This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Determining If an Oracle Home is Read-Only	10-8
File Path and Directory Changes in Read-Only Oracle Homes	10-9

## 11 Managing Oracle Database Port Numbers

---

About Managing Ports	11-1
Port Numbers and Protocols of Oracle Components	11-1

## A Oracle Database Installer Command-Line Options

---

runInstaller Command	A-1
runInstaller -setupDBHome	A-2
runInstaller -setupDBHomeAs	A-3
runInstaller -createGoldImage	A-4

# Preface

This guide explains how to install and configure Oracle Real Application Clusters (Oracle RAC).

Before you use this guide, you must first complete an installation of Oracle Clusterware, as described in the *Oracle Grid Infrastructure Installation Guide* for your platform.

- [Intended Audience](#)
- [Documentation Accessibility](#)
- [Diversity and Inclusion](#)
- [Set Up Java Access Bridge to Implement Java Accessibility](#)  
Install Java Access Bridge so that assistive technologies on Microsoft Windows systems can use the Java Accessibility API.
- [Command Syntax](#)  
Refer to these command syntax conventions to understand command examples in this guide.
- [Conventions](#)

## Intended Audience

*Oracle Real Application Clusters Installation Guide for Linux and UNIX* provides database installation information for database administrators (DBAs) who install and configure Oracle RAC.

## Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

### Access to Oracle Support

Oracle customer access to and use of Oracle support services will be pursuant to the terms and conditions specified in their Oracle order for the applicable services.

## Diversity and Inclusion

Oracle is fully committed to diversity and inclusion. Oracle respects and values having a diverse workforce that increases thought leadership and innovation. As part of our initiative to build a more inclusive culture that positively impacts our employees, customers, and partners, we are working to remove insensitive terms from our products and documentation. We are also mindful of the necessity to maintain compatibility with our customers' existing technologies and the need to ensure continuity of service as Oracle's offerings and industry standards evolve.

Because of these technical constraints, our effort to remove insensitive terms is ongoing and will take time and external cooperation.

## Set Up Java Access Bridge to Implement Java Accessibility

Install Java Access Bridge so that assistive technologies on Microsoft Windows systems can use the Java Accessibility API.

Java Access Bridge is a technology that enables Java applications and applets that implement the Java Accessibility API to be visible to assistive technologies on Microsoft Windows systems.

Refer to *Java Platform, Standard Edition Accessibility Guide* for information about the minimum supported versions of assistive technologies required to use Java Access Bridge. Also refer to this guide to obtain installation and testing instructions, and instructions for how to use Java Access Bridge.

### Related Topics

- *Java Platform, Standard Edition Java Accessibility Guide*

## Command Syntax

Refer to these command syntax conventions to understand command examples in this guide.

Convention	Description
\$	Bourne or BASH shell prompt in a command example. Do not enter the prompt as part of the command.
%	C Shell prompt in a command example. Do not enter the prompt as part of the command.
#	Superuser (root) prompt in a command example. Do not enter the prompt as part of the command.
monospace backslash \	UNIX command syntax A backslash is the UNIX and Linux command continuation character. It is used in command examples that are too long to fit on a single line. Enter the command as displayed (with a backslash) or enter it on a single line without a backslash:  <pre>dd if=/dev/rdsk/c0t1d0s6 of=/dev/rst0 bs=10b \ count=10000</pre>
braces { }	Braces indicate required items:  <pre>.DEFINE {macro1}</pre>
brackets [ ]	Brackets indicate optional items:  <pre>cvtcrt termname [outfile]</pre>
ellipses ...	Ellipses indicate an arbitrary number of similar items:  <pre>CHKVAL fieldname value1 value2 ... valueN</pre>

---

Convention	Description
<i>italic</i>	Italic type indicates a variable. Substitute a value for the variable:  <i>library_name</i>
vertical line	A vertical line indicates a choice within braces or brackets:  FILE filesize [K M]

---

## Conventions

The following text conventions are used in this document:

---

Convention	Meaning
<b>boldface</b>	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

---

# 1

## Oracle RAC Installation Checklist

Review these checklists for installing Oracle Real Application Clusters (Oracle RAC).

- [Deployment Checklist for Oracle RAC Database](#)  
Use this checklist to decide the deployment method for Oracle Database.
- [Server Hardware and Software Review Checklist for Oracle RAC Installation](#)  
Review this checklist to ensure you have met the minimum hardware and software requirements for Oracle RAC.
- [Installer Planning Checklist for Oracle Database](#)  
Use this checklist to assist you to be prepared before starting Oracle Universal Installer.
- [Oracle RAC Upgrade Checklist](#)  
Review this checklist to prepare your Oracle Real Application Clusters (Oracle RAC) databases for upgrade.

## Deployment Checklist for Oracle RAC Database

Use this checklist to decide the deployment method for Oracle Database.

**Table 1-1 Deployment Checklist for Oracle RAC Database**

Check	Task
Deploy Oracle RAC or Oracle RAC One Node software	Use one of the following deployment methods: <ul style="list-style-type: none"><li>• Install Oracle RAC or Oracle RAC One Node Database software using Oracle Universal Installer (OUI).</li><li>• Provision Oracle RAC Or Oracle RAC One Node Database software using Oracle Fleet Patching and Provisioning.</li></ul>
Deploy Oracle Database software and create Oracle RAC or Oracle RAC One Node databases	Use one of the following deployment methods: <ul style="list-style-type: none"><li>• Install Oracle RAC or Oracle RAC One Node Database using Oracle Universal Installer (OUI).</li><li>• Provision Oracle RAC Or Oracle RAC One Node Database using Oracle Fleet Patching and Provisioning.</li></ul>
Create Oracle RAC or Oracle RAC One Node Database in an already-installed Oracle home	<ul style="list-style-type: none"><li>• Use Database Configuration Assistant (DBCA).</li><li>• Use Oracle Fleet Patching and Provisioning.</li></ul>

### Related Topics

- [Installing Oracle RAC and Oracle RAC One Node](#)  
After installing Oracle Clusterware, as described in *Oracle Grid Infrastructure Installation Guide* for your platform, you can install Oracle RAC Database software.
- [About Deploying Oracle Databases Using Oracle Fleet Patching and Provisioning](#)  
Provision, patch, and upgrade software homes on any number of nodes from a single cluster with standard gold images using Oracle FPP.

# Server Hardware and Software Review Checklist for Oracle RAC Installation

Review this checklist to ensure you have met the minimum hardware and software requirements for Oracle RAC.

**Table 1-2 Hardware and Software Review Checklist for Oracle RAC**

Check	Task
Operating System General Requirements	Prepare servers as described in <i>Oracle Grid Infrastructure Installation Guide</i> for your platform.
Kernel Requirements and Fixup Scripts	During an installation, Oracle Universal Installer (OUI) detects when the minimum requirements for an installation are not met, and creates shell scripts, called fixup scripts, to finish incomplete system configuration steps. If OUI detects an incomplete task, then it generates fixup scripts ( <code>runfixup.sh</code> ). You must run these scripts as root.
Review Existing Oracle Installations and Upgrade Plans	<p>To install Oracle RAC 23ai, you must install Oracle Grid Infrastructure (Oracle Clusterware and Oracle ASM) 23ai on your cluster. The Oracle Clusterware version must be equal to or greater than the Oracle RAC version that you plan to install.</p> <p>For the most current updates and best practices about pre-upgrade, post-upgrade, compatibility, and interoperability discussions, refer to Support Note 1670757.1 on My Oracle Support.</p> <p><b>See Also:</b>  <i>Oracle Database Upgrade Guide</i>  <i>Oracle Grid Infrastructure Installation Guide</i></p>
Server Hardware on each node	Use identical server hardware on each node, to simplify server maintenance.
Time Zone Requirement	<p>Upgrade the Time Zone File and TSTZ Data:</p> <p>As part of an installation of Oracle Database 23ai, time zone version files from 1 to 12 are installed in the following path:  <code>\$ORACLE_HOME/oracore/zoneinfo/</code></p> <p>You can continue to use the current time zone version or upgrade to the latest version. Oracle recommends that you upgrade the server to the latest time zone version.</p> <p>See <i>Oracle Database Globalization Support Guide</i> for information about how to upgrade the time zone file and TSTZ data</p>

**Table 1-2 (Cont.) Hardware and Software Review Checklist for Oracle RAC**

Check	Task
Use Configuration Verification Utility (CVU)	Before you start your installation, use Configuration Verification Utility (CVU) to ensure that your system is prepared for Oracle RAC installation. If any checks fail, then fix the errors reported, either manually, or by using a generated fixup script. Contact your system or storage administrators to have them fix errors manually. CVU is available in the Grid home, in the <code>bin</code> directory.
	<div style="border-left: 2px solid #0070C0; padding-left: 10px; margin-left: 20px;"> <p> <b>Note:</b></p> <p>Starting with Oracle Grid Infrastructure 23ai, Cluster Verification Utility (CVU) is renamed to Configuration Verification Utility (CVU).</p> </div>
Ensure that Oracle RAC Databases You are Installing are Compatible with Existing Databases	<ul style="list-style-type: none"> <li>• If you have Oracle Clusterware installed, and different releases of other Oracle software installed, then the Oracle Clusterware release must be later than or equal to the Oracle Database software release. Oracle Clusterware and Oracle ASM are both upgraded to 23ai when you perform an Oracle Grid Infrastructure 23ai installation.</li> <li>• If you have an existing Oracle home, then you can create a new Oracle home and install Oracle Database 23ai into the new Oracle home. Ensure that Oracle Clusterware is in a separate Oracle Grid Infrastructure home. Oracle Grid Infrastructure for a Cluster installations cannot be installed in the Oracle home directory for Oracle Database.</li> </ul>
Platform-Specific Server Configuration	<ul style="list-style-type: none"> <li>• Ensure an external jobs user is created for HP-UX.</li> </ul>

**Related Topics**

- *Oracle Database Globalization Support Guide*
- *Oracle Database Upgrade Guide*

## Installer Planning Checklist for Oracle Database

Use this checklist to assist you to be prepared before starting Oracle Universal Installer.

**Table 1-3 Oracle Universal Installer Planning Checklist for Oracle Database Installation**

Check	Task
Read the Release Notes	Review release notes for your platform, which are available for your release at the following URL: <a href="http://docs.oracle.com/en/database/database.html">http://docs.oracle.com/en/database/database.html</a>

**Table 1-3 (Cont.) Oracle Universal Installer Planning Checklist for Oracle Database Installation**

Check	Task
Review Oracle Support Certification Matrix	<p>New platforms and operating system software versions may be certified after this guide is published, review the certification matrix on the My Oracle Support website for the most up-to-date list of certified hardware platforms and operating system versions:  <a href="https://support.oracle.com/">https://support.oracle.com/</a></p> <p>You must register online before using My Oracle Support. After logging in, from the menu options, select the <b>Certifications</b> tab. On the Certifications page, use the <b>Certification Search</b> options to search by Product, Release, and Platform. You can also search using the <b>Certification Quick Link</b> options such as Product Delivery, and Lifetime Support.</p>
Review the Licensing Information	<p>You are permitted to use only those components in Oracle Database for which you have purchased licenses. For more information about licenses, refer to the following URL:  <i>Oracle Database Licensing Information</i></p>
Run OUI with CVU and use fixup scripts	<p>Oracle Universal Installer is fully integrated with Configuration Verification Utility (CVU), automating many CVU prerequisite checks. Oracle Universal Installer runs all prerequisite checks and creates fixup scripts when you run the installer. You can run OUI up to the Summary screen without starting the installation.</p> <p>You can also run CVU commands manually to check system readiness. For more information, see:  <i>Oracle Clusterware Administration and Deployment Guide</i></p>
Update and run Oracle ORAchk for runtime and upgrade checks, or runtime health checks	<p>Oracle recommends that you update to the latest version of Oracle ORAchk by installing the latest version of Autonomous Health Framework (AHF).</p> <p>The Oracle ORAchk utility provides system checks that can help to prevent issues before and after installation. These checks include kernel requirements, operating system resource allocations, and other system requirements.</p> <p>Use the Oracle ORAchk Upgrade Readiness Assessment to obtain an automated upgrade-specific system health check for upgrades to 23ai. For example:</p> <ul style="list-style-type: none"> <li>• Before you perform a fresh database installation:  <pre>./orachk -profile preinstall</pre></li> <li>• To upgrade your existing database to a higher version or release:  <pre>./orachk -pregupgrade -targetversion 23.0.0.0.0</pre></li> </ul> <p>The Oracle ORAchk Upgrade Readiness Assessment automates many of the manual pre- and post-upgrade checks described in Oracle upgrade documentation. Check My Oracle Support Note 2550798.1 for more information about Oracle ORAchk support.  <a href="https://support.oracle.com/epmos/faces/DocContentDisplay?id=2550798.1&amp;parent=DOCUMENTATION&amp;sourceId=USERGUIDE">https://support.oracle.com/epmos/faces/DocContentDisplay?id=2550798.1&amp;parent=DOCUMENTATION&amp;sourceId=USERGUIDE</a></p>

**Table 1-3 (Cont.) Oracle Universal Installer Planning Checklist for Oracle Database Installation**

Check	Task
Verify if Oracle Grid Infrastructure is installed	<p>For Oracle Real Application Clusters (Oracle RAC) installations, ensure that you have installed and configured Oracle Grid Infrastructure for a cluster.</p> <p>If you want to use Oracle ASM or Oracle Restart, then install Oracle Grid Infrastructure for a standalone server before you install and create the database. Otherwise, to use Oracle ASM, you must complete an Oracle Grid Infrastructure installation, and then manually register the database with Oracle Restart.</p>
Check running Oracle processes, and shut down if necessary	<ul style="list-style-type: none"> <li>• On a standalone database not using Oracle ASM: You do not need to shut down the database while you install Oracle Grid Infrastructure.</li> <li>• On a standalone database using Oracle ASM: The Oracle ASM instances are restarted during installation.</li> <li>• On an Oracle RAC Database node: This installation requires an upgrade of Oracle Clusterware, as Oracle Clusterware is required to run Oracle RAC. As part of the upgrade, you must shut down the database one node at a time as the rolling upgrade proceeds from node to node.</li> </ul>
Ensure <code>cron</code> jobs do not run during installation	<p>If the installer is running when daily <code>cron</code> jobs start, then you may encounter unexplained installation problems if your <code>cron</code> job is performing cleanup, and temporary files are deleted before the installation is finished. Oracle recommends that you complete installation before daily <code>cron</code> jobs are run, or disable daily</p> <p><code>cron</code></p> <p>jobs that perform cleanup until after the installation is completed.</p>
Obtain your My Oracle Support account information.	<p>During installation, you may require a My Oracle Support user name and password to configure updates, download software updates, and other installation tasks. You can register for My Oracle Support at the following URL:</p> <p><a href="https://support.oracle.com/">https://support.oracle.com/</a></p>
Decide Oracle Database management tool	<p>You can manage Oracle Database using Oracle Enterprise Manager Cloud Control.</p> <p>If you have an existing Oracle Management Agent, and decide to use Oracle Enterprise Manager Cloud Control to centrally manage your database, then obtain the following information to enter during the database installation:</p> <ul style="list-style-type: none"> <li>• OMS host</li> <li>• OMS port</li> <li>• EM admin username</li> <li>• EM admin password</li> <li>• Specify password of ASMSNMP user</li> </ul> <p>For more information, see, <i>Oracle Enterprise Manager Cloud Control Administrator's Guide</i></p>

**Table 1-3 (Cont.) Oracle Universal Installer Planning Checklist for Oracle Database Installation**

Check	Task
Review memory allocation and Automatic Memory Management feature	<p>You can enable automatic memory management either during, or after Oracle Database installation. If you enable automatic memory management after installation, then you must shut down and restart the database.</p> <p>If the total physical memory of your database instance is greater than 4 GB, then you cannot select the Oracle Automatic Memory Management option during database installation and creation. Instead, use automatic shared memory management. Automatic shared memory management automatically distributes the available memory among the various components as required, allowing the system to maximize the use of all available SGA memory.</p> <p>For more information, see: <i>Oracle Database Administrator's Guide</i></p>
Determine superuser (root) privilege delegation option for installation	<p>During a database or grid infrastructure installation, you are asked to run configuration scripts as the <code>root</code> user.</p> <p>You can either run these scripts manually as <code>root</code> when prompted, or you can provide configuration information and passwords using a root privilege delegation option.</p> <p>To run <code>root</code> scripts automatically, select <b>Automatically run configuration scripts</b> during installation.</p> <ul style="list-style-type: none"> <li>• <b>Use root user credentials</b> Provide the superuser password for cluster member node servers.</li> <li>• <b>Use Sudo</b> Sudo is a UNIX and Linux utility that allows members of the sudoers list privileges to run individual commands as <code>root</code>. Provide the username and password of an operating system user who is a member of sudoers, and is authorized to run Sudo on each cluster member node.  To enable Sudo, have a system administrator with the appropriate privileges configure a user who is a member of the sudoers list, and provide the username and password when prompted during installation.</li> </ul>
Oracle Database Client and Oracle Database interoperability	<ul style="list-style-type: none"> <li>• For information about interoperability between Oracle Database Client and Oracle Database releases, see <a href="#">My Oracle Support Note 207303.1</a>.</li> <li>• 32-bit Oracle Database clients are desupported in Oracle Database 23ai.  Oracle has discontinued developing 32-bit Oracle Database clients. Oracle recommends that you use 64-bit Oracle Database clients. If you are using 32-bit applications, then you can continue to use older 32-bit Oracle Database clients, subject to "Client / Server Interoperability Support Matrix for Different Oracle Versions (Doc ID 207303.1)," and the release support lifecycle (My Oracle Support 742060.1).</li> </ul>

## Oracle RAC Upgrade Checklist

Review this checklist to prepare your Oracle Real Application Clusters (Oracle RAC) databases for upgrade.

**Table 1-4 Oracle RAC Upgrade Checklist**

Check	Task
Review Existing Oracle Installations and Upgrade Plans	<p>To install Oracle RAC 23ai, you must install Oracle Grid Infrastructure (Oracle Clusterware and Oracle ASM) 23ai on your cluster. The Oracle Clusterware version must be equal to or greater than the Oracle RAC version that you plan to install.</p> <p><b>See Also:</b> <i>Oracle Database Upgrade Guide</i> <i>Oracle Grid Infrastructure Installation Guide</i></p>
Ensure that Oracle RAC Databases You are Installing are Compatible with Existing Databases	<p>If you have Oracle Clusterware installed, and different releases of other Oracle software installed, then the Oracle Clusterware release must be later than or equal to the Oracle Database software release. Oracle Clusterware and Oracle ASM are both upgraded to 23ai when you perform an Oracle Grid Infrastructure 23ai installation.</p> <p>If you have an existing Oracle home, then you can create a new Oracle home and install Oracle Database 23ai into the new Oracle home. Ensure that Oracle Clusterware is in a separate Oracle Grid Infrastructure home. Oracle Grid Infrastructure for cluster installations cannot be installed in the Oracle home directory for Oracle Database.</p>
Migrate files from RAW devices to Supported Storage	<p>If you have any database data stored on RAW devices, then before you start Oracle Grid Infrastructure and Oracle RAC installation, you must use RMAN to copy that data to Oracle ASM or to another supported file system.</p>
Prepare to upgrade all existing nodes	<p>The Oracle RAC database instance is running on the same nodes that you intend to make members of the new cluster installation. For example, if you have an existing Oracle RAC database running on a three-node cluster, then you must upgrade all three nodes. You cannot upgrade only two nodes of the cluster, removing the third instance in the upgrade.</p>
Ensure that Oracle RAC database version is equal to or older than the version of Oracle Clusterware	<p>Before you upgrade Oracle RAC database, ensure that Oracle Grid Infrastructure is upgraded to an equal or a later release.</p> <p>You can have multiple Oracle homes for Oracle databases on your cluster. However, the Oracle RAC database software in these homes must be from a version that is equal to or before the version of Oracle Clusterware that is installed. For example:</p> <ul style="list-style-type: none"> <li>• If your servers use Oracle Grid Infrastructure 23ai, then you can have an Oracle Database 23ai single-instance database running on one node, and separate Oracle RAC 19c, Oracle RAC 21c, or Oracle RAC 23ai databases also running on the cluster.</li> <li>• You cannot have Oracle Grid Infrastructure 21c installed on your cluster, and install Oracle RAC 23ai.</li> </ul>

## Installing Oracle RAC and Oracle RAC One Node

After installing Oracle Clusterware, as described in *Oracle Grid Infrastructure Installation Guide* for your platform, you can install Oracle RAC Database software.

- [About Image-Based Oracle Database Installation](#)  
Understand image-based installation to simplify installation and configuration of Oracle Database software.
- [Setup Wizard Installation Options for Creating Images](#)  
Gold image-creation options to use with your Oracle Database or Oracle Grid Infrastructure installation setup wizards.
- [Downloading the Software from Oracle Software Delivery Cloud Portal](#)  
You can download the software from Oracle Software Delivery Cloud.
- [Verifying Digital Signature and Integrity of Installation Archive Files](#)  
Starting with Oracle Database 23ai, Oracle digitally signs the installation archive files with Oracle certificates to ensure the integrity of the packages before you deploy them in your environments.

Provision, patch, and upgrade software homes on any number of nodes from a single cluster with standard gold images using Oracle FPP.

### About Image-Based Oracle Database Installation

Understand image-based installation to simplify installation and configuration of Oracle Database software.

To install Oracle Database, create the new Oracle home, extract the image file into the newly-created Oracle home, and run the setup wizard to register the Oracle Database product.

Using image-based installation, you can install and upgrade Oracle Database for single-instance and cluster configurations. If you install or clone an Oracle Database image, then all Oracle Database options such as Oracle Real Application Testing (`rat`) are enabled by default.

This installation feature streamlines the installation process and supports automation of large-scale custom deployments. You can also use this installation method for deployment of customized images, after you patch the base-release software with the necessary Release Updates (Updates) or Monthly Recommended Patches (MRPs).

 **Note:**

You must extract the image software (`db_home.zip`) into the directory where you want your Oracle Database home to be located, and then run the Oracle Database Setup Wizard to start the Oracle Database installation and configuration. Oracle recommends that the Oracle home directory path you create is in compliance with the Oracle Optimal Flexible Architecture recommendations.

## Setup Wizard Installation Options for Creating Images

Gold image-creation options to use with your Oracle Database or Oracle Grid Infrastructure installation setup wizards.

### Options

In image-based installations, you can start your Oracle Database installation or Oracle Grid Infrastructure installations by running the setup wizards `runInstaller` and `gridSetup.sh` respectively. Both these wizards come with the following image-creation options.

**Table 2-1 Image-Creation Options for Setup Wizard**

Option	Description
<code>-createGoldImage</code>	Creates a gold image from the current Oracle home.
<code>-destinationLocation</code>	Specify the complete path, or location, where the gold image will be created.
<code>-exclFiles</code>	Specify the complete paths to the files to be excluded from the newly created gold image.
<code>-help</code>	Displays help for all the available options.

For example:

```
./runInstaller -createGoldImage -destinationLocation /tmp/my_db_images -
exclFiles /u01/app/oracle/product/23.0.0/dbhome_1/relnotes
```

```
./gridSetup.sh -createGoldImage -destinationLocation /tmp/my_grid_images -
exclFiles /u01/app/oracle/product/23.0.0/dbhome_1/relnotes
```

Where:

`/tmp/my_db_images` is a temporary file location where the image zip file is created.

`/tmp/my_grid_images` is a temporary file location where the image zip file is created.

`/u01/app/oracle/product/23.0.0/dbhome_1/relnotes` is the file to be excluded in the newly created gold image.

# Downloading the Software from Oracle Software Delivery Cloud Portal

You can download the software from Oracle Software Delivery Cloud.

1. Use a browser to access the Oracle Software Delivery Cloud portal:  
<https://edelivery.oracle.com/>
2. Click **Sign In** and enter your Oracle account username and password.
3. Type **Oracle Database** in the search bar. Click the **Add to Cart** button corresponding to the Oracle Database version that you want to download
4. In the Checkout page, click **Checkout** and deselect any products that you do not want to download.
5. Select the operating system platform on which you want to install the software from the **Platform/Languages** column.
6. Click **Continue**.
7. Review the license agreement.
8. Select the **I reviewed and accept the Oracle License Agreement** checkbox. Click **Continue**.
9. Click **Download** to start downloading the software.
10. After you download the files, click **View Digest** to verify that the checksum matches the value listed on the download page.

## Verifying Digital Signature and Integrity of Installation Archive Files

Starting with Oracle Database 23ai, Oracle digitally signs the installation archive files with Oracle certificates to ensure the integrity of the packages before you deploy them in your environments.

Use the Java utility `jarsigner` to verify the integrity of your Oracle Database, Oracle Database Client, Oracle Grid Infrastructure, Oracle Examples, Oracle Gateways, or Oracle GSM installation archive files. You can verify the integrity of the installation archive files before you extract the installation files.

### Quick Verification

To quickly verify the installation archive files, use the `jarsigner` command with the `-verify` option:

1. Go to the directory where you have downloaded the installation archive files.
2. Run this command to check your installation archive file:

```
jarsigner -verify installation_archive_file
```

For example, to check the Oracle Database gold image:

```
jarsigner -verify db_home.zip

jar verified.
```

### Detailed Certificate Information

If you want detailed certificate information, then use the `-verbose:summary` and `-certs` along with the `-verify` option.

1. Go to the directory where you have downloaded the installation archive files.
2. Run this command to check your installation archive file:

```
jarsigner -verify -verbose:summary -certs installation_archive_file
```

For example, to check the Oracle Database gold image:

```
jarsigner -verify -verbose:summary -certs db_home.zip
```

The output is similar to the following:

```

## Installing Oracle RAC and Oracle RAC One Node Databases

Understand the process to install Oracle Real Application Clusters (Oracle RAC) and Oracle RAC One Node Databases.

- [Steps to Install Oracle Database](#)  
Installation of Oracle Oracle RAC and Oracle RAC One Node Databases requires software-only installation followed by database creation using Oracle DBCA.
- [Installing Oracle RAC Database Software Using Setup Wizard](#)  
Install Oracle RAC or Oracle RAC One Node software using the gold image-based installation with Oracle Database setup wizard.

### Steps to Install Oracle Database

Installation of Oracle Oracle RAC and Oracle RAC One Node Databases requires software-only installation followed by database creation using Oracle DBCA.

Installation of Oracle Real Application Clusters (Oracle RAC) and Oracle RAC One Node Databases is a two-step process:

1. Install Oracle RAC software by running the Oracle Database installer.
2. Create and Configure Oracle RAC and Oracle RAC One Node Databases using Database Configuration Assistant (DBCA).

### Installing Oracle RAC Database Software Using Setup Wizard

Install Oracle RAC or Oracle RAC One Node software using the gold image-based installation with Oracle Database setup wizard.

Oracle Real Application Clusters Database installation is a two-step process. This procedure describes the first step — to install Oracle RAC software.

If you have an existing Oracle installation, then write down the version numbers, patches, and other configuration information, and review upgrade procedures for your existing installation. Review Oracle Database Upgrade Guide before proceeding with the installation.

Ensure that you have `su` or `sudo` credentials, because you will be required to either provide `root` credentials to automatically run the root scripts or run a script as the `root` user during installation.

1. Ensure that you can access other nodes with SSH. The installer requires that the user account running the Oracle RAC installation is permitted to set up passwordless SSH. The installer can set this up for you automatically, or your system administrator can set this up for you before installation is started.

2. Open the terminal from which you intend to run the installer, and log in as the user account that you want to own the Oracle Database installation (for example, `oracle`).

If you are not able to turn off `stty` commands, or have other restrictions that prevent automatic SSH configuration from within the installer, then you must ensure that SSH is configured and enabled before you proceed to start installation.

3. Download the Oracle Database installation image files (`db_home.zip`) and extract the files into a new Oracle home directory. For example:

```
$ mkdir -p /u01/app/oracle/product/23.0.0/dbhome_1
$ chgrp oinstall /u01/app/oracle/product/23.0.0/dbhome_1
$ cd /u01/app/oracle/product/23.0.0/dbhome_1
$ unzip -q /tmp/db_home.zip
```

 **Note:**

- Oracle recommends that the Oracle home directory path you create is in compliance with the Oracle Optimal Flexible Architecture recommendations. Also, unzip the installation image files only in this Oracle home directory that you created.
- Oracle home or Oracle base cannot be `symlinks`, nor can any of their parent directories, all the way to up to the `root` directory.

4. From the Oracle home directory, start the Oracle Database software installation:

```
$ cd /u01/app/oracle/product/23.0.0/dbhome_1
$ ./runInstaller
```

 **Note:**

Run the `runInstaller` command from the Oracle home directory only. Do not run `runInstaller` command that resides at `$ORACLE_HOME/oui/bin/`, or any other location, to install Oracle Real Application Clusters or Oracle Grid Infrastructure.

5. In the Select Configuration Option screen, select the **Setup Software Only** option. Click **Next**.
6. In the Select Database Installation Option screen, select the **Oracle Real Application Clusters Database Installation** option. Click **Next**.  
Starting with Oracle Database 21c, installation of non-CDB Oracle Database architecture is no longer supported.
7. In the Node Selection screen, select all the nodes where you want to install Oracle RAC or Oracle RAC One Node software. Click **Next**.
8. In the Select Database Edition screen, select the **Enterprise Edition** option. Click **Next**.
9. In the Specify Install Location screen, provide the location of Oracle base for Oracle RAC software installation.

The Oracle base directory must be different from the Grid home directory. Click **Next**.

10. In the Privileged Operating System Groups screen, accept the default operating system group names for Oracle Database administration and click **Next**.
  11. Select the option to **Automatically run configuration scripts**. Enter the credentials for the `root` user or a `sudo` account, then click **Next**.
- Alternatively, you can run the scripts manually as the `root` user at the end of the installation process when prompted by the installer.
12. The Perform Prerequisite Checks screen displays the results of the prerequisites checks. If any of the checks have a status of Failed and are not Fixable, then you must manually correct these issues. After you have fixed the issue, you can click the Check Again button to have the installer recheck the requirement and update the status. Repeat as needed until all the checks have a status of Succeeded. Click **Next**.
  13. Review the contents of the Summary screen and then click **Install**.

The installer displays a progress indicator enabling you to monitor the installation process.

14. If you did not configure automation of the root scripts, then you are required to run `root.sh` script as the `root` user, as specified in the Execute Configuration Scripts window. Do *not* click **OK** until you have run the `root.sh` script on all nodes as directed.

You can run the `root.sh` script simultaneously on all nodes in the cluster for Oracle RAC installations or upgrades.

After installing Oracle RAC software, run Database Configuration Assistant (DBCA) from the `ORACLE_HOME/bin/dbca` directory to create and configure Oracle RAC databases.

## Installing Oracle RAC Database Software Using Command-Line Interface

Install Oracle RAC or Oracle RAC One Node software using the gold image-based installation with the command-line interface.

Oracle Real Application Clusters Database installation is a two-step process. This procedure describes the first step — to install Oracle RAC software.

If you have an existing Oracle installation, then write down the version numbers, patches, and other configuration information, and review upgrade procedures for your existing installation. Review Oracle Database Upgrade Guide before proceeding with the installation.

Ensure that you have `su` or `sudo` credentials, because you will be required to either provide `root` credentials to automatically run the root scripts or run a script as the `root` user during installation.

1. Ensure that you can access other nodes with SSH. The installer requires that the user account running the Oracle RAC installation is permitted to set up passwordless SSH. The installer can set this up for you automatically, or your system administrator can set this up for you before installation is started.
2. Open the terminal from which you intend to run the installer, and log in as the user account that you want to own the Oracle Database installation (for example, `oracle`).

If you are not able to turn off `stty` commands, or have other restrictions that prevent automatic SSH configuration from within the installer, then you must ensure that SSH is configured and enabled before you proceed to start installation.

3. Download the Oracle Database installation image files (`db_home.zip`) and extract the files into a new Oracle home directory. For example:

```
$ mkdir -p /u01/app/oracle/product/23.0.0/dbhome_1
$ chgrp oinstall /u01/app/oracle/product/23.0.0/dbhome_1
$ cd /u01/app/oracle/product/23.0.0/dbhome_1
$ unzip -q /tmp/db_home.zip
```

 **Note:**

- Oracle recommends that the Oracle home directory path you create is in compliance with the Oracle Optimal Flexible Architecture recommendations. Also, unzip the installation image files only in this Oracle home directory that you created.
- Oracle home or Oracle base cannot be `symlinks`, nor can any of their parent directories, all the way to up to the `root` directory.

4. From the Oracle home directory, start the Oracle Database software installation:

```
$ cd /u01/app/oracle/product/23.0.0/dbhome_1
$ runInstaller -setupDBHome -OSDBA dba -OSBACKUPDBA backupdba -OSDGDBA
dgdba -OSKMDBA kmdba -OSRACDBA racdba
-ORACLE_BASE /u01/app/oracle -OSOPER oper -clusterNodes node1,node2,node3 -
installEdition EE
-INVENTORY_LOCATION /u01/app/oraInventory -executeRootScript -configMethod
ROOT
```

 **Note:**

Run the `runInstaller` command from the Oracle home directory only. Do not run `runInstaller` command that resides at `$ORACLE_HOME/oui/bin/`, or any other location, to install the Oracle Real Application Clusters software.

5. Provide the `root` user password when prompted.

After installing Oracle RAC software, run Database Configuration Assistant (DBCA) from the `ORACLE_HOME/bin/dbca` directory to create and configure Oracle RAC databases.

# About Deploying Oracle Databases Using Oracle Fleet Patching and Provisioning

Provision, patch, and upgrade software homes on any number of nodes from a single cluster with standard gold images using Oracle FPP.

## Note:

Starting with Oracle Database 19c, Rapid Home Provisioning feature is known as Oracle Fleet Patching and Provisioning or Oracle FPP.

With Oracle Fleet Patching and Provisioning (Oracle FPP), you create, store, and manage templates of Oracle homes as images (called gold images) of Oracle Databases, Grid Infrastructure, middleware, and applications. These gold images are maintained on an Oracle Fleet Patching and Provisioning Server, which can provision and maintain working copies of the images on any number of nodes in an Information Technology estate.

## Oracle Fleet Patching and Provisioning

Deploying Oracle software using Oracle FPP has the following advantages:

- Enables you to create and manage Oracle Real Application Clusters (Oracle RAC), single instance, and Oracle Real Application Clusters One Node (Oracle RAC One Node) databases. You can deploy single-instance databases with or without Oracle Grid Infrastructure.
- Ensures standardization and enables high degrees of automation with gold images and managed lineage of deployed software.
- Supports change management. With standardized Oracle homes, an administrator has better control of the hosted Oracle software and can easily manage the mass deployment, patching, and upgrade of the software through a single location for change management.
- Minimizes downtime during patching and upgrades, eases rollbacks, and makes provisioning for large systems easier and more efficient.
- Simplifies maintenance and patching of database software.
- Reduces the cumulative time to patch software images, since a single Oracle home may be used for many database instances.

## See Also:

*Oracle Clusterware Administration and Deployment Guide* for information about setting up the Oracle Fleet Patching and Provisioning Server and Client, creating and using gold images for provisioning and patching Oracle Database homes.

## Creating Oracle RAC or Oracle RAC One Node Databases with Oracle DBCA

Use Oracle Database Configuration Assistant (DBCA) in standalone mode to create and delete Oracle Real Application Clusters (Oracle RAC) databases.

- [About Oracle Database Configuration Assistant](#)  
Understand the features Oracle Database Configuration Assistant (Oracle DBCA) offers for creating your Oracle RAC databases.
- [Selecting Installation Options for Oracle RAC](#)  
Review the topics to select options for installing Oracle RAC.
- [Automatic Listener Migration from Earlier Releases](#)  
Review this information for listener migration from earlier database releases.
- [Verifying Requirements for Oracle DBCA](#)  
Use CVU to verify that your system is prepared for configuration changes before using Oracle DBCA to create Oracle RAC databases.
- [Tasks to Complete Before Using Oracle DBCA to Create any Oracle RAC Database](#)  
Configure your system to meet the software requirements, if you did not complete your system configuration during the Oracle Grid Infrastructure installation.
- [Selecting Oracle DBCA Options to Create an Oracle RAC or Oracle RAC One Node Database](#)  
Review this information to use Oracle Database Configuration Assistant (Oracle DBCA) to create an Oracle RAC or Oracle RAC One Node Database.
- [Using DBCA to Create an Oracle RAC One Node Database](#)  
Configure Oracle RAC One Node database using Oracle DBCA after creating a software-only setup of Oracle RAC software on cluster nodes.
- [Installing the Oracle Database Vault Option](#)  
Installing and configuring Oracle Database Vault requires actions during and after installation.
- [Deleting an Oracle RAC Database Using Oracle DBCA](#)  
Delete an Oracle RAC database using Oracle Database Configuration Assistant (Oracle DBCA) with all of the database components.

### About Oracle Database Configuration Assistant

Understand the features Oracle Database Configuration Assistant (Oracle DBCA) offers for creating your Oracle RAC databases.

Oracle DBCA enables you to create site-specific tablespaces as part of database creation. If you have data file requirements that differ from those offered by Oracle DBCA templates, then create your database with Oracle DBCA and modify the data files later. You can also run user-specified scripts as part of your database creation process.

Oracle DBCA also configures your Oracle RAC environment for various Oracle high availability features, such as cluster administration tools. Oracle DBCA also starts any database instances required to support your defined configuration.

You can use Oracle DBCA to create a database from templates supplied by Oracle, or from templates that you create. The templates contain settings optimized for a particular type of workload.

Oracle ships templates for the following two workload types:

- General purpose or transaction processing
- Data warehouse

For more complex environments, you can select the **Custom Database** option. This option does not use templates and results in a more extensive interview, which means that it takes longer to create your database.

Click **Show Details** to see the configuration for each type of database. Select the template suited to the type of workload your database supports. If you are not sure which to choose, then select the default **General Purpose or Transaction Processing** template.

## Selecting Installation Options for Oracle RAC

Review the topics to select options for installing Oracle RAC.

- [About Cluster Node Selection for Database Installation](#)  
Select the cluster nodes to install Oracle RAC or Oracle RAC One Node databases.
- [Selecting a Database Name](#)  
The database name is comprised of various strings and must contain only permitted characters. Review the following guidelines when selecting a database name.
- [Requirements for Database Passwords](#)  
To secure your database, use passwords that satisfy the Oracle recommended password requirements, even the passwords for predefined user accounts.
- [About Automatic Memory Management Installation Options](#)  
Decide if you want to configure Automatic Memory Management during installation.
- [About Character Set Selection During Installation](#)  
Before you create the database, decide the character set that you want to use.
- [Managing Oracle RAC Database Services After Installation](#)  
Administer and monitor database services using SRVCTL or Oracle Enterprise Manager Cloud Control.

### About Cluster Node Selection for Database Installation

Select the cluster nodes to install Oracle RAC or Oracle RAC One Node databases.

You can use cluster nodes to host Oracle RAC database instances that run in read-only mode, which become Oracle RAC Reader Nodes. Oracle RAC Reader Nodes facilitate Oracle Flex Cluster architecture by allocating a set of read/write instances running Online Transaction Processing (OLTP) workloads and a set of read-only database instances across cluster nodes.

### Selecting a Database Name

The database name is comprised of various strings and must contain only permitted characters. Review the following guidelines when selecting a database name.

The database name input field sets the following Oracle initialization parameter values:

- DB\_NAME

- DB\_UNIQUE\_NAME
- DB\_DOMAIN

In Oracle RAC environments, the database name (DB\_UNIQUE\_NAME) portion is a string of no more than 30 characters that can contain alphanumeric, underscore (\_), dollar (\$), and pound (#) characters, but must begin with an alphabetic character. No other special characters are permitted in a database name. The DB\_NAME parameter for a database is set to the first 8 characters of the database name.

The domain portion of the global database name (DB\_DOMAIN) can be no more than 128 characters. Domain names using underscores (\_) are not allowed. The values for DB\_UNIQUE\_NAME.DB\_DOMAIN in its entirety must be unique within the enterprise.

**Note:**

For Oracle Real Applications Cluster (Oracle RAC) databases, the pluggable database (PDB) name must be unique in the cluster.

**Database Name and ORACLE\_SID**

The Oracle Service Identifier (SID) prefix is the first 8 characters of the database name. The SID prefix can contain only the characters a-z, A-Z, and 0-9. The SID prefix cannot contain operating system special characters, so if you use special characters in the first 8 characters of the database name, then these special characters are omitted in the SID prefix. There is a single SID prefix for every database. The SID prefix for a database must be unique within the cluster.

For an Oracle RAC database, each instance has a unique identifier, ORACLE\_SID, which consists of the SID prefix and an instance number. The ORACLE\_SID prefix can contain up to 12 characters. The ORACLE\_SID for Oracle RAC database instances is generated differently, depending on how you choose to manage the database. If you select an administrator-managed database, then Oracle Database Configuration Assistant generates the default SID for the instance names, using the format *name#*, where *name* is the first eight alphanumeric characters of DB\_UNIQUE\_NAME, and *#* is the instance number. However, during installation or database creation you can specify a nondefault value for the SID. The instance number is automatically added to the end of this string for each instance.

For an Oracle RAC One Node database, the instance name is ORACLE\_SID\_1, which consists of \_1 appended to the SID prefix. During online relocation, a second instance ORACLE\_SID\_2 is started, which becomes the only instance after the relocation completes. The next online relocation uses ORACLE\_SID\_1 for the new instance.

**Example 3-1 Global Database Name and Related Initialization Parameters**

If your database has a global database name of orl\$racprod2551.example.com which you supplied during installation, then the following values are used for initialization parameters:

Parameter	Value
DB_UNIQUE_NAME	orl\$racprod2551
DB_DOMAIN	example.com
DB_NAME	orl\$racp

**Example 3-2 DB\_UNIQUE\_NAME and Related ORACLE\_SID Values**

If the `DB_UNIQUE_NAME` for a database is `orl$racprod2551`, then the following SID values are used:

Database or Instance Type	Value Used for ORACLE_SID
Single-instance Oracle database	<code>orlracpr</code>
Administrator-managed Oracle RAC instance	<code>orlracpr1</code>
Oracle RAC One Node database instance	<code>orlracpr_1</code>

## Requirements for Database Passwords

To secure your database, use passwords that satisfy the Oracle recommended password requirements, even the passwords for predefined user accounts.

Oracle Database provides a set of predefined user accounts. Create passwords in a secure fashion. If you have default passwords, change these passwords to secure passwords.

You can manage the security for Oracle Database users in various ways:

- Enforce restrictions on the way that passwords are created
- Create user profiles
- Use user resource limits to further secure user accounts

## About Automatic Memory Management Installation Options

Decide if you want to configure Automatic Memory Management during installation.

During a **Typical** installation, you create your database with Oracle Database Configuration Assistant (DBCA), and automatic memory management is enabled. If you choose **Advanced** installation, then you can either specify memory allocation manually, or enable automatic memory management.

If the total physical memory of your database instance is greater than 4 GB, then you cannot select the Oracle Automatic Memory Management option during database installation and creation. Instead, use automatic shared memory management. Automatic shared memory management automatically distributes the available memory among the various components as required, allowing the system to maximize the use of all available SGA memory.

With automatic memory management, the Oracle Database instances automatically manage and tune memory for you. With automatic memory management, you choose a memory target, and the instance automatically distributes memory between the system global area (SGA) and the instance program global area (instance PGA). As memory requirements change, the instance dynamically redistributes memory between the SGA and instance PGA.

You can enable automatic memory management either during, or after the database installation. Enabling automatic memory management after installation involves a shutdown and restart of the database.

**Note:**

By default, automatic memory management is disabled when you perform typical installation on a node that has more than 4 GB of RAM.

**Related Topics**

- *Oracle Database Administrator's Guide*

## About Character Set Selection During Installation

Before you create the database, decide the character set that you want to use.

After a database is created, changing its character set is usually very expensive in terms of time and resources. Such operations may require converting all character data by exporting the whole database and importing it back. Therefore, it is important that you carefully select the database character set at installation time.

Oracle Database uses character sets for the following:

- Data stored in SQL character data types (`CHAR`, `VARCHAR2`, `CLOB`, and `LONG`).
- Identifiers such as table names, column names, and PL/SQL variables.
- Stored SQL and PL/SQL source code, including text literals embedded in this code.

The default database character set of a database created from the General Purpose/ Transaction Processing or the Data Warehousing template is Unicode `AL32UTF8`.

Unicode is the universal character set that supports most of the currently spoken languages of the world. It also supports many historical scripts (alphabets). Unicode is the native encoding of many technologies, including Java, XML, XHTML, ECMAScript, and LDAP. Unicode is ideally suited for databases supporting the Internet and the global economy.

Because `AL32UTF8` is a multibyte character set, it requires slightly more CPU time for text processing compared to single-byte character sets. Also, storage space requirements are higher for text in most languages compared to corresponding legacy character sets. However, the universality and flexibility of Unicode that enables addition of data in new languages to applications running in an `AL32UTF8` database generally outweighs these additional costs.

The database character set of an Oracle Database, that is, of its `CDB$ROOT` container, determines which pluggable databases (PDBs) can be plugged into it. If you use Unicode `AL32UTF8` as your database character set, then you can plug in a PDB in any database character set supported by Oracle Database (with the exception of `EBCDIC`-based character sets). If you use any character set other than `AL32UTF8` when creating the container database, you will be able to plug in PDBs in the same character set only. Therefore, you should generally use the default option for the database character set when installing a new database.

If you need to deploy PDBs in a given legacy character set to fulfill a specific compatibility, storage, or performance requirement, create a temporary container database in this legacy character set with one empty PDB. This PDB will have the same legacy database character set. Then, unplug this PDB and plug it into the target `AL32UTF8` container database. Drop the temporary container database. You can use such a plugged-in PDB as a template to clone further PDBs in the same legacy character set as needed. You can use the same method to add further legacy character set template PDBs to the same `AL32UTF8` container database, as required.

 **See Also:**

*Oracle Database Globalization Support Guide* for more information about choosing a database character set for an Oracle Database.

## Managing Oracle RAC Database Services After Installation

Administer and monitor database services using SRVCTL or Oracle Enterprise Manager Cloud Control.

 **Note:**

Oracle Enterprise Manager Database Express (EM Express) is desupported in Oracle Database Release 23ai.

You cannot use Oracle Database Configuration Assistant (DBCA) to manage database services for Oracle Real Application Clusters (Oracle RAC) databases.

The Server Control (SRVCTL) utility is installed on each node by default. Oracle Enterprise Manager Cloud Control is available separately with the Oracle Enterprise Manager Cloud Control installation, and on the Oracle Technology Network website at:

<https://www.oracle.com/downloads/>

 **See Also:**

*Oracle Enterprise Manager Online Help* for service management using Oracle Enterprise Manager

## Automatic Listener Migration from Earlier Releases

Review this information for listener migration from earlier database releases.

If your system has an Oracle Grid Infrastructure 12c Release 2 (12.2), 18c, 19c, or 21c installation, and you install Oracle Grid Infrastructure 23ai either to coexist with or to upgrade the Oracle Grid Infrastructure 12.2, 18c, 19c, 21c installation, then most installation types automatically migrate the existing listener to the 23ai Oracle home. During migration, the upgrade process configures and starts a default Oracle Net Listener using the same TCP/IP port as the existing listener, with the IPC key value.

During the Oracle Clusterware upgrade, the default listener (`LISTENER_nodename`) is migrated to the Oracle Grid Infrastructure home (Grid home). Oracle Database Configuration Assistant always uses the default listener.

**Note:**

During migration, client applications may not be able to connect to any databases that are registered to the listener that is being migrated.

## Verifying Requirements for Oracle DBCA

Use CVU to verify that your system is prepared for configuration changes before using Oracle DBCA to create Oracle RAC databases.

1. To use Oracle Database Configuration Assistant (Oracle DBCA) to change the database configuration, run Configuration Verification Utility (CVU) to verify that your system is prepared for configuration changes using the following command syntax:

```
/u01/app/23.0.0/grid/bin/cluvfy stage -pre dbcfg -fixup -n node_list -d  
ORACLE_HOME [-verbose]
```

In the preceding syntax example, the variable *node\_list* is the list of nodes in your cluster, separated by commas, and the variable *ORACLE\_HOME* is the path for the Oracle home directory where OUI creates or modifies the database. The *-fixup* flag generates a fixup script that can be run as root to resolve many operating system configuration tasks if they were not completed before you run the check.

2. To verify that your system is prepared for an Oracle Database with Oracle Real Application Clusters (Oracle RAC) installation on a two-node cluster with nodes *node1* and *node2*, with the Oracle Grid Infrastructure home path */u01/app/23.0.0/grid*, and with the Oracle home path */u01/app/oracle/product/23.0.0/dbhome\_1*, enter the following command:

```
$ /u01/app/23.0.0/grid/bin/cluvfy stage -pre dbcfg -fixup -n node1,node2 -  
d  
/u01/app/oracle/product/23.0.0/dbhome_1
```

You can select the option *-verbose* to receive progress updates as CVU performs its system checks, and detailed reporting of the test results.

If the CVU summary indicates that the cluster verification check fails, and you cannot resolve these issues by running the fixup script, then review and correct the relevant system configuration steps, and run the test again.

## Tasks to Complete Before Using Oracle DBCA to Create any Oracle RAC Database

Configure your system to meet the software requirements, if you did not complete your system configuration during the Oracle Grid Infrastructure installation.

- [Load SSH Keys Into Memory Before Starting DBCA](#)  
Load SSH keys into memory for the terminal session where you start Oracle DBCA, to avoid user equivalency errors while starting Oracle DBCA.
- [Decide on a Naming Convention to Use for Your Oracle RAC Database](#)  
Review this information for naming conventions for Oracle RAC database.

- [Configure Shared Storage for the Oracle RAC Database](#)  
Install Oracle Grid Infrastructure for a cluster and configure shared storage for Oracle RAC files before creating an Oracle RAC database using Oracle DBCA.

## Load SSH Keys Into Memory Before Starting DBCA

Load SSH keys into memory for the terminal session where you start Oracle DBCA, to avoid user equivalency errors while starting Oracle DBCA.

If you use a pass phrase on your system for SSH, then you must provide the pass phrase to load the SSH keys.

- Use the following commands to load SSH keys:

```
$ exec /usr/bin/ssh-agent $SHELL
$ /usr/bin/ssh-add
```

If needed, provide the pass phrase when prompted. You can then start Oracle Database Configuration Assistant (Oracle DBCA).

## Decide on a Naming Convention to Use for Your Oracle RAC Database

Review this information for naming conventions for Oracle RAC database.

The global database name can be up to 30 characters in length, and must begin with an alphabetic character. The domain portion of the global database name can be no more than 128 characters and can contain only alphabetic and numeric characters, and the period (.) character.

The maximum number of characters you can use for the SID prefix is 8 characters. DBCA uses the SID prefix to generate a unique value for the variable `ORACLE_SID` for each instance. The SID prefix must begin with an alphabetic character.

## Configure Shared Storage for the Oracle RAC Database

Install Oracle Grid Infrastructure for a cluster and configure shared storage for Oracle RAC files before creating an Oracle RAC database using Oracle DBCA.

Storage administration tasks require the `SYSASM` system privileges, which are granted to members of the `OSASM` operating system group. This group may not be the same as the `OSDBA` group, whose members are granted the `SYSDBA` system privileges.

See *Oracle Grid Infrastructure Installation and Upgrade Guide for Linux* for your platform for more information about shared storage configuration requirements.

## Selecting Oracle DBCA Options to Create an Oracle RAC or Oracle RAC One Node Database

Review this information to use Oracle Database Configuration Assistant (Oracle DBCA) to create an Oracle RAC or Oracle RAC One Node Database.

 **Note:**

You can no longer set up email notification for Oracle Real Application Clusters (Oracle RAC) databases either from Oracle DBCA or Oracle Universal Installer (OUI).

- [Starting Oracle DBCA](#)  
Start Oracle Database Configuration Assistant (Oracle DBCA) in GUI mode to create and manage Oracle RAC databases.
- [Cluster Detection and Node Selection when Using Oracle DBCA](#)  
Oracle DBCA automatically shows Oracle RAC options at startup if it detects from the central Oracle Inventory that the Oracle home is enabled for Oracle RAC.
- [Using Oracle DBCA to Select Storage to Use With any Oracle RAC Database](#)  
Choose from Oracle ASM disk groups or a supported cluster file system to store Oracle RAC database files.
- [Using DBCA to Specify Database Initialization Parameters for Oracle RAC](#)  
Specify initialization parameters if you intend to add more nodes in your cluster.
- [Actions Performed By DBCA for Oracle RAC Databases](#)  
Review this information to understand about DBCA actions during Oracle RAC database creation.

## Starting Oracle DBCA

Start Oracle Database Configuration Assistant (Oracle DBCA) in GUI mode to create and manage Oracle RAC databases.

1. Log in as the software installation owner user, for example `oracle`.
2. Start Oracle DBCA by running the following command:

```
$ $ORACLE_HOME/bin/dbca
```

 **Note:**

You no longer need to set the operating system environment variables `ORACLE_HOME` to the Oracle RAC database home, or `ORACLE_UNQNAME` to the database unique name.

## Cluster Detection and Node Selection when Using Oracle DBCA

Oracle DBCA automatically shows Oracle RAC options at startup if it detects from the central Oracle Inventory that the Oracle home is enabled for Oracle RAC.

If DBCA does not automatically display Oracle RAC options, then DBCA was unable to detect if the Oracle home is installed on a cluster. In this case, perform the following steps to make the nodes visible to Oracle DBCA.

1. Check that the OUI inventory is correctly located in the directory `/etc/oraInst.loc`, and that the `oraInventory` file is not corrupted.

2. Perform Oracle Clusterware diagnostics by using the following CVU command:

```
$ /u01/app/23.0.0/grid/bin/cluvfy/cluvfy.sh stage -post crsinst -n nodelist
```

Note that when using DBCA, if nodes that are part of your cluster installation do not appear on the Node Selection page, then run the `Opatch lsinventory` command to perform inventory diagnostics. Also use CVU to perform clusterware diagnostics.

On the Management Options page, you are provided option for managing the database with Oracle Enterprise Manager Cloud Control.

## Using Oracle DBCA to Select Storage to Use With any Oracle RAC Database

Choose from Oracle ASM disk groups or a supported cluster file system to store Oracle RAC database files.

On the **Specify Database Storage Options** page, if you do not see the disk groups in Oracle Database Configuration Assistant (Oracle DBCA), then either Oracle ASM is not configured, or disk groups are not mounted. You can create disk groups using Automatic Storage Management Configuration Assistant (ASMCA) in the Oracle Grid Infrastructure home before starting Oracle DBCA.

If you are using Oracle ASM or cluster file system storage, then you can also select the fast recovery area and size on this page. If you are using Oracle ASM, then the Fast Recovery Area (FRA) defaults to the Oracle ASM disk group.

## Using DBCA to Specify Database Initialization Parameters for Oracle RAC

Specify initialization parameters if you intend to add more nodes in your cluster.

On the Initialization Parameters page, if you intend to add more nodes in your cluster than you have during the current DBCA session, then click **All Initialization Parameters**, and change the parameter `CLUSTER_DATABASE_INSTANCES` to the total number of nodes that you plan to add to the cluster.

If you click **All Initialization Parameters**, note that if your global database name is longer than 8 characters, then the database name value (in the `DB_NAME` parameter) is truncated to the first 8 characters, and the `DB_UNIQUE_NAME` parameter value is set to the global name.

If you are installing on a Linux system, note that **Memory Size (SGA and PGA)**, which sets the initialization parameter `MEMORY_TARGET` or `MEMORY_MAX_TARGET`, cannot be greater than the shared memory file system on your operating system.

For example, if the shared memory file system allocation on your system is 1 GB, but you set Memory Size (`MEMORY_TARGET`) to 2 GB, then you receive the following error during database startup:

```
ORA-00845: MEMORY_TARGET not supported on this system
ORA-01078: Failure in processing system parameters
```

This issue is not relevant for other platforms.

### See Also:

*Oracle Database Administrator's Guide* for information about initialization parameters

## Actions Performed By DBCA for Oracle RAC Databases

Review this information to understand about DBCA actions during Oracle RAC database creation.

After you respond to DBCA prompts, review the Summary dialog information and click **OK**, DBCA does the following:

- Creates an Oracle RAC database, and its instances
- Creates the Oracle RAC data dictionary views
- Starts the CRS (Cluster Ready Service) resource for the database

### Caution:

After you have created the Oracle RAC database, if you decide to install additional Oracle Database products in the Oracle RAC database you have created, then before you attempt to install the products, you must stop all processes running in the Oracle RAC database homes.

You must stop all processes running in the Oracle RAC homes so that Oracle Universal Installer can relink certain executables and libraries.

## Using DBCA to Create an Oracle RAC One Node Database

Configure Oracle RAC One Node database using Oracle DBCA after creating a software-only setup of Oracle RAC software on cluster nodes.

After installation of Oracle Real Application Clusters (Oracle RAC) software, start Oracle Database Configuration Assistant (Oracle DBCA).

1. From the Database Operation page, select the option **Create Database**.
2. On the Creation Mode page, select **Advanced Configuration**.
3. On the Deployment Type page, select **Oracle RAC One Node database**.

Selecting one node deploys Oracle RAC One Node on a single node. Oracle recommends that you select all nodes in the cluster to which you want Oracle RAC One Node to be able to fail over.

When you use DBCA to create an Oracle RAC One Node database, a failover service is automatically configured.

## Installing the Oracle Database Vault Option

Installing and configuring Oracle Database Vault requires actions during and after installation.

- [Starting the Listener with Oracle Database Vault Installations](#)  
You must start the listener and database instance on all Oracle RAC nodes including the node on which the installation is performed.
- [Configuring Oracle Database Vault Using Oracle DBCA](#)  
You can configure Oracle Database Vault using Oracle DBCA after installation, or choose not to configure Oracle Database Vault.

 **See Also:**

*Oracle Database Vault Administrator's Guide* for information about the Database Vault accounts and roles that are configured during installation

## Starting the Listener with Oracle Database Vault Installations

You must start the listener and database instance on all Oracle RAC nodes including the node on which the installation is performed.

You must use Server Control (SRVCTL) to start and stop the Oracle RAC instances being configured for Oracle Database Vault. Do not use SQL\*Plus to start and stop Oracle RAC instances.

 **See Also:**

*Oracle Database Vault Administrator's Guide* for more information about default Oracle Database Vault configuration

## Configuring Oracle Database Vault Using Oracle DBCA

You can configure Oracle Database Vault using Oracle DBCA after installation, or choose not to configure Oracle Database Vault.

Perform the following steps to install Oracle Database Vault using Oracle Database Configuration Assistant (Oracle DBCA):

1. After installing Oracle RAC, create the database.
2. Start DBCA and select the option **Configure Database**.
3. In the component list, select **Oracle Label Security** and **Oracle Database Vault**.
4. Provide the required Oracle Database Vault user IDs and passwords to proceed with configuration. To enable a separate Oracle Database Vault administrator, choose to configure the DV\_ACCTMGR user.
5. After you have finished, restart each database instance to finish the software configuration.

 **See Also:**

*Oracle Database Vault Administrator's Guide* for information about using Oracle Data Guard with Oracle Database Vault

## Deleting an Oracle RAC Database Using Oracle DBCA

Delete an Oracle RAC database using Oracle Database Configuration Assistant (Oracle DBCA) with all of the database components.

Deleting an Oracle Real Application Clusters (Oracle RAC) database using Oracle DBCA involves first deleting the database, and then removing the database's initialization parameter files, instances, Optimal Flexible Architecture (OFA) structure, and the Oracle network configuration for the database.

1. Start DBCA on one of the nodes:
  - Run the `dbca` command from the `$ORACLE_HOME/bin` directory.DBCA displays the Operations page, displaying different database deployment options.
2. Select **Delete a database**, and click **Next**. DBCA displays a list of all Oracle RAC and single-instance databases running from the Oracle home where DBCA is run.
3. If your user ID and password are not operating-system authenticated, then the List of Cluster Databases page displays the user name and password fields. If these fields appear, then enter a user ID and password for a user account that has `SYSDBA` privileges.
4. Select the database to delete, and click **Finish**.

After you click **Finish**, DBCA displays a dialog box to confirm the database and instances that you have configured DBCA to delete.
5. Click **OK** to begin the deletion of the database and its associated files, services, and environment settings, or click **Cancel** to stop the operation.

When you click **OK**, DBCA continues the operation and deletes all the associated instances for this database. DBCA also removes the parameter files, password files, and `oratab` entries.

At this point, you have accomplished the following:

- Deleted the selected Oracle RAC database from the cluster
- Deleted high availability services assigned to the Oracle RAC database
- Deleted the Oracle Net configuration for the Oracle RAC database
- Deconfigured Oracle Enterprise Manager for the Oracle RAC database
- Deleted the OFA directory file structure for that Oracle RAC database from the cluster
- Deleted the Oracle RAC database data files

# 4

## Oracle Real Application Clusters Postinstallation Procedures

Review this information to complete the postinstallation tasks after you have installed Oracle Real Application Clusters (Oracle RAC).

### Note:

This chapter describes only basic configurations. Refer to *Oracle Database Administrator's Guide*, and the product administration and tuning guides for more detailed configuration and tuning information.

- [Oracle Database Patching](#)  
After you upgrade to Oracle Database 23ai, you can install patches either as gold images or individual software patches by downloading the patches from My Oracle Support.
- [Required Postinstallation Tasks](#)  
Download and apply required patches for your software release after completing your initial installation.
- [Recommended Postinstallation Tasks](#)  
Oracle recommends that you complete these tasks after installation.
- [Product-Specific Postinstallation Tasks](#)  
You must complete postinstallation tasks before you can use some Oracle Database features.
- [Enabling and Disabling Oracle Database Options After Installation](#)  
The `chopt` tool changes your database options after installation.

## Oracle Database Patching

After you upgrade to Oracle Database 23ai, you can install patches either as gold images or individual software patches by downloading the patches from My Oracle Support.

- [About Oracle Database Release Update Patches](#)  
Oracle provides quarterly updates in the form of Release Updates (RUs) to release new features, upgrade existing features, enhance security, or fix problems with supported software.
- [Downloading Release Update Patches](#)  
Download and install Release Updates (RU) and Monthly Recommended Patches (MRPs) patches for your Oracle software after you complete your installation.
- [Applying Out-of-Place Oracle Database Patches](#)  
Use this procedure on the local cluster node to perform out-of-place patching of Oracle Real Application Clusters (Oracle RAC) database.

## About Oracle Database Release Update Patches

Oracle provides quarterly updates in the form of Release Updates (RUs) to release new features, upgrade existing features, enhance security, or fix problems with supported software.

Starting with Oracle Database 23ai, RUs are delivered in two formats:

- As a gold image that you can install out-of-place like a new software release.
- As a binary patch that you can apply in-place using OPatch or OPatchAuto.

You can apply out-of-place Oracle Database patches using the following steps:

1. Download the RU as a gold image.
2. Create a new Oracle home (target) identical to the old Oracle home (source) in the same Oracle base as the source Oracle home, using `runInstaller -setupDBHomeAs`.
3. Move Oracle Database from the old Oracle home to the new Oracle home using DBCA.

After you move the database to the new Oracle home, all database services will start from the new home.

## Downloading Release Update Patches

Download and install Release Updates (RU) and Monthly Recommended Patches (MRPs) patches for your Oracle software after you complete your installation.

Oracle provides quarterly updates in the form of Release Updates (RU) and Monthly Recommended Patches (MRPs). Oracle no longer releases patch sets. For more information, see [My Oracle Support Note 2285040.1](#).

Check the My Oracle Support website for required updates for your installation.

1. Log in to the My Oracle Support website:

<https://support.oracle.com>

 **Note:**

If you are not a My Oracle Support registered user, then click **Register for My Oracle Support** and register.

2. On the main My Oracle Support page, click **Patches & Updates**.
3. In the **Patch Search** region, select **Product or Family (Advanced)**.
4. On the **Product or Family (Advanced)** display, provide information about the product, release, and platform for which you want to obtain patches, and click **Search**.

The Patch Search pane opens, displaying the results of your search.

5. Select the patch number and click **ReadMe**.

The README page is displayed. It contains information about the patch and how to apply the patches to your installation.

6. Uncompress the Oracle patch updates that you downloaded from My Oracle Support.

 **Note:**

The use of OPatch and OPatchAuto for out-of-place patching continues to be deprecated.

For patching in Oracle Database 23ai, Oracle recommends that you use out-of-place patching using Gold images to apply quarterly release updates (RUs). This deprecation does not affect in-place patching. If you want to perform in-place patching, then OPatch and OPatchAuto continue to be available for this purpose. The Oracle Database 23ai Free release is not supported for patching with RUs.

**Related Topics**

- [My Oracle Support note 888.1](#)
- [Patch Delivery Methods for Oracle Database](#)

## Applying Out-of-Place Oracle Database Patches

Use this procedure on the local cluster node to perform out-of-place patching of Oracle Real Application Clusters (Oracle RAC) database.

1. Download the gold image of the desired Release Update (RU) on the first node and extract the files into a new Oracle home directory. For example:

```
$ mkdir -p /u01/app/oracle/product/23.5.0/dbhome_1
$ chgrp oinstall /u01/app/oracle/product/23.5.0/dbhome_1
$ cd /u01/app/oracle/product/23.5.0/dbhome_1
$ unzip -q /tmp/23_5_ru.zip
```

2. Configure a new Oracle home identical to the old Oracle home on the local cluster node using `runInstaller`.

```
$ ./runInstaller -silent -setupDBHomeAs source_oracle_home -
clusterNodes=Node1,Node2,Node3..NodeN
```

Where `-clusterNodes=Node1,Node2,Node3..NodeN` is the list of all the Oracle RAC nodes.

 **Note:**

You must specify all the nodes on which Oracle RAC database is running, else the patching will fail.

This step retrieves configuration information, such as users and groups used for installing Oracle Database software for the first time, and installs the Oracle Database software in the new Oracle home.

3. On the local node, move Oracle Database from the old home to the new home using the Oracle DBCA command-line interface. Run the following Oracle DBCA command from the new Oracle home.

```
$ /u01/app/oracle/product/23.5.0/dbhome_1/bin/dbca -silent -moveDatabase -  
sourceDB source_DB_name
```

Where, `-sourceDB` is the database unique name (`DB_UNIQUE_NAME`) for Oracle RAC database or system identifier (`ORACLE_SID`) for single-instance Oracle Database.

Refer to *Oracle Multitenant Administrator's Guide* for additional Oracle DBCA commands and options for Oracle Real Application Clusters (Oracle RAC) and single-instance Oracle Database.

Alternatively, you can also use Oracle DBCA in GUI mode to perform out-of-place Oracle Database patching.

#### Related Topics

- [Downloading Release Update Patches](#)  
Download and install Release Updates (RU) and Monthly Recommended Patches (MRPs) patches for your Oracle software after you complete your installation.
- `moveDatabase`

## Required Postinstallation Tasks

Download and apply required patches for your software release after completing your initial installation.

- [Setting External Jobs Ownership for HP-UX Installations](#)  
On HP-UX platforms only, set external jobs ownership to a low-privilege user.
- [Setting the Oracle User Environment Variables](#)  
Set the environment variables in the installation owner user profile file on each cluster node.
- [Recompile Invalid Objects in the Database](#)  
After you install, patch, or upgrade a database, recompile invalid objects on the CDB and PDBs with a recompilation driver script.
- [Configuring Services on Oracle RAC and Oracle RAC One Node Databases](#)  
You must add services to the PDBs after installation, if you add PDBs after installation.
- [Copying Oracle ASM Password File For Oracle RAC One Node Database](#)  
Copy the Oracle ASM password file, if configured, to all candidate nodes configured for fail over after installing Oracle RAC One Node database.

## Setting External Jobs Ownership for HP-UX Installations

On HP-UX platforms only, set external jobs ownership to a low-privilege user.

Complete the following procedure to set external jobs ownership to the low-privilege user `extjob`:

1. Log in as `root`.

2. Go to the Oracle Database Oracle home directory:

```
# cd $ORACLE_HOME/rdbms/admin/
```

3. Open `externaljob.ora` with a text editor, and find the parameters `run_user` and `run_group`.

Modify `externaljob.ora` only as root.

4. Set `run_user` to the external jobs user (`extjob`), and set `run_group` to a low-privileged group, such as `other`, for example:

```
run_user=extproc  
run_group=other
```

5. Save the file.

## Setting the Oracle User Environment Variables

Set the environment variables in the installation owner user profile file on each cluster node.

You need to set `ORACLE_BASE` and `ORACLE_HOME`, and `ORACLE_SID`; also add `ORACLE_HOME/bin` to the path environment variable.

- Set environment variables as shown, in the following example:

```
export ORACLE_BASE=/u01/app/oracle  
export ORACLE_HOME=/u01/app/oracle/product/23.0.0/dbhome_1  
export PATH=$PATH:$ORACLE_HOME/bin  
export ORACLE_SID=sales1
```

If the environment variables `ORACLE_HOME` and `ORACLE_SID` are not set, and you try to use SQL\*Plus or other tools, then you receive an error message requesting that you set these variables.

## Recompile Invalid Objects in the Database

After you install, patch, or upgrade a database, recompile invalid objects on the CDB and PDBs with a recompilation driver script.

By default, AutoUpgrade performs a recompilation of invalid Oracle objects, which is controlled by the configuration file `run_utlprp` local parameter (default: `prefix.run_utlprp=yes`). In addition, Oracle provides the recompilation scripts `utlprp.sql`, `utlprp.sql`, and `utlprpom.sql`. These scripts are located in the `Oracle_home/rdbms/admin` directory.

### Note:

Starting with AutoUpgrade 23.1, when you run the AutoUpgrade utility, AutoUpgrade runs the `utlprpom.sql` script, and does not run `utlprp.sql`. When AutoUpgrade is used for upgrades to Oracle Database 12c Release 2 (12.2.0.1) and later releases, AutoUpgrade only recompiles invalid objects owned by Oracle-maintained schemas. Because database upgrades do not need to touch user objects, AutoUpgrade maintains this policy when it recompiles invalid objects.

After installing a database, recompile all invalid objects;

1. Change directory to `Oracle_home/rdbms/admin`. For example

```
$ cd $ORACLE_HOME/rdbms/admin
```

2. Use the `catcon.pl` script in the Oracle home to run `utlrp.sql`. For example:

```
$ORACLE_HOME/perl/bin/perl catcon.pl --n 1 --e --b utlrp --d '',''
utlrp.sql
```

Note the following conditions of this use case:

- `--n` parameter: is set to 1, so the script runs each PDB recompilation in sequence.
- `--e` parameter: turns echo on.
- `--b` parameter: Sets the log file base name. It is set to `utlrp`.

Expect a time delay for the serial recompilation of PDBs to complete. Depending on the number of PDBs that you are upgrading, the recompilation can extend significantly beyond the time required for the upgrade scripts to complete.

The `utlrp.sql` script automatically recompiles invalid objects in either serial or parallel recompilation, based on both the number of invalid objects, and on the number of CPUs available. CPUs are calculated using the number of CPUs (`cpu_count`) multiplied by the number of threads for each CPU (`parallel_threads_per_cpu`). On Oracle Real Application Clusters (Oracle RAC), this number is added across all Oracle RAC nodes.

After patching or upgrading a database, there is more than one approach you can use to recompile invalid Oracle-owned and user-owned objects:

Recompile all invalid objects (the invalid objects in both Oracle and user schemas) by using `utlrp.sql` or `utlprp.sql`.

If time is a factor and the type of invalid objects is predominately application owned, then you can recompile Oracle-owned invalid objects first, and defer recompiling application-owned invalid objects to a later time. To recompile invalid objects in Oracle schemas, use `utlprpom.sql`. To recompile the remaining invalid objects, use `utlrp.sql` or `utlprp.sql`.

#### Note:

When you use either `utlprp.sql` or `utlprpom.sql`, note that both scripts require you to define the degree of parallelism that the script should use, or determine the number of parallel recompile jobs to use.

The script uses syntax as follows, where *base* is the base name you want to have given to log files, *N* is the number of PDBs on which you want to run recompilation jobs in parallel (degrees of parallelism), *script.sql* is the Oracle recompilation script you chose to use, and *P* is the number of PDBs on which you want to run in parallel:

```
$ORACLE_HOME/perl/bin/perl $ORACLE_HOME/rdbms/admin/catcon.pl -b base -
d $ORACLE_HOME/rdbms/admin
    -n N -l /tmp script.sql '--pP'
```

Suppose you are running recompilation in a CDB using the log file base name `recomp`, with a degrees of parallelism setting of 3 jobs per PDB container, the script you choose to use is `utlprp.sql`, and you want to recompile across at most 10 PDBs at a time. In that case, the syntax you use to run the recomp operation is similar to the following,

```
$ORACLE_HOME/perl/bin/perl $ORACLE_HOME/rdbms/admin/catcon.pl -b recomp -  
d $ORACLE_HOME/rdbms/admin -n 10 -l /tmp utlprp.sql '--p3'
```

### Related Topics

- Syntax and Parameters for `catcon.pl`

## Configuring Services on Oracle RAC and Oracle RAC One Node Databases

You must add services to the PDBs after installation, if you add PDBs after installation.

If you do not add services to pluggable databases (PDBs), and then the Oracle RAC One Node multitenant container database (CDB) fails over to another node, or you manually relocate the CDB to another node, then by default, all PDBs associated with the CDB that do not have registered services are restarted in `MOUNTED` state.

PDBs are opened in Read-Write mode after failover, in case of Oracle RAC One Node database, or relocation in case of any Oracle RAC database, only after you have configured the PDBs to have associated services. If you have not associated services to PDBs, then the PDBs remains in `MOUNTED` state when the CDB instance restarts.

- Use the following `srvctl` command syntax to add services to a PDB, where `cdbname` is the name of the CDB, `service_name` is the name of the service, and `pdbservice` is the name of the PDB:

```
srvctl add service -d cdbname -s service_name -pdb pdbservice
```

After you add services to your PDBs, if you relocate the CDB with which the PDBs are associated, or the CDB fails over for Oracle RAC One Node databases, then the PDBs associated with that CDB automatically open in Read-Write state.

### See Also:

*Oracle Database Concepts and Oracle Real Application Clusters Administration and Deployment Guide* for more information about PDBs and adding services

## Copying Oracle ASM Password File For Oracle RAC One Node Database

Copy the Oracle ASM password file, if configured, to all candidate nodes configured for fail over after installing Oracle RAC One Node database.

If you install Oracle RAC One Node database using Oracle Database Configuration Assistant (Oracle DBCA) and do not use shared password files stored in Oracle ASM, then you need not perform this task since DBCA copies the Oracle ASM password file to a shared location.

### See Also:

*Oracle Real Application Clusters Administration and Deployment Guide* for information about administering Oracle RAC One Node

## Recommended Postinstallation Tasks

Oracle recommends that you complete these tasks after installation.

- [Setting Up Additional User Accounts](#)  
You can set up additional user accounts to manage your database.
- [About Installing Oracle Autonomous Health Framework](#)  
Oracle Autonomous Health Framework is pre-installed with Oracle Database.

### Setting Up Additional User Accounts

You can set up additional user accounts to manage your database.

For information about setting up additional optional user accounts, see *Oracle Database Security Guide*.

### About Installing Oracle Autonomous Health Framework

Oracle Autonomous Health Framework is pre-installed with Oracle Database.

Oracle Autonomous Health Framework performs proactive health checks and collects diagnostics data for the Oracle software stack. Oracle Autonomous Health Framework updates are available on My Oracle Support and also shipped with Oracle Database Release Updates.

Oracle recommends that you update to the latest version of Oracle Autonomous Health Framework by either applying the latest Database Release Updates or by downloading and installing it from My Oracle Support Note 2550798.1:

<https://support.oracle.com/epmos/faces/DocContentDisplay?id=2550798.1&parent=DOCUMENTATION&sourceId=USERGUIDE>

Oracle Autonomous Health Framework includes the functionality from Oracle ORAchk, Oracle EXAchk, and Oracle Trace File Analyzer (TFA). Oracle Autonomous Health Framework extends health check coverage to the entire Oracle software stack, based on critical and reoccurring problems. Oracle Autonomous Health Framework proactively scans for known problems with Oracle products and deployments, including the following:

- Single-instance Oracle Database
- Oracle Grid Infrastructure
- Oracle Real Application Clusters
- Maximum Availability Architecture (MAA) Validation
- Upgrade Readiness Validations
- Oracle GoldenGate
- Oracle Exadata
- Oracle SuperCluster

- Oracle Zero Data Loss Recovery Appliance

#### Related Topics

## Product-Specific Postinstallation Tasks

You must complete postinstallation tasks before you can use some Oracle Database features.

- [Configuring Oracle Database Vault](#)  
You must register Oracle Database Vault with Oracle RAC database and create database user accounts before you can use Oracle Database Vault feature.
- [Configuring Oracle Label Security](#)  
You must configure Oracle Label Security after Oracle RAC database installation to use Oracle Label Security feature.
- [Configuring Oracle XML DB](#)  
Oracle XML DB is a required component of the Oracle Database installation. However, you must manually configure the FTP and HTTP ports for Oracle XML DB.
- [Configuring Storage for External Tables, Shared Files, or Directory Objects](#)  
Store external tables, shared files, or directory objects on shared storage that is accessible to all cluster nodes.

### Configuring Oracle Database Vault

You must register Oracle Database Vault with Oracle RAC database and create database user accounts before you can use Oracle Database Vault feature.

Oracle Universal Installer (OUI) installs Oracle Database Vault by default when you install the Oracle Real Application Clusters (Oracle RAC) software, but you must register Oracle Database Vault with the Oracle RAC database and create database user accounts before you can use it. You must create the Database Vault Owner user and, optionally, the Database Vault Account Manager administrative user accounts.

### Configuring Oracle Label Security

You must configure Oracle Label Security after Oracle RAC database installation to use Oracle Label Security feature.

**Table 4-1 Options to Configure Oracle Label Security After Installation**

Configuration	Requirement
With Oracle Internet Directory integration	To configure Oracle Label Security with Oracle Internet Directory integration, Oracle Internet Directory must be installed in your environment and the Oracle database must be registered in the directory.
Without Oracle Internet Directory integration	If you configure Oracle Label Security (OLS) without Oracle Internet Directory integration, then you cannot configure it to use Oracle Internet Directory at a later stage. To configure Oracle Label Security with Oracle Internet Directory on your database at a later time, you must remove the OLS option on the database, and then configure the OLS with Oracle Internet Directory integration option.

 **See Also:**

*Oracle Label Security Administrator's Guide* for information about configuring Oracle Label Security

## Configuring Oracle XML DB

Oracle XML DB is a required component of the Oracle Database installation. However, you must manually configure the FTP and HTTP ports for Oracle XML DB.

 **See Also:**

*Oracle XML DB Developer's Guide* for information on configuring the FTP and HTTP protocols for Oracle XML DB

## Configuring Storage for External Tables, Shared Files, or Directory Objects

Store external tables, shared files, or directory objects on shared storage that is accessible to all cluster nodes.

If your Oracle RAC database uses files that are external to the database, then locate the external files on shared storage that is accessible to all nodes. Each node should use the same mount point to access the file.

Acceptable shared file systems include Database File System (DBFS), Oracle Advanced Cluster File System (Oracle ACFS), or a supported network file system (NFS) using the Direct NFS Client.

The database directory object used to write and read files external to the database must point to a shared storage location, and each node must use the same mount point for the same shared storage location.

 **Note:**

There is no checking of the contents of the external files or directory object specified as part of the external table to ensure that the directory contents are consistent on each node. To avoid unpredictable results, you must ensure that the same file is accessed from all nodes, or that the same file is used on all nodes.

 **See Also:**

*Oracle Grid Infrastructure Installation and Upgrade Guide for Linux* for more information about configuring storage.

# Enabling and Disabling Oracle Database Options After Installation

The `chopt` tool changes your database options after installation.

When you install Oracle Database, some options are enabled and others are disabled. To enable or disable a particular database feature for an Oracle home, shut down the database and use the `chopt` tool.

- [Chopt Tool](#)  
Use the `chopt` tool after installation to add or remove Oracle Database options.

## Chopt Tool

Use the `chopt` tool after installation to add or remove Oracle Database options.

### Purpose

The `chopt` tool is a command-line utility that enables and disables database options.

### Note:

If you install or clone an Oracle Database image, then all Oracle Database options are enabled by default.

### Prerequisites

You must complete installation before you can use the `chopt` tool.

### File Path

The tool is located in the `ORACLE_HOME/bin` directory

### Syntax

```
chopt [enable | disable] db_option
```

### Options

Command Option	Description
<code>partitioning</code>	Oracle Partitioning
<code>rat</code>	Oracle Real Application Testing
<code>olap</code>	Oracle OLAP

 **Note:**

- Analytic workspaces, the OLAP DML programming language, financial reporting, and the OLAP Java API continue to be deprecated in Oracle Database 23ai.
- Be aware that OLAP will not be supported beyond the term of the current release (Oracle Database 23ai) premier support. Oracle strongly recommends that you do not start new projects using OLAP and begin migrating applications using OLAP to alternatives now. If your application requires an in-database dimensional model, then consider using Oracle Analytic Views. Analytic views provide a dimensional semantic model, calculations, and query semantics using data in Oracle Database. When used with columnar tables, analytic views provide query performance similar to the OLAP Option. If your application requires support for advanced dimensional analytics, what-if analysis, or forecasting, then consider Oracle Essbase. Oracle Essbase is a multidimensional database management system with support for complex dimensional business analytics.

 **Note:**

The Oracle Advanced Analytics (OAA) feature is enabled by default for Oracle Database. You cannot disable it using the `chopt` tool.

## Examples

To use the `chopt` tool to modify your Oracle Database, you must shut down the database before you run the `chopt` tool, and then start up the database after you add or remove database options.

### Example 4-1 Enabling Oracle Real Application Testing Using `chopt`

The following example shows how to use the `chopt` tool to enable the Oracle Real Application Testing option in an Oracle Database called Sales:

```
cd $ORACLE_HOME/bin
srvctl stop database -d Sales
chopt enable rat
srvctl start database -d Sales
```

# 5

## Understanding the Oracle RAC Installed Configuration

Understand the groups and environment settings for the Oracle Real Application Clusters (Oracle RAC) installed configuration.

Review this information to understand the Oracle Net Services configuration files and parameters for an Oracle RAC database.

## Understanding the Configured Environment in Oracle RAC

Oracle NETCA and Oracle DBCA configure your environment to meet the requirements for database creation and Oracle Enterprise Manager discovery of the databases.

**Note:**

Oracle Net Configuration Assistant (NETCA) and Database Configuration Assistant (DBCA) create configuration files on each node in your cluster.

Avoid changing host names after you complete your Oracle RAC installation, including adding or deleting domain qualifications. Node names are created from the host names during an Oracle Clusterware installation and are used extensively with database processes. Nodes with changed host names must be deleted from the cluster and added back with the new host names.

## Understanding Operating System Privileges Groups

Review this information for system privileges required for Oracle Database or Oracle Automatic Storage Management (Oracle ASM) administration.

As an administrator, you often perform special operations such as shutting down or starting up a database, or configuring storage. Because only an administrator responsible for these administration decisions must perform these operations, system privileges for Oracle Database or Oracle Automatic Storage Management (Oracle ASM) administration require a secure authentication scheme.

Membership in special operating system groups enables administrators to authenticate to Oracle Database or Oracle ASM through the operating system rather than with a user name and password. This is known as **operating system authentication**. Each Oracle Database in a cluster can have its own operating system privileges groups, so that operating system authentication can be separated for each Oracle Database on a cluster. Because there can be only one Oracle Grid Infrastructure installation on a cluster, there can be only one set of operating system privileges groups for Oracle ASM.

During installation of Oracle Grid Infrastructure and Oracle Database, you provide the group names of operating system groups. These operating system groups are designated with the logical role of granting operating system group authentication for administration system privilege for Oracle Database and Oracle ASM.

In an Oracle RAC cluster, the group ID number (GID) for system privileges groups must be identical on each cluster member node. One operating system group can be designated the logical group whose members are granted all system privileges for Oracle Database and Oracle ASM, including the `OINSTALL` system privileges for installation owners. You can also delegate logical system privileges to two or more actual operating system groups. Oracle recommends that you designate separate operating system groups for each logical system privilege. This enables you to grant one or more subsets of administrator system privileges to database administrators. These database administrators can then perform standard database administration tasks without requiring the `SYSDBA` system privileges.

System privileges groups are listed in the following table:

**Table 5-1 Role-Allocated Oracle System Privileges Operating System Groups**

Logical Operating System Group Name	Default Actual UNIX or Linux Group Name	System Privileges Authenticated By Group Membership
OINSTALL	oinstall	Install system privileges for installation owners, which includes privileges to write to the central oraInventory directory for each server, and other privileges granted to Oracle binary installation owner users.
OSDBA	dba	SYSDBA system privileges for an Oracle Database, which includes all system privileges for the database.
OSOPER	oper	SYSOPER startup and shutdown system privileges for an Oracle Database.
OSBACKUPDBA	backupdba	SYSBACKUP backup and recovery system privileges for an Oracle Database.
OSDGDBA	dgdba	SYSDBG system privileges to administer and monitor Oracle Data Guard.
OSKMDBA	kmdba	SYSKM system privileges for encryption key management for applications such as Oracle Wallet Manager.
OSASM	asmadmin	SYSASM system privileges for Oracle ASM on a cluster, which includes all system privileges for Oracle ASM storage.
OSOPER for ASM	asmoper	SYSOPER startup and shutdown system privileges for Oracle ASM on the cluster.
OSDBA for ASM	asmdba	SYSDBA for ASM system privileges to obtain read and write access to files managed by Oracle ASM. All Oracle Database software owners must be a member of this group.
OSRACDBA	racdba	SYSRAC privileges to perform day to day administration of Oracle databases on an Oracle RAC cluster. All Oracle Database software owners must be a member of this group.

 **See Also:**

- *Oracle Database Administrator's Guide* for more information about operating system groups and Oracle Database system privileges
- *Oracle Automatic Storage Management Administrator's Guide* for more information about operating system groups and Oracle ASM system privileges

## Understanding Time Zone Settings on Cluster Nodes

Oracle RAC requires that all cluster nodes have the same time zone setting.

During an Oracle Grid Infrastructure for a cluster installation, the installation process determines the time zone setting of the Grid installation owner on the node where Oracle Universal Installer (OUI) runs. OUI uses that time zone value on all of the nodes as the default time zone setting for all processes that Oracle Clusterware manages. This default setting is used for databases, Oracle ASM, and any other managed processes. However, if you start an instance with SQL\*Plus, you must ensure that the time zone value that Oracle RAC uses is the same as the Oracle Clusterware time zone. You can change the time zone that Oracle Clusterware uses for a database by running the command `srvctl setenv database -env 'TZ=time zone'`

## Understanding the Server Parameter File for Oracle RAC

Oracle Database creates an SPFILE, during database creation, either in an Oracle ASM disk group or a cluster file system in the location that you specify.

All instances in the cluster database use the same SPFILE at startup. Do not directly edit the SPFILE with an editor because the SPFILE is a binary file. Instead, change SPFILE parameter settings using Oracle Enterprise Manager or `ALTER SYSTEM SQL` statements.

### See Also:

*Oracle Real Application Clusters Administration and Deployment Guide* for information about creating and modifying SPFILE

## About ORATAB Configuration for Oracle RAC

Oracle creates an entry for each Oracle RAC database in the `oratab` configuration file.

The `oratab` file is created by the `root.sh` script during installation, and it is updated by the Database Configuration Assistant when creating or deleting a database.

Oracle ASM Agent creates Oracle ASM `oratab` entries if the node is pinned in the CSS. The `oratab` file entry is also created automatically by the Database Agent when a database is first started on a node where it has not run previously, if your system meets any of the following conditions:

- The database is a single instance Oracle Database
- The database is an admin-managed Oracle RAC database

Oracle Enterprise Manager uses the `oratab` file during service discovery to determine the name of the Oracle RAC database, and to determine if the database must be started automatically when the system is restarted.

The database entry has the following syntax:

```
$DB_UNIQUE_NAME:$ORACLE_HOME:N
```

A colon (:) is used as the field terminator. A new line terminates the entry. Lines beginning with a pound sign (#) are comments. Because all the instances of an Oracle RAC database have the same `DB_UNIQUE_NAME`, but each instance has its own `ORACLE_SID`, use the `$DB_UNIQUE_NAME` environment variable in the `oratab` file as the database entry.

The `$DB_UNIQUE_NAME` identifier for your Oracle RAC database must be unique across your enterprise. `$ORACLE_HOME` is the directory path to the database, and `N` indicates that the database should not be started at restart time. The following is an example entry for a database named `sales`:

```
sales:/u01/app/oracle/sales:N
```

## Database Components Created Using Oracle DBCA

Understand the database components that Oracle Database Configuration Assistant (Oracle DBCA) creates.

- [About Tablespaces and Data Files](#)  
For both single-instance and cluster database environments, Oracle Database is divided into smaller logical areas of space known as tablespaces.
- [About Control Files](#)  
The database is configured with two control files that must be stored on shared storage.
- [About Online Redo Log Files](#)  
Each database instance must have at least two online redo log files.

### About Tablespaces and Data Files

For both single-instance and cluster database environments, Oracle Database is divided into smaller logical areas of space known as tablespaces.

**Note:**

Starting with Oracle Database 23ai, databases created with Oracle DBCA templates have the default tablespace type as bigfile, including `SYSTEM`, `SYSAUX`, and `USER`.

Each tablespace corresponds to one or more data files on the shared storage. The following table shows the tablespace names used by an Oracle RAC database and the types of data they contain.

**Table 5-2 Tablespace Names Used with Oracle Real Application Clusters Databases**

Tablespace Name	Contents
<code>SYSAUX</code>	An auxiliary system tablespace that contains the <code>DRSYS</code> (contains data for Oracle Text), <code>CWMLITE</code> , <code>XDB</code> (for XML features), <code>ODM</code> (for Oracle Data Mining), <code>INDEX</code> and <code>EXAMPLE</code> schemas.
<code>SYSTEM</code>	Consists of the data dictionary, including definitions of tables, views, and stored procedures needed by the database. Oracle Database automatically maintains information in this tablespace.
<code>TEMP</code>	Contains temporary tables and indexes created during SQL statement processing. You may need to expand this tablespace if you run a SQL statement that involves significant sorting, such as <code>ANALYZE COMPUTE STATISTICS</code> on a very large table, or the constructs <code>GROUP BY</code> , <code>ORDER BY</code> , or <code>DISTINCT</code> .

**Table 5-2 (Cont.) Tablespace Names Used with Oracle Real Application Clusters Databases**

Tablespace Name	Contents
UNDOTBS $n$	Contains undo tablespaces for each instance that DBCA creates for automatic undo management.
USERS	Consists of application data. As you create and enter data into tables, Oracle Database fills this space with your data.

You cannot alter these tablespace names when using the preconfigured database configuration option from OUI. However, you can change the names of the tablespaces if you use the advanced database creation method.

As mentioned, each tablespace has one or more data files on shared file systems. The data file names created by the preconfigured database configuration options vary by storage type such as Oracle ASM, or a cluster file system.

#### Related Topics

- *Oracle Database Administrator's Guide*

## About Control Files

The database is configured with two control files that must be stored on shared storage.

Every database must have one unique control file. Any additional control files configured for the database are identical copies of the original control file. If a control file becomes unusable, then the database instance fails when it attempts to access the damaged control file. By multiplexing (creating multiple copies of) a control file on different disks, the database can achieve redundancy and thereby avoid a single point of failure.

#### See Also:

- *Oracle Database Concepts*
- *Oracle Database Administrator's Guide*

## About Online Redo Log Files

Each database instance must have at least two online redo log files.

The online redo log files for a database instance are called the **redo thread**. Each Oracle RAC database instance has its own redo thread to avoid contention for a single set of online redo log files. In case of instance failure, the online redo log files must be accessible by the remaining instances. Therefore, the online redo log files for an Oracle RAC database must be placed on shared storage or Oracle ASM. If you use a file system for storage, then the file system must be a shared or cluster file system.

The file names of the redo log files that are created with the preconfigured database configuration option vary by storage type.

 **See Also:**

- *Oracle Database Concepts* for more information about the online redo log files
- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about storage for online redo log files

## Managing Undo Tablespaces in Oracle RAC

Oracle Database stores rollback or undo information in undo tablespaces. To manage undo tablespaces, Oracle recommends that you use Automatic Undo Management.

Automatic Undo Management is an automated management mode for undo tablespaces that is easier to administer than manual undo management.

When Oracle ASM and Oracle Managed Files are used along with Automatic Undo Management, an instance that is started for the first time, and thus does not have an undo tablespace, has its undo tablespace created for it by another instance automatically. The same is also true for redo logs.

 **See Also:**

- *Oracle Database Administrator's Guide* for more information about automatic undo management
- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about managing undo tablespaces

## About Initialization Parameter Files

Oracle recommends using the server parameter file (SPFILE) for storing Oracle Database initialization parameters.

Oracle recommends that you store all SPFILES on Oracle ASM, including the Oracle ASM SPFILE. SPFILES must be located on shared storage. All instances in a cluster database can access this parameter file.

 **See Also:**

*Oracle Real Application Clusters Administration and Deployment Guide* for more information about the creation and use of parameter files

## Oracle Net Services Configuration for Oracle RAC Databases

You can access an Oracle RAC database using a client and server configuration or through one or more middle tiers, with or without connection pooling.

When connecting to an Oracle Database, you can use a connect descriptor or a net service name. For Oracle RAC databases, you can also use the Single Client Access Name (SCAN) to connect to any available instance of the Oracle RAC database.

- [Database Services for an Oracle RAC Database](#)  
Each database is represented by one or more services and a service is identified by a service name. A client uses service names to identify databases.
- [Naming Methods and Connect Descriptors](#)  
Each net service name is associated with a connect descriptor. A **connect descriptor** provides the location of the database and the name of the database service.
- [Easy Connect Naming Method](#)  
The Easy Connect naming method eliminates the need to look up service names in the `tnsnames.ora` file or other repository for TCP/IP environments.
- [Understanding SCANs](#)  
The SCAN is a domain name registered to at least one and up to three IP addresses, either in domain name service (DNS) or in Grid Naming Service (GNS).
- [About Connecting to an Oracle RAC Database Using SCANs](#)  
Oracle recommends that you configure Oracle RAC database clients to use the SCAN to connect to the database instead of configuring the `tnsnames.ora` file.
- [About Listener Configuration for an Oracle RAC Database](#)  
An Oracle Database receives connection requests through the local listener.
- [About Service Registration for an Oracle RAC Database](#)  
An Oracle Database service automatically registers with the listeners specified in the database initialization parameters `LOCAL_LISTENER` and `REMOTE_LISTENER`.
- [How Database Connections are Created When Using SCANs](#)  
Based on the environment, the following actions occur when you use a SCAN to connect to an Oracle RAC database using a service name.

 **See Also:**

*Oracle Database Net Services Administrator's Guide* for more information about Oracle Net Services concepts

## Database Services for an Oracle RAC Database

Each database is represented by one or more services and a service is identified by a service name. A client uses service names to identify databases.

During installation, Oracle RAC databases are configured with a default database service that has the same name as the database. This service can be used for performing database management tasks. Create additional services for client and application connections to the database.

A service name, for example `sales.example.com`, can be associated with multiple database instances, and an instance can be associated with multiple services. The listener acts as a mediator between the client and database instances and routes the connection request to the appropriate instance. Clients connecting to a service do not have to specify which instance they want to connect to.

## Naming Methods and Connect Descriptors

Each net service name is associated with a connect descriptor. A **connect descriptor** provides the location of the database and the name of the database service.

A connect descriptor is comprised of one or more protocol addresses of the listener and the connect information for the destination service. The information needed to use a service name to create a database connection can be stored in a repository, which is represented by one or more naming methods. A **naming method** is a resolution method used by a client application to resolve a service name to a connect descriptor. Oracle Net Services offers several types of naming methods that support localized configuration on each client, or centralized configuration that can be accessed by all clients in the network.

## Easy Connect Naming Method

The Easy Connect naming method eliminates the need to look up service names in the `tnsnames.ora` file or other repository for TCP/IP environments.

With Easy Connect, clients use a connect string for a TCP/IP address, which consists of a host name, and an optional port and service name. If you use this method, then no naming or directory system is required.

Networking elements for the Oracle Database server and clients are preconfigured for most environments. The Easy Connect naming method is enabled by default and does not require a repository. If you use a naming method other than Easy Connect, then additional configuration of Oracle Net Services may be required.

Oracle recommends against using the easy connect method with SCAN as it provides no high availability support.

## Understanding SCANS

The SCAN is a domain name registered to at least one and up to three IP addresses, either in domain name service (DNS) or in Grid Naming Service (GNS).

- [About the SCAN](#)  
During the installation of Oracle Grid Infrastructure, several Oracle Clusterware resources are created for the SCAN.
- [About SCAN VIP Addresses](#)  
SCAN virtual IP addresses (VIPs) function like node VIPs. However, unlike node VIPs, SCAN VIPs can run on any node in the cluster.
- [About SCAN Listeners](#)  
During Oracle Grid Infrastructure installation, SCAN listeners are created for as many IP addresses as there are SCAN VIP addresses assigned to resolve to the SCAN.

## About the SCAN

During the installation of Oracle Grid Infrastructure, several Oracle Clusterware resources are created for the SCAN.

- A SCAN virtual IP (VIP) is created for each IP address that Oracle Single Client Access Name (SCAN) resolves to
- A SCAN listener is created for each SCAN VIP

- A dependency on the SCAN VIP is configured for the SCAN listener

SCANs are defined using one of two options:

- The SCAN is defined in DNS

If you configure a SCAN manually, and use DNS for name resolution, then your network administrator should create a single name for the SCAN that resolves to three IP addresses on the same network as the public network for the cluster. The SCAN name must be resolvable without the domain suffix (for example, the address `sales1-scan.example.com` must be resolvable using `sales1-scan`). The SCAN must not be assigned to a network interface, because Oracle Clusterware resolves the SCAN.

The default SCAN is `cluster_name-scan.domain_name`. For example, in a cluster that does not use GNS, if your cluster name is `sales1`, and your domain is `example.com`, then the default SCAN address is `sales1-scan.example.com:1521`.

- The SCAN is defined in GNS

When using GNS and DHCP, Oracle Clusterware configures the VIP addresses for the SCAN name that is provided during cluster configuration. The node VIP and the three SCAN VIPs are obtained from the DHCP server when using GNS. If a new server joins the cluster, then Oracle Clusterware dynamically obtains the required VIP address from the DHCP server, updates the cluster resource, and makes the server accessible through GNS.

Oracle recommends that you configure clients connecting to the cluster to use the SCAN name. Clients connecting to Oracle RAC databases using SCANs do not have to be configured with addresses of each node that hosts a particular database or database instance. You can add or remove nodes from the database without having to reconfigure clients connecting to the database.

### Related Topics

- *Oracle Grid Infrastructure Installation and Upgrade Guide for Linux*

## About SCAN VIP Addresses

SCAN virtual IP addresses (VIPs) function like node VIPs. However, unlike node VIPs, SCAN VIPs can run on any node in the cluster.

Clients (users or applications) that connect using a SCAN instead of a node VIP name or address do not have to update the list of node names or addresses in their local `tnsnames.ora` file when nodes are added to or removed from the cluster, or when a database instance runs on a different node.

### Note:

Configuring three SCAN VIPs in DNS does not by itself ensure failover of connections. Instead, the Oracle Client uses the returned SCAN VIPs to failover the connection request to a different SCAN listener. If the connection attempt to a SCAN VIP fails, then the client uses the next returned SCAN VIP address to connect. For this reason, Oracle recommends that you use Oracle Client 11g Release 2 or later clients for connections that use the SCAN.

If you use GNS for name resolution, then you only provide the SCAN name during installation (for example, `sales1-scan`). GNS obtains DHCP address leases for three IP addresses and

resolves these addresses to the SCAN. The GNS daemon listens for registrations. When a SCAN VIP starts on a node, it registers its addresses with GNS.

Service requests to the cluster domain that GNS manages are routed to the GNS VIP address, which routes these requests to the GNS daemon for the cluster. When GNS receives a request from a DNS for the SCAN, it returns the registered addresses of the SCAN listeners to the DNS. The DNS then returns the three SCAN VIP addresses to the client.

 **See Also:**

*Oracle Clusterware Administration and Deployment Guide* for more information about SCAN names, listeners, and client service requests

## About SCAN Listeners

During Oracle Grid Infrastructure installation, SCAN listeners are created for as many IP addresses as there are SCAN VIP addresses assigned to resolve to the SCAN.

Oracle recommends that the SCAN resolves to three VIP addresses, to provide high availability and scalability. If the SCAN resolves to three addresses, then three SCAN VIPs and three SCAN listeners are created.

Each SCAN listener depends on its corresponding SCAN VIP. The SCAN listeners cannot start until the SCAN VIP is available on a node.

The addresses for the SCAN listeners resolve either through an external domain name service (DNS), or through the Grid Naming Service (GNS) within the cluster. SCAN listeners and SCAN VIPs can run on any node in the cluster. If a node where a SCAN VIP is running fails, then the SCAN VIP and its associated listener fails over to another node in the cluster. If the number of available nodes within the cluster falls to less than three, then one server hosts two SCAN VIPs and SCAN listeners. The SCAN listener also supports HTTP protocol for communication with Oracle XML Database (XDB).

 **See Also:**

*Oracle Clusterware Administration and Deployment Guide* for more information about SCAN listeners

## About Connecting to an Oracle RAC Database Using SCANS

Oracle recommends that you configure Oracle RAC database clients to use the SCAN to connect to the database instead of configuring the `tnsnames.ora` file.

Clients configured to connect to the cluster using node VIP addresses for Oracle RAC releases earlier than Oracle Database 11g Release 2 can continue to use their existing connection addresses. Using the SCAN is not required. When an earlier release of Oracle Database is upgraded, the database is not only registered with the local listeners, but is also registered with the SCAN listeners, allowing clients to start using the SCAN to connect to that database.

If the SCAN is resolved by DNS, then DNS returns all three SCAN VIP addresses to the client. If the SCAN is resolved by GNS, then DNS zone delegation sends the lookup request to GNS, which then returns all three SCAN VIP addresses to the client.

Oracle Database 23ai database clients use SCAN to connect to the database. Oracle recommends against using the easy connect method with SCAN because the easy connect method does not have the ability to specify timeouts and retries for connection establishment. Instead, applications must use an Oracle Net connect descriptor with the following format:

```
(DESCRIPTION =
  (CONNECT_TIMEOUT=90) (RETRY_COUNT=20) (RETRY_DELAY=3)
(TRANSPORT_CONNECT_TIMEOUT=3)
  ( ADDRESS = (PROTOCOL = TCP) (HOST=scan) (PORT=1521))
    (CONNECT_DATA=(SERVICE_NAME=service_name)))
```

*scan* represents the SCAN for your cluster. If you do not specify a port number, then the default value of 1521 is used for the TCP port identifier. The *service\_name* is the name of a dynamic database service.

The client then uses one of the returned SCAN VIP addresses to contact a SCAN listener. When a SCAN listener receives a connection request from a client, the SCAN listener identifies the least loaded instance in the cluster that provides the requested service. It then redirects the connection request to the local listener on the node where the least loaded instance is running, and the client is given the local listener address. The local listener then creates the connection to the database instance.

### Example 5-1 Connecting to Oracle RAC Using an Oracle Net Connect Descriptor

If the Oracle RAC database runs on a cluster for which the SCAN is *sales1-scan.mycluster.example.com*, then you can submit a connection request for the database service *oltp.example.com* by using a connect descriptor similar to the following:

```
(DESCRIPTION =
  (CONNECT_TIMEOUT=90) (RETRY_COUNT=20) (RETRY_DELAY=3)
(TRANSPORT_CONNECT_TIMEOUT=3)
  ( ADDRESS = (PROTOCOL = TCP) (HOST=sales1-
scan.mycluster.example.com) (PORT=1521))
    (CONNECT_DATA=(SERVICE_NAME=oltp.example.com)))
```

If the SCAN is resolved by DNS, then DNS returns all three SCAN VIP addresses to the client. If the SCAN is resolved by GNS, then DNS zone delegation sends the lookup request to GNS, which then returns all three SCAN VIP addresses to the client. The client then uses one of the returned SCAN VIP addresses to contact a SCAN listener.

When a SCAN listener receives a connection request from a client, the SCAN listener identifies the least loaded instance in the cluster that provides the requested service. It then redirects the connection request to the local listener on the node where the least loaded instance is running, and the client is given the local listener address. The local listener then creates the connection to the database instance.

## About Listener Configuration for an Oracle RAC Database

An Oracle Database receives connection requests through the local listener.

The local listener brokers a client request, handing off the request to the server. The listener is configured with a protocol address, and clients configured with the same protocol address can

send connection requests to the listener. When a connection is established, the client and Oracle database communicate directly with one another.

The local listener, or default listener, is located in the Grid home when you have Oracle Grid Infrastructure installed. Local listeners are configured to respond to database connection requests, and to non-database connection requests, such as external procedures or Oracle XML Database (XDB) requests. When the database starts, the Database Agent process (`oraagent`, previously known as `racgimon`) sets the `LOCAL_LISTENER` parameter to a connect descriptor that does not require an Oracle Net service name. The value for `LOCAL_LISTENER` is computed to be the endpoints of the Grid home listeners.

You can configure multiple Oracle Database listeners, each with a unique name, in one `listener.ora` file. Multiple listener configurations for database listeners are possible because each of the top-level configuration parameters has a suffix of the listener name or is the listener name itself. To configure a database to register with multiple local listeners, you must manually modify the `LOCAL_LISTENER` parameter.

 **Note:**

Oracle recommends running only one listener for each node in most customer environments.

For an Oracle RAC database, the database parameter `REMOTE_LISTENER` identifies the SCAN listeners. The database registers with the local and SCAN listeners by using the connect description information contained in these parameters. Oracle Database 11g Release 2 and later instances only register with SCAN listeners as remote listeners. Upgraded databases register with SCAN listeners as remote listeners, and also continue to register with all node listeners.

 **Caution:**

Do not modify the `REMOTE_REGISTRATION_ADDRESS` parameter for your Oracle RAC deployment. The `REMOTE_REGISTRATION_ADDRESS` parameter is set by default to protect against TNS poisoning. Refer to *Oracle Database Net Services Reference* for more information about `REMOTE_REGISTRATION_ADDRESS` parameter.

The `REMOTE_LISTENER` parameter for an Oracle RAC database is always set to the SCAN address. For example, if the SCAN for the cluster is `myscan`, and the GNS subdomain for the cluster is `mycluster.example.com`, then the `REMOTE_LISTENER` parameter has the following value:

```
myscan.mycluster.example.com:1521
```

 **Note:**

Do not set the `REMOTE_LISTENER` parameter for an Oracle RAC database to an Oracle Net alias that has a single address that uses the SCAN for the host name (`HOST=scan`).

## About Service Registration for an Oracle RAC Database

An Oracle Database service automatically registers with the listeners specified in the database initialization parameters `LOCAL_LISTENER` and `REMOTE_LISTENER`.

During registration, the listener registration (LREG) process sends information such as the service name, instance names, and workload information to the listeners. This feature is called **service registration**.

When a listener starts after the Oracle instance starts, and the listener is available for service registration, registration does not occur until the next time the Oracle Database LREG process starts its discovery routine. By default, the LREG discovery routine is started every 60 seconds. To override the 60-second delay, use the SQL statement `ALTER SYSTEM REGISTER`. This statement forces LREG to register the service immediately.

### Note:

Oracle recommends that you create a script to run the `ALTER SYSTEM REGISTER` statement immediately after starting the listener. If you run this statement when the instance is registered and all services are currently registered, or while the listener is down, then the statement has no effect.

### See Also:

*Oracle Database Net Services Administrator's Guide* for more information about service registration

## How Database Connections are Created When Using SCANS

Based on the environment, the following actions occur when you use a SCAN to connect to an Oracle RAC database using a service name.

The numbered actions correspond to the arrows shown in Load Balancing Actions for Oracle RAC Connections That Use SCAN:

1. The LREG process of each instance registers the database services with the default listener on the local node and with each SCAN listener, which is specified by the `REMOTE_LISTENER` database parameter. The listeners are dynamically updated on the amount of work being handled by the instances and dispatchers.
2. The client issues a database connection request using a connect descriptor of the form:

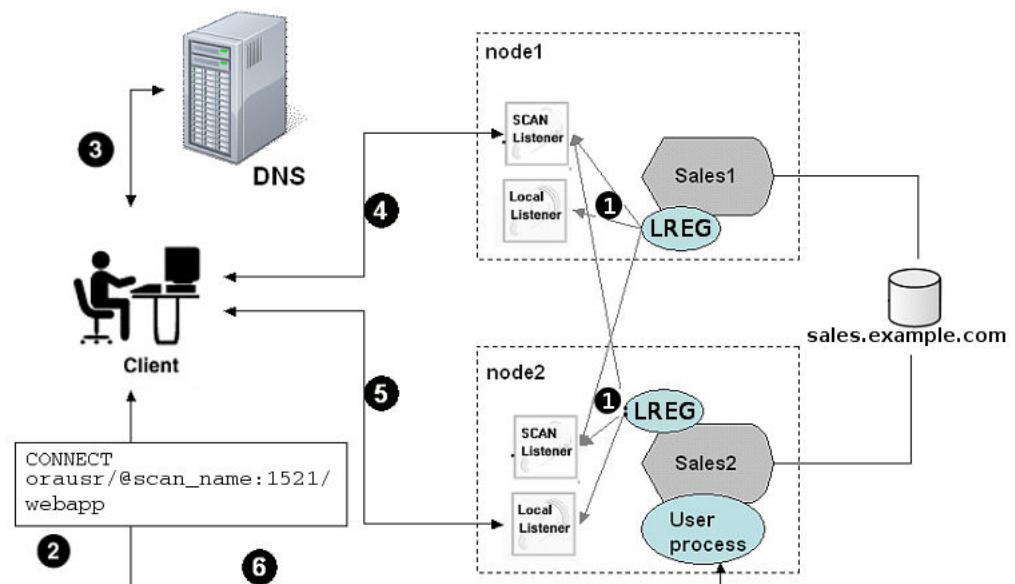

```
orausr/@scan_name:1521/webapp
```

### Note:

If you use the Easy Connect naming method, then ensure that the `sqlnet.ora` file on the client contains `EZCONNECT` in the list of naming methods specified by the `NAMES.DIRECTORY_PATH` parameter.

3. The client uses DNS to resolve `scan_name`. After DNS returns the three addresses assigned to the SCAN, the client sends a connect request to the first IP address. If the connect request fails, then the client attempts to connect using the next IP address.
4. When the connect request is successful, the client connects to a SCAN listener for the cluster that hosts the `sales` database and has an instance offering the `webapp` service, which in this example is `sales1` and `sales2`. The SCAN listener compares the workload of the instances `sales1` and `sales2` and the workload of the nodes on which they run. If the SCAN listener determines that `node2` is less loaded than `node1`, then the SCAN listener selects `node2` and sends the address for the local listener on that node back to the client.
5. The client connects to the local listener on `node2`. The local listener starts a dedicated server process for the connection to the database.
6. The client connects directly to the dedicated server process on `node2` and accesses the `sales2` database instance.

Figure 5-1 Load Balancing Actions for Oracle RAC Connections That Use SCAN

## Performance Features of Oracle Net Services and Oracle RAC

Oracle RAC databases provide the important benefits of connection load balancing and failover.

- [Load Balancing of Connections to Oracle RAC Databases](#)  
Services coordinate their sessions by registering their **workload**, or the amount of work they are currently handling, with the local listener and the SCAN listeners.
- [Connection Failover for Oracle RAC Databases](#)  
Oracle RAC provides failover with the node VIP addresses by configuring multiple listeners on multiple nodes to manage client connection requests for the same database service.

- [Shared Server Configuration for an Oracle RAC Database](#)  
Standalone Oracle databases perform load balancing by distributing connections among the shared server dispatcher processes.

## Load Balancing of Connections to Oracle RAC Databases

Services coordinate their sessions by registering their **workload**, or the amount of work they are currently handling, with the local listener and the SCAN listeners.

Clients are redirected by the SCAN listener to a local listener on the least-loaded node that is running the instance for a particular service. This feature is called **load balancing**. The local listener either directs the client to a dispatcher process (if you configured the database to use shared servers), or directs the client to a dedicated server process.

There are two types of load balancing that you can implement for an Oracle RAC database: client-side and server-side load balancing. Client-side load balancing balances the connection requests across the listeners. With server-side load balancing, the SCAN listener directs a connection request to the best instance currently providing the service by using the load balancing advisory.

### See Also:

- *Oracle Grid Infrastructure Installation and Upgrade Guide for Linux* for more information about SCAN and its configuration.
- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about failover, load balancing, and the load balancing advisory

## Connection Failover for Oracle RAC Databases

Oracle RAC provides failover with the node VIP addresses by configuring multiple listeners on multiple nodes to manage client connection requests for the same database service.

When a client issues a connection request using SCAN, the three SCAN addresses are returned to the client. If the first address fails, then the connection request to the SCAN fails over to the next address. Using multiple addresses allows a client to connect to an instance of the database even if the initial instance has failed.

If a node fails, then the service connecting to the VIP is relocated transparently to a remaining node, enabling fast notification of the failure to the clients connecting through the VIP. If the application and client are configured with transparent application failover options, then the client is reconnected to the remaining node.

## Shared Server Configuration for an Oracle RAC Database

Standalone Oracle databases perform load balancing by distributing connections among the shared server dispatcher processes.

By default, DBCA configures your Oracle RAC database with dedicated servers, not shared servers. However, if you select the shared server option when using DBCA, then DBCA configures shared servers. Oracle RAC uses both dedicated and shared server processing when shared servers are configured.

 **See Also:**

*Oracle Database Net Services Administrator's Guide* for more information about shared and dedicated server configurations

## Oracle Net Services Configuration Files and Parameters

Review this information to understand the Oracle Net Services configuration files and parameters for an Oracle RAC database.

Networking elements for the Oracle Database server and clients are preconfigured for most environments. The Easy Connect naming method is enabled by default and does not require a repository.

- [Database Initialization Parameters for Database Service Registration](#)  
An Oracle Database service automatically registers with the listeners specified in the `LOCAL_LISTENER` and `REMOTE_LISTENER` parameters.
- [Net Service Names and the tnsnames.ora File](#)  
The Oracle RAC database installation process creates a `tnsnames.ora` file on each node. This file acts as a repository of net service names.
- [Net Service Names Created by Oracle DBCA](#)  
Oracle Database Configuration Assistant (Oracle DBCA) creates net service names for database connections and instance connections.
- [Listener Configuration and the listener.ora File](#)  
Oracle recommends that you let the Oracle Agent manage Oracle listeners for Oracle Databases in an Oracle RAC environment.
- [Net Services Profile File \(sqlnet.ora\)](#)  
Use Oracle NETCA to create the Oracle Net Services profile, or the `sqlnet.ora` file.

## Database Initialization Parameters for Database Service Registration

An Oracle Database service automatically registers with the listeners specified in the `LOCAL_LISTENER` and `REMOTE_LISTENER` parameters.

During registration, the listener registration (LREG) process sends information such as the service name, instance names, and workload information to the listeners. When a listener starts after the Oracle instance starts, and the listener is available for service registration, registration does not occur until the next time the Oracle Database LREG process starts its discovery routine. By default, the LREG discovery routine is started every 60 seconds. To override the 60-second delay, use the SQL statement `ALTER SYSTEM REGISTER`. This statement forces LREG to register the service immediately.

 **Note:**

Oracle recommends that you create a script to run the `ALTER SYSTEM REGISTER` statement immediately after starting the listener. If you run this statement when the instance is registered and all services are currently registered, or while the listener is down, then the statement has no effect.

 **See Also:**

*Oracle Database Net Services Administrator's Guide* for more information about service registration

## Net Service Names and the tnsnames.ora File

The Oracle RAC database installation process creates a `tnsnames.ora` file on each node. This file acts as a repository of net service names.

Each net service name is associated with a connect identifier. A **connect identifier** is an identifier that maps a user-defined name to a connect descriptor. A connect descriptor contains the following information:

- The network route to the service, including the location of the listener through a protocol address
- The `SERVICE_NAME` parameter, with the value set to the name of a database service

 **Note:**

The `SERVICE_NAME` parameter that you use in the `tnsnames.ora` file is singular, because you can specify only one service name. The `SERVICE_NAME` parameter is not the same as the `service_names` database initialization parameter. The `service_names` database parameter defaults to the global database name, a name comprising the `db_name` and `db_domain` parameters in the initialization parameter file. When you add service names using SRVCTL or Oracle Enterprise Manager Cloud Control, it lists additional cluster-managed services for the database.

The `tnsnames.ora` file is located in both the `Grid_home/network/admin` and `ORACLE_HOME/network/admin` directories. By default, the `tnsnames.ora` file is read from the Grid home when Oracle Grid Infrastructure is installed. However, you can create the file in other directories. Oracle Net checks for the `tnsnames.ora` file in the following order:

1. The directory specified by the `TNS_ADMIN` environment variable.
2. If the `TNS_ADMIN` environment variable is not set or the file is not found in the `TNS_ADMIN` directory, then Oracle Net checks the `Grid_home/network/admin` and `ORACLE_HOME/network/admin` directories. For a read-only Oracle home, Oracle Net checks the `ORACLE_BASE_HOME/network/admin` directory.
3. For a read-only Oracle home, if the file is not available in the `ORACLE_BASE_HOME/network/admin` directory, then Oracle Net checks for the file in the `ORACLE_HOME/network/admin` directory.

The order for checking `tnsnames.ora` is the same for both the Oracle home and Oracle Grid Infrastructure home (Grid home) installations.

With Oracle Clusterware 11g Release 2 and later, the listener association no longer requires `tnsnames.ora` file entries. The listener associations are configured as follows:

- DBCA no longer sets the `LOCAL_LISTENER` parameter. The Oracle Clusterware agent that starts the database sets the `LOCAL_LISTENER` parameter dynamically, and it sets it to the

actual value, not an alias. So `listener_alias` entries are no longer needed in the `tnsnames.ora` file.

- The `REMOTE_LISTENER` parameter is configured by DBCA to reference the SCAN and SCAN port, without any need for a `tnsnames.ora` entry. Oracle Clusterware uses the Easy Connect naming method with `scaname:scanport`, so no listener associations for the `REMOTE_LISTENER` parameter are needed in the `tnsnames.ora` file.

For example, after you create the database, to add a second listener, listening on port 2012, use a command similar to the following command to have the database register with both listeners on startup:

```
SQL> alter system set local_listener='(DESCRIPTION=
(AADDRESS_LIST=(ADDRESS=(PROTOCOL=TCP) (HOST=192.168.0.61) (PORT=1521))
(ADDRESS=(PROTOCOL=TCP) (HOST=192.168.0.61) (PORT=2012))) '
scope=BOTH SID='OCRL1';
```

#### See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Net Services Administrator's Guide* for more information about the `tnsnames.ora` file

## Net Service Names Created by Oracle DBCA

Oracle Database Configuration Assistant (Oracle DBCA) creates net service names for database connections and instance connections.

- [Net Service Names for Database Connections](#)  
Clients that connect to any instance of Oracle RAC use the SCAN in the connect descriptor. You can also use net service names to connect to Oracle RAC.
- [Net Service Names for Instance Connections](#)  
Clients that connect to a particular instance of the database use the net service name for the instance.

## Net Service Names for Database Connections

Clients that connect to any instance of Oracle RAC use the SCAN in the connect descriptor. You can also use net service names to connect to Oracle RAC.

When you use Oracle Database Configuration Assistant (Oracle DBCA) to create an Oracle RAC database, the Oracle DBCA creates a database service that has the same name as the database. The default database service created by DBCA enables Oracle Enterprise Manager to discover an Oracle RAC database, and should not be used for client connections. Clients that use this database service can connect to any database instance for the Oracle RAC database. However, if you use DBCA to add a pluggable database (PDB) to an existing CDB, then DBCA does not create a database service for the new PDB.

The net service name does not require a fully qualified domain name for the server on which a database, database instance, or listener runs. SCANS are resolved by the DNS or GNS, which

returns three addresses to the client. The client then submits connection requests to each address in succession until a connection is made.

### Example 5-2 Example Net Service Name Entry for a Database Connection

This example shows a connect descriptor that is used in a `tnsnames.ora` file. The connect identifier in this case is the same as the cluster domain, `mycluster.example.com`. Instead of specifying the address for an individual server, Virtual Internet Protocol (VIP) address, or a cluster node name, the connect descriptor uses the SCAN, which is `myscan.mycluster.example.com`.

```
mycluster.example.com =
  (DESCRIPTION =
    (ADDRESS = (PROTOCOL = TCP) (HOST = host=myscan.mycluster.example.com)
      (PORT = 1522))
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SERVICE_NAME = myApp)
    )
  )
```

Oracle Clusterware resolves connection requests that use the net service name `mycluster.example.com` to any of the database instances of the `mycluster` database that run the `myApp` database service. The specific cluster node on which the instance is running is invisible to the client.

## Net Service Names for Instance Connections

Clients that connect to a particular instance of the database use the net service name for the instance.

### Example 5-3 Example Net Service Name Entry for an Instance Connection

In this example, the connect identifier is the same as the instance name, `mycluster1.example.com`. The connect descriptor uses the SCAN to locate the instance within the cluster. Clients connecting to the net service name `mycluster1.example.com` are connected to the `mycluster1` database instance of the `mycluster` database. Oracle Clusterware resolves that connection to the cluster node on which the instance is running. The specific cluster node on which the instance is running is invisible to the client.

```
mycluster1.example.com=
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=TCP) (HOST=myscan.mycluster.example.com) (PORT=1521))
    (CONNECT_DATA=
      (SERVICE_NAME=mycluster.example.com)
      (INSTANCE_NAME=mycluster1)
    )
  )
```

## Listener Configuration and the listener.ora File

Oracle recommends that you let the Oracle Agent manage Oracle listeners for Oracle Databases in an Oracle RAC environment.

### Note:

If you enable GNS, then you do not have to manually configure the listener.

- [Local Listener for an Oracle RAC Database](#)  
The local listener, or default listener, is located in the Grid home when you have Oracle Grid Infrastructure installed.
- [Remote Listeners for an Oracle RAC Database](#)  
A **remote listener**, such as SCAN listener, is a listener residing on one computer that redirects connections to a database instance on another computer.
- [Managing Multiple Listeners for an Oracle RAC Database](#)  
Review to understand how to use `SRVCTL` and `TNS_ADMIN` to manage listeners
- [How Oracle Database Uses the Listener File \(listener.ora\)](#)  
The `listener.ora` file is the configuration file for a listener, which includes protocol addresses, list of services, and control parameters.

## Local Listener for an Oracle RAC Database

The local listener, or default listener, is located in the Grid home when you have Oracle Grid Infrastructure installed.

The `listener.ora` file is located in the `Grid_home/network/admin` directory. If needed, you can edit the `listener.ora` file for the Grid home listeners to define listener parameters for node and SCAN listeners. Do not modify the endpoints because these are automatically managed by the listener agent.

During Oracle Database creation, the `LOCAL_LISTENER` parameter is automatically configured to point to the local listener for the database. You can set a value manually for `LOCAL_LISTENER`. If you modify the value of the `LOCAL_LISTENER` parameter, then the Database Agent process does not automatically update this value. Oracle recommends that you leave the parameter unset so that the Database Agent process can maintain it automatically. If you do not set `LOCAL_LISTENER`, then the Database Agent process automatically updates the database associated with the local listener in the Grid home, even when the ports or IP address of that listener are changed.

### Related Topics

- [Net Service Names and the tnsnames.ora File](#)  
The Oracle RAC database installation process creates a `tnsnames.ora` file on each node. This file acts as a repository of net service names.

#### See Also:

## Remote Listeners for an Oracle RAC Database

A **remote listener**, such as SCAN listener, is a listener residing on one computer that redirects connections to a database instance on another computer.

 **Caution:**

Do not modify the `REMOTE_REGISTRATION_ADDRESS` parameter for your Oracle RAC deployment. The `REMOTE_REGISTRATION_ADDRESS` parameter is set by default to protect against TNS poisoning. Refer to *Oracle Database Net Services Reference* for more information about `REMOTE_REGISTRATION_ADDRESS` parameter.

In Oracle RAC environments, Oracle recommends that you let the Oracle Agent manage the Oracle listeners for the databases.

## Managing Multiple Listeners for an Oracle RAC Database

Review to understand how to use `SRVCTL` and `TNS_ADMIN` to manage listeners

To administer Oracle Database 23ai local and SCAN listeners using the `lsnrctl` command, set your `ORACLE_HOME` environment variable to the path for the Grid home. Do not attempt to use the `lsnrctl` commands from Oracle home locations for earlier releases, because they cannot be used with Oracle Database 23ai.

For listeners not managed by Oracle Clusterware, you can use a non-default location for the `listener.ora` file by setting the `TNS_ADMIN` environment variable or registry value to point to the directory that contains the Oracle Net Services configuration files. To use a non-default location for a listener managed by Oracle Clusterware, you must use `SRVCTL` and the `setenv` command to modify the value of `TNS_ADMIN` for each listener.

## How Oracle Database Uses the Listener File (`listener.ora`)

The `listener.ora` file is the configuration file for a listener, which includes protocol addresses, list of services, and control parameters.

The `listener.ora` file can include the protocol addresses it is accepting connection requests on, a list of the database and other services it is listening for, and control parameters used by the listener. You can modify the configuration of the listeners used by Oracle Clusterware and Oracle RAC with Server Control Utility (`SRVCTL`) commands, or by using `NETCA`. Manual editing of the `listener.ora` file is not required.

Each listener is configured with one or more protocol addresses that specify its listening endpoints. The listener agent dynamically updates endpoints with the listener. Starting with Oracle Database 11g Release 2, the `listener.ora` file now only contains an IPC key and the following information:

```
(ADDRESS = (PROTOCOL=TCP) (HOST=) (PORT=1521))
```

In the previous example, the protocol `ADDRESS` refers implicitly to the `HOST` endpoint of the local node. The `listener.ora` file is the same on every node for an Oracle RAC database. Listening endpoints, such as the port numbers, are dynamically registered with the listener.

Before you install Oracle RAC, during the Oracle Grid Infrastructure installation, `NETCA` creates and starts a default listener in the Grid home called `LISTENER`. The listener is configured with default protocol listening addresses. The listener is configured to respond to connection requests that are directed to one protocol address specified during installation.

During the Oracle RAC installation, the Oracle RAC database uses the listener in the Grid home, and configures service information about the Oracle RAC database. The database services automatically register their information with the listener, such as the service name, instance names, and load information. Dynamic service registration eliminates the need for static configuration of database services. However, static service configuration is required if you plan to use Oracle Enterprise Manager.

#### Example 5-4 Example listener.ora File for an Oracle RAC Node

The following is an example `listener.ora` file as it would appear after installation, with an entry for a node named `node1` and a `SCAN` listener.

```
LISTENER_SCAN1=(DESCRIPTION=(ADDRESS_LIST=(ADDRESS=(PROTOCOL=IPC) (KEY=LISTENER_SCAN1))))
# line added by Agent
LISTENER_NODE1=(DESCRIPTION=(ADDRESS_LIST=(ADDRESS=(PROTOCOL=IPC) (KEY=LISTENER))))
# line added by Agent
# listener.ora.mycluster Network Configuration File:
/u01/app/oracle/product/23.0.0/dbhome_1/network/admin/listener.ora.mycluster
# Generated by Oracle configuration tools.

LISTENER_NODE1 =
  (DESCRIPTION_LIST =
    (DESCRIPTION =
      (ADDRESS = (PROTOCOL = IPC) (KEY = EXTPROC1521))
    )
  )

ENABLE_GLOBAL_DYNAMIC_ENDPOINT_LISTENER_NODE1=ON      # line added by Agent
ENABLE_GLOBAL_DYNAMIC_ENDPOINT_LISTENER_SCAN2=ON      # line added by Agent
ENABLE_GLOBAL_DYNAMIC_ENDPOINT_LISTENER_SCAN1=ON      # line added by Agent
```

## Net Services Profile File (sqlnet.ora)

Use Oracle `NETCA` to create the Oracle Net Services profile, or the `sqlnet.ora` file.

In an Oracle Grid Infrastructure installation, the `sqlnet.ora` file is located in the following directory by default:

```
Grid_home/network/admin
```

For the local listener for the Oracle RAC database instance, the default location of the `sqlnet.ora` file is `$ORACLE_HOME/network/admin` directory. In this directory there is a default `sqlnet.ora` file. Also, you can find a sample `sqlnet.ora` file in the subdirectory `sample`.

Oracle Net Configuration Assistant (NETCA) creates the following entry in the `sqlnet.ora` file:

```
NAMES.DIRECTORY_PATH=(TNSNAMES, EZCONNECT)
```

The parameter `NAMES.DIRECTORY_PATH` specifies the priority order of the naming methods to use to resolve connect identifiers to connect descriptors.

 **See Also:**

- *Oracle Database Net Services Administrator's Guide* for more information about the `sqlnet.ora` file

# 6

## Removing Oracle Database Software

Use the `deinstall` command that is included in Oracle homes to remove Oracle software. Oracle does not support the removal of individual products or components.

### **Caution:**

If you have a single-instance database on a node in a cluster, and if you have multiple databases with the same global database name (GDN), then you cannot use the `deinstall` command to remove one database only.

- [About Oracle Deinstallation Options](#)  
You can stop and remove Oracle Database software and components in an Oracle Database home with the `deinstall` command.
- [Identifying All Instances On a Cluster](#)  
Review this information to identify all instances associated with the Oracle home you want to remove.
- [Oracle Deinstallation \(Deinstall\)](#)  
You can run the `deinstall` command from an Oracle home directory after installation.
- [Deinstallation Examples for Oracle Database](#)  
Use these examples to help you understand how to run the `deinstall` command.
- [Deinstallation Parameter File Example for Oracle RAC](#)  
You can run the `deinstall` command on Oracle RAC Databases with the `-paramfile` option to use the values you specify in the parameter file.

## About Oracle Deinstallation Options

You can stop and remove Oracle Database software and components in an Oracle Database home with the `deinstall` command.

You can remove the following software using `deinstall`:

- Oracle Database
- Oracle Grid Infrastructure, which includes Oracle Clusterware and Oracle Automatic Storage Management (Oracle ASM)
- Oracle Real Application Clusters (Oracle RAC)
- Oracle Database Client

The `deinstall` command is available in Oracle home directories after installation. It is located in the `$ORACLE_HOME/deinstall` directory.

`deinstall` creates a response file by using information in the Oracle home and using the information you provide. You can use a response file that you generated previously by running

the `deinstall` command using the `-checkonly` option. You can also edit the response file template.

If you run `deinstall` to remove an Oracle Grid Infrastructure installation, then the deinstaller prompts you to run the `deinstall` command as the `root` user. For Oracle Grid Infrastructure for a cluster, the script is `rootcrs.sh`, and for Oracle Grid Infrastructure for a standalone server (Oracle Restart), the script is `roothas.sh`.

 **Note:**

You must run the `deinstall` command from the same release to remove Oracle software. Do not run the `deinstall` command from a later release to remove Oracle software from an earlier release. For example, do not run the `deinstall` command from the 23ai Oracle home to remove Oracle software from an existing 19c Oracle home.

If the software in the Oracle home is not running (for example, after an unsuccessful installation), then `deinstall` cannot determine the configuration, and you must provide all the configuration details either interactively or in a response file.

In addition, before you run `deinstall` for Oracle Grid Infrastructure installations:

- Dismount Oracle Advanced Cluster File System (Oracle ACFS) and disable Oracle Automatic Storage Management Dynamic Volume Manager (Oracle ADVM).
- If Grid Naming Service (GNS) is in use, then notify your DNS administrator to delete the subdomain entry from the DNS.

### Files Deleted by `deinstall`

When you run `deinstall`, if the central inventory (`oraInventory`) contains no other registered homes besides the home that you are deconfiguring and removing, then `deinstall` removes the following files and directory contents in the Oracle base directory of the Oracle Database installation owner:

- `admin`
- `cfgtoollogs`
- `checkpoints`
- `diag`
- `oradata`
- `fast_recovery_area`

Oracle strongly recommends that you configure your installations using an Optimal Flexible Architecture (OFA) configuration, and that you reserve Oracle base and Oracle home paths for exclusive use of Oracle software. If you have any user data in these locations in the Oracle base that is owned by the user account that owns the Oracle software, then `deinstall` deletes this data.

**▲ Caution:**

`deinstall` deletes Oracle Database configuration files, user data, and fast recovery area (FRA) files even if they are located outside of the Oracle base directory path.

## Identifying All Instances On a Cluster

Review this information to identify all instances associated with the Oracle home you want to remove.

1. Enter the following command to identify all instances associated with the Oracle home you want to remove, where `dbname` is the name of the database:

```
$ srvctl status database -d dbname
```

The output of this command contains entries similar to the following:

```
+ASM1:/u01/app/23.0.0/grid:N  
CUST:/u01/app/oracle/product/23.0.0/dbhome_1:N
```

These entries show that the `+ASM` Oracle Automatic Storage Management instance in the Oracle Grid Infrastructure for a cluster home (`/u01/app/23.0.0/grid`) and the `CUST` Oracle database instance are associated with the Oracle home directory `/u01/app/oracle/product/23.0.0/dbhome_1`.

2. Alternately, you can check for registered instances by viewing the `oratab` file:

AIX, HP-UX, or Linux:

```
$ more /etc/oratab
```

Oracle Solaris:

```
$ more /var/opt/oracle/oratab
```

## Oracle Deinstallation (Deinstall)

You can run the `deinstall` command from an Oracle home directory after installation.

### Purpose

`deinstall` stops Oracle software, and removes Oracle software and configuration files on the operating system for a specific Oracle home.

### Syntax

The `deinstall` command uses the following syntax:

```
(./deinstall [-silent] [-checkonly] [-paramfile complete path of input  
response file]  
[-params name1=value name2=value . . .])
```

[*-o complete path of directory for saving files*]  
 [*-tmpdir complete path of temporary directory to use*]  
 [*-logdir complete path of log directory to use*] [*-local*] [*-skipLocalHomeDeletion*] [*-skipRemoteHomeDeletion*] [*-help*]

## Parameters

Parameter	Description
<code>-silent</code>	<p>Use this flag to run <code>deinstall</code> in noninteractive mode. This option requires one of the following:</p> <ul style="list-style-type: none"> <li>A working system that it can access to determine the installation and configuration information. The <code>-silent</code> flag does not work with failed installations.</li> <li>A response file that contains the configuration values for the Oracle home that is being deinstalled or deconfigured.</li> </ul> <p>You can generate a response file to use or modify by running <code>deinstall</code> with the <code>-checkonly</code> flag. <code>deinstall</code> then discovers information from the Oracle home to deinstall and deconfigure. It generates the response file that you can then use with the <code>-silent</code> option.</p> <p>You can also modify the template file <code>deinstall.rsp.tmpl</code>, located in the <code>\$ORACLE_HOME/deinstall/response</code> directory.</p>
<code>-checkonly</code>	<p>Use this flag to check the status of the Oracle software home configuration. Running <code>deinstall</code> with the <code>-checkonly</code> flag does not remove the Oracle configuration. The <code>-checkonly</code> flag generates a response file that you can then use with the <code>deinstall</code> command and <code>-silent</code> option.</p>
<code>-paramfile</code> <i>complete path of input response file</i>	<p>Use this flag to run <code>deinstall</code> with a response file in a location other than the default. When you use this flag, provide the complete path where the response file is located.</p> <p>The default location of the response file is <code>\$ORACLE_HOME/deinstall/response</code>.</p>
<code>-params</code> [ <i>name1=value name2=value name3=value ...</i> ]	<p>Use this flag with a response file to override one or more values to change in a response file you have created.</p>
<code>-o</code> <i>complete path of directory for saving response files</i>	<p>Use this flag to provide a path other than the default location where the response file (<code>deinstall.rsp.tmpl</code>) is saved.</p> <p>The default location of the response file is <code>\$ORACLE_HOME/deinstall/response</code>.</p>
<code>-tmpdir</code> <i>complete path of temporary directory to use</i>	<p>Use this flag to specify a non-default location where <code>deinstall</code> writes the temporary files for the deinstallation.</p>
<code>-logdir</code> <i>complete path of log directory to use</i>	<p>Use this flag to specify a non-default location where <code>deinstall</code> writes the log files for the deinstallation.</p>

Parameter	Description
-local	Use this flag on a multinode environment to deinstall Oracle software in a cluster. When you run <code>deinstall</code> with this flag, it deconfigures and deinstalls the Oracle software on the local node (the node where <code>deinstall</code> is run). On remote nodes, it deconfigures Oracle software, but does not deinstall the Oracle software.
-skipLocalHomeDeletion	Use this flag in Oracle Grid Infrastructure installations on a multinode environment to deconfigure a local Grid home without deleting the Grid home.
-skipRemoteHomeDeletion	Use this flag in Oracle Grid Infrastructure installations on a multinode environment to deconfigure a remote Grid home without deleting the Grid home.
-help	Use this option to obtain additional information about the command option flags.

## Deinstallation Examples for Oracle Database

Use these examples to help you understand how to run the `deinstall` command.

Run `deinstall` from the `$ORACLE_HOME/deinstall` directory. The deinstallation starts without prompting you for the Oracle home path.

```
$ ./deinstall
```

You can generate a deinstallation response file by running `deinstall` with the `-checkonly` flag. Alternatively, you can use the response file template located at `$ORACLE_HOME/deinstall/response/deinstall.rsp.tmpl`. If you have a response file, then use the optional flag `-paramfile` to provide a path to the response file.

In the following example, the `deinstall` command is in the path `/u01/app/oracle/product/23.0.0/dbhome_1/deinstall`. It uses a response file called `my_db_paramfile.tmpl` in the software owner location `/home/usr/oracle`:

```
$ cd /u01/app/oracle/product/23.0.0/dbhome_1/deinstall
$ ./deinstall -paramfile /home/usr/oracle/my_db_paramfile.tmpl
```

To remove the Oracle Grid Infrastructure home, use the `deinstall` command in the Oracle Grid Infrastructure home.

In this example, the Oracle Grid Infrastructure home is `/u01/app/23.0.0/grid`

```
$ cd /u01/app/23.0.0/grid/deinstall
$ ./deinstall -paramfile /home/usr/oracle/my_grid_paramfile.tmpl
```

## Deinstallation Parameter File Example for Oracle RAC

You can run the `deinstall` command on Oracle RAC Databases with the `-paramfile` option to use the values you specify in the parameter file.

### Deinstallation Parameter File Description and Example

The following is an example of a parameter file, in which the Oracle Database binary owner is `oracle`, the Oracle Database home (Oracle home) is in the path `/u01/app/oracle/product/23.0.0/dbhome_1/`, the Oracle base (where other Oracle software is installed) is `/u01/app/oracle/`, the central Oracle Inventory home (`oraInventory`) is `/u01/app/oraInventory`, the virtual IP address (VIP) is `192.0.2.1`, the local node (the node where you run the `deinstall` command from) is `myserver`, and the OSDBA group is `dba`:

```

## Using Scripts or Response Files to Create Oracle RAC Databases

Review this information for noninteractive installations during which you can create Oracle Real Application Clusters (Oracle RAC) databases using scripts.

### Note:

The scripts generated by Database Configuration Assistant (DBCA) are for reference only. Oracle strongly recommends that you use DBCA to create a database.

- [Using DBCA to Generate Installation Scripts for Oracle RAC](#)  
You can use Oracle DBCA to generate scripts to create an Oracle RAC database, create a database using the generated scripts, and prepare the database for use.
- [About DBCA Noninteractive \(Silent\) Configuration for Oracle RAC](#)  
Use Oracle DBCA to perform a noninteractive, or silent configuration of Oracle RAC database using the templates supplied by Oracle or custom templates.
- [Using Oracle DBCA Commands for Noninteractive \(Silent\) Configuration for Oracle RAC](#)  
Use `createDatabase` command to create an Oracle RAC database using Oracle DBCA.
- [How Response Files Work](#)  
Response files can assist you with installing an Oracle product multiple times on multiple computers.
- [Preparing Response Files](#)  
Review this information to prepare response files for use during silent mode or response file mode installations.
- [Running Oracle Universal Installer Using a Response File](#)  
After creating the response file, run Oracle Universal Installer at the command line, specifying the response file you created, to perform the installation.
- [Postinstallation Configuration Using Response File Created During Installation](#)  
Use response files to configure Oracle software after installation. You can use the same response file created during installation to also complete postinstallation configuration.
- [Running Configuration Assistants Using Response Files](#)  
You can run configuration assistants in response file or silent mode to configure and start Oracle software after it is installed on the system.

## Using DBCA to Generate Installation Scripts for Oracle RAC

You can use Oracle DBCA to generate scripts to create an Oracle RAC database, create a database using the generated scripts, and prepare the database for use.

1. Start DBCA and select your preferred options to build the Oracle RAC database.

On the Creation Options page of your DBCA session, deselect Create Database and select **Generate Database Creation Scripts** before you click **Finish**. You can accept the default destination directory for the scripts, or browse for a different location. In either case, note the path name for use in the next step.

2. Go to the directory where DBCA created the scripts, and review the SQL scripts to ensure that they contain the statements to build a database with the characteristics you require. If they do not, then Oracle recommends that you rerun DBCA to create scripts with the desired configuration rather than editing the scripts yourself.
3. On each cluster node you identified during your DBCA session, run the script `sid.sh`, where `sid` is the SID prefix that you entered on the DBCA Database Name page.
4. Set the initialization parameter, `cluster_database`, to the value `TRUE` in your SPFILE by running an `ALTER SYSTEM` statement in SQL\*Plus, or by uncommenting the parameter in the SPFILE for each instance.
5. Configure Oracle Net Services to support your new database and instances.
6. Set the `REMOTE_LISTENER` parameter to the `SCAN` (using the Easy Connect Naming syntax `scanname:scanport`) in your SPFILE by entering an `ALTER SYSTEM` statement in SQL\*Plus, or by uncommenting the parameter in the PFILE for each instance.
7. Run the Server Control Utility (SRVCTL) to configure and start database and instance applications as described in the following document:

*Oracle Real Application Clusters Administration and Deployment Guide*

#### Related Topics

- [Understanding the Configured Environment in Oracle RAC](#)  
Oracle NETCA and Oracle DBCA configure your environment to meet the requirements for database creation and Oracle Enterprise Manager discovery of the databases.

## About DBCA Noninteractive (Silent) Configuration for Oracle RAC

Use Oracle DBCA to perform a noninteractive, or silent configuration of Oracle RAC database using the templates supplied by Oracle or custom templates.

To perform a silent configuration, you must have completed an Oracle Grid Infrastructure (Oracle Clusterware and Oracle ASM) installation, run the `root.sh` script from the Oracle Database home, and defined the Oracle home directory environment variable.

The templates contain settings optimized for a particular type of workload. Oracle provides templates for the following two workload types:

- General purpose or transaction processing
- Data warehouse

For more complex environments, you can select the Custom Database option. This option does not use templates and results in a more extensive installation interview, which means that it takes longer to create your database.

## Using Oracle DBCA Commands for Noninteractive (Silent) Configuration for Oracle RAC

Use `createDatabase` command to create an Oracle RAC database using Oracle DBCA.

- Use the following command syntax to create an Oracle Real Application Clusters (Oracle RAC) database using the general purpose template and `AUTOMATIC` management policy, placing the data files in an existing Oracle ASM disk group, configuring a TDE wallet, and defining default encryption algorithm during the database creation. It also configures Oracle Machine Learning for Python in the database and sets the `SYS`, `SYSTEM`, and `DBSNMP` passwords to `password`, which is the password for each account:

```
$ORACLE_HOME/bin/dbca -silent -createDatabase -templateName  
"General_Purpose.dbc" \  
-gdbName gdb_name -sid SID_prefix \  
-storageType ASM -diskGroupName DATA -nodelist node1,node2 -characterSet  
WE8MSWIN1252 \  
-recoveryAreaDestination RECO -databaseType "MULTIPURPOSE" \  
-createAsContainerDatabase true -numberOfPDBs 2 -pdbName rracwpdb
```

Nodes `node1` and `node2` are the cluster nodes on which Oracle RAC database instances are created. The disk group name is `DATA`.

### See Also:

*Oracle Multitenant Administrator's Guide* for a complete description of Oracle Database Configuration Assistant (Oracle DBCA) commands and options

## How Response Files Work

Response files can assist you with installing an Oracle product multiple times on multiple computers.

- [Modes for Oracle DBCA Noninteractive \(Silent\) Configuration](#)  
You run the Oracle DBCA installer from a command prompt using either silent mode or response file mode.
- [Reasons for Using Silent Mode or Response File Mode](#)  
Review this section for use cases for running the installer in silent mode or response file mode.
- [Creating a Database Using Oracle ASM for Database Files](#)  
Before you create a database that uses Oracle Automatic Storage Management (Oracle ASM), you must run the `root.sh` script.
- [Using Response Files](#)  
Use response files to install and configure Oracle products using the installer in silent or response file mode.

## Modes for Oracle DBCA Noninteractive (Silent) Configuration

You run the Oracle DBCA installer from a command prompt using either silent mode or response file mode.

When you start Oracle Universal Installer (OUI), you can use a response file to automate the installation and configuration of Oracle software, either fully or partially. OUI uses the values contained in the response file to provide answers to some or all installation prompts.

Typically, the installer runs in interactive mode, which means that it prompts you to provide information in graphical user interface (GUI) screens. When you use response files to provide this information, you run the installer from a command prompt using either of the following modes:

- **Silent mode**  
If you include responses for all of the prompts in the response file and specify the `-silent` option when starting the installer, then it runs in silent mode. During a silent mode installation, the installer does not display any screens. Instead, it displays progress information in the terminal that you used to start it.
- **Response file mode**  
If you include responses for some or all of the prompts in the response file and omit the `-silent` option, then the installer runs in response file mode. During a response file mode installation, the installer displays all the screens, screens for which you specify information in the response file, and also screens for which you did not specify the required information in the response file.

You define the settings for a silent or response file installation by entering values for the variables listed in the response file. For example, to specify the Oracle home name, provide the Oracle home path for the `ORACLE_HOME` environment variable:

```
ORACLE_HOME=/u01/app/oracle/product/23.0.0/dbhome_1
```

## Reasons for Using Silent Mode or Response File Mode

Review this section for use cases for running the installer in silent mode or response file mode.

Mode	Uses
Silent	<p>Use silent mode for the following installations:</p> <ul style="list-style-type: none"> <li>• Complete an unattended installation, which you schedule using operating system utilities such as <code>at</code>.</li> <li>• Complete several similar installations on multiple systems without user interaction.</li> <li>• Install the software on a system that does not have X Window System software installed on it.</li> </ul> <p>The installer displays progress information on the terminal that you used to start it, but it does not display any of the installer screens.</p>
Response file	<p>Use response file mode to complete similar Oracle software installations on more than one system, providing default answers to some, but not all of the installer prompts.</p>

## Creating a Database Using Oracle ASM for Database Files

Before you create a database that uses Oracle Automatic Storage Management (Oracle ASM), you must run the `root.sh` script.

For this reason, you cannot create a database using Oracle ASM as the storage option for database files during a silent mode installation. Instead, you can complete a software-only installation using `silent-mode`, and then run the Oracle Net Configuration Assistant and DBCA in silent mode after you have completed the software-only installation and you have run the `root.sh` script.

 **Note:**

This limitation applies only to databases that use Oracle Automatic Storage Management as the storage option for database files. You can create a database that uses the file system option during a silent-mode installation.

## Using Response Files

Use response files to install and configure Oracle products using the installer in silent or response file mode.

 **Note:**

You must complete all required preinstallation tasks on a system before running the installer in silent or response file mode.

1. Prepare a response file.
2. Run the installer in silent or response file mode.
3. Run the root scripts as prompted by Oracle Universal Installer.
4. If you completed a software-only installation, then run Net Configuration Assistant and Oracle DBCA in silent or response file mode to create the database listener and an Oracle Database instance respectively.

## Preparing Response Files

Review this information to prepare response files for use during silent mode or response file mode installations.

- [Editing a Response File Template](#)  
Oracle provides response file templates for each product and each configuration tool.
- [Recording Response Files](#)  
You can use OUI in interactive mode to record response files, which you can then edit and use to complete silent mode or response file mode installations.

## Editing a Response File Template

Oracle provides response file templates for each product and each configuration tool.

### About Response File Templates

For Oracle Database, the response file templates are located in the `$ORACLE_HOME/install/response` directory. For Oracle Grid Infrastructure, the response file templates are located in the `Grid_home/install/response` directory.

Where, `Grid_home` is the Oracle Grid Infrastructure home directory path.

#### Note:

If you copied the software to a hard disk, then the response files are located in the `$ORACLE_HOME/install/response` directory.

All response file templates contain comment entries, sample formats, examples, and other useful instructions. Read the response file instructions to understand how to specify values for the response file variables, so that you can customize your installation.

The following table lists the response files provided with this software:

**Table 7-1 Response Files for Oracle Database and Oracle Grid Infrastructure**

Response File	Description
<code>db_install.rsp</code>	Silent installation of Oracle Database.
<code>dbca.rsp</code>	Silent creation and configuration of Oracle Database using Oracle DBCA.
<code>netca.rsp</code>	Silent configuration of Oracle Net using Oracle NETCA.
<code>gridsetup.rsp</code>	Silent configuration of Oracle Grid Infrastructure installations.

#### Caution:

When you modify a response file template and save a file for use, the response file may contain plain text passwords. Ownership of the response file should be given to the Oracle software installation owner only, and permissions on the response file should be changed to 600. Oracle strongly recommends that database administrators or other administrators delete or secure response files when they are not in use.

To copy and modify a response file:

1. Copy the response file from the response file directory to a directory on your system:  
For example, for Oracle Database:

```
$ cp $ORACLE_HOME/install/response/db_install.rsp local_directory
```

2. Open the response file in a text editor:

```
$ vi /local_directory/db_install.rsp
```

3. Follow the instructions in the file to edit it.

 **Note:**

The installer or configuration assistant fails if you do not correctly configure the response file. Also, ensure that your response file name has the `.rsp` suffix.

4. Secure the response file by changing the permissions on the file to 600:

```
$ chmod 600 /local_dir/db_install.rsp
```

Ensure that only the Oracle software owner user can view or modify response files or consider deleting them after the installation succeeds.

 **Note:**

A fully-specified response file for an Oracle Database installation contains the passwords for database administrative accounts and for a user who is a member of the OSDBA group (required for automated backups).

## Recording Response Files

You can use OUI in interactive mode to record response files, which you can then edit and use to complete silent mode or response file mode installations.

Recording response files is useful for Advanced or software-only installations. You can save all the installation steps into a response file during installation by clicking **Save Response File** on the **Summary** page. You can use the generated response file for a silent installation later. When you record the response file, you can either complete the installation, or you can exit from the installer on the Summary page, before OUI starts to set up the software to the system.

If you use record mode during a response file mode installation, then the installer records the variable values that were specified in the original source response file into the new response file.

 **Note:**

OUI does not save passwords while recording the response file.

1. Complete preinstallation tasks as for a standard installation.

When you run the installer to record a response file, it checks the system to verify that it meets the requirements to install the software. For this reason, Oracle recommends that you complete all of the required preinstallation tasks and record the response file while completing an installation.

2. Ensure that the Oracle software owner user (typically `oracle`) has permissions to create or write to the Oracle home path that you specify when you run the installer.
3. On each installation screen, specify the required information.

4. When the installer displays the **Summary** screen, perform the following steps:
  - a. Click **Save Response File**. In the window, specify a file name and location for the new response file. Click **Save** to write the responses you entered to the response file.
  - b. Click **Finish** to continue with the installation. Click **Cancel** if you do not want to continue with the installation. The installation stops, but the recorded response file is retained.

 **Note:**

Ensure that your response file name has the `.rsp` suffix.

5. Before you use the saved response file on another system, edit the file and make any required changes. Use the instructions in the file as a guide when editing it.

## Running Oracle Universal Installer Using a Response File

After creating the response file, run Oracle Universal Installer at the command line, specifying the response file you created, to perform the installation.

Run Oracle Universal Installer at the command line, specifying the response file you created. The Oracle Universal Installer executables, `runInstaller` and `gridSetup.sh`, provide several options. For help information on the full set of these options, run the `gridSetup.sh` or `runInstaller` command with the `-help` option. For example:

- For Oracle Database:

```
$ $ORACLE_HOME/runInstaller -help
```

- For Oracle Grid Infrastructure:

```
$ /u01/app/23.0.0/grid/gridSetup.sh -help
```

The help information appears in a window after some time.

Perform the following steps to run the installer using a response file:

1. Complete the preinstallation tasks for a normal installation.
2. Log in as the software installation owner user.
3. If you are completing a response file mode installation, then set the operating system `DISPLAY` environment variable for the user running the installation.

 **Note:**

You do not have to set the `DISPLAY` environment variable if you are completing a silent mode installation.

4. To start the installer in silent or response file mode, enter a command similar to the following:

- For Oracle Database:

```
$ $ORACLE_HOME/runInstaller [-silent] -responseFile responsefilename
```

- For Oracle Grid Infrastructure:

```
$ /u01/app/23.0.0/grid/gridSetup.sh [-silent] -responseFile responsefilename
```

 **Note:**

Do not specify a relative path to the response file. If you specify a relative path, then the installer fails.

In this example:

- `-silent` runs the installer in silent mode.
  - `responsefilename` is the full path and file name of the installation response file that you configured.
5. If this is the first time you are installing Oracle software on your system, then Oracle Universal Installer prompts you to run the `oraInstRoot.sh` script. Log in as the `root` user and run the `oraInstRoot.sh` script:

```
$ su root
password:
# /u01/app/oraInventory/oraInstRoot.sh
```

 **Note:**

You do not have to manually create the `oraInst.loc` file. Running the `oraInstRoot.sh` script is sufficient as it specifies the location of the Oracle Inventory directory.

6. When the installation completes, log in as the `root` user and run the `root.sh` script. For example:

```
$ su root
password:
# $ORACLE_HOME/root.sh
```

## Postinstallation Configuration Using Response File Created During Installation

Use response files to configure Oracle software after installation. You can use the same response file created during installation to also complete postinstallation configuration.

- [Using the Installation Response File for Postinstallation Configuration](#)  
You can use the response file created during installation to also complete postinstallation configuration.
- [Running Postinstallation Configuration Using Response File](#)  
You can use a response file to complete postinstallation tasks on one or more servers simultaneously.

## Using the Installation Response File for Postinstallation Configuration

You can use the response file created during installation to also complete postinstallation configuration.

Run the installer with the `-executeConfigTools` option to configure configuration assistants after installing Oracle Grid Infrastructure or Oracle Database. You can use the response file located at `$ORACLE_HOME/install/response/product_timestamp.rsp` to obtain the passwords required to run the configuration tools. You must update the response file with the required passwords before running the `-executeConfigTools` command.

Oracle strongly recommends that you maintain security with a password response file:

- Permissions on the response file should be set to 600.
- The owner of the response file should be the installation owner user, with the group set to the central inventory (`oraInventory`) group.

### Example 7-1 Response File Passwords for Oracle Grid Infrastructure (`grid` user)

```
bmcPassword=password  
sysasmPassword=password  
asmnmpPassword=password  
emadminPassword=password
```

If you do not have a BMC card, or you do not want to enable IPMI, then leave the `ipmi.bmcPassword` input field blank.

If you do not want to enable Oracle Enterprise Manager for management, then leave the `emAdminPassword` password field blank.

### Example 7-2 Response File Passwords for Oracle Grid Infrastructure for a Standalone Server (`oracle` user)

```
sysasmPassword=password  
asmnmpPassword=password  
emadminPassword=password
```

If you do not want to enable Oracle Enterprise Manager for management, then leave the `emAdminPassword` password field blank.

### Example 7-3 Response File Passwords for Oracle Database (`oracle` user)

This example illustrates the passwords to specify for use with the database configuration assistants.

```
sysPassword=password  
systemPassword=password  
dbsnmpPassword=password
```

```
pdbadminPassword=password  
emAdminPassword=password  
asmsnmpPassword=password
```

You can also specify `allPassword=password` to use the same password for all database users.

The database configuration assistants require the SYS, SYSTEM, PDBADMIN, and DBSNMP passwords for use with Oracle DBCA. You must specify the following passwords, depending on your system configuration:

- If the database uses Oracle Automatic Storage Management (Oracle ASM) for storage, then you must specify a password for the `ASMSNMPPassword` variable. If you are not using Oracle ASM, then leave the value for this password variable blank.

## Running Postinstallation Configuration Using Response File

You can use a response file to complete postinstallation tasks on one or more servers simultaneously.

Complete this procedure to run configuration assistants with the `executeConfigTools` command and a response file.

1. Edit the response file and specify the required passwords for your configuration. You can use the response file created during installation, located at `$ORACLE_HOME/install/response/product_timestamp.rsp`.

2. Change directory to the Oracle home containing the installation software. For example:  
For Oracle Grid Infrastructure:

```
cd Grid_home
```

Where, *Grid\_home* is the path to the Oracle Grid Infrastructure home directory `/u01/app/23.0.0/grid`

For Oracle Database:

```
cd $ORACLE_HOME
```

3. Run the configuration script using the following syntax:

For Oracle Grid Infrastructure:

```
$ ./gridSetup.sh -executeConfigTools -responseFile Grid_home/install/  
response/product_timestamp.rsp
```

For Oracle Database:

```
$ ./runInstaller -executeConfigTools -responseFile $ORACLE_HOME/install/  
response/product_timestamp.rsp
```

For Oracle Database, you can also run the response file located in the directory `$ORACLE_HOME/install/response/`:

```
$ ./runInstaller -executeConfigTools -responseFile $ORACLE_HOME/install/  
response/db_install.rsp
```

The postinstallation configuration tool runs the installer in the graphical user interface mode, displaying the progress of the postinstallation configuration. Specify the `[-silent]` option to run the postinstallation configuration in the silent mode.

For example, for Oracle Grid Infrastructure:

```
$ ./gridSetup.sh -executeConfigTools -responseFile /u01/app/23.0.0/grid/  
install/response/grid_2022-01-09_01-03-36PM.rsp [-silent]
```

For Oracle Database:

```
$ ./runInstaller -executeConfigTools -responseFile /u01/app/oracle/product/  
23.0.0/dbhome_1/response/db_2022-01-09_01-03-36PM.rsp [-silent]
```

## Running Configuration Assistants Using Response Files

You can run configuration assistants in response file or silent mode to configure and start Oracle software after it is installed on the system.

### Note:

If you copied the software to a hard disk, then the response file template is located in the `/response` directory.

- [Running Oracle DBCA Using Response Files](#)  
You can run Oracle DBCA in response file mode to configure and start an Oracle database on the system.
- [Running Net Configuration Assistant Using Response Files](#)  
You can run NETCA in silent mode to configure and start an Oracle Net Listener on the system, and configure naming methods and Oracle Net service names.

## Running Oracle DBCA Using Response Files

You can run Oracle DBCA in response file mode to configure and start an Oracle database on the system.

To run Oracle Database Configuration Assistant (Oracle DBCA) in response file mode, you must copy and edit a response file template. Oracle provides a response file template named `dbca.rsp` in the `ORACLE_HOME/assistants/dbca` directory. To run Oracle DBCA in response file mode, you must use the `-responseFile` flag in combination with the `-silent` flag. You must also use a graphical display and set the `DISPLAY` environment variable.

To run Oracle DBCA in response file mode:

1. Copy the `dbca.rsp` response file template from the response file directory to a directory on your system:

```
$ cp $ORACLE_HOME/assistants/dbca/dbca.rsp /local_directory
```

In this example, `directory_path` is the path of the directory where you have copied the installation binaries.

As an alternative to editing the response file template, you can also create a database by specifying all required information as command line options when you run Oracle DBCA. For information about the list of options supported, enter the following command:

```
$ $ORACLE_HOME/bin/dbca -help
```

2. Open the response file in a text editor:

```
$ vi /local_dir/dbca.rsp
```

3. Follow the instructions in the file to edit the file.

 **Note:**

Oracle DBCA fails if you do not correctly configure the response file.

4. Log in as the Oracle software owner user, and set the `ORACLE_HOME` environment variable to specify the correct Oracle home directory.
5. To run Oracle DBCA in response file mode, set the `DISPLAY` environment variable.
6. Use the following command syntax to run Oracle DBCA in silent or response file mode using a response file:

```
$ORACLE_HOME/bin/dbca [-silent] -createDatabase -responseFile /local_dir/  
dbca.rsp
```

In this example:

- `-silent` option indicates that Oracle DBCA runs in silent mode.
- `local_dir` is the full path of the directory where you copied the `dbca.rsp` response file template.

During configuration, Oracle DBCA displays a window that contains the status messages and a progress bar.

## Running Net Configuration Assistant Using Response Files

You can run NETCA in silent mode to configure and start an Oracle Net Listener on the system, and configure naming methods and Oracle Net service names.

To run Oracle Net Configuration Assistant (NETCA) in silent mode, you must copy and edit a response file template. Oracle provides a response file template named `netca.rsp` in the `$ORACLE_HOME/assistants/netca` directory.

To run Net Configuration Assistant using a response file:

1. Copy the `netca.rsp` response file template from the response file directory to a directory on your system:

```
$ cp $ORACLE_HOME/assistants/netca/netca.rsp local_directory
```

2. Open the response file in a text editor:

```
$ vi /local_directory/netca.rsp
```

3. Follow the instructions in the file to edit it.

 **Note:**

Net Configuration Assistant fails if you do not correctly configure the response file.

4. Log in as the Oracle software owner user, and set the `ORACLE_HOME` environment variable to specify the correct Oracle home directory.
5. Enter a command similar to the following to run Net Configuration Assistant in silent mode:

```
$ $ORACLE_HOME/bin/netca -silent -responsefile /local_directory/netca.rsp
```

In this command:

- The `/silent` option indicates to run Net Configuration Assistant in silent mode.
- `local_directory` is the full path of the directory where you copied the `netca.rsp` response file template.

# 8

## Directory Structure for Oracle RAC Environments

Understand the directory structure for Oracle Real Application Clusters (Oracle RAC) software environments.

- [Understanding the Oracle RAC Directory Structure](#)  
When you install Oracle RAC database, all subdirectories except for the Oracle Inventory directory, are placed under a top-level Oracle base directory.
- [Directory Structures for Oracle RAC](#)  
Understand the hierarchical directory tree of a sample Optimal Flexible Architecture (OFA)-compliant database for Oracle RAC.

### Understanding the Oracle RAC Directory Structure

When you install Oracle RAC database, all subdirectories except for the Oracle Inventory directory, are placed under a top-level Oracle base directory.

The Oracle Automatic Storage Management (Oracle ASM) home (if applicable), and the Oracle Clusterware home, are placed under a top-level Oracle base directory. The Oracle home and `admin` directories are also located under the Oracle base directory.

#### See Also:

*Oracle Database Installation Guide for Linux* for your platform for more information about the Oracle home and `admin` directories

### Directory Structures for Oracle RAC

Understand the hierarchical directory tree of a sample Optimal Flexible Architecture (OFA)-compliant database for Oracle RAC.

**Table 8-1 Directory Structure for A Sample OFA-Compliant Environment**

Directory	Description
<code>\$ORACLE_BASE</code>	The default <code>ORACLE_BASE</code> directory, where the software owner is the <code>oracle</code> user. For example: <code>/u01/app/oracle</code>
<code>installation_type</code>	Type of installation under the Oracle base directory. For example, when installing Oracle Database 23ai, the value for <code>installation_type</code> is <code>product/23.0.0/dbhome_1</code> . For example: <code>/u01/app/oracle/product/23.0.0/dbhome_1</code>

**Table 8-1 (Cont.) Directory Structure for A Sample OFA-Compliant Environment**

Directory	Description
\$ORACLE_HOME	The location in which the Oracle Database software is installed. You can also choose to add a counter, if you have multiple installations of the software. For example, if you are creating a second Oracle home for the Oracle Database 23ai software, then the path is as follows: <code>/u01/app/oracle/product/23.0.0/dbhome_2</code> Note that the Oracle database home is under the Oracle base directory path. An Oracle Clusterware directory must <i>not</i> be under the Oracle base directory path where the database executable files are located.
db	The directory in which the local initialization parameter file is stored for the database.
admin	The administrative directory. Note that with Oracle Database 11g, <code>bdump</code> , <code>cdump</code> , and <code>udump</code> files are relocated to the directory associated with <code>ADR_BASE</code> . For example: <code>/u01/app/oracle/admin</code>
<i>db_unique_name</i>	The database unique name; this is the same as <code>dbname</code> when the database name is 8 or fewer characters in length. For example, if your database name is <code>sales</code> , the directory path is: <code>/u01/app/oracle/admin/sales</code>
<code>/hdump</code> <code>/pfile</code>	The dump destinations for database server.
<code>\$ADR_BASE/bdump</code> <code>\$ADR_BASE/cdump</code> <code>\$ADR_BASE/udump</code>	Automatic Diagnostic Repository dump destination trace files. Note that this directory path is set by the initialization parameter <code>DIAGNOSTIC_DEST</code> , and that the path for the Automatic Data Repository must be located on a shared storage location available to all the nodes. By default, this path is a subset of the Oracle base directory, in the following path: <code>\$ORACLE_BASE/diag/</code>
Oracle Grid Infrastructure for a cluster home (Grid home)	An OFA-compliant path for the Oracle Clusterware home. The default value is: <code>/u01/app/23.0.0/grid</code> During the Oracle Grid Infrastructure for a cluster installation, Oracle Clusterware and Oracle Automatic Storage Management (Oracle ASM) software is installed. The <code>root.sh</code> script changes permissions of all of the parent directories of the Oracle Clusterware home directory to grant write access only to the root user. Because of this, the Oracle Clusterware home directory must not be a subdirectory of the Oracle base directory.
bin	The subtree for Oracle Clusterware and Oracle ASM executable files.
network	The subtree for Oracle Net Services configuration files and utilities.

## Preparing to Upgrade an Existing Oracle RAC Database

Understand how you can prepare an Oracle Real Application Clusters (Oracle RAC) database for patch updates or upgrade.

- [Backing Up the Oracle RAC Database](#)  
Before you make any changes to the Oracle software, Oracle recommends that you create a backup of the Oracle Database installation.
- [Using CVU to Validate Readiness for Oracle RAC Upgrades](#)  
Review the contents in this section to validate that your Oracle RAC cluster is ready for upgrades.
- [AutoUpgrade and Cluster-Managed Oracle Database Upgrades](#)  
Starting with Oracle Database 21c, AutoUpgrade can automate Oracle Real Application Clusters (Oracle RAC) and Oracle RAC One Node upgrades using the multitenant architecture.

### Backing Up the Oracle RAC Database

Before you make any changes to the Oracle software, Oracle recommends that you create a backup of the Oracle Database installation.

### Using CVU to Validate Readiness for Oracle RAC Upgrades

Review the contents in this section to validate that your Oracle RAC cluster is ready for upgrades.

- [cluvfy Command Options for Database Upgrade Validation](#)  
Use the Configuration Verification Utility (CVU) command `cluvfy stage -pre dbinst -upgrade` to check the readiness of your Oracle RAC installation for upgrades.
- [Verifying System Readiness for Oracle Database Upgrades](#)  
Use Configuration Verification Utility (CVU) to assist you with system checks in preparation for starting a database upgrade.

### cluvfy Command Options for Database Upgrade Validation

Use the Configuration Verification Utility (CVU) command `cluvfy stage -pre dbinst -upgrade` to check the readiness of your Oracle RAC installation for upgrades.

#### Note:

Starting with Oracle Grid Infrastructure 23ai, Cluster Verification Utility (CVU) is renamed to Configuration Verification Utility (CVU).

## Purpose

Running `cluvfy` with the `-predbinst -upgrade` options performs system checks to confirm if the cluster is in a correct state for upgrading from an existing Oracle RAC installation.

## Syntax

```
cluvfy stage -pre dbinst -upgrade -src_dbhome src_RAChome [-dbname
db_names_list] -dest_dbhome dest_RAChome -dest_version dest_version
[-fixup] [-fixupnoexec] [-method root|-method sudo -user user_name
[-location dir_path ]] [-verbose]
```

The command performs the appropriate checks on all the nodes in the cluster before setting up an Oracle RAC Database. The following table describes the options for the command.

## Options

**Table 9-1 Configuration Verification Utility Command Options for Oracle RAC Databases**

Option	Description
<code>-src_dbhome src_RAChome</code>	Location of the source Oracle RAC home that you are upgrading, where <code>src_RAChome</code> is the path to the home to upgrade.
<code>-dest_dbhome dest_RAChome</code>	Location of the Oracle RAC home for upgrade, where <code>dest_RAChome</code> is the path to the Oracle RAC home.
<code>-dest_version dest_version</code>	Release number of the upgrade, including any patchset. The release number must include the five digits designating the release to the level of the platform-specific patch. For example: 23.0.0.0.0.
<code>-user user_name</code>	User name to access all the nodes with root privileges.
<code>-location dir_path</code>	Full file system path for the <code>sudo</code> executable.
<code>-dbname db_names_list</code>	List of unique names of the databases being upgraded.
<code>-verbose</code>	Displays detailed output of individual checks.
<code>-fixup</code>	If specified, on verification failure, performs fixup operations.
<code>-fixupnoexec</code>	If specified, on verification failure, fix up data is generated and the instruction for manual execution of the generated fix ups is displayed.

You can verify that the permissions required for installing Oracle RAC have been configured on the nodes `node1` and `node2` by running the following command.

```
$ ./cluvfy stage -pre dbinst -upgrade
-src_dbhome /u01/app/oracle/product/21.0.0/dbhome_1
-dest_dbhome /u01/app/oracle/product/23.0.0/dbhome_1
-dest_version 23.0.0.0.0 -fixup -verbose
```

## Verifying System Readiness for Oracle Database Upgrades

Use Configuration Verification Utility (CVU) to assist you with system checks in preparation for starting a database upgrade.

The installer runs the appropriate CVU checks automatically, and either prompts you to fix problems, or provides a fixup script to be run on all nodes in the cluster before proceeding with the upgrade.

### See Also:

*Oracle Database Upgrade Guide*

## AutoUpgrade and Cluster-Managed Oracle Database Upgrades

Starting with Oracle Database 21c, AutoUpgrade can automate Oracle Real Application Clusters (Oracle RAC) and Oracle RAC One Node upgrades using the multitenant architecture.

When you run AutoUpgrade on an Oracle Database instance that is managed with Oracle Clusterware, and that database instance is a pluggable database (PDB) on a container database (CDB), AutoUpgrade detects how the database is configured:

- Oracle Real Application Clusters (Oracle RAC) cluster member node, using Oracle Automatic Storage Management (Oracle ASM), or a supported shared file system.
- Oracle Real Application Clusters One Node (Oracle RAC One Node) using Oracle ASM

Based on that detection, AutoUpgrade proceeds with the upgrade steps required for that configuration type.

### Note:

Choosing this upgrade option requires downtime of the cluster while AutoUpgrade completes upgrades of database instances, and system configuration. If you use Oracle Enterprise Manager, then you must reconfigure it after the upgrade.

### Overview of Steps for Cluster-Managed Oracle Database Instances

When you have installed the new release binaries, and AutoUpgrade detects cluster-managed databases, AutoUpgrade completes the following steps in sequence:

1. Disables Oracle RAC services (if needed).
2. Disables Oracle RAC or Oracle RAC One Node databases managed by Oracle Clusterware.
3. Shuts down all Oracle Database instances in the cluster.
4. Starts the local instance, with the cluster initialization parameter `CLUSTER_DATABASE=FALSE`.
5. Upgrades the local Oracle RAC or Oracle RAC One Node database instance.

6. Registers and enables Oracle RAC in target version in the clusterware (`CLUSTER_DATABASE=TRUE`).
7. Starts all Oracle Database instances on the cluster.

### Requirements for Using AutoUpgrade to Upgrade Oracle Databases Managed with Oracle Clusterware

Your source release Oracle Database instances and your target release Oracle Database instances must meet the following requirements:

- You must address any issues that are identified by AutoUpgrade pre-upgrade validation checks.
- The source release Oracle Database instances that you want to upgrade must be supported for direct upgrade to the target Oracle Database release.
- The source Oracle Database release and the target Oracle Database release must be running on an operating system supported for Oracle Database on both the source and target releases. If your source database is running on an operating system that is not supported with the target Oracle Database release, then you must migrate your source Oracle Database to a supported operating system before upgrade.
- The source release Oracle home must be installed on all cluster member nodes, and configured as an Oracle RAC or Oracle RAC One Node database.
- The target release Oracle home must be installed and configured as an Oracle RAC or Oracle RAC One Node database
- The source Oracle Database must be up and running.
- The operating system must be either Oracle Linux (formerly Oracle Enterprise Linux), or a supported Portable Operating System Interface POSIX Linux or Unix operating system.
- The user account performing the upgrade must be configured with operating system authentication.
- The system uses Oracle Automatic Storage Management for storage (recommended), or a supported shared storage system.
- The system must have a properly configured and functioning Oracle Grid Infrastructure software configuration for Oracle RAC or Oracle RAC One Node.

### Required Tasks for Database Administrators to Use AutoUpgrade

As the database administrator, you must complete the following tasks:

- Create an adequate backup strategy to prevent data loss from any problems resulting from the upgrade.
- Configure Listener and Transparent Network Substrate (TNS) files, both for local `tnsnames.ora` and SCAN listeners, if needed.
- Configure Oracle Wallet certificates and management (if needed). The Oracle Wallet must be set for automatic login.

- [Enabling a Read-Only Oracle Home](#)  
Configure your Oracle home as a read-only Oracle home after you have performed a software-only Oracle Database installation.
- [Copying demo Directories to Oracle Base Home](#)  
In a read-only mode ORACLE\_HOME, you must copy the `demo` directories listed in this topic from ORACLE\_HOME to ORACLE\_BASE\_HOME.
- [Determining If an Oracle Home is Read-Only](#)  
Run the `orabasehome` command to determine if your Oracle home is a read/write or read-only Oracle home.
- [File Path and Directory Changes in Read-Only Oracle Homes](#)  
Learn from these examples the differences between hierarchical file mappings in a read-only Oracle home compared to a read/write Oracle home.

## Evolution of Oracle Homes

Learn about read-only Oracle home concepts like Oracle base home, Oracle base config, and orabasetab.

- [About Read-Only Oracle Homes](#)  
With Oracle Database 23ai, an Oracle home is available in read/write mode by default. However, you can choose to configure an Oracle home in read-only mode after you have performed a software-only Oracle Database installation.
- [About Oracle Base Home](#)  
Both, in a read-only ORACLE\_HOME and read/write ORACLE\_HOME, the user-specific files, instance-specific files, and log files reside in a location known as the ORACLE\_BASE\_HOME.
- [About Oracle Base Config](#)  
Both, in a read-only ORACLE\_HOME and read/write ORACLE\_HOME, the configuration files reside in a location known as ORACLE\_BASE\_CONFIG.
- [About orabasetab](#)  
The `orabasetab` file is used to define fundamental directories based on \$ORACLE\_HOME, ORACLE\_BASE, ORACLE\_BASE\_HOME and ORACLE\_BASE\_CONFIG.

## About Read-Only Oracle Homes

With Oracle Database 23ai, an Oracle home is available in read/write mode by default. However, you can choose to configure an Oracle home in read-only mode after you have performed a software-only Oracle Database installation.

A read-only Oracle Home simplifies provisioning by implementing separation of installation and configuration.

In a read-only Oracle home, all the configuration data and log files reside outside of the read-only Oracle home.

Apart from the traditional `ORACLE_BASE` and `ORACLE_HOME` directories, the following directories contain files that used to be in `ORACLE_HOME`:

- `ORACLE_BASE_HOME`
- `ORACLE_BASE_CONFIG`

 **Note:**

This feature does not affect how database administrators monitor, diagnose, and tune their system performance.

## About Oracle Base Home

Both, in a read-only `ORACLE_HOME` and read/write `ORACLE_HOME`, the user-specific files, instance-specific files, and log files reside in a location known as the `ORACLE_BASE_HOME`.

In a read/write `ORACLE_HOME`, the `ORACLE_BASE_HOME` path is the same as the `ORACLE_HOME` directory. However, in a read-only `ORACLE_HOME`, the `ORACLE_BASE_HOME` directory is not co-located with `ORACLE_HOME` but is located at `ORACLE_BASE/homes/HOME_NAME`. Where, `HOME_NAME` is the internal name for `ORACLE_HOME`.

For example, the networking directories `network/admin`, `network/trace`, and `network/log` are located in the `ORACLE_BASE_HOME` directory. In a read/write `ORACLE_HOME` the networking directories appear to be in `ORACLE_HOME` because `ORACLE_BASE_HOME` is co-located with `ORACLE_HOME`, whereas in a read-only `ORACLE_HOME` the networking directories are located in `ORACLE_BASE/homes/HOME_NAME`.

To print the `ORACLE_BASE_HOME` path, run the `orabasehome` command from the `$ORACLE_HOME/bin` directory:

```
$ setenv ORACLE_HOME /u01/app/oracle/product/23.0.0/dbhome_1
$ cd $ORACLE_HOME/bin
$ ./orabasehome
```

The `orabasehome` command returns the location of `ORACLE_BASE_HOME` irrespective of whether the home is a read-only `ORACLE_HOME` or a read/write `ORACLE_HOME`.

For example, to know the location of networking files like `sqlnet.ora`, `tnsnames.ora`, or `listener.ora`, run `orabasehome`:

**Example 10-1 Output in a Read-Only ORACLE\_HOME**

```
$ ./orabasehome  
/u01/app/oracle/homes/OraDB23Home1
```

Where, /u01/app/oracle is ORACLE\_BASE and OraDB23Home1 is the HOME\_NAME.

**Example 10-2 Output in a Read/Write ORACLE\_HOME**

```
$ ./orabasehome  
/u01/app/oracle/product/23.0.0/dbhome_1
```

Where, /u01/app/oracle/product/23.0.0/dbhome\_1 is the ORACLE\_HOME.

## About Oracle Base Config

Both, in a read-only ORACLE\_HOME and read/write ORACLE\_HOME, the configuration files reside in a location known as ORACLE\_BASE\_CONFIG.

In a read/write ORACLE\_HOME, the ORACLE\_BASE\_CONFIG path is the same as the ORACLE\_HOME path because it is located at \$ORACLE\_HOME. However, in a read-only ORACLE\_HOME, the ORACLE\_BASE\_CONFIG path is the same as ORACLE\_BASE.

ORACLE\_BASE\_CONFIG/dbs contains the configuration files for ORACLE\_HOME. Each file in the dbs directory contains \$ORACLE\_SID so that the directory can be shared by many different ORACLE\_SIDs.

To print the ORACLE\_BASE\_CONFIG path, run the orabaseconfig command from the \$ORACLE\_HOME/bin directory:

```
$ setenv ORACLE_HOME /u01/app/oracle/product/23.0.0/dbhome_1  
$ cd $ORACLE_HOME/bin  
$ ./orabaseconfig
```

The orabaseconfig command returns the location of ORACLE\_BASE\_CONFIG irrespective of whether the home is a read-only ORACLE\_HOME or a read/write ORACLE\_HOME.

For example, to know the location of configuration files like SPFILE and the password file, run orabaseconfig:

**Example 10-3 Output in Read-Only ORACLE\_HOME**

```
$ ./orabaseconfig  
/u01/app/oracle
```

Where, /u01/app/oracle is the ORACLE\_BASE.

**Example 10-4 Output in Read/Write ORACLE\_HOME**

```
$ ./orabaseconfig  
/u01/app/oracle/product/23.0.0/dbhome_1
```

where, /u01/app/oracle/product/23.0.0/dbhome\_1 is the ORACLE\_HOME.

## About orabasetab

The `orabasetab` file is used to define fundamental directories based on `$ORACLE_HOME`, `ORACLE_BASE`, `ORACLE_BASE_HOME` and `ORACLE_BASE_CONFIG`.

The `orabasetab` file resides in `ORACLE_HOME/install/orabasetab`. To determine if an `ORACLE_HOME` is read-only or read/write, check for the presence of the `orabasetab` file. The `orabasetab` file also defines the `ORACLE_BASE` and the `HOME_NAME` of the Oracle home. `HOME_NAME` is the internal name for `ORACLE_HOME`.

The last line in the `orabasetab` file, which starts with `$ORACLE_HOME`, defines the directories for `$ORACLE_HOME`. The last line consists of four fields, each separate by a colon delimiter (`:`).

1. The first field matches the current `$ORACLE_HOME`.
2. The second field defines the `ORACLE_BASE` for the current `ORACLE_HOME`.
3. The third field defines the `HOME_NAME` which is used in constructing the `ORACLE_BASE_HOME` path in a read-only `ORACLE_HOME`.
4. The fourth field displays `Y` in a read-only `ORACLE_HOME` and `N` in a read/write `ORACLE_HOME`.

In a read-only `ORACLE_HOME`, the `ORACLE_BASE_HOME` path is `ORACLE_BASE/homes/HOME_NAME` and `ORACLE_BASE_CONFIG` is the same as `ORACLE_BASE`.

In a read/write `ORACLE_HOME`, `ORACLE_HOME`, `ORACLE_BASE_HOME` and `ORACLE_BASE_CONFIG` are all the same.

### Viewing an orabasetab File

1. Log in as the Oracle installation owner user account (`oracle`).
2. Go to the `$ORACLE_HOME/install` directory.

```
$ cd /u01/app/oracle/product/23.0.0/dbhome_1/install
```

3. View the contents of the `orabasetab` file.

```
$ cat orabasetab
/u01/app/oracle/product/23.0.0/dbhome_1:/u01/app/oracle:Oradb23Home1:Y:
```

In this example, a `Y` in the fourth field at the end of the line indicates you have a read-only Oracle home.

## Enabling a Read-Only Oracle Home

Configure your Oracle home as a read-only Oracle home after you have performed a software-only Oracle Database installation.

To enable a read-only Oracle home:

1. Perform a software-only Oracle Database installation.
2. Run the `roohctl -enable` script.
3. Run Oracle Database Configuration Assistant (Oracle DBCA) to create a database.

## Software-Only Database Installation

1. Log in as the Oracle installation owner user account (`oracle`) that you want to own the software binaries.
2. Download the Oracle Database installation image files (`db_home.zip`) to a directory of your choice. For example, you can download the image files to the `/tmp` directory.
3. Create the Oracle home directory and extract the image files that you have downloaded in to this Oracle home directory. For example:

```
$ mkdir -p /u01/app/oracle/product/23.0.0/dbhome_1
$ chown oracle:oinstall /u01/app/oracle/product/23.0.0/dbhome_1
$ cd /u01/app/oracle/product/23.0.0/dbhome_1
$ unzip -q /tmp/db_home.zip
```

### Note:

Ensure that the Oracle home directory path you create is in compliance with the Oracle Optimal Flexible Architecture recommendations. Also, unzip the installation image files only in this Oracle home directory that you created.

4. From the Oracle home directory, run the `runInstaller` command to start the Oracle Database installer.
5. In the Select Configuration Option screen, select **Set Up Software Only**.
6. Select your installation type. Installation screens vary depending on the installation option you select. Respond to the configuration prompts as needed.

### Note:

Click **Help** if you have any questions about the information you are asked to submit during installation.

## Run the `roohctl` Script

1. Go to the `bin` directory

```
$ cd /u01/app/oracle/product/23.0.0/dbhome_1/bin
```

2. Run the `roohctl` script to enable read-only Oracle home.

```
$ ./roohctl -enable
```

3. On Oracle Real Application Clusters (Oracle RAC) installations, run the preceding `roohctl` script on every node of the cluster. Alternatively, run the `roohctl` script with the `nodelist` option and provide the list of cluster nodes:

```
$ ./roohctl -enable -nodelist comma_separated_list_of_nodes
```

### Run Oracle Database Configuration Assistant

1. Ensure that you are still in the `bin` directory and run Oracle DBCA.

```
$ ./dbca
```

2. In the Select Database Operation screen, select **Create a Database**.
3. The configuration screens vary depending on the options you select. Respond to the prompts as needed.

#### Note:

Click **Help** if you have any questions about the information you are asked to submit during database creation.

## Copying demo Directories to Oracle Base Home

In a read-only mode `ORACLE_HOME`, you must copy the `demo` directories listed in this topic from `ORACLE_HOME` to `ORACLE_BASE_HOME`.

Oracle Database contains various `demo` directories that include a variety of examples and product demonstrations that you can use to learn about the products, options, and features of Oracle Database. In a read-only mode `ORACLE_HOME`, you cannot use these `demo` directories in `ORACLE_HOME` because writes are performed to these `demo` directories when they are used.

Many of the `demo` directories are not available by default. You must install Oracle Database Examples to view and use the examples and product demonstrations.

Copy the respective `demo` directory to the corresponding location in `ORACLE_BASE_HOME`. Now, you can use this copy of the `demo` directory.

You must copy the following `demo` directories from `ORACLE_HOME` to `ORACLE_BASE_HOME`:

- `jdbc/demo`
- `odbc/demo`
- `ord/http/demo`
- `precomp/demo`
- `rdbms/demo`
- `sqlplus/demo`
- `xdk/demo`

You must also create symbolic links for the `odbc/demo`, `precomp/demo`, `rdbms/demo`, and `xdk/demo` `demo` directories. See the "Creating Symbolic Links" section in this topic.

### Copying demo Directories

For example, to copy the `rdbms/demo` directory from `ORACLE_HOME` to `ORACLE_BASE_HOME`, perform the following:

1. Login as the Oracle software owner user (`oracle`).
2. Check if the `rdbms/demo` directory is copied to `ORACLE_BASE_HOME`.

```
$ ls -l -d $(orabasehome)/rdbms/demo
```

3. If the `rdbms/demo` directory has not been copied, then create it and copy it.

```
$ mkdir -p $(orabasehome)/rdbms
$ cp -r $ORACLE_HOME/rdbms/demo $(orabasehome)/rdbms/demo
```

Similarly, copy all the `demo` directories listed earlier from `ORACLE_HOME` to `ORACLE_BASE_HOME`.

### Creating Symbolic Links

You must create symbolic links for the `odbc/demo`, `precomp/demo`, `rdbms/demo`, and `xdk/demo` `demo` directories.

For `rdbms/demo`, replace `$ORACLE_HOME/rdbms/demo` with a symbolic link to the copy.

1. Ensure that the symbolic link does not already exist.

```
$ ls -l -d $ORACLE_HOME/rdbms/demo
```

2. If `$ORACLE_HOME/rdbms/demo` is still the original `demo` directory, rename it and replace it with the symbolic link.

```
$ cd $ORACLE_HOME/rdbms
$ mv demo demo.installed
$ ln -s $(orabasehome)/rdbms/demo $ORACLE_HOME/rdbms/demo
```

For `odbc/demo`, replace `$ORACLE_HOME/odbc/demo` with a symbolic link to the copy.

1. Ensure that the symbolic link does not already exist.

```
$ ls -l -d $ORACLE_HOME/odbc/demo
```

2. If `$ORACLE_HOME/odbc/demo` is still the original `demo` directory, rename it and replace it with the symbolic link.

```
$ cd $ORACLE_HOME/odbc
$ mv demo demo.installed
$ ln -s $(orabasehome)/odbc/demo $ORACLE_HOME/odbc/demo
```

For `precomp/demo`, replace `$ORACLE_HOME/precomp/demo` with a symbolic link to the copy.

1. Ensure that the symbolic link does not already exist.

```
$ ls -l -d $ORACLE_HOME/precomp/demo
```

2. If `$ORACLE_HOME/precomp/demo` is still the original `demo` directory, rename it and replace it with the symbolic link.

```
$ cd $ORACLE_HOME/precomp
$ mv demo demo.installed
$ ln -s $(orabasehome)/precomp/demo $ORACLE_HOME/precomp/demo
```

The `xdk/demo` directory requires a symbolic link at `$ORACLE_HOME/xdk/include` pointing to `$(orabasehome)/xdk/include` after you copy the `xdk/demo` directory.

1. Ensure that the symbolic link does not already exist:

```
$ ls -l -d $ORACLE_HOME/xdk/include
```

2. If the symbolic link does not exist, then, run the following command:

```
$ ln -s $ORACLE_HOME/xdk/include $(orabasehome)/xdk/include
```

#### Note:

In the `plsql/demo` directory, `ncmpdemo.sql` is unusable in read-only mode.

### Copying the `init.ora` File

Copy the `init.ora` file from `ORACLE_HOME` to `ORACLE_BASE_HOME`.

1. Login as the Oracle software owner user (`oracle`).
2. Check if the `init.ora` file exists in `ORACLE_BASE_HOME`.

```
$ ls $(orabasehome)/init.ora
```

If an `init.ora` file exists in `ORACLE_BASE_HOME`, then update this `init.ora` file to be in-sync with the `$ORACLE_HOME/init.ora` file.

3. If the `init.ora` file does not exist in `ORACLE_BASE_HOME`, then copy it from `ORACLE_HOME`.

```
$ cp $ORACLE_HOME/init.ora $(orabasehome)/init.ora
```

## Determining If an Oracle Home is Read-Only

Run the `orabasehome` command to determine if your Oracle home is a read/write or read-only Oracle home.

If the output of the `orabasehome` command is the same as `$ORACLE_HOME`, then your Oracle home is in read/write mode. If the output displays the path `ORACLE_BASE/homes/HOME_NAME`, then your Oracle home is in read-only mode.

1. Set the `ORACLE_HOME` environment variable:

Bourne, Bash or Korn shell:

```
$ ORACLE_HOME=/u01/app/oracle/product/23.0.0/dbhome_1
$ export ORACLE_HOME
```

C shell:

```
% setenv ORACLE_HOME /u01/app/oracle/product/23.0.0/dbhome_1
```

2. Go to the `bin` directory and run the `orabasehome` command:

```
$ cd $ORACLE_HOME/bin
$ ./orabasehome
/u01/app/oracle/homes/OraDB23Home1
```

In a read-only mode Oracle home, `orabasehome` prints the value of `ORACLE_BASE/homes/HOME_NAME`, and in a read-write mode Oracle home, `orabasehome` prints the value of `$ORACLE_HOME`.

In this example, the Oracle home is in read-only mode.

## File Path and Directory Changes in Read-Only Oracle Homes

Learn from these examples the differences between hierarchical file mappings in a read-only Oracle home compared to a read/write Oracle home.

This example shows an Optimal Flexible Architecture-compliant Oracle Database installation, for the user `oracle`, with the `ORACLE_HOME`, `ORACLE_BASE`, `ORACLE_BASE_HOME`, and `ORACLE_BASE_CONFIG` logical locations. The database files are mounted on `/u01` and the `HOME_NAME` is `OraDB23Home1`.

This example also shows the changes in the Oracle Database software defined paths of configuration files, log files, and other directories in a read-only Oracle home when compared to a read/write Oracle home.

**Table 10-1 Read-Only Oracle Home and Read/Write Oracle Home File Path Examples**

Directory	Read-Only Oracle Home File Path	Read/Write Oracle Home File Path
<code>ORACLE_HOME</code>	<code>/u01/app/oracle/product/23.0.0/dbhome_1</code>	<code>/u01/app/oracle/product/23.0.0/dbhome_1</code>
<code>ORACLE_BASE</code>	<code>/u01/app/oracle/</code>	<code>/u01/app/oracle/</code>
<code>ORACLE_BASE_HOME</code>	<code>ORACLE_BASE/homes/HOME_NAME</code> (or) <code>/u01/app/oracle/homes/OraDB23Home1</code>	<code>ORACLE_HOME</code> (or) <code>/u01/app/oracle/product/23.0.0/dbhome_1</code>

**Table 10-1 (Cont.) Read-Only Oracle Home and Read/Write Oracle Home File Path Examples**

Directory	Read-Only Oracle Home File Path	Read/Write Oracle Home File Path
ORACLE_BASE_CONFIG	ORACLE_BASE (or) /u01/app/oracle/	ORACLE_HOME (or) /u01/app/oracle/ product/23.0.0/ dbhome_1
network	ORACLE_BASE_HOME/network/ admin (or) /u01/app/oracle/homes/ OraDB23Home1/network/ admin	ORACLE_HOME/network/admin (or) /u01/app/oracle/ product/23.0.0/ dbhome_1/network/admin
dbs	ORACLE_BASE_CONFIG/dbs (or) /u01/app/oracle/dbs	ORACLE_HOME/dbs (or) /u01/app/oracle/ product/23.0.0/ dbhome_1/dbs
hs	ORACLE_BASE_HOME/hs/ admin (or) /u01/app/oracle/homes/ OraDB23Home1/hs/admin	ORACLE_HOME/hs/admin (or) /u01/app/oracle/ product/23.0.0/ dbhome_1/hs/admin
mgw	ORACLE_BASE_HOME/mgw/ admin (or) /u01/app/oracle/homes/ OraDB23Home1/mgw/admin	ORACLE_HOME/mgw/admin (or) /u01/app/oracle/ product/23.0.0/ dbhome_1/mgw/admin
drdaas	ORACLE_BASE_HOME/drdaas/ admin (or) /u01/app/oracle/homes/ OraDB23Home1/drdaas/ admin	ORACLE_HOME/drdaas/admin (or) /u01/app/oracle/ product/23.0.0/ dbhome_1/drdaas/admin

- To print the ORACLE\_BASE\_HOME path, run:

```
$ setenv ORACLE_HOME /u01/app/oracle/product/23.0.0/dbhome_1
$ cd $ORACLE_HOME/bin
$ ./orabasehome
```

- To print the ORACLE\_BASE\_CONFIG path, run:

```
$ setenv ORACLE_HOME /u01/app/oracle/product/23.0.0/dbhome_1  
$ cd $ORACLE_HOME/bin  
$ ./orabaseconfig
```

## Managing Oracle Database Port Numbers

Review default port numbers. If needed, use these steps to change assigned ports after installation.

- [About Managing Ports](#)  
During installation, Oracle Universal Installer assigns port numbers to components from a set of default port numbers.
- [Port Numbers and Protocols of Oracle Components](#)  
Review this information for port numbers and protocols used by components that are configured during the installation. By default, the first port in the range is assigned to the component, if it is available.

### About Managing Ports

During installation, Oracle Universal Installer assigns port numbers to components from a set of default port numbers.

Many Oracle Database components and services use ports. As an administrator, it is important to know the port numbers used by these services, and to ensure that the same port number is not used by two services on your host. Enter the following command to identify the ports currently used on your computer:

```
$/bin/netstat -a
```

Most port numbers are assigned during installation. Every component and service has an allotted port range, which is the set of port numbers Oracle Database attempts to use when assigning a port. Oracle Database starts with the lowest number in the range and performs the following checks:

- Is the port used by another Oracle Database installation on the host?  
The installation may be up or down at the time. Oracle Database can still detect if the port is used.
- Is the port used by a process that is currently running?  
This can be any process on the host, even a non-Oracle Database process.
- Is the port listed in the `/etc/services` file?

If the answer to any of the preceding questions is yes, then Oracle Database moves to the next highest port in the allotted port range, and continues checking until it finds a free port.

### Port Numbers and Protocols of Oracle Components

Review this information for port numbers and protocols used by components that are configured during the installation. By default, the first port in the range is assigned to the component, if it is available.

**Table 11-1 Ports Used in Oracle Components**

Component	Description	Default Port Number	Port Range	Protocol	Used Only On Interconnect
Cluster Synchronization Service daemon (CSSD)	The Cluster Synchronization Service (CSS) daemon uses a fixed port for node restart advisory messages.  This port is used on all interfaces that have broadcast capability. Broadcast occurs only when a node eviction restart is imminent.	42424	Dynamic	UDP	Yes
Grid Plug and Play (GPNPD)	GPNPD provides access to the Grid Plug and Play profile, and coordinates updates to the profile among the nodes of the cluster to ensure that all of the nodes have the most recent profile.	Dynamic	Dynamic	TCP	No
Multicast Domain Name Service (mDNS)	The mDNS process is a background process on Linux and UNIX, and a service on Window, and is necessary for Grid Plug and Play and GNS.	5353	Dynamic	UDP/TCP	No
Oracle Cluster Registry	The port number is assigned automatically during installation. You cannot view or modify it afterward.	Dynamic	Dynamic	UDP	Yes
Oracle Clusterware Daemon (CRSD)	Oracle Clusterware daemon internode connection. The port number is assigned automatically during installation. You cannot view or modify it afterward.	Dynamic	Dynamic	UDP	Yes
Oracle Connection Manager	Listening port for Oracle client connections to Oracle Connection Manager. You can configure Oracle Connection Manager after installation using NETCA.	1630	1630	TCP	No
Oracle Fleet Patching and Provisioning Server	Port for the Oracle Fleet Patching and Provisioning server.	8889	8889	TCP	Not applicable
Oracle Fleet Patching and Provisioning Server	Port for the Oracle Fleet Patching and Provisioning server.	8896	8896	RMI	No
Oracle Data Guard	Shares the Oracle Net Listener port and is configured during installation. To reconfigure this port, use Oracle Net Configuration Assistant (NETCA) to reconfigure the listener.	1521 (same value as the listener)	modifiable manually to any available port	TCP	No

**Table 11-1 (Cont.) Ports Used in Oracle Components**

Component	Description	Default Port Number	Port Range	Protocol	Used Only On Interconnect
Oracle Event Manager (EVM)	Generates events for Oracle Clusterware. The port number is assigned automatically during installation. You cannot view or modify it afterward.	Dynamic	Dynamic	UDP	Yes
Oracle Grid Interprocess Communication Daemon (GIPCD)	A support daemon that enables Redundant Interconnect Usage.	42424	Dynamic	UDP	Yes
Oracle Grid Interprocess Communication (GIPC)	Oracle Clusterware uses this port to listen all interconnects for last gasp messages.	39748	39748	UDP	Yes
Oracle Grid Naming Service (GNSD)	The Oracle Grid Naming Service daemon performs name resolution for the cluster.	53	53	UDP	No
Oracle Grid Naming Service (GNSD)	The Oracle Grid Naming Service daemon performs name resolution for the cluster.	Dynamic	Dynamic	TCP	No
Oracle HA Services daemon (OHASD)	The Oracle High Availability Services (OHAS) daemon starts the Oracle Clusterware stack.	42424	Dynamic	UDP	Yes
Oracle Net Listener	Allows Oracle client connections to the database by using Oracle Net Services. You can configure this port during installation. To reconfigure this port, use NETCA.	1521	Port number changes to the next available port. Modifiable manually to any available port.	TCP	No
Oracle ASM Listener	Port for Oracle ASM Listener.	1525	Port number changes to the next available port. Modifiable manually to any available port.	TCP	No

**Table 11-1 (Cont.) Ports Used in Oracle Components**

Component	Description	Default Port Number	Port Range	Protocol	Used Only On Interconnect
Oracle Notification Services (ONS)	Port for ONS, used to publish and subscribe service for communicating information about Fast Application Notification (FAN) events. The FAN notification process uses system events that Oracle Database publishes when cluster servers become unreachable or if network interfaces fail. Use <code>srvctl</code> to modify ONS ports.	6100 (local) 6200 (remote)	Configured manually	TCP	No
Oracle Real Application Clusters	The port number is assigned automatically during installation. You cannot view or modify it afterward.	Dynamic	Dynamic	UDP	Yes
Oracle XML DB (FTP)	The Oracle XML DB FTP port is used when applications need to access an Oracle database from an FTP listener. The port is configured during installation and you <i>cannot</i> view it afterward. Refer to <i>Oracle XML DB Developer's Guide</i> for information about changing this port number.	0	Configured manually	FTP	No
Oracle XML DB (HTTP)	The Oracle XML DB HTTP port is used if Web-based applications need to access an Oracle database from an HTTP listener. The port is configured during installation and you <i>cannot</i> view it afterward. Refer to <i>Oracle XML DB Developer's Guide</i> for information about changing this port number.	0	Configured manually	HTTP	No

**Table 11-1 (Cont.) Ports Used in Oracle Components**

Component	Description	Default Port Number	Port Range	Protocol	Used Only On Interconnect
Oracle Trace File Analyzer (TFA)	<p>The Oracle Trace File Analyzer (TFA) daemons in a cluster communicate securely over ports 5000 to 5005.</p> <p>If the port range is not available on your system, then replace it with the ports available on your system using the</p> <pre>tfactl set port</pre> <p>command.</p>	5000	5000 to 5005	SSL/TLS	No

## Oracle Database Installer Command-Line Options

Use this comprehensive list of Oracle Database installer silent mode commands to install, configure, and manage Oracle Database.

- [runInstaller Command](#)  
The `runInstaller` command provides various flags that you can use without specifying any command option.
- [runInstaller -setupDBHome](#)  
The `runInstaller -setupDBHome` command installs the Oracle Database software and register the software with the Oracle central inventory.
- [runInstaller -setupDBHomeAs](#)  
The `runInstaller -setupDBHomeAs` command installs the Oracle Database software with Oracle base and privileged operating system groups identical to the specified Oracle home.
- [runInstaller -createGoldImage](#)  
The `runInstaller -createGoldImage` command creates a gold image from the current Oracle Database home.

### runInstaller Command

The `runInstaller` command provides various flags that you can use without specifying any command option.

#### Syntax

```
runInstaller [-silent [-ignorePrereqFailure]] [-responseFile  
responsefilename] [-debug] [-applyRU patch_directory]  
[-applyOneOffs list_of_patch_directory_locations] [-executeConfigTools [-  
skipStackCheck]]
```

#### Parameters

**Table A-1** runInstaller Command Parameters

Parameter	Description
-help	Displays <code>runInstaller</code> command help.
-silent	Run the installer in the silent mode. You can either provide a response file path for inputs or a list of command line variable value pairs.
-ignorePrereqFailure	Specify this option to ignore all prerequisite checks failures.
-responseFile	Absolute path of the response file, which has installation option values.
-debug	Run the Oracle Database installer in the debug mode.
-applyRU	Apply quarterly Release Update (RUs) to the Oracle Database home.

**Table A-1 (Cont.) runInstaller Command Parameters**

Parameter	Description
-applyOneOffs	Apply one-off patches to the Oracle Database home. You can pass multiple one-off patches as a comma separated list of locations.
-executeConfigTools	Run the configuration tools for an installed Oracle Database home. <b>Note:</b> You can use this parameter only with other commands, such as <code>runInstaller -setupDBHome</code> .
-skipStackCheck	Skip the stack status check.
-configMethod	Specify the configuration method to use for automatic root script execution. It can be either as the <code>root</code> user or as a <code>sudo</code> user.

### Example

The following example shows you how to install the Oracle Database software using a response file.

```
runInstaller -silent -ignorePrereqFailure -responseFile /u01/app/oracle/
product/23.0.0/dbhome_1/install/response/db_install.rsp
```

## runInstaller -setupDBHome

The `runInstaller -setupDBHome` command installs the Oracle Database software and register the software with the Oracle central inventory.

### Syntax

```
runInstaller -setupDBHome {(-OSDBA sysdba_group -OSBACKUPDBA
osbackup_dba_group
-OSDGDBA os_dg_dba_group -OSKMDBA os_km_dba_group -OSRACDBA os_rac_dba_group) }
-ORACLE_BASE Oracle_base_dir] [-OSOPER os_oper_group] [-clusterNodes
list_of_nodes]
[-installEdition <EE | SE2>] [-INVENTORY_LOCATION central_inventory_location]
```

### Parameters

**Table A-2 runInstaller -setupDBHome Command Parameters**

Parameter	Description
-help	Displays <code>runInstaller -setupDBHome</code> command help.
-ORACLE_BASE	Complete path to the Oracle base location to use for the Oracle Database installation.
-clusterNodes	A comma-separated list of cluster nodes on which you want to install the Oracle Database software.
-installEdition <EE   SE2>	Select a database edition from Enterprise Edition (EE) and Standard Edition 2 (SE2).
-INVENTORY_LOCATION	Complete path to the location where you want to store the inventory files. If you have previously installed an Oracle software on this computer, then specify the existing inventory path.

## Example

The following example shows how to install Oracle Database software on a three node cluster:

```
runInstaller -setupDBHome -OSDBA sysdba -OSBACKUPDBA sysbackup -OSDGDBA sysdg
-OSKMDBA syskm -OSRACDBA sysrac
-clusterNodes node1,node2,node3 -installEdition EE -
INVENTORY_LOCATION /u01/app/oraInventory
```

# runInstaller -setupDBHomeAs

The `runInstaller -setupDBHomeAs` command installs the Oracle Database software with Oracle base and privileged operating system groups identical to the specified Oracle home.

## Syntax

```
runInstaller -setupDBHomeAs source_Oracle_home [-OSDBA sysdba_group] [-OSOPER
os_oper_group]
[-OSBACKUPDBA osbackup_dba_group] [-OSDGDBA os_dg_dba_group] [-OSKMDBA
os_km_dba_group]
[-OSRACDBA os_rac_dba_group] [-ORACLE_BASE Oracle_base_dir] [-clusterNodes
list_of_nodes]
[-installEdition <EE | SE2>] [-executeRootScript [-configMethod <ROOT | SUDO>
[-sudoPath] [-sudoUserName]]]
```

## Parameters

**Table A-3 runInstaller -setupDBHomeAs Command Parameters**

Parameter	Description
-help	Displays <code>runInstaller -setupDBHome</code> command help.
-OSDBA	The name of the SYSDBA privileged operating system group. The default is dba.
-OSOPER	The name of the SYSOPER startup and shutdown system privileges for an Oracle Database.
-OSBACKUPDBA	The name of the SYSBACKUP backup and recovery system privileges for an Oracle Database.
-OSDGDBA	The name of the SYSDG system privileges to administer and monitor Oracle Data Guard.
-OSKMDBA	The name of the SYSKM system privileges for encryption key management for applications such as Oracle Wallet Manager.
-OSRACDBA	The name of the SYSRAC privileges to perform day to day administration of Oracle databases on an Oracle RAC cluster. All Oracle Database software owners must be a member of this group.
-ORACLE_BASE	Complete path to the Oracle base location to use for the Oracle Database installation.
-clusterNodes	A comma-separated list of cluster nodes on which you want to install the Oracle Database software.

**Table A-3 (Cont.) runInstaller -setupDBHomeAs Command Parameters**

Parameter	Description
-installEdition <EE   SE2>	Select a database edition from Enterprise Edition (EE) and Standard Edition 2 (SE2).

**Example**

The following example shows you how to setup an Oracle home identical to the specified source Oracle home, on a three node cluster:

```
runInstaller -setupDBHomeAs /u01/app/oracle/product/23.0.0/dbhome_1 -
clusterNodes node1,node2,node3
-installEdition EE -executeRootScript -configMethod ROOT
```

## runInstaller -createGoldImage

The `runInstaller -createGoldImage` command creates a gold image from the current Oracle Database home.

**Syntax**

```
runInstaller -createGoldImage -destinationLocation
directory_to_store_gold_image [-exclFiles list_of_excluded_files]
```

**Parameters****Table A-4 runInstaller -createGoldImage Command Parameters**

Parameter	Description
-help	Displays <code>runInstaller -createGoldImage</code> command help.
-destinationLocation	Specify the complete path, or location, where you want to store the gold images.
-exclFiles	Specify the complete paths to the files to be excluded from the newly created gold image.

**Example**

The following example shows you how to create a gold image at the specified location:

```
runInstaller -createGoldImage -destinationLocation /tmp/my_grid_images -
exclFiles /u01/app/oracle/product/23.0.0/dbhome_1/
relnotes
```
