE Member Function	Gets the type of the object involved for the DDL
SET_BASE_TABLE_NAME Member Procedure	Sets the base (dependent) table name
SET_BASE_TABLE_OWNER Member Procedure	Sets the base (dependent) table owner
SET_CURRENT_SCHEMA Member Procedure	Sets the default schema (user) name
SET_DDL_TEXT Member Procedure	Sets the DDL text
SET_EDITION_NAME Member Procedure	Sets the name of the edition in which the DDL statement was executed
SET_LOGON_USER Member Procedure	Sets the logon user name
SET_OBJECT_TYPE Member Procedure	Sets the object type
Common Subprograms	See " Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD " for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types

EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

Syntax

```
MEMBER PROCEDURE EXECUTE;
```

GET_BASE_TABLE_NAME Member Function

Gets the base (dependent) table name.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME ()  
RETURN VARCHAR2;
```

GET_BASE_TABLE_OWNER Member Function

Gets the base (dependent) table owner.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER ()  
RETURN VARCHAR2;
```

GET_CURRENT_SCHEMA Member Function

Gets the current schema name.

Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;
```

GET_DDL_TEXT Member Procedure

Gets the DDL text in a CLOB.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
    ddl_text    CLOB;
BEGIN
    DBMS_OUTPUT.PUT_LINE( ' -----' );
    DBMS_OUTPUT.PUT_LINE( ' Displaying DDL text in a DDL LCR: ' );
    DBMS_OUTPUT.PUT_LINE( ' -----' );
    DBMS_LOB.CREATETEMPORARY(ddl_text, true);
    ddl_lcr.GET_DDL_TEXT(ddl_text);
    DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
    DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/
```

Note:

GET_DDL_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

Syntax

```
MEMBER FUNCTION GET_DDL_TEXT(
    ddl_text IN/OUT CLOB);
```

Parameter

Table 304-4 GET_DDL_TEXT Procedure Parameter

Parameter	Description
ddl_text	The DDL text in the DDL LCR

GET_EDITION_NAME Member Function

Gets the name of the edition in which the DDL statement was executed.

See Also:

Oracle Database Development Guide

Syntax

```
MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;
```

GET_LOGON_USER Member Function

Gets the logon user name.

Syntax

```
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;
```

GET_OBJECT_TYPE Member Function

Gets the type of the object involved for the DDL.

Syntax

```
MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;
```

SET_BASE_TABLE_NAME Member Procedure

Sets the base (dependent) table name.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(
    base_table_name IN VARCHAR2);
```

Parameter

Table 304-5 SET_BASE_TABLE_NAME Procedure Parameter

Parameter	Description
base_table_name	The name of the base table

SET_BASE_TABLE_OWNER Member Procedure

Sets the base (dependent) table owner.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
    base_table_owner IN VARCHAR2);
```

Parameter

Table 304-6 SET_BASE_TABLE_OWNER Procedure Parameter

Parameter	Description
<code>base_table_owner</code>	The name of the base table owner

SET_CURRENT_SCHEMA Member Procedure

Sets the default schema (user) name.

Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(  
    current_schema IN VARCHAR2);
```

Parameter

Table 304-7 SET_CURRENT_SCHEMA Procedure Parameter

Parameter	Description
<code>current_schema</code>	The name of the schema to set as the current schema Set this parameter to a non-NULL value.

SET_DDL_TEXT Member Procedure

Sets the DDL text.

Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(  
    ddl_text IN CLOB);
```

Parameter

Table 304-8 SET_DDL_TEXT Procedure Parameter

Parameter	Description
<code>ddl_text</code>	The DDL text Set this parameter to a non-NULL value.

SET_EDITION_NAME Member Procedure

Sets the name of the edition in which the DDL statement was executed.

See Also:

Oracle Database Development Guide

Syntax

```
MEMBER PROCEDURE SET_EDITION_NAME(  
    edition_name IN VARCHAR2);
```

Parameter

Table 304-9 SET_EDITION_NAME Procedure Parameter

Parameter	Description
edition_name	Name of the edition

SET_LOGON_USER Member Procedure

Sets the logon user name.

Syntax

```
MEMBER PROCEDURE SET_LOGON_USER(  
    logon_user IN VARCHAR2);
```

Parameter

Table 304-10 SET_LOGON_USER Procedure Parameter

Parameter	Description
logon_user	The name of the schema to set as the logon user

SET_OBJECT_TYPE Member Procedure

Sets the object type.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_TYPE(  
    object_type IN VARCHAR2);
```

Parameter**Table 304-11 SET_OBJECT_TYPE Procedure Parameter**

Parameter	Description
object_type	<p>The object type</p> <p>The following are valid object types:</p> <p>CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW</p> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p>

304.3.2 LCR\$_ROW_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the LCR\$_ROW_LIST type.

Note:

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

If you create or modify a row logical change record (row LCR), then make sure the `command_type` attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This topic contains information about the constructor for DDL LCRs and information about the member subprograms for this type.

 **Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

 **See Also:**[LCR\\$_ROW_LIST Type](#)**LCR\$_ROW_RECORD Constructor**

Creates a SYS.LCR\$_ROW_RECORD object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
  source_database_name IN VARCHAR2,
  command_type         IN VARCHAR2,
  object_owner         IN VARCHAR2,
  object_name          IN VARCHAR2,
  tag                  IN RAW           DEFAULT NULL,
  transaction_id       IN VARCHAR2     DEFAULT NULL,
  scn                  IN NUMBER       DEFAULT NULL,
  old_values           IN SYS.LCR$_ROW_LIST DEFAULT NULL,
  new_values           IN SYS.LCR$_ROW_LIST DEFAULT NULL,
  position             IN RAW           DEFAULT NULL,

  statement            IN VARCHAR2     DEFAULT NULL,

  bind_variables       IN SYS.LCR$_ROW_LIST DEFAULT NULL,

  bind_by_position    IN VARCHAR2     DEFAULT 'N',

  root_name            IN VARCHAR2     DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;

```

LCR\$_ROW_RECORD Constructor Function Parameters

Table 304-12 Constructor Function Parameters for LCR\$_ROW_RECORD

Parameter	Description
source_database_name	<p>The database where the row change occurred</p> <p>If the LCRs originated in a CDB, then this field specifies the global name of the container where the row change occurred.</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify <code>DBS1</code> and the local domain is <code>EXAMPLE.COM</code>, then the function specifies <code>DBS1.EXAMPLE.COM</code> automatically. Set this parameter to a non-NULL value.</p>
command_type	<p>The type of command executed in the DML statement</p> <p>Set this parameter to a non-NULL value.</p> <p>Valid values are the following:</p> <pre> INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM </pre> <p>If <code>INSERT</code>, then ensure that the LCR has a <code>new_values</code> collection that is not empty and an empty or <code>NULL</code> <code>old_values</code> collection.</p> <p>If <code>UPDATE</code>, then ensure that the LCR has a <code>new_values</code> collection that is not empty and an <code>old_values</code> collection that is not empty.</p> <p>If <code>DELETE</code>, then ensure that the LCR has a <code>NULL</code> or empty <code>new_values</code> collection and an <code>old_values</code> collection that is not empty.</p> <p>If <code>LOB ERASE</code>, <code>LOB WRITE</code>, or <code>LOB TRIM</code>, then ensure that the LCR has a <code>new_values</code> collection that is not empty and an empty or <code>NULL</code> <code>old_values</code> collection.</p>
object_owner	<p>The user who owns the table on which the row change occurred</p> <p>Set this parameter to a non-NULL value.</p>
object_name	<p>The table on which the DML statement was executed</p> <p>Set this parameter to a non-NULL value.</p>
tag	<p>A binary tag that enables tracking of the LCR</p> <p>For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used.</p>
transaction_id	<p>The identifier of the transaction</p>
scn	<p>The SCN at the time when the change record was written to the redo log</p> <p>The SCN value is meaningless for a user-created LCR.</p>
old_values	<p>The column values for the row before the DML change</p> <p>If the DML statement is an <code>UPDATE</code> or a <code>DELETE</code> statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an <code>INSERT</code> statement, then there are no old values.</p>

Table 304-12 (Cont.) Constructor Function Parameters for LCR\$_ROW_RECORD

Parameter	Description
new_values	The column values for the row after the DML change If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. See Also: <i>Oracle Database XStream Guide</i>
statement	This parameter is reserved for internal use only.
bind_variables	This parameter is reserved for internal use only.
bind_by_position	This parameter is reserved for internal use only.
root_name	If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.

Summary of LCR\$_ROW_RECORD Subprograms

Table 304-13 LCR\$_ROW_RECORD Type Subprograms

Subprogram	Description
ADD_COLUMN Member Procedure	Adds the value as old or new, depending on the value type specified, for the column
CONVERT_LONG_TO_LOB_CHUNK Member Procedure	Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB
DELETE_COLUMN Member Procedure	Deletes the old value, the new value, or both, for the specified column, depending on the value type specified
EXECUTE Member Procedure	Executes the LCR under the security domain of the current user
GET_JSON_INFORMATION Member Function	Gets JSON information.
GET_LOB_INFORMATION Member Function	Gets the LOB information for the column
GET_LOB_OFFSET Member Function	Gets the LOB offset for the specified column
GET_LOB_OPERATION_SIZE Member Function	Gets the operation size for the LOB column
GET_LONG_INFORMATION Member Function	Gets the LONG information for the column
GET_ROW_TEXT Member Procedure	Gets the SQL statement for the change that is encapsulated in the LCR

Table 304-13 (Cont.) LCR\$_ROW_RECORD Type Subprograms

Subprogram	Description
GET_VALUE Member Function	Gets the old or new value for the specified column, depending on the value type specified
GET_VALUES Member Function	Gets a list of old or new values, depending on the value type specified
GET_WHERE_CLAUSE Member Procedure	Gets a <code>WHERE</code> clause for the change that is encapsulated in the row LCR
GET_XML_INFORMATION Member Function	Gets the XML information for the specified column
IS_STATEMENT_LCR Member Function	Reserved for internal use only
KEEP_COLUMNS Member Procedure	Keeps a list of columns a row LCR
RENAME_COLUMN Member Procedure	Renames a column in an LCR
SET_JSON_INFORMATION Member Procedure	Sets the JSON information for a column.
SET_LOB_INFORMATION Member Procedure	Sets LOB information for the column
SET_LOB_OFFSET Member Procedure	Sets the LOB offset for the specified column
SET_LOB_OPERATION_SIZE Member Procedure	Sets the operation size for the LOB column
SET_ROW_TEXT Member Procedure	Reserved for internal use only
SET_VALUE Member Procedure	Overwrites the value of the specified column
SET_VALUES Member Procedure	Replaces the existing old or new values for the LCR, depending on the value type specified
SET_XML_INFORMATION Member Procedure	Sets the XML information for the column
Common Subprograms	See Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD for a list of subprograms common to the <code>SYS.LCR\$_ROW_RECORD</code> and <code>SYS.LCR\$_DDL_RECORD</code> types

ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

**Note:**

To set a column value that already exists, run `SET_VALUE`.

**See Also:**

[SET_VALUE Member Procedure](#)

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.

Syntax

```
MEMBER PROCEDURE ADD_COLUMN(
    value_type    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    column_value  IN  ANYDATA);
```

Parameters

Table 304-14 `ADD_COLUMN` Procedure Parameters

Parameter	Description
<code>value_type</code>	The type of value to add for the column Specify <code>old</code> to add the old value of the column. Specify <code>new</code> to add the new value of the column.
<code>column_name</code>	The column name This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.

Table 304-14 (Cont.) ADD_COLUMN Procedure Parameters

Parameter	Description
<code>column_value</code>	<p>The value of the column</p> <p>If <code>NULL</code>, then this procedure raises an error.</p> <p>If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified.</p> <p>A <code>NULL</code> column value can be specified by encapsulating the <code>NULL</code> value in an <code>ANYDATA</code> wrapper.</p>

CONVERT_LONG_TO_LOB_CHUNK Member Procedure

Converts `LONG` data in a row LCR into a `CLOB`, or converts `LONG RAW` data in a row LCR into a `BLOB`.

This procedure can change the operation code from `LONG WRITE` to `LOB WRITE` for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- `LONG` data can be sent as a part of a row LCR with one of the following operation codes: `INSERT`, `UPDATE`, or `LONG_WRITE`. Because `LONG` data can be sent in multiple pieces, make sure that this method is invoked on either none or all `LONG` pieces.
- `LOB` to `LONG` conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;
```

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
    column_name IN VARCHAR2,
    value_type  IN VARCHAR2 DEFAULT '*');
```

Parameters

Table 304-15 DELETE_COLUMN Procedure Parameters

Parameter	Description
<code>column_name</code>	The column name An error is raised if the column does not exist in the LCR.
<code>value_type</code>	The type of value to delete for the column Specify <code>old</code> to delete the old value of the column. Specify <code>new</code> to delete the new value of the column. If <code>*</code> is specified, then the procedure deletes both the old and new values.

EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR has been constructed using the `LCR$_ROW_RECORD` constructor function but has not been enqueued.
- The LCR is in the error queue.

Note:

Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lobs` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with `VARCHAR2` and `RAW` data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lobs` set to `FALSE` attempts to execute a row LCR that contains a LOB locator.

- A DML or error handler configured with `assemble_lob` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Syntax

```
MEMBER PROCEDURE EXECUTE(
    conflict_resolution IN BOOLEAN);
```

Parameters

Table 304-16 EXECUTE Procedure Parameters

Parameter	Description
<code>conflict_resolution</code>	<p>If <code>TRUE</code>, then any conflict resolution defined for the table using the <code>SET_UPDATE_CONFLICT_HANDLER</code> procedure in the <code>DBMS_APPLY_ADM</code> package is used to resolve conflicts resulting from the execution of the LCR.</p> <p>If <code>FALSE</code>, then conflict resolution is not used.</p> <p>An error is raised if this parameter is not specified or is set to <code>NULL</code>.</p>

GET_JSON_INFORMATION Member Function

Gets JSON information.

The return value can be one of the following:

```
DBMS_LCR.NOT_OSON CONSTANT NUMBER := 1;
DBMS_LCR.OSON_DOC CONSTANT NUMBER := 2;
```

Note:

OSON is Oracle binary format for JSON column.

They represent either a column not containing `OSON` data or full `OSON` document.

Syntax

```
MEMBER FUNCTION GET_JSON_INFORMATION(
    column_name IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 304-17 GET_JSON_INFORMATION Member Function Parameter

Parameter	Description
<code>column_name</code>	Name of column to obtain JSON information.

GET_LOB_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LOB          CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LOB         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LOB       CONSTANT NUMBER := 3;
DBMS_LCR.EMPTY_LOB        CONSTANT NUMBER := 4;
DBMS_LCR.LOB_CHUNK        CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK   CONSTANT NUMBER := 6;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 304-18 GET_LOB_INFORMATION Function Parameters

Parameter	Description
value_type	The type of value to return for the column, either old or new
column_name	The name of the column
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_LOB_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is DBMS_LCR.LAST_LOB_CHUNK or DBMS_LCR.LOB_CHUNK
- The command type is LOB ERASE or LOB WRITE

Otherwise, returns NULL.

Syntax

```
GET_LOB_OFFSET(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2)
RETURN NUMBER;
```

Parameters**Table 304-19 GET_LOB_OFFSET Function Parameters**

Parameter	Description
value_type	The type of value to return for the column Currently, only <code>new</code> can be specified.
column_name	The name of the LOB column

GET_LOB_OPERATION_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for `CLOB` columns and the number of bytes for `BLOB` columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is `LOB ERASE` or `LOB TRIM`
- The information is `DBMS_LCR.LAST_LOB_CHUNK`

Otherwise, returns `NULL`.

Syntax

```
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2)
RETURN NUMBER,
```

Parameters**Table 304-20 GET_LOB_OPERATION_SIZE Function Parameters**

Parameter	Description
value_type	The type of value to return for the column Currently, only <code>new</code> can be specified.
column_name	The name of the LOB column

GET_LONG_INFORMATION Member Function

Gets the `LONG` information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LONG          CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LONG         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LONG       CONSTANT NUMBER := 3;
DBMS_LCR.LONG_CHUNK        CONSTANT NUMBER := 4;
DBMS_LCR.LAST_LONG_CHUNK   CONSTANT NUMBER := 5;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 304-21 GET_LONG_INFORMATION Function Parameters

Parameter	Description
value_type	The type of value to return for the column, either old or new
column_name	The name of the column
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_ROW_TEXT Member Procedure

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the SQL statement in a CLOB datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
    row_text IN/OUT CLOB);
```

The following procedure returns the SQL statement with bind variables in a CLOB datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
    row_text IN/OUT CLOB,
    variable_list IN/OUT LCR$_ROW_LIST,
    bind_var_syntax IN VARCHAR2 DEFAULT ':');
```

See Also:

"LCR\$_ROW_LIST Type"

Parameters

Table 304-22 GET_ROW_TEXT Procedure Parameters

Parameter	Description
<code>row_text</code>	The SQL statement for the change that is encapsulated in the LCR
<code>variable_list</code>	The values for the bind variables in the order of the bind variables
<code>bind_var_syntax</code>	The syntax for the bind variables One of the following values is valid: <ul style="list-style-type: none"> Specify <code>:</code>, the default, for bind values to be in the form <code>:1</code>, <code>:2</code>, and so on. Specify <code>?</code> for bind values to be in the form <code>?.</code>

GET_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of a column.

Syntax

```
MEMBER FUNCTION GET_VALUE (
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN ANYDATA;
```

Parameters

Table 304-23 GET_VALUE Function Parameters

Parameter	Description
<code>value_type</code>	The type of value to return for the column Specify <code>old</code> to get the old value for the column. Specify <code>new</code> to get the new value for the column.
<code>column_name</code>	The column name If the column is present and has a <code>NULL</code> value, then the function returns an <code>ANYDATA</code> instance containing a <code>NULL</code> value. If the column value is absent, then the function returns a <code>NULL</code> .

Table 304-23 (Cont.) GET_VALUE Function Parameters

Parameter	Description
use_old	<p>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value.</p> <p>If N and value_type is new, then the function returns NULL if no new value exists.</p> <p>If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter.</p> <p>NULL is not a valid specification for the use_old parameter.</p>

GET_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the values of all columns.

Syntax

```
MEMBER FUNCTION GET_VALUES(
    value_type IN VARCHAR2,
    use_old    IN VARCHAR2 DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

Parameters

Table 304-24 GET_VALUES Function Parameters

Parameter	Description
value_type	<p>The type of values to return</p> <p>Specify old to return a list of old values. Specify new to return a list of new values.</p>
use_old	<p>If Y and value_type is new, then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and the old values where there are no new values.</p> <p>If N and value_type is new, then the function returns a list of all new values in the LCR without returning any old values.</p> <p>If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter.</p> <p>NULL is not a valid specification for the use_old parameter.</p>

GET_WHERE_CLAUSE Member Procedure

Gets a WHERE clause for the change that is encapsulated in the row LCR.

Use the `WHERE` clause returned by `GET_WHERE_CLAUSE` instead of using the `ROWID`, because the `ROWID` is not ANSI compatible. The generated `WHERE` clause might not match the `WHERE` clause in the original DML operation.

The `ROWID` of an `INSERT` statement is the `ROWID` of the new row created by the `INSERT`. The `WHERE` clause generated for an `INSERT` operation identifies the new row. Therefore, the generated `WHERE` clause includes all of the new values inserted.

For example, consider the following insert into the `hr.departments` table:

```
INSERT INTO hr.departments (  
    department_id, department_name, manager_id, location_id)  
VALUES (10, 'HR', 20, 40);
```

The generated `WHERE` clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated `WHERE` clause is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND  
      "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The `ROWID` of an `UPDATE` statement is the `ROWID` of the row that was updated. The `WHERE` clause generated for an `UPDATE` operation identifies the row after the `UPDATE` executes. The generated `WHERE` clause is based on the old and new values of the `UPDATE`.

For example, consider the following update to the `hr.departments` table:

```
UPDATE hr.departments SET department_name='Management'  
WHERE department_name='Administration' AND location_id = 20 AND  
      manager_id = 30 AND department_id = 10;
```

The values of the row after the `UPDATE` are 10, 'Management', 30, and 20. Hence, the generated `WHERE` clause to identify the row is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND  
      "MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for `"DEPARTMENT_NAME"`, because the new value is the value of the column after the `UPDATE`. For the rest of the columns, the old values are used.

The `ROWID` of a `DELETE` operation is the row that existed before it was deleted. The generated `WHERE` clause consists of all the old column values present in the `DELETE` operation.

LOB columns do not appear in generated `WHERE` clauses. The generated `WHERE` clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the `WHERE` clause of a SQL statement in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(  
    where_clause IN/OUT CLOB);
```

The following procedure returns the `WHERE` clause of a SQL statement with bind variables in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(  
    where_clause IN/OUT CLOB,
```

```
variable_list    IN/OUT  LCR$_ROW_LIST,
bind_var_syntax  IN       VARCHAR2  DEFAULT ':');
```

See Also:

[LCR\\$_ROW_LIST Type](#)

Parameters

Table 304-25 GET_WHERE_CLAUSE Procedure Parameters

Parameter	Description
where_clause	The WHERE clause of the SQL statement for the change that is encapsulated in the LCR
variable_list	The values for the bind variables in the order of the bind variables
bind_var_syntax	The syntax for the bind variables One of the following values is valid: <ul style="list-style-type: none"> Specify :, the default, for bind values to be in the form :1, :2, and so on. Specify ? for bind values to be in the form ?.

GET_XML_INFORMATION Member Function

Gets the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML    CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC    CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF   CONSTANT NUMBER := 3;
```

```
DBMS_LCR.XML_DIFF   CONSTANT NUMBER := 3;
```

DBMS_LCR.NOT_XML indicates that the column is not an XMLType column.

DBMS_LCR.XML_DOC indicates that the column contains an XML document.

DBMS_LCR.XML_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Returns NULL if the specified column does not exist.

Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION(
    column_name IN VARCHAR2)
RETURN NUMBER;
```

Parameter

Table 304-26 GET_XML_INFORMATION Function Parameter

Parameter	Description
column_name	The column name

IS_STATEMENT_LCR Member Function

This function is reserved for internal use only.

KEEP_COLUMNS Member Procedure

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.

Syntax

```
MEMBER PROCEDURE KEEP_COLUMNS (
    column_list IN VARCHAR2,
    value_type IN VARCHAR2 DEFAULT '*');
```

Parameters

Table 304-27 KEEP_COLUMNS Procedure Parameters

Parameter	Description
column_list	The names of the columns kept for the row LCR Specify a comma-delimited list of type VARCHAR2. This procedure removes columns that are not in the list from the current row LCR.
value_type	The type of value for which to keep the columns Specify <i>old</i> to keep the old values of the columns. An error is raised if the old values do not exist in the LCR. Specify <i>new</i> to keep the new values of the columns. An error is raised if the new values do not exist in the LCR. If <i>*</i> is specified, then the procedure keeps both the old and the new columns.

RENAME_COLUMN Member Procedure

Renames a column in a row LCR.

Syntax

```
MEMBER PROCEDURE RENAME_COLUMN (
    from_column_name IN VARCHAR2,
    to_column_name IN VARCHAR2,
    value_type IN VARCHAR2 DEFAULT '*');
```

Parameters

Table 304-28 RENAME_COLUMN Procedure Parameters

Parameter	Description
<code>from_column_name</code>	The existing column name
<code>to_column_name</code>	The new column name An error is raised if a column with the specified name already exists.
<code>value_type</code>	The type of value for which to rename the column Specify <code>old</code> to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify <code>new</code> to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If <code>*</code> is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.

SET_JSON_INFORMATION Member Procedure

Sets the JSON information for a column.

Syntax

```
MEMBER PROCEDURE SET_JSON_INFORMATION(
    self          IN OUT NOCOPY LCR$_ROW_RECORD,
    value_type    IN VARCHAR2,
    column_name   IN VARCHAR2,
    json_information IN NUMBER);
```

Parameters

Table 304-29 SET_JSON_INFORMATION Procedure Parameters

Parameter	Description
<code>self</code>	
<code>value_type</code>	The type of value to set for the column. The supported values are: <ul style="list-style-type: none"> NEW OLD
<code>column_name</code>	The name of the column. An exception is raised if the column does not exist in the LCR.
<code>json_information</code>	The supported values are: <ul style="list-style-type: none"> DBMS_LCR.NOT_OSON DBMS_LCR.OSON_DOC

SET_LOB_INFORMATION Member Procedure

Sets LOB information for the column.

Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
    value_type      IN VARCHAR2,
    column_name     IN VARCHAR2,
    lob_information IN NUMBER);
```

Parameters

Table 304-30 SET_LOB_INFORMATION Procedure Parameters

Parameter	Description												
value_type	The type of value to set for the column, either old or new Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.												
column_name	The name of the column. An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.												
lob_information	Specify one of the following values: <table border="0"> <tr> <td>DBMS_LCR.NOT_A_LOB</td> <td>CONSTANT NUMBER := 1;</td> </tr> <tr> <td>DBMS_LCR.NULL_LOB</td> <td>CONSTANT NUMBER := 2;</td> </tr> <tr> <td>DBMS_LCR.INLINE_LOB</td> <td>CONSTANT NUMBER := 3;</td> </tr> <tr> <td>DBMS_LCR.EMPTY_LOB</td> <td>CONSTANT NUMBER := 4;</td> </tr> <tr> <td>DBMS_LCR.LOB_CHUNK</td> <td>CONSTANT NUMBER := 5;</td> </tr> <tr> <td>DBMS_LCR.LAST_LOB_CHUNK</td> <td>CONSTANT NUMBER := 6;</td> </tr> </table>	DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;	DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;	DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;	DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;	DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;	DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;
DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;												
DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;												
DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;												
DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;												
DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;												
DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;												

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OFFSET(
    value_type      IN VARCHAR2,
    column_name     IN VARCHAR2,
    lob_offset      IN NUMBER);
```

Parameters

Table 304-31 SET_LOB_OFFSET Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column Currently, only <code>new</code> can be specified.
column_name	The column name An error is raised if the column value does not exist in the LCR.
lob_offset	The LOB offset number Valid values are <code>NULL</code> or a positive integer less than or equal to <code>DBMS_LOB.LOBBMAXSIZE</code> .

SET_LOB_OPERATION_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for `CLOB` columns and bytes for `BLOB` columns.

Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE (
  value_type      IN  VARCHAR2,
  column_name     IN  VARCHAR2,
  lob_operation_size IN NUMBER);
```

Parameters

Table 304-32 SET_LOB_OPERATION_SIZE Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column Currently, only <code>new</code> can be specified.
column_name	The name of the LOB column An exception is raised if the column value does not exist in the LCR.

Table 304-32 (Cont.) SET_LOB_OPERATION_SIZE Procedure Parameters

Parameter	Description
<code>lob_operation_size</code>	If <code>lob_information</code> for the LOB is or will be <code>DBMS_LCR.LAST_LOB_CHUNK</code> , then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> . A LOB TRIM value must be a nonnegative integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> . Otherwise, set to NULL.

SET_ROW_TEXT Member Procedure

This procedure is reserved for internal use only.

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

 **Note:**

To add a column to a row LCR, run `ADD_COLUMN`.

 **See Also:**

[ADD_COLUMN Member Procedure](#)

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a LONG or LONG RAW column.

Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value an XMLType column, specify the XMLType for the column_value parameter. The SET_VALUE member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType column is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

Syntax

```
MEMBER PROCEDURE SET_VALUE (  
    value_type    IN  VARCHAR2,  
    column_name   IN  VARCHAR2,  
    column_value  IN  ANYDATA);
```

Parameters

Table 304-33 SET_VALUE Procedure Parameters

Parameter	Description
<code>value_type</code>	The type of value to set Specify <code>old</code> to set the old value of the column. Specify <code>new</code> to set the new value of the column.
<code>column_name</code>	The column name An error is raised if the specified <code>column_value</code> does not exist in the LCR for the specified <code>column_type</code> .
<code>column_value</code>	The new value of the column If <code>NULL</code> is specified, then this procedure raises an error. To set the value to <code>NULL</code> , encapsulate the <code>NULL</code> in an <code>ANYDATA</code> instance. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns.

SET_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

Considerations for LOB Columns

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), then you can use this member procedure in the handler procedure. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on `LONG` or `LONG RAW` columns.

Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value of one or more `XMLType` columns in a row LCR, specify an `XMLType` for each `XMLType` column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` columns are represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with `XMLType` columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.

Syntax

```
MEMBER PROCEDURE SET_VALUES(  
    value_type IN VARCHAR2,  
    value_list IN SYS.LCR$_ROW_LIST);
```

Parameters

Table 304-34 SET_VALUES Procedure Parameters

Parameter	Description
value_type	The type of values to replace Specify <code>old</code> to replace the old values. Specify <code>new</code> to replace the new values.
value_list	List of values to replace the existing list Use a <code>NULL</code> or an empty list to remove all values. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns.

SET_XML_INFORMATION Member Procedure

Sets the XML information for the column.

Syntax

```
MEMBER PROCEDURE SET_XML_INFORMATION(
    column_name      IN VARCHAR2,
    xml_information  IN NUMBER);
```

Parameters

Table 304-35 SET_XML_INFORMATION Procedure Parameters

Parameter	Description
column_name	The name of the column An exception is raised if the column value does not exist in the LCR.
xml_information	Specify one of the following values: DBMS_LCR.NOT_XML CONSTANT NUMBER := 1; DBMS_LCR.XML_DOC CONSTANT NUMBER := 2; DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3; DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3; DBMS_LCR.NOT_XML indicates that the column is not an XMLType column. DBMS_LCR.XML_DOC indicates that the column contains an XML document. DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation. DBMS_LCR.XML_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

304.3.3 Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD

These functions and procedures are common to both the LCR\$_DDL_RECORD and LCR\$_ROW_RECORD type.

See Also:

For descriptions of the subprograms for these types that are exclusive to each type:

- ["LCR\\$_DDL_RECORD Type"](#)
- ["LCR\\$_ROW_RECORD Type"](#)

Table 304-36 Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
GET_COMMAND_TYPE Member Function	Gets the command type of the logical change record (LCR)
GET_COMMIT_SCN Member Function	Gets the commit system change number (SCN) of the transaction to which the current LCR belongs
GET_COMMIT_SCN_FROM_POSITION Static Function	Gets the commit SCN of a transaction from the input position, which is generated by an XStream outbound server
GET_COMMIT_TIME	Gets the commit time of the transaction to which the current LCR belongs
GET_COMPATIBLE Member Function	Gets the minimal database compatibility required to support the LCR
GET_EXTRA_ATTRIBUTE Member Function	Gets the value for the specified extra attribute in the LCR
GET_OBJECT_NAME Member Function	Gets the name of the object that is changed by the LCR
GET_OBJECT_OWNER Member Function	Gets the owner of the object that is changed by the LCR
GET_POSITION Member Function	Gets the position of the current LCR
GET_ROOT_NAME Member Function	Gets the global name of the root for a CDB.
GET_SCN Member Function	Gets the SCN of the LCR
GET_SCN_FROM_POSITION Static Function	Gets the SCN from the input position, which is generated by an XStream outbound server
GET_SOURCE_DATABASE_NAME Member Function	Gets the source database name.
GET_SOURCE_TIME Member Function	Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created
GET_TAG Member Function	Gets the tag for the LCR

Table 304-36 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
GET_THREAD_NUMBER Member Function	Gets the thread number of the database instance that made the change that is encapsulated in the LCR
GET_TRANSACTION_ID Member Function	Gets the transaction identifier of the LCR
IS_NULL_TAG Member Function	Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL
SET_COMMAND_TYPE Member Procedure	Sets the command type in the LCR
SET_EXTRA_ATTRIBUTE Member Procedure	Sets the value for the specified extra attribute in the LCR
SET_OBJECT_NAME Member Procedure	Sets the name of the object that is changed by the LCR
SET_OBJECT_OWNER Member Procedure	Sets the owner of the object that is changed by the LCR
SET_ROOT_NAME Member Procedure	Sets the global name of the root in a CDB.
SET_SOURCE_DATABASE_NAME Member Procedure	Sets the source database name of the object that is changed by the LCR
SET_TAG Member Procedure	Sets the tag for the LCR

GET_COMMAND_TYPE Member Function

Gets the command type of the LCR.

 **See Also:**

The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER FUNCTION GET_COMMAND_TYPE ()
RETURN VARCHAR2;
```

GET_COMMIT_SCN Member Function

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns NULL.

Syntax

```
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

GET_COMMIT_SCN_FROM_POSITION Static Function

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

Syntax

```
STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
    position IN RAW)
RETURN NUMBER;
```

Parameters**Table 304-37 GET_COMMIT_SCN_FROM_POSITION Function Parameter**

Parameter	Description
position	The position You can obtain the position by using the <code>GET_POSITION</code> member function or by querying the <code>DBA_XSTREAM_OUTBOUND_PROGRESS</code> data dictionary view.

**Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_COMMIT_TIME

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns `NULL`.

Syntax

```
MEMBER FUNCTION GET_COMMIT_TIME()
RETURN DATE;
```

GET_COMPATIBLE Member Function

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

The return value for this function can be one of the following:

Return Value	COMPATIBLE Initialization Parameter Equivalent
DBMS_STREAMS.COMPATIBLE_9_2	9.2.0
DBMS_STREAMS.COMPATIBLE_10_1	10.1.0
DBMS_STREAMS.COMPATIBLE_10_2	10.2.0
DBMS_STREAMS.COMPATIBLE_11_1	11.1.0
DBMS_STREAMS.COMPATIBLE_11_2	11.2.0

DDL LCRs always return `DBMS_STREAMS.COMPATIBLE_9_2`.

You can use the following functions in the `DBMS_STREAMS` package for constant compatibility return values:

- The `COMPATIBLE_9_2` function returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant.
- The `COMPATIBLE_10_1` function returns `DBMS_STREAMS.COMPATIBLE_10_1` constant.
- The `COMPATIBLE_10_2` function returns `DBMS_STREAMS.COMPATIBLE_10_2` constant.
- The `COMPATIBLE_11_1` function returns `DBMS_STREAMS.COMPATIBLE_11_1` constant.
- The `COMPATIBLE_11_2` function returns `DBMS_STREAMS.COMPATIBLE_11_2` constant.
- The `MAX_COMPATIBLE` function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the `GET_COMPATIBLE` member function for an LCR in rule conditions and apply handlers.

See Also:

- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

Syntax

```
MEMBER FUNCTION GET_COMPATIBLE ()
RETURN NUMBER;
```

GET_EXTRA_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an `ANYDATA` instance. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

See Also:

[INCLUDE_EXTRA_ATTRIBUTE Procedure](#)

Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(  
    attribute_name IN VARCHAR2)  
RETURN ANYDATA;
```

Parameters

Table 304-38 GET_EXTRA_ATTRIBUTE Function Parameter

Parameter	Description
attribute_name	<p>The name of the extra attribute to return</p> <p>Valid names are:</p> <ul style="list-style-type: none"> • row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID. • serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. • session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. • thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. • tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. • username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. <p>An error is raised if the specified attribute_name is not valid. If no value exists for the specified extra attribute, then the function returns a NULL.</p> <p>See Also: <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p>

GET_OBJECT_NAME Member Function

Gets the name of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()  
RETURN VARCHAR2;
```

GET_OBJECT_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()  
RETURN VARCHAR2;
```

GET_POSITION Member Function

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

Syntax

```
MEMBER FUNCTION GET_POSITION()  
RETURN RAW;
```

Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_ROOT_NAME Member Function

Gets the global name of the root in a CDB, which is the root name for the LCR.

Syntax

```
MEMBER FUNCTION GET_ROOT_NAME()  
RETURN VARCHAR2;
```

GET_SCN Member Function

Gets the system change number (SCN) of the LCR.

Syntax

```
MEMBER FUNCTION GET_SCN()  
RETURN NUMBER;
```

GET_SCN_FROM_POSITION Static Function

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.

Syntax

```
STATIC FUNCTION GET_SCN_FROM_POSITION(  
    position IN RAW)  
RETURN NUMBER;
```

Parameters

Table 304-39 GET_SCN_FROM_POSITION Function Parameter

Parameter	Description
position	The position You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.

 **Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_SOURCE_DATABASE_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

Syntax

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME ()  
RETURN VARCHAR2;
```

GET_SOURCE_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME ()  
RETURN DATE;
```

GET_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

Syntax

```
MEMBER FUNCTION GET_TAG ()  
RETURN RAW;
```

GET_THREAD_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

**See Also:**

Oracle Real Application Clusters Administration and Deployment Guide

Syntax

```
MEMBER FUNCTION GET_THREAD_NUMBER()  
RETURN NUMBER;
```

GET_TRANSACTION_ID Member Function

Gets the transaction identifier of the LCR.

Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()  
RETURN VARCHAR2;
```

IS_NULL_TAG Member Function

Returns **Y** if the tag for the LCR is **NULL**, or returns **N** if the tag for the LCR is not **NULL**.

Syntax

```
MEMBER FUNCTION IS_NULL_TAG()  
RETURN VARCHAR2;
```

SET_COMMAND_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing **INSERT** to **GRANT** would raise an error.

**See Also:**

- The description of the `command_type` parameter in [LCR\\$_DDL_RECORD Constructor Function Parameters](#)
- The description of the `command_type` parameter in [LCR\\$_ROW_RECORD Type](#)
- The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER PROCEDURE SET_COMMAND_TYPE(  
    command_type IN VARCHAR2);
```

Parameter

Table 304-40 SET_COMMAND_TYPE Procedure Parameter

Parameter	Description
command_type	The command type Set this parameter to a non-NULL value.

SET_EXTRA_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

See Also:

[INCLUDE_EXTRA_ATTRIBUTE Procedure](#)

Syntax

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(  
    attribute_name IN VARCHAR2,  
    attribute_value IN ANYDATA);
```

Parameters

Table 304-41 SET_EXTRA_ATTRIBUTE Procedure Parameter

Parameter	Description
<code>attribute_name</code>	<p>The name of the extra attribute to set</p> <p>Valid names are:</p> <ul style="list-style-type: none"> <code>row_id</code> The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is <code>VARCHAR2</code>. <code>serial#</code> The serial number of the session that performed the change captured in the LCR. The type is <code>NUMBER</code>. <code>session#</code> The identifier of the session that performed the change captured in the LCR. The type is <code>NUMBER</code>. <code>thread#</code> The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is <code>NUMBER</code>. <code>tx_name</code> The name of the transaction that includes the LCR. The type is <code>VARCHAR2</code>. <code>username</code> The name of the current user who performed the change captured in the LCR. The type is <code>VARCHAR2</code>. <p>An error is raised if the specified <code>attribute_name</code> is not valid.</p> <p>See Also: <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p>
<code>attribute_value</code>	<p>The value to which the specified extra attribute is set</p> <p>If set to <code>NULL</code>, then this procedure removes the specified extra attribute from the LCR. To set to <code>NULL</code>, encapsulate the <code>NULL</code> in an <code>ANYDATA</code> instance.</p>

SET_OBJECT_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME(
    object_name IN VARCHAR2);
```

Parameter**Table 304-42 SET_OBJECT_NAME Procedure Parameter**

Parameter	Description
object_name	The name of the object

SET_OBJECT_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
    object_owner IN VARCHAR2);
```

Parameter**Table 304-43 SET_OBJECT_OWNER Procedure Parameter**

Parameter	Description
object_owner	The schema that contains the object

SET_ROOT_NAME Member Procedure

Sets the global name of the root in a CDB. The setting is the root name for the LCR.

Syntax

```
MEMBER PROCEDURE SET_ROOT_NAME(
    root_name IN VARCHAR2);
```

Parameter**Table 304-44 SET_ROOT_NAME Procedure Parameter**

Parameter	Description
root_name	The global name of the root.

SET_SOURCE_DATABASE_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
    source_database_name IN VARCHAR2);
```

Parameter

Table 304-45 SET_SOURCE_DATABASE_NAME Procedure Parameter

Parameter	Description
source_database_name	The source database of the change If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.

SET_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

Syntax

```
MEMBER PROCEDURE SET_TAG(
    tag IN RAW);
```

Parameter

Table 304-46 SET_TAG Procedure Parameter

Parameter	Description
tag	The binary tag for the LCR The size limit for a tag value is two kilobytes.

304.3.4 LCR\$_ROW_LIST Type

This type identifies a list of column values for a row in a table.

It uses the LCR\$_ROW_UNIT type and is used in the LCR\$_ROW_RECORD type.

See Also:

- [LCR\\$_ROW_UNIT Type](#)
- [LCR\\$_ROW_RECORD Type](#)

Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT
/
```

304.3.5 LCR\$_ROW_UNIT Type

This type identifies the value for a column in a row.

It is used in the LCR\$_ROW_LIST type.

See Also:

[LCR\\$_ROW_LIST Type](#)

Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
  column_name      VARCHAR2(4000),
  data             ANYDATA,
  lob_information  NUMBER,
  lob_offset       NUMBER,
  lob_operation_size NUMBER
  long_information NUMBER);
/
```

Attributes

Table 304-47 LCR\$_ROW_UNIT Attributes

Attribute	Description												
column_name	The name of the column												
data	The data contained in the column												
lob_information	Contains the LOB information for the column and contains one of the following values: <table border="0" style="margin-left: 20px;"> <tr> <td>DBMS_LCR.NOT_A_LOB</td> <td>CONSTANT NUMBER := 1;</td> </tr> <tr> <td>DBMS_LCR.NULL_LOB</td> <td>CONSTANT NUMBER := 2;</td> </tr> <tr> <td>DBMS_LCR.INLINE_LOB</td> <td>CONSTANT NUMBER := 3;</td> </tr> <tr> <td>DBMS_LCR.EMPTY_LOB</td> <td>CONSTANT NUMBER := 4;</td> </tr> <tr> <td>DBMS_LCR.LOB_CHUNK</td> <td>CONSTANT NUMBER := 5;</td> </tr> <tr> <td>DBMS_LCR.LAST_LOB_CHUNK</td> <td>CONSTANT NUMBER := 6;</td> </tr> </table>	DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;	DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;	DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;	DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;	DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;	DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;
DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;												
DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;												
DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;												
DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;												
DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;												
DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;												
lob_offset	The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.												
lob_operation_size	If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.												

Table 304-47 (Cont.) LCR\$_ROW_UNIT Attributes

Attribute	Description
long_information	<p>Contains the LONG information for the column and contains one of the following values:</p> <pre>DBMS_LCR.not_a_long CONSTANT NUMBER := 1; DBMS_LCR.null_long CONSTANT NUMBER := 2; DBMS_LCR.inline_long CONSTANT NUMBER := 3; DBMS_LCR.long_chunk CONSTANT NUMBER := 4; DBMS_LCR.last_long_chunk CONSTANT NUMBER := 5;</pre>

MGD_ID Package Types

The `MGD_ID` package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The `MGD_ID` Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification).

The `MGD_ID` package contains several predefined types.

See Also:

Oracle Database Development Guide for more information.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of Types](#)
- [Summary of MGD_ID Subprograms](#)

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

305.1 MGD_ID Package Types Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and create the required Identity Code Package schema objects in the `MGDSYS` schema.

`MGD_ID` is a `MGDSYS`-owned object type. Any `MGD_ID` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the `MGD_ID` object type and its subprograms.

`EXECUTE` privilege is granted to `PUBLIC` for this ADT: `MGD_ID`.

A public synonym, by the same name, is created for this ADT: `MGD_ID`.

305.2 Summary of Types

This table lists and briefly describes the `MGD_ID` Package object types.

Table 305-1 MGD_ID Package Object Types

Object Type Name	Description
MGD_ID_COMPONENT Object Type	Datatype that specifies the name and value pair attributes that define a component
MGD_ID_COMPONENT_VARRAY Object Type	Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object
MGD_ID Object Type	Represents an <code>MGD_ID</code> object that specifies the category identifier for the code category for this identity code and its list of components

305.2.1 MGD_ID_COMPONENT Object Type

The `MGD_ID_COMPONENT` type is a datatype that specifies the name and value pair attributes that define a component.

Syntax

```
MGD_ID_COMPONENT as object (name VARCHAR2(256),
                             value VARCHAR2(1024));
```

Attributes

Table 305-2 MGD_ID_COMPONENT Attributes

Attribute	Description
name	Name of component
value	Value of the component as a character

Examples

See the [MGD_ID Constructor Function](#) for an example.

305.2.2 MGD_ID_COMPONENT_VARRAY Object Type

The `MGD_ID_COMPONENT_VARRAY` type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

Syntax

```
MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_COMPONENT;
```

Examples

See the [MGD_ID Constructor Function](#) for an example.

305.2.3 MGD_ID Object Type

The `MGD_ID` type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

Syntax

```
MGD_ID as object (category_id VARCHAR2(256),
                 components  MGD_ID_COMPONENT_VARRAY);
```

Attributes

Table 305-3 MGD_ID Object Type Attributes

Attribute	Description
<code>category_id</code>	Category identifier for the code category of this code
<code>components</code>	List of components as name-value attributes

Methods

[Table 305-5](#) describes the methods of the `MGD_ID` object type.

Table 305-4 MGD_ID Methods

Method	Description
<code>MGD_ID</code> constructor function	Creates an <code>MGD_ID</code> object based on the parameters passed in and returns self as a result
<code>FORMAT</code> function	Returns the string representation of the <code>MGD_ID</code> in the specified format
<code>GET_COMPONENT</code> function	Returns the string value of the specified <code>MGD_ID</code> component
<code>TO_STRING</code> function	Returns the string value of semicolon (;) separated component name value pairs of the <code>MGD_ID</code> object
<code>TRANSLATE</code> function	Returns the result of the conversion of the identifier from one format to the specified format

Examples

See the [Summary of MGD_ID Subprograms](#) section and the section about using the Identity Code package in Using the Identity Code Package in *Oracle Database Development Guide* for examples.

305.3 Summary of MGD_ID Subprograms

This table describes the subprograms in the `MGD_ID` object type.

All the values and names passed to the procedures defined in the `MGD_ID` object type are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

Table 305-5 MGD_ID Object Type Subprograms

Subprogram	Description
MGD_ID Constructor Function	Creates an <code>MGD_ID</code> object based on the parameters passed in and returns self as a result
FORMAT Function	Returns the string representation of the <code>MGD_ID</code> object in the specified format
GET_COMPONENT Function	Returns the string value of the specified <code>MGD_ID</code> component
TO_STRING Function	Returns the string value of semicolon (;) separated component name value pairs of the <code>MGD_ID</code> object
TRANSLATE Function	Returns the result of the conversion of the identifier from one format to the specified format

305.3.1 MGD_ID Constructor Function

This constructor function constructs an identity code type object, `MGD_ID`. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs an `MGD_ID` object type based on the category ID and a list of components.

```
MGD_ID (
    category_id      IN VARCHAR2,
    components       IN MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
    category_id      VARCHAR2,
    identifier        VARCHAR2,
    parameter_list   VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category name, category version, and a list of components.

```
MGD_ID (
    category_name    VARCHAR2,
    category_version VARCHAR2,
```

```

    components          MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;

```

Constructs an `MGD_ID` object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```

MGD_ID (
    category_name      VARCHAR2,
    category_version   VARCHAR2,
    identifier          VARCHAR2,
    parameter_list     VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;

```

Parameters

Table 305-6 MGD_ID Constructor Function Parameters

Parameter	Description
<code>category_id</code>	Category identifier
<code>components</code>	List of component name value pairs
<code>category_name</code>	Category name, such as EPC
<code>category_version</code>	Category version. If <code>NULL</code> , the latest version for the specified category name will be used.
<code>identifier</code>	<p>Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of <code>BINARY</code>, <code>PURE_IDENTITY</code>, <code>TAG_ENCODING</code>, or <code>LEGACY</code>.</p> <p>Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.</p>
<code>parameter_list</code>	<p>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:</p> <pre>filter=3;companyprefixlength=7;taglength=96</pre>

Usage Notes

- Use `MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID` as `category_id`.
- If the category is not already registered, an error is raised.
- If the `bit_length` parameter is `NULL`, the `bit_length` is 8* the length of `bit_encoding`.
- If the component list does not contain all required components, an exception `MGD_ID_UTL.e_LackComponent` will be thrown.

Examples

The following examples construct identity code type objects.

Construct an MGD_ID object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
             MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix','0037000'),
               MGD_ID_COMPONENT('itemref','030241'),
               MGD_ID_COMPONENT('serial','1041970'),
               MGD_ID_COMPONENT('schemes','SGTIN-64')
             )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
.
.
.

.
.
.

```

305.3.2 FORMAT Function

This function returns the string representation of the MGD_ID object in the specified format.

Syntax

```

FORMAT (parameter_list IN VARCHAR2,
       output_format   IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;

```

Parameters

Table 305-7 FORMAT Function Parameters

Parameter	Description
<code>parameter_list</code>	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: <code>filter=3;companyprefixlength=7;taglength=96</code>
<code>output_format</code>	One of the supported output formats into which an MGD_ID component is formatted: <ul style="list-style-type: none"> • BINARY • LEGACY • TAG_ENCODING • PURE_IDENTITY • ONS_HOSTNAME

Examples

See the example for the [GET_COMPONENT Function](#).

305.3.3 GET_COMPONENT Function

This function returns the value of the specified MGD_ID component.

Syntax

```
GET_COMPONENT (
    component_name IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 305-8 GET_COMPONENT Function Parameter

Parameter	Description
<code>component_name</code>	Name of component

Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```

--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  -----
  --PURE_IDENTIT
  -----
  dbms_output.put_line('..Testing constructor with pure identity');
  -----
  -- PURE_IDENTITY representation can be translated to BINARY and
  -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.
  -----
  id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970', 'scheme=SGTIN-64;filter=3');
  dbms_output.put_line(id.to_string);
  dbms_output.put_line('filter          = ' || id.get_component('filter'));
  dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
  dbms_output.put_line('itemref       = ' || id.get_component('itemref'));
  dbms_output.put_line('serial        = ' || id.get_component('serial'));
  dbms_output.put_line('BINARY format = ' || id.format(NULL, 'BINARY'));
  dbms_output.put_line('PURE_IDENTITY format = ' || id.format(NULL, 'PURE_IDENTITY'));
  dbms_output.put_line('TAG_ENCODING format = ' || id.format(NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;

.
.
.

```

305.3.4 TO_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD_ID object.

Syntax

```

TO_STRING
RETURN VARCHAR2;

```

Examples

The following example converts the MGD_ID object into a string value:

```
-- Contents of toString3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('..Testing to_string');
  id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
  DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
  DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();

PL/SQL procedure successfully completed.
.
.
```

305.3.5 TRANSLATE Function

This static function translates between different representations directly without first constructing an `MGD_ID` object.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```
TRANSLATE (
  category_name    IN VARCHAR2,
  identifier        IN VARCHAR2,
  parameter_list   IN VARCHAR2,
  output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```
TRANSLATE (
  category_name    IN VARCHAR2,
  category_version IN VARCHAR2,
  identifier        IN VARCHAR2,
  parameter_list   IN VARCHAR2,
  output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 305-9 TRANSLATE Function Parameters

Parameter	Description
<code>category_name</code>	Name of category
<code>category_version</code>	Category version. If NULL, the latest version of the specified category name will be used.
<code>identifier</code>	EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.
<code>parameter_list</code>	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: <code>filter=3;companyprefixlength=7;taglength=96</code>
<code>output_format</code>	One of the supported output formats into which an MGD_ID component shall be converted: <ul style="list-style-type: none"> • BINARY • LEGACY • TAG_ENCODING • PURE_IDENTITY • ONS_HOSTNAME

Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the `parameter_list` parameter.

Examples

The following examples translates one GID-96 representation into another:

```
-- Contents of translatel.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
  dbms_output.put_line(
    mgd_id.translate('EPC',

306

Rule TYPES

This chapter describes the types used with rules, rule sets, and evaluation contexts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of Rule Types](#)

306.1 Rule TYPES Overview

These types are used in rules and enable clients to evaluate rules with the rules engine.

See Also:

- [DBMS_RULE](#)
- [DBMS_RULE_ADM](#)

306.2 Rule TYPES Security Model

`PUBLIC` is granted `EXECUTE` privilege on these `RULE` types.

See Also:

Oracle Database Security Guide for more information about user group `PUBLIC`

306.3 Summary of Rule Types

This table lists the `Rule Types` and briefly describes them.

Table 306-1 Rule Types

Type	Description
RE\$ATTRIBUTE_VALUE Type	Specifies the value of a variable attribute
RE\$ATTRIBUTE_VALUE_LIST Type	Identifies a list of attribute values
RE\$COLUMN_VALUE Type	Specifies the value of a table column
RE\$COLUMN_VALUE_LIST Type	Identifies a list of column values

Table 306-1 (Cont.) Rule Types

Type	Description
RE\$NAME_ARRAY Type	Identifies a list of names
RE\$NAME_ARRAY Type	Identifies a list of name-value pairs
RE\$NV_LIST Type	Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule
RE\$NV_NODE Type	Identifies a name-value pair
RE\$RULE_HIT Type	Specifies a rule found because of evaluation
RE\$RULE_HIT_LIST Type	Identifies a list of rules found because of evaluation
RE\$RULE_NAME Type	Allows users to pass a list of rule as argument.
RE\$RULE_NAME_LIST Type	Identifies a list of Rule Name values
RE\$TABLE_ALIAS Type	Provides the table corresponding to an alias used in a rule evaluation context
RE\$TABLE_ALIAS_LIST Type	Identifies a list of table aliases used in a rule evaluation context
RE\$TABLE_VALUE Type	Specifies the value of a table row using a ROWID
RE\$TABLE_VALUE_LIST Type	Identifies a list of table values
RE\$VALUE Type	Represents one datapoint value element
RE\$VALUE_LIST Type	Defines a list of RE\$VALUE type
RE\$VARIABLE_TYPE Type	Provides the type of a variable used in a rule evaluation context
RE\$VARIABLE_TYPE_LIST Type	Identifies a list of variables and their types used in a rule evaluation context
RE\$VARIABLE_VALUE Type	Specifies the value of a variable
RE\$VARIABLE_VALUE_LIST Type	Identifies a list of variable values

Rule types are used with the following Oracle-supplied PL/SQL packages:

- `DBMS_RULE`
- `DBMS_RULE_ADM`

You can use the `DBMS_RULE_ADM` package to create and administer rules, rule sets, and evaluation contexts, and you can use the `DBMS_RULE` package to evaluate rules.

When you use Replication (Oracle GoldenGate and XStream), rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Replication (Oracle GoldenGate and XStream) packages use rules:

- `DBMS_APPLY_ADM`
- `DBMS_CAPTURE_ADM`
- `DBMS_PROPAGATION_ADM`

306.3.1 RE\$ATTRIBUTE_VALUE Type

RE\$ATTRIBUTE_VALUE type specifies the value of a variable attribute.

Note:

Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (
  variable_name  VARCHAR2(32),
  attribute_name VARCHAR2(4000),
  attribute_value ANYDATA);
```

Attributes

Table 306-2 RE\$ATTRIBUTE_VALUE Attributes

Attribute	Description
variable_name	Specifies the variable used in a rule
attribute_name	Specifies the attribute name. The attribute name can be a multi-component name, such as a1.b2.c3.
attribute_value	Specifies the attribute value

306.3.2 RE\$ATTRIBUTE_VALUE_LIST Type

The RE\$ATTRIBUTE_VALUE_LIST type identifies a list of attribute values.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

306.3.3 RE\$COLUMN_VALUE Type

RE\$COLUMN_VALUE type specifies the value of a table column.

Note:

Enclose the column name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE (
  table_alias  VARCHAR2(32),
```

```
column_name  VARCHAR2(4000),
column_value ANYDATA);
```

Attributes

Table 306-3 RE\$COLUMN_VALUE Attributes

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
column_name	Specifies the column name
column_value	Specifies the column value

306.3.4 RE\$COLUMN_VALUE_LIST Type

RE\$COLUMN_VALUE_LIST type identifies a list of column values.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

306.3.5 RE\$NAME_ARRAY Type

RE\$NAME_ARRAY type identifies a list of names.

Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

306.3.6 RE\$NV_ARRAY Type

RE\$NV_ARRAY type identifies a list of name-value pairs.

Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

306.3.7 RE\$NV_LIST Type

identifies an object containing a list of name-value pairs and methods that operate on this list.

This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
  actx_list SYS.RE$NV_ARRAY);
```

Attributes

Table 306-4 RE\$NV_LIST Attributes

Attribute	Description
actx_list	The list of name-value pairs

RE\$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE\$NV_LIST type:

- [ADD_PAIR Member Procedure](#)
- [GET_ALL_NAMES Member Function](#)
- [GET_VALUE Member Function](#)
- [REMOVE_PAIR Member Procedure](#)

ADD_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

**Note:**

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE ADD_PAIR(
    name    IN VARCHAR2,
    value   IN ANYDATA);
```

Parameters

Table 306-5 ADD_PAIR Procedure Parameters

Parameter	Description
name	The name in the name-value pair being added to the list. If the name exists in the list, then this procedure raises an error.
value	The value in the name-value pair being added to the list

GET_ALL_NAMES Member Function

Returns a list of all the names in the name-value pair list.

Syntax

```
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;
```

GET_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

Note:

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER FUNCTION GET_VALUE (  
    name IN VARCHAR2)  
RETURN ANYDATA;
```

Parameters

Table 306-6 GET_VALUE Function Parameters

Parameter	Description
name	The name whose value to return

REMOVE_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

Note:

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE REMOVE_PAIR (  
    name IN VARCHAR2);
```

Parameters

Table 306-7 REMOVE_PAIR Procedure Parameters

Parameter	Description
name	The name of the pair to remove

306.3.8 RE\$NV_NODE Type

RE\$COLUMN_VALUE type identifies a name-value pair.

Note:

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$NV_NODE (  
    nvn_name    VARCHAR2(30),  
    nvn_value   ANYDATA);
```

Attributes

Table 306-8 RE\$NV_NODE Attributes

Attribute	Description
nvn_name	Specifies the name in the name-value pair
nvn_value	Specifies the value in the name-value pair

306.3.9 RE\$RULE_HIT Type

The RE\$RULE_HIT type specifies a rule found because of an evaluation.

See Also:

- [CREATE_RULE Procedure](#)
- [ALTER_RULE Procedure](#)

Syntax

```
TYPE SYS.RE$RULE_HIT (  
    rule_name          VARCHAR2(65),  
    rule_action_context RE$NV_LIST);
```

Attributes**Table 306-9 RE\$RULE_HIT Attributes**

Attribute	Description
rule_name	The rule name in the form <i>schema_name.rule_name</i> . For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>"hr"."employee_rule"</code> .
rule_action_context	The rule action context as specified in the <code>CREATE_RULE</code> or <code>ALTER_RULE</code> procedure of the <code>DBMS_RULE_ADM</code> package

306.3.10 RE\$RULE_HIT_LIST Type

The `RE$RULE_HIT_LIST` type identifies a list of rules found because of an evaluation.

Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

306.3.11 RE\$RULE_NAME Type

The `RE$RULE_HIT` type is create to allow use to pass a list of rule as argument.

Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME AS OBJECT (
  rule_name          IN          varchar2,
  evaluation_context IN          varchar2);
```

Attributes**Table 306-10 RE\$RULE_NAME Attributes**

Attribute	Description
rule_name	The rule name in the form <i>SCHEMA_NAME.RULE_NAME</i> . For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>"hr"."employee_rule"</code> .
Evaluation_context	The evaluation context as specified in the <code>CREATE_RULE</code> or <code>ALTER_RULE</code> procedure of the <code>DBMS_RULE_ADM</code> package

306.3.12 RE\$RULE_NAME_LIST Type

`RE$RULE_HIT_LIST` type Identifies a list of Rule Name values.

Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME_LIST AS VARRAY(1024) OF SYS.RE$RULE_NAME;
```

306.3.13 RE\$TABLE_ALIAS Type

RE\$TABLE_ALIAS type provides the table corresponding to an alias used in a rule evaluation context.

A specified table name must satisfy the schema object naming rules.

Note:

Enclose the table name in double quotation marks (") if the name contains special characters.

See Also:

Oracle Database SQL Language Reference for information about schema object naming rules

Syntax

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(  
    table_alias VARCHAR2(32),  
    table_name  VARCHAR2(194));
```

Attributes

Table 306-11 RE\$TABLE_ALIAS Attributes

Attribute	Description
table_alias	The alias used for the table in a rule
table_name	The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following: <i>schema_name.table_name</i> <i>table_name</i> For example, if the <i>schema_name</i> is <i>hr</i> and the <i>table_name</i> is <i>employees</i> , then enter the following: <i>hr.employees</i>

306.3.14 RE\$TABLE_ALIAS_LIST Type

The RE\$TABLE_ALIAS_LIST type identifies a list of table aliases used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

306.3.15 RE\$TABLE_VALUE Type

The RE\$TABLE_VALUE type specifies the value of a table row using a ROWID.

Syntax

```
TYPE SYS.RE$TABLE_VALUE(  
    table_alias VARCHAR2(32),  
    table_rowid VARCHAR2(18));
```

Attributes

Table 306-12 RE\$TABLE_VALUE Attributes

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
table_rowid	Specifies the rowid for the table row

306.3.16 RE\$TABLE_VALUE_LIST Type

The RE\$TABLE_VALUE_LIST type identifies a list of table values.

Note:

Each table alias in the list in the list must be unique.

Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

306.3.17 RE\$VALUE Type

The RE\$VALUE type represents one datapoint value element.

Syntax

```
TYPE SYS.RE$VALUE (  
    table_values          IN      SYS.RE$TABLE_VALUE_LIST:= NULL,  
    column_values        IN      SYS.RE$COLUMN_VALUE_LIST:=NULL,  
    variable_values      IN      SYS.RE$VARIABLE_VALUE_LIST:=NULL,  
    attribute_values     IN      SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL)
```

Attributes

Table 306-13 RE\$VALUE Attributes

Attribute	Description
table_values	ROWID of table row for expression evaluation
column_values	Values of columns referred in the expression
variable_values	Values of variables referred in expression
attribute_values	Values of attributes referred in expression

306.3.18 RE\$VALUE_LIST Type

RE\$TABLE_VALUE_LIST type is a varray for defining a list of RE\$VALUE type. It represents a list of datapoint element.

Syntax

```
CREATE OR REPLACE TYPE SYS.RE$VALUE_LIST AS VARRAY(1024) OF SYS.RE$VALUE;
```

306.3.19 RE\$VARIABLE_TYPE Type

The RE\$VARIABLE_TYPE type provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

Note:

Enclose the variable name in double quotation marks (") if the name contains special characters.

See Also:

Oracle Database SQL Language Reference for information about schema object naming rules

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (
  variable_name          VARCHAR2(32),
  variable_type          VARCHAR2(4000),
  variable_value_function VARCHAR2(228),
  variable_method_function VARCHAR2(228));
```

Attributes

Table 306-14 RE\$VARIABLE_TYPE Attributes

Attribute	Description
<code>variable_name</code>	The variable name used in a rule
<code>variable_type</code>	The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the <i>Oracle Database SQL Language Reference</i> for more information about these types.
<code>variable_value_function</code>	A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the " Usage Notes " for more information.
<code>variable_method_function</code>	Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the " Usage Notes " for more information.

Usage Notes

The functions for both the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

```
schema_name.package_name.function_name@dblink
```

Any of the following parts of the format can be omitted: *schema_name*, *package_name*, and *@dblink*.

For example, if the *schema_name* is *hr*, the *package_name* is *var_pac*, the *function_name* is *func_value*, and the *dblink* is *dbs1.net*, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

Signature for `variable_value_function`

The function must have the following signature:

```
FUNCTION variable_value_function_name(
  evaluation_context_schema IN VARCHAR2,
  evaluation_context_name   IN VARCHAR2,
  variable_name              IN VARCHAR2,
  event_context              IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```

Signature for variable_method_function

This function must have the following signature:

```

FUNCTION variable_method_function_name(
  evaluation_context_schema IN VARCHAR2,
  evaluation_context_name  IN VARCHAR2,
  variable_value           IN SYS.RE$VARIABLE_VALUE,
  method_name              IN VARCHAR2,
  event_context            IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;

```

306.3.20 RE\$VARIABLE_TYPE_LIST Type

The RE\$VARIABLE_TYPE_LIST type identifies a list of variables and their types used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

306.3.21 RE\$VARIABLE_VALUE Type

The RE\$VARIABLE_VALUE type specifies the value of a variable.

Note:

Enclose the variable name in double quotation marks (") if the name contains special characters.

Syntax

```

TYPE SYS.RE$VARIABLE_VALUE (
  variable_name VARCHAR2(32),
  variable_data ANYDATA);

```

Attributes

Table 306-15 RE\$VARIABLE_VALUE Attributes

Attribute	Description
variable_name	Specifies the variable name used in a rule
variable_data	Specifies the data for the variable value

306.3.22 RE\$VARIABLE_VALUE_LIST Type

The RE\$VARIABLE_VALUE_LIST type identifies a list of variable values.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

307

SODA Types

There are several SODA types: `SODA_DOCUMENT_T`, `SODA_COLLECTION_T`, `SODA_OPERATION_T`, and `SODA_CURSOR_T`. `SODA_DOCUMENT_T` and `SODA_COLLECTION_T` represent two primary abstractions provided by SODA: document and collections. `SODA_OPERATION_T` is used for specifying condition of operations on the collection. `SODA_CURSOR_T` is a cursor over results of read operations on the collection.

This chapter contains the following topics:

- [SODA Types Overview](#)
- [SODA Types Security Model](#)
- [Summary of SODA Types](#)

307.1 SODA Types Overview

There are several SODA types: `SODA_DOCUMENT_T`, `SODA_COLLECTION_T`, `SODA_OPERATION_T`, and `SODA_CURSOR_T`. `SODA_DOCUMENT_T` and `SODA_COLLECTION_T` represent two primary abstractions provided by SODA: document and collections. `SODA_OPERATION_T` is used for specifying condition of operations on the collection. `SODA_CURSOR_T` is a cursor over results of read operations on the collection.

See Also:

- [Oracle Database SODA for PL/SQL Developer's Guide](#)
- [DBMS_SODA](#)

307.2 SODA Types Security Model

The SODA Types are available to users with the `SODA_APP` role.

All SODA types are `SYS` types. `PUBLIC` is granted `EXECUTE` privilege on the SODA types described in this chapter:

- `TYPE SODA_Collection_T`
- `TYPE SODA_Document_T`
- `TYPE SODA_Operation_T`
- `TYPE SODA_Cursor_T`

307.3 Summary of SODA Types

This chapter lists the SODA types and describes them.

Table 307-1 SODA Types

Type	Description
SODA_Collection_T Type	This SODA type represents a SODA collection. This type is not persistable.
SODA_Document_T Type	This SODA type represents a document with content, usually in JSON format. This type is not persistable.
SODA_OPERATION_T Type	This SODA type performs read/write operations, such as document finds with filtering and pagination, removes, and replaces on a SODA collection. This type is not persistable.
SODA_CURSOR_T Type	This SODA type represents the result set of documents. This type is not persistable.

307.3.1 SODA_Collection_T Type

This SODA type represents a SODA collection. A reference of SODA collection can only be obtained by either calling `DBMS_SODA.CREATE_COLLECTION()` or `DBMS_SODA.OPEN_COLLECTION()`.

Table 307-2 SODA_Collection_T Type Subprograms

Subprogram	Description
CREATE_INDEX Function	Creates an index using an index specification expressed in JSON. Three types of specifications are supported. Each specifying a different type of index: for B-tree, JSON search with Data Guide, and Spatial.
CREATE_VIEW_FROM_DG Function	Creates a view with relational columns, using scalar JSON fields as specified in the data guide.
DROP_INDEX Function	Drops the named index.
FIND Function	Returns the <code>SODA_OPERATION_T</code> object. This is the only way to get the reference of <code>SODA_Operation_T</code> as there is no constructor.
FIND_ONE Function	Fetches the document matching the key.
GET_DATA_GUIDE Function	Returns the JSON data guide as a CLOB.
GET_INDEX Function	This function returns the specification for the supplied index created on the collection.

Table 307-2 (Cont.) SODA_Collection_T Type Subprograms

Subprogram	Description
GET_METADATA Function	Returns the metadata of the collection in JSON format.
GET_NAME Function	Returns the name of the collection.
INSERT_ONE Function	Inserts a document into the collection.
INSERT_ONE_AND_GET Function	Inserts a document into the collection and returns a result document with all components except for content.
LIST_INDEXES Function	This function returns the specifications for all the indexes created on the collection.
REMOVE_ONE Function	Removes the document matching the key.
REPLACE_ONE Function	Replaces the content and (optionally) the media type of the document matching the key.
REPLACE_ONE_AND_GET Function	Replaces the content and (optionally) the media type of the document matching the key and returns a result document with all components (except content).
SAVE Function	Saves a document into the collection.
SAVE_AND_GET Function	Saves a document into the collection.
TRUNCATE Function	Deletes all documents in the collection.

307.3.1.1 CREATE_INDEX Function

This function creates an index using an index specification expressed in JSON. Three types of specifications are supported. Each specifying a different type of index: for B-tree, JSON search with Data Guide, and Spatial.

Syntax

```
CREATE_INDEX (
    specification VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 307-3 CREATE_INDEX Function Parameters

Parameter	Description
specification	The index specification.

Example 307-1 Return Values

The function returns:

- 1—if the index was successfully created
- 0—if the index was not created

Exceptions

Error—If an error occurs creating the index.

See Also:

For more information about SODA Index specifications, see:

- Overview of SODA Indexing
- SODA Index Specifications (Reference)

307.3.1.2 CREATE_VIEW_FROM_DG Function

This function creates a view with relational columns, using scalar `JSON` fields as specified in the data guide. A data guide enabled `JSON` search index is not required for this function; the data guide is passed to the function. An error is thrown if the data guide passed to the function is invalid.

This procedure is available only for Autonomous Database starting 19c release.

Syntax

```
CREATE_VIEW_FROM_DG (
  data_guide          IN   CLOB,
  view_name           IN   VARCHAR2,
  materialize         IN   BOOLEAN DEFAULT FALSE,
  mv_refresh_mode     IN   NUMBER DEFAULT 1,
  path                IN   VARCHAR2 DEFAULT '$',
  resolve_name_conflicts IN  BOOLEAN  DEFAULT FALSE,
  col_name_prefix     IN   VARCHAR2 DEFAULT NULL,
  mixed_case_columns  IN   BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 307-4 CREATE_VIEW_FROM_DG Function Parameters

Parameter	Description
<code>data_guide</code>	Data guide of the collection.
<code>view_name</code>	Name of the view to be created.
<code>materialize</code>	A boolean value to indicate if the view should be materialized or not. The default value is <code>FALSE</code> .
<code>mv_refresh_mode</code>	The materialized view refresh mode. Possible values are: <ul style="list-style-type: none"> • <code>DBMS_SODA.MV_REFRESH_ON_STATEMENT</code> (default) • <code>DBMS_SODA.MV_REFRESH_ON_COMMIT</code> • <code>DBMS_SODA.MV_REFRESH_ON_DEMAND</code>

Table 307-4 (Cont.) CREATE_VIEW_FROM_DG Function Parameters

Parameter	Description
<code>path</code>	<p>The path of the JSON field to be expanded. It uses JSON path expression syntax. For example:</p> <ul style="list-style-type: none"> • <code>\$</code> will create a view starting from the JSON document root • <code>\$.purchaseOrder</code> will create a view starting from <code>purchaseOrder</code>. It expands the children or descendants under <code>purchaseOrder</code>, and create view columns for every scalar value. <p>The default value is <code>\$</code>.</p>
<code>resolve_name_conflicts</code>	<p>By default, if there are conflicts among <code>o:preferred_column_name</code>, an error is raised. If you set this parameter to <code>TRUE</code>, the procedure automatically resolves the view column name conflicts by appending a sequence number.</p> <p>The default value is <code>FALSE</code>.</p>
<code>col_name_prefix</code>	<p>By default, the view column name is the same as the JSON field name. This parameter allows you to provide a prefix to prepend to the view column names.</p> <p>The default value is <code>NULL</code>.</p>
<code>mixed_case_columns</code>	<p>By default, the view column names are case sensitive. This parameter allows you to change the behavior to case insensitive. The default value is <code>FALSE</code>.</p>

Return Values

The function returns:

- 1—if the procedure is successfully completed
- 0—if the procedure could not be successfully completed

Exceptions

Error—If an error occurs if the function was unable to create a view.

**See Also:**

For more info on the JSON data guide, see [JSON Data Guide](#)

307.3.1.3 DROP_INDEX Function

This function drops the named index.

Syntax

```
DROP_INDEX (  
    index_Name IN VARCHAR2,  
    force      IN BOOLEAN DEFAULT FALSE)  
RETURN NUMBER;
```

Example 307-2 Parameters

Table 307-5 DROP_INDEX Function Parameters

Parameter	Description
index_Name	The name of the index.
force	The force parameter can be TRUE or FALSE. Should only be set to TRUE for dropping a JSON search index or spatial index (not B-tree index). For more information, see DROP INDEX

Return Values

The function returns:

- 1—If the index was successfully dropped
- 0—If the index was not dropped. For example, if there was no existing index with the specified name.

Exceptions

Error—if an error occurs while dropping the index.

307.3.1.4 FIND Function

This function returns the operation type for the collection. The operation type allows building and executing various read/write operations. This is the only way to get the reference of `SODA_Operation_T` as there is no constructor.

Syntax

```
FIND ()  
RETURN SODA_Operation_T;
```

Return Values

This function returns `SODA_OPERATION_T` object.

Exceptions

This function does not throw any exception.

307.3.1.5 FIND_ONE Function

This function fetches the document matching the given key.

Syntax

```
FIND_ONE (  
    key          IN VARCHAR2)  
RETURN SODA_Document_T;
```

Parameters

Table 307-6 FIND_ONE Function Parameters

Parameter	Description
key	The key of the document to be fetched.

Return Values

This function returns the document that matches the key. Returns `NULL` if no match is found.

Exceptions

`Error`—If an error occurs while finding the document.

307.3.1.6 GET_DATA_GUIDE Function

This function fetches the JSON data guide as a CLOB. The JSON data guide is essentially inferred schema for the JSON documents in the collection. In order to be able to return the JSON data guide, a collection must have a JSON Search Index defined on it, with the data guide enabled.

Syntax

```
GET_DATA_GUIDE (  
RETURN CLOB;
```

Return Values

The function returns the JSON data guide as a CLOB.

See Also:

For more info on the JSON data guide, see [JSON Data Guide](#)

Exceptions

`Error`—If an error occurs while fetching the data guide.

307.3.1.7 GET_INDEX Function

This function returns the specification for the supplied index created on the collection.

Syntax

```
GET_INDEX (  
    index_name          IN VARCHAR2,  
    schema_name        IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 307-7 GET_INDEX Function Parameters

Parameter	Description
index_name	The name of the index to be described.
schema_name	Name of the schema containing the index. This parameter is optional. If this parameter is not set, the method will look for the specified index in the schema from which this method is called.

Return Values

The function returns the index specification in JSON format.

Exceptions

Error—If an error occurs while returning the index specification.

307.3.1.8 GET_METADATA Function

This function returns the metadata of the collection in JSON format.

Syntax

```
GET_METADATA ()  
RETURN VARCHAR2;
```

Return Values

This function returns the metadata of the collection in JSON format.

307.3.1.9 GET_NAME Function

This function returns the name of the collection.

Syntax

```
GET_NAME ()  
RETURN NVARCHAR2;
```

Return Values

This function returns the name of the collection.

307.3.1.10 INSERT_ONE Function

This function inserts a document into the collection.

Syntax

```
INSERT_ONE (
    document      IN SODA_Document_T)
RETURN NUMBER;
```

Parameters**Table 307-8 INSERT_ONE Function Parameters**

Parameter	Description
document	The input document.

Return Values

The function returns a number— 1 if the doc was inserted successfully, 0 otherwise.

Exceptions

Error—If an error occurs while inserting the document into the collection.

307.3.1.11 INSERT_ONE_AND_GET Function

This function inserts a document into the collection.

Syntax

```
INSERT_ONE_AND_GET (
    document      IN SODA_Document_T,
    hint          IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

Parameters**Table 307-9 INSERT_ONE_AND_GET Function Parameters**

Parameter	Description
document	The input document.
hint	A hint string in Oracle SQL format, without the enclosing /*+ and */. This parameter is optional.

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content.

Exceptions

Error—If an error occurs while inserting the document into the collection.

307.3.1.12 LIST_INDEXES Function

This function returns the specifications for all the indexes created on the collection.

Syntax

```
LIST_INDEXES ( )  
  RETURN SODA_Index_List_T;
```

Return Values

The function returns index specifications in `JSON` format as an instance of `SODA_Index_List_T`.

Exceptions

Error—If an error occurs while returning the index specification.

307.3.1.13 REMOVE_ONE Function

This function removes the document matching the given key.

Syntax

```
REMOVE_ONE (   
  key          IN VARCHAR2)   
  RETURN NUMBER;
```

Parameters

Table 307-10 REMOVE_ONE Function Parameters

Parameter	Description
key	The key of the document.

Return Values

This function returns the following values:

- 1—If the document was successfully removed.
- 0—If the document with the specified key was not found.

Exceptions

Error—If an error occurs while deleting the document from the collection.

307.3.1.14 REPLACE_ONE Function

This function updates the existing document with a new content and media type using the key. Any components set in `document` with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE (
    key          IN VARCHAR2,
    document     IN SODA_Document_T)
RETURN NUMBER;
```

Parameters

Table 307-11 REPLACE_ONE Parameters

Parameter	Description
<code>key</code>	The key of the document.
<code>document</code>	The document with the new content and media type to replace the old one.

Return Values

This function returns a number—1 if the document was replaced, 0 otherwise.

Exceptions

Error—If an error occurs while replacing the document in the collection.

307.3.1.15 REPLACE_ONE_AND_GET Function

This function updates the existing document with a new content and media type using the key. Any components set in `document` with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE_AND_GET (
    key          IN VARCHAR2,
    document     IN SODA_Document_T)
RETURN SODA_Document_T;
```

Parameters

Table 307-12 REPLACE_ONE_AND_GET Function Parameters

Parameter	Description
<code>key</code>	The key of the document.
<code>document</code>	The document with the new content and media type to replace the old one.

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content. Last-modified and version components, if supported by the given collection, will be updated with new values. If no document in the collection had the supplied key, `NULL` is returned instead of the result document.

Exceptions

Error—If an error occurs while replacing the document in the collection.

307.3.1.16 SAVE Function

This function saves a document into the collection. This function is equivalent to the `INSERT_ONE(document)` function except that if client-assigned keys are used, and the document with the specified key already exists in the collection, it will be replaced with the input document. The key is automatically created, unless this collection is configured with client-assigned keys and the key is provided in the input document.

Syntax

```
SAVE (
    document IN SODA_Document_T)
RETURN NUMBER;
```

Parameters**Table 307-13 SAVE Parameters**

Parameter	Description
document	The input document. This cannot be null.

Return Values

The function returns a number- 1 if the function successfully completed, 0 otherwise.

Exceptions

Error—If an error occurs while saving the document.

307.3.1.17 SAVE_AND_GET Function

This function saves a document into the collection. This method is equivalent to `INSERT_ONE_AND_GET(document)` except that if client-assigned keys are used, and the document with the specified key already exists in the collection, it will be replaced with the input document. The key will be automatically created, unless this collection is configured with client-assigned keys and the key is provided in the input document.

Syntax

```
SAVE_AND_GET (
    document      IN SODA_Document_T,
    hint          IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

Parameters

Table 307-14 SAVE_AND_GET Function Parameters

Parameter	Description
document	The input document. This cannot be null.
hint	A hint string in Oracle SQL format, without the enclosing /*+ and */. This parameter is optional.

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content.

Exceptions

Error—If an error occurs while saving or getting the document.

307.3.1.18 TRUNCATE Function

This function deletes all documents in the collection.

Syntax

```
TRUNCATE ( )  
  RETURN Number;
```

Return Values

The function returns:

- 1—if the function is successfully completed
- 0—if the function could not be successfully completed

Exceptions

Error—if an error occurs while deleting the documents in the collection.

307.3.2 SODA_Document_T Type

This SODA type represents a document with content, that is usually in JSON format.

This type is not persistable pl/sql type. However, SODA is a system that basically provides persistence — it has read and write operations. So you do not persist SODA_DOCUMENT_T directly, but you pass it to a write operation (like insert or replace), which is defined on SODA_COLLECTION_T, in order to write the document content and other components to the database.

A document has the following components:

- key
- content
- created-on timestamp

- last-modified timestamp
- version
- media type

Table 307-15 SODA_Document_T Type Subprograms

Subprogram	Description
GET_BLOB Function	Fetches the BLOB content of a BLOB-based document.
GET_CLOB Function	Fetches the CLOB content of a CLOB-based document.
GET_CREATED_ON Function	Fetches the created-on timestamp in VARCHAR2.
GET_DATA_TYPE Function	Fetches the SQL datatype of the document content with which it was created.
GET_JSON Function	Fetches the JSON content of a JSON-based document.
GET_KEY Function	Fetches the document key in VARCHAR2.
GET_LAST_MODIFIED Function	Fetches the last modified timestamp in VARCHAR2.
GET_MEDIA_TYPE Function	Fetches the media type of the document content in VARCHAR2.
GET_VARCHAR2 Function	Fetches the VARCHAR2 content of a VARCHAR2-based document.
GET_VERSION Function	Fetches the version of the document in VARCHAR2.
SODA_Document_T Function	There are three different SODA_DOCUMENT_T constructor functions. Each constructor function instantiates a document object using key, content, and media type.

307.3.2.1 GET_BLOB Function

This function fetches the BLOB content of the document. It assumes that the document was constructed with BLOB content, or was returned from a collection with BLOB content. Otherwise, an error is returned.

Syntax

```
GET_BLOB ()
RETURN BLOB;
```

Return Values

This function returns the BLOB content of a document.

Exceptions

SODA Error: If the document was initially not created with BLOB content.

307.3.2.2 GET_CLOB Function

The function fetches CLOB content of the document. It assumes that the document was constructed with CLOB content, or was returned from a collection with CLOB content. Otherwise, an error is returned.

Syntax

```
GET_CLOB ()
  RETURN CLOB;
```

Return Values

This function returns the CLOB content of a document.

Exceptions

SODA Error: If the document was initially not created with CLOB content.

307.3.2.3 GET_CREATED_ON Function

This function fetches the created-on timestamp. The timestamp string is in ISO-8601 format, in particular this form: YYYY-MM-DDThh:mm:ss.ssssssZ format. As indicated by the Z at the end, timestamps are returned in UTC (Z indicates zero UTC offset).

Syntax

```
GET_CREATED_ON ()
  RETURN VARCHAR2;
```

Return Values

This function returns the created-on timestamp.

307.3.2.4 GET_DATA_TYPE Function

This function fetches the SQL datatype of the document content with which it was created.

Syntax

```
GET_DATA_TYPE ()
  RETURN PLS_INTEGER;
```

Return Values

Table 307-16 GET_DATA_TYPE Return Values

Constant	Value	Description
DOC_VARCHAR2 CONSTANT PLS_INTEGER	1	VARCHAR2
DOC_BLOB CONSTANT PLS_INTEGER	2	BLOB

Table 307-16 (Cont.) GET_DATA_TYPE Return Values

Constant	Value	Description
DOC_CLOB CONSTANT PLS_INTEGER	3	CLOB
DOC_JSON CONSTANT PLS_INTEGER	4	JSON

307.3.2.5 GET_JSON Function

This function fetches the `JSON` content of the document. It assumes that the document was constructed with `JSON` type content, or was returned from a collection with `JSON` type content. Otherwise, an error is returned.

Syntax

```
GET_JSON ()  
RETURN JSON;
```

Return Values

This function returns the `JSON` content of a document.

Exceptions

`SODA Error`: If the document was initially not created with `JSON` content.

307.3.2.6 GET_KEY Function

This function fetches the document key.

Syntax

```
GET_KEY ()  
RETURN VARCHAR2;
```

Return Values

This function returns the document key.

307.3.2.7 GET_LAST_MODIFIED Function

This function fetches the last modified timestamp. The timestamp string is in `ISO-8601` format, in particular this form: `YYYY-MM-DDThh:mm:ss.ssssssZ` format. As indicated by the `Z` at the end, timestamps are returned in `UTC` (`Z` indicates zero `UTC` offset).

Syntax

```
GET_LAST_MODIFIED ()  
RETURN VARCHAR2;
```

Return Values

This function returns the last modified timestamp.

307.3.2.8 GET_MEDIA_TYPE Function

This function fetches the media type of the document content.

Syntax

```
GET_MEDIA_TYPE ()  
RETURN VARCHAR2;
```

Return Values

This function returns the media type of the document content. `application/JSON` is the media type for `JSON` documents (default).

307.3.2.9 GET_VARCHAR2 Function

This function fetches the `VARCHAR2` content of the document. It assumes that the document was constructed with `VARCHAR2` content, or was returned from a collection with `VARCHAR2` content. Otherwise, an error is returned.

Syntax

```
GET_VARCHAR2 ()  
RETURN VARCHAR2;
```

Return Values

This function returns the `VARCHAR2` content of a document.

Exceptions

SODA Error: If the document was initially not created with `VARCHAR2` content.

307.3.2.10 GET_VERSION Function

This function fetches the version of the document.

Syntax

```
GET_VERSION ()  
RETURN VARCHAR2;
```

Return Values

This function returns the version of the document.

307.3.2.11 SODA_Document_T Function

This function instantiates a document object using key, content, and media type. There are three different `SODA_DOCUMENT_T` constructor functions. The second parameter (`<v|b|c>_Content`) is different in each constructor. It is `VARCHAR2` in the first variant, `BLOB` in the second, and `CLOB` in the third.

Key and media type are optional parameters (will be defaulted to `NULL`). All three parameters can be set to `NULL`. If `media_Type` is set to `NULL`, it will be defaulted to `application/json`.

Use `key` and `j_Content` with the constructor to instantiate a document object using `key` and `content`. Media type parameter is not present in this constructor as the data is of `JSON` type. Therefore, media type is understood to be `application/json`.

Syntax

```
SODA_DOCUMENT_T (
    key          IN VARCHAR2 DEFAULT NULL,
    v_Content    IN VARCHAR2,
    media_Type   IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

```
SODA_DOCUMENT_T (
    key          IN VARCHAR2 DEFAULT NULL,
    b_Content    IN BLOB,
    media_Type   IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

```
SODA_DOCUMENT_T (
    key          IN VARCHAR2 DEFAULT NULL,
    c_Content    IN CLOB,
    media_Type   IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

```
SODA_DOCUMENT_T (
    key          IN VARCHAR2 DEFAULT NULL,
    j_Content    IN JSON)
RETURN SODA_Document_T;
```

Parameters

Table 307-17 SODA_Document_T Parameters

Parameter	Description
<code>key</code>	The key of the document.
<code>v_Content</code>	The content of the document in <code>VARCHAR2</code> format.
<code>b_Content</code>	The content of the document in <code>BLOB</code> format.
<code>c_Content</code>	The content of the document in <code>CLOB</code> format.
<code>j_Content</code>	The content of the document as <code>JSON</code> type instance.
<code>media_Type</code>	The media type of the document. The media type could be <code>application/json</code> for <code>JSON</code> documents.

Note:

`v_Content`, `b_Content`, and `c_Content` are not all parameters of a single `SODA_DOCUMENT_T` constructor function. Each one corresponds to a particular variant of the constructor function as shown in the `Syntax` section.

Return Values

This function returns a document of type `SODA_Document_T`.

307.3.3 SODA_OPERATION_T Type

This `SODA` type is used to perform read/write operations, such as document finds with filtering and pagination, removes, and replaces on a `SODA` collection.

Table 307-18 SODA_OPERATION_T Type Subprograms

Subprogram	Description
ACQUIRE_LOCK Function	This function ensures that the document(s) affected by a <code>read</code> operation are locked for update (which is equivalent to SQL <code>'select for update'</code>).
AS_OF_SCN Function	This function sets the SCN value for the operation.
AS_OF_TIMESTAMP Function	This function sets the the timestamp value for the operation.
COUNT Function	Returns a count of the number of documents in the collection that match the criteria. If <code>skip(...)</code> or <code>limit(...)</code> were chained together with this <code>count()</code> , an exception is raised.
FILTER Function	Sets the filter (also known as QBE or query-by-example) criteria on the operation. Returns the same <code>SODA_OPERATION_T</code> object so that further criteria can be chained together if required.
GET_CURSOR Function	Returns a <code>SODA_CURSOR_T</code> object that can be used to iterate over the documents that match the criteria.
GET_DATA_GUIDE Function	This function gets the data guide.
GET_ONE Function	Returns a single <code>SODA_DOCUMENT_T</code> object that matches the criteria. Note that, if multiple documents match the criteria, only the first document is returned.
HINT Function	This function sets the hint attribute of the operation.
KEY Function	Specifies that the document with the specified key should be returned. This causes any previous calls made to this function and <code>KEYS(...)</code> , when they appear in the same chain, to be ignored. Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.

Table 307-18 (Cont.) SODA_OPERATION_T Type Subprograms

Subprogram	Description
KEYS Function	<p>Specifies that documents that match the keys supplied to this function should be returned. This causes any previous calls made to this function and <code>KEY(...)</code>, when they appear in the same chain, to be ignored.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object, so that further operation criteria can be chained together, if needed.</p>
LIMIT Function	<p>Sets a limit on the specified number of documents the operation should return. This setting is only usable for read operations such as <code>GET_CURSOR</code>. For write operations, any value set using this method is ignored.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p>
REMOVE Function	<p>Removes all of the documents in the collection that match the criteria. Returns the number of documents that was removed.</p>
REPLACE_ONE Function	<p>Replaces a single document in the collection with the specified document. Returns a number that indicates if the document was replaced or not.</p> <p>Currently, before calling this function, you must call the function <code>KEY(...)</code> to uniquely identify the document being replaced. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.</p>
REPLACE_ONE_AND_GET Function	<p>Replaces a single document in the collection with the specified document. Returns a result document if the document was replaced, <code>NULL</code> otherwise.</p> <p>Currently, before calling this function, you must call the function <code>KEY(...)</code> to uniquely identify the document being replaced.</p> <p>This function is similar to <code>REPLACE_ONE</code>. The only difference is that <code>REPLACE_ONE_AND_GET</code> also returns the result document with updated components, such as version and last-modified timestamp. The result document does not contain the content component.</p> <p>Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.</p>
SAMPLE Function	<p>Sets the sampling parameters to be used for the operation.</p>

Table 307-18 (Cont.) SODA_OPERATION_T Type Subprograms

Subprogram	Description
SKIP Function	<p>Sets the number of documents that match the operation criteria that will be skipped from the operation result. This setting is only usable for read operations such as <code>GET_CURSOR</code>. For write operations, any value set using this method is ignored.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p>
VERSION Function	<p>Specifies that only documents with the supplied version should be returned. Typically, this is chained together with <code>KEY(...)</code> to implement optimistic locking for write operations such as <code>REMOVE</code> and <code>REPLACE</code>.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p>

307.3.3.1 ACQUIRE_LOCK Function

This function ensures that the the document(s) affected by a read operation are locked for update (which is equivalent to SQL 'select for update'). An operation involving `LOCK()` would be followed by another operation that updates the document in the collection. For example, via `REPLACE` or `REMOVE` functions. The lock will prevent other transactions from modifying the document in the meantime.

The next commit or rollback, performed after the operation involving this `ACQUIRE_LOCK()` function, will unlock the document, i.e. commit or rollback the transaction which is holding the lock on this document.

This function should only be used in conjunction with read operations, other than `COUNT()` and `GET_DATA_GUIDE()` functions.

Specifying it in conjunction with `SKIP` and `LIMIT` functions is also not allowed (an error is thrown).

If specified in conjunction with a write operation, such as, `REPLACE` or `REMOVE`, it's simply ignored and has no effect.

Syntax

```
ACQUIRE_LOCK ( )
RETURN SODA_Operation_T;
```

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

307.3.3.2 AS_OF_SCN Function

This function sets the SCN value for the operation.

Syntax

```
AS_OF_SCN (
    scn          IN NUMBER)
RETURN SODA_Operation_T;
```

Parameters**Table 307-19 AS_OF_SCN Function Parameters**

Parameter	Description
scn	The input value for SCN. This cannot be NULL.

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on.

307.3.3.3 AS_OF_TIMESTAMP Function

This function sets the the timestamp value for the operation.

Syntax

```
AS_OF_TIMESTAMP (
    timestamp    IN VARCHAR2)
RETURN SODA_Operation_T;
```

Parameters**Table 307-20 AS_OF_TIMESTAMP Function Parameters**

Parameter	Description
timestamp	The input timestamp. This cannot be NULL.

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on.

307.3.3.4 COUNT Function

This function returns a count of the number of documents in the collection that match the criteria. If skip(...) or limit(...) were chained together with this count(), an exception is raised.

Syntax

```
COUNT ()
RETURN NUMBER;
```

Return Values

This function returns the number of documents matching the criteria specified in the operation.

Exceptions

Error—If an error occurs while finding the count.

307.3.3.5 FILTER Function

Sets the filter (also known as QBE or query-by-example) criteria on the operation. Returns the same `SODA_OPERATION_T` object so that further criteria can be attached if needed.

Syntax

```
FILTER (
    qbe          IN VARCHAR2)
RETURN SODA_Operation_T;
```

Parameters**Table 307-21** FILTER Function Parameters

Parameter	Description
qbe	The string representing the query by example.

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

 **See Also:**

- Overview of SODA Filter Specifications (QBEs)
- SODA Filter Specifications (Reference)

307.3.3.6 GET_CURSOR Function

Returns a `SODA_CURSOR_T` object that can be used to iterate over the documents that match the criteria.

Syntax

(Optional) Enter syntax information here.

```
GET_CURSOR ()
RETURN SODA_Cursor_T;
```

Return Values

This function returns a `SODA_CURSOR_T` object that can be used to iterate over the documents that match the read operation criteria.

Exceptions

SODA Error: If an error occurs while fetching the cursor.

307.3.3.7 GET_DATA_GUIDE Function

This function gets the data guide.

Syntax

```
GET_DATA_GUIDE (
  format      IN PLS_INTEGER DEFAULT 1,
  flag        IN PLS_INTEGER DEFAULT 0)
RETURN CLOB;
```

Parameters

Table 307-22 GET_DATA_GUIDE Function Parameters

Parameter	Description
format	<p>The format of the data guide. This parameter can have one of the following values:</p> <ul style="list-style-type: none"> DBMS_SODA.DATAGUIDE_FORMAT_HIERARCHICAL CONSTANT PLS_INTEGER := 1; DBMS_SODA.DATAGUIDE_FORMAT_FLAT CONSTANT PLS_INTEGER := 2; <p>The default value is 1.</p>
flag	<p>This parameter can have one of the following values:</p> <ul style="list-style-type: none"> DBMS_SODA.DATAGUIDE_PRETTY CONSTANT PLS_INTEGER := 1; DBMS_SODA.DATAGUIDE_GEOJSON CONSTANT PLS_INTEGER := 2; DBMS_SODA.DATAGUIDE_GATHER_STATS CONSTANT PLS_INTEGER := 4; <p>The default value is 0.</p>

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

307.3.3.8 GET_ONE Function

Returns a single `SODA_DOCUMENT_T` object that matches the criteria. Note that, if multiple documents match the criteria, only the first document is returned.

Syntax

```
GET_ONE ()
RETURN SODA_Document_T;
```

Return Values

The first matching document.

Exceptions

`ERROR`—If an error occurs while fetching the document.

307.3.3.9 HINT Function

This function sets the hint attribute of the operation.

Syntax

```
HINT (  
    hint          IN VARCHAR2)  
RETURN SODA_Operation_T;
```

Parameters

Table 307-23 HINT Function Parameters

Parameter	Description
hint	A hint string in Oracle SQL format, with out the enclosing /*+ and */.

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

307.3.3.10 KEY Function

Specifies that the document with the specified key should be returned. This causes any previous calls made to this function and `KEYS(...)`, when they appear in the same chain, to be ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

Syntax

```
KEY (  
    key          IN VARCHAR2)  
RETURN SODA_Operation_T;
```

Parameters

Table 307-24 KEY Function Parameters

Parameter	Description
key	The key to be used for the operations.

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

307.3.3.11 KEYS Function

Specifies that documents that match the keys supplied to this function should be returned. This causes any previous calls made to this function and `key(...)`, when they appear in the

same chain, to be ignored. Returns the same `SODA_OPERATION_T` object, so that further operation criteria can be chained together, if needed.

Syntax

```
KEYS (
    key_list IN SODA_Key_List_T)
RETURN SODA_Operation_T;
```

Parameters

Table 307-25 KEYS Function Parameters

Parameter	Description
<code>key_list</code>	The parameter is a <code>SODA_Key_List_T</code> which is a list of <code>VARCHAR2</code> values representing keys. Assuming <code>key_list</code> is a variable of type <code>SODA_Key_List_T</code> , it can be initialized as follows: <code>key_list := SODA_Key_List_T('key1', 'key2', 'key3', etc);</code>

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

307.3.3.12 LIMIT Function

This function sets a limit on the specified number of documents the operation should return. This setting is only usable for read operations such as `GET_CURSOR`. For write operations, any value set using this method is ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

Syntax

```
LIMIT (
    limit IN NUMBER)
RETURN SODA_Operation_T;
```

Parameters

Table 307-26 LIMIT Function Parameters

Parameter	Description
<code>limit</code>	A limit on the number of results returned by read operations.

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

307.3.3.13 REMOVE Function

This function removes all of the documents in the collection that match the criteria. Returns the number of documents that was removed.

Syntax

```
REMOVE ()
RETURN NUMBER;
```

Return Values

This function returns the number of matching documents that were removed in the operation.

Exceptions

Error—If an error occurs while removing the documents.

307.3.3.14 REPLACE_ONE Function

This function replaces a single document in the collection with the specified document. Returns a number that indicates if the document was replaced or not. Currently, before calling this function, you must call the function `KEY(...)` to uniquely identify the document being replaced. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE (
    document IN SODA_Document_T)
RETURN NUMBER;
```

Parameters

Table 307-27 REPLACE_ONE Function Parameters

Parameter	Description
document	The document object with the new content and media type to be used for replacement.

Return Values

This function returns a number—1 if the document was replaced, 0 otherwise.

Exceptions

Error—If an error occurs while updating the collection.

307.3.3.15 REPLACE_ONE_AND_GET Function

Replaces a single document in the collection with the specified document. Returns a result document if the document was replaced, `NULL` otherwise. Currently, before calling this function, you must call the function `KEY(...)` to uniquely identify the document being replaced. This function is similar to `REPLACE_ONE`. The only difference is that `REPLACE_ONE_AND_GET` also

returns the result document with updated components, such as version and last-modified timestamp. The result document does not contain the content component. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE_AND_GET (
    document      IN SODA_Document_T)
RETURN SODA_Document_T;
```

Parameters

Table 307-28 REPLACE_ONE_AND_GET Function Parameters

Parameter	Description
document	The document object with the new content and media type to be used for replacement.

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content. Last-modified and version components, if supported by the given collection, will be updated with new values. If no document in the collection had the supplied key, `NULL` is returned instead of the result document.

Exceptions

Error—If an error occurs while updating the collection

307.3.3.16 SAMPLE Function

This function sets the sampling parameters to be used for the operation.

Syntax

```
SAMPLE (
    pct      IN DOUBLE,
    seed    IN NUMBER      DEFAULT NULL,
    method  IN PLS_INTREFER DEFAULT DBMS_SODA.SAMPLE_ROW)
RETURN SODA_Operation_T;
```

Parameters

Table 307-29 SAMPLE Function Parameters

Parameter	Description
pct	The percentage of the total documents or block count to be included in the sample. The value must be in the range .000001 to, but not including, 100. This percentage indicates the probability of each row or each cluster of rows in the case of block sampling, being selected as part of the sample. It does not mean that the database will retrieve exactly the percentage of documents in the collection.
seed	Specify this attribute to instruct the database to attempt to return the same sample from one execution to the next. The seed value must be an integer between 0 and 4294967295. If you omit this attribute, then the resulting sample will change from one execution to the next.
method	The type of sampling method to be used. Valid values are: <ul style="list-style-type: none"> DBMS_SODA.SAMPLE_ROW DBMS_SODA.SAMPLE_BLOCK

Return Values

This function returns the `SELF` operation object.

307.3.3.17 SKIP Function

This function sets the number of documents that match the operation criteria that will be skipped from the operation result. This setting is only usable for read operations such as `GET_CURSOR`. For write operations, any value set using this method is ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

Syntax

```
SKIP (
    offset          IN NUMBER)
RETURN SODA_Operation_T;
```

Parameters

Table 307-30 SKIP Function Parameters

Parameter	Description
offset	The number of documents to skip.

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on

307.3.3.18 VERSION Function

This function specifies that only documents with the supplied version should be returned. Typically, this is chained together with `KEY(...)` to implement optimistic locking for write operations such as `REMOVE` and `REPLACE`. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

Syntax

```
VERSION (
    version          IN VARCHAR2)
RETURN SODA_Operation_T;
```

Parameters**Table 307-31** VERSION Function Parameters

Parameter	Description
<code>version</code>	Document version to be used for the operation.

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on

307.3.4 SODA_CURSOR_T Type

This SODA type is used to represent a result set of documents.

Table 307-32 SODA_CURSOR_T Type Subprograms

Subprogram	Description
CLOSE Function	Closes the cursor.
HAS_NEXT Function	Returns <code>TRUE</code> , if the next document is available for the cursor. Otherwise, returns <code>FALSE</code> .
NEXT Function	Returns the next SODA documented pointed by the cursor.

307.3.4.1 CLOSE Function

This function closes the cursor.

Syntax

```
CLOSE ()
RETURN BOOLEAN;
```

Example 307-3 Return Values

This function returns a boolean value.

307.3.4.2 HAS_NEXT Function

This function returns `TRUE`, if the next document is available for the cursor. Otherwise, returns `FALSE`.

Syntax

```
HAS_NEXT ()  
  RETURN BOOLEAN;
```

Return Values

This function returns a boolean value. `TRUE`, if the next document is available for the cursor. Otherwise, returns `FALSE`.

Exceptions

`Error`—If an error occurs while checking if the next document is available.

307.3.4.3 NEXT Function

This function returns the next `SODA` documented pointed by the cursor.

Syntax

```
NEXT ()  
  RETURN SODA_Document_T;
```

Return Values

This function returns the next `SODA` documented pointed by the cursor. Returns `NULL` when the `HAS_NEXT` function returns `FALSE`.

Exceptions

`Error`—If an error occurs while getting the next document.

UTL Streams Types

UTL Streams Types describe abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the 'SYS' schema. The streams may be referenced by PUBLIC and are described in the following sections.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of UTL Binary Streams Types](#)

See Also:

For more information, see Oracle XML DB Developer's Guide

308.1 UTL Streams Types Security Model

EXECUTE on UTL Streams Types is granted to PUBLIC.

308.2 Summary of UTL Binary Streams Types

This table lists the UTL Binary Streams Types and briefly describes them.

Table 308-1 UTL Streams Types

Type	Description
UTL_BINARYINPUTSTREAM Type	Reads bytes and closes a stream.
UTL_BINARYOUTPUTSTREAM Type	Writes bytes and closes a stream.
UTL_CHARACTERINPUTSTREAM Type	Reads chars and closes a stream.
UTL_CHARACTEROUTPUTSTREAM Type	Writes chars and closes a stream.

308.2.1 UTL_BINARYINPUTSTREAM Type

This type is similar to `java.io.InputStream` in that it can only read and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (
```

```

MEMBER FUNCTION available (
    self    IN OUT NOCOPY Utl_BinaryInputStream)
RETURN INTEGER,

MEMBER FUNCTION read (
    self    IN OUT NOCOPY Utl_BinaryInputStream,
    numBytes IN           INTEGER DEFAULT 1)
RETURN RAW,

MEMBER PROCEDURE read (
    self    IN OUT NOCOPY Utl_BinaryInputStream,
    bytes   IN OUT NOCOPY RAW,
    numBytes IN OUT      INTEGER),

MEMBER PROCEDURE read (
    self    IN OUT NOCOPY Utl_BinaryInputStream,
    bytes   IN OUT NOCOPY RAW,
    offset  IN INTEGER,
    numBytes IN OUT      INTEGER),

member function close (
    self    In Out Nocopy Utl_BinaryInputStream)

) NOT FINAL;

```

Attributes

Table 308-2 UTL_BINARYINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	<ul style="list-style-type: none"> #1 - Reads the number of bytes specified by <code>numBytes</code> (default is 1) and returns the bytes as a RAW. If there are no remaining bytes a value of NULL is returned. #2 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>. Additionally, the actual number of bytes read is returned in parameter <code>numBytes</code>. If this parameter is set to 0 then there are no more bytes to be read. #3 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes read is returned in parameter <code>numBytes</code>. If this value is 0, then there are no additional bytes to be read.
CLOSE	Releases all resources held on the node to support the stream

308.2.2 UTL_BINARYOUTPUTSTREAM Type

This type is similar to `java.io.OutputStream` in that it can only write and close a stream.

Syntax

```

CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

    MEMBER FUNCTION write (
        self    IN OUT NOCOPY sys.utl_BinaryOutputStream,

```

```

        bytes      IN          RAW,
        numBytes   IN          INTEGER DEFAULT 1)
RETURN INTEGER,

MEMBER PROCEDURE write (                                -- #2
    self          IN OUT NOCOPY sys.utl_BinaryOutputStream,
    bytes         IN NOCOPY    RAW,
    numBytes      IN OUT      INTEGER),

MEMBER PROCEDURE write (                                -- #3
    self          IN OUT NOCOPY utl_BinaryOutputStream,    bytes      IN
NOCOPY          RAW,
    offset       IN          INTEGER,
    numBytes     IN OUT      INTEGER),

MEMBER PROCEDURE flush (
    self         IN OUT NOCOPY utl_BinaryOutputStream),

MEMBER PROCEDURE close (
    self         IN OUT NOCOPY utl_BinaryOutputStream)

) NOT FINAL;
```

Attributes

Table 308-3 UTL_BINARYOUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
WRITE	<ul style="list-style-type: none"> #1 - Writes the number of bytes specified by <code>numBytes</code> (default is 1) from <code>RAW</code> into the stream. The actual number of bytes written is returned. #2 - Writes the number of bytes specified in parameter <code>numBytes</code> from parameter <code>bytes</code> to the stream. The actual number of bytes written is returned in parameter <code>numBytes</code>. #3 - Writes the number of bytes specified by <code>numBytes</code> to the stream, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes written is returned in parameter <code>numBytes</code>.
FLUSH	Insures that any buffered bytes are copied to the node destination
CLOSE	Frees all resources associated with the stream

308.2.3 UTL_CHARACTERINPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```

CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

MEMBER FUNCTION available (
    self          IN OUT NOCOPY    utl_CharacterInputStream)
RETURN INTEGER,

MEMBER FUNCTION read (                                -- #1
    self          IN OUT NOCOPY    utl_CharacterInputStream,
    numChars     IN                INTEGER DEFAULT 1,
```

```

        lineFeed IN          BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2,

MEMBER PROCEDURE read (                                -- #2
    self      IN OUT NOCOPY utl_CharacterInputStream,
    chars     IN OUT NOCOPY VARCHAR2,
    numChars  IN OUT          INTEGER,
    lineFeed  IN BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE read (                                -- #3
    self      IN OUT NOCOPY utl_CharacterInputStream,
    chars     IN OUT NOCOPY VARCHAR2,
    offset    IN              INTEGER,
    numChars  IN OUT          INTEGER,
    lineFeed  IN              BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE close (
    self      IN OUT NOCOPY utl_CharacterInputStream)
) NOT FINAL;

```

Attributes

Table 308-4 UTL_CHARACTERINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	<ul style="list-style-type: none"> • #1 - Returns the number of characters remaining to be read • #2 - Reads the number of characters specified by numChars (default value is 1) and returns the characters as a VARCHAR2. If the value of lineFeed is true (default value is FALSE) then the reading stops if a linefeed character is found. If there are no remaining characters a value of NULL is returned. • #3 - Reads reads the number of characters specified by parameter numChars into the parameter chars. Additionally, the actual number of characters read is returned in parameter numChars. If this value is 0, then there are no more characters to be read. If the value of lineFeed is TRUE (default is FALSE), then reading stops if a linefeed character is encountered.
CLOSE	Releases all resources held by the stream

308.2.4 UTL_CHARACTEROUTPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (`chars`) and close a stream.

Syntax

```

CREATE OR REPLACE TYPE utl_CharacterOutputStream AS OBJECT (

MEMBER FUNCTION write (                                -- #1
    self      IN OUT NOCOPY utl_CharacterOutputStream,
    chars     IN              VARCHAR2,
    numChars  IN              INTEGER DEFAULT 1,
    lineFeed  IN              BOOLEAN DEFAULT FALSE)
RETURN INTEGER,

```

```

MEMBER PROCEDURE write (                                     -- #2
    self      IN OUT NOCOPY utl_CharacterOutputStream,
    chars     IN OUT NOCOPY VARCHAR2,
    numChars  IN OUT      INTEGER,
    lineFeed  IN          BOOLEAN DEFAULT FALSE),

member procedure write (                                     -- #3
    self      IN OUT NOCOPY utl_CharacterOutputStream,
    chars     IN NOCOPY    varchar2,
    offset    IN          integer,
    numChars  IN OUT      integer,
    lineFeed  IN          boolean default false),

MEMBER PROCEDURE flush (
    self      IN OUT NOCOPY utl_CharacterOutputStream),

MEMBER PROCEDURE close (
    self      IN OUT NOCOPY utl_CharacterOutputStream)

) NOT FINAL;

```

Attributes

Table 308-5 UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
WRITE	<ul style="list-style-type: none"> #1 - Writes the number of characters specified by <code>numChars</code> (default is 1) from parameter <code>chars</code> into the stream and returns the actual number of characters written. If the value of <code>lineFeed</code> is TRUE (default is FALSE) a <code>lineFeed</code> character is inserted after the last character. #2 - writes the number of characters specified by parameter <code>numChars</code>, from parameter <code>chars</code> into the stream. The actual number of characters written is returned in parameter <code>numChars</code>. If the value of <code>lineFeed</code> is true (default is FALSE) a <code>lineFeed</code> character is inserted after the last character. #3 - Writes the number of characters specified by parameter <code>numChars</code>, from parameter <code>chars</code>, beginning at <code>offset</code> specified by parameter <code>offset</code>. The actual number of characters written is returned in parameter <code>numChars</code>. If the value of <code>lineFeed</code> is true (default is FALSE) a <code>lineFeed</code> character is inserted after the last character .
FLUSH	Copies all characters that may be contained within buffers to the node value
CLOSE	Releases all resources held by the stream

XMLTYPE

`XMLType` is a system-defined opaque type for handling XML data. It has predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLAGG` SQL function.

This chapter contains the following topics:

- [Summary of XMLType Subprograms](#)

See Also:

- *Oracle XML DB Developer's Guide*

309.1 Summary of XMLType Subprograms

This table summarizes functions and procedures of `XMLType`.

Table 309-1 XMLTYPE Subprograms

Method	Description
CREATENONSCHMABASEDXML	Creates a non schema based XML from the input schema based instance.
CREATESCHMABASEDXML	Creates a schema based <code>XMLType</code> instance from the non-schema based instance using the input schema URL.
CREATEXML	Static function for creating and returning an <code>XMLType</code> instance.
EXISTSNODE	Takes a <code>XMLType</code> instance and a <code>XPath</code> and returns 1 or 0 indicating if applying the <code>XPath</code> returns a non-empty set of nodes.
EXTRACT	Takes a <code>XMLType</code> instance and an <code>XPath</code> , applies the <code>XPath</code> expression and returns the results as an <code>XMLType</code> .
GETBLOBVAL	Returns the value of the <code>XMLType</code> instance as a <code>BLOB</code> .
GETCLOBVAL	Returns the value of the <code>XMLType</code> instance as a <code>CLOB</code> .
GETNAMESPACE	Returns the namespace for the top level element in a schema based document.
GETNUMBERVAL	Returns the value of the <code>XMLType</code> instance as a <code>NUMBER</code> . This is only valid if the input <code>XMLType</code> instance contains a simple text node and is convertible to a number.
GETROOTELEMENT	Returns the root element of the input instance. Returns <code>NULL</code> if the instance is a fragment.

Table 309-1 (Cont.) XMLTYPE Subprograms

Method	Description
GETSCHEMAURL	Returns the XML schema URL if the input is an XML Schema based.
GETSTRINGVAL	Returns the value of the XMLType instance as a string.
ISFRAGMENT	Checks if the input XMLType instance is a fragment or not. A fragment is a XML instance, which has more than one root element.
ISSCHEMABASED	Returns 1 or 0 indicating if the input XMLType instance is a schema based one or not.
ISSCHEMAVALID	Checks if the input instance is schema valid according to the given schema URL.
ISSCHEMAVALIDATED	Checks if the instance has been validated against the schema.
SCHEMAVALIDATE	Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.
SETSCHEMAVALIDATED	Sets the schema valid flag to avoid costly schema validation.
TOOBJECT	Converts the XMLType instance to an object type.
TRANSFORM	Takes an XMLType instance and an associated stylesheet (which is also an XMLType instance), applies the stylesheet and returns the result as XML.
XMLTYPE	Constructs an instance of the XMLType datatype. The constructor can take in the XML as a CLOB, VARCHAR2 or take in a object type.

309.1.1 CREATENONSCHEMABASEDXML

This member function creates a non-schema based XML document from a schema based instance.

Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```

309.1.2 CREATESCHEMABASEDXML

This member function creates a schema based XMLType instance from a non-schema based XMLType value.

It uses either the supplied SCHEMA URL, or the SCHEMALOCATION attribute of the instance.

Syntax

```
MEMBER FUNCTION createSchemaBasedXML(
schema IN varchar2 := NULL)
return XMLType deterministic;
```

Table 309-2 CREATESCHEMABASEDXML Subprogram Parameters

Parameter	Description
schema	Optional XMLSchema URL used to convert the value to the specified schema.

309.1.3 CREATEXML

This static function creates and returns an `XMLType` instance. The string and `CLOB` parameters used to pass in the data must contain well-formed and valid XML documents.

The options are described in the following table.

Table 309-3 CREATEXML Subprograms

Syntax	Description
<pre> STATIC FUNCTION createXML(xmlData IN varchar2) RETURN XMLType deterministic; </pre>	Creates the <code>XMLType</code> instance from a string.
<pre> STATIC FUNCTION createXML(xmlData IN clob) RETURN XMLType deterministic; </pre>	Creates the <code>XMLType</code> instance from a <code>CLOB</code> .
<pre> STATIC FUNCTION createXML (xmlData IN clob, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) RETURN XMLType deterministic; </pre>	This static function creates a schema-based <code>XMLType</code> instance using the specified schema and xml data parameters.
<pre> STATIC FUNCTION createXML (xmlData IN varchar2, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) RETURN XMLType deterministic; </pre>	This static function creates a schema-based <code>XMLType</code> instance using the specified schema and xml data parameters.
<pre> STATIC FUNCTION createXML (xmlData IN "<ADT_1>", schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN NUMBER := 0) RETURN XMLType deterministic; </pre>	Creates an XML instance from an instance of an user-defined type.

Table 309-3 (Cont.) CREATEXML Subprograms

Syntax	Description
<pre> STATIC FUNCTION createXML (xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) RETURN XMLType deterministic; </pre>	Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.
<pre> STATIC FUNCTION createXML (xmlData IN AnyData, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) RETURN sys.XMLType deterministic parallel_enable </pre>	Creates an XML instance from ANYDATA. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.
<pre> STATIC FUNCTION createXML (xmlData IN blob, csid IN number, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic </pre>	Creates an XML instance from a BLOB.
<pre> STATIC FUNCTION createXML (xmlData IN bfile, csid IN number, Schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic </pre>	Creates an XML instance from a BFILE.

Table 309-4 CREATEXML Parameters

Parameter	Description
xmlData	The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema. Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>).
validated	Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)

Table 309-4 (Cont.) CREATEXML Parameters

Parameter	Description
wellformed	Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL). Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>).
csid	The character set id of input XML data.

309.1.4 EXISTSNODE

This member function checks if the node exists.

If the XPath string is NULL or the document is empty, then a value of 0 is returned, otherwise returns 1.

The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION existsNode(xpath IN varchar2) RETURN number deterministic;</pre>	Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.
<pre>MEMBER FUNCTION existsNode(xpath in varchar2, nsmap in varchar2) RETURN number deterministic;</pre>	This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.

Table 309-5 EXISTSNODE Subprogram Parameters

Parameter	Description
xpath	The XPath expression to test.
nsmap	Optional namespace mapping.

309.1.5 EXTRACT

This member function extracts an XMLType fragment and returns an XMLType instance containing the result nodes. If the XPath does not result in any nodes, it then returns NULL.

The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION extract(xpath IN varchar2) RETURN XMLType deterministic;</pre>	<p>Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType.</p>
<pre>MEMBER FUNCTION extract(xpath IN varchar2, nsmmap IN varchar2) RETURN XMLType deterministic;</pre>	<p>This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment.</p>

Table 309-6 EXTRACT Subprogram Parameters

Parameter	Description
xpath	The XPath expression to apply.
nsmmap	Optional prefix to namespace mapping information.

309.1.6 GETBLOBVAL

This member function returns a BLOB containing the serialized XML representation. If the BLOB returned is temporary, it must be freed after use.

Syntax

```
MEMBER FUNCTION getBlobVal(
    csid IN NUMBER)
RETURN BLOB DETERMINISTIC;
```

Table 309-7 GETBLOBVAL Subprogram Parameters

Parameter	Description
csid	The desired character set ID of output BLOB

309.1.7 GETCLOBVAL

This member function returns a CLOB containing the serialized XML representation. If the CLOB returned is temporary, it must be freed after use. The CLOBs returned by this function are read-only.

Syntax

```
MEMBER FUNCTION getClobVal()
RETURN clob deterministic;
```

309.1.8 GETNAMESPACE

GETNAMESPACE is a member function. It returns the namespace of the top level element in the instance. It returns NULL if the input is a fragment or is a non-schema based instance.

Syntax

```
MEMBER FUNCTION getNamespace  
return varchar2 deterministic;
```

309.1.9 GETNUMBERVAL

This is a member function. It returns a numeric value, formatted from the text value pointed to by the XMLType instance. The XMLType must point to a valid text node that contains a numerical value.

The options are described in the following table.

Syntax

```
MEMBER FUNCTION getNumberVal()  
RETURN number deterministic;
```

309.1.10 GETROOTELEMENT

this member function gets the root element of the XMLType instance. It returns NULL if the instance is a fragment.

Syntax

```
MEMBER FUNCTION getRootElement  
return varchar2 deterministic;
```

309.1.11 GETSCHEMAURL

This member function returns the XML Schema URL corresponding to the XMLType instance, if the XMLType instance is a schema-based document. Otherwise, it returns NULL.

Syntax

```
MEMBER FUNCTION getSchemaURL  
return varchar2 deterministic;
```

309.1.12 GETSTRINGVAL

This member function returns the document as a string. It returns a string containing the serialized XML representation, or in the case of text nodes, the text itself.

If the XML document exceeds the VARCHAR2 maximum size (4000), then an error is raised at run time.

Syntax

```
MEMBER FUNCTION getStringVal()  
RETURN varchar2 deterministic;
```

309.1.13 ISFRAGMENT

ISFRAGMENT determines if the XMLType instance corresponds to a well-formed document, or a fragment. It returns 1 or 0 indicating if the XMLType instance contains a fragment or a well-formed document.

Syntax

```
MEMBER FUNCTION isFragment()  
RETURN number deterministic;
```

309.1.14 ISSCHEMABASED

This member function determines whether the XMLType instance is schema-based or not. It returns 1 or 0 depending on whether the XMLType instance is schema-based.

Syntax

```
MEMBER FUNCTION isSchemaBased  
return number deterministic;
```

309.1.15 ISSCHEMAVALID

This member function checks if the input instance conforms to a specified schema. It does not change the validation status of the XML instance.

If an XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance's own schema.

Syntax

```
member function isSchemaValid(  
schurl IN VARCHAR2 := NULL,  
elem IN VARCHAR2 := NULL)  
return NUMBER deterministic;
```

Table 309-8 ISSCHEMAVALID Subprogram Parameters

Parameter	IN / OUT	Description
schurl	(IN)	The URL of the XML Schema against which to check conformance.
elem	(IN)	Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.

309.1.16 ISSCHEMAVALIDATED

This member function returns the validation status of the `XMLType` instance to tell if a schema-based instance has been actually validated against its schema. It returns 1 if the instance has been validated against the schema, 0 otherwise.

Syntax

```
MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
```

309.1.17 SCHEMAVALIDATE

This member procedure validates the XML instance against its schema, if it has not already been done.

For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

Syntax

```
MEMBER PROCEDURE schemaValidate(
    self IF OUT NOCOPY XMLType);
```

Table 309-9 SCHEMAVALIDATE Subprogram Parameters

Parameter	IN / OUT	Description
self	(OUT)	XML instance being validated against the schema.

309.1.18 SETSCHEMAVALIDATED

This member function sets the `VALIDATION` state of the input XML instance.

Syntax

```
MEMBER PROCEDURE setSchemaValidated(
    self IF OUT NOCOPY XMLType,
    flag IN BINARY_INTEGER := 1);
```

Table 309-10 SERTSSCHEMAVALIDATED Subprogram Parameters

Parameter	IN / OUT	Description
self	(OUT)	XML instance.
flag	(IN)	0 - NOT VALIDATED; 1 - VALIDATED (Default)

309.1.19 TOOBJECT

This member procedure converts the XML value to an object type using the `XMLSCHEMA` mapping, if available. If a `SCHEMA` is not supplied or the input is a non-schema based XML, the procedure uses canonical mapping between elements and object type attributes.

Syntax

```
MEMBER PROCEDURE toObject(
  SELF in XMLType,
  object OUT "<ADT_1>",
  schema in varchar2 := NULL,
  element in varchar2 := NULL);
```

Table 309-11 TOOBJECT Subprogram Parameters

Parameter	IN / OUT	Description
SELF	(IN)	Instance to be converted. Implicit if used as a member procedure.
object	(IN)	Converted object. An object instance of the required type may be passed in to this function
schema	(IN)	Schema URL. The mapping of the <code>XMLType</code> instance to the converted object instance may be specified using a schema. Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>).
element	(IN)	Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter. Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>).

309.1.20 TRANSFORM

This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs

If any of the arguments other than the parammap is `NULL`, then a `NULL` is returned.

Syntax

```
MEMBER FUNCTION transform(
  xsl IN XMLType,
  parammap in varchar2 := NULL)
RETURN XMLType deterministic;
```

Table 309-12 TRANSFORM Subprogram Parameters

Parameter	IN / OUT	Description
xsl	(IN)	The XSL stylesheet describing the transformation
parammap	(IN)	Top level parameters to the XSL - string of name=value pairs

309.1.21 XMLTYPE

This is an XMLType constructor.

The options are described in the following table.

Table 309-13 XMLTYPE Member Subprogram Parameters

Syntax	Description
<pre> constructor function XMLType(xmlData IN clob, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN Number := 0) return self as result deterministic;</pre>	<p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p>
<pre> constructor function XMLType(xmlData IN varchar2, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic;</pre>	<p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p>
<pre> constructor function XMLType (xmlData IN "w<ADT_1>", schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic;</pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.</p>
<pre> constructor function XMLType(xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) return self as result deterministic;</pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.</p>
<pre> constructor function XMLType(xmlData IN AnyData, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic parallel_enable</pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p>

Table 309-13 (Cont.) XMLTYPE Member Subprogram Parameters

Syntax	Description
<pre> constructor function XMLType(xmlData IN blob, csid IN number, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.</p>
<pre> constructor function XMLType(xmlData IN bfile, csid IN number, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified BFILE parameter.</p>

Table 309-14 XMLTYPE Constructor Subprogram Parameters

Parameter	Description
xmlData	The data in the form of a BFILE, BLOB, CLOB, REFS, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema. Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>).
validated	Indicates that the instance is valid to the given XML Schema.
wellformed	Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL). Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>).
csid	The character set id of input XML data.
