By analyzing the privileges that users must have to perform specific tasks, privilege analysis policies help you to achieve a least privilege model for your users.

141.2 DBMS_PRIVILEGE_CAPTURE Security Model

The privilege analysis administrator role, `CAPTURE_ADMIN`, is granted `EXECUTE` permission on the `DBMS_PRIVILEGE_CAPTURE` package by default.

The `CAPTURE_ADMIN` role is granted to the `DBA` role during database installation.

141.3 DBMS_PRIVILEGE_CAPTURE Constants

The `DBMS_PRIVILEGE_CAPTURE` package defines several enumerated constants for specifying parameter values.

Table 141-1 DBMS_PRIVILEGE_CAPTURE Constants

Constant	Value	Type	Description
G_DATABASE	1	NUMBER	Analyzes all privilege use, except privileges used by the SYS user.
G_ROLE	2	NUMBER	Analyzes privilege use for the specified roles.
G_CONTEXT	3	NUMBER	Analyzes privilege use when the condition parameter evaluates to true.
G_ROLE_AND_CONTEXT	4	NUMBER	Analyzes privilege use for the specified roles when the condition parameter evaluates to true.

141.4 DBMS_PRIVILEGE_CAPTURE Examples

These examples illustrate using the `DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE` procedure to create various types of privilege analysis, like database analysis, role analysis, and context-specific analysis. The examples also illustrate combining different conditions in context-specific analysis.

```
--Create a database privilege analysis policy
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'all_priv_analysis_pol',
    description   => 'database-wide policy to analyze all privileges',
    type         => DBMS_PRIVILEGE_CAPTURE.G_DATABASE);
END;

--Create a privilege analysis policy to analyze privileges from the role PUBLIC
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'pub_analysis_pol',
    description   => 'Policy to record privilege use by PUBLIC',
    type         => DBMS_PRIVILEGE_CAPTURE.G_ROLE,
    roles        => role_name_list('PUBLIC'));
END;

-- Create a policy to analyze privileges from the application module, "Account
-- Payable"
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'acc_pay_analysis_pol',
    type         => DBMS_PRIVILEGE_CAPTURE.G_CONTEXT,
    condition     => 'SYS_CONTEXT(''USERENV'', ''MODULE'') = ''Account Payable''');
END;

-- Create a policy that records privileges for session user APPS when running the
-- application module "Account Payable"
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'acc_pay_analysis_pol',
    type         => DBMS_PRIVILEGE_CAPTURE.G_CONTEXT,
    condition     => 'SYS_CONTEXT(''USERENV'', ''MODULE'') = ''Account Payable'' AND
                    SYS_CONTEXT(''USERENV'', ''SESSION_USER'') = ''APPS''');
END;
```

141.5 Summary of DBMS_PRIVILEGE_CAPTURE Subprograms

This table lists and briefly describes the DBMS_PRIVILEGE_CAPTURE package subprograms.

Table 141-2 DBMS_PRIVILEGE_CAPTURE Package Subprograms

Subprogram	Description
CAPTURE_DEPENDENCY_PRIVS Procedure	Captures the privileges that are used by definer's rights and invoker's rights PL/SQL program units for compilation.
CREATE_CAPTURE Procedure	Creates a policy that specifies the conditions for analyzing privilege use.
DELETE_RUN Procedure	Deletes a privilege analysis capture run
DISABLE_CAPTURE Procedure	Stops the recording of privilege use for a specified privilege analysis policy
DROP_CAPTURE Procedure	Removes a privilege analysis policy together with the data recorded
ENABLE_CAPTURE Procedure	Starts the recording of privilege analysis for a specified privilege analysis policy
GENERATE_RESULT Procedure	Populates the privilege analysis data dictionary views with data

141.5.1 CAPTURE_DEPENDENCY_PRIVS Procedure

This procedure captures the privileges that are used by definer's rights and invoker's rights PL/SQL program units for compilation.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS ();
```

Parameters

This procedure has no parameters.

Usage Notes

Every rerun of the DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS procedure deletes any existing records from the privilege analysis data dictionary views. It then recaptures records based on the existing PL/SQL program units.

141.5.2 CREATE_CAPTURE Procedure

This procedure creates a privilege analysis policy that specifies the conditions for analyzing privilege use. It also optionally specifies the roles for which privilege use is to be analyzed, and the conditions under which privilege use is to be analyzed.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE (
    name          IN VARCHAR2,
    description   IN VARCHAR2 DEFAULT NULL,
    type          IN NUMBER DEFAULT G_DATABASE,
    roles         IN ROLE_NAME_LIST DEFAULT ROLE_NAME_LIST(),
    condition     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 141-3 CREATE_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the privilege analysis policy. A string of size up to 30 characters.
description	Description of the policy (up to 1024 characters)
type	Type of the privilege analysis policy. Possible values are: <ul style="list-style-type: none"> G_DATABASE: Captures all privilege use in the database, except privileges used by the SYS user. G_ROLE: Captures the use of a privilege if the privilege is part of a specified role or list of roles. G_CONTEXT: Captures the use of a privilege if the context specified by the <code>condition</code> parameter evaluates to true. G_ROLE_AND_CONTEXT: Captures the use of a privilege if the privilege is part of the specified list of roles and when the condition specified by the <code>condition</code> parameter is true.
roles	The roles whose privileges are to be analyzed. Required if the type is G_ROLE or G_ROLE_AND_CONTEXT.
condition	PL/SQL boolean expression containing up to 4000 characters. Required if type is G_CONTEXT or G_ROLE_AND_CONTEXT. Note that the boolean expression can only contain SYS_CONTEXT, but not other functions.

Usage Notes

- When using role-based analysis for the `CREATE_CAPTURE` procedure, privilege use is analyzed even if the privilege is indirectly granted to the specified role.

For example, say role R2 contains role R1, and R1 contains privilege P1. If the privilege policy includes only role R2, any use of the P1 privilege is still analyzed, as privilege P1 is an indirect part of role R2.

- When using the `condition` parameter, use the following syntax for the PL/SQL expression:

```
condition ::= predicate | (predicate1) AND (predicate2)
            | (predicate1) OR (predicate2)
```

Where,

```
predicate ::= sys_context(namespace, attribute) relop constant_value |
sys_context(namespace, attribute) between constant_value and
constant_value | sys_context(namespace, attribute) in {constant_value
(,constant_value)* }
```

Where,

```
relop ::= = | < | <= | > | >= | <>
```

- A privilege analysis policy cannot analyze the use of SYS user privileges.

141.5.3 DELETE_RUN Procedure

This procedure deletes a privilege analysis capture run.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.DELETE_RUN (
    name          IN VARCHAR2,
    run_name      IN VARCHAR2);
```

Parameters

Table 141-4 *DELETE_RUN Procedure Parameters*

Parameter	Description
name	Name of the privilege analysis policy with which the capture run is associated
run_name	Name of the capture run

Usage Notes

- You can find the names of existing privilege capture policies by querying the DBA_PRIV_CAPTURES data dictionary view.
- Another way to delete a capture run is to drop the policy with which the capture run is associated. Dropping the policy automatically drops its associated capture runs.
- When you drop a capture run it is no longer accessible through the privilege capture data dictionary views.

141.5.4 DISABLE_CAPTURE Procedure

This procedure stops the recording of privilege use for a specified privilege analysis policy. When a policy is disabled, privilege use meeting the policy condition is no longer recorded.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.DISABLE_CAPTURE (
    name          IN VARCHAR2);
```

Parameters

Table 141-5 DISABLE_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the privilege analysis policy to be disabled

Usage Notes

When a privilege analysis policy is first created, it is disabled by default.

141.5.5 DROP_CAPTURE Procedure

This procedure removes a privilege analysis policy together with the data recorded. When a policy is removed, all previously recorded privilege use data associated with the policy is deleted.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.DROP_CAPTURE (
    name          IN VARCHAR2);
```

Parameters

Table 141-6 DROP_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the privilege analysis policy to be removed

Usage Notes

- You must disable a privilege analysis policy before removing it. An enabled policy cannot be removed.
- If there are capture runs associated with this policy, then they are automatically dropped when you drop the policy.

141.5.6 ENABLE_CAPTURE Procedure

This procedure starts the recording of privilege analysis for a specified privilege analysis policy and optionally provides a capture run for this policy. After a policy is enabled, all privilege use under the policy condition is recorded.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.ENABLE_CAPTURE (
    name          IN VARCHAR2,
    run_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 141-7 *ENABLE_CAPTURE Procedure Parameters*

Parameter	Description
name	Name of the privilege analysis policy to be enabled
run_name	Name of the capture run to associate with this policy, less than 128 characters. Enclose exotic characters in double quotation marks.

Usage Notes

The following usage notes apply:

- When a privilege analysis policy is first created, it is disabled by default. You must run `ENABLE_CAPTURE` to enable the privilege analysis policy.
- You can enable only one privilege analysis policy at a time. However, a database-wide privilege analysis of the `G_DATABASE` type can be enabled together with another non `G_DATABASE` privilege analysis.
- You cannot enable the same run multiple times. For example, `run_01` cannot be used again if you want to re-enable the capture for `run_01`. Instead, create a new run.

141.5.7 GENERATE_RESULT Procedure

This procedure populates the privilege analysis data dictionary views with data.

 **See Also:**

Oracle® Database Security Guide for more information about privilege analysis views.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT (
  name          IN VARCHAR2,
  run_name      IN VARCHAR2 DEFAULT NULL,
  DEPENDENCY   IN BOOLEAN DEFAULT NULL);
```

Parameters

Table 141-8 *GENERATE_RESULT Procedure Parameters*

Parameter	Description
name	Name of the privilege analysis policy for which views are populated
run_name	Name of the capture run that is associated with the privilege analysis policy. If you omit this parameter, then the records of all created runs will be analyzed. When you specify the <code>run_name</code> parameter, only the records of that run are analyzed and all other runs are unaffected.

Table 141-8 (Cont.) *GENERATE_RESULT* Procedure Parameters

Parameter	Description
dependency	Enter Y (yes) or N (no) to indicate if PL/SQL compilation privileges, set by the <code>DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS</code> procedure, should be included in the report.

Usage Notes

You must disable a privilege analysis policy before populating the privilege analysis views for the policy. You cannot invoke this subprogram on an enabled privilege analysis policy.

DBMS_PROCESS

The `DBMS_PROCESS` package provides an interface to manage the prespawmed servers.

This chapter contains the following topics:

- [DBMS_PROCESS Overview](#)
- [DBMS_PROCESS Security Model](#)
- [Summary of DBMS_PROCESS Subprograms](#)

142.1 DBMS_PROCESS Overview

By default, Oracle Database can prespawn foreground processes to improve the performance of client connections.

A prespawmed process refers to a process that has been spawned but does not have a session yet. When a user connects to the database or a service process is needed, the process performs further initialization as needed.

To manage foreground processes, use the `DBMS_PROCESS` package. The procedures in this package configure the number of foreground processes for a connection pool, start a connection pool, and stop a connection pool.

See Also:

- *Oracle Database Administrator's Guide* for a detailed description of managing a pre-created processes
- *Oracle Database Reference* for information about the `USE_DEDICATED_BROKER` parameter, which determines how dedicated servers are spawned. `TRUE` enables the listener to send the connection to a dedicated connection broker that spawns the dedicated server. `FALSE` sets the listener to spawn a dedicated server directly.

142.2 DBMS_PROCESS Security Model

You must be granted the `SYSDBA` administrative privilege to use the `DBMS_PROCESS` package.

142.3 Summary of DBMS_PROCESS Subprograms

This table lists the DBMS_PROCESS subprograms and briefly describes them.

Table 142-1 DBMS_PROCESS Package Subprograms

Subprogram	Description
CONFIGURE_POOL Procedure	Configures the minimum number of prespawnd processes, the number of prespawnd processes in a batch, and the initial number of pre-spawnd processes for a foreground connection pool
START_POOL Procedure	Starts a prespawnd foreground process pool.
STOP_POOL Procedure	Stops a prespawnd foreground process pool.

142.3.1 CONFIGURE_POOL Procedure

This procedure configures the minimum number of prespawnd processes, the number of prespawnd processes in a batch, and the initial number of pre-spawnd processes for a foreground connection pool.

Syntax

```
DBMS_PROCESS.CONFIGURE_POOL(
    pool_name      IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL",
    min_count      IN  NUMBER  DEFAULT 10,
    batch_count    IN  NUMBER  DEFAULT 20,
    init_count     IN  NUMBER  DEFAULT 0);
```

Parameters

Table 142-2 CONFIGURE_POOL Procedure Parameters

Parameter	Description
pool_name	Name of the foreground pool
min_count	Count after which a batch of prespawnd processes will be spawned in the pool (default 10; maximum number of processes 64,000)
batch_count	Batch of prespawnd servers to be spawned in the pool (default 20). The total value of the min_count and batch_count values cannot exceed the PROCESSES parameter value.
init_count	Set of prespawnd servers to be spawned in startup, or before a storm of connections, spawned in batches (default 0). Do not exceed the PROCESSES parameter value.

Exceptions

Table 142-3 CONFIGURE_POOL Procedure Exceptions

Error	Description
ORA-456	Prespawn not enabled
ORA-457	Prespawn pool not found
ORA-458	Prespawn pool already started
ORA-459	Prespawn pool not started
ORA-460	Process pool invalid configuration value(s)

Usage Notes

- To find information about foreground processes, query the V\$PROCESS_POOL dynamic view.

Example

```
BEGIN
  DBMS_PROCESS.CONFIGURE_POOL (
    pool_name => 'hrdb_pool',
    min_count => 40,
    batch_count => 20,
    init_count => 10);
END;
/
```

142.3.2 START_POOL Procedure

This procedure starts a prespawnd foreground process pool.

Syntax

```
DBMS_PROCESS.START_POOL(
  pool_name          IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL");
```

Parameters

Table 142-4 START_POOL Procedure Parameters

Parameter	Description
pool_name	Name of prespawnd foreground process pool. To find existing pools, query the V\$PROCESS_POOL dynamic view.

Exceptions

Table 142-5 START_POOL Procedure Exceptions

Error	Description
ORA-457	Prespawn pool not found
ORA-458	Prespawn pool already started
ORA-459	Prespawn pool not started

Example

```
BEGIN
  DBMS_PROCESS.START_POOL (
    pool_name => 'hrdb_pool',
  );
END;
```

142.3.3 STOP_POOL Procedure

This procedure stops a prespawnd foreground process pool.

Syntax

```
DBMS_PROCESS.STOP_POOL(
  pool_name          IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL");
```

Parameters

Table 142-6 STOP_POOL Procedure Parameters

Parameter	Description
pool_name	Name of the prespawnd foreground process pool. To find existing pools, query the V\$PROCESS_POOL dynamic view.

Exceptions

Table 142-7 STOP_POOL Procedure Exceptions

Error	Description
ORA-457	Prespawn pool not found
ORA-458	Prespawn pool already started
ORA-459	Prespawn pool not started

Example

```
BEGIN
  DBMS_PROCESS.STOP_POOL (
    pool_name => 'hrdb_pool',
  );
END;
```

DBMS_PROFILER

The package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Summary of DBMS_PROFILER Subprograms](#)

143.1 DBMS_PROFILER Overview

This package enables the collection of profiler (performance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

Note:

It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on. And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in the following tables.

Table 143-1 Columns in Table PLSQL_PROFILER_RUNS

Column	Datatype	Definition
runid	NUMBER PRIMARY KEY	Unique run identifier from plsql_profiler_runnumber
related_run	NUMBER	Runid of related run (for client/server correlation)

Table 143-1 (Cont.) Columns in Table PLSQL_PROFILER_RUNS

Column	Datatype	Definition
run_owner	VARCHAR2 (128)	User who started run
run_date	DATE	Start time of run
run_comment	VARCHAR2 (2047)	User provided comment for this run
run_total_time	NUMBER	Elapsed time for this run in nanoseconds
run_system_info	VARCHAR2 (2047)	Currently unused
run_comment1	VARCHAR2 (2047)	Additional comment
spare1	VARCHAR2 (256)	Unused

Table 143-2 Columns in Table PLSQL_PROFILER_UNITS

Column	Datatype	Definition
runid	NUMBER	Primary key, references plsql_profiler_runs,
unit_number	NUMBER	Primary key, internally generated library unit #
unit_type	VARCHAR2 (128)	Library unit type
unit_owner	VARCHAR2 (128)	Library unit owner name
unit_name	VARCHAR2 (128)	Library unit name timestamp on library unit
unit_timestamp	DATE	In the future will be used to detect changes to unit between runs
total_time	NUMBER	Total time spent in this unit in nanoseconds. The profiler does not set this field, but it is provided for the convenience of analysis tools.
spare1	NUMBER	Unused
spare2	NUMBER	Unused

Table 143-3 Columns in Table PLSQL_PROFILER_DATA

Column	Datatype	Definition
runid	NUMBER	Primary key, unique (generated) run identifier
unit_number	NUMBER	Primary key, internally generated library unit number
line#	NUMBER	Primary key, not null, line number in unit
total_occur	NUMBER	Number of times line was executed
total_time	NUMBER	Total time spent executing line in nanoseconds
min_time	NUMBER	Minimum execution time for this line in nanoseconds
max_time	NUMBER	Maximum execution time for this line in nanoseconds
spare1	NUMBER	Unused
spare2	NUMBER	Unused
spare3	NUMBER	Unused
spare4	NUMBER	Unused

With Oracle database version 8.x, a sample textual report writer(`profrep.sql`) is provided with the PL/SQL demo scripts.

Note that prior to Oracle Database 10g, the `DBMS_PROFILER` package was not automatically loaded when the database was created, and the Oracle-supplied `PROFLOAD.SQL` script was used to create it. In 10g and beyond, the `DBMS_PROFILER` package is loaded automatically when the database is created, and `PROFLOAD.SQL` is no longer needed.

143.2 DBMS_PROFILER Security Model

The profiler only gathers data for units for which a user has `CREATE` privilege; you cannot use the package to profile units for which `EXECUTE ONLY` access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled `DEBUG`. Oracle advises that modules that are being profiled should be compiled `DEBUG`, since this provides additional information about the unit in the database.

Note:

`DBMS_PROFILER` treats any program unit that is compiled in `NATIVE` mode as if you do not have `CREATE` privilege, that is, you will not get any output.

143.3 DBMS_PROFILER Operational Notes

These notes describe a typical run, how to interpret output, and two methods of exception generation.

Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a "run". A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the `START_PROFILER` and `STOP_PROFILER` functions.

The user must first create database tables in the profiler user's schema to collect the data. The `PROFTAB.SQL` script creates the tables and other data structures required for persistently storing the profiler data.

Note that running `PROFTAB.SQL` drops the current tables. The `PROFTAB.SQL` script is in the `RDBMS/ADMIN` directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, "*warm up*" the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the `SYSADMIN` should use a modified `PROFTAB.SQL` script which:

- Creates the profiler tables and sequence
- Grants `SELECT/INSERT/UPDATE` on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

 **Note:**

Do not alter the actual fields of the tables.

A typical run then involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

 **Note:**

The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the `FLUSH_DATA` or the `STOP_PROFILER` function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the `FLUSH_DATA` function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures. Flushing the collected data involves storing collected data in the database tables created earlier.

 **See Also:**

"[FLUSH_DATA Function and Procedure](#)".

Interpreting Output

The table `plsql_profiler_data` contains one row for each line of the source unit for which code was generated. The `line#` value specifies which source line. If the row exists, and the `total_occur` value in that row is > 0 , some code associated with that line was executed. If the row exists, and `total_occur` value is 0, no code associated with that line was executed. If the row doesn't exist in the table, no code was generated for that line, and therefore it should not be mentioned in reports

If the source of a single statement is on a single line, any code generated for that statement will be attributed to that line number. (In some cases, such as a simple declaration, or because of optimization, no code will be needed). To get coverage information, units should be compiled with `PLSQL_OPTIMIZE_LEVEL=1`.

If a statement spans multiple lines, any code generated for that statement will be attributed to some line in the range, but it is not guaranteed that every line in the range will have code attributed to it. In such a case there will be gaps in the set of line# values. In particular, multi-line SQL-related statements may appear to be on a single line (usually the first). This is because PL/SQL passes the processed text of the cursor to the SQL engine; therefore, as far as PL/SQL is concerned, the entire SQL statement is a single indivisible operation.

When multiple statements are on the same line, the profiler will combine the occurrences for each statement. This may be confusing if a line has embedded control flow. For example, if 'then ...' and 'else ...' are on the same line, it will not be possible to determine whether the 'then' or the 'else' was taken.

In general, profiler and coverage reports are most easily interpreted if each statement is on its own line.

Two Methods of Exception Generation

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

143.4 DBMS_PROFILER Exceptions

DBMS_PROFILER throws the exceptions described in this topic.

Table 143-4 DBMS_PROFILER Exceptions

Exception	Description
<code>version_mismatch</code>	Corresponds to <code>error_version</code> .
<code>profiler_error</code>	Corresponds to either "error_param" or "error_io".

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'

```
error_param constant binary_integer := 1;
```
- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'

```
error_io    constant binary_integer := 2;
```

- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the `DBMS_PROFILER` package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.

```
error_version constant binary_integer := -1;
```

143.5 Summary of DBMS_PROFILER Subprograms

This table lists the `DBMS_PROFILER` subprograms and briefly describes them.

Table 143-5 DBMS_PROFILER Package Subprograms

Subprogram	Description
FLUSH_DATA Function and Procedure	Flushes profiler data collected in the user's session
GET_VERSION Procedure	Gets the version of this API
INTERNAL_VERSION_CHECK Function	Verifies that this version of the <code>DBMS_PROFILER</code> package can work with the implementation in the database
PAUSE_PROFILER Function and Procedure	Pauses profiler data collection
RESUME_PROFILER Function and Procedure	Resumes profiler data collection
START_PROFILER Functions and Procedures	Starts profiler data collection in the user's session
STOP_PROFILER Function and Procedure	Stops profiler data collection in the user's session

143.5.1 FLUSH_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

Note:

Use the `PROFTAB.SQL` script to create the tables and other data structures required for persistently storing the profiler data.

Syntax

```
DBMS_PROFILER.FLUSH_DATA
    RETURN BINARY_INTEGER;

DBMS_PROFILER.FLUSH_DATA;
```

143.5.2 GET_VERSION Procedure

This procedure gets the version of this API.

Syntax

```
DBMS_PROFILER.GET_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

Parameters

Table 143-6 GET_VERSION Procedure Parameters

Parameter	Description
major	Major version of DBMS_PROFILER.
minor	Minor version of DBMS_PROFILER.

143.5.3 INTERNAL_VERSION_CHECK Function

This function verifies that this version of the DBMS_PROFILER package can work with the implementation in the database.

Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK  
    RETURN BINARY_INTEGER;
```

143.5.4 PAUSE_PROFILER Function and Procedure

This function pauses profiler data collection.

Syntax

```
DBMS_PROFILER.PAUSE_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.PAUSE_PROFILER;
```

143.5.5 RESUME_PROFILER Function and Procedure

This function resumes profiler data collection.

Syntax

```
DBMS_PROFILER.RESUME_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.RESUME_PROFILER;
```

143.5.6 START_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the `START_PROFILER` function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

Syntax

```
DBMS_PROFILER.START_PROFILER(
  run_comment   IN VARCHAR2 := sysdate,
  run_comment1  IN VARCHAR2 := '',
  run_number    OUT BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER(
  run_comment IN VARCHAR2 := sysdate,
  run_comment1 IN VARCHAR2 := '')
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER(
  run_comment   IN VARCHAR2 := sysdate,
  run_comment1  IN VARCHAR2 := '',
  run_number    OUT BINARY_INTEGER);
```

```
DBMS_PROFILER.START_PROFILER(
  run_comment IN VARCHAR2 := sysdate,
  run_comment1 IN VARCHAR2 := '');
```

Parameters

Table 143-7 START_PROFILER Function Parameters

Parameter	Description
<code>run_comment</code>	Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data.
<code>run_number</code>	Stores the number of the run so you can store and later recall the run's data.
<code>run_comment1</code>	Allows you to make interesting comments about the run.

143.5.7 STOP_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_PROFILER.STOP_PROFILER
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.STOP_PROFILER;
```

DBMS_PROPAGATION_ADM

The `DBMS_PROPAGATION_ADM` package, one of a set of Oracle Replication packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_PROPAGATION_ADM Subprograms](#)

144.1 DBMS_PROPAGATION_ADM Overview

This package provides interfaces to start, stop, and configure a propagation.

144.2 DBMS_PROPAGATION_ADM Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_PROPAGATION_ADM` package is used to manage an Oracle Replication configuration, it requires that the user is granted the privileges of an Oracle Replication administrator.

144.3 Summary of DBMS_PROPAGATION_ADM Subprograms

This table lists the `DBMS_PROPAGATION_ADM` subprograms and briefly describes them.

Table 144-1 DBMS_PROPAGATION_ADM Package Subprograms

Subprogram	Description
ALTER_PROPAGATION Procedure	Adds, alters, or removes a rule set for a propagation
CREATE_PROPAGATION Procedure	Creates a propagation and specifies the source queue, destination queue, and rule set for the propagation
DROP_PROPAGATION Procedure	Drops a propagation
START_PROPAGATION Procedure	Starts a propagation
STOP_PROPAGATION Procedure	Stops a propagation

**Note:**

All subprograms commit unless specified otherwise.

144.3.1 ALTER_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION (
  propagation_name      IN  VARCHAR2,
  rule_set_name         IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set      IN  BOOLEAN   DEFAULT FALSE,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 144-2 ALTER_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing positive rule set. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing positive rule set.</p>

Table 144-2 (Cont.) ALTER_PROPAGATION Procedure Parameters

Parameter	Description
<code>remove_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages.</p> <p>If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified propagation.</p> <p>If the <code>rule_set_name</code> parameter is non-NULL, then this parameter should be set to <code>FALSE</code>.</p>
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p>
<code>remove_negative_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages.</p> <p>If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified propagation.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-NULL, then this parameter should be set to <code>FALSE</code>.</p>

144.3.2 CREATE_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION (
    propagation_name      IN  VARCHAR2,
    source_queue          IN  VARCHAR2,
    destination_queue     IN  VARCHAR2,
    destination_dblink   IN  VARCHAR2  DEFAULT NULL,
    rule_set_name        IN  VARCHAR2  DEFAULT NULL,
    negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
    queue_to_queue       IN  BOOLEAN   DEFAULT NULL,
    original_propagation_name IN  VARCHAR2  DEFAULT NULL,
    auto_merge_threshold IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 144-3 CREATE_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner. Note: The propagation_name setting cannot be altered after the propagation is created.
source_queue	The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue	The name of the destination queue, specified as [schema_name.]queue_name. For example, to specify a destination queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_dblink	The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue. If NULL, then the source queue and destination queue must be in the same database. Note: Connection qualifiers are not allowed.

Table 144-3 (Cont.) CREATE_PROPAGATION Procedure Parameters

Parameter	Description
<code>rule_set_name</code>	<p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p>
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p>

Table 144-3 (Cont.) CREATE_PROPAGATION Procedure Parameters

Parameter	Description
<code>queue_to_queue</code>	<p>If <code>TRUE</code> or <code>NULL</code>, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If <code>FALSE</code>, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p>
<code>original_propagation_name</code>	<p>Specify the original propagation name if the propagation being created is part of a split and merge operation. The split operation clones the original propagation under a new name. The name of the original propagation is important when the cloned propagation is copied back to the original stream.</p> <p>Specify <code>NULL</code> if the propagation being created is not part of a split and merge operation.</p>
<code>auto_merge_theshold</code>	<p>Specify a positive number if both of the following conditions are met:</p> <ul style="list-style-type: none"> The propagation being created is part of a split and merge operation. The stream will be merged back to the original stream automatically. <p>Specify <code>NULL</code> if either of the following conditions are met:</p> <ul style="list-style-type: none"> The propagation being created is not part of a split and merge operation. The propagation being created is part of a split and merge operation, but the stream being split off will not be merged back to the original stream automatically.

Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

See Also:

[DBMS_RULE_ADM](#)

144.3.3 DROP_PROPAGATION Procedure

This procedure drops a propagation and deletes all messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
    propagation_name      IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 144-4 DROP_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Oracle Replication client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation is removed from the data dictionary views for Oracle Replication rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

The following are the data dictionary views for Oracle Replication rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

Note:

When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.

144.3.4 START_PROPAGATION Procedure

This procedure starts a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.START_PROPAGATION(
    propagation_name IN VARCHAR2);
```

Parameter

Table 144-5 START_PROPAGATION Procedure Parameter

Parameter	Description
propagation_name	The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is `ENABLED`, then the propagation is started upon database instance startup.

144.3.5 STOP_PROPAGATION Procedure

This procedure stops a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.STOP_PROPAGATION(
    propagation_name IN VARCHAR2,
    force             IN BOOLEAN DEFAULT FALSE);
```

Parameter

Table 144-6 STOP_PROPAGATION Procedure Parameter

Parameter	Description
propagation_name	The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner.
force	If <code>TRUE</code> , then the procedure stops the propagation and clears the statistics for the propagation. If <code>FALSE</code> , then the procedure stops the propagation without clearing the statistics for the propagation.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the propagation is not started upon database instance startup.

DBMS_QOPATCH

The `DBMS_QOPATCH` package provides an interface to view the installed database patches.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Error Messages](#)
- [Summary of DBMS_QOPATCH Subprograms](#)

145.1 DBMS_QOPATCH Overview

The `DBMS_QOPATCH` package provides a PLSQL/SQL interface to view the installed database patches. The interface provides all the patch information available as part of the `OPATCH LSINVENTORY -XML` command. The package accesses the OUI patch inventory in real time to provide patch and meta-information.

145.2 DBMS_QOPATCH Security Model

The `DBMS_QOPATCH` package is created as part of SYS schema and SYS is the only user who can execute these subprograms.

145.3 DBMS_QOPATCH Operational Notes

The following operational notes apply to `DBMS_QOPATCH`.

- The package will work only if the database is `OPEN`.
- In an Oracle Real Application Clusters (RAC) environment, if the subprogram requires to fetch data from other RAC nodes it spawns a job in the other node(s) to get the data. In this case `JOB_QUEUE_PROCESSES` needs to be `>0` for the package to fetch the data from other RAC nodes.
- If there is a delay in the job execution, the package returns `ORA-20008` error.

145.4 DBMS_QOPATCH Exceptions

This table lists the exceptions raised by the `DBMS_QOPATCH` package.

Table 145-1 DBMS_QOPATCH Error Messages

Error Code	Description
ORA-20001	Latest XML inventory is not loaded into table.

Table 145-1 (Cont.) DBMS_QOPATCH Error Messages

Error Code	Description
ORA-20002	Directory creation failed.
ORA-20003	Configuration of a job on a node failed.
ORA-20004	Job configuration failed as node is inactive.
ORA-20005	Job is not configured with given node, instance name.
ORA-20006	Number of RAC active instances and opatch jobs configured are not same.
ORA-20007	Job configuration failed as node or instance is not active.
ORA-20008	Timed out - job execution time is more than 120Secs.
ORA-20009	Job execution failed.
ORA-20010	Node is inactive and job cannot be executed.
ORA-20011	Job name is NULL and inventory cannot be loaded.
ORA-20012	JOB_QUEUE_PROCESSES is set to zero and the inventory cannot be loaded.
ORA-20013	DBMS_QOPATCH ran mostly in non-install area.
ORA-20014	Database is not opened.
ORA-20015	Database opened as read-only.

145.5 Summary of DBMS_QOPATCH Subprograms

This table lists and briefly describes the DBMS_QOPATCH package subprograms.

Table 145-2 DBMS_QOPATCH Package Subprograms

Subprogram	Description
CHECK_PATCH_INSTALLED Function	Checks if a patch is installed.
GET_OPATCH_BUGS Function	Provides a bugs list for a patch in XML format if the patch number is given. If patch is not given then it lists all the bugs installed in all the patches in XML format.
GET_OPATCH_COUNT Function	Provides the total number of installed patches in XML format
GET_OPATCH_DATA Function	Provides top level patch information for the patch (such as Patch ID, patch creation time) in the XML element
GET_OPATCH_FILES Function	Provides the list of files modified in the given patch number in XML format
GET_OPATCH_INSTALL_INFO Function	Returns the XML element containing the ORACLE_HOME details such as patch and inventory location
GET_OPATCH_LIST Function	Provides list of patches installed as an XML element from the XML inventory
GET_OPATCH_LSINVENTORY	Returns whole opatch inventory as XML instance document.
GET_OPATCH_OLAYS Function	Provides overlay patches for a given patch as XML element

Table 145-2 (Cont.) DBMS_QOPATCH Package Subprograms

Subprogram	Description
GET_OPATCH_PREQS Function	Provides prerequisite patches for a given patch as XML element
GET_OPATCH_XSLT	Returns the style-sheet for the opatch XML inventory presentation
GET_PATCH_DETAILS Function	Displays the detailed patch information from <code>opatch lsinventory</code> .
GET_SQLPATCH_STATU S Procedure	Displays the SQL patch status by querying from SQL patch registry to produce complete patch level information
IS_PATCH_INSTALLED Function	Provides information (such as patchID, application date, and SQL patch information) on the installed patch as XML node by querying the XML inventory
OPATCH_COMPARE_CU RRENT Function	Compares the current database with a list of bugs.
OPATCH_COMPARE_NO DES Function	Compares the given RAC node(s) with the instance to the present connected node with current node. The return value indicates whether the data was refreshed or not.
SET_CURRENT_OPINST Procedure	Sets the node name and instance to get the inventory details specific to it in an Oracle Real Application Clusters (RAC) environment

145.5.1 CHECK_PATCH_INSTALLED Function

Checks if the patch is installed.

Syntax

```
DBMS_QOPATCH.CHECK_PATCH_INSTALLED (
    bugs      IN QOPATCH_LIST);
RETURN VARCHAR2;
```

Parameters

Table 145-3 CHECK_PATCH_INSTALLED Parameters

Parameter	Description
<code>bugs</code>	List of patches to be checked.

145.5.2 GET_OPATCH_BUGS Function

This function provides a bugs list in a patch if the patch number is given. If a patch number is not given, it lists all the bugs in the specified XML format.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_BUGS (
    patchnum IN VARCHAR2 DEFAULT NULL);
RETURN XMLTYPE;
```

Parameters

Table 145-4 GET_OPATCH_BUGS Function Parameters

Parameter	Description
patchnum	Patch number

145.5.3 GET_OPATCH_COUNT Function

This function provides the total number of installed patches in XML format.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_COUNT (
    patchnum IN VARCHAR2);
RETURN XMLTYPE;
```

Parameters

Table 145-5 GET_OPATCH_COUNT Function Parameters

Parameter	Description
patchnum	Patch number

145.5.4 GET_OPATCH_DATA Function

This function provides top level patch information for the patch (such as Patch ID, patch creation time) in the XML element.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_DATA (
    patchnum IN VARCHAR2);
RETURN XMLTYPE;
```

Parameters

Table 145-6 GET_OPATCH_DATA Function Parameters

Parameter	Description
patchnum	Patch number

145.5.5 GET_OPATCH_FILES Function

This function provides the list of files modified in the given patch number in XML format.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_FILES (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

Parameters

Table 145-7 GET_OPATCH_FILES Function Parameters

Parameter	Description
patchnum	Patch number

145.5.6 GET_OPATCH_INSTALL_INFO Function

This function returns the XML element containing the ORACLE_HOME details such as patch and inventory location.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_INSTALL_INFO  
RETURNS XMLTYPE;
```

145.5.7 GET_OPATCH_LIST Function

This function provides list of patches installed as an XML element from the XML inventory.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_LIST  
RETURN XMLTYPE;
```

145.5.8 GET_OPATCH_LSINVENTORY

This function returns whole opatch inventory as XML instance document.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_LSINVENTORY  
RETURN XMLTYPE;
```

145.5.9 GET_OPATCH_OLAYS Function

This function provides overlay patches for a given patch as XML element.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_OLAYS (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

Parameters

Table 145-8 GET_OPATCH_OLAYS Function Parameters

Parameter	Description
patchnum	Patch number

145.5.10 GET_OPATCH_PREQS Function

This function provides prerequisite patches for a given patch as XML element.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_PREQS (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

Parameters

Table 145-9 GET_OPATCH_PREQS Function Parameters

Parameter	Description
patchnum	Patch number

145.5.11 GET_OPATCH_XSLT

This function returns the style-sheet for the opatch XML inventory presentation. You can use the return type of this subprogram to perform XMLTRANSFORM and the transformed result has the same appearance as opatch text output.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_XSLT  
RETURN XMLTYPE;
```

145.5.12 GET_PATCH_DETAILS Function

Displays the detailed patch information from `opatch lsinventory`.

Syntax

```
DBMS_QOPATCH.GET_PATCH_DETAILS (
    patch    IN VARCHAR2);
RETURN XMLTYPE;
```

Parameters**Table 145-10** GET_PATCH_DETAILS Function Parameters

Parameter	Description
patch	The patch number.

145.5.13 GET_SQLPATCH_STATUS Procedure

This procedure displays the SQL patch status by querying from SQL patch registry to produce complete patch level information. If the patch number is given, it displays the information specific to the given SQL patch, otherwise information for all SQL patches.

Syntax

```
DBMS_QOPATCH.GET_SQLPATCH_STATUS (
    patchnum IN VARCHAR2 DEFAULT NULL);
```

Parameters**Table 145-11** GET_SQLPATCH_STATUS Procedure Parameters

Parameter	Description
patchnum	Patch number

145.5.14 IS_PATCH_INSTALLED Function

This function provides information (such as patchID, application date, and SQL patch information) on the installed patch as XML node by querying the XML inventory.

Syntax

```
DBMS_QOPATCH.IS_PATCH_INSTALLED (
    patchnum IN VARCHAR2);
RETURN XMLTYPE;
```

Parameters**Table 145-12** IS_PATCH_INSTALLED Function Parameters

Parameter	Description
patchnum	Patch number

145.5.15 OPATCH_COMPARE_CURRENT Function

Compares the current database with a list of bugs.

Syntax

```
DBMS_QOPATCH.OPATCH_COMPARE_CURRENT Function (  
    bugs      IN QOPATCH_LIST);  
RETURN VARCHAR2;
```

Parameters

Table 145-13 OPATCH_COMPARE_CURRENT Function Parameters

Parameter	Description
bugs	List of bugs to compare with the current database.

145.5.16 OPATCH_COMPARE_NODES Function

Compares the given RAC node(s) with the instance to the present connected node with current node. The return value indicates whether the data was refreshed or not.

Syntax

```
DBMS_QOPATCH.OPATCH_COMPARE_NODES (  
    node      IN VARCHAR2 DEFAULT NULL,  
    inst      IN VARCHAR2 DEFAULT NULL);  
RETURN VARCHAR2;
```

Parameters

Table 145-14 OPATCH_COMPARE_NODES Function Parameters

Parameter	Description
node	Node name
inst	Instance name

145.5.17 SET_CURRENT_OPINST Procedure

This procedure sets the node name and instance to get the inventory details specific to it in an Oracle Real Application Clusters (RAC) environment.

Syntax

```
DBMS_QOPATCH.SET_CURRENT_OPINST (  
    node_name  IN VARCHAR2 DEFAULT NULL,  
    inst_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 145-15 SET_CURRENT_OPINST Procedure Parameters

Parameter	Description
node_name	Name of node
inst_name	Name of instance

DBMS_RANDOM

The `DBMS_RANDOM` package provides a built-in random number generator. `DBMS_RANDOM` is not intended for cryptography.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS_RANDOM Subprograms](#)

146.1 DBMS_RANDOM Deprecated Subprograms

These subprograms are deprecated with Oracle Database 11g. Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- [INITIALIZE Procedure](#)
- [RANDOM Function](#)
- [TERMINATE Procedure](#)

146.2 DBMS_RANDOM Security Model

This package should be installed as `SYS`. By default, the package is initialized with the current user name, current time down to the second, and the current session. Oracle recommends that users who need to execute this package should be given `EXECUTE` privilege explicitly and should not rely on `PUBLIC EXECUTE` privilege.

146.3 DBMS_RANDOM Operational Notes

These operational notes apply to `DBMS_RANDOM`.

- `DBMS_RANDOM.RANDOM` produces integers in $[-2^{31}, 2^{31})$.
- `DBMS_RANDOM.VALUE` produces numbers in $[0,1)$ with 38 digits of precision.

`DBMS_RANDOM` can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, user ID, and process ID if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling

one of the overloads of `DBMS_RANDOM.SEED`. To produce different output for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

146.4 Summary of DBMS_RANDOM Subprograms

This table lists the `DBMS_RANDOM` subprograms and briefly describes them.

Table 146-1 *DBMS_RANDOM Package Subprograms*

Subprogram	Description
INITIALIZE Procedure	Initializes the package with a seed value
NORMAL Function	Returns random numbers in a normal distribution
RANDOM Function	Generates a random number
SEED Procedures	Resets the seed
STRING Function	Gets a random string
TERMINATE Procedure	Terminates package
VALUE Functions	Gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number <i>x</i> , where <i>x</i> is greater than or equal to <i>low</i> and less than <i>high</i>

146.4.1 INITIALIZE Procedure

This deprecated procedure initializes the generator.

Note:

This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

Syntax

```
DBMS_RANDOM.INITIALIZE (
    val IN BINARY_INTEGER);
```

Pragmas

```
PRAGMA restrict_references (initialize, WNDS);
```

Parameters

Table 146-2 *INITIALIZE Procedure Parameters*

Parameter	Description
<code>val</code>	Seed number used to generate a random number

Usage Notes

This procedure is obsolete as it simply calls the [SEED Procedures](#).

146.4.2 NORMAL Function

This function returns random numbers in a standard normal distribution.

Syntax

```
DBMS_RANDOM.NORMAL  
RETURN NUMBER;
```

Pragmas

```
PRAGMA restrict_references (normal, WNDS);
```

Return Values

Table 146-3 NORMAL Function Parameters

Parameter	Description
number	Returns a random number

146.4.3 RANDOM Function

This deprecated procedure generates a random number.

Note:

This function is deprecated with Release 11gR1 and, although currently supported, it should not be used.

Syntax

```
DBMS_RANDOM.RANDOM  
RETURN binary_integer;
```

Pragmas

```
PRAGMA restrict_references (random, WNDS);
```

Return Values

Table 146-4 RANDOM Function Parameters

Parameter	Description
binary_integer	Returns a random integer greater or equal to $-power(2,31)$ and less than $power(2,31)$

146.4.4 SEED Procedures

This procedure resets the seed.

Syntax

```
DBMS_RANDOM.SEED (  
    val IN BINARY_INTEGER);
```

```
DBMS_RANDOM.SEED (  
    val IN VARCHAR2);
```

Pragmas

```
PRAGMA restrict_references (seed, WNDS);
```

Parameters

Table 146-5 SEED Procedure Parameters

Parameter	Description
val	Seed number or string used to generate a random number

Usage Notes

The seed can be a string up to length 2000.

146.4.5 STRING Function

This function gets a random string.

Syntax

```
DBMS_RANDOM.STRING  
    opt IN CHAR,  
    len IN NUMBER)  
RETURN VARCHAR2;
```

Pragmas

```
PRAGMA restrict_references (string, WNDS);
```

Parameters

Table 146-6 STRING Function Parameters

Parameter	Description
opt	Specifies what the returning string looks like: <ul style="list-style-type: none"> 'u', 'U' - returning string in uppercase alpha characters 'l', 'L' - returning string in lowercase alpha characters 'a', 'A' - returning string in mixed case alpha characters 'x', 'X' - returning string in uppercase alpha-numeric characters 'p', 'P' - returning string in any printable characters. Otherwise the returning string is in uppercase alpha characters.
len	Length of the returning string

Return Values

Table 146-7 STRING Function Return Values

Parameter	Description
VARCHAR2	Returns a VARCHAR2

146.4.6 TERMINATE Procedure

When you are finished with the package, call the `TERMINATE` procedure.

**Note:**

This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

Syntax

```
DBMS_RANDOM.TERMINATE;
```

146.4.7 VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number *x*, where *x* is greater than or equal to *low* and less than *high*.

Syntax

```
DBMS_RANDOM.VALUE
  RETURN NUMBER;

DBMS_RANDOM.VALUE (
  low IN NUMBER,
  high IN NUMBER)
  RETURN NUMBER;
```

Parameters

Table 146-8 VALUE Function Parameters

Parameter	Description
low	Lowest number in a range from which to generate a random number. The number generated may be equal to low
high	Highest number below which to generate a random number. The number generated will be less than high

Return Values

Table 146-9 VALUE Function Return Values

Parameter	Description
NUMBER	Returns an Oracle Number

DBMS_REDACT

The `DBMS_REDACT` package provides an interface to Oracle Data Redaction, which enables you to redact data that is returned from queries issued by low-privileged users or an application.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Procedures](#)
- [Summary of DBMS_REDACT Subprograms](#)

See Also:

- *Oracle Database Advanced Security Guide* regarding using Data Redaction to protect sensitive data

147.1 DBMS_REDACT Overview

Data redaction provides a way to define redaction policies for an application. Oracle Data Redaction provides functionality to redact data that is returned from user `SELECT` queries in an application. The redaction takes place in real time. The Data Redaction policy applies to the querying user, depending on this user's `SYS_CONTEXT` or `XS_SYS_CONTEXT` values. This redaction process does not require that the queried data be static or unchanging, or for the entire data set to be redacted at one time in an off-line manner. Oracle Database redacts the data only for the rows specified by the user's query, not the data for the entire column. The redaction takes place immediately before the data is returned to the querying user or application.

147.2 DBMS_REDACT Security Model

If the querying user has the `EXEMPT REDACTION POLICY` system privilege, redaction will not be performed. If the user does not have the `EXEMPT REDACTION POLICY` system privilege, the policy expression will be evaluated in the current user's environment. If the policy expression evaluates to `TRUE`, then redaction will be performed, otherwise no redaction will be performed.

You must have the `EXECUTE` privilege on the `DBMS_REDACT` package, as well as the `ADMINISTER REDACTION POLICY` system or schema privilege, to execute its subprograms. Procedures in the interface are executed with privileges of the current user.

In addition to the `EXECUTE` privilege on the `DBMS_REDACT` package to execute its subprograms, you must have the following privileges:

- The `CREATE TABLE` or `CREATE ANY TABLE` privilege when the data redaction policy is on an object in your own schema. This requirement applies to the following procedures:
 - `DBMS_REDACT.ADD_POLICY`
 - `DBMS_REDACT.DROP_POLICY`
 - `DBMS_REDACT.ALTER_POLICY`
 - `DBMS_REDACT.DISABLE_POLICY`
 - `DBMS_REDACT.ENABLE_POLICY`
 - `DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL`
- The `CREATE ANY TABLE` privilege when the data redaction policy is on an object in another user's schema. This requirement applies to the following procedures:
 - `DBMS_REDACT.UPDATE_FULL_REDACTION_VALUES`
 - `DBMS_REDACT.CREATE_POLICY_EXPRESSION`
 - `DBMS_REDACT.DROP_POLICY_EXPRESSION`
 - `DBMS_REDACT.UPDATE_POLICY_EXPRESSION`

147.3 DBMS_REDACT Constants

The `DBMS_REDACT` package defines several constants for specifying parameter values.

Table 147-1 Values for function_type Parameter of DBMS_REDACT.ADD_POLICY

Constant	Value	Type	Description
NONE	0	BINARY_INTEGER	No redaction
FULL	1	BINARY_INTEGER	Redact to fixed values
NULLIFY	6	BINARY_INTEGER	Returns a null value as a redacted value
PARTIAL	2	BINARY_INTEGER	Partial redaction, redact a portion of the column data
RANDOM	4	BINARY_INTEGER	Random redaction, each query results in a different random value
REGEXP	5	BINARY_INTEGER	Regular expression based redaction
REGEXP_WIDTH	7	BINARY_INTEGER	Regular expression based redaction that preserves the width of a column that uses a regular expression; designed for applications that use the <code>OCI_ATTR_CHAR_SIZE</code> attribute of the Oracle OLE DB Provider interface

Table 147-2 Values for action Parameter of DBMS_REDACT.ALTER_POLICY

Constant	Value	Type	Description
ADD_COLUMN	1	BINARY_INTEGER	Add a column to the redaction policy
DROP_COLUMN	2	BINARY_INTEGER	Drop a column from the redaction policy
MODIFY_EXPRESSION	3	BINARY_INTEGER	Modify the expression of a redaction policy (the expression evaluates to a BOOLEAN value: if TRUE then redaction is applied, otherwise not)
MODIFY_COLUMN	4	BINARY_INTEGER	Modify a column in the redaction policy to change the redaction function_type or the function_parameters
SET_POLICY_DESCRIPTION	5	BINARY_INTEGER	Set a description for the redaction policy
SET_COLUMN_DESCRIPTION	6	BINARY_INTEGER	Set a description for the redaction performed on the column

147.4 DBMS_REDACT Operating Procedures

The following table presents the relationship between the type of redaction function and its parameters, based on the datatype of the column being redacted. Examples of the various format strings are provided, showing how to perform some commonplace redaction for a string datatype (in this case, a Social Security Number (SSN)), a DATE datatype, and various examples of redaction for the number datatype.

Table 147-3 Data Redaction Function Types

function_type	function_parameters	Examples
DBMS_REDACT.NONE	-	-
DBMS_REDACT.FULL	-	-
DBMS_REDACT.NULLIFY	-	-
DBMS_REDACT.PARTIAL (for character types)	<p>A comma-separated list, containing the following five fields (with no spaces after the commas delimiting the fields):</p> <ul style="list-style-type: none"> REDACT_PARTIAL_INPUT_FORMAT REDACT_PARTIAL_OUTPUT_FORMAT REDACT_PARTIAL_MASKCHAR REDACT_PARTIAL_MASKFROM REDACT_PARTIAL_MASKTO <p>See Table 147-4.</p>	<p>'VVVFVVVFVVVV, VVV-VV-VVVV, X, 1, 5' for redacting the first 5 digits of SSN strings like 123-45-6789, adding dashes back to format it, resulting in strings like XXX-XX-6789</p> <p>'VVVFVVVFVVVV, VVV VV VVVV, X, 1, 5' for redacting the first 5 digits of SSN strings like 123-45-6789, adding spaces to format it, resulting in strings like XXX XX 6789</p>

Table 147-3 (Cont.) Data Redaction Function Types

function_type	function_parameters	Examples
DBMS_REDACT.PARTIAL (for character types), continued	REDACT_PARTIAL_INPUT_FORMAT - the input format: V for value to be possibly redacted, F for formatting character to be ignored	The REDACT_PARTIAL_INPUT_FORMAT field value VVVFVVVFVVV for matching SSN strings like 123-45-6789
DBMS_REDACT.PARTIAL (for character types), continued	REDACT_PARTIAL_OUTPUT_FORMAT - the output format: V for output of redaction. Any other character will be treated as a formatting character and output literally.	The REDACT_PARTIAL_OUTPUT_FORMAT field value VVV-VV-VVVV can be used to redact SSN strings into XXX-XX-6789 (X comes from REDACT_PARTIAL_MASKCHAR field).
DBMS_REDACT.PARTIAL (for character types), continued	REDACT_PARTIAL_MASKCHAR - the character used to redact the input	The value X for redacting SSN strings into XXX-XX-6789.
DBMS_REDACT.PARTIAL (for character types), continued	REDACT_PARTIAL_MASKFROM - specifies which V within the REDACT_PARTIAL_INPUT_FORMAT from which to start the redaction (see explanation following the next entry, REDACT_PARTIAL_MASKTO)	The value 1 for redacting SSN strings starting at the first V of REDACT_PARTIAL_INPUT_FORMAT of VVVFVVVFVVV into strings like XXX-XX-6789
DBMS_REDACT.PARTIAL (for character types), continued	REDACT_PARTIAL_MASKTO - specifies which V within the REDACT_PARTIAL_INPUT_FORMAT at which to end the redaction	The value 5 for redacting SSN strings up to and including the fifth V within REDACT_PARTIAL_INPUT_FORMAT of VVVFVVVFVVV into strings like XXX-XX-6789. Note how the format character '-' (corresponding to the first F within REDACT_PARTIAL_INPUT_FORMAT) is ignored as far as redaction is concerned, so the value here is 5 as opposed to 6.

Table 147-3 (Cont.) Data Redaction Function Types

function_type	function_parameters	Examples
DBMS_REDACT.PARTIAL (for character types), continued	<p>The REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO field values are specified as counts of the number of V characters in the REDACT_PARTIAL_INPUT_FORMAT field, up to and including the intended position, starting from the leftmost V. This way, REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO are independent of the specific formatting of the data. For example, in the common use case of redacting an SSN to show only the last four digits, data like 123456789 (with REDACT_PARTIAL_INPUT_FORMAT of VVVVVVVVV) and data like 123-45-6789 (with REDACT_PARTIAL_INPUT_FORMAT of VVVFVVFVVVV), would both use REDACT_PARTIAL_MASKFROM of 1 and REDACT_PARTIAL_MASKTO of 5.</p>	-
DBMS_REDACT.PARTIAL (for number types)	<p>A comma-separated list, containing the following three fields (with no spaces after the commas delimiting the fields):</p> <ul style="list-style-type: none"> • REDACT_PARTIAL_MASKCHAR • REDACT_PARTIAL_MASKFROM • REDACT_PARTIAL_MASKTO <p>See Table 147-4.</p>	'9, 1, 5' for redacting the first 5 digits of an SSN number 123456789 into 999996789; or '0, 1, 2' for redacting a number 1.23 to 0.03.
DBMS_REDACT.PARTIAL (for number types), continued	<p>REDACT_PARTIAL_MASKCHAR - the character used to redact the input, in the range between 0 and 9</p> <p>REDACT_PARTIAL_MASKFROM - the position, starting from 1, from which to start the redaction. The position does not include the decimal point if it is present.</p> <p>REDACT_PARTIAL_MASKTO - the position at which to end the redaction</p>	-

Table 147-3 (Cont.) Data Redaction Function Types

function_type	function_parameters	Examples
DBMS_REDACT.PARTIAL (for datetime datatypes)	<p>A list, containing the following five fields (concatenated so that there is no space between the fields):</p> <ul style="list-style-type: none"> • REDACT_PARTIAL_DATE_MONTH • REDACT_PARTIAL_DATE_DAY • REDACT_PARTIAL_DATE_YEAR • REDACT_PARTIAL_DATE_HOUR • REDACT_PARTIAL_DATE_MINUTE • REDACT_PARTIAL_DATE_SECOND <p>See Table 147-4.</p>	'm12DYHMS', which changes 01-May-01 01:01:01 to 01-Dec-01 01:01:01.
DBMS_REDACT.PARTIAL (for datetime datatypes), continued	<p>REDACT_PARTIAL_DATE_MONTH: - 'M' (no redacting of month) or 'm#' (redact month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12</p> <p>REDACT_PARTIAL_DATE_DAY: 'D' (no redacting of date) or 'd#' (redact day to #, if possible), # between 1 and 31</p> <p>REDACT_PARTIAL_DATE_YEAR: 'Y' (no redacting of year) or 'y#' (redact year to #, if possible), # between 1 and 9999</p> <p>REDACT_PARTIAL_DATE_HOUR: 'H' (no redacting of hour) or 'h#' (redact hour to #, if possible), # between 0 and 23</p> <p>REDACT_PARTIAL_DATE_MINUTE: 'M' (no redacting of minute) or 'm#' (redact minute to #, if possible), # between 0 and 59</p> <p>REDACT_PARTIAL_DATE_SECOND: 'S' (no redacting of second) or 's#' (redact second to #, if possible), # between 0 and 59</p>	
DBMS_REDACT.REGEXP	-	-
DBMS_REDACT.REGEXP_WITH	-	-
DBMS_REDACT.RANDOM	-	-

Table 147-4 Format Descriptors with Component Field Names and Delimiters

Datatype	Format Descriptor for Partial redaction
Character	REDACT_PARTIAL_INPUT_FORMAT ', ' REDACT_PARTIAL_OUTPUT_FORMAT ', ' REDACT_PARTIAL_MASKCHAR ', ' REDACT_PARTIAL_MASKFROM ', ' REDACT_PARTIAL_MASKTO
Number	REDACT_PARTIAL_MASKCHAR ', ' REDACT_PARTIAL_MASKFROM ', ' REDACT_PARTIAL_MASKTO
Datetime	REDACT_PARTIAL_DATE_MONTH REDACT_PARTIAL_DATE_DAY REDACT_PARTIAL_DATE_YEAR REDACT_PARTIAL_DATE_HOUR REDACT_PARTIAL_DATE_MINUTE REDACT_PARTIAL_DATE_SECOND

147.5 Summary of DBMS_REDACT Subprograms

This table lists and briefly describes the DBMS_REDACT package subprograms.

Table 147-5 DBMS_REDACT Package Subprograms

Subprogram	Description
ADD_POLICY Procedure	Defines a Data Redaction policy for a table or view
ALTER_POLICY Procedure	Alters a Data Redaction policy for a table or view
APPLY_POLICY_EXPR_TO_COL Procedure	Applies a named Data Redaction policy expression to a redacted column
CREATE_POLICY_EXPRESSION Procedure	Creates a named Data Redaction policy expression
DISABLE_POLICY Procedure	Disables a Data Redaction policy
DROP_POLICY Procedure	Drops a Data Redaction policy
DROP_POLICY_EXPRESSION Procedure	Drops a named Data Redaction policy expression
ENABLE_POLICY Procedure	Enables a Data Redaction policy
UPDATE_FULL_REDACTION_VALUES Procedure	Modifies the default displayed values for a Data Redaction policy for full redaction
UPDATE_POLICY_EXPRESSION Procedure	Updates a named Data Redaction policy expression

147.5.1 ADD_POLICY Procedure

This procedure defines a Data Redaction policy for a table or view.

Syntax

```
DBMS_REDACT.ADD_POLICY (
    object_schema          IN    VARCHAR2 := NULL,
```

```

object_name          IN    VARCHAR2,
policy_name          IN    VARCHAR2,
column_name          IN    VARCHAR2 := NULL,
function_type        IN    BINARY_INTEGER := DBMS_REDACT.FULL,
function_parameters  IN    VARCHAR2 := NULL,
expression           IN    VARCHAR2,
enable               IN    BOOLEAN := TRUE,
regexp_pattern       IN    VARCHAR2 := NULL,
regexp_replace_string IN  VARCHAR2 := NULL,
regexp_position      IN    BINARY_INTEGER := 1,
regexp_occurrence    IN    BINARY_INTEGER := 0,
regexp_match_parameter IN  VARCHAR2 := NULL,
policy_description   IN    VARCHAR2 := NULL,
column_description   IN    VARCHAR2 := NULL);

```

Parameters

Table 147-6 *ADD_POLICY Procedure Parameters*

Parameter	Description
object_schema	Schema owning the table or view, current user if NULL
object_name	Name of table or view on which to add a Data Redaction policy
policy_name	Name of policy
column_name	[Optional] Name of one column to which the redaction policy applies. If you must redact more than one column, use the ALTER_POLICY Procedure to add the additional columns.
function_type	Type of redaction function to use. Possible values are: <ul style="list-style-type: none"> - DBMS_REDACT.NONE - DBMS_REDACT.FULL (default) - DBMS_REDACT.NULLIFY - DBMS_REDACT.PARTIAL - DBMS_REDACT.RANDOM - DBMS_REDACT.REGEXP - DBMS_REDACT.REGEXP_WIDTH <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_* parameters to define the Data Redaction policy.</p> <p>See Table 147-1 for an overview of the meanings of these values, and for some examples of their use.</p>

Table 147-6 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
function_parameters	<p>Parameters to the redaction function. The possible values depend on the value of the <code>function_type</code> provided.</p> <p>If the <code>function_type</code> is <code>DBMS_REDACT.REGEXP</code> or <code>DBMS_REDACT.REGEXP_WIDTH</code>, then you must omit the <code>function_parameters</code> parameter, and use the <code>regexp_*</code> parameters to define the Data Redaction policy.</p> <ul style="list-style-type: none"> - <code>DBMS_REDACT.NONE</code>: Can be omitted entirely and defaults to <code>NULL</code> - <code>DBMS_REDACT.FULL</code>: Can be omitted entirely and defaults to <code>NULL</code> - Redacting parameters for partial character redacting. For character datatypes, a comma-separated list containing these fields: <ul style="list-style-type: none"> • Input format: 'V' for value to be possibly redacted, 'F' for formatting character to be ignored • Output format: 'V' for output of redacting, any other characters will be treated as formatting characters. • Redact character: a character that will be used to replace the actual values. Examples are '*' and 'x'. • Starting digit position: specifies the starting (character) position to begin replacing actual values with the redacting character. The beginning of the string is position 1. Positions do not include formatting characters. • Ending digit position: specifies the ending (character) position to end redacting. An example is 'VVVFVVFVVVV,VVV-VV-VVVV,X,1,5' for redacting the first 5 digits of SSN string 123-45-6789, and adding dashes back to format it like an SSN, resulting in XXX-XX-6789. <p>For number datatypes, a comma-separated list containing these fields:</p> <ul style="list-style-type: none"> • Redact character: this is a character between '0' to '9' that will be used to replace the actual values. • Starting digit position: specifies the starting (digit) position to begin replacing actual values with the redacting character. The beginning of the string is position 1. Positions do not include the decimal point. • Ending digit position: this specifies the ending digit position to end redacting. An example is '9,1,5' for redacting the first 5 digits of a Social Security number 123456789, resulting in 999996789. <p>For datetime datatypes, the format is a packed string (no spaces or commas) containing the following sequence of fields. Please note that each field can consist of one or more characters, and the field length depends on whether redacting is required. The one-character fields are used to specify that no redaction of that component of the datetime value is to take place. The longer fields indicate a specific time or date to use as the redacted value of that component of the datetime value.</p>

Table 147-6 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
	<ul style="list-style-type: none"> Month: 'M' (no redacting of month) or 'm#' (redact month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12 Day: 'D' (no redacting of day) or 'd#' (redact day to #, if possible), # between 1 and 31 Year: 'Y' (no redacting of year) or 'y#' (redact year to #, if possible), # between 1 and 9999 Hour: 'H' (no redacting of hour) or 'h#' (redact hour to #, if possible), # between 0 and 23 Minute: 'M' (no redacting of minute) or 'm#' (redact minute to #, if possible), # between 0 and 59 Second: 'S' (no redacting of second) or 's#' (redact second to #, if possible), # between 0 and 59 <p>An example is 'm12d1y2001h1m1s1', which changes 02-May-13 12:30:23 to 01-Dec-01 01:01:01.</p> <p>For partial character and number-redacting shortcuts, see <i>Oracle Database Advanced Security Guide</i>.</p>
expression	<p>Default boolean expression for the table or view. If this expression is used, then redaction takes place only if this policy expression evaluates to TRUE.</p> <p>The following functions are supported:</p> <ul style="list-style-type: none"> SYS_CONTEXT XS_SYS_CONTEXT SUBSTR functions (includes SUBSTRB, SUBSTRC, SUBSTR2, SUBSTR4) LENGTH functions (includes LENGTHB, LENGTHC, LENGTH2, LENGTH4) V (APEX_UTIL.GET_SESSION_STATE) NV (APEX_UTIL.GET_NUMERIC_SESSION_STATE) OLS_LABEL_DOMINATES DOMINATES OLS_DOMINATES OLS_DOM DOM OLS_STRICTLY_DOMINATES STRICTLY_DOMINATES S_DOM SA_UTL.DOMINATES SA_UTL.CHECK_READ SA_UTL.NUMERIC_LABEL CHAR_TO_LABEL SA_SESSION.LABEL <p>See <i>Oracle Database Advanced Security Guide</i> for more information about these supported functions</p>

Table 147-6 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
enable	<p>Boolean value that determines whether the Data Redaction policy is enabled on creation.</p> <p>The default value is <code>TRUE</code>, which means that the policy is automatically enabled upon creation. If the <code>enable</code> parameter is set to <code>FALSE</code>, the policy takes effect only when it is subsequently enabled by calling the <code>DBMS_REDACT.ENABLE_POLICY</code> procedure.</p>
regexp_pattern	<p>Regular expression pattern up to 512 bytes.</p> <p>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>. Also, do not specify the <code>function_parameters</code> parameter when <code>function_type</code> is <code>DBMS_REDACT.REGEXP</code>.</p> <p>See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression patterns.</p>
regexp_replace_string	<p>Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form <code>\n</code>, where <code>n</code> is a number between 1 and 9.</p> <p>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>.</p>
regexp_position	<p>Integer counting from 1, specifies the position where the search must begin. The default is 1.</p> <p>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>.</p>
regexp_occurrence	<ul style="list-style-type: none"> Use 0 to replace all occurrences of the match. The default is 0. Use positive integer <code>n</code> to replace the <code>n</code>-th occurrence of the match. <p>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>.</p>
regexp_match_parameter	<p>Changes the default matching behavior, possible values are a combination of 'i', 'c', 'n', 'm', 'x'</p> <p>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>.</p> <p>See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression match parameters.</p>
policy_description	Description of redaction policy
column_description	Description of the column being redacted

Exceptions

- ORA-28060 - A Data Redaction policy already exists on this column.
- ORA-28061 - This object cannot have a Data Redaction policy defined on it.
- ORA-28062 - The policy expression is too long.
- ORA-28063 - The policy expression is empty.

- ORA-28064 - The redaction function is not valid.
- ORA-28066 - Invalid column *column*.
- ORA-28067 - Missing or invalid column name.
- ORA-28069 - A Data Redaction policy already exists on this object.
- ORA-28073 - The column *column_name* has an unsupported datatype or attribute.
- ORA-28074 - The *field_name* field of the redaction parameters is not valid.

The field can be any of the following:

- REDACT_PARTIAL_INPUT_FORMAT
- REDACT_PARTIAL_OUTPUT_FORMAT
- REDACT_PARTIAL_MASKCHAR
- REDACT_PARTIAL_MASKFROM
- REDACT_PARTIAL_MASKTO
- REDACT_PARTIAL_DATE_MONTH
- REDACT_PARTIAL_DATE_DAY
- REDACT_PARTIAL_DATE_YEAR
- REDACT_PARTIAL_DATE_HOUR
- REDACT_PARTIAL_DATE_MINUTE
- REDACT_PARTIAL_DATE_SECOND

See [Table 147-3](#) and [Table 147-4](#) for examples of the field contents and field ordering.

- ORA-28075 - The data redaction policy expression has an error.
- ORA-28076 - Empty role name specified as SYS_SESSION_ROLES attribute.
- ORA-28077 - The specified role name *role_name* for SYS_SESSION_ROLES exceeds the maximum length.
- ORA-28078 - A regular expression parameter is missing or invalid.
- ORA-28082 - The parameter *parameter* is invalid (where the possible values are *function_parameters*, *column_description*, *policy_name* and *policy_description*).
- ORA-28085 - The input and output lengths of the redaction do not match.
- ORA-28092 - The parameter *param_name* with value *value* has an error.
- ORA-28097 - A data redaction policy cannot be applied to an object owned by SYS.
- ORA-28104 - Input value for *parameter* is not valid.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

See [Operating Procedures](#) for more information regarding function types and function parameters with related examples.

A named Data Redaction policy expression that has been applied to a redacted column takes precedence over the expression defined in the `expression` parameter. To find redacted columns that are affected by named policy expressions, query the `REDACTION_EXPRESSIONS` data dictionary view.

Example

Partial redaction policy:

```
BEGIN
  DBMS_REDACT.ADD_POLICY (
    object_schema      => 'hr',
    object_name        => 'employees',
    column_name        => 'employee_id',
    policy_name        => 'redact_emp_id_nums',
    function_type      => DBMS_REDACT.PARTIAL,
    function_parameters => '7,1,5',
    expression         => '1=1');
END;
```

Full redaction policy:

```
BEGIN
  DBMS_REDACT.ADD_POLICY (
    object_schema      => 'hr',
    object_name        => 'employees',
    column_name        => 'employee_id',
    policy_name        => 'redact_emp_ids',
    function_type      => DBMS_REDACT.FULL,
    expression         => 'SYS_CONTEXT(''SYS_SESSION_ROLES'', 'CLERK')
                        = 'FALSE');
END;
```

147.5.2 ALTER_POLICY Procedure

This procedure alters an existing Data Redaction policy for a table or view.

It alters a the policy in one or more of the following ways:

- By changing the policy expression
- By changing the type of redaction for a specified column
- By changing the parameters to the redaction function for a specified column
- By adding a column to the redaction policy (the redaction type and any parameters must be specified).
- By removing a column from the redaction policy
- By changing the description of the policy
- By changing the description of the column

Syntax

```
DBMS_REDACT.ALTER_POLICY (
  object_schema      IN    VARCHAR2 := NULL,
  object_name        IN    VARCHAR2,
  policy_name        IN    VARCHAR2,
  action             IN    BINARY_INTEGER := DBMS_REDACT.ADD_COLUMN,
  column_name        IN    VARCHAR2 := NULL,
```

```

function_type          IN    BINARY_INTEGER := DBMS_REDACT.FULL,
function_parameters    IN    VARCHAR2 := NULL,
expression             IN    VARCHAR2,
regexp_pattern         IN    VARCHAR2 := NULL,
regexp_replace_string  IN    VARCHAR2 := NULL,
regexp_position        IN    BINARY_INTEGER := 1,
regexp_occurrence      IN    BINARY_INTEGER := 0,
regexp_match_parameter IN    VARCHAR2 := NULL,
policy_description     IN    VARCHAR2 := NULL,
column_description     IN    VARCHAR2 := NULL);

```

Parameters

Table 147-7 ALTER_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema owning the table or view, current user if NULL
object_name	Name of table or view on which to alter a Data Redaction policy
policy_name	Name of policy limited to 30 bytes
action	Action to take. For more information see Table 147-2 .
column_name	(Optional) Name of one column to which the redaction policy applies. Required for the following actions: <ul style="list-style-type: none"> • add_column • drop_column • modify_column • set_column_description
function_type	Type of redaction function to use. Possible values are: <ul style="list-style-type: none"> - DBMS_REDACT.NONE - DBMS_REDACT.FULL (default) - DBMS_REDACT.NULLIY - DBMS_REDACT.PARTIAL - DBMS_REDACT.RANDOM - DBMS_REDACT.REGEXP - DBMS_REDACT.REGEXP_WIDTH <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_pattern, regexp_replace_string, regexp_position, regexp_occurrence, and regexp_match_parameter to define the Data Redaction policy.</p> <p>See Table 147-1 for an overview of the meanings of these values, and for some examples of their use.</p>

Table 147-7 (Cont.) ALTER_POLICY Procedure Parameters

Parameter	Description
function_parameters	<p>Parameters to the redaction function. Use only if function_type is DBMS_REDACT.PARTIAL.</p> <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_pattern, regexp_replace_string, regexp_position, regexp_occurrence, and regexp_match_parameter to define the Data Redaction policy.</p> <ul style="list-style-type: none"> - If the function_type is DBMS_REDACT.NONE or DBMS_REDACT.NULLIFY, the function_parameters parameter must be omitted. - If the function_type is DBMS_REDACT.FULL, the function_parameters parameter must be omitted. - If the function_type is DBMS_REDACT.PARTIAL, the function_parameters parameter represents the redacting parameters for partial redacting. <ul style="list-style-type: none"> • Input format: 'V' for value to be possibly redacted, 'F' for formatting character to be ignored • Output format: 'V' for output of redacting, any other characters will be treated as formatting characters • Redact character: a character that will be used to replace the actual values. Examples are '*' and 'x' • Starting digit position: specifies the starting (character) position to begin replacing actual values with the redacting character. The beginning of the string is position 1. Positions do not include formatting characters. • Ending digit position: specifies the ending (character) position to end redacting. An example is 'VVVFVVVFVVVV, VVV-VV-VVVV, X, 1, 5' for redacting the first 5 digits of SSN string 123-45-6789, and adding dashes back to format it like an SSN, resulting in XXX-XX-6789. <p>For number datatypes, a comma-separated list containing these fields:</p> <ul style="list-style-type: none"> • Redact character: this is a character between '0' to '9' that will be used to replace the actual values. • Starting digit position: specifies the starting (digit) position to begin replacing actual values with the redacting character. The beginning of the string is position 1. Positions do not include the decimal point. • Ending digit position: this specifies the ending digit position to end redacting. An example is '9, 1, 5' for redacting the first 5 digits of a Social Security number number 123456789, resulting in 999996789. <p>For datetime datatypes, the format is a packed string (no spaces or commas) containing the following sequence of fields. Please note that each field can consist of one or more characters, and the field length depends on whether redacting is required. The one-character fields are used to specify that no redaction of that component of the datetime value is to take</p>

Table 147-7 (Cont.) ALTER_POLICY Procedure Parameters

Parameter	Description
	<p>place. The longer fields indicate a specific time or date to use as the redacted value of that component of the datetime value.</p> <ul style="list-style-type: none"> • Month: 'M' (no redacting of month) or 'm#' (redact month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12. • Day: 'D' (no redacting of date) or 'd#' (redact day to #, if possible), # between 1 and 31. • Year: 'Y' (no redacting of year) or 'y#' (redact year to #, if possible), # between 1 and 9999. • Hour: 'H' (no redacting of hour) or 'h#' (redact hour to #, if possible), # between 0 and 23. • Minute: 'M' (no redacting of minute) or 'm#' (redact minute to #, if possible), # between 0 and 59. • Second: 'S' (no redacting of second) or 's#' (redact second to #, if possible), # between 0 and 59. <p>An example is 'm12DYHMS', which changes 01-May-01 01:01:01 to 01-Dec-01 01:01:01</p> <p>For partial character and number-redacting shortcuts, see <i>Oracle Database Advanced Security Guide</i>.</p>
expression	<p>Default boolean expression for the table or view. If this expression is used, then redaction takes place only if this policy expression evaluates to TRUE.</p> <p>The following functions are supported:</p> <ul style="list-style-type: none"> • SYS_CONTEXT • XS_SYS_CONTEXT (See <i>Oracle Database Advanced Security Guide</i>) • NV (APEX_UTIL.GET_NUMERIC_SESSION_STATE) • V (APEX_UTIL.GET_SESSION_STATE) • OLS_LABEL_DOMINATES • DOMINATES • OLS_DOMINATES • OLS_DOM • DOM • OLS_STRICTLY_DOMINATES • STRICTLY_DOMINATES • S_DOM • SA_UTL.DOMINATES • SA_UTL.CHECK_READ • SA_UTL.NUMERIC_LABEL • CHAR_TO_LABEL • SA_SESSION.LABEL

Table 147-7 (Cont.) ALTER_POLICY Procedure Parameters

Parameter	Description
regexp_pattern	Regular expression pattern up to 512 bytes. Use only if the function_type parameter is DBMS_REDACT.REGEXP. Also, do not specify the function_parameters parameter when function_type is DBMS_REDACT.REGEXP. See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression patterns.
regexp_replace_string	Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form \n, where n is a number between 1 and 9. Use only if the function_type parameter is DBMS_REDACT.REGEXP
regexp_position	Integer counting from 1, specifies the position where the search must begin. Use only if the function_type parameter is DBMS_REDACT.REGEXP. The default is 1.
regexp_occurrence	<ul style="list-style-type: none"> Use 0 to replace all occurrences of the match. 0 is the default. Use positive integer <i>n</i> to replace the <i>n</i>-th occurrence of the match. Use only if the function_type parameter is DBMS_REDACT.REGEXP.
regexp_match_parameter	Changes the default matching behavior, possible values are a combination of 'i', 'c', 'ic', 'iq', 'n', 'm', 'x' Use only if the function_type parameter is DBMS_REDACT.REGEXP. See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression match parameters.
policy_description	Description of redaction policy
column_description	Description of the column being redacted

Exceptions

- ORA-28060 - A data redaction policy already exists on this column.
- ORA-28061 - This object cannot have a data redaction policy defined on it.
- ORA-28062 - The policy expression is too long.
- ORA-28063 - The policy expression is empty.
- ORA-28064 - The redaction function is not valid.
- ORA-28066 - Invalid column *column*.
- ORA-28067 - Missing or invalid column name.
- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28069 - A Data Redaction policy already exists on this object.

- ORA-28070 - The column *column* does not have a Data Redaction policy.
- ORA-28071 - The action is not valid.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28073 - The column *column_name* has an unsupported datatype or attribute.
- ORA-28074 - The *field_name* field of the redaction parameters is not valid.

The field can be any of the following:

- REDACT_PARTIAL_INPUT_FORMAT
- REDACT_PARTIAL_OUTPUT_FORMAT
- REDACT_PARTIAL_MASKCHAR
- REDACT_PARTIAL_MASKFROM
- REDACT_PARTIAL_MASKTO
- REDACT_PARTIAL_DATE_MONTH
- REDACT_PARTIAL_DATE_DAY
- REDACT_PARTIAL_DATE_YEAR
- REDACT_PARTIAL_DATE_HOUR
- REDACT_PARTIAL_DATE_MINUTE
- REDACT_PARTIAL_DATE_SECOND

See [Table 147-3](#) and [Table 147-4](#) for examples of the field contents and field ordering.

- ORA-28075 - The data redaction policy expression has an error.
- ORA-28076 - Empty role name specified as SYS_SESSION_ROLES attribute.
- ORA-28077 - The specified role name *role_name* for SYS_SESSION_ROLES exceeds the maximum length.
- ORA-28078 - A regular expression parameter is missing or invalid.
- ORA-28082 - The parameter *parameter* is invalid (where the possible values are *function_parameters*, *column_description*, *policy_name* and *policy_description*).
- ORA-28085 - The input and output lengths of the redaction do not match.
- ORA-28092 - The parameter *param_name* with value *value* has an error.
- ORA-28097 - A data redaction policy cannot be applied to an object owned by SYS.
- ORA-28104 - Input value for *parameter* is not valid.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

See [Operating Procedures](#) for more information regarding Function Types and Function Parameters with related examples.

A named Data Redaction policy expression that has been applied to a redacted column takes precedence over the expression defined in the `expression` parameter. To find redacted columns that are affected by named policy expressions, query the `REDACTION_EXPRESSIONS` data dictionary view.

Examples

```
BEGIN
  DBMS_REDACT.ALTER_POLICY (
    object_schema      => 'HR',
    object_name        => 'EMPLOYEES',
    policy_name        => 'redact_emp_id_nums',
    action              => DBMS_REDACT.DROP_COLUMN,
    column_name        => 'EMAIL');
END;
```

147.5.3 APPLY_POLICY_EXPR_TO_COL Procedure

This procedure associates a named Oracle Data Redaction policy expression with a redacted column from a table or view.

Syntax

```
DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL (
  object_schema      IN VARCHAR2 := NULL,
  object_name        IN VARCHAR2,
  column_name        IN VARCHAR2,
  policy_expression_name IN VARCHAR2 := NULL);
```

Parameters

Table 147-8 *APPLY_POLICY_EXPR_TO_COL Procedure Parameters*

Parameter	Description
<code>object_schema</code>	Name of the schema that contains the redacted column. If omitted, then the current schema is used.
<code>object_name</code>	Name of the object (table or view) that contains the redacted column
<code>column_name</code>	Name of the redacted column to which the policy expression is applied
<code>policy_expression_name</code>	If NULL, then the named policy expression associated with the redacted column <code>column_name</code> is removed.

Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

You can find existing Data Redaction policy expressions by querying the REDACTION_EXPRESSIONS data dictionary view. To find columns that have been redacted, query the REDACTION_COLUMNS data dictionary view.

Example

```
BEGIN
  DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL(
    object_schema      => 'OE',
    object_name        => 'CUSTOMERS',
    column_name        => 'INCOME_LEVEL',
    policy_expression_name => 'oe_redact_pol');
END;
```

147.5.4 CREATE_POLICY_EXPRESSION Procedure

This procedure creates a named Oracle Data Redaction policy expression.

Syntax

```
DBMS_REDACT.CREATE_POLICY_EXPRESSION (
  policy_expression_name  IN  VARCHAR2,
  expression              IN  VARCHAR2,
  policy_expression_description IN VARCHAR2 := NULL);
```

Parameters

Table 147-9 CREATE_POLICY_EXPRESSION Procedure Parameters

Parameter	Description
policy_expression_name	Name of the policy expression
expression	Definition of the policy expression
policy_expression_description	Description of the policy expression

Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

See [APPLY_POLICY_EXPR_TO_COL Procedure](#) for how to apply policy expressions to table columns.

After you create a policy expression, you can associate it with a redacted table or view column by running the DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL procedure. To find existing redacted columns, query the REDACTION_COLUMNS data dictionary view.

Example

```

BEGIN
  DBMS_REDACT.CREATE_POLICY_EXPRESSION(
    policy_expression_name => 'oe_redact_pol',
    expression              => 'SYS_CONTEXT(''USERENV'', ''SESSION_USER'') =
''OE''',
    policy_expression_description => 'Enables policy for user OE ');
END;

```

147.5.5 DISABLE_POLICY Procedure

This procedure disables a Data Redaction policy.

Syntax

```

DBMS_REDACT.DISABLE_POLICY (
  object_schema IN VARCHAR2 := NULL,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2);

```

Parameters**Table 147-10** *DISABLE_POLICY Procedure Parameters*

Parameter	Description
object_schema	Schema owning the table or view, current user if NULL
object_name	Name of table or view for which to disable a Data Redaction policy
policy_name	Name of policy to be disabled

Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28080 - The policy was already disabled.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

Examples

```

BEGIN
  DBMS_REDACT.DISABLE_POLICY (
    object_schema => 'hr',
    object_name   => 'employees',
    policy_name   => 'redact_emp_ids');
END;

```

147.5.6 DROP_POLICY Procedure

This procedure drops a Data Redaction policy by removing a redaction policy from the table or view.

Syntax

```
DBMS_REDACT.DROP_POLICY (
  object_schema      IN    VARCHAR2 := NULL,
  object_name        IN    VARCHAR2,
  policy_name        IN    VARCHAR2);
```

Parameters

Table 147-11 *DROP_POLICY Procedure Parameters*

Parameter	Description
object_schema	Schema owning the table or view, current user if NULL
object_name	Name of table or view from which to drop a Data Redaction policy
policy_name	Name of policy to be dropped

Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28072 - The specified policy name is incorrect.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

Examples

```
BEGIN
  DBMS_REDACT.DROP_POLICY (
    object_schema => 'hr',
    object_name   => 'employees',
    policy_name   => 'redact_emp_ids');
END;
```

147.5.7 DROP_POLICY_EXPRESSION Procedure

This procedure drops a named policy expression.

Syntax

```
DBMS_REDACT.DROP_POLICY_EXPRESSION (
  policy_expression_name IN    VARCHAR2);
```

Parameters

Table 147-12 *DROP_POLICY_EXPRESSION Procedure Parameters*

Parameter	Description
<code>policy_expression_name</code>	Name of the policy expression

Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

You can find existing Data Redaction policy expressions by querying the `REDACTION_EXPRESSIONS` data dictionary view.

Example

```
BEGIN
  DBMS_REDACT.DROP_POLICY_EXPRESSION(
    policy_expression_name => 'oe_redact_pol');
END;
```

147.5.8 ENABLE_POLICY Procedure

This procedure re-enables a Data Redaction policy.

Syntax

```
DBMS_REDACT.ENABLE_POLICY (
  object_schema          IN   VARCHAR2 := NULL,
  object_name            IN   VARCHAR2,
  policy_name            IN   VARCHAR2);
```

Parameters

Table 147-13 *ENABLE_POLICY Procedure Parameters*

Parameter	Description
<code>object_schema</code>	Schema owning the table or view, current user if <code>NULL</code>
<code>object_name</code>	Name of table or view on which to enable a Data Redaction policy
<code>policy_name</code>	Name of policy to be enabled

Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28071 - The action is not valid.
- ORA-28072 - The specified policy name is incorrect.

- ORA-28079 - The policy was already enabled.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

Examples

```
BEGIN
  DBMS_REDACT.ENABLE_POLICY (
    object_schema => 'hr',
    object_name   => 'employees',
    policy_name   => 'redact_emp_ids');
END;
```

147.5.9 UPDATE_FULL_REDACTION_VALUES Procedure

This procedure modifies the default displayed values for a Data Redaction policy for full redaction.

Syntax

```
DBMS_REDACT.UPDATE_FULL_REDACTION_VALUES (
  number_val      IN NUMBER           := NULL,
  binfloat_val    IN BINARY_FLOAT     := NULL,
  bindouble_val   IN BINARY_DOUBLE    := NULL,
  char_val        IN CHAR              := NULL,
  varchar_val     IN VARCHAR2         := NULL,
  nchar_val       IN NCHAR             := NULL,
  nvarchar_val    IN NVARCHAR2        := NULL,
  date_val        IN DATE              := NULL,
  ts_val          IN TIMESTAMP         := NULL,
  tswtz_val       IN TIMESTAMP WITH TIME ZONE := NULL,
  blob_val        IN BLOB              := NULL,
  clob_val        IN CLOB              := NULL,
  nclob_val       IN NCLOB             := NULL,
  boolean_val     IN BOOLEAN          := NULL);
```

Parameters

Table 147-14 *UPDATE_FULL_REDACTION_VALUES Procedure Parameters*

Parameter	Description
number_val	Modifies the default value for columns of the NUMBER datatype
binfloat_val	Modifies the default value for columns of the BINARY_FLOAT datatype
bindouble_val	Modifies the default value for columns of the BINARY_DOUBLE datatype
char_val	Modifies the default value for columns of the CHAR datatype
varchar_val	Modifies the default value for columns of the VARCHAR2 datatype
nchar_val	Modifies the default value for columns of the NCHAR datatype
nvarchar_val	Modifies the default value for columns of the NVARCHAR2 datatype
date	Modifies the default value for columns of the DATE datatype

Table 147-14 (Cont.) UPDATE_FULL_REDACTION_VALUES Procedure Parameters

Parameter	Description
ts_val	Modifies the default value for columns of the <code>TIMESTAMP</code> datatype
tswtz_val	Modifies the default value for columns of the <code>TIMESTAMP WITH TIME ZONE</code> datatype
blob_val	Modifies the default value for columns of the <code>BLOB</code> datatype
clob_val	Modifies the default value for columns of the <code>CLOB</code> datatype
nclob_val	Modifies the default value for columns of the <code>NCLOB</code> datatype
boolean_val	Modifies the default value for columns of the <code>BOOLEAN</code> datatype

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

147.5.10 UPDATE_POLICY_EXPRESSION Procedure

This procedure updates a named Oracle Data Redaction policy expression.

Syntax

```
DBMS_REDACT.UPDATE_POLICY_EXPRESSION (
  policy_expression_name      IN   VARCHAR2,
  expression                  IN   VARCHAR2,
  policy_expression_description IN   VARCHAR2 := NULL);
```

Parameters**Table 147-15 UPDATE_POLICY_EXPRESSION Procedure Parameters**

Parameter	Description
policy_expression_name	Name of the policy expression
expression	Definition of the policy expression
policy_expression_description	Description of the policy expression

Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

You can find existing policy expressions by querying the `REDACTION_EXPRESSIONS` data dictionary view.

Example

```
BEGIN
  DBMS_REDACT.UPDATE_POLICY_EXPRESSION(
    policy_expression_name => 'oe_redact_pol',
    expression             =>
'SYS_CONTEXT(''USERENV'', ''SESSION_USER'') != ''OE'',
    policy_expression_description => 'Updates policy expression for
oe_redact_pol');
END;
```

DBMS_REDEFINITION

The `DBMS_REDEFINITION` package provides an interface to perform an online redefinition of tables.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of DBMS_REDEFINITION Subprograms](#)

See Also:

Oracle Database Administrator's Guide for more information about online redefinition of tables

148.1 DBMS_REDEFINITION Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

148.2 DBMS_REDEFINITION Security Model

Subprograms in the `DBMS_REDEFINITION` package are run with invokers' rights (with the privileges of the current user).

There are two modes:

- In `USER` mode, the user who has the `CREATE TABLE` and `CREATE MVIEW` privileges may redefine a table residing in his own schema.
- In `FULL` mode, the user who has the `ANY` privilege may redefine tables in any schema.

148.3 DBMS_REDEFINITION Constants

The `DBMS_REDEFINITION` package defines several constants for specifying parameter values.

Table 148-1 DBMS_REDEFINITION Constants

Constant	Type	Value	Description
CONS_CONSTRAINT	PLS_INTEGER	3	Used to specify that dependent object type is a constraint
CONS_INDEX	PLS_INTEGER	2	Used to specify that dependent object type is a index
CONS_MVLOG	PLS_INTEGER	10	Used to (un)register a materialized view log, as a dependent object of the table, through the REGISTER_DEPENDENT_OBJECT Procedure and the UNREGISTER_DEPENDENT_OBJECT Procedure .
CONS_ORIG_PARAMS	PLS_INTEGER	1	Used to specify that indexes should be cloned with their original storage parameters
CONS_TRIGGER	PLS_INTEGER	4	Used to specify that dependent object type is a trigger
CONS_USE_PK	BINARY_INTEGER	1	Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having not-NULL constraints)
CONS_USE_ROWID	BINARY_INTEGER	2	Used to indicate that the redefinition should be done using rowids
CONS_VPD_AUTO	BINARY_INTEGER	2	Used to indicate to copy VPD policies automatically
CONS_VPD_MANUAL	BINARY_INTEGER	4	Used to indicate to copy VPD policies manually
CONS_VPD_NONE	BINARY_INTEGER	1	Used to indicate that there are no VPD policies on the original table

148.4 DBMS_REDEFINITION Operational Notes

The following operational notes apply to DBMS_REDEFINITION.

- `CONS_USE_PK` and `CONS_USE_ROWID` are constants used as input to the "options_flag" parameter in both the [START_REDEF_TABLE Procedure](#) and [CAN_REDEF_TABLE Procedure](#). `CONS_USE_ROWID` is used to indicate that the redefinition should be done using rowids while `CONS_USE_PK` implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
- `CONS_INDEX`, `CONS_MVLOG`, `CONS_TRIGGER` and `CONS_CONSTRAINT` are used to specify the type of the dependent object being (un)registered in [REGISTER_DEPENDENT_OBJECT Procedure](#) and [UNREGISTER_DEPENDENT_OBJECT Procedure](#) (parameter "dep_type").

`CONS_INDEX` ==> dependent object is of type INDEX

`CONS_TRIGGER` ==> dependent object is of type TRIGGER

CONS_CONSTRAINT==> dependent object type is of type CONSTRAINT

CONS_MVLOG ==> dependent object is of type MATERIALIZED VIEW LOG

- CONS_ORIG_PARAMS as used as input to the "copy_indexes" parameter in [COPY_TABLE_DEPENDENTS Procedure](#). Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.

148.5 DBMS_REDEFINITION Rules and Limits

Various rules and limits apply to implementation of the DBMS_REDEFINITION package.

For more information about these, see the *Oracle Database Administrator's Guide*.

148.6 DBMS_REDEFINITION Examples

The following examples demonstrate DBMS_REDEFINITION functionality.

We create two tables EMP and EMP_INT as the original and the interim tables, respectively:

```
CREATE TABLE "EMP"
( "EMPNO" NUMBER(4,0) PRIMARY KEY,
  "ENAME" VARCHAR2(10),
  "JOB" VARCHAR2(9),
  "MGR" NUMBER(4,0),
  "HIREDATE" DATE,
  "SAL" NUMBER(7,2),
  "COMM" NUMBER(7,2),
  "DEPTNO" NUMBER(2,0))
```

```
TABLESPACE myts;
```

```
CREATE TABLE "EMP_INT"
( "EMPNO" NUMBER(4,0) PRIMARY KEY,
  "ENAME" VARCHAR2(10),
  "JOB" VARCHAR2(9),
  "MGR" NUMBER(4,0),
  "HIREDATE" DATE,
  "SAL" NUMBER(7,2),
  "COMM" NUMBER(7,2),
  "DEPTNO" NUMBER(2,0))
```

```
TABLESPACE compressed_ts;
```

Regular Multi-Step Redefinition

```
DBMS_REDEFINITION.START_REDEF_TABLE('SCOTT', 'EMP', 'EMP_INT',
  ENABLE_ROLLBACK => TRUE);
DBMS_REDEFINITION.FINISH_REDEF_TABLE('SCOTT', 'EMP', 'EMP_INT');
```

Assume the DBA wants to evaluate the performance of the application for 2 days, after moving the table EMP from tablespace myts to compressed_ts. One can run

sync_interim_table [SYNC_INTERIM_TABLE Procedure](#) to keep both the tables in sync (say, every hour).

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE('SCOTT', 'EMP', 'EMP_INT');
```

Case 1 — DBA is not happy with the performance, so decides to rollback.

```
DBMS_REDEFINITION.ROLLBACK('SCOTT', 'EMP', 'EMP_INT');
```

Case 2 — DBA is happy with the performance, so decides not to rollback.

```
DBMS_REDEFINITION.ABORT_ROLLBACK('SCOTT', 'EMP', 'EMP_INT');
```

This terminates the possibility of rollback.

Single-Step Redefinition

```
DBMS_REDEFINITION.REDEF_TABLE('SCOTT','EMP','ROW STORE COMPRESS  
ADVANCED', enable_rollback => TRUE);
```

Note:

Online table redefinition rollback is not supported when the `REDEF_TABLE` procedure is used to redefine a table.

148.7 Summary of DBMS_REDEFINITION Subprograms

This table lists the `DBMS_REDEFINITION` subprograms and briefly describes them.

Table 148-2 DBMS_REDEFINITION Package Subprograms

Subprogram	Description
ABORT_REDEF_TABLE Procedure	Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process
ABORT_ROLLBACK Procedure	Aborts rollback
ABORT_UPDATE Procedure	Aborts an update started with the <code>EXECUTE_UPDATE</code> procedure
CAN_REDEF_TABLE Procedure	Determines if a given table can be redefined online
COPY_TABLE_DEPENDENTS Procedure	Copies the dependent objects of the original table onto the interim table
EXECUTE_UPDATE Procedure	Optimizes the performance of bulk updates to a table
FINISH_REDEF_TABLE Procedure	Completes the redefinition process

Table 148-2 (Cont.) DBMS_REDEFINITION Package Subprograms

Subprogram	Description
REDEF_TABLE Procedure	Provides a single push-button interface that integrates several redefinition steps
REGISTER_DEPENDENT_OBJECT Procedure	Registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table
ROLLBACK Procedure	Performs rollback
SET_PARAM Procedure	Sets a new value for a specified parameter used by the redefinition process identified by a redefinition ID
START_REDEF_TABLE Procedure	Initiates the redefinition process
SYNC_INTERIM_TABLE Procedure	Keeps the interim table synchronized with the original table
UNREGISTER_DEPENDENT_OBJECT Procedure	Unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table

148.7.1 ABORT_REDEF_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process.

This procedure can also be used to terminate the redefinition process any time after the [START_REDEF_TABLE Procedure](#) has been called and before the [FINISH_REDEF_TABLE Procedure](#) is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

Syntax

```
DBMS_REDEFINITION.ABORT_REDEF_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  part_name      IN VARCHAR2 := NULL);
```

Parameters

Table 148-3 ABORT_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table. Can take a comma-delimited list of interim table names.
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. <code>NULL</code> implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.

148.7.2 ABORT_ROLLBACK Procedure

This procedure aborts rollback for a table that was redefined.

When online redefinition of a table is started with the `START_REDEF_TABLE` procedure, rollback can be enabled for the changes performed by online redefinition of a table by setting the `enable_rollback` parameter to `TRUE`. If you want to retain the changes made by online redefinition, you can abort the rollback to clean up the database objects that enable rollback.

Syntax

```
DBMS_REDEFINITION.ABORT_ROLLBACK (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2 := NULL,
  part_name      IN VARCHAR2 := NULL);
```

Parameters

Table 148-4 ABORT_ROLLBACK Procedure Parameters

Parameter	Description
<code>uname</code>	Schema name of the tables
<code>orig_table</code>	Name of the table to be redefined
<code>int_table</code>	Name of the interim table
<code>part_name</code>	Name of the partition being redefined

148.7.3 ABORT_UPDATE Procedure

This procedure can aborts an update started with the `EXECUTE_UPDATE` procedure in the `RDBMS_REDEFINITION` package.

Syntax

```
DBMS_REDEFINITION.ABORT_UPDATE (
  update_stmt IN CLOB);
```

Parameters

Table 148-5 ABORT_UPDATE Procedure Parameters

Parameter	Description
<code>update_stmt</code>	The SQL <code>UPDATE</code> statement to be aborted The SQL statement must exactly match the SQL statement in the <code>EXECUTE_UPDATE</code> procedure.

**See Also:***Oracle Database Administrator's Guide*

148.7.4 CAN_REDEF_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (
  uname          IN VARCHAR2,
  tname          IN VARCHAR2,
  options_flag   IN PLS_INTEGER := 1,
  part_name      IN VARCHAR2 := NULL);
```

Parameters

Table 148-6 CAN_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	Schema name of the table
tname	Name of the table to be re-organized
options_flag	Indicates the type of redefinition method to use. <ul style="list-style-type: none"> If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having <code>NOT NULL</code> constraints). The default method of redefinition is using primary keys. If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. <code>NULL</code> implies the entire table is being redefined.

Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

148.7.5 COPY_TABLE_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

Syntax

```

DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS (
  uname           IN  VARCHAR2,
  orig_table      IN  VARCHAR2,
  int_table       IN  VARCHAR2,
  copy_indexes    IN  PLS_INTEGER := 1,
  copy_triggers   IN  BOOLEAN     := TRUE,
  copy_constraints IN  BOOLEAN     := TRUE,
  copy_privileges IN  BOOLEAN     := TRUE,
  ignore_errors   IN  BOOLEAN     := FALSE,
  num_errors      OUT PLS_INTEGER,
  copy_statistics IN  BOOLEAN     := FALSE,
  copy_mvlog      IN  BOOLEAN     := FALSE);

```

Parameters

Table 148-7 COPY_TABLE_DEPENDENTS Procedure Parameters

Parameter	Description
uname	Schema name of the tables
orig_table	Name of the table being redefined
int_table	Name of the interim table
copy_indexes	Flag indicating whether to copy the indexes <ul style="list-style-type: none"> 0 - do not copy any index dbms_redefinition.cons_orig_params – copy the indexes using the physical parameters of the source indexes
copy_triggers	TRUE = clone triggers, FALSE = do nothing
copy_constraints	TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2 or higher, then clone CHECK and NOT NULL constraints
copy_privileges	TRUE = clone privileges, FALSE = do nothing
ignore_errors	TRUE = if an error occurs while cloning a particular dependent object, then skip that object and continue cloning other dependent objects. FALSE = that the cloning process should stop upon encountering an error.
num_errors	Number of errors that occurred while cloning dependent objects
copy_statistics	TRUE = copy statistics, FALSE = do nothing
copy_mvlog	TRUE = copy materialized view log, FALSE = do nothing

Usage Notes

- The user must check the column `num_errors` before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the [COPY_TABLE_DEPENDENTS Procedure](#) again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the [REGISTER_DEPENDENT_OBJECT Procedure](#).

- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.

148.7.6 EXECUTE_UPDATE Procedure

This procedure can optimize the performance of bulk updates to a table. Performance is optimized because the updates are not logged in the redo log.

The `EXECUTE_UPDATE` procedure automatically uses the components of online table redefinition, such as an interim table, a materialized view, and a materialized view log, to enable optimized bulk updates to a table. The `EXECUTE_UPDATE` procedure also removes fragmentation of the affected rows and ensures that the update is atomic. If the bulk updates raise any errors, then you can use the `ABORT_UPDATE` procedure to undo the changes made by the `EXECUTE_UPDATE` procedure.

Syntax

```
DBMS_REDEFINITION.EXECUTE_UPDATE (
    update_stmt IN CLOB);
```

Parameters

Table 148-8 EXECUTE_UPDATE Procedure Parameters

Parameter	Description
update_stmt	The SQL UPDATE statement

See Also:

Oracle Database Administrator's Guide

148.7.7 FINISH_REDEF_TABLE Procedure

This procedure completes the redefinition process.

Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (
    uname          IN VARCHAR2,
    orig_table     IN  VARCHAR2,
```

```

int_table          IN  VARCHAR2,
part_name          IN  VARCHAR2 := NULL,
dml_lock_timeout  IN  PLS_INTEGER := NULL,
continue_after_errors IN  BOOLEAN := FALSE,
disable_rollback  IN  PLS_INTEGER := FALSE);

```

Parameters

Table 148-9 FINISH_REDEF_TABLE Procedure Parameters

Parameters	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table. Can take a comma-delimited list of interim table names.
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.
dml_lock_timeout	Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode).
continue_after_errors	When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition).
disable_rollback	When set to TRUE, disables the rollback option if it was enabled in the START_REDEF_TABLE procedure. Specifying TRUE cleans up the database objects that enable rollback.

Examples

Wait up to 600 seconds for required locks on SH.SALES:

```

EXECUTE DBMS_REDEFINITION.FINISH_REDEF_TABLE (
  'SH', 'SALES', 'INT_SALES', 600);

```

148.7.8 REDEF_TABLE Procedure

This procedure provides a single interface that integrates several redefinition steps including the CAN_REDEF_TABLE Procedure, the START_REDEF_TABLE Procedure, the COPY_TABLE_DEPENDENTS Procedure and the FINISH_REDEF_TABLE Procedure.

This procedure can change data storage properties including tablespaces (for table, partition, subpartition, index, LOB column), compress type (for table, partition, subpartition, index, LOB column) and STORE_AS clause for the LOB column.

Syntax

```

DBMS_REDEFINITION.REDEF_TABLE (
  uname          IN  VARCHAR2,
  tname          IN  VARCHAR2,
  table_compression_type  IN  VARCHAR2 := NULL,
  table_part_tablespace  IN  VARCHAR2 := NULL,
  index_key_compression_type  IN  VARCHAR2 := NULL,

```

```

index_tablespace      IN VARCHAR2 := NULL,
lob_compression_type  IN VARCHAR2 := NULL,
lob_tablespace       IN VARCHAR2 := NULL,
lob_store_as         IN VARCHAR2 := NULL,
refresh_dep_mviews   IN VARCHAR2 := 'N',
dml_lock_timeout     IN PLS_INTEGER := NULL);

```

Parameters

Table 148-10 REDEF_TABLE Procedure Parameters

Parameter	Description
uname	Schema name of the table
tname	Name of the table to be redefined
table_compression_type	Text string of the table compression clause. NULL means there is no change.
table_part_tablespace	Tablespace name for the entire table or partitions. NULL means there is no change.
index_key_compression_type	Text string of the compression clause for all indexes on the table. NULL means there is no change.
index_tablespace	Tablespace name for all indexes on the table. NULL means there is no change.
lob_compression_type	Text string of the compression clause for all LOBs in the entire table. NULL means there is no change.
lob_tablespace	Tablespace name for all LOBs in the table. NULL means there is no change.
lob_store_as	Specifies LOB store as 'SECUREFILE' or 'BASICFILE'. NULL means there is no change.
refresh_dep_mviews	When set to 'Y', fast refresh of dependent materialized views is performed once at the end of the redefinition operation.
dml_lock_timeout	Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode).

Examples

```

BEGIN
  DBMS_REDEFINITION.REDEF_TABLE (
    uname           => 'TABOWNER2',
    tname          => 'EMP2',
    table_compression_type => 'ROW STORE COMPRESS ADVANCED',
    table_part_tablespace => 'NEWTBS',
    index_key_compression_type => 'COMPRESS 1',
    index_tablespace   => 'NEWIDXTBS',
    lob_compression_type   => 'COMPRESS HIGH',
    lob_tablespace     => 'SLOBTBS',
    lob_store_as      => 'SECUREFILE');
END;

```

Related Topics

- [CAN_REDEF_TABLE Procedure](#)
This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.
- [START_REDEF_TABLE Procedure](#)
This procedure starts a table redefinition.
- [COPY_TABLE_DEPENDENTS Procedure](#)
This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.
- [FINISH_REDEF_TABLE Procedure](#)
This procedure completes the redefinition process.

See Also:

Oracle Database Administrator's Guide regarding "Performing Online Redefinition with the REDEF_TABLE Procedure"

148.7.9 REGISTER_DEPENDENT_OBJECT Procedure

This procedure registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same

Syntax

```
DBMS_REDEFINITION.REGISTER_DEPENDENT_OBJECT(
  uname          IN   VARCHAR2,
  orig_table     IN   VARCHAR2,
  int_table      IN   VARCHAR2,
  dep_type       IN   PLS_INTEGER,
  dep_owner      IN   VARCHAR2,
  dep_orig_name  IN   VARCHAR2,
  dep_int_name   IN   VARCHAR2);
```

Parameters

Table 148-11 REGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table

Table 148-11 (Cont.) REGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
dep_type	Type of the dependent object (see Constants and Operational Notes)
dep_owner	Owner of the dependent object
dep_orig_name	Name of the original dependent object
dep_int_name	Name of the interim dependent object

Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from `DBA_REDEFINITION_ERRORS` if an entry exists for that object.

148.7.10 ROLLBACK Procedure

This procedure rolls back changes to a table after online table redefinition to return the table to its original definition and preserve DML changes made to the table.

Syntax

```
DBMS_REDEFINITION.ROLLBACK (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2 := NULL,
  part_name       IN VARCHAR2 := NULL,
  dml_lock_timeout IN PLS_INTEGER := NULL,
  continue_after_errors IN BOOLEAN := FALSE);
```

Parameters**Table 148-12 ROLLBACK Procedure Parameters**

Parameter	Description
uname	Schema name of the table to be redefined
orig_table	Name of the table to be redefined
int_table	Name of the interim table.
part_name	Name of the partition being redefined.
dml_lock_timeout	Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode).
continue_after_errors	When rolling back redefinition changes on multiple partitions, allows operation execution to continue on the next partition (applies only to batched partition redefinition).

148.7.11 SET_PARAM Procedure

This procedure sets a new value for a specified parameter used by the redefinition process identified by a redefinition ID.

Note:

Currently, the only value that can be changed by this procedure is the value for the `refresh_dep_mviews` parameter that is specified in the `REDEF_TABLE` procedure or the `START_REDEF_TABLE` procedure. You can determine the redefinition ID and check the value of the `refresh_dep_mviews` parameter for an online table redefinition operation by querying the `DBA_REDEFINITION_STATUS` view.

Syntax

```
DBMS_REDEFINITION.SET_PARAM (
    redefinition_id IN VARCHAR2,
    param_name      IN VARCHAR2,
    param_value     IN VARCHAR2);
```

Parameters

Table 148-13 SET_PARAM Procedure Parameters

Parameter	Description
<code>redefinition_id</code>	The redefinition ID that identifies the redefinition process
<code>param_name</code>	The parameter name
<code>param_value</code>	The new parameter value

See Also:

Oracle Database Administrator's Guide

148.7.12 START_REDEF_TABLE Procedure

This procedure starts a table redefinition.

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

Syntax

```
DBMS_REDEFINITION.START_REDEF_TABLE (
    uname          IN VARCHAR2,
    orig_table     IN VARCHAR2,
```

```

int_table          IN VARCHAR2,
col_mapping        IN VARCHAR2 := NULL,
options_flag       IN BINARY_INTEGER := 1,
orderby_cols       IN VARCHAR2 := NULL,
part_name          IN VARCHAR2 := NULL,
continue_after_errors IN BOOLEAN := FALSE,
copy_vpd_opt       IN BINARY_INTEGER := CONS_VPD_NONE,
refresh_dep_mviews IN VARCHAR2 := 'N',
enable_rollback    IN BOOLEAN := FALSE);

```

Parameters

Table 148-14 START_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table. Can take a comma-delimited list of interim table names.
col_mapping	Mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the SELECT clause of a query.) If NULL, all the columns in the original table are selected and have the same name after redefinition.
options_flag	Indicates the type of redefinition method to use: <ul style="list-style-type: none"> If dbms_redefinition.cons_use_pk, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys. If dbms_redefinition.cons_use_rowid, the redefinition is done using rowids.
orderby_cols	This optional parameter accepts the list of columns (along with the optional keyword(s) ascending/descending) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.
continue_after_errors	When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition)
copy_vpd_opt	Specifies how VPD policies are handled in online redefinition
refresh_dep_mviews	When set to 'Y', fast refresh of dependent materialized views is performed when the START_REDEF_TABLE procedure is run, each time the SYNC_INTERIM_TABLE procedure is run, and when the FINISH_REDEF_TABLE procedure is run.

Table 148-14 (Cont.) START_REDEF_TABLE Procedure Parameters

Parameter	Description
enable_rollback	When set to TRUE, enables the rollback option. When this parameter is set to true, Oracle Database maintains the interim table created during redefinition after redefinition is complete. You can run the SYNC_INTERIM_TABLE procedure to synchronize the interim table periodically to apply DML changes made to the redefined table to the interim table. An internal materialized view and materialized view log enables maintenance of the interim table. If you decide to roll back the online table redefinition with the ROLLBACK procedure, then the interim table is synchronized, and Oracle Database switches back to it so that the table has its original definition.

Examples

Start redefinition of three partitions (sal03q1, sal03q2, sal03q3) in table 'STEVE.salestable' using three interim tables of int_salestable1, int_salestable2 and int_salestable3, respectively. The operation will continue on sal03q3 even if it fails on sal03q1.

```
DBMS_REDEFINITION.START_REDEF_TABLE (
  uname           => 'STEVE',
  orig_table      => 'salestable',
  int_table       => 'int_salestable1, int_salestable2, int_salestable3',
  col_mapping     => NULL,
  options_flag    => DBMS_REDEFINITION.CONST_USE_ROWID,
  part_name       => 'sal03q1,sal03q2,sal03q3',
  continue_after_errors => TRUE);
```

Specify to copy VPD policies automatically:

```
EXECUTE DBMS_REDEFINITION.START_REDEF_TABLE (
  uname           => 'SCOTT',
  orig_table      => 'T',
  int_table       => 'INT_T',
  copy_vpd_opt   => DBMS_REDEFINITION.CONST_VPD_AUTO);
```

148.7.13 SYNC_INTERIM_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

Syntax

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (
  uname           IN  VARCHAR2,
  orig_table      IN  VARCHAR2,
  int_table       IN  VARCHAR2,
  part_name       IN  VARCHAR2 := NULL,
  continue_after_errors IN  BOOLEAN := FALSE);
```

Parameters

Table 148-15 SYNC_INTERIM_TABLE Procedure Parameters

Parameter	Description
uname	Schema name of the table
orig_table	Name of the table to be redefined
int_table	Name of the interim table. Can take a comma-delimited list of interim table names.
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. <code>NULL</code> implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.
continue_after_errors	When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition)

Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the [FINISH_REDEF_TABLE Procedure](#) before completing the online redefinition.
- This procedure can be called between long running operations (such as `CREATE INDEX`) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

148.7.14 UNREGISTER_DEPENDENT_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPENDENT_OBJECT (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  dep_type       IN PLS_INTEGER,
  dep_owner      IN VARCHAR2,
  dep_orig_name  IN VARCHAR2,
  dep_int_name   IN VARCHAR2);
```

Parameters

Table 148-16 UNREGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table

Table 148-16 (Cont.) UNREGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
dep_type	Type of the dependent object
dep_owner	Owner of the dependent object
dep_orig_name	Name of the original dependent object
dep_int_name	Name of the interim dependent object

DBMS_REFRESH

The `DBMS_REFRESH` package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time. These groups are called refresh groups.

This chapter contains the following topics:

- [DBMS_REFRESH Overview](#)
- [DBMS_REFRESH Security Model](#)

149.1 DBMS_REFRESH Overview

When it is important for materialized views to be transactionally consistent with each other, you can organize them into refresh groups.

By refreshing the refresh group, you can ensure that the data in all of the materialized views in the refresh group correspond to the same transactionally consistent point in time. A materialized view in a refresh group still can be refreshed individually, but doing so nullifies the benefits of the refresh group because refreshing the materialized view individually does not refresh the other materialized views in the refresh group.

149.2 DBMS_REFRESH Security Model

Users must have the `EXECUTE` privilege to run the procedures of `DBMS_REFRESH` package.

149.3 Summary of DBMS_REFRESH Subprograms

This table lists the `DBMS_REFRESH` subprograms and briefly describes them.

Table 149-1 DBMS_REFRESH Package Subprograms

Subprogram	Description
ADD Procedure	Adds materialized views to a refresh group
CHANGE Procedure	Changes the refresh interval for a refresh group
DESTROY Procedure	Removes all of the materialized views from a refresh group and deletes the refresh group
MAKE Procedure	Specifies the members of a refresh group and the time interval used to determine when to refresh the members of this group
REFRESH Procedure	Manually refreshes a refresh group
SUBTRACT Procedure	Removes materialized views from a refresh group

149.3.1 ADD Procedure

This procedure adds materialized views to a refresh group.

Syntax

```
DBMS_REFRESH.ADD (
    name      IN VARCHAR2,
    { list    IN VARCHAR2,
      | tab    IN DBMS_UTILITY.UNCL_ARRAY, }
    lax       IN BOOLEAN := FALSE);
```

Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 149-2 ADD Procedure Parameters

Parameter	Description
<code>name</code>	Name of the refresh group to which you want to add members, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default.
<code>list</code>	Comma-delimited list of materialized views that you want to add to the refresh group. Synonyms are not supported. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.
<code>tab</code>	Instead of a comma-delimited list, you can supply a PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a materialized view. The first materialized view should be in position 1. The last position must be <code>NULL</code> . Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.
<code>lax</code>	A materialized view can belong to only one refresh group at a time. If you are moving a materialized view from one group to another, then you must set the <code>lax</code> flag to <code>TRUE</code> to succeed. Oracle then automatically removes the materialized view from the other refresh group and updates its refresh interval to be that of its new group. Otherwise, the call to <code>ADD</code> generates an error message.

149.3.2 CHANGE Procedure

This procedure changes the refresh interval for a refresh group.

Syntax

```
DBMS_REFRESH.CHANGE (
    name                IN VARCHAR2,
    next_date           IN DATE           := NULL,
    interval            IN VARCHAR2      := NULL,
    implicit_destroy    IN BOOLEAN       := NULL,
    rollback_seg        IN VARCHAR2      := NULL,
    push_deferred_rpc   IN BOOLEAN       := NULL,
    refresh_after_errors IN BOOLEAN      := NULL,
    purge_option        IN BINARY_INTEGER := NULL,
    parallelism         IN BINARY_INTEGER := NULL,
    heap_size           IN BINARY_INTEGER := NULL);
```

Parameters

Table 149-3 CHANGE Procedure Parameters

Parameter	Description
name	Name of the refresh group for which you want to alter the refresh interval.
next_date	Next date that you want a refresh to occur. By default, this date remains unchanged.
interval	Function used to calculate the next time to refresh the materialized views in the refresh group. This interval is evaluated immediately before the refresh. Thus, select an interval that is greater than the time it takes to perform a refresh. By default, the interval remains unchanged.
implicit_destroy	Allows you to reset the value of the <code>implicit_destroy</code> flag. If this flag is set, then Oracle automatically deletes the group if it no longer contains any members. By default, this flag remains unchanged.
rollback_seg	Allows you to change the rollback segment used. By default, the rollback segment remains unchanged. To reset this parameter to use the default rollback segment, specify <code>NULL</code> , including the quotes. Specifying <code>NULL</code> without quotes indicates that you do not want to change the rollback segment currently being used.
push_deferred_rpc	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
refresh_after_err ors	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
purge_option	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
parallelism	<ul style="list-style-type: none"> 0 specifies serial propagation. $n > 1$ specifies parallel propagation with n parallel processes. 1 specifies parallel propagation using only one parallel process.

Table 149-3 (Cont.) CHANGE Procedure Parameters

Parameter	Description
heap_size	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.

 **Note:**

Do not set this parameter unless directed to do so by Oracle Support Services.

149.3.3 DESTROY Procedure

This procedure removes all of the materialized views from a refresh group and delete the refresh group.

Syntax

```
DBMS_REFRESH.DESTROY (
    name IN VARCHAR2);
```

Parameters

Table 149-4 DESTROY Procedure Parameters

Parameter	Description
name	Name of the refresh group that you want to destroy.

149.3.4 MAKE Procedure

This procedure specifies the members of a refresh group and the time interval used to determine when to refresh the members of this group.

Syntax

```
DBMS_REFRESH.MAKE (
    name                IN    VARCHAR2
    { list              IN    VARCHAR2,
      | tab             IN    DBMS_UTILITY.UNCL_ARRAY, }
    next_date          IN    DATE,
    interval            IN    VARCHAR2,
    implicit_destroy   IN    BOOLEAN      := FALSE,
    lax                 IN    BOOLEAN      := FALSE,
    job                 IN    BINARY_INTEGER := 0,
    rollback_seg       IN    VARCHAR2     := NULL,
    push_deferred_rpc  IN    BOOLEAN      := TRUE,
    refresh_after_errors IN    BOOLEAN      := FALSE
    purge_option        IN    BINARY_INTEGER := NULL,
    parallelism         IN    BINARY_INTEGER := NULL,
    heap_size           IN    BINARY_INTEGER := NULL
```

```

job_name          IN    VARCHAR2          := NULL,
auto_commit       IN    BOOLEAN           := NULL);

```

 **Note:**

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 149-5 MAKE Procedure Parameters

Parameter	Description
<code>name</code>	Unique name used to identify the refresh group, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default. Refresh groups must follow the same naming conventions as tables.
<code>list</code>	Comma-delimited list of materialized views that you want to refresh. Synonyms are not supported. These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your current database. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.
<code>tab</code>	Instead of a comma-delimited list, you can supply a PL/SQL associative array of names of materialized views that you want to refresh using the data type <code>DBMS_UTILITY.UNCL_ARRAY</code> . If the table contains the names of <code>n</code> materialized views, then the first materialized view should be in position 1 and the <code>n + 1</code> position should be set to <code>NULL</code> . Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.
<code>next_date</code>	Next date that you want a refresh to occur.
<code>interval</code>	Function used to calculate the next time to refresh the materialized views in the group. This field is used with the <code>next_date</code> value. For example, if you specify <code>NEXT_DAY(SYSDATE+1, "MONDAY")</code> as your interval, and if your <code>next_date</code> evaluates to Monday, then Oracle refreshes the materialized views every Monday. This interval is evaluated immediately before the refresh. Thus, select an interval that is greater than the time it takes to perform a refresh.
<code>implicit_destroy</code>	Set this to <code>TRUE</code> to delete the refresh group automatically when it no longer contains any members. Oracle checks this flag only when you call the <code>SUBTRACT</code> procedure. That is, setting this flag still enables you to create an empty refresh group.
<code>lax</code>	A materialized view can belong to only one refresh group at a time. If you are moving a materialized view from an existing group to a new refresh group, then you must set this to <code>TRUE</code> to succeed. Oracle then automatically removes the materialized view from the other refresh group and updates its refresh interval to be that of its new group. Otherwise, the call to <code>MAKE</code> generates an error message.
<code>job</code>	Needed by the Import utility. Use the default value, 0.

Table 149-5 (Cont.) MAKE Procedure Parameters

Parameter	Description
rollback_seg	Name of the rollback segment to use while refreshing materialized views. The default, NULL, uses the default rollback segment.
push_deferred_rpc	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
refresh_after_errors	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
purge_option	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
parallelism	<ul style="list-style-type: none"> 0 specifies serial propagation. $n > 1$ specifies parallel propagation with n parallel processes. 1 specifies parallel propagation using only one parallel process.
heap_size	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.

 **Note:**
Do not set this parameter unless directed to do so by Oracle Support Services.

job_name	This parameter is needed by the import utility. User should use the default value, NULL.
auto_commit	<p>Supported values are NULL, TRUE, and FALSE.</p> <ul style="list-style-type: none"> NULL—allows the user to continue using DBMS_JOB. TRUE—commit statement will be automatically issued after the job of the refresh group are created by DBMS_REFRESH.MAKE. FALSE—user must issue a commit statement to finish the transaction after calling DBMS_REFRESH.MAKE. <p>The default value is NULL.</p>

Usage Notes

Import utility and export utility need CREATE JOB privilege if DBMS_SCHEDULER jobs are used.

149.3.5 REFRESH Procedure

This procedure manually refreshes a refresh group.

Syntax

```
DBMS_REFRESH.REFRESH (
    name IN VARCHAR2);
```

Parameters

Table 149-6 REFRESH Procedure Parameters

Parameter	Description
name	Name of the refresh group that you want to refresh manually.

149.3.6 SUBTRACT Procedure

This procedure removes materialized views from a refresh group.

Syntax

```
DBMS_REFRESH.SUBTRACT (
  name      IN      VARCHAR2,
  { list    IN      VARCHAR2,
    | tab    IN      DBMS_UTILITY.UNCL_ARRAY, }
  lax       IN      BOOLEAN := FALSE);
```

**Note:**

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 149-7 SUBTRACT Procedure Parameters

Parameter	Description
name	Name of the refresh group from which you want to remove members, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default.
list	Comma-delimited list of materialized views that you want to remove from the refresh group. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your current database. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.
tab	Instead of a comma-delimited list, you can supply a PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a materialized view. The first materialized view should be in position 1. The last position must be <code>NULL</code> . Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.
lax	Set this to <code>FALSE</code> if you want Oracle to generate an error message if the materialized view you are attempting to remove is not a member of the refresh group.

DBMS_REPAIR

The `DBMS_REPAIR` package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS_REPAIR Subprograms](#)

See Also:

For detailed information about using the `DBMS_REPAIR` package, see *Oracle Database Administrator's Guide*

150.1 DBMS_REPAIR Overview

The `DBMS_REPAIR` package is intended for use by database administrators only. It is not intended for use by application developers.

150.2 DBMS_REPAIR Security Model

The package is owned by `SYS`. Execution privilege is not granted to other users.

150.3 DBMS_REPAIR Constants

The `DBMS_REPAIR` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_REPAIR.TABLE_OBJECT`.

The following table lists the parameters and the enumerated constants.

Table 150-1 DBMS_REPAIR Parameters with Enumerated Constants

Parameter	Option	Type	Description
object_type	• TABLE_OBJECT	BINARY_INTEGE	-
	• INDEX_OBJECT	R	
	• CLUSTER_OBJECT		
action	• CREATE_ACTION	BINARY_INTEGE	-
	• DROP_ACTION	R	
	• PURGE_ACTION		
table_type	• REPAIR_TABLE	BINARY_INTEGE	-
	• ORPHAN_TABLE	R	
flags	• SKIP_FLAG	BINARY_INTEGE	-
	• NOSKIP_FLAG	R	
object_id	• ALL_INDEX_ID := 0	BINARY_INTEGE R	Clean up all objects that qualify
wait_for_lock	• LOCK_WAIT := 1	BINARY_INTEGE	Specifies whether to try getting DML locks on underlying table [[sub]partition] object
	• LOCK_NOWAIT := 0	R	

**Note:**

The default table_name will be REPAIR_TABLE when table_type is REPAIR_TABLE, and will be ORPHAN_KEY_TABLE when table_type is ORPHAN_TABLE.

150.4 DBMS_REPAIR Operating Notes

The procedure to create the ORPHAN_KEYS_TABLE is similar to the one used to create the REPAIR_TABLE.

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;
```

The DBA would create the repair and orphan keys tables once. Subsequent executions of the [CHECK_OBJECT Procedure](#) would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the 'REPAIR_' prefix, and the name of the orphan keys table must begin with the 'ORPHAN_' prefix. The following code is also legal:

```

CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE,
                             DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE,
                             DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_FOOBAR;
DESCRIBE REPAIR_ABCD;
SELECT * FROM ORPHAN_FOOBAR;
SELECT * FROM REPAIR_ABCD;

```

When invoking the [CHECK_OBJECT Procedure](#) the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the [ADMIN_TABLES Procedure](#) or `CREATE_ACTION`.

Other actions in the [ADMIN_TABLES Procedure](#) can be used to purge/delete the `REPAIR_TABLE` and the `ORPHAN_KEYS_TABLE`.

150.5 DBMS_REPAIR Exceptions

The table in this topic describes the exceptions raised by the `DDBMS_REPAIR` subprograms.

Table 150-2 DBMS_REPAIR Exceptions

Exception	Description	Action
942	Reported by <code>DBMS_REPAIR.ADMIN_TABLES</code> during a <code>DROP_ACTION</code> when the specified table doesn't exist.	-
955	Reported by <code>DBMS_REPAIR.CREATE_ACTION</code> when the specified table already exists.	-
24120	An invalid parameter was passed to the specified <code>DBMS_REPAIR</code> procedure.	Specify a valid parameter value or use the parameter's default.
24122	An incorrect block range was specified.	Specify correct values for the <code>BLOCK_START</code> and <code>BLOCK_END</code> parameters.
24123	An attempt was made to use the specified feature, but the feature is not yet implemented.	Do not attempt to use the feature.
24124	An invalid <code>ACTION</code> parameter was specified.	Specify <code>CREATE_ACTION</code> , <code>PURGE_ACTION</code> or <code>DROP_ACTION</code> for the <code>ACTION</code> parameter.
24125	An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since <code>DBMS_REPAIR.CHECK_OBJECT</code> was run.	Use <code>DBMS_REPAIR.ADMIN_TABLES</code> to purge the repair table and run <code>DBMS_REPAIR.CHECK_OBJECT</code> to determine whether there are any corrupt blocks to be fixed.
24127	<code>TABLESPACE</code> parameter specified with an <code>ACTION</code> other than <code>CREATE_ACTION</code> .	Do not specify <code>TABLESPACE</code> when performing actions other than <code>CREATE_ACTION</code> .
24128	A partition name was specified for an object that is not partitioned.	Specify a partition name only if the object is partitioned.

Table 150-2 (Cont.) DBMS_REPAIR Exceptions

Exception	Description	Action
24129	An attempt was made to pass a table name parameter without the specified prefix.	Pass a valid table name parameter.
24130	An attempt was made to specify a repair or orphan table that does not exist.	Specify a valid table name parameter.
24131	An attempt was made to specify a repair or orphan table that does not have a correct definition.	Specify a table name that refers to a properly created table.
24132	An attempt was made to specify a table name is greater than 30 characters long.	Specify a valid table name parameter.

150.6 DBMS_REPAIR Examples

This topic shows examples of DBMS_REPAIR usage.

```
/* Fix the bitmap status for all the blocks in table mytab in schema sys */
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');

/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT,1, 45, 1);
```

150.7 Summary of DBMS_REPAIR Subprograms

This table lists the DBMS_REPAIR subprograms and briefly describes them.

Table 150-3 DBMS_REPAIR Package Subprograms

Subprogram	Description
ADMIN_TABLES Procedure	Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions
CHECK_OBJECT Procedure	Detects and reports corruptions in a table or index
DUMP_ORPHAN_KEYS Procedure	Reports on index entries that point to rows in corrupt data blocks
FIX_CORRUPT_BLOCKS Procedure	Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT
ONLINE_INDEX_CLEAN Function	Performs a manual cleanup of failed or interrupted online index builds or rebuilds
REBUILD_FREELISTS Procedure	Rebuilds an object's freelists
SEGMENT_FIX_STATUS Procedure	Fixes the corrupted state of a bitmap entry

Table 150-3 (Cont.) DBMS_REPAIR Package Subprograms

Subprogram	Description
SKIP_CORRUPT_BLOCKS Procedure	Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered

150.7.1 ADMIN_TABLES Procedure

This procedure provides administrative functions for the DBMS_REPAIR package repair and orphan key tables.

Syntax

```
DBMS_REPAIR.ADMIN_TABLES (
  table_name IN VARCHAR2,
  table_type IN BINARY_INTEGER,
  action IN BINARY_INTEGER,
  tablespace IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 150-4 ADMIN_TABLES Procedure Parameters

Parameter	Description
table_name	Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.
table_type	Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE. See " Constants ".
action	Indicates what administrative action to perform. Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned. When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_<table_name> is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated. Created in the SYS schema. See " Constants ".
tablespace	Indicates the tablespace to use when creating a table. By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.

150.7.2 CHECK_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

Syntax

```
DBMS_REPAIR.CHECK_OBJECT (
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  partition_name   IN VARCHAR2      DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN BINARY_INTEGER DEFAULT NULL,
  relative_fno    IN BINARY_INTEGER DEFAULT NULL,
  block_start     IN BINARY_INTEGER DEFAULT NULL,
  block_end       IN BINARY_INTEGER DEFAULT NULL,
  corrupt_count   OUT BINARY_INTEGER);
```

Parameters

Table 150-5 CHECK_OBJECT Procedure Parameters

Parameter	Description
schema_name	Schema name of the object to be checked.
object_name	Name of the table or index to be checked.
partition_name	Partition or subpartition name to be checked. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked.
object_type	Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code> . See " Constants ".
repair_table_name	Name of the repair table to be populated. The table must exist in the <code>SYS</code> schema. Use the <code>ADMIN_TABLES</code> Procedure to create a repair table. The default name is <code>REPAIR_TABLE</code> .
flags	Reserved for future use.
relative_fno	Relative file number: Used when specifying a block range.
block_start	First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.
block_end	Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of <code>block_start</code> or <code>block_end</code> is specified, then the other defaults to the first or last block in the file respectively.
corrupt_count	Number of corruptions reported.

Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.

150.7.3 DUMP_ORPHAN_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

Syntax

```
DBMS_REPAIR.DUMP_ORPHAN_KEYS (
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  partition_name   IN VARCHAR2      DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT INDEX_OBJECT,
  repair_table_name IN VARCHAR2      DEFAULT 'REPAIR_TABLE',
  orphan_table_name IN VARCHAR2      DEFAULT 'ORPHAN_KEYS_TABLE',
  flags           IN BINARY_INTEGER DEFAULT NULL,
  key_count       OUT BINARY_INTEGER);
```

Parameters

Table 150-6 DUMP_ORPHAN_KEYS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Object name.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. The default is <code>INDEX_OBJECT</code> . See " Constants ".
repair_table_name	Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table.
orphan_table_name	Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block. The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table.
flags	Reserved for future use.

Table 150-6 (Cont.) DUMP_ORPHAN_KEYS Procedure Parameters

Parameter	Description
key_count	Number of index entries processed.

150.7.4 FIX_CORRUPT_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the CHECK_OBJECT Procedure.

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

Syntax

```
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN  VARCHAR2      DEFAULT NULL,
  object_type      IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN  BINARY_INTEGER DEFAULT NULL,
  fix_count       OUT BINARY_INTEGER);
```

Parameters

Table 150-7 FIX_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Name of the object with corrupt blocks to be fixed.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See " Constants ".
repair_table_name	Name of the repair table with the repair directives. Must exist in the SYS schema.
flags	Reserved for future use.
fix_count	Number of blocks fixed.

Related Topics

- [CHECK_OBJECT Procedure](#)
This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

150.7.5 ONLINE_INDEX_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds.

This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns `TRUE` if all indexes specified were cleaned up and `FALSE` if one or more indexes could not be cleaned up.

Syntax

```
DBMS_REPAIR.ONLINE_INDEX_CLEAN (
    object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,
    wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)
RETURN BOOLEAN;
```

Parameters

Table 150-8 ONLINE_INDEX_CLEAN Function Parameters

Parameter	Description
<code>object_id</code>	Object id of index to be cleaned up. The default cleans up all object ids that qualify.
<code>wait_for_lock</code>	This parameter specifies whether to try getting DML locks on underlying table [[sub]partition] object. The default retries up to an internal retry limit, after which the lock get will give up. If <code>LOCK_NOWAIT</code> is specified, then the lock get does not retry.

150.7.6 REBUILD_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object.

All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

Syntax

```
DBMS_REPAIR.REBUILD_FREELISTS (
    schema_name    IN VARCHAR2,
    object_name    IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL,
    object_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

Parameters

Table 150-9 REBUILD_FREELISTS Procedure Parameters

Parameter	Description
<code>schema_name</code>	Schema name.
<code>object_name</code>	Name of the object whose freelists are to be rebuilt.

Table 150-9 (Cont.) REBUILD_FREELISTS Procedure Parameters

Parameter	Description
partition_name	Partition or subpartition name whose freelists are to be rebuilt. If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See " Constants ".

150.7.7 SEGMENT_FIX_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

Syntax

```
DBMS_REPAIR.SEGMENT_FIX_STATUS (
    segment_owner  IN VARCHAR2,
    segment_name   IN VARCHAR2,
    segment_type   IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
    file_number    IN BINARY_INTEGER DEFAULT NULL,
    block_number   IN BINARY_INTEGER DEFAULT NULL,
    status_value   IN BINARY_INTEGER DEFAULT NULL,
    partition_name IN VARCHAR2 DEFAULT NULL,);
```

Parameters

Table 150-10 SEGMENT_FIX_STATUS Procedure Parameters

Parameter	Description
schema_owner	Schema name of the segment.
segment_name	Segment name.
partition_name	Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.
segment_type	Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL.
file_number	(optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
block_number	(optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.

Table 150-10 (Cont.) SEGMENT_FIX_STATUS Procedure Parameters

Parameter	Description
status_value	<p>(optional) The value to which the block status described by the <code>file_number</code> and <code>block_number</code> will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values:</p> <ul style="list-style-type: none"> • 1 = block is full • 2 = block is 0-25% free • 3 = block is 25-50% free • 4 = block is 50-75% free • 5 = block is 75-100% free <p>The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.</p>

150.7.8 SKIP_CORRUPT_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

Note:

When Oracle performs an index range scan on a corrupt index after DBMS_REPAIR.SKIP_CORRUPT_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  object_type  IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

Parameters

Table 150-11 SKIP_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
schema_name	Schema name of the object to be processed.
object_name	Name of the object.

Table 150-11 (Cont.) SKIP_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or CLUSTER_OBJECT. See "Constants".
flags	If SKIP_FLAG is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If NOSKIP_FLAG is specified, then scans that encounter software corrupt blocks return an ORA-1578. See "Constants".

151

DBMS_RESCONFIG

The `DBMS_RESCONFIG` package provides an interface to operate on the resource configuration list, and to retrieve listener information for a resource.

This chapter contains the following topics:

- [Overview](#)
- [Summary of DBMS_RESCONFIG Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for more information about "Resource Configuration".

151.1 DBMS_RESCONFIG Overview

The `DBMS_RESCONFIG` package contains functions and procedures to manage the resource configuration lists of individual resources and the repository.

151.2 Summary of DBMS_RESCONFIG Subprograms

This table lists and briefly describes the `DBMS_RESCONFIG` package subprograms.

Table 151-1 DBMS_RESCONFIG Package Subprograms

Subprogram	Description
ADDREPOSITORYRESCONFIG Procedure	Inserts the resource configuration specified by absolute path at the given position of the repository's configuration list
ADDRESCONFIG Procedure	Inserts the resource configuration specified by the absolute path at the given position in the target resource's configuration list
APPENDRESCONFIG Procedure	Appends the resource configuration specified by rcpath to the target resource's configuration list if it is not already included in the list
DELETEREPOSITORYRESCONFIG Procedure	Removes the configuration at the given position in the repository's configuration list.
DELETERESCONFIG Procedures	Removes the configuration at the given position in the target resource's configuration list.
GETLISTENERS Function	Returns the list of listeners applicable for a given resource
GETREPOSITORYRESCONFIG Function	Returns the resource configuration at the specified position of the repository's configuration list

Table 151-1 (Cont.) DBMS_RESCONFIG Package Subprograms

Subprogram	Description
GETREPOSITORYRESCONFIGPATHS Function	Returns a list of resource configuration paths defined for the repository
GETRESCONFIG Function	Returns the resource configuration at the specified position of the target resource's configuration list
GETRESCONFIGPATHS Function	Returns a list of resource configuration paths defined in the target resource's configuration list
PATCHREPOSITORYRESCONFIGLIST Procedure	Removes invalid references from the repository resource configuration list, and makes the repository available

151.2.1 ADDREPOSITORYRESCONFIG Procedure

This procedure inserts the resource configuration specified by absolute path of the resource configuration at the specified position of the repository's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```
DBMS_RESCONFIG.ADDREPOSITORYRESCONFIG (
    rcpath    IN    VARCHAR2,
    pos       IN    PLS_INTEGER := NULL);
```

Parameters

Table 151-2 ADDREPOSITORYRESCONFIG Function Parameters

Parameter	Description
rcpath	Absolute path of the resource configuration to be inserted. An exception is raised if <code>rcpath</code> already exists in the target's configuration list.
pos	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range (<code>pos < 0</code> or <code>pos ></code> the size of the target resource's configuration list).

Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `XDBADMIN` role and `READ` privilege on the resource configuration to be inserted; otherwise, an error is returned.

151.2.2 ADDRESCONFIG Procedure

This procedure inserts the resource configuration specified by the absolute path of the resource configuration at the given position in the target resource's configuration list. It

shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG (
    respath    IN    VARCHAR2,
    rcpath     IN    VARCHAR2,
    pos        IN    PLS_INTEGER := NULL);
```

Parameters

Table 151-3 ADDRESCONFIG Function Parameters

Parameter	Description
respath	Absolute path of the target resource
rcpath	Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list.
pos	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range ($pos < 0$ or $pos >$ the size of the target resource's configuration list).

Usage Notes

- An error is raised if the document referenced by rcpath is not based on XDBResConfig.xsd schema.
- Users must have WRITE-CONFIG privilege on the target resource and read privilege on the resource configuration to be inserted; otherwise, an error is returned.

151.2.3 APPENDRESCONFIG Procedure

This procedure appends the resource configuration specified by rcpath to the target resource's configuration list if it is not already included in the list.

Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG (
    respath      IN    VARCHAR2,
    rcpath       IN    VARCHAR2,
    appendOption IN    PLS_INTEGER);
```

Parameters

Table 151-4 ADDRESCONFIG Function Parameters

Parameter	Description
respath	Absolute path of the target resource
rcpath	Absolute path of the resource configuration to be appended at the end of the target's configuration list. If rcpath already exists in the list then nothing is appended.

Table 151-4 (Cont.) ADDRESCONFIG Function Parameters

Parameter	Description
appendOption	Either APPEND_RESOURCE or APPEND_RECURSIVE. If APPEND_RESOURCE is specified then only the target resource is affected. If APPEND_RECURSIVE is specified then the target resource and all its descendents will be affected.

Usage Notes

- An error is raised if the document referenced by rcpath is not based on XDBResConfig.xsd schema.
- Users must have WRITE-CONFIG privilege on all affected resources and required read privilege on the resource configuration to be inserted; otherwise, an error is returned.

151.2.4 DELETEREPOSITORYRESCONFIG Procedure

This procedure removes the configuration at the given position in the repository's configuration list. It shifts any subsequent elements to the left.

Syntax

```
DBMS_RESCONFIG.DELETEREPOSITORYRESCONFIG (
    pos          IN    PLS_INTEGER);
```

Parameters

Table 151-5 DELETEREPOSITORYRESCONFIG Function Parameters

Parameter	Description
pos	The index of the configuration to be removed. An exception is raised if the index is out of range (pos < 0 or pos >= the size of the target resource's configuration list).

Usage Notes

- Users must have XDBADMIN role to execute this.
- This statement is treated as if it is a DDL statement. This means the system will implicitly commit before and after this statement.

151.2.5 DELETERESCONFIG Procedures

This procedure removes the configuration at the given position in the target resource's configuration list. It shifts any subsequent elements to the left. Users can use the overloaded for recursive deletion.

Syntax

```
DBMS_RESCONFIG.DELETERESCONFIG (
    respath      IN  VARCHAR2,
    pos          IN  PLS_INTEGER);
```

```
DBMS_RESCONFIG.DELETERESCONFIG (
    respath      IN  VARCHAR2,
    rcpath       IN  VARCHAR2,
    deleteOption IN  PLS_INTEGER);
```

Parameters

Table 151-6 DELETERESCONFIG Procedure Parameters

Parameter	Description
respath	Absolute path of the target resource
pos	The index of the configuration to be removed. An exception is raised if the index is out of range ($pos < 0$ or $pos \geq$ the size of the target resource's configuration list).
rcpath	Absolute path of the resource configuration to be deleted if found in list.
deleteOption	Either <code>DELETE_RESOURCE</code> or <code>DELETE_RECURSIVE</code> . If <code>DELETE_RESOURCE</code> is specified then only the configuration list of the target resource is affected. If <code>DELETE_RECURSIVE</code> is specified then the configuration list of the target resource and all its descendents will be affected.

Usage Notes

Users must have `WRITE-CONFIG` privilege on the target resource to execute this.

151.2.6 GETLISTENERS Function

This function returns the list of listeners applicable for a given resource.

The value returned by this function is an XML document containing the `<event-listeners>` element of the `XDBResconfig.xsd` schema. It contains all the listeners applicable to the target resource, including repository-level listeners. From the returned XML document users can use the `EXTRACT` operator to retrieve the listeners defined for a specific event.

Syntax

```
DBMS_RESCONFIG.GETLISTENERS (
    path  IN  VARCHAR2)
RETURN XMLTYPE;
```

Parameters

Table 151-7 GETLISTENERS Function Parameters

Parameter	Description
path	Absolute path of the target resource

Usage Notes

Users must have the required access privilege on all resource configurations referenced by the repository and the target resource; otherwise, an error is returned.

151.2.7 GETREPOSITORYRESCONFIG Function

This function returns the resource configuration at the specified position of the repository's configuration list.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIG (
    pos    IN    PLS_INTEGER)
RETURN XMLTYPE;
```

Parameters

Table 151-8 GETREPOSITORYRESCONFIG Function Parameters

Parameter	Description
pos	Index of element to return. An exception is raised if the index is out of range ($pos < 0$ or $pos \geq$ the size of the repository's configuration list).

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

151.2.8 GETREPOSITORYRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined for the repository.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIGPATHS
RETURN XDB$STRING_LIST_T;
```

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

151.2.9 GETRESCONFIG Function

This function returns the resource configuration at the specified position of the target resource's configuration list.

Syntax

```
DBMS_RESCONFIG.GETRESCONFIG(  
    respath IN VARCHAR2,  
    pos IN PLS_INTEGER)  
RETURN XMLTYPE;
```

Parameters

Table 151-9 GETRESCONFIG Function Parameters

Parameter	Description
respath	Absolute path of the target resource
pos	Index of element to return. An exception is raised if the index is out of range ($pos < 0$ or $pos \geq$ the size of the target resource's configuration list).

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

151.2.10 GETRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined in the target resource's configuration list.

Syntax

```
DBMS_RESCONFIG.GETRESCONFIGPATHS(  
    respath IN VARCHAR2)  
RETURN XDB$STRING_LIST_T;
```

Parameters

Table 151-10 GETRESCONFIGPATHS Function Parameters

Parameter	Description
respath	Absolute path of the target resource

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

151.2.11 PATCHREPOSITORYRESCONFIGLIST Procedure

This procedure removes invalid references from the repository resource configuration list, and makes the repository available.

Under normal circumstances, deletion of a resource configuration resource cannot be performed if it is part of the repository resource configuration list. If, for some reason, the deletion of a resource configuration resource that is part of the repository resource configuration list succeeds, then any repository operation results in a 'dangling reference' error. This procedure removes those invalid references.

This procedure must be run as `SYS`.

Syntax

```
DBMS_RESCONFIG.PATCHREPOSITORYRESCONFIGLIST;
```

DBMS_RESOURCE_MANAGER

The `DBMS_RESOURCE_MANAGER` package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_RESOURCE_MANAGER Subprograms](#)

See Also:

For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*

152.1 DBMS_RESOURCE_MANAGER Deprecated Subprograms

The `SET_INITIAL_CONSUMER_GROUP` Procedure has been deprecated with Oracle Database 11g.

- [SET_INITIAL_CONSUMER_GROUP Procedure](#)

Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

152.2 DBMS_RESOURCE_MANAGER Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures.

The procedures to grant and revoke this privilege are in the package [DBMS_RESOURCE_MANAGER_PRIVS](#).

152.3 DBMS_RESOURCE_MANAGER Constants

The `DBMS_RESOURCE_MANAGER` package defines several constants for specifying parameter values.

These are shown in the following table.

Table 152-1 DBMS_RESOURCE_MANAGER Constants

Constant	Type	Value	Description
<code>CLIENT_ID</code>	<code>VARCHAR2 (30)</code>	<code>CLIENT_ID</code>	Client identifier of the session
<code>CLIENT_MACHINE</code>	<code>VARCHAR2 (30)</code>	<code>CLIENT_MACHINE</code>	Name of the computer from which the client is making the connection
<code>CLIENT_OS_USER</code>	<code>VARCHAR2 (30)</code>	<code>CLIENT_OS_USER</code>	Operating system user name of the client that is logging in
<code>CLIENT_PROGRAM</code>	<code>VARCHAR2 (30)</code>	<code>CLIENT_PROGRAM</code>	Name of the client program used to log in to the server
<code>MODULE_NAME</code>	<code>VARCHAR2 (30)</code>	<code>MODULE_NAME</code>	Module name in the currently running application as set by the SET_MODULE Procedure in the DBMS_APPLICATION_INFO package, or the equivalent OCI attribute setting
<code>MODULE_NAME_ACTION</code>	<code>VARCHAR2 (30)</code>	<code>MODULE_NAME_ACTION</code>	A combination of the current module and the action being performed as set by either of the following procedures in the DBMS_APPLICATION_INFO package, or their equivalent OCI attribute setting: <ul style="list-style-type: none"> SET_MODULE Procedure SET_ACTION Procedure The attribute is specified as the module name followed by a period (<code>.</code>), followed by the action name (<code>module_name.action_name</code>).
<code>ORACLE_FUNCTION</code>	<code>VARCHAR2 (30)</code>	<code>ORACLE_FUNCTION</code>	Function the session is currently executing. Valid functions are the <code>BACKUP</code> , <code>COPY</code> , <code>DATALOAD</code> , and <code>INMEMORY</code> . <code>BACKUP</code> is set for sessions that are doing backup operations using <code>RMAN</code> . <code>COPY</code> is set for sessions that are doing image copies using <code>RMAN</code> . <code>DATALOAD</code> is set for sessions that are loading data using Oracle Data Pump.
<code>ORACLE_USER</code>	<code>VARCHAR2 (30)</code>	<code>ORACLE_USER</code>	Oracle Database user name

Table 152-1 (Cont.) DBMS_RESOURCE_MANAGER Constants

Constant	Type	Value	Description
SERVICE_MODULE	VARCHAR2 (30)	SERVICE_MODULE	Combination of service and module names in this form: <i>service_name.module_name</i>
SERVICE_MODULE_ACTION	VARCHAR2 (30)	SERVICE_MODULE_ACTION	Combination of service name, module name, and action name, in this form: <i>service_name.module_name.action_name</i>
SERVICE_NAME	VARCHAR2 (30)	SERVICE_NAME	Service name used by the client to establish a connection

152.4 Summary of DBMS_RESOURCE_MANAGER Subprograms

This table lists the DBMS_RESOURCE_MANAGER subprograms and briefly describes them.

Table 152-2 DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
BEGIN_SQL_BLOCK Procedure	Indicates the start of a block of SQL statements to be treated as a group by resource manager
CALIBRATE_IO Procedure	Calibrates the I/O capabilities of storage
CLEAR_PENDING_AREA Procedure	Clears the work area for the resource manager
CREATE_CATEGORY Procedure	Creates a new resource consumer group category
CREATE_CDB_PLAN Procedure	Creates entries which define consolidation resource plans.
CREATE_CDB_PLAN_DIRECTIVE Procedure	Creates the plan directives of the consolidation resource plan
CREATE_CDB_PROFILE_DIRECTIVE Procedure	Creates the performance profile directives of the consolidation resource plan
CREATE_CONSUMER_GROUP Procedure	Creates entries which define resource consumer groups
CREATE_PENDING_AREA Procedure	Creates a work area for changes to resource manager objects
CREATE_PLAN Procedure	Creates entries which define resource plans
CREATE_PLAN_DIRECTIVE Procedure	Creates resource plan directives
CREATE_SIMPLE_PLAN Procedure	Creates a single-level resource plan containing up to eight consumer groups in one step
DELETE_CATEGORY Procedure	Deletes an existing resource consumer group category
DELETE_CDB_PLAN Procedure	Deletes the consolidation resource plan
DELETE_CDB_PLAN_DIRECTIVE Procedure	Deletes the plan directive of the consolidation resource plan

Table 152-2 (Cont.) DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
DELETE_CDB_PROFILE_DIRECTIVE Procedure	Deletes the performance profile directive of the consolidation resource plan
DELETE_CONSUMER_GROUP Procedure	Deletes entries which define resource consumer groups
DELETE_PLAN Procedure	Deletes the specified plan as well as all the plan directives it refers to
DELETE_PLAN_CASCADE Procedure	Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups)
DELETE_PLAN_DIRECTIVE Procedure	Deletes resource plan directives
DEQUEUE_PARALLEL_STATEMENT Procedure	Dequeues a parallel statement from the parallel statement queue
END_SQL_BLOCK Procedure	Indicates the end of a block of SQL statements that should be treated as a group by resource manager
SET_CONSUMER_GROUP_MAPPING Procedure	Adds, deletes, or modifies entries for the login and run-time attribute mappings
SET_CONSUMER_GROUP_MAPPING_PRI Procedure	Creates the session attribute mapping priority list
SET_INITIAL_CONSUMER_GROUP Procedure	Assigns the initial resource consumer group for a user (Caution: Deprecated Subprogram)
SUBMIT_PENDING_AREA Procedure	Submits pending changes for the resource manager
SWITCH_CONSUMER_GROUP_FOR_SESS Procedure	Changes the resource consumer group of a specific session
SWITCH_CONSUMER_GROUP_FOR_USER Procedure	Changes the resource consumer group for all sessions with a given user name
SWITCH_PLAN Procedure	Sets the current resource manager plan
UPDATE_CATEGORY Procedure	Updates an existing resource consumer group category
UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure	Updates the plan directives with regard to automated maintenance tasks
UPDATE_CDB_DEFAULT_DIRECTIVE Procedure	Updates the default values for a consolidation plan
UPDATE_CDB_PLAN Procedure	Updates the consolidation resource plan
UPDATE_CDB_PLAN_DIRECTIVE Procedure	Updates the plan directives for a consolidation resource plan
UPDATE_CDB_PROFILE_DIRECTIVE Procedure	Updates the performance profile directives of the consolidation resource plan
UPDATE_CONSUMER_GROUP Procedure	Updates entries which define resource consumer groups
UPDATE_PLAN Procedure	Updates entries which define resource plans
UPDATE_PLAN_DIRECTIVE Procedure	Updates resource plan directives
VALIDATE_PENDING_AREA Procedure	Validates pending changes for the resource manager

152.4.1 BEGIN_SQL_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the start of a block of SQL statements that should be treated as a group by resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.BEGIN_SQL_BLOCK;
```

Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in *Oracle Database VLDB and Partitioning Guide*.

152.4.2 CALIBRATE_IO Procedure

This procedure calibrates the I/O capabilities of storage. Calibration status is available from the `V$IO_CALIBRATION_STATUS` view and results for a successful calibration run are located in `DBA_RSRC_IO_CALIBRATE` table.

Syntax

```
DBMS_RESOURCE_MANAGER.CALIBRATE_IO (
  num_physical_disks    IN PLS_INTEGER DEFAULT 1,
  max_latency           IN PLS_INTEGER DEFAULT 20,
  max_iops              OUT PLS_INTEGER,
  max_mbps              OUT PLS_INTEGER,
  actual_latency        OUT PLS_INTEGER);
```

Parameters

Table 152-3 CALIBRATE_IO Procedure Parameters

Parameter	Description
<code>num_physical_disks</code>	Approximate number of physical disks in the database storage. This parameter is used to determine the initial I/O load for the calibration run.
<code>max_latency</code>	Maximum tolerable latency in milliseconds for database-block-sized IO requests
<code>max_iops</code>	Maximum number of I/O requests per second that can be sustained. The I/O requests are randomly-distributed, database-block-sized reads.
<code>max_mbps</code>	Maximum throughput of I/O that can be sustained, expressed in megabytes per second. The I/O requests are randomly-distributed, 1 megabyte reads.
<code>actual_latency</code>	Average latency of database-block-sized I/O requests at <code>max_iops</code> rate, expressed in milliseconds

Usage Notes

- Only users with the `SYSDBA` privilege can run this procedure. Qualified users must also turn on `timed_statistics`, and ensure `asynch_io` is enabled for datafiles. This can be

achieved by setting `filesystemio_options` to either `ASYNCH` or `SETALL`. One can also query the `asynch_io` status by means of the following SQL statement:

```
col name format a50
SELECT name, asynch_io FROM v$datafile f,v$iostat_file i
  WHERE f.file#      = i.file_no
  AND  filetype_name = 'Data File'
/
```

- Only one calibration can be run at a time. If another calibration is initiated at the same time, it will fail.
- For an Oracle Real Application Clusters (Oracle RAC) database, the workload is simultaneously generated from all instances.
- In a multitenant container database (CDB), calibration can only be run from the CDB root (`CDB$ROOT`).
- Calibration is extremely disruptive to the database performance. It is strongly recommended to run calibration only when database users can tolerate severe deterioration to database performance.
- For optimal calibration results, no other database workloads should be running.

See Also:

Oracle Database Performance Tuning Guide for more information about calibration

Examples

Example of using I/O Calibration procedure

```
SET SERVEROUTPUT ON
DECLARE
  lat NUMBER;
  iops INTEGER;
  mbps INTEGER;
BEGIN
  -- DBMS_RESOURCE_MANAGER.CALIBRATE_IO (<DISKS>, <MAX_LATENCY>, iops, mbps, lat);
  DBMS_RESOURCE_MANAGER.CALIBRATE_IO (2, 10, iops, mbps, lat);

end;
/
```

View for I/O calibration results

```
SQL> desc v$io_calibration_status
Name                                                    Null?    Type
-----
STATUS                                                  VARCHAR2(13)
CALIBRATION_TIME                                       TIMESTAMP(3)

SQL> desc gv$io_calibration_status
Name                                                    Null?    Type
-----
INST_ID                                                NUMBER
STATUS                                                  VARCHAR2(13)
CALIBRATION_TIME                                       TIMESTAMP(3)
```

Column explanation:

STATUS:

IN PROGRESS : Calibration in Progress (Results from previous calibration
run displayed, if available)
READY : Results ready and available from earlier run
NOT AVAILABLE : Calibration results not available.

CALIBRATION_TIME: End time of the last calibration run

DBA table that stores I/O Calibration results

SQL> desc DBA_RSRC_IO_CALIBRATE

Name	Null?	Type
START_TIME		TIMESTAMP(6)
END_TIME		TIMESTAMP(6)
MAX_IOPS		NUMBER
MAX_MBPS		NUMBER
MAX_PMBPS		NUMBER
LATENCY		NUMBER
NUM_PHYSICAL_DISKS		NUMBER

comment on column DBA_RSRC_IO_CALIBRATE.LATENCY is
'latency for data-block read requests'
/
comment on column DBA_RSRC_IO_CALIBRATE.NUM_PHYSICAL_DISKS is
'number of physical disks in the storage subsystem (as specified by user)'
/
```

152.4.3 CLEAR_PENDING_AREA Procedure

This procedure clears pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```

152.4.4 CREATE_CATEGORY Procedure

This procedure creates a new consumer group category. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans.

The view `DBA_RSRC_CATEGORIES` defines the currently defined categories. The `ADMINISTRATIVE`, `INTERACTIVE`, `BATCH`, `MAINTENANCE`, and `OTHER` categories are available.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CATEGORY (
  category IN VARCHAR2,
  comment  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 152-4 CREATE_CATEGORY Procedure Parameters

Parameter	Description
category	Name of consumer group category
comment	User comment

152.4.5 CREATE_CDB_PLAN Procedure

Creates entries which define consolidation resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN (
  plan          IN VARCHAR2(32),
  comment      IN VARCHAR2(2000) DEFAULT NULL);
```

Parameters

Table 152-5 CREATE_CDB_PLAN Procedure Parameters

Parameter	Description
plan	Name of the consolidation plan
comment	User comment

Usage Notes

This procedure can be run only from the CDB root (`CDB$ROOT`).

152.4.6 CREATE_CDB_PLAN_DIRECTIVE Procedure

This procedure creates the plan directives of the consolidation resource plan. Plan directives specify the resource allocation policy for pluggable databases (PDBs).

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN_DIRECTIVE (
  plan                IN    VARCHAR2,
  pluggable_database IN    VARCHAR2,
  comment             IN    VARCHAR2 (2000) DEFAULT '',
  shares              IN    NUMBER           DEFAULT NULL,
  utilization_limit   IN    NUMBER           DEFAULT NULL,
  parallel_server_limit IN NUMBER           DEFAULT NULL,
  memory_limit        IN    NUMBER           DEFAULT 100,
  memory_min         IN    NUMBER           DEFAULT 0);
```

Parameters

Table 152-6 CREATE_CDB_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	Name of the consolidation plan
pluggable_database	Name of the PDB
comment	User comment
shares	Specifies the share of resource allocation for the PDB. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through UPDATE_CDB_DEFAULT_DIRECTIVE Procedure .
utilization_limit	Specifies the maximum percentage of the CDB's CPU and Exadata I/O resources that the PDB can utilize. CPU Resource Manager and Exadata I/O Resource Manager can also be limited by setting the <code>CPU_COUNT</code> parameter for the PDB.

Table 152-6 (Cont.) CREATE_CDB_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
<code>parallel_server_limit</code>	<p>Parallel servers that the PDB can use after which parallel statements are queued. Alternatively, you can set the <code>parallel_servers_target</code> at the PDB level.</p> <p>A PDB can set a lower limit for parallel execution servers than the limit specified in the CDB resource plan. When the <code>PARALLEL_SERVERS_TARGET</code> initialization parameter is set in a PDB, and parallel execution server limit is specified for a PDB in the CDB resource plan, then the lower limit is used.</p> <p>For example, assume that the <code>parallel_servers_target</code> initialization parameter is set to 100 in the CDB root and <code>parallel_server_limit</code> is set to 70 for <code>hrpdb</code> in the CDB resource plan. Also, assume that <code>hrpdb</code> has its <code>parallel_servers_target</code> initialization parameter set to 50. In this case, the limit for parallel execution servers for <code>hrpdb</code> is 50, because 50 is lower than the CDB resource plan limit of 70 for <code>hrpdb</code>.</p>
<code>memory_limit</code>	<p>This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache.</p>
<code>memory_min</code>	<p>This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache.</p>

Note:

Oracle recommends, that you use `parallel_servers_target` parameter instead of `parallel_servers_limit` in a CDB resource plan.

Usage Notes

- The default value for `shares`, `utilization_limit`, and `parallel_server_limit` is NULL. When a user specifies NULL, or does not specify a value, this indicates that the default value should be used.
- This procedure can be run only from the CDB root (`CDB$ROOT`).

152.4.7 CREATE_CDB_PROFILE_DIRECTIVE Procedure

This procedure creates the performance profile directives of the consolidation resource plan. The directives specify the resource allocation policy for pluggable databases (PDBs) that use the performance profile.

For a PDB to use the new performance profile, the PDB must have the `DB_PERFORMANCE_PROFILE` initialization parameter set to the profile name.

This procedure provides an easy way to specify the directive for a large number of PDBs with the same resource requirements. Each PDB with a `DB_PERFORMANCE_PROFILE` initialization parameter set to the performance profile name inherits the settings specified by this directive, including the shares, utilization limit, and so on.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PROFILE_DIRECTIVE (
  plan                IN    VARCHAR2,
  profile             IN    VARCHAR2,
  comment            IN    VARCHAR2 (2000) DEFAULT '',
  shares             IN    NUMBER           DEFAULT NULL,
  utilization_limit  IN    NUMBER           DEFAULT NULL,
  parallel_server_limit IN NUMBER           DEFAULT NULL,
  memory_limit       IN    NUMBER           DEFAULT 100,
  memory_min        IN    NUMBER           DEFAULT 0);
```

Parameters

Table 152-7 CREATE_CDB_PROFILE_DIRECTIVE Procedure Parameters

Parameter	Description
plan	Name of the consolidation plan
profile	Name of the performance profile
comment	User comment
shares	Specifies the share of resource allocation for PDBs that use the performance profile. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through UPDATE_CDB_DEFAULT_DIRECTIVE Procedure .
utilization_limit	Specifies the maximum percentage of CPU Resource Manager and Exadata I/O Resource Manager that PDBs that use the performance profile can utilize.
parallel_server_limit	Specifies the maximum percentage of <code>parallel_servers_target</code> parallel servers that PDBs that use the performance profile can use.
memory_limit	This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache.
memory_min	This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache.

152.4.8 CREATE_CONSUMER_GROUP Procedure

This procedure creates entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (
  consumer_group IN VARCHAR2,
  comment        IN VARCHAR2 DEFAULT NULL,
```

```

cpu_mth          IN VARCHAR2 DEFAULT NULL,
mgmt_mth        IN VARCHAR2 DEFAULT 'ROUND-ROBIN',
category        IN VARCHAR2 DEFAULT 'OTHER');

```

Parameters

Table 152-8 CREATE_CONSUMER_GROUP Procedure Parameters

Parameter	Description
consumer_group	Name of the consumer group
comment	User comment
cpu_mth	Name of CPU resource allocation method (deprecated)
mgmt_mth	Name of CPU resource allocation method
category	Describes the category of the consumer group. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans. The view <code>DBA_RSRC_CATEGORIES</code> defines the currently defined categories. Categories can be modified, using the CREATE_CATEGORY Procedure , UPDATE_CATEGORY Procedure , and DELETE_CATEGORY Procedure .

152.4.9 CREATE_PENDING_AREA Procedure

This procedure makes changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the `VALIDATE` procedure to confirm whether the changes you have made are valid. You do not have to perform your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

Note:

Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

For resource plans, the following rules must be adhered to, and they are checked whenever the `validate` or `submit` procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- The plan directive parameter, `parallel_degree_limit_p1`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 28 plan directives coming from any given plan (that is, no plan can have more than 28 children).
- There cannot be more than 28 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROUPS` somewhere in any active plan schema. This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROUPS` directive.

 **Note:**

These rules are not applicable for CDB resource plans.

If any of the preceding rules are broken when checked by the `VALIDATE` or `SUBMIT` procedures, then an informative error message is returned. You may then make changes to fix one or more problems and reissue the `validate` or `submit` procedures.

152.4.10 CREATE_PLAN Procedure

This procedure creates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
  plan                IN  VARCHAR2,
  comment             IN  VARCHAR2 DEFAULT NULL,
  cpu_mth             IN  VARCHAR2 DEFAULT NULL, -- deprecated
  active_sess_pool_mth IN  VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
  parallel_degree_limit_mth IN  VARCHAR2 DEFAULT
    'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
  queueing_mth       IN  VARCHAR2 DEFAULT 'FIFO_TIMEOUT',
  mgmt_mth           IN  VARCHAR2 DEFAULT 'EMPHASIS',
  sub_plan           IN  BOOLEAN DEFAULT FALSE,
  max_iops           IN  NUMBER DEFAULT NULL,
  max_mbps           IN  NUMBER DEFAULT NULL);
```

Parameters

Table 152-9 CREATE_PLAN Procedure Parameters

Parameter	Description
plan	Name of the resource plan
comment	User comment
cpu_mth	Allocation method for CPU resources (deprecated)
active_sess_pool_mth	Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available.
parallel_degree_limit_mth	Resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available.
queueing_mth	Queuing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available
mgmt_mth	Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups RATIO - for single-level plans that use ratios to specify how I/O resources are distributed
sub_plan	If TRUE, indicates that this plan is only intended for use as a sub-plan. Sub-plans are not required to have an OTHER_GROUPS directive. Default is FALSE.
max_iops	Nonoperative
max_mbps	Nonoperative

Usage Notes

If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.

152.4.11 CREATE_PLAN_DIRECTIVE Procedure

This procedure creates resource plan directives.

Note:

The parameters `max_utilization_limit` and `parallel_target_percentage` are deprecated with Oracle Database 11g Release 1 (11.1.0.1), and are replaced by `utilization_limit` and `parallel_server_limit`.

Syntax

```

DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (
  plan                IN VARCHAR2,
  group_or_subplan    IN VARCHAR2,
  comment             IN VARCHAR2 DEFAULT NULL,
  cpu_p1              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p2              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p3              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p4              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p5              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p6              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p7              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p8              IN NUMBER   DEFAULT NULL, -- deprecated
  active_sess_pool_p1 IN NUMBER   DEFAULT NULL,
  queueing_p1         IN NUMBER   DEFAULT NULL,
  parallel_degree_limit_p1 IN NUMBER DEFAULT NULL,
  switch_group        IN VARCHAR2 DEFAULT NULL,
  switch_time         IN NUMBER   DEFAULT NULL,
  switch_estimate     IN BOOLEAN  DEFAULT FALSE,
  max_est_exec_time   IN NUMBER   DEFAULT NULL,
  undo_pool           IN NUMBER   DEFAULT NULL,
  max_idle_time       IN NUMBER   DEFAULT NULL,
  max_idle_blocker_time IN NUMBER DEFAULT NULL,
  switch_time_in_call IN NUMBER   DEFAULT NULL, -- deprecated
  mgmt_p1             IN NUMBER   DEFAULT NULL,
  mgmt_p2             IN NUMBER   DEFAULT NULL,
  mgmt_p3             IN NUMBER   DEFAULT NULL,
  mgmt_p4             IN NUMBER   DEFAULT NULL,
  mgmt_p5             IN NUMBER   DEFAULT NULL,
  mgmt_p6             IN NUMBER   DEFAULT NULL,
  mgmt_p7             IN NUMBER   DEFAULT NULL,
  mgmt_p8             IN NUMBER   DEFAULT NULL,
  switch_io_megabytes IN NUMBER   DEFAULT NULL,
  switch_io_reqs      IN NUMBER   DEFAULT NULL,
  switch_for_call     IN BOOLEAN  DEFAULT NULL,
  max_utilization_limit IN NUMBER DEFAULT NULL, -- deprecated
  parallel_target_percentage IN NUMBER DEFAULT NULL, -- deprecated
  parallel_server_limit IN NUMBER DEFAULT NULL,
  utilization_limit   IN NUMBER   DEFAULT NULL,
  switch_io_logical   IN NUMBER   DEFAULT NULL,
  switch_elapsed_time IN NUMBER   DEFAULT NULL,
  shares              IN NUMBER   DEFAULT NULL,
  parallel_stmt_critical IN VARCHAR2 DEFAULT NULL,
  session_pga_limit   IN NUMBER   DEFAULT NULL,
  pq_timeout_action   IN NUMBER   DEFAULT NULL,
  parallel_queue_timeout IN NUMBER DEFAULT NULL,);

```

**Note:**

Oracle recommends that you use shares instead of mgmt_p*.

Parameters

Table 152-10 CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	Name of the resource plan
group_or_subplan	Name of the consumer group or subplan
comment	Comment for the plan directive
cpu_p1	-- deprecated: use mgmt_p1 or, even better, shares instead
cpu_p2	-- deprecated: use mgmt_p2 or, even better, shares instead
cpu_p3	-- deprecated: use mgmt_p3 or, even better, shares instead
cpu_p4	-- deprecated: use mgmt_p4 or, even better, shares instead
cpu_p5	-- deprecated: use mgmt_p5 or, even better, shares instead
cpu_p6	-- deprecated: use mgmt_p6 or, even better, shares instead
cpu_p7	-- deprecated: use mgmt_p7 or, even better, shares instead
cpu_p8	-- deprecated: use mgmt_p8 or, even better, shares instead
active_sess_pool_p1	Specifies maximum number of sessions that can currently have an active call
queueing_p1	Specified time (in seconds) after which a call in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
parallel_degree_limit_p1	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited. If the value is 0, then all operations will be serial.
switch_group	Specifies consumer group to switch to, once a switch condition is met. If the group name is CANCEL_SQL, then the current call is canceled when the switch condition is met. If the group name is KILL_SESSION, then the session is killed when the switch condition is met. If the group name is LOG_ONLY, then no action is taken other than recording this event via SQL monitor. Default is NULL.
switch_time	Specifies the time on CPU (not elapsed time) that a session can execute before an action is taken. Default is NULL, which means unlimited. As with other switch directives, if switch_for_call is TRUE, the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.
switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. This is used in conjunction with the switch_time directive. Default value is FALSE.
max_est_exec_time	Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.

Table 152-10 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
undo_pool	Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group
max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
max_idle_blocker_time	Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource
switch_time_in_call	Deprecated. If this parameter is specified, <code>switch_time</code> is set to <code>switch_time_in_call</code> (in seconds) and <code>switch_for_call</code> is effectively set to TRUE. It is better to use <code>switch_time</code> and <code>switch_for_call</code> .
mgmt_p1	Resource allocation value for level 1 (replaces <code>cpu_p1</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the first level RATIO - specifies the weight of resource usage
mgmt_p2	Resource allocation value for level 2 (replaces <code>cpu_p2</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the second level RATIO - non-applicable
mgmt_p3	Resource allocation value for level 3 (replaces <code>cpu_p3</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the third level RATIO - non-applicable
mgmt_p4	Resource allocation value for level 4 (replaces <code>cpu_p4</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the fourth level RATIO - non-applicable
mgmt_p5	Resource allocation value for level 5 (replaces <code>cpu_p5</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the fifth level RATIO - non-applicable
mgmt_p6	Resource allocation value for level 6 (replaces <code>cpu_p6</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the sixth level RATIO - non-applicable
mgmt_p7	Resource allocation value for level 7 (replaces <code>cpu_p7</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the seventh level RATIO - non-applicable
mgmt_p8	Resource allocation value for level 8 (replaces <code>cpu_p8</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the eighth level RATIO - non-applicable

Table 152-10 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
<code>switch_io_megabytes</code>	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited. As with other switch directives, if <code>switch_for_call</code> is <code>TRUE</code> , the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.
<code>switch_io_reqs</code>	Specifies the number of I/O requests that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited. As with other switch directives, if <code>switch_for_call</code> is <code>TRUE</code> , the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.
<code>switch_for_call</code>	Specifies that if an action is taken because of the <code>switch_time</code> , <code>switch_io_megabytes</code> , <code>switch_io_reqs</code> , <code>switch_io_logical</code> or <code>switch_elapsed_time</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is <code>NULL</code> , which means that the original consumer group is not restored at the end of the top call.
<code>max_utilization_limit</code>	-- deprecated: use <code>utilization_limit</code> instead
<code>parallel_target_percentage</code>	-- deprecated: use <code>parallel_sever_limit</code> instead
<code>parallel_queue_timeout</code>	Specifies the time (in seconds) that a parallel statement may remain in its Consumer Group's parallel statement queue before it is removed and terminated with an error (ORA- 07454).

 **Note:**

You can use the `pq_timeout_action` parameter to specify the action to be taken when a parallel statement is removed from the queue.

`parallel_sever_limit` Specifies the maximum percentage of `parallel_servers_target` parallel servers that the Consumer Group can use, after which parallel statements are queued.

`utilization_limit` Resource limit. Currently it includes CPU and I/O for Exadata. For CPU, this limits the CPU utilization for the consumer group. For Exadata I/O, this limits the disk utilization for the consumer group. This does not apply to parallel servers.

`switch_io_logical` Number of logical IOs that will trigger the action specified by `switch_group`. As with other switch directives, if `switch_for_call` is `TRUE`, the number of logical IOs is accumulated from the start of a call. Otherwise, the number of logical IOs is accumulated for the length of the session.

Table 152-10 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
<code>switch_elapsed_time</code>	Elapsed time that will trigger the action specified by <code>switch_group</code> . As with other switch directives, if <code>switch_for_call</code> is <code>TRUE</code> , the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.
<code>shares</code>	Specifies the share of resource allocation for the consumer group. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each consumer group. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If CPU Resource Manager and Exadata I/O Resource Manager are enabled, then the default value is 1.
<code>parallel_stmt_critical</code>	<p>If set to <code>BYPASS_QUEUE</code>, parallel statements from the Consumer Group are not queued, regardless of the <code>PARALLEL_DEGREE_POLICY</code> parameter value.</p> <p>If set to <code>QUEUE</code>, all the parallel statements from the consumer group, irrespective of the <code>parallel_degree_policy</code> parameter value, are eligible for queuing.</p> <p>Default is <code>FALSE</code>, which means that parallel statements are eligible for queuing, based on the <code>parallel_degree_policy</code> parameter value.</p>
<code>session_pga_limit</code>	<p>Maximum amount of untunable PGA (in MB) that a session in this consumer group can allocate before being terminated. <code>NULL</code> (default) indicates no limit.</p> <p>SQL operations that allocate tunable PGA (operations that can opt to use temp space) are not controlled by this limit.</p>
<code>pq_timeout_action</code>	<p>Specifies the action to be taken when a parallel statement is removed from the queue due to <code>parallel_queue_timeout</code>.</p> <p>The values are:</p> <ul style="list-style-type: none"> <code>CANCEL</code> — The parallel statement is terminated with error <code>ORA-7454</code> <code>RUN</code> — The SQL statement runs immediately, and might get downgraded if parallel servers are unavailable <p>The default action of this parameter is <code>CANCEL</code>.</p>

Usage Notes

- All parameters default to `NULL`.
- For `max_idle_time` and `max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `switch_for_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using `switch_for_call`, the resource usage of one client will not affect a future client that happens to be executed on the same session.
- An error is thrown if `PQ_TIMEOUT_ACTION` is specified, but `PARALLEL_QUEUE_TIMEOUT` is not specified.
- Specifies the action to be taken when a parallel statement is removed from the queue.

152.4.12 CREATE_SIMPLE_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the `CREATE_CONSUMER_GROUP` and `CREATE_RESOURCE_PLAN_DIRECTIVES` procedures separately.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (
  simple_plan      IN VARCHAR2 DEFAULT NULL,
  consumer_group1 IN VARCHAR2 DEFAULT NULL,
  group1_cpu       IN NUMBER   DEFAULT NULL,    -- deprecated
  consumer_group2 IN VARCHAR2 DEFAULT NULL,
  group2_cpu       IN NUMBER   DEFAULT NULL,    -- deprecated
  consumer_group3 IN VARCHAR2 DEFAULT NULL,
  group3_cpu       IN NUMBER   DEFAULT NULL,    -- deprecated
  consumer_group4 IN VARCHAR2 DEFAULT NULL,
  group4_cpu       IN NUMBER   DEFAULT NULL,    -- deprecated
  consumer_group5 IN VARCHAR2 DEFAULT NULL,
  group5_cpu       IN NUMBER   DEFAULT NULL,    -- deprecated
  consumer_group6 IN VARCHAR2 DEFAULT NULL,
  group6_cpu       IN NUMBER   DEFAULT NULL,    -- deprecated
  consumer_group7 IN VARCHAR2 DEFAULT NULL,
  group7_cpu       IN NUMBER   DEFAULT NULL,    -- deprecated
  consumer_group8 IN VARCHAR2 DEFAULT NULL,
  group8_cpu       IN NUMBER   DEFAULT NULL,    -- deprecated
  group1_percent  IN NUMBER   DEFAULT NULL,
  group2_percent  IN NUMBER   DEFAULT NULL,
  group3_percent  IN NUMBER   DEFAULT NULL,
  group4_percent  IN NUMBER   DEFAULT NULL,
  group5_percent  IN NUMBER   DEFAULT NULL,
  group6_percent  IN NUMBER   DEFAULT NULL,
  group7_percent  IN NUMBER   DEFAULT NULL,
  group8_percent  IN NUMBER   DEFAULT NULL);
```

Parameters

Table 152-11 CREATE_SIMPLE_PLAN Procedure Parameters

Parameter	Description
<code>simple_plan</code>	Name of the resource plan
<code>consumer_group1</code>	Name of the consumer group
<code>group1_cpu</code>	Percentage for group (deprecated)
<code>consumer_group2</code>	Name of the consumer group
<code>group2_cpu</code>	Percentage for group (deprecated)
<code>consumer_group3</code>	Name of the consumer group
<code>group3_cpu</code>	Percentage for group (deprecated)
<code>consumer_group4</code>	Name of the consumer group
<code>group4_cpu</code>	Percentage for group (deprecated)
<code>consumer_group5</code>	Name of the consumer group

Table 152-11 (Cont.) CREATE_SIMPLE_PLAN Procedure Parameters

Parameter	Description
group5_cpu	Percentage for group (deprecated)
consumer_group6	Name of the consumer group
group6_cpu	Percentage for group (deprecated)
consumer_group7	Name of the consumer group
group7_cpu	Percentage for group (deprecated)
consumer_group8	OTHER_GROUPS - all sessions that aren't mapped to a consumer group.
group8_cpu	Percentage for group (deprecated)
group1_percent	Percentage of resources allocated for this consumer group
group2_percent	Percentage of resources allocated for this consumer group
group3_percent	Percentage of resources allocated for this consumer group
group4_percent	Percentage of resources allocated for this consumer group
group5_percent	Percentage of resources allocated for this consumer group
group6_percent	Percentage of resources allocated for this consumer group
group7_percent	Percentage of resources allocated for this consumer group
group8_percent	Percentage of resources allocated to other groups

152.4.13 DELETE_CATEGORY Procedure

This procedure deletes an existing resource consumer group category.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CATEGORY (
    category      IN    VARCHAR2);
```

Parameters

Table 152-12 DELETE_CATEGORY Procedure Parameters

Parameter	Description
category	Name of consumer group category

152.4.14 DELETE_CDB_PLAN Procedure

This procedure deletes the consolidation resource plan.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PLAN (
    plan      IN    VARCHAR2(32)  DEFAULT NULL);
```

Parameters

Table 152-13 DELETE_CDB_PLAN Procedure Parameters

Parameter	Description
plan	Name of the consolidation plan

Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

152.4.15 DELETE_CDB_PLAN_DIRECTIVE Procedure

This procedure deletes the plan directives of the consolidation resource plan. Once the plan directive is deleted, the pluggable database will get the default resource allocation.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PLAN_DIRECTIVE (
    plan                IN    VARCHAR2 (32)  DEFAULT NULL,
    pluggable_database  IN    VARCHAR2 (32)  DEFAULT NULL);
```

Parameters

Table 152-14 DELETE_CDB_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	Name of the consolidation plan
pluggable_database	Name of the pluggable database in which the plan directive is to be deleted

Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

152.4.16 DELETE_CDB_PROFILE_DIRECTIVE Procedure

This procedure deletes the performance profile directive of the consolidation resource plan. Once the directive is deleted, the pluggable databases (PDBs) that use the performance profile use the default resource allocation.

For a PDB to use a performance profile, the PDB must have the DB_PERFORMANCE_PROFILE initialization parameter set to the performance profile name.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PROFILE_DIRECTIVE (
    plan                IN    VARCHAR2 (32)  DEFAULT NULL,
    profile             IN    VARCHAR2 (32)  DEFAULT NULL);
```

Parameters**Table 152-15 DELETE_CDB_PROFILE_DIRECTIVE Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan
profile	Name of the performance profile directive to be deleted

Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

152.4.17 DELETE_CONSUMER_GROUP Procedure

This procedure deletes entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (
    consumer_group IN VARCHAR2);
```

Parameters**Table 152-16 DELETE_CONSUMER_GROUP Procedure Parameters**

Parameters	Description
consumer_group	Name of the consumer group to be deleted

152.4.18 DELETE_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN (
    plan IN VARCHAR2);
```

Parameters**Table 152-17 DELETE_PLAN Procedure Parameters**

Parameter	Description
plan	Name of the resource plan to delete

152.4.19 DELETE_PLAN_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (
    plan IN VARCHAR2);
```

Parameters

Table 152-18 DELETE_PLAN_CASCADE Procedure Parameters

Parameters	Description
plan	Name of the plan

Usage Notes

If DELETE_PLAN_CASCADE encounters any error, then it rolls back the operation, and nothing is deleted.

152.4.20 DELETE_PLAN_DIRECTIVE Procedure

This procedure deletes resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (
    plan          IN VARCHAR2,
    group_or_subplan IN VARCHAR2);
```

Parameters

Table 152-19 DELETE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	Name of the resource plan
group_or_subplan	Name of the group or subplan

152.4.21 DEQUEUE_PARALLEL_STATEMENT Procedure

This procedure dequeues a parallel statement from the parallel statement queue.

If the PARALLEL_DEGREE_POLICY initialization parameter is set to AUTO or ADAPTIVE, then parallel statement queuing is enabled. If a parallel statement is in the parallel statement queue, then you can use this procedure to dequeue the parallel statement so that it runs immediately.

Syntax

```
DBMS_RESOURCE_MANAGER.DEQUEUE_PARALLEL_STATEMENT (
  session_id      IN PLS_INTEGER,
  session_serial  IN PLS_INTEGER,
  inst_id         IN PLS_INTEGER DEFAULT NULL,
  sql_id          IN VARCHAR2 DEFAULT NULL);
```

Parameters**Table 152-20 DEQUEUE_PARALLEL_STATEMENT Procedure Parameters**

Parameter	Description
session_id	The session id of the session running the parallel statement to be dequeued.
session_serial	The serial number of the session.
inst_id	Instance ID where the session is running. If NULL, then the current instance is used.
sql_id	The SQL ID of the session's statement to dequeue. If the session is running SQL with a different SQL ID, then the statement is not dequeued.

152.4.22 END_SQL_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the end of a block of SQL statements that should be treated as a group by resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.END_SQL_BLOCK;
```

Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in *Oracle Database VLDB and Partitioning Guide*.

152.4.23 SET_CONSUMER_GROUP_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING (
  attribute      IN VARCHAR2,
  value          IN VARCHAR2,
  consumer_group IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 152-21 SET_CONSUMER_GROUP_MAPPING Procedure Parameters

Parameters	Description
attribute	Mapping attribute to add or modify. It can be one of the Constants listed.
value	Attribute value to match. This includes both absolute mapping and regular expressions.
consumer_group	Name of the mapped consumer group, or NULL to delete a mapping

Usage Notes

- If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the `consumer_group` argument is NULL, then any mapping from the given attribute and value will be deleted.
- The subprogram supports simple regex expressions for the `value` parameter. It implements the same semantics as the SQL 'LIKE' operator. Specifically, it uses '%' as a multicharacter wildcard and '_' as a single character wildcard. The '\' character can be used to escape the wildcards. Note that wildcards can only be used if the attribute is one of the following:

- CLIENT_OS_USER
- CLIENT_PROGRAM
- CLIENT_MACHINE
- MODULE_NAME
- MODULE_NAME_ACTION
- SERVICE_MODULE
- SERVICE_MODULE_ACTION

- Consumer group mapping comparisons for `DBMS_RESOURCE_MANAGER.CLIENT_PROGRAM` are performed by stripping the @ sign and following characters from `V$SESSION.PROGRAM` before comparing it to the `CLIENT_PROGRAM` value supplied.

152.4.24 SET_CONSUMER_GROUP_MAPPING_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI (
    explicit          IN NUMBER,
    oracle_user       IN NUMBER,
    service_name      IN NUMBER,
    client_os_user    IN NUMBER,
```

```

client_program      IN NUMBER,
client_machine     IN NUMBER,
module_name        IN NUMBER,
module_name_action IN NUMBER,
service_module     IN NUMBER,
service_module_action IN NUMBER,
client_id          IN NUMBER DEFAULT 11);

```

Parameters

Table 152-22 SET_CONSUMER_GROUP_MAPPING_PRI Procedure Parameters

Parameters	Description
explicit	Priority of the explicit mapping
oracle_user	Priority of the Oracle user name mapping
service_name	Priority of the client service name mapping
client_os_user	Priority of the client operating system user name mapping
client_program	Priority of the client program mapping
client_machine	Priority of the client machine mapping
module_name	Priority of the application module name mapping
module_name_action	Priority of the application module name and action mapping
service_module	Priority of the service name and application module name mapping
module_name_action	Priority of the service name, application module name, and application action mapping
client_id	Client identifier

Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:
 - `DBMS_SESSION.SWITCH_CURRENT_CONSUMER_GROUP`
 - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS`
 - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER`
- Each priority value must be a unique integer from 1 to 11. Together, they establish an ordering where 1 is the highest priority and 11 is the lowest.

152.4.25 SET_INITIAL_CONSUMER_GROUP Procedure

This deprecated procedure sets the initial resource consumer group for a user.

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs.

 **Note:**

This procedure is deprecated in Release 11gR1. While the procedure remains available in the package, Initial Consumer Group is set by the session-to-consumer group mapping rules.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
    user          IN  VARCHAR2,
    consumer_group IN  VARCHAR2);
```

Parameters

Table 152-23 SET_INITIAL_CONSUMER_GROUP Procedure Parameters

Parameters	Description
user	Name of the user
consumer_group	User's initial consumer group

Usage Notes

- The ADMINISTER_RESOURCE_MANAGER or the ALTER USER system privilege are required to be able to execute this procedure. The user, or PUBLIC, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

 **Note:**

These semantics are similar to those for ALTER USER DEFAULT ROLE.

- If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: DEFAULT_CONSUMER_GROUP.
- DEFAULT_CONSUMER_GROUP has switch privileges granted to PUBLIC; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have DEFAULT_CONSUMER_GROUP as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to DEFAULT_CONSUMER_GROUP.

152.4.26 SUBMIT_PENDING_AREA Procedure

This procedure submits pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

Note:

A call to `SUBMIT_PENDING_AREA` may fail even if `VALIDATE_PENDING_AREA` succeeds. This may happen if a plan being deleted is loaded by an instance after a call to `VALIDATE_PENDING_AREA`, but before a call to `SUBMIT_PENDING_AREA`.

Syntax

```
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

152.4.27 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure

This procedure changes the resource consumer group of a specific session. It also changes the consumer group of any parallel execution servers that are related to the top user session. This procedure is RAC instance specific. You need to connect to the PDB in same RAC instance where the session to be switched is running, and then run this procedure.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (
    session_id      IN NUMBER,
    session_serial  IN NUMBER,
    consumer_group  IN VARCHAR2);
```

Parameters

Table 152-24 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure Parameters

Parameter	Description
<code>session_id</code>	SID column from the view <code>V\$SESSION</code>
<code>session_serial</code>	SERIAL# column from view <code>V\$SESSION</code> .
<code>consumer_group</code>	Name of the consumer group to which to switch

152.4.28 SWITCH_CONSUMER_GROUP_FOR_USER Procedure

This procedure changes the resource consumer group for all sessions with a given user ID. It also changes the consumer group of any parallel execution servers that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (
    user            IN VARCHAR2,
    consumer_group  IN VARCHAR2);
```

Parameters

Table 152-25 SWITCH_CONSUMER_GROUP_FOR_USER Procedure Parameters

Parameter	Description
user	Name of the user
consumer_group	Name of the consumer group to which to switch

Usage Notes

- The [SWITCH_CONSUMER_GROUP_FOR_SESS Procedure](#) and the SWITCH_CONSUMER_GROUP_FOR_USER procedures let you raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the nice command on UNIX.
- These procedures cause the session to be moved into the newly specified consumer group immediately.

152.4.29 SWITCH_PLAN Procedure

This procedure sets the current resource manager plan.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
    plan_name          IN   VARCHAR2,
    sid                IN   VARCHAR2 DEFAULT '*',
    allow_scheduler_plan_switches IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 152-26 SWITCH_PLAN Procedure Parameters

Parameter	Description
plan_name	Name of the plan to which to switch. Passing in an empty string ("") for the plan_name, disables the resource manager
sid	The sid parameter is relevant only in an Oracle Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the sid of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances.
allow_scheduler_plan_switches	FALSE - disables automated plan switches by the job scheduler at window boundaries. To reenale automated plan switches, switch_plan must be called again by the administrator with allow_scheduler_plan_switches set to TRUE. By default automated plan switches by the job scheduler are enabled.

152.4.30 UPDATE_CATEGORY Procedure

This procedure updates an existing resource consumer group category.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CATEGORY (
    category      IN    VARCHAR2,
    new_comment   IN    VARCHAR2  DEFAULT NULL);
```

Parameters

Table 152-27 UPDATE_CATEGORY Procedure Parameters

Parameter	Description
category	Name of consumer group category
new_comment	User comment

Usage Notes

To clear (reset to the directive's default value), use the value -1.

152.4.31 UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure

This procedure updates the plan directives with regard to automated maintenance tasks in the CDB root (CDB\$ROOT).

By default, all maintenance tasks occur directly in the PDBs themselves.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_AUTOTASK_DIRECTIVE (
    plan                IN    VARCHAR2,
    new_comment         IN    VARCHAR2  DEFAULT NULL,
    new_shares          IN    NUMBER    DEFAULT NULL,
    new_utilization_limit IN    NUMBER    DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER    DEFAULT NULL,
    new_memory_limit    IN    NUMBER    DEFAULT NULL,
    new_memory_min      IN    NUMBER    DEFAULT NULL);
```

Parameters

Table 152-28 UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure Parameters

Parameter	Description
plan	Name of the consolidation plan
new_comment	New user comment
new_shares	Specifies the new share of resource allocation for CDB root's automated maintenance tasks
new_utilization_limit	Specifies the new maximum percentage of CPU that automated maintenance tasks in the CDB root can utilize

Table 152-28 (Cont.) UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure Parameters

Parameter	Description
<code>new_parallel_server_limit</code>	Specifies the new maximum percentage of <code>parallel_servers_target</code> parallel servers that automated maintenance tasks in the CDB root are allowed to use
<code>new_memory_limit</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.
<code>new_memory_min</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.

Usage Notes

- By default for automated maintenance tasks, the values are
 - `shares`: -1
 - `utilization_limit`: 90
 - `parallel_server_limit`: 100
- The `shares = -1` means that the automated maintenance tasks get an allocation of 20% of the system. If the user specifies the `shares`, it behaves the same properties as the other CDB plan directive functions. If the user does not change the `shares` or later changes it back to -1, autotask will get 20% of the system.
- This procedure can be run only from the CDB root.
- To clear (reset to the directive's default value), use the value -1.

152.4.32 UPDATE_CDB_DEFAULT_DIRECTIVE Procedure

This procedure updates the plan directives of the consolidation resource plan.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_DEFAULT_DIRECTIVE (
    plan                IN    VARCHAR2    DEFAULT NULL,
    new_comment         IN    VARCHAR2    DEFAULT NULL,
    new_shares          IN    NUMBER      DEFAULT NULL,
    new_utilization_limit IN    NUMBER      DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER      DEFAULT NULL,
    new_memory_limit    IN    NUMBER      DEFAULT NULL,
    new_memory_min      IN    NUMBER      DEFAULT NULL);
```

Parameters

Table 152-29 UPDATE_CDB_DEFAULT_DIRECTIVE Procedure Parameters

Parameter	Description
<code>plan</code>	Name of the consolidation plan
<code>new_comment</code>	New user comment

Table 152-29 (Cont.) UPDATE_CDB_DEFAULT_DIRECTIVE Procedure Parameters

Parameter	Description
<code>new_shares</code>	Specifies the share of resource allocation for the pluggable database. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>new_shares</code> parameter is also used for Parallel Statement Queuing.
<code>new_utilization_limit</code>	Specifies the maximum percentage of CPU that the pluggable database can utilize.
<code>new_parallel_server_limit</code>	Specifies the maximum percentage of <code>parallel_servers_target</code> parallel servers that the pluggable database can use.
<code>new_memory_limit</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.
<code>new_memory_min</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.

Usage Notes

- By default, the default values are
 - `new_shares: 1`
 - `utilization_limit: 100`
 - `parallel_server_limit: 100`
- Note that the default values are `NULL`. This has the same meaning as in [UPDATE_CDB_PLAN_DIRECTIVE Procedure](#). If the user does not specify a value, the value will not be modified.
- This procedure can be run only from the CDB root (`CDB$ROOT`).
- To clear (reset to the directive's default value), use the value `-1`.

152.4.33 UPDATE_CDB_PLAN Procedure

This procedure updates the consolidation resource plan.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PLAN (
  plan           IN    VARCHAR2(32),
  new_comment    IN    VARCHAR2(2000) DEFAULT NULL);
```

Parameters

Table 152-30 UPDATE_CDB_PLAN Procedure Parameters

Parameter	Description
plan	Name of the consolidation plan
new_comment	User comment

Usage Notes

- This procedure can be run only from the CDB root (CDB\$ROOT).
- To clear (reset to the directive's default value), use the value -1.

152.4.34 UPDATE_CDB_PLAN_DIRECTIVE Procedure

Updates the plan directives for a consolidation resource plan. Plan directives specify the resource allocation policy for pluggable databases (PDBs).

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PLAN_DIRECTIVE (
    plan                IN    VARCHAR2 (30),
    pluggable_database  IN    VARCHAR2 (30)
    new_comment         IN    VARCHAR2 (200) DEFAULT NULL,
    new_shares          IN    NUMBER          DEFAULT NULL,
    new_utilization_limit IN    NUMBER          DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER          DEFAULT NULL,
    new_memory_limit    IN    NUMBER          DEFAULT NULL,
    new_memory_min      IN    NUMBER          DEFAULT NULL);
```

Parameters

Table 152-31 UPDATE_CDB_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	Name of the consolidation plan
pluggable_database	Name of the pluggable database
new_comment	New user comment
new_shares	The share of resource allocation for the pluggable database CPU Resource Manager is enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through the UPDATE_CDB_DEFAULT_DIRECTIVE Procedure .
new_utilization_limit	The new maximum percentage of CPU that the pluggable database can utilize

Table 152-31 (Cont.) UPDATE_CDB_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
<code>new_parallel_server_limit</code>	The new maximum percentage of <code>parallel_servers_target</code> parallel servers that the pluggable database can use
<code>new_memory_limit</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.
<code>new_memory_min</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.

Usage Notes

- The default value for the `new_*` parameters is `NULL` which indicates that the existing value is left unchanged. If the user does not specify one of the arguments when calling this function, the value is not modified.
- This procedure can be run only from the CDB root (`CDB$ROOT`).
- To clear (reset to the directive's default value), use the value `-1`.

152.4.35 UPDATE_CDB_PROFILE_DIRECTIVE Procedure

This procedure updates the performance profile directives of the consolidation resource plan. The directives specify the resource allocation policy for pluggable databases (PDBs) that use the performance profile.

For a PDB to use a performance profile, the PDB must have the `DB_PERFORMANCE_PROFILE` initialization parameter set to the performance profile name.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PROFILE_DIRECTIVE (
  plan          IN    VARCHAR2,
  profile       IN    VARCHAR2,
  new_comment   IN    VARCHAR2 (2000) DEFAULT '',
  new_shares    IN    NUMBER          DEFAULT NULL,
  new_utilization_limit IN    NUMBER          DEFAULT NULL,
  new_parallel_server_limit IN    NUMBER          DEFAULT NULL,
  new_memory_limit IN    NUMBER          DEFAULT 100,
  new_memory_min IN    NUMBER          DEFAULT 0);
```

Parameters**Table 152-32 UPDATE_CDB_PROFILE_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>plan</code>	Name of the consolidation plan
<code>profile</code>	Name of the performance profile
<code>new_comment</code>	New user comment

Table 152-32 (Cont.) UPDATE_CDB_PROFILE_DIRECTIVE Procedure Parameters

Parameter	Description
<code>new_shares</code>	The share of resource allocation for the PDBs that use the performance profile
<code>new_utilization_limit</code>	The new maximum percentage of CPU that PDBs that use the performance profile can use
<code>new_parallel_server_limit</code>	The new maximum percentage of <code>parallel_servers_target</code> parallel servers that PDBs that use the performance profile can use
<code>new_memory_limit</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.
<code>new_memory_min</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.

Usage Notes

- This procedure can be run only from the CDB root (CDB\$ROOT).
- To clear (reset to the directive's default value), use the value `-1`.

152.4.36 UPDATE_CONSUMER_GROUP Procedure

This procedure updates entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (
    consumer_group IN VARCHAR2,
    new_comment    IN VARCHAR2 DEFAULT NULL,
    new_cpu_mth    IN VARCHAR2 DEFAULT NULL,
    new_mgmt_mth   IN VARCHAR2 DEFAULT NULL,
    new_category   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 152-33 UPDATE_CONSUMER_GROUP Procedure Parameter

Parameter	Description
<code>consumer_group</code>	Name of consumer group
<code>new_comment</code>	New user comment
<code>new_cpu_mth</code>	Name of new method for CPU resource allocation (deprecated)
<code>new_mgmt_mth</code>	Name of new method for CPU resource allocation
<code>new_category</code>	New consumer group category

Usage Notes

- If the parameters to the `UPDATE_CONSUMER_GROUP` procedure are not specified, then they remain unchanged in the data dictionary.

- To clear (reset to the directive's default value), use the value -1.

152.4.37 UPDATE_PLAN Procedure

This procedure updates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
    plan                IN VARCHAR2,
    new_comment         IN VARCHAR2 DEFAULT NULL,
    new_cpu_mth         IN VARCHAR2 DEFAULT NULL, -- deprecated
    new_active_sess_pool_mth IN VARCHAR2 DEFAULT NULL,
    new_parallel_degree_limit_mth IN VARCHAR2 DEFAULT NULL,
    new_queueing_mth    IN VARCHAR2 DEFAULT NULL,
    new_mgmt_mth        IN VARCHAR2 DEFAULT NULL,
    new_sub_plan        IN BOOLEAN DEFAULT FALSE,
    new_max_iops         IN NUMBER DEFAULT NULL,
    new_max_mbps        IN NUMBER DEFAULT NULL);
```

Parameters

Table 152-34 UPDATE_PLAN Procedure Parameters

Parameter	Description
plan	Name of resource plan
new_comment	New user comment
new_cpu_mth	Name of new allocation method for CPU resources (deprecated)
new_active_sess_pool_mth	Name of new method for maximum active sessions
new_parallel_degree_limit_mth	Name of new method for degree of parallelism
new_queueing_mth	Specifies type of queuing policy to use with active session pool feature
new_mgmt_mth	Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> • EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups. • RATIO - for single-level plans that use ratios to specify how I/O resources are distributed.
new_sub_plan	New setting for whether the plan is only intended for use as a sub-plan
new_max_iops	Nonoperative
new_max_mbps	Nonoperative

Usage Notes

- If the parameters to [UPDATE_PLAN Procedure](#) are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.
- To clear (reset to the directive's default value), use the value -1.

152.4.38 UPDATE_PLAN_DIRECTIVE Procedure

This procedure updates resource plan directives.

Note:

The parameters `new_max_utilization_limit` and `new_parallel_target_percentage` are deprecated with Oracle Database 11g Release 1 (12.1.0.1), and are replaced by `new_utilization_limit` and `new_parallel_server_limit`.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
  plan                               IN VARCHAR2,
  group_or_subplan                    IN VARCHAR2,
  new_comment                          IN VARCHAR2 DEFAULT NULL,
  new_cpu_p1                           IN NUMBER  DEFAULT NULL, -- deprecated
  new_cpu_p2                           IN NUMBER  DEFAULT NULL, -- deprecated
  new_cpu_p3                           IN NUMBER  DEFAULT NULL, -- deprecated
  new_cpu_p4                           IN NUMBER  DEFAULT NULL, -- deprecated
  new_cpu_p5                           IN NUMBER  DEFAULT NULL, -- deprecated
  new_cpu_p6                           IN NUMBER  DEFAULT NULL, -- deprecated
  new_cpu_p7                           IN NUMBER  DEFAULT NULL, -- deprecated
  new_cpu_p8                           IN NUMBER  DEFAULT NULL, -- deprecated
  new_active_sess_pool_p1              IN NUMBER  DEFAULT NULL,
  new_queueing_p1                      IN NUMBER  DEFAULT NULL,
  new_parallel_degree_limit_p1         IN NUMBER  DEFAULT NULL,
  new_switch_group                     IN VARCHAR2 DEFAULT NULL,
  new_switch_time                      IN NUMBER  DEFAULT NULL,
  new_switch_estimate                  IN BOOLEAN DEFAULT FALSE,
  new_max_est_exec_time                IN NUMBER  DEFAULT NULL,
  new_undo_pool                        IN NUMBER  DEFAULT NULL,
  new_max_idle_time                    IN NUMBER  DEFAULT NULL,
  new_max_idle_blocker_time           IN NUMBER  DEFAULT NULL,
  switch_time_in_call                  IN NUMBER  DEFAULT NULL, -- deprecated
  new_mgmt_p1                          IN NUMBER  DEFAULT NULL,
  new_mgmt_p2                          IN NUMBER  DEFAULT NULL,
  new_mgmt_p3                          IN NUMBER  DEFAULT NULL,
  new_mgmt_p4                          IN NUMBER  DEFAULT NULL,
  new_mgmt_p5                          IN NUMBER  DEFAULT NULL,
  new_mgmt_p6                          IN NUMBER  DEFAULT NULL,
  new_mgmt_p7                          IN NUMBER  DEFAULT NULL,
  new_mgmt_p8                          IN NUMBER  DEFAULT NULL,
  new_switch_io_megabytes              IN NUMBER  DEFAULT NULL,
  new_switch_io_reqs                  IN NUMBER  DEFAULT NULL,
  new_switch_for_call                  IN BOOLEAN DEFAULT NULL,
  new_max_utilization_limit            IN NUMBER  DEFAULT NULL,
  new_parallel_target_percentage       IN NUMBER  DEFAULT NULL,
  new_parallel_queue_timeout           IN NUMBER  DEFAULT NULL,
  new_parallel_server_limit            IN NUMBER  DEFAULT NULL,
  new_utilization_limit                IN NUMBER  DEFAULT NULL,
  new_switch_io_logical                IN NUMBER  DEFAULT NULL,
  new_switch_elapsed_time              IN NUMBER  DEFAULT NULL,
  new_shares                           IN NUMBER  DEFAULT NULL,
```

```

new_parallel_stmt_critical    IN VARCHAR2 DEFAULT NULL,
new_session_pga_limit        IN NUMBER   DEFAULT NULL,
new_pq_timeout_action        IN NUMBER   DEFAULT NULL);

```

Parameters

Table 152-35 UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	Name of the resource plan
group_or_subplan	Name of the consumer group or subplan
new_comment	Comment for the plan directive
new_cpu_p1	Deprecated - use new_mgmt_p1 instead
new_cpu_p2	Deprecated - use new_mgmt_p2 instead
new_cpu_p3	Deprecated - use new_mgmt_p3 instead
new_cpu_p4	Deprecated- use new_mgmt_p4 instead
new_cpu_p5	Deprecated - use new_mgmt_p5 instead
new_cpu_p6	Deprecated- use new_mgmt_p6 instead
new_cpu_p7	Deprecated- use new_mgmt_p7 instead
new_cpu_p8	Deprecated- use new_mgmt_p8 instead
new_active_sess_pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
new_queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
new_parallel_degree_limit_p1	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
new_switch_group	Specifies consumer group to which this session is switched if other switch criteria are met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.
new_switch_time	Specifies time (in CPU seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
new_switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
new_max_est_exec_time	Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
new_undo_pool	Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group
new_max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
new_max_idle_blocker_time	Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource

Table 152-35 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
<code>new_switch_time_in_call</code>	Deprecated. If this parameter is specified, <code>new_switch_time</code> will be effectively set to <code>new_switch_time_in_call</code> and <code>new_switch_for_call</code> will be effectively set to <code>TRUE</code> .
<code>new_mgmt_p1</code>	Resource allocation value for level 1 (replaces <code>new_cpu_p1</code>): <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the first level • RATIO - specifies the weight of resource usage
<code>new_mgmt_p2</code>	Resource allocation value for level 2 (replaces <code>new_cpu_p2</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the second level • RATIO - non-applicable
<code>new_mgmt_p3</code>	Resource allocation value for level 3 (replaces <code>new_cpu_p3</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the third level • RATIO - non-applicable
<code>new_mgmt_p4</code>	Resource allocation value for level 4 (replaces <code>new_cpu_p4</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the fourth level • RATIO - non-applicable
<code>new_mgmt_p5</code>	Resource allocation value for level 5 (replaces <code>new_cpu_p5</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the fifth level • RATIO - non-applicable
<code>new_mgmt_p6</code>	Resource allocation value for level 6 (replaces <code>new_cpu_p6</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the sixth level • RATIO - non-applicable
<code>new_mgmt_p7</code>	Resource allocation value for level 7 (replaces <code>new_cpu_p7</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the seventh level • RATIO - non-applicable
<code>new_mgmt_p8</code>	Resource allocation value for level 8 (replaces <code>new_cpu_p8</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the eighth level • RATIO - non-applicable
<code>new_switch_io_megabytes</code>	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.
<code>new_switch_io_reqs</code>	Specifies the number of I/O requests that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.
<code>new_switch_for_call</code>	Specifies that if an action is taken because of the <code>new_switch_time</code> , <code>new_switch_io_megabytes</code> , or <code>new_switch_io_reqs</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is <code>FALSE</code> , which means that the original consumer group is not restored at the end of the top call.
<code>new_max_utilization_limit</code>	Deprecated - use <code>new_utilization_limit</code> instead
<code>new_parallel_target_percentage</code>	Deprecated - use <code>new_parallel_server_limit</code> instead
<code>new_parallel_server_limit</code>	Parallel server limit. Setting this overwrites the limit for parallel server set by <code>utilization_limit</code> .

Table 152-35 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
<code>new_utilization_limit</code>	Resource limit. For CPU, this limits the CPU utilization for the consumer group. For parallel servers, this limits the parallel servers used as a percentage of <code>parallel_servers_target</code> .
<code>new_switch_elapsed_time</code>	Elapsed time that will trigger the action specified by <code>switch_group</code> . As with other switch directives, if <code>new_switch_for_call</code> is TRUE, the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.
<code>new_shares</code>	Specifies the share of resource allocation for the pluggable database. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If CPU Resource Manager and Exadata I/O Resource Manager are enabled, then the default value is 1.
<code>new_parallel_stmt_critical</code>	If set to <code>BYPASS_QUEUE</code> , parallel statements from this consumer group are not queued. If set to <code>QUEUE</code> , all the parallel statements, irrespective of the <code>parallel_degree_policy</code> parameter value, from the consumer group get queued. Default is <code>FALSE</code> , which means that certain parallel statements are eligible for queuing depending upon the <code>parallel_degree_policy</code> parameter value.
<code>new_session_pga_limit</code>	Maximum amount of PGA in MB that sessions in this consumer group can allocate before being terminated. <code>NULL</code> (default) indicates no change.
<code>new_parallel_queue_timeout</code>	Specifies the time (in seconds) that a parallel statement may remain in its Consumer Group's parallel statement queue before it is removed. The default action of this parameter is <code>ERROR</code> . This action can be altered using the <code>new_pq_timeout_action</code> parameter.
<code>new_pq_timeout_action</code>	Specifies the action to be taken when a parallel statement is removed from the queue due to <code>new_parallel_queue_timeout</code> . The values are: <ul style="list-style-type: none"> • <code>CANCEL</code> — The SQL statement is terminated with error <code>ORA-7454</code> • <code>RUN</code> — The SQL statement runs immediately, and might get downgraded if parallel servers are unavailable

Usage Notes

- If the parameters for `UPDATE_PLAN_DIRECTIVE` are left unspecified, then they remain unchanged in the data dictionary.
- For `new_max_idle_time` and `new_max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `new_switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on `new_switch_time_in_call`, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.
- To clear (reset to the directive's default value), use the value `-1`.

152.4.39 VALIDATE_PENDING_AREA Procedure

This procedure validates pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```

DBMS_RESOURCE_MANAGER_PRIVS

The `DBMS_RESOURCE_MANAGER_PRIVS` package maintains privileges associated with the Resource Manager.

This chapter contains the following topics:

- [Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms](#)

See Also:

For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*

153.1 Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

This table lists the `DBMS_RESOURCE_MANAGER_PRIVS` subprograms and briefly describes them.

Table 153-1 DBMS_RESOURCE_MANAGER_PRIVS Package Subprograms

Subprogram	Description
GRANT_SWITCH_CONSUMER_GRP OUP Procedure	Grants the privilege to switch to resource consumer groups
GRANT_SYSTEM_PRIVILEGE Procedure	Performs a grant of a system privilege
REVOKE_SWITCH_CONSUMER_GRP OUP Procedure	Revokes the privilege to switch to resource consumer groups.
REVOKE_SYSTEM_PRIVILEGE Procedure	Performs a revoke of a system privilege

153.1.1 GRANT_SWITCH_CONSUMER_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
    grantee_name    IN VARCHAR2,
    consumer_group  IN VARCHAR2,
    grant_option    IN BOOLEAN);
```

Parameters

Table 153-2 GRANT_SWITCH_CONSUMER_GROUP Procedure Parameters

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
consumer_group	Name of consumer group.
grant_option	TRUE if grantee should be allowed to grant access, FALSE otherwise.

Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the `grant_option` parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

See Also:

[DBMS_RESOURCE_MANAGER](#)

Examples

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
  'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
  dbms_resource_manager.oracle_user, 'scott', 'mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/
```

153.1.2 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
  grantee_name    IN VARCHAR2,
```

```

privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
admin_option   IN BOOLEAN);

```

Parameters

Table 153-3 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
privilege_name	Name of the privilege to be granted.
admin_option	TRUE if the grant is with admin_option, FALSE otherwise.

Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: `ADMINISTER_RESOURCE_MANAGER`. Database administrators have this system privilege with the `ADMIN` option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the `ADMIN` option can also grant this privilege to others.

Examples

The following call grants this privilege to a user called `scott` without the `ADMIN` option:

```

BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
  grantee_name => 'scott',
  privilege_name => 'ADMINISTER_RESOURCE_MANAGER',
  admin_option => FALSE);
END;
/

```

153.1.3 REVOKE_SWITCH_CONSUMER_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

Syntax

```

DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
  revokee_name IN VARCHAR2,
  consumer_group IN VARCHAR2);

```

Parameters

Table 153-4 REVOKE_SWITCH_CONSUMER_GROUP Procedure Parameter

Parameter	Description
revokee_name	Name of user/role from which to revoke access.
consumer_group	Name of consumer group.

Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the `DEFAULT_CONSUMER_GROUP` consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from `PUBLIC`, then any users who could previously only use the consumer group through `PUBLIC` will not be able to switch to that consumer group.

Examples

The following example revokes the privileges to switch to `mail_maintenance_group` from Scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
  'scott', 'mail_maintenance_group');
END;
/
```

153.1.4 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (
  revokee_name   IN VARCHAR2,
  privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

Parameters

Table 153-5 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
<code>revokee_name</code>	Name of the user or role from whom privilege is to be revoked.
<code>privilege_name</code>	Name of the privilege to be revoked.

Examples

The following call revokes the `ADMINISTER_RESOURCE_MANAGER` from user `scott`:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');
END;
/
```

DBMS_RESULT_CACHE

The `DBMS_RESULT_CACHE` package provides an interface to allow the DBA to administer that part of the shared pool that is used by the SQL result cache and the PL/SQL function result cache.

Both these caches use the same infrastructure. Therefore, for example, `DBMS_RESULT_CACHE.BYPASS` determines whether both caches are bypassed or both caches are used, and `DBMS_RESULT_CACHE.FLUSH` flushes both all the cached results for SQL queries and all the cached results for PL/SQL functions.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_RESULT_CACHE Subprograms](#)

See Also:

- *Oracle Database Performance Tuning Guide*, for more information about "Result Cache Concepts"
- *Oracle Database PL/SQL Language Reference*, for more information about PL/SQL function Result Cache "Using the Cross-Session PL/SQL Function Result Cache"
- *Database PL/SQL Language Reference*, for more information about Result Cache Management.

154.1 DBMS_RESULT_CACHE Security Model

Only database administrators should be granted the `EXECUTE` privilege for this package.

154.2 DBMS_RESULT_CACHE Constants

The `DBMS_RESULT_CACHE` package defines several constants for specifying parameter values.

The following table describes these constants.

Table 154-1 DBMS_RESULT_CACHE Constants

Constant	Definition	Description
<code>STATUS_BYPS</code>	<code>CONSTANT VARCHAR2(10) := 'BYPASS';</code>	Cache has been made temporarilyunavailable.

Table 154-1 (Cont.) DBMS_RESULT_CACHE Constants

Constant	Definition	Description
STATUS_CORR	CONSTANT VARCHAR2(10) := 'CORRUPT';	The result cache is in an unusable state.
STATUS_DISA	CONSTANT VARCHAR2(10) := 'DISABLED';	Cache is not available.
STATUS_ENAB	CONSTANT VARCHAR2(10) := 'ENABLED';	Cache is available.
STATUS_SYNC	CONSTANT VARCHAR2(10) := 'SYNC';	Cache is available, but synchronizing with Oracle RAC nodes.

154.3 Summary of DBMS_RESULT_CACHE Subprograms

This table lists the DBMS_RESULT_CACHE subprograms and briefly describes them.

Table 154-2 DBMS_RESULT_CACHE Package Subprograms

Subprogram	Description
BLOCK_LIST Function	Returns all the block listed cache ids of a local instance.
BLOCK_LIST_ADD Procedure	Adds a <code>cache_id</code> to the block list.
BLOCK_LIST_CLEAR Procedure	Removes all <code>cache_ids</code> from the block list.
BLOCK_LIST_REMOVE Procedure	Removes the <code>cache_id</code> from the block list.
BYPASS Procedure	Sets the bypass mode for the result cache.
FLUSH Function & Procedure	Attempts to remove all the objects from the result cache, and depending on the arguments retains or releases the memory and retains or clears the statistics.
IGNORE_LIST Function	This table function returns a row for each entry that's been added into the ignore list.
IGNORE_LIST_ADD Procedure	This procedure adds to the ignore list a table specified by object number or by owner and table name.
IGNORE_LIST_CLEAR Procedure	This procedure drops the entire ignore list.
IGNORE_LIST_REMOVE Procedure	This procedure removes a table specified by object number or by owner and table name.
INVALIDATE Functions & Procedures	Invalidates all the result-set objects that are dependent upon the specified dependency object.
INVALIDATE_OBJECT Functions & Procedures	Invalidates the specified result-set object(s)
MEMORY_REPORT Procedure	Produces the memory usage report for the result cache.
OBJECT_BLOCK_LIST Function	Returns all the object numbers currently in the block list
OBJECT_BLOCK_LIST_ADD Procedure	Adds objects to the object block list

Table 154-2 (Cont.) DBMS_RESULT_CACHE Package Subprograms

Subprogram	Description
OBJECT_BLOCK_LIST_CLEAR Procedure	Clears the entire block list
OBJECT_BLOCK_LIST_REMOVE Procedure	Removes objects from the object block list.
STATUS Function	Checks the status of the result cache.

154.3.1 BLACK_LIST Function

This procedure is deprecated with Oracle Database 23ai. Use the [BLOCK_LIST Function](#) instead.

154.3.2 BLACK_LIST_ADD Procedure

This procedure is deprecated with Oracle Database 23ai. Use the [BLOCK_LIST_ADD Procedure](#) instead.

154.3.3 BLACK_LIST_CLEAR Procedure

This procedure is deprecated with Oracle Database 23ai. Use the [BLOCK_LIST_CLEAR Procedure](#) instead.

154.3.4 BLACK_LIST_REMOVE Procedure

This procedure is deprecated with Oracle Database 23ai. Use the [BLOCK_LIST_REMOVE Procedure](#) instead.

154.3.5 BYPASS Procedure

This procedure sets the bypass mode for the Result Cache.

It sets one of the following bypass modes:

- When bypass mode is turned on, it implies that cached results are no longer used and that no new results are saved in the cache.
- When bypass mode is turned off, the cache resumes normal operation.

Syntax

```
DBMS_RESULT_CACHE.BYPASS (  
  bypass_mode IN BOOLEAN,  
  session     IN  BOOLEAN);
```

Parameters

Table 154-3 BYPASS Procedure Parameters

Parameter	Description
bypass_mode	<ul style="list-style-type: none"> TRUE => Result Cache usage is bypassed FALSE => Result Cache usage is turned on
session	<ul style="list-style-type: none"> TRUE => Applies to current session FALSE (default) => Applies to all sessions

Usage Notes

This operation is database instance specific.

Examples

This operation can be used when there is a need to hot patch PL/SQL code in a running system. If a code-patch is applied to a PL/SQL module on which a result cached function directly or transitively depends, then the cached results associated with the result cache function are not automatically flushed (if the instance is not restarted/bounced). This must be manually achieved.

To ensure correctness during the patching process follow these steps:

1. Place the result cache in bypass mode, and flush existing result.

```
BEGIN
  DBMS_RESULT_CACHE.BYPASS (TRUE);
  DBMS_RESULT_CACHE.FLUSH;
END;
/
```

This step must be performed on each instance if in a Oracle Real Application Clusters environment.

2. Apply the PL/SQL code patches.
3. Resume use of the result cache, by turning off the cache bypass mode.

```
BEGIN
  DBMS_RESULT_CACHE.BYPASS (FALSE);
END;
/
```

This step must be performed on each instance if in a Oracle Real Application Clusters environment.

154.3.6 FLUSH Function & Procedure

This function and procedure attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics.

Syntax

```
DBMS_RESULT_CACHE.FLUSH (
  retainMem IN BOOLEAN DEFAULT FALSE,
```

```

    retainSta IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBMS_RESULT_CACHE.FLUSH (
    retainMem IN BOOLEAN DEFAULT FALSE,
    retainSta IN BOOLEAN DEFAULT FALSE);

```

Parameters

Table 154-4 FLUSH Function & Procedure Parameters

Parameter	Description
retainMem	<ul style="list-style-type: none"> TRUE => retains the free memory in the cache FALSE (default) => releases the free memory to the system
retainSta	<ul style="list-style-type: none"> TRUE => retains the existing cache statistics FALSE (default) => clears the existing cache statistics

Return Values

TRUE if successful in removing all the objects.

154.3.7 IGNORE_LIST Function

This table function returns a row for each entry that's been added into the ignore list.

Objects in the ignore list are never considered for auto block listing. This allows users to override auto block listing.

Syntax

```

type ign_recT is record( objNo NUMBER);
type ign_tabT is table of ign_recT;
DBMS_RESULT_CACHE.IGNORE_LIST (
    RETURN ign_tabT pipelined;

```

154.3.8 IGNORE_LIST_ADD Procedure

This procedure adds to the ignore list a table specified by object number or by owner and table name.

Objects in the ignore list are never considered for auto block listing. This allows users to override auto block listing.

Syntax

```

DBMS_RESULT_CACHE.IGNORE_LIST_ADD (
    objNo IN NATURALN);

```

Syntax

```
DBMS_RESULT_CACHE.IGNORE_LIST_ADD (  
  owner   IN  VARCHAR2,  
  name    IN  VARCHAR2);
```

Parameters**Table 154-5 IGNORE_LIST_ADD Procedure Parameters**

Parameter	Description
objNo	The objNo is added to the ignore list.
name	The table specified by owner and name are added to the ignore list.
owner	The table specified by owner and name are added to the ignore list.

154.3.9 IGNORE_LIST_CLEAR Procedure

This procedure drops the entire ignore list.

Objects in the ignore list are never considered for auto block listing. This allows users to override auto block listing.

Syntax

```
DBMS_RESULT_CACHE.IGNORE_LIST_CLEAR;
```

154.3.10 IGNORE_LIST_REMOVE Procedure

This procedure removes a table specified by object number or by owner and table name.

Syntax

```
DBMS_RESULT_CACHE.IGNORE_LIST_REMOVE (  
  objNo   IN  NATURALN);
```

Syntax

```
DBMS_RESULT_CACHE.IGNORE_LIST_REMOVE (  
  owner   IN  VARCHAR2,  
  name    IN  VARCHAR2);
```

Parameters

Table 154-6 IGNORE_LIST_REMOVE Procedure Parameters

Parameter	Description
objNo	The objNo is removed from the ignore list.
name	The table specified by owner and name is removed to the ignore list.
owner	The table specified by owner and name is removed to the ignore list.

154.3.11 INVALIDATE Functions & Procedures

This function and procedure invalidates all the result-set objects that dependent upon the specified dependency object.

Syntax

```
DBMS_RESULT_CACHE.INVALIDATE (
    owner      IN VARCHAR2,
    name       IN VARCHAR2)
RETURN NUMBER;

DBMS_RESULT_CACHE.INVALIDATE (
    owner      IN VARCHAR2,
    name       IN VARCHAR2);

DBMS_RESULT_CACHE.INVALIDATE (
    object_id  IN BINARY_INTEGER)
RETURN NUMBER;

DBMS_RESULT_CACHE.INVALIDATE (
    object_id  IN BINARY_INTEGER);
```

Parameters

Table 154-7 INVALIDATE Function & Procedure Parameters

Parameter	Description
owner	Schema name
name	Object name
object_id	Dictionary object number

Return Values

The number of objects invalidated.

154.3.12 INVALIDATE_OBJECT Functions & Procedures

This function and procedure invalidates the specified result-set object(s).

Syntax

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
    id          IN BINARY_INTEGER)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
    id          IN BINARY_INTEGER);
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
    cache_id    IN VARCHAR2)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
    cache_id    IN VARCHAR2);
```

Parameters

Table 154-8 INVALIDATE_OBJECT Function & Procedure Parameters

Parameter	Description
id	Address of the cache object in the Result Cache
cache_id	Result cache identifier of a SQL cursor or PL/SQL function.

Return Values

The number of objects invalidated.

154.3.13 MEMORY_REPORT Procedure

This procedure produces the memory usage report for the Result Cache.

Syntax

```
DBMS_RESULT_CACHE.MEMORY_REPORT (
    detailed    IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 154-9 MEMORY_REPORT Procedure Parameters

Parameter	Description
detailed	<ul style="list-style-type: none"> TRUE => produces a more detailed report FALSE (default) => produces the standard report

Usage Notes

Invoking this procedure from SQL*Plus requires that the serveroutput be turned on.

Examples

```
SET SERVEROUTPUT ON

EXECUTE DBMS_RESULT_CACHE.MEMORY_REPORT;
```

154.3.14 OBJECT_BLACK_LIST Function

This function is deprecated with Oracle Database 23ai. Use the [OBJECT_BLOCK_LIST Function](#) instead.

154.3.15 OBJECT_BLACK_LIST_ADD Procedure

This procedure is deprecated with Oracle Database 23ai. Use the [OBJECT_BLOCK_LIST_ADD Procedure](#) instead.

154.3.16 OBJECT_BLACK_LIST_CLEAR Procedure

This procedure is deprecated with Oracle Database 23ai. Use the [OBJECT_BLOCK_LIST_CLEAR Procedure](#) instead.

154.3.17 OBJECT_BLACK_LIST_REMOVE Procedure

This procedure is removed with Oracle Database 23ai. Use [OBJECT_BLOCK_LIST_REMOVE Procedure](#) instead.

154.3.18 STATUS Function

This function checks the status of the Result Cache.

Syntax

```
DBMS_RESULT_CACHE.STATUS
RETURN VARCHAR2;
```

Note:

For more information on the constants, see [DBMS_RESULT_CACHE Constants](#).

154.3.19 BLOCK_LIST Function

This table function returns all the block-listed cache ids of a local instance.

Syntax

```
DBMS_RESULT_CACHE.BLOCK_LIST
RETURN BL_TABT;
```

154.3.20 BLOCK_LIST_ADD Procedure

This procedure adds a `cache_id` to the block list.

Syntax

```
DBMS_RESULT_CACHE.BLOCK_LIST_ADD (
  cache_id  IN VARCHAR2,
  global    IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 154-10 BLOCK_LIST_ADD Procedure Parameters

Parameter	Description
<code>cache_id</code>	The <code>cache_id</code> is added to the block list.
<code>global</code>	TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache.

154.3.21 BLOCK_LIST_CLEAR Procedure

This procedure removes all `cache_ids` from the block list.

Syntax

```
DBMS_RESULT_CACHE.BLOCK_LIST_CLEAR (
  global  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 154-11 BLOCK_LIST_CLEAR Procedure Parameters

Parameter	Description
<code>global</code>	TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache.

154.3.22 BLOCK_LIST_REMOVE Procedure

This procedure removes the `cache_id` from the block list.

Syntax

```
DBMS_RESULT_CACHE.BLOCK_LIST_REMOVE (
  cache_id  IN VARCHAR2,
  global    IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 154-12 BLOCK_LIST_REMOVE Procedure Parameters

Parameter	Description
cache_id	The cache_id is removed from the block list.
global	TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache.

154.3.23 OBJECT_BLOCK_LIST Function

This table function returns all the object numbers currently in the block list.

Syntax

```
DBMS_RESULT_CACHE.OBJECT_BLOCK_LIST ()
RETURN NATURALN;
```

154.3.24 OBJECT_BLOCK_LIST_ADD Procedure

This procedure adds objects to the object block list. These procedures only have to be run once in the cluster as they take effect everywhere at once. However, they do not persist between cluster shutdowns and startups.

Syntax

```
DBMS_RESULT_CACHE.OBJECT_BLOCK_LIST_ADD (
  objNo      IN BINARY_INTEGER);

DBMS_RESULT_CACHE.OBJECT_BLOCK_LIST_ADD (
  owner      IN VARCHAR2,
  name       IN VARCHAR2);
```

Parameters

Table 154-13 OBJECT_BLOCK_LIST_ADD Procedure Parameters

Parameter	Description
objNo	The object number.
owner	The owner of the object.
name	The name of the table.

154.3.25 OBJECT_BLOCK_LIST_CLEAR Procedure

This procedure clears the entire block list.

Syntax

```
DBMS_RESULT_CACHE.OBJECT_BLOCK_LIST_CLEAR ();
```

154.3.26 OBJECT_BLOCK_LIST_REMOVE Procedure

This procedure removes objects from the object block list.

Syntax

```
DBMS_RESULT_CACHE.OBJECT_BLOCK_LIST_REMOVE (  
    objNo          IN BINARY_INTEGER);
```

```
DBMS_RESULT_CACHE.OBJECT_BLOCK_LIST_REMOVE (  
    owner          IN VARCHAR2,  
    name           IN VARCHAR2);
```

Parameters

Table 154-14 OBJECT_BLOCK_LIST_REMOVE Procedure Parameters

Parameter	Description
objNo	The object number.
owner	The owner of the object.
name	The name of the table.

DBMS_RESUMABLE

With the `DBMS_RESUMABLE` package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- [Operational Notes](#)
- [Summary of DBMS_RESUMABLE Subprograms](#)

155.1 DBMS_RESUMABLE Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DBMS_RESUMABLE.ABORT()` procedure.

155.2 Summary of DBMS_RESUMABLE Subprograms

This table lists the `DBMS_RESUMABLE` subprograms and briefly describes them.

Table 155-1 *DBMS_RESUMABLE Package Subprograms*

Subprogram	Description
ABORT Procedure	Aborts a suspended resumable space allocation
GET_SESSION_TIMEOUT Function	Returns the current timeout value of the resumable space allocations for a session with <code>session_id</code>
GET_TIMEOUT Function	Returns the current timeout value of resumable space allocations for the current session
SET_SESSION_TIMEOUT Procedure	Sets the timeout of resumable space allocations for a session with <code>session_id</code>
SET_TIMEOUT Procedure	Sets the timeout of resumable space allocations for the current session

Table 155-1 (Cont.) DBMS_RESUMABLE Package Subprograms

Subprogram	Description
SPACE_ERROR_INFO Function	Looks for space-related errors in the error stack, otherwise returning FALSE

155.2.1 ABORT Procedure

This procedure aborts a suspended resumable space allocation.

The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDL, `session_id` is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

Syntax

```
DBMS_RESUMABLE.ABORT (
    session_id IN NUMBER);
```

Parameters

Table 155-2 ABORT Procedure Parameters

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.

Usage Notes

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

155.2.2 GET_SESSION_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

Syntax

```
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (
    session_id IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 155-3 GET_SESSION_TIMEOUT Function Parameters

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.

Return Values

Table 155-4 GET_SESSION_TIMEOUT Function Return Values

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for a session with <code>session_id</code> . The timeout is returned in seconds.

Usage Notes

If `session_id` does not exist, the `GET_SESSION_TIMEOUT` function returns -1.

155.2.3 GET_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

Syntax

```
DBMS_RESUMABLE.GET_TIMEOUT  
RETURN NUMBER;
```

Return Values

Table 155-5 GET_TIMEOUT Function Return Values

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for the current session. The returned value is in seconds.

Usage Notes

If the current session is not resumable enabled, the `GET_TIMEOUT` function returns -1.

155.2.4 SET_SESSION_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with `session_id`.

The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

Syntax

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (  
    session_id IN NUMBER,  
    timeout    IN NUMBER);
```

Parameters

Table 155-6 SET_SESSION_TIMEOUT Procedure Parameters

Parameter	Description
session_id	The session identifier of the resumable space allocation.
timeout	The timeout of the resumable space allocation.

155.2.5 SET_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (
    timeout IN NUMBER);
```

Parameters

Table 155-7 SET_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The timeout of the resumable space allocation.

155.2.6 SPACE_ERROR_INFO Function

This function looks for space-related errors in the error stack.

If it cannot find a space related error, it will return `FALSE`. Otherwise, `TRUE` is returned and information about the particular object that causes the space error is returned.

Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
    error_type      OUT VARCHAR2,
    object_type     OUT VARCHAR2,
    object_owner    OUT VARCHAR2,
    table_space_name OUT VARCHAR2,
    object_name     OUT VARCHAR2,
    sub_object_name OUT VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 155-8 SPACE_ERROR_INFO Function Parameters

Parameter	Description
error_type	The space error type. It will be one of the following: <ul style="list-style-type: none">• NO MORE SPACE• MAX EXTENTS REACHED• SPACE QUOTA EXCEEDED
object_type	The object type. It will be one of the following: <ul style="list-style-type: none">• TABLE• INDEX• CLUSTER• TABLE SPACE• ROLLBACK SEGMENT• UNDO SEGMENT• LOB SEGMENT• TEMP SEGMENT• INDEX PARTITION• TABLE PARTITION• LOB PARTITION• TABLE SUBPARTITION• INDEX SUBPARTITION• LOB SUBPARTITION The type can also be <code>NULL</code> if it does not apply.
object_owner	The owner of the object. <code>NULL</code> if it cannot be determined.
table_space_name	The table space where the object resides. <code>NULL</code> if it cannot be determined.
object_name	The name of rollback segment, temp segment, table, index, or cluster.
sub_object_name	The partition name or sub-partition name of <code>LOB</code> , <code>TABLE</code> , or <code>INDEX</code> . <code>NULL</code> if it cannot be determined.

DBMS_RLS

The `DBMS_RLS` package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD).

`DBMS_RLS` is available with the Enterprise Edition only.

See Also:

Oracle Database Security Guide for usage information about `DBMS_RLS`

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of DBMS_RLS Subprograms](#)

156.1 DBMS_RLS Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (  
    'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select', 'user_ctx', 'time');
```

Whenever the `EMPLOYEES` table, under the `HR` schema, is referenced in a query or subquery (`SELECT`), the server calls the `EMP_SEC` function (under the `HR` schema). This function returns a predicate specific to the current schema for the `EMP_POLICY` policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: `INDEX`, `SELECT`, `INSERT`, `UPDATE`, or `DELETE`.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE P1
```

Here, `P1` (for example, where `SAL > 10000`, or even a subquery) is the predicate returned from the `EMP_SEC` function. The server treats the `EMPLOYEES` table as a view and does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require `EXECUTE` privilege on the policy function, because the server makes the call with the function definer's right.

 **Note:**

The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no `JOIN`, `ORDER BY`, `GROUP BY`, and so on.

`DBMS_RLS` also provides the interface to drop or enable security policies. For example, you can drop or enable the `EMP_POLICY` with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', TRUE);
```

156.2 DBMS_RLS Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

156.3 DBMS_RLS Constants

The `DBMS_RLS` package includes constants that can be used for specifying parameter values.

Table 156-1 DBMS_RLS Constants

Constant	Type	Value	Description
<code>ADD_ATTRIBUTE_ASSOCIATION</code>	<code>BINARY_INTEGER</code>	1	Used with <code>DBMS_RLS.ALTER_POLICY</code> and <code>DBMS_RLS.ALTER_GROUPED_POLICY</code> : adds the specified namespace and attribute to the policy or grouped policy

Table 156-1 (Cont.) DBMS_RLS Constants

Constant	Type	Value	Description
REMOVE_ATTRIBUTE_ASSOCIATION	BINARY_INTEGER	2	Used with <code>DBMS_RLS.ALTER_POLICY</code> and <code>DBMS_RLS.ALTER_GROUPED_POLICY</code> : removes the specified namespace and attribute to the policy or grouped policy.

156.4 DBMS_RLS Operational Notes

The `DBMS_RLS` procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the `DBMS_RLS` procedures are part of the DDL transaction.

For example, you may create a trigger for `CREATE TABLE`. Inside the trigger, you may add a column through `ALTER TABLE`, and you can add a policy through `DBMS_RLS`. All these operations are in the same transaction as `CREATE TABLE`, even though each one is a DDL statement. The `CREATE TABLE` succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from `V$VPD_POLICIES`.

A synonym can reference only a view or a table.

156.5 DBMS_RLS Rules and Limits

Using long identifiers is supported for VPD. The maximum length for arguments such as `object_schema`, `object_name`, and `policy_name`, which apply to objects (table names, policy names, and subprogram names) and views is 128 bytes.

156.6 Summary of DBMS_RLS Subprograms

This table lists and briefly describes the subprograms available in `DBMS_RLS`.

Table 156-2 DBMS_RLS Package Subprograms

Subprogram	Description
ADD_GROUPED_POLICY Procedure	Adds a policy associated with a policy group
ADD_POLICY Procedure	Adds a fine-grained access control policy to a table, view, or synonym
ADD_POLICY_CONTEXT Procedure	Adds the context for the active application
ALTER_POLICY Procedure	Associates an application context attribute with VPD policies
ALTER_GROUPED_POLICY Procedure	Adds application context related changes
CREATE_POLICY_GROUP Procedure	Creates a policy group
DELETE_POLICY_GROUP Procedure	Deletes a policy group

Table 156-2 (Cont.) DBMS_RLS Package Subprograms

Subprogram	Description
DISABLE_GROUPED_POLICY Procedure	Disables a row-level group security policy
DROP_GROUPED_POLICY Procedure	Drops a policy associated with a policy group
DROP_POLICY Procedure	Drops a fine-grained access control policy from a table, view, or synonym
DROP_POLICY_CONTEXT Procedure	Drops a driving context from the object so that it will have one less driving context
ENABLE_GROUPED_POLICY Procedure	Enables or disables a row-level group security policy
ENABLE_POLICY Procedure	Enables or disables a fine-grained access control policy
REFRESH_GROUPED_POLICY Procedure	Reparses the SQL statements associated with a refreshed policy
REFRESH_POLICY Procedure	Causes all the cached statements associated with the policy to be reparsed

156.6.1 ADD_GROUPED_POLICY Procedure

This procedure adds a policy associated with a policy group.

Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY (
  object_schema      IN  VARCHAR2      DEFAULT NULL,
  object_name        IN  VARCHAR2,
  policy_group       IN  VARCHAR2      DEFAULT 'SYS_DEFAULT',
  policy_name        IN  VARCHAR2,
  function_schema    IN  VARCHAR2      DEFAULT NULL,
  policy_function     IN  VARCHAR2,
  statement_types    IN  VARCHAR2      DEFAULT NULL,
  update_check       IN  BOOLEAN        DEFAULT FALSE,
  enable             IN  BOOLEAN        DEFAULT TRUE,
  static_policy      IN  BOOLEAN        DEFAULT FALSE,
  policy_type        IN  BINARY_INTEGER DEFAULT NULL,
  long_predicate     IN  BOOLEAN        DEFAULT FALSE,
  sec_relevant_cols  IN  VARCHAR2,
  sec_relevant_cols_opt IN BINARY_INTEGER DEFAULT NULL,
  namespace         IN  VARCHAR2      DEFAULT NULL,
  attribute          IN  VARCHAR2      DEFAULT NULL);
```

Parameters

Table 156-3 ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of the table, view, or synonym to which the policy is added
policy_group	Name of the policy group to which the policy belongs
policy_name	Name of the policy; must be unique for the same table or view

Table 156-3 (Cont.) ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
<code>function_schema</code>	Schema owning the policy function. If no <code>function_schema</code> is specified or is NULL, then the current schema is used.
<code>policy_function</code>	Name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.
<code>statement_types</code>	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, UPDATE, or DELETE. The default is to apply to all of these types except INSERT and INDEX.
<code>update_check</code>	For INSERT and UPDATE statements only, setting <code>update_check</code> to TRUE causes the server to check the policy against the value after INSERT or UPDATE. The check applies only to the security relevant columns that are included in the policy definition. In other words, the INSERT or UPDATE operation will fail only if the security relevant column that is defined in the policy is added or updated in the INSERT or UPDATE statement.
<code>enable</code>	Indicates if the policy is enable when it is added. The default is TRUE.
<code>static_policy</code>	Default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.
<code>policy_type</code>	Default is NULL, which means <code>policy_type</code> is decided by the value of <code>static_policy</code> . The available policy types are listed in Table 156-5 . Specifying any of these policy types overrides the value of <code>static_policy</code> .
<code>long_predicate</code>	Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.
<code>sec_relevant_cols</code>	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
<code>namespace</code>	Name which determines the application context namespace
<code>attribute</code>	Attribute which determines the application context attribute name

Usage Notes

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the [CREATE_POLICY_GROUP Procedure](#).
- The policy name must be unique within a policy group for a specific object.

- Policies from the default policy group, `SYS_DEFAULT`, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with `EXEMPT ACCESS POLICY` system privilege.

156.6.2 ADD_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

 **See Also:**
[Operational Notes](#)

A `COMMIT` is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ADD_POLICY (
  object_schema          IN  VARCHAR2          DEFAULT NULL,
  object_name            IN  VARCHAR2,
  policy_name            IN  VARCHAR2,
  function_schema        IN  VARCHAR2          DEFAULT NULL,
  policy_function        IN  VARCHAR2,
  statement_types        IN  VARCHAR2          DEFAULT NULL,
  update_check           IN  BOOLEAN           DEFAULT FALSE,
  enable                 IN  BOOLEAN           DEFAULT TRUE,
  static_policy          IN  BOOLEAN           DEFAULT FALSE,
  policy_type            IN  BINARY_INTEGER   DEFAULT NULL,
  long_predicate         IN  BOOLEAN           DEFAULT FALSE,
  sec_relevant_cols      IN  VARCHAR2          DEFAULT NULL,
  sec_relevant_cols_opt IN  BINARY_INTEGER   DEFAULT NULL,
  namespace              IN  VARCHAR2          DEFAULT NULL,
  attribute              IN  VARCHAR2          DEFAULT NULL);
```

Parameters

Table 156-4 ADD_POLICY Procedure Parameters

Parameter	Description
<code>object_schema</code>	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used.
<code>object_name</code>	Name of table, view, or synonym to which the policy is added.
<code>policy_name</code>	Name of policy to be added. It must be unique for the same table or view. Do not enter special characters such as spaces or commas. If you want to use special characters for the policy name, then enclose the name in quotation marks.
<code>function_schema</code>	Schema owning the policy function. If no <code>function_schema</code> is specified or is <code>NULL</code> , then the current schema is used.

Table 156-4 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
<code>policy_function</code>	Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.
<code>statement_types</code>	Statement types to which the policy applies. It can be any combination of <code>INDEX</code> , <code>SELECT</code> , <code>UPDATE</code> , or <code>DELETE</code> . The default is to apply to all of these types except <code>INSERT</code> and <code>INDEX</code> .
<code>update_check</code>	Optional argument for the <code>INSERT</code> or <code>UPDATE</code> statement type. The default is <code>FALSE</code> . If you plan to use the <code>INSERT</code> statement type, then you must set <code>update_check</code> to <code>TRUE</code> . Otherwise, an <code>ORA-28104 input value for string is not valid error</code> is generated. The check applies only to the security relevant columns that are included in the policy definition. In other words, the <code>INSERT</code> or <code>UPDATE</code> operation will fail only if the security relevant column that is defined in the policy is added or updated in the <code>INSERT</code> or <code>UPDATE</code> statement.
<code>enable</code>	Indicates if the policy is enabled when it is added. The default is <code>TRUE</code> .
<code>static_policy</code>	The default is <code>FALSE</code> . If it is set to <code>TRUE</code> , the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for <code>SYS</code> or the privileged user who has the <code>EXEMPT ACCESS POLICY</code> privilege.
<code>policy_type</code>	Default is <code>NULL</code> , which means <code>policy_type</code> is decided by the value of <code>static_policy</code> . The available policy types are listed in Table 156-5 . Specifying any of these policy types overrides the value of <code>static_policy</code> .
<code>long_predicate</code>	Default is <code>FALSE</code> , which means the policy function can return a predicate with a length of up to 4000 bytes. <code>TRUE</code> means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.
<code>sec_relevant_cols</code>	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
<code>sec_relevant_cols_opt</code>	Use with <code>sec_relevant_cols</code> to display all rows for column-level VPD filtered queries (<code>SELECT</code> only), but where sensitive columns appear as <code>NULL</code> . Default is set to <code>NULL</code> , which allows the filtering defined with <code>sec_relevant_cols</code> to take effect. Set to <code>dbms_ols.ALL_ROWS</code> to display all rows, but with sensitive column values, which are filtered by <code>sec_relevant_cols</code> , displayed as <code>NULL</code> . See Usage Notes for restrictions and additional information about this option.
<code>namespace</code>	Name which determines the application context namespace
<code>attribute</code>	Attribute which determines the application context attribute name

Table 156-5 DBMS_RLS.ADD_POLICY Policy Types

Policy Type	Description
STATIC	Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as SYS_CONTEXT or SYSDATE. Applies to only one object.
SHARED_STATIC	Same as STATIC except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.
CONTEXT_SENSITIVE	Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.
SHARED_CONTEXT_SENSITIVE	Same as CONTEXT_SENSITIVE except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.
DYNAMIC	The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function upon each statement parsing and execution. Applies to only one object.

Usage Notes

- SYS is free of any security policy.
- The policy functions are called by the server. Following is the interface for the function:

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table or view.
--- object_name is the name of table, view, or synonym to which the policy
applies.
```
- The policy functions must have the purity level of WNDS (write no database state).

See Also:

The *Oracle Database Development Guide* has more details about the RESTRICT_REFERENCES pragma.

- Predicates generated from different VPD policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.

- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

```
"select c1, c2, ... from tab tab where <predicate>"
```

- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with `sec_relevant_cols_opt => dbms_ols.ALL_ROWS`) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as `NULL`. The restrictions for this option are as follows:
 - Only applies to `SELECT` statements
 - Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
 - If your application performs calculations, or does not expect `NULL` values, then you should use the default behavior of column-level VPD, which is specified with the `sec_relevant_cols` parameter.
 - If you use `UPDATE AS SELECT` with this option, then only the values in the columns you are allowed to see will be updated.
 - This option may prevent some rows from displaying. For example:

```
SELECT * FROM employees
WHERE salary = 10
```

This query may not return rows if the `salary` column returns a `NULL` value because the column masking option has been set.

- When you add a VPD policy to a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- The maximum number of policies that can be created for a single object is 255.

Examples

As the first of two examples, the following creates a policy that applies to the `hr.employee` table. This is a column-level VPD policy that will be enforced only if a `SELECT` or an `INDEX` statement refers to the `salary`, `birthdate`, or `SSN` columns of the table explicitly, or implicitly through a view. It is also a `CONTEXT_SENSITIVE` policy, so the server will invoke the policy function `hr.hrfun` at parse time. The namespace and attribute application context parameters restrict the policy evaluation only when the application context values change. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the `long_predicate` parameter is omitted from the call.

```

BEGIN
  DBMS_RLS.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employee',
    policy_name   => 'hr_policy',
    function_schema => 'hr',
    policy_function => 'hrfun',
    statement_types => 'select,index',
    policy_type    => DBMS_RLS.CONTEXT_SENSITIVE,
    sec_relevant_cols => 'salary,birthdate,ssn',
    namespace     => 'empno_ctx',
    attribute     => 'emp_id');
END;

```

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a `SHARED_STATIC` policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, `subfun`, if that search fails.

```

BEGIN
  DBMS_RLS.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employee',
    policy_name   => 'hosting_policy',
    function_schema => 'hr',
    policy_function => 'subfun',
    policy_type    => dbms_rls.SHARED_STATIC);
END;

```

156.6.3 ADD_POLICY_CONTEXT Procedure

This procedure adds the context for the active application.

Syntax

```

DBMS_RLS.ADD_POLICY_CONTEXT (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  namespace      IN VARCHAR2,
  attribute      IN VARCHAR2);

```

Parameters

Table 156-6 ADD_POLICY_CONTEXT Procedure Parameters

Parameter	Description
<code>object_schema</code>	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used.
<code>object_name</code>	Name of the table, view, or synonym to which the policy is added.
<code>namespace</code>	Name which determines the application context namespace
<code>attribute</code>	Attribute which determines the application context attribute name

Usage Notes

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the `SYS_DEFAULT` policy group.
- To add a policy to table `HR.EMPLOYEES` in group `access_control_group`, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_group','policy1','SYS',
 'HR.ACCESS');
```

156.6.4 ALTER_POLICY Procedure

This procedure associates an application context attribute with VPD policies.

Syntax

```
DBMS_RLS.ALTER_POLICY (
  object_schema  IN VARCHAR2 DEFAULT NULL,
  object_name    IN VARCHAR2,
  policy_name    IN VARCHAR2,
  alter_option   IN NUMBER,
  namespace     IN VARCHAR2 DEFAULT NULL,
  attribute      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 156-7 ALTER_POLICY Procedure Parameters

Parameter	Description
<code>object_schema</code>	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used.
<code>object_name</code>	Name of the table, view, or synonym to which the policy is added
<code>policy_name</code>	Name of the policy, unique for the same table or view
<code>alter_option</code>	Used to determine whether the application context is being added or removed from an Oracle Virtual Private Database policy
<code>namespace</code>	Name which determines the application context namespace
<code>attribute</code>	Attribute which determines the application context attribute name

Usage Notes

Note the following:

- This procedure associates an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for DYNAMIC, STATIC or SHARED_STATIC policies will result in an error. If namespace is specified, attribute should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of ALTER_POLICY which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS_DEFAULT policy group.
- To add a policy to table hr.employees in group access_control_group, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY(
    'hr','employees','access_control_group','policy1','SYS','HR.ACCESS');
```

156.6.5 ALTER_GROUPED_POLICY Procedure

This procedure adds application context related changes.

Syntax

```
DBMS_RLS.ALTER_GROUPED_POLICY (
    object_schema    IN VARCHAR2 DEFAULT NULL,
    object_name      IN VARCHAR2,
    policy_group     IN VARCHAR2 DEFAULT SYS_DEFAULT,
    policy_name      IN VARCHAR2,
    alter_option     IN NUMBER,
    namespace        IN VARCHAR2 DEFAULT NULL,
    attribute        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 156-8 ALTER_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.

Table 156-8 (Cont.) ALTER_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_name	Name of the table, view, or synonym to which the policy is added
policy_group	Name of the policy group to which this policy belongs; must be unique for the same table or view
policy_name	Name of the policy, unique for the same table or view
alter_option	Used to determine whether the application context is being added or removed from the Oracle Virtual Private Database policy
namespace	Name that determines the application context namespace
attribute	Attribute determines the application context attribute name

Usage Notes

Note the following:

- This procedure will associate an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for DYNAMIC, STATIC or SHARED_STATIC policies will result in an error. If namespace is specified, attribute should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of ALTER_GROUPED_POLICY which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS_DEFAULT policy group.
- To add a policy to table hr.employees in group access_control_group, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY (
    'hr', 'employees', 'access_control_group', 'policy1', 'SYS', 'HR.ACCESS');
```

156.6.6 CREATE_POLICY_GROUP Procedure

This procedure creates a policy group.

Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2,  
    policy_group  IN VARCHAR2);
```

Parameters

Table 156-9 CREATE_POLICY_GROUP Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used.
object_name	Name of the table, view, or synonym to which the policy is added
policy_group	Name of the policy group that the policy belongs to

Usage Notes

The group must be unique for each table or view.

156.6.7 DELETE_POLICY_GROUP Procedure

This procedure deletes a policy group.

Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2,  
    policy_group  IN VARCHAR2);
```

Parameters

Table 156-10 DELETE_POLICY_GROUP Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used.
object_name	Name of the table, view, or synonym to which the policy is added
policy_group	Name of the policy group that the policy belongs to

Usage Notes

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.

156.6.8 DISABLE_GROUPED_POLICY Procedure

This procedure disables a row-level group security policy.

Syntax

```
DBMS_RLS.DISABLE_GROUPED_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  group_name     IN VARCHAR2,
  policy_name    IN VARCHAR2);
```

Parameters

Table 156-11 DISABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym
object_name	Name of the table, view, or synonym with which the policy is associated
group_name	Name of the group of the policy
policy_name	Name of the policy to be enabled or disabled

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the ENABLE_GROUPED_POLICY procedure is executed with "enable" set to FALSE.

156.6.9 DROP_GROUPED_POLICY Procedure

This procedure drops a policy associated with a policy group.

Syntax

```
DBMS_RLS.DROP_GROUPED_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  policy_group   IN VARCHAR2 'SYS_DEFAULT',
  policy_name    IN VARCHAR2);
```

Parameters

Table 156-12 DROP_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of the table, view, or synonym to which the policy is dropped
policy_group	Name of the policy group to which the policy belongs
policy_name	Name of the policy

156.6.10 DROP_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also:

[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.DROP_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  policy_name    IN VARCHAR2);
```

Parameters

Table 156-13 DROP_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view or synonym. If no object_schema is specified, or NULL is provided, then the current user's schema is assumed.
object_name	Name of the table, view, or synonym for which the policy is dropped
policy_name	Name of policy to be dropped from table, view, or synonym

Usage Notes

- When you drop a VPD policy from a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.

156.6.11 DROP_POLICY_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

Syntax

```
DBMS_RLS.DROP_POLICY_CONTEXT (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  namespace     IN VARCHAR2,
  attribute      IN VARCHAR2);
```

Parameters**Table 156-14** DROP_POLICY_CONTEXT Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of the table, view, or synonym to which the policy is dropped
namespace	Namespace of the driving context
attribute	Attribute of the driving context

156.6.12 ENABLE_GROUPED_POLICY Procedure

This procedure enables or disables a row-level group security policy.

Syntax

```
DBMS_RLS.ENABLE_GROUPED_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  group_name     IN VARCHAR2,
  policy_name    IN VARCHAR2,
  enable        IN BOOLEAN TRUE);
```

Parameters**Table 156-15** ENABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of the table, view, or synonym with which the policy is associated
group_name	Name of the group of the policy

Table 156-15 (Cont.) ENABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
policy_name	Name of the policy to be enabled or disabled
enable	TRUE enables the policy; FALSE disables the policy

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

156.6.13 ENABLE_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

 **See Also:**
[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ENABLE_POLICY (
    object_schema IN VARCHAR2 NULL,
    object_name   IN VARCHAR2,
    policy_name   IN VARCHAR2,
    enable        IN BOOLEAN TRUE);
```

Parameters

Table 156-16 ENABLE_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of table, view, or synonym with which the policy is associated
policy_name	Name of policy to be enabled or disabled
enable	TRUE to enable the policy, FALSE to disable the policy

156.6.14 REFRESH_GROUPED_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

Syntax

```
DBMS_RLS.REFRESH_GROUPED_POLICY (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2 NULL,  
    group_name    IN VARCHAR2 NULL,  
    policy_name   IN VARCHAR2 NULL);
```

Parameters

Table 156-17 REFRESH_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used.
object_name	Name of the table, view, or synonym with which the policy is associated
group_name	Name of the group of the policy
policy_name	Name of the policy

Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

156.6.15 REFRESH_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also:

[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.REFRESH_POLICY (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2 NULL,  
    policy_name   IN VARCHAR2 NULL);
```

Parameters

Table 156-18 REFRESH_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of table, view, or synonym with which the policy is associated
policy_name	Name of policy to be refreshed

Usage Notes

- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

DBMS_ROLLING

The `DBMS_ROLLING` PL/SQL package is used to implement the Rolling Upgrade Using Active Data Guard feature.

The Active Data Guard feature of Oracle Data Guard streamlines the process of upgrading Oracle Database software in a Data Guard configuration in a rolling fashion. The Rolling Upgrade Using Active Data Guard feature requires a license for the Oracle Active Data Guard option. You can use this feature for database release upgrades starting with the first patchset of Oracle Database 12c.

Starting with Oracle Database 23ai, Transaction Guard works during `DBMS_ROLLING` operations to ensure continuous application functions during switchover, issued by `DBMS_ROLLING` to Transient Logical Standby. Transaction Guard returns the commit outcome of the current in-flight transaction when an error or outage occurs. Applications embed the Transaction Guard APIs in their error handling procedures to ensure that work continues without any in-flight work lost or duplicate submissions after an outage.

Additionally, you can use this feature immediately for other database maintenance tasks. The database where maintenance is performed must be operating at a minimum of Oracle Database 12c Release 1 (12.1). Such maintenance tasks include:

- Adding partitioning to non-partitioned tables
- Changing BasicFiles LOBs to SecureFiles LOBs
- Changing `XMLType` stored as `CLOB` to `XMLType` stored as binary XML
- Altering tables to be OLTP-compressed

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of `DBMS_ROLLING` Subprograms](#)

See Also:

Oracle Data Guard Concepts and Administration for information about using `DBMS_ROLLING` to perform a rolling upgrade

157.1 `DBMS_ROLLING` Overview

The `DBMS_ROLLING` PL/SQL package provides procedures that you can use to perform any change throughout a Data Guard configuration in a rolling fashion.

These procedures include a rolling upgrade of the Oracle Database software. Although the focus of this document is rolling upgrade operations, the content is applicable to the deployment of any rolling changes.

Starting with Oracle Database 23ai, Transaction Guard works during `DBMS_ROLLING` operations to ensure continuous application functions during switchover, issued by `DBMS_ROLLING` to Transient Logical Standby.

All the procedures are executed at the current primary database, which eliminates the potential confusion of moving between remote databases to perform various operations related to the rolling upgrade. If necessary, all the procedures can be called again to resume the rolling upgrade after an error or interruption. (The upgrade script must still be run at the standby.)

The package also provides a procedure that allows you to return a Data Guard configuration back to its original, pre-upgrade state in the event users wish to abandon the rolling upgrade.

The actual execution of a rolling upgrade has been reduced to three steps (excluding the upgrade of the Oracle Database software itself and the on-disk setup of the new Oracle Database software). The number of steps remains the same regardless of the size of the Data Guard configuration.

Conceptually, for the purposes of the `DBMS_ROLLING` package, you divide your Data Guard configuration into two groups: the leading group and the trailing group. The databases in the leading group undergo the upgrade operation (or any other change that you are deploying) first. The databases in the trailing group undergo the upgrade of the Oracle Database software (or any other change that you are deploying) only after the switchover operation. This insulates them from the upgrade and gives you time to evaluate the effect of the change in the leading group databases.

Each group has a master database: the future primary database as specified in the `DBMS_ROLLING.INIT_PLAN` procedure is the master of the leading group, called Leading Group Master (LGM), while the original primary database is the master of the trailing group called Trailing Group Master (TGM). You can configure databases to protect the LGM and the TGM. Standbys designated to protect the LGM are referred to as Leading Group Standbys (LGS). Standbys designated to protect the TGM are referred to as Trailing Group Standbys (TGS). These terms are used throughout this documentation.

If you perform a rolling upgrade using a transient logical standby database (including using `DBMS_ROLLING`), then you must manually load audit records from the operating system spillover location before the switchover. Before you run `DBMS_ROLLING.SWITCHOVER`, run `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` on the trailing group master (current primary database).

157.2 DBMS_ROLLING Security Model

The `DBMS_ROLLING` package is available to users who have been granted the DBA role.

157.3 Summary of DBMS_ROLLING Subprograms

This table lists and briefly describes the `DBMS_ROLLING` package subprograms.

Table 157-1 DBMS_ROLLING Package Subprograms

Subprogram	Description
INIT_PLAN Procedure	Initializes a rolling operation plan with system-generated default values.
DESTROY_PLAN Procedure	Destroys any existing rolling operation plan, its parameters, and all resources associated with the rolling operation.
BUILD_PLAN Procedure	Validates plan parameters and creates or modifies a rolling operation plan.
SET_PARAMETER Procedure	Modifies a rolling operation parameter.
START_PLAN Procedure	Starts the rolling operation.
SWITCHOVER Procedure	Performs a switchover between the current primary database and the transient logical standby database.
FINISH_PLAN Procedure	Finalizes the rolling operation.
ROLLBACK_PLAN Procedure	Completely rolls back the rolling operation.

157.3.1 INIT_PLAN Procedure

This procedure initializes a rolling operation plan with system-generated default values.

Syntax

```
DBMS_ROLLING.INIT_PLAN (
    future_primary IN VARCHAR2);
```

Parameters

Table 157-2 INIT_PLAN Procedure Parameters

Parameter	Description
future_primary	DB_UNIQUE_NAME of the future primary (also known as the Leading Group Master (LGM))

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45401: upgrade plan is already active
- ORA-45402: LOG_ARCHIVE_CONFIG must contain the DG_CONFIG attribute
- ORA-45403: database %s must be specified in DG_CONFIG
- ORA-45411: operation requires additional arguments
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure communicates with all databases defined in the log_archive_config init.ora parameter and validates that each database is a valid participant in the rolling

upgrade. Valid participants other than the primary database must have a database role of either physical standby, DG, or logical standby.

- The designated future primary must be a physical standby or ADG.

157.3.2 DESTROY_PLAN Procedure

This procedure destroys any existing upgrade plan, its parameters, and all resources associated with a rolling operation.

Syntax

```
DBMS_ROLLING.DESTROY_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45422: operation requires existing plan
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- When a rolling operation is complete, this procedure can be called to completely purge all states related to a rolling operation.
- This procedure must also be called after a `ROLLBACK_PLAN` to purge the metadata.

157.3.3 BUILD_PLAN Procedure

This procedure validates plan parameters and creates or modifies a rolling operation plan.

A successfully constructed plan is required in order to perform a rolling operation. This procedure must return successfully before the `START_PLAN` procedure can be called to start the rolling operation. Parameter changes made after a plan has been created may require calling the `BUILD_PLAN` procedure to modify the existing plan. The `DBA_ROLLING_EVENTS` view will indicate if any invocation of the `SET_PARAMETER` procedure requires a plan rebuild. Failure to rebuild the plan will result in an ORA-45416 error when attempting to resume the rolling operation.

Syntax

```
DBMS_ROLLING.BUILD_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45403: database %s must be specified in the `DG_CONFIG`
- ORA-45414: could not connect to a remote database

- ORA-45419: `DB_UNIQUE_NAME` parameter must be specified
- ORA-45433: failover was detected on an unsupported database
- ORA-45434: multiple failovers of the same type detected
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure connects to databases specified as plan parameters. These instances must be mounted or open, and must be reachable via the network.

157.3.4 SET_PARAMETER Procedure

This procedure modifies a rolling operation parameter.

Starting with Oracle Database 20c, a new parameter called `BLOCK_UNSUPPORTED` is added to the `DBMS_ROLLING.SET_PARAMETER` procedure. By default, `BLOCK_UNSUPPORTED` is set to 1, indicating that operations performed on tables that are unsupported by Transient Logical Standby will be blocked on the primary database. If set to 0, then the `DBMS_ROLLING` package does not block operations on unsupported tables. Those tables will not be maintained by Transient Logical Standby, and will diverge from the primary database.

Syntax

```
DBMS_ROLLING.SET_PARAMETER (
  scope          IN VARCHAR2 DEFAULT NULL,
  name           IN NUMBER,
  value          IN VARCHAR2);
```

Parameters

Table 157-3 *SET_PARAMETER Procedure Parameters*

Parameter	Description
scope	Parameter scope. It can either be NULL for global parameters, or the <code>DB_UNIQUE_NAME</code> of a specific database for local parameters.
name	The <code>DBMS_ROLLING</code> constant for a given parameter.
value	New value for the parameter or NULL to revert to a default value.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45408: parameter name is unknown
- ORA-45409: parameter value is invalid or out of bounds
- ORA-45410: parameter may not be modified
- ORA-45411: operation requires additional arguments
- ORA-45412: parameter scope argument is unknown
- ORA-45413: parameter has no default value
- ORA-45414: could not connect to a remote database

- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- Changes to a parameter value may require a call to the `DBMS_ROLLING.BUILD_PLAN` procedure to modify the existing plan. Users should check the `DBA_ROLLING_EVENTS` view after setting a parameter to determine if a rebuild is necessary.
- [Table 157-4](#) lists all the available parameters and their descriptions. The parameter names and values described in the table are all of type `VARCHAR2`.
- The `MINVAL` and `MAXVAL` columns in the `DBA_ROLLING_PARAMETERS` view identify the valid range of values for a parameter. The view does not contain any parameters until the `DBMS_ROLLING.INIT_PLAN` procedure has been successfully invoked.

Table 157-4 Valid Values for DBMS_ROLLING.SET_PARAMETER Procedure

Parameter Name	Global?	Description	Default
<code>ACTIVE_SESSIONS_TIMEOUT</code>	Yes	The maximum amount of time in seconds to enforce <code>ACTIVE_SESSIONS_WAIT</code> before halting the rolling upgrade. This parameter is only valid if <code>ACTIVE_SESSIONS_WAIT</code> is set to 1.	3600
<code>ACTIVE_SESSIONS_WAIT</code>	Yes	Whether the switchover operation will wait for active sessions to finish. If set to 1, the <code>SWITCHOVER</code> procedure waits for active sessions to complete. If set to 0, the <code>SWITCHOVER</code> procedure kills active sessions to expedite the switchover.	0
<code>BACKUP_CONTROLFILE</code>	Yes	File name of the backup control file that is created during a rolling upgrade.	<code>rolling_change_backup.f</code>
<code>BLOCK_UNSUPPORTED</code>	Yes	This parameter can be set for Rolling Upgrade to Block Unsupported Operations on the source database. Possible values are 0 and 1. <ul style="list-style-type: none"> 1: Turns blocking on. This is the default value. 0: Turns blocking off. Scope is not considered for this parameter. 	1
<code>DGBROKER</code>	Yes	Use Data Guard broker for managing apply, recovery, and log archive destinations.	1 if broker is enabled, 0 otherwise.
<code>DICTIONARY_LOAD_TIMEOUT</code>	Yes	The maximum amount of time in seconds to enforce <code>DICTIONARY_LOAD_WAIT</code> before halting the rolling upgrade. This parameter is only valid if <code>DICTIONARY_LOAD_WAIT</code> is set to 1.	3600
<code>DICTIONARY_LOAD_WAIT</code>	Yes	Whether the instantiation of the transient logical standby will include a wait for the complete loading of the data dictionary snapshot in redo. If set to 1, then the <code>START_PLAN</code> procedure will not return until the dictionary has been completely loaded. If set to 0, then the <code>START_PLAN</code> procedure will only verify that the loading of the dictionary has started.	0
<code>DICTIONARY_PLS_WAIT_INTERVAL</code>	Yes	The time in seconds to wait in between attempts to quiesce PL/SQL activity in order to write the data dictionary to redo.	300

Table 157-4 (Cont.) Valid Values for DBMS_ROLLING.SET_PARAMETER Procedure

Parameter Name	Global?	Description	Default
DICTIONARY_PLS_WAIT_TIMEOUT	Yes	The maximum amount of time in seconds to attempt to quiesce PL/SQL activity in order to write the data dictionary to redo.	3600
EVENT_RECORDS	Yes	The maximum number of records to permit in DBA_ROLLING_EVENTS	10000
FAILOVER	Yes	Automatically attempt to adjust the upgrade plan as a result of a failover event. This parameter resets its value to 0 upon completion of a subsequent call to BUILD_PLAN.	0
GRP_PREFIX	Yes	Execution of procedures in DBMS_ROLLING results in a number of Guaranteed Restore Points (GRP) taken in various databases participating in the Data Guard configuration. All such GRPs have the same prefix in their names. You can use this parameter to override the default prefix.	DBMSRU
IGNORE_BUILD_WARNINGS	Yes	Ignore warnings which would otherwise raise exceptions during execution of the BUILD_PLAN procedure.	1
IGNORE_LAST_ERROR	Yes	Ignore last encountered error upon startup of next rolling operation. This parameter resets its value to 0 upon invocation of a procedure call which resumes the rolling upgrade.	0
LAD_ENABLED_TIMEOUT	Yes	The maximum time in seconds to wait for a recently enabled log archive destination to reach a VALID state.	600
LOG_LEVEL	Yes	Logging level for the DBS_ROLLING PL/SQL package. A value of INFO results in the logging of errors and relevant non-fatal warnings. A value of FULL results in the logging of all events.	INFO
MEMBER	No	The upgrade group in which the specified database is a member. A value of LEADING indicates that the standby is a member of the leading upgrade group. As such, it is a standby of the Leading Group Master (LGM). The LGM is the database which is converted into the transient logical standby, and which becomes the new primary after the switchover. A value of TRAILING indicates that the standby is a member of the trailing upgrade group. As such, it is a standby of the Trailing Group Master (TGM). The TGM is the original primary database.	LEADING
READY_LGM_LAG_TIME	Yes	The apply lag time in seconds associated with the READY_LGM_LAG_WAIT parameter.	600
READY_LGM_LAG_TIMEOUT	Yes	The maximum amount of time in seconds to enforce READY_LGM_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if READY_LGM_LAG_WAIT is set to 1.	60

Table 157-4 (Cont.) Valid Values for DBMS_ROLLING.SET_PARAMETER Procedure

Parameter Name	Global?	Description	Default
READY_LGM_LAG_WAIT	Yes	Whether the START_PLAN procedure will wait for the apply lag on the leading group master to fall below READY_LGM_LAG_TIME seconds before returning control back to the user. If set to 1, the wait is performed. If set to 0, the wait is not performed.	0
SWITCH_LGM_LAG_TIME	Yes	The apply lag time in seconds associated with the SWITCH_LGM_LAG_WAIT parameter.	600
SWITCH_LGM_LAG_TIMEOU T	Yes	The maximum amount of time in seconds to enforce SWITCH_LGM_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if SWITCH_LGM_LAG_WAIT is set to 1.	60
SWITCH_LGM_LAG_WAIT	Yes	Whether the SWITCHOVER procedure will wait for the apply lag on the leading group master to fall below SWITCH_LGM_LAG_TIME seconds before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed.	1
SWITCH_LGS_LAG_TIME	Yes	The apply lag time in seconds associated with the SWITCH_LGS_LAG_WAIT parameter.	60
SWITCH_LGS_LAG_TIMEOU T	Yes	The maximum amount of time in seconds to enforce SWITCH_LGS_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if SWITCH_LGS_LAG_WAIT is set to 1.	60
SWITCH_LGS_LAG_WAIT	Yes	Whether the SWITCHOVER procedure will wait for the apply lag on the leading group standbys to fall below SWITCH_LGS_LAG_TIME seconds before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed.	0
UPDATED_LGS_TIMEOUT	Yes	The maximum amount of time in seconds to enforce UPDATED_LGS_WAIT before halting the rolling upgrade. This parameter is only valid if UPDATED_LGS_WAIT is set to 1.	10800
UPDATED_LGS_WAIT	Yes	Whether the SWITCHOVER procedure will wait for the leading group standbys to complete recovery of all upgrade redo before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed	1
UPDATED_TGS_TIMEOUT	Yes	The maximum amount of time in seconds to enforce UPDATED_TGS_WAIT before halting the rolling upgrade. This parameter is only valid if UPDATED_TGS_WAIT is set to 1.	10800
UPDATED_TGS_WAIT	Yes	Whether the FINISH_PLAN procedure will wait for the trailing group standbys to complete recovery of all upgrade redo before returning control to the user. If set to 1, the wait is performed. If set to 0, the wait is not performed.	1

157.3.5 START_PLAN Procedure

This procedure starts the rolling operation. This procedure must be executed on the primary database to formally start the rolling operation.

When the `START_PLAN` procedure is complete, the `future_primary` parameter in the `INIT_PLAN` procedure will be converted into a fully configured transient logical standby database.

Syntax

```
DBMS_ROLLING.START_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- A rolling operation plan must have previously been generated through the `BUILD_PLAN` procedure.

157.3.6 SWITCHOVER Procedure

This procedure performs a switchover between the current primary database and the transient logical standby database.

At the successful completion of the procedure, the LGM assumes the primary role for the Data Guard configuration.

Syntax

```
DBMS_ROLLING.SWITCHOVER ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-16224: database guard is enabled
- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure can only be called after you have manually upgraded the transient logical standby and opened it on the higher Oracle Database version.
- Once the future primary has been upgraded, logical apply should be restarted and allowed to catch up with the primary since the primary will have been open for business and generating redo which the standby must now apply. Failing to do so will cause the switchover to take a long time since it will have to apply all of that redo.

157.3.7 FINISH_PLAN Procedure

This procedure finalizes the rolling operation.

It configures the former primary as a physical standby of the new primary by flashing it back to an earlier taken GRP (guaranteed restore point), converting its role to physical standby, and then starting managed recovery which will recover all redo generated by the new primary including upgrade redo and any other redo generated before or after the upgrade.

Syntax

```
DBMS_ROLLING.FINISH_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure can only be called after you have remounted the former primary and remaining physical standbys on the higher Oracle Database version.

157.3.8 ROLLBACK_PLAN Procedure

This procedure rolls back the configuration-wide rolling operation.

Once completed, all of the databases in the leading group become physical standbys of the original primary database. This procedure can only be called if the configuration has not yet gone through a switchover operation since the `START_PLAN` procedure was invoked.

Syntax

```
DBMS_ROLLING.ROLLBACK_PLAN;
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45441: no databases eligible for rollback
- ORA-45442: rollback is not permitted after a role change
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- You must manually restart media recovery on the lower Oracle Database version if the upgrade of the transient logical standby has already been performed.

DBMS_ROWID

The `DBMS_ROWID` package lets you create `ROWIDs` and obtain information about `ROWIDs` from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other `ROWID` components without writing code to interpret the base-64 character external `ROWID`. `DBMS_ROWID` is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

**Note:**

`DBMS_ROWID` is not to be used with universal `ROWIDs` (`UROWIDs`).

This chapter contains the following topics:

- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of DBMS_ROWID Subprograms](#)

158.1 DBMS_ROWID Security Model

This package runs with the privileges of calling user, rather than the package owner `SYS`.

158.2 DBMS_ROWID Types

There are four `DBMS_ROWID` types.

These are:

- Extension and restriction types
- Verification types
- Object types
- Conversion types

Extension and Restriction Type

The types are as follows:

- `RESTRICTED`—restricted `ROWID`
- `EXTENDED`—extended `ROWID`

For example:

```
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

Note:

Extended ROWIDs are only used in Oracle database version 8.Xi and higher.

Verification Types

Table 158-1 Verification Types

Result	Description
VALID	Valid ROWID
INVALID	Invalid ROWID

For example:

```
rowid_is_valid   constant integer := 0;
rowid_is_invalid constant integer := 1;
```

Object Types

Table 158-2 Object Types

Result	Description
UNDEFINED	Object Number not defined (for restricted ROWIDs)

For example:

```
rowid_object_undefined constant integer := 0;
```

Conversion Types

Table 158-3 Conversion Types

Result	Description
INTERNAL	Convert to/from column of ROWID type
EXTERNAL	Convert to/from string format

For example:

```
rowid_convert_internal constant integer := 0;
rowid_convert_external constant integer := 1;
```

158.3 DBMS_ROWID Exceptions

This table describes the Exceptions raised by DBMS_ROWID subprograms.

Table 158-4 Exceptions

Exception	Description
ROWID_INVALID	Invalid rowid format
ROWID_BAD_BLOCK	Block is beyond end of file

For example:

```
ROWID_INVALID exception;
  pragma exception_init(ROWID_INVALID, -1410);

ROWID_BAD_BLOCK exception;
  pragma exception_init(ROWID_BAD_BLOCK, -28516);
```

158.4 DBMS_ROWID Operational Notes

These operation notes apply to DBMS_ROWID.

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SQL ROWID, either restricted or extended, as required.
- You can call the DBMS_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

Note:

ROWID_INFO is a procedure. It can only be used in PL/SQL code.

- You can use functions from the DBMS_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID_BLOCK_NUMBER function is used to return just the block number of a single row in the EMP table:

```
SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
       FROM emp
       WHERE ename = 'KING';
```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict_references, it could mean the violation is due to:
 - A problem with the current procedure or function
 - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
 - Calling a package procedure or function that touches the initialization code in a package or that sets the default values

158.5 DBMS_ROWID Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID_OBJECT function in the DBMS_ROWID package, then displays the object number:

```
DECLARE
  object_no  INTEGER;
  row_id     ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
     WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...

```

158.6 Summary of DBMS_ROWID Subprograms

This table lists the DBMS_ROWID subprograms and briefly describes them.

Table 158-5 DBMS_ROWID Package Subprograms

Subprogram	Description
ROWID_BLOCK_NUMBER Function	Returns the block number of a ROWID
ROWID_CREATE Function	Creates a ROWID, for testing only
ROWID_INFO Procedure	Returns the type and components of a ROWID
ROWID_OBJECT Function	Returns the object number of the extended ROWID
ROWID_RELATIVE_FNO Function	Returns the file number of a ROWID
ROWID_ROW_NUMBER Function	Returns the row number
ROWID_TO_ABSOLUTE_FNO Function	Returns the absolute file number associated with the ROWID for a row in a specific table
ROWID_TO_EXTENDED Function	Converts a ROWID from restricted format to extended
ROWID_TO_RESTRICTED Function	Converts an extended ROWID to restricted format
ROWID_TYPE Function	Returns the ROWID type: 0 is restricted, 1 is extended
ROWID_VERIFY Function	Checks if a ROWID can be correctly extended by the ROWID_TO_EXTENDED function

158.6.1 ROWID_BLOCK_NUMBER Function

This function returns the database block number for the input ROWID.

Syntax

```
DBMS_ROWID.ROWID_BLOCK_NUMBER (  
    row_id      IN  ROWID,  
    ts_type_in  IN  VARCHAR2 DEFAULT 'SMALLFILE')  
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_block_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 158-6 ROWID_BLOCK_NUMBER Function Parameters

Parameter	Description
row_id	ROWID to be interpreted
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs

Examples

The example SQL statement selects the block number from a ROWID and inserts it into another table:

```
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')  
FROM some_table  
WHERE key_value = 42);
```

158.6.2 ROWID_CREATE Function

This function lets you create a ROWID, given the component parts as parameters.

This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

Syntax

```
DBMS_ROWID.ROWID_CREATE (  
    rowid_type  IN NUMBER,  
    object_number IN NUMBER,  
    relative_fno IN NUMBER,  
    block_number IN NUMBER,  
    row_number  IN NUMBER)  
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 158-7 ROWID_CREATE Function Parameters

Parameter	Description
rowid_type	Type (restricted or extended) Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID. If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID.
object_number	Data object number (rowid_object_undefined for restricted)
relative_fno	Relative file number
block_number	Block number in this file
row_number	Returns row number in this block

Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj_number now contains 9999.

158.6.3 ROWID_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID.

This is a procedure, and it cannot be used in a SQL statement.

Syntax

```
DBMS_ROWID.ROWID_INFO (
  rowid_in      IN  ROWID,
  rowid_type    OUT NUMBER,
  object_number OUT NUMBER,
  relative_fno  OUT NUMBER,
  block_number  OUT NUMBER,
  row_number    OUT NUMBER);
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 158-8 ROWID_INFO Procedure Parameters

Parameter	Description
rowid_in	ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID.
rowid_type	Returns type (restricted/extended)
object_number	Returns data object number (rowid_object_undefined for restricted)
relative_fno	Returns relative file number
block_number	Returns block number in this file
row_number	Returns row number in this block

See Also:

"ROWID_TYPE Function"

Examples

This example reads back the values for the ROWID that you created in the ROWID_CREATE:

```
DBMS_ROWID.ROWID_INFO (
  my_rowid, rid_type, obj_num, file_num, block_num, row_num, 'BIGFILE');
```

158.6.4 ROWID_OBJECT Function

This function returns the data object number for an extended ROWID.

The function returns zero if the input ROWID is a restricted ROWID.

Syntax

```
DBMS_ROWID.ROWID_OBJECT (
  rowid_id IN ROWID)
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_object,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 158-9 ROWID_OBJECT Function Parameters

Parameter	Description
row_id	ROWID to be interpreted

**Note:**

The `ROWID_OBJECT_UNDEFINED` constant is returned for restricted ROWIDs.

Examples

```
SELECT dbms_rowid.rowid_object (ROWID)
FROM emp
WHERE empno = 7499;
```

158.6.5 ROWID_RELATIVE_FNO Function

This function returns the relative file number of the ROWID specified as the `IN` parameter. (The file number is relative to the tablespace.)

Syntax

```
DBMS_ROWID.ROWID_RELATIVE_FNO (
    rowid_id      IN   ROWID,
    ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

Parameters**Table 158-10 ROWID_RELATIVE_FNO Function Parameters**

Parameter	Description
<code>row_id</code>	ROWID to be interpreted
<code>ts_type_in</code>	Type of the tablespace (bigfile/smallfile) to which the row belongs

Examples

The example PL/SQL code fragment returns the relative file number:

```
DECLARE
    file_number    INTEGER;
    rowid_val      ROWID;
BEGIN
    SELECT ROWID INTO rowid_val
    FROM dept
    WHERE loc = 'Boston';
    file_number :=
        dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');
    ...
```

158.6.6 ROWID_ROW_NUMBER Function

This function extracts the row number from the ROWID IN parameter.

Syntax

```
DBMS_ROWID.ROWID_ROW_NUMBER (  
    row_id IN ROWID)  
    RETURN NUMBER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(rowid_row_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 158-11 ROWID_ROW_NUMBER Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

Examples

Select a row number:

```
SELECT dbms_rowid.rowid_row_number(ROWID)  
    FROM emp  
    WHERE ename = 'ALLEN';
```

158.6.7 ROWID_TO_ABSOLUTE_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table.

The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

Syntax

```
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (  
    row_id      IN ROWID,  
    schema_name IN VARCHAR2,  
    object_name IN VARCHAR2)  
    RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

Parameters

Table 158-12 ROWID_TO_ABSOLUTE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted
schema_name	Name of the schema which contains the table
object_name	Table name

Examples

```
DECLARE
  abs_fno      INTEGER;
  rowid_val    CHAR(18);
  object_name  VARCHAR2(20) := 'EMP';
BEGIN
  SELECT ROWID INTO rowid_val
  FROM emp
  WHERE empno = 9999;
  abs_fno := dbms_rowid.rowid_to_absolute_fno(
  rowid_val, 'SCOTT', object_name);
```

Note:

For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

158.6.8 ROWID_TO_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format.

Later, it may be removed from this package into a different place.

Syntax

```
DBMS_ROWID.ROWID_TO_EXTENDED (
  old_rowid      IN ROWID,
  schema_name    IN VARCHAR2,
  object_name    IN VARCHAR2,
  conversion_type IN INTEGER)
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
```

Parameters

Table 158-13 ROWID_TO_EXTENDED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted
schema_name	Name of the schema which contains the table (optional)
object_name	Table name (optional).
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

Return Values

ROWID_TO_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

Examples

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID_COL that holds ROWIDs (restricted), and a column TABLE_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

```
UPDATE SCOTT.RIDS
   SET rowid_col =
      dbms_rowid.rowid_to_extended (
         rowid_col, 'SCOTT', TABLE_COL, 0);
```

Usage Notes

- If the schema and object names are provided as IN parameters, then this function verifies SELECT authority on the table named, and converts the restricted ROWID provided to an extended ROWID, using the data object number of the table. That ROWID_TO_EXTENDED returns a value, however, does not guarantee that the converted ROWID actually references a valid row in the table, either at the time that the function is called, or when the extended ROWID is actually used.
- If the schema and object name are not provided (are passed as NULL), then this function attempts to fetch the page specified by the restricted ROWID provided. It treats the file number stored in this ROWID as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended ROWID value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.
- If an extended ROWID value is supplied, the data object number in the input extended ROWID is verified against the data object number computed from the table name parameter. If the two numbers do not match, the INVALID_ROWID exception is raised. If they do match, the input ROWID is returned.

- ROWID_TO_EXTENDED cannot be used with partition tables.

See Also:

The [ROWID_VERIFY Function](#) has a method to determine if a given ROWID can be converted to the extended format.

158.6.9 ROWID_TO_RESTRICTED Function

This function converts an extended ROWID into restricted ROWID format.

Syntax

```
DBMS_ROWID.ROWID_TO_RESTRICTED (
    old_rowid      IN ROWID,
    conversion_type IN INTEGER)
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_restricted,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 158-14 ROWID_TO_RESTRICTED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

158.6.10 ROWID_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

Syntax

```
DBMS_ROWID.ROWID_TYPE (
    rowid_id IN ROWID)
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_type,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 158-15 ROWID_TYPE Function Parameters

Parameter	Description
row_id	ROWID to be interpreted

Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN
    my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

158.6.11 ROWID_VERIFY Function

This function verifies the ROWID.

It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

Note:

You can use this function in a WHERE clause of a SQL statement, as shown in the example.

Syntax

```
DBMS_ROWID.ROWID_VERIFY (
    rowid_in      IN ROWID,
    schema_name   IN VARCHAR2,
    object_name   IN VARCHAR2,
    conversion_type IN INTEGER
) RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

Parameters

Table 158-16 ROWID_VERIFY Function Parameters

Parameter	Description
rowid_in	ROWID to be verified
schema_name	Name of the schema which contains the table
object_name	Table name
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

Examples

Considering the schema in the example for the `ROWID_TO_EXTENDED` function, you can use the following statement to find bad ROWIDs prior to conversion. This enables you to fix them beforehand.

```
SELECT ROWID, rowid_col
FROM SCOTT.RIDS
WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;
```

DBMS_RULE

The `DBMS_RULE` package contains subprograms that enable the evaluation of a rule set for a specified event.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_RULE Subprograms](#)

159.1 DBMS_RULE Overview

This package contains subprograms that enable the evaluation of a rule set for a specified event.

See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE` package
- [DBMS_RULE_ADM](#)

159.2 DBMS_RULE Security Model

`PUBLIC` is granted `EXECUTE` privilege on this package.

See Also:

Oracle Database Security Guide for more information about user group `PUBLIC`

159.3 Summary of DBMS_RULE Subprograms

This table lists the `DBMS_RULE` subprograms and briefly describes them.

Table 159-1 `DBMS_RULE` Package Subprograms

Subprogram	Description
CLOSE_ITERATOR Procedure	Closes an open iterator

Table 159-1 (Cont.) DBMS_RULE Package Subprograms

Subprogram	Description
EVALUATE Procedure	Evaluates the rules in the specified rule set that use the evaluation context specified
EVALUATE_EXPRESSION Procedure	Evaluates an expression under the logged in user in a session
EVALUATE_EXPRESSION_ITERATOR Procedure	Finds the relevant datapoints and pass <code>re\$value_list</code> into evaluation interface
EVALUATE_RULE Procedure	Evaluates the condition defined in the Rule
EVALUATE_RULE_ITERATOR Procedure	Finds the relevant datapoints and pass <code>re\$value_list</code> into evaluation interface
GET_NEXT_HIT Function	Returns the next rule that evaluated to <code>TRUE</code> from a true rules iterator, or returns the next rule that evaluated to <code>MAYBE</code> from a maybe rules iterator; returns <code>NULL</code> if there are no more rules that evaluated to <code>TRUE</code> or <code>MAYBE</code> .
IS_FAST Procedure	Returns <code>TRUE</code> if the expression can be evaluated fast. An expression can be evaluated fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.
GET_NEXT_RESULT Function	Iterates over result from the expression given <code>result_val_iterator</code> .

159.3.1 CLOSE_ITERATOR Procedure

This procedure closes an open iterator.

Syntax

```
DBMS_RULE.CLOSE_ITERATOR(
    iterator IN BINARY_INTEGER);
```

Parameter

Table 159-2 CLOSE_ITERATOR Procedure Parameter

Parameter	Description
<code>iterator</code>	Iterator to be closed

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

**See Also:**[EVALUATE Procedure](#)

159.3.2 EVALUATE Procedure

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

Syntax

```

DBMS_RULE.EVALUATE (
    rule_set_name          IN      VARCHAR2,
    evaluation_context     IN      VARCHAR2,
    event_context         IN      SYS.RE$NV_LIST          DEFAULT NULL,
    table_values          IN      SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
    column_values         IN      SYS.RE$COLUMN_VALUE_LIST  DEFAULT NULL,
    variable_values       IN      SYS.RE$VARIABLE_VALUE_LIST  DEFAULT NULL,
    attribute_values      IN      SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,

    skip_rules            IN      SYS.RE$RULE_NAME_LIST      DEFAULT NULL,

    dop                   IN      NUMBER,

    result_cache         IN      BOOLEAN                  DEFAULT FALSE,
    stop_on_first_hit    IN      BOOLEAN                  DEFAULT FALSE,
    simple_rules_only    IN      BOOLEAN                  DEFAULT FALSE,
    true_rules           OUT     SYS.RE$RULE_HIT_LIST,
    maybe_rules          OUT     SYS.RE$RULE_HIT_LIST);

DBMS_RULE.EVALUATE (
    rule_set_name          IN      VARCHAR2,
    evaluation_context     IN      VARCHAR2,
    event_context         IN      SYS.RE$NV_LIST          DEFAULT NULL,
    table_values          IN      SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
    column_values         IN      SYS.RE$COLUMN_VALUE_LIST  DEFAULT NULL,
    variable_values       IN      SYS.RE$VARIABLE_VALUE_LIST  DEFAULT NULL,
    attribute_values      IN      SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,

    skip_rules            IN      SYS.RE$RULE_NAME_LIST      DEFAULT NULL,

    dop                   IN      NUMBER,

    simple_rules_only    IN      BOOLEAN                  DEFAULT FALSE,
    true_rules_iterator  OUT     BINARY_INTEGER,
    maybe_rules_iterator OUT     BINARY_INTEGER);

```

Parameters

Table 159-3 EVALUATE Procedure Parameters

Parameter	Description
<code>rule_set_name</code>	Name of the rule set in the form <code>[schema_name.]rule_set_name</code> . For example, to evaluate all of the rules in a rule set named <code>hr_rules</code> in the <code>hr</code> schema, enter <code>hr.hr_rules</code> for this parameter. If the schema is not specified, then the schema of the current user is used.
<code>evaluation_context</code>	An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated.
<code>event_context</code>	A list of name-value pairs that identify events that cause evaluation
<code>table_values</code>	Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.
<code>column_values</code>	Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in <code>table_values</code> .
<code>variable_values</code>	A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.
<code>attribute_values</code>	Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in <code>variable_values</code> .
<code>stop_on_first_hit</code>	If <code>TRUE</code> , then the rules engine stops evaluation as soon as it finds a <code>TRUE</code> rule. If <code>TRUE</code> and there are no <code>TRUE</code> rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to <code>TRUE</code> given more data. If <code>FALSE</code> , then the rules engine continues to evaluate rules even after it finds a <code>TRUE</code> rule.
<code>simple_rules_only</code>	If <code>TRUE</code> , then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If <code>FALSE</code> , then evaluates all rules.

Table 159-3 (Cont.) EVALUATE Procedure Parameters

Parameter	Description
<code>true_rules</code>	<p>Receives the output of the <code>EVALUATE</code> procedure into a varray of <code>RE\$RULE_HIT_LIST</code> type.</p> <p>If no rules evaluate to <code>TRUE</code>, then <code>true_rules</code> is empty.</p> <p>If at least one rule evaluates to <code>TRUE</code> and <code>stop_on_first_hit</code> is <code>TRUE</code>, then <code>true_rules</code> contains one rule that evaluates to <code>TRUE</code>.</p> <p>If <code>stop_on_first_hit</code> is <code>FALSE</code>, then <code>true_rules</code> contains all rules that evaluate to <code>TRUE</code>.</p>
<code>maybe_rules</code>	<p>If all rules can be evaluated completely, without requiring any additional data, then <code>maybe_rules</code> is empty.</p> <p>If <code>stop_on_first_hit</code> is <code>TRUE</code>, then if there is at least one rule that may evaluate to <code>TRUE</code> given more data, and no rules evaluate to <code>TRUE</code>, then <code>maybe_rules</code> contains one rule that may evaluate to <code>TRUE</code>.</p> <p>If <code>stop_on_first_hit</code> is <code>FALSE</code>, then <code>maybe_rules</code> contains all rules that may evaluate to <code>TRUE</code> given more data.</p>
<code>true_rules_iterator</code>	Contains the iterator for accessing rules that are <code>TRUE</code>
<code>maybe_rules_iterator</code>	Contains the iterator for accessing rules that may be <code>TRUE</code> given additional data or the ability to issue SQL
<code>skip_rules</code>	List of rules to skip within this evaluation.
<code>dop</code>	Degree of parallelism
<code>result_cache</code>	If <code>TRUE</code> , Result Cache will be created. If evaluate procedure is called with either <code>true_rules_iterator</code> or <code>maybe_rules_iterator</code> , then <code>result_cache</code> is not enabled.

Usage Notes

Note:

Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first `TRUE` rule or the first `MAYBE` rule (if there are no `TRUE` rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as `MAYBE` rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as `MAYBE` rules, unless they can be determined to be `TRUE` or `FALSE` based on the values of one or more simple expressions within the rule. For example, given a value of 1 for attribute "a.b" of variable "x", a rule with the following rule condition can be returned as `TRUE`, without a value for table "tab":

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- `TRUE` rules, which is the list of rules that evaluate to `TRUE` based on the given data. These rules are returned either in the `OUT` parameter `true_rules`, which returns all of the rules that evaluate to `TRUE`, or in the `OUT` parameter `true_rules_iterator`, which returns each rule that evaluates to `TRUE` one at a time.
- `MAYBE` rules, which is the list of rules that could not be evaluated for one of the following reasons:
 - The rule refers to data that was unavailable. For example, a variable attribute "x.a.b" is specified, but no value is specified for the variable "x", the attribute "a", or the attribute "a.b".
 - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as `TRUE`, or partial data is available.

Maybe rules are returned either in the `OUT` parameter `maybe_rules`, which returns all of the rules that evaluate to `MAYBE`, or in the `OUT` parameter `maybe_rules_iterator`, which returns each rule that evaluates to `MAYBE` one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to `TRUE` and `MAYBE` for the event or an iterator for rules that evaluate to `TRUE` and `MAYBE`. A true rules iterator enables the client to fetch each rule that evaluates to `TRUE` one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to `MAYBE` one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to `TRUE` or `MAYBE` from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.
- The iterator returns `NULL` because no more rules evaluate to `TRUE` or `MAYBE`.
- The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE_SET` privilege on the rule set
- Have `EXECUTE_ANY_RULE_SET` system privilege
- Be the rule set owner

 **Note:**

The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

 **See Also:**

- [Rule TYPES](#) for more information about the types used with the DBMS_RULE package
- [GET_NEXT_HIT](#) Function
- [CLOSE_ITERATOR](#) Procedure

159.3.3 EVALUATE_EXPRESSION Procedure

This procedure allows user to evaluate an expression under the logged in user in a session.

Any re-execute of the same expression with same table alias and variable type will result in reusing the same compiled context. With fixed compile cache size, its possible of aging....

Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION(
  rule_expression          IN          VARCHAR2,
  table_aliases            IN          SYS.RE$TABLE_ALIAS_LIST:= NULL,
  variable_types          IN          SYS.RE$VARIABLE_TYPE_LIST:= NULL,
  table_values             IN          SYS.RE$TABLE_VALUE_LIST:= NULL,
  column_values           IN          SYS.RE$COLUMN_VALUE_LIST:=NULL,
  variable_values         IN          SYS.RE$VARIABLE_VALUE_LIST:=NULL,
  attribute_values        IN          SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL,
  cache                   IN          BOOLEAN DEFAULT FALSE,
  result_val              OUT         BOOLEAN);
```

Parameters

Table 159-4 EVALUATE_EXPRESSION Procedure Parameters

Parameter	Description
rule_expression	Contains an expression string.
table_alias	Contains alias of tables referred in the expression string.
variable_types	Contains type definitions of variables used in expression.
table_values	Contains ROWID of table row for expression evaluation.
column_values	Contains values of columns referred in the expression.
variable_values	Contains values of variables referred in the expression.
attribute_values	Contains values of attributes referred in the expression.
cache	If TRUE, Result Cache will be created.

Table 159-4 (Cont.) EVALUATE_EXPRESSION Procedure Parameters

Parameter	Description
result_val	Result of the evaluation.

159.3.4 EVALUATE_EXPRESSION_ITERATOR Procedure

This is a user visible interface. Because PL/SQL based callbacks can be expensive, we provide an array based approach. The client program is assumed to find the relevant datapoints and pass `re$value_list` into evaluation interface. The expression evaluation engine is expected to walk through this list and evaluate expression for each datapoint (`re$value_list`) element.

Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION_ITERATOR(
    rule_expression      IN          varchar2,
    table_aliases        IN          sys.re$table_alias_list:= NULL,
    variable_types       IN          sys.re$variable_type_list:= NULL,
    values               IN          sys.re$value_list,
    cache                IN          boolean DEFAULT FALSE,
    result_val_iter_id   OUT         BINARY_INTEGER)
```

Parameters

Table 159-5 EVALUATE_EXPRESSION_ITERATOR Procedure Parameter

Parameter	Description
rule_expression	Contains an expression string.
table_alias	Alias of tables referred in the above expression string.
variable_types	Type definitions of variables used in expression.
values	List of datapoint values for evaluation.
cache	If TRUE, Result Cache will be created.
result_val_iter_id	Contains iterator for result of array of values sent using value.

159.3.5 EVALUATE_RULE Procedure

The Rule Evaluation API expects that `CREATE_RULE` procedure has been called with an legitimate `EVALUATION_CONTEXT` prior. This API will evaluate the condition defined in the Rule.

Syntax

```
DBMS_RULE.EVALUATE_RULE(
    rule_name           IN          VARCHAR2,
    event_context       IN          SYS.RE$NV_LIST           DEFAULT NULL,
    table_values        IN          SYS.RE$table_value_list  DEFAULT NULL,
    column_values       IN          SYS.RE$column_value_list DEFAULT NULL,
    variable_values     IN          SYS.RE$variable_value_list DEFAULT NULL,
    attribute_values    IN          SYS.RE$attribute_value_list DEFAULT NULL,
```

```

cache          IN  BOOLEAN DEFAULT FALSE,
result_val     OUT BOOLEAN);

```

Parameters

Table 159-6 EVALUATE_RULE Procedure Parameter

Parameter	Description
rule_name	Name of the rule previously create using CREATE_RULE procedure.
event_context	A list of name-value pairs that identify events that cause evaluation.
table_values	ROWID of table row for expression evaluation.
column_values	Values of columns referred in the expression
variable_values	Values of variables referred in expression
attribute_values	Values of attributes referred in expression
cache	If TRUE, Result Cache will be created.
result_val	Result of the evaluation

159.3.6 EVALUATE_RULE_ITERATOR Procedure

This is an iterative interface. The client program is assumed to find the relevant datapoints and pass re\$value_list into evaluation interface.

Evaluation engine is expected to walk through this list and evaluate expression for each datapoint (re\$value_list) element. User can use DBMS_RULE.GET_NEXT_RESULT procedure to iterate through the result list.

Syntax

```

DBMS_RULE.EVALUATE_RULE_ITERATOR(
rule_name      IN      VARCHAR2,
event_context  IN      SYS.RE$NV_LIST DEFAULT NULL,
values         IN      SYS.RE$VALUE_LIST,
cache         IN      BOOLEAN DEFAULT FALSE,
result_val_iter_id OUT  BINARY_INTEGER);

```

Parameters

Table 159-7 EVALUATE_RULE_ITERATOR Procedure Parameter

Parameter	Description
rule_name	Name of the rule previously create using CREATE_RULE procedure.
event_context	A list of name-value pairs that identify events that cause evaluation
values	List of datapoint values for evaluation.
cache	If TRUE, Result Cache will be created.
result_val_iter_id	Contains iterator for result of array of values sent using values

159.3.7 GET_NEXT_HIT Function

This function returns the next rule that evaluated to `TRUE` from a true rules iterator, or returns the next rule that evaluated to `MAYBE` from a maybe rules iterator. The function returns `NULL` if there are no more rules that evaluated to `TRUE` or `MAYBE`.

Syntax

```
DBMS_RULE.GET_NEXT_HIT(  
    iterator IN BINARY_INTEGER)  
RETURN SYS.RE$RULE_HIT;
```

Parameter

Table 159-8 GET_NEXT_HIT Function Parameter

Parameter	Description
<code>iterator</code>	The iterator from which the rule that evaluated to <code>TRUE</code> or <code>MAYBE</code> is retrieved

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns `NULL`, it is closed automatically. If an open iterator is no longer needed, then use the `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package to close it.

Note:

This function raises an error if the rule set being evaluated was modified after the call to the `DBMS_RULE.EVALUATE` procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE` package
- [EVALUATE Procedure](#)
- [CLOSE_ITERATOR Procedure](#)

159.3.8 GET_NEXT_RESULT Function

This function iterates over result from the expression given in `RESULT_VAL_ITERATOR`. It returns the expression at iterator evaluated to `TRUE` or `FALSE`.

Syntax

```
DBMS_RULE.GET_NEXT_RESULT (
  result_val_iterator_id  IN  BINARY_INTEGER)
RETURN  BOOLEAN;
```

Parameter

Table 159-9 GET_NEXT_RESULT Function Parameter

Parameter	Description
<code>result_val_iterator_id</code>	Iterator returned from <code>EVALUATE_EXPRESSION_ITERATOR</code>

159.3.9 IS_FAST Procedure

Given an expression, of either rule or Independent Expression, this procedure will return `TRUE` if the expression can be evaluated as fast. An expression can be evaluated as fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.

Syntax

```
DBMS_RULE.IS_FAST(
  expression          IN          VARCHAR2,
  table_aliases       IN          SYS.RE$TABLE_ALIAS_LIST:= NULL,
  variable_types      IN          SYS.RE$VARIABLE_TYPE_LIST:= NULL,
  result_val          OUT         BOOLEAN);
```

Parameter

Table 159-10 IS_FAST Procedure Parameter

Parameter	Description
<code>expression</code>	Expression to check
<code>table_aliases</code>	Alias of tables referred in the above expression string
<code>variable_types</code>	Type definitions of variables used in expression
<code>result_val</code>	If the expression can be evaluated as fast

160

DBMS_RULE_ADM

The `DBMS_RULE_ADM` package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_RULE_ADM Subprograms](#)

160.1 DBMS_RULE_ADM Overview

This package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package
- [DBMS_RULE](#)

160.2 DBMS_RULE_ADM Security Model

`PUBLIC` is granted `EXECUTE` privilege on this package.

See Also:

Oracle Database Security Guide for more information about user group `PUBLIC`

160.3 Summary of DBMS_RULE_ADM Subprograms

This table lists the `DBMS_RULE_ADM` subprograms and briefly describes them.

Table 160-1 `DBMS_RULE_ADM` Package Subprograms

Subprogram	Description
ADD_RULE Procedure	Adds the specified rule to the specified rule set

Table 160-1 (Cont.) DBMS_RULE_ADM Package Subprograms

Subprogram	Description
ALTER_EVALUATION_CONTEXT Procedure	Alters a rule evaluation context
ALTER_RULE Procedure	Changes one or more aspects of the specified rule
CREATE_EVALUATION_CONTEXT Procedure	Creates a rule evaluation context
CREATE_RULE Procedure	Creates a rule with the specified name
CREATE_RULE_SET Procedure	Creates a rule set with the specified name
DROP_EVALUATION_CONTEXT Procedure	Drops the rule evaluation context with the specified name
DROP_RULE Procedure	Drops the rule with the specified name
DROP_RULE_SET Procedure	Drops the rule set with the specified name
GRANT_OBJECT_PRIVILEGE Procedure	Grants the specified object privilege on the specified object to the specified user or role
GRANT_SCHEMA_PRIVILEGE Procedure	Grants the specified schema privilege on the specified schema to the specified user or role.
GRANT_SYSTEM_PRIVILEGE Procedure	Grants the specified system privilege to the specified user or role
REMOVE_RULE Procedure	Removes the specified rule from the specified rule set
REVOKE_OBJECT_PRIVILEGE Procedure	Revokes the specified object privilege on the specified object from the specified user or role
REVOKE_SCHEMA_PRIVILEGE Procedure	Revokes the specified schema privilege on the specified schema from the specified user or role.
REVOKE_SYSTEM_PRIVILEGE Procedure	Revokes the specified system privilege from the specified user or role

**Note:**

All subprograms commit unless specified otherwise.

160.3.1 ADD_RULE Procedure

This procedure adds the specified rule to the specified rule set.

Syntax

```
DBMS_RULE_ADM.ADD_RULE(
  rule_name          IN  VARCHAR2,
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2  DEFAULT NULL,
  rule_comment       IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 160-2 ADD_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are adding to the rule set, specified as <code>[schema_name.]rule_name</code> . For example, to add a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>rule_set_name</code>	The name of the rule set to which you are adding the rule, specified as <code>[schema_name.]rule_set_name</code> . For example, to add the rule to a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>evaluation_context</code>	An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the current user is the default. Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.
<code>rule_comment</code>	Optional description, which can contain the reason for adding the rule to the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE` privilege on the rule
- Have `EXECUTE_ANY_RULE` system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

160.3.2 ALTER_EVALUATION_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST  DEFAULT NULL,
  remove_table_aliases         IN  BOOLEAN                  DEFAULT FALSE,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST DEFAULT NULL,
  remove_variable_types        IN  BOOLEAN                  DEFAULT FALSE,
  evaluation_function           IN  VARCHAR2                DEFAULT NULL,
  remove_evaluation_function    IN  BOOLEAN                  DEFAULT FALSE,
  evaluation_context_comment    IN  VARCHAR2                DEFAULT NULL,
  remove_eval_context_comment  IN  BOOLEAN                  DEFAULT FALSE);
```

Parameters

Table 160-3 ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are altering, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to alter an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	If <code>NULL</code> and <code>remove_table_aliases</code> is <code>FALSE</code> , then the procedure retains the existing table aliases. If <code>NULL</code> and <code>remove_table_aliases</code> is <code>TRUE</code> , then the procedure removes the existing table aliases. If non- <code>NULL</code> , then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases. Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
remove_table_aliases	If <code>TRUE</code> and <code>table_aliases</code> is <code>NULL</code> , then the procedure removes the existing table aliases for the evaluation context. If <code>TRUE</code> and <code>table_aliases</code> is non- <code>NULL</code> , then the procedure raises an error. If <code>FALSE</code> , then the procedure does not remove table aliases.

Table 160-3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
variable_types	<p>If NULL and <code>remove_variable_types</code> is FALSE, then the procedure retains the variable types. If NULL and <code>remove_variable_types</code> is TRUE, then the procedure removes the existing variable types.</p> <p>If non-NULL, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.</p>
remove_variable_types	<p>If TRUE and <code>variable_types</code> is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and <code>variable_types</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the variable types.</p>
evaluation_function	<p>If NULL and <code>remove_evaluation_function</code> is FALSE, then the procedure retains the existing evaluation function. If NULL and <code>remove_evaluation_function</code> is TRUE, then the procedure removes the existing evaluation function.</p> <p>If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function.</p> <p>An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default.</p> <p>See CREATE_EVALUATION_CONTEXT Procedure for more information about evaluation functions.</p>
remove_evaluation_function	<p>If TRUE and <code>evaluation_function</code> is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and <code>evaluation_function</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the evaluation function.</p>
evaluation_context_comment	<p>If NULL and <code>remove_eval_context_comment</code> is FALSE, then the procedure retains the existing evaluation context comment. If NULL and <code>remove_evaluation_function</code> is TRUE, then the procedure removes the existing evaluation context comment.</p> <p>If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment.</p> <p>An evaluation context comment is an optional description of the rule evaluation context.</p>

Table 160-3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
remove_eval_context_comment	If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation context comment.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL_ON_EVALUATION_CONTEXT or ALTER_ON_EVALUATION_CONTEXT object privilege on an evaluation context owned by another user
- Have ALTER_ANY_EVALUATION_CONTEXT system privilege

See Also:

[Rule TYPES](#) for more information about the types used with the DBMS_RULE_ADM package

160.3.3 ALTER_RULE Procedure

This procedure changes one or more aspects of the specified rule.

Syntax

```
DBMS_RULE_ADM.ALTER_RULE(
    rule_name           IN  VARCHAR2,
    condition           IN  VARCHAR2           DEFAULT NULL,
    evaluation_context  IN  VARCHAR2           DEFAULT NULL,
    remove_evaluation_context IN  BOOLEAN       DEFAULT FALSE,
    action_context     IN  SYS.RE$NV_LIST     DEFAULT NULL,
    remove_action_context IN  BOOLEAN       DEFAULT FALSE,
    rule_comment       IN  VARCHAR2           DEFAULT NULL,
    remove_rule_comment IN  BOOLEAN       DEFAULT FALSE);
```

Parameters

Table 160-4 ALTER_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are altering, specified as <code>[schema_name.]rule_name</code> . For example, to alter a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>condition</code>	The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.
<code>evaluation_context</code>	An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.
<code>remove_evaluation_context</code>	If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the <code>evaluation_context</code> parameter is non-NULL, then this parameter should be set to FALSE.
<code>action_context</code>	If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
<code>remove_action_context</code>	If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the <code>action_context</code> parameter is non-NULL, then this parameter should be set to FALSE.
<code>rule_comment</code>	If non-NULL, then the existing comment of the rule is replaced by the specified comment.
<code>remove_rule_comment</code>	If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule. If FALSE, then the procedure retains any comment for the specified rule. If the <code>rule_comment</code> parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE privilege on the rule

- Have ALTER_ANY_RULE system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also:

[Rule TYPEs](#) for more information about the types used with the DBMS_RULE_ADM package

160.3.4 CREATE_EVALUATION_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT (
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST   DEFAULT NULL,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  evaluation_function          IN  VARCHAR2                  DEFAULT NULL,
  evaluation_context_comment   IN  VARCHAR2                  DEFAULT NULL);
```

Parameters

Table 160-5 CREATE_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are creating, specified as <i>[schema_name.]evaluation_context_name</i> . For example, to create an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
variable_types	A list of variables for the evaluation context

Table 160-5 (Cont.) CREATE_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
<code>evaluation_function</code>	An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default. See " Usage Notes " for more information about the evaluation function.
<code>evaluation_context_comment</code>	An optional description of the rule evaluation context.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have `CREATE_EVALUATION_CONTEXT_OBJ` system privilege
- Have `CREATE_ANY_EVALUATION_CONTEXT` system privilege

See Also:

[Rule TYPEs](#) for more information about the types used with the `DBMS_RULE_ADM` package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2,
  event_context      IN  SYS.RE$NV_LIST           DEFAULT NULL,
  table_values       IN  SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
  column_values      IN  SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values    IN  SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values   IN  SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
  stop_on_first_hit  IN  BOOLEAN                 DEFAULT FALSE,
  simple_rules_only  IN  BOOLEAN                 DEFAULT FALSE,
  true_rules         OUT SYS.RE$RULE_HIT_LIST,
  maybe_rules        OUT SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;
```

Note:

Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- `DBMS_RULE_ADM.EVALUATION_SUCCESS`: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation

obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.

- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

160.3.5 CREATE_RULE Procedure

This procedure creates a rule.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE (
  rule_name          IN  VARCHAR2,
  condition          IN  VARCHAR2,
  evaluation_context IN  VARCHAR2          DEFAULT NULL,
  action_context     IN  SYS.RE$NV_LIST   DEFAULT NULL,
  rule_comment       IN  VARCHAR2          DEFAULT NULL);
```

Parameters

Table 160-6 CREATE_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are creating, specified as <code>[schema_name.]rule_name</code> . For example, to create a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>condition</code>	The condition to be associated with the rule. A condition evaluates to <code>TRUE</code> or <code>FALSE</code> and can be any condition allowed in the <code>WHERE</code> clause of a <code>SELECT</code> statement. For example, the following is a valid rule condition: <code>department_id = 30</code> Ensure that the proper case is used for text in rule conditions. Note: Do not include the word "WHERE" in the condition.
<code>evaluation_context</code>	An optional evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> , which is associated with the rule. If the schema is not specified, then the current user is the default. If <code>evaluation_context</code> is not specified, then the rule inherits the evaluation context from its rule set.
<code>action_context</code>	The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
<code>rule_comment</code>	An optional description of the rule

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the `CREATE_RULE_OBJ` system privilege
- Have `CREATE_ANY_RULE` system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`.
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also:

[Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package

160.3.6 CREATE_RULE_SET Procedure

This procedure creates a rule set.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
    rule_set_name      IN  VARCHAR2,
    evaluation_context IN  VARCHAR2 DEFAULT NULL,
    rule_set_comment   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 160-7 CREATE_RULE_SET Procedure Parameters

Parameter	Description
<code>rule_set_name</code>	The name of the rule set you are creating, specified as <code>[schema_name.]rule_set_name</code> . For example, to create a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>evaluation_context</code>	An optional evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> , which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.
<code>rule_set_comment</code>	An optional description of the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
- Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

160.3.7 DROP_EVALUATION_CONTEXT Procedure

This procedure drops a rule evaluation context.

Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT (
    evaluation_context_name IN VARCHAR2,
    force                    IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 160-8 DROP_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
<code>evaluation_context_name</code>	The name of the evaluation context you are dropping, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to drop an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>force</code>	If <code>TRUE</code> , then the procedure removes the rule evaluation context from all rules and rule sets that use it. If <code>FALSE</code> and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context. If <code>FALSE</code> and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception. Caution: Setting <code>force</code> to <code>TRUE</code> can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the <code>ADD_RULE</code> procedure, then the rule cannot be evaluated.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have `DROP_ANY_EVALUATION_CONTEXT` system privilege

160.3.8 DROP_RULE Procedure

This procedure drops a rule.

Syntax

```
DBMS_RULE_ADM.DROP_RULE (
    rule_name IN VARCHAR2,
    force     IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 160-9 DROP_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are dropping, specified as <code>[schema_name.]rule_name</code> . For example, to drop a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>force</code>	<p>If <code>TRUE</code>, then the procedure removes the rule from all rule sets that contain it.</p> <p>If <code>FALSE</code> and no rule sets contain the rule, then the procedure drops the rule.</p> <p>If <code>FALSE</code> and one or more rule sets contain the rule, then the procedure raises an exception.</p>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have `DROP_ANY_RULE` system privilege

Note:

- To remove a rule from a rule set without dropping the rule from the database, use the `REMOVE_RULE` procedure.
- The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.

160.3.9 DROP_RULE_SET Procedure

This procedure drops a rule set.

Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(
  rule_set_name IN VARCHAR2,
  delete_rules  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 160-10 DROP_RULE_SET Procedure Parameters

Parameter	Description
rule_set_name	The name of the rule set you are dropping, specified as [<i>schema_name</i> .] <i>rule_set_name</i> . For example, to drop a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default.
delete_rules	If TRUE , then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped. If FALSE , then the procedure does not drop the rules in the rule set.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have **DROP_ANY_RULE_SET** system privilege
- Be the owner of the rule set

Note:

The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

160.3.10 GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
  privilege      IN BINARY_INTEGER,
  object_name    IN VARCHAR2,
  grantee        IN VARCHAR2,
  grant_option   IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 160-11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the object privilege to grant to the grantee on the object. See " Usage Notes " for the available object privileges.
object_name	The name of the object for which you are granting the privilege to the grantee, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, to grant the privilege on a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant this privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have `EXECUTE` privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

[Table 160-12](#) lists the object privileges.

Table 160-12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
<code>SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT</code>	Alter and execute a particular evaluation context in another user's schema
<code>SYS.DBMS_RULE_ADM.ALL_ON_RULE</code>	Alter and execute a particular rule in another user's schema
<code>SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET</code>	Alter and execute a particular rule set in another user's schema
<code>SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT</code>	Alter a particular evaluation context in another user's schema
<code>SYS.DBMS_RULE_ADM.ALTER_ON_RULE</code>	Alter a particular rule in another user's schema
<code>SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET</code>	Alter a particular rule set in another user's schema
<code>SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT</code>	Execute a particular evaluation context in another user's schema
<code>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE</code>	Execute a particular rule in another user's schema

Table 160-12 (Cont.) Object Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET	Execute a particular rule set in another user's schema

Examples

For example, to grant the HR user the privilege to alter a rule named hr_dml in the strmadmin schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege   => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name => 'strmadmin.hr_dml',
    grantee     => 'hr',
    grant_option => FALSE);
END;
/
```

160.3.11 GRANT_SCHEMA_PRIVILEGE Procedure

This procedure grants the specified schema privilege on the specified schema to the specified user or role.

Syntax

```
DBMS_RULE_ADM.GRANT_SCHEMA_PRIVILEGE(
  privilege   IN  BINARY_INTEGER,
  schema      IN  VARCHAR2,
  grantee     IN  VARCHAR2,
  grant_option IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 160-13 GRANT_SCHEMA_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the schema privilege to grant to the grantee.
schema	The name of the schema on which schema privilege is to be granted.
grantee	The name of the user or role to which the schema privilege is to be granted.
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others.

Usage Notes

[Table 160-16](#) lists the system privileges.

Table 160-14 System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT	Alter any evaluation context owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE	Alter any rule owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET	Alter any rule set owned by any user
SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT	Create a new evaluation context in any schema
SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ	Create a new evaluation context in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE	Create a new rule in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ	Create a new rule in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET	Create a new rule set in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ	Create a new rule set in the grantee's schema
SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT	Drop any evaluation context in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE	Drop any rule in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET	Drop any rule set in any schema
SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT	Execute any evaluation context owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE	Execute any rule owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET	Execute any rule set owned by any user

160.3.12 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE (
  privilege      IN  BINARY_INTEGER,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN    DEFAULT FALSE);
```

Parameters

Table 160-15 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the system privilege to grant to the grantee.
grantee	The name of the user or role for which the privilege is granted
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others.

Usage Notes

Table 160-16 lists the system privileges.

Table 160-16 System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT	Alter any evaluation context owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE	Alter any rule owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET	Alter any rule set owned by any user
SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT	Create a new evaluation context in any schema
SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ	Create a new evaluation context in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE	Create a new rule in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ	Create a new rule in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET	Create a new rule set in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ	Create a new rule set in the grantee's schema
SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT	Drop any evaluation context in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE	Drop any rule in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET	Drop any rule set in any schema
SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT	Execute any evaluation context owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE	Execute any rule owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET	Execute any rule set owned by any user

For example, to grant the `strmadmin` user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege   => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee     => 'strmadmin',
    grant_option => FALSE);
END;
/
```

160.3.13 REMOVE_RULE Procedure

This procedure removes the specified rule from the specified rule set.

Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
  rule_name           IN  VARCHAR2,
  rule_set_name       IN  VARCHAR2,
  evaluation_context  IN  VARCHAR2  DEFAULT NULL,
  all_evaluation_contexts IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 160-17 REMOVE_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are removing from the rule set, specified as <code>[schema_name.]rule_name</code> . For example, to remove a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>rule_set_name</code>	The name of the rule set from which you are removing the rule, specified as <code>[schema_name.]rule_set_name</code> . For example, to remove the rule from a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>evaluation_context_name</code>	The name of the evaluation context associated with the rule you are removing, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to specify an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default. If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the <code>ADD_RULE</code> procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error. Specify <code>NULL</code> if you did not specify an evaluation context when you added the rule to the rule set. If you specify <code>NULL</code> and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.
<code>all_evaluation_contexts</code>	If <code>TRUE</code> , then the procedure removes the rule from the rule set with all of its associated evaluation contexts. If <code>FALSE</code> , then the procedure only removes the rule with the specified evaluation context. This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

 **Note:**

This procedure does not drop a rule from the database. To drop a rule from the database, use the `DROP_RULE` procedure.

160.3.14 REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE (
  privilege   IN  BINARY_INTEGER,
  object_name IN  VARCHAR2,
  revokee     IN  VARCHAR2);
```

Parameters

Table 160-18 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the object privilege on the object to revoke from the revokee. See GRANT_OBJECT_PRIVILEGE Procedure for a list of the object privileges.
object_name	The name of the object for which you are revoking the privilege from the revokee, specified as <code>[schema_name.]object_name</code> . For example, to revoke an object privilege on a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
revokee	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

160.3.15 REVOKE_SCHEMA_PRIVILEGE Procedure

This procedure revokes the specified schema privilege on the specified schema from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SCHEMA_PRIVILEGE (
  privilege IN  BINARY_INTEGER,
  schema    IN  VARCHAR2,
  revokee   IN  VARCHAR2);
```

Parameters

Table 160-19 REVOKE_SCHEMA_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the schema privilege to revoke from the revokee. See GRANT_SCHEMA_PRIVILEGE Procedure for a list of the schema privileges.
schema	The name of the schema from which the schema privilege is to be revoked.
revokee	The name of the user or role from which the schema privilege is to be revoked.

160.3.16 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(  
    privilege IN BINARY_INTEGER,  
    revokee   IN VARCHAR2);
```

Parameters

Table 160-20 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the system privilege to revoke from the revokee. See GRANT_SYSTEM_PRIVILEGE Procedure for a list of the system privileges.
revokee	The name of the user or role from which the privilege is revoked

DBMS_SAGA_ADM

The `DBMS_SAGA_ADM` package provides a collection of saga administration functions and procedures to define and manage saga participants, coordinators and brokers.

This chapter contains the following topics:

- [DBMS_SAGA_ADM Overview](#)
- [DBMS_SAGA_ADM Security Model](#)
- [Summary of DBMS_SAGA_ADM Subprograms](#)

161.1 DBMS_SAGA_ADM Overview

The `SYS.DBMS_SAGA_ADM` package provides the saga administration APIs to manage sagas.

The saga administration APIs implemented using the `DBMS_SAGA_ADM` package enables the administrators to define and manage saga participants, coordinators and brokers. The package APIs are described here for your reference.

161.2 DBMS_SAGA_ADM Security Model

A participant must invoke the procedures in `DBMS_SAGA_ADM` package from inside its schema and PDB. Invocation of APIs in the `DBMS_SAGA_ADM` package requires the `SAGA_ADM_ROLE` role.

161.3 Summary of DBMS_SAGA_ADM Subprograms

This table lists and briefly describes the `DBMS_SAGA_ADM` package subprograms.

Table 161-1 DBMS_SAGA_ADM Package Subprograms

Subprogram	Description
ADD_COORDINATOR Procedure	Adds a saga coordinator to the saga framework
DROP_COORDINATOR Procedure	Drops the given coordinator from the saga framework.
ADD_PARTICIPANT Procedure	Adds a participant to the local PDB and the broker
DROP_PARTICIPANT Procedure	Drops the given participant on the local PDB and the broker if there are no pending sagas and pending saga messages for the participant.
ADD_BROKER Procedure	Adds a broker to the saga framework and creates a JMS topic for the broker.
DROP_BROKER Procedure	Drops a broker and the associated JMS topic.
REGISTER_SAGA_CALLBACK Procedure	Allows users to create or modify a callback package if created using <code>add_participant</code> procedure.

161.3.1 ADD_BROKER Procedure

This procedure adds a broker to the saga framework.

As a part of adding a broker, a JMS topic is created for the broker. Both incoming and outgoing message propagation channels from participants to the broker use the broker's JMS topic.

Syntax

```
add_broker(
  broker_name          IN varchar2,
  broker_schema        IN varchar2 default sys_context('userenv',
'CURRENT_USER'),
  storage_clause        IN varchar2 default NULL,
  queue_partitions     IN number DEFAULT 1,
  version              IN number default 1
);
```

Parameters

Table 161-2 ADD_BROKER Procedure Parameters

Parameter	Description
broker_name	A unique broker name.
broker_schema	The schema for the microservice participant being added. If no value is provided, CURRENT_USER is used.
storage_clause	The storage parameter is included in the CREATE_TRANSACTIONAL_EVENT_QUEUE statement when the inbound and outbound JMS topics are created. The storage_clause argument can take any text that you can use in a standard DBMS_AQADM.CREATE_TRANSACTIONAL_EVENT_QUEUE storage_clause argument.
queue_partitions	The number of partitions for the Saga entity IN/OUT queues. This allows for higher parallelism and throughput for the Saga entity. DEFAULT is 1.
version	Saga version

161.3.2 DROP_BROKER Procedure

This procedure drops a broker and the associated JMS topic.

A broker can only be dropped if there are no registered participants and pending messages for the broker.

Syntax

```
drop_broker(broker_name IN varchar2)
```

Parameters

Table 161-3 DROP_BROKER Procedure Parameters

Parameter	Description
broker_name	The broker name to be dropped.

161.3.3 ADD_COORDINATOR Procedure

This procedure adds a Saga coordinator to the Saga framework. A Saga coordinator acts as a transaction manager for Sagas. The Saga coordinator maintains the state of a Saga across various participants.

Syntax

```
add_coordinator(
  coordinator_name      IN varchar2,
  coordinator_schema    IN varchar2 DEFAULT sys_context('USERENV', 'CURRENT_USER'),
  storage_clause        IN varchar2 DEFAULT NULL,
  dblink_to_broker     IN varchar2 DEFAULT NULL,
  mailbox_schema       IN varchar2,
  broker_name          IN varchar2,
  dblink_to_coordinator IN varchar2 DEFAULT NULL,
  queue_partitions      IN number DEFAULT 1,
  listener_count       IN number DEFAULT -1,
  version              IN number default 1);
```

Parameters

Table 161-4 ADD_COORDINATOR Procedure Parameters

Parameter	Description
coordinator_name	A unique name for the Saga coordinator.
coordinator_schema	The schema for the Saga coordinator being added. The parameter uses CURRENT_USER if no value is specified.
storage_clause	The storage parameter is included in the CREATE_TRANSACTIONAL_EVENT_QUEUE statement when the inbound and outbound JMS topics are created. The storage_clause argument can take any text that you can use in a standard DBMS_AQADM.CREATE_TRANSACTIONAL_EVENT_QUEUE storage_clause argument.
dblink_to_broker	Pre-created database link to connect from the coordinator PDB to the broker PDB.
mailbox_schema	The schema for the mailbox owner at the broker.
broker_name	The name of the broker.
dblink_to_coordinator	Pre-created database link to connect from the broker PDB to the coordinator PDB.

Table 161-4 (Cont.) ADD_COORDINATOR Procedure Parameters

Parameter	Description
queue_partitions	The number of partitions for the Saga entity IN/OUT queues. This allows for higher parallelism and throughput for the Saga entity. DEFAULT is 1.
listener_count	The number of concurrent Saga listener processes consuming inbound messages for the Saga coordinator. listener_count can have one of the following values: <ul style="list-style-type: none"> DBMS_SAGA_ADM.AQ_NTFN, which is also the DEFAULT. In this case, the Saga coordinator processes messages using the AQ notification mechanism. DBMS_SAGA_ADM.AUTO_NTFN- In this case, the Saga coordinator processes messages using job queue processes that dequeue from the coordinator queue. The job automatically adds and removes jobs depending on the queue depth. If any positive number (N) is specified, then N number of fixed jobs are created to process the messages for the Saga coordinator.
version	Saga version

 **Note:**

The number of queue partitions should be equal to the partition count specified while performing the add_broker() operation.

161.3.4 DROP_COORDINATOR Procedure

This procedure drops the given coordinator and disables message propagation between the coordinator and the broker. A coordinator can only be dropped if there are no participants associated with the coordinator.

Syntax

```
drop_coordinator(coordinator_name IN varchar2)
```

Parameters

Table 161-5 DROP_COORDINATOR Procedure Parameters

Parameter	Description
coordinator_name	The name of the saga coordinator that is being dropped.

161.3.5 ADD_PARTICIPANT Procedure

This procedure adds a Saga participant to the database and the broker.

A participant name is unique to the broker where the participant is added. The ADD_PARTICIPANT procedure creates system-defined inbound and outbound JMS

topics for the participant. A JMS topic is also created at the broker's side if the topic does not exist. Message propagation relationships are set up from:

- The outbound JMS topic of the participant to the JMS topic of the broker.
- The JMS topic of the broker to the inbound JMS topic of the participant.

Syntax

```
add_participant(
  participant_name          IN varchar2,
  participant_schema       IN varchar2 DEFAULT sys_context('USERENV',
'CURRENT_USER'),
  storage_clause           IN varchar2 DEFAULT NULL,
  coordinator_name        IN varchar2 DEFAULT NULL,
  dblink_to_broker        IN varchar2,
  mailbox_schema          IN varchar2,
  broker_name             IN varchar2,
  callback_schema         IN varchar2 DEFAULT sys_context('USERENV','CURRENT_USER'),
  callback_package        IN varchar2,
  dblink_to_participant   IN varchar2,
  queue_partitions        IN number DEFAULT 1,
  version                 IN number DEFAULT 1
);
```

Parameters

Table 161-6 ADD_PARTICIPANT Procedure Parameters

Parameter	Description
participant_name	A unique name for the saga participant.
participant_schema	The schema for the saga participant being added. The parameter uses CURRENT_USER if no value is specified.
storage_clause	The storage parameter is included in the CREATE_TRANSACTIONAL_EVENT_QUEUE statement when the inbound and outbound JMS topics are created. The storage_clause argument can take any text that you can use in a standard DBMS_AQADM.CREATE_TRANSACTIONAL_EVENT_QUEUE storage_clause argument.
coordinator_name	The name of the saga coordinator. If no value is provided and create_coordinator is TRUE, a system generated name is assumed.
dblink_to_broker	The pre-created database link to connect from the participant PDB to broker PDB.
mailbox_schema	The schema for the mailbox owner at the broker's side.
broker_name	The name of the broker. If no value is provided, the mailbox_schema name is assumed.
callback_schema	The schema of the user-defined callback package. If no value is provided, CURRENT_USER is used.
callback_package	The name of the user-defined callback package. The callback package isolates application developers from the internal details of the saga infrastructure, and enables the developers to focus on business logic.
dblink_to_participa nt	The pre-created database link to connect from broker PDB to the participant PDB.

Table 161-6 (Cont.) ADD_PARTICIPANT Procedure Parameters

Parameter	Description
queue_partitions	The number of partitions for the Saga entity IN/OUT queues. This allows for higher parallelism and throughput for the Saga entity. DEFAULT is 1.
version	Saga version

Note:

The number of queue partitions should be equal to the partition count specified while performing the `add_broker()` operation.

Usage Notes

The `ADD_PARTICIPANT` procedure needs coordinator name as an argument, hence the `ADD_COORDINATOR` procedure must be used before the `ADD_PARTICIPANT` procedure.

161.3.6 DROP_PARTICIPANT Procedure

This procedure drops the given participant on the local PDB and the broker.

The `DROP_PARTICIPANT` procedure drops the given participant on the local PDB and the broker if there are no pending sagas and pending saga messages for the participant. The `DROP_PARTICIPANT` procedure also disables message propagation between the participant and the broker.

Syntax

```
drop_participant(participant_name IN varchar2)
```

Parameters

Table 161-7 DROP_PARTICIPANT Procedure Parameters

Parameter	Description
participant_name	The name of the participant microservice that is being dropped.

161.3.7 REGISTER_SAGA_CALLBACK Procedure

This procedure enables users to create or modify a callback package if the package is created using `ADD_PARTICIPANT` procedure.

If the callback package was not added before, the `REGISTER_SAGA_CALLBACK` procedure sets up the required subscribers and the notification callback. While doing an add participant the user has the option of specifying the callback package. If they want to defer specifying the callback package or if they want to change the callback package they can use the `REGISTER_SAGA_CALLBACK` procedure. If the callback already exists for a participant, then it is simply replaced. The

REGISTER_SAGA_CALLBACK procedure is useful in cases where the user is not sure about whether to implement PL/SQL or Java, and wants to decide about it later, or the user wants to switch implementations (for example, from a Java client to a PL/SQL based client).

Syntax

```
register_saga_callback(participant_name IN varchar2,  
  callback_schema      IN varchar2 default sys_context('USERENV','CURRENT_USER'),  
  callback_package     IN varchar2);
```

Parameters

Table 161-8 REGISTER_SAGA_CALLBACK Procedure Parameters

Parameter	Description
participant_name	The name of the participant already created.
callback_schema	The schema for the user-defined callback package. If no value is provided, CURRENT_USER is used.
callback_package	The name of the user-defined callback package. The callback package isolates application developers from the internal details of the saga infrastructure, and enables them to focus on business logic.

DBMS_SAGA

The `DBMS_SAGA` package provides a collection of saga functions and procedures to initiate and finalize sagas.

This chapter contains the following topics:

- [DBMS_SAGA Overview](#)
- [DBMS_SAGA Security Model](#)
- [Summary of DBMS_SAGA Subprograms](#)

162.1 DBMS_SAGA Overview

The `DBMS_SAGA` package enables you (developers) to use PL/SQL and develop packaged microservices applications in the database without requiring a mid-tier.

The `DBMS_SAGA` package provides the PL/SQL interfaces to allow client programs to interact with database sagas.

If you want to implement microservices using a mid-tier to communicate with a database, it is recommended that you use the AQJMS extensions to implement the saga functionality.

See Also:

Managing a Saga Using JMS Interface for more information about the AQJMS extensions.

162.2 DBMS_SAGA Security Model

The `DBMS_SAGA` package requires the `SAGA_PARTICIPANT` role to participate in sagas.

162.3 Summary of DBMS_SAGA Subprograms

This table lists and briefly describes the `DBMS_SAGA` package subprograms.

Table 162-1 DBMS_SAGA Package Subprograms

Subprogram	Description
BEGIN_SAGA Function	Creates and returns a new <code>saga_id_t</code> (GUID). The new Saga ID is inserted into the <code>Saga\$</code> dictionary table.
GET_SAGA_ID Function	Gets the Saga ID for a Saga associated with a database session.
SET_SAGA_ID Procedure	Sets the Saga ID for a database session to the <code>saga_id</code> provided.
COMMIT_SAGA Procedure	Commits the Saga identified by the <code>saga_id</code> parameter.

Table 162-1 (Cont.) DBMS_SAGA Package Subprograms

Subprogram	Description
ROLLBACK_SAGA Procedure	Rolls back the Saga identified by the <code>saga_id</code> parameter.
IS_INCOMPLETE Function	Returns <code>TRUE</code> if the Saga corresponding to the provided <code>saga_id</code> is considered incomplete.
SET_INCOMPLETE Procedure	Marks the Saga identified by the provided <code>saga_id</code> as incomplete.
SEND_REQUEST Procedure	Enrolls a participant to an initiated Saga.

162.3.1 BEGIN_SAGA Function

This function creates and returns a new saga GUID: `saga_id_t`. The new saga ID is inserted into the `saga$` dictionary table.

Syntax

```
function begin_saga(initiator_name IN varchar2,
                  timeout    IN number default NULL,
                  version    IN number default 1)
return saga_id_t;
```

Parameters

Table 162-2 BEGIN_SAGA Procedure Parameters

Parameter	Description
<code>initiator_name</code>	The name of the saga initiator.
<code>timeout</code>	The timeout value specified as number of seconds. This value overrides the value of the <code>max_saga_duration</code> parameter.

162.3.2 GET_SAGA_ID Function

This function returns the saga, if any, associated with the current database session.

Syntax

```
function get_saga_id() return saga_id_t;
```

162.3.3 SET_SAGA_ID Procedure

This procedure sets the saga ID for a database session to the `saga_id` provided.

Syntax

```
procedure set_saga_id(saga_id IN saga_id_t);
```

Parameters

Table 162-3 SET_SAGA Procedure Parameters

Parameter	Description
saga_id	The saga identifier of the type <code>saga_id_t</code> .

162.3.4 COMMIT_SAGA Procedure

This procedure commits the saga that is identified with the `saga_id` parameter.

The `force` option is used to forcefully commit a saga participant transaction for pending or incomplete sagas. For the `COMMIT_SAGA()` call on the participant database, `force=TRUE` only commits the saga branch operation on the participant database. The default value of `force` is `TRUE`.

Syntax

```
procedure commit_saga(saga_participant IN VARCHAR2,
  saga_id IN saga_id_t,
  force IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 162-4 COMMIT_SAGA Procedure Parameters

Parameter	Description
saga_participant	The saga participant (<code>participant_name</code>).
saga_id	The saga identifier of the type <code>saga_id_t</code> .
force	The flag to indicate whether the commit saga operation is initiated for a saga branch.

162.3.5 ROLLBACK_SAGA Procedure

This procedure aborts the saga corresponding to the `saga_id` parameter.

The `force` option can be used to forcefully roll back a saga participant transaction for pending or incomplete sagas. For the `ROLLBACK_SAGA()` call on the participant database, `force=TRUE` only rolls back the saga branch operation on the participant database. The default value of `force` is `TRUE`.

Syntax

```
procedure rollback_saga (saga_participant IN VARCHAR2,
  saga_id IN saga_id_t,
  force IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 162-5 ROLLBACK_SAGA Procedure Parameters

Parameter	Description
saga_participant	The saga participant (<code>participant_name</code>).
saga_id	The saga identifier of the type <code>saga_id_t</code> .
force	The flag to indicate whether the rollback saga operation is initiated for a participant transaction. The default value is <code>TRUE</code> .

162.3.6 IS_INCOMPLETE Function

This function returns `TRUE` if the saga corresponding to the provided `saga_id` is considered incomplete.

A saga is considered incomplete for the following reasons:

- If the saga exceeds the duration identified by the `max_saga_duration` parameter or the duration established by the `begin_saga()` call.
- If the saga participant fails to finalize the saga (commit or rollback).

Syntax

```
function is_incomplete (saga_id IN saga_id_t) returns boolean;
```

Parameters

Table 162-6 IS_COMPLETE Function Parameters

Parameter	Description
saga_id	The saga identifier of the type <code>saga_id_t</code> .

162.3.7 SET_INCOMPLETE Procedure

This procedure marks the saga corresponding to the provided `saga_id` as incomplete.

This is an administrative interface to mark certain sagas as incomplete such that these sagas can be flagged for manual intervention.

Syntax

```
procedure set_incomplete (saga_id IN saga_id_t);
```

Parameters

Table 162-7 SET_INCOMPLETE Procedure Parameters

Parameter	Description
saga_id	The saga identifier of the type <code>saga_id_t</code> .

162.3.8 SEND_REQUEST Procedure

This procedure can be used by the client to enroll a participant in the initiated saga.

This procedure abstracts the creation of the saga message, conversion of JSON payloads, and enqueueing the message to the participant. The application developer can manually perform this step as well.

Syntax

```
procedure send_request(saga_id IN saga_id_t,  
    recipient      IN VARCHAR2,  
    payload        IN JSON DEFAULT NULL,  
    saga_version  IN NUMBER DEFAULT 1,  
    saga_spare    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 162-8 SEND_REQUEST Procedure Parameters

Parameter	Description
saga_id	The saga identifier that is derived using the <code>BEGIN_SAGA()</code> function.
recipient	The participant to enroll in this saga.
payload	The JSON payload to call <code>request()</code> of the participant being enrolled.
saga_version	The version of the saga framework (default is 1).
saga_spare	The currently unused field.

DBMS_SCHEDULER

The `DBMS_SCHEDULER` package provides a collection of scheduling functions and procedures that can be called from any PL/SQL program.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Rules and Limits](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_SCHEDULER Subprograms](#)

See Also:

Oracle Database Administrator's Guide for more information regarding how to use `DBMS_SCHEDULER`

163.1 DBMS_SCHEDULER Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 12c Release 1 (12.1):

- [CREATE_CREDENTIAL Procedure](#)
- [DROP_CREDENTIAL Procedure](#)

163.2 DBMS_SCHEDULER Security Model

The `DBMS_SCHEDULER` package ignores privileges granted on scheduler objects, such as jobs or chains, through roles. Object privileges must be granted directly to the user.

163.3 DBMS_SCHEDULER Rules and Limits

These rules apply when using the `DBMS_SCHEDULER` package.

- Only `SYS` can perform actions on objects in the `SYS` schema.
- Several of the procedures accept comma-delimited lists of object names. If you provide a list of names, then the Scheduler stops executing the list at the first object that returns an

error. Therefore, the Scheduler does not perform the tasks needed for the remaining objects on the list.

For example, consider the statement `DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3');`

If `job3` cannot be stopped, then the jobs that follow it, `jobclass1`, `jobclass2`, and `jobclass3` cannot be stopped. The jobs that preceded `job3`, `job1` and `job2`, are stopped.

- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

163.4 DBMS_SCHEDULER Operational Notes

The Scheduler uses a rich **calendar**ing syntax to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendaring syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendaring syntax.

Calendaring Syntax

This section starts with the calendaring syntax. It is followed by descriptions of various parts of the syntax.

In the calendaring syntax, `*` means 0 or more.

```
repeat_interval = regular_schedule | combined_schedule
```

```
regular_schedule = frequency_clause
[";" interval_clause] [";" bymonth_clause] [";" byweekno_clause]
[";" byyearday_clause] [";" bydate_clause] [";" bymonthday_clause]
[";" byday_clause] [";" byhour_clause] [";" byminute_clause]
[";" bysecond_clause] [";" bysetpos_clause] [";" include_clause]
[";" exclude_clause] [";" intersect_clause] [";" periods_clause]
[";" byperiod_clause]
```

```
frequency_clause = "FREQ" "=" ( predefined_frequency | user_defined_frequency )
```

```
predefined_frequency = "YEARLY" | "MONTHLY" | "WEEKLY" | "DAILY" |
"HOURLY" | "MINUTELY" | "SECONDLY"
```

```

combined_schedule = schedule_list

```

Table 163-1 Values for repeat_interval

Name	Description
FREQ	This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency.
INTERVAL	This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 99.
BYMONTH	This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.
BYWEEKNO	<p>This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. The first week is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th.</p> <p>The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year.</p> <p>As an example, in the year 1998, the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01, and January 1st, 1999, is in the ISO week 1998-53.</p> <p>byweekno is only valid for YEARLY.</p> <p>Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY; BYWEEKNO=53; BYMONTH=1".</p>
BYYEARDAY	This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.
BYDATE	<p>This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause follows:</p> <pre>BYDATE=0115,0315,0615,0915,1215,20060115</pre> <p>The following SPAN example is equivalent to <pre>BYDATE=0110,0111,0112,0113,0114,</pre> which is a span of 5 days starting at 1/10: <pre>BYDATE=0110+SPAN:5D</pre> <p>The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of <i>n</i> days or weeks centered around the supplied date. If <i>n</i> is an even number, it is adjusted up to the next odd number.</p> <p>Offsets adjust the supplied date by adding or subtracting <i>n</i> days or weeks. <pre>BYDATE=0205-OFFSET:2W</pre> is equivalent to <pre>BYDATE=0205-14D</pre> (the OFFSET: keyword is optional), which is also equivalent to <pre>BYDATE=0122</pre>.</p> </p>

Table 163-1 (Cont.) Values for repeat_interval

Name	Description
BYMONTHDAY	This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month.
BYDAY	This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month.
BYHOUR	This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.
BYMINUTE	This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.
BYSECOND	This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.
BYSETPOS	<p>This selects one or more items, by position, in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be:</p> <pre>FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1</pre> <p>Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies.</p> <p>The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.</p>
INCLUDE	<p>This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure.</p> <p>This clause only works on a full day and therefore cannot be used with BYHOUR, BYMIN, and BYSECOND.</p>

Table 163-1 (Cont.) Values for repeat_interval

Name	Description
EXCLUDE	<p>This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the <code>CREATE_SCHEDULE</code> procedure.</p> <p>This clause only works on a full day and therefore cannot be used with <code>BYHOUR</code>, <code>BYMIN</code>, and <code>BYSECOND</code>.</p>
INTERSECT	<p>This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps.</p> <p>For example, assume that the named schedule <code>last_sat</code> indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule <code>end_qtr</code> indicates the last day of each quarter in 2005:</p> <pre>3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005</pre> <p>These calendaring expressions result in the dates that follow:</p> <pre>3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005</pre> <pre>FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr</pre> <p>In this example, the terms <code>FREQ=MONTHLY; BYMONTHDAY=-1</code> indicate the last day of each month.</p> <p>This clause only works on a full day and therefore cannot be used with <code>BYHOUR</code>, <code>BYMIN</code>, and <code>BYSECOND</code>.</p>
PERIODS	<p>This identifies the number of periods that together form one cycle of a user-defined frequency. It is used in the <code>repeat_interval</code> expression of the schedule that defines the user-defined frequency. It is mandatory when the <code>repeat_interval</code> expression in the main schedule contains a <code>BYPERIOD</code> clause. The following example defines the quarters of a fiscal year.</p> <pre>FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4</pre>
BYPERIOD	<p>This selects periods from a user-defined frequency. For example, if a main schedule names a user-defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause <code>BYPERIOD=2,4</code> in the main schedule selects the 2nd and 4th fiscal quarters.</p>

Combining Schedules

There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules
 For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule.

- Embedding other schedules into the main schedule using `include`, `exclude`, and `intersect` clauses

With this method, the embedded schedules inherit certain attributes from the main schedule.

- Timestamps generated by the `INCLUDE` clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the `INTERVAL` clause, the `BYPERIOD` clause, or the `BYMONTH` clause for `freq=monthly`.
- Days that are added by the `INCLUDE` clause follow the hourly/minutes/seconds execution pattern of the main schedule.
- When the `INCLUDE` clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See ["Start Dates and Repeat Intervals"](#), later in this section.) For example, a `repeat_interval` of `FREQ=MONTHLY;INCLUDE=HOLIDAY` executes only on holidays and not on the month/day defaults retrieved from the start date.

The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
  'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
  'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the `INTERVAL` clause. If the start date of the main schedule is 1/1/2005, then 2/20 is not added. On the dates that are added, the embedded schedule follows the execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m. on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

User-Defined Frequencies

Instead of using predefined frequencies like `DAILY`, `WEEKLY`, `MONTHLY`, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following `repeat_interval` expression is used in a schedule named `fiscal_year` that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the `fiscal_year` schedule as a user-defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user-defined frequency do not have to be equal in length. In the main schedule, the `BYSETPOS` clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the `BYPERIOD` clause in the main schedule. To enable this, the schedule that is used as the user-defined frequency must include a `PERIODS` clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the `repeat_interval` clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

Start Dates and Repeat Intervals

The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the `repeat_interval`. For example, if the specified frequency is yearly and there is no `BYMONTH` or `BYMONTHDAY` clause in the repeat interval, then the month and day that the job runs on are retrieved from the start date. Similarly, if frequency is monthly but there is no `BYMONTHDAY` clause in the repeat interval, then the day of the month that the job runs on is retrieved from the start date. If present, `BYHOUR`, `BYMINUTE`, and `BYSECOND` defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the `INCLUDE`, `EXCLUDE`, or `INTERSECT` clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are. The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly
```

is expanded internally to:

```
freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule S1 has a `repeat_interval` of `FREQ=YEARLY;BYDATE=0701`.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

is expanded internally to:

```
freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an `INCLUDE` clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

General Rules

When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semicolon, and each clause can be present at most once, with the exception of the `include`, `exclude`, and `intersect` clauses.
- Spaces are allowed between syntax elements and the strings are case-insensitive.
- The list of values for a specific `BY` clause do not need to be ordered.

- When not enough `BY` clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "`FREQ=YEARLY`" with a start date of `02/15/2003` becomes "`FREQ=YEARLY;BYMONTH=FEB;BYMONTHDAY=15`", which means every year on the 15th of February.

"`FREQ=YEARLY;BYMONTH=JAN,JUL`" with start date `01/21/2003` becomes "`FREQ=YEARLY;BYMONTH=JAN,JUL;BYMONTHDAY=21`", which means every year on January 21 and July 21.

- The `byweekno` clause is only allowed if the frequency is `YEARLY`. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a `BYDAY` clause. For example, "`FREQ=YEARLY;BYWEEKNO=2`" with a start date of `01/01/2003` will return:

```
01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,
01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, .... and so on.
```

Note that when the `byweekno` clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "`FREQ=YEARLY;BYWEEKNO=1,53`" for the specified week numbers in 2004, it will return the dates:

```
12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
```

- For those `BY` clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying `BYMONTHDAY=31` will not give you the last day of every month, because not every month has 31 days. Instead, `BYMONTHDAY=-1` will give you the last day of the month.

This is not supported for `BY` clauses that are fixed in size. In other words, `BYMONTH`, `BYHOUR`, `BYMINUTE`, and `BYSECOND` are not supported.

- The basic values for the `BYDAY` clause are the days of the week. When the frequency is `YEARLY`, or `MONTHLY`, you are allowed to specify a positive or negative number in front of each day of the week. In the case of `YEARLY`, `BYDAY=40MON`, indicates the 40th Monday of the year. In the case of `MONTHLY`, `BYDAY=-2SAT`, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.

- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the `start_date` argument. If jobs must follow daylight savings adjustments, then you must specify a region name for the time zone of the `start_date`. For example specifying the `start_date` time zone as 'US/Eastern' in New York ensures that daylight saving adjustments are automatically applied. If instead, the time zone of the `start_date` is set to an absolute offset, such as '-5:00', then daylight savings adjustments are not followed and your job execution is off by an hour for half the year.
- When `start_date` is NULL, the Scheduler determines the time zone for the repeat interval as follows:
 1. It checks whether or not the session time zone is a region name. The session time zone can be set by either:
 - Issuing an ALTER SESSION statement, for example:

```
SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
```
 - Setting the ORA_SDTZ environment variable.
 2. If the session time zone is an absolute offset instead of a region name, the Scheduler uses the value of the DEFAULT_TIMEZONE Scheduler attribute. For more information, see the [SET_SCHEDULER_ATTRIBUTE Procedure](#).
 3. If the DEFAULT_TIMEZONE attribute is NULL, the Scheduler uses the time zone of `systimestamp` when the job or window is enabled.

BYSETPOS Clause Rules

The following are rules for the BYSETPOS clause.

- The BYSETPOS clause is the last clause to be evaluated. It is processed after all other BY clauses and the INCLUDE, EXCLUDE and INTERSECT clauses have been evaluated.
- The INTERVAL clause does not change the size of the period to which the BYSETPOS clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which BYSETPOS is applied is generated from a month, not a quarter. The only impact of the INTERVAL clause is to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

```
FREQ=MONTHLY;INTERVAL=3;BYDAY=MON,TUE,WED,THU,FRI;BYSETPOS=-2
```

provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which BYSETPOS is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

```
FREQ=MONTHLY;BYDAY=MON,TUE,FRI;BYSETPOS=1,3
```

on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

BYDATE Clause Rules

The following are rules for the `BYDATE` clause.

- If dates in the `BYDATE` clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the `BY` clauses in the calendaring expression. For example, if `repeat_interval` is defined as

```
freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
```

then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

EXCLUDE Clause Rules

Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, `jan_fifteen` is a named schedule that resolves to the single date of 01/15:

```
freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
  exclude=jan_fifteenth
```

In this case, all three instances of the job are removed for 01/15.

OFFSET Rules

You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute `JOB2` exactly 15 days after every occurrence of `JOB1`, add `+OFFSET:15D` to the schedule of `JOB1`, as follows:

```
BEGIN
dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
  'job1_schedule+OFFSET:15D');
END;
/
```

Note that negative offsets to named schedules are not supported.

Example 163-1 Putting It All Together

This example demonstrates the use of user-defined frequencies, spans, offsets, and the `BYSETPOS` and `INCLUDE` clauses. (Note that the `OFFSET:` keyword is optional in an offset clause.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
  dbms_scheduler.create_schedule('year_start', repeat_interval=>
    'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
  dbms_scheduler.create_schedule('retail_fiscal_year',
    to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
    'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end;
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing `holiday` schedule.

```
begin
  dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>
```

```
'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;
  BYPERIOD=2,4;BYSETPOS=5');
end;
/
```

163.5 DBMS_SCHEDULER Data Structures

The `DBMS_SCHEDULER` package defines `OBJECT` types and `TABLE` types.

OBJECT Types

- `JOBARG` Object Type
- `JOB_DEFINITION` Object Type
- `JOBATTR` Object Type
- `SCHEDULER$_STEP_TYPE` Object Type
- `SCHEDULER$_EVENT_INFO` Object Type
- `SCHEDULER_FILEWATCHER_RESULT` Object Type
- `SCHEDULER_FILEWATCHER_REQUEST` Object Type

TABLE Types

- `JOBARG_ARRAY` Table Type
- `JOB_DEFINITION_ARRAY` Table Type
- `JOBATTR_ARRAY` Table Type
- `SCHEDULER$_STEP_TYPE_LIST` Table Type

163.5.1 DBMS_SCHEDULER JOBARG Object Type

This type is used by the `JOB` and `JOBATTR` object types. It represents a job argument in a batch of job arguments.

Syntax

```
TYPE jobarg IS OBJECT (
  arg_position          NUMBER,
  arg_text_value       VARCHAR2(4000),
  arg_anydata_value    ANYDATA,
  arg_operation        VARCHAR2(5));
```

Attributes

Table 163-2 JOBARG Object Type Attributes

Attribute	Description
<code>arg_position</code>	Position of the argument
<code>arg_text_value</code>	Value of the argument if the type is <code>VARCHAR2</code>
<code>arg_anydata_value</code>	Value of the argument if the type is <code>AnyData</code>

Table 163-2 (Cont.) JOBARG Object Type Attributes

Attribute	Description
arg_operation	Type of the operation: <ul style="list-style-type: none"> • SET • RESET

JOBARG Constructor Function

This constructor function constructs a job argument. It is overloaded to construct job arguments with different types of values.

Syntax

Constructs a job argument with a text value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_value         IN VARCHAR2)
RETURN SELF AS RESULT;
```

Constructs a job argument with an AnyData value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_value         IN ANYDATA)
RETURN SELF AS RESULT;
```

Constructs a job argument with a NULL value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_reset         IN BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;
```

Parameters**Table 163-3 JOBARG Constructor Function Parameters**

Parameter	Description
arg_position	Position of the argument
arg_value	Value of the argument
arg_reset	If arg_reset is TRUE, then the argument at that position is reset. Setting arg_reset to FALSE (which is the default) will create an argument with a NULL value.

JOBARG_ARRAY Table Type**Syntax**

```
TYPE jobarg_array IS TABLE OF jobarg;
```

163.5.2 JOBARG_ARRAY Table Type

The `jobarg_array` type is a table of `jobarg`.

Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

163.5.3 DBMS_SCHEDULER JOB_DEFINITION Object Type

This type is used by the `CREATE_JOBS` procedure and represents a job in a batch of jobs.

Syntax

```
TYPE job_definition IS OBJECT (
  job_name                VARCHAR2(100),
  job_class                VARCHAR2(32),
  job_style                VARCHAR2(11),
  program_name            VARCHAR2(100),
  job_action               VARCHAR2(4000),
  job_type                 VARCHAR2(20),
  schedule_name           VARCHAR2(65),
  repeat_interval          VARCHAR2(4000),
  schedule_limit           INTERVAL DAY TO SECOND,
  start_date               TIMESTAMP WITH TIME ZONE,
  end_date                 TIMESTAMP WITH TIME ZONE,
  event_condition          VARCHAR2(4000),
  queue_spec               VARCHAR2(100),
  number_of_arguments     NUMBER,
  arguments                SYS.JOBARG_ARRAY,
  job_priority             NUMBER,
  job_weight               NUMBER,
  max_run_duration         INTERVAL DAY TO SECOND,
  max_runs                 NUMBER,
  max_failures             NUMBER,
  logging_level            NUMBER,
  restartable              VARCHAR2(5),
  stop_on_window_close    VARCHAR2(5),
  raise_events             NUMBER,
  comments                 VARCHAR2(240),
  auto_drop                VARCHAR2(5),
  enabled                  VARCHAR2(5),
  follow_default_timezone VARCHAR2(5),
  parallel_instances       VARCHAR2(5),
  aq_job                   VARCHAR2(5),
  instance_id              NUMBER,
  credential_name          VARCHAR2(65),
  destination              VARCHAR2(4000),
  database_role            VARCHAR2(20),
  allow_runs_in_restricted_mode VARCHAR2(5);
  restart_on_recovery      BOOLEAN;
  restart_on_failure       BOOLEAN;)
```

Object Attributes

Table 163-4 provides brief descriptions of the attributes of the `JOB_DEFINITION` object type. For more complete information about these attributes, see the "[CREATE_JOB Procedure](#)" and the "[SET_ATTRIBUTE Procedure](#)".

Table 163-4 JOB_DEFINITION Object Types

Attribute	Description
<code>job_name</code>	Name of the job
<code>job_class</code>	Name of the job class
<code>job_style</code>	Style of the job: <ul style="list-style-type: none"> REGULAR LIGHTWEIGHT IN_MEMORY_RUNTIME IN_MEMORY_FULL
<code>program_name</code>	Name of the program that the job runs
<code>job_action</code>	Inline action of the job. This is either the code for an anonymous PL/SQL block or the name of a stored procedure, external executable, or chain.
<code>job_type</code>	Job action type ('PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT')
<code>schedule_name</code>	Name of the schedule that specifies when the job has to execute
<code>repeat_interval</code>	Inline time-based schedule
<code>schedule_limit</code>	Maximum delay time between scheduled and actual job start before a job run is canceled
<code>start_date</code>	Start date and time of the job
<code>end_date</code>	End date and time of the job
<code>event_condition</code>	Event condition for event-based jobs
<code>queue_spec</code>	File watcher name or queue specification for event-based jobs
<code>number_of_arguments</code>	Number of job arguments
<code>arguments</code>	Array of job arguments
<code>job_priority</code>	Job priority
<code>job_weight</code>	*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1. Weight of the job for parallel execution.
<code>max_run_duration</code>	Maximum run duration of the job
<code>max_runs</code>	Maximum number of runs before the job is marked as completed
<code>max_failures</code>	Maximum number of failures tolerated before the job is marked as broken
<code>logging_level</code>	Job logging level
<code>restartable</code>	Indicates whether the job is restartable (TRUE) or not (FALSE)

Table 163-4 (Cont.) JOB_DEFINITION Object Types

Attribute	Description
stop_on_window_close	Indicates whether the job is stopped when the window that it runs in ends (TRUE) or not (FALSE). Equivalent to the stop_on_window_close job attribute described in the SET_ATTRIBUTE Procedure .
raise_events	State changes that raise events
comments	Comments on the job
auto_drop	If TRUE (the default), indicates that the job should be dropped once completed
enabled	Indicates whether the job should be enabled immediately after creating it (TRUE) or not (FALSE)
follow_default_timezone	If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.
parallel_instances	For event-based jobs only. If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel. If FALSE, then an event is discarded if it is raised while the job that handles it is already running,
aq_job	For internal use only
instance_id	The instance ID of the instance that the job must run on For in-memory full jobs, the instance_id value determines in which instance to stop the job; if left NULL, the job is stopped in all instances.
credential_name	The credential to use for a single destination or the default credential for a group of destinations
destination	The name of a single external destination or database destination, or a group name of type external destination or database destination
database_role	In an Oracle Data Guard environment, the database role ('PRIMARY' or 'LOGICAL STANDBY') for which the job runs
allow_runs_in_restricted_mode	If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode
restart_on_recovery	If set to TRUE for a job and the job is stopped by a database shutdown, then the job is restarted when the database is recovered. If set to FALSE, and the job is stopped by a database shutdown, then the job is marked as stopped when the database is recovered.
restart_on_failure	If set to TRUE for a job and the job fails due to an application error, then the job is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the job is marked FAILED. If set to FALSE (the default), a failed job is immediately marked FAILED.

JOB_DEFINITION Constructor Function

This constructor function constructs a `job_definition` object.

Syntax

```

constructor function job_definition (
    job_name          IN      VARCHAR2,
    job_style         IN      VARCHAR2 DEFAULT 'REGULAR',
    program_name     IN      VARCHAR2 DEFAULT NULL,
    job_action        IN      VARCHAR2 DEFAULT NULL,
    job_type          IN      VARCHAR2 DEFAULT NULL,
    schedule_name    IN      VARCHAR2 DEFAULT NULL,
    repeat_interval  IN      VARCHAR2 DEFAULT NULL,
    event_condition  IN      VARCHAR2 DEFAULT NULL,
    queue_spec       IN      VARCHAR2 DEFAULT NULL,
    start_date       IN      TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    end_date         IN      TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    number_of_arguments IN  NATURAL DEFAULT NULL,
    arguments        IN      SYS.JOBARG_ARRAY DEFAULT NULL,
    job_class        IN      VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
    schedule_limit   IN      INTERVAL DAY TO SECOND DEFAULT NULL,
    job_priority     IN      NATURAL DEFAULT NULL,
    job_weight       IN      NATURAL DEFAULT NULL,
    max_run_duration IN      INTERVAL DAY TO SECOND DEFAULT NULL,
    max_runs         IN      NATURAL DEFAULT NULL,
    max_failures     IN      NATURAL DEFAULT NULL,
    logging_level    IN      NATURALN DEFAULT 64,
    restartable      IN      BOOLEAN DEFAULT FALSE,
    stop_on_window_close IN  BOOLEAN DEFAULT FALSE,
    raise_events     IN      NATURAL DEFAULT NULL,
    comments         IN      VARCHAR2 DEFAULT NULL,
    auto_drop        IN      BOOLEAN DEFAULT TRUE,
    enabled          IN      BOOLEAN DEFAULT FALSE,
    follow_default_timezone IN  BOOLEAN DEFAULT FALSE,
    parallel_instances IN  BOOLEAN DEFAULT FALSE,
    aq_job           IN      BOOLEAN DEFAULT FALSE,
    instance_id      IN      NATURAL DEFAULT NULL,
    credential_name  IN      VARCHAR2 DEFAULT NULL,
    destination      IN      VARCHAR2 DEFAULT NULL,
    database_role    IN      VARCHAR2 DEFAULT NULL,
    allow_runs_in_restricted_mode IN  BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;

```

JOB_DEFINITION_ARRAY Table Type

Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

163.5.4 JOB_DEFINITION_ARRAY Table Type

The type `job_definition_array` is a table of `job_definition`.

Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

163.5.5 JOBATTR Object Type

This type is used by the `SET_JOB_ATTRIBUTES` procedure and represents a job attribute in a batch of job attributes.

Syntax

```
TYPE jobattr IS OBJECT (
  job_name          VARCHAR2(100),
  attr_name         VARCHAR2(30),
  char_value        VARCHAR2(4000),
  char_value2       VARCHAR2(4000),
  args_value        JOBARG_ARRAY,
  num_value         NUMBER,
  timestamp_value   TIMESTAMP(6) WITH TIME ZONE,
  interval_value    INTERVAL DAY(2) TO SECOND(6));
```

Attributes

Table 163-5 JOBATTR Object Type Attributes

Attribute	Description
<code>job_name</code>	Name of the job
<code>attr_name</code>	Name of the attribute
<code>char_value</code>	Value of the argument if the type is <code>VARCHAR2</code>
<code>char_value2</code>	Second <code>VARCHAR2</code> attribute value
<code>args_value</code>	Value of the argument if the type is a <code>JOBARG</code> array
<code>num_value</code>	Value of the argument if the type is <code>NUMBER</code>
<code>timestamp_value</code>	Value of the argument if the type is <code>TIMESTAMP WITH TIME ZONE</code>
<code>interval_value</code>	Value of the argument if the type is <code>INTERVAL DAY TO SECOND</code>

JOBATTR Constructor Function

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: `VARCHAR2`, `NUMBER`, `TIMESTAMP WITH TIME ZONE`, `INTERVAL DAY TO SECOND`, and an array of `JOBARG` types.

Syntax

```
constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN VARCHAR2,
  attr_value2       IN VARCHAR2 DEFAULT NULL)
  RETURN SELF AS RESULT;

constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN [NUMBER, BOOLEAN,
                       TIMESTAMP WITH TIME ZONE,
```

```

                                INTERVAL DAY TO SECOND, JOBARG_ARRAY))
RETURN SELF AS RESULT;

constructor function jobattr (
    job_name          IN VARCHAR2,
    attr_name         IN VARCHAR2)
RETURN SELF AS RESULT;

```

Parameters

Table 163-6 JOBATTR Constructor Function Parameters

Parameter	Description
job_name	Name of the job
attr_name	Name of the argument
attr_value	Value of the argument
attr_value2	Most attributes have only one value associated with them, but some can have two. The attr_value2 argument is for this optional second value.

JOBATTR Table Type

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

163.5.6 JOBATTR_ARRAY Table Type

The type jobattr_array is a table of jobattr.

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

163.5.7 SCHEDULER\$_STEP_TYPE Object Type

This type is used by RUN_CHAIN to return a list of chain steps with an initial state.

Syntax

```
TYPE scheduler$_step_type IS OBJECT (
    step_name  VARCHAR2(32),
    step_type  VARCHAR2(32));
```

Attributes

Table 163-7 SCHEDULER\$_STEP_TYPE Object Type Attributes

Attribute	Description
step_name	Name of the step
step_type	State of the step

163.5.8 SCHEDULER\$_STEP_TYPE_LIST Table Type

This type is a table of scheduler\$_step_type.

Syntax

```
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```

163.5.9 SCHEDULER\$_EVENT_INFO Object Type

This is the datatype of the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE, from which your application consumes job state events raised by the Scheduler.

It is a secure queue owned by SYS.

Syntax

```
TYPE SCHEDULER$_EVENT_INFO IS OBJECT (
  event_type          VARCHAR2(4000),
  object_owner       VARCHAR2(4000),
  object_name        VARCHAR2(4000),
  event_timestamp    TIMESTAMP WITH TIME ZONE,
  error_code         NUMBER,
  error_msg          VARCHAR2(4000),
  event_status       NUMBER,
  log_id            NUMBER,
  run_count          NUMBER,
  failure_count     NUMBER,
  retry_count       NUMBER,
  spare1            NUMBER,
  spare2            NUMBER,
  spare3            VARCHAR2(4000),
  spare4            VARCHAR2(4000),
  spare5            TIMESTAMP WITH TIME ZONE,
  spare6            TIMESTAMP WITH TIME ZONE,
  spare7            RAW(2000),
  spare8            RAW(2000));
```

Attributes

Table 163-8 SCHEDULER_EVENT_INFO Object Type Attributes

Attribute	Description
event_type	One of "JOB_STARTED", "JOB_SUCCEEDED", "JOB_FAILED", "JOB_BROKEN", "JOB_COMPLETED", "JOB_STOPPED", "JOB_SCH_LIM_REACHED", "JOB_DISABLED", "JOB_CHAIN_STALLED", "JOB_OVER_MAX_DUR". For descriptions of these event types, see Table 163-85 .
object_owner	Owner of the job that raised the event
object_name	Name of the job that raised the event
event_timestamp	Time at which the event occurred
error_code	Applicable only when an error is thrown during job execution. Contains the top-level error code.

Table 163-8 (Cont.) SCHEDULER_EVENT_INFO Object Type Attributes

Attribute	Description
error_msg	Applicable only when an error is thrown during job execution. Contains the entire error stack.
event_status	Adds further qualification to the event type. If event_type is "JOB_STARTED," status 1 indicates that it is a normal start, and status 2 indicates that it is a retry. If event_type is "JOB_FAILED," status 4 indicates that it was a failure due to an error that was thrown during job execution, and status 8 indicates that it was an unusual termination of some kind. If event_type is "JOB_STOPPED," status 16 indicates that it was a normal stop, and status 32 indicates that it was a stop with the FORCE option set to TRUE.
log_id	Points to the ID in the scheduler job log from which additional information can be obtained. Note that there need not always be a log entry corresponding to an event. In such cases, log_id is NULL.
run_count	Run count for the job when the event was raised.
failure_count	Failure count for the job when the event was raised.
retry_count	Retry count for the job when the event was raised.
spare1 – spare8	Not currently in use.

163.5.10 SCHEDULER_FILEWATCHER_RESULT Object Type

This is the datatype of a file arrival event message.

You access the event message as a parameter of an event-based job (or a parameter of a program referenced by an event-based job). The message contains information needed to locate and process a file that arrived on a local or remote system.

Syntax

```
TYPE scheduler_filewatcher_result IS OBJECT (
  destination          VARCHAR2(4000),
  directory_path       VARCHAR2(4000),
  actual_file_name     VARCHAR2(4000),
  file_size            NUMBER,
  file_timestamp       TIMESTAMP WITH TIME ZONE,
  ts_ms_from_epoch     NUMBER,
  matching_requests    SYS.SCHEDULER_FILEWATCHER_REQ_LIST);
```

Attributes

Table 163-9 SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

Attribute	Description
destination	Destination at which the file was found, expressed as a host name or IP address.
directory_path	Absolute path of directory in which the file was found.

Table 163-9 (Cont.) SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

Attribute	Description
actual_file_name	Actual name of the file that was found. If the file name specified in the file watcher did not contain wildcards, then this is the same as the name specified in the file watcher.
file_size	Size of the file that was found, in bytes.
file_timestamp	Timestamp assigned to the file when the file watcher considered the file found, based on the minimum file size and steady state duration attributes.
ts_ms_from_epoch	For internal use only.
matching_requests	List of matching requests. This is a TABLE of type objects SCHEDULER_FILEWATCHER_REQUEST. Each matching request corresponds to a file watcher whose destination, directory_path, and file_name attributes matched the arrived file. See " SCHEDULER_FILEWATCHER_REQUEST Object Type ".

163.5.11 SCHEDULER_FILEWATCHER_REQUEST Object Type

This type is returned in the `matching_requests` attribute of the SCHEDULER_FILEWATCHER_RESULT Object Type. Its attributes are similar to the attributes of a file watcher.

Syntax

```
TYPE scheduler_filewatcher_request IS OBJECT (
  owner          VARCHAR2(4000),
  name           VARCHAR2(4000),
  requested_path_name VARCHAR2(4000),
  requested_file_name VARCHAR2(4000),
  credential_owner VARCHAR2(4000),
  credential_name VARCHAR2(4000),
  min_file_size  NUMBER,
  steady_state_dur NUMBER);
```

Attributes

Table 163-10 SCHEDULER_FILEWATCHER_REQUEST Object Type Attributes

Attribute	Description
owner	Owner of the matched file watcher.
name	Name of the matched file watcher.
requested_path_name	Value of the <code>directory_path</code> attribute of the matched file watcher.
requested_file_name	Value of the <code>file_name</code> attribute of the matched file watcher.
credential_owner	Owner of the credential referenced by the matched file watcher.
credential_name	Name of the credential referenced by the matched file watcher.
min_file_size	Value of the <code>min_file_size</code> attribute of the matched file watcher.

Table 163-10 (Cont.) SCHEDULER_FILEWATCHER_REQUEST Object Type Attributes

Attribute	Description
steady_state_dur	Value of the steady_state_duration attribute of the matched file watcher.

163.6 Summary of DBMS_SCHEDULER Subprograms

This table lists the DBMS_SCHEDULER subprograms and briefly describes them.

Table 163-11 DBMS_SCHEDULER Package Subprograms

Subprogram	Description
ADD_EVENT_QUEUE_SUBSCRIBER Procedure	Adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE
ADD_GROUP_MEMBER Procedure	Adds one or more members to an existing group
ADD_JOB_EMAIL_NOTIFICATION Procedure	Adds e-mail notifications for a job for a list of recipients and a list of job state events
ADD_TO_INCOMPATIBILITY Procedure	Adds jobs or programs to an existing incompatibility definition
ALTER_CHAIN Procedure	Alters specified steps of a chain
ALTER_RUNNING_CHAIN Procedure	Alters specified steps of a running chain
CLOSE_WINDOW Procedure	Closes an open window prematurely
COPY_JOB Procedure	Copies an existing job
CREATE_CHAIN Procedure	Creates a chain, which is a named series of programs that are linked together for a combined objective
CREATE_CREDENTIAL Procedure	Creates a credential
CREATE_DATABASE_DESTINATION Procedure	Creates a database destination for use with remote database jobs
CREATE_EVENT_SCHEDULE Procedure	Creates an event schedule, which is a schedule that starts a job based on the detection of an event
CREATE_FILE_WATCHER Procedure	Creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job
CREATE_GROUP Procedure	Creates a group

Table 163-11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
CREATE_INCOMPATIBILITY Procedure	Creates an incompatibility definition
CREATE_JOB Procedure	Creates a single job
CREATE_JOB_CLASS Procedure	Creates a job class, which provides a way to group jobs for resource allocation and prioritization
CREATE_JOBS Procedure	Creates multiple jobs
CREATE_PROGRAM Procedure	Creates a program
CREATE_RESOURCE Procedure	Specifies resources used by jobs or creates a new resource
CREATE_SCHEDULE Procedure	Creates a schedule
CREATE_WINDOW Procedure	Creates a window, which provides a way to automatically activate different resource plans at different times
DEFINE_ANYDATA_ARGUMENT Procedure	Defines a program argument whose value is of a complex type and must be passed encapsulated in an AnyData object
DEFINE_CHAIN_EVENT_STEP Procedure	Adds or replaces a chain step and associates it with an event schedule or inline event. See also: DEFINE_CHAIN_STEP .
DEFINE_CHAIN_RULE Procedure	Adds a rule to an existing chain
DEFINE_CHAIN_STEP Procedure	Defines a chain step, which can be a program or another (nested) chain. See also: DEFINE_CHAIN_EVENT_STEP .
DEFINE_METADATA_ARGUMENT Procedure	Defines a special metadata argument for the program. You can retrieve specific metadata through this argument.
DEFINE_PROGRAM_ARGUMENT Procedure	Defines a program argument whose value can be passed as a string literal to the program
DISABLE Procedure	Disables a program, job, chain, window, database destination, external destination, file watcher, group, or incompatibility
DROP_AGENT_DESTINATION Procedure	Drops one or more external destinations. Use only when the preferred method of dropping external destinations—unregistering the Scheduler agent with the database—fails.
DROP_CHAIN Procedure	Drops an existing chain
DROP_CHAIN_RULE Procedure	Removes a rule from an existing chain
DROP_CHAIN_STEP Procedure	Drops a chain step

Table 163-11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
DROP_CREDENTIAL Procedure	Drops a credential
DROP_DATABASE_DESTINATION Procedure	Drops one or more database destinations
DROP_FILE_WATCHER Procedure	Drops one or more file watchers
DROP_GROUP Procedure	Drops one or more groups
DROP_INCOMPATIBILITY Procedure	Drops an existing incompatibility definition
DROP_JOB Procedure	Drops a job or all jobs in a job class
DROP_JOB_CLASS Procedure	Drops a job class
DROP_PROGRAM Procedure	Drops a program
DROP_PROGRAM_ARGUMENT Procedure	Drops a program argument
DROP_SCHEDULE Procedure	Drops a schedule
DROP_WINDOW Procedure	Drops a window
DUMP_IN_MEMORY_TRACE Procedure	Dumps the scheduler in-memory trace buffer of the specified process state object address into the current trace file of the requester process.
ENABLE Procedure	Enables a program, job, chain, window, database destination, external destination, file watcher, or group
END_DETACHED_JOB_RUN Procedure	Ends a running detached job
EVALUATE_CALENDAR_STRING Procedure	Evaluates the calendar string and tells you what the next execution date of a job or window will be
EVALUATE_RUNNING_CHAIN Procedure	Forces reevaluation of the rules of a running chain to trigger any rules for conditions that have been satisfied
GENERATE_JOB_NAME Function	Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named <code>sally1</code> , <code>sally2</code> , and so on
GET_AGENT_INFO Function	Returns job information specific to an agent, such as how many are running and so on, depending on the attribute selected
GET_AGENT_VERSION Function	Returns the version string of a Scheduler agent that is registered with the database and is currently running
GET_ATTRIBUTE Procedure	Retrieves the value of an attribute of an object
GET_FILE Procedure	Retrieves a file from a host
GET_SCHEDULER_ATTRIBUTE Procedure	Retrieves the value of a Scheduler attribute

Table 163-11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
OPEN_WINDOW Procedure	Opens a window prematurely. The window is opened immediately for the duration
PURGE_LOG Procedure	Purges specific rows from the job and window logs
PUT_FILE Procedure	Saves a file to one or more hosts
REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure	Unsubscribes a user from the Scheduler event queue <code>SYS.SCHEDULER\$_EVENT_QUEUE</code>
REMOVE_FROM_INCOMPATIBILITY Procedure	Removes jobs or programs from an incompatibility definition
REMOVE_GROUP_MEMBER Procedure	Removes one or more members from a group
REMOVE_JOB_EMAIL_NOTIFICATION Procedure	Removes e-mail notifications for a job
RESET_JOB_ARGUMENT_VALUE Procedure	Resets the current value assigned to an argument defined with the associated program
RUN_CHAIN Procedure	Immediately runs a chain by creating a run-once job
RUN_JOB Procedure	Runs a job immediately
SET_AGENT_REGISTRATION_PASS Procedure	Sets the agent registration password for a database
SET_ATTRIBUTE Procedure	Changes an attribute of a job, schedule, or other Scheduler object
SET_ATTRIBUTE_NULL Procedure	Changes an attribute of an object to NULL
SET_JOB_ANYDATA_VALUE Procedure	Sets the value of a job argument encapsulated in an <code>AnyData</code> object
SET_JOB_ARGUMENT_VALUE Procedure	Sets the value of a job argument
SET_JOB_ATTRIBUTES Procedure	Sets the value of a job attribute
SET_RESOURCE_CONSTRAINT Procedure	Specifies the resources used by jobs
SET_SCHEDULER_ATTRIBUTE Procedure	Sets the value of a Scheduler attribute
STOP_JOB Procedure	Stops a currently running job or all jobs in a job class

163.6.1 ADD_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`, and grants the user permission to dequeue from this queue using the designated agent.

Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-12 ADD_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If NULL, an agent is created and assigned the user name of the calling user.

Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

163.6.2 ADD_GROUP_MEMBER Procedure

This procedure adds one or more members to an existing group.

Syntax

```
DBMS_SCHEDULER.ADD_GROUP_MEMBER (
    group_name          IN VARCHAR2,
    member              IN VARCHAR2);
```

Parameters

Table 163-13 ADD_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the group.
member	<p>A comma-separated list of members to add to the group. Members must match the group type. A group of the same type can be a member. The Scheduler immediately expands the included group name into its list of members.</p> <p>An error is returned if any of the members do not exist. A member that is already in the group is skipped, and no error is generated.</p> <p>The keyword LOCAL can be included as a member for database destination or external destination groups. See the "CREATE_GROUP Procedure" for information about this keyword.</p>

Usage Notes

The following users may add members to a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE_SCHEDULER privilege to add a member to a group of type WINDOW.

See Also:

"CREATE_GROUP Procedure"

163.6.3 ADD_JOB_EMAIL_NOTIFICATION Procedure

This procedure adds e-mail notifications for a job. E-mails are then sent to the specified list of recipients whenever any of the specified job state events is raised.

Syntax

```
DBMS_SCHEDULER.ADD_JOB_EMAIL_NOTIFICATION (
  job_name          IN VARCHAR2,
  recipients        IN VARCHAR2,
  sender            IN VARCHAR2 DEFAULT NULL,
  subject           IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_SUBJECT,
  body              IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_BODY,
  events            IN VARCHAR2 DEFAULT 'JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED,
                                     JOB_CHAIN_STALLED, JOB_OVER_MAX_DUR',
  filter_condition  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-14 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
job_name	Name of the job that e-mail notifications are added for. Cannot be NULL.
recipients	Comma-separated list of e-mail addresses to send notifications to. E-mail notifications for all listed events are sent to all recipients. Cannot be NULL.
sender	e-mail address to use as the sender address (the From: address) in the e-mail header. If NULL or omitted, the e-mail address specified in the Scheduler attribute <code>email_sender</code> is used. See <i>Oracle Database Administrator's Guide</i> for more information on this Scheduler attribute.
subject	The subject to use in the e-mail header. Table 163-15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>subject</code> is omitted, the default subject is used. The default subject is the following text, where text enclosed in the '%' character represents a variable: 'Oracle Scheduler Job Notification - %job_owner%.%job_name%.%job_subname% %event_type%'

Table 163-14 (Cont.) ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
body	<p>The body of the e-mail message. Table 163-15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>body</code> is omitted, the default body is used. The default body is the following text, where text enclosed in the '%' character represents a variable:</p> <pre>'Job: %job_owner%.%job_name%.%job_subname% Event: %event_type% Date: %event_timestamp% Log id: %log_id% Job class: %job_class_name% Run count: %run_count% Failure count: %failure_count% Retry count: %retry_count% Error code: %error_code% Error message: %error_message%'</pre>
events	<p>Comma-separate list of job state events to send e-mail notifications for. Cannot be NULL. A notification is sent to all recipients if any of the listed events is raised. Table 163-85 lists the valid events for this parameter. If <code>events</code> is omitted, notifications are sent for the following default events:</p> <pre>JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED, JOB_CHAIN_STALLED, JOB_OVER_MAX_DUR</pre>
filter_condition	<p>Used to filter events to send e-mail notifications for. If NULL, all occurrences of the specified events cause e-mail notifications to be sent. <code>filter_condition</code> must be a boolean SQL WHERE clause that may refer to the <code>:event</code> bind variable. This bind variable is automatically bound to an object of type <code>SCHEDULER\$_EVENT_INFO</code> that represents the raised event.</p> <p>For example, to send an e-mail notification only when the error number in an event is 600 or 700, use the following <code>filter_condition</code>:</p> <pre>:event.error_code=600 or :event.error_code=700</pre> <p>See "SCHEDULER\$_EVENT_INFO Object Type".</p>

[Table 163-15](#) lists the variables that you can use in the subject and body arguments.

Table 163-15 Variables Used in the SUBJECT and BODY Parameters

Variable	Comment
<code>%job_owner%</code>	Schema in which job was created
<code>%job_name%</code>	Name of the job that e-mail notifications are added for
<code>%job_subname%</code>	Present for event-based jobs with the <code>parallel_instances</code> attribute set and for chain steps
<code>%event_type%</code>	Valid values are listed in Table 163-85
<code>%event_timestamp%</code>	Time at which the event occurred

Table 163-15 (Cont.) Variables Used in the SUBJECT and BODY Parameters

Variable	Comment
%log_id%	Refers to the LOG_ID column in views *_SCHEDULER_JOB_LOG and *_SCHEDULER_JOB_RUN_DETAILS
%error_code%	Number of the error code.
%error_message%	The text of the error message
%run_count%	Run count for the job when the event was raised
%failure_count%	Failure count for the job when the event was raised
%retry_count%	Retry count for the job when the event was raised

Usage Notes

You can call `ADD_JOB_EMAIL_NOTIFICATION` once for each different set of notifications that you want to configure for a particular job. For example, you may want to send notifications for the `JOB_FAILED`, `JOB_BROKEN`, `JOB_SCH_LIM_REACHED`, and `JOB_CHAIN_STALLED` events to the principle DBA and all senior DBAs, but send a notification for the `JOB_OVER_MAX_DUR` event only to the principle DBA.

This procedure succeeds only if the Scheduler attribute `email_server` is set to a valid SMTP server. See *Oracle Database Administrator's Guide* for more information.

To call this procedure, you must be the job owner or have the `CREATE ANY JOB` system privilege or have the `ALTER` object privilege on the job.

163.6.4 ADD_TO_INCOMPATIBILITY Procedure

This procedure adds jobs or programs to an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.ADD_TO_INCOMPATIBILITY (
    incompatibility_name    IN VARCHAR2,
    object_name             IN VARCHAR2);
```

Parameters

Table 163-16 ADD_TO_INCOMPATIBILITY Procedure Parameters

Parameter	Description
<code>incompatibility_name</code>	The name of the incompatibility definition.
<code>object_name</code>	One or more (comma-separated) programs or jobs

Usage Notes

This procedure does not raise an error if any specified objects already exist in the incompatibility definition.

**See Also:**Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

163.6.5 ALTER_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects all future runs of the specified steps, both in the currently running chain job and in future runs of the same chain job or other chain jobs that point to the chain.

Syntax

Alters the value of a boolean attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
  chain_name      IN VARCHAR2,
  step_name       IN VARCHAR2,
  attribute        IN VARCHAR2,
  value           IN BOOLEAN);
```

Alters the value of a character attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
  chain_name      IN VARCHAR2,
  step_name       IN VARCHAR2,
  attribute        IN VARCHAR2,
  char_value      IN VARCHAR2);
```

Parameters

Table 163-17 ALTER_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step or a comma-separated list of steps to alter. This cannot be NULL.

Table 163-17 (Cont.) ALTER_CHAIN Procedure Parameters

Parameter	Description
attribute	<p>The attribute of the steps to change. Must be one of the following:</p> <ul style="list-style-type: none"> • 'PAUSE' <p>If set to TRUE for a step, after the step has run, its state changes to PAUSED (and the completed attribute remains FALSE).</p> <p>If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE.</p> <p>Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps.</p> • 'PAUSED_BEFORE' <p>If set to TRUE for a step and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run.</p> <p>If PAUSED_BEFORE is reset to FALSE for a chain step that has paused before starting (using ALTER_RUNNING_CHAIN), then the step starts running if any of the rule conditions that start the step are true.</p> <p>Setting PAUSED_BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</p> • 'SKIP' <p>If set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met, the step immediately changes to state PAUSED.</p> • 'RESTART_ON_FAILURE' <p>If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED.</p> <p>If set to FALSE (the default), a failed chain step is immediately marked FAILED.</p> • 'RESTART_ON_RECOVERY' <p>If set to TRUE for a step and the step is stopped by a database shutdown, then the step is restarted when the database is recovered.</p> <p>If set to FALSE, and the step is stopped by a database shutdown, then the step is marked as stopped when the database is recovered and the chain continues.</p> • 'DESTINATION_NAME' <p>The name of an existing database destination or external destination. You can view external destination names in the view ALL_SCHEDULER_EXTERNAL_DESTS, and database destination names in the views *_SCHEDULER_DB_DESTS. You cannot specify a destination group for this attribute. This parameter is NULL by default.</p> • 'CREDENTIAL_NAME' <p>The credential to use when running this step. NULL by default.</p>

Table 163-17 (Cont.) ALTER_CHAIN Procedure Parameters

Parameter	Description
value	The value to set for the attribute (for a boolean attribute).
char_value	The value to set for the attribute (for a character attribute).

Usage Notes

Altering a chain requires `ALTER` privileges on the chain either by being the owner of the chain, or by having the `ALTER` object privilege on the chain or by having the `CREATE ANY JOB` system privilege.

163.6.6 ALTER_RUNNING_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects only steps of the instance of the chain for the specified running chain job.

Syntax

```
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (
  job_name          IN VARCHAR2,
  step_name         IN VARCHAR2,
  attribute         IN VARCHAR2,
  value             IN {BOOLEAN|VARCHAR2});
```

Parameters

Table 163-18 ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
job_name	The name of the job that is running the chain
step_name	The name of the step or a comma-separated list of steps to alter. If this is set to <code>NULL</code> and attribute is <code>PAUSE</code> or <code>SKIP</code> , then all steps of the running chain are altered.

Table 163-18 (Cont.) ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
attribute	<p>The attribute of the steps to change. Valid values are:</p> <ul style="list-style-type: none"> <li data-bbox="602 373 1458 667"> <p>• 'PAUSE'</p> <p>If the PAUSE attribute is set TRUE for a step, then after the step runs, its state changes to PAUSED (and the completed attribute remains false).</p> <p>If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to completion (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE. Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. If step_name is set to NULL, PAUSE is set to TRUE for all steps of this running chain.</p> <li data-bbox="602 674 1458 1060"> <p>• 'PAUSE_BEFORE'</p> <p>If set to TRUE for a step that has not yet run and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run.</p> <p>If PAUSE_BEFORE is reset to FALSE for a chain step that has paused before starting, then the step starts running if any of the rule conditions that start the step are true.</p> <p>Setting PAUSE_BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</p> <p>If step_name is set to NULL, then PAUSE_BEFORE is set to the specified value for all steps of this running chain.</p>

Table 163-18 (Cont.) ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
attribute CONTINUED	<ul style="list-style-type: none"> 'SKIP' If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If step_name is set to NULL, SKIP is set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step immediately changes to state PAUSED. 'RESTART_ON_FAILURE' If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED. If set to FALSE (the default), a failed chain step is immediately marked FAILED. 'RESTART_ON_RECOVERY' If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues. 'STATE' This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following: 'NOT_STARTED', 'SUCCEEDED', 'FAILED error_code' If the state is being changed to FAILED, an error code must be included (this must be a positive integer).
value	The value to set for the attribute. Valid values are: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED error_code'

Usage Notes

Altering a running chain requires you to have alter privileges on the job that is running (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

When trying to update a step defined with a nested chain, it is necessary to specify the job_name as <SCHEMA>.<JOB_NAME>.<STEP_NAME_IN_TOP_LEVEL_CHAIN> to be able to make reference to the steps inside the subchain.

163.6.7 CLOSE_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler switches the resource plan to the

one that is in effect outside the window, or in the case of overlapping windows, to another window.

Syntax

```
DBMS_SCHEDULER.CLOSE_WINDOW (
    window_name          IN VARCHAR2);
```

Parameters

Table 163-19 CLOSE_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window

Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running does not stop when the window it is running in closes, unless the attribute `stop_on_window_close` is set to `TRUE` for the job. However, the resources allocated to the job can change if the resource plan changes.

When a running job has a group of type `WINDOW` as its schedule, the job is not stopped when its window is closed if another window in the same window group becomes active. This is the case even if the job has the attribute `stop_on_window_close` set to `TRUE`.

Closing a window requires the `MANAGE SCHEDULER` privilege.

163.6.8 COPY_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

Syntax

```
DBMS_SCHEDULER.COPY_JOB (
    old_job              IN VARCHAR2,
    new_job              IN VARCHAR2);
```

Parameters

Table 163-20 COPY_JOB Procedure Parameters

Parameter	Description
old_job	The name of the existing job
new_job	The name of the new job

Usage Notes

To copy a job, you must have privileges to create a job in the schema of the new job (the `CREATE JOB` system privilege if it is in your own schema, otherwise, the `CREATE ANY`

JOB system privilege). If the old job is not in the your own schema, then you must also have ALTER privileges on the old job or the CREATE ANY JOB system privilege.

163.6.9 CREATE_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, myschema.myname).

A chain is always created as disabled and must be enabled with the [ENABLE Procedure](#) before it can be used.

Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (
    chain_name          IN VARCHAR2,
    rule_set_name       IN VARCHAR2 DEFAULT NULL,
    evaluation_interval IN INTERVAL DAY TO SECOND DEFAULT NULL,
    comments            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-21 CREATE_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name to assign to the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, therefore, there cannot already be a table or other object with this name and schema.
rule_set_name	In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use DEFINE_CHAIN_RULE to add rules and DROP_CHAIN_RULE to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form SCHED_RULESET{N} and the evaluation context created is of the form SCHED_EVCTX{N}
evaluation_interval	If this is NULL, reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non-NULL value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at NULL if possible. evaluation_interval cannot be less than a minute or greater than a day.
comments	An optional comment describing the purpose of the chain

Usage Notes

To create a chain in your own schema, you must have the CREATE JOB system privilege. To create a chain in a different schema you must have the CREATE ANY JOB system privilege. If you do not provide a rule_set_name, a rule set and evaluation context is created in the schema that the chain is being created in, so you must have the privileges required to create

these objects. See the `DBMS_RULE_ADM.CREATE_RULE_SET` and `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedures for more information.

163.6.10 CREATE_CREDENTIAL Procedure

This deprecated procedure creates a stored username/password pair. Credentials are assigned to jobs so that they can authenticate with a local or remote host operating system or a remote Oracle database.

Note:

This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the `DBMS_CREDENTIAL` package, specifically the `CREATE_CREDENTIAL Procedure`.

Syntax

```
DBMS_SCHEDULER.CREATE_CREDENTIAL (
  credential_name      IN VARCHAR2,
  username             IN VARCHAR2,
  password             IN VARCHAR2,
  database_role        IN VARCHAR2 DEFAULT NULL,
  windows_domain       IN VARCHAR2 DEFAULT NULL,
  comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-22 CREATE_CREDENTIAL Procedure Parameters

Parameter	Description
<code>credential_name</code>	The name to assign to the credential. It can optionally be prefixed with a schema name. It cannot be set to <code>NULL</code> . It is converted to uppercase unless enclosed in double quotation marks.
<code>username</code>	The user name for logging into to the host operating system or remote Oracle database. This cannot be set to <code>NULL</code> and is case-sensitive. It cannot contain double quotes or spaces. Maximum length is 64.
<code>password</code>	The password for the user name. This cannot be set to <code>NULL</code> and is case sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views. Maximum length is 128.
<code>database_role</code>	The value of the <code>database_role</code> attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: <code>SYSDBA</code> and <code>SYSOPER</code>
<code>windows_domain</code>	For a Windows remote executable target, this is the domain that the specified user belongs to. The domain is converted to uppercase automatically. Maximum length is 64.
<code>comments</code>	A text string that can be used to describe the credential. Scheduler does not use this parameter. Maximum length is 240.

Usage Notes

Credentials reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a credential in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

163.6.11 CREATE_DATABASE_DESTINATION Procedure

This procedure creates a database destination. A database destination represents an Oracle database on which remote database jobs run.

The host that the remote database resides on must have a running Scheduler agent that is registered with the database that this procedure is called from.

Syntax

```
DBMS_SCHEDULER.CREATE_DATABASE_DESTINATION (
    destination_name      IN VARCHAR2,
    agent                 IN VARCHAR2,
    tns_name              IN VARCHAR2,
    comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-23 CREATE_DATABASE_DESTINATION Procedure Parameters

Parameter	Description
<code>destination_name</code>	The name to assign to the database destination. It can optionally be prefixed with a schema name. Cannot be <code>NULL</code> . It is converted to uppercase unless enclosed in double quotation marks.
<code>agent</code>	The external destination name of the Scheduler agent to connect. Equivalent to an agent name. The external destination must already exist. The external destination representing an agent is created automatically on a database instance when the agent registers with that instance. An agent's name is specified in its agent configuration file. If it is not specified, it defaults to the first part (before the first period) of the name of the host it resides on.
<code>tns_name</code>	An Oracle Net connect identifier that is resolved to the Oracle database instance being connected to. The exact syntax depends on the Oracle Net configuration. The connect identifier can be a complete Oracle Net connect descriptor (network address and database service name) or a <i>net service name</i> , which is an alias for a connect descriptor. The alias must be resolved in the <code>tnsnames.ora</code> file on the local computer. The maximum size for <code>tns_name</code> is 2000 characters. If <code>tns_name</code> is <code>NULL</code> , the agent connects to the default Oracle database on its host. You specify the default database by assigning values to the <code>ORACLE_HOME</code> and <code>ORACLE_SID</code> parameters in the agent configuration file, <code>schagent.conf</code> , located in the agent home directory. See <i>Oracle Database Net Services Administrator's Guide</i> for more information on connect identifiers.
<code>comments</code>	A text string that describes the database destination. Scheduler does not use this argument.

Usage Notes

Database destinations reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a database destination in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

163.6.12 CREATE_EVENT_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

Syntax

```
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (
    schedule_name      IN VARCHAR2,
    start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    event_condition    IN VARCHAR2 DEFAULT NULL,
    queue_spec         IN VARCHAR2,
    end_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    comments           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-24 CREATE_EVENT_SCHEDULE Parameters

Parameter	Description
<code>schedule_name</code>	The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
<code>start_date</code>	This attribute specifies the date and time that this schedule becomes valid. Occurrences of the event before this date and time are ignored in the context of this schedule.
<code>event_condition</code>	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression, provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the <code>DBMS_AQADM.ADD_SUBSCRIBER</code> procedure.
<code>queue_spec</code>	This argument specifies either a file watcher name or the queue into which events that start this particular job are enqueued (the source queue). If the source queue is a secure queue, the <code>queue_spec</code> argument is a string containing a pair of values of the form <i>queue_name, agent name</i> . For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
<code>end_date</code>	The date and time after which jobs do not run and windows do not open. An event schedule that has no <code>end_date</code> is valid forever. <code>end_date</code> must be after the <code>start_date</code> . If it is not, then an error is generated when the schedule is created.

Table 163-24 (Cont.) CREATE_EVENT_SCHEDULE Parameters

Parameter	Description
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

You must have the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

**See Also:**

["CREATE_FILE_WATCHER Procedure"](#)

163.6.13 CREATE_FILE_WATCHER Procedure

This procedure creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job. After you create a file watcher, you reference it in an event-based job or event schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_FILE_WATCHER (
  file_watcher_name      IN VARCHAR2,
  directory_path         IN VARCHAR2,
  file_name              IN VARCHAR2,
  credential_name        IN VARCHAR2,
  destination            IN VARCHAR2 DEFAULT NULL,
  min_file_size          IN PLS_INTEGER DEFAULT 0,
  steady_state_duration IN INTERVAL DAY TO SECOND DEFAULT NULL,
  comments               IN VARCHAR2 DEFAULT NULL,
  enabled                IN BOOLEAN DEFAULT TRUE);
```

Parameters**Table 163-25 CREATE_FILE_WATCHER Parameters**

Parameter	Description
file_watcher_name	The name to assign to the file watcher. The name must be unique in the SQL namespace. For example, a file watcher cannot have the same name as a table in a schema. This can optionally be prefixed with a schema name. Cannot be NULL.

Table 163-25 (Cont.) CREATE_FILE_WATCHER Parameters

Parameter	Description
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.
file_name	Name of the file to look for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.
credential_name	Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have EXECUTE privileges on the credential. Cannot be NULL.
destination	Name of an external destination. You create an external destination by registering a remote Scheduler agent with the database. See the view ALL_SCHEDULER_EXTERNAL_DESTS for valid external destination names. If this parameter is NULL, the file watcher is created on the local host.
min_file_size	Minimum size in bytes that the file must be before the file watcher considers the file found. Default is 0.
steady_state_duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. Cannot exceed one hour. If NULL, an internal value is used. The minimum value is 10 seconds. Oracle recommends similar steady_state_duration values for all file watchers for efficient file watcher job operation. Also, the repeat interval of the file watcher schedule must be equal or greater than the steady_state_duration value.
comments	Optional comment.
enabled	If TRUE (the default), the file watcher is enabled.

Usage Notes

You must have the CREATE JOB system privilege to create a file watcher in your own schema. You require the CREATE ANY JOB system privilege to create a file watcher in a schema different from your own (except the SYS schema, which is disallowed).

163.6.14 CREATE_GROUP Procedure

This procedure creates a group. Groups contain members, which you can specify when you create the group or at a later time. There are three types of groups: window groups, database destination groups, and external destination groups.

You can use a group name in other DBMS_SCHEDULER package procedures to specify a list of objects. For example, to specify multiple destinations for a remote database job, you provide a group name for the DESTINATION_NAME parameter of the job.

Syntax

```
DBMS_SCHEDULER.CREATE_GROUP (
    group_name          IN VARCHAR2,
    group_type          IN VARCHAR2,
```

```
member          IN VARCHAR2 DEFAULT NULL,
comments       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-26 CREATE_GROUP Procedure Parameters

Parameter	Description
group_name	The name to assign to the group. It can optionally be prefixed with a schema name. It cannot be NULL. It is converted to uppercase unless enclosed in double quotation marks.
group_type	<p>The type of members in the group. All members must be of the same type. Possible types are:</p> <ul style="list-style-type: none"> 'DB_DEST' Database destination: Members are database destinations, for running remote database jobs. 'EXTERNAL_DEST' External destination: Members are external destinations, for running remote external jobs. 'WINDOW' Members are Scheduler windows. You must have the <code>MANAGE SCHEDULER</code> privilege to create a group of this type. <p>Members in database destination and external destination groups have the following format:</p> <pre>[[schema.]credential@][schema.]destination</pre> <p>where:</p> <ul style="list-style-type: none"> <i>credential</i> is the name of an existing credential. <i>destination</i> is the name of an existing database destination or external destination. <p>The credential portion of a destination member is optional. If omitted, the job using this destination member uses its default credential.</p> <p>Members in window groups are window names. Because all Scheduler windows reside in the <code>SYS</code> schema, you do not specify a schema name for windows.</p>
member	<p>Optional comma-separated list of group members. The default is NULL. If NULL, use the <code>ADD_GROUP_MEMBER</code> procedure to add members. You can also use <code>ADD_GROUP_MEMBER</code> to add additional members at a later time.</p> <p>The keyword <code>LOCAL</code> can be used as a member in database destination groups and external destination groups.</p> <ul style="list-style-type: none"> In database destination groups, <code>LOCAL</code> represents the source database on which the job is created. It cannot be preceded with a credential. In external destination groups, <code>LOCAL</code> represents the host on which the source database resides. It can be optionally preceded with a credential name. If no credential is provided, jobs that use this group as their destination must have a default credential.
comments	A text string that describes the group. Scheduler does not use this argument.

Usage Notes

Groups reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a group in a schema other than your own, you must have the `CREATE ANY JOB` privilege. The group name must be unique among all Scheduler objects.

You can grant the `SELECT` or `READ` privilege on a group so that other users can reference the group when creating jobs or schedules. To enable other users to modify a group, you can grant the `ALTER` privilege on the group.

Each group member must be unique within the group. For destination groups, the credential/destination name pairs must be unique within the group. An error is generated if any of the group members do not exist. For destination groups, both the credential and destination portions of a member must exist.

Another group of the same type can be a group member. The Scheduler immediately expands the included group name into its list of members.

Groups are created enabled, but you can disable them.

Example

The following PL/SQL block creates a group named `production_dest1`, whose members are database destinations for a collection of production databases.

```
BEGIN
  DBMS_SCHEDULER.CREATE_GROUP(
    GROUP_NAME    => 'production_dest1',
    GROUP_TYPE    => 'DB_DEST',
    MEMBER        => 'LOCAL, oracle_cred@prodhost1, prodhost2',
    COMMENTS      => 'All sector1 production machines');
END;
```

163.6.15 CREATE_INCOMPATIBILITY Procedure

This procedure creates an incompatibility definition.

Syntax

```
DBMS_SCHEDULER.CREATE_INCOMPATIBILITY (
  incompatibility_name  IN VARCHAR2,
  object_name          IN VARCHAR2,
  constraint_level     IN VARCHAR2 DEFAULT 'JOB_LEVEL',
  enabled              IN BOOLEAN DEFAULT TRUE,
  comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-27 CREATE_INCOMPATIBILITY Procedure Parameters

Parameter	Description
<code>incompatibility_name</code>	The name of the incompatibility definition.
<code>object_name</code>	One or more (comma-separated) programs or jobs.

Table 163-27 (Cont.) CREATE_INCOMPATIBILITY Procedure Parameters

Parameter	Description
<code>constraint_level</code>	One or more (comma-separated) programs or jobs.
<code>enabled</code>	Specifies whether the constraint is initially enabled (<code>true</code>) or not enabled (<code>false</code>).
<code>comments</code>	Optional descriptive comment.

Usage Notes

If `object_name` contains multiple (comma-separated) values, they must be either all programs or all jobs that are incompatible with each other (that is, they cannot be run at the same time). For jobs, the list must consist of two or more jobs, and `constraint_level` must be 'JOB_LEVEL'. For programs, `constraint_level` can be either 'JOB_LEVEL' or 'PROGRAM_LEVEL'. When set to the default value 'JOB_LEVEL', only a single job that is based on the program (or programs) mentioned in `object_name` can run at the same time. When `constraint_level` is set to 'PROGRAM_LEVEL', the programs are incompatible, but the jobs based on the same program are not incompatible.

For example, if the value of `object_name` is 'P1,P2,P3' and `constraint_level` is 'PROGRAM_LEVEL', many jobs based on P1 can be running at the same time, but if any P1 based job is running, none based on P2 or P3 can be running. Or, similarly, many jobs based on P3 can be running at the same time, but none based on P1 or P2. If `constraint_level` is set to 'JOB_LEVEL', then only a single job out of all the jobs based on programs P1, P2 and P3 can be running at a time.

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

163.6.16 CREATE_JOB Procedure

This procedure creates a single job.

If you create the job as enabled by setting the `enabled` attribute to `TRUE`, the Scheduler automatically runs the job according to its schedule. If you create the job disabled, the job does not run until you enable it with the [SET_ATTRIBUTE Procedure](#).

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a job in a single call without using an existing program or schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  job_type          IN VARCHAR2,
  job_action        IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER          DEFAULT 0,
  start_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
```

```

repeat_interval      IN VARCHAR2                DEFAULT NULL,
end_date            IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class           IN VARCHAR2                DEFAULT 'DEFAULT_JOB_CLASS',
enabled             IN BOOLEAN                 DEFAULT FALSE,
auto_drop           IN BOOLEAN                 DEFAULT TRUE,
comments            IN VARCHAR2                DEFAULT NULL,
credential_name     IN VARCHAR2                DEFAULT NULL,
destination_name    IN VARCHAR2                DEFAULT NULL);

```

Creates a job using a named schedule object and a named program object:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name           IN VARCHAR2,
  program_name       IN VARCHAR2,
  schedule_name      IN VARCHAR2,
  job_class          IN VARCHAR2                DEFAULT 'DEFAULT_JOB_CLASS',
  enabled            IN BOOLEAN                 DEFAULT FALSE,
  auto_drop          IN BOOLEAN                 DEFAULT TRUE,
  comments           IN VARCHAR2                DEFAULT NULL,
  job_style          IN VARCHAR2                DEFAULT 'REGULAR',
  credential_name    IN VARCHAR2                DEFAULT NULL,
  destination_name   IN VARCHAR2                DEFAULT NULL);

```

Creates a job using a named program object and an inlined schedule:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name           IN VARCHAR2,
  program_name       IN VARCHAR2,
  start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval    IN VARCHAR2                DEFAULT NULL,
  end_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  job_class          IN VARCHAR2                DEFAULT 'DEFAULT_JOB_CLASS',
  enabled            IN BOOLEAN                 DEFAULT FALSE,
  auto_drop          IN BOOLEAN                 DEFAULT TRUE,
  comments           IN VARCHAR2                DEFAULT NULL,
  job_style          IN VARCHAR2                DEFAULT 'REGULAR',
  credential_name    IN VARCHAR2                DEFAULT NULL,
  destination_name   IN VARCHAR2                DEFAULT NULL);

```

Creates a job using a named schedule object and an inlined program:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name           IN VARCHAR2,
  schedule_name      IN VARCHAR2,
  job_type           IN VARCHAR2,
  job_action         IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER           DEFAULT 0,
  job_class          IN VARCHAR2                DEFAULT 'DEFAULT_JOB_CLASS',
  enabled            IN BOOLEAN                 DEFAULT FALSE,
  auto_drop          IN BOOLEAN                 DEFAULT TRUE,
  comments           IN VARCHAR2                DEFAULT NULL,
  credential_name    IN VARCHAR2                DEFAULT NULL,
  destination_name   IN VARCHAR2                DEFAULT NULL);

```

Creates a job using an inlined program and an event:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name           IN VARCHAR2,
  job_type           IN VARCHAR2,
  job_action         IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER           DEFAULT 0,
  start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,

```

```

event_condition      IN VARCHAR2          DEFAULT NULL,
queue_spec           IN VARCHAR2,
end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class            IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
enabled              IN BOOLEAN          DEFAULT FALSE,
auto_drop            IN BOOLEAN          DEFAULT TRUE,
comments             IN VARCHAR2          DEFAULT NULL,
credential_name      IN VARCHAR2          DEFAULT NULL,
destination_name     IN VARCHAR2          DEFAULT NULL);

```

Creates a job using a named program object and an event:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name            IN VARCHAR2,
  program_name        IN VARCHAR2,
  start_date          IN TIMESTAMP WITH TIME ZONE,
  event_condition     IN VARCHAR2,
  queue_spec          IN VARCHAR2,
  end_date            IN TIMESTAMP WITH TIME ZONE,
  job_class           IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
  enabled             IN BOOLEAN          DEFAULT FALSE,
  auto_drop           IN BOOLEAN          DEFAULT TRUE,
  comments            IN VARCHAR2          DEFAULT NULL,
  job_style           IN VARCHAR2          DEFAULT 'REGULAR',
  credential_name     IN VARCHAR2          DEFAULT NULL,
  destination_name    IN VARCHAR2          DEFAULT NULL);

```

Parameters

Table 163-28 *CREATE_JOB Procedure Parameters*

Parameter	Description
job_name	<p>The name to assign to the job. The name must be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name.</p> <p>If <code>job_name</code> is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the <code>GENERATE_JOB_NAME</code> procedure to generate a name and then use the output in the <code>CREATE_JOB</code> procedure. The <code>GENERATE_JOB_NAME</code> procedure generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "GENERATE_JOB_NAME Function" for more information.</p>

Table 163-28 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
job_type	<p>This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. See <code>job_action</code> in the next row for related information.</p> <p>The supported values are:</p> <ul style="list-style-type: none"> 'PLSQL_BLOCK' This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is <code>PLSQL_BLOCK</code>. In this case, the number of arguments must be 0. 'STORED_PROCEDURE' This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. 'EXECUTABLE' This specifies that the job is going to be run outside the database using an external executable. External jobs are anything that can be executed from the command line of the operating system. <code>Anydata</code> arguments are not supported with a job or program type of <code>EXECUTABLE</code>. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege before the job can be enabled or run. 'CHAIN' This specifies that the job is a chain. Arguments are not supported for a chain, so <code>number_of_arguments</code> must be 0. 'EXTERNAL_SCRIPT' This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is <code>cmd.exe</code> and for UNIX based systems the <code>sh</code> shell, unless a different interpreter is specified by prefixing the first line of the script with <code>#!</code>. 'SQL_SCRIPT' This specifies that the job is a SQL*Plus script. The job must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by the SQL*Plus executable. The job may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script. Note that if you choose to use connect credential, you must use <code>set_attribute</code> to specify the <code>Connect_Credential_Name</code> attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database <code>userid / password</code>. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege. 'BACKUP_SCRIPT' This specifies that the job is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The job points to a credential that contains a valid operating system username and password. The RMAN session runs under this operating system user. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege.

Table 163-28 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
job_action	<p>This attribute specifies the action of the job. If <code>job_action</code> is not specified for an inline program, then an error is generated when creating the job.</p> <p>The job action is executed inside an autonomous transaction, and all autonomous transaction guidelines and restrictions apply. For example, online DDL operations are not allowed inside an autonomous transaction, and therefore cannot be used in the job action.</p> <p>The following actions are possible:</p> <ul style="list-style-type: none"> For a PL/SQL block: <p>The action is to execute PL/SQL code. These blocks must end with a semicolon. For example, <code>my_proc();</code> or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;</code></p> <p>Note that the Scheduler wraps <code>job_action</code> in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except <code>event_message</code> in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.</p> <p>See Table 163-40 for details on available metadata attributes.</p> For a stored procedure: <p>The action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, <code>job_action_action=>'Schema"."Procedure"</code>.</p> <p>PL/SQL procedures with <code>INOUT</code> or <code>OUT</code> arguments are not supported as <code>job_action</code> when the job or program type is <code>STORED_PROCEDURE</code>.</p> For an executable: <p>The action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance.</p> <p>NOTE: Shell script syntax is not supported, only syntax for the name of and path to an executable is supported.</p> For a chain: <p>The action is the name of a Scheduler chain object. You must specify the schema of the chain if it resides in a different schema than the job.</p> For an external script: <p>The <code>job_action</code> must be either the path to an operating system script or an inline operating system script. If the <code>job_action</code> is a path to a script, then the script must reside on every computer that the job runs on. The <code>job_action</code> may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The job must point to a credential that contains a valid operating system username and password.</p> For a SQL script:

Table 163-28 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
	<p>The <code>job_action</code> must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the <code>job_action</code> is a path to a script, then the script must reside on every computer that the job runs on.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session.</p> <ul style="list-style-type: none"> For a backup script: <p>The <code>job_action</code> is either the path to a RMAN script or an inline RMAN script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.</p>
<code>number_of_arguments</code>	This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.
<code>program_name</code>	The name of the program associated with this job. If the program is of type EXECUTABLE, the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.
<code>start_date</code>	<p>This attribute specifies the first date and time on which this job is scheduled to start. If <code>start_date</code> and <code>repeat_interval</code> are left null, then the job is scheduled to run as soon as the job is enabled.</p> <p>For repeating jobs that use a calendaring expression to specify the repeat interval, <code>start_date</code> is used as a reference date. The first time the job runs is the first match of the calendaring expression that is on or after the current date and time.</p> <p>The Scheduler cannot guarantee that a job executes on an exact time because the system may be overloaded and thus resources unavailable.</p>
<code>event_condition</code>	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure.
<code>queue_spec</code>	<p>This argument specifies either of the following:</p> <ul style="list-style-type: none"> The source queue where events that start this particular job are enqueued. If it is secure, then the <code>queue_spec</code> argument is a pair of values of the form <code>queue_name, agent name</code>. If it is not secure, then only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue. A file watcher name. For more information on this option, see <i>Oracle Database Administrator's Guide</i>.
<code>repeat_interval</code>	<p>This attribute specifies how often the job repeats. You can specify the repeat interval by using calendaring or PL/SQL expressions.</p> <p>The expression specified is evaluated to determine the next time the job should run. If <code>repeat_interval</code> is not specified, the job runs only once at the specified start date. See "Calendaring Syntax" for further information.</p>
<code>schedule_name</code>	The name of the schedule, window, or window group associated with this job.

Table 163-28 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
job_class	The class this job is associated with.
end_date	<p>This attribute specifies the date and time after which the job expires and is no longer run. After the end_date, if auto_drop is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached.</p> <p>The value for end_date must be after the value for start_date. If end_date is less than start_date, then an error will be generated. If end_date is the same as start_date, then the job will not execute and no error will be generated.</p>
comments	This attribute specifies a comment about the job. By default, this attribute is NULL.
job_style	<p>Style of the job being created. This argument can have one of the following values:</p> <ul style="list-style-type: none"> 'REGULAR' creates a regular job. This is the default. 'LIGHTWEIGHT' creates a lightweight job. This value is permitted only when the job references a program object. Use lightweight jobs when you have many short-duration jobs that run frequently. Under certain circumstances, using lightweight jobs can deliver a small performance gain. 'IN_MEMORY_RUNTIME' creates an in-memory runtime job. These jobs are based on lightweight job structures, so the same rules and restrictions apply; however, they further boost performance by keeping an in-memory cache, so they minimize disk access for pre-run and post-run actions. 'IN_MEMORY_FULL' creates an in-memory full job. In-memory full jobs require a program and cannot have a schedule or repeat interval. They run automatically when the job is enabled, and after running they are discarded. They keep all the job information in memory and are not backed up on disk, meaning that they are lost when the instance is rebooted. They are designed to run actions that must be performed immediately with the least amount of overhead possible.
credential_name	<p>The default credential to use with the job. Applicable only to remote database jobs, remote external jobs, local external jobs, script jobs, and event-based jobs that process file arrival events. The credential must exist.</p> <p>For local database jobs, it must be NULL.</p> <p>For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.</p> <p>See also: "CREATE_CREDENTIAL Procedure"</p>

Table 163-28 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
destination_name	<p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. Must be NULL for jobs running on the local database or for local external jobs (executables).</p> <p>This attribute can be a single destination name or the name of a group of type 'EXTERNAL_DEST' or 'DB_DEST'. The single destination or group must already exist.</p> <p>The following applies to this attribute:</p> <ul style="list-style-type: none"> • If it is a database destination, it must have been created by the CREATE_DATABASE_DESTINATION Procedure. • If it is an external destination, it must have been implicitly created by registering a remote Scheduler agent with the local database. • If it is a group, each member of the group must exist, and the job must run on all destinations named in the group. See "CREATE_GROUP Procedure". <p>destination_name cannot reference a destination group when:</p> <ul style="list-style-type: none"> • The job type is 'CHAIN' • The job style is 'LIGHTWEIGHT', 'IN_MEMORY_RUNTIME', or 'IN_MEMORY_FULL' <p>If the credential_name argument of CREATE_JOB is NULL, each destination must be preceded by a credential, in the following format:</p> <pre>credential.destination</pre> <p>The credential must already exist. If the credential_name argument is provided, then it serves as the default credential for every destination that is not preceded by a credential.</p> <p>You can query the views *_SCHEDULER_DB_DESTS and ALL_SCHEDULER_EXTERNAL_DESTS for existing destinations and *_SCHEDULER_GROUP_MEMBERS for existing groups and their members.</p> <p>*** destination job attribute is deprecated in Oracle Database 11gR2 and superseded by destination_name.</p>
enabled	<p>This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured, and the job exists as a database object. However, the Scheduler ignores the job and the job coordinator does not pick it for processing. In order for the job coordinator to process the job, the job must be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.</p>
auto_drop	<p>This flag, if TRUE, causes a job to be automatically dropped after it has completed or has been automatically disabled. A job is considered completed if:</p> <ul style="list-style-type: none"> • Its end date (or the end date of the job schedule) has passed. Note that a job with a Window schedule will not be auto-dropped when the window closes, because this is not considered to be the end of the Window. • It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. • It is not a repeating job and has run once. <p>A job is disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE.</p> <p>If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure.</p> <p>By default, jobs are created with auto_drop set to TRUE.</p>

Usage Notes

Jobs are created as disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

The `JOB_QUEUE_PROCESSES` initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. Beginning with Oracle Database 11g Release 2, `JOB_QUEUE_PROCESSES` applies to `DBMS_SCHEDULER` jobs. Setting this parameter to 0 disables `DBMS_SCHEDULER` jobs.

To create a job in your own schema, you need to have the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires `EXECUTE` privileges for that class or program.

Not all possible job attributes can be set with `CREATE_JOB`. Some must be set after the job is created. For example, job arguments must be set with the [SET_JOB_ARGUMENT_VALUE Procedure](#) or the [SET_JOB_ANYDATA_VALUE Procedure](#). Other job attributes, such as `job_priority` and `max_runs`, are set with the [SET_ATTRIBUTE Procedure](#).

To create multiple jobs efficiently, use the `CREATE_JOBS` procedure.

Note:

The Scheduler runs event-based jobs for each occurrence of an event that matches the event condition of the job. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

163.6.17 CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the `SYS` schema.

Syntax

```
DBMS_SCHEDULER.CREATE_JOB_CLASS (
  job_class_name          IN VARCHAR2,
  resource_consumer_group IN VARCHAR2 DEFAULT NULL,
  service                 IN VARCHAR2 DEFAULT NULL,
  logging_level           IN PLS_INTEGER
                          DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,
  log_history             IN PLS_INTEGER DEFAULT NULL,
  comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-29 CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
job_class_name	<p>The name to assign to the job class. Job classes can only be created in the SYS schema.</p> <p>This attribute specifies the name of the job class and uniquely identifies the job class. The name must be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.</p>
resource_consumer_group	<p>This attribute specifies the resource consumer group that this class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with determines the resources that are allocated to the job class.</p> <p>If a resource consumer group is dropped, job classes associated with it are then associated with the default resource consumer group.</p> <p>If no resource consumer group is specified, job classes are associated with the default resource consumer group.</p> <p>If the specified resource consumer group does not exist when creating the job class, an error occurs.</p>
service	<p>This attribute specifies the database service that the jobs in this class have affinity to. In an Oracle RAC environment, this means that the jobs in this class only run on those database instances that are assigned to the specific service.</p> <p>Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING for details. If both the resource_consumer_group and service attributes are specified, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence.</p> <p>If no service is specified, the job class belongs to the default service, which means it has no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service.</p> <p>If the specified service does not exist when creating the job class, then an error occurs.</p>
logging_level	<p>This attribute specifies how much information is logged. The possible options are:</p> <ul style="list-style-type: none"> • DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. • DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. • DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs that failed in this class. • DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so, an entry is recorded in the log.

Table 163-29 (Cont.) CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
log_history	This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL (the default), retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).
comments	This attribute is for an optional comment about the job class. By default, this attribute is NULL.

Usage Notes

For users to create jobs that belong to a job class, the job owner must have EXECUTE privileges on the job class. Therefore, after the job class has been created, EXECUTE privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the EXECUTE privilege to a role.

Creating a job class requires the MANAGE_SCHEDULER system privilege.

163.6.18 CREATE_JOBS Procedure

This procedure creates multiple jobs and sets the values of their arguments in a single call.

Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (
    jobdef_array      IN SYS.JOB_DEFINITION_ARRAY,
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 163-30 CREATE_JOBS Procedure Parameters

Parameter	Description
jobdef_array	The array of job definitions. See "Data Structures" for a description of the JOB_DEFINITION_ARRAY and JOB_DEFINITION datatypes.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> STOP_ON_FIRST_ERROR returns on the first error. Previous successfully created jobs are committed to disk. This is the default. TRANSACTIONAL returns on the first error and everything that happened before that error is rolled back. ABSORB_ERRORS tries to absorb any errors and attempts to create the rest of the jobs on the list. It commits all successfully created jobs. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

This procedure creates many jobs in the context of a single transaction. To realize the desired performance gains, the jobs being created must be grouped in batches of sufficient size.

Calling `CREATE_JOBS` with a small array size may not be much faster than calling `CREATE_JOB` once for each job.

You cannot use this procedure to create multiple-destination jobs. That is, the `destination` attribute of the `job_definition` object cannot reference a destination group.

Examples

See *Oracle Database Administrator's Guide*.

163.6.19 CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (
    program_name          IN VARCHAR2,
    program_type          IN VARCHAR2,
    program_action        IN VARCHAR2,
    number_of_arguments  IN PLS_INTEGER DEFAULT 0,
    enabled               IN BOOLEAN DEFAULT FALSE,
    comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-31 CREATE_PROGRAM Procedure Parameters

Parameter	Description
<code>program_name</code>	The name to assign to the program. The name must be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.

Table 163-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
<code>program_type</code>	<p>This attribute specifies the type of program you are creating. If it is not specified then you get an error. These are the supported values for <code>program_type</code>:</p> <ul style="list-style-type: none"> • <code>'PLSQL_BLOCK'</code> This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is <code>PLSQL_BLOCK</code>. In this case, the number of arguments must be 0. • <code>'STORED_PROCEDURE'</code> This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with <code>INOUT</code> or <code>OUT</code> arguments are not supported. • <code>'EXECUTABLE'</code> This specifies that the job is going to be run outside the database using an external executable. External programs imply anything that can be executed from the operating system command line. <code>AnyData</code> arguments are not supported with job or program type <code>EXECUTABLE</code>. • <code>'EXTERNAL_SCRIPT'</code> project 25230, this bullet and next two This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is <code>cmd.exe</code> and for UNIX based systems the <code>sh</code> shell, unless a different interpreter is specified by prefixing the first line of the script with <code>#!</code>. • <code>'SQL_SCRIPT'</code> This specifies that the program is a SQL*Plus script. A job using this program must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by SQL*Plus executable. The job using this program may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script. Note that if you choose to use connect credential, you must use <code>set_attribute</code> to specify the <code>Connect_Credential_Name</code> attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password. • <code>'BACKUP_SCRIPT'</code> This specifies that the program is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing.

Table 163-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_action	<p>This attribute specifies the action of the program. If program_action is not specified, an error is generated.</p> <p>project 25230 last 3 bullets</p> <p>The following actions are possible:</p> <ul style="list-style-type: none"> For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semicolon. For example, <code>my_proc();</code> or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;</code>. <p>Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except event_message in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 163-40 for details on available metadata attributes.</p> <p>If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: job_name, job_owner, job_start, window_start, window_end. For more information, see the "DEFINE_METADATA_ARGUMENT Procedure".</p> <ul style="list-style-type: none"> For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in a schema other than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, <code>program_action=>'Schema"."Procedure"'</code>. For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at sign('@') and the job is local, the at sign is replaced with the SID of the current Oracle instance. For an external script, the action must be either the path to an operating system script or an inline operating system script. If the program_action is a path to a script, then the script must reside on every computer that the program runs on. The program_action may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job. <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The program points</p>

Table 163-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
	<p>to a credential that contains a valid operating system username and password.</p> <ul style="list-style-type: none"> For a SQL script, the action must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session. For a backup script, the action must be either the path to a RMAN script or an inline RMAN script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.
<code>number_of_arguments</code>	<p>This attribute specifies the number of arguments the program takes. If this parameter is not specified, then the default is 0. A program can have a maximum of 255 arguments.</p> <p>If the <code>program_type</code> is <code>PLSQL_BLOCK</code>, then this parameter is ignored.</p>
<code>enabled</code>	<p>This flag specifies whether the program should be created as enabled or not. If the flag is set to <code>TRUE</code>, then validity checks are made and the program is created as <code>ENABLED</code> if all the checks be successful. By default, this flag is set to <code>FALSE</code>, meaning not created enabled. You can also call the <code>ENABLE</code> procedure to enable the program before it can be used.</p>
<code>comments</code>	<p>A comment about the program. By default, this attribute is <code>NULL</code>.</p>

Usage Notes

To create a program in their own schema, users need the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a program in any schema. A program is created in a disabled state by default (unless the `enabled` parameter is set to `TRUE`). It cannot be executed by a job until it is enabled.

To use your programs, other users must have `EXECUTE` privileges, therefore once a program has been created, you have to grant `EXECUTE` privileges on it.

["DEFINE_PROGRAM_ARGUMENT Procedure"](#)

163.6.20 CREATE_RESOURCE Procedure

This procedure allows users to specify the resources used by jobs or to create a new resource.

Syntax

```
DBMS_SCHEDULER.CREATE_RESOURCE (
  resource_name  IN VARCHAR2,
  units          IN PLS_INTEGER,
  status         IN VARCHAR2 DEFAULT 'ENFORCE_CONSTRAINTS',
  constraint_level IN VARCHAR2 DEFAULT 'JOB_LEVEL',
  comments       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-32 CREATE_RESOURCE Procedure Parameters

Parameter	Description
resource_name	The name of the resource.
units	The number of units of this resource that the job or program uses.
status	The status of the resource. <ul style="list-style-type: none"> 'ENFORCE_CONSTRAINTS'. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached no additional jobs using this resource will get started. 'IGNORE_CONSTRAINTS'. When set, the scheduler will ignore any constraints on this resource. 'BLOCKED_ALL_JOBS'. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states.
constraint_level	Level of the constraint: <code>JOB_LEVEL</code> or <code>PROGRAM_LEVEL</code> . For incompatibilities, for <code>JOB_LEVEL</code> , the incompatibility members must be jobs; for <code>PROGRAM_LEVEL</code> the incompatibility members must be programs.
comments	Descriptive comment about the resource.

Usage Notes

The following example creates a new resource.

```
BEGIN
  DBMS_SCHEDULER.CREATE_RESOURCE(
    resource_name => 'my_resource',
    units => 3,
    state => 'ENFORCE_CONSTRAINTS',
    comments => 'Resource1'
  )
END;
/
```

See Also:

- [Creating or Dropping a Resource in Oracle Database Administrator's Guide](#)
- [SET_RESOURCE_CONSTRAINT Procedure](#)

163.6.21 CREATE_SCHEDULE Procedure

This procedure creates a schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_SCHEDULE (
    schedule_name      IN VARCHAR2,
    start_date         IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    repeat_interval    IN VARCHAR2,
    end_date           IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    comments           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-33 CREATE_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for start_date is a reference date. In this case, the start of the schedule is not the start_date; it depends on the repeat interval specified. start_date is used to determine the first instance of the schedule. If start_date is specified in the past and no value for repeat_interval is specified, the schedule is invalid. For a repeating job or window, start_date can be derived from the repeat_interval if it is not specified. If start_date is null, then the date that the job or window is enabled is used. start_date and repeat_interval cannot both be null.
repeat_interval	This attribute specifies how often the schedule repeats. It is expressed using calendaring syntax. See " Calendaring Syntax " for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.
end_date	The date and time after which jobs will not run and windows will not open. A non-repeating schedule that has no end_date is valid forever. end_date has to be after the start_date. If this is not the case, then an error is generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

This procedure requires the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

163.6.22 CREATE_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. You can then use the window to schedule jobs that run under the associated resource plan. Windows are created in the `SYS` schema.

The procedure is overloaded.

Syntax

Creates a window using a named schedule object:

```
DBMS_SCHEDULER.CREATE_WINDOW (
  window_name          IN VARCHAR2,
  resource_plan        IN VARCHAR2,
  schedule_name        IN VARCHAR2,
  duration              IN INTERVAL DAY TO SECOND,
  window_priority      IN VARCHAR2 DEFAULT 'LOW',
  comments              IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```
DBMS_SCHEDULER.CREATE_WINDOW (
  window_name          IN VARCHAR2,
  resource_plan        IN VARCHAR2,
  start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval      IN VARCHAR2,
  end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  duration              IN INTERVAL DAY TO SECOND,
  window_priority      IN VARCHAR2 DEFAULT 'LOW',
  comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-34 CREATE_WINDOW Procedure Parameters

Parameter	Description
<code>window_name</code>	The name to assign to the window. The name must be unique in the SQL namespace. All windows are in the <code>SYS</code> schema, so the preface 'SYS' is optional.

Table 163-34 (Cont.) CREATE_WINDOW Procedure Parameters

Parameter	Description
resource_plan	<p>This attribute specifies the resource plan that automatically activates when the window opens. When the window closes, the system switches to the appropriate resource plan, which is usually the plan that was in effect before the window opened, but can also be the plan of a different window.</p> <p>Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</p> <p>If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.</p>
start_date	<p>This attribute specifies the first date and time on which this window is scheduled to open. If the value for start_date specified is in the past or is not specified, the window opens as soon as it is created.</p> <p>For repeating windows that use a calendaring expression to specify the repeat interval, the value for start_date is a reference date. The first time the window opens depends on the repeat interval specified and the value for start_date.</p>
duration	<p>This attribute specifies how long the window stays open. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if no value is specified when the window is created, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.</p>
schedule_name	<p>This attribute specifies the name of the schedule associated with the window.</p>
repeat_interval	<p>This attribute specifies how often the window repeats. It is expressed using the Scheduler calendaring syntax. See "Calendaring Syntax" for more information.</p> <p>A PL/SQL expression cannot be used to specify the repeat interval for a window.</p> <p>The expression specified is evaluated to determine the next time the window opens. If no repeat_interval is specified, the window opens only once at the specified start date.</p>
end_date	<p>This attribute specifies the date and time after which the window no longer opens. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window is set to FALSE.</p> <p>A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified, then the window keeps repeating forever.</p> <p>The end_date must be after the start_date. If it is not, then an error is generated when the window is created.</p>

Table 163-34 (Cont.) CREATE_WINDOW Procedure Parameters

Parameter	Description
window_priority	This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority determines which window opens. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, therefore, the low priority window does not open if it overlaps a high priority window. By default, windows are created with priority 'LOW'.
comments	This attribute specifies an optional comment about the window. By default, this attribute is NULL.

Usage Notes

Creating a window requires the `MANAGE SCHEDULER` privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the `ALTER SYSTEM SET RESOURCE_MANAGER_PLAN` statement or the `DBMS_RESOURCE_MANAGER.SWITCH_PLAN` package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler windows. For more information, see *Oracle Database Administrator's Guide* and "[SWITCH_PLAN Procedure](#)".

163.6.23 DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an `ANYDATA` object. A job that references the program can override the default value.

Syntax

```
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN SYS.ANYDATA,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-35 DEFINE_ANYDATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique, so it can replace any argument already defined at this position.

Table 163-35 (Cont.) DEFINE_ANYDATA_ARGUMENT Procedure Parameters

Parameter	Description
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ANYDATA_VALUE Procedure .
argument_type	The datatype of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.
default_value	The default value to be assigned to the argument encapsulated within an AnyData object. This is optional.
out_argument	This parameter is reserved for future use. It must be set to FALSE.

Usage Notes

All program arguments from one to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

 **See Also:**

- ["DEFINE_PROGRAM_ARGUMENT Procedure"](#)
- ["SET_JOB_ANYDATA_VALUE Procedure"](#)

163.6.24 DEFINE_CHAIN_EVENT_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event.

Once started in a running chain, this step does not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step replaces the old one.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    event_schedule_name IN VARCHAR2,
    timeout             IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
    chain_name          IN VARCHAR2,
```

```

step_name          IN VARCHAR2,
event_condition    IN VARCHAR2,
queue_spec         IN VARCHAR2,
timeout           IN INTERVAL DAY TO SECOND DEFAULT NULL);

```

Parameters

Table 163-36 DEFINE_CHAIN_EVENT_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain that the step is in
step_name	The name of the step
event_schedule_name	The name of the event schedule that the step waits for
timeout	This parameter is reserved for future use
event_condition	See the CREATE_EVENT_SCHEDULE Procedure
queue_spec	See the CREATE_EVENT_SCHEDULE Procedure

Usage Notes

Defining a chain step requires ALTER privileges on the chain either as the owner of the chain, or as a user with the ALTER object privilege on the chain or the CREATE ANY JOB system privilege.

You can base a chain step on a file watcher as well. To do this, provide the file watcher name directly in the queue_spec parameter, or use a file watcher schedule for the event_schedule_name parameter.

See Also:

"[DEFINE_CHAIN_STEP Procedure](#)"

163.6.25 DEFINE_CHAIN_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax and indicates the prerequisites for the action to occur. The action is a result of the condition being met.

An actual rule object is created to store the rule in the schema where the chain resides. If a rule name is given, this name is used for the rule object. If an existing rule name in the schema of the chain is given, the existing rule is altered. (A schema different than the schema of the chain cannot be specified). If no rule name is given, one is generated in the form SCHED_RULE\${N}.

Syntax

```

DBMS_SCHEDULER.DEFINE_CHAIN_RULE (
  chain_name      IN VARCHAR2,
  condition       IN VARCHAR2,
  action          IN VARCHAR2,

```

```
rule_name          IN VARCHAR2 DEFAULT NULL,
comments          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-37 DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
condition	<p>A boolean expression which must evaluate to <code>TRUE</code> for the action to be performed. Every chain must have a rule that evaluates to <code>TRUE</code> to start the chain. For this purpose, you can use a rule that has 'TRUE' as its condition if you are using Scheduler chain condition syntax, or '1=1' as its condition if you are using SQL syntax.</p> <ul style="list-style-type: none"> Scheduler Chain Condition Syntax See "Scheduler Chain Condition Syntax" and <i>Oracle Database Administrator's Guide</i> for details SQL WHERE Clause Syntax Conditions expressed with SQL must use the syntax of a SELECT statement WHERE clause. You can refer to chain step attributes by using the chain step name as a bind variable. The bind variable syntax is <code>:step_name.attribute</code>. (<code>step_name</code> refers to a typed object.) Possible attributes are: <code>completed</code>, <code>state</code>, <code>start_date</code>, <code>end_date</code>, <code>error_code</code>, and <code>duration</code>. Possible values for the state attribute include: 'NOT_STARTED', 'SCHEDULED', 'RUNNING', 'PAUSED', 'STALLED', 'SUCCEEDED', 'FAILED', and 'STOPPED'. If a step is in the state 'SUCCEEDED', 'FAILED', or 'STOPPED', its completed attribute is set to 'TRUE', otherwise completed is 'FALSE'.
action	<p>The action to be performed when the rule evaluates to <code>TRUE</code>. The action must consist of at least one keyword with an optional value and an optional delay clause.</p> <p>Possible actions include:</p> <ul style="list-style-type: none"> <code>[AFTER delay_interval] START step_1[,step_2 ...]</code> <code>STOP step_1[,step_2 ...]</code> <code>END [{end_value step_name.error_code}]</code> <p>At the beginning of the START action, a delay clause can specify a delay interval before performing the action. <code>delay_interval</code> is a formatted datetime interval of the form <code>HH:MM:SS</code>.</p> <p>The END action ends the chain with an error code equal to either the supplied <code>end_value</code> or the error code that <code>step_name</code> completes with. The default error code is 0, indicating a successful chain run.</p>
rule_name	The name of the rule being created. If no <code>rule_name</code> is given, one is generated in the form <code>SCHED_RULE\$_{N}</code> .
comments	An optional comment describing the rule. This is stored in the rule object created.

Scheduler Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain.

Chain Condition Syntax

The following are the available constructs for Scheduler chain condition syntax, which are all boolean expressions:

```

TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer

```

These boolean operators are available to create more complex conditions:

```

expression AND expression
expression OR expression
NOT (expression)

```

integer can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the `NOT` operator.

PL/SQL code that runs as part of a step can set the value of `ERROR_CODE` for that step with the `RAISE_APPLICATION_ERROR` statement.

Usage Notes

Defining a chain rule requires `ALTER` privileges on the chain (either as the owner, or as a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator's Guide* for more information.

Examples

The following are examples of using rule conditions and rule actions.

Rule Conditions Using Scheduler Chain Condition Syntax

```

'step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when
any
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'step1 error_code IN (1, 3, 5, 7)'
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7

```

Rule Conditions Using SQL Syntax

```
':step1.completed = 'TRUE' AND :step1.end_date >SYSDATE-1/24'
--satisfied when step step1 completed less than an hour ago

':step1.duration > interval '5' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to complete
```

Rule Actions

```
'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has not
completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.
```

163.6.26 DEFINE_CHAIN_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have `EXECUTE` privileges on the program or chain associated with the step. Only one program or chain can run during a step.

You cannot set all possible step attributes with this procedure. Use the `ALTER_CHAIN` procedure to set additional chain step attributes, such as `credential_name` and `destination_name`.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    program_name        IN VARCHAR2);
```

Parameters

Table 163-38 DEFINE_CHAIN_STEP Procedure Parameters

Parameter	Description
<code>chain_name</code>	The name of the chain to alter.
<code>step_name</code>	The name of the step being defined. If a step already exists with this name, the new step replaces the old one.

Table 163-38 (Cont.) DEFINE_CHAIN_STEP Procedure Parameters

Parameter	Description
program_name	The name of a program or chain to run during this step. The chain owner must have EXECUTE privileges on this program or chain.

Usage Notes

Defining a chain step requires ALTER privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

See Also:

- ["ALTER_CHAIN Procedure"](#)
- ["DEFINE_CHAIN_EVENT_STEP Procedure"](#)

163.6.27 DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

Syntax

```
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (
  program_name          IN VARCHAR2,
  metadata_attribute    IN VARCHAR2,
  argument_position     IN PLS_INTEGER,
  argument_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-39 DEFINE_METADATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered
metadata_attribute	The metadata to be passed. Valid metadata attributes are: 'job_name', 'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end', and 'event_message'. Table 163-40 describes these attributes in detail.
argument_position	The position of the argument as it is passed to the executable. The position cannot be greater than the number_of_arguments specified for the program. It must be unique, so it replaces any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures.

Table 163-40 Metadata Attributes

Metadata Attribute	Datatype	Description
job_name	VARCHAR2	Name of the currently running job
job_subname	VARCHAR2	Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain.
job_owner	VARCHAR2	Owner of the currently running job
job_scheduled_start	TIMESTAMP WITH TIME ZONE	When the currently running job was scheduled to start
job_start	TIMESTAMP WITH TIME ZONE	When the currently running job started
window_start	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window opened
window_end	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window is scheduled to close
event_message	(See Description)	For an event-based job, the message content of the event that started the job. The datatype of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table. In the case of a file arrival event, event_message is of type SYS.SCHEDULER_FILEWATCHER_RESULT. See "SCHEDULER_FILEWATCHER_RESULT Object Type".

Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

All metadata attributes except event_message can be used in PL/SQL blocks that you enter into the job_action or program_action attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

163.6.28 DEFINE_PROGRAM_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

Syntax

Defines a program argument without a default value:

```
PROCEDURE define_program_argument(
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument with a default value:

```
PROCEDURE define_program_argument(
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-41 DEFINE_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique so it replaces any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ARGUMENT_VALUE Procedure .
argument_type	The datatype of the argument being defined. This is not verified or used by the Scheduler. The program user uses <code>argument_type</code> when deciding what value to assign to the argument. Any valid SQL datatype is allowed.
default_value	The default value to be assigned to the argument if none is specified by the job.
out_argument	This parameter is reserved for future use. It must be set to <code>FALSE</code> .

Usage Notes

All program arguments from 1 to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also define a program argument if you have the `CREATE ANY JOB` privilege.

`DEFINE_PROGRAM_ARGUMENT` only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

See Also:

- ["DEFINE_ANYDATA_ARGUMENT Procedure"](#)
- ["SET_JOB_ARGUMENT_VALUE Procedure"](#)

163.6.29 DISABLE Procedure

This procedure disables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is disabled, its `enabled` attribute is set to `FALSE`.

Syntax

```
DBMS_SCHEDULER.DISABLE (
    name           IN VARCHAR2,
    force          IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 163-42 DISABLE Procedure Parameters

Parameter	Description
<code>name</code>	The name of the object being disabled. Can be a comma-delimited list. If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled. If a group name is specified, then the group is disabled, but the enabled state of the group members is unaffected.
<code>force</code>	If <code>TRUE</code> , objects are disabled even if other objects depend on them. See the usage notes for more information.
<code>commit_semantics</code>	The commit semantics. The following types are supported: <ul style="list-style-type: none"> <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default. <code>TRANSACTIONAL</code>: The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when <code>force</code> is set to <code>TRUE</code>. <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors and disable the rest of the jobs and commits all the disable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. This type is only supported when disabling a job or a list of jobs.

Usage Notes

Windows must be preceded by `SYS`.

Disabling an object that is already disabled does not generate an error.

The purpose of the `force` option is to point out dependencies. No dependent objects are altered.

To run `DISABLE` for a window or a group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege.

You can use `DISABLE` with any schema except the `SYS` schema.

Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its `state` in the job queue is changed to `disabled`.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

For jobs with multiple destinations, you cannot disable a child job at a specific destination. Instead, you can disable the destination.

Programs

When a program is disabled, the status is changed to `disabled`. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call and are allowed to continue.

No arguments that pertain to the program are affected when the program is disabled.

File Watchers

If `force` is set to `FALSE`, the file watcher must not be referenced by any job, otherwise an error will occur. If you force disabling a file watcher, jobs that depend on it become disabled.

Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error occurs.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is reenabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

Window Groups

When a group of type `WINDOW` is disabled, jobs (other than a running job) that have the window group as their schedule will not run when the member windows open. However, a job that has one of the window group members as its schedule still runs.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

Job Chains

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run. If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur. If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime. Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

Database Destinations

When you disable a database destination:

- The destination is skipped when a multiple destination job runs.
- If all destinations are disabled for a job, the Scheduler generates an error when it attempts to run the job.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all jobs that reference the database destination.

External Destinations

When you disable an external destination:

- Dependent database destinations remain enabled, but the Scheduler generates an error when it attempts to run a job with a database destination that depends on the external destination.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all external jobs that reference the external destination and for all database jobs with a database destination that depends on the external destination.

Groups

If you disable an external destination group or database destination group, the Scheduler generates an error when it attempts to run a job that names the group as its destination.

163.6.30 DROP_AGENT_DESTINATION Procedure

This procedure drops one or more external destinations, also known as agent destinations. It should be used only when the preferred method of dropping an external destination, using the `schagent` utility to unregister a Scheduler agent with a database, is unavailable due to failures.

This procedure can be called only by the `SYS` user or a user with the `MANAGE SCHEDULER` privilege.

**Note:**

External destinations are created on a source database only implicitly by registering an agent with the database. There is no user-callable `CREATE_AGENT_DESTINATION` procedure.

Syntax

```
DBMS_SCHEDULER.DROP_AGENT_DESTINATION (
    destination_name      IN VARCHAR2);
```

Parameters**Table 163-43 DROP_AGENT_DESTINATION Procedure Parameters**

Parameter	Description
<code>destination_name</code>	<p>A comma-separated list of external destinations to drop. Because user <code>SYS</code> owns all external destinations, do not prefix them with a schema name.</p> <p>The procedure stops processing if it encounters an external destination that does not exist. All external destinations processed before the error are dropped.</p> <p>Cannot be <code>NULL</code>.</p>

Usage Notes

When an external destination is dropped:

- All database destinations that refer to the external destination are disabled and their `agent` attribute is set to `NULL`.
- Members of external destination groups that refer to the destination are removed from the group.
- All job instances in the `*_SCHEDULER_JOB_DESTS` views that refer to the external destination are also dropped.
- Jobs running against the destination are stopped.

163.6.31 DROP_CHAIN Procedure

This procedure drops an existing chain.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN (
    chain_name      IN VARCHAR2,
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-44 DROP_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to drop. Can also be a comma-delimited list of chains.
force	If <code>force</code> is set to <code>FALSE</code> , the chain must not be referenced by any job, otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code> , all jobs pointing to the chain are disabled before the chain is dropped. Running jobs that point to this chain are stopped before the chain is dropped.

Usage Notes

Dropping a chain requires alter privileges on the chain (either as the owner, or a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user must have the privileges required to do this. See the `DBMS_RULE_ADM.DROP_RULE_SET` and `DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT` procedures for more information.

If `force` is `FALSE`, no jobs may be using this chain. If `force` is `TRUE`, any jobs that use this chain are disabled before the chain is dropped (and any of these jobs that are running will be stopped).

163.6.32 DROP_CHAIN_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_RULE (
    chain_name      IN VARCHAR2,
    rule_name       IN VARCHAR2,
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-45 DROP_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
rule_name	The name of the rule to drop
force	If <code>force</code> is set to <code>TRUE</code> , the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If <code>force</code> is set to <code>FALSE</code> and the chain is running, an error is generated.

Usage Notes

Dropping a chain rule requires alter privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so you must have the privileges to drop this rule object. See the DBMS_RULE_ADM.DROP_RULE procedure for more information.

163.6.33 DROP_CHAIN_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_STEP (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-46 DROP_CHAIN_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step being dropped. Can be a comma-separated list.
force	If force is set to TRUE, this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted. If force is set to FALSE and this chain is currently running, an error is thrown.

Usage Notes

Dropping a chain step requires ALTER privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

163.6.34 DROP_CREDENTIAL Procedure

This deprecated procedure drops a credential.

Note:

This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the DBMS_CREDENTIAL package, specifically the DROP_CREDENTIAL Procedure.

Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (
    credential_name      IN VARCHAR2,
    force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-47 DROP_CREDENTIAL Procedure Parameters

Parameter	Description
credential_name	The name of the credential being dropped. This can optionally be prefixed with a schema name. This cannot be set to NULL.
force	If set to FALSE, the credential must not be referenced by any job, or an error will occur. If set to TRUE, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime.

Usage Notes

Only the owner of a credential or a user with the CREATE ANY JOB system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

163.6.35 DROP_DATABASE_DESTINATION Procedure

This procedure drops one or more database destinations.

Syntax

```
DBMS_SCHEDULER.DROP_DATABASE_DESTINATION (
    destination_name    IN VARCHAR2);
```

Parameters

Table 163-48 DROP_DATABASE_DESTINATION Procedure Parameters

Parameter	Description
destination_name	The name of the destination to drop. Can be a comma-separated list of database destinations to drop. Each database destination can optionally be prefixed with a schema name. The procedure stops processing if it encounters a database destination that does not exist. All database destinations processed before the error are dropped. Cannot be NULL.

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop the database destination.

When a database destination is dropped:

- All job instances that refer to the destination in the *_SCHEDULER_JOB_DESTS views are also dropped.
- Jobs running against the destination are stopped.
- Members of database destination groups that refer to the destination are removed from the group.

See Also:

[CREATE_DATABASE_DESTINATION Procedure](#)

163.6.36 DROP_FILE_WATCHER Procedure

This procedure drops one or more file watchers.

Syntax

```
DBMS_SCHEDULER.DROP_FILE_WATCHER (
    file_watcher_name    IN VARCHAR2,
    force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-49 DROP_FILE_WATCHER Procedure Parameters

Parameter	Description
file_watcher_name	The file watcher to drop. Can be a comma-separated list of file watchers. Each file watcher name can optionally be prefixed with a schema name. Cannot be NULL.
force	If set to FALSE, the file watcher must not be referenced by any job, or an error occurs. If set to TRUE, the file watcher is dropped whether or not there are jobs referencing it. In this case, jobs that reference the dropped file watcher are disabled.

Usage Notes

Only the owner of a file watcher or a user with the CREATE ANY JOB system privilege may drop the file watcher.

Running jobs that point to the file watcher are not affected by this procedure and are allowed to continue.

See Also:

["CREATE_FILE_WATCHER Procedure"](#)

163.6.37 DROP_GROUP Procedure

This procedure drops one or more groups.

Syntax

```
DBMS_SCHEDULER.DROP_GROUP (  
    group_name      IN VARCHAR2,  
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-50 DROP_GROUP Procedure Parameters

Parameter	Description
group_name	A group to drop. Can be a comma-separated list of group names. Each group name can optionally be prefixed with a schema name. The procedure stops processing if it encounters a group that does not exist. All groups processed before the error are dropped. Cannot be NULL.
force	If FALSE, the group must not be referenced by any job, otherwise an error occurs. If TRUE, the group is dropped whether or not there are jobs referencing it. In this case, all jobs referencing the group are disabled and all job instances that reference the group are removed from the *_SCHEDULER_JOB_DESTS views.

Usage Notes

Only the owner or a user with the `CREATE ANY JOB` system privilege may drop a group. You must have the `MANAGE SCHEDULER` privilege to drop a group of type `WINDOW`.

See Also:

["CREATE_FILE_WATCHER Procedure"](#)

163.6.38 DROP_INCOMPATIBILITY Procedure

This procedure drops an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.DROP_INCOMPATIBILITY (  
    incompatibility_name  IN VARCHAR2);
```

Parameters

Table 163-51 DROP_INCOMPATIBILITY Procedure Parameters

Parameter	Description
<code>incompatibility_name</code>	The name of the incompatibility definition.

Usage Notes

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

163.6.39 DROP_JOB Procedure

This procedure drops one or more jobs or all jobs in one or more job classes. Dropping a job also drops all argument values set for that job.

Syntax

```
DBMS_SCHEDULER.DROP_JOB (
    job_name          IN VARCHAR2,
    force             IN BOOLEAN DEFAULT FALSE,
    defer             IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 163-52 DROP_JOB Procedure Parameters

Parameter	Description
<code>job_name</code>	The name of a job or job class. Can be a comma-delimited list. For a job class, the <code>SYS</code> schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.
<code>force</code>	If <code>force</code> is set to <code>TRUE</code> , the Scheduler first attempts to stop the running job instances (by issuing the <code>STOP_JOB</code> call with the <code>force</code> flag set to <code>false</code>), and then drops the jobs.
<code>defer</code>	If <code>defer</code> is set to <code>TRUE</code> , the Scheduler allows the running jobs to complete and then drops the jobs.

Table 163-52 (Cont.) DROP_JOB Procedure Parameters

Parameter	Description
<code>commit_semantics</code>	<p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> • <code>STOP_ON_FIRST_ERROR</code> returns on the first error and previous successful drop operations are committed to disk. This is the default. • <code>TRANSACTIONAL</code> returns on the first error. Everything that happened before that error is rolled back. This type is not supported when <code>force</code> is set to <code>TRUE</code>. • <code>ABSORB_ERRORS</code> tries to absorb any errors and drop the rest of the jobs, and commits all the successful drops. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. <p>Only <code>STOP_ON_FIRST_ERROR</code> is permitted when job classes are included in the <code>job_name</code> list.</p>

Usage Notes

If both `force` and `defer` are set to `FALSE` and a job is running at the time of the call, the attempt to drop that job fails. The entire call to `DROP_JOB` may then fail, depending on the setting of `commit_semantics`.

Setting both `force` and `defer` to `TRUE` results in an error.

Dropping a job requires `ALTER` privileges on the job either as the owner of the job or as a user with the `ALTER` object privilege on the job or the `CREATE ANY JOB` system privilege.

163.6.40 DROP_JOB_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

Syntax

```
DBMS_SCHEDULER.DROP_JOB_CLASS (
    job_class_name      IN VARCHAR2,
    force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-53 DROP_JOB_CLASS Procedure Parameters

Parameter	Description
<code>job_class_name</code>	The name of the job class. Can be a comma-delimited list.
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, a class being dropped must not be referenced by any jobs, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful is the class dropped.</p> <p>Running jobs that belong to the job class are not affected.</p>

Usage Notes

Dropping a job class requires the `MANAGE SCHEDULER` system privilege.

163.6.41 DROP_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

Syntax

```
DBMS_SCHEDULER.DROP_PROGRAM (
    program_name          IN VARCHAR2,
    force                 IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-54 DROP_PROGRAM Procedure Parameters

Parameter	Description
<code>program_name</code>	The name of the program to be dropped. Can be a comma-delimited list.
<code>force</code>	If <code>force</code> is set to <code>FALSE</code> , the program must not be referenced by any job, otherwise an error occurs. If <code>force</code> is set to <code>TRUE</code> , all jobs referencing the program are disabled before the program is dropped. Running jobs that point to the program are not affected by the <code>DROP_PROGRAM</code> call and are allowed to continue.

Usage Notes

Dropping a program requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program if you have the `CREATE ANY JOB` privilege.

163.6.42 DROP_PROGRAM_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_name         IN VARCHAR2);
```

Parameters

Table 163-55 DROP_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
<code>program_name</code>	The name of the program to be altered. A program with this name must exist.
<code>argument_name</code>	The name of the argument being dropped
<code>argument_position</code>	The position of the argument to be dropped

Usage Notes

Dropping a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program argument if you have the `CREATE ANY JOB` privilege.

163.6.43 DROP_RESOURCE Procedure

This procedure drops a resource.

Syntax

```
DBMS_SCHEDULER.DROP_RESOURCE (
    resource_name IN VARCHAR2,
    force         IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-56 DROP_RESOURCE Procedure Parameters

Parameter	Description
<code>resource_name</code>	The name of the resource to be dropped. Can be a comma-delimited list.
<code>force</code>	If <code>force</code> is set to <code>FALSE</code> , the resource must not have any existing constraints, otherwise an error occurs. If <code>force</code> is set to <code>TRUE</code> , the resource will be dropped and any constraints defined on this resource will also be dropped.

Usage Notes

Only the owner or a user with the `CREATE ANY JOB` system privilege may drop the resource.

See Also:

Creating or Dropping a Resource in *Oracle Database Administrator's Guide*

163.6.44 DROP_SCHEDULE Procedure

This procedure drops a schedule.

Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE (  
    schedule_name    IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-57 DROP_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name of the schedule. Can be a comma-delimited list.
force	If <code>force</code> is set to <code>FALSE</code> , the schedule must not be referenced by any job or window, otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code> , any jobs or windows that use this schedule are disabled before the schedule is dropped Running jobs and open windows that point to the schedule are not affected.

Usage Notes

You must be the owner of the schedule being dropped or have `ALTER` privileges for the schedule or the `CREATE ANY JOB` privilege.

163.6.45 DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. The window is removed from any groups that reference it.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW (  
    window_name      IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-58 DROP_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window. Can be a comma-delimited list.

Table 163-58 (Cont.) DROP_WINDOW Procedure Parameters

Parameter	Description
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, the window must be not be open or referenced by any job, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the window is dropped and those jobs that have the window as their schedule are disabled. However, jobs that have a window group, of which the dropped window is a member, as their schedule, are not disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply.</p> <p>Running jobs that have the window as their schedule is allowed to continue, unless the <code>stop_on_window_close</code> flag is set to <code>TRUE</code> for the job. If this is the case, the job is stopped when the window is dropped.</p>

Usage Notes

Dropping a window requires the `MANAGE SCHEDULER` privilege.

163.6.46 DUMP_IN_MEMORY_TRACE Procedure

This procedure dumps the scheduler in-memory trace buffer of the specified process state object address into the current trace file of the requester process.

Syntax

```
DBMS_SCHEDULER.DUMP_IN_MEMORY_TRACE (
    PROCESS_ADDRESS IN RAW);
```

Parameters**Table 163-59 DUMP_IN_MEMORY_TRACE Procedure Parameters**

Parameter	Description
<code>PROCESS_ADDRESS</code>	State object address of the process being dumped.

Usage Notes

Either connecting as a `SYS` user or having the `DBA` role is required to execute `dump_in_memory_trace`.

163.6.47 ENABLE Procedure

This procedure enables a program, job, chain, window, database destination, external destination, file watcher, or group.

When an object is enabled, its `enabled` attribute is set to `TRUE`. By default, jobs, chains, and programs are created disabled and database destinations, external destinations, file watchers, windows, and groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule. Enabling a disabled job also resets the job `RUN_COUNT`, `FAILURE_COUNT` and `RETRY_COUNT` columns in the `*_SCHEDULER_JOBS` data dictionary views.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (
    name           IN VARCHAR2,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 163-60 ENABLE Procedure Parameters

Parameter	Description
name	<p>The name of the Scheduler object being enabled. Can be a comma-delimited list of names.</p> <p>If a job class name is specified, then all the jobs in the job class are enabled.</p> <p>If a group name is specified, then the group is enabled, but the enabled state of the group members is unaffected.</p>
commit_semantics	<p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> • <code>STOP_ON_FIRST_ERROR</code> - The procedure returns on the first error and previous successful enable operations are committed to disk. This is the default. • <code>TRANSACTIONAL</code> - The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs. • <code>ABSORB_ERRORS</code> - The procedure tries to absorb any errors and enable the rest of the jobs. It commits all the enable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. This type is only supported when enabling a job or a list of jobs.

Usage Notes

Window names must be preceded by `SYS`.

To run `ENABLE` for a window or group of type `WINDOW`, you must have the `MANAGE_SCHEDULER` privilege. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE_EXTERNAL_JOB` system privilege before the job can be enabled or run.

To enable a file watcher, the file watcher owner must have the `EXECUTE` privilege on the designated credential.

You can use `ENABLE` with any schema except the `SYS` schema.

163.6.48 END_DETACHED_JOB_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the `detached` attribute set to `TRUE`.

A detached job run does not end until this procedure or the [STOP_JOB Procedure](#) is called.

Syntax

```
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (
  job_name          IN VARCHAR2,
  error_number      IN PLS_INTEGER DEFAULT 0,
  additional_info   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-61 END_DETACHED_JOB_RUN Procedure Parameters

Parameter	Description
<code>job_name</code>	The name of the job to end. Must be a detached job that is running.
<code>error_number</code>	If zero, then the job run is logged as succeeded. If -1013, then the job run is logged as stopped. If any other number, then the job run is logged as failed with that error number.
<code>additional_info</code>	This text is stored in the <code>additional_info</code> column of the <code>*_scheduler_job_run_details</code> views for this job run.

Usage Notes

This procedure requires that you either own the job or have `ALTER` privileges on it. You can also end any detached job run if you have the `CREATE ANY JOB` privilege.

See Also:

Oracle Database Administrator's Guide for information about detached jobs.

163.6.49 EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler calendaring syntax. This procedure evaluates the calendar expression and tells you the next execution date and time of a job or window. This is very useful for testing the correct definition of the calendar string without actually scheduling the job or window.

This procedure can also get multiple steps of the repeat interval by passing the `next_run_date` returned by one invocation as the `return_date_after` argument of the next invocation.

See the calendaring syntax described in "[Operational Notes](#)".

Syntax

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
    calendar_string    IN  VARCHAR2,
    start_date         IN  TIMESTAMP WITH TIME ZONE,
    return_date_after  IN  TIMESTAMP WITH TIME ZONE,
    next_run_date      OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 163-62 EVALUATE_CALENDAR_STRING Procedure Parameters

Parameter	Description
calendar_string	The calendar expression to be evaluated. The string must be in the calendaring syntax described in " Operational Notes ".
start_date	The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be NULL.
return_date_after	The return_date_after argument helps the Scheduler determine which one of all possible matches (all valid execution dates) to return from those determined by the start_date and the calendar string. When a NULL value is passed for this argument, the Scheduler automatically fills in systimestamp as its value.
next_run_date	The first timestamp that matches the calendar string and start date that occur after the value passed in for the return_date_after argument.

Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
start_date          TIMESTAMP;
return_date_after  TIMESTAMP;
next_run_date      TIMESTAMP;
BEGIN
start_date :=
    to_timestamp_tz('01-JAN-2003 10:00:00', 'DD-MON-YYYY HH24:MI:SS');
return_date_after := start_date;
FOR i IN 1..5 LOOP
    DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
        'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
        start_date, return_date_after, next_run_date);
    DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
    return_date_after := next_run_date;
END LOOP;
END;
/

next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
```

```
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM
```

PL/SQL procedure successfully completed.

Usage Notes

No specific Scheduler privileges are required.

163.6.50 EVALUATE_RUNNING_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (`RUN_JOB` can be used to start the job.)

If any of the steps of the chain are themselves running chains, another `EVALUATE_RUNNING_CHAIN` is performed on each of the nested running chains.

Syntax

```
DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (
    job_name          IN VARCHAR2);
```

Parameters

Table 163-63 EVALUATE_RUNNING_CHAIN Procedure Parameter

Parameter	Description
job_name	The name of the running job (pointing to a chain) to reevaluate the rules for

Usage Notes

Running `EVALUATE_RUNNING_CHAIN` on a job requires alter privileges on the job (either as the owner, or as a user with `ALTER` privileges on the job or the `CREATE ANY JOB` system privilege).

 **Note:**

The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with an event step in the chain

For most chains, this is sufficient. `EVALUATE_RUNNING_CHAIN` should be used only under the following circumstances:

- After manual intervention of a running chain with the `ALTER_RUNNING_CHAIN` procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, `EVALUATE_RUNNING_CHAIN` may not be needed if you set the `evaluation_interval` attribute when you created the chain.

163.6.51 GENERATE_JOB_NAME Function

This function returns a unique name for a job.

The name will be of the form `{prefix}N` where `N` is a number from a sequence. If no prefix is specified, the generated name will, by default, be `JOB$_1`, `JOB$_2`, `JOB$_3`, and so on. If `'SCOTT'` is specified as the prefix, the name will be `SCOTT1`, `SCOTT2`, and so on.

Syntax

```
DBMS_SCHEDULER.GENERATE_JOB_NAME (
    prefix          IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

Parameters

Table 163-64 GENERATE_JOB_NAME Function Parameter

Parameter	Description
<code>prefix</code>	The prefix to use when generating the job name

Usage Notes

If the prefix is explicitly set to `NULL`, the name is just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the `DBMS_SCHEDULER` calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the `GENERATE_JOB_NAME` function never returns the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

163.6.52 GET_AGENT_INFO Function

This function can return job information specific to an agent, such as how many are running and so on, depending on the attribute selected.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_INFO (
    agent_name      IN VARCHAR2,
    attribute       IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 163-65 GET_AGENT_INFO Function Parameter

Parameter	Description
agent_name	The name of an external destination where the agent is running
attribute	<p>Possible Attributes values</p> <ul style="list-style-type: none"> • VERSION: Returns the agent version number. Requires the <code>CREATE JOB</code> system privilege. • UPTIME: Returns the time the agent has been up and running. Requires the <code>CREATE JOB</code> system privilege. • NUMBER_OF_RUNNING_JOBS: Returns the number of jobs that the agent is currently running. Requires the <code>CREATE JOB</code> system privilege. • TOTAL_JOBS_RUN: Returns the number of jobs run by the agent since it was started. Requires the <code>CREATE JOB</code> system privilege. • RUNNING_JOBS: Returns a comma-separated list of the names of the jobs running currently. Requires the <code>MANAGE SCHEDULER</code> system privilege. • ALL: Returns all the information the previous options return. It requires the <code>MANAGE SCHEDULER</code> system privilege.

Usage Notes

This function returns the same information as the `schagent` utility status option. See *Oracle Database Administrator's Guide*.

163.6.53 GET_AGENT_VERSION Function

This function returns the version string of a Scheduler agent that is registered with the database and is currently running. `GET_AGENT_VERSION` throws an error if the agent is not registered with the database or if the agent is not currently running.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_VERSION (
    agent_host      IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 163-66 GET_AGENT_VERSION Function Parameter

Parameter	Description
agent_host	Either the hostname and port on which the agent is running in the form <code>hostname:port</code> or the name of the agent as shown in the <code>destination_name</code> column of the <code>ALL_SCHEDULER_EXTERNAL_DESTS</code> view which lists all Scheduler agents registered with the database.

Usage Notes

This function requires the `CREATE EXTERNAL JOB` system privilege.

163.6.54 GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to retrieve values of various types.

Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value        OUT {VARCHAR2|PLS_INTEGER|BOOLEAN|DATE|TIMESTAMP|
                    TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                    INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value        OUT VARCHAR2,
    value2       OUT VARCHAR2);
```

Parameters

Table 163-67 GET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being retrieved. See the SET_ATTRIBUTE Procedure for tables of attribute values.
value	The existing value of the attribute
value2	The <code>value2</code> argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.

Usage Notes

To run `GET_ATTRIBUTE` for a job class, you must have the `MANAGE SCHEDULER` privilege or have `EXECUTE` privileges on the class. For a schedule, window, or group, no

privileges are necessary. Otherwise, you must be the owner of the object or have `ALTER` or `EXECUTE` privileges on that object or have the `CREATE ANY JOB` privilege.

See the [SET_ATTRIBUTE Procedure](#) for tables of attribute values that you can retrieve for the various Scheduler object types.

163.6.55 GET_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

This procedure differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle database) installed.

Syntax

```
DBMS_SCHEDULER.GET_FILE (
    source_file          IN VARCHAR2,
    source_host          IN VARCHAR2,
    credential_name      IN VARCHAR2,
    file_contents        IN OUT NOCOPY {BLOB|CLOB});
```

```
DBMS_SCHEDULER.GET_FILE (
    source_file          IN VARCHAR2,
    source_host          IN VARCHAR2,
    credential_name      IN VARCHAR2,
    destination_file_name IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_permissions IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-68 GET_FILE Procedure Parameters

Parameter	Description
source_file	<p>Fully qualified path name of the file to retrieve from the operating system. The file name is case-sensitive and is not converted to uppercase. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host.</p> <p>If the format of this parameter is <i>external_log_id_stdout</i>, then the stdout from the designated external job run is returned.</p> <p>If the format of this parameter is <i>external_log_id_stderr</i>, the error text from the designated external job run is returned.</p> <p>You obtain the value of <i>external_log_id</i> from the <i>ADDITIONAL_INFO</i> column of the <i>*_SCHEDULER_JOB_RUN_DETAILS</i> views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the <i>external_log_id</i> name/value pair, and then append either <i>_stdout</i> or <i>_stderr</i> to its value.</p> <p>The external job must have an associated credential. The <i>credential_name</i> parameter of <i>GET_FILE</i> must name the same credential that is used by the job, and the <i>source_host</i> parameter must be the same as the <i>destination</i> attribute of the job.</p>
source_host	<p>If the file is to be retrieved from a remote host, then this parameter must be a valid an external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views <i>*_SCHEDULER_EXTERNAL_DESTS</i>.)</p> <p>If <i>source_host</i> is NULL or set to 'localhost', then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the <i>schagent.conf</i> file, which is located in the Scheduler agent home directory on the remote host.</p>
credential_name	The name of the credential to use for accessing the file system.
file_contents	The variable into which the file contents is read.
destination_file_name	The file to which the file contents is written.
destination_directory_object	The directory object that specifies the path to the destination file, when <i>destination_file_name</i> is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

Usage Notes

The caller must have the *CREATE EXTERNAL JOB* system privilege and have *EXECUTE* privileges on the credential.

163.6.56 GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (
    attribute    IN VARCHAR2,
    value       OUT VARCHAR2);
```

Parameters

Table 163-69 GET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	The name of the attribute
value	The existing value of the attribute

Usage Notes

To run GET_SCHEDULER_ATTRIBUTE, you must have the `MANAGE SCHEDULER` privilege.

[Table 163-70](#) lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see [Table 163-102](#) and the section "Configuring the Scheduler" in *Oracle Database Administrator's Guide*.

Table 163-70 Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

Scheduler Attribute	Description
current_open_window	Name of the currently open window
default_timezone	Default time zone used by the Scheduler for repeat intervals and windows
email_sender	The default e-mail address of the sender for job state e-mail notifications
email_server	The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is <code>NULL</code> .
event_expiry_time	Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be <code>NULL</code> .
log_history	Retention period in days for job and window logs. The range of valid values is 0 through 1000000.
max_job_slave_processes	This Scheduler attribute is not used.

163.6.57 OPEN_WINDOW Procedure

This procedure manually opens a window, unrelated to its schedule.

The window opens and the resource plan associated with it takes effect immediately, for the duration specified or for the normal duration of the window, if no duration is given. Only an enabled window can be manually opened.

Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (
    window_name          IN VARCHAR2,
    duration              IN INTERVAL DAY TO SECOND,
    force                 IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 163-71 OPEN_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window
duration	The duration of the window. It is of type interval day to second. If it is NULL, then the window opens for the regular duration as specified in the window metadata.
force	<p>If <code>force</code> is set to <code>FALSE</code>, then opening an already open window generates an error.</p> <p>If <code>force</code> is set to <code>TRUE</code>:</p> <p>You can open a window that is already open. The window stays open for the duration specified in the call, from the time the <code>OPEN_WINDOW</code> command was issued.</p> <p>For example: <code>window1</code> was created with a duration of four hours. It has now been open for two hours. If, at this point, you reopen <code>window1</code> using the <code>OPEN_WINDOW</code> call and do not specify a duration, then <code>window1</code> stays open for four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes.</p> <p>The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.</p>

Usage Notes

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated and is determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If there are jobs running when the window opens, the resources allocated to them might change if there is a switch in resource plan.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the `ALTER SYSTEM` statement with the `force` option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the `MANAGE_SCHEDULER` privilege.

163.6.58 PURGE_LOG Procedure

The `PURGE_LOG` procedure purges rows from the job and window log that were not purged automatically by the scheduler.

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The `PURGE_LOG` procedure can be used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

Syntax

```
DBMS_SCHEDULER.PURGE_LOG (
  log_history          IN PLS_INTEGER  DEFAULT 0,
  which_log           IN VARCHAR2     DEFAULT 'JOB_AND_WINDOW_LOG',
  job_name            IN VARCHAR2     DEFAULT NULL);
```

Parameters

Table 163-72 PURGE_LOG Procedure Parameters

Parameter	Description
<code>log_history</code>	This specifies how much history (in days) to keep. The valid range is 0 - 1000000. If set to 0, no history is kept.
<code>which_log</code>	This specifies the log type. Valid values are: <code>job_log</code> , <code>window_log</code> , and <code>job_and_window_log</code> .
<code>job_name</code>	This specifies which job-specific entries must be purged from the job log. This can be a comma-delimited list of job names and job classes. Whenever <code>job_name</code> has a value other than <code>NULL</code> , the <code>which_log</code> argument implicitly includes the job log.

Usage Notes

This procedure requires the `MANAGE_SCHEDULER` privilege.

Examples

The following completely purges all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following purges all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following purges all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in `jobclass1` and older than 1 day:

```
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```

163.6.59 PUT_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer.

It differs from the equivalent UTL_FILE procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

Syntax

```
DBMS_SCHEDULER.PUT_FILE (
    destination_file      IN VARCHAR2,
    destination_host      IN VARCHAR2,
    credential_name       IN VARCHAR2,
    file_contents         IN {BLOB|CLOB},
    destination_permissions IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_SCHEDULER.PUT_FILE (
    destination_file      IN VARCHAR2,
    destination_host      IN VARCHAR2,
    credential_name       IN VARCHAR2,
    source_file_name      IN VARCHAR2,
    source_directory_object IN VARCHAR2,
    destination_permissions IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-73 PUT_FILE Procedure Parameters

Parameter	Description
destination_file	Fully qualified path name of the file to save to the operating system file system. The file name is case-sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.
destination_host	If NULL or set to 'localhost', the file is saved to the file system of the local computer. To save to a remote host, this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.)
credential_name	The name of the credential to use for accessing the destination file system.
file_contents	The variable from which the file contents is read.
source_file_name	The file from which the file contents is written
source_directory_object	The directory object that specifies the path to the source file, when source_file_name is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

Usage Notes

The caller must have the `CREATE EXTERNAL JOB` system privilege and have `EXECUTE` privileges on the credential.

163.6.60 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`.

Syntax

```
DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (
    subscriber_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-74 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
<code>subscriber_name</code>	Name of the Oracle Advanced Queuing (AQ) agent to remove the subscription from. If <code>NULL</code> , the user name of the calling user is used.

Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

163.6.61 REMOVE_FROM_INCOMPATIBILITY Procedure

This procedure removes jobs or programs from an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.REMOVE_FROM_INCOMPATIBILITY (
    incompatibility_name  IN VARCHAR2,
    object_name          IN VARCHAR2);
```

Parameters

Table 163-75 REMOVE_FROM_INCOMPATIBILITY Procedure Parameters

Parameter	Description
<code>incompatibility_name</code>	The name of the incompatibility definition.
<code>object_name</code>	One or more (comma-separated) programs or jobs

Usage Notes

This procedure does not raise an error if any specified objects do not already exist in the incompatibility definition.

**See Also:**Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

163.6.62 REMOVE_GROUP_MEMBER Procedure

This procedure removes one or more members from an existing group.

Syntax

```
DBMS_SCHEDULER.REMOVE_GROUP_MEMBER (
    group_name          IN VARCHAR2,
    member              IN VARCHAR2);
```

Parameters

Table 163-76 REMOVE_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the group.
member_name	The name of the member to remove from group. Comma-separated list of members to remove. An error is returned if any of the members is not part of the group. A group of the same type can be named as a member. The Scheduler immediately expands the included group name into its list of members. If the member is a destination, any job instances that run on this destination are removed from the *_SCHEDULER_JOB_DESTS views.

Usage Notes

The following users may remove members from a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to remove a member from a group of type WINDOW.

**See Also:**["CREATE_GROUP Procedure"](#)

163.6.63 REMOVE_JOB_EMAIL_NOTIFICATION Procedure

This procedure removes e-mail notifications for a job. You can remove all e-mail notifications or remove notifications only for specified recipients or specified events.

Syntax

```
DBMS_SCHEDULER.REMOVE_JOB_EMAIL_NOTIFICATION (
  job_name          IN VARCHAR2,
  recipients        IN VARCHAR2 DEFAULT NULL,
  events            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-77 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
job_name	Name of the job to remove e-mail notifications for. Cannot be NULL.
recipients	E-mail address to remove e-mail notification for. Comma-separated list of e-mail addresses.
events	Job state event to remove e-mail notification for. Comma-separated list of job state events.

Usage Notes

When you specify multiple recipients and multiple events, the notification for each specified event is removed for each specified recipient. The procedure ignores any recipients or events that are specified but that were not previously added.

If `recipients` is NULL, e-mail notifications for the specified events are removed for all existing recipients. If `events` is NULL, notifications for all events are removed for the specified recipients. If both `recipients` and `events` are NULL, all e-mail notifications are removed for the job.

For example, if `recipients` is 'jsmith@example.com,rjones@example.com' and `events` is 'JOB_FAILED,JOB_BROKEN', then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for both `jsmith` and `rjones`. If `recipients` is NULL, then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for `jsmith`, `rjones`, and any other previously defined recipients for these events.

To call this procedure, you must be the job owner or a user with the `CREATE ANY JOB` system privilege or `ALTER` object privilege on the job.

See Also:

"[ADD_JOB_EMAIL_NOTIFICATION Procedure](#)"

163.6.64 RESET_JOB_ARGUMENT_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job.

RESET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
    job_name          IN VARCHAR2,
    argument_position IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
    job_name          IN VARCHAR2,
    argument_name     IN VARCHAR2);
```

Parameters

Table 163-78 RESET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job being altered
argument_position	The position of the program argument being reset
argument_name	The name of the program argument being reset

Usage Notes

If the corresponding program argument has no default value, the job is disabled. Resetting a program argument of a job belonging to another user requires ALTER privileges on that job. Arguments can be specified by position or by name.

RESET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also reset a job argument value if you have the CREATE ANY JOB privilege.

RESET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

163.6.65 RUN_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given.

If no job_name is given, one is generated of the form RUN_CHAIN\$_chainnameN, where chainname is the first 8 characters of the chain name and N is an integer.

If a list of start steps is given, only those steps are started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run).

If `start_steps` is `NULL`, then the chain starts normally—that is, it performs an initial evaluation to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

Syntax

Runs a chain, with a list of start steps.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    start_steps         IN VARCHAR2,
    job_name            IN VARCHAR2 DEFAULT NULL);
```

Runs a chain, with a list of initial step states.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    step_state_list    IN SYS.SCHEDULER$_STEP_TYPE_LIST,
    job_name           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-79 RUN_CHAIN Procedure Parameters

Parameter	Description
<code>chain_name</code>	The name of the chain to run
<code>job_name</code>	The name of the job to create to run the chain
<code>start_steps</code>	Comma-separated list of the steps to start when the chain starts running
<code>step_state_list</code>	List of chain steps with an initial state (SUCCEEDED or FAILED) to set for each. Set the attributes of <code>sys.scheduler\$_step_type</code> as follows: <code>step_name</code> The name of the step <code>step_type</code> 'SUCCEEDED' or 'FAILED' <code>error_number</code> where <code>error_number</code> is a positive or negative integer.

Usage Notes

Running a chain requires `CREATE JOB` if the job is being created in the user's schema, or `CREATE ANY JOB` otherwise. In addition, the owner of the job being created needs execute privileges on the chain (as the owner of the chain, or as a user with the `EXECUTE` privilege on the chain or the `EXECUTE ANY PROGRAM` system privilege).

Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```
declare
    initial_step_states sys.scheduler$_step_type_list;
begin
    initial_step_states := sys.scheduler$_step_type_list(
        sys.scheduler$_step_type('step1', 'SUCCEEDED'),
        sys.scheduler$_step_type('step2', 'FAILED 27486'),
```

```

sys.scheduler$_step_type('step3', 'SUCCEEDED'),
sys.scheduler$_step_type('step5', 'SUCCEEDED');
dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/

```

163.6.66 RUN_JOB Procedure

This procedure runs a job immediately.

If a job is enabled, the Scheduler runs it automatically. It is not necessary to call RUN_JOB to run a job according to its schedule. Use RUN_JOB to run a job outside of its normal schedule.

Syntax

```

DBMS_SCHEDULER.RUN_JOB (
  job_name          IN VARCHAR2,
  use_current_session IN BOOLEAN DEFAULT TRUE);

```

Parameters

Table 163-80 RUN_JOB Procedure Parameters

Parameter	Description
job_name	<p>A job name or a comma-separated list of entries, where each is the name of an existing job, optionally preceded by a schema name and dot separator.</p> <p>If you specify a multiple-destination job, the job runs on all destinations. In this case, the use_current_session argument must be FALSE.</p>
use_current_session	<p>This specifies whether or not the job run should occur in the same session that the procedure was invoked from. The job always runs as the job owner, in the job owner's schema, unless it has credential specified, then the job runs using the user named in the credential.</p> <p>When use_current_session is set to TRUE:</p> <ul style="list-style-type: none"> You can test a job and see any possible errors on the command line. state, run_count, last_start_date, last_run_duration, and failure_count of *_scheduler_jobs are not updated. RUN_JOB can be run in parallel with a regularly scheduled job run. <p>When use_current_session is set to FALSE:</p> <ul style="list-style-type: none"> You need to check the job log to find error information. All relevant fields in *_scheduler_jobs are updated. RUN_JOB fails if a regularly scheduled job is running. <p>For jobs that have a specified destination or destination group, or point to chains or programs with the detached attribute set to TRUE, use_current_session must be FALSE.</p>

Usage Notes

Jobs do not have to be enabled. If a job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.

- The job owner has `EXECUTE` privileges on the job class.
- If a program or chain is referenced, the program/chain exists.
- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the `CREATE EXTERNAL JOB` privilege if this is an external job.

A `TRUE` value for `use_current_session` is not permitted for the following types of jobs:

- Jobs that specify a destination or destination group in the `destination_name` attribute
- Jobs that point to chains (chain jobs)
- Jobs that make use of detached programs (detached jobs).

above bug fix 1261887 6.12.11

When `use_current_session` is `TRUE`, the call to `RUN_JOB` blocks until the job completes. Any errors that occur during the execution of the job are returned as errors to the `RUN_JOB` procedure.

Using `RUN_JOB` with `use_current_session=TRUE` does not update the job state and the job will not appear in `*_SCHEDULER_RUNNING_JOBS` views.

above bug fix 19185117 9.15.14

When `use_current_session` is `FALSE`, `RUN_JOB` returns immediately, and the job is picked up by the job coordinator process and passed on to a job secondary process for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use `RUN_JOB` in their sessions simultaneously when `use_current_session` is set to `TRUE`.

`RUN_JOB` requires that you own the job or have `ALTER` privileges on that job. You can also run a job if you have the `CREATE ANY JOB` privilege.

Example

The following is an example of using `RUN_JOB`.

```
BEGIN
  DBMS_SCHEDULER.RUN_JOB(
    JOB_NAME      => 'EODJOB, DSS.ETLJOB',
    USE_CURRENT_SESSION => FALSE);
END;
```

163.6.67 SET_AGENT_REGISTRATION_PASS Procedure

This procedure sets the agent registration password for a database.

A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (
  registration_password  IN VARCHAR2,
```

```

expiration_date      IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
max_uses             IN NUMBER DEFAULT NULL);

```

Parameters

Table 163-81 SET_AGENT_REGISTRATION_PASS Procedure Parameters

Parameter	Description
registration_password	This is the password that remote agents must specify in order to successfully register with the database. If this is NULL, then no agents will be able to register with the database.
expiration_date	If this is set to a non-NULL value, then the registration_password is not valid after this date. After this date, no agents can register with the database. This cannot be set to a date in the past.
max_uses	This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents can register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations.

Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the `MANAGE SCHEDULER` system privilege.

By default, `max_uses` is set to `NULL`, which means that there is no limit to the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to `NULL` if no new agents are being registered.

163.6.68 SET_ATTRIBUTE Procedure

This procedure modifies an attribute of a Scheduler object. It is overloaded to accept values of various types.

To set an attribute to `NULL`, use the `SET_ATTRIBUTE_NULL` procedure. The attributes that can be set depend on the object being altered. All object attributes can be changed, except the object name.

Syntax

```

DBMS_SCHEDULER.SET_ATTRIBUTE (
    name           IN VARCHAR2,
    attribute      IN VARCHAR2,
    value          IN {BOOLEAN|DATE|TIMESTAMP|
                     TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                     INTERVAL DAY TO SECOND});

```

```

DBMS_SCHEDULER.SET_ATTRIBUTE (
    name           IN VARCHAR2,
    attribute      IN VARCHAR2,
    value          IN VARCHAR2,

```

```
value2          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163-82 SET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object.
attribute	See Table 163-84 through Table 163-94 .
value	The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure.
value2	The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.

[Table 163-83](#) is a directory of Scheduler object types and tables of attributes for the object types.

These object types can be viewed with Scheduler Data Dictionary Views, listed in *Oracle Database Administrator's Guide*.

Table 163-83 Attribute Tables for Scheduler Object Types

Scheduler Object Type	Table of Attributes
Job	Table 163-84
Program	Table 163-86
Schedule	Table 163-87
File Watcher	Table 163-88
Job Class	Table 163-89
Window	Table 163-90
Chain	Table 163-91
Database Destination	Table 163-92
External Destination	Table 163-93
Group	Table 163-94
Credential	Table 163-95
Resource	Table 163-96

Usage Notes

If an object is altered and it was in the enabled state, the Scheduler first disables it, then makes the change and reenables it. If any errors are encountered during the enable process, the object is not reenabled and an error is generated.

If an object is altered and it was in the disabled state, it remains disabled after it is altered.

To run `SET_ATTRIBUTE` for a window, a group of type `WINDOW`, or job class, you must have the `MANAGE_SCHEDULER` privilege. Otherwise, you must be the owner of the object being altered or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

Job

If there is a running instance of the job when the `SET_ATTRIBUTE` call is made, it is not affected by the call. The change is only affects future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run is scheduled using the new schedule attributes. Schedule attributes of a job include `schedule_name`, `start_date`, `end_date`, and `repeat_interval`.

If any of the program attributes of a job are altered while the job is running, the new program attributes take effect the next time the job runs. Program attributes of a job include `program_name`, `job_action`, `job_type`, and `number_of_arguments`.

If any job argument values are altered while the job is running, the new values take effect the next time the job runs.

Granting the `ALTER` privilege on a job lets a user alter all attributes of that job except its program attributes (`program_name`, `job_type`, `job_action`, `program_action`, and `number_of_arguments`) and does not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column `SYSTEM` set to `TRUE` in job views.

Program

If any currently running jobs use the program that was altered, they continue to run with the program definition prior to the alter. The job runs with the new program definition the next time the job executes.

Schedule

If a schedule is altered, the change does not affect running jobs and open windows that use this schedule. The change only goes into effect the next time the jobs runs or the window opens.

File Watcher

If a file watcher is altered, any currently running event-based jobs started by the file arrival event are not affected. On the local system, the new file watcher attributes take effect the next time that the file watcher checks for the arrival of the file (every ten minutes by default). On remote systems, there may be an additional delay before the new file watcher attributes take effect.

Job Class

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the `MANAGE_SCHEDULER` privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet. Job Class names must be preceded by `SYS`.

Window

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan, when a window with a designated resource plan opens, the Resource Manager activates with that plan. Window names must be preceded by `SYS`.

Job Attribute Values

Table 163-84 lists attribute values for jobs.

Note:

See the `CREATE_JOB` procedure and the `CREATE_JOBS` procedure for more complete descriptions of the attributes in this table.

Table 163-84 Job Attribute Values

Name	Description
<code>allow_runs_in_restricted_mode</code>	If <code>TRUE</code> , the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode. <code>FALSE</code> by default.
<code>auto_drop</code>	This attribute, if <code>TRUE</code> , causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if: <ul style="list-style-type: none"> • Its end date (or the end date of the schedule) has passed. • It has run <code>max_runs</code> number of times. <code>max_runs</code> must be set with <code>SET_ATTRIBUTE</code>. • It is not a repeating job and has run once. A job is automatically disabled when it has failed <code>max_failures</code> times. <code>max_failures</code> is also set with <code>SET_ATTRIBUTE</code> . If this attribute is set to <code>FALSE</code> , the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the <code>DROP_JOB</code> procedure. By default, jobs are created with <code>auto_drop</code> set to <code>TRUE</code> .
<code>comments</code>	An optional comment.
<code>connect_credential_name</code>	feature 25230 This attribute may be set to point to a database credential. For a SQL*Plus or backup script job, the credential connects to the database before running the script. For other job types, it is ignored. The job owner must have execute privileges on the credential, otherwise the job fails. Using a <code>connect_credential_name</code> is recommended since it allows the password to be stored securely in a credential in the database rather than in plain view in the job, program action, or script.
<code>credential_name</code>	This attribute specifies the name of the credential object (credential) to use for a remote database job, a remote external job, a local external job, or an event-based job that processes a file arrival event. For local external jobs only, if this attribute is <code>NULL</code> (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.

Table 163-84 (Cont.) Job Attribute Values

Name	Description
database_role	<p>This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby.</p> <p>Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a database_role of 'PRIMARY', and the other with a database_role of 'LOGICAL STANDBY'.</p>
destination	<p>*** Deprecated in Oracle Database 11g Release 2. Use destination_name instead.</p> <p>This attribute specifies a host on which to run a remote external job. It must be set to the host name or IP address of the destination host. It can optionally be followed by a port number, in the following format:</p> <p><i>hostname:port</i></p> <p>This attribute is set to NULL by default.</p>
destination_name	<p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. For jobs running on the local database or for local external jobs (executables), must be NULL.</p> <p>See Table 163-28 for details about this attribute.</p>
end_date	<p>Specifies the date and time after which the job expires and is no longer run. After the end_date, if is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached.</p> <p>The value for end_date must be after the value for start_date. If end_date is less than start_date, then an error will be generated. If end_date is the same as start_date, then the job will not execute and no error will be generated.</p>
event_spec	<p>This attribute takes two values: the value argument specifies the event condition and the value2 argument specifies the queue specification. For more details, see the descriptions for the event_condition and queue_spec arguments in the "CREATE_JOB Procedure".</p>
follow_default_timezone	<p>If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.</p> <p>For example, if the job was set to run at 02:00 in the previous time zone, it will run at 02:00 in the new time zone.</p> <p>If the job start_date is not null, then the time zone for the run date and time for the job is always specified by the time zone of the start_date.</p> <p>If FALSE, the next start date and time for the job is not recomputed when the default_timezone scheduler attribute is changed. In this case, if the old time zone is three hours earlier than the new time zone, then a job scheduled to run at 02:00 in the old time zone runs at 05:00 in the new time zone.</p> <p>Summer and winter transitions do not change the default time zone name.</p>

Table 163-84 (Cont.) Job Attribute Values

Name	Description
instance_id	Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.
instance_stickiness	<p>This attribute should only be used for a database running in an Oracle Real Application Clusters (Oracle RAC) environment. By default, it is set to <code>TRUE</code>. If you set <code>instance_stickiness</code> to <code>TRUE</code>, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it does not start new jobs for a significant period of time, another instance runs the job. If the interval between runs is large, <code>instance_stickiness</code> is ignored and the job is handled as if it were a non-sticky job.</p> <p>If <code>instance_stickiness</code> is set to <code>FALSE</code>, each instance of the job runs on the first instance available.</p> <p>For environments other than Oracle RAC, this attribute is not useful because there is only one instance.</p>
job_action	The action that the job performs, depending on the <code>job_type</code> attribute. For example, if <code>job_type</code> is <code>'STORED_PROCEDURE'</code> , <code>job_action</code> contains the name of the stored procedure.
job_class	The class this job is associated with.
job_priority	<p>This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution.</p> <p>If no job priority is specified when creating a job, the default priority of 3 is assigned to it.</p>
job_type	<p>The type of this job. Valid values are: <code>'PLSQL_BLOCK'</code>, <code>'STORED_PROCEDURE'</code>, <code>'EXECUTABLE'</code>, <code>CHAIN</code>, <code>'EXTERNAL_SCRIPT'</code>, <code>'SQL_SCRIPT'</code>, and <code>'BACKUP_SCRIPT'</code>.</p> <p>If this is set, <code>program_name</code> must be <code>NULL</code>.</p>
job_weight	<p>*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1.</p> <p>Weight of the job for parallel execution.</p>

Table 163-84 (Cont.) Job Attribute Values

Name	Description
logging_level	<p>This attribute specifies how much information is logged. The possible options are:</p> <p><code>DBMS_SCHEDULER.LOGGING_OFF</code></p> <p>(The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur.</p> <p><code>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</code></p> <p>The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p><code>DBMS_SCHEDULER.LOGGING_RUNS</code></p> <p>The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p><code>DBMS_SCHEDULER.LOGGING_FULL</code></p> <p>In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with <code>SET_ATTRIBUTE</code>), stop, and so on.</p>
max_failures	<p>This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its <code>STATE</code> is set to <code>BROKEN</code> in the <code>*_SCHEDULER_JOB</code> views.</p> <p><code>max_failures</code> can be an integer between 1 to 1,000,000. By default, it is set to <code>NULL</code>, which indicates that new instances of the job are started regardless of how many previous instances have failed.</p>
max_run_duration	<p>This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is <code>INTERVAL DAY TO SECOND</code>. If this attribute is set to a non-zero and non-<code>NULL</code> value, and job duration exceeds this value, the Scheduler raises an event of type <code>JOB_OVER_MAX_DUR</code>. It is then up to your event handler to decide whether or not to allow the job to continue.</p>
max_runs	<p>This attribute specifies the maximum number of consecutive scheduled runs of the job. Once <code>max_runs</code> is reached, the job is disabled and its state is changed to <code>COMPLETED</code>.</p> <p><code>max_runs</code> can be an integer between 1 and 1,000,000. By default, it is set to <code>NULL</code>, which means that it repeats forever or until <code>end_date</code> or <code>max_failures</code> is reached.</p>
number_of_arguments	<p>The number of arguments if the program is inlined. If this is set, <code>program_name</code> should be <code>NULL</code>.</p>

Table 163-84 (Cont.) Job Attribute Values

Name	Description
parallel_instances	<p>This is a boolean attribute that can be set only for event-based jobs.</p> <p>If FALSE (the default), then if an event is raised and the event-based job that processes that event is already running, the new event is ignored.</p> <p>If TRUE, then an instance of the job is started for every instance of the event, and each job instance is a lightweight job so multiple instances of the same event-based job can run in parallel. Each lightweight job takes its attributes (such as action, maximum run duration, and so on) from the definition of the event-based job (its <i>parent job</i>). After the lightweight job completes, it is dropped. There is no explicit limit to the number of lightweight jobs that can run simultaneously to process multiple instances of the event. However, limitations may be imposed by available system resources.</p> <p>The lightweight jobs are not visible in any of the *_SCHEDULER_JOBS views. However, they are visible in the *_SCHEDULER_RUNNING_JOBS views. The name of each lightweight job is the same as that of the parent job, and a subname is automatically generated to distinguish each lightweight job from its parent and from its siblings.</p>
program_name	<p>The name of a program object to use with this job. If this is set, job_action, job_type and number_of_arguments should be NULL.</p>
raise_events	<p>This attribute tells the Scheduler at what stages of the job execution to raise events. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it.</p> <ul style="list-style-type: none"> • job_started CONSTANT PLS_INTEGER := 1 • job_succeeded CONSTANT PLS_INTEGER := 2 • job_failed CONSTANT PLS_INTEGER :=4 • job_broken CONSTANT PLS_INTEGER :=8 • job_completed CONSTANT PLS_INTEGER :=16 • job_stopped CONSTANT PLS_INTEGER :=32 • job_sch_lim_reached CONSTANT PLS_INTEGER :=64 • job_disabled CONSTANT PLS_INTEGER :=128 • job_chain_stalled CONSTANT PLS_INTEGER :=256 • job_all_events CONSTANT PLS_INTEGER := 511 • job_run_completed CONSTANT PLS_INTEGER := job_succeeded + job_failed + job_stopped <p>Table 163-85 describes these event types in detail.</p>
repeat_interval	<p>Either a PL/SQL function returning the next date and time on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See "Calendaring Syntax" for more information.</p>

Table 163-84 (Cont.) Job Attribute Values

Name	Description
restartable	<p>This attribute specifies whether or not a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to <code>FALSE</code>. Setting this to <code>TRUE</code> means that if a job fails while running, it is restarted from the beginning point of the job.</p> <p>In the case of a chain job, if this attribute is <code>TRUE</code>, the chain is restarted from the beginning after an application failure. If this attribute is <code>FALSE</code>, or if there has been a database failure, the chain is restarted at the last running step. The <code>restart_on_recovery</code> attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.)</p> <p>Note that setting this attribute to <code>TRUE</code> might lead to data inconsistencies in some situations, for example, if data is committed within a job.</p> <p>Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries.</p> <p>The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler retries the job a maximum of six times. The first time, it waits for one second and multiplies this wait time with a factor of 10 each time thereafter.</p> <p>Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1.</p> <p>The Scheduler stops retrying a job when:</p> <ul style="list-style-type: none"> • One of the retries succeeds. • All of its six retries have failed. • The next retry would occur after the next regularly scheduled run of the job. <p>The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.</p>
schedule_limit	<p>In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m.</p> <p>If <code>schedule_limit</code> is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log reflects the skipped run.</p>
schedule_name	<p>The name of a schedule, window, or group of type <code>WINDOW</code> to use as the schedule for this job. If this is set, <code>end_date</code>, <code>start_date</code> and <code>repeat_interval</code> should all be <code>NULL</code>.</p>
start_date	<p>The original date and time on which this job started or is scheduled to start. If this is set, <code>schedule_name</code> should be <code>NULL</code>.</p>

Table 163-84 (Cont.) Job Attribute Values

Name	Description
stop_on_window_close	<p>This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to <code>TRUE</code> implies that the job should stop once the associated window is closed. The job is stopped using the <code>stop_job</code> procedure with <code>force</code> set to <code>FALSE</code>.</p> <p>By default, <code>stop_on_window_close</code> is set to <code>FALSE</code>. Therefore, if you do not set this attribute, the job continues after the window closes.</p> <p>Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.</p>
store_output	<p>This is a boolean attribute. If set to <code>TRUE</code>, then for job runs that are logged, all job output and error messages are stored in the <code>*_JOB_RUN_DETAILS</code> views. If set to <code>FALSE</code>, then the output and messages are not stored. For new jobs, this is set, by default, to <code>TRUE</code>.</p>

The following event types are valid values for the `raise_events` attribute in [Table 163-84](#).

Table 163-85 Event Types Raised by the Scheduler

Event Type	Description
job_all_events	Not an event, but a constant that provides an easy way for you to enable all events
job_broken	The job has been disabled and has changed to the <code>BROKEN</code> state because it exceeded the number of failures defined by the <code>max_failures</code> job attribute
job_chain_stalled	A job running a chain is in the <code>CHAIN_STALLED</code> state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain <code>evaluation_interval</code> is set to <code>NULL</code> . No progress is made in the chain unless there is manual intervention.
job_completed	The job completed because it reached its <code>max_runs</code> or <code>end_date</code>
job_disabled	The job was disabled by the Scheduler or by a call to <code>SET_ATTRIBUTE</code>
job_failed	The job failed, either due to an error or an unusual termination.
job_over_max_dur	The job exceeded the maximum run duration specified by its <code>max_run_duration</code> attribute. (Note: you do not need to enable this event with the <code>raise_events</code> job attribute; it is always enabled.)
job_run_completed	A job run either failed, succeeded, or was stopped
job_sch_lim_reached	The schedule limit of the job was reached. The job was not started because the delay in starting the job exceeded the value of the <code>schedule_limit</code> job attribute.
job_started	The job started
job_stopped	The job was stopped by a call to <code>STOP_JOB</code>
job_succeeded	The job completed successfully

Program Attribute Values

[Table 163-86](#) lists program attribute values.

Note:

See the "[CREATE_PROGRAM Procedure](#)" for more complete descriptions of the attributes in this table.

Table 163-86 Program Attribute Values

Name	Description
comments	An optional comment. This can describe what the program does or give usage details.
detached	If TRUE, the program is a detached program. See <i>Oracle Database Administrator's Guide</i> for information about detached jobs and detached programs.
number_of_arguments	The number of arguments required by the stored procedure or other executable that the program invokes
program_action	The action that the program performs, indicated by the <code>program_type</code> attribute. For example, if <code>program_type</code> is 'STORED_PROCEDURE', <code>program_action</code> contains the name of the stored procedure.
program_type	The type of program. This must be one of these supported program types: 'PLSQL_BLOCK', 'STORED_PROCEDURE', and 'EXECUTABLE'.

Schedule Attribute Values

[Table 163-87](#) lists schedule attribute values.

Note:

See "[CREATE_SCHEDULE Procedure](#)" for more complete descriptions of the attributes in this table.

Table 163-87 Schedule Attribute Values

Name	Description
comments	An optional comment.
end_date	The cutoff date and time after which the schedule does not specify any dates.
event_spec	This attribute takes two values: the <code>value</code> argument should contain the event condition and the <code>value2</code> argument should contain the queue specification. For more details, see the descriptions for the <code>event_condition</code> and <code>queue_spec</code> arguments to the " CREATE_JOB Procedure ".
repeat_interval	An attribute specifying how often the schedule should repeat, using the calendaring syntax. See " Calendaring Syntax " for more information.
start_date	The start or reference date and time used by the calendaring syntax.

File Watcher Attribute Values

Table 163-88 lists file watcher attribute values.

Table 163-88 File Watcher Attribute Values

Parameter	Description
destination	Remote host name or IP address where the file is expected to arrive. If NULL, destination is the local host.
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.
file_name	Name of the file being looked for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.
credential_name	Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have the EXECUTE privilege on the credential. Cannot be NULL.
min_file_size	Minimum file size in bytes before the file watcher considers the file found. Default is 0.
steady_state_duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. If NULL, an internal value is used. The lower limit for this attribute is 10 seconds.
comments	Optional comment.

Job Class Attribute Values

Table 163-89 lists job class attribute values.

**Note:**

See the "[CREATE_JOB_CLASS Procedure](#)" for more complete descriptions of the attributes in this table.

Table 163-89 Job Class Attribute Values

Name	Description
comments	An optional comment about the class.
log_history	This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).

Table 163-89 (Cont.) Job Class Attribute Values

Name	Description
logging_level	<p>This attribute specifies how much information is logged. The valid values are:</p> <ul style="list-style-type: none"> DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs in the class that failed, with the reason for failure. DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. DBMS_SCHEDULER.LOGGING_FULL The Scheduler records all operations performed on all jobs in this class, in addition to recording every run of a job. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so on, an entry is recorded in the log.
resource_consumer_group	<p>The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See <i>Oracle Database Administrator's Guide</i> for a description of resource consumer groups and the Database Resource Manager.</p>
service	<p>The database service that the jobs in the job class have affinity to. If both the resource_consumer_group and service attributes are set for a job class, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence.</p>

Window Attribute Values

Table 163-90 lists window attribute values.

Note:

See the "[CREATE_WINDOW Procedure](#)" for more complete descriptions of the attributes in this table.

Table 163-90 Window Attribute Values

Name	Description
comments	An optional comment about the window.
duration	The duration of the window.
end_date	The date after which the window no longer opens. If this is set, schedule_name must be NULL.
repeat_interval	An attribute specifying how often the schedule should repeat, using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, schedule_name must be NULL. See " Calendaring Syntax " for more information.

Table 163-90 (Cont.) Window Attribute Values

Name	Description
resource_plan	<p>The resource plan to be associated with a window. When the window opens, the system switches to this resource plan. When the window closes, the original resource plan is restored. If a resource plan has been made active with the <i>force</i> option, no resource plan switch occurs.</p> <p>Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</p>
schedule_name	The name of a schedule to use with this window. If this is set, start_date, end_date, and repeat_interval must all be NULL.
start_date	The next date and time on which this window is scheduled to open. If this is set, schedule_name must be NULL.
window_priority	The priority of the window. Must be either 'LOW' (default) or 'HIGH'.

Chain Attribute Values

Table 163-91 lists chain attribute values.

**Note:**

See the "[CREATE_CHAIN Procedure](#)" for more complete descriptions of the attributes in this table.

Table 163-91 Chain Attribute Values

Name	Description
comments	An optional comment describing the purpose of the chain.
evaluation_interval	<p>If not NULL, provides an additional evaluation of the chain at this interval, as well as at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives)</p> <p>This attribute should only be used when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler, because the extra interval is CPU intensive. For most chains, the normal evaluation times are sufficient.</p>

Table 163-91 (Cont.) Chain Attribute Values

Name	Description
rule_set_name	<p>In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use <code>DEFINE_CHAIN_RULE</code> to add rules and <code>DROP_CHAIN_RULE</code> to remove them.</p> <p>Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form <code>SCHED_RULESET\${N}</code> and the evaluation context created is of the form <code>SCHED_EVCTX\${N}</code>.</p>

Database Destination Attribute Values

Table 163-92 lists database destination attribute values.

Note:

See the "[CREATE_DATABASE_DESTINATION Procedure](#)" for more complete descriptions of the attributes in this table.

Table 163-92 Database Destination Attribute Values

Name	Description
agent	<p>The name of the external destination (also known as agent destination) that is used to connect to the remote database.</p> <p>You can obtain valid external destination names from the view <code>ALL_SCHEDULER_EXTERNAL_DESTS</code>.</p>
connect_info	<p>The TNS connect descriptor that identifies the remote database to connect to, or the net service name (alias) in <code>tnsnames.ora</code> that resolves to the connect descriptor.</p> <p>Note: This corresponds to the <code>tns_name</code> argument of <code>CREATE_DATABASE_DESTINATION</code>.</p>
enabled	If <code>TRUE</code> , the database destination is enabled.
comments	An optional comment about the database destination.

External Destination Attribute Values

Table 163-93 lists external destination attribute values.

 **Note:**

External destinations are created only implicitly by registering a remote Scheduler agent with the local database.

Table 163-93 External Destination Attribute Values

Name	Description
hostname	(GET_ATTRIBUTE only) The fully qualified host name (including domain) or IP address of the computer on which the Scheduler agent resides.
port	(GET_ATTRIBUTE only) The TCP port number on which the agent listens.
ip_address	(GET_ATTRIBUTE only) The IP address of the host on which the agent resides.
enabled	If TRUE, the external destination is enabled.
comments	An optional comment about the external destination.

Group Attribute Values

Table 163-94 lists group attribute values.

 **Note:**

See the "[CREATE_GROUP Procedure](#)" for more complete descriptions of the attributes in this table.

Table 163-94 Group Attribute Values

Name	Description
group_type	(GET_ATTRIBUTE only) The group type (either WINDOW, DB_DEST, or EXTERNAL_DEST).
member_name	Comma-separated list of members. Replaces the existing list of members. To add one or more members to the existing list, use ADD_GROUP_MEMBER. Note: this attribute corresponds to the <code>member</code> argument of CREATE_GROUP.
enabled	If TRUE, the group is enabled.
comments	An optional comment about the group.
number_of_members	(GET_ATTRIBUTE only) The number of members in the group.

Credential Attribute Values

Table 163-95 lists credential attribute values.

 **Note:**

Credential attribute values for the `SET_ATTRIBUTE` and `GET_ATTRIBUTE` procedures are deprecated with Oracle Database Release 12c Release 1 (12.1). While these attribute values remain available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the `DBMS_CREDENTIAL` package, specifically the attribute parameter in the `UPDATE_CREDENTIAL Procedure`.

Table 163-95 Credential Attribute Values

Name	Description
username	The user name for logging into to the host operating system or remote Oracle database. Maximum length is 64.
password	The password for the user name. Maximum length is 128.
comments	A description of the credential. Maximum length is 240.
windows_domain	For a Windows remote executable target, this is the domain that the specified user belongs to. Maximum length is 64.
database_role	The value of the <code>database_role</code> attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: SYSDBA and SYSOPER.

Resource Attribute Values

[Table 163-96](#) lists resource attribute values.

Table 163-96 Resource Attribute Values

Name	Description
resource_name	The name of the resource
units	The number of units of this resource that the job or program uses.
status	The status of the resource. ENFORCE_CONSTRAINTS. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached, no additional jobs using this resource will get started. IGNORE_CONSTRAINTS. When set, the scheduler will ignore any constraints on this resource. BLOCKED_ALL_JOBS. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states.
constraint_level	Level of the constraint: JOB_LEVEL or PROGRAM_LEVEL For incompatibilities, for JOB_LEVEL, the incompatibility members must be jobs; for PROGRAM_LEVEL the incompatibility members must be programs.
comments	Descriptive comment about the resource.

163.6.69 SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of an object to `NULL`.

The attributes that can be set depend on the object being altered. If the object is enabled, it is disabled before being altered and reenabled afterward. If the object cannot be reenabled, an error is generated and the object is left in a disabled state.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2);
```

Parameters

Table 163-97 SET_ATTRIBUTE_NULL Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being changed

Usage Notes

To run `SET_ATTRIBUTE_NULL` for a window, group of type `WINDOW`, or job class, you must have the `MANAGE_SCHEDULER` privilege. Otherwise, you must be the owner of the object being altered or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

163.6.70 SET_JOB_ANYDATA_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an `AnyData` object.

It overrides any default value set for the program argument. `NULL` is a valid assignment for a program argument.

The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE_ANYDATA_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

`SET_JOB_ANYDATA_VALUE` is overloaded.

Syntax

Sets a program argument by its position.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
    job_name          IN VARCHAR2,
    argument_position IN PLS_INTEGER,
    argument_value    IN SYS.ANYDATA);
```

Sets a program argument by its name.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
  job_name          IN VARCHAR2,
  argument_name     IN VARCHAR2,
  argument_value    IN SYS.ANYDATA);
```

Parameters

Table 163-98 SET_JOB_ANYDATA_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be assigned to the program argument, encapsulated in an AnyData object

Usage Notes

SET_JOB_ANYDATA_VALUE requires that you own the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ANYDATA_VALUE does not apply to lightweight jobs because lightweight jobs cannot take AnyData arguments.

See Also:

- ["SET_JOB_ARGUMENT_VALUE Procedure"](#)
- ["DEFINE_ANYDATA_ARGUMENT Procedure"](#)

163.6.71 SET_JOB_ARGUMENT_VALUE Procedure

This procedure sets the value of an argument for a job.

It overrides any default value set for the corresponding program or stored procedure argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE_PROGRAM_ARGUMENT Procedure](#) or the [DEFINE_METADATA_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

SET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Sets an argument value by position:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_position  IN PLS_INTEGER,
  argument_value     IN VARCHAR2);
```

Sets an argument value by name:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2,
  argument_value     IN VARCHAR2);
```

Parameters

Table 163-99 SET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_VALUE procedure.

Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

SET_JOB_ARGUMENT_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

See Also:

- ["SET_JOB_ANYDATA_VALUE Procedure"](#)
- ["DEFINE_PROGRAM_ARGUMENT Procedure"](#)

163.6.72 SET_JOB_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

Syntax

```
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (
  jobattr_array      IN JOBATTR_ARRAY,
  commit_semantics   IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 163-100 SET_JOB_ATTRIBUTES Procedure Parameters

Parameter	Description
jobattr_array	The array of job attribute changes.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> • <code>STOP_ON_FIRST_ERROR</code> returns on the first error and commits previous successful attribute changes to disk. This is the default. • <code>TRANSACTIONAL</code> returns on the first error and rolls back everything that happened before that error. • <code>ABSORB_ERRORS</code> tries to absorb any errors and complete the rest of the job attribute changes on the list. It commits all the successful changes. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details.

Usage Notes

Calling `SET_ATTRIBUTE` on an enabled job disables the job, changes the attribute value, and reenables the job. `SET_JOB_ATTRIBUTES` changes the attribute values in the context of a single transaction.

163.6.73 SET_RESOURCE_CONSTRAINT Procedure

This procedure allows users to specify the resources used by jobs.

Syntax

```
DBMS_SCHEDULER.SET_RESOURCE_CONSTRAINT (
    object_name      IN VARCHAR2,
    resource_name    IN VARCHAR2,
    units            IN NUMBER DEFAULT 1);
```

Parameters

Table 163-101 SET_RESOURCE_CONSTRAINT Procedure Parameters

Parameter	Description
object_name	The name of a program or a job, or a comma separated list of these objects.
resource_name	The name of the resource.
units	The number of units of this resource that the job or program uses.

Usages Notes

`object_name` can be the name or comma-separated list of names of either programs or jobs. This creates a constraint on the named resource for these programs or jobs.

`units` specifies the number of units of the resource that the program or job can use. If `units` is set to 0, then the program or job does not use this resource anymore, and the

resulting constraint is deleted. Setting `units` to 0 on a resource with no previous constraint results in an error.

When multiple constraints are defined on the same resource, the object types must match. When one or more existing constraints for a resource are based on jobs and a new constraint is added for the same resource that is based on a program (or vice versa) an error will be raised.

163.6.74 SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately, depending on the attribute affected.

[Table 163-102](#) provides short attribute descriptions for the `SET_SCHEDULER_ATTRIBUTE` procedure. For complete descriptions, see section "Setting Scheduler Preferences" in *Oracle Database Administrator's Guide*.

Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (  
    attribute      IN VARCHAR2,  
    value          IN VARCHAR2);
```

Parameters

Table 163-102 SET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	<p>The name of the Scheduler attribute. Possible values are:</p> <ul style="list-style-type: none"> • 'default_timezone': Repeating jobs and windows that use the calendaring syntax retrieve the time zone from this attribute when start_date is not specified. See "Calendaring Syntax" for more information. • 'email_server': The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL. • 'email_sender': The default e-mail address of the sender of job state e-mail notifications. • 'email_server_credential': The schema and name of an existing credential object that SYS has execute object privileges on. Default is NULL. The username and password stored in this credential are used to authenticate with the e-mail server when sending e-mail notifications. • 'email_server_encryption': This attribute indicates whether or not encryption is enabled for this email server connection, and if so, at what point encryption starts, and with which protocol. Values are: <ul style="list-style-type: none"> – NONE: the default, indicating no encryption used – SSL_TLS: indicating that either SSL or TLS are used, from the beginning of the connection – STARTTLS: indicating that the connection starts unencrypted, but the command STARTTLS is sent to the e-mail server and starts encryption • 'event_expiry_time': The time, in seconds, before a job state event generated by the Scheduler expires from the Scheduler event queue. If NULL, job state events expire after 24 hours. • 'log_history': The number of days that log entries for both the job log and the window log are retained. Default is 30 and the range of valid values is 0 through 1000000. • 'max_job_slave_processes': This Scheduler attribute is not used.
value	The new value of the attribute

Usage Notes

To run SET_SCHEDULER_ATTRIBUTE, you must have the `MANAGE SCHEDULER` privilege.

See Also:

Oracle Database Administrator's Guide for more detailed descriptions of Scheduler attributes

163.6.75 STOP_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class.

After stopping the job, the state of a one-time job is set to `STOPPED`, whereas the state of a repeating job is set to `SCHEDULED` or `COMPLETED`, depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all running steps of the running chain are stopped.

If a job has multiple destinations, the database attempts to stop the job at all destinations.

For external jobs, `STOP_JOB` stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

For in-memory full jobs in an Oracle Real Application Clusters environment, `STOP_JOB` uses the `instance_id` attribute of the job definition to determine in which instance (or all of them if the attribute is left null) to stop the in-memory full job. (In-memory full jobs are kept cached in memory, and as such are limited to the instance currently caching them. Because of this, the same `job_name` can in some conditions be used for different jobs on different instances.)

Syntax

```
DBMS_SCHEDULER.STOP_JOB (
  job_name          IN VARCHAR2
  force             IN BOOLEAN DEFAULT FALSE
  commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 163-103 STOP_JOB Procedure Parameters

Parameter	Description
<code>job_name</code>	<p>Name of a job to stop. Can be a comma-separated list of jobs, where each entry can be one of the following:</p> <ul style="list-style-type: none"> Job name: the name of an existing job, optionally preceded by a schema name and dot separator. Job destination ID: a number, obtained from the <code>JOB_DEST_ID</code> column of the <code>*_SCHEDULER_JOB_DESTS</code> views, that represents the unique combination of a job, a credential, and a destination. Job class: the name of a job class. Must be preceded by the <code>SYS</code> schema name and a dot separator. <p>If you specify a job class, all jobs that belong to that job class are stopped. If you specify a job that was created with a destination group as its <code>destination_name</code> attribute, all job instances on all destinations are stopped.</p>

Table 163-103 (Cont.) STOP_JOB Procedure Parameters

Parameter	Description
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the secondary process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the Scheduler immediately terminates the secondary process. Oracle recommends that <code>STOP_JOB</code> with <code>force</code> set to <code>TRUE</code> be used only after a <code>STOP_JOB</code> with <code>force</code> set to <code>FALSE</code> has failed.</p> <p>Use of the <code>force</code> option requires the <code>MANAGE SCHEDULER</code> system privilege.</p>
<code>commit_semantics</code>	<p>The commit semantics. The following two types are supported:</p> <ul style="list-style-type: none">• <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and commits previous successful stop operations to disk. This is the default.• <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors, stops the rest of the jobs, and commits all the successful stop operations. This type is available only if no job classes are specified in the <code>job_name</code> list. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details.

Usage Notes

`STOP_JOB` without the `force` option requires that you be the owner of the job or have `ALTER` privileges on that job. You can also stop a job if you have the `CREATE ANY JOB` or `MANAGE SCHEDULER` privilege.

`STOP_JOB` with the `force` option requires that you have the `MANAGE SCHEDULER` privilege.

Example

The following is an example of using `STOP_JOB`.

```
BEGIN
  DBMS_SCHEDULER.STOP_JOB('DSS.ETLJOB', 984, 1223, SYS.ETL_JOBCLASS');
END;
```

DBMS_SEARCH

The `DBMS_SEARCH` package enables the indexing of multiple schema objects in a single index.

This Oracle Text package provides procedures and functions to create, maintain, and query a ubiquitous search index. Ubiquitous database search is a full-text and range-based search across multiple tables and views. To add data sources from different schemas to the index, the index owner must have `SELECT` and `DML` access to the sources.

A complete description of this package is available in *Oracle Text Reference*.

Related Topics

- [Oracle Text Reference](#)

DBMS_SERVER_ALERT

The `DBMS_SERVER_ALERT` package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- [Security Model](#)
- [Object Types](#)
- [Relational Operators](#)
- [Supported Metrics](#)
- [Summary of DBMS_SERVER_ALERT Subprograms](#)

165.1 DBMS_SERVER_ALERT Security Model

The user needs `DBA` or `IMP_FULL_DATABASE` roles to use the `DBMS_SERVER_ALERT` package.

165.2 DBMS_SERVER_ALERT Object Types

You qualify the metric by an individual object for the listed object types.

Table 165-1 Object Types Defined as Constants

Constant	Description
<code>OBJECT_TYPE_SYSTEM</code>	Metrics collected on the system level for each instance.
<code>OBJECT_TYPE_FILE</code>	Metrics collected on the file level. These are used for <code>AVG_FILE_READ_TIME</code> and <code>AVG_FILE_WRITE_TIME</code> metrics.
<code>OBJECT_TYPE_SERVICE</code>	Metrics collected on the service level. Currently <code>ELAPSED_TIME_PER_CALL</code> and <code>CPU_TIME_PER_CALL</code> are collected.
<code>OBJECT_TYPE_TABLESPACE</code>	Metrics collected on the tablespace level. Note: Dictionary managed tablespaces are not supported.
<code>OBJECT_TYPE_EVENT_CLASS</code>	Metrics collected on wait event class level. Currently supported metrics are <code>AVG_USERS_WAITING</code> and <code>DB_TIME_WAITING</code> .
<code>OBJECT_TYPE_SESSION</code>	Metrics collected on the session level. Currently only <code>BLOCKED_USERS</code> is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.
<code>OBJECT_TYPE_WRCCLIENT</code>	Refers to a group of metrics (<code>WCR_...</code>) used during replay to monitor the replay clients' performance

165.3 DBMS_SERVER_ALERT Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

Table 165-2 Relational Operators Defined as Constants

Constant	Description
OPERATOR_CONTAINS	A metric value matching an entry in a list of threshold values is considered a violation.
OPERATOR_DO_NOT_CHECK	The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric.
OPERATOR_EQ	A metric value equal to the threshold value is considered a violation.
OPERATOR_GE	A metric value greater than or equal to the threshold value is considered a violation.
OPERATOR_GT	A metric value greater than the threshold value is considered a violation.
OPERATOR_LE	A metric value less than or equal to the threshold value is considered a violation.
OPERATOR_LT	A metric value less than the threshold value is considered a violation.
OPERATOR_NE	A metric value not equal to the threshold value is considered a violation.

165.4 DBMS_SERVER_ALERT Supported Metrics

These metrics are supported. All internal metric names are supplied as package constants.

Table 165-3 List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
AVG_FILE_READ_TIME	Average File Read Time	Microseconds
AVG_FILE_WRITE_TIME	Average File Write Time	Microseconds
AVG_USERS_WAITING	Average Number of Users Waiting on a Class of Wait Events	Count of sessions
BLOCKED_USERS	Number of Users blocked by some Session	Number of Users
BRANCH_NODE_SPLITS_SEC	Branch Node Splits (for each second)	Splits for each Second
BRANCH_NODE_SPLITS_TXN	Branch Node Splits (for each transaction)	Splits for each Transaction
BUFFER_CACHE_HIT	Buffer Cache Hit (%)	% of cache accesses

Table 165-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
CONSISTENT_CHANGES_SEC	Consistent Changes (for each second)	Changes for each Second
CONSISTENT_CHANGES_TXN	Consistent Changes (for each transaction)	Changes for each Transaction
CONSISTENT_GETS_SEC	Consistent Gets (for each second)	Gets for each Second
CONSISTENT_GETS_TXN	Consistent Gets (for each transaction)	Gets for each Transaction
CR_BLOCKS_CREATED_SEC	CR Blocks Created (for each second)	Blocks for each Second
CR_BLOCKS_CREATED_TXN	CR Blocks Created (for each transaction)	Blocks for each Transaction
CR_RECORDS_APPLIED_SEC	CR Undo Records Applied (for each second)	Records for each Second
CR_RECORDS_APPLIED_TXN	CR Undo Records Applied (for each transaction)	Records for each Transaction
CURSOR_CACHE_HIT	Cursor Cache Hit (%)	% of soft parses
DATABASE_WAIT_TIME	Database Wait Time (%)	% of all database time
DATABASE_CPU_TIME	Database CPU Time (%)	% of all database time
DB_BLKGETS_SEC	DB Block Gets (for each second)	Gets for each Second
DB_BLKGETS_TXN	DB Block Gets (for each transaction)	Gets for each Transaction
DB_TIME_WAITING	Percent of Database Time Spent Waiting on a Class of Wait Events	% of Database Time
DBWR_CKPT_SEC	DBWR Checkpoints (for each second)	Checkpoints for each Second
DISK_SORT_SEC	Sorts to Disk (for each second)	Sorts for each Second
DISK_SORT_TXN	Sorts to Disk (for each transaction)	Sorts for each Transaction
ELAPSED_TIME_PER_CALL	Elapsed time for each user call for each service	Microseconds for each call
ENQUEUE_DEADLOCKS_SEC	Enqueue Deadlocks (for each second)	Deadlocks for each Second
ENQUEUE_DEADLOCKS_TXN	Enqueue Deadlocks (for each transaction)	Deadlocks for each Transaction
ENQUEUE_REQUESTS_SEC	Enqueue Requests (for each second)	Requests for each Second
ENQUEUE_REQUESTS_TXN	Enqueue Requests (for each transaction)	Requests for each Transaction
ENQUEUE_TIMEOUTS_SEC	Enqueue Timeouts (for each second)	Timeouts for each Second
ENQUEUE_TIMEOUTS_TXN	Enqueue Timeouts (for each transaction)	Timeouts for each Transaction
ENQUEUE_WAITS_SEC	Enqueue Waits (for each second)	Waits for each Second
ENQUEUE_WAITS_TXN	Enqueue Waits (for each transaction)	Waits for each Transaction
EXECUTE_WITHOUT_PARSE	Executes Performed Without Parsing	% of all executes
FULL_INDEX_SCANS_SEC	Fast Full Index Scans (for each second)	Scans for each Second

Table 165-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
FULL_INDEX_SCANS_TXN	Fast Full Index Scans (for each transaction)	Scans for each Transaction
GC_AVG_CR_GET_TIME	Global Cache CR Request	Milliseconds
GC_AVG_CUR_GET_TIME	Global Cache Current Request	Milliseconds
GC_BLOCKS_CORRUPT	Global Cache Blocks Corrupt	Blocks
GC_BLOCKS_LOST	Global Cache Blocks Lost	Blocks
HARD_PARSSES_SEC	Hard Parses (for each second)	Parses for each Second
HARD_PARSSES_TXN	Hard Parses (for each transaction)	Parses for each Transaction
LEAF_NODE_SPLITS_SEC	Leaf Node Splits (for each second)	Splits for each Second
LEAF_NODE_SPLITS_TXN	Leaf Node Splits (for each transaction)	Splits for each Transaction
LIBRARY_CACHE_HIT	Library Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_MISS	Library Cache Miss (%)	% of cache accesses
LOGONS_CURRENT	Current Number of Logons	Number of Logons
LOGONS_SEC	Cumulative Logons (for each second)	Logons for each Second
LOGONS_TXN	Cumulative Logons (for each transaction)	Logons for each Transaction
LONG_TABLE_SCANS_SEC	Scans on Long Tables (for each second)	Scans for each Second
LONG_TABLE_SCANS_TXN	Scans on Long Tables (for each transaction)	Scans for each Transaction
OPEN_CURSORS_SEC	Cumulative Open Cursors (for each second)	Cursors for each Second
MEMORY_SORTS_PCT	Sorts in Memory (%)	% of sorts
NETWORK_BYTES_SEC	Network Bytes, for each second	Bytes for each Second
OPEN_CURSORS_CURRENT	Current Number of Cursors	Number of Cursors
OPEN_CURSORS_TXN	Cumulative Open Cursors (for each transaction)	Cursors for each Transaction
OS_SCHED_CPU_WAIT_TIME	Operating System Scheduler CPU Wait (by time)	Microseconds
PARSE_FAILURES_SEC	Parse Failures (for each second)	Parses for each Second
PARSE_FAILURES_TXN	Parse Failures (for each transaction)	Parses for each Transaction
PGA_CACHE_HIT	PGA Cache Hit (%)	% bytes processed in PGA
PHYS_DESGN_WAIT_SCT	Physical Design Wait (by session count)	Count of sessions
PHYSICAL_READS_SEC	Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_TXN	Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_SEC	Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_TXN	Physical Writes (for each transaction)	Writes for each Transaction

Table 165-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
PHYSICAL_READS_DIR_SEC	Direct Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_DIR_TXN	Direct Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_DIR_SEC	Direct Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_DIR_TXN	Direct Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_LOB_SEC	Direct LOB Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_LOB_TXN	Direct LOB Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_LOB_SEC	Direct LOB Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_LOB_TXN	Direct LOB Physical Writes (for each transaction)	Writes for each Transaction
PROCESS_LIMIT_PCT	Process Limit Usage (%)	% of maximum value
PX_DOWNGRADED_SEC	Downgraded Parallel Operations (for each second)	Operations for each Second
PX_DOWNGRADED_25_SEC	Downgraded to 25% and more (for each second)	Operations for each Second
PX_DOWNGRADED_50_SEC	Downgraded to 50% and more (for each second)	Operations for each Second
PX_DOWNGRADED_75_SEC	Downgraded to 75% and more (for each second)	Operations for each Second
PX_DOWNGRADED_SER_SEC	Downgraded to serial (for each second)	Operations for each Second
RB_RECORDS_APPLIED_SEC	Rollback Undo Records Applied (for each second)	Records for each Second
RB_RECORDS_APPLIED_TXN	Rollback Undo Records Applied (for each transaction)	Records for each Transaction
REDO_ALLOCATION_HIT	Redo Log Allocation Hit	% of redo allocations
REDO_GENERATED_SEC	Redo Generated (for each second)	Redo Bytes for each Second
REDO_GENERATED_TXN	Redo Generated (for each transaction)	Redo Bytes for each Transaction
REDO_WRITES_SEC	Redo Writes (for each second)	Writes for each Second
REDO_WRITES_TXN	Redo Writes (for each transaction)	Writes for each Transaction
RECURSIVE_CALLS_SEC	Recursive Calls (for each second)	Calls for each Second
RECURSIVE_CALLS_TXN	Recursive Calls (for each transaction)	Calls for each Transaction
RESPONSE_TXN	Response (for each transaction)	Seconds for each Transaction
ROWS_PER_SORT	Rows Processed for each Sort	Rows for each Sort

Table 165-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
SESS_LOGICAL_READS_SEC	Session Logical Reads (for each second)	Reads for each Second
SESS_LOGICAL_READS_TXN	Session Logical Reads (for each transaction)	Reads for each Transaction
SESSION_CPU_SEC	Database CPU (for each second)	Microseconds for each Second
SESSION_CPU_TXN	Database CPU (for each transaction)	Microseconds for each Transaction
SESSION_LIMIT_PCT	Session Limit Usage (%)	% of maximum value
SHARED_POOL_FREE_PCT	Shared Pool Free(%)	% of shared pool
SOFT_PARSE_PCT	Soft Parse (%)	% of all parses
SQL_SRV_RESPONSE_TIME	Service Response (for each execution)	Seconds
TABLESPACE_PCT_FULL	Tablespace space usage	% full
TABLESPACE_BYT_FREE	Tablespace bytes space usage	Kilobytes free
TOTAL_TABLE_SCANS_SEC	Total Table Scans (for each second)	Scans for each Second
TOTAL_TABLE_SCANS_TXN	Total Table Scans (for each transaction)	Scans for each Transaction
TOTAL_INDEX_SCANS_SEC	Total Index Scans (for each second)	Scans for each Second
TOTAL_INDEX_SCANS_TXN	Total Index Scans (for each transaction)	Scans for each Transaction
TOTAL_PARSSES_SEC	Total Parses (for each second)	Parses for each Second
TOTAL_PARSSES_TXN	Total Parses (for each transaction)	Parses for each Transaction
USER_COMMITS_SEC	User Commits (for each second)	Commits for each Second
USER_COMMITS_TXN	User Commits (for each transaction)	Commits for each Transaction
USER_ROLLBACKS_SEC	User Rollbacks (for each second)	Rollbacks for each Second
USER_ROLLBACKS_TXN	User Rollbacks (for each transaction)	Rollbacks for each Transaction
USER_CALLS_SEC	User Calls (for each second)	Calls for each Second
USER_CALLS_TXN	User Calls (for each transaction)	Calls for each Transaction
USER_CALLS_PCT	User Calls (%)	% of all calls
USER_LIMIT_PCT	User Limit Usage (%)	% of maximum value
WCR_AVG_IO_LAT	Average IO response time (for a WRC client)	Milliseconds
WCR_PCPU	Percentage of replay threads on CPU (for a WRC client)	% of total replay threads
WCR_PIO	Percentage of replay threads doing IOs (for a WRC client)	% of total replay threads

165.5 Summary of DBMS_SERVER_ALERT Subprograms

This table lists the DBMS_SERVER_ALERT subprograms and briefly describes them.

Table 165-4 DBMS_SERVER_ALERT Package Subprograms

Subprogram	Description
EXPAND_MESSAGE Function	Expands alert messages
GET_THRESHOLD Procedure	Gets the current threshold settings for a specified metric
SET_THRESHOLD Procedure	Sets the warning and critical thresholds for a specified metric

165.5.1 EXPAND_MESSAGE Function

This function expands alert messages.

Syntax

```
DBMS_SERVER_ALERT.EXPAND_MESSAGE (
  user_language      IN  VARCHAR2,
  message_id        IN  NUMBER,
  argument_1        IN  VARCHAR2,
  argument_2        IN  VARCHAR2,
  argument_3        IN  VARCHAR2,
  argument_4        IN  VARCHAR2,
  argument_5        IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 165-5 EXPAND_MESSAGE Function Parameters

Parameter	Description
user_language	The language of the current session.
message_id	Id of the alert message
argument_1	The first argument in the alert message.
argument_2	The second argument in the alert message.
argument_3	The third argument in the alert message.
argument_4	The fourth argument in the alert message.
argument_5	The fifth argument in the alert message.

165.5.2 GET_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD (
  metrics_id        IN  BINARY_INTEGER,
  warning_operator  OUT BINARY_INTEGER,
  warning_value     OUT VARCHAR2,
  critical_operator  OUT BINARY_INTEGER,
  critical_value    OUT VARCHAR2,
  observation_period OUT BINARY_INTEGER,
  consecutive_occurrences OUT BINARY_INTEGER,
```

```

instance_name      IN  VARCHAR2,
object_type        IN  BINARY_INTEGER,
object_name        IN  VARCHAR2);

```

Parameters

Table 165-6 GET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See " Supported Metrics ".
warning_operator	The operator for the comparing the actual value with the warning threshold.
warning_value	The warning threshold value.
critical_operator	The operator for the comparing the actual value with the critical threshold.
critical_value	The critical threshold value.
observation_period	The period at which the metric values are computed and verified against the threshold setting.
consecutive_occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV\$INSTANCE View.
object_type	Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.
object_name	The name of the object.

Usage Notes

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid.

165.5.3 SET_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

Syntax

```

DBMS_SERVER_ALERT.SET_THRESHOLD(
  metrics_id          IN  BINARY_INTEGER,
  warning_operator    IN  BINARY_INTEGER,
  warning_value       IN  VARCHAR2,
  critical_operator   IN  BINARY_INTEGER,
  critical_value      IN  VARCHAR2,
  observation_period  IN  BINARY_INTEGER,
  consecutive_occurrences IN BINARY_INTEGER,
  instance_name       IN  VARCHAR2,
  object_type         IN  BINARY_INTEGER,
  object_name        IN  VARCHAR2);

```

Parameters

Table 165-7 SET_THRESHOLD Procedure Parameters

Parameter	Description
<code>metrics_id</code>	The internal name of the metric. See " Supported Metrics ".
<code>warning_operator</code>	The operator for the comparing the actual value with the warning threshold (such as <code>OPERATOR_GE</code>). See " Relational Operators ".
<code>warning_value</code>	The warning threshold value. This is <code>NULL</code> if no warning threshold is set. A list of values may be specified for <code>OPERATOR_CONTAINS</code> .
<code>critical_operator</code>	The operator for the comparing the actual value with the critical threshold. See " Relational Operators ".
<code>critical_value</code>	The critical threshold value. This is <code>NULL</code> if not set. A list of values may be specified for <code>OPERATOR_CONTAINS</code> .
<code>observation_period</code>	The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.
<code>consecutive_occurrences</code>	The number of observation periods the metric value should violate the threshold value before the alert is issued.
<code>instance_name</code>	The name of the instance for which the threshold is set. This is <code>NULL</code> for database-wide alerts.
<code>object_type</code>	See " Object Types ".
<code>object_name</code>	The name of the object. This is <code>NULL</code> for <code>SYSTEM</code> .

Usage Notes

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the `DBA_THRESHOLDS` view. The exception is the lower-case string 'database_wide' which is semantically equivalent to passing `NULL` for the instance name, the latter being the preferred usage.

DBMS_SERVICE

The `DBMS_SERVICE` package lets you create, delete, activate, and deactivate services for a single instance.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Procedures](#)
- [Exceptions](#)
- [Summary of DBMS_SERVICE Subprograms](#)

 **See Also:**

Oracle Real Application Clusters Administration and Deployment Guide for administering services in Oracle Real Application Clusters.

166.1 DBMS_SERVICE Overview

`DBMS_SERVICE` supports the workload management of high availability, quality of service, job scheduling, and other planned operations in the RDBMS for the purposes of workload measurement, management, prioritization, and XA and distributed transaction management.

Oracle Real Application Clusters (RAC) can manage service names across instances as administered through `SRVCTL`. The `DBMS_SERVICE` package allows the creation, deletion, starting, and stopping of services in a single instance. Additionally, it provides the ability to disconnect all sessions that connect to an instance with a service name.

 **See Also:**

For more information about Oracle Real Application Clusters, *Oracle Real Application Clusters Administration and Deployment Guide*.

166.2 DBMS_SERVICE Security Model

The `DBMS_SERVICE` package has certain security requirements.

Privileges

The client using this package must have the `ALTER SYSTEM` execution privilege and the `V$SESSION` table read privilege.

Schemas

This package must be installed under `SYS` schema.

Roles

The `EXECUTE` privilege of the package is granted to the `DBA` role only.

166.3 DBMS_SERVICE Constants

The `DBMS_SERVICE` package provides constants that can be used for specifying parameter values.

- Constants used in calling arguments are described in [Table 166-1](#)
- Constants used in connection balancing goal arguments are described in [Table 166-2](#)
- Constants used in TAF failover attribute arguments are described in [Table 166-3](#)

Table 166-1 Constants Used in Calling Arguments

Name	Type	Value	Description
<code>GOAL_NONE</code>	NUMBER	0	Disables Load Balancing Advisory
<code>GOAL_SERVICE_TIME</code>	NUMBER	1	Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service
<code>GOAL_THROUGHPUT</code>	NUMBER	2	Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service

Table 166-2 Constants Used in Connection Balancing Goal Arguments

Name	Type	Value	Description
<code>CLB_GOAL_SHORT</code>	NUMBER	1	Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either <code>goal_service_time</code> or <code>goal_throughput</code>). When <code>GOAL=NONE</code> (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization.

Table 166-2 (Cont.) Constants Used in Connection Balancing Goal Arguments

Name	Type	Value	Description
CLB_GOAL_LONG	NUMBER	2	Balances the number of connections for each instance using session count for each service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design.

Table 166-3 Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

Name	Type	Value	Description
FAILOVER_METHOD_NONE	VARCHAR2	0	Server side TAF is not enabled for this service
FAILOVER_METHOD_BASIC	VARCHAR2	1	Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time.
FAILOVER_TYPE_NONE	VARCHAR		Server side TAF type is NONE
FAILOVER_TYPE_SESSION	VARCHAR		Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF reconnects to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback.
FAILOVER_TYPE_SELECT	VARCHAR		Server side TAF failover type is SELECT
FAILOVER_RETRIES	NUMBER		Number of connection attempts when failover occurs. Specifies the number of times for Application Continuity and TAF to attempt the reconnect and re-authenticate pair. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) for Application Continuity is 30.
FAILOVER_RESTORE_NONE	CONSTANT VARCHAR2	NONE	The initial state is not restored before replaying for Application Continuity and TAF. This is recommended for OCI applications that use Application Continuity and build their own state in the request. For example, SQLPLUS.
FAILOVER_RESTORE_BASIC	VARCHAR2	LEVEL1	This is the recommended value for Java and ODP.NET applications using Application Continuity. The initial states that the user knows are restored automatically before replaying. If the user needs additional states, a callback must be registered.

Table 166-3 (Cont.) Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

Name	Type	Value	Description
FAILOVER_DELAY	NUMBER		Number of seconds delay between each connection attempt. This is the delay that Application Continuity and TAF waits if a reconnect and re-authentication fails. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) is 10s when using Application Continuity. Using FAILOVER_DELAY the failover can be delayed until the service is next available. This can work well in conjunction with a planned outage that may make a service temporarily unavailable (such as for several minutes).
STOP_OPTION_NONE	VARCHAR		Sessions are not disconnected.
STOP_OPTION_IMMEDIATE	VARCHAR		Sessions are disconnected immediately after the drain_timeout expires.
STOP_OPTION_TRANSACTIONAL	VARCHAR		Sessions are disconnected after the transactions during the drain_timeout. The sessions disconnect immediately when drain_timeout expires.
DYNAMIC	NUMBER		For Application Continuity, this parameter specifies whether the session state that is not transactional is changed by the application during request execution. A value of DYNAMIC is recommended for all applications. If you are in any doubt, or the application can be customized, you must use DYNAMIC.

Usage Notes

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF continues to re-attempt the connect and authentication as long as the callback returns a value of OCI_FO_RETRY. Any delay must be coded into the callback logic
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method defaults to BASIC. Delay and retries are optional and may be specified independently.

166.4 DBMS_SERVICE Operating Procedures

You cannot use the following procedures with Oracle Real Applications Clusterware, Oracle Restart, and Oracle Global Data Services.

- – [CREATE_SERVICE Procedure](#)
- [DELETE_SERVICE Procedure](#)
- [MODIFY_SERVICE Procedure](#)

- [START_SERVICE Procedure](#)
- [STOP_SERVICE Procedure](#)
- With Oracle Database 12c release 1, you are advised to use the parameter interface in all service-related subprograms.
- If you wish to use `DBMS_SERVICE` on a pluggable database (PDB) in a single instance, you must connect to that PDB first.

166.5 DBMS_SERVICE Exceptions

This table lists the exceptions raised by the `DBMS_SERVICE` package.

Table 166-4 DBMS_SERVICE Exceptions

Exception	Error Code	Description
<code>NULL_SERVICE_NAME</code>	44301	Service name argument was found to be NULL
<code>NULL_NETWORK_NAME</code>	44302	Network name argument was found to be NULL
<code>SERVICE_EXISTS</code>	44303	Service name already exists
<code>SERVICE_DOES_NOT_EXIST</code>	44304	Specified service does not exist
<code>SERVICE_IN_USE</code>	44305	Specified service was running
<code>SERVICE_NAME_TOO_LONG</code>	44306	Service name was too long
<code>NETWORK_PREFIX_TOO_LONG</code>	44307	Network name, excluding the domain, was too long
<code>NOT_INITIALIZED</code>	44308	Services layer was not yet initialized
<code>GENERAL_FAILURE</code>	44309	An unknown failure
<code>MAX_SERVICES_EXCEEDED</code>	44310	Maximum number of services has been reached
<code>SERVICE_NOT_RUNNING</code>	44311	Specified service was not running
<code>DATABASE_CLOSED</code>	44312	Database was closed
<code>INVALID_INSTANCE</code>	44313	Instance name argument was not valid
<code>NETWORK_EXISTS</code>	44314	Network name already exists
<code>NULL_ATTRIBUTES</code>	44315	All attributes specified were NULL
<code>INVALID_ARGUMENT</code>	44316	Invalid argument supplied
<code>DATABASE_READONLY</code>	44317	Database is open read-only
<code>MAX_SN_LENGTH</code>	44318	Total length of all running service network names exceeded the maximum allowable length
<code>ERR_AQ_SERVICE</code>	44319	Cannot delete AQ service
<code>ERR_GLB_SERVICE</code>	44320	Cannot delete global service
<code>ERR_INVALID_PDB_NAME</code>	44771	Invalid name for a pluggable database

Table 166-4 (Cont.) DBMS_SERVICE Exceptions

Exception	Error Code	Description
ERR_CRS_API	44772	Cluster ready services (CRS) operation failed
ERR_PDB_CLOSED	44773	Cannot perform requested service operation
ERR_PDB_INVALID	44774	Pluggable database attribute cannot be changed
ERR_PDB_NAME	44775	Pluggable database service cannot be created
ERR_PDB_EXP	44776	Pluggable database service cannot be deleted
ERR_PDB_FAIL	44777	Pluggable database service cannot be started

166.6 Summary of DBMS_SERVICE Subprograms

This table lists the DBMS_SERVICE subprograms and briefly describes them.

Table 166-5 DBMS_SERVICE Package Subprograms

Subprogram	Description
CREATE_SERVICE Procedure	Creates service
DELETE_SERVICE Procedure	Deletes service
DISCONNECT_SESSION Procedure	Disconnects sessions running under this service
MODIFY_SERVICE Procedure	Modifies service
START_SERVICE Procedure	Activates service
STOP_SERVICE Procedure	Stops service

166.6.1 CREATE_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

Note:

The service attribute values `FAILOVER_TYPE = TRANSACTION` with `SESSION_STATE_CONSISTENCY = STATIC` are no longer a supported service attribute combination.

In previous releases, you could use the service parameter `SESSION_STATE_CONSISTENCY` to manage session state automatically using **Application Continuity** by setting `SESSION_STATE_CONSISTENCY` to `DYNAMIC` or `STATIC`. However, starting with Oracle Database 23ai, you can no longer use the `STATIC` option. Instead, use one of the following failover options:

- `FAILOVER_TYPE = AUTO` with `SESSION_STATE_CONSISTENCY = AUTO`
- `FAILOVER_TYPE = TRANSACTION` with `SESSION_STATE_CONSISTENCY = DYNAMIC`

These configurations enforce session state tracking in Oracle Database, ensuring that session state is preserved at session migration and session failover.

Syntax

```
DBMS_SERVICE.CREATE_SERVICE(
    service_name          IN VARCHAR2,
    network_name          IN VARCHAR2,
    parameter_array       IN TABLE OF VARCHAR2(100));
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.CREATE_SERVICE(
    service_name          IN VARCHAR2,
    network_name          IN VARCHAR2,
    goal                  IN NUMBER DEFAULT NULL,
    dtp                   IN BOOLEAN DEFAULT NULL,
    true_cache_service    IN VARCHAR2,
    aq_ha_notifications   IN BOOLEAN DEFAULT NULL,
    failover_method        IN VARCHAR2 DEFAULT NULL,
    failover_type          IN VARCHAR2 DEFAULT NULL,
    failover_retries       IN NUMBER DEFAULT NULL,
    failover_delay         IN NUMBER DEFAULT NULL,
    clb_goal               IN NUMBER DEFAULT NULL,
    edition                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 166-6 CREATE_SERVICE Procedure Parameters

Parameter	Description
<code>service_name</code>	Name of the service, limited to 64 characters in the Data Dictionary

Table 166-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
network_name	Network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET service_names character set (see <i>Oracle Database Net Services Reference</i>).
parameter_array	Associative array with name-value pairs of the service attributes. Supported names: <ul style="list-style-type: none"> • goal • dtp • true_cache_service • aq_ha_notifications • failover_method • failover_type • failover_retries • failover_restore • failover_delay • clb_goal • edition • commit_outcome • reset_state • retention_timeout • replay_initiation_timeout • session_state_consistency • sql_translation_profile • drain_timeout • stop_option • placement_policy
goal	Workload management goal directive for the service. Valid values: <ul style="list-style-type: none"> • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE
dtp	Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)
true_cache_service	Name of the True Cache service being registered with the primary service.
aq_ha_notifications	Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity
failover_method	Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.
failover_type	TRANSACTION for Application Continuity. SELECT or BASIC for TAF.

Table 166-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
<code>failover_retries</code>	Number of connection retries for Application Continuity and TAF. Using the <code>failover_retries</code> and <code>failover_delay</code> parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.
<code>failover_delay</code>	Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with RAC when the service is already available.
<code>edition</code>	<p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have <code>USE</code> privilege on the edition, or the edition does not exist, this raises the error <code>ORA-38802 (edition does not exist)</code>.</p>
<code>drain_timeout</code>	If this parameter is defined, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The <code>drain_timeout</code> can be set on the service, so stopping and relocating drains for this time by default.
<code>stop_option</code>	<p>Provides options to terminate a session. The supported values are:</p> <ul style="list-style-type: none"> • <code>TRANSACTIONAL</code> <code>drain_timeout</code> applies to the transactions. After the <code>drain_timeout</code> expire, the sessions are immediately killed. • <code>IMMEDIATE</code> The sessions are killed after <code>drain_timeout</code> expires. • <code>NONE</code> Sessions are not terminated. <p>However, these parameter values can be overridden using the command line.</p>
<code>commit_outcome</code>	<p>Determines whether transaction <code>COMMIT</code> outcome is accessible after the <code>COMMIT</code> has executed. While the database guarantees that <code>COMMIT</code> is durable, this ensures that the outcome of the <code>COMMIT</code> is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:</p> <ul style="list-style-type: none"> • Invoking the GET_LTXID_OUTCOME Procedure of the <code>DBMS_APP_CONT</code> package requires that the <code>commit_outcome</code> attribute be set. • <code>commit_outcome</code> has no effect on active Data Guard and read-only databases. • <code>commit_outcome</code> is only allowed on the database service and on user-defined database services

Table 166-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
reset_state	Clears the session state usage between requests, so that each new request starts clean (usage web and stateless applications).
retention_timeout	Used in conjunction with <code>commit_outcome</code> , it determines the amount of time (in seconds) that the <code>COMMIT_OUTCOME</code> is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).
replay_initiation_timeout	For Application Continuity, <code>replay_initiation_timeout</code> is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.
session_state_consistency	Describes how nontransactional is changed during a request (DYNAMIC). This parameter is considered only if <code>failover_type</code> is set to <code>TRANSACTION</code> for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to <code>DYNAMIC</code> (default). Almost all applications should use <code>DYNAMIC</code> mode. If you are unsure, use <code>DYNAMIC</code> mode.
sql_translation_profile	Name of SQL translation profile.
clb_goal	Method used for Connection Load Balancing (see Table 166-2)
placement_policy	NUMBER Placement policy for the service. Possible values: <ul style="list-style-type: none"> • 0: PDB-NONE • 1: PDB-SINGLETON • 2: PDB-UNIFORM

 **Note:**

Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.example.com','ernie.example.com');

DECLARE
  params dbms_service.svc_parameter_array;
BEGIN
  params('TRUE_CACHE_SERVICE')      := 'C_SALES';
  params('FAILOVER_TYPE')           := 'TRANSACTION';
  params('REPLAY_INITIATION_TIMEOUT') := 1800;
  params('RETENTION_TIMEOUT')       := 86400;
  params('FAILOVER_DELAY')          := 10;
  params('FAILOVER_RETRIES')        := 30;
```

```

params('DRAIN_TIMEOUT')           :=60;
params('STOP_OPTION')              :='DBMS_SERVICE.STOP_OPTION_IMMEDIATE';
params('FAILOVER_RESTORE')         :='DBMS_SERVICE.FAILOVER_RESTORE_BASIC';
params('commit_outcome')           :='true';
params('aq_ha_notifications')      :='true';
DBMS_SERVICE.MODIFY_SERVICE('GOLD',params);
END;
```

166.6.2 DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

Note:

Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.DELETE_SERVICE(
    service_name IN VARCHAR2);
```

Parameters

Table 166-7 DELETE_SERVICE Procedure Parameters

Parameter	Description
<code>service_name</code>	Name of the service, limited to 64 characters in the Data Dictionary

Examples

```
DBMS_SERVICE.DELETE_SERVICE('ernie.example.com');
```

166.6.3 DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

```
DBMS_SERVICE.DISCONNECT_SESSION(
    service_name      IN VARCHAR2,
    disconnect_option IN NUMBER DEFAULT POST_TRANSACTION);
```

Parameters

Table 166-8 DISCONNECT_SESSION Procedure Parameters

Parameter	Description
<code>service_name</code>	Name of the service, limited to 64 characters in the Data Dictionary
<code>disconnect_option</code>	The options, package constants, are expressed as NUMBER: <ul style="list-style-type: none">• <code>POST_TRANSACTION = 0</code>: session disconnects after the current transaction commits or rolls back• <code>IMMEDIATE = 1</code>: session disconnects immediately• <code>NOREPLAY = 2</code>: session disconnects immediately and be flagged to not be replayed by application continuity, that is <code>IMMEDIATE</code> and <code>NOREPLAY</code> together Note: <code>IMMEDIATE</code> or <code>POST_TRANSACTION</code> and <code>NOREPLAY</code> is automatically translated as 1 or 0 or 2 respectively. However, passing a string literal (quoted using either the ' or " characters, such as "IMMEDIATE" or 'POST_TRANSACTION' or 'NOREPLAY') raises an error.

Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the `DBMS_JOB` package or put the SQL session in background if the caller does not want to wait for all corresponding sessions to be disconnected.

Examples

This disconnects sessions with `service_name 'ernie.example.com'`.

```
DBMS_SERVICE.DISCONNECT_SESSION('ernie.example.com');
```

If a service is using application continuity, and you do not want the sessions replayed but simply terminated, use the following:

```
EXECUTE DBMS_SERVICE.DISCONNECT_SESSION('service name', DBMS_SERVICE.NOREPLAY);
```

166.6.4 MODIFY_SERVICE Procedure

This procedure modifies an existing service.

Note:

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

Syntax

```
DBMS_SERVICE.MODIFY_SERVICE(
    service_name          IN VARCHAR2,
    parameter_array      IN svc_parameter_array);
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.MODIFY_SERVICE(
    service_name          IN VARCHAR2,
    goal                  IN NUMBER DEFAULT NULL,
    dtp                   IN BOOLEAN DEFAULT NULL,
    true_cache_service   IN VARCHAR2,
    aq_ha_notifications  IN BOOLEAN DEFAULT NULL,
    failover_method       IN VARCHAR2 DEFAULT NULL,
    failover_type         IN VARCHAR2 DEFAULT NULL,
    failover_retries     IN NUMBER DEFAULT NULL,
    failover_delay        IN NUMBER DEFAULT NULL,
    clb_goal              IN NUMBER DEFAULT NULL,
    edition               IN VARCHAR2 DEFAULT NULL,
    modify_edition        IN BOOLEAN DEFAULT FALSE;
```

Parameters

Table 166-9 MODIFY_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service, limited to 64 characters in the Data Dictionary

Table 166-9 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
parameter_array	<p>Associative array with name/value pairs of the service attributes. Supported names:</p> <ul style="list-style-type: none"> • goal • dtp • true_cache_service • aq_ha_notifications • failover_method • failover_type • failover_restore • failover_retries • failover_delay • drain_timeout • stop_option • edition • commit_outcome • retention_timeout • replay_initiation_timeout • session_state_consistency • sql_translation_profile • placement_policy
goal	<p>Workload management goal directive for the service. Valid values:</p> <ul style="list-style-type: none"> • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE
dtp	<p>Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)</p>
true_cache_service	<p>Name of the True Cache service being registered with the primary service.</p>
aq_ha_notifications	<p>Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity</p>
failover_method	<p>Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.</p>
failover_type	<p>Failover TYPE for the service for Application Continuity and TAF.</p>
failover_restore	<p>For Application Continuity, when the failover_restore parameter is set, the session states are restored before replaying for ODP.NET and Java. Use LEVEL1 for ODP.NET and Java with Application Continuity to restore the initial state.</p> <p>For AC OCI, use NONE for applications that are not STATIC.</p>

Table 166-9 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
<code>failover_retries</code>	Number of connection retries for Application Continuity and TAF. Using the <code>failover_retries</code> and <code>failover_delay</code> parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.
<code>failover_delay</code>	Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with Oracle RAC when the service is already available.
<code>drain_timeout</code>	When this parameter is set, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The <code>drain_timeout</code> can be set on the service, to stop and relocate drains for this time by default.
<code>edition</code>	<p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have <code>USE</code> privilege on the edition, or the edition does not exist, this raises the error <code>ORA-38802</code> (edition does not exist).</p>
<code>commit_outcome</code>	<p>Determines whether transaction <code>COMMIT</code> outcome is accessible after the <code>COMMIT</code> has executed. While the database guarantees that <code>COMMIT</code> is durable, this ensures that the outcome of the <code>COMMIT</code> is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:</p> <ul style="list-style-type: none"> Invoking the GET_LTXID_OUTCOME Procedure of the <code>DBMS_APP_CONT</code> package requires that the <code>commit_outcome</code> attribute be set. <code>commit_outcome</code> has no effect on active Data Guard and read-only databases. <code>commit_outcome</code> is allowed only on user-defined database services
<code>retention_timeout</code>	Used in conjunction with <code>commit_outcome</code> , it determines the amount of time (in seconds) that the <code>COMMIT_OUTCOME</code> is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).
<code>replay_initiation_timeout</code>	For Application Continuity, <code>replay_initiation_timeout</code> is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.

Table 166-9 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
session_state_consistency	Describes how nontransactional is changed during a request. This parameter is considered only if <code>failover_type</code> is set to <code>TRANSACTION</code> for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to <code>DYNAMIC</code> (default). Almost all applications should use <code>DYNAMIC</code> mode. If you are unsure, use <code>DYNAMIC</code> mode.
sql_translation_profile	Name of SQL translation profile.
modify_edition	If <code>TRUE</code> , the edition service attribute is updated to use the edition argument value. If <code>FALSE</code> or <code>NULL</code> , the edition attribute is not updated.
clb_goal	Method used for Connection Load Balancing (see Table 166-2)
placement_policy	NUMBER Placement policy for the service. Possible values: <ul style="list-style-type: none"> • 0: PDB-NONE • 1: PDB-SINGLETON • 2: PDB-UNIFORM

 **Note:**

Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

Usage Notes

- If you are using Clustered Managed Services with Oracle Clusterware, or using Oracle Restart with your single instance database, you must modify services using the `srvctl` command rather than `DBMS_SERVICE`. When the service is started by Oracle Clusterware or Oracle Restart, the service is modified in the database to match the resource defined to either Oracle Clusterware or Oracle Restart. Any changes made with `DBMS_SERVICE` are lost unless they are also made with the corresponding `srvctl` command. Starting with 11.2.0.2, service attribute modifications take effect immediately when the service is started or modified by `srvctl`.
- Although users can modify the edition attribute while the service is up and running, it may not be safe to do so. Users must proceed with caution because this causes new connections to be connected at the new edition, while the existing connection is not affected. This can cause mid-tier operations to connect to the wrong edition.

166.6.5 START_SERVICE Procedure

This procedure starts a service. In Oracle RAC, implementing this option acts on the instance specified.

Note:

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.START_SERVICE(  
    service_name IN VARCHAR2,  
    instance_name IN VARCHAR2);
```

Parameters

Table 166-10 START_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service limited to 64 characters in the Data Dictionary
instance_name	Name of the instance where the service must be activated (optional). NULL results in starting of the service on the local instance. In single instance, this can only be the current instance or NULL. Specify DBMS_SERVICE.ALL_INSTANCES to start the service on all configured instances.

Examples

```
DBMS_SERVICE.START_SERVICE('ernie.example.com');
```

166.6.6 STOP_SERVICE Procedure

This procedure stops a service.

Note:

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.STOP_SERVICE(  
    service_name IN VARCHAR2,  
    instance_name IN VARCHAR2 DEFAULT NULL,  
    stop_option IN VARCHAR2 DEFAULT NULL,
```

```

drain_timeout IN NUMBER    DEFAULT NULL,
replay       IN BOOLEAN   DEFAULT TRUE);

```

Parameters

Table 166-11 STOP_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service limited to 64 characters in the Data Dictionary
instance_name	Name of the instance where the service must be stopped (optional). NULL results in stopping of the service locally. In single instance, this can only be the current instance or NULL. The default in Oracle RAC and exclusive case is NULL. Specify DBMS_SERVICE.ALL_INSTANCES to stop the service on all configured instances.
stop_option	To specify how sessions are stopped with draining. The possible values are as follows: <ul style="list-style-type: none"> IMMEDIATE: sessions are aborted immediately after the time specified in drain_timeout. TRANASCTIONAL: applies for transactions. After the transaction expires, the sessions are immediately terminated. NONE: sessions are not terminated. These values can be overridden on the command line using SRVCTL.
drain_timeout	The time in seconds for the session to drain.
replay	Enable application continuity replay.

Examples

```
DBMS_SERVICE.STOP_SERVICE('ernie.example.com');
```

167

DBMS_SESSION

This package provides access to `SQL ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_SESSION Subprograms](#)

167.1 DBMS_SESSION Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

167.2 DBMS_SESSION Operational Notes

You should not attempt to turn `close_cached_open_cursors` on or off.

167.3 DBMS_SESSION Data Structures

The `DBMS_SESSION` package defines `TABLE` types.

Table Types

- [INTEGER_ARRAY Table Type](#)
- [LNAME_ARRAY Table Type](#)

167.3.1 DBMS_SERVICE INTEGER_ARRAY Table Type

`INTEGER_ARRAY` is a table type of `BINARY_INTEGER`.

Syntax

```
TYPE integer_array IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

167.3.2 DBMS_SERVICE LNAME_ARRAY Table Type

`LNAME_ARRAY` is a table type of `VARCHAR2`.

Syntax

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

167.4 Summary of DBMS_SESSION Subprograms

This table lists the DBMS_SESSION subprograms in alphabetical order and briefly describes them.

Table 167-1 DBMS_SESSION Package Subprograms

Subprogram	Description
CLEAR_ALL_CONTEXT Procedure	Clears all context information.
CLEAR_ALL_LOCAL_CONTEXTS Procedure	Clears all session based application context values that are set in the current session.
CLEAR_CONTEXT Procedure	Clears the context.
CLEAR_IDENTIFIER Procedure	Clears the identifier.
CLOSE_DATABASE_LINK Procedure	Closes database link.
CURRENT_IS_ROLE_ENABLED Function	Determines if the named role is currently enabled.
FREE_UNUSED_USER_MEMORY Procedure	Lets you reclaim unused memory after performing operations requiring large amounts of memory.
GET_PACKAGE_MEMORY_UTILIZATION Procedure	Describes static package memory usage.
IS_ROLE_ENABLED Function	Determines if the named role is enabled for the session.
IS_SESSION_ALIVE Function	Determines if the specified session is active.
LIST_CONTEXT Procedures	Returns a list of active namespace and context for the current session.
MODIFY_PACKAGE_STATE Procedure	Used to perform various actions (as specified by the <code>action_flags</code> parameter) on the session state of all PL/SQL program units active in the session.
RESET_PACKAGE Procedure	De-instantiates all packages in the session.
SESSION_IS_ROLE_ENABLED Function	Determines if the named role is enabled at the session level.
SESSION_TRACE_DISABLE Procedure	Resets the session-level SQL trace for the session from which it was called.
SESSION_TRACE_ENABLE Procedure	Enables session-level SQL trace for the invoking session.
SET_CONTEXT Procedure	Sets or resets the value of a context attribute.
SET_EDITION_DEFERRED Procedure	Requests a switch to the specified edition.
SET_IDENTIFIER Procedure	Sets the identifier.
SET-NLS Procedure	Sets Globalization Support (NLS).
SET_ROLE Procedure	Sets role.
SET_SQL_TRACE Procedure	Turns tracing on or off.
SLEEP Procedure	Suspends the session for a specified period of time.
SWITCH_CURRENT_CONSUMER_GROUP Procedure	Facilitates changing the current resource consumer group of a user's current session.

Table 167-1 (Cont.) DBMS_SESSION Package Subprograms

Subprogram	Description
UNIQUE_SESSION_ID Function	Returns an identifier that is unique for all sessions currently connected to this database.

167.4.1 CLEAR_ALL_CONTEXT Procedure

This procedure clears application context information in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT
(namespace VARCHAR2);
```

Parameters

Table 167-2 CLEAR_ALL_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace where the application context information is to be cleared. Required.

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

167.4.2 CLEAR_ALL_LOCAL_CONTEXTS Procedure

This procedure clears all session-based application context values that are set in the current session and are initialized locally, externally, and globally, but cannot be accessed globally.

Syntax

```
DBMS_SESSION.CLEAR_ALL_LOCAL_CONTEXTS;
```

Usage Notes

Any public user with the CLEAR ALL LOCAL CONTEXTS privilege can execute this procedure. If a user without the CLEAR ALL LOCAL CONTEXTS privilege executes this procedure, it fails with the following error:

```
ORA-01056: User $USER_NAME does not have CLEAR ALL LOCAL CONTEXTS privilege
```

167.4.3 CLEAR_CONTEXT Procedure

This procedure clears application context in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
  namespace      VARCHAR2,
  client_identifier VARCHAR2
  attribute      VARCHAR2);
```

Parameters

Table 167-3 CLEAR_CONTEXT Procedure Parameters

Parameter	Description
namespace	<p>Namespace in which the application context is to be cleared. Required.</p> <p>For a session-local context, namespace must be specified. If namespace is defined as Session Local Context, then client_identifier is optional since it is only associated with a globally accessed context.</p> <p>For a globally accessed context, namespace must be specified. NULL is a valid value for client_identifier because a session with no identifier set can see a context that looks like the (namespace, attribute, value, username, null) set using SET_CONTEXT.</p>
client_identifier	Applies to a global context and is optional for other types of contexts; 64-byte maximum
attribute	Specific attribute in the namespace to be cleared. Optional. the default is NULL. If you specify attribute as NULL, then (namespace, attribute, value) for that namespace are cleared from the session. If attribute is not specified, then all context information that has the namespace and client_identifier arguments is cleared.

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

167.4.4 CLEAR_IDENTIFIER Procedure

This procedure removes the set_client_id in the session.

Syntax

```
DBMS_SESSION.CLEAR_IDENTIFIER;
```

Usage Notes

This procedure is executable by public.

167.4.5 CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement:
`ALTER SESSION CLOSE DATABASE LINK <name>`

Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (  
    dblink VARCHAR2);
```

Parameters

Table 167-4 CLOSE_DATABASE_LINK Procedure Parameters

Parameter	Description
dblink	Name of the database link to close

167.4.6 CURRENT_IS_ROLE_ENABLED Function

This function determines if the named role is currently enabled.

Syntax

```
DBMS_SESSION.CURRENT_IS_ROLE_ENABLED (  
    rolename VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 167-5 CURRENT_IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.

Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

167.4.7 FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

**Note:**

This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

Syntax

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server:** This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server:** This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies. They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared. After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed

table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure `FREE_UNUSED_USER_MEMORY`.

```
CREATE PACKAGE foobar
  type number_idx_tbl is table of number indexed by binary_integer;

  store1_table number_idx_tbl;    -- PL/SQL indexed table
  store2_table number_idx_tbl;    -- PL/SQL indexed table
  store3_table number_idx_tbl;    -- PL/SQL indexed table
  ...
END;                                -- end of foobar

DECLARE
  ...
  empty_table number_idx_tbl;    -- uninitialized ("empty") version
BEGIN
  FOR i in 1..1000000 loop
    store1_table(i) := i;        -- load data
  END LOOP;
  ...
  store1_table := empty_table;   -- "truncate" the indexed table
  ...
  -
  dbms_session.free_unused_user_memory; -- give memory back to system

  store1_table(1) := 100;        -- index tables still declared;
  store2_table(2) := 200;        -- but truncated.
  ...
END;
```

167.4.8 GET_PACKAGE_MEMORY_UTILIZATION Procedure

This procedure describes static package memory usage.

The output collections describe memory usage in each instantiated package. Each package is described by its owner name, package name, used memory amount, and unused allocated memory amount. The amount of unused memory is greater than zero because of memory fragmentation and also because once used free memory chunks initially go to a free list owned by the package memory heap. They are released back to the parent heap only when the [FREE_UNUSED_USER_MEMORY Procedure](#) is invoked.

Syntax

```
DBMS_SESSION.GET_PACKAGE_MEMORY_UTILIZATION (
  owner_names OUT NOCOPY LNAME_ARRAY,
  unit_names  OUT NOCOPY LNAME_ARRAY,
  unit_types  OUT NOCOPY INTEGER_ARRAY,
```

```
used_amounts    OUT NOCOPY INTEGER_ARRAY,
free_amounts    OUT NOCOPY INTEGER_ARRAY);
```

Parameters

Table 167-6 GET_PACKAGE_MEMORY_UTILIZATION Function Parameters

Parameter	Description
owner_name	Owner of package
unit_name	Name of package
unit_types	Value of the type# columns of the dictionary table obj\$
used_amounts	Amount of allocated memory specified in bytes
free_amounts	Amount of available memory specified in bytes

167.4.9 IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

Note:

This function is deprecated starting in Oracle Database 19c. Use `DBMS_SESSION.CURRENT_IS_ROLE_ENABLED` or `DBMS_SESSION.SESSION_IS_ROLE_ENABLED` instead.

Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (
    rolename    VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 167-7 IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.\

Return Values

Table 167-8 IS_ROLE_ENABLED Function Return Values

Return	Description
is_role_enabled	TRUE or FALSE, depending on whether the role is enabled

167.4.10 IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

```
DBMS_SESSION.IS_SESSION_ALIVE (
    uniqueid VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 167-9 IS_SESSION_ALIVE Function Parameters

Parameter	Description
uniqueid	Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID.

Return Values

Table 167-10 IS_SESSION_ALIVE Function Return Values

Return	Description
is_session_alive	TRUE or FALSE, depending on whether the session is active

167.4.11 LIST_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

Syntax

```
TYPE AppCtxRecTyp IS RECORD (
    namespace VARCHAR2(30),
    attribute VARCHAR2(30),
    value      VARCHAR2(256));

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
    list OUT AppCtxTabTyp,
    size OUT NUMBER);
```

Parameters

Table 167-11 LIST_CONTEXT Procedure Parameters

Parameter	Description
list	Buffer to store a list of application context set in the current session

Return Values

Table 167-12 LIST_CONTEXT Procedure Return Values

Return	Description
list	A list of (namespace, attribute, values) set in current session
size	Returns the number of entries in the buffer returned

Usage Notes

The context information in the list appears as a series of <namespace> <attribute> <value>. Because `list` is a table type variable, its size is dynamically adjusted to the size of returned list.

167.4.12 MODIFY_PACKAGE_STATE Procedure

This procedure is used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running.

The procedure uses the `DBMS_SESSION` constants listed in [Table 167-14](#).

Syntax

```
DBMS_SESSION.MODIFY_PACKAGE_STATE(  
    action_flags IN PLS_INTEGER);
```

Parameters

Table 167-13 MODIFY_PACKAGE_STATE Procedure Parameters

Parameter	Description
<code>action_flags</code>	<p>Bit flags that determine the action taken on PL/SQL program units:</p> <p><code>DBMS_SESSION.FREE_ALL_RESOURCES</code> (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstantiated and package globals are reinitialized. Invoking <code>MODIFY_PACKAGE_STATE</code> with the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> parameter provides functionality identical to the <code>DBMS_SESSION.RESET_PACKAGE()</code> interface.</p> <p><code>DBMS_SESSION.REINITIALIZE</code> (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the <code>DBMS_SESSION.REINITIALIZE</code> flag is similar to the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> flag in that both have the effect of reinitializing all packages.</p> <p>However, <code>DBMS_SESSION.REINITIALIZE</code> should exhibit better performance than the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> option because:</p> <ul style="list-style-type: none"> • Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused. • Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use. • The session memory for PL/SQL modules without global state (such as types, stored-procedures) are not freed and recreated.

Usage Notes

See the parameter descriptions in [Table 167-16](#) for the differences between the flags and why `DBMS_SESSION.REINITIALIZE` exhibits better performance than `DBMS_SESSION.FREE_ALL_RESOURCES`.

Table 167-14 Action_flags Constants for MODIFY_PACKAGE_STATE

Constant	Description
<code>FREE_ALL_RESOURCES</code>	<code>PLS_INTEGER:= 1</code>
<code>REINITIALIZE</code>	<code>PLS_INTEGER:= 2</code>

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```
package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
  cursor c is select * from emp;
  procedure bar;
end P;
/
package body P is
  v varchar2(20) := 'hello';
  procedure bar is
  begin
    ...
  end;
  procedure init_pkg is
  begin
    ....
  end;
begin
  -- initialization block
  init_pkg;
  ...
  ...
end P;
/
```

For the package P, reinitialization involves:

- Setting P.n to NULL
- Invoking function P2.foo and setting P.m to the value returned from P2.foo
- Setting P.d to the return value of SYSDATE built-in
- Closing cursor P.c if it was previously opened
- Setting P.v to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.
- When using FREE_ALL_RESOURCES or REINITIALIZE, make sure that resetting package variable values does not affect the application.
- Because DBMS_SESSION.REINITIALIZE does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the FREE_ALL_RESOURCES flag or the RESET_PACKAGE procedure had been used. For instance, after performing DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE), if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages remains until the end of the session (or until DBMS_SESSION.RESET_PACKAGE is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE) does not compile on the client because it uses the constant DBMS_SESSION.REINITIALIZE.

Instead, use `DBMS_SESSION.MODIFY_PACKAGE_STATE(2)` on the client, because the argument is explicitly provided.

Examples

This example illustrates the use of `DBMS_SESSION.MODIFY_PACKAGE_STATE`. Consider a package `P` with some global state (a cursor `c` and a number `cnt`). When the package is first initialized, the package variable `cnt` is 0 and the cursor `c` is `CLOSED`. Then, in the session, change the value of `cnt` to 111 and also execute an `OPEN` operation on the cursor. If you call `print_status` to display the state of the package, you see that `cnt` is 111 and that the cursor is `OPEN`. Next, call `DBMS_SESSION.MODIFY_PACKAGE_STATE`. If you print the status of the package `P` again using `print_status`, you see that `cnt` is 0 again and the cursor is `CLOSED`. If the call to `DBMS_SESSION.MODIFY_PACKAGE_STATE` had not been made, then the second `print_status` would have printed 111 and `OPEN`.

```
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
  begin
    dbms_output.put_line('P.cnt = ' || cnt);
    if c%ISOPEN then
      dbms_output.put_line('P.c is OPEN');
    else
      dbms_output.put_line('P.c is CLOSED');
    end if;
  end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
  2  P.cnt := 111;
  3  open p.c;
  4  P.print_status;
  5  end;
  6  /
P.cnt = 111
P.c is OPEN

PL/SQL procedure successfully completed.

SQL> begin
  2  dbms_session.modify_package_state(dbms_session.reinitialize);
  3  end;
  4  /

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
SQL>
SQL> begin
  2  P.print_status;
```

```
3 end;  
4 /  
P.cnt = 0  
P.c is CLOSED
```

PL/SQL procedure successfully completed.

167.4.13 RESET_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

Note:

See "[SESSION_TRACE_ENABLE Procedure](#)". The `MODIFY_PACKAGE_STATE` interface, introduced in Oracle9i, provides an equivalent of the `RESET_PACKAGE` capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to `RESET_PACKAGE` frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

`RESET_PACKAGE` can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. `RESET_PACKAGE` guarantees that all package variables are reset to their initial values.

Syntax

```
DBMS_SESSION.RESET_PACKAGE;
```

Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use `RESET_PACKAGE` to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values does not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

`RESET_PACKAGE` does not free the memory, cursors, and package variables immediately when called.

**Note:**

RESET_PACKAGE only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls RESET_PACKAGE. The RESET_PACKAGE effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).

Examples

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

167.4.14 SESSION_IS_ROLE_ENABLED Function

This function determines if the named role is enabled for the login user session.

Syntax

```
DBMS_SESSION.SESSION_IS_ROLE_ENABLED (  
    rolename    VARCHAR2)  
    RETURN BOOLEAN;
```

Parameters

Table 167-15 SESSION_IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.

Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

167.4.15 SESSION_TRACE_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

Syntax

```
DBMS_SESSION.SESSION_TRACE_DISABLE;
```

167.4.16 SESSION_TRACE_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE (
    waits      IN   BOOLEAN DEFAULT TRUE,
    binds      IN   BOOLEAN DEFAULT FALSE,
    plan_stat  IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 167-16 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
waits	Specifies if wait information is to be traced
binds	Specifies if bind information is to be traced
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

167.4.17 SET_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of the five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

Syntax

```
DBMS_SESSION.SET_CONTEXT (
    namespace VARCHAR2,
    attribute  VARCHAR2,
    value      VARCHAR2,
    username   VARCHAR2,
    client_id  VARCHAR2 );
```

Parameters

Table 167-17 SET_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace of the application context to be set, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure.
attribute	The attribute of the application context to be set, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure.
value	Value of the application context to be set, limited to 4 kilobytes.
username	Database username attribute of the application context, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure. The default value is NULL.
client_id	Application-specific client_id attribute of the application context, limited to 64 bytes. The default value is NULL.

Usage Notes

- The first three parameters are required for all types of context.
- The `username` parameter must be a valid SQL identifier.
- The `client_id` parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for `set_identifier`.
- If the `namespace` parameter is a global context namespace, then the `username` parameter is matched against the current database user name in the session, and the `client_id` parameter is matched against the current `client_id` in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package.
- The caller of SET_CONTEXT must be in the calling stack of a procedure that has been associated to the context namespace through a CREATE CONTEXT statement. The checking of the calling stack does not cross a DBMS boundary.
- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.
- If the value of the parameter in the namespace has been set, SET_CONTEXT overwrites this value.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

 **See Also:**

Oracle Database Security Guide for more information about

- "Setting the username and client ID"
- "Example: Creating a Global Application Context that Uses a Client Session ID"

167.4.18 SET_EDITION_DEFERRED Procedure

This procedure requests a switch to the specified edition. The switch takes effect at the end of the current client call.

Syntax

```
DBMS_SESSION.SET_EDITION_DEFERRED (
    edition    IN    VARCHAR2);
```

Parameters

Table 167-18 SET_EDITION_DEFERRED Procedure Parameters

Parameter	Description
edition	Name of the edition to which to switch. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lower case characters are present in the edition's actual name and, if double quotation marks are not used, the contents are set in uppercase. The caller must have <code>USE</code> privilege on the named edition.

167.4.19 SET_IDENTIFIER Procedure

This procedure sets the client ID in the session.

Syntax

```
DBMS_SESSION.SET_IDENTIFIER (
    client_id VARCHAR2);
```

Parameters

Table 167-19 SET_IDENTIFIER Procedure Parameters

Parameter	Description
client_id	Case-sensitive application-specific identifier of the current database session. The maximum number of bytes for this parameter is 64 bytes. If the input exceeds 64 bytes, then <code>ORA-28264</code> is raised.

Usage Notes

- `SET_IDENTIFIER` sets the session's client id to the given value. This value can be used to identify sessions in `v$session` by means of `v$session.client_identifier`. It can also be used to identify sessions by means of `sys_context('USERENV','CLIENT_IDENTIFIER')`.
- This procedure is executable by `PUBLIC`.

167.4.20 SET_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the SQL statement: `ALTER SESSION SET <nls_parameter> = <value>`.

Syntax

```
DBMS_SESSION.SET_NLS (
    param VARCHAR2,
    value VARCHAR2);
```

Parameters

Table 167-20 SET_NLS Procedure Parameters

Parameter	Description
param	Globalization Support parameter. The parameter name must begin with 'NLS'.
value	Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, "set_nls (nls_date_format,'DD-MON-YY')".

167.4.21 SET_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the `SET ROLE` SQL statement.

Syntax

```
DBMS_SESSION.SET_ROLE (
    role_cmd VARCHAR2);
```

Parameters

Table 167-21 SET_ROLE Procedure Parameters

Parameter	Description
role_cmd	Text is appended to "set role" and then run as SQL

Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

167.4.22 SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the SQL statement `ALTER SESSION SET SQL_TRACE`

Syntax

```
DBMS_SESSION.SET_SQL_TRACE (
    sql_trace boolean);
```

Parameters

Table 167-22 SET_SQL_TRACE Procedure Parameters

Parameter	Description
sql_trace	TRUE turns tracing on, FALSE turns tracing off

167.4.23 SLEEP Procedure

This procedure suspends the session for a specified period of time.

Syntax

```
DBMS_SESSION.SLEEP (
    seconds IN NUMBER);
```

Parameters

Table 167-23 SLEEP Procedure Parameters

Parameter	Description
seconds	Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.

167.4.24 SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

Syntax

```
DBMS_SESSION.switch_current_consumer_group (
    new_consumer_group    IN VARCHAR2,
    old_consumer_group    OUT VARCHAR2,
    initial_group_on_error IN BOOLEAN);
```

Parameters

Table 167-24 SWITCH_CURRENT_CONSUMER_GROUP Procedure Parameters

Parameter	Description
<code>new_consumer_group</code>	Name of consumer group to which you want to switch
<code>old_consumer_group</code>	Name of the consumer group from which you just switched out
<code>initial_group_on_error</code>	If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error

Return Values

This procedure outputs the old consumer group of the user in the parameter `old_consumer_group`.

Note:

- The `old_consumer_group` parameter returns the name of old consumer group only if it were set explicitly. That is, you might get NULL if the old consumer group was set by some mapping rules.
- You can switch back to the old consumer group later using the value returned in `old_consumer_group`.

Exceptions

Table 167-25 SWITCH_CURRENT_CONSUMER_GROUP Procedure Exceptions

Exception	Description
29368	Non-existent consumer group
1031	Insufficient privileges
29396	Cannot switch to OTHER_GROUPS consumer group

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (`old_consumer_group`) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting `initial_group_on_error` to TRUE, `SWITCH_CURRENT_CONSUMER_GROUP` puts the current session into the default group, if it can't put it into the group designated by `new_consumer_group`. The error associated with the attempt to move a session into `new_consumer_group` is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

```

CREATE OR REPLACE PROCEDURE high_priority_task is
  old_group varchar2(30);
  prev_group varchar2(30);
  curr_user varchar2(30);
BEGIN
  -- switch invoker to privileged consumer group. If we fail to do so, an
  -- error is thrown, but the consumer group does not change
  -- because 'initial_group_on_error' is set to FALSE

  dbms_session.switch_current_consumer_group('tkrogrp1', old_group, FALSE);
  -- set up exception handler (in the event of an error, we do not want to
  -- return to caller while leaving the session still in the privileged
  -- group)

  BEGIN
    -- perform some operations while under privileged group

  EXCEPTION
    WHEN OTHERS THEN
      -- It is possible that the procedure owner does not have privileges
      -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
      -- that the user is moved out of the privileged group in such a
      -- situation

      dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
      RAISE;
    END;

  -- we've succeeded. Now switch to old_group, or if cannot do so, switch
  -- to caller's initial consumer group

  dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/

```

167.4.25 UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

```

DBMS_SESSION.UNIQUE_SESSION_ID
  RETURN VARCHAR2;

```

Pragmas

```

pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);

```

Return Values

Table 167-26 UNIQUE_SESSION_ID Function Return Values

Return	Description
unique_session_id	Returns up to 24 bytes

167.4.26 USE_DEFAULT_EDITION_ALWAYS procedure

This procedure turns a mode 'on' or 'off' that disassociates the session from an edition at the end of each and every client call.

Following each call and before the next top level call, no edition will be in use by the session. The session will use the reigning database default edition on its next operation.

Syntax

```
DBMS_SESSION.USE_DEFAULT_EDITION_ALWAYS (
    mode_on IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 167-27 USE_DEFAULT_EDITION_ALWAYS Procedure Parameters

Parameter	Description
mode_on	TRUE to turn on this mode, FALSE to turn off this mode.

Usage Notes

- A choice of session edition that might otherwise occur due to use of ALTER SESSION SET EDITION, SET_EDITION_DEFERRED, USE_DEFAULT_EDITION_DEFERRED, or the edition-choosing aspect of ALTER SESSION SET CONTAINER will be overridden by this mode.
- Turn this mode off before invoking the above mechanisms to avoid the overriding effect.

167.4.27 USE_DEFAULT_EDITION_DEFERRED procedure

This procedure disassociates the session from an edition.

The reset takes effect at the end of the current client call. Following this call, and before the next top level call, no edition will be in use by the session. The session will use the reigning database default edition on its next operation.

Syntax

```
DBMS_SESSION.USE_DEFAULT_EDITION_DEFERRED
```

DBMS_SFW_ACL_ADMIN

The DBMS_SFW_ACL_ADMIN package provides interfaces for administering and managing access control policies for the "database service firewall" feature. Each policy is represented by an access control list (ACL) containing hosts that are allowed access to a specific database service. Local listeners and server processes validate all inbound client connections against the ACL.

This chapter contains the following topics:

- [DBMS_SFW_ACL_ADMIN Security Model](#)
- [DBMS_SFW_ACL_ADMIN Operational Notes](#)
- [DBMS_SFW_ACL_ADMIN Examples](#)
- [Summary of DBMS_SFW_ACL_ADMIN Subprograms](#)

168.1 DBMS_SFW_ACL_ADMIN Security Model

This package is owned by the DBSFUSER schema. The procedures in this package can be run only by the DBSFUSER user.

168.2 DBMS_SFW_ACL_ADMIN Operational Notes

These operation notes apply to DBMS_SFW_ACL_ADMIN.

- An ACL contains entries, which are called "ace", for "access control entries".
- You add entries to an ACL using the [IP_ADD_ACE Procedure](#) and [IP_ADD_PDB_ACE Procedure](#). After calling these procedures, you call the [COMMIT_ACL Procedure](#) to send the updated ACL to the listeners. Similarly, if you remove entries from an ACL using the [IP_REMOVE_ACE Procedure](#), [IP_REMOVE_ACL Procedure](#), [IP_REMOVE_PDB_ACE Procedure](#), or [IP_REMOVE_PDB_ACL Procedure](#), you need to call the [COMMIT_ACL Procedure](#) to update the ACL on the listeners.
- Access control must be enabled using the new FIREWALL endpoint attribute and the new LOCAL_REGISTRATION_ADDRESS_listenerName parameter. The configuration can be done manually in listener.ora or through the Server Control Utility (SRVCTL). Refer to the *Oracle Database Net Services Reference* and the *Oracle Real Application Clusters Administration and Deployment Guide* for configuration instructions.
- You can query the IP_ACL table to show the committed ACLs. But to see the ACLs that have been sent to the local listeners, you have to query the V\$IP_ACL or GV\$IP_ACL view. The IP_ACL table can contain ACLs that are not in [G]V\$IP_ACL because the database services for those ACLs were not running at the time of the commit. When the services are running, you can call the COMMIT_ACL procedure again to send the committed ACLs in the IP_ACL table to the local listeners.

In an Oracle RAC environment, GV\$IP_ACL can be used to query ACLs across the database cluster, and V\$IP_ACL to query ACLs in the connected instance.

168.3 DBMS_SFW_ACL_ADMIN Examples

These three examples show how DBMS_SFW_ACL_ADMIN can be used to administer and manage access control policies.

The following example adds three access control entries to the ACL and commits them.

```
## Connect to DBSFUSER
SQL> connect dbsfuser/<password>
Connected.

## Create an ACL for database service SVC1
SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.1');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.2');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','test02.example.com');
PL/SQL procedure successfully completed.

## Commit the ACLs to the DB ACL table.
## This sends the ACLs for running services to ALL local Listeners
SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

The following example retrieves the ACLs committed from the previous example.

```
SQL> select * from ip_acl;
SERVICE_NAME          HOST
-----
"SVC1.EXAMPLE.COM"     192.168.12.1
"SVC1.EXAMPLE.COM"     192.168.12.2
"SVC1.EXAMPLE.COM"     TEST02.EXAMPLE.COM

## View ACLs sent to the local Listeners
## NOTE: ACLs are sent ONLY to running services
SQL> select * from v$ip_acl;
SERVICE_NAME          HOST          CON_ID
-----
SVC1.EXAMPLE.COM      192.168.12.1      1
SVC1.EXAMPLE.COM      192.168.12.2      1
SVC1.EXAMPLE.COM      TEST02.EXAMPLE.COM 1
```

The following example adds access control entries for pluggable database "PDB1" using various host formats.

```
SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.3');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.0/23');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.*');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

168.4 Summary of DBMS_SFW_ACL_ADMIN Subprograms

This table lists the DBMS_SFW_ACL_ADMIN subprograms and briefly describes them.

Table 168-1 DBMS_SFW_ACL_ADMIN Package Subprograms

Subprogram	Description
COMMIT_ACL Procedure	Commits changes to the ACL tables, and propagates the changes to the local listeners for database instances.
IP_ADD_ACE Procedure	Adds an access control entry to the ACL for a database service.
IP_ADD_PDB_ACE Procedure	Adds an access control entry to the ACL for all the database services in a pluggable database (PDB).
IP_REMOVE_ACE Procedure	Removes an entry from the ACL for a database service.
IP_REMOVE_ACL Procedure	Removes all entries from the ACL for a database service.
IP_REMOVE_PDB_ACE Procedure	Removes an access control entry from the ACL for all the database services in a pluggable database (PDB).
IP_REMOVE_PDB_ACL Procedure	Removes all entries from the ACL for all the database services in a pluggable database (PDB).

168.4.1 COMMIT_ACL Procedure

This procedure commits changes to the ACL tables. It also propagates the changes to the local listeners for database instances.

If you have changed access entries for database services, but the database services were not running at the time when you called the COMMIT_ACL procedure, then those changes will be committed to the ACL tables, but they will not be sent to the local listener. To send the entries to the listener, start up the database services, and call the COMMIT_ACL procedure again.

This procedure returns when the operation has completed successfully.

Syntax

```
DBMS_SFW_ACL_ADMIN.COMMIT_ACL;
```

Parameters

None

168.4.2 IP_ADD_ACE Procedure

This procedure adds an access control entry to the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_ACE (
  p_service_name IN VARCHAR2,
  p_host         IN VARCHAR2);
```

Parameters

Table 168-2 IP_ADD_ACE Procedure Parameters

Parameter	Description
p_service_name	The name of the database service for which you want to add an access control entry.
p_host	The host of the client that is allowed access to the service. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed.

168.4.3 IP_ADD_PDB_ACE Procedure

This procedure adds an access control entry to the ACL for all the database services in a pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_PDB_ACE (
  p_pdb_name IN VARCHAR2,
  p_host     IN VARCHAR2);
```

Parameters

Table 168-3 IP_ADD_PDB_ACE Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.
p_host	The host of the client that is allowed access to the database services in the PDB. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed.

168.4.4 IP_REMOVE_ACE Procedure

This procedure removes an entry from the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACE (
  p_service_name IN VARCHAR2,
  p_host         IN VARCHAR2);
```

Parameters

Table 168-4 IP_REMOVE_ACE Procedure Parameters

Parameter	Description
p_service_name	The name of the database service from which you want to remove an access control entry.

Table 168-4 (Cont.) IP_REMOVE_ACE Procedure Parameters

Parameter	Description
p_host	The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the IP_ACL table to get the list of entries for a database service.

168.4.5 IP_REMOVE_ACL Procedure

This procedure removes all entries from the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACL (
  p_service_name IN VARCHAR2);
```

Parameters

Table 168-5 IP_REMOVE_ACL Procedure Parameters

Parameter	Description
p_service_name	The name of the database service whose ACL you want to clear.

168.4.6 IP_REMOVE_PDB_ACE Procedure

This procedure removes an access control entry from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACE (
  p_pdb_name IN VARCHAR2,
  p_host     IN VARCHAR2);
```

Parameters

Table 168-6 IP_REMOVE_PDB_ACE Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.
p_host	The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the IP_ACL table to get the list of entries for a database service.

168.4.7 IP_REMOVE_PDB_ACL Procedure

This procedure removes all entries from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACL (  
    p_pdb_name IN VARCHAR2);
```

Parameters

Table 168-7 IP_REMOVE_PDB_ACL Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.

DBMS_SHARED_POOL

The `DBMS_SHARED_POOL` package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. `DBMS_SHARED_POOL` enables you to display the sizes of objects in the shared pool, and mark them for keeping or not-keeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of DBMS_SHARED_POOL Subprograms](#)

169.1 DBMS_SHARED_POOL Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

`DBMS_SHARED_POOL` is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, `DBMS_SHARED_POOL` supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. `DBMS_SHARED_POOL` is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

169.2 DBMS_SHARED_POOL Operational Notes

To create `DBMS_SHARED_POOL`, run the `DBMSPOOL.SQL` script. The `PRVTPPOOL.PLB` script is automatically executed after `DBMSPOOL.SQL` runs. These scripts are *not* run by as part of standard database creation.

169.3 Summary of DBMS_SHARED_POOL Subprograms

This table lists the `DBMS_SHARED_POOL` subprograms and briefly describes them.

Table 169-1 *DBMS_SHARED_POOL Package Subprograms*

Subprogram	Description
ABORTED_REQUEST_THRESHOLD Procedure	Sets the aborted request threshold for the shared pool
KEEP Procedure	Keeps an object in the shared pool
MARKHOT Procedure	Marks a library cache object as a hot object

Table 169-1 (Cont.) DBMS_SHARED_POOL Package Subprograms

Subprogram	Description
PURGE Procedure	Purges the named object or specified heap(s) of the object
SIZES Procedure	Shows objects in the shared pool that are larger than the specified size
UNKEEP Procedure	Unkeeps the named object
UNMARKHOT Procedure	Unmarks a library cache object as a hot object

169.3.1 ABORTED_REQUEST_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (
    threshold_size NUMBER);
```

Parameters

Table 169-2 ABORTED_REQUEST_THRESHOLD Procedure Parameters

Parameter	Description
threshold_size	Size, in bytes, of a request which does not try to free unpinned (not "unkeep-ed") memory within the shared pool. The range of threshold_size is 5000 to ~2 GB inclusive.

Exceptions

An exception is raised if the threshold is not in the valid range.

Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an 'ALTER SYSTEM FLUSH SHARED_POOL'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than thresh_hold size. This user gets the 'out of memory' error without attempting to search the LRU list.

169.3.2 KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for

frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

Syntax

```
DBMS_SHARED_POOL.KEEP (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P');

DBMS_SHARED_POOL.KEEP (
    schema        VARCHAR2,
    objname       VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER,
    edition_name  VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.KEEP (
    hash          VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER);
```

Parameters

Table 169-3 KEEP Procedure Parameters

Parameter	Description
name	The name of the object to keep.
flag	A character string indicating the kind of object to keep in the shared pool. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name. <ul style="list-style-type: none"> • Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. • Set to 'Q' or 'q' to specify that the input is the name of a sequence. • Set to 'R' or 'r' to specify that the input is the name of a trigger. • Set to 'T' or 't' to specify that the input is the name of a type. • Set to 'JS' or 'js' to specify that the input is the name of a java source. • Set to 'JC' or 'jc' to specify that the input is the name of a java class. • Set to 'JD' or 'jd' to specify that the input is the name of a java shared data. • Set to 'JR' or 'jr' to specify that the input is the name of a java resource. • Set to 'C' or 'c' to specify that the input is the name of a cursor.
schema	The user name or the schema to which the object belongs to.
objname	The name of the object to keep.
namespace	A number indicating the library cache namespace in which the object has to be searched for.
heaps	The heaps to keep. For example, if heap 0 and heap 6 are to be kept.
edition_name	The name of the edition that the target object resides in. This parameter is optional.
hash	A 16-byte hash value for the object.

Exceptions

An exception is raised if the named object is not found.

Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, types, and Java objects, which are specified by name.
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package `HISPACKAGE`, owned by `SCOTT`. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte names are allowed). A cursor can be kept by `DBMS_SHARED_POOL.KEEP('0034CFFF, 20348871', 'C')`, `0034CFFF` being the `ADDRESS` and `20348871` the `HASH_VALUE`. Note that the complete hexadecimal address must be in the first 8 characters.

169.3.3 MARKHOT Procedure

This procedure marks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.MARKHOT (
  schema          VARCHAR2,
  objname         VARCHAR2,
  namespace       NUMBER DEFAULT 1,
  global          BOOLEAN DEFAULT TRUE,
  edition_name    VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.MARKHOT (
  hash           VARCHAR2,
  namespace       NUMBER DEFAULT 1,
  global          BOOLEAN DEFAULT TRUE);
```

Parameters

Table 169-4 MARKHOT Procedure Parameters

Parameter	Description
schema	User name or the schema to which the object belongs
objname	Name of the object
namespace	Number indicating the library cache namespace in which the object is to be searched. Views, such as <code>USER_OBJECTS</code> and <code>DBA_OBJECTS</code> , reflect the namespace as a number column, as do most dictionary tables such as <code>OBJ\$</code> .
global	If <code>TRUE</code> (default), mark the object hot on all Oracle RAC instances
hash	16-byte hash value for the object

Table 169-4 (Cont.) MARKHOT Procedure Parameters

Parameter	Description
edition_name	Denotes the name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

Users can examine column, V\$DB_OBJECT_CACHE.PROPERTY, to see whether or not the object has been marked hot. The values for PROPERTY are:

- HOTCOPYnnn- An object that is a hot copy with integer identifier of 'nnn'. For example, HOTCOPY5, HOTCOPY94, and HOTCOPY125.
- HOTCOPY-As above but the identifier is unknown
- HOT-The "root" kgl object that has been marked as hot
- NULL-A normal object

169.3.4 PURGE Procedure

This procedure purges the named object or specified heaps of the object.

Syntax

```
DBMS_SHARED_POOL.PURGE (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P',
    heaps         NUMBER DEFAULT 1);
```

```
DBMS_SHARED_POOL.PURGE (
    schema        VARCHAR2,
    objname       VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER,
    edition_name  VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.PURGE (
    hash          VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER);
```

Parameters

Table 169-5 PURGE Procedure Parameters

Parameter	Description
name	Name of the object to purge. The value for this identifier is the concatenation of the address and hash_value columns from the v\$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be purged.
flag	A character string indicating the kind of object to purge from the shared pool. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name. <ul style="list-style-type: none"> Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'Q' or 'q' to specify that the input is the name of a sequence. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'JS' or 'js' to specify that the input is the name of a java source. Set to 'JC' or 'jc' to specify that the input is the name of a java class. Set to 'JD' or 'jd' to specify that the input is the name of a java shared data. Set to 'JR' or 'jr' to specify that the input is the name of a java resource. Set to 'C' or 'c' to specify that the input is the name of a cursor.
heaps	Heaps to be purged. For example, if heap 0 and heap 6 are to be purged: 1<<0 1<<6 => hex 0x41 => decimal 65, so specify heaps =>65. Default value is 1, that is, heap 0 which means the whole object would be purged
schema	User name or the schema to which the object belongs
objname	Name of the object to purge
namespace	Parameter is a number indicating the library cache namespace in which the object is to be searched
hash	16-byte hash value for the object
edition_name	The name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-6570: An exception is raised if the named object cannot be found

ORA-6570: An object cannot be purged it marked as permanently kept

Usage Notes

All objects supported by the [KEEP Procedure](#) are supported for PURGE.

169.3.5 PURGE_ROW_CACHE Procedure

This procedure purges the row cache as identified by cache id, or a specific object within the selected cache.

Syntax

```
DBMS_SHARED_POOL.PURGE_ROW_CACHE (
    cacheid number, hash varchar2 DEFAULT null);
```

Parameters

Table 169-6 PURGE_ROW_CACHE Procedure Parameters

Parameter	Description
cacheid	Indicates which cache to purge.
hash	The hash value of a targeted object to purge within the named cache. The default value (NULL) purges the entire cache.

169.3.6 SIZES Procedure

This procedure shows objects in the `shared_pool` that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the `KEEP` or `UNKEEP` calls.

Syntax

```
DBMS_SHARED_POOL.SIZES (
    minsize NUMBER);
```

Parameters

Table 169-7 SIZES Procedure Parameters

Parameter	Description
minsize	Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.

Usage Notes

Issue the `SQLDBA` or `SQLPLUS` `'SET SERVEROUTPUT ON SIZE XXXXX'` command prior to using this procedure so that the results are displayed.

169.3.7 UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

```
DBMS_SHARED_POOL.UNKEEP (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P');
```

```
DBMS_SHARED_POOL.UNKEEP (
  schema      VARCHAR2,
  objname     VARCHAR2,
  namespace   NUMBER,
  edition_name VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.UNKEEP (
  hash        VARCHAR2,
  namespace   NUMBER);
```

⚠ WARNING:

This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

Parameters

Table 169-8 UNKEEP Procedure Parameters

Parameter	Description
name	The name of the object to unkeep.
flag	A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name.
schema	The user name or the schema to which the object belongs to.
objname	The name of the object to unkeep.
namespace	A number that indicates the library cache namespace in which the object has to be searched for.
edition_name	The name of the edition that the target object resides in. This parameter is optional.
hash	A 16-byte hash value for the object.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found

169.3.8 UNMARKHOT Procedure

This procedure unmarks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.UNMARKHOT (
  schema      VARCHAR2,
  objname     VARCHAR2,
  namespace   NUMBER DEFAULT 1,
  global      BOOLEAN DEFAULT TRUE,
  edition_name VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.UNMARKHOT (
    hash          VARCHAR2,
    namespace     NUMBER DEFAULT 1,
    global        BOOLEAN DEFAULT TRUE);
```

Parameters

Table 169-9 UNMARKHOT Procedure Parameters

Parameter	Description
schema	User name or the schema to which the object belongs
objname	Name of the object
namespace	Number indicating the library cache namespace in which the object is to be searched
global	If TRUE, unmark the object hot on all Oracle RAC instances. The default value of this parameter is TRUE.
hash	A 16-byte hash value for the object
edition_name	Denotes the name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input, or non-existent object)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

DBMS_SHARDING_DIRECTORY

This package provides procedures to manage an Oracle Globally Distributed Database sharded database created with directory-based data distribution.

This chapter contains the following topics:

- [DBMS_SHARDING_DIRECTORY Overview](#)
- [DBMS_SHARDING_DIRECTORY Security Model](#)
- [Summary of DBMS_SHARDING_DIRECTORY Subprograms](#)

170.1 DBMS_SHARDING_DIRECTORY Overview

PL/SQL package `DBMS_SHARDING_DIRECTORY` provides support operations on the directory table for sharded databases using the directory-based data distribution method.

This package includes procedures to:

- Add a key to a partition entry
- Remove a key mapping entry
- Flag a key for partition split

The APIs in this package can be invoked on the shard catalog.

The directory table is automatically created during root table creation. The definition of the directory table is `shard user schema.root_table$SDIR`.

When adding and removing keys there are APIs that include commit and those that do not. Unless the commit versions of the APIs are used, the directory content is not propagated to the shards until commit is issued explicitly.

See Also:

Directory-Based Sharding in *Oracle Globally Distributed Database Guide* for a detailed description of sharded database directory-based data distribution.

170.2 DBMS_SHARDING_DIRECTORY Security Model

All `DBMS_SHARDING_DIRECTORY` subprograms require the user to have `EXECUTE` privilege over the `DBMS_SHARDING_DIRECTORY` package.

Only the schema owner of the root table is allowed to execute the procedures in this package, and they can only execute it on the shard catalog.

170.3 DBMS_SHARDING_DIRECTORY Public Constants

There are public constants defined for use with the `DBMS_SHARDING_DIRECTORY.setAssignmentRule` procedure for key-to-partition assignment rules.

All such constants are defined as part of the `DBMS_SHARDING_DIRECTORY` package. Any references to these constants must be prefixed by `DBMS_SHARDING_DIRECTORY.` and followed by the symbols in the following lists

- `NONE` constant number :=0; -- turn off rule-based assignment
- `LAST_PARTITION` constant number := 1; -- rule for assigning key only to the last added partition
- `ROUND_ROBIN` constant number :=2; -- rule for assigning key to partition by round robin
- `RANDOM` constant number :=3; -- rule for assigning key to partition randomly
- `CUSTOM` constant number :=4; -- TBD

170.4 Summary of DBMS_SHARDING_DIRECTORY Subprograms

This table lists and describes the subprograms of the `DBMS_SHARDING_DIRECTORY` package

Table 170-1 DBMS_SHARDING_DIRECTORY Package Subprograms

Subprogram	Description
addKeyToPartition Procedure	This procedure allows you to add a new key to the directory with the specified partition name.
addKeyToPartitionCommit Procedure	This procedure allows you to add a new key to the directory with the specified partition name, and performs a commit at the end.
flagKeyForSplit Procedure	This procedure allows you to mark a key in the directory for split, to be performed later.
removeKey Procedure	This procedure allows you to remove a key from the directory.
removeKeyCommit Procedure	This procedure allows you to remove a key from the directory, and performs a commit at the end.
setAssignmentRule	This procedure allows you to indicate an automatic key-to-partition assignment rule for subsequent new key inserts into the root table.

170.4.1 addKeyToPartition Procedure

This procedure allows you to add a new key to the directory with the specified partition name.

Syntax

```
DBMS_SHARDING_DIRECTORY.addKeyToPartition(
  (schema_name    IN varchar2,
   root_table     IN varchar2,
   partition_name IN  varchar2,
   key ... );
```

Parameters

Table 170-2 addKeyToPartition Procedure Parameters

Parameter	Description
schema_name	Root table schema name.
partition_name	Name of the partition.
root_table	Root table name.
key	Shard key column values.

Usage Notes

Note that the `key` column value needs to be in the same order as specified in the `CREATE TABLE` statement with the correct types. The procedure can only succeed if the provided key does not yet exist in the directory.

170.4.2 addKeyToPartitionCommit Procedure

This procedure allows you to add a new key to the directory with the specified partition name.

Syntax

```
DBMS_SHARDING_DIRECTORY.addKeyToPartitionCommit(
  (schema_name    IN varchar2,
   root_table     IN varchar2,
   partition_name IN  varchar2,
   key ... );
```

Parameters

Table 170-3 addKeyToPartitionCommit Procedure Parameters

Parameter	Description
schema_name	Root table schema name.
partition_name	Name of the partition.
root_table	Root table name.
key	Shard key column values.

Usage Notes

The `addKeyToPartitionCommit` procedure is exactly the same as the `addKeyToPartition` procedure with the same parameters, except that it performs a commit automatically at the end.

Note that the `key` column value needs to be in the same order as specified in the `CREATE TABLE` statement with the correct types. The procedure can only succeed if the provided key does not yet exist in the directory.

170.4.3 flagKeyForSplit Procedure

This procedure allows you to mark a key in the directory for split, to be performed later.

Syntax

```
DBMS_SHARDING_DIRECTORY.flagKeyForSplit(  
    (schema_name    IN varchar2,  
     root_table     IN varchar2,  
     key ... );
```

Parameters

Table 170-4 flagKeyForSplit Procedure Parameters

Parameter	Description
<code>schema_name</code>	Root table schema name.
<code>root_table</code>	Root table name.
<code>key</code>	Shard key column values.

Usage Notes

Note that the `key` column values need to be in the same order as specified in the `CREATE TABLE` statement with the correct types. The procedure can only succeed if the provided key exists in the directory.

A subsequent `ALTER TABLE SPLIT PARTITION` operation will go through all the keys that have been marked for split in the directory and split the corresponding data out into the new partition.

170.4.4 removeKey Procedure

This procedure allows you to remove a key from the directory.

Syntax

```
DBMS_SHARDING_DIRECTORY.removeKey(  
    (schema_name    IN varchar2,  
     root_table     IN varchar2,  
     key ... );
```

Parameters

Table 170-5 removeKey Procedure Parameters

Parameter	Description
schema_name	Root table schema name.
root_table	Root table name.
key	Shard key column values.

Usage Notes

Note that the `key` column values need to be in the same order as specified in the `CREATE TABLE` statement with the correct types. The procedure can only succeed if the provided key exists in the directory, and there are no tables (either root table or child tables) with rows still referencing the key.

170.4.5 removeKeyCommit Procedure

This procedure allows you to remove a key from the directory.

Syntax

```
DBMS_SHARDING_DIRECTORY.removeKeyCommit(
  (schema_name    IN varchar2,
   root_table     IN varchar2,
   key ... );
```

Parameters

Table 170-6 removeKeyCommit Procedure Parameters

Parameter	Description
schema_name	Root table schema name.
root_table	Root table name.
key	Shard key column values.

Usage Notes

The `removeKeyCommit` procedure is exactly the same as the `removeKey` procedure with the same parameters, except that it performs a commit automatically at the end.

Note that the `key` column values need to be in the same order as specified in the `CREATE TABLE` statement with the correct types. The procedure can only succeed if the provided key exists in the directory, and there are no tables (either root table or child tables) with rows still referencing the key.

170.4.6 setAssignmentRule

This procedure allows you to indicate an automatic key-to-partition assignment rule for subsequent new key inserts into the root table.

It will be in effect across different sessions and regardless of system restart until another call to this procedure is made with a different `rule_id` value, or with `NONE`, meaning automatic assignment should be turned off.

Rule ID values are defined in [DBMS_SHARDING_DIRECTORY Public Constants](#).

Syntax

```
DBMS_SHARDING_DIRECTORY.setAssignmentRule(  
    (schema_name    IN varchar2,  
     root_table     IN varchar2,  
     rule_id        IN number);
```

Parameters

Table 170-7 setAssignmentRule Procedure Parameters

Parameter	Description
<code>schema_name</code>	Root table schema name.
<code>root_table</code>	Root table name.
<code>rule_id</code>	Rule ID value, as defined in DBMS_SHARDING_DIRECTORY Public Constants .

DBMS_SODA

The `DBMS_SODA` package is a `PL/SQL` package implementing Simple Oracle Document Access (`SODA`). `SODA` allows you to use the Oracle Database as a NoSQL document store. The core abstraction provided by `SODA` is that of document collections. The `DBMS_SODA` package allows you to create, list, and delete document collections from `PL/SQL`, and to perform CRUD (create, replace, update, delete) operations on documents. All `DDL` functions are encapsulated within this package.

This chapter contains the following topics:

- [DBMS_SODA Security Model](#)
- [Summary of DBMS_SODA Subprograms](#)
- [Summary of SODA Online Redefinition Subprograms](#)

See Also:

- [Oracle Database SODA for PL/SQL Developer's Guide](#)
- [SODA Types](#)

171.1 DBMS_SODA Security Model

This package is available to users with the `SODA_APP` role.

All `SODA` types (packages and types) are `SYS` types. `PUBLIC` is granted `EXECUTE` privilege on the `DBMS_SODA` described in this chapter.

171.2 Summary of DBMS_SODA Subprograms

This table lists the `DBMS_SODA` subprograms in alphabetical order and briefly describes them.

Table 171-1 DBMS_SODA Package Subprograms

Subprogram	Purpose
CREATE_COLLECTION Function	Creates a collection using the collection name and metadata.
DROP_COLLECTION Function	Drops an existing collection from the user's schema. This also removes all the documents in the collection.
GET_AS_OF_SCN Function	This function returns the current database SCN number.

Table 171-1 (Cont.) DBMS_SODA Package Subprograms

Subprogram	Purpose
GET_AS_OF_TIMESTAMP Function	This function returns the current database timestamp value.
GET_DEFAULT_METADATA_AS_CLOB Function	This function returns the default metadata.
GET_DEFAULT_METADATA_AS_VARCHAR2 Function	This function returns the default metadata.
LIST_COLLECTION_NAMES Function	Lists the collection names in the user's schema as a table of NVARCHAR2.
OPEN_COLLECTION Function	Opens an existing collection.

171.2.1 CREATE_COLLECTION Function

Creates a collection using the collection name and metadata. Uses the settings specified in the metadata and auto-assigns the ones that are not, and returns the collection object. If the metadata argument is omitted or set to `NULL`, a collection is created with default metadata. The returned collection is open for `read` and/or `write` operations. If a collection already exists, the function just opens and returns the collection object.

Syntax

```
DBMS_SODA.CREATE_COLLECTION (
    collection_Name      IN NVARCHAR2,
    metadata             IN VARCHAR2 DEFAULT NULL,
    create_Mode         IN PLS_INTEGER DEFAULT CREATE_MODE_DDL)
RETURN SODA_Collection_T;
```

Parameters

Table 171-2 CREATE_COLLECTION Parameters

Parameter	Description
<code>collection_Name</code>	The name of the collection. The value of <code>collection_Name</code> is case-sensitive.
<code>metadata</code>	The metadata of the collection in <code>VARCHAR2</code> format.

Table 171-2 (Cont.) CREATE_COLLECTION Parameters

Parameter	Description
create_Mode	<p>Valid values are:</p> <ul style="list-style-type: none"> DBMS_SODA.CREATE_MODE_DDL (default). First attempts to create a new table for the collection. If table exists already, tries to map that existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned). DBMS_SODA.CREATE_MODE_MAP. Tries to map an existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned).

Return Values

The function returns a `Soda_Collection_T` object representing the collection.

Exceptions

- Descriptor Error—if the input descriptor is invalid
- Error—if an error occurs while creating the collection

**See Also:**

Oracle Database SODA for PL/SQL Developer's Guide

171.2.2 DROP_COLLECTION Function

Drops an existing collection from the user's schema. This also removes all the documents in the collection.

Syntax

```
DBMS_SODA.DROP_COLLECTION (
    collection_Name    IN NVARCHAR2,
    purge              IN BOOLEAN DEFAULT FALSE,
    drop_Mapped_Table IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 171-3 DROP_COLLECTION Parameters

Parameter	Description
collection_Name	The name of the collection. The value of collection_Name is case-sensitive.
purge	The default value is FALSE.
drop_Mapped_Table	The default value is FALSE.

Return values

This function returns the following values:

- 1—if the collection was dropped successfully
- 0—if the collection does not exist

Exceptions

If an error occurs while dropping the collection, for example, due to uncommitted writes to the collection or privilege issues.

See Also:

Oracle Database SODA for PL/SQL Developer's Guide

171.2.3 GET_AS_OF_SCN Function

This function returns the current database SCN number.

Syntax

```
DBMS_SODA.GET_AS_OF_SCN ( )  
RETURN NUMBER;
```

Return values

This function returns the current database SCN number.

171.2.4 GET_AS_OF_TIMESTAMP Function

This function returns the current database timestamp value.

Syntax

```
DBMS_SODA.GET_AS_OF_TIMESTAMP ( )  
RETURN VARCHAR2;
```

Return values

This function returns the current database timestamp value.

171.2.5 GET_DEFAULT_METADATA_AS_CLOB Function

This function returns the default metadata.

Syntax

```
DBMS_SODA.GET_DEFAULT_METADATA_AS_CLOB ( )  
RETURN CLOB;
```

Return Values

This function returns the default metadata using the `CLOB` datatype.

171.2.6 GET_DEFAULT_METADATA_AS_VARCHAR2 Function

This function returns the default metadata.

Syntax

```
DBMS_SODA.GET_DEFAULT_METADATA_AS_VARCHAR2 ( )  
RETURN VARCHAR2;
```

Return Values

This function returns the default metadata using the `VARCHAR2` datatype.

171.2.7 LIST_COLLECTION_NAMES Function

This function returns a list of collection names in the user's schema as a table of `NVARCHAR2`.

Syntax

```
DBMS_SODA.LIST_COLLECTION_NAMES ( )  
RETURN SODA_CollName_List_T;
```

Return Values

This function returns a list of collection names as a table of `NVARCHAR2 (255)`. The collection list is empty if there are no collections in the schema.

Exceptions

`Error`—if an error occurs while listing the collection names.

**See Also:**

Oracle Database SODA for PL/SQL Developer's Guide

171.2.8 OPEN_COLLECTION Function

Opens an existing collection for `read` and/or `write` operations.

Syntax

```
DBMS_SODA.OPEN_COLLECTION (
    collection_Name      IN NVARCHAR2)
RETURN SODA_Collection_T;
```

Parameters

Table 171-4 OPEN_COLLECTION Parameters

Parameter	Description
<code>collection_Name</code>	The name of the collection. The value of <code>collection_Name</code> is case-sensitive.

Return Values

This function returns the following values:

- a collection object which is open
- `NULL`, if the collection does not exist

Exceptions

`Error`—if an error occurs while creating the collection

See Also:

- [Opening an Existing Document Collection with SODA for PL/SQL](#)
- [Checking Whether a Given Collection Exists with SODA for PL/SQL](#)

171.3 Summary of SODA Online Redefinition Subprograms

This table lists the SODA Online Redefinition subprograms in alphabetical order and briefly describes them.

Table 171-5 SODA Online Redefinition Subprograms

Subprogram	Purpose
ABORT_REDEF_COLLECTION Procedure	This procedure reverts the changes made to a collection if there are any errors in <code>CREATE_INTERIM_COLLECTION</code> , <code>START_REDEF_COLLECTION</code> , <code>COPY_COLLECTION_DEPENDENTS</code> , <code>SYNC_INTERIM_COLLECTION</code> , or due to any other reasons.
CAN_REDEF_COLLECTION Procedure	This procedure checks if the data table can be redefined. If the data table cannot be redefined, errors are raised.
COPY_COLLECTION_DEPENDENTS Procedure	This procedure copies all the dependents that are defined on the original table to the interim table. However, if the interim table is JSON type, constraints like <code>IS JSON NOT NULL</code> will not be copied because those are extraneous.
CREATE_INTERIM_COLLECTION Procedure	This procedure creates an interim SODA collection. The <code>interim_metadata</code> specifies the changes the user needs to make. For example, a delta applied as a patch to the original metadata.
FINISH_REDEF_COLLECTION Procedure	This procedure performs the following tasks in one atomic transaction. It introduces a downtime. This can only be called after every dependent required for a SODA data table is present on the interim collection, otherwise an error is raised.
START_REDEF_COLLECTION Procedure	This procedure starts the redefinition process. Copies the existing data from the original table to the interim table and performs the required transformations on the redefined columns.
SYNC_INTERIM_COLLECTION Procedure	This procedure synchronizes the changes to the interim table if the original data table was changed. This procedure can only be called after every dependent required for the SODA data table is present on the interim collection, otherwise, an error is raised.
TO_UUID Function	This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the <code>REMAP_DATA</code> feature of Data Pump.

171.3.1 ABORT_REDEF_COLLECTION Procedure

This procedure reverts the changes made to a collection if there are any errors in CREATE_INTERIM_COLLECTION, START_REDEF_COLLECTION, COPY_COLLECTION_DEPENDENTS, SYNC_INTERIM_COLLECTION, or due to any other reasons.

Syntax

```
DBMS_SODA.ABORT_REDEF_COLLECTION (
    collection_name      IN  NVARCHAR2,
    interim_collection_name IN NVARCHAR2);
```

Parameters

Table 171-6 ABORT_REDEF_COLLECTION Procedure Parameters

Parameter	Description
collection_name	The name of the collection to be redefined.
interim_collection_name	The name used for the interim collection.

171.3.2 CAN_REDEF_COLLECTION Procedure

This procedure checks if the data table can be redefined. If the data table cannot be redefined, errors are raised.

Syntax

```
DBMS_SODA.CAN_REDEF_COLLECTION (
    collection_name IN NVARCHAR2);
```

Parameters

Table 171-7 CAN_REDEF_COLLECTION Procedure Parameters

Parameter	Description
collection_name	The name of the collection to be redefined.

171.3.3 COPY_COLLECTION_DEPENDENTS Procedure

This procedure copies all the dependents that are defined on the original table to the interim table.

Syntax

```
DBMS_SODA.COPY_COLLECTION_DEPENDENTS (
    collection_name      IN  NVARCHAR,
    interim_collection_name IN NVARCHAR2,
    ignore_error        IN  BOOLEAN DEFAULT NULL,
    num_errors          OUT PLS_INTEGER);
```

Parameters

Table 171-8 COPY_COLLECTION_DEPENDENTS Procedure Parameters

Parameter	Description
<code>collection_name</code>	The name of the collection to be redefined.
<code>interim_collection_name</code>	The name used for the interim collection.
<code>ignore_error</code>	Ignore the errors encountered in the process and proceed.
<code>num_errors</code>	The number of errors encountered in the process.

171.3.4 CREATE_INTERIM_COLLECTION Procedure

This procedure creates an interim SODA collection. The `interim_metadata` specifies the changes the user needs to make. For example, a delta applied as a patch to the original metadata.

Syntax

```
DBMS_SODA.CREATE_INTERIM_COLLECTION (
  collection_name      IN  NVARCHAR2,
  interim_collection_name  IN  NVARCHAR2,
  interim_metadata     IN  VARCHAR2);
```

Parameters

Table 171-9 CREATE_INTERIM_COLLECTION Procedure Parameters

Parameter	Description
<code>collection_name</code>	The name of the collection to be redefined.
<code>interim_collection_name</code>	The name used for the interim collection.
<code>interim_metadata</code>	The metadata snippet specifying the columns that need to be redefined and how they need to be redefined.

Usage Notes

The `interim_metadata` parameter can contain the following fields. An error is raised if other fields are present and if the fields are not the same as those in the metadata for the original collection.

- Set `contentColumn.sqlType` to `JSON` in order to redefine the `CONTENT` column to `JSON` type, automatically generating the `VERSION` column if needed.
- Set `versionColumn.method` to `UUID` to redefine the `VERSION` column to use `UUID`.
- Set `tableName` to specify a name for the data table of this interim collection. If this field is not present, a default data table name will be generated according to the rules of table name defaulting outlined in Default Naming of a Collection Table. However, if the table already exists, the collection is created using the `MAP` mode. In this scenario, make sure that the mapped table does not have any constraints defined.
- The user can combine the above fields in the supplied `interim_metadata` snippet. For example, the most common use case is to both redefine the content column to `JSON` type

and redefine the version column to UUID, which can be achieved by setting the interim_metadata parameter to {"contentColumn" : {"sqlType": "JSON"}, "versionColumn" : {"method": "UUID"}}.

171.3.5 FINISH_REDEF_COLLECTION Procedure

This procedure performs the following tasks in one atomic transaction. It introduces a downtime. This can only be called after every dependent required for a SODA data table is present on the interim collection, otherwise an error is raised.

Syntax

```
DBMS_SODA.FINISH_REDEF_COLLECTION (
  collection_name          IN  NVARCHAR,
  interim_collection_name IN  NVARCHAR2,
  dml_lock_timeout        IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 171-10 FINISH_REDEF_COLLECTION Procedure Parameters

Parameter	Description
collection_name	The name of the collection to be redefined.
interim_collection_name	The name used for the interim collection.
dml_lock_timeout	The wait period in seconds. If the lock is not acquired within this wait period, an error occurs.

Usage Notes

This action cannot be undone. After this procedure is executed, you cannot perform ROLLBACK procedure provided by the DBMS_REDEFINITION package.

Caution:

Before calling FINISH_REDEF_COLLECTION Procedure, the interim collection should be tried out to make sure it can be accessed and is working as expected. In case of any issues, use [ABORT_REDEF_COLLECTION Procedure](#).

It is very important to do this before calling FINISH_REDEF_COLLECTION because the latter cannot be reversed.

171.3.6 START_REDEF_COLLECTION Procedure

This procedure starts the redefinition process. Copies the existing data from the original table to the interim table and performs the required transformations on the redefined columns.

Syntax

```
DBMS_SODA.START_REDEF_COLLECTION (
  collection_name          IN  NVARCHAR,
  interim_collection_name IN  NVARCHAR2,
  copy_vpd_opt            IN  DEFAULT NULL,
  refresh_dep_mviews     IN  DEFAULT NULL);
```

Parameters

Table 171-11 START_REDEF_COLLECTION Procedure Parameters

Parameter	Description
collection_name	The name of the collection to be redefined.
interim_collection_name	The name used for the interim collection.
copy_vpd_opt	Can be either <code>DBMS_REDEFINITION.CONST_VPD_MANUAL</code> or <code>DBMS_REDEFINITION.CONST_VPD_NONE</code> . <code>DBMS_REDEFINITION.CONST_VPD_MANUAL</code> is used to indicate to copy VPD policies manually. <code>DBMS_REDEFINITION.CONST_VPD_NONE</code> is used to indicate that there are no VPD policies on the original table. If NULL, <code>DBMS_REDEFINITION.CONST_VPD_NONE</code> is used.
refresh_dep_mviews	Can be N or Y. When set to N, fast refresh of dependent materialized views is performed when the <code>START_REDEF_TABLE</code> procedure is run, each time the <code>SYNC_INTERIM_TABLE</code> procedure is run, and when the <code>FINISH_REDEF_TABLE</code> procedure is run. If NULL, N is used.

171.3.7 SYNC_INTERIM_COLLECTION Procedure

This procedure synchronizes the changes to the interim table if the original data table was changed. This procedure can only be called after every dependent required for the SODA data table is present on the interim collection, otherwise, an error is raised.

Syntax

```
DBMS_SODA.SYNC_INTERIM_COLLECTION (
  collection_name          IN  NVARCHAR,
  interim_collection_name IN  NVARCHAR2);
```

Parameters

Table 171-12 SYNC_INTERIM_COLLECTION Procedure Parameters

Parameter	Description
collection_name	The name of the collection to be redefined.
interim_collection_name	The name used for the interim collection.

171.3.8 TO_UUID Function

This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the `REMAP_DATA` feature of Data Pump.

Syntax

```
DBMS_SODA.TO_UUID (  
    placeholder          IN    NVARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 171-13 TO_UUID Parameters

Parameter	Description
placeholder	This parameter is not used and can be ignored. It is used due to the syntactic constraints for the Data Pump <code>REMAP_DATA</code> function.

Return values

This function returns a hexadecimal string that can be used as a `UUID` value.

See Also:

`REMAP_DATA` in the *Oracle® Database Utilities Guide*.

DBMS_SPACE

The `DBMS_SPACE` package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- [Security Model](#)
- [Data Structures](#)
- [Summary of DBMS_SPACE Subprograms](#)

172.1 DBMS_SPACE Security Model

This package runs with `SYS` privileges. The execution privilege is granted to `PUBLIC`. Subprograms in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

172.2 DBMS_SPACE Data Structures

The `DBMS_SPACE` package defines an `OBJECT` type, a `RECORD` type, and a `TABLE` type.

OBJECT Types

[CREATE_TABLE_COST_COLINFO](#) Object Type

RECORD Types

[ASA_RECO_ROW](#) Record Type

TABLE Types

[ASA_RECO_ROW_TB](#) Table Type

172.2.1 DBMS_SPACE CREATE_TABLE_COST_COLINFO Object Type

This type describes the datatype and size of a column in the table.

Syntax

```
TYPE create_table_cost_colinfo IS OBJECT(  
    col_type    VARCHAR(200),  
    col_size    NUMBER)
```

Attributes

Table 172-1 CREATE_TABLE_COST_COLINFO Object Type

Attribute	Description
col_type	Column type
col_size	Column size

172.2.2 DBMS_SPACE ASA_RECO_ROW Record Type

This type contains the column type of individual columns returned by the ASA_RECOMMENDATIONS Function.

Syntax

```
TYPE asa_reco_row IS RECORD (
  tablespace_name    VARCHAR2(30),
  segment_owner     VARCHAR2(30),
  segment_name      VARCHAR2(30),  segment_type    VARCHAR2(18),
  partition_name    VARCHAR2(30),
  allocated_space   NUMBER,
  used_space        NUMBER,
  reclaimable_space NUMBER,
  chain_rowexcess   NUMBER,
  recommendations   VARCHAR2(1000),
  c1                VARCHAR2(1000),
  c2                VARCHAR2(1000),
  c3                VARCHAR2(1000),
  task_id           NUMBER,
  mesg_id           NUMBER);
```

Attributes

Table 172-2 ASA_RECO_ROW Attributes

Field	Description
tablespace_name	Name of the tablespace containing the object
segment_owner	Name of the schema
segment_name	Name of the object
segment_type	Type of the segment 'TABLE','INDEX' and so on
partition_name	Name of the partition
allocated_space	Space allocated to the segment
used_space	Space actually used by the segment
reclaimable_space	Reclaimable free space in the segment
chain_rowexcess	Percentage of excess chain row pieces that can be eliminated
recommendations	Recommendation or finding for this segment
c1	Command associated with the recommendation
c2	Command associated with the recommendation

Table 172-2 (Cont.) ASA_RECO_ROW Attributes

Field	Description
c3	Command associated with the recommendation
task_id	Advisor Task that processed this segment
mesg_id	Message ID corresponding to the recommendation

Related Topics

- [DBMS_SPACE ASA_RECOMMENDATIONS Function](#)
This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

172.2.3 DBMS_SPACE ASA_RECO_ROW_TB Table Type

The type `asa_reco_row_tb` is a table of `asa_reco_row`.

Syntax

```
TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
```

172.3 Summary of DBMS_SPACE Subprograms

This table lists the `DBMS_SPACE` subprograms and briefly describes them.

Table 172-3 DBMS_SPACE Package Subprograms

Subprogram	Description
ASA_RECOMMENDATIONS Function	Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user
CREATE_INDEX_COST Procedure	Determines the cost of creating an index on an existing table
CREATE_TABLE_COST Procedures	Determines the size of the table given various attributes
FREE_BLOCKS Procedure	Returns information about free blocks in an object (table, index, or cluster)
ISDATAFILEDROPPABLE_NAME Procedure	Checks whether a datafile is droppable
OBJECT_DEPENDENT_SEGMENTS Function	Returns the list of segments that are associated with the object
OBJECT_GROWTH_TREND Function	A table function where each row describes the space usage of the object at a specific point in time
SHRINK_TABLESPACE Procedure	Analyzes a bigfile tablespace before resizing or resizes a bigfile tablespace and optionally returns information about the resize operation
SPACE_USAGE Procedures	Returns information about free blocks in an auto segment space managed segment
UNUSED_SPACE Procedure	Returns information about unused space in an object (table, index, or cluster)

172.3.1 DBMS_SPACE ASA_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

Syntax

```
DBMS_SPACE.ASA_RECOMMENDATIONS (
    all_runs          IN    VARCHAR2 DEFAULT := TRUE,
    show_manual      IN    VARCHAR2 DEFAULT := TRUE,
    show_findings    IN    VARCHAR2 DEFAULT := FALSE)
RETURN ASA_RECO_ROW_TB PIPELINED;
```

Parameters

Table 172-4 ASA_RECOMMENDATIONS Procedure Parameters

Parameter	Description
all_runs	Returns the results of all the auto advisor runs or only the results of the latest run. The valid values are TRUE and FALSE. The default value is TRUE. If TRUE, returns recommendations/findings for all runs of auto segment advisor. If FALSE, returns the results of the LATEST run only. LATEST does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.
show_manual	This parameter is used to indicate if the results of manual jobs should be included. If TRUE, results of manual tasks are shown. If FALSE, results of manual tasks are not shown. Specifying manual=true does not negate the specification of auto advisor tasks. However, the all_runs settings may override manual. If all_runs is FALSE, implying we only want to see the latest of auto advisor job, then manual may not be specified as TRUE. The valid values are TRUE and FALSE. The default value is TRUE.
show_findings	Shows only the findings instead of the recommendations. The valid values are TRUE and FALSE. The default value is FALSE.

Table 172-5 Parameter Usage

all_runs	show_manual	show_findings	Outcome
TRUE	TRUE	TRUE	All findings from auto advisor and manual tasks.
TRUE	TRUE	FALSE	All recommendations from auto advisor and manual tasks.
TRUE	FALSE	TRUE	All findings from auto advisor tasks.
TRUE	FALSE	FALSE	All recommendations from all auto advisor tasks.

Table 172-5 (Cont.) Parameter Usage

all_runs	show_manual	show_findings	Outcome
FALSE	TRUE	TRUE	N/A
FALSE	TRUE	FALSE	N/A
FALSE	FALSE	TRUE	Findings for the latest auto advisor task.
FALSE	FALSE	FALSE	Recommendations from the latest auto advisor task.

172.3.2 CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (
    ddl          IN   VARCHAR2,
    used_bytes   OUT  NUMBER,
    alloc_bytes  OUT  NUMBER,
    plan_table   IN   VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references (create_index_cost,WNDS);
```

Parameters

Table 172-6 CREATE_INDEX_COST Procedure Parameters

Parameter	Description
ddl	The create index DDL statement
used_bytes	The number of bytes representing the actual index data
alloc_bytes	Size of the index when created in the tablespace
plan_table	Which plan table to use, default NULL

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

172.3.3 CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

Syntax

```
DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    avg_row_size       IN NUMBER,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);
```

```
DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    colinfos           IN CREATE_TABLE_COST_COLUMNS,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);
```

```
CREATE TYPE create_table_cost_colinfo IS OBJECT (
    COL_TYPE    VARCHAR(200),
    COL_SIZE    NUMBER);
```

Parameters

Table 172-7 CREATE_TABLE_COST Procedure Parameters

Parameter	Description
tablespace_name	The tablespace in which the object will be created. The default is SYSTEM tablespace.
avg_row_size	The anticipated average row size in the table
colinfos	The description of the columns
row_count	The anticipated number of rows in the table
pct_free	The percentage of free space in each block for future expansion of existing rows due to updates
used_bytes	The space used by user data
alloc_bytes	The size of the object taking into account the tablespace extent characteristics

Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, `pctfree` etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
  ub NUMBER;
  ab NUMBER;
  c1 sys.create_table_cost_columns;
BEGIN
  c1 := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('DATE',NULL));

  DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',c1,100000,0,ub,ab);

  DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
  DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/
```

172.3.4 FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster).

See [SPACE_USAGE Procedures](#) for returning free block information in an auto segment space managed segment.

Syntax

```
DBMS_SPACE.FREE_BLOCKS (
  segment_owner  IN  VARCHAR2,
  segment_name   IN  VARCHAR2,
  segment_type   IN  VARCHAR2,
```

```
freelist_group_id IN NUMBER,
free_blks          OUT NUMBER,
scan_limit        IN NUMBER DEFAULT NULL,
partition_name    IN VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 172-8 FREE_BLOCKS Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
freelist_group_id	Freelist group (instance) whose free list size is to be computed
free_blks	Returns count of free blocks for the specified group
scan_limit	Maximum number of free list blocks to read (optional). Use a scan limit of X you are interested only in the question, "Do I have X blocks on the free list?"
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables. The name of subpartition should be used when partitioning is composite.

Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

Note:

An error is raised if `scan_limit` is not a positive number.

172.3.5 ISDATAFILEDROPPABLE_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

Syntax

```
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (
    filename    IN    VARCHAR2,
    value       OUT   NUMBER);
```

Pragmas

```
pragma restrict_references (free_blocks,WNDS);
```

Parameters

Table 172-9 ISDATAFILEDROPPABLE_NAME Procedure Parameters

Parameter	Description
filename	Name of the file
value	Values: 0 if the file is not droppable, 1 if the file is droppable.

Examples

```
DECLARE fname VARCHAR2(100); retval NUMBER;BEGIN SELECT file_name INTO
fname FROM dba_data_files WHERE file_name like
'%empty%';DBMS_SPACE.ISDATAFILEDROPPABLE_NAME(fname,
retval);DBMS_OUTPUT.PUT_LINE(retval);END;/
```

172.3.6 OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS (
    objowner    IN    VARCHAR2,
    objname     IN    VARCHAR2,
    partname    IN    VARCHAR2,
    objtype     IN    NUMBER)
RETURN dependent_segments_table PIPELINED;
```

Parameters

Table 172-10 OBJECT_DEPENDENT_SEGMENTS Function Parameters

Parameter	Description
objowner	The schema containing the object
objname	The name of the object
partname	The name of the partition

Table 172-10 (Cont.) OBJECT_DEPENDENT_SEGMENTS Function Parameters

Parameter	Description
objtype	Type of the object: <ul style="list-style-type: none"> • OBJECT_TYPE_TABLE constant positive := 1; • OBJECT_TYPE_NESTED_TABLE constant positive := 2; • OBJECT_TYPE_INDEX constant positive := 3; • OBJECT_TYPE_CLUSTER constant positive := 4; • OBJECT_TYPE_TABLE_PARTITION constant positive := 7; • OBJECT_TYPE_INDEX_PARTITION constant positive := 8; • OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9; • OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10; • OBJECT_TYPE_MV constant positive := 13; • OBJECT_TYPE_MVLOG constant positive := 14;

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD (
  segment_owner    VARCHAR2(100),
  segment_name     VARCHAR2(100),
  segment_type     VARCHAR2(100),
  tablespace_name  VARCHAR2(100),
  partition_name   VARCHAR2(100),
  lob_column_name  VARCHAR2(100));
```

Table 172-11 OBJECT_DEPENDENT_SEGMENT Type Parameters

Parameter	Description
segment_owner	The schema containing the segment
segment_name	The name of the segment
segment_type	The type of the segment, such as table, index or LOB
tablespace_name	The name of the tablespace
partition_name	The name of the partition, if any
lob_column_name	The name of the LOB column, if any

172.3.7 OBJECT_GROWTH_TREND Function

This is a table function. The output is one or more rows where each row describes the space usage of the object at a specific point in time.

Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```
DBMS_SPACE.OBJECT_GROWTH_TREND (
    object_owner      IN   VARCHAR2,
    object_name       IN   VARCHAR2,
    object_type       IN   VARCHAR2,
    partition_name    IN   VARCHAR2 DEFAULT NULL,
    start_time        IN   TIMESTAMP DEFAULT NULL,
    end_time          IN   TIMESTAMP DEFAULT NULL,
    interval          IN   DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
    skip_interpolated IN   VARCHAR2 DEFAULT 'FALSE',
    timeout_seconds   IN   NUMBER DEFAULT NULL,
    single_datapoint_flag IN VARCHAR2 DEFAULT 'TRUE')
RETURN object_growth_trend_table PIPELINED;
```

Parameters

Table 172-12 OBJECT_GROWTH_TREND Function Parameters

Parameter	Description
object_owner	The schema containing the object
object_name	The name of the object
object_type	The type of the object
partition_name	The name of the partition
start_time	Statistics generated after this time will be used in generating the growth trend
end_time	Statistics generated until this time will be used in generating the growth trend
interval	The interval at which to sample
skip_interpolated	Whether interpolation of missing values should be skipped
timeout_seconds	The time-out value for the function in seconds
single_data_point_flag	Whether in the absence of statistics the segment should be sampled

Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```
TYPE object_growth_trend_row IS RECORD(
    timepoint      TIMESTAMP,
    space_usage    NUMBER,
    space_alloc    NUMBER,
    quality        VARCHAR(20));
```

Table 172-13 OBJECT_GROWTH_TREND_ROW Type Parameters

Parameter	Description
timepoint	The time at which the statistic was recorded
space_usage	The space used by data
space_alloc	The size of the segment including overhead and unused space

Table 172-13 (Cont.) OBJECT_GROWTH_TREND_ROW Type Parameters

Parameter	Description
quality	The quality of result: "GOOD", "INTERPOLATED", "PROJECTION"

```
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

172.3.8 SHRINK_TABLESPACE Procedure

This procedure can resize a bigfile tablespace or analyze a bigfile tablespace before resizing.

Syntax

```
DBMS_SPACE.SHRINK_TABLESPACE (
    ts_name          IN VARCHAR2,
    shrink_mode      IN NUMBER,
    target_size      IN NUMBER,
    shrink_result    OUT CLOB);
```

```
DBMS_SPACE.SHRINK_TABLESPACE (
    ts_name          IN VARCHAR2,
    shrink_mode      IN NUMBER,
    target_size      IN NUMBER);
```

Parameters

Table 172-14 SHRINK_TABLESPACE Procedure Parameters

Parameter	Description
ts_name	The name of the tablespace to be analyzed or resized
shrink_mode	The shrink mode to execute. The values are: <ul style="list-style-type: none"> • TS_MODE_ANALYZE • TS_MODE_SHRINK • TS_MODE_SHRINK_FORCE The default mode is TS_MODE_SHRINK which moves objects online by default, except for index-organized tables. TS_MODE_SHRINK_FORCE will move objects online by default, but if the online move fails, it will attempt to move them offline.
target_size	The desired tablespace size specified in bytes . The default value is TS_TARGET_MAX_SHRINK.

Table 172-14 (Cont.) SHRINK_TABLESPACE Procedure Parameters

Parameter	Description
shrink_result	<p>Output result of the procedure returned as a CLOB.</p> <p>The output results for TS_MODE_SHRINK include:</p> <ul style="list-style-type: none"> total number and size of moved objects original and new datafile size process time <p>The output results for TS_MODE_ANALYZE include:</p> <ul style="list-style-type: none"> list of movable objects total number and size of movable objects suggested target size process time

Examples

This example analyzes bigfile tablespace TBS_1.

```
set serveroutput on
execute dbms_space.shrink_tablespace('TBS_1', shrink_mode =>
DBMS_SPACE.TS_MODE_ANALYZE);

-----ANALYZE
RESULT-----
1. { BG_TEST.SYS_IL0000081422C00004$$ | type: INDEX | blocks: 256 |
tablespace_name: TBS_1 }
2. { BG_TEST.SYS_IL0000081422C00005$$ | type: INDEX | blocks: 512 |
tablespace_name: TBS_1 }
3. { BG_TEST.T2 | type: TABLE | blocks: 512 | tablespace_name: TBS_1 }
4. { BG_TEST.T2_LOB1 | type: LOBSEGMENT | blocks: 45824 | tablespace_name:
TBS_1}
5. { BG_TEST.T2_LOB2 | type: LOBSEGMENT | blocks: 41216 | tablespace_name:
TBS_1}
Total Movable Objects: 5
Total Movable Size(GB): .67
Original Datafile Size(GB): 10
Suggested Target Size(GB): 2.09
Process Time: +00 00:00:03.94897
```

This example shrinks the bigfile tablespace TBS_1 to its current minimum possible size.

```
set serveroutput on
execute dbms_space.shrink_tablespace('TBS_1');

-----SHRINK RESULT-----
Total Moved Objects: 5
Total Moved Size(GB): 1.35
Original Datafile Size(GB): 10
New Datafile Size(GB): 1.81
Process Time: +00 00:00:50.94897
```

172.3.9 SPACE_USAGE Procedures

This procedure has two variations to show space usage.

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBS, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBS.

Note:

For LOB segments, the number of blocks that is returned from `full_blocks` and `unformatted_blocks` is actually the number of chunks for the LOB segment.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBS in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBS.

Syntax

```
DBMS_SPACE.SPACE_USAGE (
    segment_owner          IN  VARCHAR2,
    segment_name           IN  VARCHAR2,
    segment_type           IN  VARCHAR2,
    unformatted_blocks     OUT  NUMBER,
    unformatted_bytes     OUT  NUMBER,
    fs1_blocks             OUT  NUMBER,
    fs1_bytes              OUT  NUMBER,
    fs2_blocks             OUT  NUMBER,
    fs2_bytes              OUT  NUMBER,
    fs3_blocks             OUT  NUMBER,
    fs3_bytes              OUT  NUMBER,
    fs4_blocks             OUT  NUMBER,
    fs4_bytes              OUT  NUMBER,
    full_blocks            OUT  NUMBER,
    full_bytes             OUT  NUMBER,
    partition_name         IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_SPACE.SPACE_USAGE (
    segment_owner          IN  VARCHAR2,
    segment_name           IN  VARCHAR2,
    segment_type           IN  VARCHAR2,
    segment_size_blocks   OUT  NUMBER,
    segment_size_bytes    OUT  NUMBER,
    used_blocks            OUT  NUMBER,
    used_bytes             OUT  NUMBER,
    expired_blocks        OUT  NUMBER,
    expired_bytes         OUT  NUMBER,
    unexpired_blocks      OUT  NUMBER,
```

```

unexpired_bytes      OUT  NUMBER,
partition_name       IN   VARCHAR2 DEFAULT NULL);

```

Parameters

Table 172-15 SPACE_USAGE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Name of the segment to be analyzed
partition_name	Partition name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
unformatted_blocks	For LOB segments, the number of blocks that is returned from unformatted_blocks is actually the number of chunks for the LOB segment.
unformatted bytes	Total number of bytes unformatted
fs1_blocks	Number of blocks having at least 0 to 25% free space
fs1_bytes	Number of bytes having at least 0 to 25% free space
fs2_blocks	Number of blocks having at least 25 to 50% free space
fs2_bytes	Number of bytes having at least 25 to 50% free space
fs3_blocks	Number of blocks having at least 50 to 75% free space
fs3_bytes	Number of bytes having at least 50 to 75% free space
fs4_blocks	Number of blocks having at least 75 to 100% free space
fs4_bytes	Number of bytes having at least 75 to 100% free space
full_blocks	The number of blocks that is returned from full_blocks is actually the number of chunks for the LOB segment
full_bytes	Total number of bytes full in the segment
segment_size_blocks	Number of blocks allocated to the segment
segment_size_bytes	Number of bytes allocated to the segment
used_blocks	Number blocks allocated to the LOB that contains active data
used_bytes	Number bytes allocated to the LOB that contains active data
expired_blocks	Number of expired blocks used by the LOB to keep version data
expired_bytes	Number of expired bytes used by the LOB to keep version data
unexpired_blocks	Number of unexpired blocks used by the LOB to keep version data

Table 172-15 (Cont.) SPACE_USAGE Procedure Parameters

Parameter	Description
unexpired_bytes	Number of unexpired bytes used by the LOB to keep version data
partition_name	Name of the partition (NULL if not a partition)

Examples

```

variable unf number;
variable unfb number;
variable fs1 number;
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
dbms_space.space_usage('U1','T',
                      'TABLE',
                      :unf, :unfb,
                      :fs1, :fs1b,
                      :fs2, :fs2b,
                      :fs3, :fs3b,
                      :fs4, :fs4b,
                      :full, :fullb);

end;
/
print unf ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;

```

172.3.10 UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```

DBMS_SPACE.UNUSED_SPACE (
    segment_owner          IN VARCHAR2,
    segment_name           IN VARCHAR2,
    segment_type           IN VARCHAR2,
    total_blocks           OUT NUMBER,

```

```

total_bytes          OUT NUMBER,
unused_blocks        OUT NUMBER,
unused_bytes         OUT NUMBER,
last_used_extent_file_id OUT NUMBER,
last_used_extent_block_id OUT NUMBER,
last_used_block      OUT NUMBER,
partition_name       IN  VARCHAR2 DEFAULT NULL);

```

Parameters

Table 172-16 UNUSED_SPACE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
total_blocks	Returns total number of blocks in the segment
total_bytes	Returns total number of blocks in the segment, in bytes
unused_blocks	Returns number of blocks which are not used
unused_bytes	Returns, in bytes, number of blocks which are not used
last_used_extent_file_id	Returns the file ID of the last extent which contains data
last_used_extent_block_id	Returns the starting block ID of the last extent which contains data
last_used_block	Returns the last block within this extent which contains data
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose.

Examples

The following declares the necessary bind variables and executes.

```

DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,
:total_bytes, :unused_blocks, :unused_bytes, :lastextf,
:last_extb, :lastusedblock);

```

DBMS_SPACE_ADMIN

The `DBMS_SPACE_ADMIN` package provides functionality for locally managed tablespaces.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Summary of DBMS_SPACE_ADMIN Subprograms](#)

See Also:

Oracle Database Administrator's Guide for an example and description of using `DBMS_SPACE_ADMIN`.

173.1 DBMS_SPACE_ADMIN Security Model

This package runs with `SYS` privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

173.2 DBMS_SPACE_ADMIN Constants

The `DBMS_SPACE_ADMIN` package provides constants that can be used for specifying parameter values.

Table 173-1 DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
<code>SEGMENT_VERIFY_EXTENTS</code>	POSITIVE	1	Verifies that the space owned by segment is appropriately reflected in the bitmap as used
<code>SEGMENT_VERIFY_EXTENTS_GLOBAL</code>	POSITIVE	2	Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it
<code>SEGMENT_MARK_CORRUPT</code>	POSITIVE	3	Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation)

Table 173-1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENT_MARK_VALID	POSITIVE	4	Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.
SEGMENT_DUMP_EXTENT_MAP	POSITIVE	5	Dumps the extent map for a given segment
TABLESPACE_VERIFY_BITMAP	POSITIVE	6	Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent
TABLESPACE_EXTENT_MAKE_FREE	POSITIVE	7	Marks the block range (extent) as free in the bitmaps
TABLESPACE_EXTENT_MAKE_USED	POSITIVE	8	Marks the block range (extent) as used in the bitmaps
SEGMENT_VERIFY_BASIC	POSITIVE	9	Performs the basic metadata checks
SEGMENT_VERIFY_DEEP	POSITIVE	10	Performs deep verification
SEGMENT_VERIFY_SPECIFIC	POSITIVE	11	Performs a specific check for the segment
HWM_CHECK	POSITIVE	12	Checks high water mark (HWM)
BMB_CHECK	POSITIVE	13	Checks integrity among L1, L2 and L3 BMBs (Bit Map Blocks)
SEG_DICT_CHECK	POSITIVE	14	Checks consistency of segment header with corresponding SEG entry
EXTENT_TS_BITMAP_CHECK	POSITIVE	15	Checks whether the tablespace bitmaps corresponding to the extent map are marked used
DB_BACKPOINTER_CHECK	POSITIVE	16	Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment
EXTENT_SEGMENT_BITMAP_CHECK	POSITIVE	17	Checks whether the bitmap blocks are consistent with the extent map
BITMAPS_CHECK	POSITIVE	18	Checks from the datablocks that the bitmap states representing the blocks are consistent
TS_VERIFY_BITMAPS	POSITIVE	19	Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace
TS_VERIFY_DEEP	POSITIVE	20	Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option
TS_VERIFY_SEGMENTS	POSITIVE	21	Performs ASSM_SEGMENT_VERIFY on all segments in the tablespace, taking either the BASIC or the DEEP option

Table 173-1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENTS_DUMP_BITMAP_SUMMARY	POSITIVE	27	Dumps only bitmap block summaries

173.3 DBMS_SPACE_ADMIN Operational Notes

Before migrating the `SYSTEM` tablespace, certain conditions must be met. These conditions are enforced by the `TABLESPACE_MIGRATE_TO_LOCAL` procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not `SYSTEM`.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, then an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

173.4 Summary of DBMS_SPACE_ADMIN Subprograms

This table lists the `DBMS_SPACE_ADMIN` subprograms and briefly describes them.

Table 173-2 DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
ASSM_SEGMENT_VERIFY Procedure	Verifies segments created in ASSM (Automatic Segment-Space Management) tablespaces
ASSM_TABLESPACE_VERIFY Procedure	Verifies ASSM tablespaces
DROP_EMPTY_SEGMENTS Procedure	Drops segments from empty tables or table fragments and dependent objects
GET_SEGADV_ATTRIB Procedure	returns the values of attributes of <code>DBSM_SPACE_ADMIN</code> package
MATERIALIZE_DEFERRED_SEGMENTS Procedure	Materializes segments for tables and table fragments with deferred segment creation and their dependent objects
SEGMENT_CORRUPT Procedure	Marks the segment corrupt or valid so that appropriate error recovery can be done
SEGMENT_DROP_CORRUPT Procedure	Drops a segment currently marked corrupt (without reclaiming space)
SEGMENT_DUMP Procedure	Dumps the segment header and extent maps of a given segment
SEGMENT_VERIFY Procedure	Verifies the consistency of the extent map of the segment

Table 173-2 (Cont.) DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
SET_SEGADV_ATTRIB Procedure	Sets/changes the values of attributes of DBSM_SPACE_ADMIN package
TABLESPACE_FIX_BITMAPS Procedure	Marks the appropriate block range (extent) as free or used in bitmap
TABLESPACE_FIX_SEGMENT_STAT ES Procedure	Fixes the state of the segments in a tablespace in which migration was aborted
TABLESPACE_MIGRATE_FROM_LOCAL Procedure	Migrates a locally managed tablespace to dictionary-managed tablespace
TABLESPACE_MIGRATE_TO_LOCAL Procedure	Migrates a tablespace from dictionary-managed format to locally managed format
TABLESPACE_REBUILD_BITMAPS Procedure	Rebuilds the appropriate bitmaps
TABLESPACE_REBUILD_QUOTAS Procedure	Rebuilds quotas for given tablespace
TABLESPACE_RELOCATE_BITMAPS Procedure	Relocates the bitmaps to the destination specified
TABLESPACE_VERIFY Procedure	Verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized

173.4.1 ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in Automatic Segment Space Management (ASSM) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, and whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (
  segment_owner  IN VARCHAR2,
  segment_name   IN VARCHAR2,
  segment_type   IN VARCHAR2,
  partition_name IN VARCHAR2,
  verify_option  IN POSITIVE DEFAULT SEGMENT_VERIFY_BASIC,
  attrib         IN POSITIVE DEFAULT NULL);
```

Parameters

Table 173-3 ASSM_SEGMENT_VERIFY Procedure Parameters

Parameter	Description
segment_owner	Schema that owns the segment
segment_name	Name of the segment to be verified
segment_type	Segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER
partition_name	Name of the partition or subpartition
verify_option	One of the following options: <ul style="list-style-type: none"> SEGMENT_VERIFY_BASIC := 9. Performs the basic metadata checks (Default) SEGMENT_VERIFY_DEEP := 10. Performs deep verification SEGMENT_VERIFY_SPECIFIC := 11. Performs a specific check for the segment
attrib	When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following: <ul style="list-style-type: none"> HWM_CHECK := 12. Checks whether high water mark information is accurate BMB_CHECK := 13. Checks whether space bitmap blocks have correct backpointers to the segment header SEG_DICT_CHECK := 14. Checks whether dictionary information for segment is accurate EXTENT_TS_BITMAP_CHECK := 15. Checks whether extent maps are consistent with file level bitmaps DB_BACKPOINTER_CHECK := 16. Checks whether datablocks have correct backpointers to the space metadata blocks EXTENT_SEGMENT_BITMAP_CHECK := 17. Checks whether extent map in the segment matches the bitmaps in the segment BITMAPS_CHECK := 18. Checks whether space bitmap blocks are accurate

Usage Notes

- Using this procedure requires SYSDBA privileges.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.
- This procedure outputs a dump file named sid_ora_process_ID.trc to the location specified in the USER_DUMP_DEST initialization parameter.

173.4.2 ASSM_TABLESPACE_VERIFY Procedure

This procedure verifies all the segments created in an ASSM tablespace. The verification for each segment performs basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
    tablespace_name  IN VARCHAR2,
    ts_option        IN POSITIVE,
    segment_option   IN POSITIVE DEFAULT NULL);
```

Parameters

Table 173-4 ASSM_TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of the tablespace to verify. The tablespace must be an ASSM tablespace.
ts_option	<ul style="list-style-type: none"> 19: SecureFiles supports DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY only when you set the value of TS_OPTION to 19. TS_VERIFY_BITMAPS := 19. The bitmaps are verified against the extents. This detects bits that are marked used or free wrongly and detects multiple allocation of extents. The file metadata is validated against file\$ and control file. TS_VERIFY_DEEP := 20. This option is used to verify the file bitmaps as well perform checks on all the segments. TS_VERIFY_SEGMENTS := 21. This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally you can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY.
segment_option	<p>When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following:</p> <ul style="list-style-type: none"> SEGMENT_VERIFY_BASIC := 9 SEGMENT_VERIFY_DEEP := 10 <p>The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BITMAPS is specified.</p>

Usage Notes

- Using this procedure requires SYSDBA privileges.
- This procedure outputs a dump file named `sid_ora_process_ID.trc` to the location specified in the `USER_DUMP_DEST` initialization parameter.

173.4.3 DROP_EMPTY_SEGMENTS Procedure

This procedure drops segments from empty tables or table fragments and dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.DROP_EMPTY_SEGMENTS (  
    schema_name      IN      VARCHAR2  DEFAULT NULL,  
    table_name       IN      VARCHAR2  DEFAULT NULL,  
    partition_name   IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 173-5 DROP_EMPTY_SEGMENTS Procedure Parameters

Parameter	Description
schema_name	Name of schema
table_name	Name of table
partition_name	Name of partition

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the table or any of its fragments are found to be empty, and the table satisfies certain criteria (restrictions being the same as those described in "Restrictions on Deferred Segment Creation"), then the empty table fragment and associated index segments are dropped along with the corresponding LOB data and index segments. A subsequent insert creates segments with the same properties.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned
- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

173.4.4 GET_SEGADV_ATTRIB Procedure

This procedure returns the values of attributes of `DBMS_SPACE_ADMIN` package.

Syntax

```
DBMS_SPACE_ADMIN.GET_SEGADV_ATTRIB(  
    attribute IN NUMBER,  
    value     OUT NUMBER);
```

Parameters

Table 173-6 GET_SEGADV_ATTRIB Procedure Parameters

Parameter	Description
attribute	Supported attributes: <ul style="list-style-type: none"> COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor. COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.
value	Supported values: <ul style="list-style-type: none"> ATTR_ENABLE : 1 ATTR_DISABLE : 0

173.4.5 MATERIALIZE_DEFERRED_SEGMENTS Procedure

This procedure materializes segments for tables and table fragments with deferred segment creation and their dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.MATERIALIZE_DEFERRED_SEGMENTS (
  schema_name      IN      VARCHAR2  DEFAULT NULL,
  table_name       IN      VARCHAR2  DEFAULT NULL,
  partition_name   IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 173-7 MATERIALIZE_DEFERRED_SEGMENTS Procedure Parameters

Parameter	Description
schema_name	Name of schema
table_name	Name of table
partition_name	Name of partition

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the deferred or delayed segment property is set for the table or any of its fragments, then a new segment is created for those fragments and their dependent objects.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned

- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

173.4.6 SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be performed.

It cannot be used on the `SYSTEM` tablespace.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
  tablespace_name      IN   VARCHAR2,
  header_relative_file IN   POSITIVE,
  header_block        IN   NUMBER,
  corrupt_option       IN   POSITIVE DEFAULT SEGMENT_MARK_CORRUPT);
```

Parameters

Table 173-8 SEGMENT_CORRUPT Procedure Parameters

Parameter	Description
<code>tablespace_name</code>	Name of tablespace in which segment resides
<code>header_relative_file</code>	Relative file number of segment header
<code>header_block</code>	Block number of segment header
<code>corrupt_option</code>	SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID

Usage Notes

You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_MARK_CORRUPT);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_MARK_VALID);
```

173.4.7 SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space).

For this to work, the segment must be marked *temporary*. To mark a corrupt segment as temporary, issue a `DROP` command on the segment.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (
    tablespace_name      IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block         IN    NUMBER);
```

Parameters

Table 173-9 SEGMENT_DROP_CORRUPT Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header

Usage Notes

- The space for the segment is not released, and it must be fixed by using the [TABLESPACE_FIX_BITMAPS Procedure](#) or the [TABLESPACE_REBUILD_BITMAPS Procedure](#).
- The procedure cannot be used on the SYSTEM tablespace.
- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```

173.4.8 SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
    tablespace_name      IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block         IN    NUMBER,
    dump_option          IN    POSITIVE DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

Parameters

Table 173-10 SEGMENT_DUMP Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header

Table 173-10 (Cont.) SEGMENT_DUMP Procedure Parameters

Parameter	Description
dump_option	One of the following options: <ul style="list-style-type: none"> SEGMENT_DUMP_EXTENT_MAP SEGMENT_DUMP_BITMAP_SUMMARY

Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass `SEGMENT_DUMP_BITMAP_SUMMARY` as the `dump_option` parameter.
- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS.HEADER_FILE`. If `HEADER_FILE` is greater than 1023 then use `DBA_DATA_FILES.RELATIVE_FNO`.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

173.4.9 SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
  tablespace_name      IN      VARCHAR2,
  header_relative_file IN      POSITIVE,
  header_block         IN      NUMBER,
  verify_option        IN      POSITIVE DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters**Table 173-11 SEGMENT_VERIFY Procedure Parameters**

Parameters	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
verify_option	What kind of check to do: <code>SEGMENT_VERIFY_EXTENTS</code> or <code>SEGMENT_VERIFY_EXTENTS_GLOBAL</code>

Usage Notes

- Anomalies are output as block range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all block ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not

considered free, used space considered free, and the same space considered used by multiple segments.

- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps synchronized.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_VERIFY_EXTENTS);
```

173.4.10 SET_SEGADV_ATTRIB Procedure

This procedure sets the values of attributes of DBMS_SPACE_ADMIN package.

Syntax

```
DBMS_SPACE_ADMIN.SET_SEGADV_ATTRIB (
    attribute IN NUMBER,
    value     IN NUMBER);
```

Parameters

Table 173-12 SET_SEGADV_ATTRIB Procedure Parameters

Parameter	Description
attribute	Supported attributes: <ul style="list-style-type: none"> • COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor. • COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.
value	Supported values: <ul style="list-style-type: none"> • ATTR_ENABLE : 1 • ATTR_DISABLE : 0

173.4.11 TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate block range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (
    tablespace_name IN VARCHAR2,
    dbarange_relative_file IN POSITIVE,
    dbarange_begin_block IN POSITIVE,
```

```
dbarange_end_block    IN    POSITIVE,
fix_option            IN    POSITIVE);
```

Parameters

Table 173-13 TABLESPACE_FIX_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
dbarange_relative_file	Relative file number of block range (extent)
dbarange_begin_block	Block number of beginning of extent
dbarange_end_block	Block number (inclusive) of end of extent
fix_option	One of the following options: <ul style="list-style-type: none"> TABLESPACE_EXTENT_MAKE_FREE TABLESPACE_EXTENT_MAKE_USED

Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as `USED` in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83,
DBMS_SPACE_ADMIN.EXTENT_MAKE_USED);
```

Alternatively, specifying an option of `TABLESPACE_EXTENT_MAKE_FREE` marks the bits free in bitmaps. The `BEGIN` and `END` blocks must be in extent boundary and be extent multiple; otherwise, an error is raised.

173.4.12 TABLESPACE_FIX_SEGMENT_STATES Procedure

This procedure fixes the state of the segments in a tablespace in which migration was aborted.

During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, then the segment states are corrected by SMON when event 10906 is set. A database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (
    tablespace_name    IN    VARCHAR);
```

Parameters

Table 173-14 TABLESPACE_FIX_SEGMENT_STATES Procedure Parameters

Parameter Name	Description
tablespace_name	Name of the tablespace whose segments must be fixed

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1')
```

173.4.13 TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally managed tablespace to a dictionary-managed tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (
    tablespace_name      IN      VARCHAR2);
```

Parameter

Table 173-15 TABLESPACE_MIGRATE_FROM_LOCAL Procedure Parameter

Parameter	Description
tablespace_name	Name of tablespace

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```

173.4.14 TABLESPACE_MIGRATE_TO_LOCAL Procedure

This procedure migrates the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
    tablespace_name      IN      VARCHAR2,
    unit_size            IN      POSITIVE DEFAULT NULL,
    rfno                 IN      POSITIVE DEFAULT NULL);
```

Parameters

Table 173-16 TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

Parameter Name	Description
tablespace_name	Name of the tablespace to be migrated

Table 173-16 (Cont.) TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

Parameter Name	Description
<code>unit_size</code>	Bitmap unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace specified in number of blocks
<code>rfno</code>	Relative File Number of the file where the bitmap blocks are placed

Usage Notes

- Before you migrate the `SYSTEM` tablespace, migrate any dictionary-managed tablespaces that you want to use in read/write mode to locally managed. After the `SYSTEM` tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

 **See Also:***Oracle Database Administrator's Guide*

- The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.
- Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the `MINIMUM EXTENT` for the tablespace (5 if `MINIMUM EXTENT` is not specified). Thus, the calculated value will not be larger than the `MINIMUM EXTENT` for the tablespace. The last free extent in every file is ignored for GCD calculation. If you specify the unit size, then it must be a factor of the `unit_size` calculated by the system; otherwise an error message is returned.
- The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, then an error is issued. The data file specified must be part of the tablespace being migrated. If the dataflow is not specified, then the system chooses a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, then an error is raised.

Examples

To migrate a tablespace 'TS1' in 2KB blocksize with minimum extent size 1MB:

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```

The bitmaps are placed in file with relative file number 2.

173.4.15 TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the `SYSTEM` tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
    tablespace_name      IN      VARCHAR2,
    bitmap_relative_file IN      POSITIVE  DEFAULT NULL,
    bitmap_block         IN      POSITIVE  DEFAULT NULL);
```

Parameters

Table 173-17 TABLESPACE_REBUILD_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
bitmap_relative_file	Relative file number of bitmap block to rebuild
bitmap_block	Block number of bitmap block to rebuild

Usage Notes

Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the `USERS` tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

173.4.16 TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (
    tablespace_name      IN      VARCHAR2);
```

Parameters

Table 173-18 TABLESPACE_REBUILD_QUOTAS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```

173.4.17 TABLESPACE_RELOCATE_BITMAPS Procedure

This procedure relocates the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (
    tablespace_name    IN    VARCHAR2,
    filno              IN    POSITIVE,
    blkno              IN    POSITIVE);
```

Parameters

Table 173-19 TABLESPACE_RELOCATE_BITMAPS Procedure Parameters

Parameter Name	Description
tablespace_name	Name of tablespace
filno	Relative File Number of the destination file
blkno	Block Number of the destination range

Usage Notes

- Migration of a tablespace from dictionary-managed to locally managed format could result in the creation of `SPACE HEADER` segment that contains the bitmap blocks. The `SPACE HEADER` segment is treated as user data. If you explicitly resize a file at or below the space header segment, then an error is issued. Use the `TABLESPACE_RELOCATE_BITMAPS` command to move the control information to a different destination and then resize the file.
- This procedure cannot be used on the `SYSTEM` tablespace.
- The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

Note:

The source and the destination addresses must not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location, then an error is raised.

173.4.18 TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (
    tablespace_name      IN    VARCHAR2,
    verify_option        IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

Table 173-20 TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
verify_option	One option is supported: TABLESPACE_VERIFY_BITMAP

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```

DBMS_SPD

The `DBMS_SPD` package provides subprograms for managing SQL plan directives (SPD).

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Views](#)
- [Summary of DBMS_SPD Subprograms](#)

See Also:

- [DBMS_STATS](#)
- *Oracle Database SQL Tuning Guide* regarding SQL plan directives

174.1 DBMS_SPD Overview

This package provides subprograms for managing SQL plan directives (SPD).

SPD are objects generated automatically by Oracle. For example, if Oracle detects that the single table cardinality estimated made by the optimizer is different from the actual number of rows returned when accessing the table, it will automatically create a directive to perform dynamic statistics for the table. When any SQL statement referencing the table is compiled, the optimizer will perform dynamic statistics for the table to get a more accurate estimate.

174.2 DBMS_SPD Security Model

`DBMS_SPD` is an invoker-rights package. The invoker requires `ADMINISTER SQL MANAGEMENT OBJECT` privilege for executing most of the subprograms in this package. Also, the subprograms commit the current transaction (if any), perform the operation, and then commit it again.

174.3 DBMS_SPD Views

The DBA view `DBA_SQL_PLAN_DIRECTIVES` shows all the directives created in the system and the view `DBA_SQL_PLAN_DIR_OBJECTS` displays the objects that are included in the directives.

174.4 Summary of DBMS_SPD Subprograms

This table lists and briefly describes the `DBMS_SPD` package subprograms.

Table 174-1 DBMS_SPD Package Subprograms

Subprogram	Description
ALTER_SQL_PLAN_DIRECTIVE Procedure	Changes different attributes of a SQL plan directive
CREATE_STGTAB_DIRECTIVE Procedure	Creates a staging table into which to pack (export) SQL plan directives.
DROP_SQL_PLAN_DIRECTIVE Procedure	Drops a SQL plan directive
FLUSH_SQL_PLAN_DIRECTIVE Procedure	Allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.
GET_PREFS Function	Gets the values for preferences for SQL plan directives
PACK_STGTAB_DIRECTIVE Function	Packs (exports) SQL plan directives into a staging table.
SET_PREFS Procedure	Allows the setting of different preferences for SQL plan directives
UNPACK_STGTAB_DIRECTIVE Function	Unpacks (imports) SQL plan directives from a staging table.

174.4.1 ALTER_SQL_PLAN_DIRECTIVE Procedure

This procedure changes different attributes of a SQL plan directive.

Syntax

```
DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (
    directive_id      IN      NUMBER,
    attribute_name    IN      VARCHAR2,
    attribute_value   IN      VARCHAR2);
```

Parameters

Table 174-2 ALTER_SQL_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
directive_id	SQL plan directive ID
attribute_name	<ul style="list-style-type: none"> ENABLED AUTO_DROP
attribute_value	<p>Possible values:</p> <ul style="list-style-type: none"> ENABLED: <ul style="list-style-type: none"> - If YES directive is enabled and may be used - If NO directive is not enabled and will not be used AUTO_DROP: <ul style="list-style-type: none"> - If YES directive will be dropped automatically if not used for SPD_RETENTION_WEEKS. This is the default behavior. - If NO directive will not be dropped automatically

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-13158 `OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (12345, 'STATE', 'PERMANENT');
END;
```

174.4.2 CREATE_STGTAB_DIRECTIVE Procedure

This procedure creates a staging table into which to pack (export) SQL plan directives.

Syntax

```
DBMS_SPD.CREATE_STGTAB_DIRECTIVE (
  table_name          IN VARCHAR2,
  table_owner         IN VARCHAR2 := USER,
  tablespace_name     IN VARCHAR2 := NULL);
```

Parameters

Table 174-3 *CREATE_STGTAB_DIRECTIVE Procedure Parameters*

Parameter	Description
<code>table_name</code>	Name of staging table
<code>table_owner</code>	Name of schema owner of staging table. Default is current schema.
<code>tablespace_name</code>	Name of tablespace. Default <code>NULL</code> means create staging table in the default tablespace:

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-44001 `INVALID_SCHEMA`: The input schema does not exist.
- ORA-13159 `TABLE_ALREADY_EXISTS`: The specified table already exists.
- ORA-29304 `TABLESPACE_MISSING`: The specified tablespace does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

174.4.3 DROP_SQL_PLAN_DIRECTIVE Procedure

This procedure drops a SQL plan directive.

Syntax

```
DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (  
    directive_id      IN      NUMBER);
```

Parameters

Table 174-4 *DROP_SQL_PLAN_DIRECTIVE Procedure Parameters*

Parameter	Description
directive_id	SQL plan directive ID

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-13158 `OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN  
    DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (12345);  
END;
```

174.4.4 FLUSH_SQL_PLAN_DIRECTIVE Procedure

This procedure allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.

The information recorded in the SGA is periodically flushed by an Oracle background process. This procedure provides a way to flush the information manually.

Syntax

```
DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
```

Exceptions

ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
END;
```

174.4.5 GET_PREFS Function

This function returns the value for the specified preferences for SQL plan directives.

Syntax

```
DBMS_SPD.GET_PREFS (
  pname      IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 174-5 *GET_PREFS Function Parameters*

Parameter	Description
pname	Preference name. The procedure supports the preference <code>SPD_RETENTION_WEEKS</code> .

Return Values

Preference value

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.

Usage Notes

- The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.
- `SPD_RETENTION_WEEKS` - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```
SELECT DBMS_SPD.GET_PREFS('SPD_RETENTION_WEEKS') FROM DUAL;
```

174.4.6 PACK_STGTAB_DIRECTIVE Function

This function packs (exports) SQL plan directives into a staging table.

Syntax

```
DBMS_SPD.PACK_STGTAB_DIRECTIVE (
    table_name      IN VARCHAR2,
    table_owner     IN VARCHAR2 := USER,
    directive_id    IN NUMBER    := NULL,
    obj_list        IN OBJECTTAB := NULL)
RETURN NUMBER
```

Parameters

Table 174-6 *PACK_STGTAB_DIRECTIVE* Function Parameters

Parameter	Description
table_name	Name of staging table
table_owner	Name of schema owner of staging table. Default is current schema.
directive_id	SQL plan directive ID. Default NULL means all directives in the system.
obj_list	Used to filter the directives to be packed based on the objects used in directives. If obj_list is not NULL, a directive is packed only if all the objects in the directive exist in obj_list.

Return Values

Number of SQL plan directives packed.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```
-- Pack all directives in the system
SELECT DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
```

```

-- Pack directives relevant to objects in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := NULL;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Pack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(2);

  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

```

174.4.7 SET_PREFS Procedure

This procedure allows the setting of different preferences for SQL plan directives.

Syntax

```

DBMS_SPD.SET_PREFS (
  pname      IN  VARCHAR2,
  pvalue     IN  VARCHAR2);

```

Parameters

Table 174-7 *SET_PREFS Procedure Parameters*

Parameter	Description
pname	Preference name. The procedure supports the preference SPD_RETENTION_WEEKS.

Table 174-7 (Cont.) SET_PREFS Procedure Parameters

Parameter	Description
pvalue	<p>Preference value.</p> <ul style="list-style-type: none"> SPD_RETENTION_WEEKS: SQL plan directives are purged if not used for more than the value set for this preference. Default is 53 (SPD_RETENTION_WEEKS_DEFAULT) weeks, which means a directive is purged if it has been left unused for little over a year. It can be set to any value greater than or equal to 0. Also value NULL can be passed to set the preference to default.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.

Usage Notes

- The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
- SPD_RETENTION_WEEKS - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```
BEGIN
  DBMS_SPD.SET_PREFS('SPD_RETENTION_WEEKS', '4');
END;
```

174.4.8 UNPACK_STGTAB_DIRECTIVE Function

This procedure unpacks (imports) SQL plan directives from a staging table.

Syntax

```
DBMS_SPD.UNPACK_STGTAB_DIRECTIVE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := USER,
  directive_id    IN NUMBER    := NULL,
  obj_list        IN OBJECTTAB := NULL)
RETURN NUMBER
```

Parameters

Table 174-8 UNPACK_STGTAB_DIRECTIVE Function Parameters

Parameter	Description
table_name	Name of staging table
table_owner	Name of schema owner of staging table. Default is current schema.

Table 174-8 (Cont.) UNPACK_STGTAB_DIRECTIVE Function Parameters

Parameter	Description
directive_id	SQL plan directive ID. Default NULL means all directives in the system.
obj_list	Used to filter the directives to be unpacked based on the objects used in directives. If obj_list is not NULL, a directive is unpacked only if all the objects in the directive exist in obj_list.

Return Values

Number of SQL plan directives unpacked.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```
-- Unack all directives in the staging table
SELECT DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Unpack directives relevant to objects in SH schema
DECLARE
  my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt number;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := null;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Unpack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt NUMBER;
begin
  my_list.extend(2);
```

```
-- SALES table
my_list(1).owner := 'SH';
my_list(1).object_name := 'SALES';
my_list(1).object_type := 'TABLE';

-- CUSTOMERS table
my_list(2).owner := 'SH';
my_list(2).object_name := 'CUSTOMERS';
my_list(2).object_type := 'TABLE';

dir_cnt :=
  DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
```

DBMS_SPM

The `DBMS_SPM` package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_SPM Subprograms](#)

See Also:

For more information about "Using SQL Plan Management" in the *Oracle Database SQL Tuning Guide*

175.1 DBMS_SPM Overview

The `DBMS_SPM` package allows the user to manage SQL execution plans using SQL plan management.

SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.
- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.
- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution plans developed under a standard test configuration for the new SQL statements. If the system production

configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.

175.2 DBMS_SPM Security Model

The package is owned by `SYS`. The `EXECUTE` package privilege is required to execute its procedures. Any user granted the `ADMINISTER SQL MANAGEMENT OBJECT` privilege is able to execute the `DBMS_SPM` package.

175.3 DBMS_SPM Constants

The `DBMS_SPM` package provides constants that can be used for specifying parameter values.

These are shown in the following table. These constants are defined as standard input for the `time_limit` parameter of the `EVOLVE_SQL_PLAN_BASELINE` Function.

Table 175-1 DBMS_SPM Constants

Constant	Type	Value	Description
<code>AUTO_LIMIT</code>	<code>INTEGER</code>	<code>2147483647</code>	Oracle determines the appropriate time spent by the <code>EVOLVE_SQL_PLAN_BASELINE</code> Function.
<code>NO_LIMIT</code>	<code>INTEGER</code>	<code>2147483647 -1</code>	There is no limit to the time spent by the <code>EVOLVE_SQL_PLAN_BASELINE</code> Function.

175.4 DBMS_SPM Examples

These examples will help you understand use of `DBMS_SPM`.

Detailed examples are located under the following topics:

- [Migrating Stored Outlines to SQL Plan Baselines](#)
- [Migrating Outlines to Utilize SQL Plan Management Features](#)
- [Migrating Outlines to Preserve Stored Outline Behavior](#)
- [Performing Follow-Up Tasks After Stored Outline Migration](#)

175.5 DBMS_SPM Data Structures

The `DBMS_SPM` package defines a `TABLE` type.

Table Types

- [DBMS_SPM NAMELIST Table Type](#)

175.5.1 DBMS_SPM NAMELIST Table Type

This type allows for a list of names as an input parameter.

Syntax

```
TYPE name_list IS TABLE OF VARCHAR2(30);
```

175.6 Summary of DBMS_SPM Subprograms

This table lists and briefly describes the DBMS_SPM package subprograms.

Table 175-2 DBMS_SPM Package Subprograms

Subprogram	Description
ACCEPT_SQL_PLAN_BASELINE Procedure	Accepts a plan based on the recommendation of an evolve task
ADD_VERIFIED_SQL_PLAN_BASELINE Function	Finds the plans available for the given SQL_ID in different sources such as Cursor Cache, Auto SQL Tuning Set, and Automatic Workload Repository.
ALTER_SQL_PLAN_BASELINE Function	Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format
CANCEL_EVOLVE_TASK Procedure	Cancel a currently executing evolve task
CONFIGURE Procedure	Sets configuration options for SQL management base, in parameter/value format
CREATE_EVOLVE_TASK Function	Creates an advisor task and sets its parameters
CREATE_STGTAB_BASELINE Procedure	Creates a staging table that used for transporting SQL plan baselines from one system to another
DROP_EVOLVE_TASK Procedure	Drops an evolved task
DROP_SQL_PLAN_BASELINE Function	Drops a single plan, or all plans associated with a SQL statement
EVOLVE_SQL_PLAN_BASELINE Function	Evolve SQL plan baselines associated with one or more SQL statements
EXECUTE_EVOLVE_TASK Function	Executes a previously created evolve task
IMPLEMENT_EVOLVE_TASK Function	Implements a plan based on the recommendation of an evolve task
INTERRUPT_EVOLVE_TASK Procedure	Interrupts a currently executing evolve task
LOAD_PLANS_FROM_CURSOR_CACHE Functions	Loads one or more plans present in the cursor cache for a SQL statement
LOAD_PLANS_FROM_AWR Function	Loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded
LOAD_PLANS_FROM_SQLSET Function	Loads plans stored in a SQL tuning set (STS) into SQL plan baselines

Table 175-2 (Cont.) DBMS_SPM Package Subprograms

Subprogram	Description
MIGRATE_STORED_OUTLINE Functions	Migrates existing stored outlines to SQL plan baselines
PACK_STGTAB_BASELINE Function	Packs (exports) SQL plan baselines from SQL management base into a staging table
RESET_EVOLVE_TASK Procedure	Resets an evolve task to its initial state
RESUME_EVOLVE_TASK Procedure	Resumes a previously interrupted task
REPORT_AUTO_EVOLVE_TASK Function	Displays the results of an execution of an automatic evolve task.
REPORT_EVOLVE_TASK Function	Displays the results of an evolved task
SET_EVOLVE_TASK_PARAMETER Procedure	Sets a parameter of an evolve task
UNPACK_STGTAB_BASELINE Function	Unpacks (imports) SQL plan baselines from a staging table into SQL management base

175.6.1 ACCEPT_SQL_PLAN_BASELINE Procedure

The procedure accepts a plan based on the recommendation of an evolve task.

Syntax

```
DBMS_SPM.ACCEPT_SQL_PLAN_BASELINE (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER      := NULL,
  task_owner     IN  VARCHAR2    := NULL,
  force          IN  BOOLEAN     := FALSE);
```

Parameters

Table 175-3 ACCEPT_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
task_name	Identifier of task to implement
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
task_owner	Owner of the evolve task. Defaults to the current schema owner.
force	Accept the plan even if the advisor did not recommend such an action. The default is FALSE requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.

175.6.2 ADD_VERIFIED_SQL_PLAN_BASELINE Function

This function finds the plans available for the given SQL_ID in different sources such as Cursor Cache, Auto SQL Tuning Set, and Automatic Workload Repository.

Syntax

```
DBMS_SPM.ADD_VERIFIED_SQL_PLAN_BASELINE (
    sql_id IN VARCHAR2
);
```

Parameters

Table 175-4 ADD_VERIFIED_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_id	The SQL statement identifier, which is used to identify the plans in different sources, such as the cursor cache.

Return Value

A CLOB containing a report of SQL plan baselines verified, reproduced and accepted.

Usage Notes

SQL plan baselines are created to ensure that the best-known plans are used for the selected SQL statement. These are the steps that the function executes:

1. Loads plans from Cursor Cache, Automatic Workload Repository, and Auto SQL Tuning Set (SYS_AUTO_STG) into SQL Plan Management SQL plan history in a non-accepted state.
2. Uses the SQL Plan Management Evolve Advisor internally to identify the best-performing execution plans. The best-performing plans are accepted.

When the function has completed, it will have accepted the best plans among the plans available from the Cursor Cache, AWR, and the Automatic SQL Tuning Set.

Note:

"Administer SQL Management Object" privilege. is required.

Examples

Example 1:36k32wnz0v0fd923079310

```
select sql_id, plan_hash_value, sql_text
from   v$sql
where  sql_text like 'select /* SPM_TEST_QUERY%'
/
```

```
SQL_ID          PLAN_HASH_VALUE  SQL_TEXT
```

```
-----
-----
36k32wnz0v0fd  923079310      select /* SPM_TEST_QUERY */ num from
example_spm_table where id = 100
```

Example 2:9230793102448381833

```
select sql_text, sqlset_name, plan_hash_value
from   dba_sqlset_statements
where  sql_text like 'select /* SPM_TEST_QUERY%';
```

```
SQL_TEXT
SQLSET_NAME  PLAN_HASH_VALUE
-----
```

```
-----
select /* SPM_TEST_QUERY */ num from example_spm_table where id =
100   SYS_AUTO_STS   923079310
select /* SPM_TEST_QUERY */ num from example_spm_table where id =
100   SYS_AUTO_STS   2448381833
```

Example 3:

```
set tab off
set serveroutput on
set pagesize 100
set linesize 250
set long 100000
column report format a200

var rep clob;

BEGIN
  :rep := DBMS_SPM.ADD_VERIFIED_SQL_PLAN_BASELINE('36k32wnz0v0fd');
END;
/
```

```
select :rep report from dual;
```

```
SQL Plan Baselines verified for SQL ID: 36k32wnz0v0fd
```

```
-----
-----
Plan Hash Value  Plan Name                                Reproduced
Accepted  Source
-----  -----  -----
-----  -----
923079310        SQL_PLAN_163tr5qgzwmgt05ce4c2e         YES
YES            CURSOR CACHE
2448381833       SQL_PLAN_163tr5qgzwmgt1f191f3e         YES
NO            SQL TUNING SET
-----
-----
```

```
SQL Handle      : SQL_130f372d9ffe4df9
```

```
SQL Text      : select /* SPM_TEST_QUERY */ num from example_spm_table where
id = 100
-----
-----
```

Example 4:

```
select sql_text, accepted, enabled, sql_handle, plan_name
from dba_sql_plan_baselines
where sql_text like 'select /* SPM_TEST_QUERY%';
```

```
SQL_TEXT                                     ACC
ENA SQL_HANDLE          PLAN_NAME
-----
select /* SPM_TEST_QUERY */ num from example_spm_table where id = 100 YES
YES SQL_130f372d9ffe4df9 SQL_PLAN_163tr5qgzwmgt05ce4c2e
select /* SPM_TEST_QUERY */ num from example_spm_table where id = 100 NO
YES SQL_130f372d9ffe4df9 SQL_PLAN_163tr5qgzwmgt1f191f3e
```

Example 5

```
select * from
table(dbms_xplan.display_sql_plan_baseline('SQL_130f372d9ffe4df9'));
```

```
-----
---
SQL handle: SQL_130f372d9ffe4df9
SQL text: select /* SPM_TEST_QUERY */ num from example_spm_table where id =
100
-----
---
```

```
-----
---

1 - filter("ID"=100)
```

175.6.3 ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    attribute_name  IN VARCHAR2,
    attribute_value IN VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

Table 175-5 ALTER_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.
plan_name	Name of a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.
attribute_name	Name of the plan attribute to set (see table below).
attribute_value	Value of the plan attribute to use (see table below)

Table 175-6 Names & Values for ALTER_SQL_PLAN_BASELINE Function Parameters

Name	Description	Possible Values
enabled	'YES' means the plan is available for use by the optimizer. It may or may not be used, depending on accepted status.	'YES' or 'NO'
fixed	'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.	'YES' or 'NO'
autopurge	'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.	'YES' or 'NO'
plan_name	Name of the plan	String of up to 30 characters
description	Plan description.	String of up to 500 bytes

Return Values

The number of plans altered.

Usage Notes

When a single plan is specified, one of the various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

175.6.4 CANCEL_EVOLVE_TASK Procedure

The procedure cancels a currently executing evolve task. All intermediate results are removed from the task.

Syntax

```
DBMS_SPM.CANCEL_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 175-7 CANCEL_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to cancel

175.6.5 CONFIGURE Procedure

This procedure sets configuration options for the SQL management base and for the maintenance of SQL plan baselines. You can call this function multiple times, setting a different configuration option each time.

Syntax

```
DBMS_SPM.CONFIGURE (
    parameter_name    IN VARCHAR2,
    parameter_value   IN VARCHAR2 := NULL,
    allow             IN BOOLEAN := TRUE);
```

Parameters

Table 175-8 CONFIGURE Procedure Parameters

Parameter	Description
parameter_name	Name of parameter to set (see table below).
parameter_value	Value of parameter to use (see table below). The maximum length of parameter_value is 1000 characters.
allow	Whether to include (<i>true</i>) or exclude (<i>false</i>) matching SQL statements and plans for the <i>auto_capture_*</i> parameters. If null, then the procedure ignores the specified parameter.

Table 175-9 Names and Values for CONFIGURE Procedure Parameters

Parameter Name	Description	Possible Values
auto_capture_action	Action to include (=) or exclude (<>) for SQL plan management automatic capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely.	Action name, for example, R%
auto_capture_module	Module to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Module name, for example, LOGGER
auto_capture_parsing_schema_name	Parsing schema to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Schema name, for example, HR
auto_capture_sql_text	Search pattern to apply to SQL text of LIKE or NOT LIKE, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Text of a SQL statement, for example, SELECT a%
auto_spm_evolve_task	Setting to enable or disable the high-frequency SPM Evolve Advisor task. The high-frequency task runs every hour and runs for no longer than 30 minutes. These settings are not configurable. The frequent executions mean that the optimizer has more opportunities to find and evolve better performing plans. The default value is OFF, which means the high-frequency SPM Evolve Advisor task is disabled. The value AUTO enables Real-time SQL plan management.. The value ON enables the high-frequency SPM Evolve Advisor task. This implements a feature called Background-Verified automatic SQL plan management The value ALLOW is ignored. Note: See About Automatic SQL Plan Management in the Oracle Database SQL Tuning Guide, which discusses the high frequency SPM Evolve task and explains the difference between real-time and background-verified Automatic SQL Plan Management.	ON, OFF, AUTO

Table 175-9 (Cont.) Names and Values for CONFIGURE Procedure Parameters

Parameter Name	Description	Possible Values
<code>plan_retention_weeks</code>	Number of weeks to retain unused plans before the database purges them. A null value resets to the default value of 53 weeks, or 1 year plus 1 week. (This retains plans for annually executing queries.) The value of <code>allow</code> is ignored.	5–523 (default is 53)
<code>space_budget_percent</code>	Maximum percent of <code>SYSAUX</code> space that can be used for SQL management base. The database issues alerts when this amount is exceeded. A null value resets the percentage to the default value of 10%. The value of <code>allow</code> is ignored.	1–50 (default is 10)

Exceptions

Table 175-10 CONFIGURE Exceptions

Error Number	Description
ORA-38133	Invalid parameter name
ORA-38134	Invalid parameter value
ORA-38150	Not enough space for new filter
ORA-38151	Module name too long
ORA-38152	Action name too long
ORA-38304	Missing or invalid user name

Usage Notes

- When `parameter_name` is `auto_capture_sql_text`, the `parameter_value` is an automatic search filter. The filter uses the search pattern of `LIKE parameter_name` when `allow=>>true`. The filter uses the pattern `NOT LIKE parameter_name` when `allow=>>false`.

For all other non-null `parameter_name` values, the search pattern depends on the `allow` setting. The parameter uses an equal sign (=) when `allow=>>true`. The parameter uses a not-equal sign (<>) when `allow=>>false`.
- You can configure multiple automatic capture parameters of different types. You cannot specify multiple values for the same parameter. Instead, the values specified for a particular parameter are combined. For example, specifying `auto_capture_sql_text` to be `'%TABLE1%'`, `TRUE`, and `'%TABLE2%'`, `FALSE` will result in matching SQL text `LIKE '%TABLE1%'` and `NOT LIKE '%TABLE2%'`. The database uses these configuration settings only when the initialization parameter `OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES` is set to `TRUE`.
- A null value for `parameter_value` removes the filter for `parameter_name` entirely. By using `parameter_value=>''` in combination with `allow=FALSE`, you can filter out

all values for a parameter, and then create a separate filter to include only specified values. The `DBA_SQL_MANAGEMENT_CONFIG` view shows the current filters.

- The default space budget for SQL management base is no more than ten percent of the size of `SYSAUX` tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).
- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

Examples

The following example creates a filter for SQL text that is like `SELECT a%`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', 'TRUE');
```

The following example filters out the `HR` parsing schema:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_PARSING_SCHEMA_NAME', 'HR', 'FALSE');
```

The following example removes any existing filters for SQL text:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', NULL, NULL);
```

The following example removes any `LIKE` or `NOT LIKE` filters for the SQL text `select a%`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', NULL);
```

The following example creates a filter with the predicate `(action LIKE 'R%') OR (action LIKE '%E_')`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', 'R%', 'TRUE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', '%E_', 'TRUE');
```

The following example creates a filter with the predicate `NOT(module LIKE 'LOGGER') AND NOT(module LIKE 'UTIL_')`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'LOGGER', 'FALSE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'UTIL_', 'FALSE');
```

175.6.6 CREATE_EVOLVE_TASK Function

The function has two overloads, both of which create an advisor task and sets its parameters. This version which takes a SQL handle creates an evolve task in order to evolve one or more plans for a given SQL statement.

Syntax

```
DBMS_SPM.CREATE_EVOLVE_TASK (
    sql_handle IN VARCHAR2 := NULL,
```

```

plan_name      IN VARCHAR2 := NULL,
time_limit     IN NUMBER    := DBMS_SPM.AUTO_LIMIT,
task_name      IN VARCHAR2 := NULL,
description    IN VARCHAR2 := NULL)
RETURN VARCHAR2;

DBMS_SPM.CREATE_EVOLVE_TASK (
  plan_list     IN DBMS_SPM.NAME_LIST,
  time_limit    IN NUMBER    := DBMS_SPM.AUTO_LIMIT,
  task_name     IN VARCHAR2 := NULL,
  description   IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

Parameters

Table 175-11 CREATE_EVOLVE_TASK Function Parameters

Parameter	Description
sql_handle	Handle of a SQL statement. The default NULL considers all SQL statements with non-accepted plans.
plan_list	List of plan names. The plans may belong to different SQL statements.
plan_name	Plan identifier. The default NULL considers all non-accepted plans of the specified SQL handle or all SQL statements if the SQL handle is NULL.
time_limit	Time limit in number of minutes. The time limit is global and it is used in the following manner. The time limit for first non-accepted plan is equal to the input value. The time limit for the second non-accepted plan is equal to (input value - time spent in first plan verification) and so on. The default DBMS_SPM.AUTO_LIMIT means let the system choose an appropriate time limit based on the number of plan verifications required to be done. The value DBMS_SPM.NO_LIMIT means no time limit.
task_name	Evolve task name
description	Description of the task (maximum 256 characters)

Return Values

SQL evolve task unique name

175.6.7 CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

Syntax

```

DBMS_SPM.CREATE_STGTAB_BASELINE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := NULL,
  tablespace_name IN VARCHAR2 := NULL);

```

Parameters

Table 175-12 CREATE_STGTAB_BASELINE Procedure Parameters

Parameter	Description
<i>table_name</i>	Name of staging table to create for the purpose of packing and unpacking SQL plan baselines
<i>table_owner</i>	Name of owner of the staging table. The default, NULL, means that the current schema is the table owner.
<i>tablespace_name</i>	Name of the tablespace. The default, NULL, results in creating the staging table in the default tablespace.

Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user or DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Copy the staging table from the source system to the target system. For example, you can use Oracle Data Pump to export and import the staging table.
4. Select SQL plan baselines from the staging table and unpack them into the target system

175.6.8 DROP_EVOLVE_TASK Procedure

The procedure drops an evolved task.

Syntax

```
DBMS_SPM.DROP_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 175-13 DROP_EVOLVE_TASK Procedure Parameters

Parameter	Description
<i>task_name</i>	Identifier of the task that you want to drop

175.6.9 DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
    sql_handle         IN VARCHAR2 := NULL,
    plan_name          IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

Parameters

Table 175-14 DROP_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means to drop all plans associated with the SQL statement identified by sql_handle.

Return Values

The number of plans dropped

175.6.10 EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans.

If interrogated by the user (parameter `verify = 'YES'`), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter `commit = 'YES'`).

The second form of the function employs a plan list format.

Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  sql_handle   IN VARCHAR2 := NULL,
  plan_name    IN VARCHAR2 := NULL,
  time_limit   IN INTEGER   := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;

DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  plan_list    IN DBMS_SPM.NAME_LIST,
  time_limit   IN INTEGER   := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

Parameters

Table 175-15 EVOLVE_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement identifier. Unless <code>plan_name</code> is specified, NULL means to consider all statements with non-accepted plans in their SQL plan baselines.
plan_name	Plan identifier. Default NULL means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if <code>sql_handle</code> is NULL.
plan_list	A list of plan names. Each plan in the list can belong to same or different SQL statement.
time_limit	Time limit in number of minutes. This applies only if <code>verify = 'YES'</code> . The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on. <ul style="list-style-type: none"> DBMS_SPM.AUTO_LIMIT (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done. DBMS_SPM.NO_LIMIT means there is no time limit. A positive integer value represents a user specified time limit.
verify	Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan. <ul style="list-style-type: none"> 'YES' (Default) - verifies that a non-accepted plan gives better performance before changing it to an accepted plan 'NO' - directs not to execute plans but only to change non-accepted plans into accepted plans
commit	Specifies whether to update the ACCEPTED status of non-accepted plans from 'NO' to 'YES'. <ul style="list-style-type: none"> 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when <code>verify = 'YES'</code>. 'NO' - generate a report without any updates. Note that <code>commit = 'NO'</code> together with <code>verify = 'NO'</code> represents a no-op.

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if `verify = 'YES'` the result of their performance verification.

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

175.6.11 EXECUTE_EVOLVE_TASK Function

The function executes a previously created evolve task.

Syntax

```
DBMS_SPM.EXECUTE_EVOLVE_TASK (
    task_name      IN VARCHAR2,
    execution_name IN VARCHAR2 := NULL,
    execution_desc IN VARCHAR2 := NULL);
RETURN VARCHAR2;
```

Parameters

Table 175-16 EXECUTE_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Evolve task name
execution_name	Name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by the function.
execution_desc	Description of the execution (maximum 256 characters)

Return Values

Name of the new execution

175.6.12 IMPLEMENT_EVOLVE_TASK Function

The function implements all the actions recommended by an evolve task.

Syntax

```
DBMS_SPM.IMPLEMENT_EVOLVE_TASK (
    task_name      IN VARCHAR2,
    task_owner     IN VARCHAR2 := NULL,
    execution_name IN VARCHAR2 := NULL,
    force          IN BOOLEAN   := FALSE)
RETURN NUMBER;
```

Parameters

Table 175-17 IMPLEMENT_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Identifier of task to report
task_owner	Owner of the evolve task. Defaults to the current schema owner.
execution_name	Name to qualify and identify an execution. If NULL, the action will be taken for the last task execution.

Table 175-17 (Cont.) IMPLEMENT_EVOLVE_TASK Function Parameters

Parameter	Description
force	Accept all plans even if the advisor did not recommend such an action. The default is <code>FALSE</code> requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.

Return Values

The number of plans accepted

175.6.13 INTERRUPT_EVOLVE_TASK Procedure

The procedure interrupts a currently executing evolve task. The task ends its operations as at a normal exit and the user can access the intermediate results. The task can be resumed later.

Syntax

```
DBMS_SPM.INTERRUPT_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters**Table 175-18 INTERRUPT_EVOLVE_TASK Procedure Parameters**

Parameter	Description
task_name	Identifier of task to interrupt

175.6.14 LOAD_PLANS_FROM_AWR Function

This function loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_AWR
    begin_snap      IN NUMBER,
    end_snap        IN NUMBER,
    basic_filter     IN VARCHAR2 := NULL,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES',
    commit_rows     IN NUMBER := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 175-19 LOAD_PLANS_FROM_AWR Function Parameters

Parameter	Description
begin_snap	Begin snapshot
end_snap	End snapshot
basic_filter	SQL predicate to filter the SQL from AWR. NULL means all plans in AWR are selected. Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW.
fixed	Default 'NO' means the loaded plans will not change the current 'fixed' property of the SQL plan baseline into which they are loaded.
enabled	Default 'YES' means the loaded plans will be considered by the optimizer
commit_rows	Number of SQL plans to load before doing a periodic commit.
dbid	The DBID that is used for imported or PDB-level AWR data.

Usage Notes

Requires the `Administer SQL Management Object` privilege

See Also:

For information on the `SQLSET_ROW` objects, see [SQLSET_ROW Object Type](#).

175.6.15 LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using `attribute_name` and `attribute_value` pair.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
  sql_text        IN CLOB,
  fixed           IN VARCHAR2 := 'NO',
  enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
```

```

    sql_handle      IN VARCHAR2,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    sql_id          IN VARCHAR2,
    plan_hash_value IN NUMBER   := NULL,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    attribute_name  IN VARCHAR2,
    attribute_value IN VARCHAR2,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

```

Parameters

Table 175-20 LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
sql_id	SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created.
plan_hash_value	Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID.
sql_text	SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
sql_handle	SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The sql_handle must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
fixed	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
attribute_name	One of possible attribute names: <ul style="list-style-type: none"> SQL_TEXT" 'PARSING_SCHEMA_NAME' 'MODULE' 'ACTION'

Table 175-20 (Cont.) LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
attribute_value	Attribute value is used as a search pattern of LIKE predicate if attribute name is 'SQL_TEXT'. Otherwise, it is used as an equality search value. (for example, for specifying attribute_name => 'SQL_TEXT', and attribute_value => '% HR-123 %' means applying SQL_TEXT LIKE '% HR-123 %' as a selection filter. Similarly, specifying attribute_name => 'MODULE', and attribute_value => 'HR' means applying 'MODULE = 'HR' as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is 'SQL_TEXT'.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer

Return Values

Number of plans loaded

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

175.6.16 LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
    sqlset_name      IN  VARCHAR2,
    sqlset_owner     IN  VARCHAR2 := NULL,
    basic_filter     IN  VARCHAR2 := NULL,
    fixed            IN  VARCHAR2 := 'NO',
    enabled          IN  VARCHAR2 := 'YES'
    commit_rows     IN  NUMBER   := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 175-21 LOAD_PLANS_FROM_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the STS from where the plans are loaded into SQL plan baselines
sqlset_owner	Owner of STS. NULL means current schema is the owner.

Table 175-21 (Cont.) LOAD_PLANS_FROM_SQLSET Function Parameters

Parameter	Description
<code>basic_filter</code>	A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any <code>WHERE</code> clause predicate that can specified against the view <code>DBA_SQLSET_STATEMENTS</code> . For example <code>basic_filter => 'sql_text like 'select /*LOAD_STS*/%'</code> or <code>basic_filter => 'sql_id='b62q7nc33gzwx''</code> .
<code>fixed</code>	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
<code>enabled</code>	Default 'YES' means the loaded plans are enabled for use by the optimizer
<code>commit_rows</code>	Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

175.6.17 MIGRATE_STORED_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

Syntax

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
    attribute_name    IN  VARCHAR2,
    attribute_value   IN  CLOB,
    fixed             IN  VARCHAR2 := 'NO')
RETURN CLOB;
```

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
    outln_list        IN  DBMS_SPM.NAME_LIST,
    fixed            IN  VARCHAR2 := 'NO')
RETURN CLOB;
```

Parameters

Table 175-22 MIGRATE_STORED_OUTLINE Function Parameters

Parameter	Description
<code>attribute_name</code>	Specifies the type of parameter used in <code>attribute_value</code> to identify the migrated stored outlines. It is case insensitive. Possible values: <ul style="list-style-type: none"> <code>outline_name</code> <code>sql_text</code> <code>category</code> <code>all</code>
<code>attribute_value</code>	Based on <code>attribute_name</code> , this can be: <ul style="list-style-type: none"> Name of stored outline to be migrated SQL text of stored outlines to be migrated Category of stored outlines to be migrated NULL if <code>attribute_name</code> is <code>all</code>
<code>fixed</code>	NO (default) or YES. Specifies the "fixed" status of the plans generated during migration. By default, plans are generated as "non-fixed" plans.
<code>outln_list</code>	List of outline names to be migrated

Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

- Number of stored outlines successfully migrated
- Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

Usage Note

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.
- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to `DEFAULT`. The module name of a plan baseline is set to be the same as the stored outline.
- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.
- When user specifies to migrate `all`, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.

175.6.18 PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```
DBMS_SPM.PACK_STGTAB_BASELINE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := NULL,
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  sql_text        IN CLOB      := NULL,
  creator         IN VARCHAR2 := NULL,  origin          IN VARCHAR2 := NULL,
  enabled         IN VARCHAR2 := NULL,
  accepted        IN VARCHAR2 := NULL,
  fixed           IN VARCHAR2 := NULL,
  module          IN VARCHAR2 := NULL,
  action          IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 175-23 PACK_STGTAB_BASELINE Function Parameters

Parameter	Description
table_name	Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted)
table_owner	Name of staging table owner. Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of SQL plan baselines packed

175.6.19 RESET_EVOLVE_TASK Procedure

This procedure resets an evolve task to its initial state.

All intermediate results will be removed from the task. Call this procedure on a task that is not currently executing.

Syntax

```
DBMS_SPM.RESET_EVOLVE_TASK (
    task_name          IN  VARCHAR2);
```

Parameters

Table 175-24 RESET_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to reset

175.6.20 RESUME_EVOLVE_TASK Procedure

The procedure resumes a previously interrupted task.

Syntax

```
DBMS_SPM.RESUME_EVOLVE_TASK (
    task_name          IN  VARCHAR2);
```

Parameters

Table 175-25 RESUME_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to resume

175.6.21 REPORT_AUTO_EVOLVE_TASK Function

The procedure displays the results of an execution of an automatic evolve task.

Syntax

```
DBMS_SPM.REPORT_AUTO_EVOLVE_TASK (
    type          IN  VARCHAR2 := TYPE_TEXT,
    level         IN  VARCHAR2 := LEVEL_TYPICAL,
    section       IN  VARCHAR2 := SECTION_ALL,
    object_id     IN  NUMBER   := NULL,
    execution_name IN  VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 175-26 REPORT_AUTO_EVOLVE_TASK Function Parameters

Parameter	Description
type	Type of the report. Possible values are TEXT, HTML, XML
level	Format of the report. Possible values are BASIC, TYPICAL, ALL.
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
execution_name	Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.

Return Values

The report

175.6.22 REPORT_EVOLVE_TASK Function

The procedure displays the results of an evolved task.

Syntax

```
DBMS_SPM.REPORT_EVOLVE_TASK (
  task_name      IN  VARCHAR2,
  type           IN  VARCHAR2  := TYPE_TEXT,
  level         IN  VARCHAR2  := LEVEL_TYPICAL,
  section       IN  VARCHAR2  := SECTION_ALL,
  object_id     IN  NUMBER    := NULL,
  task_owner    IN  VARCHAR2  := NULL,
  execution_name IN  VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

Table 175-27 REPORT_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Identifier of task to report
type	Type of the report. Possible values are TEXT, HTML, XML
level	Format of the report. Possible values are BASIC, TYPICAL, ALL.
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
task_owner	Owner of the evolve task. Defaults to the current schema owner.
execution_name	Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.

Return Values

The report

175.6.23 SET_EVOLVE_TASK_PARAMETER Procedure

The procedure sets a parameter of an evolve task, either a VARCHAR2 or a NUMBER.

Syntax

```
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (
    task_name      IN  VARCHAR2,
    parameter      IN  VARCHAR2,
    value          IN  NUMBER);
```

```
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (
    task_name      IN  VARCHAR2 := NULL,
    parameter      IN  VARCHAR2,
    value          IN  VARCHAR2);
```

Parameters

Table 175-28 SET_EVOLVE_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Evolve task name
parameter	Name of the parameter to set (see following table)
value	Value of the parameter (see following table)

The following table describes parameters for the SET_EVOLVE_TASK_PARAMETER procedure.

Table 175-29 DBMS_SPM.SET_EVOLVE_TASK_PARAMETER Parameters

Parameter	Description	Default
alternate_plan_source	<p>Determines which sources to search for additional plans:</p> <ul style="list-style-type: none"> AUTO (the database selects the source automatically) AUTOMATIC_WORKLOAD_REPOSITORY CURSOR_CACHE SQL_TUNING_SET <p>You can combine multiple values with the plus sign (+).</p>	<p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is AUTO. If manual, the default is CURSOR_CACHE+AUTOMATIC_WORKLOAD_REPOSITORY.

Table 175-29 (Cont.) DBMS_SPM.SET_EVOLVE_TASK_PARAMETER Parameters

Parameter	Description	Default
alternate_plan_baseline	<p>Determines which alternative plans should be loaded:</p> <ul style="list-style-type: none"> AUTO lets Autonomous Database choose whether to load plans for statements with or without baselines. EXISTING loads alternate plans with for statements with existing baselines. NEW loads alternative plans for statements without a baseline, in which case a new baseline is created. <p>You can combine multiple values with the plus sign (+), as in EXISTING+NEW.</p>	EXISTING
alternate_plan_limit	Specifies the maximum number of plans to load in total (that is, not the limit for each SQL statement).	<p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is UNLIMITED. If manual, the default is 10.
accept_plans	<p>Specifies whether to accept recommended plans automatically.</p> <p>When ACCEPT_PLANS is true, SQL plan management automatically accepts all plans recommended by the task.</p> <p>When ACCEPT_PLANS is false, the task verifies the plans and generates a report of its findings, but does not evolve the plans automatically. You can use a report to identify new SQL plan baselines and accept them manually.</p>	true (regardless of whether the advisor is run automatically or manually)
time_limit	Global time limit in seconds. This is the total time allowed for the task.	<p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is 3600. If manual, the default is 2147483646.

See Also:

Oracle Database Licensing Information User Manual for details on which features are supported for different editions and services

175.6.24 UNPACK_STGTAB_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (
    table_name      IN VARCHAR2,
    table_owner     IN VARCHAR2 := NULL,
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    sql_text        IN CLOB      := NULL,
    creator         IN VARCHAR2 := NULL,    origin          IN VARCHAR2 := NULL,
    enabled         IN VARCHAR2 := NULL,
    accepted        IN VARCHAR2 := NULL,
    fixed           IN VARCHAR2 := NULL,
    module          IN VARCHAR2 := NULL,
    action          IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 175-30 UNPACK_STGTAB_BASELINE Function Parameters

Parameter	Description
table_name	Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted)
table_owner	Name of staging table owner. Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of plans unpacked

DBMS_SQL

The `DBMS_SQL` package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL.

For example, you can enter a `DROP TABLE` statement from within a stored procedure by using the [PARSE Procedures](#) supplied with the `DBMS_SQL` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_SQL Subprograms](#)

See Also:

For more information on native dynamic SQL, see *Oracle Database PL/SQL Language Reference*.

176.1 DBMS_SQL Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to `DBMS_SQL` that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than `DBMS_SQL`. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)
- There are some tasks that can only be performed using `DBMS_SQL`. For tasks that require `DBMS_SQL`, see *Oracle Database PL/SQL Language Reference*.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

 **See Also:**

Oracle Call Interface Programmer's Guide

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the `DBMS_SQL` package. These differences include the following:

- The OCI binds by address and the `DBMS_SQL` package binds by value.
- With `DBMS_SQL` you must call `VARIABLE_VALUE` to retrieve the value of an `OUT` parameter for an anonymous block, and you must call `COLUMN_VALUE` after fetching rows to retrieve the values of the columns in the rows into your program.
- The current release of the `DBMS_SQL` package does not provide `CANCEL` cursor procedures.
- Indicator variables are not required, because `NULLs` are fully supported as values of a PL/SQL variable.

176.2 DBMS_SQL Security Model

`DBMS_SQL` is a `SYS`-owned package compiled with `AUTHID CURRENT_USER`. Any `DBMS_SQL` subprogram called from an anonymous PL/SQL block runs with the privileges of the current user.

 **See Also:**

Oracle Database PL/SQL Language Reference for more information about using Invoker Rights or Definer Rights

Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, `ORA-29471`, is raised when any `DBMS_SQL` subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and `DBMS_SQL` becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the [IS_OPEN Function](#) denotes a cursor currently open in the session, the return value is `TRUE`. If the actual value is `NULL`, then the return value is `FALSE`. Otherwise, this raises an `ORA-29471` error.

Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single `DBMS_SQL` subprogram call. The check is:

- The `current_user` is the same on calling the subprogram as it was on calling the most recent parse.

- The enabled roles on calling the subprogram must be identical to the enabled roles on calling the most recent parse.
- The container is the same on calling the subprogram as it was on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, then an `ORA-29470` error is raised.

The mechanism for defining when checks are performed is a new overload for the `OPEN_CURSOR` subprogram, which takes a formal parameter, `security_level`, with allowed values `NULL`, `1` and `2`.

- When `security_level = 1` (or is `NULL`), the checks are made only when binding and executing.
- When `security_level = 2`, the checks are always made.

Upgrade Considerations

This security regime is stricter than those in the previous releases. As a consequence, users of `DBMS_SQL` may encounter runtime errors on upgrade.

176.3 DBMS_SQL Constants

The `DBMS_SQL Constants` package provides constants that are used with the `language_flag` parameter of the `PARSE` Procedures.

These constants are described in the following table.

Table 176-1 DBMS_SQL Constants

Name	Type	Value	Description
V6	INTEGER	0	Specifies Oracle database version 6 behavior
NATIVE	INTEGER	1	Specifies normal behavior for the database to which the program is connected
V7	INTEGER	2	Specifies Oracle database version 7 behavior
FOREIGN_SYNTA X	INTEGER	4294967295	Specifies a non-Oracle database syntax and behavior. The SQL statement to be parsed needs to be translated first using the SQL translation profile set in the database session. The SQL translation profile is a database schema object that directs how SQL statements are translated to Oracle. An error is raised if a profile is not set.

Related Topics

- [PARSE Procedures](#)
This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

176.4 DBMS_SQL Operational Notes

These operational notes describe processing queries, processing updates, inserts, and deletes, and locating errors.

Processing Queries

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the `SELECT` statement by calling the [DEFINE_COLUMN Procedures](#), the [DEFINE_COLUMN_LONG Procedure](#), or the [DEFINE_ARRAY Procedure](#).
2. Run your `SELECT` statement by calling the [EXECUTE Function](#).
3. Call the [FETCH_ROWS Function](#) (or `EXECUTE_AND_FETCH`) to retrieve the rows that satisfied your query.
4. Call [COLUMN_VALUE Procedure](#) or [COLUMN_VALUE_LONG Procedure](#) to determine the value of a column retrieved by the [FETCH_ROWS Function](#) for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the [VARIABLE_VALUE Procedures](#) to retrieve the values assigned to the output variables of these procedures.

Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an `INSERT`, `UPDATE`, or `DELETE`, then you must perform the following steps:

1. Run your `INSERT`, `UPDATE`, or `DELETE` statement by calling the [EXECUTE Function](#).
2. If statements have the `returning` clause, then you must call the [VARIABLE_VALUE Procedures](#) to retrieve the values assigned to the output variables.

Locating Errors

The `DBMS_SQL` package has additional functions for obtaining information about the last referenced cursor in the session. The values returned by these functions are meaningful only immediately after a SQL statement is run. In addition, some error-locating functions are meaningful only after certain `DBMS_SQL` calls. For example, you call the [LAST_ERROR_POSITION Function](#) immediately after calling one of the [PARSE Procedures](#).

176.5 DBMS_SQL Execution Flow

These functions comprise the `DBMS_SQL` execution flow.

1. [OPEN_CURSOR](#)
2. [PARSE](#)
3. [BIND_VARIABLE](#), [BIND_VARIABLE_PKG](#) or [BIND_ARRAY](#)
4. [DEFINE_COLUMN](#), [DEFINE_COLUMN_LONG](#) or [DEFINE_ARRAY](#)
5. [EXECUTE](#)

6. [FETCH_ROWS](#) or [EXECUTE_AND_FETCH](#)
7. [VARIABLE_VALUE](#), [VARIABLE_PKG](#), [COLUMN_VALUE](#) or [COLUMN_VALUE_LONG](#)
8. [CLOSE_CURSOR](#)

176.5.1 OPEN_CURSOR

To process a SQL statement, you must have an open cursor. When you call the `OPEN_CURSOR` Functions, you receive a cursor `ID` number for the data structure representing a valid cursor maintained by Oracle.

These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the `DBMS_SQL` package.

Related Topics

- [OPEN_CURSOR Functions](#)
This function opens a new cursor.

176.5.2 PARSE

Every SQL statement must be parsed by calling the `PARSE` procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

The execution flow of `DBMS_SQL` is shown in [Figure 176-1](#).

Figure 176-1 DBMS_SQL Execution Flow

illustration: arpls008
release: 9
caption: DBMS_SQL Execution Flow
date: 7/31/01
platform: pc
ref: ADG8013

Related Topics

- [PARSE Procedures](#)
 This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

176.5.3 BIND_VARIABLE, BIND_VARIABLE_PKG or BIND_ARRAY

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the [BIND_ARRAY Procedures](#), or [BIND_VARIABLE Procedures](#), or the [BIND_VARIABLE_PKG Procedure](#) to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind variable. The `BIND_ARRAY` procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each `EXECUTE`. This is similar to the array interface supported by the OCI.

Note that the datatype of the values bound to placeholders cannot be PL/SQL-only datatypes.

176.5.4 DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY

The `DEFINE_COLUMN`, `DEFINE_COLUMN_LONG`, and `DEFINE_ARRAY` procedures specify the variables that receive `SELECT` values on a query.

The columns of the row being selected in a `SELECT` statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures ([DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_LONG Procedure](#), or [DEFINE_ARRAY Procedure](#)) to specify the variables that are to receive the `SELECT` values, much the way an `INTO` clause does for a static query.

Use the `DEFINE_COLUMN_LONG` procedure to define `LONG` columns, in the same way that `DEFINE_COLUMN` is used to define non-`LONG` columns. You must call `DEFINE_COLUMN_LONG` before using the [COLUMN_VALUE_LONG Procedure](#) to fetch from the `LONG` column.

Use the `DEFINE_ARRAY` procedure to define a PL/SQL collection into which you want to fetch rows in a single `SELECT` statement. `DEFINE_ARRAY` provides an interface to fetch multiple rows at one fetch. You must call `DEFINE_ARRAY` before using the `COLUMN_VALUE` procedure to fetch the rows.

176.5.5 EXECUTE

Call the `EXECUTE` Function to run your SQL statement.

Related Topics

- [EXECUTE Function](#)
This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.

176.5.6 FETCH_ROWS or EXECUTE_AND_FETCH

The `FETCH_ROWS` Function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve any more rows. Instead of calling `EXECUTE` Function and then `FETCH_ROWS`, you may find it more efficient to call `EXECUTE_AND_FETCH` Function if you are calling `EXECUTE` for a single execution.

Related Topics

- [FETCH_ROWS Function](#)
This function fetches a row from a given cursor.
- [EXECUTE Function](#)
This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.
- [EXECUTE_AND_FETCH Function](#)
This function executes the given cursor and fetches rows.

176.5.7 VARIABLE_VALUE, VARIABLE_VALUE_PKG, COLUMN_VALUE, or COLUMN_VALUE_LONG

The type of call determines which procedure or function to use.

For queries, call the [COLUMN_VALUE Procedure](#) to determine the value of a column retrieved by the [FETCH_ROWS Function](#).

For anonymous blocks containing calls to `PL/SQL` procedures or DML statements with `returning` clause, call the [VARIABLE_VALUE Procedures](#) or the [VARIABLE_VALUE_PKG Procedure](#) to retrieve the values assigned to the output variables when statements were run.

To fetch only part of a `LONG` database column (which can be up to two gigabytes in size), use the [DEFINE_COLUMN_LONG Procedure](#). You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

176.5.8 CLOSE_CURSOR

When you no longer need a cursor for a session, close the cursor by calling the `CLOSE_CURSOR` Procedure. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your *Oracle Open Gateway* documentation for additional information.

Related Topics

- [CLOSE_CURSOR Procedure](#)
This procedure closes a given cursor.

176.6 DBMS_SQL Exceptions

This exception is raised by the `COLUMN_VALUE` Procedure or the `VARIABLE_VALUE` Procedures when the type of the given `OUT` parameter (for where to put the requested value) is different from the type of the value.

```
inconsistent_type EXCEPTION;  
pragma exception_init(inconsistent_type, -6562);
```

Related Topics

- [COLUMN_VALUE Procedure](#)
This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.
- [VARIABLE_VALUE Procedures](#)
This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with `returning` clause.

176.7 DBMS_SQL Examples

These example procedures use the `DBMS_SQL` package.

Example : Using DBMS_SQL Demo

This example does not need dynamic SQL because the text of the statement is known at compile time, but it illustrates the basic concept underlying the package.

The `DEMO` procedure deletes all of the employees from the `EMP` table whose salaries are greater than the salary that you specify when you run `DEMO`.

```
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS  
    cursor_name INTEGER;  
    rows_processed INTEGER;  
BEGIN  
    cursor_name := dbms_sql.open_cursor;  
    DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',  
                   DBMS_SQL.NATIVE);  
    DBMS_SQL.BIND_VARIABLE(cursor_name, 'x', salary);  
    rows_processed := DBMS_SQL.EXECUTE(cursor_name);  
    DBMS_SQL.CLOSE_CURSOR(cursor_name);  
EXCEPTION  
WHEN OTHERS THEN  
    DBMS_SQL.CLOSE_CURSOR(cursor_name);  
END;
```

Example 2

The following sample procedure is passed a SQL statement, which it then parses and runs:

```
CREATE OR REPLACE PROCEDURE exec(string IN varchar2) AS  
    cursor_name INTEGER;  
    ret INTEGER;  
BEGIN
```

```
cursor_name := DBMS_SQL.OPEN_CURSOR;
```

DDL statements are run by the parse call, which performs the implied commit.

```
DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
ret := DBMS_SQL.EXECUTE(cursor_name);
DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@domain.com('CREATE TABLE acct(c1 INTEGER)');
```

Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

```
id          of type NUMBER
name        of type VARCHAR2(30)
birthdate  of type DATE
```

This procedure does not need the use of dynamic SQL; however, it illustrates the concepts of this package.

```
CREATE OR REPLACE PROCEDURE copy (
    source      IN VARCHAR2,
    destination IN VARCHAR2) IS
    id_var      NUMBER;
    name_var    VARCHAR2(30);
    birthdate_var DATE;
    source_cursor INTEGER;
    destination_cursor INTEGER;
    ignore      INTEGER;
BEGIN

    -- Prepare a cursor to select from the source table:
    source_cursor := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(source_cursor,
        'SELECT id, name, birthdate FROM ' || source,
        DBMS_SQL.NATIVE);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
    ignore := DBMS_SQL.EXECUTE(source_cursor);

    -- Prepare a cursor to insert into the destination table:
```

```

destination_cursor := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(destination_cursor,
                'INSERT INTO ' || destination ||
                ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
                DBMS_SQL.NATIVE);

-- Fetch a row from the source table and insert it into the destination table:
LOOP
  IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
    -- get column values of the row
    DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
    DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
    DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

    -- Bind the row into the cursor that inserts into the destination table. You
    -- could alter this example to require the use of dynamic SQL by inserting an
    -- if condition before the bind.
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
                           birthdate_var);

    ignore := DBMS_SQL.EXECUTE(destination_cursor);
  ELSE
    -- No more rows to copy:
    EXIT;
  END IF;
END LOOP;

-- Commit and close all cursors:
COMMIT;
DBMS_SQL.CLOSE_CURSOR(source_cursor);
DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
  WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(source_cursor) THEN
      DBMS_SQL.CLOSE_CURSOR(source_cursor);
    END IF;
    IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
      DBMS_SQL.CLOSE_CURSOR(destination_cursor);
    END IF;
    RAISE;
END;
/

```

Example 4: RETURNING clause

With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions in bind variables.

If a single row is inserted, updated, or deleted, then use DBMS_SQL.BIND_VARIABLE to bind these outbinds. To get the values in these bind variables, call DBMS_SQL.VARIABLE_VALUE

Note:

This process is similar to DBMS_SQL.VARIABLE_VALUE, which must be called after running a PL/SQL block with an outbind inside DBMS_SQL.

i) Single-row insert

```

CREATE OR REPLACE PROCEDURE single_Row_insert
  (c1 NUMBER, c2 NUMBER, r OUT NUMBER) IS
  c NUMBER;
  n NUMBER;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/

```

ii) Single-row update

```

CREATE OR REPLACE PROCEDURE single_Row_update
  (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
  c NUMBER;
  n NUMBER;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
      'WHERE rownum < 2 ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/

```

iii) Single-row delete

```

CREATE OR REPLACE PROCEDURE single_Row_Delete
  (c1 NUMBER, r OUT NUMBER) IS
  c NUMBER;
  n number;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE ROWNUM = :bnd1 ' ||
      'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/

```

iv) Multiple-row insert

```

CREATE OR REPLACE PROCEDURE multi_Row_insert
(c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
 r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
n := DBMS_SQL.EXECUTE(c);
DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

v) Multiple-row update.

```

CREATE OR REPLACE PROCEDURE multi_Row_update
(c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;
BEGIN
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
n := DBMS_SQL.EXECUTE(c);
DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

Note:

bnd1 and bnd2 can be arrays too. The value of the expression for all the rows updated will be in bnd3. There is no way to determine which rows were updated for each value of bnd1 and bnd2.

vi) Multiple-row delete

```

CREATE OR REPLACE PROCEDURE multi_row_delete
(c1 DBMS_SQL.NUMBER_TABLE,
 r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
n := DBMS_SQL.EXECUTE(c);
DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable

```

```

        DBMS_SQL.CLOSE_CURSOR(c);
    END;
/

```

vii) outbind in bulk PL/SQL

```

CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
    (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
r NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
    DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
    r := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/

```

Note:

DBMS_SQL.BIND_ARRAY of number_Table internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

Example 5: Binds and Defines of User-defined Types in DBMS_SQL

```

CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/
INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
/
INSERT INTO depts VALUES('Asia',
dnames_var('Finance','Payroll','Shipping','Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2)
IS
    some_dnames dnames_var;
    c          NUMBER;
    r          NUMBER;
    sql_stmt VARCHAR2(32767) :=
        'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names
        INTO :b3';

BEGIN

    c := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

```

```

DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

r := DBMS_SQL.EXECUTE(c);

-- Get value of outbind variable
DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

DBMS_SQL.CLOSE_CURSOR(c);

-- select dept_names
sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
DBMS_SQL.BIND_VARIABLE(c, 'b1', region);

r := DBMS_SQL.EXECUTE_AND_FETCH(c);

DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

DBMS_SQL.CLOSE_CURSOR(c);

-- loop through some_dnames collections
FOR i IN some_dnames.FIRST .. some_dnames.LAST LOOP
    DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
END LOOP;
END;
/

DECLARE
    new_dnames dnames_var;
BEGIN
    new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                             'Executive', 'Marketing');
    update_depts(new_dnames, 'Asia');
END;
/

```

176.8 DBMS_SQL Data Structures

The `DBMS_SQL` package defines `RECORD` type and `TABLE` type data structures.

RECORD Types

- [DBMS_SQL DESC_REC Record Type](#) (deprecated)
- [DBMS_SQL DESC_REC2 Record Type](#)
- [DBMS_SQL DESC_REC3 Record Type](#)
- [DBMS_SQL DESC_REC4 Record Type](#)

TABLE Types for DESCRIBE_COLUMNS Procedures

- [DBMS_SQL DESC_TAB Table Type](#)

- [DBMS_SQL DESC_TAB2 Table Type](#)
- [DBMS_SQL DESC_TAB3 Table Type](#)
- [DBMS_SQL DESC_TAB4 Table Type](#)

TABLE Types For Scalar and LOB Collections

DBMS_SQL bulk operations are only supported with these predefined DBMS_SQL TABLE types.

- [DBMS_SQL BFILE_TABLE Table Type](#)
- [DBMS_SQL BINARY_DOUBLE_TABLE Table Type](#)
- [DBMS_SQL BINARY_FLOAT_TABLE Table Type](#)
- [DBMS_SQL BLOB_TABLE Table Type](#)
- [DBMS_SQL CLOB_TABLE Table Type](#)
- [DBMS_SQL DATE_TABLE Table Type](#)
- [DBMS_SQL INTERVAL_DAY_TO_SECOND_TABLE Table Type](#)
- [DBMS_SQL INTERVAL_YEAR_TO_MONTH_TABLE Table Type](#)
- [DBMS_SQL JSON_TABLE Table Type](#)
- [DBMS_SQL NUMBER_TABLE Table Type](#)
- [DBMS_SQL TIME_TABLE Table Type](#)
- [DBMS_SQL TIME_WITH_TIME_ZONE_TABLE Table Type](#)
- [DBMS_SQL TIMESTAMP_TABLE Table Type](#)
- [DBMS_SQL TIMESTAMP_WITH_LTZ_TABLE Table Type](#)
- [DBMS_SQL TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type](#)
- [DBMS_SQL UROWID_TABLE Table Type](#)
- [DBMS_SQL VARCHAR2_TABLE Table Type](#)
- [DBMS_SQL VARCHAR2A Table Type](#)
- [DBMS_SQL VARCHAR2S Table Type](#)
- [DBMS_SQL VECTOR Table Type](#)

176.8.1 DBMS_SQL DESC_REC Record Type

This record type holds the describe information for a single column in a dynamic query.

**Note:**

This type has been deprecated in favor of the [DESC_REC2 Record Type](#).

It is the element type of the `DESC_TAB` table type and the [DESCRIBE_COLUMNS Procedure](#).

Syntax

```

TYPE desc_rec IS RECORD (
    col_type          BINARY_INTEGER := 0,
    col_max_len       BINARY_INTEGER := 0,
    col_name          VARCHAR2(32)   := '',
    col_name_len      BINARY_INTEGER := 0,
    col_schema_name   VARCHAR2(32)   := '',
    col_schema_name_len BINARY_INTEGER := 0,
    col_precision     BINARY_INTEGER := 0,
    col_scale         BINARY_INTEGER := 0,
    col_charsetid     BINARY_INTEGER := 0,
    col_charsetform   BINARY_INTEGER := 0,
    col_null_ok       BOOLEAN        := TRUE);
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;

```

Fields**Table 176-2 DESC_REC Fields**

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

176.8.2 DBMS_SQL DESC_REC2 Record Type

DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

This record type is identical to DESC_REC except for the col_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC_REC because column name values can be greater than 32 characters. DESC_REC is deprecated as a result.

Syntax

```

TYPE desc_rec2 IS RECORD (
    col_type          binary_integer := 0,
    col_max_len       binary_integer := 0,
    col_name          varchar2(32767) := '',
    col_name_len      binary_integer := 0,
    col_schema_name   varchar2(32)   := '',

```

```

col_schema_name_len binary_integer := 0,
col_precision       binary_integer := 0,
col_scale           binary_integer := 0,
col_charsetid       binary_integer := 0,
col_charsetform     binary_integer := 0,
col_null_ok         boolean         := TRUE);

```

Fields

Table 176-3 DESC_REC2 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

Related Topics

- [DESCRIBE_COLUMNS2 Procedure](#)
This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

176.8.3 DBMS_SQL DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (type_name) and type name len (type_name_len) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The col_type_name and col_type_name_len fields are only populated when the col_type field's value is 109, the Oracle type number for user-defined types.

Syntax

```

TYPE desc_rec3 IS RECORD (
  col_type           binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,
  col_schema_name   varchar2(32)   := '',
  col_schema_name_len binary_integer := 0,
  col_precision     binary_integer := 0,

```

```

col_scale          binary_integer := 0,
col_charsetid     binary_integer := 0,
col_charsetform   binary_integer := 0,
col_null_ok       boolean := TRUE,
col_type_name     varchar2(32767) := '',
col_type_name_len binary_integer := 0);

```

Fields

Table 176-4 DESC_REC3 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set ID
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible
col_type_name	User-define type column type name, this field is valid when col_type is 109
col_type_name_len	Length of user-define type column type name, this field is valid when col_type is 109

176.8.4 DBMS_SQL DESC_REC4 Record Type

DESC_REC4 is the element type of the DESC_TAB4 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC4 is identical to DESC_REC3 except that it supports longer identifiers in the fields that hold the schema name (col_schema_name) and type name (col_type_name) of a column in a dynamic query.

Syntax

```

TYPE desc_rec4 IS RECORD (
  col_type          binary_integer := 0,
  col_max_len      binary_integer := 0,
  col_name         varchar2(32767) := '',
  col_name_len     binary_integer := 0,
  col_schema_name  DBMS_ID := '',

```

```

col_schema_name_len    binary_integer := 0,
col_precision          binary_integer := 0,
col_scale              binary_integer := 0,
col_charsetid         binary_integer := 0,
col_charsetform       binary_integer := 0,
col_null_ok           boolean := TRUE,
col_type_name         DBMS_ID := '',
col_type_name_len     binary_integer := 0);

```

176.8.5 DBMS_SQL BFILE_TABLE Table Type

This is a table of `BFILE`.

Syntax

```
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```

176.8.6 DBMS_SQL BINARY_DOUBLE_TABLE Table Type

This is a table of BINARY_DOUBLE.

Syntax

```
TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
```

176.8.7 DBMS_SQL BINARY_FLOAT_TABLE Table Type

This is a table of BINARY_FLOAT.

Syntax

```
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```

176.8.8 DBMS_SQL BLOB_TABLE Table Type

This is a table of BLOB.

Syntax

```
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
```

176.8.9 DBMS_SQL BOOLEAN_TABLE Table Type

This is a table of BOOLEAN.

Syntax

```
TYPE boolean_table IS TABLE OF BOOLEAN INDEX BY BINARY_INTEGER;
```

176.8.10 DBMS_SQL CLOB_TABLE Table Type

This is a table of CLOB.

Syntax

```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
```

176.8.11 DBMS_SQL DATE_TABLE Table Type

This is a table of DATE.

Syntax

```
type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
```

176.8.12 DBMS_SQL DESC_TAB Table Type

This is a table of DESC_REC Record Type.

Syntax

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Related Topics

- [DBMS_SQL DESC_REC Record Type](#)

176.8.15 DBMS_SQL DESC_TAB4 Table Type

This is a table of DBMS_SQL DESC_REC4 Record Type.

Syntax

```
TYPE DESC_TAB4 IS TABLE OF DESC_REC4 INDEX BY BINARY_INTEGER;
```

Related Topics

- [DBMS_SQL DESC_REC4 Record Type](#)
DESC_REC4 is the element type of the DESC_TAB4 table type and the DESCRIBE_COLUMNS3 Procedure.

176.8.16 DBMS_SQL INTERVAL_DAY_TO_SECOND_TABLE Table Type

This is a table of `DSINTERVAL_UNCONSTRAINED`.

Syntax

```
TYPE interval_day_to_second_Table IS TABLE OF  
    DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
```

176.8.17 DBMS_SQL INTERVAL_YEAR_TO_MONTH_TABLE Table Type

This is a table of `YMINTERVAL_UNCONSTRAINED`.

Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED  
    INDEX BY BINARY_INTEGER;
```

176.8.18 DBMS_SQL JSON_TABLE Table Type

This is a table of `JSON`.

Syntax

```
TYPE JSON_TABLE IS TABLE OF JSON INDEX BY BINARY_INTEGER;
```

176.8.19 DBMS_SQL NUMBER_TABLE Table Type

This is a table of `NUMBER`.

Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

176.8.20 DBMS_SQL TIME_TABLE Table Type

This is a table of `TIME_UNCONSTRAINED`.

Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

176.8.21 DBMS_SQL TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of TIME_TZ_UNCONSTRAINED.

Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;;
```

176.8.22 DBMS_SQL TIMESTAMP_TABLE Table Type

This is a table of TIMESTAMP_UNCONSTRAINED.

Syntax

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

176.8.23 DBMS_SQL TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of TIMESTAMP_LTZ_UNCONSTRAINED

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF  
TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```

176.8.24 DBMS_SQL TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of TIMESTAMP_TZ_UNCONSTRAINED.

Syntax

```
TYPE timestamp_with_time_zone_Table IS TABLE OF  
TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

176.8.25 DBMS_SQL UROWID_TABLE Table Type

This is a table of UROWID.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

176.8.26 DBMS_SQL VARCHAR2_TABLE Table Type

This is table of VARCHAR2(4000).

Syntax

```
TYPE varchar2_table IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

176.8.27 DBMS_SQL VARCHAR2A Table Type

This is table of VARCHAR2 (32767).

Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

176.8.28 DBMS_SQL VARCHAR2S Table Type

This is table of VARCHAR2 (256).

Note:

This type has been superseded by the [VARCHAR2A Table Type](#). Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

176.8.29 DBMS_SQL VECTOR Table Type

This is a table of VECTOR.

DBMS_SQL bulk operations are supported with this predefined DBMS_SQL TABLE type.

Syntax

```
TYPE VECTOR_Table IS TABLE OF VECTOR INDEX BY BINARY_INTEGER;
```

176.9 Summary of DBMS_SQL Subprograms

This table lists the DBMS_SQL subprograms and briefly describes them.

Table 176-6 DBMS_SQL Package Subprograms

Subprogram	Description
BIND_ARRAY Procedures	Binds a given value to a given collection.
BIND_VARIABLE Procedures	Binds a given value to a given variable.
BIND_VARIABLE_PKG Procedure	Binds a given value to a given package variable.
CLOSE_CURSOR Procedure	Closes given cursor and frees memory.
COLUMN_VALUE Procedure	Returns value of the cursor element for a given position in a cursor.
COLUMN_VALUE_LONG Procedure	Returns a selected part of a LONG column, that has been defined using DEFINE_COLUMN_LONG.

Table 176-6 (Cont.) DBMS_SQL Package Subprograms

Subprogram	Description
DEFINE_ARRAY Procedure	Defines a collection to be selected from the given cursor, used only with <code>SELECT</code> statements.
DEFINE_COLUMN Procedures	Defines a column to be selected from the given cursor, used only with <code>SELECT</code> statements.
DEFINE_COLUMN_CHAR Procedure	Defines a column of type <code>CHAR</code> to be selected from the given cursor, used only with <code>SELECT</code> statements.
DEFINE_COLUMN_LONG Procedure	Defines a <code>LONG</code> column to be selected from the given cursor, used only with <code>SELECT</code> statements.
DEFINE_COLUMN_RAW Procedure	Defines a column of type <code>RAW</code> to be selected from the given cursor, used only with <code>SELECT</code> statements.
DEFINE_COLUMN_ROWID Procedure	Defines a column of type <code>ROWID</code> to be selected from the given cursor, used only with <code>SELECT</code> statements.
DESCRIBE_COLUMNS Procedure	Describes the columns for a cursor opened and parsed through <code>DBMS_SQL</code> .
DESCRIBE_COLUMNS2 Procedure	Describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure .
DESCRIBE_COLUMNS3 Procedure	Describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure .
EXECUTE Function	Executes a given cursor.
EXECUTE_AND_FETCH Function	Executes a given cursor and fetch rows.
FETCH_ROWS Function	Fetches a row from a given cursor.
GET_NEXT_RESULT Procedures	Gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.
IS_OPEN Function	Returns <code>TRUE</code> if given cursor is open.
LAST_ERROR_POSITION Function	Returns byte offset in the SQL statement text where the error occurred.
LAST_ROW_COUNT Function	Returns cumulative count of the number of rows fetched
LAST_ROW_ID Function	Returns <code>ROWID</code> of last row processed.
LAST_SQL_FUNCTION_CODE Function	Returns SQL function code for statement.
OPEN_CURSOR Functions	Returns cursor ID number of new cursor.
PARSE Procedures	Parses given statement.
RETURN_RESULT Procedures	Returns the result of an executed statement to the client application.
TO_CURSOR_NUMBER Function	Takes an <code>OPENED</code> strongly or weakly-typed ref cursor and transforms it into a <code>DBMS_SQL</code> cursor number.
TO_REFCURSOR Function	Takes an <code>OPENED</code> , <code>PARSED</code> , and <code>EXECUTED</code> cursor and transforms/migrates it into a PL/SQL manageable <code>REF CURSOR</code> (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.
VARIABLE_VALUE Procedures	Returns value of named variable for given cursor.

Table 176-6 (Cont.) DBMS_SQL Package Subprograms

Subprogram	Description
VARIABLE_VALUE_PKG Procedure	Returns value of named variable for given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause for a declared package. The type of the variable must be declared in the package specification.

176.9.1 BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_ARRAY (
    c                IN INTEGER,
    name             IN VARCHAR2,
    <variable>      IN <table_type>
    [,index1        IN INTEGER,
    index2          IN INTEGER] ] );
```

Where the <variable> and its corresponding <table_type> can be any one of the following matching pairs, with BIND_ARRAY being overloaded to accept different data types.

```
bdbl_tab    Binary_Double_Table
bf_tab      Bfile_Table
bflt_tab    Binary_Float_Table
bl_tab      Blob_Table
bool_tab    Boolean_Table
c_tab       Varchar2_Table
c_tab       Varchar2A
cl_tab      Clob_Table
d_tab       Date_Table
ids_tab     Interval_Day_To_Second_Table
iym_tab     Interval_Year_To_Month_Table
j_tab       Json_Table
n_tab       Number_Table
tm_tab      Time_Table
tms_tab     Timestamp_Table
tstz_tab    Timestamp_With_ltz_Table
tstz_tab    Timestamp_With_Time_Zone_Table
ttz_tab     Time_With_Time_Zone_Table
ur_tab      Urowid_Table
v_tab       Vector_Table
```

Parameters

Table 176-7 BIND_ARRAY Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the collection in the statement.
variable	Local variable that has been declared as <table_type>. The table type can be one of the predefined options or a user defined collection type. For a full list of predefined DBMS_SQL table types for scalar and LOB collections, see DBMS_SQL Data Structures.
index1	Index for the table element that marks the lower bound of the range.
index2	Index for the table element that marks the upper bound of the range.

Usage Notes

For binding a range, the table must contain the elements that specify the range — `tab(index1)` and `tab(index2)` — but the range does not have to be dense. `index1` must be less than or equal to `index2`. All elements between `tab(index1)` and `tab(index2)` are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The `DBMS_SQL` package lets you work on collections of data using the PL/SQL table type.

Table items are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local `DBMS_SQL` buffers (the same as for all scalar types) and then the table is manipulated from the local

DBMS_SQL buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

Example 176-1 Use DBMS_SQL.BIND_ARRAY with VECTOR

```
CREATE TABLE vec_seq_table(
  col_vector VECTOR(1, float32),
  col_seq NUMBER
);

SET SERVEROUTPUT ON;
DECLARE
  cur NUMBER;
  stmt_1 VARCHAR2(255) :=
    'INSERT INTO vec_seq_table(col_vector, col_seq) VALUES (:1, :2)';
  number_array DBMS_SQL.NUMBER_TABLE;
  v_array DBMS_SQL.VECTOR_TABLE;
  rowsProcessed NUMBER;
BEGIN
  FOR cnt IN 1 .. 5 LOOP
    v_array(cnt) := TO_VECTOR([' || cnt || '], 1, float32);
    number_array(cnt) := cnt;
  END LOOP;

  cur := DBMS_SQL.OPEN_CURSOR();
  DBMS_SQL.PARSE(cur, stmt_1, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(cur, ':1', v_array);
  DBMS_SQL.BIND_ARRAY(cur, ':2', number_array);
  rowsProcessed := DBMS_SQL.EXECUTE(cur);
  DBMS_SQL.CLOSE_CURSOR(cur);
  COMMIT;
END;
/

SELECT * FROM vec_seq_table ORDER BY col_seq;
```

Result:

COL_VECTOR	COL_SEQ
[1.0E+000]	1
[2.0E+000]	2
[3.0E+000]	3
[4.0E+000]	4
[5.0E+000]	5

Example 176-2 Examples Using Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements INSERT, UPDATE and DELETE.

Here is an example of a bulk INSERT statement that demonstrates adding seven new employees to the emp table:

```
DECLARE
  stmt VARCHAR2(200);
  empno_array      DBMS_SQL.NUMBER_TABLE;
  empname_array    DBMS_SQL.VARCHAR2_TABLE;
  jobs_array       DBMS_SQL.VARCHAR2_TABLE;
  mgr_array        DBMS_SQL.NUMBER_TABLE;
  hiredate_array   DBMS_SQL.VARCHAR2_TABLE;
  sal_array        DBMS_SQL.NUMBER_TABLE;
  comm_array       DBMS_SQL.NUMBER_TABLE;
  deptno_array     DBMS_SQL.NUMBER_TABLE;
  c               NUMBER;
  dummy           NUMBER;
BEGIN
  empno_array(1) := 9001;
  empno_array(2) := 9002;
  empno_array(3) := 9003;
  empno_array(4) := 9004;
  empno_array(5) := 9005;
  empno_array(6) := 9006;
  empno_array(7) := 9007;

  empname_array(1) := 'Dopey';
  empname_array(2) := 'Grumpy';
  empname_array(3) := 'Doc';
  empname_array(4) := 'Happy';
  empname_array(5) := 'Bashful';
  empname_array(6) := 'Sneezy';
  empname_array(7) := 'Sleepy';

  jobs_array(1) := 'Miner';
  jobs_array(2) := 'Miner';
  jobs_array(3) := 'Miner';
  jobs_array(4) := 'Miner';
  jobs_array(5) := 'Miner';
  jobs_array(6) := 'Miner';
  jobs_array(7) := 'Miner';

  mgr_array(1) := 9003;
  mgr_array(2) := 9003;
  mgr_array(3) := 9003;
  mgr_array(4) := 9003;
  mgr_array(5) := 9003;
  mgr_array(6) := 9003;
  mgr_array(7) := 9003;

  hiredate_array(1) := '06-DEC-2006';
  hiredate_array(2) := '06-DEC-2006';
  hiredate_array(3) := '06-DEC-2006';
  hiredate_array(4) := '06-DEC-2006';
  hiredate_array(5) := '06-DEC-2006';
  hiredate_array(6) := '06-DEC-2006';
  hiredate_array(7) := '06-DEC-2006';

  sal_array(1) := 1000;
  sal_array(2) := 1000;
  sal_array(3) := 1000;
  sal_array(4) := 1000;
  sal_array(5) := 1000;
  sal_array(6) := 1000;
  sal_array(7) := 1000;
```

```
comm_array(1) := 0;
comm_array(2) := 0;
comm_array(3) := 0;
comm_array(4) := 0;
comm_array(5) := 0;
comm_array(6) := 0;
comm_array(7) := 0;

deptno_array(1) := 11;
deptno_array(2) := 11;
deptno_array(3) := 11;
deptno_array(4) := 11;
deptno_array(5) := 11;
deptno_array(6) := 11;
deptno_array(7) := 11;

stmt := 'INSERT INTO emp VALUES (
      :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
      :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
EXCEPTION WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(c) THEN
    DBMS_SQL.CLOSE_CURSOR(c);
  END IF;
  RAISE;
END;
/
SHOW ERRORS;
```

Here is an example of a bulk UPDATE statement that demonstrates updating salaries for four existing employees in the emp table:

```
DECLARE
  stmt VARCHAR2(200);
  empno_array DBMS_SQL.NUMBER_TABLE;
  salary_array DBMS_SQL.NUMBER_TABLE;
  c NUMBER;
  dummy NUMBER;
BEGIN

  empno_array(1) := 7369;
  empno_array(2) := 7876;
  empno_array(3) := 7900;
  empno_array(4) := 7934;

  salary_array(1) := 10000;
  salary_array(2) := 10000;
  salary_array(3) := 10000;
  salary_array(4) := 10000;
```

```

stmt := 'update emp set sal = :salary_array
        WHERE empno = :num_array';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/

```

In a `DELETE` statement, for example, you could bind an array in the `WHERE` clause and have the statement be run for each element in the array:

```

DECLARE
    stmt VARCHAR2(200);
    dept_no_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
begin
    dept_no_array(1) := 10; dept_no_array(2) := 20;
    dept_no_array(3) := 30; dept_no_array(4) := 40;
    dept_no_array(5) := 30; dept_no_array(6) := 40;
    stmt := 'delete from emp where deptno = :dept_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
    dummy := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.CLOSE_CURSOR(c);

    EXCEPTION WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
END;
/

```

In the preceding example, only elements 1 through 4 are used as specified by the `BIND_ARRAY` call. Each element of the array potentially deletes a large number of employees from the database.

176.9.2 BIND_VARIABLE Procedures

These procedures bind a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```

DBMS_SQL.BIND_VARIABLE (
    c                IN INTEGER,
    name             IN VARCHAR2,
    value            IN <datatype>);

```

Where <datatype> can be any one of the following types:

```
ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
JSON
NESTED table
NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
VARRAY
VECTOR
YMINTERVAL_UNCONSTRAINED
```

Notice that `BIND_VARIABLE` is overloaded to accept different data types.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets `[]` indicate an optional parameter for the `BIND_VARIABLE` procedure.

```
DBMS_SQL.BIND_VARIABLE (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.BIND_VARIABLE_CHAR (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_RAW (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN RAW [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_ROWID (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN ROWID);
```

Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

Parameters

Table 176-8 BIND_VARIABLE Procedures Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the variable in the statement. The length of the bind variable name must be <=30 bytes.
value	Value that you want to bind to the variable in the cursor. For IN and IN/OUT variables, the value has the same type as the type of the value being passed in for this parameter.
out_value_size	Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable. If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized.

Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);
```

or

```
BIND_VARIABLE (cursor_name, 'X', 3500);
```

176.9.3 BIND_VARIABLE_PKG Procedure

This procedure binds a variable given value or set of values to a given variable in a cursor, based on the name of the variable in the statement. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

```
DBMS_SQL.BIND_VARIABLE_PKG (
  c           IN INTEGER,
  name       IN VARCHAR2,
  value      IN <datatype>);
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY

- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE

Table 176-9 BIND_VARIABLE_PKG Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable in the statement for which you are retrieving the value.
value	<ul style="list-style-type: none"> • Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE_PKG</code>. • Array option: Local variable that has been declared <code><table_type></code>

Example 176-3 Dynamic SQL using DBMS_SQL.BIND_VARIABLE_PKG to Bind a Package Variable

The variables types are declared in the package specification. The `BIND_VARIABLE_PKG` is used to bind the variable `v1` in the cursor SQL statement.

```

CREATE OR REPLACE PACKAGE ty_pkg AS
    TYPE rec IS RECORD ( n1 NUMBER, n2 NUMBER);
    TYPE trec IS TABLE OF REC INDEX BY BINARY_INTEGER;
    TYPE trecv IS TABLE OF NUMBER;
    TYPE trecv IS VARRAY(100) OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_ibbi AS
    dummy NUMBER;
    cur NUMBER;
    v1 ty_pkg.trec;
    str VARCHAR2(3000);
    n1 NUMBER;
    n2 NUMBER;
BEGIN
    FOR i in 1..3 LOOP
        v1(i).n1 := i*10;
        v1(i).n2 := i*20;
    END LOOP;
    str := 'SELECT * FROM TABLE(:v1) ' ;
    cur := DBMS_SQL.OPEN_CURSOR();
    DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
    dummy := DBMS_SQL.EXECUTE(cur);
    DBMS_SQL.DEFINE_COLUMN(cur, 1, n1);
    DBMS_SQL.DEFINE_COLUMN(cur, 2, n2);

```

```

LOOP
  IF DBMS_SQL.FETCH_ROWS(cur) > 0 THEN
    -- get column values of the row
    DBMS_SQL.COLUMN_VALUE(cur, 1, n1);
    DBMS_SQL.COLUMN_VALUE(cur, 2, n2);
    DBMS_OUTPUT.PUT_LINE('n1 = '||n1||' n2 = '||n2);
  ELSE
    -- No more rows
    EXIT;
  END IF;
END LOOP;
DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_ibbi;
/
EXEC dyn_sql_ibbi;

n1 = 10 n2 = 20
n1 = 20 n2 = 40
n1 = 30 n2 = 60

```

176.9.4 CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

```
DBMS_SQL.CLOSE_CURSOR (
  c      IN OUT INTEGER);
```

Pragmas

```
pragma restrict_references(close_cursor,RNDS,WNDS);
```

Parameters

Table 176-10 CLOSE_CURSOR Procedure Parameters

Parameter	Mode	Description
c	IN	ID number of the cursor that you want to close.
c	OUT	Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor.

176.9.5 COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.

Syntax

```
DBMS_SQL.COLUMN_VALUE (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT <datatype>
    [,column_error OUT NUMBER]
    [,actual_length OUT INTEGER]);
```

Where square brackets [] indicate optional parameters and <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
JSON
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
VECTOR
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT CHAR CHARACTER SET ANY_CS
    [,column_error OUT NUMBER]
    [,actual_length OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_RAW (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT RAW
    [,column_error OUT NUMBER]
    [,actual_length OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_ROWID (
```

```

c          IN  INTEGER,
position   IN  INTEGER,
value      OUT ROWID
[,column_error OUT NUMBER]
[,actual_length OUT INTEGER]);

```

The following syntax enables the `COLUMN_VALUE` procedure to accommodate bulk operations:

```

DBMS_SQL.COLUMN_VALUE(
  c          IN          INTEGER,
  position   IN          INTEGER,
  <param_name> IN OUT NOCOPY <table_type>);

```

Where the `<param_name>` and its corresponding `<table_type>` can be any one of these matching pairs:

```

bdbl_tab    Binary_Double_Table
bf_tab      Bfile_Table
bflt_tab    Binary_Float_Table
bl_tab      Blob_Table
bool_tab    Boolean_Table
c_tab       Varchar2_Table
c_tab       Varchar2A
cl_tab      Clob_Table
d_tab       Date_Table
ids_tab     Interval_Day_To_Second_Table
iym_tab     Interval_Year_To_Month_Table
j_tab       Json_table
n_tab       Number_Table
tm_tab      Time_Table
tms_tab     Timestamp_Table
tstz_tab    Timestamp_With_ltz_Table
tstz_tab    Timestamp_With_Time_Zone_Table
ttz_tab     Time_With_Time_Zone_Table
ur_tab      Urowid_Table
v_tab       Vector_Table

```

Pragmas

```
pragma restrict_references(column_value,RNDS,WNDS);
```

Parameters

Table 176-11 COLUMN_VALUE Procedure Parameters (Single Row)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
value	Returns the value at the specified column. Oracle raises exception <code>ORA-06562, inconsistent_type</code> , if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>DEFINE_COLUMN</code> .
column_error	Returns any error code for the specified column value.

Table 176-11 (Cont.) COLUMN_VALUE Procedure Parameters (Single Row)

Parameter	Description
actual_length	The actual length, before any truncation, of the value in the specified column.

Table 176-12 COLUMN_VALUE Procedure Parameters (Bulk)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
<param_name>	Local variable that has been declared <table_type>. <param_name> is an IN OUT NOCOPY parameter for bulk operations. For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing the DEFINE_ARRAY Procedure a batch size (the cnt parameter) of 10 rows was specified and a start index (lower_bound) of 1 was specified, then the first call to this subprogram after calling the FETCH_ROWS Function will populate elements at index 1..10, and the next call will populate elements 11..20, and so on.

Exceptions

INCONSISTENT_TYPE (ORA-06562) is raised if the type of the given OUT parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure DEFINE_COLUMN.

Example 176-4 Use COLUMN_VALUE Procedure with the VECTOR Data Type

This example demonstrates using the COLUMN_VALUE procedure along with the procedures DEFINE_ARRAY, the table type VECTOR_Table, and the function FROM_VECTOR to interact with a table with a VECTOR column.

```
DROP TABLE dbmsSqlTable;
CREATE TABLE dbmsSqlTable (embedding VECTOR(3, float32), id NUMBER);
INSERT INTO dbmsSqlTable VALUES ('[1.11, 2.22, 3.33]', 1);
INSERT INTO dbmsSqlTable VALUES ('[4.44, 5.55, 6.66]', 2);
INSERT INTO dbmsSqlTable VALUES ('[7.77, 8.88, 9.99]', 3);

SET SERVEROUTPUT ON;

DECLARE
    cur NUMBER;
    stmt_1 VARCHAR2(255) := 'SELECT embedding FROM dbmsSqlTable ORDER BY id';
    vecArray DBMS_SQL.VECTOR_TABLE;
    rowsProcessed NUMBER;
BEGIN
    cur := DBMS_SQL.OPEN_CURSOR();
    DBMS_SQL.PARSE(cur, stmt_1, DBMS_SQL.NATIVE);
    DBMS_SQL.DEFINE_ARRAY(cur, 1, vecArray, 3, 1);
```

```

rowsProcessed := DBMS_SQL.EXECUTE_AND_FETCH(cur);

FOR i IN 1..rowsProcessed LOOP
    DBMS_SQL.COLUMN_VALUE(cur, 1, vecArray);
    DBMS_OUTPUT.PUT_LINE('fetched ID ' || i || ': ' ||
FROM_VECTOR(vecArray(i)));
END LOOP;
DBMS_SQL.CLOSE_CURSOR(cur);
END;
/

```

Result:

```

fetched ID 1: [1.11000001E+000,2.22000003E+000,3.32999992E+000]
fetched ID 2: [4.44000006E+000,5.55000019E+000,6.65999985E+000]
fetched ID 3: [7.76999998E+000,8.88000011E+000,9.98999977E+000]

```

176.9.6 COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

```

DBMS_SQL.COLUMN_VALUE_LONG (
    c           IN  INTEGER,
    position    IN  INTEGER,
    length      IN  INTEGER,
    offset      IN  INTEGER,
    value       OUT VARCHAR2,
    value_length OUT INTEGER);

```

Pragmas

```
pragma restrict_references(column_value_long,RNDS,WNDS);
```

Parameters

Table 176-13 COLUMN_VALUE_LONG Procedure Parameters

Parameter	Description
c	Cursor ID number of the cursor from which to get the value.
position	Position of the column of which to get the value.
length	Number of bytes of the long value to fetch.
offset	Offset into the long field for start of fetch.
value	Value of the column as a VARCHAR2.
value_length	Number of bytes actually returned in value.

176.9.7 DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a FETCH_ROWS call). This procedure lets you do batch fetching of rows from a

single `SELECT` statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into `DBMS_SQL` buffers until you run a `COLUMN_VALUE` call, at which time the rows are copied into the table that was passed as an argument to the `COLUMN_VALUE` call.

Syntax

```
DBMS_SQL.DEFINE_ARRAY (
  c                IN INTEGER,
  position         IN INTEGER,
  <variable>      IN <table_type>
  cnt             IN INTEGER,
  lower_bound     IN INTEGER);
```

Where `<variable>` and its corresponding `<table_type>` can be any one of the following matching pairs, with `DEFINE_ARRAY` being overloaded to accept different data types:

<code>bdbl_tab</code>	<code>Binary_Double_Table</code>
<code>bf_tab</code>	<code>Bfile_Table</code>
<code>bflt_tab</code>	<code>Binary_Float_Table</code>
<code>bl_tab</code>	<code>Blob_Table</code>
<code>bool_tab</code>	<code>Boolean_Table</code>
<code>c_tab</code>	<code>Varchar2_Table</code>
<code>c_tab</code>	<code>Varchar2A</code>
<code>cl_tab</code>	<code>Clob_Table</code>
<code>d_tab</code>	<code>Date_Table</code>
<code>ids_tab</code>	<code>Interval_Day_To_Second_Table</code>
<code>iym_tab</code>	<code>Interval_Year_To_Month_Table</code>
<code>j_tab</code>	<code>Json_Table</code>
<code>n_tab</code>	<code>Number_Table</code>
<code>tm_tab</code>	<code>Time_Table</code>
<code>tms_tab</code>	<code>Timestamp_Table</code>
<code>tstz_tab</code>	<code>Timestamp_With_ltz_Table</code>
<code>tstz_tab</code>	<code>Timestamp_With_Time_Zone_Table</code>
<code>ttz_tab</code>	<code>Time_With_Time_Zone_Table</code>
<code>ur_tab</code>	<code>Urowid_Table</code>
<code>v_tab</code>	<code>Vector_Table</code>

Pragmas

```
pragma restrict_references (define_array,RNDS,WNDS);
```

The subsequent `FETCH_ROWS` call fetch "count" rows. When the `COLUMN_VALUE` call is made, these rows are placed in positions `lower_bound`, `lower_bound+1`, `lower_bound+2`, and so on. While there are still rows coming, the user keeps issuing `FETCH_ROWS/COLUMN_VALUE` calls. The rows keep accumulating in the table specified as an argument in the `COLUMN_VALUE` call.

Parameters

Table 176-14 DEFINE_ARRAY Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind an array.
position	Relative position of the column in the array being defined. The first column in a statement has position 1.
variable	Local variable that has been declared as <table_type>. The table type can be one of the predefined options or a user defined collection type. For a full list of predefined DBMS_SQL table types for scalar and LOB collections, see DBMS_SQL Data Structures .
cnt	Number of rows that must be fetched.
lower_bound	Results are copied into the collection, starting at this lower bound index.

Usage Notes

The count (cnt) must be an integer greater than zero; otherwise an exception is raised. The lower_bound can be positive, negative, or zero. A query on which a DEFINE_ARRAY call was issued cannot contain array binds.

Examples

```

PROCEDURE BULK_PLSQL(deptid NUMBER)
  TYPE namelist IS TABLE OF employees.last_name%TYPE;
  TYPE sallist IS TABLE OF employees.salary%TYPE;
  names    namelist;
  sals     sallist;
  c        NUMBER;
  r        NUMBER;
  sql_stmt VARCHAR2(32767) :=
    'SELECT last_name, salary FROM employees WHERE department_id = :b1';

BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

  DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);

  DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
  DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);

  r := DBMS_SQL.EXECUTE(c);

  LOOP
    r := DBMS_SQL.FETCH_ROWS(c);
    DBMS_SQL.COLUMN_VALUE(c, 1, names);
    DBMS_SQL.COLUMN_VALUE(c, 2, sals);
    EXIT WHEN r != 5;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  -- loop through the names and sals collections
  FOR i IN names.FIRST .. names.LAST LOOP

```

```

        DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
    END LOOP;
END;
/

```

Example 176-5 Example: Defining an Array

The following examples show how to use the `DEFINE_ARRAY` procedure:

```

declare
    c      NUMBER;
    d      NUMBER;
    n_tab  DBMS_SQL.NUMBER_TABLE;
    indx   NUMBER := -10;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    dbms_sql.parse(c, 'select n from t order by 1', DBMS_SQL.NATIVE);

    DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);

    d := DBMS_SQL.EXECUTE(c);
    loop
        d := DBMS_SQL.FETCH_ROWS(c);

        DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);

        EXIT WHEN d != 10;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

    EXCEPTION WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
END;
/

```

Each time the preceding example calls [FETCH_ROWS Function](#), it fetches 10 rows that are kept in `DBMS_SQL` buffers. When the [COLUMN_VALUE Procedure](#) is called, those rows move into the PL/SQL table specified (in this case `n_tab`), at positions -10 to -1, as specified in the `DEFINE` statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at `EXECUTE` time and is updated every time `COLUMN_VALUE` is called. If you reexecute at any point, then the current index for each `DEFINE` is reinitialized to "indx".

In this way the entire result of the query is fetched into the table. When `FETCH_ROWS` cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the `DEFINE_ARRAY` procedure:

Consider a table `MULTI_TAB` defined as:

```

CREATE TABLE multi_tab (num NUMBER,
                        dat1 DATE,
                        var VARCHAR2(24),
                        dat2 DATE)

```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```

DECLARE
    c          NUMBER;
    d          NUMBER;
    n_tab      DBMS_SQL.NUMBER_TABLE;
    d_tab1     DBMS_SQL.DATE_TABLE;
    v_tab      DBMS_SQL.VARCHAR2_TABLE;
    d_tab2     DBMS_SQL.DATE_TABLE;
    indx       NUMBER := 10;
BEGIN

    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);

    DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 5, indx);
    DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
    DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab, 5, indx);
    DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);

    d := DBMS_SQL.EXECUTE(c);

    LOOP
        d := DBMS_SQL.FETCH_ROWS(c);

        DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
        DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
        DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
        DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);

        EXIT WHEN d != 5;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

/*

The four tables can be used for anything. One usage might be to use BIND_ARRAY to
move the rows to another table by using a statement such as 'INSERT into SOME_T
values (:a, :b, :c, :d);

*/

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/

```

176.9.8 DEFINE_COLUMN Procedures

This procedure defines a column to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN <datatype>);
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
JSON
NUMBER
TIME_UNCONSTRAINED

```

Note that `DEFINE_COLUMN` is overloaded to accept different datatypes.

The following syntax is also supported for the `DEFINE_COLUMN` procedure:

```
DBMS_SQL.DEFINE_COLUMN (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN VARCHAR2 CHARACTER SET ANY_CS,
    column_size IN INTEGER);
```

Pragmas

```
pragma restrict_references (define_column, RNDS, WNDS);
```

Parameters

Table 176-15 DEFINE_COLUMN Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.

Table 176-15 (Cont.) DEFINE_COLUMN Procedure Parameters

Parameter	Description
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of type VARCHAR2.

Usage Notes

When using character length semantics the maximum number of bytes that can be returned for a column value of type VARCHAR2 is calculated as: `column_size * maximum character byte size for the current character set`. For example, specifying the `column_size` as 10 means that a maximum of 30 (10*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.

176.9.9 DEFINE_COLUMN_CHAR Procedure

This procedure defines a column with CHAR data to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_LONG Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_CHAR (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN CHAR CHARACTER SET ANY_CS,
    column_size IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 176-16 DEFINE_COLUMN_CHAR Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.

Table 176-16 (Cont.) DEFINE_COLUMN_CHAR Procedure Parameters

Parameter	Description
column_size	Maximum expected size of the column value in characters for columns of type CHAR.

176.9.10 DEFINE_COLUMN_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_LONG (
    c           IN INTEGER,
    position    IN INTEGER);
```

Parameters

Table 176-17 DEFINE_COLUMN_LONG Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.

176.9.11 DEFINE_COLUMN_RAW Procedure

This procedure defines a column of type RAW to be selected from the given cursor.

This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_RAW (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN RAW,
    column_size IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters**Table 176-18 DEFINE_COLUMN_RAW Procedure Parameters**

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of RAW type.

176.9.12 DEFINE_COLUMN_ROWID Procedure

This procedure defines a column of type `ROWID` to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#) and [DEFINE_COLUMN_RAW Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_ROWID (
  c           IN INTEGER,
  position    IN INTEGER,
  column      IN ROWID);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters**Table 176-19 DEFINE_COLUMN_ROWID Procedure Parameters**

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.

176.9.13 DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through `DBMS_SQL`.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (
  c           IN  INTEGER,
  col_cnt    OUT INTEGER,
  desc_t     OUT DESC_TAB);
```

Parameters

Table 176-20 DESCRIBE_COLUMNS Procedure Parameters

Parameter	Description
<code>c</code>	ID number of the cursor for the columns being described
<code>col_cnt</code>	Number of columns in the select list of the query
<code>desc_t</code>	Describe table to fill in with the description of each of the columns of the query

Example 176-6 Describe Columns

This code can be used as a substitute to the SQL*Plus `DESCRIBE` call by using a `SELECT *` query on the table that you want to describe.

```
DECLARE
  c           NUMBER;
  d           NUMBER;
  col_cnt    INTEGER;
  f           BOOLEAN;
  rec_tab    DBMS_SQL.DESC_TAB;
  col_num    NUMBER;
  PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
  BEGIN
    DBMS_OUTPUT.NEW_LINE;
    DBMS_OUTPUT.PUT_LINE('col_type           = ' || rec.col_type);
    DBMS_OUTPUT.PUT_LINE('col_maxlen        = ' || rec.col_max_len);
    DBMS_OUTPUT.PUT_LINE('col_name         = ' || rec.col_name);
    DBMS_OUTPUT.PUT_LINE('col_name_len     = ' || rec.col_name_len);
    DBMS_OUTPUT.PUT_LINE('col_schema_name  = ' || rec.col_schema_name);
    DBMS_OUTPUT.PUT_LINE('col_schema_name_len = ' ||
rec.col_schema_name_len);
    DBMS_OUTPUT.PUT_LINE('col_precision    = ' || rec.col_precision);
    DBMS_OUTPUT.PUT_LINE('col_scale        = ' || rec.col_scale);
    DBMS_OUTPUT.PUT('col_null_ok          = ');
    IF (rec.col_null_ok) THEN
      DBMS_OUTPUT.PUT_LINE('true');
    ELSE
      DBMS_OUTPUT.PUT_LINE('false');
    END IF;
  END;
BEGIN
```

```

c := DBMS_SQL.OPEN_CURSOR;

DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);

d := DBMS_SQL.EXECUTE(c);

DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

/*
 * Following loop could simply be for j in 1..col_cnt loop.
 * Here we are simply illustrating some of the PL/SQL table
 * features.
 */
col_num := rec_tab.first;
IF (col_num IS NOT NULL) THEN
  LOOP
    print_rec(rec_tab(col_num));
    col_num := rec_tab.next(col_num);
    EXIT WHEN (col_num IS NULL);
  END LOOP;
END IF;

DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

176.9.14 DESCRIBE_COLUMNS2 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```

DBMS_SQL.DESCRIBE_COLUMNS2 (
  c           IN INTEGER,
  col_cnt    OUT INTEGER,
  desc_t     OUT DESC_TAB2);

```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);
```

Parameters

Table 176-21 DESCRIBE_COLUMNS2 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Related Topics

- [DESCRIBE_COLUMNS Procedure](#)

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

176.9.15 DESCRIBE_COLUMNS3 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS3 (
  c           IN  INTEGER,
  col_cnt    OUT INTEGER,
  desc_t     OUT DESC_TAB3);
```

```
BMS_SQL.DESCRIBE_COLUMNS3 (
  c           IN  INTEGER,
  col_cnt    OUT INTEGER,
  desc_t     OUT DESC_TAB4);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

Parameters**Table 176-22 DESCRIBE_COLUMNS3 Procedure Parameters**

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Usage Notes

The cursor passed in by the cursor ID has to be OPENED and PARSED, otherwise an "invalid cursor id" error is raised.

Examples

```
CREATE TYPE PROJECT_T AS OBJECT
  ( projname    VARCHAR2(20),
    mgr         VARCHAR2(20) )
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/

DECLARE
  curid      NUMBER;
  desctab    DBMS_SQL.DESC_TAB3;
  colcnt    NUMBER;
  sql_stmt   VARCHAR2(200) := 'select * from projecttab';
```

```

BEGIN

    curid := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

    DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

    FOR i IN 1 .. colcnt LOOP
        IF desctab(i).col_type = 109 THEN
            DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
            DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                desctab(i).col_type_name);
        END IF;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

```

Output:

```
PROJECT is user-defined type: HR.PROJECT_T
```

- [DESCRIBE_COLUMNS Procedure](#)
This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

176.9.16 EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed.

The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types of statements, including DDL, the return value is undefined and must be ignored.

Syntax

```

DBMS_SQL.EXECUTE (
    c    IN INTEGER)
RETURN INTEGER;

```

Parameters

Table 176-23 EXECUTE Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to execute.

Return Values

Returns number of rows processed

Usage Notes

The `DBMS_SQL` cursor that is returned by the `TO_CURSOR_NUMBER` Function performs in the same way as a `DBMS_SQL` cursor that has already been executed. Consequently, calling `EXECUTE` for this cursor will cause an error.

176.9.17 EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows.

This function provides the same functionality as calling `EXECUTE` and then calling `FETCH_ROWS`. Calling `EXECUTE_AND_FETCH` instead, however, may reduce the number of network round-trips when used against a remote database.

The `EXECUTE_AND_FETCH` function returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (
    c          IN INTEGER,
    exact      IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (execute_and_fetch, WNDS);
```

Parameters

Table 176-24 EXECUTE_AND_FETCH Function Parameters

Parameter	Description
<code>c</code>	ID number of the cursor to execute and fetch.
<code>exact</code>	Set to <code>TRUE</code> to raise an exception if the number of rows actually matching the query differs from one. Note: Oracle does not support the exact fetch <code>TRUE</code> option with <code>LONG</code> columns. Even if an exception is raised, the rows are still fetched and available.

Return Values

Returns designated rows

176.9.18 FETCH_ROWS Function

This function fetches a row from a given cursor.

You can call `FETCH_ROWS` repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling `COLUMN_VALUE`, for each column, after each call to `FETCH_ROWS`.

The `FETCH_ROWS` function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.FETCH_ROWS (
    c          IN INTEGER)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

Parameters

Table 176-25 FETCH_ROWS Function Parameters

Parameter	Description
c	ID number.

Return Values

Returns a row from a given cursor

176.9.19 GET_NEXT_RESULT Procedures

This procedure gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.

The statements are returned in same order as they are returned by the [RETURN_RESULT Procedures](#).

Syntax

```
DBMS_SQL.GET_NEXT_RESULT (
    c          IN          INTEGER,
    rc         OUT        SYS_REFCURSOR);
```

```
DBMS_SQL.GET_NEXT_RESULT (
    c          IN          INTEGER,
    rc         OUT        INTEGER);
```

Parameters

Table 176-26 GET_NEXT_RESULT Procedure Parameters

Parameter	Description
c	Recursive statement cursor
rc	Cursor or ref cursor of the statement of the next returned result

Exceptions

ORA-01403 no_data_found: This is raised when there is no further returned statement result.

Usage Notes

- After the cursor of a statement result is retrieved, the caller must close the cursor properly when it is no longer needed.
- The cursors for all unretrieved returned statements will be closed after the cursor of the recursive statement is closed.

Examples

```

DECLARE
  c INTEGER;
  rc SYS_REFCURSOR;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR(treat_as_client_for_results => TRUE);
  DBMS_SQL.PARSE(c          => c,
                 statement   => 'begin proc; end;');
  DBMS_SQL.EXECUTE(c);
  LOOP
    BEGIN
      DBMS_SQL.GET_NEXT_RESULT(c, rc);
    EXCEPTIONS
      WHEN no_data_found THEN
        EXIT;
    END;
    LOOP
      FETCH rc INTO ...
      ...
    END LOOP;
  END LOOP;
END;

```

176.9.20 IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

```

DBMS_SQL.IS_OPEN (
  c          IN INTEGER)
  RETURN BOOLEAN;

```

Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

Parameters

Table 176-27 IS_OPEN Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to check.

Return Values

Returns `TRUE` for any cursor number that has been opened but not closed, and `FALSE` for a `NULL` cursor number. Note that the [CLOSE_CURSOR Procedure](#) Procedure `NULLS` out the cursor variable passed to it.

Exceptions

ORA-29471 `DBMS_SQL access denied`: This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent `DBMS_SQL` call in the same session will raise this error, meaning that `DBMS_SQL` is non-operational for this session.

176.9.21 LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```
DBMS_SQL.LAST_ERROR_POSITION  
    RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_error_position,RNDS,WNDS);
```

Return Values

Returns the byte offset in the SQL statement text where the error occurred

Usage Notes

Call this function after a `PARSE` call, before any other `DBMS_SQL` procedures or functions are called.

176.9.22 LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```
DBMS_SQL.LAST_ROW_COUNT  
    RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_row_count,RNDS,WNDS);
```

Return Values

Returns the cumulative count of the number of rows fetched

Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call. If called after an `EXECUTE` call, then the value returned is zero.

176.9.23 LAST_ROW_ID Function

This function returns the ROWID of the last row processed.

Syntax

```
DBMS_SQL.LAST_ROW_ID  
    RETURN ROWID;
```

Pragmas

```
pragma restrict_references(last_row_id,RNDS,WNDS);
```

Return Values

Returns the ROWID of the last row processed

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call.

176.9.24 LAST_SQL_FUNCTION_CODE Function

This function returns the SQL function code for the statement.

These codes are listed in the *Oracle Call Interface Programmer's Guide*.

Syntax

```
DBMS_SQL.LAST_SQL_FUNCTION_CODE  
    RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

Return Values

Returns the SQL function code for the statement

Usage Notes

You must call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

176.9.25 OPEN_CURSOR Functions

This function opens a new cursor.

The `security_level` parameter allows for application of fine-grained control to the security of the opened cursor.

Syntax

```
DBMS_SQL.OPEN_CURSOR (  
    treat_as_client_for_results    IN    BOOLEAN    DEFAULT FALSE)  
    RETURN INTEGER;
```

```
DBMS_SQL.OPEN_CURSOR (
    security_level          IN    INTEGER,
    treat_as_client_for_results IN    BOOLEAN    DEFAULT FALSE)
RETURN INTEGER;
```

Parameters

Table 176-28 OPEN_CURSOR Function Parameters

Parameter	Description
security_level	<p>Specifies the level of security protection to enforce on the opened cursor. Valid security level values are 0, 1, and 2. When a NULL argument value is provided to this overload, as well as for cursors opened using the overload of open_cursor without the security_level parameter, the default security level value 1 will be enforced on the opened cursor.</p> <ul style="list-style-type: none"> Level 0 - allows all DBMS_SQL operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default. Level 1 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor. Level 2 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.
treat_as_client_for_results	<p>Allows the caller of the recursive statement to set itself as the client to receive the statement results returned from the recursive statement to client. The statement results returned may be retrieved by the GET_NEXT_RESULT Procedures.</p>

Pragmas

```
pragma restrict_references(open_cursor,RNDS,WNDS);
```

Return Values

Returns the cursor ID number of the new cursor

Usage Notes

- When you no longer need this cursor, you must close it explicitly by calling the [CLOSE_CURSOR Procedure](#).
- You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

176.9.26 PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are multiple versions of the `PARSE` procedure:

- Taking a `VARCHAR2` statement as an argument
- Taking a segmented string, one taking `VARCHAR2A`, a `TABLE OF VARCHAR2(32767)`, and another, taking `VARCHAR2S`, a `TABLE OF VARCHAR2(256)`, as argument. These overloads concatenate elements of a PL/SQL table statement and parse the resulting string. You can use these procedures to parse a statement that is longer than the limit for a single `VARCHAR2` variable by splitting up the statement.
- Taking a `CLOB` statement as an argument. You can use the `CLOB` overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

Each version has multiple overloads.

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2,
    language_flag    IN    INTEGER[
[,edition          IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN    VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN    BOOLEAN DEFAULT TRUE]
[,schema          IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2]);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    CLOB,
    language_flag    IN    INTEGER[
[,edition          IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN    VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN    BOOLEAN DEFAULT TRUE]
[,schema          IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2]);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2A,
    lb              IN    INTEGER,
    ub              IN    INTEGER,
    lfflg          IN    BOOLEAN,
    language_flag    IN    INTEGER[
[,edition          IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN    VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN    BOOLEAN DEFAULT TRUE]
[,schema          IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2]);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2s,
    lb              IN    INTEGER,
```

```

ub                IN    INTEGER,
lfflg            IN    BOOLEAN,
language_flag    IN    INTEGER[
[,edition        IN    VARCHAR2 DEFAULT NULL],
  apply_crossedition_trigger IN  VARCHAR2 DEFAULT NULL,
  fire_apply_trigger    IN    BOOLEAN DEFAULT TRUE]
[,schema        IN    VARCHAR2 DEFAULT NULL]
[,container      IN    VARCHAR2)];

```

Parameters

Table 176-29 PARSE Procedure Parameters

Parameter	Description
c	ID number of the cursor in which to parse the statement.
statement	<p>SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs.</p> <p>Unlike a PL/SQL statement, your SQL statement must not include a final semicolon. For example:</p> <pre>DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2);</pre> <pre>DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);</pre>
lb	Lower bound for elements in the statement
ub	Upper bound for elements in the statement
lfflg	If TRUE, then insert a linefeed after each element on concatenation.
language_flag	Specifies the behavior for the SQL statement. For more information about the possible values and its corresponding behaviors, see DBMS_SQL Constants
edition	<p>Specifies the edition in which to run the statement under the following conditions:</p> <ul style="list-style-type: none"> • If NULL and container is NULL, the statement will be run in the current edition. • If a valid container is specified, passing NULL indicates the statement is to run in the target container's default edition. • Given the user and the edition with which the statement is to be executed, the user must have USE privilege on the edition. <p>The following general conditions apply. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the edition's actual name, and if double quotation marks are not used the contents will be uppercased.</p>

Table 176-29 (Cont.) PARSE Procedure Parameters

Parameter	Description
<code>apply_crossedition_trigger</code>	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the <code>edition</code> and <code>current_schema</code> setting in which the statement is to be executed. The trigger must be owned by the user that will execute the statement. If a non-NULL value is specified, the specified crossedition trigger will be executed assuming <code>fire_apply_trigger</code> is TRUE, the trigger is enabled, the trigger is defined on the table which is the target of the statement, the type of the statement matches the trigger's <code>dml_event_clause</code> , any effective WHEN and UPDATE OF restrictions are satisfied, and so on. Other forward crossedition triggers may also be executed, selected using the "crossedition trigger DML rules" applied as if the specified trigger was doing a further DML to the table that is the target of the statement. Non-crossedition triggers and reverse crossedition triggers will not be executed. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the trigger's actual name, and if double quotation marks are not used, the contents will be uppercased.
<code>fire_apply_trigger</code>	Indicates whether the specified <code>apply_crossedition_trigger</code> is itself to be executed, or must only be a guide used in selecting other triggers. This is typically set FALSE when the statement is a replacement for the actions the <code>apply_crossedition_trigger</code> would itself perform. If FALSE, the specified trigger is not executed, but other triggers are still selected for firing as if the specified trigger was doing a DML to the table that is the target of the statement. The <code>apply_crossedition_trigger</code> and <code>fire_apply_trigger</code> parameters are ignored if the statement is not a DML.
<code>schema</code>	Specifies the schema in which to resolve unqualified object names. If NULL, the current schema is the effective user's schema.
<code>container</code>	Name of the target container in which the cursor is to run. If NULL or unspecified, the name of the target container is that of the calling container and no container switch is performed. If a valid container name is specified, the current user must be a common user with SET CONTAINER privilege to switch to the target container. If a container switch completes, the effective user will have its default roles.

Usage Notes

- Using DBMS_SQL to dynamically run DDL statements can cause the program to stop responding. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, stops the program from running.
- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

For example, the following code does *not* compile on the client:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant
DBMS_SQL.NATIVE
```

The following code works on the client, because the argument is explicitly provided:

DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client

- The VARCHAR2S type is currently supported for backward compatibility of legacy code. However, you are advised to use VARCHAR2A both for its superior capability and because VARCHAR2S will be deprecated in a future release.
- To parse SQL statements larger than 32 KB, the new CLOB overload version of the PARSE procedure can be used instead of the VARCHAR2A overload.
- If the container parameter value is the same as the calling container, a container switch will not occur. However, the default roles of the current user will be in effect.

Exceptions

If you create a type, procedure, function, or package using DBMS_SQL that has compilation warnings, an ORA-24344 exception is raised, and the PL/SQL unit is still created.

176.9.27 RETURN_RESULT Procedures

This procedure returns the result of an executed statement to the client application.

The result can be retrieved later by the client. Alternatively, it can return the statement result to and be retrieved later by the immediate caller that executes a recursive statement in which this statement result will be returned.

The caller can be:

- A PL/SQL stored procedure executing the recursive statement using DBMS_SQL
- A Java stored procedure using JDBC
- A .NET stored procedure using ADO.NET
- An external procedure using the Oracle Call Interface (OCI)

Syntax

```
DBMS_SQL.RETURN_RESULT(
  rc          IN OUT    SYS_REFCURSOR,
  to_client   IN        BOOLEAN          DEFAULT TRUE);
```

```
DBMS_SQL.RETURN_RESULT(
  rc          IN OUT    INTEGER,
  to_client   IN        BOOLEAN          DEFAULT TRUE);
```

Parameters

Table 176-30 RETURN_RESULT Procedure Parameters

Parameter	Description
rc	Statement cursor or ref cursor
to_client	Returns (or does not return) the statement result to the client. If not, it is returned to the immediate caller.

Usage Notes

- Currently only a SQL query can be returned, and the return of statement results over remote procedure calls is not supported.
- Once the statement is returned, it is no longer accessible except by the client or the immediate caller to which it is returned.
- Statement results cannot be returned when the statement being executed by the client or any intermediate recursive statement is a SQL query and an error is raised.
- A ref cursor being returned can be strongly or weakly-typed.
- A query being returned can be partially fetched.
- Because EXECUTE IMMEDIATE statement provides no interface to retrieve the statement results returned from its recursive statement, the cursors of the statement results returned to the caller of the EXECUTE IMMEDIATE statement will be closed when the statement completes. To retrieve the returned statement results from a recursive statement in PL/SQL, use DBMS_SQL to execute the recursive statement.

Examples

```
CREATE PROCEDURE proc AS
  rc1 sys_refcursor;
  rc2 sys_refcursor;
BEGIN
  OPEN rc1 FOR SELECT * FROM t1;
  DBMS_SQL.RETURN_RESULT(rc1);
  OPEN rc2 FOR SELECT * FROM t2;
  DBMS_SQL.RETURN_RESULT(rc2);
END;
/
```

176.9.28 TO_CURSOR_NUMBER Function

This function takes an OPENED strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.

Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER (
  rc IN OUT SYS_REFCURSOR)
RETURN INTEGER;
```

Parameters

Table 176-31 TO_CURSOR_NUMBER Function Parameters

Parameter	Description
rc	REF CURSOR to be transformed into a cursor number

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a REF CURSOR

Usage Notes

- The REF CURSOR passed in has to be OPENED, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- The DBMS_SQL cursor that is returned by this subprogram performs in the same way as a DBMS_SQL cursor that has already been executed.

Examples

```

CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
  TYPE CurType IS REF CURSOR;
  src_cur      CurType;
  curid        NUMBER;
  desctab      DBMS_SQL.DESC_TAB;
  colcnt       NUMBER;
  namevar      VARCHAR2(50);
  numvar       NUMBER;
  datevar      DATE;
  empno        NUMBER := 100;
BEGIN

  -- sql_stmt := 'select ..... from employees where employee_id = :b1';
  OPEN src_cur FOR sql_stmt USING empno;

  -- Switch from native dynamic SQL to DBMS_SQL
  curid := DBMS_SQL.TO_CURSOR_NUMBER (src_cur);

  DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

  -- Define columns
  FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col_type = 2 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
    ELSIF desctab(i).col_type = 12 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
    .....
  ELSE
    DBMS_SQL.DEFINE_COLUMN(curid, i, namevar, 25);
  END IF;
  END LOOP;

  -- Fetch Rows
  WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
    FOR i IN 1 .. colcnt LOOP
      IF (desctab(i).col_type = 1) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
      ELSIF (desctab(i).col_type = 2) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
      ELSIF (desctab(i).col_type = 12) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
      ....
    END IF;
  END LOOP;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(curid);

```

```
END;
/
```

176.9.29 TO_REFCURSOR Function

This function takes an `OPENED`, `PARSED`, and `EXECUTED` cursor and transforms/migrates it into a PL/SQL manageable `REF CURSOR` (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.

This subprogram is only used with `SELECT` cursors.

Syntax

```
DBMS_SQL.TO_REFCURSOR(
    cursor_number IN OUT INTEGER)
RETURN SYS_REFCURSOR;
```

Parameters

Table 176-32 TO_REFCURSOR Function Parameters

Parameter	Description
<code>cursor_number</code>	Cursor number of the cursor to be transformed into <code>REF CURSOR</code>

Return Values

Returns a PL/SQL `REF CURSOR` transformed from a `DBMS_SQL` cursor number

Usage Notes

- The cursor passed in by the `cursor_number` has to be `OPENED`, `PARSED`, and `EXECUTED`; otherwise an error is raised.
- Once the `cursor_number` is transformed into a `REF CURSOR`, the `cursor_number` is no longer accessible by any `DBMS_SQL` operations.
- After a `cursor_number` is transformed into a `REF CURSOR`, using `DBMS_SQL.IS_OPEN` to check to see if the `cursor_number` is still open results in an error.
- If the cursor number was last parsed with a valid container parameter, it cannot be converted to a `REF CURSOR`.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
    TYPE CurType IS REF CURSOR;
    src_cur          CurType;
    curid            NUMBER;
    sql_stmt         VARCHAR2(200);
    ret             INTEGER;
    empnos          DBMS_SQL.Number_Table;
    depts           DBMS_SQL.Number_Table;
BEGIN

    -- DBMS_SQL.OPEN_CURSOR
    curid := DBMS_SQL.OPEN_CURSOR;

    sql_stmt := 'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID
```

```

= :b1';

DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
ret := DBMS_SQL.EXECUTE(curid);

-- Switch from DBMS_SQL to native dynamic SQL
src_cur := DBMS_SQL.TO_REFCURSOR(curid);

-- Fetch with native dynamic SQL
FETCH src_cur BULK COLLECT INTO empnos, depts;

IF empnos.COUNT > 0 THEN
  DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
  DBMS_OUTPUT.PUT_LINE('-----');
  -- Loop through the empnos and depts collections
  FOR i IN 1 .. empnos.COUNT LOOP
    DBMS_OUTPUT.PUT_LINE(empnos(i) || ' ' || depts(i));
  END LOOP;
END IF;
-- Close cursor
CLOSE src_cur;
END;
/

```

176.9.30 VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with **returning clause**.

Syntax

```

DBMS_SQL.VARIABLE_VALUE (
  c           IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT NOCOPY <datatype>);

```

Where <datatype> can be any one of the following types:

```

ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
JSON
NESTED table
NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED

```

```
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
VARRAY
VECTOR
YMINTERVAL_UNCONSTRAINED
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.VARIABLE_VALUE_CHAR (
  c          IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT CHAR CHARACTER SET ANY_CS);
```

```
DBMS_SQL.VARIABLE_VALUE_RAW (
  c          IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT RAW);
```

```
DBMS_SQL.VARIABLE_VALUE_ROWID (
  c          IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT ROWID);
```

The following syntax enables the VARIABLE_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.VARIABLE_VALUE (
  c          IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT NOCOPY <table_type>);
```

For bulk operations, <table_type> must be a supported DBMS_SQL predefined TABLE type.

See [DBMS_SQL Data Structures](#)

Pragmas

```
pragma restrict_references(variable_value,RNDS,WNDS);
```

Parameters

Table 176-33 VARIABLE_VALUE Procedure Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	<ul style="list-style-type: none"> Single row option: Returns the value of the variable for the specified position. Oracle raises the exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to BIND_VARIABLE. Array option: Local variable that has been declared <table_type>. For bulk operations, value is an OUT NOCOPY parameter.

176.9.31 VARIABLE_VALUE_PKG Procedure

This procedure returns the value of the named variable for a given cursor.

It is used to return the values of bind variables of collection or record types inside PL/SQL blocks or DML statements with `returning` clause for a declared package. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

```
DBMS_SQL.VARIABLE_VALUE_PKG (
  c          IN   INTEGER,
  name       IN   VARCHAR2,
  value      OUT NOCOPY <table_type>);
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE

Parameters

Table 176-34 VARIABLE_VALUE_PKG Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	<ul style="list-style-type: none"> • Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE_PKG</code>. • Array option: Local variable that has been declared <table_type>.

Example 176-7 Dynamic SQL using DBMS_SQL.VARIABLE_VALUE_PKG to Get the Value of a Bind Variable

The data types are declared in the package specification. The `VARIABLE_VALUE_PKG` is used to get the value of the bind variable `v2` in the cursor SQL statement.

```
CREATE OR REPLACE PACKAGE ty_pkg AS
TYPE rec IS RECORD
  ( n1 NUMBER,
```

```
        n2 NUMBER);
TYPE trect IS TABLE OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_nt AS
    dummy NUMBER;
    cur    NUMBER;
    v1 ty_pkg.trect;
    v2 ty_pkg.trect;
    str VARCHAR2(3000);
BEGIN
    v1 := ty_pkg.trect(1000);
    str := 'declare v1 ty_pkg.trect; begin v1:=v1; v1(1) := 2000; :v2 :=
v1; end;' ;
    cur := DBMS_SQL.OPEN_CURSOR();
    DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v2', v2);
    dummy := DBMS_SQL.EXECUTE(cur);
    DBMS_SQL.VARIABLE_VALUE_PKG(cur, ':v2', v2);
    DBMS_OUTPUT.PUT_LINE('n = '
|| v2(1));
    DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_nt;
/
EXEC dyn_sql_nt;

n = 2000
```

DBMS_SQL_FIREWALL

The `DBMS_SQL_FIREWALL` package enables you to monitor users and detect or prevent SQL injection attacks against those users.

This chapter contains the following topics:

- [DBMS_SQL_FIREWALL Overview](#)
- [DBMS_SQL_FIREWALL Security Model](#)
- [DBMS_SQL_FIREWALL Constants](#)
- [Summary of DBMS_SQL_FIREWALL Subprograms](#)

177.1 DBMS_SQL_FIREWALL Overview

The `DBMS_SQL_FIREWALL` PL/SQL package enables you to manage SQL Firewall, which tracks and can block SQL injection attacks.

The `DBMS_SQL_FIREWALL` package enables you to capture SQL activities of users, create allow-lists (that is, permitted actions) from the captured SQL activities, and then enforce the allow-lists to prevent or detect potential SQL injection attacks. In addition to SQL statements, the allow-list can contain a context list, which is a set of session contexts allowed for database connections. An example of a context can be IP addresses. You can also configure SQL Firewall to not run when Oracle Scheduler is running, because to do so may interfere with Oracle Scheduler operations. After you enable the allow-list, any SQL that the user performs will be monitored by SQL Firewall. SQL that the user performs that is not in the allow-list is considered to be a SQL injection attack. You can configure SQL Firewall to either allow the user to continue performing these SQL operations, or you can block these activities. Note that the SQL operations that violate the allow-list will always be written to a log table that you can query with data dictionary views.

You can configure SQL Firewall in both the root and in individual pluggable databases (PDBs).

Related Topics

- [Oracle Database Security Guides](#)

177.2 DBMS_SQL_FIREWALL Security Model

Oracle Database protects the administration of SQL Firewall by storing its metadata in tables in the `SYS` schema.

Hence, these tables rely on dictionary protection, just as other dictionary tables in `SYS` do. Therefore, users who have the `SELECT ANY TABLE` system privilege cannot query these tables unless they also have the `SELECT ANY DICTIONARY` system privilege or are granted the `SELECT` object privileges on the tables. Only the `SYS` user can grant these privileges to other users.

Oracle Database stores the SQL Firewall tables in the `SYSAUX` tablespace by default. If you want to move the SQL Firewall log tables to a different (user-defined) tablespace, then you must first disable SQL Firewall, and then use the `MOVE` clause of the `ALTER TABLE` statement to perform the move operation.

To use the procedures in the `DBMS_SQL_FIREWALL` package, a user must be granted the `SQL_FIREWALL_ADMIN` role.

- *Oracle Database Security Guide*

177.3 DBMS_SQL_FIREWALL Constants

The `DBMS_SQL_FIREWALL` package provides constants that are used with several SQL Firewall procedures.

These constants are described in the following table.

Table 177-1 DBMS_SQL_FIREWALL Constants

Name	Type	Value	Description
<code>DBMS_SQL_FIREWALL.ENFORCE_ALL</code>	NUMBER	3	Enforces both allowed SQL and allowed contexts when you run the <code>DBMS_SQL_FIREWALL.ENABLE_ALLOW_LIST</code> procedure
<code>DBMS_SQL_FIREWALL.ENFORCE_CONTEXT</code>	NUMBER	1	Enforces allowed contexts when you run the <code>DBMS_SQL_FIREWALL.ENABLE_ALLOW_LIST</code> procedure.
<code>DBMS_SQL_FIREWALL.ENFORCE_SQL</code>	NUMBER	2	Enforces allowed SQL when you run the <code>DBMS_SQL_FIREWALL.ENABLE_ALLOW_LIST</code> procedure
<code>DBMS_SQL_FIREWALL.ALL_LOGS</code>	NUMBER	3	Purges all logs when you run the <code>DBMS_SQL_FIREWALL.PURGE</code> procedure
<code>DBMS_SQL_FIREWALL.CAPTURE_LOG</code>	NUMBER	1	Purges only capture logs when you run the <code>DBMS_SQL_FIREWALL.PURGE</code> procedure
<code>DBMS_SQL_FIREWALL.IP_ADDRESS</code>	NUMBER	3	Specifies the user's IP address when you run the <code>DBMS_SQL_FIREWALL.ADD_ALLOWED_CONTEXT</code> or <code>DBMS_SQL_FIREWALL.DELETE_ALLOWED_CONTEXT</code> procedure

Table 177-1 (Cont.) DBMS_SQL_FIREWALL Constants

Name	Type	Value	Description
DBMS_SQL_FIREWALL.OS_PROGRAM	NUMBER	1	Specifies the user's operating system program when you run the DBMS_SQL_FIREWALL.ADD_ALLOWED_CONTEXT or DBMS_SQL_FIREWALL.DELETE_ALLOWED_CONTEXT procedure
DBMS_SQL_FIREWALL.OS_SYSTEM_NAME	NUMBER	2	Specifies an operating system name when you run the DBMS_SQL_FIREWALL.ADD_ALLOWED_CONTEXT or DBMS_SQL_FIREWALL.DELETE_ALLOWED_CONTEXT procedure
DBMS_SQL_FIREWALL.SCHEDULER_JOB	NUMBER	1	Indicates whether SQL Firewall will capture and enforce allow-lists for database connections and SQL executions during Oracle Scheduler operations. Use this constant with the DBMS_SQL_FIREWALL.EXCLUDE and DBMS_SQL_FIREWALL.INCLUDE procedures.
DBMS_SQL_FIREWALL.VIOLATION_LOG	NUMBER	2	Purges only violation logs when you run the DBMS_SQL_FIREWALL.PURGE procedure

177.4 Summary of DBMS_SQL_FIREWALL Subprograms

This table lists and describes the DBMS_SQL_FIREWALL package subprograms.

Table 177-2 DBMS_SQL_FIREWALL Package Subprograms

Subprogram	Description
ADD_ALLOWED_CONTEXT Procedure	Adds a context to the list of allowed contexts for a user who is configured for SQL Firewall
APPEND_ALLOW_LIST Procedure	Appends additional contents to an existing allow-list by using the existing capture logs or violation logs of the user, or both
APPEND_ALLOW_LIST_SINGLE_SQL Procedure	Appends a single SQL record to the violation log or capture log to an existing allow-list

Table 177-2 (Cont.) DBMS_SQL_FIREWALL Package Subprograms

Subprogram	Description
CREATE_CAPTURE Procedure	Creates a SQL Firewall capture for a specified user at a given level
DELETE_ALLOWED_CONTEXT Procedure	Deletes a SQL Firewall context value that had been assigned to a user
DELETE_ALLOWED_SQL Procedure	Deletes a specified entry from the allowed SQL that had been assigned to a user
DISABLE Procedure	Disables SQL Firewall
DISABLE_ALLOW_LIST Procedure	Disables SQL Firewall allow-list enforcement for a given user
DROP_ALLOW_LIST Procedure	Deletes the SQL Firewall allow-list of a specified user
DROP_CAPTURE Procedure	Drops a SQL Firewall capture and deletes all the associated capture logs
ENABLE Procedure	Enables SQL Firewall
ENABLE_ALLOW_LIST Procedure	Enables SQL Firewall allow-list enforcement for a given user
EXCLUDE Procedure	Prevents SQL Firewall from capturing or enforcing allow-lists for database connections and SQL executions during Oracle Scheduler operations
EXPORT_ALLOW_LIST Procedure	Exports the allow-list of the given user in JSON format, into the CLOB provided from the <code>allow_list</code> argument
FLUSH_LOGS Procedure	Flushes all the SQL Firewall logs that reside in the memory into the log tables
GENERATE_ALLOW_LIST Procedure	Generates a SQL Firewall allow-list for the specified user by using data from the existing capture logs of the user
IMPORT_ALLOW_LIST Procedure	Imports the allow-list from the specified CLOB for the given user, to the target database
INCLUDE Procedure	Enables SQL Firewall to capture and enforce allow-lists for database connections and SQL executions during Oracle Scheduler operations
PURGE_LOG Procedure	Purges SQL Firewall logs
START_CAPTURE Procedure	Starts a SQL Firewall capture for a user
STOP_CAPTURE Procedure	Stops a SQL Firewall capture for a user
UPDATE_ALLOW_LIST_ENFORCEMENT Procedure	Updates the SQL Firewall allow-list enforcement options for the given user

177.4.1 ADD_ALLOWED_CONTEXT Procedure

This procedure adds a context to the list of allowed contexts for a user's SQL Firewall allow-list.

Syntax

```
DBMS_SQL_FIREWALL.ADD_ALLOWED_CONTEXT (
  username      IN  VARCHAR2,
  context_type  IN  NUMBER,
  value         IN  VARCHAR2);
```

Parameters

Table 177-3 ADD_ALLOWED_CONTEXT Procedure Parameters

Parameter	Description
username	Specifies the name of the user who has a SQL Firewall allow-list. To find all the users who has an allow-list, query <code>DBA_SQL_FIREWALL_ALLOW_LISTS</code> .
context_type	Specifies one of the following context types: <ul style="list-style-type: none"> • <code>DBMS_SQL_FIREWALL.IP_ADDRESS</code> accepts IPv4 and IPv6 addresses and subnets in the CIDR notation. • <code>DBMS_SQL_FIREWALL.OS_USERNAME</code> accepts any valid operating system user name, such as <code>oracle</code>. • <code>DBMS_SQL_FIREWALL.OS_PROGRAM</code> accepts any valid operating system program name, such as <code>sqlplus</code> or <code>SQL Developer</code>.
value	Specifies the value of the <code>context_type</code> constant, such as an IP address for <code>DBMS_SQL_FIREWALL.IP_ADDRESS</code> . To allow a local (bequeathed) connection that does not have an IP address, specify with the value <code>Local</code> for the <code>DBMS_SQL_FIREWALL.IP_ADDRESS</code> type. To specify all values of the context (such as all possible operating system programs), then enter the <code>%</code> wild card character.

Usage Notes

- You can find the user's current context type settings by querying the following data dictionary views:
 - `DBA_SQL_FIREWALL_ALLOWED_IP_ADDR`
 - `DBA_SQL_FIREWALL_ALLOWED_OS_PROG`
 - `DBA_SQL_FIREWALL_ALLOWED_OS_USER`
- Before you can add any contexts for the user, the user's allow-list must be created (using the `DBMS_SQL_FIREWALL.GENERATE_ALLOW_LIST` procedure).
- This procedure can be run when the allow-list is enabled or disabled, and it takes effects immediately.

Example

```
BEGIN
  DBMS_SQL_FIREWALL.ADD_ALLOWED_CONTEXT (
    username      => 'PFITCH',
```

```

    context_type => DBMS_SQL_FIREWALL.OS_PROGRAM,
    value        => 'SQL Developer'
);
END;
/

```

177.4.2 APPEND_ALLOW_LIST Procedure

This procedure appends additional contents to an existing allow-list by using the existing capture logs or violation logs of the user, or both.

Syntax

```

DBMS_SQL_FIREWALL.APPEND_ALLOW_LIST (
    username      IN VARCHAR2,
    source        IN NUMBER);

```

Parameters

Table 177-4 APPEND_ALLOW_LIST Procedure Parameters

Parameter	Description
username	Specifies the name of the user who was designated for the SQL Firewall allow-list. To find this user, query DBA_SQL_FIREWALL_ALLOW_LISTS.
source	Specifies one of the following log types: <ul style="list-style-type: none"> DBMS_SQL_FIREWALL.CAPTURE_LOG DBMS_SQL_FIREWALL.VIOLATION_LOG DBMS_SQL_FIREWALL.ALL_LOGS

Usage Notes

- DBMS_SQL_FIREWALL.APPEND_ALLOW_LIST processes the specified source logs and identifies contents to be appended to the allow-list. Then it populates the SQL Firewall metadata tables for the allowed SQL and allowed contexts, which will be used during the allow-list enforcement.
- You can run this procedure when the allow-list is either enabled or disabled.
- The change takes effect immediately.
- A new allow-list version number will be associated with all the allowed SQL entries added by the same DBMS_SQL_FIREWALL.APPEND_ALLOW_LIST execution. This new version number will be 1 plus the current maximum allow-list version of the specified user.

Example

```

BEGIN
    DBMS_SQL_FIREWALL.APPEND_ALLOW_LIST (
        username      => 'PFITCH',
        source        => DBMS_SQL_FIREWALL.CAPTURE_LOG
    );
END;
/

```

177.4.3 APPEND_ALLOW_LIST_SINGLE_SQL Procedure

This procedure appends a single SQL record to the violation log or capture log to an existing allow-list.

This procedure is useful for when you want to individually append SQL commands from the violations log or the capture log to an existing allow-list.

Syntax

```
DBMS_SQL_FIREWALL.APPEND_ALLOW_LIST_SINGLE_SQL (
  username      IN  VARCHAR2,
  sql_signature IN  VARCHAR2,
  current_user  IN  VARCHAR2,
  top_level     IN  VARCHAR2,
  source        IN  NUMBER DEFAULT);
```

Parameters

Table 177-5 APPEND_ALLOW_LIST_SINGLE_SQL Procedure Parameters

Parameter	Description
username	Specifies the name of the user who was designated for the SQL Firewall allow-list. To find this user, query <code>DBA_SQL_FIREWALL_ALLOW_LISTS</code> .
sql_signature	Specifies the signature of the SQL to be added. To find the signature of the SQL for the target record, query the <code>DBA_SQL_FIREWALL_CAPTURE</code> or <code>DBA_SQL_FIREWALL_VIOLATIONS</code> dynamic view.
current_user	Specifies the name of the user who the SQL command was executed as. For example, if user <code>pfitch</code> invokes a definer's rights procedure created in the <code>psmith</code> schema, then all the SQL commands in the procedure are executed as <code>psmith</code> , the <code>current_user</code> . If the procedure is an invoker's rights procedure, then the <code>current_user</code> is the invoker, <code>pfitch</code> .
top_level	Specifies whether the SQL that was executed was top level. Possible values are as follows: <ul style="list-style-type: none"> Y (for Yes) means that the target SQL record is top-level (that is, the statement that the user directly runs). N (for No) means that the target SQL record is not top-level (that is, the SQL command that is issued from PL/SQL units).
source	Specifies the source log to add the SQL record from: <ul style="list-style-type: none"> <code>DBMS_SQL_FIREWALL.CAPTURE_LOG</code> <code>DBMS_SQL_FIREWALL.VIOLATION_LOG</code> (default)

Usage Notes

- `DBMS_SQL_FIREWALL.APPEND_ALLOW_LIST_SINGLE_SQL` processes the specified source log and identifies the target SQL record to be appended to the allow-list. Then it populates the SQL Firewall metadata tables for the allowed SQL, which will be used during the allow-list enforcement.
- You can run this procedure when the allow-list is either enabled or disabled.
- The change takes effect immediately.

- A new allow-list version number will be associated with the newly added allowed SQL entry.

Example

1. Query the `DBA_SQL_FIREWALL_VIOLATIONS` or the `DBA_SQL_FIREWALL_CAPTURE_LOGS` data dictionary view to find the target SQL record that you want to add to the allow-list. Obtain the values for the `USERNAME`, `SQL_SIGNATURE`, `CURRENT_USER`, and `TOP_LEVEL` columns for the target SQL record.
2. Enter these values in the `DBMS_SQL_FIREWALL.APPEND_ALLOW_LIST_SINGLE_SQL` SQL procedure to add the target SQL record to the allow-list. For example:

```
BEGIN
  DBMS_SQL_FIREWALL.APPEND_ALLOW_LIST_SINGLE_SQL (
    username      => 'PFITCH',
    sql_signature =>
'7D33A84D0A1B56E382B9A92D01BCD19933969CB16E2AB4934A2258563F5ADB44',
    current_user  => 'PSMITH',
    top_level     => 'N',
    source        => DBMS_SQL_FIREWALL.CAPTURE_LOG
  );
END;
/
```

177.4.4 CREATE_CAPTURE Procedure

This procedure creates a SQL Firewall capture for a specified user at a given level.

Syntax

```
DBMS_SQL_FIREWALL.CREATE_CAPTURE (
  username      IN VARCHAR2,
  top_level_only IN BOOLEAN,
  start_capture IN BOOLEAN);
```

Parameters

Table 177-6 CREATE_CAPTURE Procedure Parameters

Parameter	Description
<code>username</code>	Specifies the name of the user whose SQL Firewall capture is to be created. To find existing users, query <code>DBA_SQL_FIREWALL_CAPTURES</code> .
<code>top_level_only</code>	<ul style="list-style-type: none"> • <code>TRUE</code> captures only SQL statements that have been directly issued by the user • <code>FALSE</code> captures both top-level SQL statements and SQL statements that have been issued by PL/SQL units. This setting is the default.

Table 177-6 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
start_capture	<ul style="list-style-type: none"> TRUE starts the capture process right away, after you run DBMS_SQL_FIREWALL.CREATE_CAPTURE. This setting is the default. FALSE does not start the capture process. You can start it later on by using DBMS_SQL_FIREWALL.START_CAPTURE.

Usage Notes

To find the status of existing SQL Firewall captures, including users who have already been configured for SQL Firewall captures, query the DBA_SQL_FIREWALL_CAPTURES data dictionary view.

Example

```
BEGIN
  DBMS_SQL_FIREWALL.CREATE_CAPTURE (
    username      => 'C##HR_ADMIN',
    top_level_only => TRUE,
    start_capture => TRUE
  );
END;
/
```

177.4.5 DELETE_ALLOWED_CONTEXT Procedure

This procedure deletes a context from the list of allowed contexts for a user's SQL Firewall allow-list.

Syntax

```
DBMS_SQL_FIREWALL.DELETE_ALLOWED_CONTEXT (
  username      IN VARCHAR2,
  context_type  IN NUMBER,
  value         IN VARCHAR2);
```

Parameters

Table 177-7 DELETE_ALLOWED_CONTEXT Procedure Parameters

Parameter	Description
username	Specifies the name of the user who was designated for the SQL Firewall allow-list. To find this user, query DBA_SQL_FIREWALL_ALLOW_LISTS.
context_type	<ul style="list-style-type: none"> DBMS_SQL_FIREWALL.IP_ADDRESS accepts IPv4 and IPv6 addresses and subnets in the CIDR notation. DBMS_SQL_FIREWALL.OS_USERNAME accepts any valid operating system user name, such as oracle. DBMS_SQL_FIREWALL.OS_PROGRAM accepts any valid operating system program name, such as sqlplus or SQL Developer.

Table 177-7 (Cont.) DELETE_ALLOWED_CONTEXT Procedure Parameters

Parameter	Description
value	Specifies the value of the <code>context_type</code> constant, such as an IP address for <code>DBMS_SQL_FIREWALL.IP_ADDRESS</code> . If you omit this value or specify <code>NULL</code> , then all the allowed context values of the specified context type are deleted. This setting is the default.

Usage Notes

- You can find the user's current context type settings by querying the following data dictionary views:
 - `DBA_SQL_FIREWALL_ALLOWED_IP_ADDR`
 - `DBA_SQL_FIREWALL_ALLOWED_OS_PROG`
 - `DBA_SQL_FIREWALL_ALLOWED_OS_USER`
- This procedure can be run when the allow-list is enabled or disabled, and it takes effects immediately.

Example

```
BEGIN
  DBMS_SQL_FIREWALL.DELETE_ALLOWED_CONTEXT, (
    username      => 'PFITCH',
    context_type  => DBMS_SQL_FIREWALL.OS_PROGRAM,
    value         => 'SQL Developer'
  );
END;
/
```

177.4.6 DELETE_ALLOWED_SQL Procedure

This procedure deletes a specified entry from the list of allowed SQL for a user's SQL Firewall allow-list

Syntax

```
DBMS_SQL_FIREWALL.DELETE_ALLOWED_SQL (
  username      IN  VARCHAR2,
  allowed_sql_id IN  NUMBER);
```

Parameters

Table 177-8 DELETE_ALLOWED_SQL Procedure Parameters

Parameter	Description
username	Specifies the name of the user who was designated for the SQL Firewall allow-list. To find this user, query <code>DBA_SQL_FIREWALL_ALLOW_LISTS</code> .

Table 177-8 (Cont.) DELETE_ALLOWED_SQL Procedure Parameters

Parameter	Description
allowed_sql_id	Specifies the ID of the allowed SQL entry to be deleted from the allowed SQL of this user. To find this value, query DBA_SQL_FIREWALL_ALLOWED_SQL.

Usage Notes

- You can run this procedure when the allow-list is either enabled or disabled.
- The change takes effect immediately.

Example

```
BEGIN
  DBMS_SQL_FIREWALL.DELETE_ALLOWED_SQL (
    username      => 'PFITCH',
    allowed_sql_id => 1
  );
END;
/
```

177.4.7 DISABLE Procedure

This procedure disables SQL Firewall and stops all the existing captures and allow-lists that are enabled.

Syntax

```
DBMS_SQL_FIREWALL.DISABLE;
```

Parameters

None

Usage Notes

You can find the current status of SQL Firewall by querying the DBA_SQL_FIREWALL_STATUS data dictionary view.

Example

```
EXEC DBMS_SQL_FIREWALL.DISABLE;
```

177.4.8 DISABLE_ALLOW_LIST Procedure

This procedure immediately disables SQL Firewall allow-list enforcement for a given user.

Syntax

```
DBMS_SQL_FIREWALL.DISABLE_ALLOW_LIST (
  username      IN VARCHAR2);
```

Parameters

Table 177-9 DISABLE_ALLOW_LIST Procedure Parameters

Parameter	Description
username	Specifies the name of the user who was designated for the SQL Firewall allow-list. To find this user, query DBA_SQL_FIREWALL_ALLOW_LISTS. If you specify NULL, then all allow-lists that are currently enabled will be disabled.

Usage Notes

To find the status of users' allow-lists, query the DBA_SQL_FIREWALL_ALLOW_LISTS data dictionary view.

Example

```
EXEC DBMS_SQL_FIREWALL.DISABLE_ALLOW_LIST ('PFITCH');
```

177.4.9 DROP_ALLOW_LIST Procedure

This procedure deletes the SQL Firewall allow-list of a specified user.

Syntax

```
DBMS_SQL_FIREWALL.DROP_ALLOW_LIST (
    username          IN  VARCHAR2);
```

Parameters

Table 177-10 DROP_ALLOW_LIST Procedure Parameters

Parameter	Description
username	Specifies the name of the user who was designated for the SQL Firewall allow-list. To find this user, query DBA_SQL_FIREWALL_ALLOW_LISTS.

Usage Notes

- To find the status of users' allow-lists, query the DBA_SQL_FIREWALL_ALLOW_LISTS data dictionary view.
- You cannot drop an allow-list that is currently enabled. To disable an allow-list, run the DBMS_SQL_FIREWALL.DISABLE_ALLOW_LIST procedure.

Example

```
EXEC DBMS_SQL_FIREWALL.DROP_ALLOW_LIST ('PFITCH');
```

177.4.10 DROP_CAPTURE Procedure

This procedure drops a SQL Firewall capture and deletes all the associated capture logs.

Syntax

```
DBMS_SQL_FIREWALL.DROP_CAPTURE (
    username          IN VARCHAR2);
```

Parameters

Table 177-11 DROP_CAPTURE procedure Parameters

Parameter	Description
username	Specifies the name of the user whose SQL Firewall capture is to be dropped. To find this user, query <code>DBA_SQL_FIREWALL_CAPTURES</code> .

Usage Notes

- To find the status of existing SQL Firewall captures, query the `DBA_SQL_FIREWALL_CAPTURES` data dictionary view.
- You cannot drop a capture that is currently running. To stop the capture, run the `DBMS_SQL_FIREWALL.STOP_CAPTURE` procedure.
- Dropping a capture for a user does not affect the user's allow-list, which can continue to run even if the capture has been dropped. Captures and allow-lists are separate entities.

Example

```
EXEC DBMS_SQL_FIREWALL.DROP_CAPTURE ('C##HR_ADMIN');
```

177.4.11 ENABLE Procedure

This procedure enables SQL Firewall and starts all existing captures and allow-lists that are configured to be enabled.

Syntax

```
DBMS_SQL_FIREWALL.ENABLE;
```

Parameters

None

Usage Notes

You can find the current status of SQL Firewall by querying the `DBA_SQL_FIREWALL_STATUS` data dictionary view.

Example

```
EXEC DBMS_SQL_FIREWALL.ENABLE;
```

177.4.12 ENABLE_ALLOW_LIST Procedure

This procedure immediately enables SQL Firewall allow-list enforcement for a given user.

Syntax

```
DBMS_SQL_FIREWALL.ENABLE_ALLOW_LIST (
  username      IN VARCHAR2,
  enforce       IN NUMBER,
  block         IN BOOLEAN;
```

Parameters

Table 177-12 ENABLE_ALLOW_LIST Procedure Parameters

Parameter	Description
username	Specifies the name of the user whose SQL Firewall allow-list is to be enabled. To find this user, query <code>DBA_SQL_FIREWALL_ALLOW_LISTS</code> . If you enter <code>NULL</code> , then the allow-lists for all users who do not yet have allow-lists enabled are enabled.
enforce	<ul style="list-style-type: none"> <code>DBMS_SQL_FIREWALL.ENFORCE_CONTEXT</code> enforces the allowed contexts that have been configured. <code>DBMS_SQL_FIREWALL.ENFORCE_SQL</code> enforces the allowed SQL that has been configured. <code>DBMS_SQL_FIREWALL.ENFORCE_ALL</code> enforces both allowed contexts and allowed SQL. This setting is the default.
block	<ul style="list-style-type: none"> <code>TRUE</code> blocks user's database connection or the user's SQL execution whenever the user violates the allow-list definition. <code>FALSE</code> allows unmatched user database connections or SQL commands to proceed. This setting is the default.

Usage Notes

- To find the status of users' allow-lists, query the `DBA_SQL_FIREWALL_ALLOW_LISTS` data dictionary view.
- SQL Firewall always generates a violation log for any unmatched database connection or SQL statement regardless of the `block` option setting.

Example

```
BEGIN
  DBMS_SQL_FIREWALL.ENABLE_ALLOW_LIST (
    username      => 'PFITCH',
    enforce       => DBMS_SQL_FIREWALL.ENFORCE_SQL,
    block         => TRUE
  );
END;
```

177.4.13 EXCLUDE Procedure

This procedure prevents SQL Firewall from capturing or enforcing allow-lists for database connections and SQL executions during Oracle Scheduler operations.

Oracle Scheduler jobs are often used in databases for various maintenance purposes. Accidentally interrupting critical jobs can cause undesirable consequences. You can configure SQL Firewall to not capture any SQL statements nor enforce any allow-lists that are run during an Oracle Scheduler job session. This procedure applies to all users that have been configured for SQL Firewall captures and allow-lists. By default, Oracle Scheduler jobs are excluded from SQL Firewall operations.

Syntax

```
DBMS_SQL_FIREWALL.EXCLUDE (  
    FEATURE          IN NUMBER);
```

Parameters

Table 177-13 EXCLUDE Procedure Parameters

Parameter	Description
FEATURE	Enter DBMS_SQL_FIREWALL.SCHEDULER_JOB for this value.

Usage Notes

- To find the status of whether SQL Firewall is enforced during Oracle Scheduler operations, query the EXCLUDE_JOBS column of the DBA_SQL_FIREWALL_STATUS data dictionary view. If the output is Y, then Oracle Scheduler jobs are excluded from SQL Firewall operations.
- To enable Oracle Firewall to run during Oracle Scheduler operations, run the DBMS_SQL_FIREWALL.INCLUDE procedure.

Example

```
EXEC DBMS_SQL_FIREWALL.EXCLUDE (DBMS_SQL_FIREWALL.SCHEDULER_JOB);
```

177.4.14 EXPORT_ALLOW_LIST Procedure

This procedure exports the allow-list of the given user in JSON format, into the CLOB provided from the allow_list argument.

Syntax

```
DBMS_SQL_FIREWALL.EXPORT_ALLOW_LIST (  
    username      IN      VARCHAR2,  
    allow_list    IN/OUT CLOB;
```

Parameters

Table 177-14 EXPORT_ALLOW_LIST Procedure Parameters

Parameter	Description
username	Specifies the user that the allow-list was created for. To find which user has an allow-list, query <code>DBA_SQL_FIREWALL_ALLOW_LISTS</code> .
allow_list	Specifies the CLOB (which must already exist) into which the exported allow-list must go

Usage Notes

- Before you run this procedure, you must create the CLOB and then pass it to the API (for example, by `DBMS_LOB.CREATETEMPORARY` for the PL/SQL client, or by `OracleConnection.createClob()` for JDBC Java client).
- The export operation includes the allow-list's settings (`status`, `enforce`, `block`, `top_level_only`, `generated_on`, and `status_updated_on` timestamp), **allowed SQL**, and allowed contexts. In addition, the export operation includes all the referenced SQL logs (by the allowed SQL).
- `DBMS_SQL_FIREWALL.EXPORT_ALLOW_LIST` does not export capture logs or violation logs.
- To find the status of users' allow-lists, query the `DBA_SQL_FIREWALL_ALLOW_LISTS` data dictionary view.
- If you want to export all the SQL Firewall metadata, which includes captures and allow-lists for all users, then instead of using `DBMS_SQL_FIREWALL.EXPORT_ALLOW_LIST`, use the `include=SQL_FIREWALL` clause in the Oracle Data Pump `expdp` command. See *Oracle Database Security Guide*.

Example

```

BEGIN
  DBMS_SQL_FIREWALL.EXPORT_ALLOW_LIST (
    username      => 'PFITCH',
    allow_list    => ALLOW_LIST_CLOB;
  );
END;
/

```

177.4.15 FLUSH_LOGS Procedure

This procedure flushes all the SQL Firewall logs that reside in the memory into the log tables.

Syntax

```
DBMS_SQL_FIREWALL.FLUSH_LOGS;
```

Parameters

None

Usage Notes

- Usually you do not need to invoke this procedure explicitly, because logs in the memory are flushed to the log tables frequently in the background. But in case if you want to see the capture logs or violation logs immediately after the action during when SQL Firewall is running, you can run this procedure before looking at the logs.
- The `DBMS_SQL_FIREWALL.FLUSH_LOGS` procedure is equivalent to the `DBMS_MEMOPTIMIZE_ADMIN.WRITES_FLUSH` procedure. (See [WRITES_FLUSH Procedure.](#))

Example

```
EXEC DBMS_SQL_FIREWALL.FLUSH_LOGS;
```

177.4.16 GENERATE_ALLOW_LIST Procedure

This procedure generates a SQL Firewall allow-list for the specified user by using the existing capture logs of the user.

Syntax

```
DBMS_SQL_FIREWALL.GENERATE_ALLOW_LIST (
    username          IN VARCHAR2;
```

Parameters

Table 177-15 GENERATE_ALLOW_LIST Procedure Parameters

Parameter	Description
username	Specifies the name of the user who was designated for the SQL Firewall allow-list. To find this user, query <code>DBA_SQL_FIREWALL_CAPTURES</code> .

Usage Notes

- To find information about existing generated allow-lists, query the `DBA_SQL_FIREWALL_ALLOW_LISTS` data dictionary view.
- Before you run this procedure, the following components must be in place:
 - The specified user must exist.
 - A capture (using `DBMS_SQL_FIREWALL.CREATE_CAPTURE`) has been created for this user. This capture must be disabled (using `DBMS_SQL_FIREWALL.STOP_CAPTURE`) before you can generate an allow-list for the user.
 - No allow-list exists yet for the user.

Example

```
EXEC DBMS_SQL_FIREWALL.GENERATE_ALLOW_LIST ('PFITCH');
```

177.4.17 IMPORT_ALLOW_LIST Procedure

This procedure imports the allow-list from the specified CLOB for the given user, to the target database.

Syntax

```
DBMS_SQL_FIREWALL.IMPORT_ALLOW_LIST (
  username      IN      VARCHAR2,
  allow_list    IN      CLOB;
```

Parameters

Table 177-16 IMPORT_ALLOW_LIST Procedure Parameters

Parameter	Description
username	Specifies the user of the exported allow-list. To check whether this user already had an allow-list created in the target database, query <code>DBA_SQL_FIREWALL_ALLOW_LISTS</code> .
allow_list	Specifies the CLOB that was created when the allow-list was exported with <code>DBMS_SQL_FIREWALL.EXPORT_ALLOW_LIST</code> .

Usage Notes

- If this user does not have an allow-list in the target database, a new allow-list will be created for this user using the allow-list from the JSON payload. The new allow-list will have the same settings (`status`, `top_level_only`, `enforce`, `block`, `generated_on`, `status_updated_on`), same allowed contexts and same allowed SQL as the one in the JSON. If the specified user already has an allow-list in the target database, then all the settings (`status`, `top_level_only`, `enforce`, `block`, and various timestamps) of the existing allow-list will remain untouched, but only the allowed SQL and allowed contexts from the JSON will be merged into the ones for the existing allow-list.
- In addition, the import operation includes all the referenced SQL logs (by the allowed SQL).
- To find the status of users' allow-lists, query the `DBA_SQL_FIREWALL_ALLOW_LISTS` data dictionary view.
- If you want to import all the SQL Firewall metadata, which includes captures and allow-lists, then instead of using `DBMS_SQL_FIREWALL.IMPORT_ALLOW_LIST`, use the `include=SQL_FIREWALL` clause in the Oracle Data Pump `impdp` command. See *Oracle Database Security Guide*.

Example

```
BEGIN
  DBMS_SQL_FIREWALL.IMPORT_ALLOW_LIST (
    username      => 'PFITCH',
    allow_list    => ALLOW_LIST_CLOB;
  );
```

```
END;
/
```

177.4.18 INCLUDE Procedure

This procedure enables SQL Firewall to capture and enforce allow-lists for database connections and SQL executions during Oracle Scheduler operations.

Syntax

```
DBMS_SQL_FIREWALL.INCLUDE (
    FEATURE          IN NUMBER);
```

Parameters

Table 177-17 INCLUDE Procedure Parameters

Parameter	Description
FEATURE	Enter DBMS_SQL_FIREWALL.SCHEDULER_JOB for this value.

Usage Notes

- To find the status of whether SQL Firewall is enforced during Oracle Scheduler operations, query the EXCLUDE_JOBS column of the DBA_SQL_FIREWALL_STATUS data dictionary view. If the output is N, then SQL Firewall can perform during Oracle Scheduler operations.
- To prevent SQL Firewall from running during Oracle Scheduler operations, run the DBMS_SQL_FIREWALL.EXCLUDE procedure.

Example

```
EXEC DBMS_SQL_FIREWALL.INCLUDE (DBMS_SQL_FIREWALL.SCHEDULER_JOB);
```

177.4.19 PURGE_LOG Procedure

This procedure purges SQL Firewall logs that belong to the given user based on the specified purge time (that is, logs that were generated before the specified purge time).

Syntax

```
BEGIN
    DBMS_SQL_FIREWALL.PURGE_LOG (
        username      IN VARCHAR2,
        purge_time    IN TIMESTAMP WITH TIME ZONE,
        log_type      IN NUMBER);
```

Parameters

Table 177-18 PURGE_LOG Procedure Parameters

Parameter	Description
username	Specifies the user whose capture logs or violation logs you want to purge. To see capture logs, query DBA_SQL_FIREWALL_CAPTURE_LOGS; to see violation logs, query DBA_SQL_FIREWALL_VIOLATIONS.
purge_time	The timestamp (in <code>TIMESTAMP</code> format) that you can specify to purge only logs that were generated before a certain time. If you omit this value, then Oracle Database purges all logs, regardless of the time when they were generated.
log_type	Specifies the type of the logs to be purged. <ul style="list-style-type: none"> DBMS_SQL_FIREWALL.CAPTURE_LOG DBMS_SQL_FIREWALL.VIOLATION_LOG DBMS_SQL_FIREWALL.ALL_LOGS (default)

Usage Notes

To find information about SQL Firewall logs, query the `DBA_SQL_FIREWALL_VIOLATIONS` data dictionary view.

Example

```
BEGIN
  DBMS_SQL_FIREWALL.PURGE_LOG (
    username    => 'PSMITH',
    purge_time  => TO_TIMESTAMP_TZ('23-JAN-22 18.44.42 -07:00',
  'DD/MM/YY HH24:MI:SS TZH:TZM'),
    log_type    => DBMS_SQL_FIREWALL.VIOLATION_LOG
  );
END;
/
```

177.4.20 START_CAPTURE Procedure

This procedure immediately starts a SQL Firewall capture for a user.

Syntax

```
DBMS_SQL_FIREWALL.START_CAPTURE (
  username      IN VARCHAR2);
```

Parameters

Table 177-19 START_CAPTURE Procedure Parameters

Parameter	Description
username	Specifies the name of the user to be designated for the SQL Firewall capture.

Usage Notes

- A user can only have one SQL Firewall capture. To find if the user already has been configured for a capture, query the `DBA_SQL_FIREWALL_CAPTURES` data dictionary view.
- After you start the capture process, all SQL the user enters is captured into the SQL Firewall capture log table. You can periodically check the this SQL by querying the `DBA_SQL_FIREWALL_CAPTURE_LOGS` data dictionary view.

Example

```
EXEC DBMS_SQL_FIREWALL.START_CAPTURE ('PFITCH');
```

177.4.21 STOP_CAPTURE Procedure

This procedure immediately stops a SQL Firewall capture for a given user.

Syntax

```
DBMS_SQL_FIREWALL.STOP_CAPTURE (
    username          IN  VARCHAR2);
```

Parameters**Table 177-20 STOP_CAPTURE Procedure Parameters**

Parameter	Description
username	Specifies the name of the user who was designated for the SQL Firewall capture. To find this user, query <code>DBA_SQL_FIREWALL_CAPTURES</code> .

Usage Notes

- The capture process must be currently running before you can run this procedure. You can check its status by querying the `DBA_SQL_FIREWALL_CAPTURES` data dictionary view.
- After you stop the capture process, you can generate an allow-list for the user by running the `DBMS_SQL_FIREWALL.GENERATE_ALLOW_LIST` procedure.

Example

```
EXEC DBMS_SQL_FIREWALL.STOP_CAPTURE ('PFITCH');
```

177.4.22 UPDATE_ALLOW_LIST_ENFORCEMENT Procedure

This procedure immediately updates the SQL Firewall allow-list enforcement options for the given user.

Syntax

```
BEGIN
    DBMS_SQL_FIREWALL.UPDATE_ALLOW_LIST_ENFORCEMENT (
        username          IN  VARCHAR2,
```

```

enforce      IN  NUMBER,
block        IN  BOOLEAN);

```

Parameters

Table 177-21 UPDATE_ALLOW_LIST_ENFORCEMENT Procedure Parameters

Parameter	Description
username	Specifies the name of the user for whom the allow-list was generated. To find this user, query DBA_SQL_FIREWALL_ALLOW_LISTS. If you enter NULL, then the enforcement options of all the existing allow-lists (both enabled or disabled allow-lists) are updated.
enforce	<ul style="list-style-type: none"> DBMS_SQL_FIREWALL.ENFORCE_CONTEXT enforces the allowed contexts that have been configured. DBMS_SQL_FIREWALL.ENFORCE_SQL enforces the allowed SQL that has been configured. DBMS_SQL_FIREWALL.ENFORCE_ALL enforces both allowed contexts and allowed SQL. This setting is the default.
block	<ul style="list-style-type: none"> TRUE blocks user's database connection or the user's SQL execution whenever the user violates the allow-list definition. FALSE allows unmatched user database connections or SQL commands to proceed. This setting is the default.

Usage Notes

To find the status of users' allow-lists, query the DBA_SQL_FIREWALL_ALLOW_LISTS data dictionary view.

Example

```

BEGIN
  DBMS_SQL_FIREWALL.UPDATE_ALLOW_LIST_ENFORCEMENT (
    username      => 'PFITCH',
    enforce       => DBMS_SQL_FIREWALL.ENFORCE_SQL,
    block         => TRUE
  );
END;
/

```

DBMS_SQL_MONITOR

The `DBMS_SQL_MONITOR` package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

This chapter contains the following topics:

- [DBMS_SQL_MONITOR Overview](#)
- [DBMS_SQL_MONITOR Security Model](#)
- [DBMS_SQL_MONITOR Constants](#)
- [Summary of DBMS_SQL_MONITOR Subprograms](#)

See Also:

[DBMS_SQLTUNE](#)

178.1 DBMS_SQL_MONITOR Overview

The `DBMS_SQL_MONITOR` package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

These features provide automatic monitoring of SQL statements, PL/SQL blocks, or composite database operations that are considered high-cost. A simple database operation is a single SQL statement or PL/SQL procedure or function. A composite database operation is activity between two defined points in time in a database session. The monitored data is collected in the `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views.

The following subprograms begin and end monitoring of a composite database operation:

- [BEGIN_OPERATION Function](#)
- [END_OPERATION Procedure](#)

The following subprograms report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`:

- [REPORT_SQL_MONITOR Function](#)
- [REPORT_SQL_MONITOR_XML Function](#)
- [REPORT_SQL_MONITOR_LIST Function](#)
- [REPORT_SQL_MONITOR_LIST_XML Function](#)

178.2 DBMS_SQL_MONITOR Security Model

This package is available to `PUBLIC` and executes with invoker's rights privileges. The reporting functions require privileges to select data from the catalog as provided by the role `SELECT_CATALOG_ROLE`.

178.3 DBMS_SQL_MONITOR Constants

The `DBMS_SQL_MONITOR` package uses the constants shown in the following table.

Table 178-1 DBMS_SQL_MONITOR Constants

Constant	Type	Value	Description
<code>FORCE_TRACKING</code>	<code>VARCHAR2(30)</code>	<code>'Y'</code>	Force track the composite database operation when the operation starts
<code>NO_FORCE_TRACKING</code>	<code>VARCHAR2(30)</code>	<code>'N'</code>	Do not force track the composite database operation when the operation starts. It is only tracked when it has consumed 5 seconds of CPU or I/O time.

178.4 Summary of DBMS_SQL_MONITOR Subprograms

This table lists and describes the `DBMS_SQL_MONITOR` package subprograms.

Table 178-2 DBMS_SQL_MONITOR Package Subprograms

Subprogram	Description
BEGIN_OPERATION Function	This function starts a database operation in the current session.
END_OPERATION Procedure	This function ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect.
REPORT_SQL_MONITOR Function	This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.
REPORT_SQL_MONITOR_XML Function	This function is identical to the <code>REPORT_SQL_MONITOR</code> function, except that the return type is <code>XMLType</code> .
REPORT_SQL_MONITOR_LIST Function	This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.
REPORT_SQL_MONITOR_LIST_XML Function	This function is identical to the <code>REPORT_SQL_MONITOR_LIST</code> function, except that it returns <code>XMLType</code> .

178.4.1 BEGIN_OPERATION Function

This function starts a database operation in the current session.

Syntax

```
DBMS_SQL_MONITOR.BEGIN_OPERATION (
  dbop_name      IN VARCHAR2,
  dbop_eid       IN NUMBER   := NULL,
  forced_tracking IN VARCHAR2 := NO_FORCE_TRACKING,
  attribute_list IN VARCHAR2 := NULL,
  session_id     IN NUMBER   := NULL,
  session_serial IN NUMBER   := NULL)
RETURN NUMBER;
```

Parameters

Table 178-3 *BEGIN_OPERATION Procedure Parameters*

Parameter	Description
dbop_name	Name for the composite database operation.
dbop_eid	Unique identifier for the current execution of the composite database operation.
forced_tracking	Whether tracking is forced. Possible values are: <ul style="list-style-type: none"> FORCE_TRACKING - forces the composite database operation to be tracked when the operation starts. You can also use the string variable Y. NO_FORCE_TRACKING - tracks the operation only when it has consumed at least 5 seconds of CPU or I/O time. You can also use the string variable N. See " DBMS_SQL_MONITOR Constants ".
attribute_list	List of user-created attributes. It is a comma-separated list of name-value pairs (for example, 'table_name=emp, operation=load').
session_id	Session ID of the session to be monitored. If omitted (or null), then the database monitors the current session.
session_serial	Serial number of the session to be monitored. If omitted (or null), then the database uses only the session ID to determine the session.

Return Values

This function returns the database operation execution ID. If the value is null for dbop_eid, then the database generates a unique value.

178.4.2 END_OPERATION Procedure

This procedure ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect.

Syntax

```
DBMS_SQL_MONITOR.END_OPERATION (
    dbop_name      IN VARCHAR2,
    dbop_eid       IN NUMBER);
```

Parameters

Table 178-4 END_OPERATION Procedure Parameters

Parameter	Description
dbop_name	Name of a composite database operation
dbop_eid	Unique identifier for the current execution of the composite database operation

178.4.3 REPORT_SQL_MONITOR Function

This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

For each operation, it gives key information and associated global statistics. Use this function to get detailed monitoring information for a database operation.

The target database operation for this report can be:

- The last database operation monitored by Oracle Database (default, no parameter).
- The last database operation executed in the specified session and monitored by Oracle Database. The session is identified by its session ID and optionally its serial number (-1 is current session).
- The last execution of a specific database operation identified by its `sql_id`.
- A specific execution of a database operation identified by the combination `sql_id`, `sql_exec_start`, and `sql_exec_id`.
- The last execution of a specific database operation identified by `dbop_name`.
- The specific execution of a database operation identified by the combination `dbop_name`, `dbop_exec_id`.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR (
    sql_id          IN VARCHAR2 DEFAULT NULL,
    dbop_name       IN VARCHAR2 DEFAULT NULL,
    dbop_exec_id    IN NUMBER   DEFAULT NULL,
    session_id      IN NUMBER   DEFAULT NULL,
    session_serial  IN NUMBER   DEFAULT NULL,
```

```

sql_exec_start      IN DATE      DEFAULT NULL,
sql_exec_id         IN NUMBER     DEFAULT NULL,
inst_id             IN NUMBER     DEFAULT NULL,
start_time_filter   IN DATE      DEFAULT NULL,
end_time_filter     IN DATE      DEFAULT NULL,
instance_id_filter  IN NUMBER     DEFAULT NULL,
parallel_filter     IN VARCHAR2  DEFAULT NULL,
plan_line_filter    IN NUMBER     DEFAULT NULL,
event_detail        IN VARCHAR2  DEFAULT 'YES',
bucket_max_count    IN NUMBER     DEFAULT 128,
bucket_interval     IN NUMBER     DEFAULT NULL,
base_path           IN VARCHAR2  DEFAULT NULL,
last_refresh_time   IN DATE      DEFAULT NULL,
report_level        IN VARCHAR2  DEFAULT 'TYPICAL',
type                IN VARCHAR2  DEFAULT 'TEXT',
sql_plan_hash_value IN NUMBER     DEFAULT NULL,
con_name            IN VARCHAR2  DEFAULT NULL)
RETURN CLOB;

```

Parameters

Table 178-5 *REPORT_SQL_MONITOR Procedure Parameters*

Parameter	Description
sql_id	SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last simple database operation monitored by Oracle.
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed
dbop_exec_id	Execution ID for the composite database operation for which monitoring information is displayed
session_id	Targets only the subset of statements executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.
session_serial	In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.
sql_exec_start	Time at which execution of the monitored SQL was started. Only applicable when sql_id is specified. Used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.
sql_exec_id	A numeric ID generated internally by SQL monitor to identify different executions of the same SQL statement. Thus each execution will have the same sql_id but a different sql_exec_id. Only applicable when sql_id is specified and is used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.
inst_id	Looks only at queries started on the specified instance. Use -1 to target the current instance. The default, NULL will target all instances.
start_time_filter	If not NULL, the report shows activity from V\$ACTIVE_SESSION_HISTORY started after this date. If NULL, the reported activity starts once the targeted database operation has started.

Table 178-5 (Cont.) REPORT_SQL_MONITOR Procedure Parameters

Parameter	Description
end_time_filter	If not NULL, the report shows activity from V\$ACTIVE_SESSION_HISTORY started before this date. If NULL, the reported activity ends when the targeted database operation has ended or SYSDATE if the operation is still executing.
instance_id_filter	Only looks at activity for the specified instance. Use NULL (the default) to target all instances. Only relevant if the query runs in parallel.
parallel_filter	Parallel filter applies only to parallel execution and allows you to select only a subset of the processes involved in the parallel execution. The string parallel_filter can be: <ul style="list-style-type: none"> • NULL - target all parallel execution servers as wells as the query coordinator • ['qc'] [servers (<svr_grp>[,] <svr_set>[,] <svr_num>)] where any NULL value is interpreted as ALL
plan_line_filter	Selects activity and execution statistics for the specified line number in the plan of a SQL.
event_detail	When set to NO, the activity is aggregated by wait_class only. Use YES (default) to aggregate by wait_class, event_name.
bucket_max_count	Specifies the maximum number of buckets to create in the report
bucket_interval	Represents the exact time interval, in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
base_path	URL path for flex HTML resources since flex HTML format requires access to external files (Java scripts and the flash swf file).
last_refresh_time	If not NULL (default), the time when the report was last retrieved (SYSDATE attribute of the report tag). Use this option when you want to display the report of an running query and when that report is refreshed on a regular basis. This optimizes the size of the report since only the new changed information will be returned. In particular, the following will be optimized: <ul style="list-style-type: none"> • SQL text will not be returned when this option is specified • Activity histogram will start at the bucket that intersects that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket

Table 178-5 (Cont.) REPORT_SQL_MONITOR Procedure Parameters

Parameter	Description
report_level	<p>Level of detail for the report. Of the following, only one can be specified:</p> <ul style="list-style-type: none"> NONE: Minimum possible BASIC: This is equivalent to <code>sql_text-plan-xplan-sessions-instance-activity_histogram-plan_histogram-metrics</code> where the token "-" implies that report section will not be included in the report. TYPICAL: Everything but <code>plan_histogram</code> ALL: Everything <p>In addition, individual report sections can also be enabled or disabled by using a <code>±section_name</code>. Several sections are defined:</p> <ul style="list-style-type: none"> XPLAN: Shows explain plan. ON by default. PLAN: Shows plan monitoring statistics. ON by default. SESSIONS: Show session details. Applies only to parallel queries. ON by default. INSTANCE: Shows instance details. Applies only to parallel and cross instance queries. ON by default. PARALLEL: An umbrella parameter for specifying sessions as well as instance details ACTIVITY: Shows activity summary at global level, plan line level and session INSTANCE LEVEL: (If applicable). ON by default. BINDS: Shows bind information when available. ON by default. METRICS: Shows metric data (such as CPU and IOs) over time. ON by default ACTIVITY_HISTOGRAM: Shows a histogram of the overall query activity. ON by default. PLAN_HISTOGRAM: Shows activity histogram at plan line level. OFF by default. OTHER: Other information. ON by default. <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> -SQL_TEXT: No SQL text in report +SQL_TEXT: Alright with partial SQL text, that is, up to the first 2000 chars as stored in <code>GV\$SQL_MONITOR</code> SQL_FULLTEXT: No full SQL text, that is, <code>+sql_text</code> +SQL_FULLTEXT: Show full SQL text (default)
type	<p>Report type:</p> <ul style="list-style-type: none"> TEXT: text report (default) HTML: simple HTML report ACTIVE: database active report. Some information (explain plan, <code>activity_histogram</code>, <code>metrics</code> and <code>plan_histogram</code>) is only shown when this type is selected XML: raw data for the report
sql_plan_hash_value	Targets only those with the specified plan hash value. Default is NULL.
con_name	Container name in a multitenant database.

Return Values

SQL monitor report, an XML document.

Usage Notes

The user invoking this function must have privilege to access the following fixed views:

- GV\$SQL_MONITOR
- GV\$SQL_PLAN_MONITOR
- GV\$ACTIVE_SESSION_HISTORY
- GV\$SESSION_LONGOPS
- GV\$SQL if SQL full text is requested and its length is greater than 2 KB

178.4.4 REPORT_SQL_MONITOR_XML Function

This function is identical to the `REPORT_SQL_MONITOR` function, except that the return type is `XMLType`.

Related Topics

- [REPORT_SQL_MONITOR Function](#)
This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

178.4.5 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

For each database operation, it gives key information and associated global statistics.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR_LIST (
  sql_id           IN VARCHAR2 DEFAULT NULL,
  dbop_name       IN VARCHAR2 DEFAULT NULL,
  monitor_type    IN NUMBER   DEFAULT MONITOR_TYPE_ALL,
  session_id     IN NUMBER   DEFAULT NULL,
  session_serial  IN NUMBER   DEFAULT NULL,
  inst_id        IN NUMBER   DEFAULT NULL,
  active_since_date IN DATE    DEFAULT NULL,
  active_since_sec IN NUMBER   DEFAULT NULL,
  last_refresh_time IN DATE    DEFAULT NULL,
  report_level    IN VARCHAR2 DEFAULT 'TYPICAL',
  auto_refresh    IN NUMBER   DEFAULT NULL,
  base_path      IN VARCHAR2 DEFAULT NULL,
  type           IN VARCHAR2 DEFAULT 'TEXT',
  con_name       IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 178-6 *REPORT_SQL_MONITOR_LIST Procedure Parameters*

Parameter	Description
sql_id	SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last operation monitored by Oracle Database.
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed.
monitor_type	Monitor type: <ul style="list-style-type: none"> MONITOR_TYPE_SQL returns only simple database operations MONITOR_TYPE_DBOP returns composite database operations MONITOR_TYPE_ALL returns all types
session_id	Targets only the subset of database operations executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.
session_serial	In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.
inst_id	Looks only at monitored database operations originating from the specified instance. Use -1 to target the instance where the report executed. To target all instances, use NULL (default).
active_since_date	If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified start time.
active_since_sec	If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified date and time. In this case, the start time is specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to limit the report to all operations that have been active in the past 1 hour.
last_refresh_time	If not NULL (default), the time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report will show details about the execution of monitored queries that have been active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, and sql_exec_id). Also, for queries that have their first refresh time after the specified date, only the SQL execution key and statistics are returned.
report_level	Level of detail for the report. The level can be BASIC (SQL text up to 200 character), TYPICAL (which include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters), or ALL which is the same as TYPICAL.
auto_refresh	Specifies the duration in seconds after which report data will be automatically refreshed while the monitored SQL or database operation is still executing. This applies to active report types.

Table 178-6 (Cont.) REPORT_SQL_MONITOR_LIST Procedure Parameters

Parameter	Description
base_path	URL path for flex HTML resources since flex HTML format requires access to external files (java scripts and the flash swf file).
type	Report type: <ul style="list-style-type: none"> TEXT: text report (default) HTML: simple HTML report ACTIVE: database active report. Some information (explain plan, activity_histogram, metrics, and plan_histogram) is only shown when this type is selected. XML: raw data for the report
con_name	Container name in a multitenant database.

Return Values

A report in text, XML, or HTML format that contains the list of the database operations monitored.

Usage Notes

- Use the [REPORT_SQL_MONITOR Function](#) to get detailed monitoring information for a single database operation.
- The user invoking this function needs to have the privilege to access the fixed views `GV$SQL_MONITOR` and `GV$SQL`.

178.4.6 REPORT_SQL_MONITOR_LIST_XML Function

This function is identical to the `REPORT_SQL_MONITOR_LIST` function, except that it returns `XMLType`.

Related Topics

- [REPORT_SQL_MONITOR_LIST Function](#)
This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

DBMS_SQL_TRANSLATOR

The `DBMS_SQL_TRANSLATOR` package provides an interface for creating, configuring, and using SQL translation profiles.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS_SQL_TRANSLATOR Subprograms](#)

See Also:

SQL Translation Framework Architecture and Overview in *Oracle Database Migration Guide*

179.1 DBMS_SQL_TRANSLATOR Security Model

`DBMS_SQL_TRANSLATOR` is an invoker's rights package.

When translating a SQL statement or error, the translator package procedure will be invoked with the same current user and current schema as those in which the SQL statement being parsed. The owner of the translator package must be granted the `TRANSLATE SQL` user privilege on the current user.

Additionally, the current user must be granted the `EXECUTE` privilege on the translator package.

179.2 DBMS_SQL_TRANSLATOR Constants

`DBMS_SQL_TRANSLATOR` defines several constants to use when specifying parameter values.

These are shown in the following table.

Table 179-1 DBMS_SQL_TRANSLATOR Constants

Constant	Value	Type	Description
ATTR_EDITIONABLE	'EDITIONABLE'	VARCHAR2 (30)	Name of the SQL translation profile attribute that specifies whether the SQL translation profile becomes an editioned or noneditioned object if editioning is later enabled for the schema object type SQL translation profile in the owner's schema (see Operational Notes)
ATTR_FOREIGN_SQL_SYNTAX	'FOREIGN_SQL_SYNTAX'	VARCHAR2 (30)	Name of the SQL translation profile attribute that indicates if the profile is for translation of foreign SQL syntax (see Operational Notes)
ATTR_LOG_TRANSLATION_ERROR	'TRANSLATION_ERROR'	VARCHAR2 (30)	Name of the SQL translation profile attribute that controls if the profile should log translation error in the database alert log (see Operational Notes)
ATTR_RAISE_TRANSLATION_ERROR	'TRANSLATION_ERROR'	VARCHAR2 (30)	Name of the SQL translation profile attribute that controls if the profile should raise translation error if a SQL statement or error fails to be translated (see Operational Notes)
ATTR_TRANSLATE_NEW_SQL	'TRANSLATE_NEW_SQL'	VARCHAR2 (30)	Name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors (see Operational Notes)
ATTR_TRACE_TRANSLATION	'TRACE_TRANSLATION'	VARCHAR2 (30)	Name of the SQL translation profile attribute that controls tracing (see Operational Notes)
ATTR_TRANSLATOR	'TRANSLATOR'	VARCHAR2 (30)	Name of the SQL translation profile attribute that specifies the translator package (see Operational Notes)
ATTR_VALUE_TRUE	'TRUE'	VARCHAR2 (30)	Value to set a SQL translation profile attribute to true (see Operational Notes)
ATTR_VALUE_FALSE	'FALSE'	VARCHAR2 (30)	Value to set a SQL translation profile attribute to false (see Operational Notes)

179.3 DBMS_SQL_TRANSLATOR Operational Notes

The subprograms that modify a profile have DDL transaction semantics and when invoked will commit any open transaction in the session.

ATTR_EDITIONABLE Constant

Editionable is true by default.

ATTR_FOREIGN_SQL_SYNTAX Constant

Foreign SQL syntax is true by default.

ATTR_LOG_TRANSLATION_ERROR Constant

- If log translation is enabled in a SQL translation profile, an alert log is written to the database alert log if no custom translation is found for a SQL statement or error. This allows the user to catch any error in the custom translation in a profile.
- Log translation error is false by default.

ATTR_RAISE_TRANSLATION_ERROR Constant

Raise translation error is false by default.

ATTR_TRANSLATE_NEW_SQL Constant

- The name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors. If so, the translator package, if registered, will translate a new SQL statement or error not already translated in custom translations, and also register the new translation as custom translation. If not, any new SQL statement or error encountered will result in a translation error
- Translate new SQL statements and errors is true by default.

ATTR_TRACE_TRANSLATION Constant

- If tracing is enabled in a SQL translation profile, any SQL statement or error translated by the profile in a database session and its translation is written to the database session's trace file.
- Tracing is disabled by default.

ATTR_TRANSLATOR Constant

- The translator package must be a PL/SQL package with the following three procedures. The [TRANSLATE_SQL Procedure](#) and the [TRANSLATE_ERROR Procedure](#) are called to translate SQL statements and errors. The names of the parameters of the translate procedures must be followed.

```
PROCEDURE TRANSLATE_SQL(
    sql_text          IN CLOB,
    translated_text   OUT CLOB);
```

```
PROCEDURE TRANSLATE_ERROR(
    error_code        IN BINARY_INTEGER,
    translated_code   OUT BINARY_INTEGER,
    translated_sqlstate OUT VARCHAR2);
```

Parameters:

```
profile_name      - profile name
sql_text          - SQL statement to be translated
translated_text   - translated SQL statement
error_code        - Oracle error code
translated_code   - translated error code
translated_sqlstate - translated SQLSTATE
```

- When NULL is returned in translated_text, translated_code, or translated_sqlstate, it means that no translation is required and the original SQL statement, error code, or SQLSTATE is used instead.
- The name of the translator package follows the naming rules for database packages of the form [schema.]package_name. When the schema and package names are used, they

are set to uppercase by default unless surrounded by double quotation marks. For example, setting a translator package, `translator => 'dbms_tsqL_translator'` is the same as `translator => 'Dbms_Tsql_Translator'` and `translator => 'DBMS_TSQ_L_TRANSLATOR'`, but not the same as `translator => "dbms_tsqL_translator"`. The default schema name is the profile owner.

- The translator attribute is not set by default.

ATTR_VALUE_TRUE Constant

The value to set a SQL translation profile attribute to true.

ATTR_VALUE_FALSE Constant

The value to set a SQL translation profile attribute to false.

179.4 DBMS_SQL_TRANSLATOR Exceptions

This table lists the exceptions raised by the `DBMS_SQL_TRANSLATOR` package.

Table 179-2 Exceptions Raised by DBMS_SQL_TRANSLATOR

Exception	Error Code	Description
BAD_ARGUMENT	29261	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEG E	1031	User has insufficient privilege for the operation
NO_SUCH_PROFILE	24252	Profile does not exist
NO_SUCH_USER	1918	Profile owner does not exist
NO_TRANSLATION_FOUND	24253	No translation of the SQL statement or error code found
PROFILE_EXISTS	955	Profile already exists

179.5 DBMS_SQL_TRANSLATOR Examples

This is an example of basic SQL translation using `DBMS_SQL_TRANSLATOR`.

Basic SQL Translation

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(
    profile_name => 'tsqL_application');
  DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE(
    profile_name => 'tsqL_application',
    attribute_name => DBMS_SQL_TRANSLATOR.ATTR_TRANSLATOR,
    attribute_value => 'migration_repo.sybase_tsqL_translator');
END;
```

179.6 Summary of DBMS_SQL_TRANSLATOR Subprograms

This table lists the DBMS_SQL_TRANSLATOR subprograms and briefly describes them.

Table 179-3 DBMS_SQL_TRANSLATOR Package Subprograms

Subprogram	Description
CREATE_PROFILE Procedure	Creates a SQL translation profile
DEREGISTER_SQL_TRANSLATION Procedure	Deregisters the custom translation of a SQL statement in a SQL translation profile
DEREGISTER_ERROR_TRANSLATION Procedure	Deregisters the translation of an Oracle error code and <code>SQLSTATE</code> in a SQL translation profile
DROP_PROFILE Procedure	Drops a SQL translation profile and its contents
ENABLE_ERROR_TRANSLATION Procedure	Enables or disables a custom translation of an Oracle error code in a SQL translation profile
ENABLE_SQL_TRANSLATION Procedure	Enables or disables a custom translation of a SQL statement in a SQL translation profile
EXPORT_PROFILE Procedure	Exports the content of a SQL translation profile
IMPORT_PROFILE Procedure	Imports the content of a SQL translation profile
REGISTER_ERROR_TRANSLATION Procedure	Registers a custom translation of an Oracle error code and <code>SQLSTATE</code> in a SQL translation profile
REGISTER_SQL_TRANSLATION Procedure	Registers a custom translation of a SQL statement in a SQL translation profile
SET_ATTRIBUTE Procedure	Sets an attribute of a SQL translation profile
SQL_HASH Function	Computes the hash value of a SQL statement in a SQL translation profile
SQL_ID Function	Computes the SQL identifier of a SQL statement in a SQL translation profile
TRANSLATE_ERROR Procedure	Translates an Oracle error code and an ANSI <code>SQLSTATE</code> using a SQL translation profile
TRANSLATE_SQL Procedure	Translates a SQL statement using a SQL translation profile

179.6.1 CREATE_PROFILE Procedure

This procedure creates a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.CREATE_PROFILE (
    profile_name    IN VARCHAR2);
```

Parameters

Table 179-4 CREATE_PROFILE Procedure Parameters

Parameter	Description
profile_name	Name of profile

Exceptions

Table 179-5 CREATE_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
PROFILE_EXISTS	Profile already exists

Usage Notes

- A SQL translation profile is a database schema object that resides in SQL translation profile namespace. Its name follows the naming rules for database objects of the form [schema.]name. When the schema and profile names are used in the DBMS_SQL_TRANSLATOR package, they are uppercased unless surrounded by double quotation marks. For example, the translation profile profile_name => 'tsql_application' is the same as profile_name => 'Tsql_Application' and profile_name => 'TSQL_APPLICATION', but not the same as profile_name => 'tsql_application'.
- A SQL translation profile is an editionable object type.
- A SQL translation profile cannot be created as a common object in a multitenant container database (CDB).
- To destroy a SQL translation profile, use the [DROP_PROFILE Procedure](#).

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(profile_name => 'tsql_application');
END;
```

179.6.2 DEREGISTER_SQL_TRANSLATION Procedure

This procedure deregisters the custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (
  profile_name      IN  VARCHAR2,
  sql_text          IN  CLOB);
```

Parameters

Table 179-6 *DEREGISTER_SQL_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement

Exceptions

Table 179-7 *DEREGISTER_SQL_TRANSLATION Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
PROFILE_EXISTS	Profile already exists

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp');
END;
```

179.6.3 DEREGISTER_ERROR_TRANSLATION Procedure

This procedure deregisters the translation of an Oracle error code and `SQLSTATE` in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION (
  profile_name      IN  VARCHAR2,
  error_code        IN  PLS_INTEGER);
```

Parameters

Table 179-8 *DEREGISTER_ERROR_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
error_code	Oracle error code

Exceptions

Table 179-9 DEREGISTER_ERROR_TRANSLATION Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION(
    profile_name => 'tsql_application',
    error_code   => 1);
END;
```

179.6.4 DROP_PROFILE Procedure

This procedure drops a SQL translation profile and its contents.

Syntax

```
DBMS_SQL_TRANSLATOR.DROP_PROFILE (
  profile_name IN VARCHAR2);
```

Parameters

Table 179-10 DROP_PROFILE Procedure Parameters

Parameter	Description
profile_name	Name of profile

Exceptions

Table 179-11 DROP_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DROP_PROFILE (
```

```

        profile_name => 'tsql_application');
END;
```

179.6.5 ENABLE_ERROR_TRANSLATION Procedure

This procedure enables or disables a custom translation of an Oracle error code in a SQL translation profile.

Syntax

```

DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION (
    profile_name     IN  VARCHAR2,
    sql_text         IN  CLOB,
    enable           IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 179-12 *ENABLE_ERROR_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
enable	Enable or disable the translation

Exceptions

Table 179-13 *ENABLE_ERROR_TRANSLATION Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```

BEGIN
    DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION(
        profile_name => 'tsql_application',
        sql_text     => 'SELECT TOP 5 * FROM emp'
        enable       => TRUE);
END;
```

179.6.6 ENABLE_SQL_TRANSLATION Procedure

This procedure enables or disables a custom translation of a SQL statement in a SQL translation profile.

Syntax

```

DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION (
    profile_name     IN  VARCHAR2,
```

```
sql_text      IN CLOB,
enable        IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 179-14 *ENABLE_SQL_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
enable	Enable or disable the translation

Exceptions

Table 179-15 *ENABLE_SQL_TRANSLATION Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp',
    enable       => TRUE);
END;
```

179.6.7 EXPORT_PROFILE Procedure

This procedure exports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.EXPORT_PROFILE (
  profile_name IN VARCHAR2,
  content      OUT NOCOPY CLOB);
```

Parameters

Table 179-16 *EXPORT_PROFILE Procedure Parameters*

Parameter	Description
profile_name	Name of profile
content	Content of profile

Exceptions

Table 179-17 EXPORT_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Usage Notes

- The content of the SQL translation profile is exported in XML format as follows. Note that the profile name will not be exported.

```
SQLTranslationProfile Translator="translator package name"
                      ForeignSQLSyntax="TRUE|FALSE"
                      TranslateNewSQL="TRUE|FALSE"
                      RaiseTranslationError="TRUE|FALSE"
                      LogTranslationError="TRUE|FALSE"
                      TraceTranslation="TRUE|FALSE"
                      Editionable="TRUE|FALSE">
  <SQLTranslations>
    <SQLTranslation Enabled="TRUE|FALSE">
      <SQLText>original SQL text</SQLText>
      <TranslatedText>translated SQL text</TranslatedText>
    </SQLTranslation>
    ...
  </SQLTranslations>
  <ErrorTranslations>
    <ErrorTranslation Enabled="TRUE|FALSE">
      <ErrorCode>Oracle error code</ErrorCode>
      <TranslatedCode>translated error code</TranslatedCode>
      <TranslatedSQLSTATE>translated SQLSTATE</TranslatedSQLSTATE>
    </ErrorTranslation>
    ...
  </ErrorTranslations>
</SQLTranslationProfile>
```

- To import the content to a SQL translation profile, use the [IMPORT_PROFILE Procedure](#).

Examples

```
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.EXPORT_PROFILE(
    profile_name => 'tsql_application',
    content      => content);
END;
```

179.6.8 IMPORT_PROFILE Procedure

This procedure imports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.IMPORT_PROFILE (
  profile_name      IN   VARCHAR2,
  content           IN   CLOB);
```

Parameters

Table 179-18 *IMPORT_PROFILE Procedure Parameters*

Parameter	Description
profile_name	Name of profile
content	Content of profile

Exceptions

Table 179-19 *IMPORT_PROFILE Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist

Usage Notes

- The content of the SQL translation profile must be in XML format as used by the [EXPORT_PROFILE Procedure](#). All elements and attributes are optional.
- If the profile does not exist, it is created. If it exists, the content overrides any existing attribute, translator package, SQL or error translation registration.
- To export the content to a SQL translation profile, use the [EXPORT_PROFILE Procedure](#).

Examples

```
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.IMPORT_PROFILE(
    profile_name => 'tsql_application',
    content      => content);
END;
```

179.6.9 REGISTER_ERROR_TRANSLATION Procedure

This procedure registers a custom translation of an Oracle error code and `SQLSTATE` in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION (
  profile_name      IN  VARCHAR2,
  error_code       IN  PLS_INTEGER,
  translated_code   IN  PLS_INTEGER DEFAULT NULL,
  translated_sqlstate IN VARCHAR2 DEFAULT NULL,
  enable           IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 179-20 REGISTER_ERROR_TRANSLATION Procedure Parameters

Parameter	Description
<code>profile_name</code>	Name of profile
<code>error_code</code>	Oracle error code
<code>translated_code</code>	Translated error code
<code>translated_sqlstate</code>	Translated <code>SQLSTATE</code>
<code>enable</code>	Enable or disable the translation

Exceptions

Table 179-21 REGISTER_ERROR_TRANSLATION Procedure Exceptions

Exception	Description
<code>BAD_ARGUMENT</code>	Bad argument is passed to the PL/SQL interface
<code>INSUFFICIENT_PRIVILEGE</code>	User has insufficient privilege for the operation
<code>NO_SUCH_USER</code>	Profile owner does not exist
<code>NO_SUCH_PROFILE</code>	Profile does not exist

Usage Notes

- When the Oracle Database translates an Oracle error code using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- The old translation of the error code and `SQLSTATE`, if present, is replaced with the new translation.
- To deregister a translation, use the [DEREGISTER_ERROR_TRANSLATION Procedure](#).

Examples

```
BEGIN
    DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION(
        profile_name => 'tsql_application',
        error_code   => 1,
        translated_code => 2601);
END;
```

179.6.10 REGISTER_SQL_TRANSLATION Procedure

This procedure registers a custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION (
    profile_name     IN VARCHAR2,
    sql_text         IN CLOB,
    translated_text  IN CLOB DEFAULT NULL,
    enable           IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 179-22 REGISTER_SQL_TRANSLATION Procedure Parameters

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
translated_text	Translated SQL statement
enable	Enable or disable the translation

Exceptions

Table 179-23 REGISTER_SQL_TRANSLATION Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Usage Notes

- When the Oracle Database translates a statement using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.

- When `translated_text` is `NULL`, no translation is required and the original statement is used.
- The old translation of the SQL statement, if present, is replaced with the new translation.
- To deregister a translation, use the [DEREGISTER_SQL_TRANSLATION Procedure](#).

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp',
    translated_text => 'SELECT * FROM emp WHERE rownum <= :SYS_N_001');
END;
```

179.6.11 SET_ATTRIBUTE Procedure

This procedure sets an attribute of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE (
  profile_name  IN  VARCHAR2,
  attribute_name IN  VARCHAR2,
  attribute_value IN VARCHAR2;)
```

Parameters

Table 179-24 *SET_ATTRIBUTE Procedure Parameters*

Parameter	Description
<code>profile_name</code>	Name of profile
<code>attribute_name</code>	Name of attribute
<code>attribute_value</code>	Value of attribute

Exceptions

Table 179-25 *SET_ATTRIBUTE Procedure Exceptions*

Exception	Description
<code>BAD_ARGUMENT</code>	Bad argument is passed to the PL/SQL interface
<code>INSUFFICIENT_PRIVILEGE</code>	User has insufficient privilege for the operation
<code>NO_SUCH_USER</code>	Profile owner does not exist
<code>NO_SUCH_PROFILE</code>	Profile does not exist

Usage Notes

See [Constants](#)

179.6.12 SQL_HASH Function

This procedure computes the hash value of a SQL statement in the session's SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SQL_HASH (  
    sql_text          IN CLOB)  
RETURN NUMBER DETERMINISTIC;
```

Parameters

Table 179-26 SQL_HASH Function Parameters

Parameter	Description
sql_text	SQL statement

Return Values

Returns hash value of the SQL statement in the SQL translation profile

Exceptions

Table 179-27 SQL_HASH Function Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface

Examples

```
DECLARE  
    sqltext CLOB;  
    txltext CLOB;  
    sqlhash NUMBER;  
BEGIN  
    sqltext := 'SELECT TOP 1 * FROM emp';  
    sqlhash := DBMS_SQL_TRANSLATOR.SQL_HASH (sqltext);  
    SELECT translated_text INTO txltext  
    FROM user_sql_translations  
    WHERE sql_hash = sqlhash  
    AND DBMS_LOB.COMPARE (sql_text, sqltext) = 0;  
END;
```

179.6.13 SQL_ID Function

This procedure computes the SQL identifier of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SQL_ID (  
    sql_text          IN CLOB)  
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 179-28 SQL_ID Function Parameters

Parameter	Description
sql_text	SQL statement

Return Values

Returns the SQL ID of the SQL statement in the SQL translation profile

Exceptions

Table 179-29 SQL_ID Function Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface

Examples

```

DECLARE
  sqltext CLOB;
  sqlid   VARCHAR2(13);
BEGIN
  sqltext := 'SELECT TOP 1 * FROM emp';
  sqlid   := DBMS_SQL_TRANSLATOR.SQL_ID (sqltext);
END;

```

179.6.14 TRANSLATE_ERROR Procedure

This procedure translates an Oracle error code and an ANSI SQLSTATE using the session's SQL translation profile

Syntax

```

DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR (
  error_code          IN          PLS_INTEGER,
  translated_code     OUT         PLS_INTEGER,
  translated_sqlstate OUT NOCOPY  VARCHAR2);

```

Parameters

Table 179-30 TRANSLATE_ERROR Procedure Parameters

Parameter	Description
error_code	Oracle error code
translated_code	Translated error code
translated_sqlstate	Translated SQLSTATE

Exceptions

Table 179-31 TRANSLATE_ERROR Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist
NO_TRANSLATION_FOUND	No translation of the SQL statement or error code is found

Examples

```

DECLARE
    translated_code      BINARY_INTEGER;
    translated_sqlstate  VARCHAR2(5);
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR(
        error_code       => 1,
        translated_code  => translated_code,
        translated_sqlstate => translated_sqlstate);
END;
```

179.6.15 TRANSLATE_SQL Procedure

This procedure translates a SQL statement using a SQL translation profile.

Syntax

```

DBMS_SQL_TRANSLATOR.TRANSLATE_SQL (
    sql_text          IN          CLOB,
    translated_text   OUT NOCOPY CLOB);
```

Parameters

Table 179-32 TRANSLATE_SQL Procedure Parameters

Parameter	Description
sql_text	SQL statement
translated_text	Translated SQL statement

Exceptions

Table 179-33 TRANSLATE_SQL Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist

Table 179-33 (Cont.) TRANSLATE_SQL Procedure Exceptions

Exception	Description
NO_SUCH_PROFILE	Profile does not exist

Examples

```
ALTER SESSION SET SQL_TRANSLATION_PROFILE = tsql_application;
```

```
DECLARE
    translated_text CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_SQL(
        sql_text      => 'select top 5 * from emp',
        translated_text => translated_text);
END;
```

DBMS_SQLDIAG

The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

This chapter contains the following topics:

- [DBMS_SQLDIAG Overview](#)
- [DBMS_SQLDIAG Security Model](#)
- [DBMS_SQLDIAG Constants](#)
- [Summary of DBMS_SQLDIAG Subprograms](#)

See Also:

Oracle Database Administrator's Guide for more information about "Managing Diagnostic Data"

180.1 DBMS_SQLDIAG Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement by using the DBMS_SQLDIAG package subprograms.

The SQL Repair Advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

See Also:

Oracle Database Administrator's Guide for more information about how to run the SQL Repair Advisor using the DBMS_SQLDIAG package subprograms.

180.2 DBMS_SQLDIAG Security Model

You must have the `ADVISOR` role to execute the DBMS_SQLDIAG package.

180.3 DBMS_SQLDIAG Constants

DBMS_SQLDIAG defines constants to use when specifying parameter values.

These constants are shown in the following tables:

- [Table 180-1](#) describes the name of SQL repair advisor as seen by the advisor framework

- [Table 180-2](#) describes SQLDIAG advisor task scope parameter values
- [Table 180-3](#) describes SQLDIAG advisor `time_limit` constants
- [Table 180-4](#) describes possible formats for a report
- [Table 180-5](#) describes possible levels of detail in the report
- [Table 180-6](#) describes possible report sections (comma delimited)
- [Table 180-7](#) describes possible values for the `problem_type` parameter of the `CREATE_DIAGNOSIS_TASK` Functions
- [Table 180-8](#) describes possible values for the `_sql_findings_mode` parameter

Table 180-1 DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

Constant	Type	Value	Description
ADV_SQL_DIAG_NAME	VARCHAR2 (18)	SQL Repair Advisor	Name of SQL repair advisor as seen by the advisor framework

Table 180-2 DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values

Constant	Type	Value	Description
SCOPE_COMPREHENSIVE	VARCHAR2 (13)	COMPREHENSIVE	Detailed analysis of the problem which may take more time to execute
SCOPE_LIMITED	VARCHAR2 (7)	LIMITED	Brief analysis of the problem

Table 180-3 DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants

Constant	Type	Value	Description
TIME_LIMIT_DEFAULT	NUMBER	1800	Default time limit for analysis of the problem

Table 180-4 DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2 (4)	HTML	Report from the REPORT_DIAGNOSIS_TASK Function in HTML form
TYPE_TEXT	VARCHAR2 (4)	TEXT	Report from the REPORT_DIAGNOSIS_TASK Function in text form

Table 180-4 (Cont.) DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_XML	VARCHAR2 (3)	XML	Report from the REPORT_DIAGNOSIS_TASK Function in XML form

Table 180-5 DBMS_SQLDIAG Constants - Report Level (possible values) Constants

Constant	Type	Value	Description
LEVEL_ALL	VARCHAR2 (3)	ALL	Complete report including annotations about statements skipped over
LEVEL_BASIC	VARCHAR2 (5)	BASIC	Shows information about every statement analyzed, including recommendations not implemented
LEVEL_TYPICAL	VARCHAR2 (7)	TYPICAL	Simple report shows only information about the actions taken by the advisor.

Table 180-6 DBMS_SQLDIAG Constants - Report Section (possible values) Constants

Constant	Type	Value	Description
SECTION_ALL	VARCHAR2 (3)	ALL	All statements
SECTION_ERRORS	VARCHAR2 (6)	ERRORS	Statements with errors
SECTION_FINDINGS	VARCHAR2 (8)	FINDINGS	Tuning findings
SECTION_INFORMATION	VARCHAR2 (11)	INFORMATION	General information
SECTION_PLANS	VARCHAR2 (5)	PLANS	Explain plans
SECTION_SUMMARY	VARCHAR2 (7)	SUMMARY	Summary information

Table 180-7 DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_PERFORMANCE	NUMBER	1	User suspects this is a performance problem
PROBLEM_TYPE_WRONG_RESULTS	NUMBER	2	User suspects the query is giving inconsistent results
PROBLEM_TYPE_COMPILATION_ERROR	NUMBER	3	User sees a crash in compilation

Table 180-7 (Cont.) DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_EXECUTION_ERR OR	NUMBER	4	User sees a crash in execution
PROBLEM_TYPE_ALT_PLAN_GEN	NUMBER	5	User to explore all alternative plans

Table 180-8 DBMS_SQLDIAG Constants - Findings Filter Constants

Constant	Type	Value	Description
SQLDIAG_FINDINGS_ALL	NUMBER	1	Show all possible findings
SQLDIAG_FINDINGS_VALIDAT ION	NUMBER	2	Show status of validation rules over structures
SQLDIAG_FINDINGS_FEATURE S	NUMBER	3	Show only features used by the query
SQLDIAG_FINDINGS_FILTER_ PLANS	NUMBER	4	Show the alternative plans generated by the advisor
SQLDIAG_FINDINGS_CR_DIFF	NUMBER	5	Show difference between two plans
SQLDIAG_FINDINGS_MASK_VA RIANT	NUMBER	6	Mask info for testing
SQLDIAG_FINDINGS_OBJ_FEA TURES	NUMBER	7	Show features usage history
SQLDIAG_FINDINGS_BASIC_I NFO	NUMBER	8	Show the alternative plans generated by the advisor

180.4 Summary of DBMS_SQLDIAG Subprograms

This table lists the DBMS_SQLDIAG subprograms and briefly describes them.

Table 180-9 DBMS_SQLDIAG Package Subprograms

Subprogram	Description
ACCEPT_SQL_PATCH Function & Procedure	Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task
ALTER_SQL_PATCH Procedure	Alters specific attributes of an existing SQL patch object
CANCEL_DIAGNOSIS_TASK Procedure	Cancels a diagnostic task
CREATE_DIAGNOSIS_TASK Functions	Creates a diagnostic task in order to diagnose a single SQL statement

Table 180-9 (Cont.) DBMS_SQLDIAG Package Subprograms

Subprogram	Description
CREATE_SQL_PATCH Function	Creates an SQL patch based on a set of user specified hints for specific statements identified by SQL text.
CREATE_STGTAB_SQLPATCH Procedure	Creates the staging table used for transporting SQL patches from one system to another
DROP_DIAGNOSIS_TASK Procedure	Drops a diagnostic task
DROP_SQL_PATCH Procedure	Drops the named SQL patch from the database
EXECUTE_DIAGNOSIS_TASK Procedure	Executes a diagnostic task
EXPLAIN_SQL_TESTCASE Function	Explains a SQL test case
EXPORT_SQL_TESTCASE Procedures	Exports a SQL test case to a directory
EXPORT_SQL_TESTCASE_DIR_BY_INC Function	Generates a SQL Test Case corresponding to the incident ID passed as an argument.
EXPORT_SQL_TESTCASE_DIR_BY_TXT Function	Generates a SQL Test Case corresponding to the SQL passed as an argument
GET_FIX_CONTROL Function	Returns the value of fix control for a given bug number
GET_SQL Function	Imports a SQL test case
IMPORT_SQL_TESTCASE Procedures	Imports a SQL test case into a schema
INCIDENTID_2_SQL Procedure	Initializes a <code>sql_setrow</code> from an incident ID
INTERRUPT_DIAGNOSIS_TASK Procedure	Interrupts a diagnostic task
LOAD_SQLSET_FROM_TCB Function	Loads a <code>SQLSET</code> from Test Case Builder (TCB) file
PACK_STGTAB_SQLPATCH Procedure	SQL patches into the staging table created by the CREATE_STGTAB_SQLPATCH Procedure
REPLAY_SQL_TESTCASE Function	Reports on a diagnostic task
REPORT_SQL Function	Generates a diagnostic report in HTML format for a specific SQL statement.
REPORT_DIAGNOSIS_TASK Function	Reports on a diagnostic task
RESET_DIAGNOSIS_TASK Procedure	Resets a diagnostic task
RESUME_DIAGNOSIS_TASK Procedure	Resumes a diagnostic task
SET_DIAGNOSIS_TASK_PARAMETER Procedure	Sets a diagnosis task parameter
SQL_DIAGNOSE_AND_REPAIR Function	Diagnoses a given SQL statement for a given SQL ID for the given problem type.

Table 180-9 (Cont.) DBMS_SQLDIAG Package Subprograms

Subprogram	Description
UNPACK_STGTAB_SQLPATCH Procedure	Unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure , using the patch data stored in the staging table to create patches on this system

180.4.1 ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
    task_name      IN  VARCHAR2,
    object_id      IN  NUMBER := NULL,
    name           IN  VARCHAR2 := NULL,
    description    IN  VARCHAR2 := NULL,
    category       IN  VARCHAR2 := NULL,
    task_owner     IN  VARCHAR2 := NULL,
    replace        IN  BOOLEAN := FALSE,
    force_match    IN  BOOLEAN := FALSE)
RETURN VARCHAR2;
```

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
    task_name      IN  VARCHAR2,
    object_id      IN  NUMBER := NULL,
    name           IN  VARCHAR2 := NULL,
    description    IN  VARCHAR2 := NULL,
    category       IN  VARCHAR2 := NULL,
    task_owner     IN  VARCHAR2 := NULL,
    replace        IN  BOOLEAN := FALSE,
    force_match    IN  BOOLEAN := FALSE);
```

Parameters

Table 180-10 ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
taskname	Name of the SQL diagnosis task
object_id	Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task
name	Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.
description	User specified string describing the purpose of this SQL patch. Maximum size of description is 500.

Table 180-10 (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
category	Category name which must match the value of the <code>SQLDIAGNOSE_CATEGORY</code> parameter in a session for the session to use this patch. It defaults to the value <code>DEFAULT</code> . This is also the default of the <code>SQLDIAGNOSE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.
task_owner	Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.
replace	If the patch already exists, it will be replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> .
force_match	If <code>TRUE</code> this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>CURSOR_SHARING</code> parameter. If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>CURSOR_SHARING</code> parameter.

Return Values

Name of the SQL patch

Usage Notes

Requires `CREATE ANY SQL PROFILE` privilege

180.4.2 ALTER_SQL_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (
    name           IN VARCHAR2,
    attribute_name IN VARCHAR2,
    attribute_value IN VARCHAR2);
```

Parameters

Table 180-11 ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
name	Name of SQL patch to alter.

Table 180-11 (Cont.) ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
attribute_name	Name of SQL patch to alter. Possible values: <ul style="list-style-type: none"> STATUS -> can be set to ENABLED or DISABLED NAME -> can be reset to a valid name (must be a valid Oracle identifier and must be unique). DESCRIPTION -> can be set to any string of size no more than 500 CATEGORY -> can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text) This parameter is mandatory and is case sensitive.
attribute_value	New value of the attribute. See attribute_name for valid attribute values. This parameter is mandatory.

Usage Notes

Requires ALTER ANY SQL PATCH privilege

180.4.3 CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 180-12 CANCEL_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

180.4.4 CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name

Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_text          IN  CLOB,
    bind_list         IN  sql_binds := NULL,
    user_name         IN  VARCHAR2 := NULL,
    scope             IN  VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN  NUMBER   := TIME_LIMIT_DEFAULT,
    task_name         IN  VARCHAR2 := NULL,
```

```

description      IN  VARCHAR2  := NULL,
problem_type     IN  NUMBER     := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;

```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```

DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
  sql_id          IN  VARCHAR2,
  plan_hash_value IN  NUMBER   := NULL,
  scope           IN  VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit      IN  NUMBER   := TIME_LIMIT_DEFAULT,
  task_name       IN  VARCHAR2 := NULL,
  description     IN  VARCHAR2 := NULL,
  problem_type    IN  NUMBER   := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;

```

Prepares the diagnosis of a Sqlset:

```

DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
  sqlset_name     IN  VARCHAR2,
  basic_filter    IN  VARCHAR2 := NULL,
  object_filter   IN  VARCHAR2 := NULL,
  rank1           IN  VARCHAR2 := NULL,
  rank2           IN  VARCHAR2 := NULL,
  rank3           IN  VARCHAR2 := NULL,
  result_percentage IN NUMBER := NULL,
  result_limit    IN  NUMBER   := NULL,
  scope           IN  VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit      IN  NUMBER   := TIME_LIMIT_DEFAULT,
  task_name       IN  VARCHAR2 := NULL,
  description     IN  VARCHAR2 := NULL,
  plan_filter     IN  VARCHAR2 := 'MAX_ELAPSED_TIME',
  sqlset_owner    IN  VARCHAR2 := NULL,
  problem_type    IN  NUMBER   := PROBLEM_TYPE_PERFORMANCE) RETURN VARCHAR2;

```

Parameters

Table 180-13 CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	Set of bind values
user_name	Username for who the statement/sqlset will be diagnosed
scope	Diagnosis scope (limited/comprehensive)
time_limit	Maximum duration in seconds for the diagnosis session
task_name	Optional diagnosis task name
description	Maximum of 256 SQL diagnosis session description
problem_type	Determines the goal of the task. Possible values are: <ul style="list-style-type: none"> PROBLEM_TYPE_WRONG_RESULTS PROBLEM_TYPE_COMPILATION_ERROR PROBLEM_TYPE_EXECUTION_ERROR
sql_id	Identifier of the statement
plan_hash_value	Hash value of the SQL execution plan

Table 180-13 (Cont.) CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
sqlset_name	Sqlset name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set (STS)
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from (filtered/ranked) SQL
plan_filter	Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> • LAST_GENERATED: plan with most recent timestamp • FIRST_GENERATED: opposite to LAST_GENERATED • LAST_LOADED: plan with most recent first_load_time stat info • FIRST_LOADED: opposite to LAST_LOADED • MAX_ELAPSED_TIME: plan with maximum elapsed time • MAX_BUFFER_GETS: plan with maximum buffer gets • MAX_DISK_READS: plan with maximum disk reads • MAX_DIRECT_WRITES: plan with maximum direct writes • MAX_OPTIMIZER_COST: plan with maximum optimum cost
sqlset_owner	Owner of the sqlset, or null for current schema owner

180.4.5 CREATE_SQL_PATCH Function

This function creates a SQL patch based on a set of user specified hints for specific statements identified by SQL text.

A SQL patch is usually created automatically by the SQL Repair Advisor to prevent any errors during the compilation or execution of a SQL statement. This function provides a way to manually create a SQL patch based on a set of hints that resolves the error.

Syntax

```
DBMS_SQLDIAG.CREATE_SQL_PATCH (
  sql_text      IN  CLOB,
  hint_text     IN  CLOB,
  name          IN  VARCHAR2  := NULL,
  description   IN  VARCHAR2  := NULL,
  category     IN  VARCHAR2  := NULL,
  validate     IN  BOOLEAN    := TRUE)
RETURN VARCHAR2;
```

```
DBMS_SQLDIAG.CREATE_SQL_PATCH (
  sql_id       IN  VARCHAR2,
  hint_text    IN  CLOB,
  name        IN  VARCHAR2  := NULL,
  description  IN  VARCHAR2  := NULL,
  category    IN  VARCHAR2  := NULL,
```

```

        validate          IN  BOOLEAN    := TRUE)
RETURN VARCHAR2;

```

Parameters

Table 180-14 CREATE_SQL_PATCH Function Parameters

Parameter	Description
sql_text	Text of the SQL statement
sql_id	The SQL identifier for the SQL statement
hint_text	Hints to include in the SQL patch
name	Optional SQL patch name
description	Description of the SQL patch
category	Category name
validate	Whether to validate the provided hints

Return Values

Both functions return the SQL patch name.

180.4.6 CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```

DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (
    table_name          IN  VARCHAR2,
    schema_name         IN  VARCHAR2 := NULL,
    tablespace_name     IN  VARCHAR2 := NULL);

```

Parameters

Table 180-15 CREATE_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
table_name	(Mandatory) Name of the table to create (case-sensitive)
schema_name	Schema to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive)

180.4.7 DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

```
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

Parameters

Table 180-16 DROP_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

180.4.8 DROP_SQL_PATCH Procedure

This procedure drops the named SQL patch from the database.

Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (  
    name          IN  VARCHAR2,  ignore  IN  BOOLEAN := FALSE);
```

Parameters

Table 180-17 DROP_SQL_PATCH Function & Procedure Parameters

Parameter	Description
name	Name of patch to be dropped. The name is case sensitive.
ignore	Ignore errors due to object not existing.

Usage Notes

Requires `DROP ANY SQL PATCH` privilege

180.4.9 EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

Parameters

Table 180-18 EXECUTE_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

180.4.10 EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (
    sqlTestCase      IN  CLOB)
RETURN CLOB;
```

Parameters

Table 180-19 EXPLAIN_SQL_TESTCASE Function Parameters

Parameter	Description
sqlTestCase	XML document describing the SQL test case

180.4.11 EXPORT_SQL_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    sql_text           IN          CLOB,
    user_name          IN          VARCHAR2 := NULL,
    bind_list          IN          sql_binds := NULL,
    exportEnvironment  IN          BOOLEAN := TRUE,
    exportMetadata     IN          BOOLEAN := TRUE,
    exportData         IN          BOOLEAN := FALSE,
    exportPkgbody      IN          BOOLEAN := FALSE,
    samplingPercent    IN          NUMBER := 100,
    ctrlOptions        IN          VARCHAR2 := NULL,
    timeLimit          IN          NUMBER := 0,
    testcase_name     IN          VARCHAR2 := NULL,
    testcase           IN OUT NOCOPY CLOB,
    preserveSchemaMapping IN      BOOLEAN := FALSE,
    version            IN          VARCHAR2 := 'COMPATIBLE');
```

This variant extracts the SQL information from an incident file.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    incident_id        IN          VARCHAR2,
```

```

exportEnvironment      IN          BOOLEAN := TRUE,
exportMetadata        IN          BOOLEAN := TRUE,
exportData            IN          BOOLEAN := FALSE,
exportPkgbody         IN          BOOLEAN := FALSE,
samplingPercent       IN          NUMBER := 100,
ctrlOptions           IN          VARCHAR2 := NULL,
timeLimit             IN          NUMBER :=
                        DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
testcase_name         IN          VARCHAR2 := NULL,
testcase              IN OUT NOCOPY CLOB,
preserveSchemaMapping IN          BOOLEAN := FALSE)
version               IN          VARCHAR2 := 'COMPATIBLE';

```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use V\$SQL to get the SQL identifier and the SQL hash value.

```

DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory            IN          VARCHAR2,
  sql_id               IN          VARCHAR2,
  plan_hash_value      IN          NUMBER := NULL,
  exportEnvironment    IN          BOOLEAN := TRUE,
  exportMetadata       IN          BOOLEAN := TRUE,
  exportData           IN          BOOLEAN := FALSE,
  exportPkgbody        IN          BOOLEAN := FALSE,
  samplingPercent      IN          NUMBER := 100,
  ctrlOptions          IN          VARCHAR2 := NULL,
  timeLimit            IN          NUMBER :=
                        DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
  testcase_name        IN          VARCHAR2 := NULL,
  testcase             IN OUT NOCOPY CLOB,
  preserveSchemaMapping IN          BOOLEAN := FALSE)
  version              IN          VARCHAR2 := 'COMPATIBLE';

```

Parameters

Table 180-20 EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to export
incident_id	Incident ID containing the offending SQL
sql_id	Identifier of the statement in the cursor cache
username	Name of the user schema to use to parse the SQL, defaults to SYS
bind_list	List of bind values associated to the statement
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
exportPkgbody	TRUE if the body of the packages referenced in the SQL are exported

Table 180-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file

Table 180-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> name="capture" - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <p>BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.</p> <p>WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</p> <p>Note this must be the same value as used in the IMPORT_SQL_TESTCASE Procedures.</p> name="mexec_count"—Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name="stat_history_since"—Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported. name="compress"—This option is used to compress the SQL Test Case Builder output files into a zip file. The possible values are: <ul style="list-style-type: none"> YES NO <p>The default value is NO.</p> name="diag_event"—This option is used to specify the level of trace information to include in the SQL Test Case Builder output. The possible values are: <ul style="list-style-type: none"> ADS COMPILER SQLEXEC_LOW SQLEXEC_MEDIUM SQLEXEC_HIGH SQLEXEC_HIGHEST <p>The default value is ADS + COMPILER.</p> name="problem_type"—This option is used to assign an issue type for a SQL Test Case Builder test case. For example, if a test case is related to performance regression issue, then you can assign the value of PERFORMANCE to the problem_type option. The possible values are : <ul style="list-style-type: none"> PERFORMANCE WRONG_RESULTS COMPILATION_ERROR EXECUTION_ERROR <p>The default value is PERFORMANCE.</p>

Table 180-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
timeLimit	How much time should we spend exporting the SQL test case
testcaseName	An optional name for the SQL test case. This is used to prefix all the generated scripts
testcase	Resulting testcase
preserveSchemaMapping	TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment
version	Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted. <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0.

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
 - a dump file containing schemas objects and statistics (.dmp)
 - the explain plan for the statements (in advanced mode)
 - diagnostic information gathered on the offending statement
 - an import script to execute to reload the objects
 - a SQL script to replay system statistics of the source
 - a table of contents file describing the SQL test case
 - metadata. (xxxxmain.xml)
 - a README.txt file that explain the usage of the TCB
 - the outlines used by the statement (ol.xml)
 - a list of parameters set in the exporting db/env (prmpimp.sql)
 - a SQL monitor report, if any (smrpt.html)
 - an AWR report, if any (awrrpt.html)
 - a list of binds used in this statement (bndlst.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA privilege.
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data,

call `EXPORT_SQL_TESTCASE` with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.

- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call `EXPORT_SQL_TESTCASE` with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT_SQL_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.
- To export objects statistics history, the database compatibility should be set to 12.0 or higher.
- This procedure does not export data and statistics on a Global Temporary Table (GTT).

Examples

The user can specify multiple parameters in the `ctrlOptions` encapsulated either by using the `<parameters>` parent tag or without the parent tag.

Using the `<parameters>` tag

```
<parameters>
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>
</parameters>
```

Without the `<parameters>` tag

```
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>
```

The `compress` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
      <parameter name="capture">with_runtime_info</parameter>
      <parameter name="compress">yes</parameter>
      </parameters>';
```

The `diag_event` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
      <parameter name="capture">with_runtime_info</parameter>
      <parameter name="compress">yes</parameter>
      </parameters>';
```

The `problem_type` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
      <parameter name="capture">with_runtime_info</parameter>
      <parameter name="compress">yes</parameter>
      </parameters>';
```

180.4.12 EXPORT_SQL_TESTCASE_DIR_BY_INC Function

This function generates a SQL test case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
    incident_id      IN    NUMBER,
    directory        IN    VARCHAR2,
    exportEnvironment IN  VARCHAR2 := 'TRUE',
    exportMetadata   IN  VARCHAR2 := 'TRUE',
    exportData       IN  VARCHAR2 := 'FALSE',
    samplingPercent  IN  VARCHAR2 := '100',
    ctrlOptions      IN  VARCHAR2 := NULL
    version          IN  VARCHAR2 := 'COMPATIBLE')
RETURN BOOLEAN;
```

Parameters

Table 180-21 EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
incident_id	Incident ID containing the offending SQL. For more information about Incidents, see <i>Oracle Database Performance Tuning Guide</i> .
directory	Directory path to the generated files
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <ul style="list-style-type: none"> BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.

Table 180-21 (Cont.) EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
version	<p>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</p> <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0.

180.4.13 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (
  incident_id      IN   NUMBER,
  directory        IN   VARCHAR2,
  sql_text         IN   CLOB,
  user_name        IN   VARCHAR2 := 'SYS',
  exportEnvironment IN VARCHAR2 := 'TRUE',
  exportMetadata   IN   VARCHAR2 := 'TRUE',
  exportData       IN   VARCHAR2 := 'FALSE',
  samplingPercent  IN   VARCHAR2 := '100',
  ctrlOptions      IN   VARCHAR2 := NULL,
  version          IN   VARCHAR2 := 'COMPATIBLE')
RETURN BOOLEAN;
```

Parameters

Table 180-22 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters

Parameter	Description
incident_id	Incident ID containing the offending SQL
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to explain
username	Name of the user schema to use to parse the SQL, defaults to SYS
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported

Table 180-22 (Cont.) EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters

Parameter	Description
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <ul style="list-style-type: none"> BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.
version	<p>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</p> <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database Release 10.0.0.

180.4.14 GET_FIX_CONTROL Function

This function returns the value of fix control for a given bug number.

Syntax

```
DBMS_SQLDIAG.GET_FIX_CONTROL (
    bug_number IN NUMBER)
RETURN NUMBER;
```

Parameters**Table 180-23 GET_FIX_CONTROL Function Parameters**

Parameter	Description
bug_number	Bug number

180.4.15 GET_SQL Function

This function loads a `sql_setrow` from the trace file associated to an the given incident ID.

Syntax

```
DBMS_SQLDIAG.GET_SQL (
    incident_id IN    VARCHAR2)
    RETURN SQLSET_ROW;
```

Parameters**Table 180-24 GET_SQL Function Parameters**

Parameter	Description
incident_id	Identifier of the incident

180.4.16 IMPORT_SQL_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
    directory          IN    VARCHAR2,
    sqlTestCase        IN    CLOB,
    importEnvironment  IN    BOOLEAN    := TRUE,
    importMetadata     IN    BOOLEAN    := TRUE,
    importData         IN    BOOLEAN    := TRUE,
    importPkgbody      IN    BOOLEAN    := FALSE,
    importDiagnosis    IN    BOOLEAN    := TRUE,
    ignoreStorage      IN    BOOLEAN    := TRUE,
    ctrlOptions        IN    VARCHAR2   := NULL,
    preserveSchemaMapping IN    BOOLEAN    := FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
    directory          IN    VARCHAR2,
    filename           IN    VARCHAR2,
    importEnvironment  IN    BOOLEAN    := TRUE,
    importMetadata     IN    BOOLEAN    := TRUE,
    importData         IN    BOOLEAN    := TRUE,
```

```
importPkgbody          IN  BOOLEAN  := FALSE,
importDiagnosis        IN  BOOLEAN  := TRUE,
ignoreStorage          IN  BOOLEAN  := TRUE,
ctrlOptions            IN  VARCHAR2  := NULL,
preserveSchemaMapping  IN  BOOLEAN  := FALSE);
```

Parameters

Table 180-25 IMPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
directory	Directory containing test case files
filename	Name of a file containing an XML document describing the SQL test case
importEnvironment	TRUE if the compilation environment should be imported
importMetadata	TRUE if the definition of the objects referenced in the SQL should be imported
importData	TRUE if the data of the objects referenced in the SQL should be imported
importPkgbody	TRUE if the body of the packages referenced in the SQL are imported
importDiagnosis	TRUE if the diagnostic information associated to the task should be imported
ignoreStorage	TRUE if the storage attributes should be ignored
ctrlOptions	Opaque control parameters, of which only <code>capture</code> is valid for this subprogram. <ul style="list-style-type: none"> <code>capture - BASIC (default) or WITH_RUNTIME_INFO</code>. This parameter defines the mode of TCB capture. BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.
preserveSchemaMapping	TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment (schema mapping in the target database will be identical to the source database). Note that when an import is run with <code>preservesSchemaMapping</code> set to <code>TRUE</code> , if the objects in the schemas exists then the import will overwrite the existing objects.

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
 - a dump file containing schemas objects and statistics (`.dmp`)
 - the explain plan for the statements (in advanced mode)
 - diagnostic information gathered on the offending statement
 - an import script to execute to reload the objects
 - a SQL script to replay system statistics of the source

- a table of contents file describing the SQL test case
 - metadata. (xxxxxmain.xml)
 - a README.txt file that explain the usage of the TCB
 - the outlines used by the statement (ol.xml)
 - a list of parameters set in the exporting db/env (prmimp.sql)
 - a SQL monitor report, if any (smrpt.html)
 - an AWR report, if any (awrrpt.html)
 - a list of binds used in this statement (bndlst.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA privilege
 - The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call [EXPORT_SQL_TESTCASE Procedures](#) with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.
 - TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call [EXPORT_SQL_TESTCASE Procedures](#) with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT_SQL_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.
 - The `capture` value used when invoking the [EXPORT_SQL_TESTCASE Procedures](#) must be used when calling this procedure.

180.4.17 INCIDENTID_2_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

Syntax

```
DBMS_SQLDIAG.INCIDENTID_2_SQL (
    incident_id    IN    VARCHAR2,
    sql_stmt      OUT   SQLSET_ROW,
    problem_type  OUT   NUMBER,
    err_code      OUT   BINARY_INTEGER,
    err_mesg      OUT   VARCHAR2);
```

Parameters

Table 180-26 INCIDENTID_2_SQL Procedure Parameters

Parameter	Description
<code>incident_id</code>	Identifier of the incident
<code>sql_stmt</code>	Resulting SQL

Table 180-26 (Cont.) INCIDENTID_2_SQL Procedure Parameters

Parameter	Description
problem_type	Tentative type of SQL problem (currently among PROBLEM_TYPE_COMPILATION_ERROR and PROBLEM_TYPE_EXECUTION_ERROR)
err_code	Error code if any otherwise it is set to NULL
err_msg	Error message if any otherwise it is set to NULL

180.4.18 INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

Syntax

```
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (
    taskname          IN    VARCHAR2);
```

Parameters

Table 180-27 INTERRUPT_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

180.4.19 LOAD_SQLSET_FROM_TCB Function

This function loads a `SQLSET` from a Test Case Builder file.

Syntax

```
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB (
    directory          IN    VARCHAR2,
    filename           IN    VARCHAR2,
    sqlset_name        IN    VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 180-28 LOAD_SQLSET_FROM_TCB Function Parameters

Parameter	Description
directory	Name of directory
filename	Name of file
sqlset_name	Name of <code>SQLSET</code>

180.4.20 PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.

Syntax

```
DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH (
    patch_name          IN  VARCHAR2 := '%',
    patch_category      IN  VARCHAR2 := 'DEFAULT',
    staging_table_name  IN  VARCHAR2,
    staging_schema_owner IN  VARCHAR2 := NULL);
```

Parameters

Table 180-29 PACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
patch_name	Name of patch to pack (% wildcards acceptable, case-sensitive)
patch_category	Category to which to pack patches (% wildcards acceptable, case-insensitive)
staging_table_name	(Mandatory) Name of the table to use (case-sensitive)
staging_schema_owner	Schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- **Requires:** ADMINISTER SQL PLAN MANAGEMENT OBJECT privilege and INSERT privilege on the staging table
- By default, we move all SQL patches in category DEFAULT. Note that the subprogram issues a COMMIT after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

Related Topics

- [CREATE_STGTAB_SQLPATCH Procedure](#)
This procedure creates the staging table used for transporting SQL patches from one system to another.

180.4.21 REPLAY_SQL_TESTCASE Function

This function automates the reproduction of the SQL Test Case.

Syntax

```
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (
    directory          IN  VARCHAR2,
    filename           IN  VARCHAR2,
    ctrlOptions        IN  VARCHAR2 := NULL,
    format             IN  VARCHAR2 := 'TEXT')
RETURN CLOB;

DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (
    directory          IN  VARCHAR2,
```

```

sqlTestCase      IN  CLOB,
ctrlOptions      IN  VARCHAR2  := NULL,
format           IN  VARCHAR2  := 'TEXT')
RETURN CLOB;

```

Parameters

Table 180-30 REPLAY_SQL_TESTCASE Function Parameters

Parameter	Description
directory	Directory containing test case files
filename	Name of a file containing an XML document describing the SQL test case
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> replay - EXPLAIN (default), OUTLINE, EXECUTION or OUTLINE EXECUTION. This parameter defines TCB replay functionality. <p>EXPLAIN: Replay explains the statement without using outlines</p> <p>OUTLINE: Replay uses outlines mode and explains the statement using outlines</p> <p>EXECUTION: Replay executes the statement without using outlines</p> <p>OUTLINE EXECUTION: Replay executes the statement using outlines</p> <p>Note that if the user gives an incorrect parameter value, then the replay runs in default mode and no error is thrown.</p> name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution.
sqlTestCase	SQL test case
format	Format of the replay report. Possible formats are: TEXT, XML and HTML..

Examples

TCB Replay Mode: Execute

```

SELECT /* tcbdynpl_1 */ /*+ gather_plan_statistics */ * FROM (SELECT * FROM emp where
emp.sal > 100) emp, dept WHERE emp.deptno = dept.deptno And emp.sal > 1000 /*
tcbdynpl_1 */

```

Explain Plan

Plan Hash Value : 2219294842

```

-----
| Id | Operation                                | Name          | Rows |
-----
|  0 | SELECT STATEMENT                          |               |    13 |
| * 1 |  HASH JOIN                                |               |    13 |
|  2 |    NESTED LOOPS                            |               |      |
|  3 |      NESTED LOOPS                          |               |    13 |
|  4 |        STATISTICS COLLECTOR                |               |      |
|  5 |          TABLE ACCESS FULL                | DEPT          |     4 |
| * 6 |            INDEX RANGE SCAN                | EMP_IDX_DEPTNO |      |
| * 7 |              TABLE ACCESS BY INDEX ROWID | EMP           |     3 |
-----

```

```

| * 8 | TABLE ACCESS FULL | EMP | 13 |
-----

Predicate Information (identified by operation id):
-----
* 1 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 6 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 7 - filter("EMP"."SAL">1000)
* 8 - filter("EMP"."SAL">1000)

Runtime Plan
Plan Hash Value : 2219294842

-----
| Id | Operation | Name | E-Card | A-Card |
-----
| 0 | SELECT STATEMENT | | | 0 |
| * 1 | HASH JOIN | | 13 | 0 |
| 2 | TABLE ACCESS FULL | DEPT | 4 | 0 |
| * 3 | TABLE ACCESS FULL | EMP | 13 | 0 |
-----

Predicate Information (identified by operation id):
-----
* 1 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 3 - filter("EMP"."SAL">1000)

REPLAY Note:
-----
- Replay used dynamic sampling
- Replay forced Dynamic plan

```

180.4.22 REPORT_SQL Function

Generates a diagnostic report in HTML format for a specific SQL statement.

Syntax

```

DBMS_SQLDIAG.REPORT_SQL (
    sql_id      IN  VARCHAR2,
    directory   IN  VARCHAR2,
    level       IN  VARCHAR2
)
RETURN CLOB;

```

Parameters

Table 180-31 DBMS_SQLDIAG.REPORT_SQL Parameters

Parameter	Description
sql_id	ID of the SQL statement.
directory	Directory object where the report is written. By default, this parameter is NULL and the report is returned as a CLOB, not written to disk.

Table 180-31 (Cont.) DBMS_SQLDIAG.REPORT_SQL Parameters

Parameter	Description
level	Three options: TYPICAL <ul style="list-style-type: none"> BASIC – Restricted report carrying only... ??? TYPICAL – The standard report. ALL – The extended report.

Usage Notes

By default, the level parameter is NULL and the report is returned as a CLOB, not written to disk.

Example 180-1

In this example, SQL_ID 'gtckcpxmp3ry7' is passed in, the directory is the standard Data Pump directory, and ALL detail is returned in the report.

```
declare my_report clob; begin my_report :=
dbms_sqldiag.report_sql('gtckcpxmp3ry7',directory=>'DATA_PUMP_DIR',level=>'ALL'); end;/
```

180.4.23 REPORT_DIAGNOSIS_TASK Function

This function reports on a diagnostic task. It returns a CLOB containing the desired report.

Syntax

```
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (
  taskname      IN  VARCHAR2,
  type          IN  VARCHAR2 := TYPE_TEXT,
  level         IN  VARCHAR2 := LEVEL_TYPICAL,
  section       IN  VARCHAR2 := SECTION_ALL,
  object_id     IN  NUMBER   := NULL,
  result_limit  IN  NUMBER   := NULL,
  owner_name    IN  VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 180-32 REPORT_DIAGNOSIS_TASK Function Parameters

Parameter	Description
taskname	Name of task to report
type	Type of the report. Possible values are: TEXT, HTML, XML (see Table 180-4).
level	Format of the recommendations. Possible values are TYPICAL, BASIC, ALL (Table 180-5).
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL (Table 180-6).

Table 180-32 (Cont.) REPORT_DIAGNOSIS_TASK Function Parameters

Parameter	Description
object_id	Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).
result_limit	Number of statements in a STS for which the report is generated
owner_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

180.4.24 RESET_DIAGNOSIS_TASK Procedure

This procedure resets a diagnostic task.

Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 180-33 RESET_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

180.4.25 RESUME_DIAGNOSIS_TASK Procedure

This procedure resumes a diagnostic path.

Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 180-34 RESUME_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

180.4.26 SET_DIAGNOSIS_TASK_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2.

The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- MODE: diag scope (comprehensive, limited)

- `_SQLDIAG_FINDING_MODE`: findings in the report (see "Table 180-8" for possible values)

Syntax

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (
    taskname          IN   VARCHAR2,
    parameter         IN   VARCHAR2,  value          IN   NUMBER);
```

Parameters

Table 180-35 SET_DIAGNOSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
taskname	Identifier of the task to execute
parameter	Name of the parameter to set
value	New value of the specified parameter

180.4.27 SQL_DIAGNOSE_AND_REPAIR Function

Diagnoses a given SQL statement for a given SQL ID for the given problem type. This function creates an incident, populate incident metadata with required information like, SQL ID, SQL text, compilation environment, and so on. It also creates a diagnostic task, executes it and accepts SQL PATCH recommendation for a given SQL ID.

Syntax

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
    sql_text          IN   CLOB,
    bind_list         IN   sql_binds := NULL,
    scope             IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN   NUMBER   := TIME_LIMIT_DEFAULT,
    problem_type      IN   NUMBER   := PROBLEM_TYPE_PERFORMANCE,
    auto_apply_patch  IN   VARCHAR2 := YES)
RETURN NUMBER;
```

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
    sql_id            IN   VARCHAR2,
    plan_hash_value   IN   NUMBER   := NULL,
    scope             IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN   NUMBER   := TIME_LIMIT_DEFAULT,
    problem_type      IN   NUMBER   := PROBLEM_TYPE_PERFORMANCE,
    auto_apply_patch  IN   VARCHAR2 := YES)
RETURN NUMBER;
```

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
    incident_id       IN   VARCHAR2,
    scope             IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN   NUMBER   := TIME_LIMIT_DEFAULT,
    problem_type      IN   NUMBER   := PROBLEM_TYPE_PERFORMANCE,
    auto_apply_patch  IN   VARCHAR2 := YES)
RETURN NUMBER;
```

Parameters

Table 180-36 SQL_DIAGNOSE_AND_REPAIR Function Parameters

Parameter	Description
sql_text	Text of the SQL statement.
sql_id	SQL ID of the SQL query.
plan_hash_value	The plan to be used for diagnosis. The default value is NULL.
bind_list	Binds to be used for diagnosis. The default value is NULL.
scope	The scope of diagnostic advisor. Possible values are: <ul style="list-style-type: none"> SCOPE_LIMITED—only index and plan analyze are invoked for a given SQL. SCOPE_COMPREHENSIVE—besides index and plan analyze, auto-tune is called first to tune the statement. The default value is SCOPE_COMPREHENSIVE.
time_limit	Time limit for diagnostic task. The default value is TIME_LIMIT_DEFAULT.
problem_type	Problem type that is being diagnosed. The following problem type are supported: <ul style="list-style-type: none"> PROBLEM_TYPE_PERFORMANCE—performance problem. PROBLEM_TYPE_WRONG_RESULTS—incorrect results. PROBLEM_TYPE_COMPILATION_ERROR—crash during compilation of the statement. PROBLEM_TYPE_EXECUTION_ERROR—crash during execution of the statement. The default value is PROBLEM_TYPE_PERFORMANCE.
auto_apply_patch	A value that decides if the recommended SQL patch needs to be accepted. Possible values are: <ul style="list-style-type: none"> YES—accepts the recommended SQL patch. NO—does not accepts recommended SQL patch automatically. User need to manually accept the SQL patch. The default value is YES.

180.4.28 UNPACK_STGTAB_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace

patches referring to the same statement if the names are the same (see the ACCEPT_SQL_PATCH Function & Procedure).

Syntax

```
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
    patch_name          IN  VARCHAR2 := '%',
    patch_category      IN  VARCHAR2 := '%',
    replace             IN  BOOLEAN,
    staging_table_name  IN  VARCHAR2,
    staging_schema_owner IN  VARCHAR2 := NULL);
```

Parameters

Table 180-37 UPPACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
patch_name	Name of patch to unpack (% wildcards acceptable, case-sensitive)
patch_category	Category from which to unpack patches (% wildcards acceptable, case-insensitive)
replace	Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists.
staging_table_name	(Mandatory) Name of the table to use (case-sensitive)
staging_schema_owner	Schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- **Requires:** ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT or READ privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

Related Topics

- [PACK_STGTAB_SQLPATCH Procedure](#)
This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.
- [ACCEPT_SQL_PATCH Function & Procedure](#)
This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

181

DBMS_SQLPA

The DBMS_SQLPA package provides the interface to implement the SQL Performance Analyzer.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_SQLPA Subprograms](#)

181.1 DBMS_SQLPA Overview

The DBMS_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the [CREATE_ANALYSIS_TASK Functions](#) to create an analysis task for a single statement or a group of SQL statements.
2. The [EXECUTE_ANALYSIS_TASK Function & Procedure](#) executes a previously created analysis task.
3. The [REPORT_ANALYSIS_TASK Function](#) displays the results of an analysis task.

181.2 DBMS_SQLPA Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (XXX_ANALYSIS_TASK) require privilege ADVISOR.

181.3 Summary of DBMS_SQLPA Subprograms

This table lists the DBMS_SQLPA subprograms and briefly describes them.

Table 181-1 DBMS_SQLPA Package Subprograms

Subprogram	Description
CANCEL_ANALYSIS_TASK Procedure	Cancels the currently executing task analysis of one or more SQL statements
CREATE_ANALYSIS_TASK Functions	Creates an advisor task to process and analyze one or more SQL statements
DROP_ANALYSIS_TASK Procedure	Drops a SQL analysis task

Table 181-1 (Cont.) DBMS_SQLPA Package Subprograms

Subprogram	Description
EXECUTE_ANALYSIS_TASK Function & Procedure	Executes a previously created analysis task
INTERRUPT_ANALYSIS_TASK Procedure	Interrupts the currently executing analysis task
REPORT_ANALYSIS_TASK Function	Displays the results of an analysis task
RESET_ANALYSIS_TASK Procedure	Resets the currently executing analysis task to its initial state
RESUME_ANALYSIS_TASK Procedure	Resumes a previously interrupted analysis task that was created to process a SQL tuning set.
SET_ANALYSIS_TASK_PARAMETER Procedures	Sets the SQL analysis task parameter value
SET_ANALYSIS_DEFAULT_PARAMETER Procedures	Sets the SQL analysis task parameter default value

181.3.1 CANCEL_ANALYSIS_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(
  task_name          IN VARCHAR2);
```

Parameters

Table 181-2 CANCEL_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Name of the task to cancel

Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

181.3.2 CREATE_ANALYSIS_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements.

Note:

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(  
    sql_text          IN CLOB,  
    bind_list         IN sql_binds := NULL,  
    parsing_schema    IN VARCHAR2  := NULL,  
    task_name         IN VARCHAR2  := NULL,  
    description       IN VARCHAR2  := NULL)  
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(  
    sql_id            IN VARCHAR2,  
    plan_hash_value   IN NUMBER     := NULL,  
    task_name         IN VARCHAR2  := NULL,  
    con_name          IN VARCHAR2   DEFAULT,  
    description       IN VARCHAR2  := NULL)  
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(  
    dbid              IN NUMBER     DEFAULT,  
    begin_snap        IN NUMBER,  
    end_snap          IN NUMBER,  
    sql_id            IN VARCHAR2,
```

```

plan_hash_value IN NUMBER      := NULL,
task_name       IN VARCHAR2    := NULL,
description     IN VARCHAR2    := NULL)
con_name        IN VARCHAR2    DEFAULT,
RETURN VARCHAR2;

```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```

DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sqlset_name     IN VARCHAR2,
  basic_filter    IN VARCHAR2 := NULL,
  con_name        IN VARCHAR2 DEFAULT,
  order_by        IN VARCHAR2 := NULL,
  top_sql         IN VARCHAR2 := NULL,
  task_name       IN VARCHAR2 := NULL,
  description     IN VARCHAR2 := NULL,
  sqlset_owner    IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

Parameters

Table 181-3 *CREATE_ANALYSIS_TASK* Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	A set of bind values
parsing_schema	Name of the schema where the statement can be compiled
task_name	Optional analysis task name
dbid	The DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used
con_name	Container for the SPA task. The semantics depend on the function format: For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis. For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis. The following statements are true of all function formats: <ul style="list-style-type: none"> In a non-CDB, this parameter is ignored. In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, error occurs. In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, error occurs.
description	Description of the SQL analysis task to a maximum of 256 characters
sql_id	Identifier of a SQL statement
plan_hash_value	Hash value of the SQL execution plan
begin_snap	Begin snapshot identifier

Table 181-3 (Cont.) CREATE_ANALYSIS_TASK Function Parameters

Parameter	Description
end_snap	End snapshot identifier
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
order_by	Order-by clause on the selected SQL
top_sql	Top N SQL after filtering and ranking
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

Examples

```
variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id    => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap => 1,
    end_snap   => 2,
    sql_id     => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -
    sqlset_name => 'my_workload', -
    order_by    => 'BUFFER_GETS', -
    description => 'process workload ordered by buffer gets');
```

181.3.3 DROP_ANALYSIS_TASK Procedure

This procedure drops a SQL analysis task. The task and all its result data are deleted.

Syntax

```
DBMS_SQLPA.DROP_ANALYSIS_TASK(
    task_name      IN VARCHAR2);
```

Parameters

Table 181-4 DROP_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	The name of the analysis task to drop

181.3.4 EXECUTE_ANALYSIS_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

Syntax

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2          := 'test execute',
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL)
RETURN VARCHAR2;
```

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2          := 'test execute',
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL);
```

Parameters

Table 181-5 EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute

Table 181-5 (Cont.) EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

Parameter	Description
execution_type	Type of the action to perform by the function. If NULL it will default to the value of the <code>DEFAULT_EXECUTION_TYPE</code> parameter. Possible values are: <ul style="list-style-type: none"> [TEST] EXECUTE - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default. EXPLAIN PLAN - generate explain plan for every statement in the SQL workload. This is similar to the <code>EXPLAIN PLAN</code> command. The resulting plans will be stored in the advisor framework in association with the task. COMPARE [PERFORMANCE] - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type <code>EXPLAIN_PLAN</code> or <code>TEST_EXECUTE</code> already exist in the task CONVERT SQLSET - used to read the statistics captured in a SQL Tuning Set and model them as a task execution. This can be used when you wish to avoid executing the SQL statements because valid data for the experiment already exists in the SQL Tuning Set.
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set through the SET_ANALYSIS_DEFAULT_PARAMETER Procedures).
execution_desc	A 256-length string describing the execution

Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

Examples

1. Create a task with a purpose of change impact analysis

```
EXEC :tname := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sqlset_name => 'my_sts');
```

2. Make baseline or the before change execution

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name      => :tname,
    execution_type => 'test execute',
    execution_name => 'before_change');
```

3. Make change

...

4. Make the after change version of the workload performance

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name      => :tname, -
    execution_type => 'test execute',
    execution_name => 'after_change')
```

5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

```
EXEC DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
    :tname, 'comparison_metric', 'buffer_gets');
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name      => :tname, -
    execution_type => 'compare performance', -
    execution_name => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name      => :tname, -
    execution_type => 'compare performance',
    execution_params => dbms_advisor.arglist(
        'execution_name1',
        'before_change',
        'execution_name2',
        'after_change',
        'comparison_metric',
        'buffer_gets'));
```

181.3.5 INTERRUPT_ANALYSIS_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

Syntax

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(
    task_name      IN VARCHAR2);
```

Parameters

Table 181-6 INTERRUPT_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to interrupt

Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

181.3.6 REPORT_ANALYSIS_TASK Function

This procedure displays the results of an analysis task.

Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
    task_name      IN   VARCHAR2,
    type           IN   VARCHAR2      := 'TEXT',
    level          IN   VARCHAR2      := 'TYPICAL',
    section        IN   VARCHAR2      := 'SUMMARY',
    object_id      IN   NUMBER         := NULL,
    top_sql        IN   NUMBER         := 100,
    execution_name IN   VARCHAR2      := NULL,
    task_owner     IN   VARCHAR2      := NULL,
    order_by       IN   VARCHAR2      := NULL)
RETURN CLOB;
```

Parameters

Table 181-7 REPORT_ANALYSIS_TASK Function Parameters

Parameter	Description
task_name	Name of the task to report
type	Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes).
level	Level of detail in the report: <ul style="list-style-type: none"> • ALL - details of all SQL • BASIC - currently the same as typical • CHANGED - only SQL with changed performance • CHANGED_PLANS - only SQL with plan changes • ERRORS - SQL with errors only • IMPROVED - only improved SQL • REGRESSED - only regressed SQL • TIMEOUT - only SQL which timed-out during execution • TYPICAL (default) - show information about every statement analyzed, including changing and errors • UNCHANGED - only SQL with unchanged performance • UNCHANGED_PLANS - only SQL with unchanged plans • UNSUPPORTED - only SQL not supported by SPAs

Table 181-7 (Cont.) REPORT_ANALYSIS_TASK Function Parameters

Parameter	Description
section	Optionally limit the report to a single section (ALL for all sections): <ul style="list-style-type: none"> SUMMARY (default) - workload summary only ALL - summary and details on SQL
object_id	Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)
top_sql	Number of SQL statements in a STS for which the report is generated
execution_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.
task_owner	Owner of the relevant analysis task. Defaults to the current schema owner.
order_by	How to sort SQL statements in the report (summary and body). Possible values: <ul style="list-style-type: none"> CHANGE_DIFF - sort SQL statements by change difference in SQL performance in terms of the comparison Metric NULL (default) - order SQL statement by impact on workload SQL_IMPACT - order SQL statement by change impact on SQL WORKLOAD_IMPACT - same as NULL METRIC_DELTA - same as CHANGE_DIFF

Return Values

A CLOB containing the desired report.

Usage Notes

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'ALL', 5)
from dual;
```

181.3.7 RESET_ANALYSIS_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution.

All intermediate result data will be deleted.

Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(
  task_name          IN VARCHAR2);
```

Parameters**Table 181-8** RESET_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to reset

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```

181.3.8 RESUME_ANALYSIS_TASK Procedure

This procedure resumes a previously interrupted or `FAILED` (with a fatal error) task execution.

Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
  task_name          IN VARCHAR2,
  basic_filter       IN VARCHAR2 := NULL);
```

Parameters**Table 181-9** RESUME_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to resume
basic_filter	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter <code>basic_filter</code>) that was specified when calling the CREATE_ANALYSIS_TASK Functions .

Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide. For this example we will just resume.
```

```
EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```

181.3.9 SET_ANALYSIS_TASK_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name          IN VARCHAR2,
  parameter          IN VARCHAR2,
  value              IN VARCHAR2,
  test_execute_dop  IN NUMBER DEFAULT 0,
  compare_resultset IN BOOLEAN DEFAULT TRUE);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name          IN VARCHAR2,
  parameter          IN VARCHAR2,
  value              IN NUMBER,
  test_execute_dop  IN NUMBER DEFAULT 0,
  compare_resultset IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 181-10 SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute
parameter	Name of the parameter to set. The possible analysis parameters that can be set by this procedure are: <ul style="list-style-type: none"> APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). BASIC_FILTER: basic filter for SQL tuning set CELL_SIMULATION_ENABLED: for more details, see the helper script tcellsim.sql in the ADMIN directory. COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: buffer_gets, cpu_time + buffer_gets * 10) DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all TEST EXECUTE and EXPLAIN PLAN operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database. DAYS_TO_EXPIRE: number of days until the task is deleted DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure.

Table 181-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter (contd.)	<ul style="list-style-type: none"> • DISABLE_MULTI_EXEC: SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to TRUE to disable this capability. In this case, each SQL in the SQL tuning set is executed only once. • EXECUTE_TRIGGERS: Set this parameter to TRUE to execute all statement-level triggers in the FULLDML mode. If the parameter is set to FALSE, then the triggers will not be executed even in FULLDML mode of test execution. Any changes incurred due to potential execution of triggers are always rolled back by SPA. The default value of this parameter is FALSE. • EXECUTION_DAYS_TO_EXPIRE: number of days until the task's executions will be deleted (without deleting the task) • EXECUTE_FULLDML: TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML. • EXECUTION_NAME1: name of the first task execution to analyze • EXECUTION_NAME2: name of the second task execution to analyze • LOCAL_TIME_LIMIT: per-statement time out (seconds) • METRIC_DELTA_THRESHOLD: threshold of the difference between the SQL performance metric before and after the change. The default value is zero. • NUM_ROWS_TO_FETCH: specifies the number of rows to be fetched for an SQL query. You can use one of the following values: <ul style="list-style-type: none"> – ALL_ROWS: Fetches all the rows for an SQL query – AVERAGE: Number of result rows is calculated as the ratio of total rows processed and total executions for each SQL in the STS – AUTO: Number of result rows is determined using the value of <code>optimizer_mode</code> parameter of the optimizer environment captured in the STS. If the value of <code>optimizer_mode</code> is ALL_ROWS, then all result rows will be fetched. If its value is FIRST_ROWS_n, then n result rows will be fetched by the SPA. – A valid number: Fetches the exact number of rows specified by in the SQL query <p>The default value is ALL_ROWS.</p> • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • PLAN_LINES_COMPARISON: <ul style="list-style-type: none"> - ALWAYS --line by line comparison of plans in all scenarios.- AUTO -Line by Line comparison of plans only if <code>phv2</code> is not available and <code>phv1</code> is different- NONE (default) - line by line comparison of plans only if <code>phv</code> is unknown

Table 181-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
	<ul style="list-style-type: none"> RANK_MEASURE1: first ranking measure for SQL tuning set RANK_MEASURE2: second possible ranking measure for SQL tuning set RANK_MEASURE3: third possible ranking measure for SQL tuning set REPLACE_SYSDATE_WITH: Returns a fixed date for all calls to SYSDATE within the SPA task execution. You can use one of the following values: <ul style="list-style-type: none"> CURRENT_SYSDATE: SYSDATE calls return the current date. SQLSET_SYSDATE: SYSDATE calls return the value of the column LAST_EXEC_START_TIME in the STS The default value is CURRENT_SYSDATE. RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. SQL_LIMIT: maximum number of SQL statements to process SQL_PERCENTAGE: percentage filter of SQL tuning set statements SQLSET_NAME: name of the SQL tuning set to associate to the specified task or task execution. This parameter is mainly using in comparing two SQL tuning sets using SPA. SQLSET_OWNER: owner of the SQL tuning set specified using task parameter SQLSET_NAME. TIME_LIMIT: global time out (seconds) WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression. CON_DBID_MAPPING: provide a mapping of multitenant container database (CDB) IDs. When it is set, SQL Performance Analyzer uses the new CDB ID when it finds a match for the old CDB ID and executes the SQL in that container.
parameter (contd.)	
value	New value of the specified parameter
test_execute_dop	Specifies the requested level of concurrency with which a SPA task should be executed. Values 0 or 1 indicate that the SPA task will run with no additional processes as it used to run in releases prior to Oracle Database 18c Release. A value of n (higher than 1) means that n background SPA processes are being requested to concurrently process the input workload.

Table 181-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
<code>compare_resultset</code>	<p>Directs SPA to detect if the result-sets between the two trials being compared are different. If differences are seen in the result-sets of any SQL statement between the two trials being compared, the SPA comparison report will indicate this for every such SQL statement.</p> <ul style="list-style-type: none"> • If set to <code>TRUE</code> the result set comparison will be performed • If set to <code>FALSE</code> result set comparison will not be performed.

Usage Notes

The actual number of processes granted might be equal to or lower than the number requested using the `test_execute_dop` parameter. This parameter applies only to `test-execute` or `explain plan type` of trials that process a SQL Tuning set.

Examples

To request two concurrent processes to execute the SPA task:

```
dbms_sqlpa.set_analysis_task_parameter(:tname,'TEST_EXECUTE_DOP',2)
```

To enable result-set validation

```
exec
dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','TRUE')
```

To disable result-set validation:

```
exec
dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','FALSE')
```

181.3.10 SET_ANALYSIS_DEFAULT_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

Syntax

This form of the procedure updates the default value of an analyzer parameter of type `VARCHAR2`.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
  parameter IN VARCHAR2,
  value     IN VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type `NUMBER`.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
    parameter IN VARCHAR2,
    value     IN NUMBER);
```

Parameters

Table 181-11 SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

Parameter	Description
parameter	<p>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</p> <ul style="list-style-type: none"> • APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). • BASIC_FILTER: basic filter for SQL tuning set • COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>) • DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database. • DAYS_TO_EXPIRE: number of days until the task is deleted • DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure. • EXECUTE_FULLDML: <code>TRUE</code> to execute DML statement fully, including acquiring row locks and modifying rows; <code>FALSE</code> (default) to execute only the query part of the DML without modifying data. When <code>TRUE</code>, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML. • EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions will be deleted (without deleting the task) • EXECUTION_NAME1: name of the first task execution to analyze • EXECUTION_NAME2: name of the second task execution to analyze • LOCAL_TIME_LIMIT: per-statement time out (seconds)

Table 181-11 (Cont.) SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

Parameter	Description
parameter (contd.)	<ul style="list-style-type: none"> • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • RANK_MEASURE1: first ranking measure for SQL tuning set • RANK_MEASURE2: second possible ranking measure for SQL tuning set • RANK_MEASURE3: third possible ranking measure for SQL tuning set • RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER • SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.
value	New value of the specified parameter

DBMS_SQLQ

The `DBMS_SQLQ` package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

This chapter contains the following topics:

- [DBMS_SQLQ Overview](#)
- [Summary of DBMS_SQLQ Subprograms](#)

182.1 DBMS_SQLQ Overview

The `DBMS_SQLQ` package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

You can use the `DBMS_SQLQ` package subprograms to:

- create quarantine configurations for execution plans of SQL statements and specify quarantine thresholds for their resource consumption
- query quarantine thresholds specified in quarantine configurations
- delete quarantine configurations
- transfer quarantine configurations from one database to another

182.2 Summary of DBMS_SQLQ Subprograms

This table lists the `DBMS_SQLQ` subprograms and briefly describes them.

Table 182-1 DBMS_SQLQ Package Subprograms

Procedure	Description
ALTER_QUARANTINE Procedure	Specifies a quarantine threshold in a quarantine configuration for execution plans of a SQL statement
CREATE_QUARANTINE_BY_SQL_ID Function	Creates a quarantine configuration for execution plans of a SQL statement using SQL ID
CREATE_QUARANTINE_BY_SQL_TEXT Function	Creates a quarantine configuration for execution plans of a SQL statement using SQL text
CREATE_STGTAB_QUARANTINE Procedure	Creates a staging table to store quarantine configurations
DROP_QUARANTINE Procedure	Deletes a quarantine configuration

Table 182-1 (Cont.) DBMS_SQLQ Package Subprograms

Procedure	Description
GET_PARAM_VALUE_QUARANTINE Function	Returns the value for a quarantine threshold specified in a quarantine configuration
PACK_STGTAB_QUARANTINE Function	Adds one or more quarantine configurations to a staging table
UNPACK_STGTAB_QUARANTINE Function	Creates quarantine configurations in a database from a staging table

182.2.1 ALTER_QUARANTINE Procedure

This procedure specifies a quarantine threshold for a resource in a quarantine configuration for execution plans of a SQL statement.

Syntax

```
DBMS_SQLQ.ALTER_QUARANTINE (
    quarantine_name    IN VARCHAR2,
    parameter_name     IN VARCHAR2,
    parameter_value    IN VARCHAR2);
```

Parameters

Table 182-2 ALTER_QUARANTINE Procedure Parameters

Parameter	Description
quarantine_name	Name of the quarantine configuration.
parameter_name	Name of the resource for which quarantine threshold needs to be specified. You can specify any one of the following values: <ul style="list-style-type: none"> CPU_TIME: CPU time ELAPSED_TIME: Elapsed time IO_MEGABYTES: I/O in megabytes IO_REQUESTS: Number of physical I/O requests IO_LOGICAL: Number of logical I/O requests ENABLED: Flag to enable or disable the quarantine configuration. Specify YES to enable it and NO to disable it. The default value is YES. AUTOPURGE: Flag to enable or disable automatic purging of the quarantine configuration. If it is set to YES, the quarantine configuration is automatically purged after 53 weeks, if not used. If it is set to NO, the quarantine configuration is never purged. The default value is YES.

Table 182-2 (Cont.) ALTER_QUARANTINE Procedure Parameters

Parameter	Description
parameter_value	Quarantine threshold for the resource specified in parameter_name.

Examples

In the following example, the quarantine threshold specified for CPU time is 5 seconds and elapsed time is 10 seconds for the quarantine configuration

SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4.

```
BEGIN

  DBMS_SQLQ.ALTER_QUARANTINE (
    QUARANTINE_NAME => 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
    PARAMETER_NAME  => 'CPU_TIME',
    PARAMETER_VALUE => '5');

  DBMS_SQLQ.ALTER_QUARANTINE (
    QUARANTINE_NAME => 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
    PARAMETER_NAME  => 'ELAPSED_TIME',
    PARAMETER_VALUE => '10');

END;
/
```

When the SQL statement is executed using the execution plan specified in the quarantine configuration, and if the Resource Manager threshold for CPU time is 5 seconds or less, or elapsed time is 10 seconds or less, then the SQL statement is not allowed to run.

182.2.2 CREATE_QUARANTINE_BY_SQL_ID Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL ID.

Syntax

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 182-3 CREATE_QUARANTINE_BY_SQL_ID Function Parameters

Parameter	Description
sql_id	SQL ID of the SQL statement.

Table 182-3 (Cont.) CREATE_QUARANTINE_BY_SQL_ID Function Parameters

Parameter	Description
plan_hash_value	Hash value of the execution plan of the SQL statement. Default value is NULL. When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement.

Return Value

Name of the quarantine configuration.

Examples

The following example creates a quarantine configuration for the SQL statement having the SQL ID of 8vu7s907prbgr. The quarantine configuration applies to all the execution plans of the SQL statement.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID =>
'8vu7s907prbgr');
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL ID of 8vu7s907prbgr.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID =>
'8vu7s907prbgr', PLAN_HASH_VALUE => '3488063716');
END;
/
```

182.2.3 CREATE_QUARANTINE_BY_SQL_TEXT Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL text.

Syntax

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT (
    sql_text          IN CLOB,
    plan_hash_value  IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 182-4 CREATE_QUARANTINE_BY_SQL_TEXT Function Parameters

Parameter	Description
sql_text	SQL statement.
plan_hash_value	Hash value of the execution plan of the SQL statement. Default value is NULL. When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement.

Return Value

Name of the quarantine configuration.

Examples

The following example creates a quarantine configuration that applies to all the execution plans of the SQL statement 'select count(*) from emp'.

```
DECLARE
  quarantine_config VARCHAR2(30);
BEGIN
  quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'));
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL text of 'select count(*) from emp'.

```
DECLARE
  quarantine_config VARCHAR2(30);
BEGIN
  quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'), PLAN_HASH_VALUE => '3488063716');
END;
/
```

182.2.4 CREATE_STGTAB_QUARANTINE Procedure

This procedure creates a staging table to store the quarantine configurations, so that the staging table can be exported from the current database and imported into another database, thus enabling the quarantine configurations to be used across databases.

Syntax

```
DBMS_SQLQ.CREATE_STGTAB_QUARANTINE (
  staging_table_name   IN VARCHAR2,
  staging_table_owner  IN VARCHAR2 DEFAULT NULL,
  tablespace_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 182-5 CREATE_STGTAB_QUARANTINE Procedure Parameters

Parameter	Description
staging_table_name	Name of the staging table.
staging_table_owner	Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner.
tablespace_name	Name of the tablespace in which the staging table needs to be created. Default value is NULL, which means the staging table is created in the default tablespace of the database.

Examples

The following example creates the staging table `TBL_STG_QUARANTINE` in the default tablespace of the database and sets its table owner to the database user executing this procedure.

```
BEGIN
  DBMS_SQLQ.CREATE_STGTAB_QUARANTINE(STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
/
```

182.2.5 DROP_QUARANTINE Procedure

This procedure deletes a quarantine configuration.

Syntax

```
DBMS_SQLQ.DROP_QUARANTINE(quarantine_name IN VARCHAR2);
```

Parameters

Table 182-6 DROP_QUARANTINE Procedure Parameters

Parameter	Description
quarantine_name	Name of the quarantine configuration to delete.

Examples

The following example deletes the quarantine configuration having the name `SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4`.

```
BEGIN
  DBMS_SQLQ.DROP_QUARANTINE('SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4');
END;
/
```

182.2.6 GET_PARAM_VALUE_QUARANTINE Function

This function returns the quarantine threshold for a resource specified in a quarantine configuration.

Syntax

```
DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE (  
    quarantine_name    IN VARCHAR2,  
    parameter_name    IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 182-7 GET_PARAM_VALUE_QUARANTINE Function Parameters

Parameter	Description
quarantine_name	Name of the quarantine configuration.
parameter_name	Resource for which the quarantine threshold needs to be retrieved.

Return Value

Returns the quarantine threshold for a resource specified in a quarantine configuration.

Examples

The following example returns the quarantine threshold for CPU time specified in the quarantine configuration having the name `SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4`.

```
DECLARE  
    quarantine_config_setting_value VARCHAR2(30);  
BEGIN  
    quarantine_config_setting_value := DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE(  
        QUARANTINE_NAME =>  
'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',  
        PARAMETER_NAME => 'CPU_TIME');  
END;  
/
```

182.2.7 PACK_STGTAB_QUARANTINE Function

This function adds one or more quarantine configurations into a staging table.

Syntax

```
DBMS_SQLQ.PACK_STGTAB_QUARANTINE (  
    staging_table_name    IN VARCHAR2,  
    staging_table_owner  IN VARCHAR2 DEFAULT NULL,  
    name                  IN VARCHAR2 DEFAULT '%',  
    sql_text              IN VARCHAR2 DEFAULT '%',
```

```

    enabled          IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 182-8 PACK_STGTAB_QUARANTINE Function Parameters

Parameter	Description
staging_table_name	Name of the staging table in which the quarantine configurations need to be added.
staging_table_owner	Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner.
name	Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters.
sql_text	SQL statement text. Its value is case-sensitive and it accepts wildcard characters.
enabled	Flag indicating whether the quarantine configuration should be enabled or disabled. If it is set to YES, then the quarantine configuration is enabled, else it is disabled. Default value is NULL, which means the quarantine configuration is disabled by default.

Return Value

Number of quarantine configurations added to the staging table.

Examples

The following example adds all the quarantine configurations having the names starting with SQL_QUARANTINE_ into the staging table TBL_STG_QUARANTINE.

```

DECLARE
    quarantine_configs NUMBER;
BEGIN
    quarantine_configs := DBMS_SQLQ.PACK_STGTAB_QUARANTINE (
        STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE',
        NAME => 'SQL_QUARANTINE_%');
END;
/
```

182.2.8 UNPACK_STGTAB_QUARANTINE Function

This function creates quarantine configurations in a database from a staging table.

Syntax

```

DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE (
    staging_table_name  IN VARCHAR2,
    staging_table_owner IN VARCHAR2 DEFAULT NULL,
    name               IN VARCHAR2 DEFAULT '%',
```

```

    sql_text          IN VARCHAR2 DEFAULT '%',
    enabled           IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 182-9 UNPACK_STGTAB_QUARANTINE Function Parameters

Parameter	Description
staging_table_name	Name of the staging table from which the quarantine configurations need to be created in the database.
staging_table_owner	Name of the schema owner of the staging table. Default value is <code>NULL</code> , which means the database user executing this procedure is set as the staging table owner.
name	Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters.
sql_text	SQL statement text. Its value is case-sensitive and it accepts wildcard characters.
enabled	Flag indicating whether the quarantine configuration should be enabled or disabled. If its value is <code>YES</code> , then the quarantine configuration is enabled, else it is disabled. Default value is <code>NULL</code> , which means the quarantine configuration is disabled by default.

Return Value

Number of quarantine configurations created in the database from the staging table.

Examples

The following example creates the quarantine configurations in the database from all the quarantine configurations stored in the staging table `TBL_STG_QUARANTINE`.

```

DECLARE
    quarantine_configs NUMBER;
BEGIN
    quarantine_configs := DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE (
        STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
```

DBMS_SQLSET

The `DBMS_SQLSET` package provides an interface to manage SQL tuning sets.

This package provides the same subprograms, although in some cases with slightly different names, as the SQL tuning set subprograms in `DBMS_SQLTUNE`. The difference is that `DBMS_SQLSET` does not require the Oracle Tuning Pack.

This chapter contains the following topics:

- [DBMS_SQLSET Overview](#)
- [DBMS_SQLSET Security Model](#)
- [DBMS_SQLSET Data Structures](#)
- [Summary of DBMS_SQLSET Subprograms](#)

183.1 DBMS_SQLSET Overview

Use this package to manage SQL tuning sets.

Note:

All `DBMS_SQLSET` subprograms have equivalents in the `DBMS_SQLTUNE` package.

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the [SELECT_CURSOR_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT_WORKLOAD_REPOSITORY Function](#)
- Other SQL tuning sets using the [SELECT_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT_SQLPA_TASK Function](#)
- SQL Trace files using the [SELECT_SQL_TRACE Function](#)
- A user-defined workload

The complete group of subprograms listed in [Summary of DBMS_SQLSET Subprograms](#) facilitates this functionality. As examples:

- The [CREATE_SQLSET Procedure and Function](#) creates a SQL tuning set object in the database.
- The [LOAD_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL.
- The [CAPTURE_CURSOR_CACHE Procedure](#) collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

183.2 DBMS_SQLSET Security Model

This package is available to `PUBLIC` and performs its own security checking.

SQL tuning set subprograms require either the `ADMINISTER SQL TUNING SET` or the `ADMINISTER ANY SQL TUNING SET` privilege. Users having the `ADMINISTER SQL TUNING SET` privilege can only create and modify a SQL tuning set that they own. The `ADMINISTER ANY SQL TUNING SET` privilege allows users to manipulate all SQL tuning sets, even those owned by other users. For example, you can use [CREATE_SQLSET Procedure and Function](#) to create a SQL tuning set to be owned by a different user. In this case, the different user need not have the `ADMINISTER SQL TUNING SET` privilege to manipulate the SQL tuning set.

183.3 DBMS_SQLSET Data Structures

The `SELECT_*` subprograms in the `DBMS_SQLTUNE` package return objects of the `SQLSET_ROW` type.

Object Types

- [SQLSET_ROW Object Type](#)

183.3.1 SQLSET_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of `SQLSET_ROW` objects. Each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_*` subprograms each model a data source as a collection of `SQLSET_ROW` objects, with each object uniquely identified by (`sql_id`, `plan_hash_value`). Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (  
    sql_id                VARCHAR(13),
```

```

force_matching_signature NUMBER,
sql_text                 CLOB,
object_list              sql_objects,
bind_data                RAW(2000),
parsing_schema_name     VARCHAR2(30),
module                   VARCHAR2(48),
action                   VARCHAR2(32),
elapsed_time            NUMBER,
cpu_time                 NUMBER,
buffer_gets              NUMBER,
disk_reads               NUMBER,
direct_writes            NUMBER,
rows_processed           NUMBER,
fetches                  NUMBER,
executions               NUMBER,
end_of_fetch_count       NUMBER,
optimizer_cost           NUMBER,
optimizer_env            RAW(2000),
priority                 NUMBER,
command_type             NUMBER,
first_load_time          VARCHAR2(19),
stat_period              NUMBER,
active_stat_period       NUMBER,
other                    CLOB,
plan_hash_value          NUMBER,
sql_plan                 sql_plan_table_type,
bind_list                sql_binds,
con_dbid                 NUMBER,
last_exec_start_time     VARCHAR2(19))

```

Attributes

Table 183-1 SQLSET_ROW Attributes

Attribute	Description
sql_id	Unique SQL ID.
forcing_matching_signature	Signature with literals, case, and whitespace removed.
sql_text	Full text for the SQL statement.
object_list	Currently not implemented.
bind_data	Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for <code>bind_list</code> - they are mutually exclusive.
parsing_schema_name	Schema where the SQL is parsed.
module	Last application module for the SQL.
action	Last application action for the SQL.
elapsed_time	Sum total elapsed time for this SQL statement.
cpu_time	Sum total CPU time for this SQL statement.
buffer_gets	Sum total number of buffer gets.

Table 183-1 (Cont.) SQLSET_ROW Attributes

Attribute	Description
disk_reads	Sum total number of disk reads.
direct_writes	Sum total number of direct path writes.
rows_processed	Sum total number of rows processed by this SQL.
fetches	Sum total number of fetches.
executions	Total executions of this SQL statement.
end_of_fetch_count	Number of times the SQL statement was fully executed with all of its rows fetched.
optimizer_cost	Optimizer cost for this SQL.
optimizer_env	Optimizer environment for this SQL statement.
priority	User-defined priority (1,2,3).
command_type	Statement type, such as INSERT or SELECT.
first_load_time	Load time of the parent cursor.
stat_period	Period of time (seconds) when the statistics of this SQL statement were collected.
active_stat_period	Effective period of time (in seconds) during which the SQL statement was active.
other	Other column for user-defined attributes.
plan_hash_value	Plan hash value of the plan.
sql_plan	Execution plan for the SQL statement.
bind_list	List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data: they are mutually exclusive.
con_dbid	DBID of the PDB or CDB root.
last_exec_start_time	Most recent execution start time of this SQL statement.

183.4 Summary of DBMS_SQLSET Subprograms

This table lists the DBMS_SQLSET subprograms and briefly describes them.

Table 183-2 DBMS_SQLSET Package Subprograms

Subprogram	Description
ADD_REFERENCE Function	This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.
CAPTURE_CURSOR_CACHE Procedure	This procedure captures a workload from the shared SQL area into a SQL tuning set.
CREATE_SQLSET Procedure and Function	This procedure or function creates a SQL tuning set object in the database.

Table 183-2 (Cont.) DBMS_SQLSET Package Subprograms

Subprogram	Description
CREATE_STGTAB Procedure	This procedure creates a staging table through which SQL tuning sets are imported and exported.
DELETE_SQLSET Procedure	This procedure deletes a set of SQL statements from a SQL tuning set.
DROP_SQLSET Procedure	This procedure drops a SQL tuning set if it is not active.
LOAD_SQLSET Procedure	This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.
PACK_STGTAB Procedure	This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB procedure.
REMAP_STGTAB Procedure	This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.
REMOVE_REFERENCE Procedure	This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.
SELECT_CURSOR_CACHE Function	This function collects SQL statements from the workload repository.
SELECT_SQL_TRACE Function	This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code> .
SELECT_SQLPA_TASK Function	This function collects SQL statements from a SQL Performance Analyzer comparison task.
SELECT_SQLSET Function	This is a table function that reads the contents of a SQL tuning set.
SELECT_WORKLOAD_REPOSITORY Function	This function collects SQL statements from the workload repository.
UNPACK_STGTAB Procedure	This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.
UPDATE_SQLSET Procedures	This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

183.4.1 ADD_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

Syntax

```
DBMS_SQLSET.ADD_REFERENCE (
    sqlset_name IN VARCHAR2,
    description IN VARCHAR2 := NULL,
    sqlset_owner IN VARCHAR2 :=NULL)
RETURN NUMBER;
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

Table 183-3 ADD_SQLSET_REFERENCE and ADD_REFERENCE Function Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the name of the SQL tuning set.
<code>description</code>	Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.

Return Values

The identifier of the added reference.

Usage Notes

Adding a reference to a SQL tuning set prevents the tuning set from being modified while it is being used. Invoking SQL Tuning Advisor on the SQL tuning set adds a reference automatically, so use `ADD_REFERENCE` only when the automatically generated reference is not sufficient. The `ADD_REFERENCE` function returns a reference ID that you can later supply to the `REMOVE_SQLSET_REFERENCE` procedure. Query the `DBA_SQLSET_REFERENCES` view to find all references to a specified SQL tuning set.

Examples

This example generates a reference to the SQL tuning set named `my_workload` and stores it in the `b_rid` variable.

```
VARIABLE b_rid NUMBER;
EXEC :b_rid := DBMS_SQLSET.ADD_REFERENCE(sqlset_name => 'my_workload',
description => 'my sts ref');
```

183.4.2 CAPTURE_CURSOR_CACHE Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

Syntax

```
DBMS_SQLSET.CAPTURE_CURSOR_CACHE (
    sqlset_name      IN VARCHAR2,
    time_limit       IN POSITIVE := 1800,
    repeat_interval  IN POSITIVE := 300,
    capture_option   IN VARCHAR2 := 'MERGE',
    capture_mode     IN NUMBER    := MODE_REPLACE_OLD_STATS,
    basic_filter     IN VARCHAR2 := NULL,
    sqlset_owner     IN VARCHAR2 := NULL,
    recursive_sql    IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

Table 183-4 CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the SQL tuning set name
<code>time_limit</code>	Defines the total amount of time, in seconds, to execute.
<code>repeat_interval</code>	Defines the amount of time, in seconds, to pause between sampling.
<code>capture_option</code>	Specifies whether to insert new statements, update existing statements, or both. Values are <code>INSERT</code> , <code>UPDATE</code> , or <code>MERGE</code> . The values are the same as for <code>load_option</code> in <code>load_sqlset</code> .
<code>capture_mode</code>	Specifies the capture mode (<code>UPDATE</code> and <code>MERGE</code> capture options). Possible values: <ul style="list-style-type: none"> <code>MODE_REPLACE_OLD_STATS</code> — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set <code>MODE_ACCUMULATE_STATS</code> — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.
<code>basic_filter</code>	Defines a filter to apply to the shared SQL area for each sample. If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set or <code>NULL</code> for current schema owner

Table 183-4 (Cont.) CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
<code>recursive_sql</code>	Defines a filter that includes recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>) or excludes it (<code>NO_RECURSIVE_SQL</code>).

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                     sqlset_name    =>
'my_workload', -
                                     time_limit     => 30, -
                                     repeat_interval => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                     sqlset_name    => 'my_workload', -
                                     time_limit     => 30, -
                                     repeat_interval => 5, -
                                     capture_mode    =>
DBMS_SQLSET.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                     sqlset_name    => 'my_workload', -
                                     time_limit     => 30, -
                                     repeat_interval => 5, -
                                     capture_option  => 'INSERT');
```

183.4.3 CREATE_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

Syntax

```
DBMS_SQLSET.CREATE_SQLSET (  
    sqlset_name IN VARCHAR2,  
    description IN VARCHAR2 := NULL  
    sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLSET.CREATE_SQLSET (  
    sqlset_name IN VARCHAR2 := NULL,  
    description IN VARCHAR2 := NULL,  
    sqlset_owner IN VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

Parameters

Table 183-5 CREATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.
description	Provides an optional description of the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.

Return Values

Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.

Examples

```
EXEC DBMS_SQLSET.CREATE_SQLSET(-  
    sqlset_name => 'my_workload', -  
    description => 'complete application workload');
```

183.4.4 CREATE_STGTAB Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

Syntax

```
DBMS_SQLSET.CREATE_STGTAB (
    table_name          IN VARCHAR2,
    schema_name        IN VARCHAR2 := NULL,
    tablespace_name    IN VARCHAR2 := NULL,
    db_version         IN NUMBER   := NULL);
```

Parameters

Table 183-6 CREATE_STGTAB_SQLSET and CREATE_STGTAB Procedure Parameters

Parameter	Description
table_name	Specifies the of the table to create. The name is case sensitive.
schema_name	Defines the schema in which to create the table, or NULL for the current schema. The name is case sensitive.
tablespace_name	Specifies the tablespace in which to store the staging table, or NULL for the default tablespace of the current user. The name is case sensitive.
db_version	Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use one of the following values: <ul style="list-style-type: none"> • NULL (default) — Specifies the current database version. • STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. • STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. • STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version. • STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version. • STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets:

```
EXEC DBMS_SQLSET.CREATE_STGTAB(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 12c Release 1 (12.1.0.2) format:

```
BEGIN
    DBMS_SQLSET.CREATE_STGTAB (
        table_name => 'STGTAB_SQLSET_121'
    ,    db_version => DBMS_SQLSET.STS_STGTAB_12_1_VERSION );
END;
```

183.4.5 DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

Syntax

```
DBMS_SQLSET.DELETE_SQLSET (
  sqlset_name   IN  VARCHAR2,
  basic_filter  IN  VARCHAR2 := NULL,
  sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 183-7 DELETE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
basic_filter	Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for current schema owner.

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name => 'my_workload', -
                                basic_filter => 'elapsed_time < 1000000');
```

183.4.6 DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

Syntax

```
DBMS_SQLSET.DROP_SQLSET (
  sqlset_name   IN  VARCHAR2,
  sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 183-8 DROP_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.

Table 183-8 (Cont.) DROP_SQLSET Procedure Parameters

Parameter	Description
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for current schema owner.

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLSET.DROP_SQLSET ('my_workload');
```

183.4.7 LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

Syntax

```
DBMS_SQLSET.LOAD_SQLSET (
  sqlset_name      IN VARCHAR2,
  populate_cursor  IN sqlset_cursor,
  load_option      IN VARCHAR2 := 'INSERT',
  update_option    IN VARCHAR2 := 'REPLACE',
  update_condition IN VARCHAR2 := NULL,
  update_attributes IN VARCHAR2 := NULL,
  ignore_null      IN BOOLEAN := TRUE,
  commit_rows      IN POSITIVE := NULL,
  sqlset_owner     IN VARCHAR2 := NULL);
```

Parameters

Table 183-9 LOAD_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of SQL tuning set to be loaded.
populate_cursor	Specifies the cursor reference to the SQL tuning set to be loaded.
load_option	Specifies which statements are loaded into the SQL tuning set. The possible values are: <ul style="list-style-type: none"> INSERT (default) — Adds only new statements. UPDATE — Updates existing the SQL statements and ignores any new statements. MERGE — Inserts new statements and updates the information of the existing ones.

Table 183-9 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
update_option	<p>Specifies how existing SQL statements are updated.</p> <p>This parameter is considered only if <code>load_option</code> is specified with <code>UPDATE</code> or <code>MERGE</code> as an option. The possible values are:</p> <ul style="list-style-type: none"> • <code>REPLACE</code> (default) — Updates the statement using the new statistics, bind list, object list, and so on. • <code>ACCUMULATE</code> — Combines attributes when possible (for example, statistics such as <code>elapsed_time</code>), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: <code>elapsed_time</code>, <code>buffer_gets</code>, <code>direct_writes</code>, <code>disk_reads</code>, <code>row_processed</code>, <code>fetches</code>, <code>executions</code>, <code>end_of_fetch_count</code>, <code>stat_period</code> and <code>active_stat_period</code>.
update_condition	<p>Specifies when to perform the update.</p> <p>The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination:</p> <ul style="list-style-type: none"> • <code>OLD</code> — Refers to statement attributes from the SQL tuning set (destination). • <code>NEW</code> — Refers to statement attributes from the input statements (source).
update_attributes	<p>Specifies the list of SQL statement attributes to update during a merge or update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> • <code>NULL</code> (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to <code>ALL</code> without execution contexts such as module and action. • <code>BASIC</code> — Specifies statistics and binds only. • <code>TYPICAL</code> — Specifies <code>BASIC</code> with SQL plans (without row source statistics) and without an object reference list. • <code>ALL</code> — Specifies all attributes, including the execution context attributes such as module and action. • List of comma separated attribute names to update: <ul style="list-style-type: none"> – <code>EXECUTION_CONTEXT</code> – <code>EXECUTION_STATISTICS</code> – <code>SQL_BINDS</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> with added row source statistics)
ignore_null	<p>Specifies whether to update attributes when the new value is <code>NULL</code>.</p> <p>If <code>TRUE</code>, then the procedure does not update an attribute when the new value is <code>NULL</code>. That is, do not override with <code>NULL</code> values unless intentional.</p>

Table 183-9 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
<code>commit_rows</code>	Specifies whether to commit statements after DML. If a value is provided, then the load commits after each specified number of statements is inserted. If <code>NULL</code> is provided, then the load commits only once, at the end of the operation. Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the <code>DBA_SQLSET</code> views. The <code>STATEMENT_COUNT</code> value increases as new SQL statements are loaded.
<code>sqlset_owner</code>	Defines the owner of the SQL tuning set, or the current schema owner (or <code>NULL</code> for the current owner).

Exceptions

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

Usage Notes

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more, excluding statements that belong to `SYS` schema. You select all attributes of the SQL statements and load them in the tuning set using the default mode. The default mode loads only new statements because the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLSET.CREATE_SQLSET('my_workload');

-- populate the tuning set from the shared SQL area
DECLARE
  cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLSET.SELECT_CURSOR_CACHE(
          'parsing_schema_name <> 'SYS' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
          'ALL')) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload',
                          populate_cursor => cur);
```

```
END;
/
```

Now you want to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your `update_option` because it is assumed the cursors currently in the cache have aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2,
                                                'parsing_schema_name <>'
                                                'SYS',
                                                NULL, NULL, NULL, NULL,
                                                1,
                                                NULL,
                                                'ALL')) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name      => 'my_workload',
                          populate_cursor => cur,
                          load_option     => 'MERGE',
                          update_option   => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
```

```

SELECT VALUE(P)
FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE) P;

DBMS_SQLSET.LOAD_SQLSET(sqlset_name      => 'my_workload',
                        populate_cursor => cur,
                        load_option     => 'UPDATE');

END;
/

```

183.4.8 PACK_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB procedure.

Syntax

```

DBMS_SQLSET.PACK_STGTAB (
  sqlset_name      IN VARCHAR2,
  sqlset_owner     IN VARCHAR2 := NULL,
  staging_table_name IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  db_version       IN NUMBER   := NULL);

```

Parameters

The parameters are identical for the DBMS_SQLTUNE.PACK_STGTAB_SQLSET and DBMS_SQLSET.PACK_STGTAB procedures.

Table 183-10 PACK_STGTAB_SQLSET and PACK_STGTAB Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set to pack. The name is case sensitive. Wildcard characters (%) are permitted.
sqlset_owner	Specifies the category from which to pack SQL tuning sets. The name is case sensitive. Wildcard characters (%) are permitted.
staging_table_name	Specifies the name of the table to use. The value is case sensitive.
staging_schema_owner	Specifies the schema where the table resides, or NULL for the current schema. The value is case sensitive.
db_version	Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use any of the following values: <ul style="list-style-type: none"> NULL (default) — Specifies the current database version. STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version.

Usage Notes

- To move more than one SQL tuning set, call this procedure multiple times. You can then move the populated staging table to a destination database using any method, such as a database link or Oracle Data Pump, and then unpack the SQL tuning set in the destination database.
- This function issues a `COMMIT` after packing each SQL tuning set. If an error is raised mid-execution, then clear the staging table by deleting its rows.

Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => '%'
  ,   sqlset_owner   => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'my_workload'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 2 (11.2):

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET'
```

```
, db_version => DBMS_SQLSET.STS_STGTAB_11_2_VERSION);
END;
```

183.4.9 REMAP_STGTAB Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

Syntax

```
DBMS_SQLSET.REMAP_STGTAB (
    old_sqlset_name      IN VARCHAR2,
    old_sqlset_owner     IN VARCHAR2 := NULL,
    new_sqlset_name      IN VARCHAR2 := NULL,
    new_sqlset_owner     IN VARCHAR2 := NULL,
    staging_table_name   IN VARCHAR2,
    staging_schema_owner IN VARCHAR2 := NULL,
    old_con_dbid         IN NUMBER   := NULL,
    new_con_dbid         IN NUMBER   := NULL);
);
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMAP_STGTAB_SQLSET and DBMS_SQLSET.REMAP_SQLSET procedures.

Table 183-11 REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

Parameter	Description
old_sqlset_name	Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported.
old_sqlset_owner	Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner
new_sqlset_name	Specifies the new name for the tuning set, or NULL to keep the same tuning set name.
new_sqlset_owner	Specifies the new owner for the tuning set, or NULL to keep the same owner name.
staging_table_name	Specifies the name of the table on which to perform the remap operation. The value is case sensitive.
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.
old_con_dbid	Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.
new_con_dbid	Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.

Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

Examples

```

-- Change the name of an STS in the staging table before unpacking it.
BEGIN
  DBMS_SQLSET.REMAP_STGTAB(
    old_sqlset_name =>
'my_workload'
    , old_sqlset_owner => 'SH'
    , new_sqlset_name =>
'imp_workload'
    , staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
  DBMS_SQLSET.REMAP_STGTAB(
    old_sqlset_name => 'imp_workload'
    , old_sqlset_owner => 'SH'
    , new_sqlset_owner => 'SYS'
    , staging_table_name => 'STGTAB_SQLSET');
END;

```

183.4.10 REMOVE_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

Syntax

```

DBMS_SQLSET.REMOVE_REFERENCE (
  sqlset_name   IN VARCHAR2,
  reference_id  IN NUMBER,
  sqlset_owner  IN VARCHAR2 := NULL,
  force_remove IN NUMBER   := 0);

```

Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

Table 183-12 REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the name of the SQL tuning set.
<code>reference_id</code>	Specifies the identifier of the reference to remove.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set (or <code>NULL</code> for the current schema owner).

Table 183-12 (Cont.) REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
<code>force_remove</code>	Specifies whether references can be removed for other users (1) or whether they cannot be removed (0). Setting this parameter to 1 only takes effect when the user has the ADMINISTER ANY SQL TUNING SET privilege. Otherwise, the database only removes references owned by the user.

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLSET.REMOVE_REFERENCE(sqlset_name => 'my_workload', -
                                reference_id => :rid);
```

Use the `DBA_SQLSET_REFERENCES` view to find all references to a given SQL tuning set.

183.4.11 SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

Syntax

```
DBMS_SQLSET.SELECT_CURSOR_CACHE (
  basic_filter      IN  VARCHAR2 := NULL,
  object_filter    IN  VARCHAR2 := NULL,
  ranking_measure1 IN  VARCHAR2 := NULL,
  ranking_measure2 IN  VARCHAR2 := NULL,
  ranking_measure3 IN  VARCHAR2 := NULL,
  result_percentage IN  NUMBER   := 1,
  result_limit     IN  NUMBER   := NULL,
  attribute_list   IN  VARCHAR2 := 'TYPICAL',
  recursive_sql   IN  VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 183-13 SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
<code>basic_filter</code>	Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.

Table 183-13 (Cont.) SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
<code>object_filter</code>	Currently not supported.
<code>ranking_measure(n)</code>	Defines an <code>ORDER BY</code> clause on the selected SQL.
<code>result_percentage</code>	Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. The value applies only if one ranking measure is supplied.
<code>result_limit</code>	Defines the top limit SQL from the filtered source ranked by the ranking measure.
<code>attribute_list</code>	Specifies the list of SQL statement attributes to return in the result. Possible values are: <ul style="list-style-type: none"> • <code>TYPICAL</code> — Specifies <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list (default). • <code>BASIC</code> — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. • <code>ALL</code> — Specifies all attributes. • Comma-separated list of attribute names. This values returns only a subset of SQL attributes: <ul style="list-style-type: none"> – <code>EXECUTION_STATISTICS</code> – <code>BIND_LIST</code> – <code>OBJECT_LIST</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> — Similar to <code>SQL_PLAN</code> plus row source statistics
<code>recursive_sql</code>	Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code> , which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).

Return Values

This function returns a one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

Example 183-1 Statements with 500 or More Buffer Gets

This query obtains the SQL IDs and SQL text for statements with 500 buffer gets:

```
SELECT SQL_ID, SQL_TEXT
FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;
```

Example 183-2 All Information About a Statement

The following query obtains all information about the SQL statement with the SQL ID 4rm4183czbs7j:

```
SELECT * FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('sql_id =
''4rm4183czbs7j''));
```

Example 183-3 Multiple Plans for a SQL Statement

A data source may store multiple plans for each SQL statement. The output of the SELECT_CURSOR_CACHE function is a SQL row set object that is uniquely identified by SQL ID and plan hash value. This example queries the plan hash values for the statement with the SQL ID ay1m3ssvtrh24:

```
SELECT sql_id, plan_hash_value
FROM table(DBMS_SQLSET.select_cursor_cache('sql_id =
''ay1m3ssvtrh24''))
ORDER BY sql_id, plan_hash_value;
```

Example 183-4 Processing All Statements in the Shared SQL Area

This example processes all statements in the shared SQL area:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE) p;

  -- Process each statement in cursor (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

Example 183-5 Process Statements Not Parsed by SYS

This example processes all statements not parsed in the SYS schema:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(p)
    FROM TABLE(
      DBMS_SQLSET.SELECT_CURSOR_CACHE('parsing_schema_name <>
''SYS'')) p;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
```

```
end;  
/
```

Example 183-6 All Statements from an Application Module and Action

This example processes all statements from a specified application module and action:

```
DECLARE  
  cur sys_refcursor;  
BEGIN  
  OPEN cur FOR  
    SELECT VALUE(p)  
    FROM TABLE(  
      DBMS_SQLSET.SELECT_CURSOR_CACHE(  
        'module = 'MY_APPLICATION' and action = 'MY_ACTION'')) p;  
  
  -- Process each statement (or pass cursor to load_sqlset)  
  
  CLOSE cur;  
END;/
```

Example 183-7 All Statements Whose Elapsed Time Is At Least Five Seconds

This example processes all statements that ran for at least five seconds:

```
DECLARE  
  cur sys_refcursor;  
BEGIN  
  OPEN cur FOR  
    SELECT VALUE(P)  
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;  
  
  -- Process each statement (or pass cursor to load_sqlset)  
  
  CLOSE cur;  
END;  
/
```

Example 183-8 Statements Parsed in the APPS Schema

This example processes all SQL statements that were parsed in the APPS schema and had more than 100 buffer gets:

```
DECLARE  
  cur sys_refcursor;  
BEGIN  
  OPEN cur FOR  
    SELECT VALUE(p)  
    FROM TABLE(  
      DBMS_SQLSET.SELECT_CURSOR_CACHE(  
        'buffer_gets > 100 and parsing_schema_name = 'APPS''))p;  
  
  -- Process each statement (or pass cursor to load_sqlset)
```

```

    CLOSE cur;
END;
/

```

Example 183-9 Plans and SQL Statements

This example processes all SQL statements exceeding 5 seconds. It also selects the plans for these statements. For performance reasons, the example selects execution statistics and SQL binds. The `SQL_PLAN` attribute of `sqlset_row` is `NULL`.

```

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and
-- binds
-- for performance reasons - in this case the SQL_PLAN attribute of
-- sqlset_row
-- is NULL)
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
            basic_filter      => 'elapsed_time > 5000000',
            object_filter     => NULL,
            ranking_measure1  => NULL,
            ranking_measure2  => NULL,
            ranking_measure3  => NULL,
            result_percentage => 1,
            result_limit      => NULL,
            attribute_list    => 'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN',
            recursive_sql     => HAS_RECURSIVE_SQL)) p;

    -- Process each statement (or pass cursor to load_sqlset)

    CLOSE cur;
END;/

```

Example 183-10 Top 100 Statements Ordered by Elapsed Time

This example selects the top 100 statements in the shared SQL area, ordered by elapsed time:

```

DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
            basic_filter      => NULL,
            object_filter     => NULL,
            ranking_measure_1 => 'ELAPSED_TIME',
            ranking_measure_2 => NULL,
            ranking_measure_3 => NULL,
            result_percentage => 1,

```

```

        result_limit      => 100,
        attribute_list    => 'TYPICAL',
        recursive_sql     => HAS_RECURSIVE_SQL))) p;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;
/

```

Example 183-11 Statements Responsible for Most Buffer Gets

This example processes statements that cumulatively account for 90% of the buffer gets in the shared SQL area. The buffer gets of all statements added together is approximately 90% of the sum of all statements currently in the shared SQL area.

```

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE(
      basic_filter      => NULL,
      object_filter     => NULL,
      ranking_measure_1 => 'BUFFER_GETS',
      ranking_measure_2 => NULL,
      ranking_measure_3 => NULL,
      result_percentage => .9,
      result_limit      => NULL,
      attribute_list    => 'TYPICAL',
      recursive_sql     => HAS_RECURSIVE_SQL))) p;

-- Process each statement (or pass cursor to load_sqlset).

CLOSE cur;
END;
/

```

183.4.12 SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

Syntax

```

DBMS_SQLSET.SELECT_SQL_TRACE (
  directory          IN VARCHAR2,
  file_name          IN VARCHAR2 := NULL,
  mapping_table_name IN VARCHAR2 := NULL,
  mapping_table_owner IN VARCHAR2 := NULL,
  select_mode        IN POSITIVE := SINGLE_EXECUTION,
  options            IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start      IN VARCHAR2 := NULL,

```

```

pattern_end          IN VARCHAR2 := NULL,
result_limit         IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 183-14 SELECT_SQL_TRACE Function Parameters

Parameter	Description
directory	Defines the directory object containing the trace files. This field is mandatory.
file_name	Specifies all or part of the name of the trace files. If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names.
mapping_table_name	Specifies the mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.
mapping_table_owner	Specifies the mapping table owner. If it is NULL, then the function uses the current user.
select_mode	Specifies the mode for selecting SQL from the trace. Possible values are: <ul style="list-style-type: none"> SINGLE_EXECUTION — Returns one execution of a SQL. This is the default. ALL_EXECUTIONS — Returns all executions.
options	Specifies which types of SQL statements are returned. <ul style="list-style-type: none"> LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default. ALL_COMMAND_TYPE — Returns the SQL statements with all command types.
pattern_start	Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE.
pattern_end	Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE.
result_limit	Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.

Return Values

This function returns a `SQLSET_ROW` object.

Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with `SELECT` privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the `PATH_PREFIX` clause of the `CREATE PLUGGABLE DATABASE` statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLSET.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT value(p)
     FROM TABLE(
       DBMS_SQLSET.SELECT_SQL_TRACE(
         directory=>'SQL_TRACE_DIR',
         file_name=>'%trc',
         mapping_table_name=>'mapping')) p;
  DBMS_SQLSET.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
/
```

183.4.13 SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

 **See Also:**

Oracle Database Testing Guide for a `SELECT_SQLPA_TASK` example

Syntax

```
DBMS_SQLSET.SELECT_SQLPA_TASK(  
    task_name          IN VARCHAR2,  
    task_owner        IN VARCHAR2 := NULL,  
    execution_name     IN VARCHAR2 := NULL,  
    level_filter       IN VARCHAR2 := 'REGRESSED',  
    basic_filter       IN VARCHAR2 := NULL,  
    object_filter      IN VARCHAR2 := NULL,  
    attribute_list     IN VARCHAR2 := 'TYPICAL')  
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 183-15 SELECT_SQLPA_TASK Function Parameters

Parameter	Description
<code>task_name</code>	Specifies the name of the SQL Performance Analyzer task.
<code>task_owner</code>	Specifies the owner of the SQL Performance Analyzer task. If <code>NULL</code> , then assume the current user.
<code>execution_name</code>	Specifies the name of the SQL Performance Analyzer task execution (type <code>COMPARE PERFORMANCE</code>) from which the provided filters will be applied. If <code>NULL</code> , then assume the most recent <code>COMPARE PERFORMANCE</code> execution.

Table 183-15 (Cont.) SELECT_SQLPA_TASK Function Parameters

Parameter	Description
level_filter	<p>Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</p> <ul style="list-style-type: none"> IMPROVED includes only improved SQL. REGRESSED includes only regressed SQL (default). CHANGED includes only SQL with changed performance. UNCHANGED includes only SQL with unchanged performance. CHANGED_PLANS includes only SQL with plan changes. UNCHANGED_PLANS includes only SQL with unchanged plans. ERRORS includes only SQL with errors only. MISSING_SQL includes only missing SQL statements (across STS). NEW_SQL includes only new SQL statements (across STS).
basic_filter	Specifies the SQL predicate to filter the SQL in addition to the level filters.
object_filter	Currently not supported.
attribute_list	<p>Defines the SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default. BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. ALL — Returns all attributes. Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).

Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

183.4.14 SELECT_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

Syntax

```
DBMS_SQLSET.SELECT_SQLSET (
  sqlset_name      IN   VARCHAR2,
  basic_filter     IN   VARCHAR2 := NULL,
  object_filter    IN   VARCHAR2 := NULL,
  ranking_measure1 IN   VARCHAR2 := NULL,
  ranking_measure2 IN   VARCHAR2 := NULL,
  ranking_measure3 IN   VARCHAR2 := NULL,
```

```

result_percentage IN NUMBER := 1,
result_limit     IN NUMBER := NULL)
attribute_list   IN VARCHAR2 := 'TYPICAL',
plan_filter      IN VARCHAR2 := NULL,
sqlset_owner     IN VARCHAR2 := NULL,
recursive_sql    IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 183-16 SELECT_SQLSET Function Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set to query.
basic_filter	Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the <code>SQLSET_ROW</code> .
object_filter	Currently not supported.
ranking_measure(n)	Specifies an <code>ORDER BY</code> clause on the selected SQL.
result_percentage	Specifies a filter that picks the top <i>n%</i> according to the supplied ranking measure. Note that this parameter applies only if one ranking measure is supplied.
result_limit	The top limit SQL from the filtered source, ranked by the ranking measure.
attribute_list	Defines the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> • <code>BASIC</code> — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result. • <code>TYPICAL</code> — Returns <code>BASIC</code> plus the SQL plan, but without row source statistics and without the object reference list. This is the default. • <code>ALL</code> — Returns all attributes. • Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: <ul style="list-style-type: none"> – <code>EXECUTION_STATISTICS</code> – <code>SQL_BINDS</code> – <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics)

Table 183-16 (Cont.) SELECT_SQLSET Function Parameters

Parameter	Description
<code>plan_filter</code>	<p>Specifies the plan filter.</p> <p>This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:</p> <ul style="list-style-type: none"> • <code>LAST_GENERATED</code> — Returns the plan with the most recent timestamp. • <code>FIRST_GENERATED</code> — Returns the plan with the least recent timestamp. • <code>LAST_LOADED</code> — Returns the plan with the most recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>FIRST_LOADED</code> — Returns the plan with the least recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>MAX_ELAPSED_TIME</code> — Returns the plan with the maximum elapsed time. • <code>MAX_BUFFER_GETS</code> — Returns the plan with the maximum buffer gets. • <code>MAX_DISK_READS</code> — Returns the plan with the maximum disk reads. • <code>MAX_DIRECT_WRITES</code> — Returns the plan with the maximum direct writes. • <code>MAX_OPTIMIZER_COST</code> — Returns the plan with the maximum optimizer cost value.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.
<code>recursive_sql</code>	Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code> , which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
      FROM table(DBMS_SQLSET.SELECT_SQLSET('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)
```

```

    CLOSE cur;
END;
/

```

183.4.15 SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

Syntax

```

DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  basic_filter    IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit    IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := 'TYPICAL',
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;

```

```

DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
  baseline_name   IN VARCHAR2,
  basic_filter    IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit    IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := 'TYPICAL',
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 183-17 SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
<code>begin_snap</code>	Defines the beginning AWR snapshot (non-inclusive).
<code>end_snap</code>	Defines the ending AWR snapshot (inclusive).

Table 183-17 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
baseline_name	Specifies the name of the AWR baseline period.
basic_filter	Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .
object_filter	Currently not supported.
ranking_measure(n)	Defines an <code>ORDER BY</code> clause on the selected SQL.
result_percentage	Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.
result_limit	Specifies the top limit SQL from the source according to the supplied ranking measure.
attribute_list	Specifies the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> • <code>TYPICAL</code> — Returns <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list. This is the default. • <code>BASIC</code> — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. • <code>ALL</code> — Returns all attributes • Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics).
recursive_sql	Specifies the filter that includes recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>) or excludes it (<code>NO_RECURSIVE_SQL</code>).
dbid	Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the function uses the current database DBID.

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
```

```

OPEN cur FOR
  SELECT VALUE (P)
  FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;
/

```

183.4.16 UNPACK_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

Syntax

```

DBMS_SQLSET.UNPACK_STGTAB (
  sqlset_name          IN VARCHAR2 := '%',
  sqlset_owner         IN VARCHAR2 := NULL,
  replace              IN BOOLEAN,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);

```

Parameters

The parameters are identical for DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET and DBMS_SQLSET.UNPACK_STGTAB.

Table 183-18 UNPACK_STGTAB_SQLSET and UNPACK_STGTAB Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table.
sqlset_owner	Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported.
replace	Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.
staging_table_name	Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive).
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).

Examples

```
-- unpack all STS in the staging table
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name      => '%', -
                               sqlset_owner     => '%', -
                               replace          => FALSE, -
                               staging_table_name => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the
-- same name/owner as STS on the system. In this case, users should call
-- remap_stgtab_sqlset to patch the staging table and with which to call
unpack
-- Replace set to TRUE.
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name      => '%', -
                               sqlset_owner     => '%', -
                               replace          => TRUE, -
                               staging_table_name => 'STGTAB_SQLSET');
```

183.4.17 UPDATE_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

Syntax

```
DBMS_SQLSET.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  plan_hash_value  IN  NUMBER := NULL,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  VARCHAR2 := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL);
```

```
DBMS_SQLSET.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  plan_hash_value  IN  NUMBER := NULL,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  NUMBER := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL);
```

Parameters

Table 183-19 UPDATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
sql_id	Specifies the identifier of the SQL statement to be updated.
plan_hash value	Specifies the hash value of the execution plan for a SQL statement. Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.

Table 183-19 (Cont.) UPDATE_SQLSET Procedure Parameters

Parameter	Description
attribute_name	<p>Specifies the name of the attribute to be modified.</p> <p>You can update the text field for <code>MODULE</code>, <code>ACTION</code>, <code>PARSING_SCHEMA_NAME</code>, and <code>OTHER</code>. The only numerical field that you can update is <code>PRIORITY</code>.</p> <p>If a statement has multiple plans, then the procedure changes the attribute value for all plans.</p>
attribute_value	<p>Specifies the new value of the attribute.</p>

DBMS_SQLTUNE

The `DBMS_SQLTUNE` package is the interface for tuning SQL on demand. The related package `DBMS_AUTO_SQLTUNE` package provides the interface for SQL Tuning Advisor run as an automated task.

The chapter contains the following topics:

- [DBMS_SQLTUNE Overview](#)
- [DBMS_SQLTUNE Security Model](#)
- [DBMS_SQLTUNE Data Structures](#)
- [DBMS_SQLTUNE Subprogram Groups](#)
- [Summary of DBMS_SQLTUNE Subprograms](#)

See Also:

["DBMS_AUTO_SQLTUNE Overview"](#)

184.1 DBMS_SQLTUNE Overview

The `DBMS_SQLTUNE` package provides a number of interrelated areas of functionality.

This section contains the following topics:

- [DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#)
- [DBMS_SQLTUNE SQL Profile Subprograms](#)
- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#)

SQL Tuning Advisor

SQL Tuning Advisor is one of a suite of advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, SQL Tuning Advisor automates tuning of problematic SQL statements. It takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advisor provides the advice in the form of SQL actions for tuning the SQL along with their expected performance benefit.

The group of [DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) provide a task-oriented interface that enables you to access the advisor. You can call the following subprograms in the order given to use some of SQL Tuning Advisor's features:

1. [CREATE_TUNING_TASK Functions](#) creates a tuning task for tuning one or more SQL statements.
2. The [EXECUTE_TUNING_TASK Function and Procedure](#) executes a previously created tuning task.

3. The [REPORT_TUNING_TASK Function](#) displays the results of a tuning task.
4. You use the [SCRIPT_TUNING_TASK Function](#) to create a SQL*Plus script which can then be executed to implement a set of Advisor recommendations

SQL Profile Subprograms

SQL Tuning Advisor may recommend the creation of a SQL profile to improve the performance of a statement. SQL profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of [DBMS_SQLTUNE SQL Profile Subprograms](#) provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the [ACCEPT_SQL_PROFILE Procedure and Function](#) to accept a SQL profile recommended by SQL Tuning Advisor.
- You can alter the `STATUS`, `NAME`, `DESCRIPTION`, and `CATEGORY` attributes of an existing SQL profile with the [ALTER_SQL_PROFILE Procedure](#).
- You can drop a SQL profile with the [DROP_SQL_PROFILE Procedure](#).

SQL Tuning Sets

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the [SELECT_CURSOR_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT_WORKLOAD_REPOSITORY Function](#)
- Other SQL tuning sets using the [SELECT_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT_SQLPA_TASK Function](#)
- SQL Trace files using the [SELECT_SQL_TRACE Function](#)
- A user-defined workload

The complete group of [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) facilitates this functionality. As examples:

- The [CREATE_SQLSET Procedure and Function](#) creates a SQL tuning set object in the database.

- The [LOAD_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL.
- The [CAPTURE_CURSOR_CACHE_SQLSET Procedure](#) collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

 **Note:**

When manipulating SQL tuning sets, you can use [DBMS_SQLSET](#) as an alternative to `DBMS_SQLTUNE`.

Import and Export of SQL Tuning Sets and SQL Profiles

Use `DBMS_SQLTUNE` subprograms to move SQL profiles and SQL tuning sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source database and populate this staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as Oracle Data Pump, or a database link), where it is used to reconstitute the objects in their original form. The following steps are implemented by means of subprograms included in this package:

1. To create the staging table on the source system, call the [CREATE_STGTAB_SQLPROF Procedure](#) or the [CREATE_STGTAB_SQLSET Procedure](#).
2. To populate the staging table with information from the source system, call the [PACK_STGTAB_SQLPROF Procedure](#) or [PACK_STGTAB_SQLSET Procedure](#).
3. Move the staging table to the destination system.
4. To re-create the object on the new system, call the [UNPACK_STGTAB_SQLPROF Procedure](#) or the [UNPACK_STGTAB_SQLSET Procedure](#).

 **See Also:**

Oracle Database SQL Tuning Guide for more information about programmatic flow

Automatic Tuning Task Functions

The automated system task `SYS_AUTO_SQL_TUNING_TASK` is created by the database as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

You can obtain a report on the activity of the Automatic SQL Tuning task through the `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK` API.

 **See Also:**

[DBMS_AUTO_SQLTUNE](#) for the list of subprograms that you can use to manage the automated SQL tuning task.

Real-Time SQL Monitoring

Real-time SQL Monitoring enables DBAs or performance analysts to monitor the execution of long-running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated in almost real time during statement execution. The `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views expose these statistics. In addition, `DBMS_SQLTUNE` provides the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions to report monitoring information.

Note:

`DBMS_SQL_MONITOR` also contains the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions.

Tuning a Standby Database Workload

In some cases, a standby database can assume a reporting role in addition to its data protection role. The standby database can have its own workload of queries, some of which may require tuning. You can issue SQL Tuning Advisor statements on a standby database, which is read-only. A standby-to-primary database link enables `DBMS_SQLTUNE` to write data to and read data from the primary database. The procedures that are eligible for tuning standby workloads include the `database_link_to` parameter.

184.2 DBMS_SQLTUNE Security Model

This package is available to `PUBLIC` and performs its own security checking.

Note the following:

- Because SQL Tuning Advisor relies on the advisor framework, all tuning task interfaces (`*_TUNING_TASK`) require the `ADVISOR` privilege.
- SQL tuning set subprograms (`*_SQLSET`) require either of the following privileges:
 - `ADMINISTER SQL TUNING SET`
You can only create and modify a SQL tuning set that you own.
 - `ADMINISTER ANY SQL TUNING SET`
You can operate on all SQL tuning sets, even those owned by other users.
- In earlier releases, three different privileges were needed to invoke subprograms involving SQL profiles:
 - `CREATE ANY SQL PROFILE`
 - `ALTER ANY SQL PROFILE`
 - `DROP ANY SQL PROFILE`

The preceding privileges have been deprecated in favor of `ADMINISTER SQL MANAGEMENT OBJECT`.

184.3 DBMS_SQLTUNE Data Structures

The `SELECT_*` subprograms in the `DBMS_SQLTUNE` package return objects of the `SQLSET_ROW` type.

Object Types

- [SQLSET_ROW Object Type](#)

184.3.1 SQLSET_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of `SQLSET_ROW` objects. Each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_*` subprograms each model a data source as a collection of `SQLSET_ROW` objects, with each object uniquely identified by `(sql_id, plan_hash_value)`. Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (
  sql_id                VARCHAR(13),
  force_matching_signature NUMBER,
  sql_text              CLOB,
  object_list          sql_objects,
  bind_data            RAW(2000),
  parsing_schema_name  VARCHAR2(30),
  module               VARCHAR2(48),
  action               VARCHAR2(32),
  elapsed_time         NUMBER,
  cpu_time             NUMBER,
  buffer_gets          NUMBER,
  disk_reads           NUMBER,
  direct_writes        NUMBER,
  rows_processed       NUMBER,
  fetches              NUMBER,
  executions           NUMBER,
  end_of_fetch_count   NUMBER,
  optimizer_cost       NUMBER,
  optimizer_env        RAW(2000),
  priority             NUMBER,
  command_type         NUMBER,
  first_load_time      VARCHAR2(19),
  stat_period          NUMBER,
  active_stat_period   NUMBER,
  other                CLOB,
  plan_hash_value      NUMBER,
```

```

sql_plan          sql_plan_table_type,
bind_list         sql_binds,
con_dbid         NUMBER,
last_exec_start_time  VARCHAR2(19))

```

Attributes

Table 184-1 SQLSET_ROW Attributes

Attribute	Description
sql_id	Unique SQL ID.
forcing_matching_signature	Signature with literals, case, and whitespace removed.
sql_text	Full text for the SQL statement.
object_list	Currently not implemented.
bind_data	Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for <code>bind_list</code> - they are mutually exclusive.
parsing_schema_name	Schema where the SQL is parsed.
module	Last application module for the SQL.
action	Last application action for the SQL.
elapsed_time	Sum total elapsed time for this SQL statement.
cpu_time	Sum total CPU time for this SQL statement.
buffer_gets	Sum total number of buffer gets.
disk_reads	Sum total number of disk reads.
direct_writes	Sum total number of direct path writes.
rows_processed	Sum total number of rows processed by this SQL.
fetches	Sum total number of fetches.
executions	Total executions of this SQL statement.
end_of_fetch_count	Number of times the SQL statement was fully executed with all of its rows fetched.
optimizer_cost	Optimizer cost for this SQL.
optimizer_env	Optimizer environment for this SQL statement.
priority	User-defined priority (1,2,3).
command_type	Statement type, such as <code>INSERT</code> or <code>SELECT</code> .
first_load_time	Load time of the parent cursor.
stat_period	Period of time (seconds) when the statistics of this SQL statement were collected.
active_stat_period	Effective period of time (in seconds) during which the SQL statement was active.
other	Other column for user-defined attributes.
plan_hash_value	Plan hash value of the plan.
sql_plan	Execution plan for the SQL statement.

Table 184-1 (Cont.) SQLSET_ROW Attributes

Attribute	Description
<code>bind_list</code>	List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for <code>bind_data</code> : they are mutually exclusive.
<code>con_dbid</code>	DBID of the PDB or CDB root.
<code>last_exec_start_time</code>	Most recent execution start time of this SQL statement.

184.4 DBMS_SQLTUNE Subprogram Groups

DBMS_SQLTUNE subprograms are grouped by function.

- [DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#)
- [DBMS_SQLTUNE SQL Profile Subprograms](#)
- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#)
- [DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms](#)
- [DBMS_SQLTUNE SQL Performance Reporting Subprograms](#)

184.4.1 DBMS_SQLTUNE SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

Table 184-2 SQL Tuning Task Subprograms

Subprogram	Description
" CANCEL_TUNING_TASK Procedure "	Cancels the currently executing tuning task
" CREATE_SQL_PLAN_BASELINE Procedure "	Creates a SQL plan baseline for an existing plan
" CREATE_TUNING_TASK Functions "	Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor
" DROP_TUNING_TASK Procedure "	Drops a SQL tuning task
" EXECUTE_TUNING_TASK Function and Procedure "	Executes a previously created tuning task
" IMPLEMENT_TUNING_TASK Procedure "	Implements a set of SQL profile recommendations made by SQL Tuning Advisor
" INTERRUPT_TUNING_TASK Procedure "	Interrupts the currently executing tuning task
" REPORT_AUTO_TUNING_TASK Function "	Displays a report from the automatic tuning task, reporting on a range of executions
" REPORT_TUNING_TASK Function "	Displays the results of a tuning task
" RESET_TUNING_TASK Procedure "	Resets the currently executing tuning task to its initial state
" RESUME_TUNING_TASK Procedure "	Resumes a previously interrupted task that was created to process a SQL tuning set

Table 184-2 (Cont.) SQL Tuning Task Subprograms

Subprogram	Description
" SCHEDULE_TUNING_TASK Function "	Creates a tuning task and schedules its execution as a scheduler job
" SCRIPT_TUNING_TASK Function "	Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations
" SET_TUNING_TASK_PARAMETER Procedures "	Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER

"[Summary of DBMS_SQLTUNE Subprograms](#)" contains a complete listing of all subprograms in the package.

184.4.2 DBMS_SQLTUNE SQL Profile Subprograms

This subprogram group provides an interface to manage SQL profiles.

Table 184-3 SQL Profile Subprograms

Subprogram	Description
ACCEPT_ALL_SQL_PROFILES Procedure	Accepts all SQL profiles recommended by a specific execution of a tuning task
ACCEPT_SQL_PROFILE Procedure and Function	Creates a SQL profile for the specified tuning task
ALTER_SQL_PROFILE Procedure	Alters specific attributes of an existing SQL profile object
CREATE_STGTAB_SQLPROF Procedure	Creates the staging table used for copying SQL profiles from one system to another
DROP_SQL_PROFILE Procedure	Drops the named SQL profile from the database
PACK_STGTAB_SQLPROF Procedure	Moves profile data out of the SYS schema into the staging table
REMAP_STGTAB_SQLPROF Procedure	Changes the profile data values kept in the staging table prior to performing an unpack operation
SQLTEXT_TO_SIGNATURE Function	Returns a SQL text's signature
UNPACK_STGTAB_SQLPROF Procedure	Uses the profile data stored in the staging table to create profiles on this system

"[Summary of DBMS_SQLTUNE Subprograms](#)" contains a complete listing of all subprograms in the package.

184.4.3 DBMS_SQLTUNE SQL Tuning Set Subprograms

This subprogram group provides an interface to manage SQL tuning sets.

Table 184-4 SQL Tuning Set Subprograms

Subprogram	Description
ADD_SQLSET_REFERENCE Function	Adds a new reference to an existing SQL tuning set to indicate its use by a client
CAPTURE_CURSOR_CACHE_SQLSET Procedure	Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set
CREATE_SQLSET Procedure and Function	Creates a SQL tuning set object in the database
CREATE_STGTAB_SQLSET Procedure	Creates a staging table through which SQL Tuning Sets are imported and exported
DELETE_SQLSET Procedure	Deletes a set of SQL statements from a SQL tuning set
DROP_SQLSET Procedure	Drops a SQL tuning set if it is not active
LOAD_SQLSET Procedure	Populates the SQL tuning set with a set of selected SQL
PACK_STGTAB_SQLSET Procedure	Copies tuning sets out of the SYS schema into the staging table
REMAP_STGTAB_SQLSET Procedure	Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system
REMOVE_SQLSET_REFERENCE Procedure	Deactivates a SQL tuning set to indicate it is no longer used by the client
SELECT_CURSOR_CACHE Function	Collects SQL statements from the shared SQL area
SELECT_SQL_TRACE Function	Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code>
SELECT_SQLPA_TASK Function	Collects SQL statements from a SQL performance analyzer comparison task
SELECT_SQLSET Function	Collects SQL statements from an existing SQL tuning set
SELECT_WORKLOAD_REPOSITORY Function	Collects SQL statements from the workload repository
UNPACK_STGTAB_SQLSET Procedure	Copies one or more SQL tuning sets from the staging table
UPDATE_SQLSET Procedures	Updates whether selected string fields for a SQL statement in a SQL tuning set or the set numerical attributes of a SQL in a SQL tuning set

The [Summary of DBMS_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

184.4.4 DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms

This subprogram group provides function to report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`.

Table 184-5 Real-Time SQL Monitoring Subprograms

Subprogram	Description
REPORT_SQL_MONITOR Function	Reports on Real-Time SQL Monitoring
REPORT_SQL_MONITOR_LIST Function	Builds a report for all or a subset of statements monitored by Oracle Database
REPORT_SQL_MONITOR_LIST_XML Function	Builds an XML report for all or a subset of statements monitored by Oracle Database

184.4.5 DBMS_SQLTUNE SQL Performance Reporting Subprograms

This subprogram group provides detailed reports on SQL performance using statistics from the shared SQL area and automatic workload repository (AWR).

Table 184-6 SQL Performance Reporting Subprograms

Subprogram	Description
REPORT_SQL_DETAIL Function	This function reports on a specific SQL ID.
REPORT_SQL_MONITOR Function	This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.
REPORT_SQL_MONITOR_LIST Function	This function builds a report for all or a sub-set of statements monitored by Oracle. For each statement, the subprogram gives key information and associated global statistics.
REPORT_TUNING_TASK Function	This function displays the results of a tuning task.
REPORT_TUNING_TASK_XML Function	This function displays an XML report of a tuning task.

184.5 Summary of DBMS_SQLTUNE Subprograms

This table lists the DBMS_SQLTUNE subprograms and briefly describes them.

Table 184-7 DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
ACCEPT_ALL_SQL_PROFILES Procedure	Accepts all SQL profiles recommended by a particular execution of a particular tuning task	DBMS_SQLTUNE SQL Profile Subprograms
ACCEPT_SQL_PROFILE Procedure and Function	Creates a SQL profile for the specified tuning task	DBMS_SQLTUNE SQL Profile Subprograms
ADD_SQLSET_REFERENCE Function	Adds a new reference to an existing SQL tuning set to indicate its use by a client	DBMS_SQLTUNE SQL Tuning Set Subprograms
ALTER_SQL_PROFILE Procedure	Alters specific attributes of an existing SQL profile object	DBMS_SQLTUNE SQL Profile Subprograms

Table 184-7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
CANCEL_TUNING_TASK Procedure	Cancels the currently executing tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
CAPTURE_CURSOR_CACHE_SQLSET Procedure	Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms
CREATE_SQL_PLAN_BASELINE Procedure	Creates a SQL plan baseline for an existing plan	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
CREATE_SQLSET Procedure and Function	Creates a SQL tuning set object in the database	DBMS_SQLTUNE SQL Tuning Set Subprograms
CREATE_STGTAB_SQLPROF Procedure	Creates the staging table used for copying SQL profiles from one system to another	DBMS_SQLTUNE SQL Profile Subprograms
CREATE_STGTAB_SQLSET Procedure	Creates a staging table through which SQL tuning sets are imported and exported	DBMS_SQLTUNE SQL Tuning Set Subprograms
CREATE_TUNING_TASK Functions	Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
DELETE_SQLSET Procedure	Deletes a set of SQL statements from a SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms
DROP_SQL_PROFILE Procedure	Drops the named SQL profile from the database	DBMS_SQLTUNE SQL Profile Subprograms
DROP_SQLSET Procedure	Drops a SQL tuning set if it is not active	DBMS_SQLTUNE SQL Tuning Set Subprograms
DROP_TUNING_TASK Procedure	Drops a SQL tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
EXECUTE_TUNING_TASK Function and Procedure	Executes a previously created tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
IMPLEMENT_TUNING_TASK Procedure	implements a set of SQL profile recommendations made by SQL Tuning Advisor	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
INTERRUPT_TUNING_TASK Procedure	Interrupts the currently executing tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
LOAD_SQLSET Procedure	Populates the SQL tuning set with a set of selected SQL	DBMS_SQLTUNE SQL Tuning Set Subprograms
PACK_STGTAB_SQLPROF Procedure	Moves profile data out of the SYS schema into the staging table	DBMS_SQLTUNE SQL Profile Subprograms
PACK_STGTAB_SQLSET Procedure	Moves tuning sets out of the SYS schema into the staging table	DBMS_SQLTUNE SQL Tuning Set Subprograms

Table 184-7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
REMAP_STGTAB_SQLPROF Procedure	Changes the profile data values kept in the staging table prior to performing an unpack operation	DBMS_SQLTUNE SQL Profile Subprograms
REMAP_STGTAB_SQLSET Procedure	Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system	DBMS_SQLTUNE SQL Tuning Set Subprograms
REMOVE_SQLSET_REFERENCE Procedure	Deactivates a SQL tuning set to indicate it is no longer used by the client	DBMS_SQLTUNE SQL Tuning Set Subprograms
REPORT_AUTO_TUNING_TASK Function	Displays a report from the automatic tuning task, reporting on a range of subtasks	DBMS_SQLTUNE SQL Tuning Set Subprograms
REPORT_SQL_DETAIL Function	Reports on a specific SQL ID	DBMS_SQLTUNE SQL Performance Reporting Subprograms
REPORT_SQL_MONITOR Function	Builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution	DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
REPORT_SQL_MONITOR_LIST Function	Builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics	DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
REPORT_SQL_MONITOR_LIST_XML Function	Equivalent to the <code>REPORT_SQL_MONITOR_LIST</code> function, except that it returns <code>XMLType</code>	DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
REPORT_TUNING_TASK Function	Displays the results of a tuning task	DBMS_SQLTUNE SQL Performance Reporting Subprograms
REPORT_TUNING_TASK_XML Function	Displays an XML report of a tuning task	DBMS_SQLTUNE SQL Performance Reporting Subprograms
RESET_TUNING_TASK Procedure	Resets the currently executing tuning task to its initial state	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
RESUME_TUNING_TASK Procedure	Resumes a previously interrupted task that was created to process a SQL tuning set	DBMS_SQLTUNE SQL Tuning Advisor Subprograms

Table 184-7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
SCHEDULE_TUNING_TASK Function	Creates a SQL tuning task and schedule its execution as a scheduler job	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
SCRIPT_TUNING_TASK Function	Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
SELECT_CURSOR_CACHE Function	Collects SQL statements from the shared SQL area	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_SQL_TRACE Function	Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code>	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_SQLPA_TASK Function	Collects SQL statements from a SQL Performance Analyzer comparison task	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_SQLSET Function	Collects SQL statements from an existing SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_WORKLOAD_REPOSITORY Function	Collects SQL statements from the workload repository	DBMS_SQLTUNE SQL Tuning Set Subprograms
SET_TUNING_TASK_PARAMETER Procedures	Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
SQLTEXT_TO_SIGNATURE Function	Returns a SQL text's signature	DBMS_SQLTUNE SQL Profile Subprograms
UNPACK_STGTAB_SQLPROFILE Procedure	Uses the profile data stored in the staging table to create profiles on this system	DBMS_SQLTUNE SQL Profile Subprograms
UNPACK_STGTAB_SQLSET Procedure	Moves one or more SQL tuning sets from the staging table	DBMS_SQLTUNE SQL Tuning Set Subprograms
UPDATE_SQLSET Procedures	Updates selected fields for a SQL statement in a SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms

184.5.1 ACCEPT_ALL_SQL_PROFILES Procedure

This procedure accepts all SQL profiles recommended by a specific execution of a tuning task, and sets the attributes of the SQL profiles according to the parameter values passed by the user.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ACCEPT_ALL_SQL_PROFILES (
  task_name          IN VARCHAR2,
  category           IN VARCHAR2 := NULL,
  replace            IN BOOLEAN  := FALSE,
  force_match        IN BOOLEAN  := FALSE,
  profile_type       IN VARCHAR2 := REGULAR_PROFILE,
  autotune_period    IN NUMBER   := NULL,
  execution_name     IN VARCHAR2 := NULL,
  task_owner         IN VARCHAR2 := NULL,
  description        IN VARCHAR2 := NULL,
  database_link_to   IN VARCHAR2 := NULL);
```

Parameters

Table 184-8 ACCEPT_ALL_SQL_PROFILES Procedure Parameters

Parameter	Description
task_name	The (mandatory) name of the SQL tuning task
category	This is the category name which must match the value of the <code>SQLTUNE_CATEGORY</code> parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the <code>SQLTUNE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An <code>ACCEPT_SQL_PROFILE</code> fails if this combination is duplicated.
replace	If the profile already exists, it is replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> .
force_match	If <code>TRUE</code> this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>cursor_sharing</code> parameter. If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>cursor_sharing</code> parameter.
profile_type	Options: <ul style="list-style-type: none"> <code>REGULAR_PROFILE</code> - profile without a change to parallel execution (Default, equivalent to <code>NULL</code>). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan. <code>PX_PROFILE</code> - regular profile with a change to parallel execution

Table 184-8 (Cont.) ACCEPT_ALL_SQL_PROFILES Procedure Parameters

Parameter	Description
<code>autotune_period</code>	<p>The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows:</p> <ul style="list-style-type: none"> • null or negative value (default) - all or full. The result includes all task executions. • 0 - result of the current or most recent task execution. • 1 - result for the most recent 24-hour period. • 7 - result for the most recent 7-day period. <p>The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.</p>
<code>execution_name</code>	Name of the task execution to use. If null, then the procedure generates the report for the most recent task execution.
<code>task_owner</code>	Owner of the tuning task. This is an optional parameter that must be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.
<code>description</code>	A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.
<code>database_link_to</code>	<p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Security Model

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required. The `CREATE ANY SQL PROFILE` privilege is deprecated.

184.5.2 ACCEPT_SQL_PROFILE Procedure and Function

This subprogram creates a SQL profile recommended by SQL Tuning Advisor.

The SQL text is normalized for matching purposes although it is stored in the data dictionary in denormalized form for readability. SQL text is provided through a reference to the SQL

Tuning task. If the referenced SQL statement does not exist, then the database reports an error.

    force_match    IN  BOOLEAN   := FALSE,
    profile_type   IN  VARCHAR2 := REGULAR_PROFILE,
    database_link_to IN  VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 184-9 ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
task_name	The (mandatory) name of the SQL tuning task
object_id	The identifier of the advisor framework object representing the SQL statement associated with the tuning task
name	The name of the SQL profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system generates a unique name for the SQL profile.
description	A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.

Table 184-9 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
category	The category name. This name must match the value of the <code>SQLTUNE_CATEGORY</code> parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the <code>SQLTUNE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An <code>ACCEPT_SQL_PROFILE</code> fails if this combination is duplicated.
task_owner	Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.
replace	If the profile already exists, it is replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> .
force_match	If <code>TRUE</code> this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>cursor_sharing</code> parameter. If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>cursor_sharing</code> parameter.
profile_type	Options: <ul style="list-style-type: none"> • <code>REGULAR_PROFILE</code> - profile without a change to parallel execution (Default, equivalent to <code>NULL</code>). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan. • <code>PX_PROFILE</code> - regular profile with a change to parallel execution

Table 184-9 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
database_link_to	<p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Return Values

The name of the SQL profile.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required. The CREATE ANY SQL PROFILE privilege is deprecated.

Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement from the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```
VARIABLE stmt_task VARCHAR2(64);
VARIABLE sts_task VARCHAR2(64);

-- create a tuning task tune the statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    begin_snap => 1, -
    end_snap   => 2, -
    sql_id     => 'ay1m3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);
```

Note that you do not have to specify the ID (that is, `object_id`) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, `TEST`), so that it is not used by default.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
    task_name => :stmt_task, -
    category  => 'TEST');
```

You can use command `ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST'` to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same `force_matching_signature` as the tuned statement.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name => :stmt_task, -
                                       force_match => TRUE);
```

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to 5. You must pass an object ID to the `ACCEPT_SQL_PROFILE` procedure because there are potentially many SQL profiles for the tuning task. This object ID is given along with the report.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK ( -
    sqlset_name => 'my_workload', -
    rank1      => 'ELAPSED_TIME', -
    time_limit => 3600,           -
    description => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);

-- create the profile for the sql statement corresponding to object_id = 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
    task_name => :sts_task, -
    object_id => 5);
```

184.5.3 ADD_SQLSET_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
  sqlset_name IN VARCHAR2,
  description IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

Table 184-10 ADD_SQLSET_REFERENCE and ADD_REFERENCE Function Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the name of the SQL tuning set.
<code>description</code>	Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.

Return Values

The identifier of the added reference.

Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only. The function returns a reference ID that is used to remove it later. You use the `REMOVE_SQLSET_REFERENCE` procedure to delete references to a SQL tuning set.

```
VARIABLE rid NUMBER;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE( -
```

```
sqlset_name => 'my_workload', -
description => 'my sts reference');
```

You can use the `DBA_SQLSET_REFERENCES` view to find all references on a given SQL tuning set.

184.5.4 ALTER_SQL_PROFILE Procedure

This procedure alters specific attributes of an existing SQL profile object.

The following attributes can be altered (using these attribute names):

- `STATUS` can be set to `ENABLED` or `DISABLED`.
- `NAME` can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- `DESCRIPTION` can be set to any string of size no more than 500 characters.
- `CATEGORY` can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text).

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ALTER_SQL_PROFILE (
  name           IN  VARCHAR2,
  attribute_name IN  VARCHAR2,
  value          IN  VARCHAR2);
```

Parameters

Table 184-11 ALTER_SQL_PROFILE Procedure Parameters

Parameter	Description
<code>name</code>	The (mandatory) name of the existing SQL profile to alter
<code>attribute_name</code>	The (mandatory) attribute name to alter (case insensitive) using valid attribute names
<code>value</code>	The (mandatory) new value of the attribute using valid attribute values

Usage Notes

Requires the `ALTER ANY SQL PROFILE` privilege.

Examples

```
-- Disable a profile, so it is not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
```

```

                                attribute_name => 'STATUS', -
                                value           => 'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                attribute_name => 'STATUS', -
                                value           => 'ENABLED');

-- Change the category of the profile so it is used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this
profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                attribute_name => 'CATEGORY', -
                                value           => 'TEST');

-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                attribute_name => 'CATEGORY', -
                                value           => 'DEFAULT');

```

184.5.5 CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 184-12 CANCEL_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Specifies the name of the task to cancel

Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```

184.5.6 CAPTURE_CURSOR_CACHE_SQLSET Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (
  sqlset_name      IN VARCHAR2,
  time_limit       IN POSITIVE := 1800,
  repeat_interval  IN POSITIVE := 300,
  capture_option   IN VARCHAR2 := 'MERGE',
  capture_mode     IN NUMBER    := MODE_REPLACE_OLD_STATS,
  basic_filter     IN VARCHAR2 := NULL,
  sqlset_owner     IN VARCHAR2 := NULL,
  recursive_sql    IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

Table 184-13 CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the SQL tuning set name
<code>time_limit</code>	Defines the total amount of time, in seconds, to execute.
<code>repeat_interval</code>	Defines the amount of time, in seconds, to pause between sampling.
<code>capture_option</code>	Specifies whether to insert new statements, update existing statements, or both. Values are <code>INSERT</code> , <code>UPDATE</code> , or <code>MERGE</code> . The values are the same as for <code>load_option</code> in <code>load_sqlset</code> .

Table 184-13 (Cont.) CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
capture_mode	Specifies the capture mode (UPDATE and MERGE capture options). Possible values: <ul style="list-style-type: none"> MODE_REPLACE_OLD_STATS — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set MODE_ACCUMULATE_STATS — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.
basic_filter	Defines a filter to apply to the shared SQL area for each sample. If basic_filter is not set by the caller, then the subprogram captures only statements of type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.
sqlset_owner	Specifies the owner of the SQL tuning set or NULL for current schema owner
recursive_sql	Defines a filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the time_limit and repeat_interval parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                     sqlset_name      =>
'my_workload', -
                                     time_limit       => 30, -
                                     repeat_interval => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                     sqlset_name      => 'my_workload', -
                                     time_limit       => 30, -
                                     repeat_interval => 5, -
                                     capture_mode     =>
dbms_sqлтune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                     sqlset_name      => 'my_workload', -
                                     time_limit       => 30, -
                                     repeat_interval  => 5, -
                                     capture_option   => 'INSERT');
```

184.5.7 CREATE_SQL_PLAN_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by SQL Tuning Advisor.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_SQL_PLAN_BASELINE (
  task_name          IN VARCHAR2,
  object_id         IN NUMBER      := NULL,
  plan_hash_value   IN NUMBER,
  owner_name        IN VARCHAR2   := NULL,
  database_link_to  IN VARCHAR2   := NULL);
```

Parameters

Table 184-14 CREATE_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
task_name	Name of the task for which to get a script
object_id	Object ID to which the SQL corresponds
plan_hash_value	Plan to create plan baseline
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.

Table 184-14 (Cont.) CREATE_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
database_link_to	<p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

184.5.8 CREATE_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (
  sqlset_name IN VARCHAR2,
  description IN VARCHAR2 := NULL
  sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.CREATE_SQLSET (
  sqlset_name IN VARCHAR2 := NULL,
  description IN VARCHAR2 := NULL,
  sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 184-15 CREATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.
description	Provides an optional description of the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.

Examples

```
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-
  sqlset_name => 'my_workload', -
  description => 'complete application workload');
```

184.5.9 CREATE_STGTAB_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (
  table_name          IN VARCHAR2,
  schema_name        IN VARCHAR2 := NULL,
  tablespace_name     IN VARCHAR2 := NULL);
```

Parameters

Table 184-16 CREATE_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
table_name	The name of the table to create (case-insensitive unless double quoted).
schema_name	The schema to create the table in, or NULL for the current schema (case-insensitive unless double quoted).
tablespace_name	The tablespace to store the staging table within, or NULL for the default tablespace of the current user (case-insensitive unless double quoted).

Usage Notes

- Call this procedure once before issuing a call to the [PACK_STGTAB_SQLPROF Procedure](#).
- To put different SQL profiles in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.

Examples

Create a staging table to store profile data that can be moved to another system.

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name => 'PROFILE_STGTAB');
```

184.5.10 CREATE_STGTAB_SQLSET Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (
    table_name          IN VARCHAR2,
    schema_name        IN VARCHAR2 := NULL,
    tablespace_name    IN VARCHAR2 := NULL,
    db_version         IN NUMBER   := NULL);
```

Parameters

Table 184-17 CREATE_STGTAB_SQLSET and CREATE_STGTAB Procedure Parameters

Parameter	Description
table_name	Specifies the of the table to create. The name is case sensitive.
schema_name	Defines the schema in which to create the table, or NULL for the current schema. The name is case sensitive.
tablespace_name	Specifies the tablespace in which to store the staging table, or NULL for the default tablespace of the current user. The name is case sensitive.
db_version	Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use one of the following values: <ul style="list-style-type: none"> NULL (default) — Specifies the current database version. STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version. STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version. STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version.

Security Model

You must have CREATE TABLE permissions in the specified schema and tablespace.

Usage Notes

- Call this procedure once before packing the SQL set.

- To have different tuning sets in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.
- The staging table contains nested table columns and indexes, so it should not be renamed.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 11g Release 2 (11.2) format

```
BEGIN
  DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
    table_name => 'STGTAB_SQLSET'
  ,   db_version => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION );
END;
```

184.5.11 CREATE_TUNING_TASK Functions

This function creates a SQL Tuning Advisor task.

Note:

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the shared SQL area given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.
- Create a tuning task for SQL Performance Analyzer.

In all cases, the function mainly creates a SQL Tuning Advisor task and sets its parameters.

**See Also:**

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax**SQL text format:**

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sql_text          IN CLOB,
  bind_list         IN sql_binds := NULL,
  user_name         IN VARCHAR2  := NULL,
  scope             IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER     := TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL,
  con_name          IN VARCHAR2  := NULL,
  database_link_to IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER     := NULL,
  scope           IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER     := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2  := NULL,
  description     IN VARCHAR2  := NULL,
  con_name        IN VARCHAR2  := NULL,
  database_link_to IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

AWR format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  begin_snap       IN NUMBER,
  end_snap         IN NUMBER,
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER     := NULL,
  scope           IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER     := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2  := NULL,
  description     IN VARCHAR2  := NULL,
  con_name        IN VARCHAR2  := NULL,
  dbid            IN NUMBER     := NULL,
  database_link_to IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL tuning set format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sqlset_name      IN VARCHAR2,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter    IN VARCHAR2 := NULL,
  rank1            IN VARCHAR2 := NULL,
  rank2            IN VARCHAR2 := NULL,
  rank3            IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := NULL,
  result_limit     IN NUMBER   := NULL,
  scope            IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2 := NULL,
  description      IN VARCHAR2 := NULL,
  plan_filter      IN VARCHAR2 := 'MAX_ELAPSED_TIME',
  sqlset_owner     IN VARCHAR2 := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL Performance Analyzer format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  spa_task_name     IN VARCHAR2,
  spa_task_owner    IN VARCHAR2 := NULL,
  spa_compare_exec  IN VARCHAR2 := NULL,
  basic_filter      IN VARCHAR2 := NULL,
  time_limit        IN NUMBER   := TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2 := NULL,
  description       IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 184-18 *CREATE_TUNING_TASK Function Parameters*

Parameter	Description
sql_text	Specifies the text of a SQL statement.
begin_snap	Specifies the begin snapshot identifier.
end_snap	Specifies the end snapshot identifier.
sql_id	Specifies the identifier of a SQL statement.
bind_list	Defines an ordered list of bind values in ANYDATA type. NOTE: This parameter is not supported on a standby database.
plan_hash_value	Specifies the hash value of the SQL execution plan.
sqlset_name	Specifies the SQL tuning set name.
basic_filter	Specifies the predicate used to filter the SQL from the SQL tuning set.
object_filter	Specifies the object filter.
rank(i)	Specifies an ORDER BY clause on the selected SQL statement.

Table 184-18 (Cont.) CREATE_TUNING_TASK Function Parameters

Parameter	Description
result_percentage	Specifies the percentage on the sum of a ranking measure.
result_limit	Specifies the top L(limit) SQL from the filtered or ranked SQL.
user_name	Specifies the user name for whom the statement is to be tuned.
scope	Specifies the tuning scope: <ul style="list-style-type: none"> LIMITED: SQL Tuning Advisor produces recommendations based on statistical checks, access path analysis, and SQL structure analysis. SQL profile recommendations are not generated. COMPREHENSIVE: SQL Tuning Advisor carries out all the analysis it performs under limited scope plus SQL profiling.
time_limit	Specifies the maximum duration in seconds for the tuning session.
task_name	Specifies an optional tuning task name.
description	Provides a description of the SQL tuning session, up to a maximum of 256 characters.
plan_filter	Specifies the plan filter. It is applicable when multiple plans (plan_hash_value) are associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> LAST_GENERATED: most recent timestamp FIRST_GENERATED: earliest timestamp, the opposite to LAST_GENERATED LAST_LOADED: most recent first_load_time statistics information FIRST_LOADED: earliest first_load_time statistics information, the opposite to LAST_LOADED MAX_ELAPSED_TIME: maximum elapsed time MAX_BUFFER_GETS: maximum buffer gets MAX_DISK_READS: maximum disk reads MAX_DIRECT_WRITES: maximum direct writes MAX_OPTIMIZER_COST: maximum optimizer cost
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.
spa_task_name	Specifies the name of the SQL Performance Analyzer task whose regressions are to be tuned.
spa_task_owner	Specifies the owner of specified SQL Performance Analyzer task or NULL for current user.
spa_compare_exec	Specifies the execution name of the Compare Performance trial of SQL Performance Analyzer task. If NULL, then the advisor uses the most recent execution of the given SQL Performance Analyzer task, of type COMPARE PERFORMANCE.
dbid	Specifies the DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used.

Table 184-18 (Cont.) CREATE_TUNING_TASK Function Parameters

Parameter	Description
<code>con_name</code>	<p>Specifies the container for the tuning task. The semantics depend on the function format:</p> <ul style="list-style-type: none"> For the SQL text format, this parameter specifies the container in which SQL Tuning Advisor tunes the SQL statement. If null (default), then SQL Tuning Advisor uses the current container. For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the cursor cache of all valid containers executing the SQL statement, and tunes the most expensive statement in its container. For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the AWR of all valid containers that have this SQL statement, and tunes the most expensive statement in its container. <p>The following statements are true of all function formats:</p> <ul style="list-style-type: none"> In a non-CDB, this parameter is ignored. In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, an error occurs. In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, an error occurs.
<code>database_link_to</code>	<p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

Usage Notes

With regard to the form of this subprogram that takes a SQL tuning set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed

with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Example 184-1 Examples

The following examples assume the following variable definitions:

```
VARIABLE stmt_task      VARCHAR2(64);  
VARIABLE sts_task       VARCHAR2(64);  
VARIABLE spa_tune_task  VARCHAR2(64);
```

Example 184-2 Create Tuning Task with SQL Text Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -  
    sql_text => 'SELECT quantity_sold FROM sales s, times t WHERE  
s.time_id = t.time_id AND s.time_id = TO_DATE(''24-NOV-00'')');
```

Example 184-3 Create Tuning Task with SQL ID Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>  
'ay1m3ssvtrh24');  
  
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>  
'ay1m3ssvtrh24', -  
    scope => 'LIMITED');  
  
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>  
'ay1m3ssvtrh24', -  
    time_limit => 600);
```

Example 184-4 Create Tuning Task with AWR Snapshot Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -  
    end_snap => 2, sql_id => 'ay1m3ssvtrh24');
```

Example 184-5 Create Tuning Task with SQL Tuning Set Format

This example creates a task that tunes SQL statements in order by buffer gets, and also sets a time limit of one hour. The default ranking measure is elapsed time.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -  
    sqlset_name => 'my_workload', -  
    rank1       => 'BUFFER_GETS', -  
    time_limit  => 3600, -  
    description => 'tune my workload ordered by buffer gets');
```

Example 184-6 Create Tuning Task with SPA Task Format

This example tunes the SQL statement that were reported as having regressed from the compare performance execution of the SQL Performance Analyzer task named `task_123`.

```
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    spa_task_name      => 'task_123',
    spa_task_owner    => 'SCOTT',
    spa_compare_exec  => 'exec1');
```

Example 184-7 Creating SQL Tuning Task on Standby Database

This example creates a tuning task on the standby database. The `tune_stby_wkld` task uses the `lnk_to_primary` database link to write data to the primary database, which is open read/write.

```
VAR tname VARCHAR2(30);
VAR query VARCHAR2(500);
EXEC :tname := 'tune_stby_wkld';
EXEC :query := 'SELECT /*+ FULL(t)*/ coll FROM table1 t WHERE coll=9000';
EXEC :tname := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_text => :query,-
    task_name => :tname, database_link_to => 'lnk_to_primary');
```

184.5.12 DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (
    sqlset_name   IN   VARCHAR2,
    basic_filter  IN   VARCHAR2 := NULL,
    sqlset_owner  IN   VARCHAR2 := NULL);
```

Parameters

Table 184-19 DELETE_SQLSET Procedure Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the name of the SQL tuning set.
<code>basic_filter</code>	Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set, or <code>NULL</code> for current schema owner.

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload');
```

```
-- Delete all statements in a sql tuning set which ran for less than a
second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload', -
                                basic_filter => 'elapsed_time <
1000000');
```

184.5.13 DROP_SQL_PROFILE Procedure

This procedure drops the named SQL profile from the database.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (
    name          IN VARCHAR2,
    ignore        IN BOOLEAN := FALSE);
```

Parameters

Table 184-20 DROP_SQL_PROFILE Procedure Parameters

Parameter	Description
name	The (mandatory) name of SQL profile to be dropped. The name is case sensitive.
ignore	Ignores errors due to object not existing

Usage Notes

Requires the `DROP ANY SQL PROFILE` privilege.

Examples

```
-- Drop the profile:
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

184.5.14 DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (  
  sqlset_name   IN  VARCHAR2,  
  sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 184-21 DROP_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for current schema owner.

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.  
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```

184.5.15 DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_TUNING_TASK (
  task_name          IN VARCHAR2);
```

Parameters**Table 184-22 DROP_TUNING_TASK Procedure Parameters**

Parameter	Description
task_name	Specifies name of the tuning task to drop.

184.5.16 EXECUTE_TUNING_TASK Function and Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

**See Also:**

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
  task_name          IN VARCHAR2,
  execution_name     IN VARCHAR2           := NULL,
  execution_params   IN dbms_advisor.argList := NULL,
  execution_desc     IN VARCHAR2           := NULL,
  database_link_to   IN VARCHAR2           := NULL)
RETURN VARCHAR2;
```

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
  task_name          IN VARCHAR2,
  execution_name     IN VARCHAR2           := NULL,
  execution_params   IN dbms_advisor.argList := NULL,
  execution_desc     IN VARCHAR2           := NULL,
  database_link_to   IN VARCHAR2           := NULL);
```

Parameters**Table 184-23 EXECUTE_TUNING_TASK Function & Procedure Parameters**

Parameter	Description
task_name	Name of the tuning task to execute.

Table 184-23 (Cont.) EXECUTE_TUNING_TASK Function & Procedure Parameters

Parameter	Description
<code>execution_name</code>	A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.
<code>execution_params</code>	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_TUNING_TASK_PARAMETER Procedures).
<code>execution_desc</code>	A 256-length string describing the execution.
<code>database_link_to</code>	<p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Usage Notes

A tuning task can be executed multiples times without having to reset it.

Examples

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

184.5.17 IMPLEMENT_TUNING_TASK Procedure

This procedure implements a set of SQL profile recommendations made by SQL Tuning Advisor.

Executing `IMPLEMENT_TUNING_TASK` is equivalent to executing the [SCRIPT_TUNING_TASK Function](#) and then running the script.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
    task_name          IN  VARCHAR2,
    rec_type           IN  VARCHAR2 := REC_TYPE_SQL_PROFILES,
    owner_name         IN  VARCHAR2 := NULL,
    execution_name     IN  VARCHAR2 := NULL,
    database_link_to   IN  VARCHAR2 := NULL);
```

Parameters

Table 184-24 IMPLEMENT_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Name of the tuning task for which to implement recommendations.
rec_type	Filter the types of recommendations to implement. Only 'PROFILES' is supported.
owner_name	Owner of the relevant tuning task or NULL for the current user.
execution_name	Name of the task execution to use. If NULL, then the procedure implements recommendations from the last task execution.
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri: <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

184.5.18 INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK (  
    task_name          IN VARCHAR2);
```

Parameters

Table 184-25 INTERRUPT_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Name of the tuning task to interrupt

Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

184.5.19 LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (  
    sqlset_name        IN VARCHAR2,  
    populate_cursor    IN sqlset_cursor,  
    load_option         IN VARCHAR2 := 'INSERT',  
    update_option       IN VARCHAR2 := 'REPLACE',  
    update_condition   IN VARCHAR2 := NULL,
```

```

update_attributes IN VARCHAR2 := NULL,
ignore_null      IN BOOLEAN  := TRUE,
commit_rows     IN POSITIVE  := NULL,
sqlset_owner    IN VARCHAR2 := NULL);

```

Parameters

Table 184-26 LOAD_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of SQL tuning set to be loaded.
populate_cursor	Specifies the cursor reference to the SQL tuning set to be loaded.
load_option	Specifies which statements are loaded into the SQL tuning set. The possible values are: <ul style="list-style-type: none"> INSERT (default) — Adds only new statements. UPDATE — Updates existing the SQL statements and ignores any new statements. MERGE — Inserts new statements and updates the information of the existing ones.
update_option	Specifies how existing SQL statements are updated. This parameter is considered only if load_option is specified with UPDATE or MERGE as an option. The possible values are: <ul style="list-style-type: none"> REPLACE (default) — Updates the statement using the new statistics, bind list, object list, and so on. ACCUMULATE — Combines attributes when possible (for example, statistics such as elapsed_time), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.
update_condition	Specifies when to perform the update. The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination: <ul style="list-style-type: none"> OLD — Refers to statement attributes from the SQL tuning set (destination). NEW — Refers to statement attributes from the input statements (source).

Table 184-26 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
update_attributes	<p>Specifies the list of SQL statement attributes to update during a merge or update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> • NULL (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution contexts such as module and action. • BASIC — Specifies statistics and binds only. • TYPICAL — Specifies BASIC with SQL plans (without row source statistics) and without an object reference list. • ALL — Specifies all attributes, including the execution context attributes such as module and action. • List of comma separated attribute names to update: <ul style="list-style-type: none"> – EXECUTION_CONTEXT – EXECUTION_STATISTICS – SQL_BINDS – SQL_PLAN – SQL_PLAN_STATISTICS (similar to SQL_PLAN with added row source statistics)
ignore_null	<p>Specifies whether to update attributes when the new value is NULL.</p> <p>If TRUE, then the procedure does not update an attribute when the new value is NULL. That is, do not override with NULL values unless intentional.</p>
commit_rows	<p>Specifies whether to commit statements after DML.</p> <p>If a value is provided, then the load commits after each specified number of statements is inserted. If NULL is provided, then the load commits only once, at the end of the operation.</p> <p>Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the DBA_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded.</p>
sqlset_owner	<p>Defines the owner of the SQL tuning set, or the current schema owner (or NULL for the current owner).</p>

Exceptions

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

Usage Notes

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more excluding statements that belong to SYS schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the shared SQL area
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
          'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur);
END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your `update_option` because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
          'parsing_schema_name
<> ''SYS'',
          NULL, NULL, NULL, NULL,
          1,
          NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name      => 'my_workload',
    populate_cursor => cur,
    Using DBMS_SQLTUNE
    load_option => 'MERGE',
```

```

update_option => 'ACCUMULATE');
END;

```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/

```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name      => 'my_workload',
                           populate_cursor => cur,
                           load_option     => 'UPDATE');
END;
/

```

184.5.20 PACK_STGTAB_SQLPROF Procedure

This procedure copies profile data from the `sys.` schema into the staging table.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
  profile_name      IN VARCHAR2 := '%',
  profile_category  IN VARCHAR2 := 'DEFAULT',

```

```
staging_table_name    IN VARCHAR2,
staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 184-27 PACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
profile_name	The name of the profile to pack (% wildcards acceptable, case-sensitive)
profile_category	The category to pack profiles from (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Security Model

This procedure requires `ADMINISTER SQL MANAGEMENT OBJECT` privilege and `INSERT` privilege on the staging table.

Usage Notes

This function issues a `COMMIT` after packing each SQL profile. If an error is raised mid-execution, then clear the staging table by deleting its rows.

Examples

Put only those profiles in the `DEFAULT` category into the staging table. This corresponds to all profiles used by default on this system.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name =>
'PROFILE_STGTAB');
```

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
staging_table_name =>
'PROFILE_STGTAB');
```

184.5.21 PACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB_SQLSET procedure.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (
  sqlset_name          IN VARCHAR2,
  sqlset_owner         IN VARCHAR2 := NULL,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  db_version           IN NUMBER   := NULL);
```

Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => '%'
  , sqlset_owner    => '%'
  , staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => '%'
  , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'my_workload'
  , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 1 (11.2):

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET'
  ,   db_version      => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION);
END;
```

184.5.22 REMAP_STGTAB_SQLPROF Procedure

This procedure changes the profile data values kept in the staging table prior to performing an unpack operation.

You can use this procedure to change the category of a profile. You can also use it to change the name of a profile if one already exists on the system with the same name.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
  old_profile_name      IN VARCHAR2,
  new_profile_name      IN VARCHAR2 := NULL,
  new_profile_category  IN VARCHAR2 := NULL,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 184-28 REMAP_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
<code>old_profile_name</code>	The name of the profile to target for a remap operation (case-sensitive)

Table 184-28 (Cont.) REMAP_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
<code>new_profile_name</code>	The new name of the profile, or <code>NULL</code> to remain the same (case-sensitive)
<code>new_profile_category</code>	The new category for the profile, or <code>NULL</code> to remain the same (case-sensitive)
<code>staging_table_name</code>	The name of the table on which to perform the remap operation (case-sensitive). Required.
<code>staging_schema_owner</code>	The schema where the table resides, or <code>NULL</code> for current schema (case-sensitive)

Security Model

This procedure requires the `UPDATE` privilege on the staging table.

Examples

Change the name of a profile before we unpack, to avoid conflicts

```
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
    old_profile_name => :pname
  ,   new_profile_name => 'IMP' || :pname
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

Change the SQL profile in the staging table to be 'TEST' category before we import it. This way users can test the profile on the new system before it is active.

```
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
    old_profile_name => :pname
  ,   new_profile_category => 'TEST'
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

184.5.23 REMAP_STGTAB_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
    old_sqlset_name      IN VARCHAR2,
    old_sqlset_owner    IN VARCHAR2 := NULL,
    new_sqlset_name     IN VARCHAR2 := NULL,
    new_sqlset_owner    IN VARCHAR2 := NULL,
    staging_table_name  IN VARCHAR2,
    staging_schema_owner IN VARCHAR2 := NULL,
    old_con_dbid        IN NUMBER   := NULL,
    new_con_dbid        IN NUMBER   := NULL);
);
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMAP_STGTAB_SQLSET and DBMS_SQLSET.REMAP_SQLSET procedures.

Table 184-29 REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

Parameter	Description
old_sqlset_name	Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported.
old_sqlset_owner	Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner
new_sqlset_name	Specifies the new name for the tuning set, or NULL to keep the same tuning set name.
new_sqlset_owner	Specifies the new owner for the tuning set, or NULL to keep the same owner name.
staging_table_name	Specifies the name of the table on which to perform the remap operation. The value is case sensitive.
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.
old_con_dbid	Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.
new_con_dbid	Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.

Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

Examples

```
-- Change the name of an STS in the staging table before unpacking it.
BEGIN
```

```

    DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
        old_sqlset_name =>
'my_workload'
    ,   old_sqlset_owner => 'SH'
    ,   new_sqlset_name =>
'imp_workload'
    ,   staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
    old_sqlset_name => 'imp_workload'
    ,   old_sqlset_owner => 'SH'
    ,   new_sqlset_owner => 'SYS'
    ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

184.5.24 REMOVE_SQLSET_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
    sqlset_name   IN  VARCHAR2,
    reference_id  IN  NUMBER,
    sqlset_owner  IN  VARCHAR2 := NULL,
    force_remove  IN  NUMBER   := 0);
```

Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

Table 184-30 REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the name of the SQL tuning set.
<code>reference_id</code>	Specifies the identifier of the reference to remove.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set (or <code>NULL</code> for the current schema owner).

Table 184-30 (Cont.) REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
<code>force_remove</code>	Specifies whether references can be removed for other users (1) or whether they cannot be removed (0). Setting this parameter to 1 only takes effect when the user has the ADMINISTER ANY SQL TUNING SET privilege. Otherwise, the database only removes references owned by the user.

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE( -
    sqlset_name => 'my_workload', -
    reference_id => :rid,
    sqlset_owner => NULL,
    force_remove => 0);
```

To find all references to a given SQL tuning set, query the `DBA_SQLSET_REFERENCES` view.

184.5.25 REPORT_AUTO_TUNING_TASK Function

This function displays a report from the automatic tuning task.

This function reports on a range of task executions, whereas the [REPORT_TUNING_TASK Function](#) reports on a single execution. Note that this function is deprecated with Oracle Database 11g Release 2 (11.2) in favor of `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK`.

See Also:

- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- [REPORT_AUTO_TUNING_TASK Function](#)

Syntax

```
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec    IN VARCHAR2 := NULL,
    end_exec      IN VARCHAR2 := NULL,
    type          IN VARCHAR2 := TYPE_TEXT,
    level         IN VARCHAR2 := LEVEL_TYPICAL,
    section       IN VARCHAR2 := SECTION_ALL,
```

```

    object_id    IN NUMBER    := NULL,
    result_limit IN NUMBER    := NULL)
RETURN CLOB;

```

Parameters

Table 184-31 REPORT_AUTO_TUNING_TASK Function Parameters

Parameter	Description
begin_exec	Specifies the name of the execution from which to begin the report. NULL retrieves a report on the most recent run.
end_exec	Specifies the name of the execution at which to end the report. NULL retrieves a report on the most recent run.
type	Specifies the type of the report to produce. Possible values are TYPE_TEXT which produces a text report
level	Specifies the level of detail in the report: <ul style="list-style-type: none"> LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor. LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented. LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Limits the report to a single section (ALL for all sections): <ul style="list-style-type: none"> SECTION_SUMMARY - summary information SECTION_FINDINGS - tuning findings SECTION_PLAN - explain plans SECTION_INFORMATION - general information SECTION_ERROR - statements with errors SECTION_ALL - all statements
object_id	Specifies the advisor framework object ID that represents a single statement to restrict reporting to. Specify NULL for all statements. Only valid for reports that target a single execution.
result_limit	Specifies the maximum number of SQL statements to show in the report.

Return Values

A CLOB containing the desired report.

184.5.26 REPORT_SQL_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the v\$sql views and AWR.

See Also:

[DBMS_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_DETAIL (
  sql_id                IN  VARCHAR2    DEFAULT NULL,
  sql_plan_hash_value  IN  NUMBER       DEFAULT NULL,
  start_time           IN  DATE         DEFAULT NULL,
  duration             IN  NUMBER       DEFAULT NULL,
  inst_id             IN  NUMBER       DEFAULT NULL,
  dbid                IN  NUMBER       DEFAULT NULL,
  event_detail        IN  VARCHAR2     DEFAULT 'YES',
  bucket_max_count    IN  NUMBER       DEFAULT 128,
  bucket_interval     IN  NUMBER       DEFAULT NULL,
  top_n               IN  NUMBER       DEFAULT 10,
  report_level        IN  VARCHAR2     DEFAULT 'TYPICAL',
  type                IN  VARCHAR2     DEFAULT 'ACTIVE',
  data_source         IN  VARCHAR2     DEFAULT 'AUTO',
  end_time            IN  DATE         DEFAULT NULL,
  duration_stats      IN  NUMBER       DEFAULT NULL,
  con_name            IN  VARCHAR2     DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 184-32 REPORT_SQL_DETAIL Function Parameters

Parameter	Description
sql_id	SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session.
sql_plan_hash_value	Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID.
start_time	If specified, shows SQL activity (from GV\$ACTIVE_SESSION_HISTORY) starting at this time. On Oracle RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time.
duration	Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour.
inst_id	Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance.
dbid	DBID from which to get SQL details. If NULL, uses current DBID.
event_detail	When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class, event_name).
bucket_max_count	If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used.
bucket_interval	If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
top_n	Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used.

Table 184-32 (Cont.) REPORT_SQL_DETAIL Function Parameters

Parameter	Description
report_level	<p>Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> 'TOP' - Show top values for the ASH dimensions for a SQL statement; ON by default 'SPM' - Show existing plan baselines for a SQL statement; OFF by default 'MISMATCH' - Show reasons for creating new child cursors (sharing criteria violations); OFF by default. 'STATS' - Show SQL execution statistics per plan from GV\$SQLAREA_PLAN_HASH; ON by default 'ACTIVITY' - Show top activity from ASH for each plan of a SQL statement; ON by default 'ACTIVITY_ALL' - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default 'HISTOGRAM' - Show activity histogram for each plan of a SQL statement (plan time line histogram); ON by default 'SESSIONS' - Show activity for top sessions for each plan of a SQL statement; OFF by default 'MONITOR' - Show show one monitored SQL execution per execution plan; ON by default 'XPLAN' - Show execution plans; ON by default 'BINDS' - show captured bind data; ON by default <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> -SQL_TEXT - No SQL text in report +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR -SQL_FULLTEXT - No full SQL text (+SQL_TEXT) +SQL_FULLTEXT - Show full SQL text (default value) <p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> NONE - minimum possible BASIC - SQL_TEXT+STATS+ACTIVITY+HISTOGRAM TYPICAL - SQL_FULLTEXT+TOP+STATS+ACTIVITY+HISTOGRAM+XPLAN+MONITOR ALL - everything <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p>
type	<p>Report format: 'ACTIVE' by default. Can also be 'XML' (see Usage Notes).</p>
data_source	<p>Determines the data source of SQL data based on one of the following values:</p> <ul style="list-style-type: none"> MEMORY: The data source is GV\$ view DISK: The data source is DBA_HIST_* view AUTO: Automatically determines the data source based on the time frame (default)

Table 184-32 (Cont.) REPORT_SQL_DETAIL Function Parameters

Parameter	Description
<code>end_time</code>	If specified, shows SQL activity from <code>start_time</code> to <code>end_time</code> . If NULL (default), shows SQL activity for <code>systimestamp</code> .
<code>duration_stats</code>	Duration of additional SQL execution statistics from AWR (in hours), for the report. If NULL (default), then the duration of 24 hours is considered.
<code>con_name</code>	Name of the multitenant container database (CDB).

Security Model

The invoker needs the `EXECUTE` privilege on the `DBMS_XPLAN` package.

Return Values

A CLOB containing the desired report.

Usage Notes

- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.
- The invoker needs the `SELECT` or `READ` privilege on the following views:
 - `V$SESSION`
 - `DBA_ADVISOR_FINDINGS`
 - `V$DATABASE`
 - `GV$ASH_INFO`
 - `GV$ACTIVE_SESSION_HISTORY`
 - `GV$SQLAREA_PLAN_HASH`
 - `GV$SQL`
 - `DBA_HIST_SNAPSHOT`
 - `DBA_HIST_WR_CONTROL`
 - `DBA_HIST_ACTIVE_SESS_HISTORY`
 - `DBA_HIST_SQLSTAT`
 - `DBA_HIST_SQL_BIND_METADATA`
 - `DBA_HIST_SQLTEXT`
 - `DBA_SQL_PLAN_BASELINES`
 - `DBA_SQL_PROFILES`
 - `DBA_ADVISOR_TASKS`
 - `DBA_SERVICES`

- DBA_USERS
- DBA_OBJECTS
- DBA_PROCEDURES

184.5.27 REPORT_SQL_HISTORY Function

This function generates a query history details report for a given execution in cases where the user has the required viewing privileges.

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_HISTORY(
    sql_id          IN varchar2  default NULL,
    session_id     IN number     default NULL,
    session_serial IN number     default NULL,
    sql_exec_start IN date       default NULL,
    sql_exec_id    IN number     default NULL,
    inst_id        IN number     default NULL,
    instance_id_filter IN number default NULL,
    base_path      IN varchar2   default NULL,
    report_level   IN varchar2   default 'TYPIC
    type          IN varchar2   default 'TEXT'
    sql_plan_hash_value IN number default NULL,
    con_name      IN varchar2   default NULL,
    report_id     IN number     default NULL)
RETURN CLOB;
```

Parameters

Table 184-33 REPORT_SQL_HISTORY Function Parameters

Parameter	Description
sql_id	SQL ID for for execution.
session_id	ID of the session in which the execution ran.
session_serial	Serial number of the session in which execution ran.
sql_exec_start	SQL execution start time.
sql_exec_id	SQL execution ID.
inst_id	Instance ID on which the SQL ran.
base_path	Base path URL.
report_level	Report level: 'NONE', 'BASIC', 'TYPICAL' or 'ALL'.
type	Report type: 'TEXT', 'HTML', 'XML' or 'ACTIVE'.
sql_plan_hash_value	Plan hash value of the SQL execution.
con_name	PDB Container Name.
report_id	ID of the report in the auto-report repository.

184.5.28 REPORT_SQL_HISTORY_LIST Function

This function generates a query history list report for all executions in the given user session, or across sessions for a privileged user (who holds SYS user or DBA privileges).

Syntax

```
FUNCTION DBMS_SQLTUNE.REPORT_SQL_HISTORY_LIST(
    sql_id                IN varchar2    default NULL,
    session_id           IN number      default NULL,
    session_serial       IN number      default NULL,
    inst_id              IN number      default NULL,
    max_sqltext_length  IN number      default NULL,
    top_n_count          IN number      default NULL,
    top_n_rankby        IN varchar2    default
'last_active_time',
    report_level         IN varchar2    default 'TYPICAL',
    base_path            IN varchar2    default NULL,
    type                 IN varchar2    default 'TEXT',
    con_name             IN varchar2    default NULL)
RETURN CLOB;
```

Parameters

Table 184-34 REPORT_SQL_HISTORY_LIST Function Parameters

Parameter	Description
sql_id	SQL ID to filter by.
session_id	Session ID to filter by.
session_serial	Session serial number to filter by.
inst_id	Database instance ID.
max_sqltext_length	Maximum SQL text length to display.
top_n_count	Top-N SQL statement history.
top_n_rankby	Rank by last active time.
report_level	Report level: 'NONE', 'BASIC', 'TYPICAL', or 'ALL'.
base_path	Base path URL.
type	Report type: 'TEXT', 'HTML', 'XML', or 'ACTIVE'.
con_name	PDB container name.

184.5.29 REPORT_SQL_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

See Also:

[Real-Time SQL Monitoring](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR (
  sql_id                IN VARCHAR2  DEFAULT NULL,
  dbop_name             IN VARCHAR2  DEFAULT NULL,
  dbop_exec_id         IN NUMBER     DEFAULT NULL,
  session_id           IN NUMBER     DEFAULT NULL,
  session_serial       IN NUMBER     DEFAULT NULL,
  sql_exec_start       IN DATE       DEFAULT NULL,
  sql_exec_id          IN NUMBER     DEFAULT NULL,
  inst_id              IN NUMBER     DEFAULT NULL,
  start_time_filter    IN DATE       DEFAULT NULL,
  end_time_filter      IN DATE       DEFAULT NULL,
  instance_id_filter   IN NUMBER     DEFAULT NULL,
  parallel_filter      IN VARCHAR2   DEFAULT NULL,
  plan_line_filter     IN NUMBER     DEFAULT NULL,
  event_detail         IN VARCHAR2   DEFAULT 'YES',
  bucket_max_count    IN NUMBER     DEFAULT 128,
  bucket_interval     IN NUMBER     DEFAULT NULL,
  base_path            IN VARCHAR2   DEFAULT NULL,
  last_refresh_time    IN DATE       DEFAULT NULL,
  report_level         IN VARCHAR2   DEFAULT 'TYPICAL',
  type                 IN VARCHAR2   DEFAULT 'TEXT',
  sql_plan_hash_value  IN NUMBER     DEFAULT NULL,
  con_name             IN VARCHAR2   DEFAULT NULL,
  report_id           IN NUMBER     DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 184-35 REPORT_SQL_MONITOR Function Parameters

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed.
dbop_exec_id	Execution ID for the composite database operation for which monitoring information is displayed.

Table 184-35 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
session_id	If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.
session_serial	In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
sql_exec_start	This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.
sql_exec_id	This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.
inst_id	Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.
start_time_filter	If not NULL, the report considers only the activity (from GV\$ACTIVE_SESSION_HISTORY) recorded after the specified date. If NULL, the reported activity starts when the execution of the targeted SQL statement has started.
end_time_filter	If not NULL, the report shows only the activity (from GV\$ACTIVE_SESSION_HISTORY) collected before the date end_time_filter. If NULL, the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing.
instance_id_filter	Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (Oracle RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.

Table 184-35 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
parallel_filter	<p>Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be:</p> <ul style="list-style-type: none"> • NULL to target all processes • [qc][servers(<svr_grp>[,] <svr_set>[,] <srv_num>)]: 'qc' stands for query coordinator and servers() stipulate which PX servers to consider. <p>The following examples show how to target a subset of the parallel processes:</p> <ul style="list-style-type: none"> • qc: targets only the query coordinator • servers(1): targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel. • servers(,2): targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers) • servers(1,1): consider only group 1, set 1 • servers(1,2,4): consider only group 1, set 2, server number 4. This reports for a single parallel server process • qc servers(1,2,4): same as above by also including the query coordinator
event_detail	<p>When value is 'YES' (the default), reported activity from GV\$ACTIVE_SESSION_HISTORY is aggregated by (wait_class, event_name). Use 'NO' to only aggregate by wait_class.</p>
bucket_max_count	<p>If specified, this should be the maximum number of histogram buckets created in the report</p>
bucket_interval	<p>If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.</p>
base_path	<p>URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)</p>
last_refresh_time	<p>If not NULL (default is NULL), the time when the report was last retrieved (see SYSDATE attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized:</p> <ul style="list-style-type: none"> • SQL text is not returned when this option is specified • activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket

Table 184-35 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
report_level	<p>Level of detail for the report: 'NONE', 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> 'XPLAN' - Show explain plan; ON by default 'PLAN' - Show plan monitoring statistics; ON by default 'SESSIONS' - Show session details. Applies only to parallel queries; ON by default 'INSTANCE' - Show instance details. Applies only to parallel and cross instance; ON by default 'PARALLEL' - An umbrella parameter for specifying sessions+instance details 'ACTIVITY' - Show activity summary at global level, plan line level and session or instance level (if applicable); ON by default 'BINDS' - Show bind information when available; ON by default 'METRICS' - Show metric data (CPU, I/Os, ...) over time; ON by default 'ACTIVITY_HISTOGRAM' - Show an histogram of the overall query activity; ON by default 'PLAN_HISTOGRAM' - Show activity histogram at plan line level; OFF by default 'OTHER' - Other info; ON by default <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> SQL_TEXT - No SQL text in report +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR -SQL_FULLTEXT - No full SQL text (+SQL_TEXT) +SQL_FULLTEXT - Show full SQL text (default value)
report_level (contd.)	<p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> NONE - minimum possible +BASIC - SQL_TEXT-PLAN-XPLAN-SESSIONS-INSTANCE-ACTIVITY_HISTOGRAM-PLAN_HISTOGRAM-METRICS TYPICAL - everything but PLAN_HISTOGRAM ALL - everything <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p>
type	Report format, 'TEXT' by default. Can be 'TEXT', 'HTML', 'XML' or 'ACTIVE' (see Usage Notes).
sql_plan_hash_value	Target only those SQL executions with the specified plan_hash_value. Default is NULL.
con_name	Name of the multitenant container database (CDB).
report_id	ID of the report in auto-report repository. Report IDs can be found in DBA_HIST_REPORTS.

Return Values

A CLOB containing the desired report.

Usage Notes

- The target SQL statement for this report can be:
 - The most recent SQL statement monitored by Oracle Database. This is the default behavior, so there is no need to specify any parameter.
 - The most recent SQL statement executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally its serial number. For example, use `session_id =>` for the current session or `session_id => 20, session_serial => 103` for session ID 20, serial number 103.
 - The most recent execution of a specific statement identified by its `sql_id`.
 - A specific execution of a SQL statement identified by its execution key (`sql_id, sql_exec_start` and `sql_exec_id`).
- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).
 - `GV$SQL_MONITOR`
 - `GV$SQL_PLAN_MONITOR`
 - `GV$SQL_PLAN`
 - `GV$ACTIVE_SESSION_HISTORY`
 - `GV$SESSION_LONGOPS`
 - `GV$SQL`
- The `bucket_max_count` and `bucket_interval` parameters control the activity histogram. By default, the maximum number of buckets is set to 128. The database derives the `bucket_interval` value based on this count. The `bucket_interval` (value is in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1 second) without exceeding the maximum number of buckets. For example, if the query has executed for 600 seconds, then the database selects a `bucket_interval` of 8 seconds (a power of two). The database chooses the value of 8 because $600/8 = 74$, which is less than 128 buckets maximum. Smaller than 8 seconds would be 4 seconds, which would lead to more buckets than the 128 maximum. If `bucket_interval` is specified, then the database uses the specified value instead of deriving it from `bucket_max_count`.
- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager, while not requiring any EM installation.

The report file is in HTML format. The code powering the active report is downloaded transparently by the web browser when the report is first viewed. Therefore, viewing the report requires outside connectivity.

Oracle Database SQL Tuning Guide for more information about SQL real-time monitoring.

184.5.30 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics.

Use the [REPORT_SQL_MONITOR Function](#) to get detailed monitoring information for a single SQL statement.

 **See Also:**

[Real-Time SQL Monitoring](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST (
  sql_id                IN VARCHAR2  DEFAULT NULL,
  session_id            IN NUMBER    DEFAULT NULL,
  session_serial        IN NUMBER    DEFAULT NULL,
  inst_id               IN NUMBER    DEFAULT NULL,
  active_since_date     IN DATE      DEFAULT NULL,
  active_since_sec      IN NUMBER    DEFAULT NULL,
  active_before_date    IN DATE      DEFAULT NULL,
  last_refresh_time     IN DATE      DEFAULT NULL,
  dbop_name             IN VARCHAR2  DEFAULT NULL,
  monitor_type          IN NUMBER    DEFAULT MONITOR_TYPE_ALL,
  max_sqltext_length    IN NUMBER    DEFAULT NULL,
  top_n_count           IN NUMBER    DEFAULT NULL,
  top_n_rankby          IN VARCHAR2  DEFAULT 'LAST_ACTIVE_TIME',
  report_level          IN VARCHAR2  DEFAULT 'TYPICAL',
  auto_refresh          IN NUMBER    DEFAULT NULL,
  base_path             IN VARCHAR2  DEFAULT NULL,
  type                  IN VARCHAR2  DEFAULT 'TEXT',
  con_name              IN VARCHAR2  DEFAULT NULL,
  top_n_detail_count    IN NUMBER    DEFAULT NULL)
RETURN CLOB;

```

Parameters

Table 184-36 REPORT_SQL_MONITOR_LIST Function Parameters

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.
session_id	If not NULL, then this parameter targets only the subset of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session.
session_serial	In addition to the session_id parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
inst_id	Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.
active_since_date	If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time.
active_since_sec	Same as active_since_date but with the date specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour.
active_before_date	If not NULL (default), returns only monitored statements that have been active before the specified date and time.
last_refresh_time	If not NULL (default), the date and time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report shows detail about the execution of monitored queries that active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, sql_exec_id). For queries with a first refresh time after the specified date, the function returns only the SQL execution key and statistics.
dbop_name	DB operation name. Specify NULL to display all the monitored DB operations.
monitor_type	Type of the SQL Monitor operation. Specify one of the following values: <ul style="list-style-type: none"> MONITOR_TYPE_SQL - Returns only SQL statements MONITOR_TYPE_DBOP - Returns only database operations MONITOR_TYPE_ALL - Returns SQL statements as well as database operations
max_sqltext_length	Maximum length of the SQL text. Default is NULL (no limit).
top_n_count	Limits the number of top-N SQL statements that need to be included in the report.

Table 184-36 (Cont.) REPORT_SQL_MONITOR_LIST Function Parameters

Parameter	Description
<code>top_n_rankby</code>	Specifies the attribute to rank the SQL statements. Specify this value when <code>top_n_count</code> value is not NULL. The ranking of an SQL statement is done based on one of the following values: <ul style="list-style-type: none"> • <code>LAST_ACTIVE_TIME</code> - Last active date and time (top N most recent) • <code>DURATION</code> - Total duration of execution • <code>DB_TIME</code> - DB time used • <code>CPU_TIME</code> - CPU time used • <code>IO_REQUESTS</code> - Number of I/O requests • <code>IO_BYTES</code> - Number of I/O bytes
<code>report_level</code>	Level of detail for the report. The level is one of the following: <ul style="list-style-type: none"> • <code>BASIC</code> - SQL text up to 200 characters • <code>TYPICAL</code> - include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters • <code>ALL</code> - currently the same as <code>TYPICAL</code>
<code>auto_refresh</code>	Currently non-operational, reserved for future use.
<code>base_path</code>	URL path for flex HTML resources because flex HTML format is required to access external files (java scripts and the flash SWF file itself).
<code>type</code>	Report format: <code>TEXT</code> (default), <code>HTML</code> , or <code>XML</code> .
<code>con_name</code>	Name of the multitenant container database (CDB)
<code>top_n_detail_count</code>	Limits the number of top-N SQL statements for which the SQL monitor details need to be included in the report.

Return Values

A report for the list of SQL statements that have been monitored. The report type is text, XML, or HTML.

Usage Notes

You must have the privilege to access the following fixed views: `GV$SQL_MONITOR` and `GV$SQL`.

**See Also:**

Oracle Database SQL Tuning Guide for more information about SQL real-time monitoring.

184.5.31 REPORT_TUNING_TASK Function

This function displays the results of a tuning task. By default the report is in text format.

See Also:

[DBMS_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK (
  task_name          IN   VARCHAR2,
  type               IN   VARCHAR2  := 'TEXT',
  level              IN   VARCHAR2  := 'TYPICAL',
  section            IN   VARCHAR2  := ALL,
  object_id          IN   NUMBER     := NULL,
  result_limit       IN   NUMBER     := NULL,
  owner_name         IN   VARCHAR2  := NULL,
  execution_name     IN   VARCHAR2  := NULL,
  database_link_to  IN   VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

Table 184-37 REPORT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task.
type	Type of the report to produce. Possible values are <code>TEXT</code> which produces a text report.
level	Level of detail in the report: <ul style="list-style-type: none"> <code>BASIC</code>: simple version of the report. Just show info about the actions taken by the advisor. <code>TYPICAL</code>: show information about every statement analyzed, including requests not implemented. <code>ALL</code>: highly detailed report level, also provides annotations about statements skipped over.
section	Section of the report to include. You can limit the report to any of the following single sections (<code>ALL</code> for all sections): <ul style="list-style-type: none"> <code>SUMMARY</code> - Summary information <code>FINDINGS</code> - Tuning findings <code>PLAN</code> - Explain plans <code>INFORMATION</code> - General information <code>ERROR</code> - Statements with errors <code>ALL</code> - All statements

Table 184-37 (Cont.) REPORT_TUNING_TASK Function Parameters

Parameter	Description
object_id	Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report.
owner_name	Owner of the relevant tuning task. The default is the current schema owner.
execution_name	Name of the task execution to use. If NULL, then the function generates the report for the last task execution.
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri: <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Return Values

A CLOB containing the desired report.

Examples

```
-- Display the report for a single statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task)
FROM DUAL;

-- Display the summary for a SQL tuning set.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL',
'SUMMARY')
FROM DUAL;

-- Display the findings for a specific statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT',
'TYPICAL','FINDINGS', 5)
FROM DUAL;
```

184.5.32 REPORT_TUNING_TASK_XML Function

This function displays an XML report of a tuning task.

See Also:

[DBMS_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK_LIST_XML(
  task_name      IN   VARCHAR2      := NULL,
  level          IN   VARCHAR2      := LEVEL_TYPICAL,
  section        IN   VARCHAR2      := SECTION_ALL,
  object_id      IN   NUMBER         := NULL,
  result_limit   IN   NUMBER         := 160,
  owner_name     IN   VARCHAR2      := NULL,
  execution_name IN   VARCHAR2      := NULL,
  autotune_period IN NUMBER         := NULL,
  report_tag     IN   VARCHAR2      := NULL)
RETURN XMLTYPE;
```

Parameters

Table 184-38 REPORT_TUNING_TASK_XML Function Parameters

Parameter	Description
task_name	Name of the tuning task.
level	Level of detail in the report: <ul style="list-style-type: none"> BASIC: simple version of the report. Just show info about the actions taken by the advisor. TYPICAL: show information about every statement analyzed, including requests not implemented. ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Section of the report to include. You can limit the report to any of the following single sections (ALL for all sections): <ul style="list-style-type: none"> SUMMARY - Summary information ALL - All statements
object_id	Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.

Table 184-38 (Cont.) REPORT_TUNING_TASK_XML Function Parameters

Parameter	Description
result_limit	The number of statements in a SQL tuning set or snapshot range for which the report is generated. The default is 160 (20 statements * 8 categories). The categories are as follows: <ul style="list-style-type: none"> • Profile • Index • Restructure SQL • Alternate plan • Statistics • Errors • Information • No findings
owner_name	Owner of the relevant tuning task. The default is the current schema owner.
execution_name	Name of the task execution to use. If <code>NULL</code> , then the function generates the report for the most recent task execution.
autotune_period	The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows: <ul style="list-style-type: none"> • Null or negative value (default) — All or full. The result includes all task executions. • 0 — Result of the current or most recent task execution. • 1 — Result for the most recent 24-hour period. • 7 — Result for the most recent 7-day period. The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.
report_tag	The name of the root XML tag. By default, the tag is the report reference generated by the reporting framework.

Return Values

A `CLOB` containing the desired report.

184.5.33 RESET_TUNING_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESET_TUNING_TASK(
  task_name          IN VARCHAR2);
```

Parameters

Table 184-39 RESET_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to reset

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

184.5.34 RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(
  task_name          IN VARCHAR2,
  basic_filter       IN VARCHAR2 := NULL);
```

Parameters

Table 184-40 RESUME_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to resume.
basic_filter	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter is applied in conjunction with the parameter <code>basic_filteri</code> when calling CREATE_TUNING_TASK Functions .

Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL tuning set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or
check
-- out its results and then decide. For this example we will just
resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

184.5.35 SCHEDULE_TUNING_TASK Function

This function creates a tuning task for a single SQL statement and schedules a DBMS_SCHEDULER job to execute the tuning task. One form of the function finds the information about the statement to be tuned in the shared SQL area, whereas the other finds the information in AWR.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

Shared SQL Area Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER           := NULL,
  start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
  scope           IN VARCHAR2         :=
SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER           := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2         := NULL,
  description     IN VARCHAR2         := NULL,
  con_name        IN VARCHAR2         := NULL)
RETURN VARCHAR2;
```

AWR Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
```

```

sql_id          IN VARCHAR2,
plan_hash_value IN NUMBER           := NULL,
start_date     IN TIMESTAMP WITH TIME ZONE := NULL,
scope         IN VARCHAR2         := SCOPE_COMPREHENSIVE,
time_limit    IN NUMBER           := TIME_LIMIT_DEFAULT,
task_name     IN VARCHAR2         := NULL,
description   IN VARCHAR2         := NULL,
con_name      IN VARCHAR2         := NULL,
dbid         IN NUMBER           := NULL)
RETURN VARCHAR2;

```

Parameters

Table 184-41 SCHEDULE_TUNING_TASK Function Parameters

Parameter	Description
begin_snap	The beginning snapshot identifier. The range is exclusive, which means that SQL statements in this snapshot ID are not included.
end_snap	The end snapshot identifier. The range is inclusive, which means that SQL statements in this snapshot ID are included.
sql_id	The SQL ID of the statement to be tuned.
plan_hash_value	The plan hash value of the statement to be tuned. For example, the tuning job fetches captured binds for this SQL plan.
start_date	The date on which the schedule becomes valid. If null, then SQL Tuning Advisor immediately executes the task.
scope	The scope of the tuning job: limited, or comprehensive.
time_limit	The maximum duration in seconds for the SQL tuning session.
task_name	Optional SQL tuning task name.
description	Description of the SQL tuning session. The description can contain a maximum of 256 characters.
con_name	The container from which SQL Tuning Advisor accesses the SQL statement information.
dbid	DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used.

Security Model

The caller must possess the `CREATE JOB` privilege for the job.

Return Values

A SQL tuning task name that is unique for each user. Multiple users can assign the same name to their advisor tasks.

Usage Notes

- The task is scheduled only once.
- The name of the scheduler job is created as follows:
`sqltune_job_taskid_orahash(systemtimestamp)`.

184.5.36 SCRIPT_TUNING_TASK Function

This function creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK (
  task_name          IN VARCHAR2,
  rec_type           IN VARCHAR2  := REC_TYPE_ALL,
  object_id          IN NUMBER    := NULL,
  result_limit       IN NUMBER    := NULL,
  owner_name         IN VARCHAR2  := NULL,
  execution_name     IN VARCHAR2  := NULL,
  database_link_to   IN VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

Table 184-42 SCRIPT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task for which to apply a script.
rec_type	Filter the script by types of recommendations to include. You can use any subset of the following values, separated by commas: 'ALL:' 'PROFILES' 'STATISTICS' 'INDEXES'. For example, a script with profiles and statistics would use the filter 'PROFILES, STATISTICS'.
object_id	Optionally filters by a single object ID.
result_limit	Optionally shows commands for only top <i>n</i> SQL (ordered by object_id and ignored if an object_id is also specified).
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.
excution_name	Name of the task execution to use. If NULL, the script is generated for the last task execution.

Table 184-42 (Cont.) SCRIPT_TUNING_TASK Function Parameters

Parameter	Description
database_link_to	<p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- After the script is returned, check it before executing it.
- Wrap with a call to DBMS_ADVISOR.CREATE_FILE to put it into a file.

Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of only the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;

-- Get a script of only stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about only one SQL statement when we
have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

184.5.37 SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
  basic_filter      IN   VARCHAR2 := NULL,
  object_filter    IN   VARCHAR2 := NULL,
  ranking_measure1 IN   VARCHAR2 := NULL,
  ranking_measure2 IN   VARCHAR2 := NULL,
  ranking_measure3 IN   VARCHAR2 := NULL,
  result_percentage IN  NUMBER   := 1,
  result_limit     IN   NUMBER   := NULL,
  attribute_list   IN   VARCHAR2 := NULL,
  recursive_sql    IN   VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 184-43 SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
<code>basic_filter</code>	Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of the type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .
<code>object_filter</code>	Currently not supported.
<code>ranking_measure(n)</code>	Defines an <code>ORDER BY</code> clause on the selected SQL.
<code>result_percentage</code>	Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. The value applies only if one ranking measure is supplied.
<code>result_limit</code>	Defines the top limit SQL from the filtered source ranked by the ranking measure.

Table 184-43 (Cont.) SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
<code>attribute_list</code>	<p>Specifies the list of SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>TYPICAL</code> — Specifies <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list (default). • <code>BASIC</code> — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. • <code>ALL</code> — Specifies all attributes. • Comma-separated list of attribute names. <p>This values returns only a subset of SQL attributes:</p> <ul style="list-style-type: none"> – <code>EXECUTION_STATISTICS</code> – <code>BIND_LIST</code> – <code>OBJECT_LIST</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> — Similar to <code>SQL_PLAN</code> plus row source statistics
<code>recursive_sql</code>	<p>Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>, which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).</p>

Return Values

This function returns a one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

Examples

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j''));

-- Notice that some statements can have multiple plans. The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value). This
-- is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''ay1m3ssvtrh24''))
```

```

ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor,
along the
-- lines given below

-- Select all statements in the shared SQL area.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;/

-- Look for statements not parsed by SYS.
DECLARE
  cur sys_refcursor;
BEGIN

  OPEN cur FOR
    SELECT VALUE(P)
```

```

        FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                    NULL,
                                                    'ELAPSED_TIME', NULL,
NULL,
                                                    1,
                                                    100)) P;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
end;/

-- Select the set of statements which cumulatively account for 90% of
the
-- buffer gets in the shared SQL area. This means that the buffer
gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(P)
        FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                    NULL,
                                                    'BUFFER_GETS', NULL,
NULL,
                                                    .9)) P;

-- Process each statement (or pass cursor to load_sqlset).

CLOSE cur;
END;
/

```

184.5.38 SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.SELECT_SQL_TRACE (
    directory          IN VARCHAR2,
    file_name         IN VARCHAR2 := NULL,

```

```

mapping_table_name      IN VARCHAR2 := NULL,
mapping_table_owner     IN VARCHAR2 := NULL, ,
select_mode             IN POSITIVE := SINGLE_EXECUTION,
options                 IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
pattern_start          IN VARCHAR2 := NULL,
pattern_end             IN VARCHAR2 := NULL,
result_limit           IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 184-44 SELECT_SQL_TRACE Function Parameters

Parameter	Description
directory	Defines the directory object containing the trace files. This field is mandatory.
file_name	Specifies all or part of the name of the trace files. If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names.
mapping_table_name	Specifies the mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.
mapping_table_owner	Specifies the mapping table owner. If it is NULL, then the function uses the current user.
select_mode	Specifies the mode for selecting SQL from the trace. Possible values are: <ul style="list-style-type: none"> SINGLE_EXECUTION — Returns one execution of a SQL. This is the default. ALL_EXECUTIONS — Returns all executions.
options	Specifies which types of SQL statements are returned. <ul style="list-style-type: none"> LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default. ALL_COMMAND_TYPE — Returns the SQL statements with all command types.
pattern_start	Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE.
pattern_end	Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE.
result_limit	Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.

Return Values

This function returns a `SQLSET_ROW` object.

Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with `SELECT` privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the `PATH_PREFIX` clause of the `CREATE PLUGGABLE DATABASE` statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
   cur sys_refcursor;
BEGIN
   OPEN cur FOR
   SELECT value(p)
      FROM TABLE(
         DBMS_SQLTUNE.SELECT_SQL_TRACE(
            directory=>'SQL_TRACE_DIR',
            file_name=>'%trc',
            mapping_table_name=>'mapping')) p;
   DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
   CLOSE cur;
```

```
END;
/
```

184.5.39 SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

 **See Also:**

- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- *Oracle Database Testing Guide* for a `SELECT_SQLPA_TASK` example

Syntax

```
DBMS_SQLTUNE.SELECT_SQLPA_TASK (
  task_name          IN VARCHAR2,
  task_owner         IN VARCHAR2 := NULL,
  execution_name     IN VARCHAR2 := NULL,
  level_filter       IN VARCHAR2 := 'REGRESSED',
  basic_filter       IN VARCHAR2 := NULL,
  object_filter      IN VARCHAR2 := NULL,
  attribute_list     IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 184-45 SELECT_SQLPA_TASK Function Parameters

Parameter	Description
<code>task_name</code>	Specifies the name of the SQL Performance Analyzer task.
<code>task_owner</code>	Specifies the owner of the SQL Performance Analyzer task. If <code>NULL</code> , then assume the current user.
<code>execution_name</code>	Specifies the name of the SQL Performance Analyzer task execution (type <code>COMPARE PERFORMANCE</code>) from which the provided filters will be applied. If <code>NULL</code> , then assume the most recent <code>COMPARE PERFORMANCE</code> execution.

Table 184-45 (Cont.) SELECT_SQLPA_TASK Function Parameters

Parameter	Description
level_filter	<p>Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</p> <ul style="list-style-type: none"> IMPROVED includes only improved SQL. REGRESSED includes only regressed SQL (default). CHANGED includes only SQL with changed performance. UNCHANGED includes only SQL with unchanged performance. CHANGED_PLANS includes only SQL with plan changes. UNCHANGED_PLANS includes only SQL with unchanged plans. ERRORS includes only SQL with errors only. MISSING_SQL includes only missing SQL statements (across STS). NEW_SQL includes only new SQL statements (across STS).
basic filter	Specifies the SQL predicate to filter the SQL in addition to the level filters.
object_filter	Currently not supported.
attribute_list	<p>Defines the SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default. BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. ALL — Returns all attributes. Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).

Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

184.5.40 SELECT_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQLSET (
  sqlset_name      IN  VARCHAR2,
  basic_filter     IN  VARCHAR2 := NULL,
  object_filter    IN  VARCHAR2 := NULL,
  ranking_measure1 IN  VARCHAR2 := NULL,
  ranking_measure2 IN  VARCHAR2 := NULL,
  ranking_measure3 IN  VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN  NUMBER := NULL)
attribute_list    IN  VARCHAR2 := NULL,
plan_filter       IN  VARCHAR2 := NULL,
sqlset_owner      IN  VARCHAR2 := NULL,
recursive_sql     IN  VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 184-46 SELECT_SQLSET Function Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set to query.
basic_filter	Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the SQLSET_ROW.
object_filter	Currently not supported.
ranking_measure(n)	Specifies an ORDER BY clause on the selected SQL.
result_percentage	Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this parameter applies only if one ranking measure is supplied.
result_limit	The top limit SQL from the filtered source, ranked by the ranking measure.
attribute_list	Defines the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> • BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result. • TYPICAL — Returns BASIC plus the SQL plan, but without row source statistics and without the object reference list. This is the default. • ALL — Returns all attributes. • Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: <ul style="list-style-type: none"> – EXECUTION_STATISTICS – SQL_BINDS – SQL_PLAN_STATISTICS (similar to SQL_PLAN plus row source statistics)

Table 184-46 (Cont.) SELECT_SQLSET Function Parameters

Parameter	Description
<code>plan_filter</code>	<p>Specifies the plan filter.</p> <p>This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:</p> <ul style="list-style-type: none"> • <code>LAST_GENERATED</code> — Returns the plan with the most recent timestamp. • <code>FIRST_GENERATED</code> — Returns the plan with the least recent timestamp. • <code>LAST_LOADED</code> — Returns the plan with the most recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>FIRST_LOADED</code> — Returns the plan with the least recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>MAX_ELAPSED TIME</code> — Returns the plan with the maximum elapsed time. • <code>MAX_BUFFER_GETS</code> — Returns the plan with the maximum buffer gets. • <code>MAX_DISK_READS</code> — Returns the plan with the maximum disk reads. • <code>MAX_DIRECT_WRITES</code> — Returns the plan with the maximum direct writes. • <code>MAX_OPTIMIZER_COST</code> — Returns the plan with the maximum optimizer cost value.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.
<code>recursive_sql</code>	Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code> , which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
      FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

184.5.41 SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := NULL,
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;
```

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  baseline_name   IN VARCHAR2,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := NULL,
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 184-47 SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
<code>begin_snap</code>	Defines the beginning AWR snapshot (non-inclusive).
<code>end_snap</code>	Defines the ending AWR snapshot (inclusive).
<code>baseline_name</code>	Specifies the name of the AWR baseline period.

Table 184-47 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
<code>basic_filter</code>	Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .
<code>object_filter</code>	Currently not supported.
<code>ranking_measure(n)</code>	Defines an <code>ORDER BY</code> clause on the selected SQL.
<code>result_percentage</code>	Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.
<code>result_limit</code>	Specifies the top limit SQL from the source according to the supplied ranking measure.
<code>attribute_list</code>	Specifies the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> <code>TYPICAL</code> — Returns <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list. This is the default. <code>BASIC</code> — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. <code>ALL</code> — Returns all attributes Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics).
<code>recursive_sql</code>	Specifies the filter that includes recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>) or excludes it (<code>NO_RECURSIVE_SQL</code>).
<code>dbid</code>	Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the function uses the current database DBID.

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
```

```

        FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

    -- Process each statement (or pass cursor to load_sqlset)

    CLOSE cur;
END;
/

```

184.5.42 SET_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
    task_name          IN  VARCHAR2,
    parameter          IN  VARCHAR2,
    value              IN  VARCHAR2,
    database_link_to  IN  VARCHAR2);

```

```

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
    task_name          IN  VARCHAR2,
    parameter          IN  VARCHAR2,
    value              IN  NUMBER,
    database_link_to  IN  VARCHAR2);
);

```

Parameters

Table 184-48 SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute

Table 184-48 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter	<p>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</p> <ul style="list-style-type: none"> • APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). • BASIC_FILTER: basic filter for SQL tuning set • DAYS_TO_EXPIRE: number of days until the task is deleted • DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_TUNING_TASK Function and Procedure • EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task) • LOCAL_TIME_LIMIT: per-statement time out (seconds) • MODE: tuning scope (comprehensive, limited) • OBJECT_FILTER: object filter for SQL tuning set • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • RANK_MEASURE1: first ranking measure for SQL tuning set • RANK_MEASURE2: second possible ranking measure for SQL tuning set • RANK_MEASURE3: third possible ranking measure for SQL tuning set • RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER • SQL_LIMIT: maximum number of SQL statements to tune • SQL_PERCENTAGE: percentage filter of SQL tuning set statements • TEST_EXECUTE: FULL/AUTO/OFF. <ul style="list-style-type: none"> * FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) * AUTO - test-execute for an automatically-chosen time proportional to the tuning time * OFF - do not test-execute • TIME_LIMIT: global time out (seconds) • USERNAME: username under which the statement is parsed
value	New value of the specified parameter

Table 184-48 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
database_link_to	<p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Usage Notes

When setting automatic tuning task parameters, use the [SET_AUTO_TUNING_TASK_PARAMETER Procedures](#) in the [DBMS_AUTO_SQLTUNE](#) package.

184.5.43 SQLTEXT_TO_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in dba_sql_profiles.

**See Also:**

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (
  sql_text      IN CLOB,
  force_match  IN BOOLEAN := FALSE)
RETURN NUMBER;
```

Parameters

Table 184-49 SQLTEXT_TO_SIGNATURE Function Parameters

Parameter	Description
sql_text	SQL text whose signature is required. Required.
force_match	If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed

Return Values

This function returns the signature of the specified SQL text.

184.5.44 UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (
  profile_name          IN VARCHAR2 := '%',
  profile_category     IN VARCHAR2 := 'DEFAULT',
  replace              IN BOOLEAN,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 184-50 UNPACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
profile_name	The name of the profile to unpack (% wildcards acceptable, case-sensitive)
profile_category	The category from which to unpack profiles (% wildcards acceptable, case-sensitive)
replace	The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists
staging_table_name	The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.

Table 184-50 (Cont.) UNPACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
staging_schem a_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Usage Notes

Using this procedure requires the `CREATE ANY SQL PROFILE` privilege and the `SELECT` privilege on staging table.

Examples

```
-- Unpack all profiles stored in a staging table.
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
    replace           => FALSE
  ,   staging_table_name => 'PROFILE_STGTAB');
END;

-- If there is a failure during the unpack operation, you can find the
-- profile
-- that caused the error and perform a remap_stgtab_sqlprof operation
-- targeting it.
-- You can resume the unpack operation by setting replace to TRUE so that
-- the profiles that were already created are replaced.
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
    replace           => TRUE
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

184.5.45 UNPACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

**See Also:**

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
  sqlset_name      IN VARCHAR2 := '%',
  sqlset_owner     IN VARCHAR2 := NULL,
  replace          IN BOOLEAN,
```

```
staging_table_name IN VARCHAR2,  
staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

The parameters are identical for DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET and DBMS_SQLSET.UNPACK_STGTAB.

Table 184-51 UNPACK_STGTAB_SQLSET and UNPACK_STGTAB Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table.
sqlset_owner	Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported.
replace	Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.
staging_table_name	Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive).
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).

Examples

```
-- unpack all STS in the staging table  
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -  
                                       sqlset_owner    => '%', -  
                                       replace          => FALSE, -  
                                       staging_table_name =>  
'STGTAB_SQLSET');  
  
-- errors can arise during STS unpack when a STS in the staging table  
-- has the  
-- same name/owner as STS on the system. In this case, users should  
-- call  
-- remap_stgtab_sqlset to patch the staging table and with which to  
-- call unpack  
-- Replace set to TRUE.  
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -  
                                       sqlset_owner    => '%', -  
                                       replace          => TRUE, -  
                                       staging_table_name =>  
'STGTAB_SQLSET');
```

184.5.46 UPDATE_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  NUMBER := NULL);
```

Parameters

Table 184-52 UPDATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
sql_id	Specifies the identifier of the SQL statement to be updated.
plan_hash value	Specifies the hash value of the execution plan for a SQL statement. Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.
attribute_name	Specifies the name of the attribute to be modified. You can update the text field for MODULE, ACTION, PARSING_SCHEMA_NAME, and OTHER. The only numerical field that you can update is PRIORITY. If a statement has multiple plans, then the procedure changes the attribute value for all plans.
attribute_value	Specifies the new value of the attribute.

185

DBMS_STAT_FUNCS

The `DBMS_STAT_FUNCS` package provides statistical functions.

This chapter contains the following topic:

- [Summary of DBMS_STAT_FUNCS Subprograms](#)

185.1 Summary of DBMS_STAT_FUNCS Subprograms

This table lists and briefly describes the `DBMS_STAT_FUNCS` subprograms.

Table 185-1 DBMS_STAT_FUNCS Package Subprograms

Subprogram	Description
EXPONENTIAL_DIST_FIT Procedure	Tests how well a sample of values fits an exponential distribution
NORMAL_DIST_FIT Procedure	Tests how well a sample of values fits a normal distribution
POISSON_DIST_FIT Procedure	Tests how well a sample of values fits a Poisson distribution
SUMMARY Procedure	Summarizes a numerical column of a table
UNIFORM_DIST_FIT Procedure	Tests how well a sample of values fits a uniform distribution
WEIBULL_DIST_FIT Procedure	Tests how well a sample of values fits a Weibull distribution

185.1.1 EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (  
  ownername      IN   VARCHAR2,  
  tablename      IN   VARCHAR2,  
  columnname     IN   VARCHAR2,  
  test_type      IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',  
  lambda         IN   NUMBER,  
  mu             IN   NUMBER,  
  sig            OUT  NUMBER);
```

Parameters

Table 185-2 EXPONENTIAL_DIST_FIT Procedure Parameters

Parameter	Description
<code>ownername</code>	The schema where the table resides.

Table 185-2 (Cont.) EXPONENTIAL_DIST_FIT Procedure Parameters

Parameter	Description
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The scale parameter.
mu	The location parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.

185.1.2 NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
  mean        IN   NUMBER,
  stdev       IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 185-3 NORMAL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.
mean	The mean of the distribution against which to compare.
stdev	The standard deviation of the distribution against which to compare.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.

185.1.3 POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  lambda      IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 185-4 POISSON_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The lambda parameter is the shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.

185.1.4 SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`.

The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

Syntax

```
DBMS_STAT_FUNCS.SUMMARY (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  sigma_value IN   NUMBER DEFAULT 3,
  s           OUT  SummaryType);
```

Parameters

Table 185-5 SUMMARY Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.

Table 185-5 (Cont.) SUMMARY Procedure Parameters

Parameter	Description
tablename	The table where the column resides.
columnname	The column of the table to be summarized.
sigma_value	The number of sigmas for the set of extreme values, defaults to 3.
s	The Record containing summary information about given column.

Definition of SummaryType

```
TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (
    count          NUMBER,
    min            NUMBER,
    max           NUMBER,
    range         NUMBER,
    mean          NUMBER,
    cmode         num_table,
    variance      NUMBER,
    stddev        NUMBER,
    quantile_5    NUMBER,
    quantile_25   NUMBER,
    median        NUMBER,
    quantile_75   NUMBER,
    quantile_95   NUMBER,
    plus_x_sigma  NUMBER,
    minus_x_sigma NUMBER,
    extreme_values num_table,
    top_5_values  n_arr,
    bottom_5_values n_arr);
```

185.1.5 UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

```
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
    ownername IN VARCHAR2,
    tablename IN VARCHAR2,
    columnname IN VARCHAR2,
    var_type IN VARCHAR2 DEFAULT 'CONTINUOUS',
    test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    paramA IN NUMBER,
    paramB IN NUMBER,
    sig OUT NUMBER);
```

Parameters

Table 185-6 UNIFORM_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
var_type	The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
paramA	Parameter A estimated from the sample (the location parameter).
paramB	Parameter B estimated from the sample (the scale parameter).
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.

185.1.6 WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  alpha       IN   NUMBER,
  mu          IN   NUMBER,
  beta        IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 185-7 WEIBULL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
alpha	The scale parameter.
mu	The location parameter.
beta	The slope/shape parameter.

Table 185-7 (Cont.) WEIBULL_DIST_FIT Procedure Parameters

Parameter	Description
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.

DBMS_STATS

With the `DBMS_STATS` package you can view and modify optimizer statistics gathered for database objects.

Users can also collect statistics on Global Temporary Tables (GTTs) using the `DBMS_STATS` package. However, `DBMS_STATS` cannot collect statistics on Private Temporary Tables (PTTs).

This chapter contains the following topics:

- [DBMS_STATS Overview](#)
- [DBMS_STATS Deprecated Subprograms](#)
- [DBMS_STATS Types](#)
- [DBMS_STATS Constants](#)
- [DBMS_STATS Operational Notes](#)
- [DBMS_STATS Data Structures](#)
- [Summary of DBMS_STATS Subprograms](#)

See Also:

- *Oracle Database SQL Tuning Guide*
- *Oracle Database Administrator's Guide*

186.1 DBMS_STATS Overview

To improve performance, the database enables you to collect optimizer statistics.

Note:

By default, the database collects statistics automatically, so this package is intended only for specialized cases.

Optimizer statistics can reside in the data dictionary or in a table created in the user's schema. You can also collect and manage user-defined statistics for tables and domain indexes using this package. For example, if you invoke the `DELETE_COLUMN_STATS` procedure on a column for which an association is defined, the database deletes both user-defined and standard statistics for this column.

Only optimizer statistics stored in the data dictionary have an effect on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel.

Optimizer Statistics Advisor inspects the statistics gathering process, automatically diagnoses problems in the existing practices for gathering statistics, and then generates a report of findings and recommendations. The advisor task runs automatically in the maintenance window. However, you can also run the job on demand.

**See Also:**

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics

186.2 DBMS_STATS Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

Starting with Oracle Database 11g Release 2 (11.2), the following subprograms are obsolete:

- [GET_PARAM Function](#)
Instead, use [GET_PREFS Function](#)
- [SET_PARAM Procedure](#)
Instead, use [SET_GLOBAL_PREFS Procedure](#)
- [RESET_PARAM_DEFAULTS Procedure](#)
Instead use [RESET_GLOBAL_PREF_DEFAULTS Procedure](#)

The following subprogram is deprecated with Oracle Database 12c and later:

- [GENERATE_STATS](#)

This procedure is replaced by the [GATHER_INDEX_STAT](#) procedure.

**See Also:**

"[GATHER_INDEX_STATS Procedure](#)"

186.3 DBMS_STATS Types

Histograms

Types for the minimum and maximum values and histogram endpoints include the following:

```
TYPE numarray IS VARRAY(2050) OF NUMBER;  
TYPE datearray IS VARRAY(2050) OF DATE;  
TYPE chararray IS VARRAY(2050) OF VARCHAR2(4000);  
TYPE rawarray IS VARRAY(2050) OF RAW(2000);  
TYPE fltarray IS VARRAY(2050) OF BINARY_FLOAT;  
TYPE dblarray IS VARRAY(2050) OF BINARY_DOUBLE;
```

Stale Tables

Types for listing stale tables include the following:

```

TYPE ObjectElem IS RECORD (
  ownname    VARCHAR2(30),    -- owner
  objtype    VARCHAR2(6),    -- 'TABLE' or 'INDEX'
  objname    VARCHAR2(30),    -- table/index
  partname   VARCHAR2(30),    -- partition
  subpartname VARCHAR2(30));  -- subpartition
TYPE ObjectTab IS TABLE OF ObjectElem;

```

Statistics Difference Reports

Use the following type to displays a statistics difference report:

```

TYPE DiffRepElem IS RECORD (
  report      CLOB,          -- stats difference report
  maxdiffpct NUMBER);      -- max stats difference (percentage)
TYPE DiffRepTab IS TABLE OF DiffRepElem;

```

Optimizer Statistics Advisor

The following type represents database objects for which you can gather statistics:

```

TYPE ObjectElem IS RECORD (
  ownname      dbms_quoted_id, -- owner
  objtype      VARCHAR2(6), -- 'TABLE' or 'INDEX'
  objname      dbms_quoted_id, -- table/index
  partname     dbms_quoted_id, -- partition
  subpartname  dbms_quoted_id -- subpartition
);
TYPE ObjectTab IS TABLE OF ObjectElem;

```

Note:

Make sure to maintain `satisfy_obj_filter` when the `ObjectElem` type is changed

The following type represents an operation:

```

TYPE StatsAdvOpr IS RECORD (
  name  VARCHAR2(64), -- name of the operation
  param VARCHAR2(4000)
); -- XML containing parameters and their values
TYPE StatsAdvOprTab IS TABLE OF StatsAdvOpr;

```

The following type represents a filter list:

```

TYPE StatsAdvFilter IS RECORD (
  rulename VARCHAR2(64), -- rule name
  objlist  ObjectTab,    -- object filter list
  oprlist  StatsAdvOprTab, -- operation filter list

```

```
include BOOLEAN);      -- include/exclude elements in the list
TYPE StatsAdvFilterTab IS TABLE OF StatsAdvFilter;
```

186.4 DBMS_STATS Constants

The `DBMS_STATS` package defines several constants to use specifying parameter values.

Table 186-1 DBMS_STATS Constants

Name	Type	Description
<code>ADD_GLOBAL_PREFS</code>	NUMBER	Copies global preferences
<code>AUTO_CASCADE</code>	BOOLEAN	Lets Oracle decide whether to collect statistics for indexes or not
<code>AUTO_DEGREE</code>	NUMBER	Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters
<code>AUTO_INVALIDATE</code>	BOOLEAN	Lets Oracle decide when to invalidate dependent cursors
<code>AUTO_SAMPLE_SIZE</code>	NUMBER	Indicates that auto-sample size algorithms should be used
<code>PURGE_ALL</code>	TIMESTAMP WITH TIME ZONE	A flag that can be passed to the PURGE_STATS Procedure and unconditionally deletes all the history statistics. The deletion uses <code>TRUNCATE</code> statements on the various dictionary statistics tables holding the history of statistics.
<code>RECLAIM_SYNOPSIS</code>	TIMESTAMP WITH TIME ZONE	A constant used for reclaiming synopsis table space.

186.5 DBMS_STATS Operational Notes

Observe these operational notes when using the `DBMS_STATS` package.

The `DBMS_STATS` subprograms perform the following general operations:

- [Gathering Optimizer Statistics](#)
- [Setting or Getting Statistics](#)
- [Deleting Statistics](#)
- [Transferring Statistics](#)
- [Locking or Unlocking Statistics](#)
- [Restoring and Purging Statistics History](#)
- [User-Defined Statistics](#)
- [Pending Statistics](#)
- [Comparing Statistics](#)

- [Extended Statistics](#)
- [Optimizer Statistics Advisor](#)

Most of the `DBMS_STATS` procedures include the three parameters `statown`, `stattab`, and `statid`. These parameters enable you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with sets of statistics.

The `stattab` parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the `statown` parameter is specified). You can create multiple tables with different `stattab` identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single `stattab` by using the `statid` parameter, which avoids cluttering the user's schema.

For the `SET` and `GET` procedures, if `stattab` is not provided (that is, `NULL`), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if `stattab` is not `NULL`, then the `SET` or `GET` operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of `DBMS_STATS` procedures using the [SET_DATABASE_PREFS Procedure](#), [SET_GLOBAL_PREFS Procedure](#), [SET_SCHEMA_PREFS Procedure](#) and [SET_TABLE_PREFS Procedure](#).

Most procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a `force` parameter that enables you to override a lock on statistics. Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the `ANALYZE` command:

- [GATHER_DATABASE_STATS Procedures](#)
- [GATHER_DICTIONARY_STATS Procedure](#)
- [GATHER_FIXED_OBJECTS_STATS Procedure](#)
- [GATHER_INDEX_STATS Procedure](#)
- [GATHER_SCHEMA_STATS Procedures](#)
- [GATHER_SYSTEM_STATS Procedure](#)
- [GATHER_TABLE_STATS Procedure](#)

The `GATHER_*` procedures also collect user-defined statistics for columns and domain indexes.

The `statown`, `stattab`, and `statid` parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

[GENERATE_STATS Procedure](#)

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

[PREPARE_COLUMN_VALUES Procedures](#)
[PREPARE_COLUMN_VALUES_NVARCHAR Procedure](#)
[PREPARE_COLUMN_VALUES_ROWID Procedure](#)

[SEED_COL_USAGE Procedure](#)
[SET_INDEX_STATS Procedures](#)
[SET_SYSTEM_STATS Procedure](#)
[SET_TABLE_STATS Procedure](#)

[GET_COLUMN_STATS Procedures](#)
[GET_INDEX_STATS Procedures](#)
[GET_SYSTEM_STATS Procedure](#)
[GET_TABLE_STATS Procedure](#)

In the special versions of the `SET_*_STATS` procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or user statistics table:

- User-defined statistics
- Owner of statistics type
- Name of statistics type

The user-defined statistics and the corresponding statistics type are inserted into the `USTATS$` dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the `GET_*_STATS` procedures return user-defined statistics and the statistics type owner and name as `OUT` arguments corresponding to the schema object specified. If user-defined statistics are not collected, `NULL` values are returned.

Deleting Statistics

The `DELETE_*` procedures delete both user-defined statistics and the standard statistics for the given schema object.

[DELETE_COLUMN_STATS Procedure](#)
[DELETE_DATABASE_STATS Procedure](#)
[DELETE_DICTIONARY_STATS Procedure](#)
[DELETE_FIXED_OBJECTS_STATS Procedure](#)
[DELETE_INDEX_STATS Procedure](#)
[DELETE_SCHEMA_STATS Procedure](#)
[DELETE_SYSTEM_STATS Procedure](#)
[DELETE_TABLE_STATS Procedure](#)

Note that `DELETE_TABLE_STATS`, `DELETE_DICTIONARY_STATS`, `DELETE_DATABASE_STATS` and `DELETE_SCHEMA_STATS` have a parameter `stat_category` which specifies which statistics to delete. The parameter accepts multiple values separated by comma. The supported values are `'OBJECT_STATS'` (table statistics, column statistics and index statistics) and `'SYNOPSIS'` (auxiliary statistics created when statistics are incrementally maintained). The default is `'OBJECT_STATS, SYNOPSIS'`.

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

[CREATE_STAT_TABLE Procedure](#)

[DROP_STAT_TABLE Procedure](#)

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table ([EXPORT_*](#))
- from a user statistics table to the dictionary ([IMPORT_*](#))

[EXPORT_COLUMN_STATS Procedure](#)

[EXPORT_DATABASE_STATS Procedure](#)

[EXPORT_DICTIONARY_STATS Procedure](#)

[EXPORT_FIXED_OBJECTS_STATS Procedure](#)

[EXPORT_INDEX_STATS Procedure](#)

[EXPORT_SCHEMA_STATS Procedure](#)

[EXPORT_SYSTEM_STATS Procedure](#)

[EXPORT_TABLE_STATS Procedure](#)

[IMPORT_COLUMN_STATS Procedure](#)

[IMPORT_DATABASE_STATS Procedure](#)

[IMPORT_DICTIONARY_STATS Procedure](#)

[IMPORT_FIXED_OBJECTS_STATS Procedure](#)

[IMPORT_INDEX_STATS Procedure](#)

[IMPORT_SCHEMA_STATS Procedure](#)

[IMPORT_SYSTEM_STATS Procedure](#)

[IMPORT_TABLE_STATS Procedure](#)

 **Note:**

Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

[LOCK_PARTITION_STATS Procedure](#)

[LOCK_SCHEMA_STATS Procedure](#)

[LOCK_TABLE_STATS Procedure](#)

[UNLOCK_PARTITION_STATS Procedure](#)

[UNLOCK_SCHEMA_STATS Procedure](#)

[UNLOCK_TABLE_STATS Procedure](#)

The `LOCK_*` procedures either freeze the current set of the statistics or to keep the statistics untouched. When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

[RESET_GLOBAL_PREF_DEFAULTS Procedure](#)
[RESTORE_DATABASE_STATS Procedure](#)
[RESTORE_DICTIONARY_STATS Procedure](#)
[RESTORE_FIXED_OBJECTS_STATS Procedure](#)
[RESTORE_SCHEMA_STATS Procedure](#)
[RESTORE_SYSTEM_STATS Procedure](#)
[RESTORE_TABLE_STATS Procedure](#)

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the [ALTER_STATS_HISTORY_RETENTION Procedure](#).

The other `DBMS_STATS` procedures related to restoring statistics are:

- [PURGE_STATS Procedure](#): This procedure lets you manually purge old versions beyond a time stamp.
- [GET_STATS_HISTORY_RETENTION Function](#): This function gets the current statistics history retention value.
- [GET_STATS_HISTORY_AVAILABILITY Function](#): This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

`RESTORE_*` operations are not supported for user defined statistics.

User-Defined Statistics

The `DBMS_STATS` package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the [GET_INDEX_STATS Procedures](#) invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

`SET_*` and `GET_*` operations for user-defined statistics are also supported using a special version of the `SET` and `GET` interfaces for columns and indexes.

`EXPORT_*`, `IMPORT_*` and `RESTORE_*` operations are not supported for user defined statistics.

Pending Statistics

The package gathers statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the `PUBLISH` option to `FALSE` using the `SET*PREFS` procedures. The default value for `PUBLISH` is `TRUE`. The statistics stored in private area are not used by Cost Based Optimizer unless parameter `optimizer_use_pending_statistics` is set to `TRUE`. The

default value of this parameter is `FALSE` and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the [EXPORT_PENDING_STATS Procedure](#)) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

After the performance or query plans have been verified, you can publish the pending statistics using the [PUBLISH_PENDING_STATS Procedure](#) if the performance is acceptable, or delete the pending statistics using [DELETE_PENDING_STATS Procedure](#) if it is not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- [DELETE_PENDING_STATS Procedure](#)
- [EXPORT_PENDING_STATS Procedure](#)
- [PUBLISH_PENDING_STATS Procedure](#)

Comparing Statistics

You can use the `DIFF_TABLE_STATS_*` statistics to compare statistics for a table from two different sources. The statistics can be from:

- Two different user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary history
- Pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They display statistics of the objects from both sources if the difference between those statistics exceeds a certain threshold. The threshold can be specified as an argument to the function, with a default of 10%. The database uses the statistics corresponding to the first source (`stattab1` or `time1`) as a basis for computing the differential percentage.

Extended Statistics

This package enables you to collect statistics for column groups and expressions. The statistics collected for column groups and expressions are called "extended statistics".

Statistics on column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates `c1=1` and `c2=1` and if there are statistics on column group (c1, c2), the optimizer uses these statistics for estimating the combined cardinality of the predicates. The optimizer uses the expression statistics to estimate cardinality of predicates on those expressions. The extended statistics are similar to column statistics. The procedures that take columns names accept extended statistics names in place of column names.

Related subprograms:

- [CREATE_EXTENDED_STATS Function](#)
- [DROP_EXTENDED_STATS Procedure](#)
- [SHOW_EXTENDED_STATS_NAME Function](#)
- [REPORT_COL_USAGE Function](#)
- [SEED_COL_USAGE Procedure](#)
- [RESET_COL_USAGE Procedure](#)

Optimizer Statistics Advisor

Optimizer Statistics Advisor is built-in diagnostic software that helps use to use best practices to manage optimizer statistics. The advisor analyzes how you are currently gathering statistics (using manual scripts, explicitly setting parameters, and so on), the effectiveness of existing statistics gathering jobs, and the quality of the gathered statistics. The advisor generates findings for any issues it finds. Based on these findings, the advisor provides recommendations, which it stores in `DBA_ADVISOR_RECOMMENDATIONS`.

The advisor organizes rules into the following classes:

- **System**
This class checks the preferences for statistics collection, status of the automated statistics gathering job, use of SQL plan directives, and so on. Rules in this class have the value `SYSTEM` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.
- **Operation**
This class checks whether statistics collection uses the defaults, test statistics are created using the `SET_*_STATS` procedures, and so on. Rules in this class have the value `OPERATION` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.
- **Object**
This class checks for the quality of the statistics, staleness of statistics, unnecessary collection of statistics, and so on. Rules in this class have the value `OBJECT` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.

All Optimizer Statistics Advisor subprograms require the `ADVISOR` privilege. All procedures and functions execute using the invoker's privilege for the operation instead of the task owner's privilege. For example, if a user without the `ANALYZE ANY DICTIONARY` privilege creates a task `t1`, and if a DBA then executes this task, then the task execution checks for `SYS` objects. Another example is a task that is executed by `user1`, interrupted, and then resumed by `user2`. In this case, the checks of the resumed execution are based on the privilege of `user2` rather than `user1`.

You can use the following subprograms to manage Optimizer Statistics Advisor:

- [CANCEL_ADVISOR_TASK Procedure](#)
- [CONFIGURE_ADVISOR_FILTER Function](#)
- [CONFIGURE_ADVISOR_OBJ_FILTER Function](#)
- [CONFIGURE_ADVISOR_OPR_FILTER Functions](#)
- [CONFIGURE_ADVISOR_RULE_FILTER Function](#)
- [CREATE_ADVISOR_TASK Function](#)

- [DROP_ADVISOR_TASK Procedure](#)
- [EXECUTE_ADVISOR_TASK Function](#)
- [GET_ADVISOR_OPR_FILTER Procedure](#)
- [GET_ADVISOR_RECS Function](#)
- [IMPLEMENT_ADVISOR_TASK Function](#)
- [INTERRUPT_ADVISOR_TASK Procedure](#)
- [REPORT_ADVISOR_TASK Function](#)
- [RESET_ADVISOR_TASK Procedure](#)
- [RESUME_ADVISOR_TASK Procedure](#)
- [SCRIPT_ADVISOR_TASK Function](#)
- [SET_ADVISOR_TASK_PARAMETER Procedure](#)

186.6 DBMS_STATS Data Structures

The `DBMS_STATS` package defines a `RECORD` type.

RECORD Types

- [STAT_REC Record Type](#)

186.6.1 DBMS_STATS STAT_REC Record Type

This record type is provided for users in case they want to set column statistics manually. Its fields allow specifying column min/max values, as well as a histogram for a column.

Syntax

```
TYPE STATREC IS RECORD (  
    epc    NUMBER,  
    minval RAW(2000),  
    maxval RAW(2000),  
    bkvals NUMARRAY,  
    novals NUMARRAY,  
    chvals CHARARRAY,  
    eavals RAWARRAY,  
    rpcnts NUMARRAY,  
    eavs   NUMBER);
```

Fields of the Record type COMPARISON_TYPE (STAT_REC Attributes)**Table 186-2 STAT_REC Attributes**

Field	Description
epc	Number of buckets in histogram
minval	Minimum value
maxval	Maximum value
bkvals	Array of bucket numbers
novals	Array of normalized end point values
chvals	Array of dumped end point values
eavals	Array of end point actual values
rpcnts	Array of end point value frequencies
eavs	A number indicating whether actual end point values are needed in the histogram. If using the PREPARE_COLUMN_VALUES Procedures , this field will be automatically filled.

186.7 Summary of DBMS_STATS Subprograms

This table lists the DBMS_STATS subprograms and briefly describes them.

Table 186-3 DBMS_STATS Package Subprograms

Subprogram	Description
ALTER_STATS_HISTORY_RETENTION Procedure	Changes the statistics history retention value
CANCEL_ADVISOR_TASK Procedure	Cancels an Optimizer Statistics Advisor execution
CONFIGURE_ADVISOR_FILTER Function	Configures the filter list for an Optimizer Statistics Advisor task
CONFIGURE_ADVISOR_OBJ_FILTER Function	Configures an object filter for an Optimizer Statistics Advisor task
CONFIGURE_ADVISOR_OPR_FILTER Functions	Configures an operation filter for an Optimizer Statistics Advisor task
CONFIGURE_ADVISOR_RULE_FILTER Function	Configures a rule filter for an Optimizer Statistics Advisor task
CREATE_ADVISOR_TASK Function	Creates an advisor task for the Optimizer Statistics Advisor
CONVERT_RAW_VALUE Procedures	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value
CONVERT_RAW_VALUE_NVARCHAR Procedure	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value
CONVERT_RAW_VALUE_ROWID Procedure	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value

Table 186-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
COPY_TABLE_STATS Procedure	Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling
CREATE_EXTENDED_STATS Function	Creates a virtual column for a user specified column group or an expression in a table
CREATE_STAT_TABLE Procedure	Creates a table with name <code>stattab</code> in <code>ownname</code> 's schema which is capable of holding statistics
DELETE_COLUMN_STATS Procedure	Deletes column-related statistics
DELETE_DATABASE_PREFS Procedure	Deletes the statistics preferences of all the tables
DELETE_DATABASE_STATS Procedure	Deletes statistics for the entire database
DELETE_DICTIONARY_STATS Procedure	Deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and database component schemas)
DELETE_FIXED_OBJECTS_STATS Procedure	Deletes statistics of all fixed tables
DELETE_INDEX_STATS Procedure	Deletes index-related statistics
DELETE_PENDING_STATS Procedure	Deletes the private statistics that have been collected but have not been published
DELETE_PROCESSING_RATE Procedure	Deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources
DELETE_SCHEMA_PREFS Procedure	Deletes the statistics preferences of all the tables owned by the specified owner name
DELETE_SCHEMA_STATS Procedure	Deletes schema-related statistics
DELETE_SYSTEM_STATS Procedure	Deletes system statistics
DELETE_TABLE_PREFS Procedure	Deletes statistics preferences of the specified table in the specified schema
DELETE_TABLE_STATS Procedure	Deletes table-related statistics
DIFF_TABLE_STATS_IN_HISTORY Function	Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps
DIFF_TABLE_STATS_IN_PENDING Function	Compares pending statistics and statistics as of a timestamp or statistics from dictionary
DIFF_TABLE_STATS_IN_STATTAB Function	Compares statistics for a table from two different sources
DROP_ADVISOR_TASK Procedure	Drops the specified Optimizer Statistics Advisor task
DROP_EXTENDED_STATS Procedure	Drops the statistics entry that is created for the user specified extension
DROP_STAT_TABLE Procedure	Drops a user statistics table created by <code>CREATE_STAT_TABLE</code>
EXECUTE_ADVISOR_TASK Function	Executes a previously created Optimizer Statistics Advisor task

Table 186-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
EXPORT_COLUMN_STAT S Procedure	Retrieves statistics for a particular column and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_DATABASE_PR EFS Procedure	Exports the statistics preferences of all the tables
EXPORT_DATABASE_ST ATS Procedure	Retrieves statistics for all objects in the database and stores them in the user statistics table identified by <code>statown.stattab</code>
EXPORT_DICTIONARY_S TATS Procedure	Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_FIXED_OBJECT S_STATS Procedure	Retrieves statistics for fixed tables and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_INDEX_STATS Procedure	Retrieves statistics for a particular index and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_PENDING_STAT S Procedure	Exports the statistics gathered and stored as pending
EXPORT_SCHEMA_PREF S Procedure	Exports the statistics preferences of all the tables owned by the specified owner name
EXPORT_SCHEMA_STAT S Procedure	Retrieves statistics for all objects in the schema identified by <code>ownname</code> and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_SYSTEM_STAT S Procedure	Retrieves system statistics and stores them in the user statistics table
EXPORT_TABLE_PREFS Procedure	Exports statistics preferences of the specified table in the specified schema into the specified statistics table
EXPORT_TABLE_STATS Procedure	Retrieves statistics for a particular table and stores them in the user statistics table
FLUSH_DATABASE_MONI TORING_INFO Procedure	Flushes in-memory monitoring information for all the tables to the dictionary
GATHER_DATABASE_ST ATS Procedures	Gathers statistics for all objects in the database
GATHER_DICTIONARY_S TATS Procedure	Gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components
GATHER_FIXED_OBJECT S_STATS Procedure	Gathers statistics of fixed objects
GATHER_INDEX_STATS Procedure	Gathers index statistics
GATHER_PROCESSING_ RATE Procedure	Starts the job of gathering the processing rates which end after <code>interval</code> defined in minutes
GATHER_SCHEMA_STAT S Procedures	Gathers statistics for all objects in a schema
GATHER_SYSTEM_STAT S Procedure	Gathers system statistics
GATHER_TABLE_STATS Procedure	Gathers table and column (and index) statistics

Table 186-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
GENERATE_STATS Procedure	Generates object statistics from previously collected statistics of related objects
GET_ADVISOR_OPR_FILTER Procedure	Creates an operation filter for an Optimizer Statistics Advisor operation
GET_ADVISOR_RECS Function	Generates a recommendation report for the specified item
GET_COLUMN_STATS Procedures	Gets all column-related information
GET_INDEX_STATS Procedures	Gets all index-related information
GET_PARAM Function	Gets the default value of parameters of DBMS_STATS procedures (see DBMS_STATS Deprecated Subprograms)
GET_PREFS Function	Gets the default value of the specified preference
GET_STATS_HISTORY_AVAILABILITY Function	Gets the oldest timestamp where statistics history is available
GET_STATS_HISTORY_RETENTION Function	Returns the current statistics history retention value
GET_SYSTEM_STATS Procedure	Gets system statistics from <code>stattab</code> , or from the dictionary if <code>stattab</code> is NULL
GET_TABLE_STATS Procedure	Gets all table-related information
IMPLEMENT_ADVISOR_TASK Function	Implements the recommendations made by Optimizer Statistics Advisor
IMPORT_COLUMN_STATS Procedure	Retrieves statistics for a particular column from the user statistics table identified by <code>stattab</code> and stores them in the dictionary
IMPORT_DATABASE_PREFS Procedure	Imports the statistics preferences of all the tables
IMPORT_DATABASE_STATS Procedure	Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary
IMPORT_DICTIONARY_STATS Procedure	Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary
IMPORT_FIXED_OBJECTS_STATS Procedure	Retrieves statistics for fixed tables from the user statistics table identified by <code>stattab</code> and stores them in the dictionary
IMPORT_INDEX_STATS Procedure	Retrieves statistics for a particular index from the user statistics table identified by <code>stattab</code> and stores them in the dictionary
IMPORT_SCHEMA_PREFS Procedure	Imports the statistics preferences of all the tables owned by the specified owner name
IMPORT_SCHEMA_STATS Procedure	Retrieves statistics for all objects in the schema identified by <code>ownname</code> from the user statistics table and stores them in the dictionary
IMPORT_SYSTEM_STATS Procedure	Retrieves system statistics from the user statistics table and stores them in the dictionary
IMPORT_TABLE_PREFS Procedure	Sets the statistics preferences of the specified table in the specified schema

Table 186-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
IMPORT_TABLE_STATS Procedure	Retrieves statistics for a particular table from the user statistics table identified by <code>stattab</code> and stores them in the dictionary
INTERRUPT_ADVISOR_TASK Procedure	Interrupts a currently executing Optimizer Statistics Advisor task.
LOCK_PARTITION_STATS Procedure	Locks statistics for a partition
LOCK_SCHEMA_STATS Procedure	Locks the statistics of all tables of a schema
LOCK_TABLE_STATS Procedure	Locks the statistics on the table
MERGE_COL_USAGE Procedure	Merges column usage information from a source database, by means of a <code>dblink</code> , into the local database
PREPARE_COLUMN_VALUES Procedures	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PREPARE_COLUMN_VALUES_NVARCHAR Procedure	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PREPARE_COLUMN_VALUES_ROWID Procedure	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PUBLISH_PENDING_STATS Procedure	Publishes the statistics gathered and stored as pending
PURGE_STATS Procedure	Purges old versions of statistics saved in the dictionary
REMAP_STAT_TABLE Procedure	Remaps the names of objects in the user statistics table
REPORT_ADVISOR_TASK Function	Reports the results of an Optimizer Advisor Task.
REPORT_COL_USAGE Function	Reports the recorded column (group) usage information
REPORT_GATHER_AUTO_STATS Function	Runs the auto statistics gathering job in reporting mode
REPORT_GATHER_DATABASE_STATS Functions	Runs the GATHER_DATABASE_STATS Procedures in reporting mode.
REPORT_GATHER_DICTIONARY_STATS Functions	Runs the GATHER_DICTIONARY_STATS Procedure in reporting mode
REPORT_GATHER_FIXED_OBJECTS_STATS Function	Runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode
REPORT_GATHER_SCHEMA_STATS Functions	Runs the GATHER_SCHEMA_STATS Procedures in reporting mode
REPORT_GATHER_TABLE_STATS Function	Runs the GATHER_TABLE_STATS Procedure in reporting mode

Table 186-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
REPORT_STATS_OPERATIONS Function	Generates a report of all statistics operations that take place between two timestamps which may or may not have been provided
RESET_ADVISOR_TASK Procedure	Resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing
RESET_COL_USAGE Procedure	Resets the recorded column (group) usage information
RESET_GLOBAL_PREF_DEFAULTS Procedure	Resets the default values of all parameters to Oracle recommended values
RESET_PARAM_DEFAULTS Procedure	Resets global preferences to default values (see DBMS_STATS Deprecated Subprograms)
RESTORE_DICTIONARY_STATS Procedure	Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp
RESTORE_FIXED_OBJECTS_STATS Procedure	Restores statistics of all fixed tables as of a specified timestamp
RESTORE_SCHEMA_STATS Procedure	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_SYSTEM_STATS Procedure	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_TABLE_STATS Procedure	Restores statistics of a table as of a specified timestamp (<i>as_of_timestamp</i>), as well as statistics of associated indexes and columns
RESUME_ADVISOR_TASK Procedure	Resumes an interrupted task. It only resumes the execution that was most recently interrupted
SCRIPT_ADVISOR_TASK Function	Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor
SEED_COL_USAGE Procedure	Iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements
SET_ADVISOR_TASK_PARAMETER Procedure	Updates the value of an Optimizer Statistics Advisor task parameter
SET_COLUMN_STATS Procedures	Sets column-related information
SET_DATABASE_PREFS Procedure	Sets the statistics preferences of all the tables
SET_GLOBAL_PREFS Procedure	Sets the global statistics preferences
SET_INDEX_STATS Procedures	Sets index-related information
SET_PARAM Procedure	Sets default values for parameters of DBMS_STATS procedures (see DBMS_STATS Deprecated Subprograms)
SET_PROCESSING_RATE Procedure	Sets the value of rate of processing for a given operation
SET_SCHEMA_PREFS Procedure	Sets the statistics preferences of all the tables owned by the specified owner name

Table 186-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
SET_SYSTEM_STATS Procedure	Sets system statistics
SET_TABLE_PREFS Procedure	Sets the statistics preferences of the specified table in the specified schema
SET_TABLE_STATS Procedure	Sets table-related information
SHOW_EXTENDED_STAT_S_NAME Function	Returns the name of the virtual column that is created for the user-specified extension
TRANSFER_STATS Procedure	Transfers statistics for specified table(s) from a remote database specified by <code>dblink</code> to the local database
UNLOCK_PARTITION_STATS Procedure	Unlocks the statistics for a partition
UNLOCK_SCHEMA_STATS Procedure	Unlocks the statistics on all the tables in schema
UNLOCK_TABLE_STATS Procedure	Unlocks the statistics on the table
UPGRADE_STAT_TABLE Procedure	Upgrades user statistics on an older table

186.7.1 ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value.

Statistics history retention is used by both the automatic purge and [PURGE_STATS Procedure](#).

Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
    retention      IN      NUMBER);
```

Parameters

Table 186-4 ALTER_STATS_HISTORY_RETENTION Procedure Parameters

Parameter	Description
<code>retention</code>	<p>The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1,365000]. Also you can use the following values for special purposes:</p> <ul style="list-style-type: none"> -1: Statistics history is never purged by automatic purge 0: Old statistics are never saved. The automatic purge will delete all statistics history NULL: Change statistics history retention to default value

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges

186.7.2 CANCEL_ADVISOR_TASK Procedure

This procedure cancels an Optimizer Statistics Advisor execution. The advisor removes all intermediate results of the current execution from the task.

Syntax

```
DBMS_STATS.CANCEL_ADVISOR_TASK (  
    task_name IN VARCHAR2);
```

Parameters

Table 186-5 CANCEL_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Usage Notes

To be canceled or interrupted, the specified task must be currently executing.

Example 186-1 Canceling an Optimizer Statistics Advisor

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
  v_ename  VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
EXEC DBMS_STATS.CANCEL_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13632: The user cancelled the current operation.
```

186.7.3 CONFIGURE_ADVISOR_FILTER Function

This function configures the filter list for an Optimizer Statistics Advisor task. Filters are useful for excluding irrelevant findings from a report.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_FILTER (
  task_name          IN   VARCHAR2,
  stats_adv_opr_type IN   VARCHAR2,
  configuration_type IN   VARCHAR2,
  filter             IN   StatsAdvFilterTab := NULL)
RETURN CLOB;
```

Parameters

Table 186-6 CONFIGURE_ADVISOR_FILTER Function Parameters

Parameter	Description
<code>task_name</code>	The name of the Optimizer Statistics Advisor task.
<code>stats_adv_opr_type</code>	The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. The function permits you to specify a combination of operation types by using the plus (+) operator, for example, EXECUTE +REPORT. If this parameter is null, then the filter applies to all types of advisor operations.

Table 186-6 (Cont.) CONFIGURE_ADVISOR_FILTER Function Parameters

Parameter	Description
<code>configuration_type</code>	The type of configuration. Possible values are as follows: <ul style="list-style-type: none"> • SET: Sets the specified filter list values. The submitted filter overrides existing filter values. • CLEAR: Clears the existing values for the specified filter. • SHOW: Shows the current values of the specified filter.
<code>filter</code>	The list of filter items for the script.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns a CLOB that contains the configuration of the provided filter in XML format.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Usage Notes

To provide fine-grained control and a unified interface across all procedures, `DBMS_STATS` provides the `StatsAdvFilter` type. You can use this data type to instantiate and construct a table of filters. You can then pass a parameter of type `StatsAdvFilter` to `CONFIGURE_ADVISOR_FILTER` along with a Boolean variable that specifies either of the following:

- **Inclusion list**
Only include these objects in the check.
- **Exclusion list**
Do not include these objects in the check.

You can also pass in a parameter specifying whether to replace the existing list. This list only filters object-level and operation-level items. The advisor always checks system-level rules.

You can create the following types of filters:

- **Rule filter**
This filter takes a rule name as input. Obtain rule names from the `V$STATS_ADVISOR_RULES` view.

- Operation filter

This filter is an exact match filter that takes in the name of the operation and an XML string representation of all the parameter values in the call. To obtain the XML, see the notes section of the `DBA_OPTSTAT_OPERATIONS` view. To obtain the filter for an operation, use `DBMS_STATS.GET_ADVISOR_OPR_FILTER`.

- Object filter

This filter accept an owner name and an object name. Wildcards (%) are supported in the owner name and object name. When an object name is null or %, it means a filter for all the objects in the specified schema. If the owner name is also null or %, it means a default filter for all objects in the system.

If none of the filters is specified, then the function recognizes the filter as setting the global default value of filtering (include or exclude). During the check, if no filter has been specified for a rule, operation, or object, then the function uses the default value to determine whether to include or exclude it.

Example 186-2 Enabling and Disabling Rules

You may want to turn off checks for all rules except for a specific rule. In this example, you want to check whether SQL plan directives have been disabled.

```

DECLARE
  v_task_name    VARCHAR2(128)           := 'my_task';
  v_ret          VARCHAR2(128);
  filter         DBMS_STATS.StatsAdvFilter := null;
  filterTab     DBMS_STATS.StatsAdvFilterTab := null;
  v_counter      NUMBER                 := 0;
  v_filterReport CLOB;
BEGIN
  -- Create the advisor task
  v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

  -- Initialize the filter table
  filterTab := DBMS_STATS.StatsAdvFilterTab();

  -- First filter: set filters to be FALSE by default
  filter.include := FALSE;

  -- Add this filter to the filter table
  v_counter := v_counter + 1;
  filterTab.extend;
  filterTab(v_counter) := filter;

  -- Second filter: turn on filter for one rule
  filter.include := TRUE;
  filter.rulename := 'TurnOnSQLPlanDirective';

  -- Add the SQL plan directive filter to the filter table
  v_counter := v_counter + 1;
  filterTab.extend;
  filterTab(v_counter) := filter;

  v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
                    task_name           => v_task_name,

```

```
        stats_adv_opr_type => NULL,  
        configuration_type => 'SET',  
        filter              => filterTab);  
  
    -- Drop the task  
    DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);  
END;
```

Example 186-3 Configuring an Operations Filter

In this example, your shop uses customized scripts to gather statistics for a table. If you do not want to see a specific statistics operation in the report, then you can specify an operations filter.

```
DECLARE  
    v_task_name    VARCHAR2(128)           := 'my_task';  
    v_ret          VARCHAR2(128);  
    filter         DBMS_STATS.StatsAdvFilter := null;  
    filterTab      DBMS_STATS.StatsAdvFilterTab := null;  
    opr            DBMS_STATS.StatsAdvOpr;  
    oprTab         DBMS_STATS.StatsAdvOprTab;  
    v_oprCnt       NUMBER                   := 0;  
    TYPE numTab IS TABLE OF NUMBER;  
    opr_tab        numTab;  
    v_filterReport CLOB;  
  
BEGIN  
    -- Create the advisor task  
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);  
  
    -- Initialize filter table  
    filterTab := DBMS_STATS.StatsAdvFilterTab();  
  
    -- Initialize operations filter  
    oprTab := DBMS_STATS.StatsAdvOprTab();  
  
    SELECT ID  
        BULK COLLECT INTO opr_tab  
    FROM   WRI$_OPTSTAT_OPR  
    WHERE  OPERATION = 'set_table_stats'  
    AND    TARGET = 'HR.EMPLOYEES';  
  
    -- Populate the operations table  
    FOR i IN 1..opr_tab.count LOOP  
  
        -- Use the procedure GET_ADVISOR_OPR_FILTER to construct  
        -- an operation filter  
        DBMS_STATS.GET_ADVISOR_OPR_FILTER(opr_tab(i), opr);  
  
        v_oprCnt := v_oprCnt + 1;  
        oprTab.extend;  
        oprTab(v_oprCnt) := opr;  
  
    END LOOP;  
  
    filter.include := FALSE;
```

```
filter.oprlist := oprTab;

-- Add to filter table
filterTab.extend;
filterTab(1) := filter;

v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
    task_name          => v_task_name,
    stats_adv_opr_type => NULL,
    configuration_type => 'SET',
    filter              => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);

END;
```

Example 186-4 Reporting on a Specific Schema

In this example, you want to generate a report only for the `sh` schema. Also, you want to skip the `sh.products` table. You create an object filter as follows:

```
DECLARE
    v_task_name      VARCHAR2(128)           := 'my_task';
    v_ret            VARCHAR2(128);
    filter           DBMS_STATS.StatsAdvFilter := null;
    filterTab        DBMS_STATS.StatsAdvFilterTab := null;
    v_filterReport   CLOB;
    v_counter        NUMBER                   := 0;
    obj              DBMS_STATS.ObjectElem;
    objTab           DBMS_STATS.ObjectTab;
    v_objCnt         NUMBER                   := 0;
BEGIN
    -- Create the advisor task
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

    -- Initialize filter table
    filterTab := DBMS_STATS.StatsAdvFilterTab();

    -- Set object filter to be off by default
    filter.include := FALSE;

    objTab := DBMS_STATS.ObjectTab();

    obj.ownname := NULL;
    obj.objname := NULL;

    -- Add to the object table

    v_objCnt := v_objCnt + 1;
    objTab.extend;
    objTab(v_objCnt) := obj;

    filter.objlist := objTab;
```

```
-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 1, turn on the check only for schema SH

filter.include := TRUE;

objTab := DBMS_STATS.ObjectTab();
v_objCnt := 0;

obj.ownname := 'SH';
obj.objname := NULL;

-- add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 2, exclude the check for object sh.products

filter.include := FALSE;

objTab := dbms_stats.ObjectTab();
v_objCnt := 0;

-- Specify another object filter for sh.products
obj.ownname := 'SH';
obj.objname := 'PRODUCTS';

-- Add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

v_filterReport :=
DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
    task_name          => v_task_name,
```

```

stats_adv_opr_type => NULL,
configuration_type => 'SET',
filter              => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

186.7.4 CONFIGURE_ADVISOR_OBJ_FILTER Function

This function configures an object filter for an Optimizer Statistics Advisor task.

Syntax

```

DBMS_STATS.CONFIGURE_ADVISOR_OBJ_FILTER (
  task_name          IN VARCHAR2,
  stats_adv_opr_type IN VARCHAR2,
  rule_name          IN VARCHAR2,
  ownname            IN VARCHAR2,
  tablename          IN VARCHAR2,
  action             IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 186-7 CONFIGURE_ADVISOR_OBJ_FILTER Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
stats_adv_opr_type	The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. See " CONFIGURE_ADVISOR_RULE_FILTER Function ".
rule_name	The name of the rule to configure. If null, the function applies the filter to all operation-level rules.
ownname	The owner name of the operation target. If null, the function applies the filter to all owner names.
tablename	The table name of the operation target.
action	The configuration action to take for the specified rule. See " CONFIGURE_ADVISOR_RULE_FILTER Function ".

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- **ORA-20000:** Insufficient privileges
- **ORA-20001:** Invalid input values
- **ORA-20012:** Optimizer Statistics Advisor errors

186.7.5 CONFIGURE_ADVISOR_OPR_FILTER Functions

This overloaded function configures an operation filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
  task_name          IN VARCHAR2,
  stats_adv_opr_type IN VARCHAR2,
  rule_name          IN VARCHAR2,
  operation_name     IN VARCHAR2,
  action             IN VARCHAR2)
RETURN CLOB;
```

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
  task_name          IN VARCHAR2,
  stats_adv_opr_type IN VARCHAR2,
  rule_name          IN VARCHAR2,
  operation_name     IN VARCHAR2,
  ownname           IN VARCHAR2,
  tabname           IN VARCHAR2,
  action            IN VARCHAR2)
RETURN CLOB;
```

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
  task_name          IN VARCHAR2,
  stats_adv_opr_type IN VARCHAR2,
  rule_name          IN VARCHAR2,
  operation_id       IN NUMBER,
  action            IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 186-8 CONFIGURE_ADVISOR_OPR_FILTER Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Table 186-8 (Cont.) CONFIGURE_ADVISOR_OPR_FILTER Function Parameters

Parameter	Description
stats_adv_opr_type	The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. See " CONFIGURE_ADVISOR_RULE_FILTER Function ".
rule_name	The name of the rule to configure. If null, the function applies the filter to all operation-level rules.
operation_name	The name of the operation. For example, an operation name could be gather_table_stats. This value cannot be null.
operation_id	The ID of the operation to configure. The filter applies to any operation with the same signature as the specified operation ID. If two operations have the same signature, then they have the same value for every parameter. View the operation ID in DBA_OPSTAT_OPERATIONS.ID. This value cannot be null.
ownname	The owner name of the operation target. This value cannot be null.
tabname	The table name of the operation target.
action	The configuration action to take for the specified rule. See " CONFIGURE_ADVISOR_RULE_FILTER Function ".

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 186-5 Excluding Operations for Gathering Table Statistics

In this example, your goal is to exclude operations that gather table statistics in the `hr` schema. User account `stats` has been granted the `DBA` role, `ADVISOR` privilege, and `SELECT ON DBA_OPTSTAT_OPERATIONS` privilege. You perform the following steps:

1. Log in to the database as `stats`.
2. Drop any existing task named `opt_adv_task1`.

```
DECLARE
  v_tname VARCHAR2(32767);
BEGIN
  v_tname := 'opt_adv_task1';
```

```

        DBMS_STATS.DROP_ADVISOR_TASK(v_tname);
    END;
/

```

3. Create a procedure named `opr_filter` that configures a task to advise on all operations *except* those that gather statistics for tables in the `hr` schema.

```

CREATE OR REPLACE PROCEDURE opr_filter(p_tname IN VARCHAR2) IS
    v_retc CLOB;
BEGIN
    -- For all rules, prevent the advisor from operating
    -- on the operations selected in the following query
    FOR rec IN
        (SELECT ID FROM DBA_OPTSTAT_OPERATIONS WHERE OPERATION =
'gather_table_stats' AND TARGET LIKE 'HR.%')
    LOOP
        v_retc := DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER(
            task_name          => p_tname
            , stats_adv_opr_type => NULL
            , rule_name         => NULL
            , operation_id      => rec.id
            , action            => 'DISABLE');
    END LOOP;
END;
/
SHOW ERRORS

```

4. Create a task named `opt_adv_task1`, and then execute the `opr_filter` procedure for this task.

```

DECLARE
    v_tname VARCHAR2(32767);
    v_ret   VARCHAR2(32767);
BEGIN
    v_tname := 'opt_adv_task1';
    v_ret   := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
    opr_filter(v_tname);
END;
/

```

5. Execute the task `opt_adv_task1`.

```

DECLARE
    v_tname VARCHAR2(32767);
    v_ret   VARCHAR2(32767);
begin
    v_tname := 'opt_adv_task1';
    v_ret   := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/

```

6. Print the report.

```
SPOOL /tmp/rep.txt
SET LONG 1000000
COLUMN report FORMAT A200
SET LINESIZE 250
SET PAGESIZE 1000

SELECT DBMS_STATS.REPORT_ADVISOR_TASK(
        task_name      => 'opt_adv_task1'
      , execution_name => NULL
      , type           => 'TEXT'
      , section        => 'ALL'
    ) AS report
FROM   DUAL;
SPOOL OFF
```

186.7.6 CONFIGURE_ADVISOR_RULE_FILTER Function

This function configures a rule filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_RULE_FILTER (
    task_name      IN   VARCHAR2,
    stats_adv_opr_Type IN VARCHAR2,
    rule_name      IN   VARCHAR2,
    action         IN   VARCHAR2)
RETURN CLOB;
```

Parameters

Table 186-9 SCRIPT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
stats_adv_opr_type	The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. You can specify a combination of operation types, for example, EXECUTE +REPORT. If this parameter is null, then the filter applies to all types of Optimizer Statistics Advisor operations.
rule_name	The name of the rule to configure. If null, the function applies the filter to all rules.

Table 186-9 (Cont.) SCRIPT_ADVISOR_TASK Function Parameters

Parameter	Description
action	The configuration action to take for the specified rule. Possible values are: <ul style="list-style-type: none"> • ENABLE: Enables the filter • DISABLE: Disables the filter • DELETE: Deletes the filter • SHOW: Shows the current filter value

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

186.7.7 CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value.

The `minval`, `maxval`, and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT BINARY_FLOAT);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT BINARY_DOUBLE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT DATE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT NUMBER);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT VARCHAR2);
```

Parameters

Table 186-10 CONVERT_RAW_VALUE Procedure Parameters

Parameter	Description
rawval	Raw representation of a column minimum, maximum, histogram end point actual value
resval	Converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

186.7.8 CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
    rawval    RAW,
    resval OUT NVARCHAR2);
```

Parameters

Table 186-11 CONVERT_RAW_VALUE_NVARCHAR Procedure Parameters

Parameter	Description
rawval	The raw representation of a column minimum or maximum datatype-specific output parameters
resval	The converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

186.7.9 CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
    rawval    RAW,
    resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters**Table 186-12 CONVERT_RAW_VALUE_ROWID Procedure Parameters**

Parameter	Description
rawval	The raw representation of a column minimum or maximum datatype-specific output parameters
resval	The converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

186.7.10 COPY_TABLE_STATS Procedure

This procedure copies statistics of all dependent object such as columns and local indexes. If the statistics for source are not available then nothing is copied. It can optionally scale the statistics (such as the number of blks, or number of rows) based on the given `scale_factor`.

Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    srcpartname      VARCHAR2,
    dstpartname      VARCHAR2,
    scale_factor     VARCHAR2 DEFAULT 1,
    flags            NUMBER DEFAULT 0,
    force            BOOLEAN DEFAULT FALSE);
```

Parameters**Table 186-13 COPY_TABLE_STATS Procedure Parameters**

Parameter	Description
ownname	Schema of the table of source and destination [sub] partitions
tabname	Table name of source and destination [sub] partitions
srcpartname	Source [sub] partition
dstpartname	Destination [sub] partition
scale_factor	Scale factor to scale nblks, nrows etc. in dstpartname

Table 186-13 (Cont.) COPY_TABLE_STATS Procedure Parameters

Parameter	Description
flags	For internal Oracle use.
force	When value of this argument is <code>TRUE</code> copy statistics even if the destination [sub]partition is locked

Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Invalid [sub]partition name

ORA-20001: Bad input value

Usage Notes

This procedure updates the minimum and maximum values of destination partition for the first partitioning column as follows:

- If the partitioning type is `HASH`, then the minimum and maximum values of the destination partition are same as that of the source partition.
- If the partitioning type is `LIST`, then the behavior depends on the setting of the destination partition:
 - If the destination partition is a `NOT DEFAULT` partition, then the following statements are true:
 - * The minimum value of the destination partition is set to the minimum value of the value list that describes the destination partition.
 - * The maximum value of the destination partition is set to the maximum value of the value list that describes the destination partition.
 - Alternatively, if the destination partition is a `DEFAULT` partition, then the following statements are true:
 - * The minimum value of the destination partition is set to the minimum value of the source partition.
 - * The maximum value of the destination partition is set to the maximum value of the source partition.
- If the partitioning type is `RANGE`, then the following statements are true:
 - The minimum value of the destination partition is set to the high bound of previous partition unless the destination partition is the first partition. For the first partition, the minimum value is set to the high bound of the destination partition.
 - The maximum value of the destination partition is set to the high bound of the destination partition unless the high bound of the destination partition is

MAXVALUE, in which case the maximum value of the destination partition is set to the high bound of the previous partition.

- If the source partition column's minimum value is equal to its maximum value, and if both are equal to the source partition's lower bound, and if it has a single distinct value, then the destination partition column's minimum and maximum values are both set to the destination partition's lower bound. This is done for all partitioning columns.

If the above condition does not apply, second and subsequent partitioning columns are updated as follows. The destination partition column's maximum value is set to the greater of the destination partition upper bound and the source partition column's maximum value, with one exception. If the destination partition is D and its preceding partition is $D-1$ and the key column to be adjusted is C_n , the maximum value for C_n is set to the upper bound of D (ignoring the maximum value of the source partition column) provided that the upper bounds of the previous key column C_{n-1} are the same in partitions D and $D-1$.

- If the minimum and maximum values are different for a column after modifications, and if the number of distinct values is less than 1, then the number of distinct values is updated as 2.
- If the source or destination is a partition of a composite partitioned table, then this procedure does not copy statistics of the underlying subpartitions.

186.7.11 CREATE_ADVISOR_TASK Function

This function creates an advisor task for the Optimizer Statistics Advisor.

Syntax

```
DBMS_STATS.CREATE_ADVISOR_TASK (
    task_name    IN    VARCHAR2    := NULL)
RETURN VARCHAR2;
```

Parameters

Table 186-14 CREATE_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	Name of the task. If the task name is already specified, then the function uses the specified task name. Otherwise, the function generates a new task name automatically.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- This subprogram executes using invoker's rights.

Return Values

This function returns the unique name of the Optimizer Statistics Advisor task.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20012: Optimizer Statistics Advisor errors

Example 186-6 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```

DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  -- execute the task
  v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

Note:

Oracle Database SQL Tuning Guide to learn how manage Optimizer Statistics Advisor

186.7.12 CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user-specified column group or an expression in a table.

The database gathers statistics for this extension when a user-initiated or automatic statistics gathering job gathers statistics for the table. Statistics for such an extension are called **extended statistics**. This function returns the name of this newly created entry for the extension.

This second form of this function creates statistics extensions based on the column group usage recorded by the [SEED_COL_USAGE Procedure](#). This function returns a report of extensions created.

Syntax

```

DBMS_STATS.CREATE_EXTENDED_STATS (
  ownname  VARCHAR2,
  tabname  VARCHAR2,
  extension VARCHAR2)
RETURN VARCHAR2;
```

```

DBMS_STATS.CREATE_EXTENDED_STATS (
  ownname  VARCHAR2,
  tabname  VARCHAR2)
RETURN CLOB;
```

Parameters

Table 186-15 CREATE_EXTENDED_STATS Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has columns <code>c1</code> , <code>c2</code> . An example column group is "(<code>c1</code> , <code>c2</code>)". An example expression is "(<code>c1</code> + <code>c2</code>)".

Return Values

This function returns the name of this newly created entry for the extension.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20007: Extension already exists

ORA-20008: Reached the upper limit on number of extensions

Usage Notes

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have either the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

The extension has the following restrictions:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by `SYS`.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables, or external tables.
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column cannot appear more than once in a column group.
- The extension can contain an expression only if a corresponding virtual column has been created.
- An expression must contain at least one column.
- An expression cannot contain a subquery.
- The `COMPATIBLE` parameter must be 11.0.0.0.0 or greater.

186.7.13 CREATE_STAT_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (
  ownname          VARCHAR2,
  stattab          VARCHAR2,
  tblspace         VARCHAR2 DEFAULT NULL,
  global_temporary BOOLEAN DEFAULT FALSE);
```

Parameters

Table 186-16 CREATE_STAT_TABLE Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>stattab</code>	Name of the table to create. This value should be passed as the <code>stattab</code> parameter to other procedures when the user does not want to modify the dictionary statistics directly.
<code>tblspace</code>	Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.
<code>global_temporary</code>	Whether or not the table should be created as a global temporary table

Security Model

To invoke this procedure you need whichever privileges are required for creating a table in the specified schema.

Exceptions

ORA-20000: Table already exists or insufficient privileges

ORA-20001: Tablespace does not exist

186.7.14 DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  colname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
```

```

cascade_parts BOOLEAN DEFAULT TRUE,
statown       VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                    get_param('NO_INVALIDATE')),
force         BOOLEAN DEFAULT FALSE,
col_stat_type VARCHAR2 DEFAULT 'ALL';

```

Parameters

Table 186-17 DELETE_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tablename	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).
cascade_parts	If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.
statown	Schema containing stattab (if different than ownname)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	When value of this argument is TRUE, deletes column statistics even if locked
col_stat_type	Type of column statistics to be deleted. This argument takes the following values: <ul style="list-style-type: none"> HISTOGRAM - delete column histogram only ALL - delete base column statistics and histogram

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.15 DELETE_DATABASE_PREFS Procedure

This procedure deletes the statistics preferences set for all non-system tables. You can include system tables by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname          IN   VARCHAR2,
    add_sys        IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 186-18 DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
<code>pname</code>	<p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS
<code>add_sys</code>	Determines whether <code>SYS</code> tables will be included.

Table 186-19 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> The accuracy of the new algorithm is similar to the original algorithm. The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate.
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.
GRANULARITY	Determines the granularity of statistics to collect. This value is only relevant for partitioned tables.
INCREMENTAL	Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan.
INCREMENTAL_LEVEL	Controls which synopses to collect when INCREMENTAL preference is set to TRUE.

Table 186-19 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>

Table 186-19 (Cont.) Statistics Preferences

Preference	Description
METHOD_OPT	Controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.
NO_INVALIDATE	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
OPTIONS	Determines the <code>options</code> parameter used in the GATHER_TABLE_STATS Procedure .
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.
STAT_CATEGORY	Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics (default) SYNOPSIS — information to support incremental statistics REALTIME_STATS — Specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. The value 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS' specifies table statistics, column statistics, index statistics, and synopsis. The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'.

Table 186-19 (Cont.) Statistics Preferences

Preference	Description
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1.

Security Model

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Example 186-7 Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT', TRUE);
```

See Also:

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

186.7.16 DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN  DEFAULT FALSE,
  stat_category VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 186-20 DELETE_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked
stat_category	Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> • OBJECT_STATS — table statistics, column statistics and index statistics • SYNOPSES — information to support incremental statistics • REALTIME_STATS — specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. <p>The default is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'</p>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

186.7.17 DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  stattype        VARCHAR2 DEFAULT 'ALL',
  force           BOOLEAN  DEFAULT FALSE,
  stat_category   VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 186-21 DELETE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
statab	User statistics table identifier describing from where to delete the statistics. If statab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)
statown	Schema containing statab (if different from current schema)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
stattype	Statistics type
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked

Table 186-21 (Cont.) DELETE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stat_category	<p>Statistics to delete. It accepts multiple values separated by comma:</p> <ul style="list-style-type: none"> • OBJECT_STATS — table statistics, column statistics and index statistics • SYNOPSES — information to support incremental statistics • REALTIME_STATS — Specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. <p>The default is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'</p>

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

186.7.18 DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
    statab          VARCHAR2 DEFAULT NULL,
    statid          VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    force           BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 186-22 DELETE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
statab	The user statistics table identifier describing from where to delete the current statistics. If statab is NULL, the statistics will be deleted directly in the dictionary.
statid	The (optional) identifier to associate with these statistics within statab. This only applies if statab is not NULL.
statown	Schema containing statab (if different from current schema)

Table 186-22 (Cont.) DELETE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	<p>Ignores the statistics lock on objects and deletes the statistics if set to TRUE</p>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

186.7.19 DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  cascade_parts   BOOLEAN   DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  stattype        VARCHAR2 DEFAULT 'ALL',
  force           BOOLEAN   DEFAULT FALSE);
stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 186-23 DELETE_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema

Table 186-23 (Cont.) DELETE_INDEX_STATS Procedure Parameters

Parameter	Description
indname	Name of the index
partname	Name of the index partition for which to delete the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then index statistics are deleted at the global level.
stattab	User statistics table identifier describing from where to delete the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code>)
cascade_parts	If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then setting this to <code>TRUE</code> causes the deletion of statistics for this index for all underlying partitions as well
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> <code>TRUE</code>: Dependent cursors are not invalidated. <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattype	Statistics type
force	When value of this argument is <code>TRUE</code> , deletes index statistics even if locked
stat_category	Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> <code>OBJECT_STATS</code> — table statistics, column statistics and index statistics <code>SYNOPSIS</code> — information to support incremental statistics <code>REALTIME_STATS</code> — Specifies only real-time statistics. <code>MODELS</code> — supports import, export, and deletion for regression models in real-time stats. <p>The default is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'</p>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.20 DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (  
    ownname      IN  VARCHAR2  DEFAULT USER,  
    tablename    IN  VARCHAR2);
```

Parameters

Table 186-24 DELETE_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tablename	Table name

Security Model

To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be affected by this procedure. The default owner is the user who runs the procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

If the parameter `tablename` is `NULL` delete applies to all tables of the specified schema.

Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

186.7.21 DELETE_PROCESSING_RATE Procedure

This procedure deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources.

Syntax

```
DBMS_STATS.DELETE_PROCESSING_RATE (  
    stat_source  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 186-25 DELETE_PROCESSING_RATE Procedure Parameters

Parameter	Description
stat_source	Source of processing rates: <ul style="list-style-type: none"> 'MANUAL': values set by the user manually using the SET_PROCESSING_RATE Procedure 'CALIBRATION': values collected by the calibration GATHER_PROCESSING_RATE Procedure run explicitly by the user 'FEEDBACK': values obtained by time feedback

Usage Notes

You require the `OPTIMIZER_PROCESSING_RATE` role to run this procedure since `AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

186.7.22 DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (
    ownname   IN   VARCHAR2,
    pname     IN   VARCHAR2);
```

Parameters

Table 186-26 DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name

Table 186-26 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
pname	<p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • TABLE_CACHED_BLOCKS

Table 186-27 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format.</p> • ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses.</p> • HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses.</p>

Table 186-27 (Cont.) Statistics Preferences

Preference	Description
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the <code>CREATE_EXTENDED_STATS</code> function is executed, or when extended statistics are specified explicitly in the <code>METHOD_OPT</code> clause of <code>DBMS_STATS</code>. This is the default.
CASCADE	<p>Determines whether index statistics are collected as part of gathering table statistics.</p>
COORDINATOR_TRIGGER_SHARD	<p>User of each shard uses this preference to determine whether to allow shard coordinator to interact with the statistics gathering in each shards.</p> <p>While gathering the statistics in shard coordinator, if the statistics in one of the shards are not up to date, the shard coordinator will try to trigger the statistics gathering in that shard. By using this preference, user can execute or ignore that command from the shard coordinator.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • TRUE—Allows the shard coordinator trigger the statistics gathering on sharded table in local shard if the statistics on local shard are stale. • FALSE—Ignores the statistics gathering command triggered from the shard coordinator. <p>The default value is <code>FALSE</code>.</p>
DEGREE	<p>Determines the degree of parallelism used for gathering statistics.</p>
ESTIMATE_PERCENT	<p>The value determines the percentage of rows to estimate.</p>
METHOD_OPT	<p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed.</p>

Table 186-27 (Cont.) Statistics Preferences

Preference	Description
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
GRANULARITY	The value determines granularity of statistics to collect (only pertinent if the table is partitioned)
PUBLISH	This value determines whether or not newly gathered statistics will be published once the gather job has completed.
INCREMENTAL	This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.
INCREMENTAL_LEVEL	This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.

Table 186-27 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <code>STALE_PERCENT</code> preference. <ul style="list-style-type: none"> For example, assume that <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. <ul style="list-style-type: none"> For example, assume that <code>STALE_PERCENT</code> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. <ul style="list-style-type: none"> For example, assume that <code>STALE_PERCENT</code> is 10. You specify the value 'NULL' for <code>INCREMENTAL_STALENESS</code>. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre>

Table 186-27 (Cont.) Statistics Preferences

Preference	Description
ROOT_TRIGGER_PDB	<p>The first execution uses single quotes to set the preference to the value <code>NULL</code>, whereas the second sets the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code>.</p> <p>The application PDB user, uses this preference to determine whether to allow the application root to interact with the statics gathering in PDB.</p> <p>During the statistics gathering of a metadata linked table in the application root, if the statistics in a PDB are in stale state, the application root triggers the statistics gathering for the particular PDB. Using this preference, the user can either execute or ignore the command from the application root.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • <code>TRUE</code>—Allows the application root trigger the statistics gathering on metadata linked table in application PDB if the statistics on PDB are stale. • <code>FALSE</code>—Ignores the statistics gathering command triggered from application root. <p>The default value is <code>FALSE</code>.</p>
STALE_PERCENT	<p>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.</p>
GLOBAL_TEMP_TABLE_STATS	<p>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.</p>
TABLE_CACHED_BLOCKS	<p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p>
OPTIONS	<p>Determines the <code>options</code> parameter used in the GATHER_TABLE_STATS Procedure.</p>

 **Note:**

CDB root, different from application root, never triggers statistics gathering on the PDBs and it is not controlled by this preference.

Security Model

To run this procedure, you must be the object owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.

Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

Usage Notes

All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

See Also:

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

186.7.23 DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
  ownname          VARCHAR2,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force            BOOLEAN DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 186-28 DELETE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
statab	Identifies the table where statistics are stored. If statab is NULL, then the procedure deletes statistics directly from the data dictionary.
statid	Specifies the identifier (optional) associated with these statistics within statab. This parameter is only relevant if statab is not NULL.

Table 186-28 (Cont.) DELETE_SCHEMA_STATS Procedure Parameters

Parameter	Description
statown	Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code>).
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • <code>TRUE</code>: Dependent cursors are not invalidated. • <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. • <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	Indicates whether to force the deletion for locked statistics. When the value is <code>TRUE</code> , this procedure deletes table statistics even if locked.
stat_category	<p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> • <code>OBJECT_STATS</code> — Specifies table statistics, column statistics, and index statistics. • <code>SYNOPSIS</code> — Specifies metadata for incremental statistics. • <code>REALTIME_STATS</code> — Specifies only real-time statistics. • <code>MODELS</code> — supports import, export, and deletion for regression models in real-time stats. <p>You can specify a list of comma-delimited values. For example, <code>'OBJECT_STATS, SYNOPSIS'</code> specifies table statistics, column statistics, index statistics, and synopses. The default value is <code>'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'</code>.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

186.7.24 DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the `'INTERVAL'` or `'START'` and `'STOP'` options) and resets the default to `noworkload` statistics (collected using `'NOWORKLOAD'` option), if `stattab` is not specified. If `stattab` is specified, the subprogram deletes all system statistics with the associated `statid` from the `stattab`.

Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (
    stattab      VARCHAR2 DEFAULT NULL,
    statid       VARCHAR2 DEFAULT NULL,
    statown      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-29 DELETE_SYSTEM_STATS Procedure Parameters

Parameter	Description
stattab	Identifier of the user statistics table where the statistics will be saved
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

186.7.25 DELETE_TABLE_PREFS Procedure

This procedure deletes the optimizer statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (
  ownname   IN  VARCHAR2,
  tablename IN  VARCHAR2,
  pname     IN  VARCHAR2);
```

Parameters

Table 186-30 DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tablename	Table name

Table 186-30 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
pname	<p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GRANULARITY • GLOBAL_TEMP_STATS • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS

Table 186-31 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
DEGREE	Determines the degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate.
GRANULARITY	Determines granularity of statistics to collect. This value is only relevant for partitioned tables.

Table 186-31 (Cont.) Statistics Preferences

Preference	Description
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.
INCREMENTAL	This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.
INCREMENTAL_LEVEL	This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.

Table 186-31 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <code>STALE_PERCENT</code> preference. For example, assume that <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that <code>STALE_PERCENT</code> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that <code>STALE_PERCENT</code> is 10. You specify the value 'NULL' for <code>INCREMENTAL_STALENESS</code>. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre>

Table 186-31 (Cont.) Statistics Preferences

Preference	Description
	The first execution uses single quotes to set the preference to the value <code>NULL</code> , whereas the second sets the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code> .
<code>METHOD_OPT</code>	Controls column statistics collection and histogram creation. When setting preference at the global, schema, database, or dictionary level, only <code>'FOR ALL'</code> syntax is allowed.
<code>NO_INVALIDATE</code>	The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.
<code>OPTIONS</code>	Determines the <code>options</code> parameter used in the GATHER_TABLE_STATS Procedure .
<code>PREFERENCE_OVERRIDES_PARAMETER</code>	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: <ul style="list-style-type: none"> <code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference. <code>FALSE</code> — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
<code>PUBLISH</code>	Determines whether newly gathered statistics will be published after the statistics gathering job has completed.
<code>STALE_PERCENT</code>	Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.
<code>STAT_CATEGORY</code>	Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <code>OBJECT_STATS</code> — table statistics, column statistics and index statistics (default) <code>SYNOPSIS</code> — information to support incremental statistics <code>REALTIME_STATS</code> — specifies only real-time statistics. <code>MODELS</code> — supports import, export, and deletion for regression models in real-time stats. The value <code>'OBJECT_STATS, SYNOPSIS'</code> specifies table statistics, column statistics, index statistics, and synopsis. The default value is <code>'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'</code> .
<code>TABLE_CACHED_BLOCKS</code>	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code> . Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table, be granted `ANALYZE` privilege on the table, or `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

186.7.26 DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```
DBMS_STATS.DELETE_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  cascade_parts   BOOLEAN   DEFAULT TRUE,
  cascade_columns BOOLEAN   DEFAULT TRUE,
  cascade_indexes BOOLEAN   DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  force          BOOLEAN   DEFAULT FALSE,
  stat_category  VARCHAR2  DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 186-32 DELETE_TABLE_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Specifies the name of the schema.
<code>tablename</code>	Specifies the name of the table to which this column belongs.
<code>partname</code>	Specifies the name of the table partition or subpartition from which to get the statistics. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved from the global table level.

Table 186-32 (Cont.) DELETE_TABLE_STATS Procedure Parameters

Parameter	Description
stattab	Identifies the user statistics table where statistics will be retrieved. If stattab is NULL, then the procedure retrieves statistics directly from the dictionary.
statid	Specifies the identifier (optional) associated with these statistics within stattab. This parameter is only relevant if stattab is not NULL.
cascade_parts	Specifies whether the procedure should operate on underlying partitions. If the table is partitioned, and if partname is NULL, then specifying TRUE deletes statistics for underlying partitions.
cascade_columns	Indicates whether to invoke the DELETE_COLUMN_STATS procedure. If TRUE, then this procedure calls DELETE_COLUMN_STATS for all underlying columns.
cascade_indexes	Indicates whether to invoke the DELETE_INDEX_STATS procedure. If TRUE, then this procedure calls DELETE_INDEX_STATS for all underlying columns.
statown	Specifies the schema containing stattab (if different than ownname).
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	Indicates whether to force the deletion for locked statistics. When the value is TRUE, this procedure deletes table statistics even if locked.
stat_category	Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> OBJECT_STATS — specifies table statistics, column statistics, and index statistics. SYNOPSIS — specifies metadata for incremental statistics. REALTIME_STATS — specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p> <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'.</p>

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

186.7.27 DIFF_TABLE_STATS_IN_HISTORY Function

This function compares statistics for a table as of two specified timestamps.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
  ownname      IN  VARCHAR2,
  tablename    IN  VARCHAR2,
  time1        IN  TIMESTAMP WITH TIME ZONE,
  time2        IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  pctthreshold IN  NUMBER                      DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

Table 186-33 DIFF_TABLE_STATS_IN_HISTORY Function Parameters

Parameter	Description
ownname	Specifies the owner of the table. Specify NULL for current schema.
tablename	Specifies the table for which statistics are to be compared.
time1	Specifies the first timestamp for comparison.
time2	Specifies the second timestamp for comparison.
pctthreshold	Specifies the threshold limit. The function reports differences in statistics only if the change percentage exceeds this limit. The default value is 10.

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Usage Notes

If the second timestamp is `NULL`, then the function compares the current statistics in the data dictionary with the statistics as of the first timestamp.

186.7.28 DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics to either the current statistics in the data dictionary, or user-specified historical statistics.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
  ownname      IN  VARCHAR2,
  tablename    IN  VARCHAR2,
```

```

        timestamp      IN  TIMESTAMP WITH TIME ZONE,
        pctthreshold   IN  NUMBER  DEFAULT 10)
RETURN DiffRepTab pipelined;

```

Parameters

Table 186-34 DIFF_TABLE_STATS_IN_PENDING Function Parameters

Parameter	Description
ownname	Owner of the table. Specify NULL for the current schema.
tablename	Table for which statistics are to be compared.
timestamp	Timestamp in the statistics history that corresponds to the desired statistics. If the timestamp is NULL, then this function compares the current statistics in the dictionary with the pending statistics (default).
pctthreshold	Limit for reporting. The function reports difference in statistics only if it exceeds the specified limit. The default value is 10.

Security Model

To invoke this procedure you must be owner of the table, or you must have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you must have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.29 DIFF_TABLE_STATS_IN_STATTAB Function

This function compares table statistics from two sources.

The function can obtain statistics from the following sources:

- Two user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary

The function also compares the statistics of the dependent objects: indexes, columns, and partitions. It displays statistics of the objects from both sources when the difference between those statistics exceeds a certain threshold (%). You can specify this threshold as an argument to the function. The function uses the statistics corresponding to the first source (`stattab1` or `time1`) as the basis for computing the difference percentage.

Syntax

```

DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB (
  ownname      IN  VARCHAR2,
  tablename    IN  VARCHAR2,
  stattab1     IN  VARCHAR2,
  stattab2     IN  VARCHAR2 DEFAULT NULL,
  pctthreshold IN  NUMBER  DEFAULT 10,
  statid1     IN  VARCHAR2 DEFAULT NULL,
  statid2     IN  VARCHAR2 DEFAULT NULL,

```

```

    statablown    IN  VARCHAR2 DEFAULT NULL,
    statab2own   IN  VARCHAR2 DEFAULT NULL)
RETURN DiffRepTab pipelined;

```

Parameters

Table 186-35 DIFF_TABLE_STATS_IN_STATTAB Function Parameters

Parameter	Description
ownname	Specifies the owner of the table. Specify <code>NULL</code> for current schema.
tablename	Specifies the table for which statistics are to be compared.
statab1	Specifies the user statistics table 1.
statab2	Specifies the user statistics table 2. If <code>NULL</code> , the function compares statistics in <code>statab1</code> with current statistics in the data dictionary. This is the default. To compare two sets within the statistics table, specify the same table as <code>statab1</code> (see <code>statid</code> below).
pctthreshold	Specifies the percent thresholds for comparison. The function reports difference in statistics only if it exceeds this limit. The default value is 10.
statid1	(optional) Identifies statistics set within <code>statab1</code> .
statid2	(optional) Identifies statistics set within <code>statab2</code> .
statablown	Specifies the schema containing <code>statab1</code> (if other than <code>ownname</code>).
statab2own	Specifies the schema containing <code>statab2</code> (if other than <code>ownname</code>).

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.30 DROP_ADVISOR_TASK Procedure

This procedure drops the specified Optimizer Statistics Advisor task.

Syntax

```

DBMS_STATS.DROP_ADVISOR_TASK (
    task_name IN VARCHAR2);

```

Parameters

Table 186-36 DROP_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Example 186-8 Dropping an Optimizer Statistics Advisor Task

This example drops the Optimizer Statistics Advisor task named `my_task`:

```
EXEC DBMS_STATS.DROP_ADVISOR_TASK('my_task');
```

186.7.31 DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension.

This cancels the effects of the [CREATE_EXTENDED_STATS Function](#).

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (
    ownname    VARCHAR2,
    tablename  VARCHAR2,
    extension  VARCHAR2);
```

Parameters

Table 186-37 DROP_EXTENDED_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Owner name of a table
<code>tablename</code>	Name of the table
<code>extension</code>	Can be either a column group or an expression. Suppose the specified table has two column <code>c1</code> , <code>c2</code> . An example column group can be " <code>(c1, c2)</code> " and an example expression can be " <code>(c1 + c2)</code> ".

Exceptions

- `ORA-20000`: Insufficient privileges or extension does not exist
- `ORA-20001`: Error when processing extension

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

- If no extended statistics set is created for the extension, this function throws an error.

186.7.32 DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

```
DBMS_STATS.DROP_STAT_TABLE (
    ownname VARCHAR2,
    statab VARCHAR2);
```

Parameters

Table 186-38 DROP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
statab	User statistics table identifier

Exceptions

ORA-20000: Table does not exists or insufficient privileges.

Usage Notes

To invoke this procedure you need the privileges for dropping the specified table.

186.7.33 EXECUTE_ADVISOR_TASK Function

This function executes a previously created Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.EXECUTE_ADVISOR_TASK (
    task_name          IN  VARCHAR2,
    execution_name     IN  VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 186-39 EXECUTE_ADVISOR_TASK Parameters

Parameter	Description
task_name	Name of the Optimizer Statistics Advisor task.
execution_name	A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- `SYSTEM` level

Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- Operation level

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- Object level

Users can perform this task for any object for which they have statistics collection privileges.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Returns

This function returns the name of the new execution.

Usage Notes

The results of the execution depend on user privileges and the type of rules:

- System

To perform the operation on system-level rules, you must have both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges.

- **Operation**

If you have the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges, then you can execute this function for all operations. If you have only the `ANALYZE ANY` privilege, then you can execute this function for operations related to any schemas except `SYS`. If you have only the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function for operations related to any schemas, including `SYS`. If you have neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function only for operations in your own schema.

- **Object**

If you have the privilege to collect statistics for an object, then you can execute this function for the object.

Example 186-9 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  -- execute the task
  v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

186.7.34 EXPORT_COLUMN_STATS Procedure

This procedure exports statistics for a specified column and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
  ownname  VARCHAR2,
  tablename VARCHAR2,
  colname  VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab  VARCHAR2,
  statid   VARCHAR2 DEFAULT NULL,
  statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-40 EXPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are exported.
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.35 EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL,
  add_sys      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 186-41 EXPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
stattab	Statistics table name to where statistics should be exported

Table 186-41 (Cont.) EXPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
statid	(Optional) Identifier to associate with these statistics within statab
statown	Schema containing statab (if other than ownname)
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

186.7.36 EXPORT_DATABASE_STATS Procedure

This procedure exports statistics for all objects in the database and stores them in the user statistics tables identified by statown.statab.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (
    statab          VARCHAR2,
    statid          VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    stat_category  VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 186-42 EXPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
statab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within statab
statown	Schema containing statab (if different from current schema)

Table 186-42 (Cont.) EXPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
stat_category	<p>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> • OBJECT_STATS — table statistics, column statistics and index statistics (default). • SYNOPSIS — information to support incremental statistics. • REALTIME_STATS — specifies only real-time statistics. <p>If 'OBJECT_STATS, SYNOPSIS' is specified, table statistics, column statistics, index statistics and synopsis are deleted.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.37 EXPORT_DICTIONARY_STATS Procedure

This procedure exports statistics for all data dictionary schemas (`SYS`, `SYSTEM`, and RDBMS component schemas) and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
  stattab          VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 186-43 EXPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within <code>stattab</code>
statown	Schema containing <code>stattab</code> (if different from current schema)

Table 186-43 (Cont.) EXPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
<code>stat_category</code>	<p>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> <code>OBJECT_STATS</code> — table statistics, column statistics and index statistics (default) <code>SYNOPSIS</code> — information to support incremental statistics <code>REALTIME_STATS</code> — specifies only real-time statistics. <p>If 'OBJECT_STATS, SYNOPSIS' is specified, table statistics, column statistics, index statistics and synopses are deleted.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.38 EXPORT_FIXED_OBJECTS_STATS Procedure

This procedure exports statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
  stattab  VARCHAR2,
  statid   VARCHAR2 DEFAULT NULL,
  statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-44 EXPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.39 EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (
    ownname  VARCHAR2,
    indname  VARCHAR2,
    partname VARCHAR2 DEFAULT NULL,
    stattab  VARCHAR2,
    statid   VARCHAR2 DEFAULT NULL,
    statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-45 EXPORT_INDEX_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>indname</code>	Name of the index
<code>partname</code>	Name of the index partition. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition index statistics are exported.
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- Oracle does not support export or import of statistics across databases of different character sets.

186.7.40 EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.EXPORT_PENDING_STATS (
  ownname      IN  VARCHAR2  DEFAULT USER,
  tablename    IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2  DEFAULT NULL,
  statown      IN  VARCHAR2  DEFAULT USER);
```

Parameters

Table 186-46 EXPORT_PENDING_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Owner name
<code>tablename</code>	Table name
<code>stattab</code>	Statistics table name to where to export the statistics
<code>statid</code>	(Optional) Identifier to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if other than <code>ownname</code>)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- If the parameter `tablename` is `NULL` then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

186.7.41 EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (  
    ownname      IN  VARCHAR2,  
    statab       IN  VARCHAR2,  
    statid       IN  VARCHAR2 DEFAULT NULL,  
    statown      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-47 EXPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
statab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within statab
statown	Schema containing statab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

186.7.42 EXPORT_SCHEMA_STATS Procedure

This procedure exports statistics for all objects in the schema identified by ownname and stores them in the user statistics tables identified by statab.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (  
    ownname      VARCHAR2,  
    statab       VARCHAR2,  
    statid       VARCHAR2 DEFAULT NULL,
```

```
statown          VARCHAR2 DEFAULT NULL,
stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 186-48 EXPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
stattab	Identifies the user statistics table in which to store the exported statistics.
statid	Specifies the identifier (optional) associated with these statistics within stattab.
statown	Specifies the schema containing stattab (if different than ownname).
stat_category	<p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> OBJECT_STATS — specifies table statistics, column statistics, and index statistics SYNOPSIS — specifies metadata for incremental statistics REALTIME_STATS — specifies only real-time statistics <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p> <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS'.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.43 EXPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-49 EXPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
stattab	Identifier of the user statistics table that describes where the statistics will be stored
statid	Optional identifier associated with the statistics stored from the stattab
statown	Schema containing stattab (if different from current schema)

Security Model

To run this procedure, you must have the `GATHER_SYSTEM_STATISTICS` role.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to export system statistics

Usage Notes

Oracle Database does not support the export or import of statistics across databases of different character sets.

186.7.44 EXPORT_TABLE_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

Syntax

```
DBMS_STATS.EXPORT_TABLE_PREFS (
  ownname      IN  VARCHAR2,
  tablename    IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-50 EXPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tablename	Table name
stattab	Statistics table name where to export the statistics
statid	Optional identifier to associate with these statistics within stattab

Table 186-50 (Cont.) EXPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
statown	Schema containing <code>stattab</code> (if other than <code>ownname</code>)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

186.7.45 EXPORT_TABLE_STATS Procedure

This procedure exports statistics for a specified table (including associated index statistics) and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  cascade          BOOLEAN  DEFAULT TRUE,
  statown          VARCHAR2 DEFAULT NULL,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 186-51 EXPORT_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
tablename	Specifies the name of the table.
partname	Specifies the name of the table partition. If the table is partitioned, and if <code>partname</code> is <code>NULL</code> , then the procedure exports global and partition statistics.

Table 186-51 (Cont.) EXPORT_TABLE_STATS Procedure Parameters

Parameter	Description
stattab	Specifies the identifier (optional) associated with these statistics within stattab.
statid	Specifies the identifier (optional) associated with these statistics within stattab.
cascade	Indicates whether to export column and index statistics. If TRUE, then the procedure exports column and index statistics for the specified table. This is the default.
statown	Specifies the schema containing stattab (if different than ownname).
stat_category	<p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> OBJECT_STATS — specifies table statistics, column statistics, and index statistics SYNOPSIS — specifies metadata for incremental statistics REALTIME_STATS — specifies only real-time statistics <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p> <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS'.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.46 FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure saves monitoring information for all tables in the dictionary. The database immediately updates corresponding entries in the `*_TAB_MODIFICATIONS`, `*_TAB_STATISTICS` and `*_IND_STATISTICS` views.

Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

Security Model

The `ANALYZE ANY` system privilege is required to run this procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

Starting in Oracle Database 12c Release 2 (12.2), you do not need to call `FLUSH_DATABASE_MONITORING_INFO` to view the latest information in `*_TAB_STATISTICS` and `*_IND_STATISTICS` because these views show statistics cached in the SGA and stored on disk. Because the `GATHER_*_STATS` procedures internally save monitoring information to disk, it is not necessary to run this procedure before gathering statistics.

See Also:

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

186.7.47 GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```

DBMS_STATS.GATHER_DATABASE_STATS (
  estimate_percent NUMBER      DEFAULT to_estimate_percent_type
                               (get_param('ESTIMATE_PERCENT')),
  block_sample      BOOLEAN    DEFAULT FALSE,
  method_opt       VARCHAR2   DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER     DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN    DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab         VARCHAR2   DEFAULT NULL,
  statid          VARCHAR2   DEFAULT NULL,
  options         VARCHAR2   DEFAULT 'GATHER',
  objlist         OUT         ObjectTab,
  statown        VARCHAR2   DEFAULT NULL,
  gather_sys      BOOLEAN    DEFAULT TRUE,
  no_invalidate   BOOLEAN    DEFAULT to_no_invalidate_type (
                               get_param('NO_INVALIDATE')),
  obj_filter_list ObjectTab  DEFAULT NULL);

```

```

DBMS_STATS.GATHER_DATABASE_STATS (
  estimate_percent NUMBER      DEFAULT to_estimate_percent_type
                               (get_param('ESTIMATE_PERCENT')),
  block_sample      BOOLEAN    DEFAULT FALSE,
  method_opt       VARCHAR2   DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER     DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN    DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab         VARCHAR2   DEFAULT NULL,
  statid          VARCHAR2   DEFAULT NULL,
  options         VARCHAR2   DEFAULT 'GATHER',
  statown        VARCHAR2   DEFAULT NULL,
  gather_sys      BOOLEAN    DEFAULT TRUE,
  no_invalidate   BOOLEAN    DEFAULT to_no_invalidate_type (

```

```

                                get_param('NO_INVALIDATE')),
obj_filter_list ObjectTab DEFAULT NULL);

```

Parameters

Table 186-52 GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
estimate_percent	<p>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
block_sample	<p>Determines whether the database uses random block sampling (<code>TRUE</code>) or random row sampling (<code>FALSE</code>). The default is <code>FALSE</code>.</p> <p>Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p>
method_opt	<p>When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.:</p> <ul style="list-style-type: none"> • <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code> <code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code> <ul style="list-style-type: none"> - <code>integer</code> : Number of histogram buckets. Must be in the range [1,2048]. - <code>REPEAT</code> : Collects histograms only on the columns that already have histograms. - <code>AUTO</code> : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - <code>SKEWONLY</code> : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 186-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
degree	<p>Determines the degree of parallelism used for gathering statistics. The default for <code>degree</code> is <code>NULL</code>. <code>NULL</code> means to use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Change the default using the <code>SET_DATABASE_PREFS</code>, <code>SET_GLOBAL_PREFS</code>, <code>SET_SCHEMA_PREFS</code>, and <code>SET_TABLE_PREFS</code> procedures. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement.</p> <p>Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using <code>DEGREE=>NULL</code>, <code>DEGREE=>n</code>, or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution when the size of the object does not warrant parallel execution.</p>
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics</p>
cascade	<p>Determines whether to collect index statistics as part of gathering table statistics.</p> <p>Specifying this option is equivalent to running the <code>GATHER_INDEX_STATS</code> procedure on each index of the table. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the <code>SET_DATABASE_PREFS</code>, <code>SET_GLOBAL_PREFS</code>, <code>SET_SCHEMA_PREFS</code>, and <code>SET_TABLE_PREFS</code> procedures.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics.</p> <p>The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.</p>

Table 186-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> .
options	<p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> • <code>GATHER</code> — Gathers statistics on all objects in the database. This is the default. • <code>GATHER AUTO</code> — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When <code>GATHER AUTO</code> is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed. • <code>GATHER STALE</code> — Gathers statistics on stale objects by querying the <code>*_TAB_MODIFICATIONS</code> views. Also, the database returns a list of objects found to be stale. • <code>GATHER EMPTY</code> — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. • <code>LIST AUTO</code> — Returns a list of objects to be processed with <code>GATHER AUTO</code>. • <code>LIST STALE</code> — Returns list of stale objects as determined by looking at the <code>*_TAB_MODIFICATIONS</code> views. • <code>LIST EMPTY</code> — Returns a list of objects that currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing <code>stattab</code> (if different from current schema)
gather_sys	Gathers statistics on the objects owned by the <code>SYS</code> user.
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • <code>TRUE</code>: Dependent cursors are not invalidated. • <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. • <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p>

Table 186-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
obj_filter_list	A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) or (o.a2 like s2) or ... is true.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: CREATE TABLE NEWTAB as SELECT * FROM
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

186.7.48 GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas SYS, SYSTEM and schemas of RDBMS components.

Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
  block_sample    BOOLEAN   DEFAULT FALSE,
  method_opt      VARCHAR2  DEFAULT get_param('METHOD_OPT'),
  degree          NUMBER    DEFAULT to_degree_type(get_param('DEGREE')),
  granularity     VARCHAR2  DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN   DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab        VARCHAR2  DEFAULT NULL,
  statid         VARCHAR2  DEFAULT NULL,
  options        VARCHAR2  DEFAULT 'GATHER AUTO',
  objlist        OUT       ObjectTab,
  statown        VARCHAR2  DEFAULT NULL,
```

```

no_invalidate      BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
obj_filter_list   ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER DEFAULT

to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
  degree           NUMBER DEFAULT to_degree_type(GET_PARAM('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  options          VARCHAR2 DEFAULT 'GATHER AUTO',
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN DEFAULT
                                to_no_invalidate_type(get_param('NO_INVALIDATE')),
  obj_filter_list  ObjectTab DEFAULT NULL);

```

Parameters

Table 186-53 GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
comp_id	Component id of the schema to analyze. NULL results in the analysis of schemas for all RDBMS components. Refer to the COMP_ID column of DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.

Table 186-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
method_opt	<p>The method options. This parameter accepts the following values:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY} <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
degree	<p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p>

Table 186-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics</p>
cascade	<p>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics</p>
statid	<p>The (optional) identifier to associate with these statistics within stattab</p>

Table 186-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
options	<p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> • GATHER AUTO — Gathers all necessary statistics automatically. This is the default. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed. • GATHER — Gathers statistics on all objects in the relevant schema. • GATHER STALE — Gathers statistics on stale objects by querying the <code>*_TAB_MODIFICATIONS</code> views. Also, the database returns a list of objects found to be stale. • GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. • LIST AUTO — Returns a list of objects to be processed with GATHER AUTO. • LIST STALE — Returns list of stale objects as determined by looking at the <code>*_TAB_MODIFICATIONS</code> views. • LIST EMPTY — Returns a list of objects that currently have no statistics.
objlist	The list of objects found to be stale or empty.
statown	Schema containing <code>stattab</code> , if different from the current schema.
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
obj_filter_list	<p>A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code>, <code>s2</code>, ... are specified for attributes <code>a1</code>, <code>a2</code>, ... in one object filter. An object <code>o</code> is said to satisfy this object filter if (<code>o.a1</code> like <code>s1</code>) and (<code>o.a2</code> like <code>s2</code>) and ... is true. See Applying an Object Filter List.</p>

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM`
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

186.7.49 GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN   DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')));
```

Parameters

Table 186-54 GATHER_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
statab	User statistics table identifier describing where to save the current statistics
statid	Identifier to associate with these statistics within statab (optional)
statown	Schema containing statab (if different from current schema)

Table 186-54 (Cont.) GATHER_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

186.7.50 GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible.

Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The `granularity` and `no_invalidate` arguments are not relevant to these types of indexes.

Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                     (GET_PARAM('ESTIMATE_PERCENT')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 186-55 GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Schema of index to analyze
indname	Name of index
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within <code>stattab</code>
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
degree	Degree of parallelism. The default for <code>degree</code> is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . NULL means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code> , <code>DEGREE=>n</code> , or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code> , the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.

Table 186-55 (Cont.) GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	Gather statistics on object even if it is locked

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.51 GATHER_PROCESSING_RATE Procedure

This procedure starts the job of gathering the processing rates which end after an `interval` defined in minutes.

Syntax

```
DBMS_STATS.GATHER_PROCESSING_RATE (
    gathering_mode    IN    VARCHAR2    DEFAULT 'START',
    interval          IN    NUMBER      DEFAULT NULL);
```

Parameters

Table 186-56 GATHER_PROCESSING_RATE Procedure Parameters

Parameter	Description
gathering_mode	Mode: 'START' or 'END'. The mode is based on the Active Session History (ASH) data when invoked with 'START' option. It stops gathering when invoked with 'END' option. When invoked with 'START', 'interval' option can be specified optionally. If interval is not specified, its default value is set to 60 minutes.
interval	Time interval (number of minutes) for which the processing must be gathered

Usage Notes

- You require the `OPTIMIZER_PROCESSING_RATE` role to run this procedure.
- `AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

186.7.52 GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (
    ownname          VARCHAR2,
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
    granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
    stattab         VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    options          VARCHAR2 DEFAULT 'GATHER',
    objlist          OUT      ObjectTab,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')),
    force            BOOLEAN  DEFAULT FALSE,
    obj_filter_list  ObjectTab DEFAULT NULL);
```

```
DBMS_STATS.GATHER_SCHEMA_STATS (
    ownname          VARCHAR2,
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
```

```

method_opt      VARCHAR2 DEFAULT get_param('METHOD_OPT'),
degree          NUMBER  DEFAULT to_degree_type(get_param('DEGREE')),
granularity     VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
cascade        BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
stattab        VARCHAR2 DEFAULT NULL,
statid         VARCHAR2 DEFAULT NULL,
options        VARCHAR2 DEFAULT 'GATHER',
statown        VARCHAR2 DEFAULT NULL,
no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                    get_param('NO_INVALIDATE')),
force          BOOLEAN  DEFAULT FALSE,
obj_filter_list ObjectTab DEFAULT NULL);

```

Parameters

Table 186-57 GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	<p>Determines the percentage of rows to sample.</p> <p>The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	<p>Accepts:</p> <ul style="list-style-type: none"> • <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code> <code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code> <ul style="list-style-type: none"> - <code>integer</code>: Number of histogram buckets. Must be in the range [1,2048]. - <code>REPEAT</code>: Collects histograms only on the columns that already have histograms - <code>AUTO</code>: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - <code>SKEWONLY</code>: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 186-57 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
degree	Degree of parallelism. The default for <code>degree</code> is <code>NULL</code> . The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code> , <code>DEGREE=>n</code> , or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code> , the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). ' <code>ALL</code> ' - Gathers all (subpartition, partition, and global) statistics ' <code>AUTO</code> ' - Determines the granularity based on the partitioning type. This is the default value. ' <code>DEFAULT</code> ' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the ' <code>GLOBAL AND PARTITION</code> ' for this functionality. Note that the default value is now ' <code>AUTO</code> '. ' <code>GLOBAL</code> ' - Gathers global statistics ' <code>GLOBAL AND PARTITION</code> ' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. ' <code>PARTITION</code> ' - Gathers partition-level statistics ' <code>SUBPARTITION</code> ' - Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within <code>stattab</code>

Table 186-57 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
options	<p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics on all objects in the schema. This is the default. GATHER AUTO — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, statab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed. GATHER STALE — Gathers statistics on stale objects by querying the *_TAB_MODIFICATIONS views. Also, the database returns a list of objects found to be stale. GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. LIST AUTO — Returns a list of objects to be processed with GATHER AUTO. LIST STALE — Returns list of stale objects as determined by looking at the *_TAB_MODIFICATIONS views. LIST EMPTY — Returns a list of objects that currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing statab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	Gather statistics on objects even if they are locked
obj_filter_list	A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

If the `GATHER AUTO` option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where `GATHER AUTO` is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM`
This will create statistics on `NEWTAB` but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO` on `gather_table_stats`.
- The `FREQUENCY` histograms on `NEWTAB` will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that the tables `SH.SALES` and `SH.COSTS`, if stale, will have statistics gathered upon them.

```
DECLARE
    filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
    filter_lst.extend(2);
    filter_lst(1).ownname := 'SH';
    filter_lst(1).objname := 'SALES';
    filter_lst(2).ownname := 'SH';
    filter_lst(2).objname := 'COSTS';
    DBMS_STATS.GATHER_SCHEMA_STATS(ownname=>'SH',obj_filter_list=>filter_lst);
END;
```

186.7.53 GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
    gathering_mode    VARCHAR2 DEFAULT 'NOWORKLOAD',
    interval          INTEGER   DEFAULT NULL,
    stattab          VARCHAR2  DEFAULT NULL,
    statid           VARCHAR2  DEFAULT NULL,
    statown          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 186-58 GATHER_SYSTEM_STATS Procedure Parameters

Parameter	Description
gathering_mode	<p>Specifies the mode in which the database gathers system statistics. Possible values are:</p> <ul style="list-style-type: none"> • NOWORKLOAD The database captures performance characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period, the database estimates the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. To fine tune system statistics for the workload, use START and STOP or the INTERVAL option. If you gather both NOWORKLOAD and workload-specific statistics (statistics collected using INTERVAL or START and STOP), the optimizer uses the workload statistics. Collected components include cpuspeednw, ioseektim, and iotfrspeed. • INTERVAL The database captures system activity during a specified interval in minutes. This parameter works in combination with the interval parameter. The database creates or updates system statistics in the dictionary or stattab. You can use GATHER_SYSTEM_STATS (gathering_mode=>'STOP') to stop gathering earlier than scheduled. Collected components include maxthr, slavethr, cpuspeed, sreadtim, mreadtim, and mbrc. • START STOP The database captures system activity during specified start and stop times and refreshes the dictionary or stattab with statistics for the elapsed period. The database ignores the INTERVAL value. Collected components include maxthr, slavethr, cpuspeed, sreadtim, mreadtim, and mbrc. • EXADATA In this mode, gathered system statistics take into account the unique capabilities of Oracle Exadata, such as large I/O size and high I/O throughput. The database sets multiblock read count and I/O throughput statistics along with CPU speed.
interval	Specifies the number of minutes in which to gather system statistics. This parameter applies only when gathering_mode='INTERVAL' .
stattab	Specifies the table in which the database stores the statistics.
statid	Specifies an optional identifier associated with the statistics saved in stattab .
statown	Specifies the schema containing stattab , if different from the current schema.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0

Usage Notes

To run this procedure, you must have the GATHER_SYSTEM_STATISTICS role.

Examples

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    statab   => 'mystats',
    statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    statab   => 'mystats',
    statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE jobno number;
BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
    ('mystats','OLTP');'
    sysdate, 'sysdate + 1');
  COMMIT;
END;

BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
    ('mystats','OLAP');'
    sysdate + 0.5, 'sysdate + 1');
  COMMIT;
END;
```

186.7.54 GATHER_TABLE_STATS Procedure

This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')),
  stattype         VARCHAR2 DEFAULT 'DATA',
  force            BOOLEAN  DEFAULT FALSE,
  context          DBMS_STATS.CCONTEXT DEFAULT NULL, -- non operative
  options          VARCHAR2 DEFAULT get_param('OPTIONS');
```

Parameters

Table 186-59 GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema containing the table.
tabname	Name of the table.
partname	Name of the partition.
estimate_percent	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default. You can change the default value using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Determines whether the database uses random block sampling (<code>TRUE</code>) or random row sampling (<code>FALSE</code>). The default is <code>FALSE</code> . Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.

Table 186-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
method_opt	<p>METHOD_OPT - When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed. Other than that, method_opt accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] • FOR COLUMNS [column_clause] [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column_clause is defined as column_clause := column_name extension name extension</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name: Name of a column - extension: can be either a column group in the format of (column_name, Column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
degree	<p>Determines the degree of parallelism used for gathering statistics.</p> <p>The default for degree is NULL. NULL means to use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement.</p> <p>Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution when the size of the object does not warrant parallel execution.</p>

Table 186-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>
cascade	<p>Determines whether to collect index statistics as part of gathering table statistics.</p> <p>Specifying this option is equivalent to running the GATHER_INDEX_STATS procedure on each index of the table. Use the constant DBMS_STATS.AUTO_CASCADE to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures.</p>
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Table 186-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p>
stattype	<p>Statistics type. The only value allowed is DATA.</p>
force	<p>Gather statistics of table even if it is locked</p>
context	<p>Not used.</p>
options	<p>Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics for all objects in the table. This is the default. GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. <p>For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Index statistics collection can be parallelized except for cluster, domain and join indexes.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM`
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO on gather_table_stats`.

- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Table does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

186.7.55 GENERATE_STATS Procedure

This **deprecated procedure** generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, use the GATHER_INDEX_STAT procedure. See "[GATHER_INDEX_STATS Procedure](#)".

Syntax

```
DBMS_STATS.GENERATE_STATS (
    ownname    VARCHAR2,
    objname    VARCHAR2,
    organized  NUMBER DEFAULT 7,
    force      BOOLEAN default FALSE);
```

Parameters

Table 186-60 GENERATE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of object
objname	Name of object

Table 186-60 (Cont.) GENERATE_STATS Procedure Parameters

Parameter	Description
organized	Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.
force	If TRUE, generates statistics for the target object even if it is locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

Exceptions

ORA-20000: Unsupported object type of object does not exist

ORA-20001: Invalid option or invalid statistics

186.7.56 GET_ADVISOR_OPR_FILTER Procedure

This procedure creates an operation filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.GET_ADVISOR_OPR_FILTER (
  opr_id          IN          NUMBER,
  opr_filter      IN OUT NOCOPY StatsAdvOpr);
```

Parameters

Table 186-61 GET_ADVISOR_OPR_FILTER Procedure Parameters

Parameter	Description
opr_id	The ID of the statistics operation stored in the DBA_OPTSTAT_OPERATIONS view.
opr_filter	The Optimizer Statistics Advisor filter that is generated based on the specified statistics operation.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Usage Notes

You can specify the filter using either the operation ID or the filter ID, but not both at the same time.

186.7.57 GET_ADVISOR_RECS Function

This function generates a recommendation report for the specified item.

Syntax

```
DBMS_STATS.GET_ADVISOR_RECS (
  ownname      IN   VARCHAR2,
  tablename    IN   VARCHAR2,
  rec          IN   VARCHAR2,
  type         IN   VARCHAR2   := 'TEXT')
RETURN CLOB;
```

Parameters

Table 186-62 GET_ADVISOR_RECS Function Parameters

Parameter	Description
<code>ownname</code>	The owner of the table.
<code>tablename</code>	The name of the table.
<code>rec</code>	<p>The Optimizer Statistics Advisor recommendation.</p> <ul style="list-style-type: none"> • <code>INCREMENTAL</code> When only a small number of range partitions are modified, this option improves the performance of statistics gathering dramatically. However, it requires additional space to store synopses for maintaining incremental statistics. The report analyzes this trade-off. • <code>CONCURRENT</code> The report recommends either setting the <code>CONCURRENT</code> preference, or specifying <code>AUTO_DEGREE</code> for individual tables. If the system resources and usage satisfies the conditions, the advisor always recommends setting <code>CONCURRENT</code> first. The advisor only recommends <code>AUTO_DEGREE</code> when statistics gathering on an individual table take a long time and the <code>CONCURRENT</code> preference is already set.

Table 186-62 (Cont.) GET_ADVISOR_RECS Function Parameters

Parameter	Description
type	Type of the report: TEXT, HTML, or XML.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must have the privileges to gather statistics for the objects for which recommendations are generated.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Usage Notes

The advisor does not make recommendations for manual statistics gathering. The database only make recommendations for automatic statistics gathering jobs, with the main goal of finishing the job within the maintenance window. As long as the automatic job finishes, the database does not make further recommendations.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

186.7.58 GET_COLUMN_STATS Procedures

These overloaded procedures get column-related statistics. In the user-defined statistics version, the procedure returns the type of statistics stored.

Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  colname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  distcnt OUT      NUMBER,
  density OUT      NUMBER,
  nullcnt OUT      NUMBER,
  srec OUT         StatRec,
  avgclen OUT      NUMBER,
  statown          VARCHAR2 DEFAULT NULL,
  realtime_stats  BOOLEAN iDEFAULT TRUE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  colname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  ext_stats        OUT RAW,
  stattyown        OUT VARCHAR2 DEFAULT NULL,
  stattyname       OUT VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-63 GET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tablename	Specifies the name of the table to which this column belongs.
colname	Specifies the name of the column or extension.
partname	Specifies the name of the table partition from which to get the statistics. If the table is partitioned, and if partname is NULL, then the procedure retrieves statistics at the global table level.
statab	Specifies the statistics table ID describing where to retrieve the statistics. If statab is NULL, then the procedure retrieves statistics directly from the data dictionary.
statid	Specifies an optional identifier associated with these statistics within statab. This parameter is only relevant when statab is not NULL.
ext_stats	Specifies the user-defined statistics.
stattyown	Specifies the schema of the statistics type.
stattyname	Specifies the name of the statistics type.
distcnt	Specifies the number of distinct values.
density	Specifies the column density.
nullcnt	Specifies the number of NULL values.
srec	Specifies the structure holding the internal representation of the column minimum, maximum, and histogram values.
avgclen	Specifies the average length of the column (in bytes).
statown	Specifies the schema containing statab (if different than ownname).
realtime_stats	Specifies whether to include real-time statistics. The default value is TRUE. When realtime_stats is FALSE, the database only includes optimizer statistics that were gathered by the GATHER_*_STATS procedures.

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be the owner of the table, or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

Before invoking this procedure, ensure that the table exists.

186.7.59 GET_INDEX_STATS Procedures

This overloaded procedure gets all index-related statistics. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  numrows         OUT NUMBER,
  numlblks        OUT NUMBER,
  numdist         OUT NUMBER,
  avglblk         OUT NUMBER,
  avgdblks        OUT NUMBER,
  clstfct         OUT NUMBER,
  indlevel        OUT NUMBER,
  statown         VARCHAR2 DEFAULT NULL);
```

```
DBMS_STATS.GET_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  numrows         OUT NUMBER,
  numlblks        OUT NUMBER,
  numdist         OUT NUMBER,
  avglblk         OUT NUMBER,
  avgdblks        OUT NUMBER,
  clstfct         OUT NUMBER,
  indlevel        OUT NUMBER,
  statown         VARCHAR2 DEFAULT NULL,
  guessq          OUT NUMBER);
```

Use the following form of the procedure for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  ext_stats        OUT  RAW,
  stattyown        OUT  VARCHAR2 DEFAULT NULL,
  stattyname       OUT  VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-64 GET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to get the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved for the global index level.
statab	User statistics table identifier describing from where to retrieve the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code>)
ext_stats	User-defined statistics
stattyown	Schema of the statistics type
stattyname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition)
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)
clstfct	Clustering factor for the index (partition)
indlevel	Height of the index (partition)
statown	Schema containing <code>statab</code> (if different than <code>ownname</code>)
guessq	Guess quality for the index (partition)

Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`,

you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other "minor" workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
 - When not enough data has been analyzed, such as when an object has been recently created
 - When the system does not have one major workload resulting in averages not corresponding to real values

186.7.60 GET_PARAM Function

This function returns the default value of parameters of DBMS_STATS procedures.

Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [GET_PREFS Function](#).

See also [DBMS_STATS Deprecated Subprograms](#).

Syntax

```
DBMS_STATS.GET_PARAM (  
    pname      IN  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 186-65 GET_PARAM Function Parameters

Parameter	Description
pname	Parameter name

Exceptions

ORA-20001: Invalid input values

186.7.61 GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```
DBMS_STATS.GET_PREFS (  
    pname      IN  VARCHAR2,  
    ownname    IN  VARCHAR2 DEFAULT NULL,  
    tablename  IN  VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 186-66 GET_PREFS Function Parameters

Parameter	Description
pname	<p>Preference name. The possible values are:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • AUTO_TASK_STATUS • AUTO_TASK_MAX_RUN_TIME • AUTO_TASK_INTERVAL • CASCADE • CONCURRENT • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_STALENESS • INCREMENTAL_LEVEL • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS • WAIT_TIME_TO_UPDATE_STATUS
ownname	Owner name
tabname	Table name

Table 186-67 Preference Descriptions

Preference Name	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</p> ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</p> HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</p> <ul style="list-style-type: none"> The accuracy of the new algorithm is similar to the original algorithm. The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
AUTO_TASK_STATUS	<p>Enables or disables the high-frequency automatic optimizer statistics collection. Values are:</p> <ul style="list-style-type: none"> ON — Enables high-frequency automatic optimizer statistics collection. OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.

Table 186-67 (Cont.) Preference Descriptions

Preference Name	Description
AUTO_TASK_MAX_RUN_TIME	Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default.
AUTO_TASK_INTERVAL	Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The default value is 3600 but Oracle sets it differently for some platforms and Oracle Database releases.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
CONCURRENT	Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are: <ul style="list-style-type: none"> MANUAL — Concurrency is enabled only for manual statistics gathering. AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering. ALL — Concurrency is enabled for both manual and automatic statistics gathering. OFF — Concurrency is disabled for both manual and automatic statistics.
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: <ul style="list-style-type: none"> SHARED — All sessions see the same set of statistics SESSION — Statistics gathered by the <code>GATHER_TABLE_STATS</code> procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.

Table 186-67 (Cont.) Preference Descriptions

Preference Name	Description
GRANULARITY	<p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
INCREMENTAL	<p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan.</p> <p>When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p>

Table 186-67 (Cont.) Preference Descriptions

Preference Name	Description
INCREMENTAL_LEVEL	<p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 186-67 (Cont.) Preference Descriptions

Preference Name	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <p>USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.</p> <p>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> <p>USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.</p> <p>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> <p>ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</p> <p>NULL—A partition or subpartition is considered stale when it has any DML changes.</p> <p>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</p>

Table 186-67 (Cont.) Preference Descriptions

Preference Name	Description
METHOD_OPT	<p>Note that the following two executions are different:</p> <pre data-bbox="859 407 1317 495">EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre data-bbox="859 564 1292 653">EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> <p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only FOR ALL syntax is allowed:</p> <ul data-bbox="859 963 1373 1024" style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>The size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>integer — Specifies the number of histogram buckets. The number must be between 1 and 2048.</p> <p>REPEAT — Collects histograms only on the columns that already have histograms.</p> <p>AUTO — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</p> <p>SKEWONLY — Determines the columns on which to collect histograms based on the data distribution of the columns.</p> <p>The default is FOR ALL COLUMNS SIZE AUTO. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 186-67 (Cont.) Preference Descriptions

Preference Name	Description
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p>
OPTIONS	<p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics for all objects in the table. This is the default. GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. <p>For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>
PUBLISH	<p>Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>

Table 186-67 (Cont.) Preference Descriptions

Preference Name	Description
STALE_PERCENT	<p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>
STAT_CATEGORY	<p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> • <code>OBJECT_STATS</code> - table statistics, column statistics and index statistics (default) • <code>SYNOPSIS</code> - information to support incremental statistics • <code>REALTIME_STATS</code> — specifies only real-time statistics. <p>The value '<code>OBJECT_STATS, SYNOPSIS</code>' specifies table statistics, column statistics, index statistics, and synopses.</p>
TABLE_CACHED_BLOCKS	<p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p>
WAIT_TIME_TO_UPDATE_STATS	<p>Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.</p>

Security Model

No special privilege or role is needed to invoke this procedure. To gather statistics concurrently, however, you must either have the DBA role, or have the following privileges in addition to privileges that are required for gathering statistics: `CREATE JOB`, `MANAGE SCHEDULER`, and `MANAGE ANY QUEUE`.

Exceptions

- `ORA-20000`: Unable to gather statistics concurrently: Resource Manager is not enabled.
- `ORA-20001`: Invalid input values

Usage Notes

Note the following guidelines:

- The `CONCURRENT` preference determines whether statistics are gathered concurrently when the user issues `GATHER_*_STATS` procedures. `DBMS_STATS` can

collect statistics for a single object in parallel based on the value of the `DEGREE` parameter. However, parallelism is limited to one object. The `CONCURRENT` preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers.

To gather statistics concurrently, Resource Manager must be enabled, and the setting for the `JOB_QUEUE_PROCESSES` initialization parameter must be at least 4.

- If the `ownname` and `tabname` are provided, and if a preference has been entered for the table, then the function returns the preference as specified for the table. In all other cases, it returns the global preference if it has been specified, otherwise it returns the default value.

Oracle Database SQL Tuning Guide to learn how to get optimizer statistics preferences

186.7.62 GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY  
RETURN TIMESTAMP WITH TIMEZONE;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.

186.7.63 GET_STATS_HISTORY_RETENTION Function

This function returns the current statistics history retention value.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION  
RETURN NUMBER;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.

186.7.64 GET_SYSTEM_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (  
    status OUT VARCHAR2,
```

```

dstart    OUT  DATE,
dstop     OUT  DATE,
pname     IN   VARCHAR2,
pvalue    OUT  NUMBER,
statab    IN   VARCHAR2 DEFAULT NULL,
statid    IN   VARCHAR2 DEFAULT NULL,
statown   IN   VARCHAR2 DEFAULT NULL);

```

Parameters

Table 186-68 GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
status	Output is one of the following: <ul style="list-style-type: none"> COMPLETED: AUTOGATHERING: MANUALGATHERING: BADSTATS:
dstart	Date when statistics gathering started. If status = MANUALGATHERING, the start date is returned.
dstop	Date when statistics gathering stopped. <ul style="list-style-type: none"> If status = COMPLETE, the finish date is returned. If status = AUTOGATHERING, the future finish date is returned. If status = BADSTATS, the must-finished-by date is returned.
pname	The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> iotfrspeed - I/O transfer speed in bytes for each millisecond ioseektim - seek time + latency time + operating system overhead time, in milliseconds sreadtim - average time to read single block (random read), in milliseconds mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) cpuspeednw - average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option. mbrc - average multiblock read count for sequential read, in blocks maxthr - maximum I/O system throughput, in bytes/second slavethr - average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
statab	Identifier of the user statistics table where the statistics will be obtained. If statab is NULL, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the statab

Table 186-68 (Cont.) GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
statown	Schema containing statab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

186.7.65 GET_TABLE_STATS Procedure

This overloaded procedure gets all table-related statistics.

Syntax

```
DBMS_STATS.GET_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  numrows          OUT NUMBER,
  numblks          OUT NUMBER,
  avgrlen          OUT NUMBER,
  statown          VARCHAR2 DEFAULT NULL,
  realtime_stats   BOOLEAN DEFAULT TRUE);
```

```
DBMS_STATS.GET_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  numrows          OUT NUMBER,
  numblks          OUT NUMBER,
  avgrlen          OUT NUMBER,
  statown          VARCHAR2 DEFAULT NULL,
  im_imcu_count   OUT NUMBER,
  im_block_count  OUT NUMBER,
```

```

scanrate          OUT NUMBER,
realtime_stats    BOOLEAN DEFAULT TRUE);

DBMS_STATS.GET_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  numrows         OUT NUMBER,
  numblks         OUT NUMBER,
  avgrlen         OUT NUMBER,
  cachedblk       OUT NUMBER,
  cachehit        OUT NUMBER,
  realtime_stats  BOOLEAN DEFAULT TRUE);

```

Parameters

Table 186-69 GET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
tabname	Specifies the name of the table to which this column belongs.
partname	Specifies the name of the table partition from which to get the statistics. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved from the global table level.
statab	Specifies the user statistics table ID. This ID describes where to retrieve the statistics. If <code>statab</code> is <code>NULL</code> , then the procedure gathers statistics directly from the data dictionary.
statid	Specifies the optional ID associates with these statistics within <code>statab</code> . This ID is only relevant when <code>statab</code> is not <code>NULL</code> .
numrows	Specifies the number of rows in the table or partition.
numblks	Specifies the number of blocks in the table or partition.
avgrlen	Specifies the average row length for the table or partition.
statown	Specifies the schema containing <code>statab</code> (if different from <code>ownname</code>).
im_imcu_count	Specifies the number of In-Memory Compression Units (IMCUs) in the table or partition.
im_block_count	Specifies the number of In-Memory blocks in the table or partition. An In-Memory block corresponds to a specific data block on disk. If the table is fully populated in the IM column store, then the number of In-Memory blocks equals the number of data blocks.
scanrate	Specifies the rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.

Table 186-69 (Cont.) GET_TABLE_STATS Procedure Parameters

Parameter	Description
<code>realtime_stats</code>	Specifies whether to include real-time statistics. The default value is <code>TRUE</code> . When <code>realtime_stats</code> is <code>FALSE</code> , the database only includes optimizer statistics that were gathered by the <code>GATHER_*_STATS</code> procedures.
<code>cachedblk</code>	For internal use only.
<code>cachehit</code>	For internal use only.

Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

ORA-20002: Bad user statistics table; may need to upgrade it

Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER*_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently created
 - When the system does not have one major workload resulting in averages not corresponding to real values
- The database does not support export or import of statistics across databases of different character sets.

**See Also:**

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

186.7.66 IMPLEMENT_ADVISOR_TASK Function

This function implements the recommendations made by Optimizer Statistics Advisor.

Syntax

```
DBMS_STATS.IMPLEMENT_ADVISOR_TASK (
  task_name          IN   VARCHAR2,
  execution_name     IN   VARCHAR2   := NULL,
  level              IN   VARCHAR2   := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 186-70 IMPLEMENT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
execution_name	A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.
level	The level of the implementation. Possible values are <ul style="list-style-type: none"> ALL: Ignores the filters and implements all recommendations. TYPICAL: Implements the recommendations according to the filters in place.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- SYSTEM level
 - Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.
- Operation level

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
 - Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
 - Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
 - Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- Object level
Users can perform this task for any object for which they have statistics collection privileges.

Return Values

This function returns an XML CLOB that indicates which recommendations were successfully implemented.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 186-10 Implementing Optimizer Statistics Advisor Recommendations

This script illustrates a basic Optimizer Statistics Advisor session. It creates a task, executes it, generates a report, and then implements the recommendations.

```

DECLARE
  v_tname      VARCHAR2(128) := 'my_task';
  v_ename      VARCHAR2(128) := NULL;
  v_report     CLOB := null;
  v_script     CLOB := null;
  v_imp_result CLOB;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);

  -- view the task report
  v_report := DBMS_STATS.REPORT_ADVISOR_TASK(v_tname);
  DBMS_OUTPUT.PUT_LINE(v_report);

  -- implement all recommendations
  v_imp_result := DBMS_STATS.IMPLEMENT_ADVISOR_TASK(v_tname);
END;
```

186.7.67 IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    colname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 186-71 IMPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>tabname</code>	Name of the table to which this column belongs
<code>colname</code>	Name of the column or extension
<code>partname</code>	Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition column statistics are imported.
<code>stattab</code>	User statistics table identifier describing from where to retrieve the statistics
<code>statid</code>	Identifier to associate with these statistics within <code>stattab</code> (optional)
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
<code>no_invalidate</code>	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> <code>TRUE</code>: Dependent cursors are not invalidated. <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
<code>force</code>	If set to <code>TRUE</code> , imports statistics even if statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

186.7.68 IMPORT_DATABASE_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
    statab      IN  VARCHAR2,
    statid      IN  VARCHAR2 DEFAULT NULL,
    statown     IN  VARCHAR2 DEFAULT NULL,
    add_sys     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 186-72 IMPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
<code>statab</code>	Statistics table name where to import the statistics
<code>statid</code>	Optional identifier to associate with these statistics within <code>statab</code>
<code>statown</code>	Schema containing <code>statab</code> (if different than <code>ownname</code>)
<code>add_sys</code>	Value <code>TRUE</code> will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

- To run this procedure, you need to have the `SYSDBA` role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

186.7.69 IMPORT_DATABASE_STATS Procedure

This procedure imports statistics for all objects in the database from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force           BOOLEAN DEFAULT FALSE,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 186-73 IMPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	Specifies the statistics table that contains the statistics to be imported.
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	Overrides statistics locked at the object (table) level: <ul style="list-style-type: none"> TRUE - Ignores the statistics lock and imports the statistics FALSE - The statistics will be imported only if they are not locked
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics SYNOPSIS — information to support incremental statistics REALTIME_STATS — specifies only real-time statistics. The default value is 'OBJECT_STATS, SYNOPSIS, MODELS'.

Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.70 IMPORT_DICTIONARY_STATS Procedure

This procedure imports statistics for all data dictionary schemas (SYS, SYSTEM, and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
    statab          VARCHAR2,
    statid          VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                                                get_param('NO_INVALIDATE')),
    force           BOOLEAN DEFAULT FALSE,
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 186-74 IMPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
statab	User statistics table identifier describing from where to retrieve the statistics
statid	The (optional) identifier to associate with these statistics within statab
statown	Schema containing statab (if different from current schema)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 186-74 (Cont.) IMPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
<code>force</code>	<p>Overrides statistics lock at the object (table) level:</p> <ul style="list-style-type: none"> • <code>TRUE</code> - Ignores the statistics lock and imports the statistics. • <code>FALSE</code> - The statistics will be imported only if there is no lock.
<code>stat_category</code>	<p>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> • <code>OBJECT_STATS</code> — table statistics, column statistics and index statistics • <code>SYNOPSIS</code> — information to support incremental statistics • <code>REALTIME_STATS</code> — Specifies only real-time statistics. <p>The default value is <code>'OBJECT_STATS, SYNOPSIS, REALTIME_STATS'</code>.</p>

Security Model

You must have either the `SYSDBA` privilege or both the `ANALYZE ANY DICTIONARY` and `ANALYZE ANY SYSTEM` privileges.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.71 IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure imports statistics for fixed tables from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
    stattab          VARCHAR2,
    statid           VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN   DEFAULT to_no_invalidate_type(
                                                get_param('NO_INVALIDATE')),
    force           BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 186-75 IMPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	Overrides statistics lock: <ul style="list-style-type: none"> TRUE - Ignores the statistics lock and imports the statistics FALSE - The statistics will be imported only if there is no lock

Security Model

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.72 IMPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by stattab and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
```

```

statown      VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                get_param('NO_INVALIDATE')),
force        BOOLEAN DEFAULT FALSE);

```

Parameters

Table 186-76 IMPORT_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are imported.
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	Imports statistics even if index statistics are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.

186.7.73 IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (  
    ownname    IN  VARCHAR2,  
    stattab   IN  VARCHAR2,  
    statid    IN  VARCHAR2 DEFAULT NULL,  
    statown   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-77 IMPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

186.7.74 IMPORT_SCHEMA_STATS Procedure

This procedure imports statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (  
    ownname    VARCHAR2,  
    stattab   VARCHAR2,  
    statid    VARCHAR2 DEFAULT NULL,  
    statown   VARCHAR2 DEFAULT NULL,
```

```
no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(
                get_param('NO_INVALIDATE')),
force           BOOLEAN DEFAULT FALSE,
stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 186-78 IMPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
stattab	Identifies the user table that stores the statistics to be imported.
statid	Specifies the ID associated with these statistics within stattab.
statown	Specifies the schema containing stattab (if different than ownname).
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	Specifies whether to override statistics locked at the object level. The possible values are as follows: <ul style="list-style-type: none"> TRUE — Ignores the statistics lock and imports the statistics. FALSE — Imports the statistics only if there is no lock. This is the default.
stat_category	Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> OBJECT_STATS — specifies table statistics, column statistics, and index statistics SYNOPSIS — specifies metadata for incremental statistics REALTIME_STATS — specifies only real-time statistics <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p> <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS'.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.75 IMPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by `stattab`, and stores the statistics in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
    stattab      VARCHAR2,
    statid       VARCHAR2 DEFAULT NULL,
    statown      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-79 IMPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
<code>stattab</code>	Identifier of the user statistics table where the statistics will be retrieved
<code>statid</code>	Optional identifier associated with the statistics retrieved from the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to import system statistics

Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

Oracle does not support export or import of statistics across databases of different character sets.

186.7.76 IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (
    ownname      IN VARCHAR2,
```

```

tabname    IN  VARCHAR2,
stattab    IN  VARCHAR2,
statid     IN  VARCHAR2 DEFAULT NULL,
statown    IN  VARCHAR2 DEFAULT NULL);

```

Parameters

Table 186-80 IMPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

186.7.77 IMPORT_TABLE_STATS Procedure

This procedure import statistics for a specified table from the user statistics table identified by stattab and stores them in the data dictionary.

Syntax

```

DBMS_STATS.IMPORT_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  cascade          BOOLEAN  DEFAULT TRUE,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);

```

Parameters

Table 186-81 IMPORT_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
tabname	Specifies the name of the table.
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are imported.
stattab	Identifies the user statistics table that describes where to retrieve the statistics.
statid	Specifies the ID associated with these statistics within stattab.
cascade	Indicates whether to import column and index statistics for this table. The default is TRUE.
statown	Specifies the schema containing stattab (if different than ownname).
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure</p>
force	Specifies whether to override statistics locked at the object level. The possible values are as follows: <ul style="list-style-type: none"> TRUE — Ignores the statistics lock and imports the statistics. FALSE — Imports the statistics only if there is no lock. This is the default.
stat_category	Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> OBJECT_STATS — specifies table statistics, column statistics, and index statistics SYNOPSIS — specifies metadata for incremental statistics REALTIME_STATS — specifies only real-time statistics <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p> <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS'.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

186.7.78 INTERRUPT_ADVISOR_TASK Procedure

This procedure interrupts a currently executing Optimizer Statistics Advisor task.

The task ends its operations as it does when at a normal exit, at which point you can access intermediate results. You can also resume the task using the ["RESUME_ADVISOR_TASK Procedure"](#).

Syntax

```
DBMS_STATS.INTERRUPT_ADVISOR_TASK (  
    task_name IN VARCHAR2);
```

Parameters

Table 186-82 INTERRUPT_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 186-11 Interrupting an Optimizer Statistics Advisor Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE  
    v_tname VARCHAR2(128) := 'my_task';  
    v_ename VARCHAR2(128) := NULL;
```

```

BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/

```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```

EXEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');

```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```

ORA-13638: The user interrupted the current operation.

```

186.7.79 LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

```

DBMS_STATS.LOCK_PARTITION_STATS (
  ownname    VARCHAR2,
  tablename  VARCHAR2,
  partname   VARCHAR2);

```

Parameters

Table 186-83 LOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock
tablename	Name of the table
partname	[Sub]Partition name

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.80 LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (  
    ownname    VARCHAR2);
```

Parameters

Table 186-84 LOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

186.7.81 LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2);
```

Parameters

Table 186-85 LOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

186.7.82 MERGE_COL_USAGE Procedure

This procedure merges column usage information from a source database by means of a `dblink` into the local database.

If column usage information already exists for a given table or column `MERGE_COL_USAGE` will combine both the local and the remote information.

Syntax

```
DBMS_STATS.MERGE_COL_USAGE (
    dblink    IN    VARCHAR2);
```

Parameters

Table 186-86 MERGE_COL_USAGE Procedure Parameters

Parameter	Description
<code>dblink</code>	Name of <code>dblink</code>

Usage Notes

User must be `SYS` to execute this procedure. In addition, the user specified during the creation of the `dblink` is expected to have privileges to select from tables in the `SYS` schema.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Parameter `dblink` cannot be `NULL`

ORA-20002: Unable to create a `TEMP` table

186.7.83 PREPARE_COLUMN_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using `SET_COLUMN_STATS`.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    charvals  CHARARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    datevals  DATEARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    dblvals   DBLARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
```

```

srec      IN OUT StatRec,
fltvals   FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
srec      IN OUT StatRec,
numvals   NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
srec      IN OUT StatRec,
rawvals   RAWARRAY);

```

Parameters

Table 186-87 PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
srec.epc	<p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p>
srec.bkvals	<p>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</p>
srec.rpcnts	<p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> • Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above. • Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.

Datatype-specific input parameters (use one) are shown in [Table 186-88](#).

Table 186-88 Datatype-Specific Input Parameters

Type	Description
charvals	The array of values when the column type is character-based. Up to the first 64 bytes of each string should be provided. Arrays must have between 2 and 2050 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
datevals	Array of values when the column type is date-based
dblvals	Array of values when the column type is double-based
fltvals	Array of values when the column type is float-based
numvals	Array of values when the column type is numeric-based
rawvals	Array of values when the column type is RAW. Up to the first 64 bytes of each value should be provided.
nvmin, nvmax	Minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
rwmin, rwmax	Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

Output Parameters

Table 186-89 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS
srec.eavals	Array suitable for use in a call to SET_COLUMN_STATS
srec.rpcnts	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

186.7.84 PREPARE_COLUMN_VALUES_NVARCHAR Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR (
  srec      IN OUT StatRec,
  nvmin     NVARCHAR2,
  nvmax     NVARCHAR2);
```

Parameters

Table 186-90 PREPARE_COLUMN_VALUES_NVARCHAR Procedure Parameters

Parameter	Description
srec.epc	<p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p>
srec.bkvals	<p>If you want a frequency or hybrid histogram, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</p>
srec.rpcnts	<p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above. Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.

Datatype-specific input parameters (use one) are shown in [Table 186-88](#).

Table 186-91 PREPARE_COLUMN_VALUES_NVARCHAR Datatype-Specific Input Parameters

Type	Description
nvmin, nvmax	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.

Output Parameters

Table 186-92 PREPARE_COLUMN_VALUES_NVARCHAR Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS.
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS
srec.eavals	Array suitable for use in a call to SET_COLUMN_STATS
srec.rpcnts	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

This procedure sets column-related information.

186.7.85 PREPARE_COLUMN_VALUES_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
    srec IN OUT StatRec,
    rwmn ROWID,
    rwmx ROWID);
```

Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 186-93 PREPARE_COLUMN_VALUES_ROWID Procedure Parameters

Parameter	Description
srec	<p>Values (IN):</p> <ul style="list-style-type: none"> • epc • bkvals • rpcnts <p>Values (OUT):</p> <ul style="list-style-type: none"> • minval • maxval • bkvals • novals • eavals • rpcnts
rwmin	Minimum value when the column type is <code>rowid</code> . No histogram information is provided for a column of this type.
rwmax	Maximum value when the column type is <code>rowid</code> . No histogram information is provided for a column of this type.

Table 186-94 StatRec Record Type Fields

Field	Description
epc (IN)	<p>Number of values specified in <code>charvals</code>, <code>datevals</code>, <code>dblvals</code>, <code>fltvals</code>, <code>numvals</code>, or <code>rawvals</code>. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (<code>nvarchar</code> and <code>rowid</code>).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to <code>SET_COLUMN_STATS</code>.</p>
bkvals (IN)	<p>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in <code>charvals</code>, <code>datevals</code>, <code>dblvals</code>, <code>fltvals</code>, <code>numvals</code>, or <code>rawvals</code>. Otherwise, it is merely an output parameter, and it must be set to <code>NULL</code> when this procedure is called.</p>

Table 186-94 (Cont.) StatRec Record Type Fields

Field	Description
rpents (IN)	<p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpents(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> • Whenever srec.rpents is populated, srec.bkvals must be populated as described above. • Whenever bkvals and/or rpents are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.
minval (OUT)	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.
maxval (OUT)	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS.
bkvals (OUT)	Array suitable for use in a call to SET_COLUMN_STATS.
novals (OUT)	Array suitable for use in a call to SET_COLUMN_STATS.
eavals (OUT)	Array suitable for use in a call to SET_COLUMN_STATS.
rpents (OUT)	Array suitable for use in a call to SET_COLUMN_STATS.

Usage Notes

No special privilege or role is needed to invoke this procedure.

186.7.86 PUBLISH_PENDING_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.PUBLISH_PENDING_STATS (
    ownname          IN  VARCHAR2 DEFAULT USER,
    tabname          IN  VARCHAR2,
    no_invalidate    BOOLEAN DEFAULT
        TO_NO_INVALIDATE_TYPE(GET_PARAM('NO_INVALIDATE')),
    force            IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 186-95 PUBLISH_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name

Table 186-95 (Cont.) PUBLISH_PENDING_STATS Procedure Parameters

Parameter	Description
tablename	Table name
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	If TRUE, will override the lock

Security Model

To run this procedure, you must have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter `tablename` is NULL then `publish` applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.

Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

186.7.87 PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary.

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

Syntax

```
DBMS_STATS.PURGE_STATS(
    before_timestamp    TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 186-96 PURGE_STATS Procedure Parameters

Parameter	Description
before_timestamp	Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

186.7.88 REMAP_STAT_TABLE Procedure

This procedure remaps the names of objects in the user statistics table. It allows you to import the statistics to objects with same definition but with different names.

Syntax

```
DBMS_STATS.REMAP_STAT_TABLE (
  ownname      IN   VARCHAR2,
  statab       IN   VARCHAR2,
  src_own      IN   VARCHAR2,
  src_tab      IN   VARCHAR2,
  tgt_own      IN   VARCHAR2,
  tgt_tab      IN   VARCHAR2);
```

Parameters

Table 186-97 REMAP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Owner of the statistics table. NULL means the current schema.
statab	User statistics table identifier
src_own	Owner of the table to be renamed. This argument cannot be NULL.
src_tab	Name of the table to be renamed. If NULL, all tables are owned by src_own.

Table 186-97 (Cont.) REMAP_STAT_TABLE Procedure Parameters

Parameter	Description
tgt_own	New name of the owner of the table. The owner name is also updated for the dependent objects such as columns and indexes. Note that an index of src_tab not owned by src_own is not renamed. This argument cannot be NULL.
tgt_tab	New name of the table. This argument is valid only if src_tab is not NULL.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid input

Examples

The following statement remaps all objects of sh to shsave in user statistics table sh.ustat:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', NULL, 'shsave', NULL);
```

The following statement can be used to import statistics into objects of shsave once the preceding remap procedure is completed:

```
DBMS_STATS.IMPORT_SCHEMA_STATS ('shsave', 'ustat', statown => 'sh');
```

The following statement remaps sh.customers to shsave.customers_sav:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', 'customers', 'shsave', 'customers_sav');
```

186.7.89 REPORT_ADVISOR_TASK Function

This function reports the results of an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.REPORT_ADVISOR_TASK(
  task_name      IN   VARCHAR2,
  execution_name IN   VARCHAR2  := NULL,
  type           IN   VARCHAR2  := 'TEXT',
  section        IN   VARCHAR2  := 'ALL',
  level          IN   VARCHAR2  := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 186-98 REPORT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Table 186-98 (Cont.) REPORT_ADVISOR_TASK Function Parameters

Parameter	Description
execution_name	A name that qualifies and identifies an advisor task execution. If not specified, the function uses the latest execution of the specified task.
type	The type of the Optimizer Statistics Advisor report. Possible values are TEXT, HTML, and XML.
section	A section in the report. Possible values are SUMMARY, FINDINGS, ERRORS, and ALL. You can specify combinations of different values can be using the plus (+) and minus (-) operator, as in 'SUMMARY +FINDINGS +ERRORS', and 'ALL -ERRORS'.
level	The format of the report. Possible values are BASIC, TYPICAL, ALL, and SHOW_HIDDEN. You can specify SHOW_HIDDEN together with the other three input values, as in 'BASIC +SHOW_HIDDEN' and 'TYPICAL +SHOW_HIDDEN'.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- **SYSTEM level**
Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.
- **Operation level**
The results depend on the following privileges:
 - Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
 - Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
 - Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
 - Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- **Object level**

Users can perform this task for any object for which they have statistics collection privileges.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: User input errors
- ORA-20012: Optimizer Statistics Advisor errors

Returns

This function returns a CLOB that contains the report.

Examples

(Optional) List and briefly describe the examples for using the API or subprogram here.

Example 186-12 Generating an HTML Report

This example creates a procedure named `myrep`, and then calls this procedure to generate an HTML report.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_ftype VARCHAR2, which
VARCHAR2)
IS
  v_report CLOB          := null;
  v_script CLOB          := null;
  v_ftype  VARCHAR2(400) := p_ftype;
  v_tname  VARCHAR2(400) := p_tname;
  v_len    NUMBER(10);
  v_ps    NUMBER(10) := 10000;
  v_pn    NUMBER(10) := 1;
  v_ret   VARCHAR2(32767);
BEGIN
  IF which = 'REPORT'
  THEN
    -- generate a report
    v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
      task_name => v_tname,
      type      => v_ftype,
      section   => 'ALL',
      level     => 'ALL');
    v_len := DBMS_LOB.getlength(v_report);
    WHILE (v_pn < v_len)
    LOOP
      DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
      v_pn := v_pn + v_ps;
    END LOOP;
  END IF;
END;
```

```

        END LOOP;
    ELSE
        -- generate a script
        v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
        v_len := DBMS_LOB.getlength(v_script);
        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR( v_script, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task','HTML','REPORT');
SPOOL OFF

```

Example 186-13 Generating a Textual Report for AUTO_STATS_ADVISOR_TASK

The following example invokes the `myrep` procedure created in the preceding example for `AUTO_STATS_ADVISOR_TASK`:

```
EXEC myrep('AUTO_STATS_ADVISOR_TASK','TEXT','REPORT');
```

The following sample output shows part of the report:

```

GENERAL INFORMATION
-----
Task Name       : AUTO_STATS_ADVISOR_TASK
Execution Name  : EXEC_97
Created         : 07-08-16 10:18:10
Last Modified   : 07-11-16 03:02:30
-----

SUMMARY
-----

For execution EXEC_97 of task AUTO_STATS_ADVISOR_TASK, the Statistics
Advisor
has 10 finding(s). The findings are related to the following rules:
COMPLETEAUTOJOB, MAINTAINSTATSHISTORY, USEDEFAULTPREFERENCE,
AVOIDSETPROCEDURES, USEDEFAULTPARAMS, USEGATHERSCHEMASTATS,
AVOIDSTALESTATS,
UNLOCKNONVOLATILETABLE, USEINCREMENTAL, AVOIDANALYZETABLE. Please
refer to the
finding section for detailed information.
-----

```

```

-----
FINDINGS
-----
--
Rule Name:          MaintainStatsHistory
Rule Description:   Maintain Statistics History

Finding:  Statistics history tables are too big.

Recommendation:  Check the other findings of this rule, as well as
the
                findings for the rules
AvoidFrequentStatsCollection,
                UseDefaultPreference, UseDefaultParams for possible
causes
                and
recommendations.
Rationale:  The size of the statistics history table could be big because
of
                violations of other rules.

-----

Rule Name:          UseDefaultPreference
Rule Description:   Use Default Preference for Stats Collection
Finding:  Global preference SYS_FLAGS is set to a non-default value '1'.

Recommendation:  Set the value of preference SYS_FLAGS to '0'.
Example:
-- Setting preference cascade to default value:
dbms_stats.set_global_prefs('CASCADE', NULL);

Rationale:  Preference SYS_FLAGS is for Oracle internal use only, setting
it
                to nondefault value '1' could cause unforeseen consequences.
.
.
.

```

186.7.90 REPORT_COL_USAGE Function

This function reports the recorded column (group) usage information.

Syntax

```

DBMS_STATS.REPORT_COL_USAGE (
    ownname   IN   VARCHAR2,
    tablename IN   VARCHAR2)
RETURN CLOB;

```

Parameters

Table 186-99 REPORT_COL_USAGE Function Parameters

Parameter	Description
ownname	Owner name. If NULL it reports column usage information for tables in all schemas in the database.
tablename	Table name. If NULL it reports column usage information for all tables of ownname.

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

186.7.91 REPORT_GATHER_AUTO_STATS Function

This function runs the auto statistics gathering job in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when auto statistics gathering is invoked are reported.

Syntax

```
DBMS_STATS.REPORT_GATHER_AUTO_STATS (  
    detail_level    VARCHAR2  DEFAULT 'TYPICAL',  
    format         VARCHAR2  DEFAULT 'TEXT')  
RETURN CLOB;
```

Parameters

Table 186-100 REPORT_GATHER_AUTO_STATS Function Parameters

Parameter	Description
detail_level	<p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - reason for including the object in the target list - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p>

Table 186-100 (Cont.) REPORT_GATHER_AUTO_STATS Function Parameters

Parameter	Description
format	Report format: <ul style="list-style-type: none"> • XML • HTML • TEXT (Default)

Usage Notes

Only user SYS can run the REPORT_GATHER_AUTO_STATS function.

186.7.92 REPORT_GATHER_DATABASE_STATS Functions

This function runs the GATHER_DATABASE_STATS function in reporting mode.

The database does not collect statistics, but reports all objects that would be affected when invoking GATHER_DATABASE_STATS. The input set of parameters is the same as in GATHER_DATABASE_STATS, with two extra parameters.

Syntax

```

DBMS_STATS.REPORT_GATHER_DATABASE_STATS (
    estimate_percent      IN      NUMBER      DEFAULT
to_estimate_percent_type (
    GET_PARAM('ESTIMATE_PERCENT')),
    block_sample         IN      BOOLEAN     DEFAULT FALSE,
    method_opt          IN      VARCHAR2    DEFAULT
    GET_PARAM('METHOD_OPT'),
    degree              IN      NUMBER      DEFAULT TO_DEGREE_TYPE(
        GET_PARAM('DEGREE')),
    granularity         IN      VARCHAR2    DEFAULT
    GET_PARAM('GRANULARITY'),
    cascade             IN      BOOLEAN     DEFAULT to_cascade_type (
        GET_PARAM('CASCADE')),
    statab              IN      VARCHAR2    DEFAULT NULL,
    statid              IN      VARCHAR2    DEFAULT NULL,
    options             IN      VARCHAR2    DEFAULT 'GATHER',
    statown             IN      VARCHAR2    DEFAULT NULL,
    gather_sys          IN      BOOLEAN     DEFAULT TRUE,
    no_invalidate       IN      BOOLEAN     DEFAULT TO_NO_INVALIDATE_TYPE
(
    GET_PARAM('NO_INVALIDATE')),
    gather_temp         IN      BOOLEAN     DEFAULT FALSE,
    gather_fixed        IN      BOOLEAN     DEFAULT FALSE,
    stattype            IN      VARCHAR2    DEFAULT DATA,
    obj_filter_list     IN      ObjectTab   DEFAULT NULL,
    detail_level        IN      VARCHAR2    DEFAULT 'TYPICAL',
    format              IN      VARCHAR2    DEFAULT 'TEXT')
RETURN CLOB;

```

Parameters

Table 186-101 REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
estimate_percent	<p>The percentage of rows to use for the sample size. The valid range is between 0.000001 and 100. The null value means to compute.</p> <p>Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
block_sample	<p>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p>
method_opt	<p>Method options. This parameter accepts the following values: <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code>.</p> <p><code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code></p> <ul style="list-style-type: none"> - <code>integer</code>: Number of histogram buckets. Must be in the range [1,2048]. - <code>REPEAT</code>: Collects histograms only on the columns that already have histograms. - <code>AUTO</code>: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - <code>SKEWONLY</code>: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
degree	<p>Degree of parallelism. The default for <code>degree</code> is <code>NULL</code>. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code>, <code>DEGREE=>n</code>, or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.</p>

Table 186-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
granularity	<p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
cascade	<p>Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics.</p> <p>The database assumes that the statistics table resides in the same schema as the object being analyzed. Thus, to use this option, one such table must exist in each schema.</p>
statid	<p>Identifier (optional) to associate with these statistics within <code>stattab</code>.</p>

Table 186-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
options	<p>Further specification of which objects to gather statistics for:</p> <p>GATHER: Gathers statistics on all objects in the schema.</p> <p>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are <code>stattab</code>, <code>statid</code>, <code>objlist</code> and <code>statown</code>; all other parameter settings are ignored. Returns a list of processed objects.</p> <p>GATHER STALE: Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, return a list of objects found to be stale.</p> <p>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics.</p> <p>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO</p> <p>LIST STALE: Returns a list of stale objects as determined by looking at the <code>*_tab_modifications</code> views</p> <p>LIST EMPTY: Returns a list of objects which currently have no statistics</p>
statown	Schema containing <code>stattab</code> , if different from current schema.
gather_sys	Gathers statistics on the objects owned by the <code>SYS</code> user.
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> . to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
gather_temp	<p>Gathers statistics on global temporary tables when <code>TRUE</code>. The default is <code>FALSE</code>.</p> <p>The temporary table must be created with the <code>ON COMMIT PRESERVE ROWS</code> clause. Also, the statistics collected are based on the data in the session in which this procedure is run, but they are shared across all sessions.</p>
gather_fixed	<p>Gather statistics on fixed tables when <code>TRUE</code>. The default is <code>FALSE</code>.</p> <p>Only user <code>SYS</code> can collect statistics for fixed tables. The <code>ownname</code> must be <code>SYS</code> or null. When gathering statistics for fixed tables, the database ignores specified values for the following arguments:</p> <ul style="list-style-type: none"> • <code>estimate_percent</code> • <code>block_sample</code> • <code>stattab</code> • <code>statid</code> • <code>statown</code> <p>The database does not invalidate the dependent cursors on fixed tables on which stats is collected. This option is meant for internal use only.</p>

Table 186-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
stattype	<p>The type of statistics:</p> <ul style="list-style-type: none"> • DATA — Data statistics only • CACHE — Cache statistics only • ALL — All statistics
obj_filter_list	<p>A list of object filters. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcards are allowed in the attribute values.</p> <p>When specified, GATHER_DATABASE_STATS gathers statistics only on objects that satisfy at least one object filter in the list as needed. In a single-object filter, the database can specify the constraints on the object attributes. For example, non-NULL values s1 and s2 are specified for attributes a1 and a2 in one object filter. An object o is said to satisfy this object filter when (o.a1 LIKE s1) AND (o.a2 LIKE s2) is true.</p>

Table 186-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
detail_level	<p>The level of detail for the content of the report. Valid values are as follows:</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p>

Table 186-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
format	The format of the report. Valid values are: <ul style="list-style-type: none"> XML HTML TEXT (Default)

Return Values

A CLOB object that contains the report

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

186.7.93 REPORT_GATHER_DICTIONARY_STATS Functions

This function runs the GATHER_DICTIONARY_STATS procedure in reporting mode.

The database does not collect statistics, but reports all objects affected when invoking GATHER_DICTIONARY_STATS. The detail level for the report is defined by the detail_level input parameter. See the descriptions of detail_level and format in [REPORT_GATHER_DICTIONARY_STATS Functions](#). For all other input parameters, see [GATHER_DICTIONARY_STATS Procedure](#).

Syntax

```
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (
  comp_id          IN   VARCHAR2  DEFAULT NULL,
  estimate_percent IN   NUMBER     DEFAULT
TO_ESTIMATE_PERCENT_TYPE

  (GET_PARAM('ESTIMATE_PERCENT')),
  block_sample    IN   BOOLEAN    DEFAULT FALSE,
  method_opt      IN   VARCHAR2   DEFAULT
GET_PARAM('METHOD_OPT'),
  degree          IN   NUMBER     DEFAULT TO_DEGREE_TYPE
                                (GET_PARAM('DEGREE')),
  granularity     IN   VARCHAR2   DEFAULT
GET_PARAM('GRANULARITY'),
  cascade         IN   BOOLEAN    DEFAULT TO_CASCADE_TYPE
                                (GET_PARAM('CASCADE')),
  stattab         IN   VARCHAR2   DEFAULT NULL,
  options         IN   VARCHAR2   DEFAULT 'GATHER AUTO',
  no_invalidate   IN   BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE
```

```

                                (GET_PARAM('NO_INVALIDATE')),
stattype                       IN    VARCHAR2    DEFAULT 'DATA',
obj_filter_list                 IN    ObjectTab    DEFAULT NULL,
detail_level                    IN    VARCHAR2    DEFAULT 'TYPICAL',
format                          IN    VARCHAR2    DEFAULT 'TEXT')
RETURN CLOB;

```

Parameters

Table 186-102 REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
comp_id	Component ID of the schema to analyze. NULL results in analyzing schemas of all RDBMS components. Refer refer to the COMP_ID column of the DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.
estimate_percent	Percentage of rows to sample (NULL means compute). The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to let the database determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Determines whether to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	<p>The method options. This parameter accepts the following values:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY} <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms. - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 186-102 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
degree	<p>Degree of parallelism. The default for <code>degree</code> is <code>NULL</code>. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement.</p> <p>Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code>, <code>DEGREE=>n</code>, or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.</p>
granularity	<p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • <code>ALL</code> — Gathers all statistics: subpartition, partition, and global. • <code>AUTO</code> — Determines the granularity based on the partitioning type. This is the default value. • <code>DEFAULT</code> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <code>GLOBAL AND PARTITION</code> for this functionality. • <code>GLOBAL</code> — Gathers global statistics. • <code>GLOBAL AND PARTITION</code> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • <code>PARTITION</code> — Gathers partition-level statistics. • <code>SUBPARTITION</code> — Gathers subpartition-level statistics.
cascade	<p>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics.</p>

Table 186-102 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
options	<p>Further specification of objects for which to gather statistics:</p> <ul style="list-style-type: none"> 'GATHER' - Gathers statistics on all objects in the schema 'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are <code>comp_id</code>, <code>stattab</code>, <code>statid</code> and <code>statown</code>; all other parameter settings will be ignored. Also, returns a list of objects processed. 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, returns a list of objects found to be stale. 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics. 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO' 'LIST STALE' - Returns list of stale objects as determined by looking at the <code>*_tab_modifications</code> views 'LIST EMPTY' - Returns list of objects which currently have no statistics
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattype	<p>The type of statistics:</p> <ul style="list-style-type: none"> DATA — Data statistics only CACHE — Cache statistics only ALL — All statistics
obj_filter_list	<p>A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code>, <code>s2</code>, ... are specified for attributes <code>a1</code>, <code>a2</code>, ... in one object filter. An object <code>o</code> is said to satisfy this object filter if (<code>o.a1 like s1</code>) and (<code>o.a2 like s2</code>) and ... is true.</p>
detail_level	<p>See the description in REPORT_GATHER_DICTIONARY_STATS Functions.</p>
format	<p>See the description in REPORT_GATHER_DICTIONARY_STATS Functions.</p>

Return Values

A CLOB object that contains the report

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

186.7.94 REPORT_GATHER_FIXED_OBJ_STATS Function

This function runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when GATHER_FIXED_OBJ_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER_FIXED_OBJ_STATS with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_FIXED_OBJ_STATS (
  statab          IN  VARCHAR2 DEFAULT NULL,
  statid          IN  VARCHAR2 DEFAULT NULL,
  statown         IN  VARCHAR2 DEFAULT NULL,
  no_invalidate  IN  BOOLEAN  DEFAULT TO_NO_INVALIDATE_TYPE (
                                GET_PARAM('NO_INVALIDATE')),
  detail_level   IN  VARCHAR2  DEFAULT 'TYPICAL',
  format         IN  VARCHAR2  DEFAULT 'TEXT')
RETURN CLOB;
```

Parameters

```

Parameters

Table 186-104 REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	<p>Accepts:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY} <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 186-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab

Table 186-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
options	<p>Further specification of which objects to gather statistics for:</p> <p>GATHER: Gathers statistics on all objects in the schema.</p> <p>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, statab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects.</p> <p>GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale.</p> <p>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics.</p> <p>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO.</p> <p>LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views.</p> <p>LIST EMPTY: Returns list of objects which currently have no statistics.</p>
objlist	List of objects found to be stale or empty
statown	Schema containing statab (if different than ownname)
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	Gather statistics on objects even if they are locked
obj_filter_list	<p>A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.</p>

Table 186-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
detail_level	<p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p>

Table 186-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
format	Report format: <ul style="list-style-type: none"> • XML • HTML • TEXT (Default)

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the `SAMPLE` schema or any table in the `HR` schema, if stale, will have statistics gathered upon it.

```

DECLARE
  filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
  filter_lst.extend(2);
  filter_lst(1).ownname := 'SAMPLE';
  filter_lst(1).objname := 'T%';
  filter_lst(2).ownname := 'HR';
  DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
    options => 'GATHER STALE');
END;
```

186.7.96 REPORT_GATHER_TABLE_STATS Function

This procedure runs the `GATHER_TABLE_STATS` Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when `GATHER_TABLE_STATS` is invoked are reported.

Syntax

```

DBMS_STATS.REPORT_GATHER_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
    (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
```

```

degree          NUMBER  DEFAULT to_degree_type(get_param('DEGREE')),
granularity     VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
cascade        BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
stattab        VARCHAR2 DEFAULT NULL,
statid         VARCHAR2 DEFAULT NULL,
statown        VARCHAR2 DEFAULT NULL,
no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                    get_param('NO_INVALIDATE')),
stattype       VARCHAR2 DEFAULT 'DATA',
force          BOOLEAN  DEFAULT FALSE)
detail_level   VARCHAR2 DEFAULT 'TYPICAL',  format          VARCHAR2 DEFAULT
'TEXT')
RETURN CLOB;

```

Parameters

Table 186-105 REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
ownname	Schema of table to analyze
tablename	Name of table
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 186-105 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
method_opt	<p>Accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] • FOR COLUMNS [column_clause] [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column_clause is defined as column_clause := column_name extension name extension</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name : Name of a column - extension : can be either a column group in the format of (column_name, Colum_e_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
degree	<p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p>

Table 186-105 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if <code>partname</code> is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>
cascade	<p>Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table's indexes. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within <code>stattab</code>
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattype	Statistics type. The only value allowed is <code>DATA</code> .
force	Gather statistics of table even if it is locked

Table 186-105 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
detail_level	<p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p>
format	<p>Report format:</p> <ul style="list-style-type: none"> • XML • HTML • TEXT (Default)

Return Values

A CLOB object that contains the report

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Related Topics

- [GATHER_TABLE_STATS Procedure](#)
This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

186.7.97 REPORT_SINGLE_STATS_OPERATION Function

This function generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment.

Note:

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_STATS.REPORT_SINGLE_STATS_OPERATIONS (
  opid          NUMBER,
  detail_level  VARCHAR2  DEFAULT 'TYPICAL',
  format        VARCHAR2  DEFAULT 'TEXT'
  container_id  NUMBER    DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 186-106 REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
opid	Operation ID

Table 186-106 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
detail_level	<p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - reason for including the object in the target list (applies to only automatic statistics gathering operation tasks) - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p>

Table 186-106 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
format	Report format: <ul style="list-style-type: none"> • XML • HTML • TEXT (Default)
container_id	ID of the pluggable database (PDB) on which this operation was performed. Note that in a multitenant environment, operation ID does not uniquely identify an operation. That is, different operations from distinct PDBs may have the same operation ID. Hence, in a multitenant environment, if a PDB ID is not provided, then the report may contain multiple operations. In a typical (non-CDB) database environment, operation ID is unique to each operation.

Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

186.7.98 REPORT_STATS_OPERATIONS Function

This function generates a report of all statistics operations that take place between two timestamps which may or may not have been provided.

It allows the scope of the report to be narrowed down so that report will include only auto statistics gathering runs. Furthermore, in a multitenant environment, users may optionally provide a set of pluggable database (PDB) IDs so that only statistics operations from the specified pluggable databases will be reported.

Syntax

```
DBMS_STATS.REPORT_STATS_OPERATIONS (
  detail_level      VARCHAR2 DEFAULT 'TYPICAL',
  format            VARCHAR2 DEFAULT 'TEXT',
  latestN           NUMBER DEFAULT NULL,
  since             TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  until             TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  auto_only         BOOLEAN DEFAULT FALSE,
  container_ids     DBMS_UTILITY.NUMBER_ARRAY DEFAULT DBMS_STATS.NULL_NUMTAB)
RETURN CLOB;
```

Parameters

Table 186-107 REPORT_STATS_OPERATIONS Function Parameters

Parameter	Description
detail_level	<p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed -out objects (applies to only auto statistics gathering) • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name (if the operation was run in a job) - session ID - parameter values - additional error details if the operation has failed
format	<p>Report format:</p> <ul style="list-style-type: none"> • XML • HTML • TEXT (Default)
latestN	<p>Restricts the report to contain only the latest N operations that took place between the provided time points (since and until). The default value is NULL, meaning that all qualifying operations will be reported.</p>
since	<p>The report will include only statistics operations that started after this timestamp.</p>
until	<p>The report will include only statistics operations that before after this timestamp.</p>
auto_only	<p>When TRUE, the report will contain only auto statistics gathering job runs.</p>
container_ids	<p>A multitenant environment contains one or more pluggable databases (PDBs). <code>container_ids</code> represents a set of PDB IDs so that only statistics operations from the specified PDBs are reported (applies to only multitenant environments).</p>

Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

Examples

Note that the type for `container_ids` input parameter is `DBMS_UTILITY.NUMBER_ARRAY` which is an associative PL/SQL array collection. Although associative array type allows for more flexible `harvals` table-like organization of entries, this function treats `container_ids` as a regular table collection with the first ID located at index 1 and the last id located at index `container_ids.count` without any empty array slot left between any two IDs. An example for 3 container ids is provided.

```
DECLARE
    conid_tab DBMS_UTILITY.NUMBER_ARRAY;
    report clob;
BEGIN
    conid_tab(1) := 124;
    conid_tab(2) := 63;
    conid_tab(3) := 98;
    report := DBMS_STATS.REPORT_STATS_OPERATIONS (container_ids => conid_tab);
END;
```

186.7.99 RESET_ADVISOR_TASK Procedure

This procedure resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing.

Syntax

```
DBMS_STATS.RESET_ADVISOR_TASK (
    task_name IN VARCHAR2);
```

Parameters

Table 186-108 RESET_ADVISOR_TASK Procedure Parameters

Parameter	Description
<code>task_name</code>	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values

- ORA-20012: Optimizer Statistics Advisor errors

186.7.100 RESET_COL_USAGE Procedure

This procedure deletes the recorded column (group) usage information.

This procedure should only be used in very rare cases when the seed column usage needs to be initialized.

Syntax

```
DBMS_STATS.RESET_COL_USAGE (
  ownname   IN   VARCHAR2,
  tablename IN   VARCHAR2);
```

Parameters

Table 186-109 RESET_COL_USAGE Procedure Parameters

Parameter	Description
ownname	Owner name. If NULL it deletes column usage information for tables in all schemas in the database.
tablename	Table name. If NULL it deletes column usage information for all tables of ownname. If both the owner and tablename is NULL, the seed column usage is stopped if applicable. See :SEED_COL_USAGE Procedure for more information.

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege, or both the ANALYZE ANY DICTIONARY and the ANALYZE ANY system privileges.

186.7.101 RESET_GLOBAL_PREF_DEFAULTS Procedure

This procedure sets global preference, such as CASCADE, ESTIMATE_PERCENT and GRANULARITY, to default values.

This reverses the global preferences set by the [SET_GLOBAL_PREFS Procedure](#).

Syntax

```
DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
```

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

186.7.102 RESET_PARAM_DEFAULTS Procedure

This deprecated procedure resets the default values of all parameters to Oracle recommended values.

Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. Instead of this procedure, use the [RESET_GLOBAL_PREF_DEFAULTS Procedure](#).

See also . [DBMS_STATS Deprecated Subprograms](#)

Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

186.7.103 RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DATABASE_STATS (
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,
  force                BOOLEAN DEFAULT FALSE,
  no_invalidate        BOOLEAN DEFAULT to_no_invalidate_type
                      (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 186-110 RESTORE_DATABASE_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

186.7.104 RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS (
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,
  force                BOOLEAN DEFAULT FALSE,
  no_invalidate       BOOLEAN DEFAULT to_no_invalidate_type
  (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 186-111 RESTORE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
<code>as_of_timestamp</code>	Timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

186.7.105 RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(  
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,  
  force                BOOLEAN DEFAULT FALSE,  
  no_invalidate        BOOLEAN DEFAULT to_no_invalidate_type  
                                     (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 186-112 RESTORE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> • <code>TRUE</code>: Dependent cursors are not invalidated. • <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. • <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .

Usage Notes

To run this procedure, you must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

186.7.106 RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(  
  ownname              VARCHAR2,
```

```

as_of_timestamp    TIMESTAMP WITH TIME ZONE,
force              BOOLEAN DEFAULT FALSE,
no_invalidate     BOOLEAN DEFAULT to_no_invalidate_type

(GET_PARAM('NO_INVALIDATE')));

```

Parameters

Table 186-113 RESTORE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema of the tables for which the statistics are to be restored
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.107 RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (`as_of_timestamp`).

Syntax

```

DBMS_STATS.RESTORE_SCHEMA_STATS (
    as_of_timestamp    TIMESTAMP WITH TIME ZONE);

```

Parameters

Table 186-114 RESTORE_SYSTEM_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

186.7.108 RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). It also restores statistics of associated indexes and columns.

If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  as_of_timestamp  TIMESTAMP WITH TIME ZONE,
  restore_cluster_index  BOOLEAN DEFAULT FALSE,
  force            BOOLEAN DEFAULT FALSE,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 186-115 RESTORE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The schema of the table for which the statistics are to be restored
tablename	The table name
as_of_timestamp	The timestamp to which to restore statistics
restore_cluster_index	If the table is part of a cluster, restore statistics of the cluster index if set to TRUE
force	Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.

Table 186-115 (Cont.) RESTORE_TABLE_STATS Procedure Parameters

Parameter	Description
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.109 RESUME_ADVISOR_TASK Procedure

This procedure resumes an interrupted task. It only resumes the execution that was most recently interrupted.

Syntax

```
DBMS_STATS.RESUME_ADVISOR_TASK (
    task_name IN VARCHAR2);
```

Parameters

Table 186-116 RESUME_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.

- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 186-14 Resuming an Interrupted Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
  v_ename  VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

In the second SQL*Plus session, you resume the task execution as follows:

```
XEC DBMS_STATS.RESUME_ADVISOR_TASK('my_task');
```

186.7.110 SCRIPT_ADVISOR_TASK Function

Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor.

The generated script contains PL/SQL statements that you can choose to execute. Preceding the commands for each action are comments that list the potential side effects. You can review the comments, and choose to execute only the desired sections.

Syntax

```
DBMS_STATS.SCRIPT_ADVISOR_TASK (
  task_name      IN   VARCHAR2,
  execution_name IN   VARCHAR2  := NULL,
  dir_name       IN   VARCHAR2  := NULL,
  level         IN   VARCHAR2  := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 186-117 SCRIPT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
execution_name	A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.
dir_name	Directory name to which to write the generated script. If the name is not specified (NULL), then the function includes the script in the returned CLOB. If the name is specified, then the function returns the script as a CLOB and as a new file in the specified directory.
level	The level of the script to generate. Possible values are <ul style="list-style-type: none"> ALL: Ignores the filter and generates a script for all findings TYPICAL: Generates a script according to the filters in place

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- SYSTEM level**
Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- Operation level**

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.

- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- Object level
Users can perform this task for any object for which they have statistics collection privileges.

Return Values

This function returns a CLOB that contains the script.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 186-15 Creating an Optimizer Statistics Advisor Script

This example creates a procedure named `myrep`, and then calls this procedure to print the script the implements the recommendations.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_fotype VARCHAR2, which
VARCHAR2)
IS
  v_report CLOB          := null;
  v_script CLOB          := null;
  v_fotype VARCHAR2(400) := p_fotype;
  v_tname  VARCHAR2(400) := p_tname;
  v_len    NUMBER(10);
  v_ps     NUMBER(10)    := 10000;
  v_pn     NUMBER(10)    := 1;
  v_ret    VARCHAR2(32767);
BEGIN
  IF which = 'REPORT'
  THEN
    -- generate a report
    v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
      task_name => v_tname,
      type      => v_fotype,
      section   => 'ALL',
      level     => 'ALL');
    v_len := DBMS_LOB.getlength(v_report);
```

```
        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    ELSE
        -- generate a script
        v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
        v_len := DBMS_LOB.getlength(v_script);
        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_script, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task','-','SCRIPT');
SPOOL OFF
```

Oracle Database SQL Tuning Guide

186.7.111 SEED_COL_USAGE Procedure

This procedure seeds column usage information from a statements in the specified SQL tuning set, or in the database.

The procedure iterates over the SQL statements, compiles them, and then seeds column usage information for the columns that appear in these statements. You can monitor the workload on the system for given amount of time and seed the and seed the column usage information based on the columns that appear in statements executed during the monitoring window.

Syntax

```
DBMS_STATS.SEED_COL_USAGE (
    sqlset_name    IN    VARCHAR2,
    owner_name     IN    VARCHAR2,
    time_limit     IN    POSITIVE DEFAULT NULL);
```

Parameters

Table 186-118 SEED_COL_USAGE Procedure Parameters

Parameter	Description
sqlset_name	Name of the SQL tuning set that contains the statements to be monitored. If this parameter and owner_name are both null, then the procedure monitors all statements in the database for the specified time limit.
owner_name	Owner of the SQL tuning set that contains the statements to be monitored. If this parameter and sqlset_name are both null, then the procedure monitors all statements in the database for the specified time limit.
time_limit	Time limit (in seconds).

Security Model

To invoke this procedure you must have the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

This procedure also records group of columns. You can create extensions for the recorded group of columns using the [CREATE_EXTENDED_STATS Function](#) procedure. If `sqlset_name` and `owner_name` are NULL, then the procedure records the column (group) usage information for the statements executed in the system in next `time_limit` seconds.

This monitoring procedure records different information from the traditional column usage information that is visible in `SYS.COL_USAGE$`. The procedure stores information in `SYS.COL_GROUP_USAGE$`.

Examples

The following example turns on monitoring for 5 minutes or 300 seconds.

```
BEGIN
  DBMS_STATS.SEED_COL_USAGE (null,null,300);
END;
```

186.7.112 SET_ADVISOR_TASK_PARAMETER Procedure

This procedure updates the value of an Optimizer Statistics Advisor task parameter.

Syntax

```
DBMS_STATS.SET_ADVISOR_TASK_PARAMETER (
  task_name      IN   VARCHAR2,
  parameter      IN   VARCHAR2,
  value          IN   VARCHAR2);
```

Parameters

Table 186-119 SET_ADVISOR_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
parameter	The name of the parameter to set. The function returns an error if the specified parameter does not exist.
value	The new value of the parameter.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Oracle Database SQL Tuning Guide to learn how to manage Optimizer Statistics Advisor

186.7.113 SET_COLUMN_STATS Procedures

This procedure sets column-related information.

In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is `NULL`, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  colname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  distcnt      NUMBER DEFAULT NULL,
  density      NUMBER DEFAULT NULL,
```

```

nullcnt      NUMBER DEFAULT NULL,
srec         StatRec DEFAULT NULL,
avgclen     NUMBER DEFAULT NULL,
flags       NUMBER DEFAULT NULL,
statown     VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                get_param('NO_INVALIDATE')),
force       BOOLEAN DEFAULT FALSE);

```

Use the following for user-defined statistics:

```

DBMS_STATS.SET_COLUMN_STATS (
  ownname     VARCHAR2,
  tabname     VARCHAR2,
  colname     VARCHAR2,
  partname    VARCHAR2 DEFAULT NULL,
  statab     VARCHAR2 DEFAULT NULL,
  statid     VARCHAR2 DEFAULT NULL,
  ext_stats   RAW,
  statypown  VARCHAR2 DEFAULT NULL,
  statypname VARCHAR2 DEFAULT NULL,
  statown    VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                get_param('NO_INVALIDATE')),
  force     BOOLEAN DEFAULT FALSE);

```

Parameters

Table 186-120 SET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
colname	Name of the column or extension
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.
statab	User statistics table identifier describing where to store the statistics. If statab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)
ext_stats	User-defined statistics
statypown	Schema of the statistics type
statypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.
nullcnt	Number of NULLs
srec	StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS
avgclen	Average length for the column (in bytes)

Table 186-120 (Cont.) SET_COLUMN_STATS Procedure Parameters

Parameter	Description
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	Sets the values even if statistics of the column are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent input values

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

186.7.114 SET_DATABASE_PREFS Procedure

This procedure sets the statistics preferences of all the tables, excluding the tables owned by the database. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
  pname          IN  VARCHAR2,
  pvalue        IN  VARCHAR2,
  add_sys       IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 186-121 SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The existing value for following preferences can be set and default preference values will be used: <ul style="list-style-type: none">• APPROXIMATE_NDV_ALGORITHM• AUTO_STAT_EXTENSIONS• CASCADE• DEGREE• ESTIMATE_PERCENT• GLOBAL_TEMP_TABLE_STATS• GRANULARITY• INCREMENTAL• INCREMENTAL_STALENESS• INCREMENTAL_LEVEL• METHOD_OPT• NO_INVALIDATE• OPTIONS• PREFERENCE_OVERRIDES_PARAMETER• PUBLISH• STALE_PERCENT• STAT_CATEGORY• TABLE_CACHED_BLOCKS
pvalue	Preference value. If NULL is specified, it will set the Oracle default values
add_sys	Value TRUE will include the Oracle-owned tables

Table 186-122 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> The accuracy of the new algorithm is similar to the original algorithm. The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether to collect index statistics as part of gathering table statistics.
DEGREE	Determines the degree of parallelism used for gathering statistics.

Table 186-122 (Cont.) Statistics Preferences

Preference	Description
ESTIMATE_PERCENT	<p>Determines the percentage of rows to sample.</p> <p>The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p>
GLOBAL_TEMP_TABLE_STATS	<p>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</p> <ul style="list-style-type: none">• <code>SHARED</code> — All sessions see the same set of statistics• <code>SESSION</code> — Statistics gathered by the <code>GATHER_TABLE_STATS</code> procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.
GRANULARITY	<p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none">• <code>ALL</code> — Gathers all statistics: subpartition, partition, and global.• <code>AUTO</code> — Determines the granularity based on the partitioning type. This is the default value.• <code>DEFAULT</code> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <code>GLOBAL AND PARTITION</code> for this functionality.• <code>GLOBAL</code> — Gathers global statistics.• <code>GLOBAL AND PARTITION</code> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.• <code>PARTITION</code> — Gathers partition-level statistics.• <code>SUBPARTITION</code> — Gathers subpartition-level statistics.

Table 186-122 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL	<p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p>
INCREMENTAL_LEVEL	<p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 186-122 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <code>STALE_PERCENT</code> preference. For example, assume that <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that <code>STALE_PERCENT</code> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that <code>STALE_PERCENT</code> is 10. You specify the value 'NULL' for <code>INCREMENTAL_STALENESS</code>. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre>

Table 186-122 (Cont.) Statistics Preferences

Preference	Description
METHOD_OPT	<p>The first execution uses single quotes to set the preference to the value <code>NULL</code>, whereas the second sets the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code>.</p> <p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed:</p> <ul style="list-style-type: none"> <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code> <p>The <code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code></p> <p><code>integer</code> — Specifies the number of histogram buckets. The number must be between 1 and 2048.</p> <p><code>REPEAT</code> — Collects histograms only on the columns that already have histograms.</p> <p><code>AUTO</code> — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</p> <p><code>SKEWONLY</code> — Determines the columns on which to collect histograms based on the data distribution of the columns.</p> <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> <code>TRUE</code>: Dependent cursors are not invalidated. <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p>

Table 186-122 (Cont.) Statistics Preferences

Preference	Description
OPTIONS	<p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics on all objects in the database. This is the default. GATHER AUTO — Gathers all necessary statistics automatically. This is the default. <p>The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>
PUBLISH	<p>Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>
STALE_PERCENT	<p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>
STAT_CATEGORY	<p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics (default) SYNOPSIS — information to support incremental statistics REALTIME_STATS — specifies only real-time statistics. <p>The value 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p>

Table 186-122 (Cont.) Statistics Preferences

Preference	Description
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1.

Security Model

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE', '99');
```

**See Also:**

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

186.7.115 SET_GLOBAL_PREFS Procedure

This procedure sets statistics preferences at the global level.

Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
  pname      IN   VARCHAR2,
  pvalue     IN   VARCHAR2);
```

Parameters

Table 186-123 SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
pname	<p>Preference name. The default value for the following preferences can be set:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • AUTO_TASK_STATUS • AUTO_TASK_MAX_RUN_TIME • AUTO_TASK_INTERVAL • AUTOSTATS_TARGET • CASCADE • CONCURRENT • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS • WAIT_TIME_TO_UPDATE_STATS
pvalue	<p>Preference value. If NULL is specified, it will set the Oracle default values</p>

Table 186-124 Global Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.

Table 186-124 (Cont.) Global Statistics Preferences

Preference	Description
AUTO_TASK_STATUS	Enables or disables the high-frequency automatic optimizer statistics collection. Values are: <ul style="list-style-type: none">• ON — Enables high-frequency automatic optimizer statistics collection.• OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.
AUTO_TASK_MAX_RUN_TIME	Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default.
AUTO_TASK_INTERVAL	Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes).
AUTOSTATS_TARGET	Controls the objects considered for statistics collection. It takes the following values: <ul style="list-style-type: none">• 'ALL' - Statistics collected for all objects in system• 'ORACLE' - Statistics collected for all Oracle owned objects• 'AUTO' - Oracle decides on which objects to collect statistics This preference is applicable only for automatic statistics collection.
CASCADE	Determines whether to collect index statistics as part of gathering table statistics.

Table 186-124 (Cont.) Global Statistics Preferences

Preference	Description
CONCURRENT	<p>Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are:</p> <ul style="list-style-type: none"> • MANUAL — Concurrency is enabled only for manual statistics gathering. • AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering. • ALL — Concurrency is enabled for both manual and automatic statistics gathering. • OFF — Concurrency is disabled for both manual and automatic statistics. <p>Note the following guidelines: The CONCURRENT preference determines whether statistics are gathered concurrently when the user issues GATHER_*_STATS procedures. DBMS_STATS can collect statistics for a single object in parallel based on the value of the DEGREE parameter. However, parallelism is limited to one object. The CONCURRENT preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers. To gather statistics concurrently, Resource Manager must be enabled, and the setting for the JOB_QUEUE_PROCESSES initialization parameter must be at least 4.</p>
DEGREE	<p>Determines the degree of parallelism used for gathering statistics.</p>
ESTIMATE_PERCENT	<p>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p>
GLOBAL_TEMP_TABLE_STATS	<p>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</p> <ul style="list-style-type: none"> • SHARED — All sessions see the same set of statistics • SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.

Table 186-124 (Cont.) Global Statistics Preferences

Preference	Description
GRANULARITY	<p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
INCREMENTAL	<p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan.</p> <p>When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p>

Table 186-124 (Cont.) Global Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	<p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 186-124 (Cont.) Global Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. <p>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. <p>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. <p>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</p>

Table 186-124 (Cont.) Global Statistics Preferences

Preference	Description
	<p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>
METHOD_OPT	<p>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name: name of a column - extension : can be either a column group in the format of (column_name, columne_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>

Table 186-124 (Cont.) Global Statistics Preferences

Preference	Description
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p>
OPTIONS	<p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Oracle recommends using <code>GATHER AUTO</code> to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using <code>INCREMENTAL</code> statistics. <p>For partitioned tables using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obey input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>

Table 186-124 (Cont.) Global Statistics Preferences

Preference	Description
PUBLISH	<p>Determines whether the database publishes newly gathered statistics after the gathering job completes.</p> <p>You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>
STALE_PERCENT	<p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>
STAT_CATEGORY	<p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> • <code>OBJECT_STATS</code> — table statistics, column statistics and index statistics (default) • <code>SYNOPSIS</code> — information to support incremental statistics • <code>REALTIME_STATS</code> — specifies only real-time statistics. <p>The value '<code>OBJECT_STATS, SYNOPSIS</code>' specifies table statistics, column statistics, index statistics, and synopses.</p>
TABLE_CACHED_BLOCKS	<p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p>
WAIT_TIME_TO_UPDATE_STATS	<p>Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.</p>

Security Model

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- This setting is honored only if there is no preference specified for the table to be analyzed.
- Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Example 186-16 Overriding Statistics Preferences at the Global Level

You use the `SET_GLOBAL_PREFS` procedure to set the `ESTIMATE_PERCENT` preference to 5 for every table in the database that does not have a table preference set. Because `sh.costs` does not have a preference set, the global setting applies to this table.

```
SQL> EXEC DBMS_STATS.SET_GLOBAL_PREFS ('ESTIMATE_PERCENT', '5');
```

PL/SQL procedure successfully completed.

You use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to true for the `sh.sales` table only.

```
SQL> EXEC  
DBMS_STATS.SET_TABLE_PREFS('sh','sales','PREFERENCE_OVERRIDES_PARAMETER','TRUE');
```

PL/SQL procedure successfully completed.

A script attempts to set `ESTIMATE_PERCENT` to 10 when gathering statistics for `sh.sales`. However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, and because a global preference is defined, Oracle Database gathers statistics using the global setting of 5 rather than the specified setting of 10:

```
SQL> EXEC DBMS_STATS.GATHER_TABLE_STATS ('sh', 'costs',  
ESTIMATE_PERCENT=>10);
```

PL/SQL procedure successfully completed.

Example 186-17 Configuring High-Frequency Automatic Optimizer Statistics Collection

Oracle Database 19c introduces high-frequency automatic optimizer statistics collection. This lightweight task periodically gathers statistics for stale objects. The default interval is 15 minutes. In contrast to the automated statistics collection job, the high-frequency task does not perform actions such as purging statistics for non-existent objects or invoking Optimizer Statistics Advisor.

In this example, you enable high-frequency collection, set its maximum run time to a half hour, and then set the frequency interval to 10 minutes:

```
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_STATUS','ON');  
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_MAX_RUN_TIME','1800');  
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_INTERVAL','600');
```

**See Also:**

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

186.7.116 SET_INDEX_STATS Procedures

These procedures set index-related statistics.

The version of this procedure that accepts `ext_stats` sets statistics for use with domain indexes. The statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is null, then the database stores the statistics type associated with the index or column.

Syntax

```
DBMS_STATS.SET_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2  DEFAULT NULL,
  statab       VARCHAR2  DEFAULT NULL,
  statid       VARCHAR2  DEFAULT NULL,
  numrows      NUMBER    DEFAULT NULL,
  numblks      NUMBER    DEFAULT NULL,
  numdist      NUMBER    DEFAULT NULL,
  avgblk       NUMBER    DEFAULT NULL,
  avgdblk      NUMBER    DEFAULT NULL,
  clstfct      NUMBER    DEFAULT NULL,
  indlevel     NUMBER    DEFAULT NULL,
  flags        NUMBER    DEFAULT NULL,
  statown      VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  guessq       NUMBER    DEFAULT NULL,
  cachedblk    NUMBER    DEFAULT NULL,
  cachehit     NUMBER    DEFAULT NULL,
  force        BOOLEAN   DEFAULT FALSE);
```

Use the following syntax for user-defined domain index statistics:

```
DBMS_STATS.SET_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2  DEFAULT NULL,
  statab       VARCHAR2  DEFAULT NULL,
  statid       VARCHAR2  DEFAULT NULL,
  ext_stats    RAW,
  stattydown   VARCHAR2  DEFAULT NULL,
  stattyname   VARCHAR2  DEFAULT NULL,
  statown      VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(
```

```

                                get_param('NO_INVALIDATE')),
force          BOOLEAN  DEFAULT FALSE);

```

Parameters

Table 186-125 SET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition in which to store the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are stored at the global index level.
stattab	User statistics table identifier describing where to store the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code>)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from <code>numlblks</code> and <code>numdist</code> .
avgdblks	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from <code>clstfct</code> and <code>numdist</code> .
clstfct	See <code>clustering_factor</code> column of the <code>all_indexes</code> view for a description
indlevel	Height of the index (partition)
flags	For internal Oracle use (should be left as <code>NULL</code>)
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> • <code>TRUE</code>: Dependent cursors are not invalidated. • <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. • <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
guessq	Guess quality. See the <code>pct_direct_access</code> column of the <code>all_indexes</code> view for a description.

Table 186-125 (Cont.) SET_INDEX_STATS Procedure Parameters

Parameter	Description
cachedblk	Internal use only. Do not set.
cachehit	Internal use only. Do not set.
force	Sets the values even if statistics of the index are locked

Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20005: Object statistics are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently create
 - When the system does not have one major workload resulting in averages not corresponding to real values.

Oracle Database SQL Tuning Guide to learn how to set artificial statistics

186.7.117 SET_PARAM Procedure

This deprecated procedure sets default values for parameters of DBMS_STATS procedures.

Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [SET_GLOBAL_PREFS Procedure](#).

See also [DBMS_STATS Deprecated Subprograms](#).

You can use the `GET_PARAM` Function to get the current default value of a parameter.

Syntax

```
DBMS_STATS.SET_PARAM (
    pname      IN   VARCHAR2,
    pval       IN   VARCHAR2);
```

Parameters

Table 186-126 SET_PARAM Procedure Parameters

Parameter	Description
pname	<p>The parameter name The default value for following parameters can be set.</p> <ul style="list-style-type: none"> CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures.It is used only by gather procedures. DEGREE ESTIMATE_PERCENT METHOD_OPT NO_INVALIDATE GRANULARITY AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)
pval	<p>The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values:</p> <ul style="list-style-type: none"> 'ALL' - Statistics are collected for all objects in the system 'ORACLE' - Statistics are collected for all Oracle owned objects 'AUTO' - Oracle decides for which objects to collect statistics

Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
- Note also the difference between NULL and 'NULL':
 - When NULL is unquoted, this sets the parameter to the value Oracle recommends.
 - In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Examples

```
DBMS_STATS.SET_PARAM('CASCADE', 'DBMS_STATS.AUTO_CASCADE');  
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT', '5');  
DBMS_STATS.SET_PARAM('DEGREE', 'NULL');
```

186.7.118 SET_PROCESSING_RATE Procedure

This procedure sets the value of rate of processing for a given operation.

Syntax

```
DBMS_STATS.SET_PROCESSING_RATE (  
  opname      IN   VARCHAR2,  
  procrate    IN   NUMBER);
```

Parameters

Table 186-127 SET_PROCESSING_RATE Procedure Parameters

Parameter	Description
opname	Name of the operation. Valid values are as follows: <ul style="list-style-type: none"> • AGGR • ALL • CPU • CPU_ACCESS • CPU_AGGR • CPU_BYTES_PER_SEC • CPU_FILTER • CPU_GBY • CPU_HASH_JOIN • CPU_JOIN • CPU_NL_JOIN • CPU_RANDOM_ACCESS • CPU_SEQUENTIAL_ACCESS • CPU_SM_JOIN • CPU_SORT • HASH • IO • IO_ACCESS • IO_BYTES_PER_SEC • IO_RANDOM_ACCESS • IO_SEQUENTIAL_ACCESS • MEMCMP • MEMCPY
procrate	Processing rate.

Security Model

You must have the `OPTIMIZER_PROCESSING_RATE` role to run this procedure.

Usage Notes

`AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

186.7.119 SET_SCHEMA_PREFS Procedure

This procedure sets the statistics preferences of all tables owned by the specified user.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname IN VARCHAR2,
    pname   IN VARCHAR2,
    pvalue  IN VARCHAR2);
```

Parameters

Table 186-128 SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	Preference name. You can set the default value for the following preferences: <ul style="list-style-type: none"> • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • TABLE_CACHED_BLOCKS
pvalue	Preference value. If NULL is specified, it sets the database default value.

Table 186-129 Statistics Preferences

Preference	Description
AUTO_STAT_EXTENSIONS	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can set the following preferences:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	<p>This preference takes the following values:</p> <ul style="list-style-type: none"> • SHARED - All sessions see the same set of statistics • SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.

Table 186-129 (Cont.) Statistics Preferences

Preference	Description
GRANULARITY	<p>Determines the granularity of statistics to collect (only pertinent if the table is partitioned). Possible values are:</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>
INCREMENTAL	<p>Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> • INCREMENTAL value for the partitioned table is set to TRUE • PUBLISH value for the partitioned table is set to TRUE; • User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>

Table 186-129 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	<p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:</p> <ul style="list-style-type: none">• TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run <code>GATHER_TABLE_STATS</code> on this table with <code>INCREMENTAL</code> to <code>TRUE</code> and <code>INCREMENTAL_LEVEL</code> to <code>TABLE</code> before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the <code>SET_GLOBAL/DATABASE/SCHEMA_PREFS</code> procedures.• PARTITION - partition level synopses are gathered. This is the default value. If <code>PARTITION</code> is set on a non partitioned table, no synopses are gathered.

Table 186-129 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. Assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Partitions with synopses in adaptive sampling format are not considered stale, even when the APPROXIMATE_NDV_ALGORITHM preference is set to HYPERLOGLOG. The database uses existing synopses to derive global NDV. This is the default setting. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL'); EXEC DBMS_STATS.SET_TABLE_PREFS</pre>

Table 186-129 (Cont.) Statistics Preferences

Preference	Description
	<pre>('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre>
