

Oracle® Database Appliance

X10 Deployment and User's Guide

Release 19.20.0.1 for Linux x86-64

F82828-02

October 2023

The Oracle logo, consisting of the word "ORACLE" in white, uppercase, sans-serif font, centered within a solid red square.

ORACLE®

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Contents

Preface

Audience	xviii
Documentation Accessibility	xviii
Related Documents	xix
Conventions	xix

1 Oracle Database Appliance Checklists

Checklist for System Requirements	1-1
Deployment Checklist for Oracle Database Appliance Bare Metal Systems	1-6
Checklist for Custom Network Address Configuration	1-8

2 Introduction to Oracle Database Appliance

About Oracle Database Appliance	2-1
Oracle Database Appliance Software Terminology	2-3
About the Browser User Interface	2-4

3 Ready to Oracle Database Appliance for Deployment

Attaching Storage Cables to Oracle Database Appliance X10-HA	3-1
Attaching Network Cables to Oracle Database Appliance X10-HA	3-4
Attaching Network Cables to Oracle Database Appliance X10-S or X10-L	3-6
Attaching Power Cords and Initializing Components	3-9
Configuring Oracle Integrated Lights Out Manager	3-10
Powering On Oracle Database Appliance the First Time	3-11

4 Provisioning Oracle Database Appliance Bare Metal System

Plumbing the Network	4-1
Verifying Cabling and Network Connections	4-4
Downloading Oracle Database Appliance Software	4-6
Installing Oracle Database Appliance Software	4-7

Creating the Appliance	4-9
About Enabling Oracle ASMFD on Oracle Database Appliance	4-15

5 Implementing Multi-User Access on Oracle Database Appliance

About Multi-User Access on Oracle Database Appliance	5-2
About Users, Roles, Entitlements, and Operations on a Multi-User Access Enabled Oracle Database Appliance System	5-4
About Granting and Revoking Resource Access	5-6
Provisioning Oracle Database Appliance with Multi-User Access	5-6
Creating, Viewing, and Deleting Users on Oracle Database Appliance with Multi-User Access	5-9
Activating a New User on Oracle Database Appliance with Multi-User Access	5-10
Granting and Revoking Resource Access on Oracle Database Appliance with Multi-User Access	5-11
Viewing Roles, Operations, and Entitlements on Oracle Database Appliance with Multi-User Access	5-12
Managing Databases and Database Homes on Oracle Database Appliance with Multi-User Access	5-13
Changing the Password for a User Account on Oracle Database Appliance with Multi-User Access	5-15
Resetting the Password for a Locked User Account on Oracle Database Appliance with Multi-User Access	5-15

6 Oracle Database Appliance Postinstallation Tasks

Configuring CPU Core Count	6-1
Securing Oracle ILOM Service Processors	6-2
Changing Oracle Database Appliance Passwords	6-2

7 Re-imaging Oracle Database Appliance

Uninstalling Oracle Database Appliance Components	7-1
Reimaging an Oracle Database Appliance Baremetal System	7-4
Performing Secure Erase of Data on Storage Disks	7-6
Redeployment of Oracle Database Appliance	7-7

8 Managing Oracle Databases

About Administrative Groups and Users on Oracle Database Appliance	8-2
About Data Migration Options for Oracle Database Appliance	8-3
About Creating Database Homes on Oracle ACFS Storage	8-3
About Enterprise Edition High Availability for Oracle Database Appliance	8-5

About Transparent Database Encryption (TDE) in Oracle Database Appliance	8-6
Working with Databases	8-7
Viewing Databases	8-8
Creating a Database Using the Browser User Interface	8-8
Managing Database Homes on Oracle ACFS Storage	8-11
Creating a Database Using ODA CLI Commands	8-12
Cloning a Database from Backup	8-13
Cloning an Oracle ACFS Database	8-15
Modifying a Database	8-17
Moving a Database from One Oracle Home to Another	8-19
Upgrading a Database	8-19
Upgrading a Database Manually Using AutoUpgrade	8-20
Deleting a Database	8-28
Working with Database Homes	8-28
About Managing Multiple Oracle Homes on Oracle Database Appliance	8-28
Viewing Database Homes	8-29
Creating a Database Home	8-30
Deleting a Database Home	8-30
Migrating Databases	8-30
About Migrating Databases	8-31
Configuring a Static Listener	8-32
Migrating a Database	8-33
Registering a Database	8-34
About Registering a TDE-Enabled Database	8-35
About Managing Multiple Database Instances Using Instance Caging	8-41
Oracle EM Express and DB Console	8-42

9 Managing Storage

About Managing Storage	9-1
About Managing Oracle ASM Disks	9-2
Managing Storage on Single-Node Systems	9-2
About Storage on Oracle Database Appliance X10-S and X10-L	9-3
Managing Storage on High-Availability Systems	9-4
About Storage Options for Oracle Database Appliance X10-HA	9-4

10 Managing Networks

About Network Infrastructure and VLANs on Oracle Database Appliance	10-1
About Oracle Database Appliance X10 Network Interfaces	10-2
Viewing Configured Networks and Network Interfaces	10-4

Creating a Network	10-4
Creating a Physical Network	10-5
Updating a Network	10-5
Adding a Network Interface	10-6
Deleting a Network Interface	10-6
Deleting a Network Interface Using Browser User Interface	10-7
Deleting a Network Using the Browser User Interface	10-7

11 Backup, Restore and Recover Databases

About Database Backup and Recovery Options	11-1
Configuring NFS Backup and Restore on Oracle Database Appliance	11-9
Configuring an NFS Backup Location	11-9
Backing Up the Database to NFS Location	11-13
Restoring the Database from NFS Backup	11-16
Configuring Agent Proxy Settings for Object Store Access	11-18
Creating a Database Backup Policy	11-19
Updating a Database with a Backup Policy	11-20
Updating a Backup Policy	11-20
Backing Up a Database Using the Browser User Interface	11-20
Viewing Backup Reports	11-21
Recovering a Database Using the Browser User Interface	11-21
Deleting a Backup Using the Browser User Interface	11-22
Deleting a Backup Policy	11-22
Using the CLI to Backup, Restore, and Recover	11-22
Preparing for Database Backup to Disk	11-23
Preparing for Database Backup to NFS Location	11-24
Preparing for Database Backup to Oracle Cloud	11-25
Backing Up a Database with the CLI	11-26
Recovering a Database with the CLI	11-27
Restoring a Database with the CLI	11-30
Restoring ArchiveLog with the CLI	11-32
Deleting Backups with the CLI	11-32

12 Using Oracle Data Guard for Disaster Management and Recovery on Oracle Database Appliance

About Oracle Data Guard on Oracle Database Appliance	12-2
Configuring Oracle Data Guard on Oracle Database Appliance	12-2
Viewing Oracle Data Guard Status on Oracle Database Appliance	12-12
Performing Oracle Data Guard Operations	12-13

Creating an Oracle Data Guard Network	12-14
Migrating an Oracle Database from One System to Another Using Integrated Oracle Data Guard	12-15
Patching Oracle Data Guard Databases on Oracle Database Appliance	12-20
Upgrading Oracle Data Guard Databases on Oracle Database Appliance	12-22
Enabling Oracle Active Data Guard on Existing Configurations	12-23
Registering Oracle Data Guard on Oracle Database Appliance	12-24
Deconfiguring Oracle Data Guard on Oracle Database Appliance	12-29

13 Managing CPU Pools on Oracle Database Appliance Bare Metal and KVM Deployments

About CPU Pools	13-1
Creating a CPU Pool in a Bare Metal or KVM Deployment	13-3
Remapping CPU Pools in a Bare Metal or KVM Deployment	13-4
Viewing CPU Pools in a Bare Metal or KVM Deployment	13-5
Modifying a CPU Pool in a Bare Metal or KVM Deployment	13-6
Deleting a CPU Pool in a Bare Metal or KVM Deployment	13-7
Viewing CPU Pool Audit Records in a Bare Metal or KVM Deployment	13-7
About Over-Subscribed CPU Pools	13-8

14 Managing an Oracle Database Appliance KVM Deployment

About Oracle Database Appliance KVM Deployment	14-2
About Oracle Database Appliance KVM Virtualization Architecture	14-3
About Virtual Machines and Oracle Database Appliance KVM Deployments	14-4
About KVM DB Systems on Oracle Database Appliance	14-7
Managing Database Systems in KVM Deployment	14-9
Creating a DB System in a KVM Deployment	14-10
Listing Database Systems in a KVM Deployment	14-15
Describing a Database System in a KVM Deployment	14-16
Modifying a DB System in a KVM Deployment	14-17
Attaching and Detaching a Network for a Database System in a KVM Deployment	14-19
Starting a Database System in a KVM Deployment	14-20
Stopping a Database System in a KVM Deployment	14-20
Deleting a Database System in a KVM Deployment	14-21
Managing Shared CPU Pool with Database System in a KVM Deployment	14-22
Managing Backup, Restore, and Recovery on a Database System in a KVM Deployment	14-25
Managing Oracle Data Guard on a Database System in a KVM Deployment	14-25
Setting Up and Configuring a KVM Deployment for Applications	14-26
Managing VM Storage in KVM Deployment	14-26

Creating a VM Storage in a KVM Deployment	14-27
Viewing VM Storage in a KVM Deployment	14-28
Modifying VM Storage in a KVM Deployment	14-28
Deleting a VM Storage in a KVM Deployment	14-29
Managing Virtual Networks in KVM Deployment	14-30
Creating a Virtual Network in a KVM Deployment	14-30
Viewing Virtual Networks in a KVM Deployment	14-31
Starting and Stopping Virtual Networks in a KVM Deployment	14-32
Modifying a Virtual Network in a KVM Deployment	14-32
Deleting a Virtual Network in a KVM Deployment	14-33
Managing Virtual Disks in KVM Deployment	14-33
Creating a Virtual Disk in a KVM Deployment	14-34
Viewing Virtual Disks in a KVM Deployment	14-35
Cloning a Virtual Disk in a KVM Deployment	14-35
Modifying a Virtual Disk in a KVM Deployment	14-36
Deleting a Virtual Disk in a KVM Deployment	14-37
Managing Virtual Machines in KVM Deployment	14-37
Creating a Virtual Machine in a KVM Deployment	14-38
Cloning a Virtual Machine in a KVM Deployment	14-42
Modifying a Virtual Machine in a KVM Deployment	14-43
Viewing Virtual Machines in a KVM Deployment	14-44
Starting and Stopping Virtual Machines in a KVM Deployment	14-44
Deleting a Virtual Machine in a KVM Deployment	14-45
About Overcommitting Memory or CPUs in an Oracle Database Appliance KVM System	14-46
Example JSON File to Create a Single-Node DB System	14-46
Example JSON File to Create a High-Availability DB System	14-55

15 Oracle Database Appliance Command-Line Interface

About Oracle Database Appliance Command-Line Interface	15-2
Managing ODACLI Privileges and Security with SUDO	15-4
ODACLI Command Changes with Multi-User Access on Oracle Database Appliance	15-7
odacli Network Commands	15-15
odacli configure-firstnet	15-16
odacli create-network	15-18
odacli delete-network	15-20
odacli delete-networkinterface	15-21
odacli describe-network	15-23
odacli describe-networkinterface	15-24
odacli list-networks	15-25
odacli list-networkinterfaces	15-26

odacli modify-network	15-27
odacli update-network	15-28
odacli Multi-User Access Commands	15-29
odacli list-domains	15-31
odacli describe-domain	15-32
odacli list-tenants	15-32
odacli describe-tenant	15-33
odacli create-user	15-34
odacli activate-user	15-35
odacli list-users	15-36
odacli describe-user	15-37
odacli authorize-user	15-38
odacli delete-user	15-39
odacli list-user-roles	15-40
odacli describe-user-role	15-41
odacli list-user-entitlements	15-42
odacli describe-user-entitlement	15-43
odacli list-user-operations	15-44
odacli describe-user-operation	15-44
odacli list-resources-access	15-45
odacli describe-resource-access	15-46
odacli grant-resource-access	15-47
odacli revoke-resource-access	15-48
odacli reset-password	15-49
odacli change-password	15-50
odacli Apply Patch and Update Commands	15-51
odacli cleanup-patchrepo	15-52
odacli create-prepatchreport	15-54
odacli describe-prepatchreport	15-57
odacli list-prepatchreports	15-67
odacli delete-prepatchreport	15-68
odacli list-availablepatches	15-69
odacli describe-component	15-70
odacli describe-latestpatch	15-76
odacli list-agentconfig-parameters	15-78
odacli modify-agentconfig-parameters	15-79
odacli update-agentconfig-parameters	15-82
odacli delete-agentconfig-parameters	15-85
odacli update-database	15-86
odacli update-dbhome	15-88
odacli update-dcsadmin	15-89

odacli update-dcsagent	15-90
odacli update-dcscomponents	15-91
odacli update-registry	15-92
odacli update-repository	15-100
odacli update-server	15-101
odacli update-storage	15-103
odacli update-server-postcheck	15-104
odaadmcli orachk	15-104
Data Preserving Reprovisioning Commands	15-105
odaupgradeutil	15-106
odaupgradeutil run-prechecks	15-106
odaupgradeutil describe-precheck-report	15-108
odaupgradeutil detach-node	15-110
odaupgradeutil reinitialize	15-113
odacli restore-node	15-114
odacli Appliance Commands	15-117
odacli set-credential	15-118
odacli create-appliance	15-119
odacli describe-system	15-120
odacli ping-agent	15-122
odacli list-nodes	15-123
odacli list-featuretracking	15-123
odacli Backup and Recovery Commands	15-126
odacli create-backup	15-128
odacli create-backupconfig	15-129
odacli create-objectstoreswift	15-131
odacli describe-backupconfig	15-132
odacli delete-backup	15-133
odacli delete-backupconfig	15-134
odacli describe-backupreport	15-134
odacli describe-objectstoreswift	15-136
odacli delete-objectstoreswift	15-136
odacli describe-schedule	15-137
odacli irestore-database	15-138
odacli list-backupconfigs	15-141
odacli list-backupreports	15-142
odacli list-objectstoreswifts	15-143
odacli list-schedules	15-143
odacli list-tdebackupreports	15-144
odacli recover-database	15-145
odacli restore-archivelog	15-147

odacli restore-tdewallet	15-148
odacli modify-backupconfig	15-149
odacli update-backupconfig	15-150
odacli modify-objectstoreswift	15-152
odacli update-objectstoreswift	15-153
odacli modify-schedule	15-154
odacli update-schedule	15-155
odacli Oracle Data Guard Commands	15-156
odacli configure-dataguard	15-157
odacli deconfigure-dataguard	15-161
odacli describe-dataguardstatus	15-163
odacli failover-dataguard	15-163
odacli list-dataguardstatus	15-164
odacli reinstate-dataguard	15-165
odacli register-dataguard	15-165
odacli switchover-dataguard	15-166
odacli CPU Core Commands	15-167
odacli list-cpucores	15-167
odacli describe-cpucore	15-168
odacli modify-cpucore	15-168
update-cpucore	15-169
odacli CPU Pool Commands for Bare Metal and KVM	15-171
odacli create-cpupool	15-172
odacli remap-cpupools	15-173
odacli list-cpupools	15-174
odacli describe-cpupool	15-175
odacli modify-cpupool	15-175
odacli delete-cpupool	15-176
odacli list-auditrecords	15-176
odacli describe-auditrecord	15-177
odacli Database Commands	15-178
odacli clone-database	15-179
odacli create-database	15-189
odacli delete-database	15-194
odacli describe-database	15-195
odacli list-databases	15-197
odacli modify-database	15-197
odacli move-database	15-201
odacli register-database	15-202
odacli upgrade-database	15-206
odacli DBHome Commands	15-208

odacli configure-dbhome-storage	15-209
odacli list-dbhome-storages	15-210
odacli describe-dbhome-storage	15-211
odacli modify-dbhome-storage	15-212
odacli create-dbhome	15-213
odacli delete-dbhome	15-213
odacli describe-dbhome	15-214
odacli list-dbhomes	15-215
odacli Database Storage Commands	15-216
odacli create-dbstorage	15-217
odacli delete-dbstorage	15-218
odacli describe-dbstorage	15-219
odacli describe-dgstorage	15-220
odacli list-dbstorages	15-222
odacli list-dgstorages	15-223
odacli modify-dbstorage	15-224
odacli modify-dgstorage	15-225
odacli update-dgstorage	15-226
odacli Job Commands	15-228
odacli create-jobdata-retention-policy	15-228
odacli create-purge-jobdata-job	15-230
odacli delete-jobdata-retention-policy	15-234
odacli describe-job	15-235
odacli list-jobs	15-237
odacli list-pendingjobs	15-241
odacli list-jobdata-retention-policy	15-241
odacli list-purge-jobdata-jobs	15-242
odacli list-scheduled-executions	15-243
Adaptive Classification and Redaction (ACR) Commands	15-244
odacli describe-acr	15-245
odacli enable-acr	15-245
odacli redact-acr	15-246
odacli list-acr	15-246
odacli disable-acr	15-247
Log Commands	15-247
odaadmcli manage diagcollect	15-248
odacli create-auto-logclean-policy	15-250
odacli delete-auto-logclean-policy	15-251
odacli create-logcleanjob	15-251
odacli describe-logcleanjob	15-253
odacli list-auto-logclean-policy	15-253

odacli list-logcleanjobs	15-254
odacli list-logspaceusage	15-255
odacli Oracle Auto Service Request Commands	15-256
odacli configure-asr	15-257
odacli delete-asr	15-258
odacli describe-asr	15-259
odacli test-asr	15-260
odacli modify-asr	15-261
odacli update-asr	15-262
odacli OS Commands	15-264
odacli list-osconfigurations	15-264
odacli modify-osconfigurations	15-265
odacli update-osconfigurations	15-266
odaadmcli Hardware Monitoring Commands	15-267
odaadmcli show localdisk	15-268
odaadmcli show cooling	15-268
odaadmcli show env_hw	15-269
odaadmcli show fs	15-269
odaadmcli show memory	15-270
odaadmcli show network	15-271
odaadmcli show power	15-272
odaadmcli show processor	15-272
odaadmcli show server	15-273
Storage Commands	15-274
odaadmcli asmops diskgroup	15-275
odaadmcli expand storage	15-275
odacli list-dgdisks	15-276
odacli validate-storagetopology	15-278
odaadmcli power disk	15-278
odaadmcli show controller	15-279
odaadmcli show disk	15-280
odaadmcli show diskgroup	15-281
odaadmcli show raidsyncstatus	15-282
odaadmcli show storage	15-283
odaadmcli stordiag	15-284

16 Oracle Database Appliance Command-Line Interface for KVM

About Command-Line Interface for Kernel-Based Virtual Machine (KVM)	16-2
About ODACLI Commands Supported on Oracle KVM Database System	16-3
odacli Database System Commands for KVM	16-6

odacli create-dbsystem	16-6
odacli modify-dbsystem	16-8
odacli modify-dbfileattributes	16-10
odacli list-dbsystems	16-11
odacli describe-dbsystem	16-11
odacli describe-dbsystem-image	16-18
odacli start-dbsystem	16-19
odacli stop-dbsystem	16-20
odacli delete-dbsystem	16-21
odacli Commands for Migration from Virtualized Platform to KVM	16-22
odacli migrate-ovm2kvm	16-22
odacli describe-ovm2kvm	16-24
odacli VM Storage Commands for KVM	16-27
odacli create-vmstorage	16-28
odacli list-vmstorages	16-28
odacli describe-vmstorage	16-29
odacli modify-vmstorage	16-29
odacli delete-vmstorage	16-30
odacli Virtual Disk Commands for Oracle KVM	16-30
odacli create-vdisk	16-31
odacli list-vdisks	16-31
odacli describe-vdisk	16-32
odacli modify-vdisk	16-32
odacli clone-vdisk	16-33
odacli delete-vdisk	16-33
odacli CPU Pool Commands for Bare Metal and KVM	16-34
odacli create-cpupool	16-35
odacli remap-cpupools	16-36
odacli list-cpupools	16-37
odacli describe-cpupool	16-38
odacli modify-cpupool	16-38
odacli delete-cpupool	16-39
odacli list-auditrecords	16-39
odacli describe-auditrecord	16-40
odacli VM Network Commands for KVM	16-41
odacli create-vnetwork	16-42
odacli list-vnetworks	16-43
odacli describe-vnetwork	16-43
odacli start-vnetwork	16-43
odacli stop-vnetwork	16-44
odacli modify-vnetwork	16-44

odacli delete-vnetwork	16-45
odacli Virtual Machine Commands for Oracle KVM	16-45
odacli create-vm	16-46
odacli list-vm	16-48
odacli describe-vm	16-48
odacli modify-vm	16-48
odacli start-vm	16-51
odacli stop-vm	16-52
odacli migrate-vm	16-52
odacli clone-vm	16-53
odacli delete-vm	16-53

17 Configuring and Using Oracle Auto Service Request (Oracle ASR)

About Configuring Oracle ASR	17-1
Configuring Internal Oracle ASR	17-2
Registering with External Oracle ASR Manager	17-3
Testing Oracle ASR	17-4
Managing an Oracle ASR Configuration	17-4
Additional Resources for Oracle ASR	17-5

18 Troubleshooting Oracle Database Appliance

Viewing Oracle Database Appliance Error Correlation Reports	18-2
About Enabling Linux Kernel Core Extractor for Troubleshooting	18-3
Viewing Details About DCS Error Messages	18-5
Collecting Diagnostics Data Using the BUI	18-5
Resolving Errors When Updating DCS Components During Patching	18-6
Viewing Component Information on the Appliance	18-15
Errors When Logging into the Browser User Interface	18-18
Errors when re-imaging Oracle Database Appliance	18-19
Using Oracle Autonomous Health Framework for Running Diagnostics	18-19
About Installing Oracle Autonomous Health Framework	18-20
Using the Oracle ORAchk Health Check Tool	18-21
Generating and Viewing Oracle ORAchk Health Check Tool Reports in the Browser User Interface	18-22
Generating and Viewing Database Security Assessment Reports in the Browser User Interface	18-22
Running Oracle Trace File Analyzer (TFA) Collector Commands	18-23

Index

Preface

Oracle Database Appliance is an optimized, prebuilt database system that is easy to deploy, operate, and manage. By integrating hardware and software, Oracle Database Appliance eliminates the complexities of nonintegrated, manually assembled solutions. Oracle Database Appliance reduces the installation and software deployment times from weeks or months to just a few hours while preventing configuration and setup errors that often result in suboptimal, hard-to-manage database environments.

Audience

This guide is intended for anyone who configures, maintains, or uses Oracle Database Appliance:

- System administrators
- Network administrators
- Database administrators
- Application administrators and users

This book does not include information about Oracle Database architecture, tools, management, or application development that is covered in the main body of Oracle Documentation, unless the information provided is specific to Oracle Database Appliance. Users of Oracle Database Appliance software are expected to have the same skills as users of any other Linux-based Oracle Database installations.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Related Documents

For more information about Oracle Database Appliance, go to <http://www.oracle.com/goto/oda/docs> and click the appropriate release.

For more information about using Oracle Database, go to <http://docs.oracle.com/database/> and select the database release from the menu.

For more information about Oracle Integrated Lights Out Manager 3.2, see https://docs.oracle.com/cd/E37444_01/.

For more details about other Oracle products that are mentioned in Oracle Database Appliance documentation, see the Oracle Documentation home page at <http://docs.oracle.com>.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action or terms defined in the text.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.
# prompt	The pound (#) prompt indicates a command that is run as the root user.

Oracle Database Appliance Checklists

Use these checklists to ensure you have completed the tasks required for setting up, deploying, and patching Oracle Database Appliance.

- [Checklist for System Requirements](#)
Before you begin the deployment, ensure that you have the system information described in this checklist ready. This checklist applies to baremetal and virtualized platform deployments.
- [Deployment Checklist for Oracle Database Appliance Bare Metal Systems](#)
This checklist provides an overview of the tasks to setup and deploy Oracle Database Appliance bare metal systems for the first time.
- [Checklist for Custom Network Address Configuration](#)
Use the checklist to identify the IP addresses required for Oracle Database Appliance.

Checklist for System Requirements

Before you begin the deployment, ensure that you have the system information described in this checklist ready. This checklist applies to baremetal and virtualized platform deployments.

Table 1-1 Checklist for System Configuration Information for Oracle Database Appliance

Component	Information Required	Comments
Host Name	The name for the Oracle Database Appliance System. The name must conform with the RFC 952 standard, which allows alphanumeric characters and hyphens (-), but does not allow underscores (_). The name should not begin with a numeral or hyphen and should not end in a hyphen. Oracle recommends that you use all lowercase characters for the host name.	Use this space to note the values for your appliance. Host Name:
Domain Name	Your domain name. For example: <code>example.com</code>	Domain Name:
Region	The region where you plan to operate the Oracle Database Appliance system.	Region:
Timezone	The time zone where you plan to operate the Oracle Database Appliance system.	Timezone:

Table 1-1 (Cont.) Checklist for System Configuration Information for Oracle Database Appliance

Component	Information Required	Comments
Diskgroup Redundancy	Determine the redundancy level for DATA, RECO, and FLASH: If there are up to two disks, then you can select the disk group redundancy as Normal or Flex. If there are more than two disk drives, then you can select the redundancy as Normal (two way mirror), High (three way mirror), or Flex. If you select High redundancy, then DATA, RECO, and FLASH are all High Redundancy.	Use this space to note the values for your appliance.
Number of Enabled CPU Cores	Based on your capacity-on-demand (CoD) license, this value specifies the number of enabled CPU cores	Use this space to note the values for your appliance.
Backup	Determine the backup location. For external backup, you need an NFS device.	Backup location:
Percentage of Storage Reserved for Data	Determine the amount of reserves for DATA storage. The percentage must be a whole number between 10 and 90, and determines how the disks are partitioned between DATA and RECO. For example, if you specify 80, then 80% of storage is reserved for DATA and the remaining 20% is for RECO.	Use this space to note the values for your appliance.
System Password	The password set for the root user of the system, operating system users, database users, and pdbadmin. The password is also used to set the database SYS and SYSTEM passwords. Ensure that the password you provide is in compliance with common security practices.	You must provide a system password when you deploy your appliance.
DNS Server	(Optional) DNS server details. If configuring DNS, a minimum of one DNS Server IP is required.	DNS Server details:
NTP Server	(Optional) Network Time Protocol (NTP) server details.	NTP Server details:

Table 1-1 (Cont.) Checklist for System Configuration Information for Oracle Database Appliance

Component	Information Required	Comments
Network Information for the client access network	<p>Obtain the following network information:</p> <ul style="list-style-type: none"> • Node 0 Name: such as <code>example0</code> • Node 0 Public IP Address • Node 1 Name (For HA Models): such as <code>example1</code> • Node 1 Public IP Address (For HA Models) • Node 0 Virtual IP Name (For HA Models): for example, <code>example0-vip</code> • Node 0 Public Virtual IP Address (For HA Models) • Node 1 Virtual IP Name (For HA Models): for example, <code>example1-vip</code> • Node 1 Public Virtual IP Address (For HA Models) • SCAN Name (For HA Models): for example, <code>example-scan</code> • SCAN IP Addresses: Two SCAN IP addresses are required • Netmask • Gateway IP <p>The Public and private network must not be in same subnet, they must be in non-related separate subnet.</p>	Use this space to note the values for your appliance.
Network Information for the Oracle Integrated Lights Out Manager (ILOM) network	<p>Obtain the following ILOM network information:</p> <ul style="list-style-type: none"> • ILOM host name • ILOM IP address • Subnet mask • Gateway IP • ILOM Password: default is <code>changeme</code>. <p>For HA systems, ensure that you have the information to configure two ILOM networks.</p>	Use this space to note the values for your appliance.

Table 1-1 (Cont.) Checklist for System Configuration Information for Oracle Database Appliance

Component	Information Required	Comments
User and group information	<p>Determine how you want to configure your users and groups and whether or not you want to allow operating system role separation. The default is two users with six groups.</p> <p>Operating System Role Separation: Yes/No</p> <p>Customization of Users and Groups: Yes/No</p> <p>Groups and IDs:</p> <ul style="list-style-type: none"> • Grid Infrastructure User • Grid Infrastructure User ID • Database User • Database User ID • Install Group • Install Group ID • DBA Operating System Group • DBA Operating System Group ID • ASM Admin Group • ASM Admin Group ID • ASM Operating System Group • ASM Operating System Group ID • ASM DBA Group • ASM DBA Group ID 	Use this space to note the values for your appliance.

Table 1-1 (Cont.) Checklist for System Configuration Information for Oracle Database Appliance

Component	Information Required	Comments
Initial Database Details (if you want to create one during deployment)	<p>(Optional) If you choose to create an initial database during deployment, determine the following configuration details:</p> <ul style="list-style-type: none"> • Database name • Database unique name • Database version (based on the database clones that are registered with the Oracle Database Appliance) • Determine the Oracle Database edition licensing that you have, either Enterprise Edition or Standard Edition. You cannot mix editions. • Database deployment, whether Oracle RAC or single-instance database • CDB (Container Database): Yes or No • PDB name • Shape (for example, odb1, odb2, and so on) • Database Class: Enterprise Edition, OLTP, DSS, or IMDB. Standard Edition OLTP only. • Data files on Flash storage: Yes/No • Database file size • Database character set • National character set • Database language • Storage (Oracle ASM or Oracle ACFS). • Database redundancy • Configure Oracle Enterprise Manager console. If you are using Enterprise Manager Cloud Control with this appliance, do not choose this option. • Password for the database <p>The DB Name and DB Unique name can contain alphanumeric characters and must start with an alphabet. It can contain underscores (_), but cannot contain characters such as " ! @ % ^ & * () + = \ ' ~ [] ; : " < > / ? " .</p>	Use this space to note the values for your appliance.

Table 1-1 (Cont.) Checklist for System Configuration Information for Oracle Database Appliance

Component	Information Required	Comments
Oracle Auto Service Request (Oracle ASR) information	(Optional) Do you want to configure and enable Oracle ASR at deployment or later? If required, then ensure that you have the following information. <ul style="list-style-type: none"> • ASR Type • ASR User Name • ASR Password • SNMP Version • Proxy Server Name • Proxy Port • Proxy User Name • Proxy Password 	Oracle Auto Service Request (Oracle ASR) information for your appliance

Deployment Checklist for Oracle Database Appliance Bare Metal Systems

This checklist provides an overview of the tasks to setup and deploy Oracle Database Appliance bare metal systems for the first time.

Table 1-2 Deployment Checklist for Bare Metal Systems

Component	Tasks
Register your hardware Support Identifier (SI)	Add your hardware Support Identifier (SI) to your My Oracle Support account profile. Your hardware SI is supplied when you purchase Oracle Database Appliance. If you acquire new software licenses, then you must also register your new software SIs. The SI registration process can take up to 24 hours to complete.
Plug in the Appliance	<ul style="list-style-type: none"> • Plug in all the cables including the power cords, and then wait for the SP OK light to become solid green. Do not power up yet. • If there is no video port available on your Oracle Database Appliance hardware model, then use the Server Management Serial Port to connect to a laptop, or determine the DHCP address assigned to it. Note: Serial port must be set to 115200, so make sure the baud rate speed matches.
Configure Oracle Integrated Lights Out Manager (Oracle ILOM) on Node0 and Node1	Before you configure Oracle ILOM: <ul style="list-style-type: none"> • Connect an Ethernet cable from the NET MGT port to your site's management network. The NET MGT port is a 1 GbE port for Oracle ILOM and by default, is configured for DHCP. • Obtain the Oracle ILOM host name and IP address, the netmask, and the gateway addresses from the DHCP server. • Have a new password ready to replace the default Oracle ILOM password Log into the Oracle ILOM console and follow the procedure in the topic <i>Configuring Oracle Integrated Lights Out Manager</i> .

Table 1-2 (Cont.) Deployment Checklist for Bare Metal Systems

Component	Tasks
Power ON	<ul style="list-style-type: none"> Power on each node and log in as <code>root</code> user with <code>welcome1</code> password. Verify cabling: <code># /opt/oracle/dcs/bin/odacli validate-storagetopology</code> Verify interconnect networking. Run the commands <code># ethtool p1p1</code> and <code># ethtool p1p2</code>. <p>Follow the steps described in the topic <i>Verifying Cabling and Network Connections</i>.</p>
Plumb the network	<p>Ensure that you have recorded the IP address and netmask address.</p> <p>Set up a temporary network connection to Oracle Database Appliance. Use the command <code>odacli configure-firstnet</code> on Node0, for both single- and multi-node systems.</p> <p>Log into the Oracle ILOM console and follow the procedure in the topic <i>Plumbing the Network</i>.</p>
Download Oracle Database Appliance Software	<p>Log into My Oracle Support and download the software files for deployment. Refer to the <i>Oracle Database Appliance Release Notes</i> for the latest software.</p>
Install Oracle Database Appliance	<p>Upload the zip files to a temporary location on Oracle Database Appliance and then update the repository and install the software.</p> <p>Follow the steps and run the commands described in the topic <i>Installing Oracle Database Appliance Software</i>.</p>
Create Appliance	<ul style="list-style-type: none"> Set the Browser User Interface password for the <code>oda-admin</code> user. Log into the Browser User Interface and configure system, network, and users and groups. <p>Ensure that you have the information mentioned in <i>Checklist for System Requirements</i> available to you.</p> <p>Follow the steps described in the topic <i>Creating an Appliance</i>.</p>
Perform postinstallation tasks	<p>Configure CPU core count.</p> <p>Change the passwords for Browser User Interface, Oracle users and groups, and Oracle ILOM.</p> <p>Follow the steps described in the chapter <i>Oracle Database Appliance Postinstallation Tasks</i>.</p>
Cleanup Deployments	<p>If your deployment failed for some reason, then run the cleanup script and redeploy the appliance.</p> <p>For steps to run the cleanup script, see the topic <i>Uninstalling Oracle Database Appliance Components</i>.</p>

Related Topics

- [Verifying Cabling and Network Connections](#)
After powering on Oracle Database Appliance, verify that the network connections are set up correctly.
- [Configuring Oracle Integrated Lights Out Manager](#)
Configure Oracle Integrated Lights Out Manager (Oracle ILOM) to manage Oracle Database Appliance independent of the operating system.

- [Installing Oracle Database Appliance Software](#)
Install Oracle Database Appliance software, before creating the appliance.
- [Creating the Appliance](#)
Create the appliance using the Browser User Interface or ODA CLI commands.
- [Oracle Database Appliance Postinstallation Tasks](#)
Complete these administrative tasks after you have deployed software, but before the system is operational.
- [Uninstalling Oracle Database Appliance Components](#)
Use the Oracle Database Appliance cleanup deploy utility, `/opt/oracle/oak/onecmd/cleanup.pl` to uninstall Oracle Database Appliance components.

Checklist for Custom Network Address Configuration

Use the checklist to identify the IP addresses required for Oracle Database Appliance.

 **Note:**

Oracle does not recommend changing the default Host Private Address. You cannot change the private network after deploying the appliance.

Table 1-3 Default IP Address Requirements for Oracle Database Appliance

Type of IP	IP Address Default Values	Your Values As Applicable
Client Access Network	No default	No default
Additional Network	No default	No default
Oracle Integrated Lights Out Manager (ILOM)	No default	No default
Host Private Addresses	InfiniBand has bonded interface <code>ibbond0</code> . The system configures <code>icbond0</code> on non-InfiniBand High-Availability systems. The subnets <code>192.168.16.0/24</code> and <code>192.168.17.0/24</code> are configured.	Not applicable: the private addresses are defined before deployment and should not be changed

2

Introduction to Oracle Database Appliance

Oracle Database Appliance saves time and money by simplifying deployment, maintenance, and support of database solutions for organizations of every size. Oracle Database Appliance hardware models are optimized to run Oracle Database Standard Edition and Enterprise Edition.

- [About Oracle Database Appliance](#)
Understand Oracle Database Appliance hardware models, deployment plans, and database options.
- [Oracle Database Appliance Software Terminology](#)
Understand the software patches available for Oracle Database Appliance.
- [About the Browser User Interface](#)
Use the Oracle Appliance Manager Browser User Interface to deploy and manage the appliance, databases, networks, jobs, CPU pools, compute instances, and database systems.

About Oracle Database Appliance

Understand Oracle Database Appliance hardware models, deployment plans, and database options.

About Oracle Database Appliance Hardware Models

Choose the Oracle Database Appliance hardware model that suits your business needs.

Oracle Database Appliance Hardware Model	Deployment Use Case
Oracle Database Appliance X9-2S, X9-2L, X9-2-HA	<ul style="list-style-type: none">• Oracle Database Appliance X9-2S is a small configuration designed for smaller or entry-level deployments.• Oracle Database Appliance X9-2L is a large configuration designed for larger databases.• Oracle Database Appliance X9-2-HA is a large configuration designed for larger databases and high-availability.
Oracle Database Appliance X8-2S, X8-2M, X8-2-HA	<ul style="list-style-type: none">• Oracle Database Appliance X8-2S is a small configuration designed for smaller or entry-level deployments.• Oracle Database Appliance X8-2M is a medium-sized configuration designed for performance.• Oracle Database Appliance X8-2-HA is a large configuration designed for larger databases and high-availability.

Oracle Database Appliance Hardware Model	Deployment Use Case
Oracle Database Appliance X7-2S, X7-2M, X7-2-HA	<ul style="list-style-type: none"> Oracle Database Appliance X7-2S is a small configuration designed for smaller or entry-level deployments. Oracle Database Appliance X7-2M is a medium-sized configuration designed for performance. Oracle Database Appliance X7-2-HA is a large configuration designed for larger databases and high-availability.
Oracle Database Appliance X6-2S, X6-2M, X6-2L	<ul style="list-style-type: none"> Oracle Database Appliance X6-2S is a small configuration designed for smaller or entry-level deployments. Oracle Database Appliance X6-2M is a medium-sized configuration designed for performance. Oracle Database Appliance X6-2L is a large configuration designed for larger databases.
Oracle Database Appliance X6-2-HA	Highly-available two-node Oracle RAC clusters that can support both Oracle RAC and single-instance databases.
Oracle Database Appliance X5-2	Highly-available two-node Oracle RAC clusters that can support both Oracle RAC and single-instance databases.

You cannot expand or reconfigure Oracle Database Appliance to a different configuration. For example, you cannot expand Oracle Database Appliance X7-S to Oracle Database Appliance X7-2M. For Oracle Database Appliance hardware configuration details, see the *Oracle Database Appliance Owner's Guide*.

About Oracle Database Appliance Deployment Plans

Oracle Database Appliance X8-2S and X8-2M are single node systems that you deploy as a bare metal platform.

Oracle Database Appliance X8-2-HA is a two-node system with the option to deploy as a bare metal platform or a virtualized platform.

Oracle Database Appliance X7-2S and X7-2M are single node systems that you deploy as a bare metal platform.

Oracle Database Appliance X7-2-HA is a two-node system with the option to deploy as a bare metal platform or a virtualized platform.

Oracle Database Appliance X6-2S, X6-2M, X6-2L are single node systems that you deploy as a bare metal platform.

Oracle Database Appliance X6-2-HA is a two-node system with the option to deploy as a bare metal platform or a virtualized platform.

Oracle Database Appliance X5-2 is a two-node system with the option to deploy as a bare metal platform or a virtualized platform.

About Database Deployment Options for Oracle Database Appliance

The following Oracle Database editions are available:

Database Edition	Supported Releases
Oracle Database Enterprise Edition	Oracle Database release 19c, 18c, 12.2.0.1, and 12.1.0.2
Oracle Database Standard Edition 2	Oracle Database release 19c, 18c, 12.2.0.1, and 12.1.0.2

 **Note:**

It is important to understand your Oracle Database licensing before you create databases. You cannot provision Oracle Database Enterprise Edition and Standard Edition databases in the same bare metal platform, or the same ODA_BASE virtualized deployment, subject to Oracle Database licensing requirements. Review the *Oracle Database Licensing Information User Manual* for the Oracle Database release to review supported options and products.

Oracle Database Appliance Software Terminology

Understand the software patches available for Oracle Database Appliance.

The table describes the Oracle Database Appliance patches that are available for download and the purpose of the patch.

 **Note:**

Some hardware models may not use the patches listed in the table.

Table 2-1 Software for Oracle Database Appliance

Patch	Description
Oracle Database Appliance patch bundle (quarterly patch release)	Use the patch bundle to update to the latest release after Oracle Database Appliance is deployed. The patch updates the Oracle Database Appliance server, storage, and database components.
Oracle Database Appliance Grid Infrastructure/Database Clone	Use to perform an initial deployment of Oracle Database Appliance and also to patch your deployment to the latest release. The bundle contains the latest Grid Infrastructure and Database components, Oracle Database Appliance Manager software, Oracle Linux and hardware drivers for deployment on an Oracle Database Appliance that is shipped from factory state. If you reimage Oracle Database Appliance with the Bare Metal ISO Image, download the Grid Infrastructure/Database Clone patch to deploy Oracle Database Appliance.
Oracle Database Clone	Use the Database Software Clone files to get the latest Database clone binaries for Oracle Database releases 19c, 12.2.0.1, and 12.1.0.2. The RDBMS clone files are needed to create Oracle databases and database homes.
Bare Metal ISO Image	Use to reimage the appliance and reset the system back to the factory configuration.

 **Note:**

See the *Oracle Database Appliance Release Notes* for the patch numbers and download locations and the component versions available in the patch bundle.

 **Note:**

Starting with Oracle Database 18c, Oracle provides quarterly updates in the form of Release Updates (Updates) and Release Update Revisions (Revisions). Oracle no longer releases patch sets. For more information, see My Oracle Support Note 2285040.1.

Oracle Database releases are of type `version` and `version_full` releases. The `version` release is designated in the form major release version.0.0.0.0. The major release version is based on the last two digits of the year in which an Oracle Database version is released for the first time. The `version_full` release is an update of a version release and is designated based on the major release version, the quarterly release update version (Update), and the quarterly release update revision version (Revision).

Prior to Oracle Database release 18c, changing the first or second digit in the release number was an upgrade, and changing the fourth digit indicated an update. With 18c and later releases, changing the first digit is an upgrade, and changing the second indicates an update.

About the Browser User Interface

Use the Oracle Appliance Manager Browser User Interface to deploy and manage the appliance, databases, networks, jobs, CPU pools, compute instances, and database systems.

The Browser User Interface provides a user-friendly interface to quickly view and perform many of the tasks needed to deploy, patch, and manage your bare metal system. The *Oracle Database Appliance Deployment and User's Guide* for your hardware model describes how to use the Browser User Interface to perform many of the tasks related to deployment, patching, and management of your appliance.

Use the links in the side navigation to view and manage the following:

- **Appliance**
 - Appliance information
 - System information
 - Disk group information including storage utilization such as free and used space
 - Information about all databases that use a storage disk group
 - All the patches and hardware and software components installed on the appliance

- List of RPMs and RPM Drift information
- **Network**
 - View network details
 - Create, update, and delete networks
 - View interface details
- **Oracle ASR**
 - View Oracle Auto Service Request (Oracle ASR) configuration details
 - Configure, update, test, and delete Oracle ASR
- **Patch Manager**
 - Update the patch repository with Oracle Database Appliance patches
 - View component details of the patch and versions that are installed on the appliance
 - View component details of the patch and versions that are available, but not yet installed, on the appliance
 - Run patch prechecks before applying the patch
 - Update the server and storage components
- **Compute Instances**
 - Create KVM deployment on Oracle Database Appliance
 - Create view, modify, and, delete virtual storage, virtual network, and virtual disks
 - Create view, modify, and, delete, start, and stop virtual machines
- **DB Systems**
 - Create Database System
 - List and describe Database System
 - Modify, delete, start, and stop Database System
- **CPU Pools**
 - Create view, modify, and, delete CPU pool for bare metal and KVM deployments

Use the links in the top navigation to view and manage the following:

- **Database**
 - Create a database
 - View database details
 - Apply a backup policy for the database
 - Create a manual backup
 - Recover a database from a backup
 - View and update the database backup schedule and update the archive log backup schedule for the database
 - Modify associated networks, database shape and class, and the associated backup policy for a database
 - Create, update, and delete backup policies
 - Create, update, and delete database homes

- Create and delete database backup
- Clone a database from a database backup or an Oracle ACFS database snapshot
- Patch database homes
- Move databases from one Oracle home to another
- **Object Store**
 - Create Object Store Credentials for backup and recovery
 - View the details for Object Store Credentials, including the endpoint URL, user name, and tenant
 - Update and delete Object Store Credentials
- **Monitoring**
 - View the status of hardware, storage, memory, cooling, networking, and power
 - View monitoring information for each node, in the case of High-Availability deployments
 - View system health status and drilldown to details of incidents
 - Click the hardware image to view details
- **Security**
 - View audit records and create and view database security assessment reports
- **Activity**
 - View a list of jobs, details, and status
 - Click a job description to view job details

Expand **Resources** in the upper right corner of the Browser User Interface to perform the following tasks:

- There are links to access the Oracle Database Appliance blogs, FAQs, and Documentation.
- Click **About** to view the Oracle Database Appliance release that is installed on the appliance.

Expand **Account** in the upper right corner of the Browser User Interface to perform the following tasks:

- Click **ILOM Setting** to change the root password. To enable first-time login and access to Oracle ILOM, a default Administrator (root) account and its password are provided with the system.
- Click **Change Password** to change the `oda-admin` password.
- Click **Sign Out** to sign out of the Browser User Interface. If you do not sign out, the system automatically signs you out after a period of inactivity. A warning will appear 2 minutes before the session expires.

Doc Search

You can access the Oracle Database Appliance documentation set from the Browser User Interface. There is a search box at the top right hand corner on the BUI. Search results are links to documentation pages shown as a new window in the BUI. When

you click the **Help** button, links from the documentation relevant to the context of the tab are displayed.

Along with the search results from the Oracle Database Appliance documentation pages, BUI also provides relevant Frequently Asked Questions (FAQs) for the search query. Additionally, you can also search on DCS error codes such as DCS-10001, DCS-10032, and so on in the search box and get the links to documentation pages contains these error codes. When you specify the search query, relevant documentation links, FAQs and DCS error codes links are displayed under separate sections in a new window in the BUI.

For the latest updates to the documentation for a release, see the online Oracle Database Appliance documentation library at <https://docs.oracle.com/en/engineered-systems/oracle-database-appliance/index.html>.

Readying Oracle Database Appliance for Deployment

Before deploying Oracle Database Appliance, perform these setup tasks.

- [Attaching Storage Cables to Oracle Database Appliance X10-HA](#)
Connect the storage cables for Oracle Database Appliance X10-HA.
- [Attaching Network Cables to Oracle Database Appliance X10-HA](#)
Connect Oracle Database Appliance X10-HA to either a 10GBase-T (copper) or 25GbE SFP28 (fiber) network.
- [Attaching Network Cables to Oracle Database Appliance X10-S or X10-L](#)
Connect Oracle Database Appliance X10-S or X10-L to either a 10GBase-T (copper) or 25GbE SFP28 (fiber) network.
- [Attaching Power Cords and Initializing Components](#)
Attach power cords for Oracle Database Appliance.
- [Configuring Oracle Integrated Lights Out Manager](#)
Configure Oracle Integrated Lights Out Manager (Oracle ILOM) to manage Oracle Database Appliance independent of the operating system.
- [Powering On Oracle Database Appliance the First Time](#)
Use this procedure the first time you power on Oracle Database Appliance.

Attaching Storage Cables to Oracle Database Appliance X10-HA

Connect the storage cables for Oracle Database Appliance X10-HA.

Cabling the Storage for Oracle Database Appliance X10-HA

Connect the storage cables for Oracle Database Appliance 10-HA.

Table 3-1 Storage Cabling for Oracle Database Appliance X10-HA

Callout Number	Purpose	Start - Compute Node0	End - Compute Node1
1	Connect green SFP28 cable (Interconnect Port 25GbE)	Connect into green port (PORT 2) in PCIe slot 1	Connect into green port (PORT 2) in PCIe slot 1
2	Connect yellow SFP28 cable (Interconnect Port 25GbE)	Connect into yellow port (PORT 1) in PCIe slot 1	Connect into yellow port (PORT 1) in PCIe slot 1
3	Connect dark blue SAS cable	Connect into dark blue port (SAS0) in PCIe slot 2 in Node0	Connect into dark blue port in top IO Module (PORT 0)
4	Connect light blue SAS cable	Connect into light blue port (SAS1) in PCIe slot 9 in Node0	Connect into light blue port in bottom IO Module (PORT 0)
5	Connect dark red SAS cable	Connect into dark red port (SAS1) in PCIe slot 2 in Node1	Connect into dark red port in top IO Module (PORT 1)
6	Connect light red SAS cable	Connect into light red port (SAS0) in PCIe slot 9 in Node1	Connect into light red port in bottom IO Module (PORT 1)

Cabling the Storage Expansion Shelf

Table 3-2 Cabling the Storage Expansion Shelf for Oracle Database Appliance X10-HA

Callout Number	Purpose	Start - Compute Nodes	End - Expansion Shelf
7	Connect dark blue SAS cable	Connect into dark blue port (SAS0) in PCIe slot 2 in Node1	Connect into dark blue port in top IO Module (PORT 0)
8	Connect light blue SAS cable	Connect into light blue port (SAS1) in PCIe slot 9 in Node1	Connect into light blue port in bottom IO Module (PORT 0)
9	Connect dark red SAS cable	Connect into dark red port (SAS1) in PCIe slot 2 in Node0	Connect into dark red port in top IO Module (PORT 1)
10	Connect light red SAS cable	Connect into light red port (SAS0) in PCIe slot 9 in Node0	Connect into light red port in bottom IO Module (PORT 1)

Attaching Network Cables to Oracle Database Appliance X10-HA

Connect Oracle Database Appliance X10-HA to either a 10GBase-T (copper) or 25GbE SFP28 (fiber) network.

The SFP28 ports support 10Gb and 25Gb fibre and twinaxial cable (twinax), depending on the SFP modules used in these ports. For 10GBase-T public networking, use the Cat-6 network cables. To use the SFP28 ports, use the correct transceivers and cables to meet your switch bandwidth. The following sections show the cabling options for 10GBase and 25GbE SFP28 (fiber) network ports.

Connecting the Fiber and Copper Network Cables for Oracle Database Appliance X10-HA

14	PCIe card slot 9: provides two SAS3 connectors used to connect the servers to the storage shelf and the storage expansion shelf
15	Locate LED (white)
16	100/1000Base-T network interface port with RJ-45 connector: NET 0
17	NET MGT port: 10/100/1000Base-T network interface port with RJ-45 connector used to connect to the Oracle ILOM service processor
18	USB 3.1 connector
19	System status indicators: Service Required LED (amber), Power/OK LED (green)
20	SER MGT port: RJ-45 serial port used to connect to the Oracle ILOM service processor

Fiber Cables

For optical cables, you must purchase either Short Range (SR) or Long Range (LR) SFP transceivers for each of the network ports, and then plug in the appropriate optical cable. Currently, Oracle sells both the SR and LR SFP transceivers. In addition to these transceivers, you must purchase the appropriate LC-LC terminated fiber optic cables from a third-party vendor.

Table 3-4 Transceivers for the SFP Ports - 10Gb/1Gb

Name	ATO Part Number	x-option Part Number
SFP+ 10GBase-SR (Short Range Transceiver)	2129a	X2129A-N
SFP+ 10GBase-LR (Long Range Transceiver)	5562a-z	X5562A-Z

Table 3-5 Transceivers for the SFP Ports - 25Gb

Name	ATO Part Number	x-option Part Number
Oracle 10/25 GbE Dual Rate SFP28 Short Range (SR) Transceiver	7604269	7604270
SFP28 25GBase-LR (Short Range Transceiver)	7118017	7118019
SFP28 25GBase-LR (Long Range Transceiver)	7118020	7118021

Copper Cables

You can purchase the following copper cables from Oracle. These cables have built-in SFP connectors.

Table 3-6 Networking Cables for the SFP Ports - 10Gb/1Gb

Name	Length	ATO Part Number	x-option Part Number
TwinAx passive copper cable: 1 meter	1m	7105137	X2130A-1M-N
TwinAx passive copper cable: 2 meter	2m	7105139	7105148
TwinAx passive copper cable: 3 meter	3m	7105140	X2130A-3M-N
TwinAx passive copper cable: 5 meter	5m	7105141	X2130A-5M-N

Table 3-7 Networking Cables for the SFP Ports - 25Gb

Name	Length	ATO Part Number	x-option Part Number
TwinAx passive copper cable: 1 meter	1m	7118359	7118367
TwinAx passive copper cable: 2 meter	2m	7118360	7118368
TwinAx passive copper cable: 3 meter	3m	7118361	7118369
TwinAx passive copper cable: 5 meter	5m	7118362	7118370

Attaching Network Cables to Oracle Database Appliance X10-S or X10-L

Connect Oracle Database Appliance X10-S or X10-L to either a 10GBase-T (copper) or 25GbE SFP28 (fiber) network.

The SFP28 ports support 10Gb and 25Gb fibre and twinaxial cable (twinax), depending on the SFP modules used in these ports. For 10GBase-T public networking ports that have RJ-45 connectors, use Cat-6 network cables. To use the SFP28 ports, use the correct transceivers and cables to meet your switch bandwidth. The following sections show the cabling options for 10GBase and 25GbE SFP28 (fiber) network ports.

Connecting Network Cables for Oracle Database Appliance X10-S or X10-L

Connect the Fiber and Copper Network Cables for Oracle Database Appliance X10-S or X10-L

Table 3-8 Network Ports and Power Cabling

Callout	Description

11	PCIe card slot 6: Oracle Retimer PCIe Card
12	PCIe card slot 7: filler panel
13	PCIe card slot 8: filler panel, or 3rd optional Oracle Dual Port 25Gb Ethernet Adapter or Oracle Quad Port 10GBase-T Adapter

Table 3-8 (Cont.) Network Ports and Power Cabling

Callout	Description
14	PCIe card slot 9: <ul style="list-style-type: none"> • Oracle Database Appliance X10-S: filler panel, or 2nd optional Oracle Dual Port 25Gb Ethernet Adapter or Oracle Quad Port 10GBase-T Adapter • Oracle Database Appliance X10-L: filler panel, or 3rd optional Oracle Flash Accelerator 680 PCIe Card
15	Locate LED (white)
16	100/1000Base-T network interface port with RJ-45 connector: NET 0
17	NET MGT port: 10/100/1000Base-T network interface port with RJ-45 connector used to connect to the Oracle ILOM service processor
18	USB 3.1 connector
19	System status indicators: Service Required LED (amber), Power/OK LED (green)
20	SER MGT port: RJ-45 serial port used to connect to the Oracle ILOM service processor

Fiber Cables

For optical cables, you must purchase either Short Range (SR) or Long Range (LR) SFP transceivers for each of the network ports, and then plug in the appropriate optical cable. Currently, Oracle sells both the SR and LR SFP transceivers. In addition to these transceivers, you must purchase the appropriate LC-LC terminated fiber optic cables from a third-party vendor.

Table 3-9 Transceivers for the SFP Ports - 10Gb/1Gb

Name	ATO Part Number	x-option Part Number
SFP+ 10GBase-SR (Short Range Transceiver)	2129a	X2129A-N
SFP+ 10GBase-LR (Long Range Transceiver)	5562a-z	X5562A-Z

Table 3-10 Transceivers for the SFP Ports - 25Gb

Name	ATO Part Number	x-option Part Number
Oracle 10/25 GbE Dual Rate SFP28 Short Range (SR) Transceiver	7604269	7604270
SFP28 25GBase-LR (Short Range Transceiver)	7118017	7118019
SFP28 25GBase-LR (Long Range Transceiver)	7118020	7118021

Copper Cables

You can purchase the following copper cables from Oracle. These cables have built-in SFP connectors:

Table 3-11 Networking Cables for the SFP Ports - 10Gb/1Gb

Name	Length	ATO Part Number	x-option Part Number
TwinAx passive copper cable: 1 meter	1m	7105137	X2130A-1M-N
TwinAx passive copper cable: 2 meter	2m	7105139	7105148
TwinAx passive copper cable: 3 meter	3m	7105140	X2130A-3M-N
TwinAx passive copper cable: 5 meter	5m	7105141	X2130A-5M-N

Table 3-12 Networking Cables for the SFP Ports - 25Gb

Name	Length	ATO Part Number	x-option Part Number
TwinAx passive copper cable: 1 meter	1m	7118359	7118367
TwinAx passive copper cable: 2 meter	2m	7118360	7118368
TwinAx passive copper cable: 3 meter	3m	7118361	7118369
TwinAx passive copper cable: 5 meter	5m	7118362	7118370

Attaching Power Cords and Initializing Components

Attach power cords for Oracle Database Appliance.

Caution:

Before plugging in the power cords, ensure that the electrical outlets providing the power are grounded.

If you use only a single AC circuit, then connect both power cords for each component to that circuit. If you want to maintain N+1 power supply redundancy, then use two separate AC circuits. Connect one power cord from each AC circuit into each component.

For more information about cabling with the supplied Cable Management Arm, refer to *Oracle Database Appliance Owner's Guide*.

Configuring Oracle Integrated Lights Out Manager

Configure Oracle Integrated Lights Out Manager (Oracle ILOM) to manage Oracle Database Appliance independent of the operating system.

Deploying a new Oracle Database Appliance requires a direct connection to the system to configure the Oracle Integrated Lights Out Manager (ILOM) and the first network. If you use the serial port, ensure that the baud rate speeds match. After the first public network interface is configured, you can perform the remaining deployment steps on the Oracle Database Appliance system or from a remote system.

Configuring Oracle ILOM Using IP Address Assigned by DHCP

Ensure that the ILOM NIC is enabled and that `ipv4` is enabled.

1. Using a client system's browser, enter the IP address or host name assigned by DHCP into the browser address field and press **Enter**. For example, `https://129.xxx.xx.xx`.
2. At the login page, enter the default user name, `root` and the default password, `changeme`.

The Oracle ILOM web interface is displayed.

Configuring Oracle ILOM Using Static IP Address

1. Using a client system, establish a secure shell (SSH) connection by entering the following on the command line:

```
ssh -l root sp_ip_address
```

where `sp_ip_address` is the IP address assigned by DHCP.

2. Enter the default user name, `root`, and the default password, `changeme`.

The Oracle ILOM CLI prompt appears. Change the default password to a secure password of your choice.

3. Set the working directory.

```
cd /SP/network
```

4. Specify a static Ethernet configuration as follows:

```
set pendingipaddress=xxx.xxx.xx.xx
set pendingipnetmask=yyy.yyy.yyy.y
set pendingipgateway=zzz.zzz.zz.zzz
set commitpending=true
set state=enabled
```

`xxx.xxx.xx.xx`, `yyy.yyy.yyy.y` and `zzz.zzz.zz.zzz` are the IP address, netmask, and gateway (respectively) for your ILOM and network configuration.

5. Verify changes and then exit:

```
show /SP/network
exit
```

Configuring Oracle ILOM Using the IPMI tool

To assign IP addresses to Oracle ILOM manually, follow these steps:

1. Open the IPMI tool.

```
# ipmitool -I open sunoem cli
```

2. Go to `SP/network` and verify that the port is enabled:

```
show /SP/network
```

3. If the port is not enabled, then enable the port.

```
# ipmitool -I open sunoem cli "set /SP/network state=enabled"
```

4. In `SP/network`, verify that `ipv4` is enabled.

5. If `ipv6` is enabled, then disable `ipv6` and enable `ipv4`.

```
# ipmitool -I open sunoem cli "set /SP/network/ipv6 state=disabled"  
# ipmitool -I open sunoem cli "set /SP/network/ipv4 state=enabled"
```

Related Topics

- [Deployment Checklist for Oracle Database Appliance Bare Metal Systems](#)
This checklist provides an overview of the tasks to setup and deploy Oracle Database Appliance bare metal systems for the first time.

Powering On Oracle Database Appliance the First Time

Use this procedure the first time you power on Oracle Database Appliance.

When you power on Oracle Database Appliance for the first time, the system automatically defines your public network interface based on which of the public interface ports are connected. For Oracle Database Appliance X10-2-HA, the dual-port 10/25 GbE SFP28 PCIe adapter is used for the cluster interconnect.

Note:

After you connect power cords, the green SP OK light-emitting diode (LED) lights blink for a few minutes, and then turn to steady ON. The cooling fans also may turn on. However, these events do not indicate that the system is started. You must complete all of the steps in this section to turn on the appliance properly. Read through the entire section to understand the sequence required for initial system startup.

1. (For Oracle Database Appliance X10-2-HA) Power on the attached storage shelf, or shelves, by plugging in their AC power cords. Do this before powering on the server nodes as it takes a few minutes for a storage shelf to come online.
2. Push the recessed power button to turn on the appliance.

 **Note:**

The fully-initialized state is indicated by the green SP OK LEDs staying steadily lit. If any of the green LED lights on the server are still blinking, then wait for them to complete their initialization steps.

Refer to the figures and to the following callout table to identify the power button and the system initialization status indicator lights.

Figure 3-1 Front of Oracle Database Appliance Power Panel

Table 3-13 Description of Callouts for Powering On Oracle Database Appliance

Callout	Function
5	Green Power/OK LED, located on the front panel. The light must be in the steady ON position (Green light does not blink) before you log on to the system.
6	Recessed ON/OFF power button, which is located on the front panel of the appliance. Push this button only once. Do not repeatedly push the power button.
4	SP OK LED light, located on the front panel of the appliance.

Oracle Database Appliance does not use the DO NOT SERVICE indicator.

3. Wait for Oracle Database Appliance to complete startup.

 **Note:**

Do not repeatedly push the power buttons. Startup can take several minutes to complete.

Oracle Database Appliance is ready for use when the green Power/OK LED (callout 1) on the front of the system remains steadily on.

4

Provisioning Oracle Database Appliance Bare Metal System

Understand the process to configure Oracle Database Appliance bare metal system.

The Browser User Interface is the preferred method of deploying your bare metal platform configuration. The Browser User Interface provides all of the fields necessary to provision Oracle Database Appliance, including configuring the system, network, database, and Oracle Auto Service Request (Oracle ASR). If you prefer to use the command-line interface, you must create a JSON file to configure the deployment options.

- [Plumbing the Network](#)
Plumb the Oracle Database Appliance network with the public internet protocol (IP) information assigned to a node, to enable provisioning of the Oracle Database Appliance software.
- [Verifying Cabling and Network Connections](#)
After powering on Oracle Database Appliance, verify that the network connections are set up correctly.
- [Downloading Oracle Database Appliance Software](#)
Download Oracle Database Appliance software and copy to a temporary location before applying updates to your appliance.
- [Installing Oracle Database Appliance Software](#)
Install Oracle Database Appliance software, before creating the appliance.
- [Creating the Appliance](#)
Create the appliance using the Browser User Interface or ODA CLI commands.
- [About Enabling Oracle ASMFD on Oracle Database Appliance](#)
Understand how you can enable Oracle ASMFD on bare metal systems and DB systems on Oracle Database Appliance.

Plumbing the Network

Plumb the Oracle Database Appliance network with the public internet protocol (IP) information assigned to a node, to enable provisioning of the Oracle Database Appliance software.

Important:

On Oracle Database Appliance X9-2, the `odacli configure-firstnet` command supports bonding of ports across two supported network PCI cards of the same type.

▲ Caution:

On Oracle Database Appliance X9-2, you cannot change the network bonding **after** the system is deployed. To change the network bonding, you must reimage and deploy the appliance again.

1. Connect to Oracle ILOM remote console, then log into Oracle Database Appliance as root.
2. Run the command `configure-firstnet` on **both** nodes. You can choose to enable Link Aggregation Control Protocol (LACP) on the bonding interface when you run `odacli configure-firstnet`.

```
# /opt/oracle/dcs/bin/odacli configure-firstnet
Use bonding on different network interfaces:
    bonding between ports on the same network card [0]
    bonding between Network Card 1 in slot 6 and Network Card 2 in
slot 4 [1]
    bonding between Network Card 1 in slot 6 and Network Card 3 in
slot 8 [2]
    bonding between Network Card 2 in slot 4 and Network Card 3 in
slot 8 [3]
Please input your selection (0 - 3) [0]:
Select the Interface to configure the network on (btbond1 btbond3
btbond5) [btbond1]:
Use LACP bonding on btbond1 (yes/no) [no]:
Configure DHCP on btbond1 (yes/no) [no]:
INFO: You have chosen Static configuration
Use VLAN on btbond1 (yes/no) [no]:
```

3. Complete the network configuration as prompted and configure the public network interface. Also provide the netmask and gateway IP address.

You use this network connection to transfer the software to the server node.

Example 4-1 Example of a Bonded Configuration

For a bonded configuration, answer `yes` to using a bonding public interface and configure the first network to use a `btbond3` interface without configuring DHCP.

```
# /opt/oracle/dcs/bin/odacli configure-firstnet
Select the Interface to configure the network on (btbond1 btbond3
btbond4) [btbond1]:btbond3
Use LACP bonding on btbond3 (yes/no) [no]:yes
INFO: network interface [btbond3] in LACP mode
Configure DHCP on btbond3 (yes/no) [no]:
INFO: You have chosen Static configuration
Use VLAN on btbond3 (yes/no) [no]:yes
Configure VLAN on btbond3, input VLAN ID [2 - 4094] 119
INFO: using network interface btbond3.119
Enter the IP address to configure : 10.31.129.36
Enter the Netmask address to configure : 255.255.255.240
Enter the Gateway address to configure [10.31.129.33] :
INFO: Restarting the network
```

```
Shutting down interface btbond1: [ OK ]
Shutting down interface btbond2: [ OK ]

btbond1.122...
[ OK ]
INFO: Restarting the DCS agent
initdcsagent stop/waiting
initdcsagent start/running, process 32104
```

Configuring LACP after Deployment

Use the `-o` option with the `odacli configure-firstnet` command to enable or disable LACP on a bonding interface.

Enabling LACP on a bonding interface after deployment:

```
# odacli configure-firstnet -o
INFO: Configure network option
Select the Interface to configure the network on (btbond1 btbond3
btbond5) [btbond1]:btbond3
Use LACP bonding on btbond3 (yes/no) [no]: yes
INFO: network interface [btbond3] setup in LACP mode
```

Disabling LACP on a bonding interface after deployment:

```
# odacli configure-firstnet -o
INFO: Configure network option
Select the Interface to configure the network on (btbond1 btbond3
btbond5) [btbond1]:btbond3
Use LACP bonding on btbond3 (yes/no) [yes]: no
INFO: network interface [btbond3] setup in active-backup mode
```

Verifying Cabling and Network Connections

After powering on Oracle Database Appliance, verify that the network connections are set up correctly.

Run the validation scripts only on Oracle Database Appliance HA models.

1. Log into the Oracle Database Appliance console and access the server node with user name as `root` and password `welcome1`.
2. Run validation scripts on both nodes, to verify cabling. For example:

```
# /opt/oracle/dcs/bin/odacli validate-storagetopology
INFO : ODA Topology Verification
INFO : Running on Node0
INFO : Check hardware type
SUCCESS : Type of hardware found : X9-2
INFO : Check for Environment
SUCCESS : Type of environment found : Bare Metal
INFO : Check number of Controllers
SUCCESS : Number of ahci controller found : 1
SUCCESS : Number of External SCSI controllers found : 2
INFO : Check for Controllers correct PCIe slot address
SUCCESS : Internal RAID controller :
SUCCESS : External LSI SAS controller 0 : 31:00.0
SUCCESS : External LSI SAS controller 1 : 9d:00.0
INFO : Check if JBOD powered on
SUCCESS : 2JBOD : Powered-on
INFO : Check for correct number of EBODS(2 or 4)
SUCCESS : EBOD found : 4
INFO : Check for External Controller 0
SUCCESS : Cable check for port 0 on controller 0
SUCCESS : Cable check for port 1 on controller 0
```

```
SUCCESS : Overall Cable check for controller 0
INFO : Check for External Controller 1
SUCCESS : Cable check for port 0 on controller 1
SUCCESS : Cable check for port 1 on controller 1
SUCCESS : Overall Cable check for controller 1
INFO : Check for overall status of cable validation on Node0
SUCCESS : Overall Cable Validation on Node0
SUCCESS : JBOD0 Nickname set correctly
SUCCESS : JBOD1 Nickname set correctly
```

3. If there is a storage expansion shelf connected to the appliance, then power it on. Run the `storagetopology` command on both nodes to make sure the cabling is correct. For example:

```
# /opt/oracle/dcs/bin/odacli validate-storagetopology
INFO : ODA Topology Verification
INFO : Running on Node0
INFO : Check hardware type
SUCCESS : Type of hardware found : X9-2
INFO : Check for Environment
SUCCESS : Type of environment found : Bare Metal
INFO : Check number of Controllers
SUCCESS : Number of ahci controller found : 1
SUCCESS : Number of External SCSI controllers found : 2
INFO : Check for Controllers correct PCIe slot address
SUCCESS : Internal RAID controller :
SUCCESS : External LSI SAS controller 0 : 31:00.0
SUCCESS : External LSI SAS controller 1 : 9d:00.0
INFO : Check if JBOD powered on
SUCCESS : 2JBOD : Powered-on
INFO : Check for correct number of EBODS(2 or 4)
SUCCESS : EBOD found : 4
INFO : Check for External Controller 0
SUCCESS : Cable check for port 0 on controller 0
SUCCESS : Cable check for port 1 on controller 0
SUCCESS : Overall Cable check for controller 0
INFO : Check for External Controller 1
SUCCESS : Cable check for port 0 on controller 1
SUCCESS : Cable check for port 1 on controller 1
SUCCESS : Overall Cable check for controller 1
INFO : Check for overall status of cable validation on Node0
SUCCESS : Overall Cable Validation on Node0
SUCCESS : JBOD0 Nickname set correctly
SUCCESS : JBOD1 Nickname set correctly
```

4. Verify the interconnect network:

```
# ethtool plp1
Settings for plp1:
Supported ports: [ FIBRE ]
Supported link modes: 1000baseT/Full
Supported pause frame use: Symmetric Receive-only
Supports auto-negotiation: Yes
Advertised link modes: 1000baseT/Full
1000baseT/Full
```

```

Advertised pause frame use: No
Advertised auto-negotiation: Yes
Speed: 25000Mb/s <<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<< check speed

This checklist provides an overview of the tasks to setup and deploy Oracle Database Appliance bare metal systems for the first time.

Downloading Oracle Database Appliance Software

Download Oracle Database Appliance software and copy to a temporary location before applying updates to your appliance.

1. Download the software files from My Oracle Support to a temporary location on an external client. Refer to the release notes for details about the software for the latest release.

For example, download the Oracle Database Appliance GI Clone for ODA CLI/DCS stack (patch 30403673) and Oracle Database Appliance RDBMS Clone for ODA CLI/DCS stack (patch 30403662) for 19.20.0.1:

```

p30403673_1920000_Linux-x86-64.zip
p30403662_1920000_Linux-x86-64.zip

```

2. Unzip the software — it contains README.html and one or more zip files for the patch.

```
unzip p30403673_1920000_Linux-x86-64.zip
unzip p30403662_1920000_Linux-x86-64.zip
```

The GI and RDBMS Clone files for release 19.20.0.1 are extracted.

```
odacli-dcs-19.20.0.0.0-date-GI-19.20.0.0.zip
odacli-dcs-19.20.0.0.0-date-DB-19.20.0.0.zip
```

3. Copy the software files from the external client to Oracle Database Appliance. Use the `scp` or `sftp` protocol to copy the bundle.

Example using `scp` command:

```
scp software_file root@oda_host:/tmp
```

Example using `sftp` command:

```
sftp root@oda_host
```

Enter the `root` password, and then copy the file.

```
put software_file
```

For example, for release 19.20.0.1:

```
put odacli-dcs-19.20.0.0.0-date-GI-19.20.0.0.zip
put odacli-dcs-19.20.0.0.0-date-DB-19.20.0.0.zip
```

The GI and RDBMS Clone files are copied to the temporary location on the appliance. You can update the repository, and create the appliance, as explained in the next topic.

Installing Oracle Database Appliance Software

Install Oracle Database Appliance software, before creating the appliance.

Ensure that the Oracle Database Appliance patches are downloaded and available for updating the repository, as described in the topic *Downloading Oracle Database Appliance Software*.

Starting with Oracle Database Appliance release 19.12, the sizes of volumes `/u01` and `/opt` are smaller than the corresponding sizes in earlier releases. The size of `/u01` is now 40GB and the size of `/opt` is now 30GB. A new ACFS file system, mounted at `/opt/oracle/oak/pkgrepos/orapkgs/clones`, is created during provisioning. The DATA disk group provides space of 150 GB for the file system. The Oracle Grid Infrastructure and Oracle Database clone files are stored on this file system.

! Important:

If you want to install third-party software on your Oracle Database Appliance, then ensure that the software does not impact the Oracle Database Appliance software. The version lock on Oracle Database Appliance RPMs displays a warning if the third-party software tries to override Oracle Database Appliance RPMs. You must restore the affected RPMs before patching Oracle Database Appliance so that patching completes successfully.

! Important:

To ensure that your deployment has the latest Oracle Database Appliance firmware, download the latest server patch and update the repository. Then, run the `odacli describe-component` command to check whether the firmware is current or out-of-date. If the firmware is not current, then run the `odacli update-server` and `odacli update-storage` commands before you deploy the Oracle Database Appliance software. If the firmware is current, then you can deploy the Oracle Database Appliance software as described in this topic, without updating the server and storage. Before updating the server or storage, ensure that you run the `odacli create-prepatchreport` command to generate the prechecks report, otherwise an error is displayed.

1. Verify the current system version by running the following command on **both** nodes:

```
[root@oda1 opt]# /opt/oracle/dcs/bin/odacli describe-component -v
```

On a single-node Oracle Database Appliance system, run the command `odacli describe-component` **without the `-v` option**.

```
[root@oda1 opt]# /opt/oracle/dcs/bin/odacli describe-component
```

2. Update the repository with Oracle Grid Infrastructure and Database software only. To prevent space issues in `/opt`, it is recommended that you add other repositories after the bare metal instance is provisioned.

```
[root@oda1 opt]# /opt/oracle/dcs/bin/odacli update-repository -f /tmp/GI_clone_file,/tmp/DB_clone_file
```

For example, for release 19.20.0.1:

```
[root@oda1 opt]# /opt/oracle/dcs/bin/odacli update-repository -f /tmp/odacli-dcs-19.20.0.0.0-date-DB-19.20.0.0.zip,/tmp/odacli-dcs-19.20.0.0.0-date-GI-19.20.0.0.zip
```

3. Confirm that the repository update is successful:

```
[root@oda1 opt]# /opt/oracle/dcs/bin/odacli describe-job -i job_ID
```

4. Delete the software zip files from the temporary location on the appliance to save space:

```
[root@oda1 opt]# rm software_file  
rm: remove regular file software_file? y
```

You have now updated the repository with the Oracle Database Appliance software, and can create your appliance, as described in the next topic.

Related Topics

- [Deployment Checklist for Oracle Database Appliance Bare Metal Systems](#)
This checklist provides an overview of the tasks to setup and deploy Oracle Database Appliance bare metal systems for the first time.

Creating the Appliance

Create the appliance using the Browser User Interface or ODA CLI commands.

Note:

If you plan to enable multi-user access, then refer to the chapter *Implementing Multi-User Access on Oracle Database Appliance* before you create your appliance.

Creating the Appliance using ODA CLI Commands

You can use the command `odacli create-appliance` and a JSON file that includes your appliance configuration settings to deploy the appliance instead of using the Browser User Interface. Review the readme in the `/opt/oracle/dcs/sample` directory carefully along with the provided JSON example files. Create a JSON file with the necessary changes based on your environment and requirements.

See Also:

Creating an Appliance Using a JSON File in this guide for example JSON files and the procedure to create a JSON file.

Note:

It is important to review the readme and the examples carefully before creating your JSON file. If you do not enter your network and Oracle ILOM information correctly based on your setup, you will lose network access to both the host and Oracle ILOM.

Creating the Appliance using the Browser User Interface (BUI)

Follow these steps to create the appliance using the BUI:

Ensure that ports 7070 and 7093 on the network between Oracle Database Appliance and the client machine, are open.

1. Navigate to the Browser User Interface. You are prompted to set the password for the `oda-admin` user.

`https://ODA-host-ip-address:7093/mgmt/index.html`

2. Log into the Browser User Interface with the new password.

When you launch the Browser User Interface on an unconfigured appliance, the Appliance page notifies you that the appliance is not configured and provides a link to the pages needed to configure and create the appliance.

 **Note:**

If you face any issues when logging into the Oracle Database Appliance Browser User Interface, then see the topic *Errors When Logging into the Browser User Interface* in the chapter *Troubleshooting Oracle Database Appliance*.

3. Click **Create Appliance**.
4. In the Create Appliance page, if you want to create the appliance from a saved configuration, click **Browse**, and select the JSON file. The information from the saved configuration file is loaded. You can retain or edit the fields. Otherwise, manually, provide the values to create the appliance.
5. In the System Information tab, specify the values as follows.
 - a. **System Name:** Enter the host name.

The host name can contain alphanumeric characters and dashes (-), but cannot start with a number or dash (-) or end with dash (-). Do not exceed 30 characters.
 - b. **Domain Name:** Enter the domain name.
 - c. **Region:** Select the region of the world where the Oracle Database Appliance is located.
 - d. **Time Zone:** Select the time zone where the Oracle Database Appliance is located.
 - e. (Optional) **DNS Servers:** Enter addresses for one or more DNS servers.
 - f. (Optional) **NTP Servers:** Enter addresses for one or more NTP servers.
 - g. **Diskgroup Redundancy:** If there are two disks, then you can select the disk group redundancy as Normal or Flex. To select the the redundancy as **High**, there must exist more than four disks, and a quorum disk. If five or more disks are configured, then the quorum disk is not required. Select **Normal**, **High**, or **Flex**, as per your deployment requirement.

The Flex parameter defines the disk group redundancy. Flex redundancy requires at least 3 storage devices, including a quorum. For a database to be placed on Oracle ASM, you can set the database redundancy during its creation. For a database to be placed on Oracle ACFS, the database inherits the redundancy of the ACFS file system. You can specify an ACFS file system redundancy during its creation. You can set the disk group redundancy only during appliance creation. The database redundancy can be set anytime you create the database.

The redundancy level for DATA, RECO, and FLASH can be set to Normal, Flex, or High based on whether there are two, four, or more disks.

Note: For Oracle Database Appliance hardware models other than X8-2, the redundancy level for REDO is always High.

- h. Data Storage Percentage:** Enter a whole number between 10 and 90 to define the percentage of storage reserved for DATA, the remainder is reserved for RECO. For example, if you enter 80, then 80% of the storage for DATA and 20% for RECO.
- i. Disk Group for Database Home Storage:** Select the disk group, whether DATA or RECO depending on your hardware model, and specify the size to be allocated. This chooses the disk group from which the ACFS storage required for database homes is allocated.
- j. System Password and Confirm Password:** Enter the system password in both fields.

The system password is the password set for UNIX and `root` users. The password must begin with an alpha character and cannot contain quotation marks. Do not exceed 30 characters.

- k. Specify the DNS Servers and NTP Servers details.**

Starting with Oracle Database Appliance release 19.16, if you specify DNS servers, then ensure that all host names (except SCAN) are resolvable to one and only one IP address through the given domain name and DNS servers. These include Client Access Network Host Name, VIP Name, and ILOM Host Name. This does not apply to SCAN names as they can resolve to multiple IP addresses. If any of the above host names does not resolve to an IP address or resolves to multiple IP addresses, then the the following error is displayed:

```
DCS-10045:Validation error encountered: Hostname 'hostname1' does not  
resolve to a unique IP address.
```

- 6. In the Network Information tab, configure the primary client access network, virtual networks, and an Oracle Integrated Lights Out Manager (Oracle ILOM) network. You are only required to configure the client access network. The ILOM configuration is optional if you already configured the ILOM for the appliance and you do not need to make changes.**

Specify the following, depending on whether it is a single-node or two-node Oracle Database Appliance deployment:

- a. Client Access Network Host Name:** For Node0, enter the host name for the primary client access network.
- b. Client Access Network IP Address:** For Node0, enter the IP address for the primary client access network.
- c. VIP Name for Node0:** Enter the name of the virtual IP network for Node0.
- d. VIP IP Address for Node0:** Enter the virtual IP address that resides on Node0 and is shared between the nodes.
- e. VIP Name for Node1:** Enter the name of the virtual IP network for Node0.
- f. VIP IP Address for Node1:** Enter the virtual IP address that resides on Node1 and is shared between the nodes.
- g. (Optional) ILOM Host Name:** Enter the name of the Oracle ILOM host for Node0 and Node1.

- h. (Optional) **ILOM Network IP Address**: Enter the IP address for the ILOM for Node0 and Node1.
- i. (Optional) **ILOM Network Subnet Mask**: Enter the subnet mask address for the ILOM.
- j. (Optional) **ILOM Network Gateway**: Enter the gateway address for the ILOM.
- k. **Client Access Network Subnet Mask**: Enter the subnet mask address for the primary client access network.
- l. **Client Access Network Gateway**: Enter the gateway address for the primary client access network.
- m. **Client Access Network Interface**: Enter the interface for the primary client access network.
- n. **SCAN Name**: Specify the Single Client Access Name (SCAN).
- o. **SCAN IP Address**: Specify the SCAN IP address. You can specify up to three SCAN IP addresses.

Specify the VIP address and SCAN only for high-availability deployments.

7. Determine how you want to configure your users and groups and whether or not you want to allow operating system role separation:
 - Two users with six groups: Customize Users and Groups, select **No**. Allow OS Role Separation, select **Yes**. This is the default configuration.
 - Two customized users with six customized groups: Customize Users and Groups, select **Yes**. Allow OS Role Separation, select **Yes**.
 - Single user with two groups: Customize Users and Groups, select **No**. Allow OS Role Separation, select **No**
 - Single user with six groups: Customize Users and Groups, select **Yes**. Allow OS Role Separation, select **No**. SAP deployments use this configuration.
8. Do you want to create an initial database? Select **Yes** and go to Step 9 or select **No** and go to Step 10.
9. Enter the following information to configure an initial database:
 - a. **DB Name**: Enter a name for the database.

The name must contain alphanumeric characters and cannot exceed 8 characters.
 - b. (Optional) **DB Unique Name**: Enter a globally unique name for the database.

Databases with the same DB Name within the same domain (for example, copies of a database created for reporting or a physical standby) must have a different DB Unique Name that is unique within the enterprise. The name must contain alphanumeric, underscore (_), dollar (\$), and pound (#) characters, but must begin with an alphabetic character. No other special characters are permitted in a database name. The unique name cannot exceed 30 characters.
 - c. **DB Version**: Select a database bundle patch number.
 - d. **CDB**: Select **Yes** or **No** to specify whether or not you want a Container Database (CDB).
 - e. **PDB Name**: Enter a name for the pluggable database (PDB).

The name must begin with an alphanumeric character. The following characters are valid: alphanumeric characters, and underscore (_).

- f. **PDB Admin User:** Enter an Admin user name for the pluggable database (PDB).
- g. **Database Edition:** Select the Oracle Database edition, either Standard Edition and Enterprise Edition. Your license determines which database edition you are eligible to create in the appliance.

For Oracle Database 19c Standard Edition, you can only create single-instance Oracle Database, with or without high-availability.

- h. **SYS and PDB Admin User Password:** Provide a password for the database.
- i. **Deployment:** Select a deployment type from the list. The options are RAC, RAC-One, or SI (single-instance database). If you select a single instance database, then select the node for the SI database deployment.

For Standard Edition Oracle Database 19c or later, you can choose to enable high availability for single-instance databases. For Standard Edition Oracle Database 19.6 or later, if you choose to create a single-instance database, then the high availability feature is available by default. To disable high-availability, set the value in the **Enable High Availability** field to **No**.

For Enterprise Edition Oracle Database 19.15 or later or Oracle Database 21.6 or later, you can choose to enable high availability for single-instance databases. For Enterprise Edition Oracle Database 19.15 or later or Oracle Database 21.6 or later, if you choose to create a single-instance database, then the high availability feature is disabled by default. To enable high-availability, set the value in the **Enable High Availability** field to **Yes**.

If you select a single instance database, then you have the option to create the database on either Node0 or Node1. The default is Node0.

- j. **Shape:** Select a database shape from the list.
- k. In the **Database Class** field, select a database class from the drop-down list. If an option is not available in the list, it is not supported for the database edition on the Oracle Database Appliance or the version that you selected. The default is OLTP.
- l. In the **Storage** field, select **ACFS** or **ASM** from the drop-down list. The default is Oracle ASM.
- m. If you specified the disk group redundancy as **Flex**, then you can select the **Database Redundancy** value as **Mirror** or **High**.
- n. **Data Files on Flash Storage:** Select **Yes** or **No**.

This option is only available if the HA system has HDD storage drives.

- o. **Configure EM Express:** Select **Yes** or **No**.
Select **Yes** to configure the Oracle Enterprise Manager Database Express (EM Express) console for Oracle Database 12.2.1.0 or 12.1.0.2. Selecting Yes enables you to use the console to manage the database.
- p. **Character set:** Select a character set.
- q. **National Characterset:** Select a national character set.
- r. **Language:** Select the database language.
- s. **Territory:** Select a territory or location from the list.
- t. For Oracle Database Enterprise Edition 19c or later, you can choose to enable Transparent Database Encryption (TDE). Select **Yes** or **No** in the **Enable TDE**

option. Specify and confirm the **TDE Password**. By default, the TDE option is disabled.

10. In the Diagnostics Information tab, configure and enable Oracle ASR or choose to enable trace file redaction.

Enable Trace File Redaction: Select **Yes** if you want to redact sensitive information in diagnostics collections.

You can configure and enable Oracle Auto Service Request (Oracle ASR) now or later:

- To not enable Oracle ASR during deployment, select **No** and click **Submit**. After deployment, you can configure an internal Oracle ASR or register with an external Oracle ASR Manager from either the Browser User Interface or command-line interface.
 - Internal Oracle ASR: choose to configure Oracle ASR Manager on Oracle Database Appliance or use Oracle ASR Manager configured on another server in the same network as your appliance.
 - External Oracle ASR: If you already have Oracle ASR Manager configured elsewhere, you can register Oracle Database Appliance with your existing Oracle ASR Manager.
- To enable Oracle ASR, select **Yes** and complete the fields:
 - a. Select **Internal** or **External** in the **ASR Type** field.
 - b. **ASR User Name:** Enter the e-mail address associated with the My Oracle Support account under which the server is registered.
 - c. **Password:** Enter the password associated with the My Oracle Support account under which the server is registered.
 - d. Specify the **SNMP User Name** and **SNMP Password**.
 - e. **SNMP Version:** Select **V2** or **V3**. V3 is the default and recommended version.
 - f. **HTTP Proxy used for Upload to ASR:** Select **Yes** or **No**.
 - g. **Proxy Server Name:** If you are using a proxy for upload, enter the proxy server name.
 - h. **Proxy Port:** If you are using a proxy for upload, enter the proxy port.
 - i. **(Optional) HTTP Proxy Requires Authentication:** If you are using a proxy for upload, select **Yes** if you require authentication. If you do not require authentication, select **No**.
 - j. **Proxy User Name:** If you are using a proxy for upload, enter the proxy user name.
 - k. **(Optional) Proxy Password:** If you are using a proxy for upload and require authentication, enter the proxy password.
- 11. Click **Submit**. When prompted, click **Yes** to confirm that you want to start the job to deploy the appliance.
- 12. Verify that the appliance is deployed. Run the `odacli describe-system` command. For high-availability deployments, run the command on both nodes.

The job to create the appliance takes time to complete. To monitor the job progress, click the **Activity** tab. Click the job number to view the tasks.

After deployment, the `root` and database users `SYS`, `SYSTEM`, and `PDBADMIN` are set to the system password. The `oracle` and `grid` passwords are set to the default password. Change these passwords to comply with your user security protocols.

About Enabling Oracle ASMFD on Oracle Database Appliance

Understand how you can enable Oracle ASMFD on bare metal systems and DB systems on Oracle Database Appliance.

Oracle ASM Filter Driver (Oracle ASMFD) simplifies the configuration and management of disk devices by eliminating the need to rebind disk devices used with Oracle ASM each time the system is restarted.

By default, Oracle ASMFD is enabled on Oracle Database Appliance bare metal systems and DB systems. To disable Oracle ASMFD on Oracle Database Appliance bare metal system and DB system, specify `"enableAFD": "FALSE"` in the JSON file when you provision the bare metal system and DB system. If Oracle ASMFD is not enabled on Oracle Database Appliance bare metal system, then you cannot enable Oracle ASMFD on Oracle Database Appliance DB system. If Oracle ASMFD is enabled on Oracle Database Appliance bare metal system, then you can choose to enable or disable Oracle ASMFD on Oracle Database Appliance DB system by specifying the parameter `"enableAFD": "TRUE"` or `"enableAFD": "FALSE"` in the DB system JSON file during provisioning of the DB system.

For DB systems, if the `"enableAFD"` attribute is not specified in the JSON file during provisioning, then the Oracle ASMFD configuration on the DB system is the same as the bare metal system Oracle ASMFD configuration.

For more information about specifying the `"enableAFD"` attribute in the JSON files when provisioning bare metal and DB systems, see the example JSON files provided in the chapters *Creating an Appliance Using JSON File* and *Managing an Oracle Database Appliance KVM Deployment* in this book.

 **Note:**

To identify if Oracle ASMFD is enabled or not, check whether the `/etc/oracleafd.conf` file exists or not. Oracle ASMFD is enabled if this file exists, otherwise, Oracle ASMFD is disabled.

5

Implementing Multi-User Access on Oracle Database Appliance

Understand how multi-user access can be implemented on Oracle Database Appliance, its advantages and restrictions and the associated life cycle management changes for your appliance.

Caution:

You can enable multi-user access **only** at the time of provisioning Oracle Database Appliance on bare metal systems and **cannot** rollback multi-user access after you provision and deploy your appliance. The Oracle Database Appliance administration model changes when you deploy the Multi-User Access feature. Evaluate your role separation requirements before using this feature. Deploying on a test system first can help with the evaluation and assessment of the new administration model.

Note:

You cannot enable multi-user access on Oracle Database Appliance DB systems. DB systems do not require role separation since you can create only one database on each DB system.

About Multi-User Access on Oracle Database Appliance

Before provisioning your appliance, understand how multi-user access can enhance the security of the system and provide an efficient mechanism for role separation.

Currently, a single Oracle Database Appliance account with user name and password is used to securely connect to the appliance, run ODA CLI commands, or log into BUI. The `root` user performs all administration on an Oracle Database Appliance. With multi-user access, you have the option of providing separate access to database administrators to manage databases. Display of resources within the Browser User Interface are also filtered as per user role. The `root` access is restricted to the Oracle Database Appliance system administrator to access system logs or debug issues that require `root` access.

When you enable multi-user access, you create multiple users with different roles that restrict them from accessing resources created by other users and also restrict the set of operations they can perform using ODA CLI commands or Browser User Interface (BUI). The same user credentials that you set up, can be used for logging into the BUI and running ODA CLI commands. The BUI also displays resources and information based on access to the set of resources. A separate **Multi-User Access Management** tab is available only to the `odaadmin` user to administer the users and resources in the system.

 **Note:**

When you enable multi-user access, the Oracle Database Appliance administrator is `odaadmin`. This user has access to all the resources on the appliance and can run any operations using ODACLI or the BUI using the same set of credentials. When you do not enable multi-user access, the user name you use to log into BUI is `oda-admin`.

 **Note:**

The authentication token support for ODACLI session management is linked to a multi-user access user account. Since `root` is an operating system administrative user and not a multi-user access user, auth token based session management system is not supported when a user logs in as `root`. Therefore, you must provide an Oracle Database Appliance account user name and password to run any ODACLI command.

Benefits of enabling multi-user access

- Multi-user access feature supports user lifecycle management such as creation, activation, updation, deactivation, deletion, and credential management.
- By using multi-user access, multiple departments such as finance and human resources within the same organization can use Oracle Database Appliance as a consolidation platform for hosting their databases in a secure manner as only the authorized users in the respective departments can access their departmental databases and perform lifecycle management operations on the databases.
- Organizations that have root access policy restrictions can use multi-user access and create separate users with restricted roles.
- Without multi-user access, all databases were created as the default database user chosen during provisioning. Hence, even in a `sudo`-based multi-user environment, the ODA administrator could not track usage of resources. Now such reporting is possible at the database level.
- Multi-user access feature supports token-based session management. A user enters the password only when they run the first `odacli` command. Subsequently, a token is generated and till it expires, the user is not required to enter the password again. Each time an `odacli` command is run, the existing token is refreshed with a new token that has the expiry of 120 mins or the value configured by the `odaadmin` user. This means if the `odacli` session is not idle for the expiry duration, the user does not need to enter the password again.
- Both Basic Auth and mTLS modes of authentication are supported. ODACLI and BUI uses Basic Auth. Users such as `oracle` and `grid` can also run certain operations on the DCS agent using mTLS-based authentication. Basic Auth is a password-based authentication scheme. mTLS is a certificate-based authentication scheme where both the client (user) and the server (DCS agent) mutually present and authenticate each other's certificate before the authentication is deemed complete.
- Multi-user access provides for user account locking on multiple failed login attempts and password expiration. You can also unlock and reset the account in case the password is forgotten.

 **Note:**

You can enable multi-user access **only** at the time of provisioning Oracle Database Appliance and **cannot** rollback multi-user access after you provision and deploy your appliance. Provision the feature on your test system first, and then deploy this feature on your production system.

Related Topics

Understand the ODACLI command changes when you enable multi-user access.

About Users, Roles, Entitlements, and Operations on a Multi-User Access Enabled Oracle Database Appliance System

Understand the users, roles, entitlements, and operations when you provision your appliance with multi-user access enabled.

 **Note:**

Note that in a multi-user access enabled deployment, the `oda-admin` user is not present. The ODA admin user name is `odaadmin`. The first user with administrative privileges is called `odaadmin`. This user can log into the BUI and run ODACLI commands. This user can also create other user accounts with roles and entitlements as required.

About Roles, Entitlements, and Operations

Each user can be assigned one or more roles in a multi-user enabled Oracle Database Appliance system. Each role encompasses a set of entitlements that authorizes a user to perform only a specific set of operations using ODACLI or BUI. Each entitlement in turn, is a group of a similar set of operations. For example, `PROVISIONDB-MGMT` is an entitlement that encompasses provisioning-related operations such as `create-database`, `clone-database`, `delete-database`, `register-database`. Similarly, `BACKUPDB-MGMT` encompasses backup related operations such as `create-backup`, `delete-backup`, `irestore-database`, `recover-database`, and so on. The `ODA-DB` role has access to a collection of entitlements such as `PROVISIONDB-MGMT`, `BACKUPDB-MGMT`, and `PATCHDB-MGMT`. A user with the `ODA-DB` role can perform all the database lifecycle management operations on the databases that they own. Additionally, if a user with the role of `ODA-DB` is granted the `ODA-GRID` role as well, this user can now perform Oracle Grid Infrastructure-related operations.

Roles can be internal or external. Internal roles are assigned to system users and are used internally for the purpose of administration of the Oracle Database Appliance

system. For example, the `ODA-ADMINISTRATOR` role is assigned to the Oracle Database Appliance system administrator to manage the appliance or associated entities. Another example is a DB system communicating with the bare metal using a system user with the role of `ODA-DBVMINFRA`.

External roles can be granted to the new users created by `odaadmin`, the Oracle Database Appliance system administrator. For example, the `odaadmin` creates a new user `odadb1` with the role of `ODA-DB`. Now this user `odadb1` is entitled to create databases and perform lifecycle management operations because of the role granted to them. A user can have one or more roles.

The topic *ODACLI Command Changes with Multi-User Access on Oracle Database Appliance* describes the ODACLI commands that have changes for multi-user access and the entitlements required to run the commands.

Multi-User Access User Roles

When you enable multi-user access on Oracle Database Appliance, the following user roles are available:

- **ODA-ADMINISTRATOR:** This is an internal role assigned to the first user (`odaadmin`) created during the provisioning of an Oracle Database Appliance. This role entitles `odaadmin` to run all ODACLI commands or perform all Browser User Interface (BUI) operations. This role cannot be assigned to the new users that `odaadmin` creates. The `odaadmin` account is an administrator role that can run any operation (command) on any resource. For example, user `oda1` creates a database `db1` and user `oda2` creates a database `db2`. Each user can now perform lifecycle management operations on their respective database only. But, `odaadmin` can patch both databases by running `odacli` commands. This allows both DBAs (`oda1` and `oda2`) and an overall administrator (`odaadmin`) to perform functions specific to their role.
- **ODA-DB:** This is an external role available to `odaadmin` to assign to newly-created users. This role entitles the user to perform database management operations such as create, modify, restore, recover, backup, patch, clone, move, register, and delete.
- **ODA-OAKDROOT:** This is an internal role that is assigned to system user `oakdroot` created during provisioning and is used by OAKD to execute certain operations such as get-disks and release-disks on the DCS agent.
- **ODA-GRID:** This is an internal role assigned to the `grid` user. This role entitles the user to run Oracle Grid Infrastructure-related operations.
- **ODA-DBVMINFRA:** This is an internal role assigned to the DBVM user created on the bare metal system when the DB system is provisioned. This role entitles the user to synchronize metadata between the DB system and the bare metal system.

Understand the ODACLI command changes when you enable multi-user access.

About Granting and Revoking Resource Access

Multi-user access allows exclusive or shared access to resources. Review this example about shared resource access.

Multi-user access allows exclusive or shared access to resources. It is recommended that each user creates their own database home and then creates databases in the home. This provides for an efficient method of separation of duties where each user has exclusive access to their databases. However, in certain exceptional situations, such as lack of disk space, a user can request the administrator `odaadmin` to grant them shared access to a resource owned by another user.

For example, if user `oda1` wants to create a database of version 19c and there is already a database home `DBH2` of the same version created by another user `oda2`. With the consent of user `oda2`, user `oda1` can now request the `odaadmin` user to grant them shared access to database home `DBH2`. Once the shared access is granted, user `oda1` can now create a database `db1` on the shared database home `DBH2` and manage it. Note that user `oda1` can connect to the database `db1` only through the `SYS` user password and not as a password-less connection based on operating system authentication, as the database home `DBH2` is still owned by user `oda2`. Oracle Database Appliance resources such as database home, database storage, and databases can be shared across users in a similar fashion on an on-demand basis. However, there are restrictions to the secondary owner managing the shared resource.

Provisioning Oracle Database Appliance with Multi-User Access

You can enable multi-user access **only** when you provision Oracle Database Appliance, using CLI commands or the Browser User Interface.

Provision your appliance as described in the chapter *Provisioning Oracle Database Appliance Bare Metal System*.

▲ Caution:

You can enable multi-user access **only** at the time of provisioning Oracle Database Appliance on bare metal systems and **cannot** rollback multi-user access after you provision and deploy your appliance. The Oracle Database Appliance administration model changes when you deploy the Multi-User Access feature. Evaluate your role separation requirements before using this feature. Deploying on a test system first can help with the evaluation and assessment of the new administration model.

 **Note:**

You can specify the token expiration duration, password expiration duration, maximum failed login attempts, and other details when you provision multi-user access enabled Oracle Database Appliance with JSON file. You can also specify these values as a one-time activity from the Browser User Interface when you configure multi-user access and provision Oracle Database Appliance using the Browser User Interface.

Overall Steps in Provisioning Oracle Database Appliance with Multi-User Access Enabled

1. Enable multi-user access.

- If you provision your appliance using a JSON file, then add the attribute `"isMultiUserAccessEnabled": true` in the `prov_req.json` file. If the attribute is set to `false` or does not exist in the `prov_req.json` file, then multi-user access is not enabled during provisioning of the appliance.

```
"isRoleSeparated": true,
  "isMultiUserAccessEnabled": true,
  "osUserGroup": {
    "groups": [{
      "groupId": 1001,
      "groupName": "oinstall",
      "groupRole": "oinstall"
    }],
  },
```

...

You can also set the multi-user access attributes by adding the following in the JSON file:

```
},
"asr": null,
"multiUserAccess": {
  "dcsUserPasswdExpDurationInDays": 90,
  "tokenExpirationInMins": 120,
  "maxNumFailedLoginAttempts": 3
}
}
```

The values for these attributes are as follows:

- **Token expiration duration in minutes:** The minimum value you can specify is 10 minutes, the maximum value is 600 minutes, and the default is 120 minutes.
- **Password expiration duration in days:** The minimum value you can specify is 30 days, the maximum value is 180 days, and the default is 90 days.
- **Maximum failed login attempts allowed:** The minimum value you can specify is 2, the maximum value is 5, and the default is 3.
- If you create the appliance using the Browser User Interface (BUI), then select the **Enable Multi-User Access (N/A for DB System)** checkbox in the BUI login page.

2. Provide passwords for `odaadmin`, `oracle`, and `grid` users. These are Oracle Database Appliance system users and their accounts are activated during created. The user `odaadmin` is created with the role of `ODA-ADMINISTRATOR` while the `oracle` and `grid` users are created with the role of `ODA_DB` and `ODA_GRID` respectively.
3. The system configures the multi-user access repository with a list of roles and entitlements, used for assigning to the users in the system.
4. You can now log into the appliance with the newly-created user credentials and deploy databases.

Provisioning Oracle Database Appliance Using the Browser User Interface with Multi-User Access Enabled

1. Access the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. For the first login, since the `odaadmin` role is not configured, you are prompted to provide the ODA password and enable multi-user access.
3. Select **Enable Multi-User Access (N/A for DB System)** and provide a strong password for the ODA user.
4. Click **Configure Multi-User Settings** and then set the **User Password Expiry Duration (In Days)**, **Session Expiration for CLI (minutes)**, and **Maximum Failed Login Attempts**. Click **Save** to save these settings and return to the Login page on the BUI.
5. Click **Submit**. A confirmation message is displayed on successful creation of the user.
6. Click **OK**. You are redirected to the Login page.
7. Specify the **User Name** and **ODA Password** and click **Login**. Note that the ODA admin user name is `odaadmin` if multi-user access is enabled. If multi-user access is not enabled, then the ODA admin user name is `oda-admin`.
8. In the Create Appliance page, specify the details for creating the appliance. See the topic *Creating the Appliance* for detailed information about the information you need to provide.
9. Select **Assign same password for admin, oracle, grid users** if you want to specify the same password for all users. Otherwise, specify different passwords for the `system admin`, `oracle`, and `grid` users.
10. Click **Submit** to create the appliance with multi-user access enabled.
11. The job is submitted and a confirmation page appears with a link to the job. Click the link to view the job progress, tasks, and status. After you close the Job confirmation page, you can click the **Activity** tab to monitor the job progress. Click the job number to view the tasks and status details. Click **Refresh** to refresh the page.

Use `odacli` commands to enable multi-user access for the appliance.

Creating, Viewing, and Deleting Users on Oracle Database Appliance with Multi-User Access

After provisioning the appliance with multi-user access enabled, you can create users with specific entitlements.

After you provision your appliance with multi-user access enabled, do the following:

Creating, Viewing, and Deleting Users with ODACLI Commands

1. Connect to the appliance as the `odaadmin` user.

```
ssh odaadmin@oda-box hostname/IP
```

2. Run any ODACLI command and provide the `odaadmin` password when prompted.
3. On successful authentication, create a user with the following command:

```
odacli create-user -u username -r comma-separated role names
```

For example, create a user `dbuser1` with lifecycle management privileges for databases:

```
odacli create-user -u dbuser1 -r ODA-DB
```

The `odaadmin` user creates `dbuser1` and assigns a temporary password.

4. After the user is created successfully, the `dbuser1` can log into the appliance with the temporary password.
5. The `dbuser1` is in the `Inactive` state. Activate the user with the following command:

```
odacli activate-user
```

You are prompted to change the password. Enter the temporary password, the new password, and confirm the new password.

6. Use the new password to connect by SSH into the appliance and run ODACLI commands or connect to the Browser User Interface.
7. The `odaadmin` user can view all the users in the system:

```
# odacli list-users
```

8. The `odaadmin` user can view details for a user in the system:

```
# odacli describe-user -u user_id
```

9. Delete a user in the system. Note that only the `odaadmin` user can delete a user in the system.

```
# odacli delete-user -u user_id
```

Creating, Viewing, and Deleting Users with Browser User Interface

1. Log into the Browser User Interface as the `odaadmin` user:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Multi-User Access** tab.
3. Click the Users link on the left-hand pane.
4. Click **Create User**.
5. In the Create User page, provide the **User ID**, specify the **Role**, and provide the **ODA Password** for this user. Note that the same user credentials work for login for BUI and ODA CLI commands.
6. Optionally, click **Generate mTLS Certificate** to enable mTLS-based authentication.
7. Click **Create**.
8. The job is submitted and a confirmation page appears with a link to the job. Click the link to view the job progress, tasks, and status. After you close the Job confirmation page, you can click the **Activity** tab to monitor the job progress. Click the job number to view the tasks and status details. Click **Refresh** to refresh the page.
9. In the **Multi-User Access** tab, on the Users page, click on the link for the user whose details you want to view.
10. To delete a user, log in as the `odaadmin` user. In the **Actions** drop-down list, select **Delete**. Note that only a user of type **Custom** can be deleted.

Activating a New User on Oracle Database Appliance with Multi-User Access

Understand how to activate a new user on multi-user access enabled Oracle Database Appliance.

Activating the New User on Multi-User Access Enabled System Using ODA CLI Commands

1. After a new user is created by `odaadmin` successfully, the new user, for example, `dbuser1` can log into the appliance with the temporary password.
2. Activate the user with the following command:

```
odacli activate-user
```

You are prompted to change the password. Enter the temporary password, the new password, and confirm the new password.

Activating the New User on Multi-User Access Enabled System Using Browser User Interface

1. After a new user is created by `odaadmin`, log into the Browser User Interface as the new user:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Specify the **User Name** and the temporary password in the **ODA Password** field.
3. Since this is a new account, the Account Status is `Inactive`. You are prompted to specify and confirm a new password.
4. Specify and confirm the **Password** and click **Submit**.
5. On successful password change, log into the Browser User Interface with the new password.

Granting and Revoking Resource Access on Oracle Database Appliance with Multi-User Access

You can grant and revoke resource access on the appliance.

Granting and Revoking Resource Access with ODACLI Commands

- Grant or revoke access to a resource in a multi-user access enabled system:

```
# odacli grant-resource-access -ri resource_ID -u user_name
# odacli revoke-resource-access -ri resource_ID -u user_name
```

- View access to a DCS resource in a multi-user access system:

```
# odacli describe-resource-access -ri resource_ID
```

- View access to all DCS resources defined in a multi-user access system:

```
# odacli list-resources-access -ao -rn resource_name -rt resource_type
```

Granting and Revoking Resource Access with Browser User Interface

1. Log into the Browser User Interface as `odaadmin`:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Multi-User Access** tab.
3. Click the Resources link on the left-hand pane.
4. Click on a Resource to view more details.

5. For a Resource, in the Actions drop down list, select **Grant Resource Access** to grant the user shared access to a resource. Select the **User Name** from the drop-down list and click **Grant**. Click **Yes** to confirm and submit the job.
6. Select **Revoke Resource Access** to revoke access to a resource from a user. Select the **User Name** from the drop-down list and click **Revoke**. Click **Yes** to confirm and submit the job.

Viewing Roles, Operations, and Entitlements on Oracle Database Appliance with Multi-User Access

You can view roles and entitlements on the appliance.

Viewing Roles, Operations, and Entitlements with ODACLI Commands

Note:

For Oracle Database Appliance release 19.13, the multi-user access feature is available for standalone Oracle Database Appliance systems. During provisioning, a single domain and tenancy is created by default and all users are created within the default domain and tenancy.

- View all the roles defined in the system:

```
# odacli list-user-roles
```

- View details for a user role in the system:

```
# odacli describe-user-role -n role_name
```

- View all the entitlements defined in the system:

```
# odacli list-user-entitlements
```

- View details for an entitlement in the system:

```
# odacli describe-user-entitlement -n entitlement_name
```

- View all the operations defined in the system:

```
# odacli list-user-operations
```

- View details for an operation in the system:

```
# odacli describe-user-operation -n operation_name
```

- View the domains defined in the system. In this release, this is the default domain.

```
# odacli list-domains
```

- View details for a domain in the system:

```
# odacli describe-domain -dn domain_name
```

- View the tenants in a multi-user access enabled domain. In this release, this is the default tenancy.

```
# odacli list-tenants
```

- View details for a tenant in a multi-user access enabled domain:

```
# odacli describe-tenant -tn tenant_name
```

Viewing Roles, Operations, and Entitlements with Browser User Interface

1. Log into the Browser User Interface as `odaadmin`:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Multi-User Access** tab.
3. Click the Roles link on the left-hand pane. The roles defined in the system are displayed. These roles cannot be edited or updated.
4. Click on a Role to view more details.
5. Click the Entitlements link on the left-hand pane. The entitlements defined in the system are displayed. These entitlements cannot be edited or updated.
6. Click on an Entitlement to view more details.

Managing Databases and Database Homes on Oracle Database Appliance with Multi-User Access

The custom user created on multi-user access Oracle Database Appliance can deploy and manage databases and database homes.

After you create a custom `dbuser1` on an Oracle Database Appliance with multi-user access enabled, manage databases as follows:

Creating and Listing Databases and Database Homes Using ODACLI Commands

1. Connect to the appliance as `dbuser1`.

```
ssh dbuser1@oda-box hostname/IP
```

2. Create a database:

```
odacli create-database -n dbName -v dbVersion
```

3. Run the `odacli list-databases` to view the databases owned by `dbuser1`:

```
odacli list-databases
```

Another user with the `ODA-DB` role cannot use the resource owned by `dbuser1` to create a database home, thus ensuring role separation.

4. Use the `-all` option on the appliance when multi-user access is enabled to view all the databases in the system.

```
odacli list-databases -all
```

5. Use the `-all` option on the appliance when multi-user access is enabled to view all the database homes in the system.

```
odacli list-dbhomes -all
```

Creating and Listing Databases and Database Homes Using Browser User Interface

1. Log into the Browser User Interface as `dbuser1`:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Database** tab.

3. Click **Show All Databases**. A list of all databases in the system is displayed.

- **View Details:** View the details of the database.
- **Modify:** Modify the database
- **Move:** Move the database
- **Upgrade:** Upgrade the database
- **Delete:** Delete the database.
- **Grant Access:** Grant access privilege to the database to a user.
- **Revoke Access:** Revoke access privilege to the database from a user.
- **View Pre-patch reports:** View prechecks report for patching.

4. Click the Database Home link on the left hand pane. A list of all database homes in the system is displayed.

5. For a database home, you can click the **Actions** dropdown list, and select from the following options:

- **View Database:** View the details of the database home.
- **Delete:** Delete the database.
- **Grant Access:** Grant access privilege to the database home to a user.
- **Revoke Access:** Revoke access privilege to the database home from a user.

- **View Pre-patch reports:** View prechecks report for patching.

Resetting the Password for a Locked User Account on Oracle Database Appliance with Multi-User Access

Understand how to reset the password on multi-user access Oracle Database Appliance.

Resetting Password for a Locked User Account on Multi-User Access Enabled System Using ODACLI Commands

- Unlock the `odaadmin` user account that is locked due to multiple failed login attempts or password expiry.
 1. Log in as `root`.

2. Run the following:

```
/opt/oracle/dcs/bin/resetCredsForOdaAdmin.sh
```

A temporary password is assigned to the `odaadmin` user.

3. Log in as the `odaadmin` user with the temporary password.
4. Run the following command:

```
odacli reset-password
```

You are prompted to provide the temporary password and specify and confirm the new password. After the command runs successfully, the user account is unlocked.

- Unlock any non-admin user account that is locked due to multiple failed login attempts or password expiry.

1. Log in as `odaadmin`.
2. Run the following command:

```
odacli authorize-user
```

After you provide a temporary password, the account is unlocked.

3. Log in as the user whose account was locked, with the temporary password.
4. Run the following command:

```
odacli reset-password
```

You are prompted to provide the old password, the temporary password and specify and confirm the new password. After the command runs successfully, the user account is unlocked and reactivated.

Resetting Password for a Locked User Account on Multi-User Access Enabled System Using Browser User Interface

- Unlock the non-admin user account that is locked due to multiple failed login attempts or password expiry as follows:

1. Log into the Browser User Interface as the `odaadmin` user:

```
https://host-ip-address:7093/mgmt/index.html
```

2. In the **Multi-User Access** tab, on the Users page, click on the link for the user whose password you want to reset. Note that you can reset the password for users of type **Custom** only. The Account Status for the user is `LockedFailedLogin`.
3. In the Actions drop down list, select **Authorize Password Reset**.
4. In the Authorize Password Reset page, specify the **Old Password**, specify and confirm the **Temporary ODA Password**, and click **Authorize**.

5. Now, log into the Browser User Interface as the user whose account is being unlocked. Specify the **User Name** and the temporary password in the **ODA Password** field.
6. Since the account was locked, the Account Status is `CredentialReset`. You are prompted to specify and confirm a new password.
7. Specify and confirm the **Password** and click **Submit**.
8. On successful password change, log into the Browser User Interface with the new password.

Oracle Database Appliance Postinstallation Tasks

Complete these administrative tasks after you have deployed software, but before the system is operational.

- [Configuring CPU Core Count](#)
Oracle Database Appliance is delivered with all cores on each server enabled. Follow this procedure to reduce the number of cores, if required.
- [Securing Oracle ILOM Service Processors](#)
Change the Oracle ILOM default password after completing Oracle Database Appliance deployment.
- [Changing Oracle Database Appliance Passwords](#)
After deploying your appliance, ensure that you change the following passwords for securing your system.

Related Topics

- [Deployment Checklist for Oracle Database Appliance Bare Metal Systems](#)
This checklist provides an overview of the tasks to setup and deploy Oracle Database Appliance bare metal systems for the first time.

Configuring CPU Core Count

Oracle Database Appliance is delivered with all cores on each server enabled. Follow this procedure to reduce the number of cores, if required.

1. To reduce the number of cores, run the following command on Node 0 only:
Set the cores in multiples of 2, for example, 12:

```
[root@oak1 opt]# /opt/oracle/dcs/bin/odacli update-cpucore --cores 12
```

When you run the command, the nodes are restarted to apply the changes.

2. Check if the job completed successfully:

```
[root@oak1 opt]# /opt/oracle/dcs/bin/odacli describe-job -i job_ID
```

3. Verify that the core count is updated on both nodes:

```
[root@oak1 opt]# /opt/oracle/dcs/bin/odacli describe-cpucore
```

Securing Oracle ILOM Service Processors

Change the Oracle ILOM default password after completing Oracle Database Appliance deployment.

Do not change the default password until after you have completed software deployment on the Oracle Database Appliance.

Changing Oracle ILOM Password from the Console

1. In the Oracle ILOM console, from the **Administration** menu, select **User Management**, and then navigate to the **User Accounts** subtab.
2. Select **root** user and click **Edit**.
3. Change the `root` user password.

Changing Oracle ILOM Password Using CLI Commands

1. Connect to the Oracle ILOM service processor (SP) through SSH:

```
# ssh -l root SP-ipaddr
```

2. Set the new password:

```
-> set /SP/users/root password=new_password  
Changing password for user /SP/users/root/password...  
Enter new password again: *****  
New password was successfully set for user /SP/users/root
```

Changing Oracle Database Appliance Passwords

After deploying your appliance, ensure that you change the following passwords for securing your system.

Changing the Oracle Installation Owner Passwords

During deployment, the root and database users SYS, SYSTEM and PDBADMIN are set to the system password. After deployment, the oracle and grid passwords are also set to the system password. Change the passwords to comply with your enterprise user security protocols. Refer to the *Oracle Database Appliance Security Guide* and *Oracle Database Security Guide* for information about the required configuration and best practices to secure database systems.

Changing the oda-admin User Password through the Command-Line

1. Log in to the appliance as `root`.
2. Run the `odacli set-credential` command to reset the password. Enter the new password when prompted.

```
# odacli set-credential --username oda-admin  
Enter 'user' password:  
Retype 'user' password:
```

Changing the the oda-admin User Password through the Browser User Interface

1. Log into the Browser User Interface using the user name `oda-admin`.
2. Click **About**, then **User Settings** in the upper right corner of the Browser User Interface.
3. Enter the password in the Password field and the Password Confirmation field, then click **Submit**.
A confirmation message is displayed.
4. Click **About**, then click **Sign Out**.
5. Log back into the Browser User Interface with the new password.

Note:

The `oda-admin` password expiration period is 90 days.

7

Re-imaging Oracle Database Appliance

Bare metal operating system re-imaging installs Oracle Database Appliance operating system software on the local (boot) drive.

Bare Metal is a non-virtualized Oracle Database Appliance configuration. Oracle Database Appliance ships from the factory with a bare metal configuration, default ISO image and Appliance Manager installed. Use the OS ISO Image to restore the OS to the "shipped from factory" state. Use only when necessary. Reimaging does not patch the firmware or update the component versions; it only re-images the local system disk from an operating system perspective. After imaging is completed, provision the bare metal system.

Understand how to troubleshoot errors that occur when re-imaging Oracle Database Appliance.

Uninstalling Oracle Database Appliance Components

Use the Oracle Database Appliance cleanup deploy utility, `/opt/oracle/oak/onecmd/cleanup.pl` to uninstall Oracle Database Appliance components.

About the Cleanup Utility

Use the cleanup deploy utility to do the following:

- Uninstall Oracle Auto Service Request (Oracle ASR)
- Uninstall Oracle Trace File Analyzer (TFA)
- Uninstall Oracle ORAchk Health Check Tool
- Uninstall Oracle Grid Infrastructure and the Oracle stack
- Reset or delete the Oracle Linux udev rules
- Delete users and groups that were created when the appliance was created.

The script removes the firstnet config and the client access VLAN UNIX_DB, but does not delete any other VLANs. The script also resets any disabled CPU cores and enables all of the cores.

The cleanup utility runs in two modes: default and force mode. In the default mode, the commands used as part of cleanup do not use the force option. The Oracle ASM disk status is changed from MEMBER to FORMER, but ASM header on the disk is not erased. The default mode can be used only for cleaning up or re-provisioning of the same system.

Note:

For High-Availability systems, run the cleanup utility on both nodes sequentially. Ensure that the cleanup utility has completed on the first node, and then start the process on the second node.

Running the Cleanup Utility for a Baremetal Deployment

```
# perl /opt/oracle/oak/onecmd/cleanup.pl [-griduser grid_user] [-dbuser db_user] [-groups comma separated list of groups] [-omausers dbuser1,dbuser2,dbuser3] [-erasedata] [-nodpr] [-nossh] [f]
```

When the *grid_user* and *db_user* are the same (`roleSeparation=false`), you must run the script for each user (`-gridUser` and `-dbUser`).

For example:

```
cleanup.pl -griduser grid -dbuser oracle -omausers
dbuser1,dbuser2,dbuser3
```

Table 7-1 Command Options for Cleanup Utility

Option	Description
<i>grid_user</i>	Describes the Oracle Grid Infrastructure user name. The default user is <code>grid</code> .
<i>db_user</i>	Describes the database user name. The default user is <code>oracle</code> Example with <code>grid</code> and <code>oracle</code> users: <pre>cleanup.pl -griduser grid -dbuser oracle</pre>
<i>groups</i>	Describes the comma-separated list of groups. The default groups are <code>oinstall,dba,dbaoper,asmadmin,asmoper,asmdba</code> .

Table 7-1 (Cont.) Command Options for Cleanup Utility

Option	Description
<code>omausers</code>	Describes the comma-separated list of custom users created on a multi-user access enabled Oracle Database Appliance environment. All custom users created after provisioning a multi-user access enabled environment must be removed completely before you re-provision the appliance.
<code>erasedata</code>	Completely erases all disks on the Oracle Database system. It is mandatory to run this option if intention of cleanup is to reuse or move these disks on other systems. This option needs to be run on the first node when running on high-availability systems. Example of secure erase: <code>cleanup.pl -erasedata</code>
<code>cleanDefNet</code> <code>checkHeader</code>	Cleans up the default public network. Checks for OAK/ASM header on disks after successfully running the cleanup script. Use this to validate if the OAK/ASM header was erased by the cleanup script or not. Example of checking disk header: <code>cleanup.pl -checkHeader</code>
<code>nodpr</code>	Forces regular cleanup even if Data Preserving Reprovisioning environment is detected. Wipes out all data on Oracle ASM disks. You cannot run the command <code>odacli restore-node -g</code> after this operation. On Data Preserving Reprovisioning environments, the default cleanup mode is Data Preserving Reprovisioning mode which cleans the appliance without erasing Oracle ASM disks to allow the command <code>odacli restore-node -g</code> to be reattempted. Using the <code>-nodpr</code> option allows you to override this behaviour and force regular cleanup. Example: <code>cleanup.pl -nodpr</code>

Table 7-1 (Cont.) Command Options for Cleanup Utility

Option	Description
nossh	Does not attempt to set up SSH on high-availability deployments. Use this option in cases such as when the scripts using cleanup.pl are not updated to handle stopping DCS agent, or if you have forgotten the SSH password, or if SSH is not set up on the system. Example: <code>cleanup.pl -nossh</code>
f	In the force mode, all commands use the force option. The ASM disk header is erased. The oakd header on the disk is erased in both default and force modes. Example of default mode: <code>cleanup.pl</code> Example of force mode: <code>cleanup.pl -f</code>

 **Note:**

The cleanup utility for bare metal deployments produces a log file. The utility tries to create the log file at `/opt/oracle/oak/log/hostname/cleanup/cleanup_timestamp.log`. If the log cannot be created in that location, then the log is created at `/tmp/cleanup_timestamp.log`.

Related Topics

- [Deployment Checklist for Oracle Database Appliance Bare Metal Systems](#)
This checklist provides an overview of the tasks to setup and deploy Oracle Database Appliance bare metal systems for the first time.

Reimaging an Oracle Database Appliance Baremetal System

Reimage Oracle Database Appliance to perform a bare metal restore of Oracle Database Appliance.

Bare metal restore uses Oracle Integrated Lights Out Manager (Oracle ILOM) to re-image the Oracle Database Appliance node. The ILOM must be configured before

performing a bare metal restore or reimage. Generally, the ILOM is configured as part of readying for deploying Oracle Database Appliance.

Download the Oracle Database Appliance Bare Metal ISO image to your local machine before you launch the Oracle ILOM console.

Follow these steps to reimage your appliance. For Oracle Database Appliance High-Availability deployment, follow these steps on **both** nodes.

1. Open a browser and connect to Oracle Integrated Lights Out Manager (ILOM) on Node 0 as root.

`https://ilom-ip-address`

2. Launch the Remote Console.
 - a. Expand **Remote Control** in the left navigation.
 - b. Click the **Redirection** tab.
 - c. Click **Launch** for the Remote Console in the Actions menu.

The state of the system determines what appears on the Console page.

3. Add the image.
 - a. Click the **KVMS** tab, then select **Storage**.
 - b. Click **Add**.
 - c. Browse to the Oracle Database Appliance Bare Metal ISO Image, highlight the image, then click **Select**.
 - d. Click **Connect**.

The mounting of the ISO image is successful when the **Connect** button changes to a **Disconnect** button.

- e. Click **OK**

The CD-ROM icon in the top right corner is highlighted.

4. Configure the CD-ROM as the next boot device.
 - a. Expand **Host Management** in the left menu of the ILOM Remote Console tab.
 - b. Click **Host Control**.
 - c. Select **CDROM** from the Next Boot Device menu, then click **Save**.
5. Power cycle the node.

- a. Click **Power Control** in the **Host Management** menu.

- b. Select **Power Cycle** , then click **Save**.

When the node comes back after the power cycle, re-imaging starts automatically. The Oracle Linux page appears, followed by the Running Post-Install scripts page.

The Running Post-Install scripts page is a static page and might give the impression that the reimaging process is not progressing. The post-install process during re-imaging will wait until the synchronization between the partitions of the two mirrored local hard disks is complete, which can take 15 to 20 minutes to complete.

To check the progress of re-synchronization, press the ALT-F2 key combination to open a second console and enter the following command:

```
# cat /proc/mdstat
```

When the re-synchronization is complete, re-imaging is completed and the machine restarts.

After the machine restarts, the system is ready for you to deploy the Oracle software on the appliance to create an Oracle Database Appliance bare metal platform.

Related Topics

- [Creating the Appliance](#)
Create the appliance using the Browser User Interface or ODA CLI commands.

Performing Secure Erase of Data on Storage Disks

With this release, you can securely erase data from storage devices. Running the secure erase tool deletes the data on the storage disk permanently.

You may want to consolidate storage disks between appliances. For example, you can use X7-2 disks on X6-2 models, and may want to consolidate all X6-2 disks on one system, and use all new X7-2 storage disks on another system. In such cases, use secure erase to erase headers from disks before re-imaging the disks, since the storage disks across the appliances may have different partition ratios.

Note:

The secure erase tool conforms to the NIST 800-88 standard, also called NIST Special Publication 800-88 (NIST SP 800-88), Guidelines for Media Sanitization.

Running the secure erase tool removes data from storage disks permanently. If you have any data on the disk, then take a backup of your storage disk before running the secure erase tool.

Follow the steps to run the secure erase tool:

1. Stop `oakd` and the database and Oracle Grid Infrastructure before running the secure erase tool.

On bare metal systems, run the command:

```
# odaadmcli stop oak
```

On Virtualized Platforms:

```
# oakcli stop oak
```

To stop Oracle Clusterware resources:

```
# crsctl stop crs -f
```

2. Run the secure erase tool:

```
# /opt/oracle/oak/bin/odaeraser.py
```

3. You can also run the secure erase tool when running the cleanup tool:

```
# /opt/oracle/oak/onecmd/cleanup.pl -erasedata
```

Example 7-1 Options for the Secure Erase Tool

Option	Description
-a, --all	Erases all disks. For example: <pre># /opt/oracle/oak/bin/odaeraser.py --all</pre>
--disk <i>disk1,disk2</i>	Erases specified disks. For example: <pre># /opt/oracle/oak/bin/odaeraser.py --disk e0_pd_00,e0_pd_01</pre>
--dryrun	Runs the tool in the test mode
--type HDD SSD NVMe	Erases the type of disk specified
-v, --verbose	Displays verbose output
-h, --help	Displays all CLI options for the tool

Redeployment of Oracle Database Appliance

Understand the process to redeploy Oracle Database Appliance.

After cleaning up the system and erasing the header, you can continue deployment of Oracle Database Appliance as follows:

1. Download Oracle Database Appliance software.
2. Install Oracle Database Appliance software.
3. Create the appliance.

For the above steps, run the procedures as described in this guide.

8

About Administrative Groups and Users on Oracle Database Appliance

Oracle Database Appliance Browser User Interface deployment creates operating system groups and users whose members are granted system administration privileges on the appliance.

During configuration, two administrative accounts are created for Oracle Database Appliance: the user `grid`, with a user ID (UID) of 1001, and the user `oracle`, with a UID of 1000. The user `grid` is the Oracle Grid Infrastructure installation owner. The user `oracle` is the Oracle Database installation owner, and the owner of all Oracle Database homes (Oracle homes). By default, these users are members of operating system groups whose members are granted privileges to start up and administer Oracle Database and Oracle Automatic Storage Management.

The following table describes the Oracle system privileges groups, and information about the operating system authentication groups:

Table 8-1 Operating System Groups and Users on Oracle Database Appliance

Oracle System Privileges	Group Name	Group ID (GID)	<i>grid</i> is a member	<i>oracle</i> is a member
Oracle Inventory group (OINSTALL)	<code>oinstall</code>	1001	yes (primary group)	yes (primary group)
OSOPER for dbaoper group	<code>dbaoper</code>	1002	yes	yes
OSDBA group	<code>dba</code>	1003	no	yes
OSASM group for Oracle ASM	<code>asmadmin</code>	1004	yes	no
OSOPER for ASM group	<code>asmoper</code>	1005	yes	no
OSDBA for ASM group	<code>asmdba</code>	1006	yes	yes

To change the Group Name and GID from the default values on Oracle Database Appliance bare metal platforms, change the default values from the Browser User Interface during the deployment. If you create an initial database during deployment, then the password for the SYS and SYSTEM users is the password that you set in the Browser User Interface.

To change the Group Name and GID from the default values on the Oracle Database Appliance Virtualized Platform, use the `-advance` parameter with the command `oakcli deploy`. If you create an initial database during deployment, then the password for the SYS and SYSTEM users is the ROOT password from the Configurator.

**Note:**

Change the password for both users as soon as possible after configuration to prevent unauthorized access to your database using these privileged accounts.

About Data Migration Options for Oracle Database Appliance

Oracle Database Appliance supports the use of standard Oracle Database loading and migration tools.

If you are loading data or migrating data from an existing database to Oracle Database Appliance, then you can use the standard Oracle Database loading and migration tools. These tools include the following:

- Oracle GoldenGate
- SQL*Loader
- Oracle Data Pump
- transportable tablespaces
- RMAN

You can also use the RMAN utility to back up and recover databases on Oracle Database Appliance.

About Creating Database Homes on Oracle ACFS Storage

With this release, when you create new Oracle Database homes, they are created on Oracle ACFS file system which are stored on Oracle Database Appliance storage disks. You can create new Oracle Database homes using the `odacli create-database` or `odacli create-dbhome` commands, or when you patch an existing database home.

Starting with Oracle Database Appliance release 19.20.0.1, Oracle Database homes are not created on the local disk. Oracle Database homes are created on an Oracle ACFS-managed file system. For a database user `oracle`, the new database homes are created under `/u01/app/odaorahome/oracle/`.

The mount `/u01/app/odaorahome` is a shared file system for a high-availability system. On a high-availability system, `/u01/app/odaorahome/` is a shared `ORACLE_HOME` between the nodes. Existing database homes continue to remain on the local disks.

The `ORACLE_BASE` location has also changed to an Oracle ACFS-based file system. On high-availability system, the `ORACLE_BASE` is not shared between the nodes. Each node has its own Oracle ACFS file system for `ORACLE_BASE`. The new `ORACLE_BASE` for the database homes are created under the mount `/u01/app/odaorabase/`.

The disk space for the Oracle ACFS file system is located in the `DATA` or `RECO` disk group. You must specify the disk group for the Oracle ACFS file system. For Oracle Database Appliance X8-2 hardware model and single-node systems, the Oracle ACFS file system must be located in the `DATA` disk group. You can specify the initial size of the `ORACLE_HOME` volume. The default value is 80 GB. You can set a value from 25 GB to 1024 GB. The initial volume size for `ORACLE_BASE` is fixed at 10GB. Note that for these volumes, `AUTOEXTEND` is off. You can extend the volume size with the `odacli modify-dbhome-storage` command.

Changes When Provisioning Oracle Database Appliance Release 19.20.0.1

As part of the provisioning request, you must specify the disk group and size of the volume in the json file in the sysOraHomeStorage section.

```
"sysOraHomeStorage" : {  
  "diskgroup" : "DATA",  
  "volumeSize" : "80"  
},
```

If you do not specify the values in the json file, then the following error is displayed during provisioning:

```
DCS-10045:Validation error encountered: Missing argument :  
sysOraHomeStorage
```

If the values are invalid, then the following errors may be displayed during provisioning:

```
DCS-10024:Input parameter 'Disk Group' contains unacceptable value  
'DATAL'. Allowed values are '[DATA, RECO]'. (case insensitive)  
DCS-10045:Validation error encountered: Required volumeSize value in  
sysOraHomeStorage should be in the range of 25GB to 1024GB.
```

Changes When Patching to Oracle Database Appliance Release 19.20.0.1

If you have patched your appliance from Oracle Database Appliance release 19.6 or later to 19.20.0.1, then run the `odacli configure-dbhome-storage` command **before** creating a new database home. Otherwise, the following error is displayed when creating a new database home:

```
# odacli create-dbhome -v 19.8.0.0.200714  
DCS-10601:The system is not set up to create database homes on ACFS.
```

Once the disk group for the volumes are setup, new database homes are created on the Oracle ACFS file system.

Related Topics

- [odacli configure-dbhome-storage](#)
Use the `odacli configure-dbhome-storage` command to configure the database home storage.
- [odacli list-dbhome-storages](#)
Use the `odacli list-dbhome-storages` command to view the database home storage resources after the volumes for ORACLE_HOME and ORACLE_BASE are created.
- [odacli describe-dbhome-storage](#)
Use the `odacli describe-dbhome-storage` command to view information such as how much space is available (at a volume or diskgroup level).

- [odacli modify-dbhome-storage](#)
Use the `odacli modify-dbhome-storage` command to modify database home storage and add additional disk space.

About Enterprise Edition High Availability for Oracle Database Appliance

Oracle Database Appliance supports Enterprise Edition High Availability solution with Oracle Grid Infrastructure that provides cluster-based failover for Oracle Database 19.15 and 21.6 Enterprise Edition.

About Enterprise Edition High Availability for Oracle Database

With Enterprise Edition High Availability, when there is an instance or a node failure, the database automatically fails over to the other node, after attempting to restart on the local node. The database is restarted on the surviving node, thereby providing high availability for Oracle Enterprise Edition databases.

For more details about this feature, refer to the Oracle Database Documentation Library at <https://docs.oracle.com/en/database/oracle/oracle-database/index.html>.

About Enterprise Edition High Availability for Oracle Database Appliance Release 19.20.0.1

Enterprise Edition High Availability for Oracle Database 19.20.0.1 is supported on Oracle Database Appliance for high availability deployments, that is, deployments that have two server nodes, shared storage, and server interconnects.

Oracle Database Appliance enables automatic configuration for failover at deployment time for Oracle Database 19.20.0.1 Enterprise Edition single-instance databases. Both nodes have Oracle Homes for Enterprise Edition single-instance databases.

To enable Enterprise Edition High Availability for existing Enterprise Edition Oracle RAC databases of release 19.20.0.1, you must convert these Oracle RAC databases to single-instance databases, and then upgrade to single-instance Oracle Database 19.20.0.1 Enterprise Edition database with Enterprise Edition High Availability enabled by default.

About Provisioning, Upgrading, and Relocating Enterprise Edition High Availability Oracle Database

To create a single-instance Oracle Database 19.20.0.1 with Enterprise Edition High Availability, use the following command:

```
odacli create-database -u db_unique_name -n db_name -dh db_home -y SI -g  
target_node -ha
```

To upgrade an Enterprise Edition Oracle RAC Database to Oracle Database 19.20.0.1 Enterprise Edition, convert the Oracle RAC Database to a single-instance Oracle Database:

```
odacli modify-database -in db_name -y single-instance
```

Then, upgrade the single-instance database to Oracle Database 19.20.0.1 with Enterprise Edition High Availability as follows:

```
odacli upgrade-database -i db_id -to destination_dbhome -ha
```

To relocate an Enterprise Edition High Availability Oracle Database from one node to another outside of a failover, use the following command, specifying either the target node or the target host in the command:

```
odacli modify-database -in db_name -g target_node
```

or:

```
odacli modify-database -in db_name -th target_host
```

For detailed information about these ODA CLI command options, see the *Oracle Database Appliance Command Line Reference* chapter in this guide.

- [Oracle Database Appliance Command-Line Interface](#)
The command-line interface has different classes of tools to manage Oracle Database Appliance.

About Transparent Database Encryption (TDE) in Oracle Database Appliance

Transparent Data Encryption (TDE) enables you to encrypt sensitive data that you store in tables and tablespaces.

After the data is encrypted, this data is transparently decrypted for authorized users or applications when they access this data. TDE helps protect data stored on media (also called data at rest) in the event that the storage media or data file is stolen.

Oracle Database uses authentication, authorization, and auditing mechanisms to secure data in the database, but not in the operating system data files where data is stored. To protect these data files, Oracle Database provides Transparent Data Encryption (TDE).

TDE encrypts sensitive data stored in data files. To prevent unauthorized decryption, TDE stores the encryption keys in a security module external to the database, called a keystore.

Oracle Database Appliance provides the option to create TDE-enabled databases, backup, recover, and restore TDE-enabled databases, backup and restore TDE wallet, re-keying of TDE master encryption key, and changing the password of password-protected Keystore.

Note:

To enable Transparent Data Encryption (TDE), you must deploy Enterprise Edition Oracle Database 19c or later.

 **See Also:**

[Using Transparent Data Encryption](#) in the *Oracle Database Advanced Security Guide*

 **Caution:**

When you enable TDE, you are prompted to set a password for the TDE wallet. Provide a strong password for security compliance. Set the password carefully, and ensure that this password is available to you at all times for database management operations. Failure to provide the TDE wallet password when prompted, will cause an error in accessing encrypted data.

Working with Databases

Use the Browser User Interface to display a list of databases, database details, and create and delete databases. You can use CLI commands to manage your databases.

 **Note:**

Oracle Database Appliance enables unified auditing for databases created in new database homes. Unified audit trail captures audit information and places them in one location and in one format. This consolidated view enables auditors to co-relate audit information from different components. Having a single audit trail also improves management and security of the audit trail. For more information about unified audit trail for Oracle Database, see *Oracle Database Security Guide*.

Use the Oracle Appliance Manager Browser User Interface to delete an Oracle database.

Viewing Databases

Use the Oracle Appliance Manager Browser User Interface to display a list of Oracle databases and database details, create, upgrade, and delete a database in Oracle Database Appliance.

1. Log into the Browser User Interface:

```
https://host name or ip-address:7093/mgmt/index.html
```
2. Click the **Database** tab.
3. (Optional) Click the database name, in blue font, to display more details about the database.
4. (Optional) Click **Actions** next to a database entry to view more details, upgrade or delete the database.

Creating a Database Using the Browser User Interface

Use the Oracle Appliance Manager Browser User Interface to create a database in Oracle Database Appliance.

Ensure that the repository is updated with Oracle RDBMS Clone files for a database version, before creating the database as described in *Updating Oracle Database Appliance Repository with Database Clone Files Using the CLI*.

 **Note:**

For Standard Edition Oracle Database 19c or later, you cannot create Oracle RAC Or Oracle RAC One Node Database. You can only create single-instance Oracle Database. For Standard Edition Oracle Database 19.6 or later, you can choose to enable high availability for single-instance database. For Enterprise Edition Oracle Database 19.15 or later or Oracle Database 21.6 or later, you can choose to enable high availability for single-instance databases.

The Browser User Interface provides a quick and easy method of creating new databases. The Create New Database page in the Browser User Interface is populated with default options for most of the configuration options. Drop-down lists enable you to quickly view and select from a list of available options. You can use the drop-down list to create a new database Oracle Database Home (ORACLE_HOME) for the database or select an existing ORACLE_HOME that you created earlier.

Oracle Database 19.20.0.1 is supported on both Oracle Automatic Storage Management (Oracle ASM) and Oracle ASM Cluster file system (Oracle ACFS). When databases are created in Oracle ACFS, each database is configured with its own Oracle ACFS file system for the datafiles and uses the following naming convention: `/u02/app/db user/oradata/db unique name`. The default size of this mount point is 100 GB.

The fields in the Browser User Interface adjust, depending on the database version you select.

Follow these steps to create a database:

1. Log into the Browser User Interface:
`https://host-ip-address:7093/mgmt/index.html`
2. Click the **Database** tab.
3. Click **Create Database** to display the Create Database page.
4. Select **Create Database** on the Create Database page.
5. Enter the following information on the Create Database page to configure the database:
 - a. In the **DB Name** field, enter a name for the database. The name `db1` appears in the field as an example of a database name, but the field is not populated. You must enter a name.

The name must contain lowercase alphanumeric characters and cannot exceed 8 characters. The Oracle system identifier (SID) is always set to the database name.
 - b. (Optional) In the **DB Unique Name** field, enter a name to define a unique name for the database.
 - c. In the **Use Existing DB Home** field, select **Yes** or **No**.
 - d. In the **DB Version** field, select a database bundle patch number from the drop-down list.

Available database versions with available clones appear in the list in descending order. Supported versions that are not available in the repository appear in light gray font at the bottom of the list. Search is available for the list. To add a supported version to the repository, download the RDBMS clone file and update the repository.

- e. For the **CDB** option on Oracle Database releases later than 12.1, select **Yes** or **No**, depending on whether or not you want the database to be a container database (CDB). The default is **Yes**.
- f. In the **PDB Name** field, enter a name for the pluggable database (PDB).
Alphanumeric characters and underscore (`_`) are valid. The name must begin with an alphanumeric character and cannot exceed 30 characters. The name *pdb1* appears in the field in italic text as an example, but it is not populated. You must enter a name.
- g. In the **PDB Admin User** field, enter a name.
The field shows *pdbadmin* as an example, you must enter a name. Alphanumeric characters and underscore (`_`) are valid.
- h. In the Database Edition field, enter the edition for which you have a license, either **Enterprise Edition** or **Standard Edition**.
For Standard Edition Oracle Database 19c or later, you can only create single-instance Oracle Database. For Standard Edition Oracle Database 19.6 or later, you can choose to enable high availability for single-instance database. For Enterprise Edition Oracle Database 19.15 or later or Oracle Database 21.6 or later, you can choose to enable high availability for single-instance databases.
- i. For single-instance Oracle Database deployment, specify the **Node**, either Node0 or Node1. The default is Node0. Specify whether you want to **Enable High Availability**.
- j. In the **Shape** field, select a database shape from the drop-down list. The shape determines the number of cores and total memory allocated to the database. The default is `odb1`.
- k. In the **Database Class** field, select a database class from the drop-down list. If an option is not available in the list, it is not supported for the database edition on the Oracle Database Appliance or the version that you selected. The default is OLTP.
- l. In the **Storage** field, select **ACFS** or **ASM** from the drop-down list. The default is Oracle ASM.
- m. If the disk group redundancy was set to **Flex** during the appliance creation, then you can select the **Database Redundancy** value as **Mirror** or **High**.
- n. Select the **Networks** you want to associate with the database.
- o. For the **Configure EM Express** or **Configure EM Console** option, select **Yes** or **No**. The default is **No**.
Select **Yes** to configure the Oracle Enterprise Manager Database Express (EM Express) console for Oracle Database 19.20.0.1. Selecting **Yes** enables you to use the console to manage the database.
- p. In the **SYS and PDB Admin User Password** field, enter the password for the SYS, SYSTEM, and PDB Admin.
The password must begin with an alpha character and cannot exceed 30 characters. Quotation marks are not allowed.
- q. In the **Confirm Password** field, enter the password again to confirm.
- r. In the **Characteraset** field, select an option from the drop-down list. The default is AL32UTF8.

- s. In the **National Characterset** field, select an option from the drop-down list. The default is AL16UTF16.
 - t. In the **Language** field, select a database language from the drop-down list. The default is American.
 - u. In the **Territory** field, select a territory or location for the database from the drop-down list. The default is America.
 - v. For Oracle Database Enterprise Edition 19c or later, you can choose to enable Transparent Database Encryption (TDE). Select **Yes** or **No** in the **Enable TDE** option. Specify and confirm the **TDE Password**. By default, the TDE option is disabled.
6. Click **Create**. When prompted, click **Yes** to confirm that you want to start the job to create the database.

The job is submitted and a confirmation page appears with a link to the job. Click the link to view the job progress, tasks, and status.

After you close the Job confirmation page, you can click the **Activity** tab to monitor the job progress. Click the job number to view the tasks and status details. Click **Refresh** to refresh the page.

Managing Database Homes on Oracle ACFS Storage

Use the Oracle Appliance Manager Browser User Interface or ODACLI commands to manage database home storage in Oracle Database Appliance.

Managing Database Home Storage Using the Browser User Interface

1. Log into the Browser User Interface:
`https://host-ip-address:7093/mgmt/index.html`
2. Click the **Database** tab.
3. Click Database Home Storage on the left pane.
4. If Database Home Storage is not configured, then click on the **Configure Database Home Storage** button.
5. Select the Disk Group Name and specify the Size in GB.
6. Click **Create**. When prompted, click **Yes** to confirm that you want to start the job to configure the database home storage.
7. You can also view a list of all Database Home storages from the Database tab and view details for each database.
8. To modify Database Home Storage, select **Modify** in the **Actions** drop down list.

Managing Database Home Storage Using ODACLI Commands

1. Use the `odacli configure-dbhome-storage` command to configure the database home storage:

```
# odacli configure-dbhome-storage -dg DATA
```

2. Use the `odacli list-dbhome-storages` command to list the database home storages:

```
# odacli list-dbhome-storages
```

3. Use the `odacli describe-dbhome-storages` command to describe a database home storage:

```
odacli describe-dbhome-storage -i 67622ce6-0a00-4fec-  
b948-7a0ba7922311
```

For more information about these command options, see the *Oracle Database Appliance Command Line Reference* chapter in this guide.

Use the `odacli list-dbhome-storages` command to view the database home storage resources after the volumes for `ORACLE_HOME` and `ORACLE_BASE` are created.
- [odacli describe-dbhome-storage](#)
Use the `odacli describe-dbhome-storage` command to view information such as how much space is available (at a volume or diskgroup level).
- [odacli modify-dbhome-storage](#)
Use the `odacli modify-dbhome-storage` command to modify database home storage and add additional disk space.

Creating a Database Using ODACLI Commands

Create a database from the command-line interface.

Note:

If you provisioned the appliance without creating an initial database, then you must create a Oracle home. If the version of the database home is different from the migrated database, create a database home for the migrated database. You might want to create a database home specifically for the migrated database.

Caution:

When you create a database with Transparent Data Encryption (TDE) enabled, you are prompted to set a password for the TDE wallet. Provide a strong password for security compliance. Enter this password carefully when setting it for the first time, and ensure that this password is available to you at all times for database management operations. Failure to provide the TDE wallet password when prompted, will cause an error in accessing encrypted data.

This example creates a new database named `PRODDB` with database version 19.20.0.1, and a new database home, if a database home does not exist.

1. Use the `odacli list-dbhomes` command to display a list of database homes and verify that a database home exists for the database version.

Note the ID if you want to use an existing database home or if you want to get more details. Use the `odacli describe-dbhomes` command to get more details about a specific database home.

```
# odacli list-dbhomes
ID                               Name                               DB Version
-----
b727bf80-c99e-4846-ac1f-28a81a725df6 OraDB199_home1 19.20.0.0.0
```

(continued)

Home Location

```
-----
/u01/app/orauser/product/19.0.0.0/dbhome_1
```

2. Create a database home if a database home does not exist for the database version.

If you want to create a database home for specifically for the migrated database, you can use the `odacli create-dbhome` command, or you can create the database home when you create the database. The example creates a database home for database version 19.20.0.0.0.

```
# odacli create-dbhome -v 19.20.0.0.0
```

3. Create a database. You can use an existing database home ID or you can create a database home when creating the database.

To create a database named `PRODDB` that uses an existing database home with ID `b727bf80-c99e-4846-ac1f-28a81a725df6`:

```
# odacli create-database -n PRODDB -io -dh b727bf80-c99e-4846-
ac1f-28a81a725df6
```

To create a database named `PRODDB` with database version 19.20.0.0.0 and a database home:

```
# odacli create-database -n PRODDB -v 19.20.0.0.0 -io
```

To create a TDE-enabled database named `PRODDB`:

```
# odacli create-database -n PRODDB -t
```

Cloning a Database from Backup

Use the Browser User Interface to clone a database from a backup.

When you backup a database in Oracle Database Appliance, a backup report is created. Save the backup report as a JSON file and you can use the file to create a database on the same appliance, or a different appliance.

The following are the prerequisites to cloning a database from a backup:

1. The source database backup location must be Object Store or External FRA (Network File System).
2. If you use Object Store backup location, then obtain Object Store Credentials for the host.
3. If you use an External FRA (Network File System) backup location, then obtain the Network File System (NFS) mount point location.
4. Create a backup policy using the object store credentials or NFS mount point as the backup destination.
5. Attach the backup policy to the database that you want to backup. If the source database does not have TDE enabled, then providing the Backup Encryption password is mandatory when attaching Objectstore backup policy. However, the Backup Encryption password is optional when attaching the NFS backup policy. If the source database has TDE enabled, then you need not specify the Backup Encryption password, irrespective of backup destination.
6. Create a manual backup of the database and save the backup report generated when the backup completes.

Follow these steps to create a database from backup:

1. Log into the Browser User Interface:
`https://host-ip-address:7093/mgmt/index.html`
2. Click the **Database** tab.
3. Click **Create Database** to display the Create Database page.
4. Click **Clone Database from Backup**, then click **Next** to display the Clone Database from Backup page.
5. Select the Backup Destination from which you want to create the database. If your backup destination is ObjectStore:
 - a. Select Backup Destination as **ObjectStore**.
 - b. Select your **Object Store Credential Name**.
 - c. Enter the password in the **Backup Encryption Passwords** field and the **Confirm Backup Encryption Passwords** field.

If your backup destination is Network File System (NFS):

- a. Select Backup Destination as **External FRA**.
 - b. Enter the password in the **Backup Encryption Passwords** field and the **Confirm Backup Encryption Passwords** field.
6. Click **Browse** and select the backup report from which you want to create the database.

When the backup report is loaded, additional fields appear on the page and are populated based on the backup report. You can edit some of the fields.

For Standard Edition Oracle Database 19c or later, you cannot clone Oracle RAC or Oracle RAC One Node Database. You can only clone a single-instance Oracle Database. For Standard Edition Oracle Database 19.6 or later, you can choose to enable high-availability for single-instance database. For Enterprise Edition Oracle Database 19.15 or later or Oracle Database 21.6 or later, you can choose to enable high availability for single-instance databases.

7. In the **DB Name** field, enter a name for the database.

The name must contain lowercase alphanumeric characters and cannot exceed 8 characters. The Oracle system identifier (SID) is always set to the database name.

8. Enter the password in the **SYS and PDB Admin User Password** field and the **Confirm Password** field.
9. Specify the Networks.
10. If your source database has Transparent Database Encryption (TDE) enabled, then you can enable TDE on the cloned database. If the source database has TDE enabled, then the backup report has the TDE wallet backup location and the **TDE Wallet Backup Location** field in the BUI displays this value. Specify and confirm the **TDE Password**.
11. Click **Create**.
12. Click **Yes** to confirm that you want to clone a database from the selected Object Store or External FRA.

When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.

13. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

```
# odacli describe-job -i jobId
```

Cloning an Oracle ACFS Database

Create a database from an existing Oracle ACFS database using ODACLI commands or BUI.

Cloning enables to:

- Create a database from another database without bringing down the source database
- Create multiple databases from a gold image, thus ensuring standardized mass deployments
- Optimize space utilization, by use of Oracle ACFS snapshots in cloning
- Create different types of databases, from a single source database type. For example, you can create single-instance databases, Oracle RAC databases, or Oracle RAC One Node databases from any type of source database
- Depending on the available memory and CPU cores, specify a supported database shape such as `odb1s`, `odb2`, and so on, to create any class of database from any source database.
- Create clone databases on a standby system. Since standby systems are not production systems, they are a better choice for seeding test or development environments.
- Run clone database from a database home that is different from that of the source database.
- Create clone database from a read-only source database.
- Create read-only clone database from any source database.

Following are the prerequisites to clone a database:

- Ensure that Oracle Clusterware is running on all nodes, and the source database is up and running.
- The source database must use Oracle ACFS storage.

- The source database must not be a multitenant container database (CDB).
- The source database must be opened in either read-write mode, or read-only mode if it is a primary database. A standby database can be in mounted or read-only open mode.
- The source database must not be in backup mode.
- The source database must be in archive mode.
- All data files of the source database must be in the same Oracle ACFS directory.

**Note:**

For Standard Edition Oracle Database 19c or later, you cannot clone Oracle RAC or Oracle RAC One Node Database. You can only clone a single-instance Oracle Database. For Standard Edition Oracle Database 19.6 or later, you can choose to enable high-availability for single-instance database.

Cloning an Oracle ACFS Database Using Command Line Interface

1. Run the `odacli clone-database` command.

```
odacli clone-database --databaseUniqueName --dbname --dbshape --dbtype --sourcedbname --associated-networks --cpupool --dbhomeid --disable-ha --enable-ha --newhome --read-only --tdepassword--json
```

For cloning, you can create a new database home or select an existing database home. To create a new database home, specify the `--newhome` option. To use an existing database home, specify the `--dbhomeid`. Specify the unique name of the database, the name for the new database, the database shape, the type of database, and the source database name. For TDE-enabled database, also specify the `--tdepassword` option. The TDE password of the new database must be the same as the TDE password of the source database.

For information about all the command options, see the *ODACLI Command Reference* chapter.

Cloning an Oracle ACFS Database Using the Browser User Interface

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Database** tab.
3. Click **Create Database** to display the Create Database page.
4. Click **Clone a Database**, then click **Next** to display the Clone Database page.
5. In the Clone Database page, you can create a new database home or select an existing database home.
6. To create a new database home, select the **Create New DB Home** and then provide the values as described in this procedure.
7. To specify an existing database home, select the **Source Database Name** from which you want to create the database and the **DB Home Name**.

For Oracle Database 19c Standard Edition, you can only create single-instance Oracle Database, with or without high-availability. For Standard Edition Oracle Database 19.6 or later, you can choose to enable high-availability for single-instance database. For Enterprise Edition Oracle Database 19.15 or later or Oracle Database 21.6 or later, you can choose to enable high availability for single-instance databases.

8. Select the **Database Shape** (template) for your new database. The database shape you select determines the total memory allocated to the database.
9. In the **DB Name** field, enter a name for the database.

The name must contain lowercase alphanumeric characters and cannot exceed 8 characters. The Oracle system identifier (SID) is always set to the database name.

10. Specify the **DB Unique Name** for the database. If the database unique name is not provided, then the name of the database is set to the database name.
11. Specify the Networks.

12. Enter the password in the **SYS and PDB Admin User Password** field and the **Confirm Password** field. For Transparent Database Encryption (TDE) enabled database, specify the TDE wallet password. The TDE password is the same as the TDE password of the source database.

13. Click **Create**.

14. Click **Yes** to confirm that you want to clone a database from the selected source database.

When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.

15. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

```
# odacli describe-job -i jobId
```

Related Topics

- [odacli clone-database](#)
Use the `odacli clone-database` command to clone a new database from a source database.

Modifying a Database

Use the Oracle Appliance Manager Browser User Interface or ODACLI commands to modify a database in Oracle Database Appliance.

Modifying a Database Using the Browser User Interface

1. Log into the Browser User Interface:
`https://host-ip-address:7093/mgmt/index.html`
2. Click the **Database** tab.
3. For the database that you want to modify, select **Modify** in the Actions drop down list.
4. In the Modify Database page, you can attach or detach associated networks and backup policy, and modify database shape and class. You can also change TDE wallet management from `EXTERNAL` to `ODA` for Oracle Database 19c and later databases.

5. To modify the **Database Class** or **Database Shape**, select the new value in the drop down list.
6. To attach or detach networks, modify the values in the **Attach Networks** and **Detach Networks** fields.
7. To remove the associated backup policy from the database, do not select any value in the **Select Back up Policy** drop down list.
8. If you configured Oracle Flex disk group when you created the database, you can also modify the database redundancy. If the database you are modifying is an Oracle ACFS Database, then the database redundancy for all cloned Oracle ACFS databases is modified.
9. You can choose to change the **Backup Encryption Password**. If the database has TDE enabled, then the RMAN Backup Encryption password is not used.
10. Select the **Specify TDE Option** to perform these operations:
 - Select **Re-key TDE Master Encryption Key** to re-key the TDE master encryption key of the database. Specify the **Current TDE Wallet** password.
 - Select **Change Password for TDE Wallet** and specify the **Current TDE Password** and the **New TDE Password**.
 - If the TDE wallet management is set to `EXTERNAL`, then you can view and select the **Change TDE Wallet Management** option, and set it to `ODA`.
11. For Enterprise Edition Oracle Database 19.15 or later or Oracle Database 21.6 or later, you can choose to **Enable High Availability** for single-instance databases.
12. For Standard Edition Oracle Database 19.6 or later, you can choose to **Enable High Availability** for single-instance databases.
13. Click **Modify**. When prompted, click **Yes** to confirm that you want to start the job to modify the database.

Modifying a Database Using ODA CLI Commands

1. Use the `odacli modify-database` command to modify the configuration of a database, such as backup configuration, database class, database type, TDE key, or to change the TDE wallet management from `EXTERNAL` to `ODA`.

```
# odacli modify-database -s database_shape -cl database_class -i dbid
```

For example:

```
# odacli modify-database -i 1941d594-c777-4eca-9fce-18b778d5c153 -s odb2 -cl DSS
```

For example, the following command re-keys the TDE master encryption key of the database after accepting the current TDE Wallet password.

```
# odacli modify-database -in testdb -rkt  
Enter TDE wallet password:
```

For more information about the `odacli modify-database` command options, see the *Oracle Database Appliance Command Line Reference* chapter in this guide.

Use the `odacli modify-database` command to modify the configuration of a database, such as backup configuration, database class, and database type, and to change TDE wallet management from `EXTERNAL` to `ODA`.

Moving a Database from One Oracle Home to Another

Use the Oracle Appliance Manager Browser User Interface or ODACLI commands to move a database from one Oracle home to another of the same database version.

Moving a Database Using the Browser User Interface

1. Log into the Browser User Interface:
`https://host-ip-address:7093/mgmt/index.html`
2. Click the **Database** tab.
3. For the database that you want to modify, select **Move** in the Actions drop down list.
4. Select the **Destination Database Home** where you want to move the database. The destination database home must be of the same base version. Select **Ignore Missing Patches** to ignore missing patches. For high-availability environment, you can select the **Non-Rolling** check box to perform non-rolling move of the database home.
5. Click **Move**. When prompted, click **Yes** to confirm that you want to start the job to move the database.

Moving a Database Using ODACLI Commands

1. Use the `odacli move-database` command to move a database from one Oracle home to another home of the same database version.

```
# odacli move-database -i database_ID -dh destination_database_home_ID
```

For more information about the `odacli move-database` command options, see the *Oracle Database Appliance Command Line Reference* chapter in this guide.

Related Topics

- [odacli move-database](#)
Use the command `odacli move-database` to move a database from one Oracle home to another home of the same database version.

Upgrading a Database

Use the Oracle Appliance Manager Browser User Interface to upgrade an Oracle database to a different database home version.

Before upgrading to a different database home, you must upload the Oracle RDBMS clone files to the repository and create the database home.

 **Note:**

You cannot upgrade Oracle RAC or Oracle RAC One Node Database to a destination database home of Standard Edition Oracle Database 19c or later. You must first convert Oracle RAC Or Oracle RAC One Node Database to single-instance Oracle Database using the `odacli modify-database` command and then upgrade the single-instance Oracle Database to a destination database home of Standard Edition 19c or later.

1. Log into the Browser User Interface:

```
https://host name or ip-address:7093/mgmt/index.html
```

2. Click the **Database** tab.
3. Click **Actions** next to the database that you want, then select **Upgrade**.
4. Select the destination database home version from the list of available versions for the upgrade.

When upgrading single-instance Standard Edition Oracle Database 18.9 or later to Standard Edition Oracle Database 19c or later, you can also choose to enable or disable High Availability.

When upgrading single-instance Enterprise Edition Oracle Database 19.15 or later or Oracle Database 21.6 or later, you can also choose to enable or disable High Availability.

5. You can also change the TDE wallet management option if TDE is enabled for the source database and the TDE Wallet Management is set to **External**. Select **Change TDE Wallet Management** to set the TDE Wallet Management to **ODA**.
6. Click **Upgrade**.

Upgrading a Database Manually Using AutoUpgrade

Use AutoUpgrade to manually upgrade an earlier release of Oracle database on Oracle Database Appliance.

Starting with Oracle Database Appliance release 19.17, you cannot manage releases of Oracle Database earlier than 19c using ODA CLI or BUI. To upgrade Oracle databases of release 12.1, 12.2, and 18c on Oracle Database Appliance, use OPatch to patch the databases or use Oracle Database Upgrade Assistant (DBUA) or AutoUpgrade to upgrade these databases manually with Oracle Database Appliance 19.17 or later.

Ensure the following:

- The Oracle Database Appliance server must be on Oracle Database Appliance release 19.19 or later.
 - The repository must be updated with the target database clone version on the source and target Oracle Database Appliance systems.
1. Create the destination DB home for the database:

```
#odacli create-dbhome -v 19.18.0.0.230117
```

```
[root@oda1 ~]# odacli list-dbhomes
```

ID	Name	DB
Version	DB Edition Home	
Location		Status
f90adcc1-f64a-41ce-b72d-154db155b1fa	OraDB19000_home1	
19.18.0.0.230117	EE /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1	CONFIGURED
562a7428-9ea7-4878-9005-62c9d732a12b	OraDB12102_home1	
12.1.0.2.220719	EE /u01/app/odaorahome/oracle/product/12.1.0.2/dbhome_1	CONFIGURED

2. Disable SSHCleanerJob and configure SSH user equivalence between both nodes in case of Oracle Database Appliance High-Availability systems.

```
[root@odal ~]# odacli list-schedules|grep "Name\\|SSH"
ID                                     Name
Description
CronExpression                        Disabled
44ad4fe2-4893-4c7d-a61c-15845cb74aa5  SSHCleanerJob                               SSH
cleaner job to clean up stale SSH keys    0 0/30 * 1/1 * ?
*                                          false

[root@odal ~]# odacli modify-schedule -i 44ad4fe2-4893-4c7d-
a61c-15845cb74aa5 -d
Modify job schedule success

[root@odal ~]# odacli list-schedules|grep "Name\\|SSH"
ID                                     Name
Description
CronExpression                        Disabled
44ad4fe2-4893-4c7d-a61c-15845cb74aa5  SSHCleanerJob                               SSH
cleaner job to clean up stale SSH keys    0 0/30 * 1/1 * ?
*                                          true

[oracle@odal ~]$ /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1/
deinstall/sshUserSetup.sh -user oracle -hosts "odal oda2" -
noPromptPassphrase
```

3. Create the AutoUpgrade configuration file as the `oracle` operating system user on the first node.

```
[oracle@odal ~]$ cat autoupgrade.conf
global.autoupg_log_dir=/u01/app/odaorabase/oracle/autoupgrade
upg1.dbname=italy
upg1.start_time=NOW
upg1.source_home=/u01/app/odaorahome/oracle/product/12.1.0.2/dbhome_1
upg1.target_home=/u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1
upg1.sid=italy11
upg1.log_dir=/u01/app/odaorabase/oracle/autoupgrade/italy
upg1.upgrade_node=localhost
upg1.target_version=19
```

```
upgl.run_utlpr=yes
upgl.timezone_upg=no
```

4. Change the Fast Recovery Area to Oracle ACFS if the database was created on Oracle ASM.

a. Verify whether the dbstorage of the database is ACFS or ASM.

```
# odacli list-databases
```

ID	DB Name	DB Type	DB
Version	CDB	Class	Shape
Status	DbHomeID	Storage	
5c183783-a198-413e-b96e-2c941fe1a895	italy	RAC

```
---- Drop GRP at your convenience once you consider it is no longer
needed ----
```

```
Drop GRP from italy1: drop restore point AUTOUPGRADE_9212_ROME121020
```

```
Please check the summary report at:
```

```
/u01/app/odaorabase/oracle/autoupgrade/cfgtoollogs/upgrade/auto/status/
status.html
/u01/app/odaorabase/oracle/autoupgrade/cfgtoollogs/upgrade/auto/status/
status.log
```

Note: once you confirmed that database was running as expected from all perspective and downgrade surely would not be needed, drop the restore point which was created by AutoUpgrade tool as the output also instructed

```
---- Drop GRP at your convenience once you consider it is no longer
needed ----
```

```
Drop GRP from italy1: drop restore point AUTOUPGRADE_9212_ROME121020
```

9. Enable SSHCleaner job and remove SSH user equivalence in case of Oracle Database Appliance high-availability system.

```
[root@odal ~]# odacli list-schedules|grep "Name\|SSH"
ID                               Name
Description
```

```

CronExpression          Disabled
44ad4fe2-4893-4c7d-a61c-15845cb74aa5  SSHCleanerJob
SSH cleaner job to clean up stale SSH keys      0 0/30 * 1/1 * ?
*
true

```

```

[root@oda1 ~]# odacli modify-schedule -i 44ad4fe2-4893-4c7d-
a61c-15845cb74aa5 -e
Modify job schedule success

```

```

[root@oda1 ~]# odacli list-schedules|grep "Name\|SSH"
ID          Name
Description
CronExpression          Disabled
44ad4fe2-4893-4c7d-a61c-15845cb74aa5  SSHCleanerJob
SSH cleaner job to clean up stale SSH keys      0 0/30 * 1/1 * ?
*
false

```

Remove local and remote node from /home/oracle/.ssh/authorized_keys files on both nodes as oracle OS user using "vi" command

```

[oracle@oda1 ~]$ vi /home/oracle/.ssh/authorized_keys
[oracle@oda2 ~]$ vi /home/oracle/.ssh/authorized_keys

```

Remove all id* files under /home/oracle/.ssh as oracle OS user on both nodes

```

[oracle@oda1 ~]$ rm /home/oracle/.ssh/id*
[oracle@oda2 ~]$ rm /home/oracle/.ssh/id*

```

10. Sync up the DCS metadata of the database.

```

[root@oda1 ~]# odacli list-dbhomes

scope=both;
```

12. Take a full backup.

```
[oracle@odal ~]# odacli create-backup -n italy -bt Regular-L0
```

13. Remove the temporary vmstorage.

```
[oracle@odal ~]# odacli delete-vmstorage -n tempfra
```

Deleting a Database

Use the Oracle Appliance Manager Browser User Interface to delete an Oracle database.

1. Log into the Browser User Interface:
`https://host name or ip-address:7093/mgmt/index.html`
2. Click the **Database** tab.
3. Click **Actions** next to the database that you want, then select **Delete**.
4. In the Confirmation dialog, select **Force Delete** to force the deletion and **Erase All** to erase the database, and then click **OK** to confirm the action.

Working with Database Homes

Use the Browser User Interface to display a list of database homes, details, and create and delete database homes.

- [About Managing Multiple Oracle Homes on Oracle Database Appliance](#)
Create and manage one or more Oracle home directories and Oracle databases on Oracle Database Appliance.
- [Viewing Database Homes](#)
Use the Browser User Interface to display a list of database homes and database home details, including databases associated with a DB home.
- [Creating a Database Home](#)
Use the Browser User Interface to create database homes in Oracle Database Appliance.
- [Deleting a Database Home](#)
Use the Browser User Interface to delete an Oracle database home.

About Managing Multiple Oracle Homes on Oracle Database Appliance

Create and manage one or more Oracle home directories and Oracle databases on Oracle Database Appliance.

Oracle home is the directory in which you install Oracle Database binaries, and from which Oracle Database runs. Oracle Database Appliance supports multiple Oracle homes, including support of different release Oracle Database homes. You can create multiple Oracle databases on a given Oracle home. Use Oracle Appliance Manager Browser User Interface to create and manage multiple Oracle homes and databases on Oracle Database Appliance. Oracle Database Appliance Manager automatically creates an Oracle Database Oracle home that is compliant with Oracle's Optimal Flexible Architecture (OFA) standards.

Check the *Oracle Database Appliance Release Notes* to obtain information about the specific Oracle software releases supported for your Oracle Database Appliance platform.

When you use ODA CLI commands to create multiple homes on Oracle Database Appliance, the commands start the Oracle Home cloning process. In Oracle Database Appliance deployments, the user `oracle` is the default software installation owner.

You can use the Browser User Interface or the command-line interface to create and manage databases.

Use ODA CLI commands to create, list, describe, and delete databases on Oracle Database Appliance. The `odacli create-database` command enables you to create a database with minimal user input. When you run this command without any additional options, the command creates a new database home (ORACLE_HOME). You can create a database in an existing home by using the `--dbhomeid` option. To find the `dbhomeid`, use the `odacli list-dbhomes` command.

Alternatively, you can use the Browser User Interface to create list, describe and delete databases and database homes. You can display a list of all Database Homes that includes the database home name, ID, version, the date and time that the database home was created and the location on the same page. You can also create and delete database homes on the Browser User Interface.

Caution:

Do not apply Oracle Database patches directly to Oracle Databases on Oracle Database Appliance. Only use Oracle Database Appliance patch bundles, which are tested to work across the whole software stack. If a one-off database patch is required, it may be applied to the Oracle Home. When you apply the Oracle Database Appliance patch bundle, it may cause a conflict during future patching events and you might need to roll back and then re-apply the patch.

Viewing Database Homes

Use the Browser User Interface to display a list of database homes and database home details, including databases associated with a DB home.

1. Log in to the Browser User Interface:

```
https://ip-address:7093/mgmt/index.html
```

2. Click the **Database** tab.
3. Click **Database Home** on the left menu to view all database homes. The name, ID, version, location and date and time stamp of when the database home was created appears on the page.

4. (Optional) Click **Actions** next to a database home entry, then **View Databases** to see the databases that are associated with the database home.

Creating a Database Home

Use the Browser User Interface to create database homes in Oracle Database Appliance.

Before you can create a database home, the Oracle Database Appliance RDBMS Clone file image must be in the repository. Follow these steps to create a database home:

1. Log in to the Browser User Interface:
`https://ip-address:7093/mgmt/index.html`
2. Click the **Database** tab, then click **Database Home**.
3. Click **Create Database Home**.
4. Select a database version from the list of available versions, then select the database edition, either **Enterprise Edition** or **Standard Edition**, per your licensing agreement.
5. Click **Create**. When prompted, click **Yes** to confirm that you want to start the job.

Deleting a Database Home

Use the Browser User Interface to delete an Oracle database home.

You can delete a database home (DB Home) if it is not associated with any databases.

1. Log into the Browser User Interface:
`https://host name or ip-address:7093/mgmt/index.html`
2. Click the **Database** tab.
3. Click **Database Home** on the left menu to view all database homes. The name, ID, version, location and date and time stamp of when the database home was created appears on the page.
4. Click **Actions** next to a database home entry, then **Delete**, and then confirm the action to delete a database home.

Migrating Databases

Review these topics to learn how to prepare for and migrate an entire database to your Oracle Database Appliance.

- [About Migrating Databases](#)
You can migrate an entire active container database (CDB) or non-CDB database to an Oracle Database Appliance machine by using the RMAN duplicate command.
- [Configuring a Static Listener](#)
Configure a static listener before you duplicate a database.

- **Migrating a Database**
Use the `RMAN Duplicate` command to migrate the entire database to the appliance.
- **Registering a Database**
Use the `odacli register-database` command to register the migrated database with the appliance.

About Migrating Databases

You can migrate an entire active container database (CDB) or non-CDB database to an Oracle Database Appliance machine by using the `RMAN duplicate` command.

When using `RMAN Duplicate`, ensure to have network connectivity from source and target databases:

- **Source database:** The existing database to be migrated.
- **Target database:** The new database created on an Oracle Database Appliance environment.

If you do not have network connectivity between the source and the target environments, you can use the offline migration method. Offline migration uses `RMAN backup sets` for duplication, which does not require connectivity to the primary database.

At a high level, the procedure involves the following steps:

1. Deploy or update Oracle Database Appliance to the latest version.

Confirm that the provisioning completed successfully. On bare metal systems, use the command `odacli list-jobs` and the command `odacli describe-job` to verify the status.

2. Create an instance only database from the command-line interface.

- On bare metal systems, use the command `odacli create-database` with the `instanceonly` flag on an Oracle Database Appliance machine. The new database is the target database.

Creating an instance only database also creates the following:

- ACFS Filesystem used to store the database files
- Directory structures that are required by the database instance/`rman duplicate` command
- Password file for the `SYS` user

3. Configure a static listener.

4. Migrate the existing database to the target database using the backup and restore operations.

5. Register the migrated database with the appliance.

 **Note:**

You can only migrate and register a database of the same storage type. For example, to migrate and register an Oracle ACFS database, you must create an Oracle ACFS database and then migrate and register it. Similarly, to migrate an Oracle ASM database, you must create an Oracle ASM database and then migrate it.

Configuring a Static Listener

Configure a static listener before you duplicate a database.

The static listener is only required when using RMAN Duplicate command.

Perform the following steps to manually configure the `listener.ora` file:

1. Log in as a grid user.
2. Navigate to `/u01/app/19.0.0.0/grid/network/admin/` directory.
3. Edit the default `listener.ora` file and append the static database entry.

```
SID_LIST_LISTENER=
  (SID_LIST=
    (SID_DESC=
      (GLOBAL_DBNAME=db_unique_name with domain)
      (ORACLE_HOME=db_home)
      (SID_NAME=db_unique_name)
      (ENVS="TNS_ADMIN=database_home/network/admin"))
    )
```

For example, the following file is edited for an 19.20.0.0.0 database named `PRODDB` in the `example.com` domain:

```
SID_LIST_LISTENER=
  (SID_LIST=
    (SID_DESC=
      (GLOBAL_DBNAME=PRODDB.example.com)
      (ORACLE_HOME=/u01/app/oracle/product/19.0.0.0/dbhome_2)
      (SID_NAME=PRODDB)
      (ENVS="TNS_ADMIN=/u01/app/oracle/product/19.0.0.0/
dbhome_2/network/admin"))
    )
```

4. Save the file.
5. Restart the listener.

```
srvctl stop listener -l listener
srvctl start listener -l listener
```

Migrating a Database

Use the `RMAN Duplicate` command to migrate the entire database to the appliance.

Before migrating the database, verify that a network connection exists between the source and destination databases.

1. Verify that the `sysdba` connection to the auxiliary database is working. Use the password that you defined when you created the database with the `--instanceonly` flag.

```
sqlplus sys/password@hostname:PORT/GLOBAL_DBNAME as sysdba << EOF
select 1 from dual;
exit;
EOF
```

The following example uses the `Welcome_12` password for `myhost` on port 1521 for `PRODDB.example.com`.

```
sqlplus sys/Welcome_12@myhost:1521/PRODDB.example.com as sysdba << EOF
select 1 from dual;
exit;
EOF
```

2. As oracle user, set the `ORACLE_HOME` and `ORACLE_SID` environment variables.

```
ORACLE_HOME=path of Oracle Home against which the AUX DB is created
ORACLE_SID=database unique name
```

3. Display a list of all database storage configured on the appliance and database storage identifiers (ID).

Use the `odacli list-dbstorages` to display the storage IDs for all configured filesystems.

```
# odacli list-dbstorages
ID Type                               DBUnique Name          Status
-----
68d13446-f26c-49ee-ab75-a393732aa88a  Asm          rdbl            Configured
ff2023d9-338d-4cff-8bb4-e73a89e32ce4  Acfs         PRODDB          Configured
```

4. Display the database storage details, including the `DATA`, `RECO` and `REDO` locations, for each database storage ID.

For example, use the `odacli describe-dbstorage` command to display information about the ACFS storage for ID `9fe39332-cc1a-4b4b-8393-165524a6ef6b`.

```
# odacli describe-dbstorage -i ff2023d9-338d-4cff-8bb4-e73a89e32ce4
DBStorage details
-----
ID: ff2023d9-338d-4cff-8bb4-e73a89e32ce4
DB Name: PRODDB
DBUnique Name: PRODDB
DB Resource ID: c5b77384-634e-4dc8-b10b-fa2831d2c59b
```

```
Storage Type: Acfs
DATA Location: /u02/app/oracle/oradata/PRODDB
RECO Location: /u03/app/oracle/fast_recovery_area/
REDO Location: /u03/app/oracle/redo/
State: ResourceState(status=Configured)
Created: June 22, 2019 12:07:12 PM SGT
UpdatedTime: June 22, 2019 12:26:39 PM SGT
```

5. Duplicate the database.

Use the RMAN duplicate database command to duplicate the database.

```
rman target sys/Welcome_12@source database hostname:PORT
(Continued)
/Service Name auxiliary sys/Welcome_12@Hostname of the target
database:1521/service name
RUN {
SET NEWNAME FOR DATABASE TO NEW;
duplicate target database to PRODDB from active database
SPFILE
SET cluster_database 'false'
SET audit_file_dest '/u01/app/oracle/admin/PRODDB/adump'
SET db_create_file_dest '/u02/app/oracle/oradata/PRODDB'
SET db_create_online_log_dest_1 '/u03/app/oracle/redo'
SET db_recovery_file_dest '/u03/app/oracle/fast_recovery_area'
SET control_files '/tmp/control_PRODDB.ctl' nofilenamecheck;
}
```

Registering a Database

Use the `odacli register-database` command to register the migrated database with the appliance.

The `dbclass`, `dbshape`, `servicename` and `password` are mandatory for registering the database. The `dbclass` and `dbshape` determine the `sga_target` and `pga_target` settings. The database `init.ora` parameters are reset as part of the `odacli register-database` command. Review the `init.ora` parameters after registration and ensure that the parameters set correctly.

Note:

The `odacli register-database` command is supported only for primary database of type single-instance.

Follow these steps to register a database:

1. If you have Oracle Database version 12.1 with SQL patches, ensure that the `sqlpatches` are in the Oracle Database Appliance environment. If the patches are not in the environment, copy the `$OH/sqlpatch` directories from the source database home to the `$OH` in Oracle Database Appliance before executing the `odacli register-database` command

The `odacli register-database` command invokes the `datapatch` utility for applying the post patch SQLs. If the source database has any `sqlpatches` applied that are not present in the Oracle Database Appliance environment, then the `datapatch` will fail.

2. Register the database with Oracle Database Appliance.

```
# odacli register-database -c OLTP -s odb1 -sn example_service
Enter SYS, SYSTEM and PDB Admin user password:
Retype SYS, SYSTEM and PDB Admin user password:
{
  "jobId" : "317b430f-ad5f-42ae-bb07-13f053d266e2",

3. Use the `odacli list-databases` command to view the registered database.

About Registering a TDE-Enabled Database

Understand the process to register TDE-enabled databases.

Starting with Oracle Database Appliance release 19.12, a new attribute called `TDE Wallet Management` is added to the database. The `TDE Wallet Management` value can be either

`EXTERNAL`, which means TDE is not configured by Oracle Database Appliance, or the value can be `ODA`, which means TDE is configured by Oracle Database Appliance. If the database is not TDE-enabled, then the value of the `TDE Wallet Management` attribute is `NULL`. If a database of release 18c or later is registered, then its TDE wallet management attribute value is `ODA` by default. If a database of release earlier than 18c is registered, then the TDE wallet management attribute value is `EXTERNAL` by default. The examples with sample output are provided at the end of this topic.

For Oracle Database release 19c or later, if the `TDE Wallet Management` value is `EXTERNAL`, then you can change this value to `ODA` using the `--change-tdewallet-mgmt` option in the `odacli modify-database` command. You must provide the TDE password when prompted.

For Oracle Database release 12c, the `TDE Wallet Management` value can be changed from `EXTERNAL` to `ODA` while upgrading the database to 19c or later using the `--change-tdewallet-mgmt` option in the `odacli upgrade-database` command.

**Note:**

Oracle Database Appliance does not support the conversion of a non-TDE database to a TDE-enabled database.

Prerequisites to Register a TDE-Enabled Database

Following are the prerequisites to register a TDE-enabled database:

- You can use either the software keystore or the hardware keystore to configure TDE.
- If TDE is configured using the software keystore, then you must use only the `SQLNET.ENCRYPTION_WALLET_LOCATION` parameter.
- If TDE is configured using the software keystore, then for bare metal deployments, password-protected wallet (`ewallet.p12`) and autologin TDE wallet (`cwallet.sso`) must be available in the location `/opt/oracle/dcs/commonstore/wallets/tde/db_uniquename/`.
- If autologin TDE wallet (`cwallet.sso`) is not present but password-protected wallet (`ewallet.p12`) is present, then TDE password must be provided in the register database request.
- For Oracle Database Appliance DB systems deployments, if TDE is configured using Software keystore, then TDE must be configured using the `WALLET_ROOT` parameter and TDE wallets must be at location `+DATA/DB_UNIQUE_NAME/tde`.

When TDE Wallet Management value is EXTERNAL

Following are the restrictions when the `TDE Wallet Management` value is `EXTERNAL`:

- TDE wallet re-key using ODA CLI commands is not supported. You can connect to the database and re-key the TDE wallet.

```
# odacli modify-database -in db_name -rkt
Enter TDE wallet password:
```

```
DCS-10040:Operation 'Re-Key of TDE wallet' is not supported: TDE wallet
management is not ODA.
```

- TDE wallet password change using ODACLI commands is not supported.

```
# odacli modify-database -in db_name -ctp
Enter current TDE wallet password:
Enter new TDE wallet password:
Retype new TDE wallet password:
DCS-10040:Operation 'Password change of TDE wallet' is not supported: TDE
wallet management is not ODA.
```

- TDE wallet backup is not supported.

```
# odacli create-backup -in database_name -c tdewallet
DCS-10040:Operation 'Backup of TDE wallet' is not supported: TDE wallet
management is not ODA.
```

- TDE wallet is not backed up while performing database backup.

```
# odacli create-backup -in database_name -bt regular-10

About Managing Multiple Database Instances Using Instance Caging

Use instance caging to manage your system resources on Oracle Database Appliance.

Oracle Database provides a method for managing CPU allocations on a multi-CPU server that runs multiple database instances. This method is called instance caging. Instance caging uses an initialization parameter to limit the number of CPUs that an instance can use simultaneously.

Instance caging and Oracle Database Resource Manager (the Resource Manager) work together to support your desired service levels across multiple instances. Consolidation can minimize idle resources, maximize efficiency, and lower costs.

Oracle Database Appliance templates are already tuned for the size of each database instance workload. They are designed to run on a specific number of cores. Instance caging ensures that each database workload is restricted to the set of cores allocated by the template, enabling multiple databases to run concurrently with no performance degradation, up to the capacity of Oracle Database Appliance. You can select database template sizes larger than your current needs to provide for planned growth.

Note:

Oracle strongly recommends that you use the Oracle Database Appliance templates, because they implement best practices and are configured specifically for Oracle Database Appliance.

The Oracle Database Appliance Manager interface refers to the database sizing templates as database classes.

By default, instance caging is not enabled on Oracle Database Appliance. To enable instance caging, set the initialization parameter, `RESOURCE_MANAGER_PLAN`, for each database on Oracle Database Appliance. The parameter specifies the plan to be used by the Resource Manager for the current instance. Setting this parameter directs the Resource Manager to allocate core resources among databases. If a plan is not specified with this parameter, then the Resource Manager and instance caging are not enabled.

Instance caging allocation of core resources is enabled in accordance with the Oracle Database Appliance database template size that you select for each database. The `CPU_COUNT` initialization parameter is set in the template. Use the `CPU_COUNT` setting that matches the size of each database to consolidate, and follow the standard instructions for configuring instance caging.

Oracle EM Express and DB Console

You can use Oracle Enterprise Manager Database Express (EM Express), or the Database Control Console (DB Console) to manage your database.

The EM Express console is available for supported releases of Oracle Database. The consoles are web-based tools for managing Oracle Databases.

The EM Express console provides the following features:

- Support for basic administrative tasks, such as storage and user management
- Comprehensive solutions for performance diagnostics and tuning
- Performance advisors in a graphic user interface
- Oracle Database utilities in a graphic user interface, such as SQL*Loader and Oracle Recovery Manager (RMAN)

EM Express is built inside the database server and cannot perform actions outside the database.

9

Managing Storage

Understand the storage options and how to manage storage for your Oracle Database Appliance deployment.

- [About Managing Storage](#)
Understand Oracle Database Appliance storage options.
- [About Managing Oracle ASM Disks](#)
Understand the Oracle ASM disk management features that Oracle Database Appliance supports.
- [Managing Storage on Single-Node Systems](#)
Understand the storage options for your Oracle Database Appliance X10-S and X10-L systems.
- [Managing Storage on High-Availability Systems](#)
Understand the storage for your Oracle Database Appliance X10-HA system.

About Managing Storage

Understand Oracle Database Appliance storage options.

Oracle Database Appliance uses raw storage to protect data in the following ways:

- Fast Recovery Area (FRA) backup. FRA is a storage area (directory on disk or Oracle ASM diskgroup) that contains redo logs, control file, archived logs, backup pieces and copies, and flashback logs.
- Mirroring. Double or triple mirroring provides protection against mechanical issues.

The amount of available storage is determined by the location of the FRA backup (external or internal) and if double or triple mirroring is used. External NFS storage is supported for online backups, data staging, or additional database files.

Oracle Database Appliance X10-L and X10-HA models provide storage expansion options from the base configuration. In addition, on Oracle Database Appliance X10-HA multi-node platforms, you can add an optional storage expansion shelf.

The redundancy level for FLASH is based on the DATA and RECO selection. If you choose High redundancy (triple mirroring), then FLASH is also High redundancy.

Note:

For this release of Oracle Database Appliance, you can only expand the storage on X10 at the time of initial deployment and not later.

About Managing Oracle ASM Disks

Understand the Oracle ASM disk management features that Oracle Database Appliance supports.

Oracle Database Appliance enables you to manage your Oracle ASM disks.

Bringing Oracle ASM Disk Groups Online Automatically

Oracle Database Appliance periodically checks the status of Oracle ASM disks in disk groups. If any Oracle ASM disk is OFFLINE due to transient disk errors, then Oracle Database Appliance attempts to bring the disk ONLINE.

Optimizing Oracle ASM Disk Group Rebalance Operations

Oracle Database Appliance ensures rebalancing of Oracle ASM disks to complete as quickly as possible, without overloading the system and the disks at the same time. This ensures that the system is in a steady state running with the appropriate redundancy. There are default thresholds for the values for rebalancing operations, and you can also set the custom threshold values. For example:

```
odacli update-agentconfig-parameters -n ASMRM_CPU_RQ -v 50 -d "CPU RUN
QUEUE THRESHOLD" -u
odacli update-agentconfig-parameters -n ASMRM_MAX_HDD_DISK_RQ -v 2 -d
"HDD DISK QUEUE THRESHOLD" -u
odacli update-agentconfig-parameters -n ASMRM_MAX_SSD_DISK_RQ -v 32 -d
"SSD DISK QUEUE THRESHOLD" -u
odacli update-agentconfig-parameters -n ASMRM_MAX_NVME_DISK_RQ -v 50 -
d "NVME DISK QUEUE THRESHOLD" -u
```

The above command options set custom threshold limits for rebalance monitoring of Oracle ASM disks.

You can monitor rebalance operations using the `odacli describe-schedule -i Schedule ID` and `odacli list-scheduled-executions` commands.

Managing Storage on Single-Node Systems

Understand the storage options for your Oracle Database Appliance X10-S and X10-L systems.

Note:

For this release of Oracle Database Appliance, you can only expand the storage on X10 at the time of initial deployment and not later.

- [About Storage on Oracle Database Appliance X10-S and X10-L](#)
Understand the storage for your Oracle Database Appliance single-node system.

About Storage on Oracle Database Appliance X10-S and X10-L

Understand the storage for your Oracle Database Appliance single-node system.

Oracle Database Appliance X10-S has two 6.8TB NVMe disks that host DATA and RECO disk groups. There are ten partitions that you can divide between DATA and RECO for Oracle ASM storage information. By default, DATA has an eight partition configuration and RECO has a two partition configuration. The storage capacity is fixed and cannot be expanded.

Oracle Database Appliance X10-L has two form factor-based NVMe disks namely Small Form Factor (SFF) and AIC (Add-in-Card). Both form factor NVMe disks are of 6.8TB storage capacity. SFF is a single disk of 6.8TB capacity whereas AIC has two NVMe disks each of 3.4TB capacity, with a combined storage capacity of 6.8TB. The default configuration for Oracle Database Appliance X10-L is two 6.8TB NVMe disks that host DATA and RECO disk groups.

When you first deploy and configure X10-L in this release, you can set the storage on X10-L in multiple of 2 packs of NVMe and AIC drives, such as 2, 4, and 6 disks, up to a maximum of 8 disks.

Oracle Database Appliance X10-L supports four SFF NVMe disks and four AIC NVMe disks. You must populate all four SFF NVMe disks before you add AIC NVMe disks to the system.

The table describes the NVMe storage configurations with expansion memory and storage options for single-node systems.

Table 9-1 Storage Options for Oracle Database Appliance X10-S and X10-L

Configuration	Oracle Database Appliance X10-S	Oracle Database Appliance X10-L
Base Configuration	2 x 6.8 TB NVMe = 13.6 TB NVMe	2 x 6.8 TB NVMe = 13.6 TB NVMe
Storage addition options	None	6x6.8TB NVMe storage drives for total storage of 54.4TB NVMe. You must populate all four SFF NVMe disks before you add AIC NVMe disks to the system. For the additional two SFF NVMe, order the following: Qty:1 - 7606150 (Two 6.8TB 2.5-inch NVMe PCIe SFF SSD with marlin bracket for Oracle Database Appliance X10-L) For the additional four NVMe AIC SSDs (these are PCIe NVMe Flash Cards that require cover removal to install), order the following: Qty:1 for two, Qty:2 for four: Qty:1 - 7605325 (Two 6.8 TB NVMe PCIe Cards for Oracle Database Appliance X10-L)

Managing Storage on High-Availability Systems

Understand the storage for your Oracle Database Appliance X10-HA system.

Note:

For this release of Oracle Database Appliance, you can only expand the storage on X10 at the time of initial deployment and not later.

- [About Storage Options for Oracle Database Appliance X10-HA](#)
Oracle Database Appliance High-Availability systems have options for high performance and high capacity storage configurations.

About Storage Options for Oracle Database Appliance X10-HA

Oracle Database Appliance High-Availability systems have options for high performance and high capacity storage configurations.

The base configuration of Oracle Database Appliance X10-HA hardware model has six slots (slots 0-5) with 7.68 TB drives of SSD raw storage. If you choose to order and deploy the full storage capacity, then you can fill the remaining 18 slots (slots 6-23) with either SSD or HDD drives. For even more storage, you can add a storage expansion shelf to double the storage capacity of your appliance.

In all configurations, the base storage and the storage expansion shelf each have six SSDs for DATA/RECO in the SSD option or FLASH in the HDD option.

Oracle Database Appliance X10-HA does not allocate dedicated SSD drives for REDO disk groups. Instead, the space for REDO logs is allocated on SSD drives as required.

For Oracle ASM storage, the REDO logs are stored in the available disk group space during database creation, based on the database shape selected. For Oracle ACFS storage, the space for REDO logs is allocated during the database storage creation assuming the minimum db shape (odb1s). If you create the database storage without database, then the space allocated for REDO logs is 4 GB, assuming the minimum db shape (odb1s). Subsequently, when you create a database with your required database shape on the existing database storage, the REDO logs space is extended based on shape of the database.

On Oracle Database Appliance X10-HA High Performance configurations, with only SSD drives, the DATA and RECO disk groups use all the SSD drives whether 6, 12, 18, 24, or 48 with storage expansion shelf. REDO logs are stored in the RECO disk group.

On Oracle Database Appliance X10-HA High Capacity configurations, with both HDD and SSD drives, the DATA and RECO disk groups use the HDD drives, and the SSD drives store the FLASH disk group. REDO logs are stored in the FLASH disk group.

On both High Performance and High Capacity configurations, REDO logs are always created on SSD drives, similar to earlier Oracle Database Appliance hardware models. REDO logs are always created with high redundancy irrespective of the redundancy level of the disk group, whether RECO or FLASH.

High Performance

A high performance configuration uses solid state drives (SSDs) for DATA and RECO storage. The base configuration has six disks, each with 7.68 TB SSD raw storage for DATA and RECO.

You can add up to three (3) 6-Pack SSDs on the base configuration, for a total of 184.32 TB SSD raw storage. If you need more storage, you can double the capacity by adding an expansion shelf of SSD drives. The expansion shelf provides an additional 24 SSDs, each with 7.68TB raw storage for DATA and RECO, for a total of another 184.32 TB SSD raw storage.

Adding an expansion shelf requires that the base storage shelf and expansion shelf are fully populated with SSD drives. When you expand the storage, there is no downtime.

A system fully configured for high performance has 368.64 TB SSD raw storage for DATA and RECO.

High Capacity

A high capacity configuration uses a combination of SSD and HDD drives.

The base configuration has six disks, each with 7.68 TB SSD raw storage for FLASH.

The following expansion options are available:

- Base shelf: additional 396 TB HDD raw storage for DATA and RECO (18 HDDs, each with 22 TB storage)
- Expansion Storage shelf: additional shelf storage configuration must be identical to the storage configuration of the base shelf.

A system fully configured for high capacity has a total of 884.16 TB raw storage for DATA, RECO, and FLASH, with 92.16 TB SSD and 792 TB HDD.

Table 9-2 Storage Options for Oracle Database Appliance X10-HA

Configuration	Oracle Database Appliance X10-HA SSD-Only Configuration for High Performance	Oracle Database Appliance X10-HA SSD and HDD Configuration for High Capacity
Base configuration	Base storage shelf contains 6 SSDs of 7.68 TB. <ul style="list-style-type: none"> • 6 x 7.68 TB SSD = 46 TB SSD 	Base storage shelf is fully populated with 6-pack SSDs of 7.68 TB and 18-drives of HDDs with 22 TB. <ul style="list-style-type: none"> • 6 x 7.68 TB SSD = 46 TB SSD • 18 x 22TB HDD = 396 TB HDD • Total storage on the first JBOD = 442 TB, with 46 TB SSD and 396 TB HDD

Table 9-2 (Cont.) Storage Options for Oracle Database Appliance X10-HA

Configuration	Oracle Database Appliance X10-HA SSD-Only Configuration for High Performance	Oracle Database Appliance X10-HA SSD and HDD Configuration for High Capacity
Storage addition options	<p>Base shelf contains 6 SSDs. Additional 18 SSDs must be added in packs of 6.</p> <ul style="list-style-type: none"> • Base system: 6 x 7.68 TB SSD = 46 TB SSD • Adding 6 SSDs: 12x 7.68 TB SSD = 92 TB SSD • Adding 12 SSDs: 18 x 7.68 TB SSD = 138 TB SSD • Adding 18 SSDs: 24 x 7.68 TB SSD = 184 TB SSD (full shelf) 	Not applicable. Base storage shelf is fully populated.
Storage shelf expansion options Note: For this release of Oracle Database Appliance, you can only expand the storage on X10 at the time of initial deployment.	<ul style="list-style-type: none"> • The optional expansion storage shelf can only be installed after the base storage shelf is fully populated, and it must have the same configuration as the base storage shelf. • Total storage on the base storage shelf = 184 TB SSD • Storage on the expansion shelf = 24 x 7.68 TB SSD = 184 TB SSD • Total storage including both JBODs = 368.6 TB SSD 	<ul style="list-style-type: none"> • The optional expansion storage shelf can only be installed after the base storage shelf is fully populated, and it must have the same configuration as the base storage shelf. • Total storage on the base storage shelf = 442 TB, with 46 TB SSD and 396 TB HDD • Total storage including both JBODs = 884 TB, with 92 TB SSD and 792 TB HDD

About Network Infrastructure and VLANs on Oracle Database Appliance

Learn about networks and virtual local area networks (VLANs) on the appliance.

Oracle Database Appliance has two dual-port public network interfaces (either copper or fiber), which are bonded. For dual-port networks cards, the bonded network interface used for primary public network is always `btbond1`. You can, optionally, configure upto six bonded interfaces, `btbond1` to `btbond6`. If you use network cards with four ports, then you can select either `btbond1` or `btbond2` as the public network interface.

You can use the Browser User Interface to display all physical and virtual networks. You can use ODACLI commands or the Browser User Interface to create, update, and deleted networks.

Virtual Local Area Networks (VLANs)

Oracle Database Appliance supports multiple virtual local area networks (VLANs) on the same network port or bond. VLANs are multiple logical networks that are created from a single physical network switch port, providing network security isolation for multiple workloads that share a common network. For example, application, backup, and management networks. Each VLAN acts as an independent logical network operating with other VLANs over the same physical connection. The VLAN tag associated with the data packet and network define the network. You can create a collection of isolated networks to enhance network security and bandwidth and keep data packets separated.

The network interfaces differ, depending on your Oracle Database Appliance hardware. The VLAN is created on `btbond0` in single-node and high-availability platforms. In all cases, connections to user domains are through the selected interfaces. A switch that supports tagged VLANs uses VLAN IDs to identify the packet, including to which network the packet belongs.

Note:

To use VLANs with Oracle Database Appliance, you must configure the VLANs before you deploy the appliance.

The Browser User Interface enables you to create, list, and delete VLANs on the appliance. For high-availability systems, you can use the Browser User Interface to create a VLAN on both nodes of the appliance. To create a VLAN on a specific node, use the command-line interface.

For a bare metal deployment, use the Browser User Interface or `odacli` commands to manage the following types of VLANs:

- Data Guard: For Oracle Data Guard.
- Database: For Oracle Database.
- Backup: For backup operations.
- Management: For management traffic.
- Other: For usage defined by the customer. For example, for applications.

The public VLAN is setup when you configure the first network using the command `odacli configure-firstnet`. You can set up only one public VLAN. Use the command-line interface to create other VLANs. For high-availability systems, the IP addresses for Node 0 and Node 1 cannot be the same. Oracle Database Appliance does not support Dynamic Host Configuration Protocol (DHCP) to provide IP addresses, subnet mask and default gateway.

About Oracle Database Appliance X10 Network Interfaces

Learn about onboard network interfaces for Oracle Database Appliance.

The network interfaces differ, depending on your Oracle Database Appliance hardware. In all cases, connections to user domains are through the selected

interfaces. Two ports inside a network card are used to create an active-backup mode bonding interface.

The following table lists the default network interfaces for Oracle Database Appliance bare metal systems on Oracle Database Appliance X10-HA.

Table 10-1 Network Interfaces for Oracle Database Appliance X10-HA Bare Metal Deployment

PCIe Network Card Slot	PCIe Network Port	Network Interfaces	Network Bonds	IP Addresses
PCIe Slot 1 (Interconnect)	2 x 10/25GbE SFP28 ports	p1p1, p1p2	icbond0	Node 0: 192.168.16.24 Node 1: 192.168.16.25
PCIe Slot 6 (required)	4 x 10GBase-T ports or 2 x 10/25GbE SFP28 ports	p5p1, p5p2 (p5p3, p5p4)	btbond1 (btbond2)	Either one of the IP addresses: btbond1 or btbond2, can be assigned during deployment. The remaining IP address can be assigned post deployment.
PCIe Slot 4 (optional)	4 x 10GBase-T ports or 2 x 10/25GbE SFP28 ports	p4p1, p4p2 (p4p3, p4p4)	btbond3 (btbond4)	Assigned post deployment
PCIe Slot 8 (optional)	4 x 10GBase-T ports or 2 x 10/25GbE SFP28 ports	p8p1, p8p2 (p8p3, p8p4)	btbond5 (btbond6)	Assigned post deployment
On-board	1GBase-T	em1	Not applicable	Assigned post deployment

The following table lists the default network interfaces for Oracle Database Appliance bare metal systems on Oracle Database Appliance X10-S and X10-L.

Table 10-2 Network Interfaces for Oracle Database Appliance X10-S and X10-L Bare Metal Deployment

PCIe Network Card Slot	PCIe Network Port	Network Interfaces	Network Bonds	IP Addresses
PCIe Slot 6	4 x 10GBase-T ports or 2 x 10/25GbE SFP28 ports	p5p1, p5p2 (p5p3, p5p4)	btbond1 (btbond2)	btbond1 and btbond2 can be assigned during deployment.
PCIe Slot 4 (optional for Oracle Database Appliance X10-L)	4 x 10GBase-T ports or 2 x 10/25GbE SFP28 ports	p4p1, p4p2 (p4p3, p4p4)	btbond3 (btbond4)	Can be assigned during deployment. If not assigned during deployment, then it can be assigned post deployment.

Table 10-2 (Cont.) Network Interfaces for Oracle Database Appliance X10-S and X10-L Bare Metal Deployment

PCIe Network Card Slot	PCIe Network Port	Network Interfaces	Network Bonds	IP Addresses
PCIe Slot 7 (optional for Oracle Database Appliance X10-S)	4 x 10GBase-T ports or 2 x 10/25GbE SFP28 ports	p7p1, p7p2 (p7p3, p7p4)	btbond3 (btbond4)	Can be assigned during deployment. If not assigned during deployment, then it can be assigned post deployment.
PCIe Slot 8 (optional for Oracle Database Appliance X10-S)	4 x 10GBase-T ports or 2 x 10/25GbE SFP28 ports	p8p1, p8p2 (p8p3, p8p4)	btbond5 (btbond6)	Can be assigned during deployment. If not assigned during deployment, then it can be assigned post deployment.
On-board	1GBase-T	em1	Not applicable	Assigned post deployment

Viewing Configured Networks and Network Interfaces

Use the Browser User Interface to display a list of configured networks, network details, and interfaces.

1. Click the **Appliance** tab in the Browser User Interface.
2. Click the **Network** tab in the left navigation to display a list of configured networks and configured databases.

When the appliance is a high-availability system, the network details for **Node0** and **Node1** display on the page.

3. Click **Show Interfaces** in the upper left corner of the Network page to display a list of network interfaces.

If the appliance is a high-availability system, then the network interface details for **Node0** and **Node1** display on the page.

4. Click **Show Networks** to go back to the network view.

Creating a Network

Understand how you can use the Browser User Interface to create a network for the appliance.

When naming a network, you can use alphanumeric characters, dashes (-) and underscores (_). The network name cannot exceed 40 characters and must begin with an alpha character.

1. Click the **Appliance** tab in the Browser User Interface.
2. Click the **Network** tab in the left navigation to display a list of configured networks.

3. If the appliance is a high-availability system, then the Browser User Interface helps you create the network for both nodes at the same time.
4. Click **Create Network** in the upper right corner.
5. Enter the network information in the required fields. The Interface field has a drop-down menu with available choices. The Subnet Mask field has a drop-down menu with available choices and a search box. Optionally, enter a Gateway IP address and select an option from the Network Type list. The network type helps to identify if the network is for backup, database, dataguard, management, private, or other.

If the appliance is a high-availability system, then you must also specify the SCAN (Oracle Single Client Access Name) details such as name and IP address, and VIP (Virtual IP) name and address.

6. Click **Create**.

Creating a Physical Network

Understand how you can use the Browser User Interface to create a physical network on the unused network interface.

1. Click the **Appliance** tab in the Browser User Interface.
2. Click the **Network** tab in the left navigation to display a list of configured networks.
3. If the appliance is a single-node system, then click **Create Network** in the upper right corner. If the appliance is a high-availability system, then go to Step 4.
 - a. Enter the network information in the required fields. The Interface field has a drop-down menu with available choices. The Subnet Mask field has a drop-down menu with available choices and a search box. Optionally, enter a Gateway IP address and select an option from the Network Type list. The network type helps to identify if the network is for backup, database, dataguard, management, private, or other.
 - b. Click **Create**.
4. If the appliance is a high-availability system, then the Browser User Interface helps you create the network for both nodes at the same time. Click **Create Network** in the upper right corner.
 - a. Enter the network information in the required fields. The Interface field has a drop-down menu with available choices. The Subnet Mask field has a drop-down menu with available choices and a search box. Optionally, enter a Gateway IP address and select an option from the Network Type list. The network type helps to identify if the network is for backup, database, dataguard, management, private, or other.
 - b. Click **Create**.

Updating a Network

Understand how you can use the Browser User Interface to update a network and revise the IP address, subnet mask, gateway, or type of network.

1. Click the **Appliance** tab in the Browser User Interface.
2. Click the **Network** tab in the left navigation to display a list of configured networks.

When the appliance is a high-availability system, tabs named **Node0** and **Node1** display in the right corner, below the **Refresh** button. Click a tab to display network details for each node.

3. If the appliance is a high-availability system, click **Node0** or **Node1** to display the node where the network that you want to edit resides.
4. Expand the **Actions** menu, then click **Update** for the network that you want to edit.
5. Update the information in the IP Address, Subnet Mask, and Gateway fields and select a network type from the list, as needed, then click **Update**. For High-Availability deployments, you can also update the Virtual IP Address and Oracle Single Client Access Name (SCAN).

Adding a Network Interface

Understand how you can add a configured network interface.

This procedure explains how to add a network interface card on Oracle Database Appliance X8-2.

1. Power off the appliance.
2. Add the network interface card.
3. Power on the appliance.
4. The network configuration files are automatically updated for network bonding and configuration changes.

Deleting a Network Interface

Understand how you can delete a configured network interface.

This procedure explains how to delete a network interface card on Oracle Database Appliance X8-2. You cannot delete the network interface card in slot 7. You also cannot delete the `btbond1` and `btbond2` networks.

1. Disconnect all networks for the network interface card from all applications on the appliance.
2. Power off the appliance.
3. Remove the network interface card.
4. Power on the appliance.
5. Run the command `odacli delete networkinterface` to clean up the network configuration files.

```
odacli delete networkinterface network_interface_name
```

```
[root@oak ~]# odacli delete-networkinterface btbond3  
Network btbond3 has been deleted successfully
```

```
[root@oak ~]# odacli delete-networkinterface btbond4  
Network btbond4 has been deleted successfully
```

Deleting a Network Interface Using Browser User Interface

Understand how you can delete a configured network interface using the Browser User Interface.

1. Click the **Appliance** tab in the Browser User Interface.
2. Click the **Network** tab in the left navigation to display a list of configured networks.
3. Click the **Show Interfaces** tab in the right navigation to display a list of configured network interfaces.
4. Expand the **Actions** menu, then click **Delete** for the network interface that you want to delete.
5. Confirm the action when prompted.

Deleting a Network Using the Browser User Interface

Understand how you can delete a configured network using the Browser User Interface.

1. Click the **Appliance** tab in the Browser User Interface.
2. Click the **Network** tab in the left navigation to display a list of configured networks.

When the appliance is a high-availability system, tabs named **Node0** and **Node1** display in the right corner, below the **Refresh** button. Click a tab to display network details for each node.
3. If the appliance is a high-availability system, then click **Node0** or **Node1** to display the node where the network that you want to delete resides.
4. Expand the **Actions** menu, then click **Delete** for the network that you want to delete.
5. Confirm the action when prompted.

Backup, Restore and Recover Databases

Review backup, restore, and recovery operations for your databases.

- [About Database Backup and Recovery Options](#)
Backup your databases in Oracle Database Appliance and use the restore and recover features to restore a database to the same or another system or to recover database files.
- [Configuring NFS Backup and Restore on Oracle Database Appliance](#)
To backup databases to Network File System (NFS) location or to restore the database from NFS location, you must configure the NFS backup location to ensure that Oracle Database Appliance can perform read and write operations.
- [Configuring Agent Proxy Settings for Object Store Access](#)
If the Object Store IP address is accessible only through proxy setup by the Oracle Database Appliance server, then define the proxy setting for the agent, so that the agent can access the Object Store.
- [Creating a Database Backup Policy](#)
Understand how to create a policy to backup a database to an internal or external Oracle Fast Recovery Area (FRA) location or to the Object Store using the Browser User Interface.
- [Updating a Database with a Backup Policy](#)
Attach a backup policy to a database to define the database backup attributes and destination.
- [Updating a Backup Policy](#)
Use the Browser User Interface to update the recovery window, change the ObjectStore Credential, or change the crosscheck option for a backup policy.
- [Backing Up a Database Using the Browser User Interface](#)
Apply a backup policy to a database, create a manual backup, update a database backup schedule, or update an archive log backup scheduler.
- [Viewing Backup Reports](#)
Understand how you can use the Browser User Interface to view backup reports.
- [Recovering a Database Using the Browser User Interface](#)
Understand the recovery options available for recovering a database.
- [Deleting a Backup Using the Browser User Interface](#)
Use the Browser User Interface to delete database backups.
- [Deleting a Backup Policy](#)
Use the Browser User Interface to delete a database backup policy.
- [Using the CLI to Backup, Restore, and Recover](#)
Use the command-line interface to backup, restore, and recover databases.

About Database Backup and Recovery Options

Backup your databases in Oracle Database Appliance and use the restore and recover features to restore a database to the same or another system or to recover database files.

It is important to create a backup recovery strategy to protect the databases in Oracle Database Appliance from data loss. A user error or a physical problem with a disk can cause a failure of a read or write operation on a disk file required to run the database. You can create a backup policy in the Browser User Interface or from the command-line interface.

The following backup options are available:

- Backup to an Oracle Fast Recovery Area (FRA) disk (Internal FRA)
- Backup to Oracle Cloud Infrastructure Object Storage (Oracle Object Storage)
- Backup to a Network File System (NFS) location (External FRA)

You can use the backup, restore, and recovery features with databases that have backup policy attached to them in the system. You can choose to manage your backups, and set up your backup, restore, and recovery options.

The backup feature enables you to create a backup policy with your backup parameters, such as backup location, recovery window, enable and disable crosscheck, and ObjectStoreSwift Object details. For new and existing databases, you can create and attach a backup policy to a database to perform backup. After a backup policy is attached to a database, the DCS agent automatically schedules the database backup and archive logs backup, for the database. By default, the frequency of the database backup schedule is once a day and the frequency of archive log backup schedule is 30 minutes. The database backup scheduler performs level 0 backup every Sunday and a level 1 backup Monday through Saturday. However the level 0 backup day can be changed from the default Sunday to any day of the week. The database backup scheduler and archive logs backup schedulers can be disabled or have their frequencies changed.

The DCS agent generates and saves a backup report for each backup. The backup report contains the metadata required to recover or restore a database.

Oracle Database Appliance uses the Oracle Recovery Manager (RMAN) to recover the database. You can recover from a backup report, a point-in-time (PITR), a System Change Number (SCN), or from the latest backup. When a backup report is used for recovery, it performs an SCN recovery, by reading the SCN value from the backup report. For recovery of data block, tablespaces, data files, PDBs, see the *Oracle Database Backup and Recovery Reference Guide*.

Backup Policy

The backup policy defines the backup details. When you create a backup policy, you define the destination for the database backups, either Internal FRA (Disk) or External FRA (NFS location), or Oracle Object Storage, and you define the recovery window.

If you use the Oracle Object Storage for backup and recovery, you must have an ObjectStore Resource ID or Name.

You can assign the backup policy to the database when you create the database. You can also attach a backup policy to an existing database or update a backup policy.

You can specify compression algorithm while creating the backup policy. The supported compression algorithms are BASIC, LOW, MEDIUM, and HIGH. For Objectstore backup policy, you can specify any compression algorithm. By default, if you do not specify the compression algorithm while creating the Objectstore backup policy, then MEDIUM compression algorithm is used. By default, if you do not specify the compression algorithm while creating the Disk or NFS backup policy, then BASIC compression algorithm is used. Refer to the *Oracle Database Licensing Information*

User Manual for license considerations when you use LOW, MEDIUM, or HIGH compression algorithms for Disk or NFS backup policy.

Backup Levels

Specify the backup level when you take a backup. The supported back levels are:

- **Level 0:** This backup captures all blocks in the datafile. By default, level 0 backups occur every Sunday. You can customize your backup settings through the Browser User Interface or the command-line. A level 0 backup is a full backup and is used as the parent for a level 1 backup.
- **Level 1:** This backup is an incremental backup that captures only those blocks that change between backups in each datafile. By default, a level 1 backup occurs daily, Monday through Saturday, and captures images of each block in a datafile that changed. Level 1 backups are differential backups. The Level 1 backup includes blocks that were changed from the most recent level 1 or level 0 backup.
- **LongTerm:** This backup is a long-term, or archival backup. Use LongTerm to create a backup that is all-inclusive and exempt from the backup retention policy. The backup is all-inclusive because every file needed to restore and recover the database is backed up to a single location. The backup is exempt from the retention policy that is defined in the recovery window. For long term backups, you must use External FRA (NFS location) or Objectstore backup policy.
- **Archivelog:** This is a backup of all archive logs not yet backed up to the backup destination, such as Internal FRA, External FRA (NFS location), or Object Store.

When a database is modified with a backup configuration, database backup schedule and archive logs backup schedules are created automatically. Automatic database backup schedule creates a level 0 backup on Level 0 Backup Day, by default, on Sunday, and level 1 on the remaining days of the week. Also, automatic archive logs backup schedules creates archive logs backup for the database with a default frequency of 30 minutes. These backup schedules can be edited to enable or disable or change the frequency using cron expression.

Backup to Disk

When you backup to disk, you are using the Oracle Fast Recovery Area (FRA) of the disk. FRA is a storage directory that allows backup and recovery operations on Oracle databases. The directory contains archived redo logs, backup pieces and copies, and the control file.

Advantages to backing up to disk are as follows:

- Quick recovery from backups stored on disk
- Automate management of recovery related files (like archived logs)

Note:

- When you backup to disk, the data for non-TDE database is not encrypted and RMAN backup encryption are not allowed. In addition, backup to disk requires a lot of disk space (up to two to three times the size of the database).
- If the database is TDE-enabled, then the RMAN backup encryption password is not required, irrespective of the backup destination.

The following is a high-level overview of the workflow for backup and recovery when using a disk:

1. Create a backup policy to define the backup destination (disk) and recovery window for the disk destination.
2. Create a database and attach the backup policy to the database. When the backup policy is associated with a database, archive logs backups and database backups are automatically created.
3. Manage obsolete backups.
4. Recover the database from a backup on the disk.

Backup to External FRA (Network File System)

Specifying a Network File System (NFS) location for backups, enables you to safely and securely store or retrieve a database backup at any time.

The advantages of using NFS backup location are:

- With NFS, you can access remote files, locally, by mounting local file systems on a network.
- Provides a centralized backup location, without requiring manual refresh.
- Supports enhanced security options using firewalls and Kerberos.
- Support for encrypted backups using passwords. You optionally, set the backup password, and provide the same during restore operation.
- The RMAN Backup Encryption password is applicable for databases that do not have TDE enabled. If the database has TDE enabled, then the RMAN backup password is not required, irrespective of the backup destination.

The following is a high-level overview of the workflow for backup and recovery when using an NFS location:

1. Create a mount point for the NFS location.

The mount point must be accessible from both nodes. The `oracle` user must have read/write permissions to the NFS location. If the request is being made to a remote server, ensure that it is running. See *Creating a Mount Point for NFS Backup Location* for the procedure to create a mount point.
2. Create a backup policy specifying the NFS location, and the recovery window for NFS destination.
3. Associate the database with this backup policy, either during database creation, or by updating the backup policy for the database.
4. Backups are automatically scheduled, and you can also run manual backups. You can specify manual backup options in the Browser User Interface or using ODACLI commands.
5. Manage obsolete backups.
6. Restore from backup. When you save your backups to NFS, you can restore the database to the same system or to a different system.
7. Recover the database from a backup on NFS.

Backup to Oracle Object Storage

Oracle Object Storage is a highly secure, scalable storage platform that enables you to safely and securely store or retrieve a database backup at any time. Data and the associated metadata are stored as an object in a logical container (bucket). Oracle Database Appliance creates a Backup Report and a unique ID to identify each backup.

Oracle Object Storage is tightly integrated with Oracle Cloud Infrastructure Identity and Access Management. The data, user-defined metadata associated with the data, and encryption keys are automatically encrypted using 256-bit Advanced Encryption Standard (AES- 256). The encryption keys are rotated frequently and cannot be disabled. By default, only authenticated users that have explicitly been granted access to specific resources can access data stored in Oracle Object Storage. Data is uploaded and downloaded over SSL endpoints using the HTTPS protocol.

When you backup to Oracle Object Storage, you are using your backup policy and your Oracle ObjectStoreSwift credentials. The credentials are stored in an encrypted Oracle wallet. You can attach the credentials to one or more backup policies.

Note:

Credentials are validated when you create the backup policy that uses Oracle Object Storage. The credentials are not validated against the URL and tenancy.

Advantages to using Oracle Object Storage are as follows:

- Backups are encrypted using the password for non-TDE databases. For TDE-enabled databases, backups are encrypted by default and do not require the RMAN backup encryption password to be specified separately.

Caution:

Save the password that you use during backups in a safe location, you must provide the password during recovery operations.

- Quick recovery from backups. With the Oracle Object Storage, you can safely and securely use the Browser User Interface to store or retrieve data directly from within the cloud platform, at any time.
- Automate management of recovery related files (like archived logs)
- Oracle Object Storage is not directly accessed by the operating system, instead it uses APIs to access the storage at the application level.

The following is a high-level overview of the workflow for backup and recovery when using Oracle Object Storage:

1. Create an Object Store object with your credentials.
2. Create a backup policy to define the backup location (Object Store), Object Store Credentials Name, the container (bucket) name where you want to store backups, and the recovery window.

3. Create a database and attach the backup policy either as a part of creating the database, or update the database with backup policy after creating the database. When the backup policy is associated with a database, backups are automatically created.
4. Manage obsolete backups.
5. Restore from backup. When you save your backups to Oracle Object Storage, you can restore the database to the same system or to a different system.
6. Recover the database from a backup on Oracle Object Storage.

Note:

Before you can use this backup option, you must create an Oracle Cloud Infrastructure Object Storage account. When you create the account, you define the account credentials, end point URL, and bucket. Go to the Oracle Store and sign up for Oracle Cloud Infrastructure Object Storage.

Backup Reports

A backup report is generated for each backup and is similar to, but does not replace, a recovery catalog. The report contains the Oracle Database Appliance information and metadata needed to restore or recover a database. The Backup Report is designed to keep track of all of the information required to restore or recover a database.

The following is an example of a level 1 backup report:

```

{
  "id" : "2d82460c-d648-4e75-8c7d-72cc90bc442a",

About Backup of TDE Wallet

When the database backup is performed, the TDE wallet backup is also taken. The database backup can be of any type like regular-L0, regular-L1, longterm and archivelog. Use the `odacli list-tdebackupreports` command to view the latest TDE wallet backup in a backup destination. For example, if a TDE-enabled database named `tdedb1` was attached with Disk, and then NFS, and later Oracle Object Storage backup configuration, and the database was backed up to each of these backup destination eventually, then the `odacli list-tdebackupreports` command lists three entries of TDE wallet backup corresponding to Disk, NFS and Oracle Object Storage backup destination, respectively, for the database `tdedb1`. The reason for selecting the latest copy is that the TDE wallet is a cumulative wallet, that is, all previous changes, such as re-key operation is available in the latest TDE wallet itself.

About Recovery Options

The recovery in Oracle Database Appliance always performs a full database restore or recover. The recovery options are LATEST, PITR, SCN, and BackupReport.

The following types of recovery are available:

- **LATEST:** Performs a complete recovery (valid backups and all required archived logs and online redo logs must be available)
- **PITR:** Point-in-Time Recovery that performs a recovery to a specified timestamp within the current incarnation of database
- **SCN:** SCN-based recovery that performs a recovery is an incomplete recovery to a specified SCN within the current incarnation of database.
- **BackupReport:** Performs a recovery based on the Backup Report SCN. The BackupReport option is similar to SCN, except that the recovery uses the Backup Report SCN instead of a specified SCN.

Point-in-Time Database Recovery

Point-in-Time Recovery (PITR) recovers the database to a specific point-in-time. You must specify the timestamp for this type of recovery.

A point-in-time recovery is often used for the following situations:

- You want to recover the database to an SCN before a user or administrative error.
- Complete database recovery failed because all necessary archived redo logs were not available.
- A database upgrade fails.

- You are creating a test database or a reporting database from production database backups.

System Change Number Recovery

A system change number (SCN) is a stamp that defines a committed version of a database at a point in time. Oracle assigns every committed transaction a unique SCN. You can recover a database to the latest time or to an SCN.

The database is restored from backups created before the target time, and then applies incremental backups and logs to re-create all changes between the time of the data file backups and the end point of recovery. When the end point is specified as an SCN, the database applies the redo logs and stops after each redo thread or the specified SCN, whichever occurs first. When the end point is specified as a time, the database internally determines a suitable SCN for the specified time and then recovers to this SCN.

SCN is a primary mechanism to maintain data consistency in Oracle database. With each execution, there is an increase in the count of the SCN. The following are some examples of areas that use SCN:

1. Redo records. Every redo record has an SCN version of the redo record in the redo header (redo records can have non-unique SCN). Given redo records from two threads (as in the case of RAC), recovery will order them in SCN order, essentially maintaining a strict sequential order.
2. Data block. Every data block has block SCN (block version). In addition to that, a change vector in a redo record also has expected block SCN. This means that a change vector can be applied to one and only version of the block. Code checks if the target SCN in a change vector is matching with the block SCN before applying the redo record. If there is a mismatch, corruption errors are thrown.
3. Read consistency. Every query has query environment which includes an SCN at the start of the query. A session can see the transactional changes only if that transaction commit SCN is lower than the query environment SCN.
4. Commit. Every commit generates an SCN (commit SCN) that marks a transaction boundary. Group commits are possible too.

Restoring Archive Logs

The database auto backup policies - Regular-L0, and Regular-L1 delete archive log, which could be essential in later process, such as in configuration or reinstate operations for Oracle Data Guard. Oracle Database Appliance supports restore of archive logs for a database. You can choose to restore archive logs from one SCN to another SCN, or from one timestamp to another timestamp.

Run the command `odacli restore-archivelog` specifying the SCN or timestamp period.

Obsolete Database Backups

It is important to remove older backups once they become obsolete. The type of backup and the recovery window that you define in the database backup policy determines when database backups become obsolete.

For level 0, level 1, and archive log backups, run the command `odacli delete-backup` for a given Database Resource Identifier to delete obsolete backups and backup reports based on the defined recovery window.

For Longterm backups, provide the corresponding backup report as an input and use the command `odacli delete-backup` to delete the backups from Oracle Object Storage or NFS backup location and the back report you specify in the command.

Typically, older level 0 and level 1 database backups are considered obsolete based on the defined recovery window and those obsolete backups are deleted when you run the `odacli delete-backup` command. The defined recovery window is as follows:

- Disk: 1-14 days
- Object Storage: 1-30 days

Starting with Oracle Database Appliance release 19.15, on attaching a backup policy to a database, the DCS agent creates a scheduler for deleting the database backup. It deletes the obsolete backups and backup reports for the database. By default, the frequency of this delete backup scheduler is once a week. It runs on every Monday to delete obsolete backups and backup reports of the database. The delete backup scheduler can be edited to disable it or to change its frequency.

Configuring NFS Backup and Restore on Oracle Database Appliance

To backup databases to Network File System (NFS) location or to restore the database from NFS location, you must configure the NFS backup location to ensure that Oracle Database Appliance can perform read and write operations.

Following are the steps to configure the NFS location, backup database to NFS location, and restore database as a standby database from the NFS backup location.

- [Configuring an NFS Backup Location](#)
Configure Network File System (NFS) backup location, to set up the NFS backup and mount the NFS client location on Oracle Database Appliance.
- [Backing Up the Database to NFS Location](#)
To backup a database to NFS location on Oracle Database Appliance, you must create an NFS backup configuration object and then attach the same to the database.
- [Restoring the Database from NFS Backup](#)
Understand the steps to restore a database from NFS location.

Configuring an NFS Backup Location

Configure Network File System (NFS) backup location, to set up the NFS backup and mount the NFS client location on Oracle Database Appliance.

An NFS setup involves an NFS server location and an NFS client location. While performing database backup operation, it is recommended that you configure the NFS server location on a different system, than the system where the source database, that is, the database to be backed up, is running. This ensures the database backups are not lost, even if the system where the source database is running, is corrupted or lost. However, the NFS client location must be configured on the same machine where the database is running, to perform

database backup operation. Also, while performing database restore operation, the NFS client location must be configured on the same system where the database must be restored.

 **Note:**

- An NFS backup configuration object must be created and attached to the database. This NFS backup location is a mandatory parameter to create a NFS backup configuration object.
- For TDE-enabled database, Oracle Database Appliance requires the backup path to be different for database and TDE wallet, as per security guidelines. If the source database is TDE-enabled, then configure another NFS client location following the steps in this topic.

Run the following steps on the NFS server:

1. Create an Oracle ADVM volume and format the volume as Oracle ACFS, on any node, for example, `node0`, of a different Oracle Database Appliance system, as the `grid` operating system user.

```
[root@***** ~]# su - grid

[grid@***** ~]# asmcmd

ASMCMDB> volcreate -G data -s 100G backup

ASMCMDB> volinfo -G data backup
Diskgroup Name: DATA
Volume Name: BACKUP
Volume Device: /dev/asm/backup-322
State: ENABLED
Size (MB): 102400
Resize Unit (MB): 64
Redundancy: HIGH
Stripe Columns: 8
Stripe Width (K): 4096
Usage:
Mountpath:
ASMCMDB> exit

[grid@***** ~]$ mkfs -t acfs /dev/asm/backup-322
mkfs.acfs: version = 19.0.0.0.0
mkfs.acfs: on-disk version = 46.0
mkfs.acfs: volume = /dev/asm/backup-322
mkfs.acfs: volume size = 107374182400 ( 100.00 GB )
mkfs.acfs: Format complete.

[grid@***** ~]$ exit
```

2. Create an operating system directory as the `root` user to export Oracle ACFS volume created in the previous step.

```
[root@***** ~]# mkdir /nfs_backup_server
```

3. Register the file system with Oracle Clusterware and start the file system as the `root` user.

```
[root@***** ~]# /u01/app/19.13.0.0/grid/bin/srvctl add filesystem -
d /dev/asm/backup-322 -path /nfs_backup_server -mountowner oracle -
mountgroup asmadmin
[root@***** ~]# /u01/app/19.13.0.0/grid/bin/srvctl start filesystem -
d /dev/asm/backup-322
```

4. Identify the owner and group of the `DBHOME/bin/oracle` binary of the source database and set the directory ownership to the same owner and group. In the following example, the owner and group of the `DBHOME/bin/oracle` binary are `oracle` and `asmadmin` respectively. Hence, the ownership of NFS server location is set to the same. The permissions of the directory must be set to 750.

```
[root@***** ~]# ls -ltr /u01/app/odaorahome/oracle/product/19.0.0.0/
dbhome_1/bin/oracle
-rwsr-s--x 1 oracle asmadmin 449234896 Sep 21 11:39 /u01/app/
odaorahome/oracle/product/19.0.0.0/dbhome_1/bin/oracle

[root@***** ~]# chown oracle:asmadmin /nfs_backup_server
[root@***** ~]# chmod 750 /nfs_backup_server
[root@***** ~]# ls -ld /nfs_backup_server
drwxr-x--- 2 oracle asmadmin 4096 Sep 21 12:25 /nfs_backup_server
```

5. When NFS server location and NFS client location are on different systems, then there may be cases where the IDs of the `oracle` user and the `asmadmin` group may be different. If the IDs of the `oracle` user and the `asmadmin` group are the same, then do not run step 6. In the following example, the ID of `oracle` user is 1001 on the NFS server system and 1000 on the NFS client system.

Output of the system where the NFS server location is configured:

```
[root@***** ~]# id oracle
uid=1001(oracle) gid=1001(oinstall)
groups=1001(oinstall),1006(asmdba),1003(dba),1002(dbaoper)
```

Output of the system where the NFS client location is configured:

```
[root@***** ~]# id oracle
uid=1000(oracle) gid=1001(oinstall)
groups=1001(oinstall),1006(asmdba),1003(dba),1002(dbaoper)
```

In such a case, the ownership of the NFS server location must be set to the same ID as the `oracle` user on the system where the NFS client location is configured. The ownership of the `/nfs_backup_server` location must be set to 1000 as follows:

```
[root@***** ~]# chown 1000:asmadmin /nfs_backup_server/
```

- Export the NFS server location to the systems where the NFS client location is created.

```
[root@***** ~]# cat /etc/exports
/nfs_backup_server
Node0_NFS_Client_Location_IP(rw, sync, no_root_squash)
/nfs_backup_server
Node1_NFS_Client_Location_IP(rw, sync, no_root_squash)
```

Note that the NFS mount option must be `(rw, sync, no_root_squash)`. Starting with Oracle Database Appliance release 19.17, there is no dependency on NFS mount option `no_root_squash`, It can then be `(rw, sync)`.

- Restart the NFS server.

Command on Oracle Linux 7 systems:

```
[root@***** ~]# /bin/systemctl restart nfs.service
```

Command on Oracle Linux 8 systems:

```
[root@***** ~]# /bin/systemctl restart nfs-server
```

- Verify the mount point using the `showmount -e` command.

```
[root@***** ~]# showmount -e
Export list for *****:
/nfs_backup_server
Node0_NFS_Client_Location_IP, Node1_NFS_Client_Location_IP
```

Follow these steps to mount the NFS location on Oracle Database Appliance. If the source database is on an Oracle Database Appliance high-availability system, then run the following steps on both nodes.

- Create a NFS client location as the `root` user.

```
[root@***** ~]# mkdir /nfs_backup_client
```

- Mount the NFS client location on to the NFS server location, using the IP address of the system where the NFS server location is configured.

```
[root@***** ~]# mount -t nfs NFS_Server_Location_IP:/
nfs_backup_server /nfs_backup_client
```

- [Preparing for Database Backup to NFS Location](#)
Use the command-line interface to create a policy to backup a database to an External FRA (NFS Location).

Backing Up the Database to NFS Location

To backup a database to NFS location on Oracle Database Appliance, you must create an NFS backup configuration object and then attach the same to the database.

The relationship between NFS backup configuration object and database is one-to-many, that is, you can attach one NFS backup configuration object to multiple databases. Use the NFS backup location that you configured in the *Configuring an NFS Backup Location* topic to create an NFS backup configuration object.

Follow these steps to backup a database to an NFS location:

1. Create the NFS backup configuration with the NFS backup location using the `odacli create-backupconfig` command. In the following sample output, the NFS backup location, specified using the `-c` option, is `/nfs_backup_client/`, the name of the NFS backup configuration object, specified using the `-n` option is `nfsbcfg`, the destination, specified using the `-d` option is `nfs` and the retention period, specified using the `-w` option is 1 day.

If the source database is TDE-enabled, then along with database backup location, specified using the `-c` option, the TDE wallet location must also be specified using the `-f` option. The TDE backup path must be different from the database backup path and can be configured in the same way as the database backup path.

```
# odacli create-backupconfig -n nfsbcfg -d nfs -c /nfs_backup_client/ -w
1

```

3. Backup the database using the `odacli create-backup` command. For example, you can take a backup type called Regular-LO with archivelog using the `-ka` option.

Note that you must take the backup with the `-ka` option, if you want to restore the backup as a standby database only for Oracle Database Appliance releases earlier than 19.12. From Oracle Database Appliance release 19.12 and later, the `-ka` option is not mandatory for restoring the database as standby.

```
# odacli create-backup -in mydb -bt regular-10 -ka
{

# odacli describe-backupreport -i 496d6e76-d061-4bc2-ae0a-
b3325eaa15fa > mydb.json
```

Restoring the Database from NFS Backup

Understand the steps to restore a database from NFS location.

Follow these steps to restore a database from an NFS location:

- The NFS client location must be created on both the nodes of the Oracle Database Appliance system as the `root` user.

```
[root@***** ~]# mkdir /nfs_backup_client
```

- At the server system, export the NFS server location to the Oracle Database Appliance system using the IP address of the Oracle Database Appliance system.

```
[root@***** ~]# cat /etc/exports
/nfs_backup_server
<Node0_target_machine_IP>(rw, sync, no_root_squash)
/nfs_backup_server
<Node1_target_machine_IP>(rw, sync, no_root_squash)
```

For Oracle Database Appliance release 19.16 and earlier, you must specify the `no_root_squash` parameter. Starting with Oracle Database Appliance release 19.17, you need not specify the `no_root_squash` parameter.

- Restart the NFS server on the system with the NFS server location.

Command on Oracle Linux 7 systems:

```
[root@***** ~]# /bin/systemctl restart nfs.service
```

Command on Oracle Linux 8 systems:

```
[root@***** ~]# /bin/systemctl restart nfs-server
```

- Restore the database.

```
# odacli irestore-database -r mydb.json
Enter SYS user password:
Retype SYS user password:
{
```

```

Configuring Agent Proxy Settings for Object Store Access

If the Object Store IP address is accessible only through proxy setup by the Oracle Database Appliance server, then define the proxy setting for the agent, so that the agent can access the Object Store.

To create a backup policy that uses Object Store location, the agent must be able to access the Object Store URL.

1. Define the `HttpProxyHost` and `HttpProxyPort` settings in the `update-agentconfig-parameters` command.

```
# odacli update-agentconfig-parameters -n HttpProxyHost -v www-
proxy.test.com -n HttpProxyPort -v 80 -u
```

Job details

```
-----
ID: 0b0cbf9b-b0ab-4523-a096-5da4e48fc825
Description: Update agent configuration parameter values
[HttpProxyHost, HttpProxyPort]
Status: Created
Created: October 23, 2018 4:56:53 PM IST
Message:
```

```
Task Name Start Time End Time Status
-----
```

For more information about the `update-agentconfig-parameters` command usage, see the Oracle Database Appliance Command-Line Interface.

2. Verify that the update succeeded:

```
# odacli describe-job -i 0b0cbf9b-b0ab-4523-a096-5da4e48fc825
```

Job details

```
-----
ID: 0b0cbf9b-b0ab-4523-a096-5da4e48fc825
Description: Update agent configuration parameter values
[HttpProxyHost, HttpProxyPort]
Status: Success
Created: October 23, 2018 4:56:53 PM IST
Message:
```

```
Task Name Start Time End Time Status
-----
```

3. Run the `list-agentconfigParameters` command to view the changes in the proxy settings:

```
# odacli list-agentConfigParameters
```

```
Name Value Description Updated
-----
-----
```

```
HttpProxyHost www-proxy.test.com October 23, 2018 4:56:53 PM IST
HttpProxyPort 80 October 23, 2018 4:56:53 PM IST
HttpsProxyHost https proxy server host October 23, 2018 12:23:21 AM IST
HttpsProxyPort https proxy server port October 23, 2018 12:23:21 AM IST
OSPatchRepos Repo list for OS patching October 23, 2018 12:23:21 AM IST
```

You can now use the Browser User Interface or the command-line interface to create a backup policy to use the ObjectStore location for backup.

Creating a Database Backup Policy

Understand how to create a policy to backup a database to an internal or external Oracle Fast Recovery Area (FRA) location or to the Object Store using the Browser User Interface.

The backup policy defines the backup, including the location where you want to store the backups and the recovery window. Backup to disk requires a lot of disk space (up to two to three times the size of the database).

Follow these steps to create a backup policy from the Browser User Interface:

1. Click the **Database** tab in the Browser User Interface.
2. Click **Backup Policy** in the left navigation to display a list of backup policies.
3. Click **Create Backup Policy**.
4. Enter a name for the backup policy and select the number of days for the recovery window. Select **Enable Crosscheck** to determine if the files on the disk or in the media management catalog correspond to data in the RMAN repository. The **Enable Compression** checkbox is selected by default. Selecting this option ensures backups are compressed. Select one of the following as the backup destination:
 - To backup to disk, select **Internal FRA** as the backup destination.
 - To backup to the cloud, select **ObjectStore** as the backup destination. If you have more than one Object Store, then select the Object Store Credential Name from the list. Enter a name in the Container Name field.
 - To backup to an NFS location, select **External FRA** as the backup destination, and specify the NFS mount point location.
 - To not define a destination, select **None**.

The Backup Policy name must begin with an alpha character and contain only alphanumeric characters.

5. You must specify the **TDE Wallet Backup Location** to associate the backup configuration to a TDE-enabled database.
6. Click **Create**. Click **Yes** to confirm that you want to create the backup policy.

A link to the job appears. When the job completes successfully, the backup configuration is ready.

Update an existing database to attach the backup configuration to the database using the ID or Name. When you attach the backup configuration to a database, the DCS agent schedules daily automatic backups for the database and automatic backups for archive log of the database.

Updating a Database with a Backup Policy

Attach a backup policy to a database to define the database backup attributes and destination.

1. In the Browser User Interface, click the **Database** tab.
2. For the database that you want to modify, select **Modify** in the Actions drop down list.
3. In the Modify Database page, select a backup policy from the **Select Backup Policy** drop down list.
4. Specify and confirm the **Backup Encryption Password**.
5. Click **Modify** to submit the job.
6. Click the **Activity** tab to check the job status.

When the job completes successfully, the backup policy is associated with the database.

Updating a Backup Policy

Use the Browser User Interface to update the recovery window, change the ObjectStore Credential, or change the crosscheck option for a backup policy.

Crosscheck determines if the files on the disk on in the media management catalog correspond to data in the RMAN repository.

1. Click the **Database** tab in the Browser User Interface.
2. Click **Backup Policy** in the left navigation to display a list of backup policies.
3. Expand the **Actions** menu for a backup policy, then click **Update**.
4. To change the recovery window, use the up or down arrow to change the number of days.
5. To enable or disable the crosscheck, select or deselect **Enable Crosscheck**.
6. Click **Update**. Click **Yes** to confirm that you want to update the backup policy.

A link to the job appears. When the job completes successfully, the backup configuration is ready.

Backing Up a Database Using the Browser User Interface

Apply a backup policy to a database, create a manual backup, update a database backup schedule, or update an archive log backup scheduler.

You can use the Browser User Interface or the command-line interface to create a database backup. In the command-line interface, use the command `odacli create-backup` for a specified Database.

Before creating a database backup, you must have a backup policy. The backup policy defines the recovery window and the backup destination. You must associate a backup policy with the database, otherwise you cannot create backups.

Follow these steps to backup a database from the Browser User Interface:

1. In the Browser User Interface, click the **Database** tab.
2. Click a database name to select a database from the list.
3. Review the database information, including the backup policy name and destination details. To select a backup policy for the database, click **Apply Backup Policy**. Select a policy and specify the **Backup Encryption Password**. For TDE-enabled databases, backups are encrypted by default and do not require the RMAN backup encryption password to be specified separately. For databases that do not have TDE enabled, the **Backup Encryption Password** is mandatory for Objectstore backup destination, optional for NFS backup destination and not required for Disk backup destination.
4. Click **Manual Backup, Update Database Backup Schedule** or **Update Archive Log Backup Schedule**.

If the action is disabled, then apply a backup policy.

5. Click **Yes** to confirm the job.

A link to the job appears. When the job completes successfully, the backup is ready. A list of backups appears at the bottom of the page.

Viewing Backup Reports

Understand how you can use the Browser User Interface to view backup reports.

A report is generated when a database backup is performed. The backup report lists the type, location, and date and timestamp of the backup.

1. In the Browser User Interface, click the **Database** tab, then click the database name in the list of databases.

Information about the database appears on the Database Information page.

2. Scroll to the bottom of the page to view a list of Backups.
3. Click the Job ID for a backup to view the Backup Report and more details about the backup.

Recovering a Database Using the Browser User Interface

Understand the recovery options available for recovering a database.

1. In the Browser User Interface, click the **Database** tab, then select a database from the list.
2. On the Database Information page, click **Recover**.
3. On the Recover Database page, select any of the following recovery options:

Recover Full Database to the specified Backup: Select the existing backup from which you want to recover the database

Recover Full Database to the Latest: Select this option to recover the database from the last known good state, with the least possible data loss.

Recover Full Database to the specified Timestamp: Specify the timestamp to recover the database.

Recover Full Database to the System Change Number (SCN): Specify the SCN of the backup from which you want to recover the database.

4. Specify and confirm the **Backup Encryption Password** for databases without Transparent Database Encryption (TDE) enabled.
5. If the database has TDE enabled, then the **TDE Wallet Backup Location** and **TDE Password** fields are displayed.
6. Click the **Activity** tab to check the job status.

When the job completes successfully, the database is recovered as per the specified recovery options.

Deleting a Backup Using the Browser User Interface

Use the Browser User Interface to delete database backups.

You can delete Level-0, Level-1, and Archive Log backups anytime. To delete long term backups, you must check the Backup Report for the database to determine when the backup is obsolete.

1. Click the **Database** tab in the Browser User Interface.
2. Click the database name, in blue font, to display more details about the database for which you want to delete the backup.
3. Click **Delete Backups**.
4. Select the Backup type you want to delete, whether Level-0, Level-1, and Archive Log backup or long Term backup, then click **Start**. Click **Yes** to confirm that you want to delete the backup.

A link to the job appears. When the job completes successfully, the backup is deleted.

Deleting a Backup Policy

Use the Browser User Interface to delete a database backup policy.

1. Click the **Database** tab in the Browser User Interface.
2. Click **Backup Policy** in the left navigation to display a list of backup policies.
3. Expand the **Actions** menu for a backup policy, then click **Delete**. Click **Yes** to confirm that you want to delete the backup policy.

A link to the job appears. When the job completes successfully, the backup policy is deleted.

Using the CLI to Backup, Restore, and Recover

Use the command-line interface to backup, restore, and recover databases.

- [Preparing for Database Backup to Disk](#)
Use the command-line interface to create a policy to backup a database to the Oracle Fast Recovery Area (FRA) of a disk.

- [Preparing for Database Backup to NFS Location](#)
Use the command-line interface to create a policy to backup a database to an External FRA (NFS Location).
- [Preparing for Database Backup to Oracle Cloud](#)
Create a backup configuration to backup a database to Oracle Cloud Infrastructure Object Storage.
- [Backing Up a Database with the CLI](#)
Create a level 0, level 1, LongTerm database backup, or archivelog backup with the command-line interface.
- [Recovering a Database with the CLI](#)
Recover the database to the system using a Backup Report, point-in-time recovery (PITR), a system change number (SCN), or from the latest backup time.
- [Restoring a Database with the CLI](#)
You can restore a database to a system from Oracle Object Storage or NFS backup location using a backup report and the command-line interface.
- [Restoring Archivelog with the CLI](#)
You can restore archivelog from one SCN to another SCN, or from one timestamp to another timestamp using the command-line interface.
- [Deleting Backups with the CLI](#)
Delete older, obsolete level 0, level 1, archive log, and long term backups along with obsolete backup reports.

Preparing for Database Backup to Disk

Use the command-line interface to create a policy to backup a database to the Oracle Fast Recovery Area (FRA) of a disk.

You can create a backup policy using the Browser User Interface or the command-line interface. Most of the backup and recovery commands enable you to provide either a resource name or resource ID to identify the database.

Backup to disk or the **Backup to Internal FRA** option in the Browser User Interface, requires a lot of disk space (up to two to three times the size of the database).

Follow these steps to create a backup policy through the command-line interface:

1. Create a BackupConfig object (backup configuration) using the command `odacli create-backupconfig`.

The backup configuration defines the backup, including the location where you want to store the backups and the recovery window.

The following example creates a backup configuration named `mkgldailydisk` with a backup to `disk` and a 1 day recovery window.

```
# odacli create-backupconfig -d Disk -n mkgldailydisk -w 1
```

2. Check the job status.

```
# odacli describe-job -i job_id_from_step1
```

When the job completes successfully, the backup configuration is ready.

3. Update an existing database to attach the backup configuration to the database using the ID or Name.

When you attach the backup configuration to a database, the DCS agent schedules daily automatic backups for the database and automatic backups for the archivelog.

The following example uses the Database Resource ID and Backup Configuration ID:

```
# odacli modify-database -i d3c4d8f6-5eb7-4f9e-ab27-7bdd5013ac90 -  
bi 9d942e0a-ba00-4cbc-9bfb-0de83ed279e5 -bp
```

The following example uses the Database Resource Name, `mydb` and the Backup Configuration Name, `mydb`:

```
# odacli modify-database -in mydb -bin mybcfg
```

Preparing for Database Backup to NFS Location

Use the command-line interface to create a policy to backup a database to an External FRA (NFS Location).

You can create a backup policy using the Browser User Interface or the command-line interface. Most of the backup and recovery commands enable you to provide either a resource name or resource ID to identify the database.

Backup to NFS location or the **Backup to External FRA** option in the Browser User Interface, requires creation of an NFS mount point.

Follow these steps to create a backup policy through the command-line interface:

1. Create a BackupConfig object (backup configuration) using the command `odacli create-backupconfig`.

The backup configuration defines the backup, including the location where you want to store the backups and the recovery window.

The following example creates a backup configuration named `mkgldailynfs` with a backup to `disk` and a 1 day recovery window.

```
# odacli create-backupconfig -d NFS -n mkgldailynfs -c absolute-  
path-to-parent-directory-for-NFS-destination -w 1
```

2. Check the job status.

```
# odacli describe-job -i job_id_from_step1
```

When the job completes successfully, the backup configuration is ready.

3. (Optional) Update an existing database to attach the backup configuration to the database using the ID or Name.

When you attach the backup configuration to a database, the DCS agent schedules daily automatic backups for the database and automatic backups for the archivelog.

The following example uses the Database Resource ID and Backup Configuration ID:

```
# odacli modify-database -i d3c4d8f6-5eb7-4f9e-ab27-7bdd5013ac90 -bi  
9d942e0a-ba00-4cbc-9bfb-0de83ed279e5 -bp
```

The following example uses the Database Resource Name, `mydb` and the Backup Configuration Name, `mydb`:

```
# odacli modify-database -in mydb -bin mybcfg -bp
```

The `-bp` option to specify the backup password is optional and is not applicable for TDE-enabled databases.

- [Configuring an NFS Backup Location](#)
Configure Network File System (NFS) backup location, to set up the NFS backup and mount the NFS client location on Oracle Database Appliance.

Preparing for Database Backup to Oracle Cloud

Create a backup configuration to backup a database to Oracle Cloud Infrastructure Object Storage.

Before you can backup to Oracle Object Storage, you must sign up for an Oracle Cloud Infrastructure Object Storage account and know your Oracle Object Storage credentials. When you create an Oracle ObjectStoreSwift object, the command creates and stores the credential details in the system and stores the password in an encrypted Oracle wallet. The Oracle wallet contains the Oracle Object Storage password.

Go to the Oracle Store to sign up for Oracle Cloud Infrastructure Object Storage.

1. Create an Oracle ObjectStoreSwift object using the command `create-objectstoreswift`.

```
# odacli create-objectstoreswift -e swift end point URL -n Object Store  
Swift name -t Object Store tenant name -u Object Store user name
```

For example:

```
# odacli create-objectstoreswift -e https://  
swiftobjectstorage.r1.oracleiaas.com/v1 -n ossn1 -t mytenant -u  
user.name@example.com
```

The output includes an `objectstoreswift` Resource ID to identify an ObjectStoreSwift credential.

2. Create a BackupConfig object (backup configuration) using the command `odacli create-backupconfig`.

The backup configuration defines the backup, including the location (container) where you want to store the backups, the recovery window, and the credentials that are defined in your encrypted Oracle wallet.

The following example creates a backup configuration named `hr_7d_cloud` with a backup to the `ObjectStore`. The following backup parameters are defined: the container is `hr_bucket`, `crosscheck` is not enabled, the recovery window is 7 days, and the `ObjectStoreSwift` Resource ID is provided, which attaches the `ObjectStoreSwiftObject` to the backup configuration.

```
# odacli create-backupconfig -n hr_7d_cloud -d ObjectStore -w 7 -
o b974f006-5503-4949-ab6c-6f1a56e4ac37 -c hr_bucket -no-cr
```

 **Note:**

If the `ObjectStoreSwift` Object was not created with valid credentials, then creating the backup configuration will fail.

3. Check the job status.

```
odacli describe-job -i job_id_from_step2
```

When the job completes successfully, the backup configuration is ready.

4. Update an existing database to attach the backup configuration to the database.

When you attach the backup configuration to a database, the DCS agent schedules daily automatic backups for the database, automatic backups for the archivelog, and weekly deletion of obsolete backups and backup reports for the database.

```
# odacli modify-database -i e3c4d8f6-5eb7-4f9e-ab27-7bdd5013ac10 -
bi 7d942e0a-ba00-4cbc-9bfb-0de83ed279e5 -bp
```

 **Note:**

When you create a new database, you have the option to associate the database with any type of backup configuration.

Backing Up a Database with the CLI

Create a level 0, level 1, LongTerm database backup, or archivelog backup with the command-line interface.

You can create a database backup in the Browser User Interface or with the command-line interface. When you attach a backup configuration object to a database, the DCS agent automatically schedules daily backups for the database. The day and time are based on the Oracle Database Appliance time zone. The `AutoSchedule` triggers a level 0 Backup every Sunday, a level 1 the other 6 days of the week, and an archivelog backup every 30 minutes. Use the command `odacli update-schedule` to disable or change the scheduled backup time.

To create a Long Term database backup, or a level 0 or level 1 backup outside of the automatic backups, use the command `odacli create-backup`.

 **Note:**

To recover a database, there must be a level 0 backup taken, so that the backup report contains information about the base backup. Restoring a database to the same system with a different DB Name and DB Unique Name or to another system does not always require a long term database backup report. You can use archivelog, or level 0, or level 1 backup reports as well. If you use the archivelog backup report, a prior database backup must exist. To restore a database to another system, you must have a long term database backup in Oracle Object Storage.

1. Verify that a backup configuration object is associated with the database.
2. Create a single backup, outside of the automatic backups, using the command `odacli create-backup`.

Use the Database Resource ID or Database Name to identify the database to backup, specify the type of backup, and use a tag to create a name for the backup. You can use up to 30 alphanumeric characters for the backup name tag. For example, create a level 0 backup named `2018Jan02_HRLevel10` for resource ID `20576eb1-bc32-4e34-bf97-fda0b60ca15b`

```
# odacli create-backup -i 20576eb1-bc32-4e34-bf97-fda0b60ca15b -bt
Regular-L0 -t 2018Jan02_HRLevel10
```

When the job finishes, a backup report is generated for the backup. The report contains all of the metadata required to recover a database.

3. (Optional) Display a list of backup reports.

```
# odacli list-backupreports
```

Recovering a Database with the CLI

Recover the database to the system using a Backup Report, point-in-time recovery (PITR), a system change number (SCN), or from the latest backup time.

Recovering a database in Oracle Database Appliance is a full RMAN database recovery.

Recovering from a backup report requires JSON input for the backup report.

When recovering a TDE-enabled database, you need not specify the backup password.

1. Display a list of backup reports and locate the latest Backup Report for the database and save the Backup Report ID.

```
# odacli list-backupreports
```

2. Use the Backup Report ID to display the details of the Backup Report. Determine how you want to recover the database: PITR, SCN, or Latest and locate the needed information in the Backup Report.

```
# odacli describe-backupreport -i 7fbb06bf-e3a3-4aed-

  "compressionAlgo" : "MEDIUM",
  "cpuPool" : null,
  "numberOfCores" : null
}

```

3. To recover from a backup report, based on SCN, identify the database ID and the backup report for recovery.

In the following example, the JSON input file for the backup report is `backupreport.json`.

```
# odacli recover-database -i b5fc646e-01a6-4c8b-8286-7633346c4 -br
backupreport.json
```

4. To recover based on PITR, identify the database ID and the date and time stamp for recovery.

```
# odacli recover-database -i b5fc646e-01a6-4c8b-8286-7633346c4 -t PITR -r
01/08/2018 12:57:33
```

5. To recover based on SCN, identify the database ID and the SCN number.

```
# odacli recover-database -i b5fc646e-01a6-4c8b-8286-7633346c4 -t SCN -s
392375947
```

6. To recover based on the latest backup, identify the database ID and use the Latest option.

```
# odacli recover-database -i b5fc646e-01a6-4c8b-8286-7633346c4 -t Latest
```

7. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

```
# odacli describe-job -i jobId
```

When the job completes successfully, the recovery is complete.

Note:

Use the `-p` option only if the database backup is encrypted using the RMAN backup password. The `-p` option is not applicable for TDE-enabled databases.

Restoring a Database with the CLI

You can restore a database to a system from Oracle Object Storage or NFS backup location using a backup report and the command-line interface.

When you restore a database, environment and validation checks and setup tasks are performed. Restoring a database requires a number of tasks and configuration details, such as creating database storage, Oracle Home, recreating the control file, registering the database, and establishing RMAN restore and recovery. An Oracle Database Appliance backup report is generated for each backup and contains the metadata required to restore a database. The report is designed to help you to quickly and efficiently restore a database.

You can restore a database from one appliance to another appliance, or to the same appliance when the source database is deleted:

- To restore to a different system, copy the backup report generated by the command `odacli create-backup` to any folder on the other machine and use the command `odacli irestore-database` with the backup report. You must provide the complete location of the backup report when you run the command `odacli irestore-database`.
- To restore to the same system, delete the source database and use the backup report generated by the command `odacli create-backup`.

To restore a database from Object Store backup, the backup report corresponding to that backup must be present in the target system. Also an ObjectStoreSwift object with the credential that can access the Object Store backup must be created and specified while restoring the database.

Note:

For Standard Edition Oracle Database 19c or later, you cannot restore Oracle RAC or Oracle RAC One Node Database.

Follow these steps to restore a database using the command-line (CLI):

1. Display a list of backup reports and locate the latest Backup Report in Oracle Object Storage or NFS for the database and save the Backup Report ID.

```
# odacli list-backupreports
```

2. Use the Backup Report ID to display the details of the latest Backup Report.

```
# odacli describe-backupreport -i 7fbb06bf-e3a3-4aed-  
b617-4d1cd3d33387  
{  
  "id" : "7fbb06bf-e3a3-4aed-b617-4d1cd3d33387",

d2ea7bd3d7b9_20201022075238.json",
"compressionAlgo" : "MEDIUM",
"cpuPool" : null,
"numberOfCores" : null
}
```

3. (Optional) If you need to generate a new backup report, use the command `odacli create-backup`.

```
# odacli create-backup
```

4. Locate the Swift Object Store credential ID for the database backup.

```
# odacli list-objectstoreswifts
```

5. Save the backup report from Step 2, as a JSON file in any directory on the appliance. For example, `backupreport.json`.
6. Restore the database to the system using the JSON file in the command `odacli irestore-database`. You must specify the absolute path to the JSON file.

Run the command, then enter the SYS user password when prompted.

```
# odacli irestore-database -r backupreport.json -oid Object Store ID
```

To restore a TDE-enabled database, the TDE wallet password must be provided. You must specify the `-t` option in the command `odacli irestore-database`. If source database is TDE enabled, then the target database which was restored will also have TDE enabled.

7. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

```
# odacli describe-job -i jobId
```

Restoring Archivelog with the CLI

You can restore archivelog from one SCN to another SCN, or from one timestamp to another timestamp using the command-line interface.

Follow these steps to restore archivelog using the command-line (CLI):

- Restore archivelog from one SCN to another SCN, or from one timestamp to another timestamp:

```
# odacli restore-archivelog -fs from_scn -ts to_scn
# odacli restore-archivelog -ft from_timestamp -tt to_timestamp
```

Deleting Backups with the CLI

Delete older, obsolete level 0, level 1, archive log, and long term backups along with obsolete backup reports.

For level 0, level 1, and archive log backups, the recovery window defined in the Backup Configuration determines when the backup is obsolete. The ranges are as follows:

- Backup to disk: between 1 and 14 days

- Backup to the Oracle Object Storage: between 1 and 31 days

For Long Term backups to the Oracle Object Storage or NFS, view the `keepDays` attribute of the Backup Report for a database to determine when the backup is obsolete. To delete Long Term Backup, the Database Resource ID or Database name and the Backup Report are required.

Follow these steps to delete database backups using `odacli` commands:

1. Display a list of all backup reports.

```
# odacli list-backupreports
```

2. Obtain the Database ID and type of backup.

```
# odacli describe-backupreport -i Backup Report ID
```

3. To delete obsolete level 0, level 1, and archivelog backups along with obsolete backup reports, use the Database ID or Database Name to delete the backup.

```
# odacli delete-backup -i 20576eb1-bc32-4e34-bf97-fda0b60ca15b
```

4. To delete Long Term backups, use the Backup Report from the JSON file to delete the backup.

In the following example, the JSON input file for the backup report is `backupreport.json`.

```
# odacli delete-backup -i 20576eb1-bc32-4e34-bf97-fda0b60ca15b -br  
backupreport.json
```

About Oracle Data Guard on Oracle Database Appliance

Oracle Database Appliance provides client interface through ODACLI commands for easy configuration and management of Oracle Data Guard for high availability, data protection, and disaster recovery.

Oracle Data Guard provides a comprehensive set of services that create, maintain, manage, and monitor one or more standby databases to enable production Oracle databases to survive disasters and data corruptions. Oracle Data Guard maintains these standby databases as copies of the production database. Then, if the production database becomes unavailable because of a planned or an unplanned outage, Oracle Data Guard can switch any standby database to the production role, minimizing the downtime associated with the outage. Oracle Data Guard can be used with traditional backup, restoration, and cluster techniques to provide a high level of data protection and data availability. Oracle Data Guard transport services are also used by other Oracle features such as Oracle Streams and Oracle GoldenGate for efficient and reliable transmission of redo from a source database to one or more remote destinations.

With Oracle Data Guard, administrators can optionally improve production database performance by offloading resource-intensive backup and reporting operations to standby systems.

The ability to create clone databases on a standby system enables you to set up test or development environments based on your standby databases. Since standby systems are not production systems, they are a better choice for seeding test or development environments.

Note:

Oracle Database Enterprise Edition includes Oracle Data Guard.

Configuring Oracle Data Guard on Oracle Database Appliance

Oracle Database Appliance enables you to set up Oracle Data Guard using ODACLI commands.

Prerequisites for Oracle Database Guard Configuration

Before you begin:

- Oracle recommends running the primary and the standby databases on separate Oracle Database Appliance hardware, so ensure that you have at least two separate Oracle Database Appliance machines.
- Oracle recommends that the primary and standby systems have the same Oracle Database Appliance configuration. The database must have identical configuration for database version and storage (both must have either Oracle ASM or Oracle ACFS storage) to avoid any unpredictability with the database switch roles.

- The primary and standby systems must be the same Oracle Database Appliance release, and must be on Oracle Database Appliance release 19.8 or later.
- If you have customized the operating system, then ensure that environments on both machines are identical.
- Ensure that your deployment follows Oracle Maximum Availability Architecture (MAA) best practices. See the Oracle Maximum Availability Architecture (MAA) page on Oracle Technology Network.
- If you decide to use Oracle ObjectStore for backup and recovery, then you must configure access for both the primary and standby systems.

Setting up Backup and Recovery for Oracle Database Guard Configuration

You can use either Object Store or External FRA (NFS) to set up the backup for primary and standby databases when configuring Oracle Data Guard on Oracle Database Appliance. A backup is necessary to instantiate a standby database.

To set up Object Store backup (recommended):

1. Configure the agent proxy settings:

```
# odacli update-agentconfig-parameters -n HttpProxyHost -v www-  
proxy.test.com -n HttpProxyPort -v 80 -u
```

For more information, see the topic *Configuring Agent Proxy Settings for Object Store Access* in this guide.

2. Create the Object Store credentials on both primary and standby systems:

```
# odacli create-objectstoreswift -e swift_end_point_URL -n Object  
Store_Swift_name -t Object_Store_tenant_name -u Object_Store_user_name
```

For example:

```
# odacli create-objectstoreswift -e https://swiftobjectstorage.us-  
ashburn-1.oraclecloud.com/v1 -n aaa -t test_user -u testuser
```

3. View the Object Store Swift name:

```
# odacli list-objectstoreswifts
```

4. Create the backup configuration:

```
# odacli create-backupconfig -d objectstore -c testuser -on aaa -w 7 -cr -  
n backupConfig7days
```

5. Associate the backup configuration with the database:

```
# odacli modify-database -in test_db -bin backupConfig7days -bp
```

To set up NFS backup:

1. Create the backup configuration. For High-Availability deployments, run the command on one node only.

```
# odacli create-backupconfig -n nfsbkup -w 10 -d NFS -c /u01/
nfs_backup
```

2. Associate the backup configuration with the database:

```
# odacli modify-database -in test_db -bin nfsbkup
```

Configuring Oracle Data Guard using ODACLI commands

Follow these steps:

1. Take a backup of your primary database to Object Store or External FRA (NFS).

```
# odacli create-backup --backupType Regular-L0 -in primary_DB
```

For example:

```
# odacli create-backup --backupType Regular-L0 -in test_db
```

2. Save the backup report:

```
# odacli describe-backupreport -i eba406c7-ae46-4d1d-
a1e5-3e985397b171 > backup_report_test_db_0620.json
```

The backup report ID is the ID of the backup created in step 1 and can be obtained by running the `odacli list-backupreports` command.

3. Copy the backup report to the standby system and restore the backup to a standby database.

```
# odacli irestore-database -ro STANDBY
```

If you want to use Object Store, then specify the Object Store location:

```
# odacli irestore-database -r backup_report.json -u dbUniqueName -
on objectStoreName -bp -ro STANDBY
Rman Backup Encryption Password(s). Multiple passwords needs to be
comma separated.:
Password for SYS user:
```

In the above command, specify the `dbUniqueName` of the standby system.

If your backup option is NFS, then specify the NFS location:

```
odacli irestore-database -r backup_report.json -u dbUniqueName -ro
STANDBY
Password for SYS user:
```

4. Configure Oracle Data Guard, by running the `odacli configure-dataguard` command on the primary system. Provide the values for your configuration through the interactive command line interface.

In the interactive CLI configuration steps, the parameters are as follows:

- Standby site address is IP address or host name of the standby host. Provide the fully qualified domain name and hostname if the primary and the standby systems are in the same domain and DNS is configured.
- Select Oracle Data Guard protection modes to meet availability, performance and data protection requirements. Oracle Data Guard Protection Modes are Maximum Availability, Maximum Performance, and Maximum Protection. The log transport modes are ASYNC, SYNC, and FASTSYNC. You can select the following combinations of protection modes and transport types:

Table 12-1 Oracle Data Guard protection modes and transport modes

Protection Mode \ Transport Type	ASYNC	FASTSYNC**	SYNC
MAXPERFORMANCE	Y*	Y	Y
MAXAVAILABILITY	N	Y	Y*
MAXPROTECTION	N	N	Y*

* in the table indicates the default supported pair and ** FASTSYNC mode is available only in Oracle Database 12.1 or later.

```
# odacli configure-dataguard

Viewing Oracle Data Guard Status on Oracle Database Appliance

View Oracle Data Guard status using ODACLI commands.

Viewing Oracle Data Guard Status using ODACLI commands

Follow these steps:

- To view the status of primary and standby databases in your Oracle Data Guard configuration, use the following command:

```
# odacli list-dataguardstatus
```

- To view the status of your specific Oracle Data Guard configuration, use the following command:

```
# odacli describe-dataguardstatus -i 5f0ed48a-366d-454c-a389-
fe367772dbb7
```

For more information about these command options, see the *Oracle Database Appliance Command Line Reference* chapter in this guide.

Related Topics

- [odacli Oracle Data Guard Commands](#)
Use ODACLI commands to configure and manage Oracle Data Guard in your Oracle Database Appliance deployment.

Performing Oracle Data Guard Operations

Perform failover, switchover, and reinstate operations on Oracle Data Guard using ODACLI commands.

Performing Oracle Data Guard operations using ODACLI commands

Follow these steps:

- To switch roles between the primary database and standby database in your Oracle Data Guard configuration, run the following command on the **primary** system:

```
# odacli switchover-dataguard -i dg_ID -u  
standby_db_unique_name_to_switchover
```

For example:

```
# odacli switchover-dataguard -i 75f23ce0-006a-4aeb-ba6d-b4b60275c19 -u  
test_db2
```

Confirm that the switchover of roles completed successfully:

```
# odacli describe-dataguardstatus -i 75f23ce0-006a-4aeb-ba6d-b4b60275c19
```

- A failover provides for transitioning a standby database in your configuration to take over the primary database role, if all instances of an Oracle RAC primary database fail, or are unreachable.

To failover a standby database to the primary database in your Oracle Data Guard configuration, run the following command on your current **standby** system:

```
# odacli failover-dataguard -i dg_ID -u  
standby_db_unique_name_to_failover_to
```

For example:

```
# odacli failover-dataguard -i 75f23ce0-006a-4aeb-ba6d-b4b60275c19 -u  
test_db2
```

Confirm that the requested database failover to the new primary database has completed successfully:

```
# odacli describe-dataguardstatus -i 75f23ce0-006a-4aeb-ba6d-b4b60275c19
```

- To reinstate a failed primary database after a failover and convert it to a new standby database in your Oracle Data Guard configuration, run the following command on your new primary system:

```
# odacli reinstate-dataguard -i dg_ID -u db_unique_name_to_reinstate
```

For example:

```
# odacli reinstate-dataguard -i 75f23ce0-006a-4aeb-ba6d-b4b60275c19
-u test_db2
```

Confirm that the requested database is reinstated as a new standby database:

```
# odacli describe-dataguardstatus -i 75f23ce0-006a-4aeb-ba6d-
b4b60275c19
```

For more information about these command options, see the *Oracle Database Appliance Command Line Reference* chapter in this guide.

Use ODACLI commands to configure and manage Oracle Data Guard in your Oracle Database Appliance deployment.

Creating an Oracle Data Guard Network

Create an Oracle Data Guard network and associate it with a database using ODACLI commands.

Configuring an Oracle Data Guard Network using ODACLI commands

You can configure Oracle Data Guard using a network of type Public, Database, or Dataguard.

Follow these steps:

1. Create the network:

```
# odacli create-network -n btbond1 -t VLAN -p 192.209.10.227 -w
Dataguard -no-d -s 255.255.255.240 -v 369 -g 192.209.10.225
```

2. View the new network:

```
# odacli list-networks
```

ID	Name
NIC	Interface Type Subnet Mask Gateway
VLAN ID	Node Networks
836cfa4b-5d2c-45e3-a62d-099fc7c57984	Private-network
priv0	INTERNAL 255.255.255.240 [IP Address on node0: 192.168.16.24]
1a312239-761d-4321-84d2-8da406f21e5c	Public-network
btbond1.359	VLAN 255.255.255.240 10.209.10.65
359	[IP Address on node0: 192.209.10.69]
f279ac96-5a4a-4b73-86af-1afb6ae5d4	vlan369

```
btbond1.369 VLAN 255.255.255.240 10.209.10.225 369
[ IP Address on node0: 192.209.10.227]
```

3. To attach a network of type Dataguard to a database:

```
# odacli modify-database -in test_db -an vlan369
```

For more information about these command options, see the *Oracle Database Appliance Command Line Reference* chapter in this guide.

- [odacli Oracle Data Guard Commands](#)
Use ODACLI commands to configure and manage Oracle Data Guard in your Oracle Database Appliance deployment.

Migrating an Oracle Database from One System to Another Using Integrated Oracle Data Guard

Understand how you can use Integrated Oracle Data Guard to migrate an Oracle Database from one system to another.

Migrating Oracle Data Guard Database using ODACLI commands

If your database is on an old Oracle Database Appliance hardware model, and you want to move your deployment to a new Oracle Database Appliance hardware, then you can use your Oracle Data Guard configuration on Oracle Database Appliance to migrate from one system to another. The same steps can also be applied to migrate an Oracle Database from an Oracle Database Appliance bare Metal system to a DB system in a KVM deployment, or from one DB system in a KVM deployment to another DB system.

Before you begin:

- Oracle recommends running the primary and the standby databases on separate Oracle Database Appliance hardware, so ensure that you have at least two separate Oracle Database Appliance machines.
- The primary and standby systems must be the same Oracle Database Appliance release, and must be on Oracle Database Appliance release 19.8 or later. The instances on the primary and standby databases must have similar configuration for database parameter settings including database version, memory, CPU, networking, and storage (Oracle ASM or Oracle ACFS), thus avoiding any unpredictability when the databases switch roles.
- If you have customized the operating system, then ensure that environments on both machines are identical.
- Ensure that your deployment follows Oracle Maximum Availability Architecture (MAA) best practices.

Follow these steps:

1. Take a backup of your primary database to Object Store or External FRA (NFS).

```
# odacli create-backup primary_DB
```

For example:

```
# odacli create-backup --backupType Regular-L0 -in test_db
```

2. Save the backup report:

```
# odacli describe-backupreport -i eba406c7-ae46-4d1d-
ale5-3e985397b171 > backup_report_test_db_0620.json
```

The backup report ID is the ID of the backup created in step 1 and can be obtained by running the `odacli list-backupreports` command.

3. Copy the backup report to the standby system and restore the backup to a standby database.

```
# odacli irestore-database -ro STANDBY
```

If your backup option is Object Store, then specify the Object Store location:

```
# odacli irestore-database -r backup_report.json -u dbUniqueName -
on objectStoreName -bp -ro STANDBY -dh
Password for SYS user:
Rman Backup Encryption Password(s). Multiple passwords needs to be
comma separated.:
```

If your backup option is NFS, then specify the NFS location:

```
odacli irestore-database -r backup_report.json -u dbUniqueName -ro
STANDBY
Password for SYS user:
```

4. Configure Oracle Data Guard, by running the following command on the primary system:

```
# odacli configure-dataguard
Standby site address: test_domain
root@test_domain's password:
BUI username for Standby site. If Multi-user Access is disabled on
Standby site, enter 'oda-admin';
otherwise, enter the name of the user who has irestored the Standby
database (default: oda-admin):
BUI password for Standby site:
Database name for Data Guard configuration: test_db
Primary database syspassword:
*****
*****
Data Guard default settings
Primary site network for Data Guard configuration: Public-network
Standby site network for Data Guard configuration: Public-network
Primary database listener port: 1521
Standby database listener port: 1521
Transport type: ASYNC
Protection mode: MAX_PERFORMANCE
```

```
Data Guard configuration name: test_dg
Active Data Guard: disabled
Do you want to edit this Data Guard configuration? (Y/N, default:N):

Related Topics

- [odacli Oracle Data Guard Commands](#)
Use ODACLI commands to configure and manage Oracle Data Guard in your Oracle Database Appliance deployment.

Patching Oracle Data Guard Databases on Oracle Database Appliance

Understand how you can patch primary and standby databases on Oracle Data Guard using ODACLI commands.

Prerequisites for patching Oracle Data Guard primary and standby databases using ODACLI commands

Before patching the database homes, upload the Oracle Database clone files for the database version, to the repository. See *Updating Oracle Database Appliance Repository with Database Clone Files Using the CLI* for the procedure to update the repository with the latest Oracle Database clone files. Also ensure that the primary Oracle Database Appliance system and the standby Oracle Database Appliance system are on the same Oracle Database Appliance release. It is recommended that the two systems be on the latest Oracle Database Appliance release. See *Patching Oracle Database Appliance Bare Metal Systems Using the Command-Line* for the procedure to patch your Oracle Database Appliance deployment.

! Important:

Patch the standby database on Oracle Database Appliance first, before patching the primary database to ensure that all functions are updated correctly. Patching the standby first may affect Oracle Active Data Guard OJVM functionality. Hence, ensure that you patch the standby system first, and then patch the primary system immediately after that.

Patching Oracle Data Guard primary and standby databases using `odacli update-database` command

You can use the `odacli update-database` command to update the databases in your Oracle Data Guard configuration. Follow these steps for patching databases in your Oracle Data Guard configuration:

Patching workflow with primary database A and standby database B:

1. Create prepatch report for database B:

```
# odacli create-prepatchreport -db -dbid databaseId -to dbhomeid
```

2. Update standby database B:

```
# odacli update-database -i databaseId -to dbhomeId
```

3. Switch roles between the primary database and standby database in your Oracle Data Guard configuration, by running the following command on the primary system:

```
# odacli switchover-dataguard -i dgid -u db_A
```

4. Create prepatch report for database A:

```
# odacli create-prepatchreport -db -dbid databaseId -to dbhomeid
```

5. Update database A:

```
# odacli update-database -i databaseId -to dbhomeid
```

6. Switch roles again between the primary database and standby database in your Oracle Data Guard configuration, by running the following command on the primary system:

```
# odacli switchover-dataguard -i dgid -u db_A
```

7. Create a prepatch report for the datapatch for database A:

```
# odacli create-prepatchreport -dp -dbid databaseId
```

8. Apply datapatch on database A:

```
# odacli update-database -i databaseId -dp
```

For more information about these command options, see the *Oracle Database Appliance Command Line Reference* chapter in this guide.

Patching Oracle Data Guard primary and standby databases using `odacli update-dbhome` command

Follow these steps to patch the databases in your Oracle Data Guard configuration on Oracle Database Appliance:

1. Run the following command on the standby database:

```
# odacli update-dbhome
```

2. After patching job on the standby database is successful, run the following command on the primary database:

```
# odacli update-dbhome
```

3. Confirm that the patching jobs are successful:

```
# /opt/oracle/dcs/bin/odacli list-jobs
```

4. Confirm the existing Data Guard configuration is working properly by running the following command on both primary and standby systems:

```
odacli describe-dataguardstatus -i dgid
```

For more information about these command options, see the *Oracle Database Appliance Command Line Reference* chapter in this guide.

Upgrading Oracle Data Guard Databases on Oracle Database Appliance

Understand how you can upgrade primary and standby databases on Oracle Data Guard using ODACLI commands.

Upgrading Oracle Data Guard primary and standby databases using ODACLI commands

Before upgrading the database homes, upload the RDBMS Clone Files for the database version, to the repository. See *Updating Oracle Database Appliance Repository with Database Clone Files Using the CLI* for the procedure to update the repository with the latest RDBMS Clone Files. Ensure that the primary Oracle Database Appliance system and the standby Oracle Database Appliance system are on the same Oracle Database Appliance release, and on Oracle Database Appliance release 19.8 or later. It is recommended that the two systems be on the latest Oracle Database Appliance release. See *Patching Oracle Database Appliance Bare Metal Systems Using the Command-Line* for the procedure to patch your Oracle Database Appliance deployment.

Follow these steps to upgrade the databases in your Oracle Data Guard configuration on Oracle Database Appliance:

1. Run the following command to disable log transport and apply:

```
EDIT DATABASE primary_database SET STATE='TRANSPORT-OFF';
EDIT DATABASE standby_database SET STATE='APPLY-OFF';
```

2. Upgrade the standby database:

```
# odacli upgrade-database -i standby_databaseId -to destination_DbHomeId
```

3. Upgrade the primary database:

```
# odacli upgrade-database -i primary_databaseId -to destination_DbHomeId
```

4. Run the following command to enable log transport and apply:

```
EDIT DATABASE primary_database SET STATE='TRANSPORT-ON';
EDIT DATABASE standby_database SET STATE='APPLY-ON';
```

5. Confirm the existing Data Guard configuration is working properly by running the following command on both primary and standby systems several times:

```
odacli describe-dataguardstatus -i dgid
```

For more information about these command options, see the *Oracle Database Appliance Command Line Reference* chapter in this guide.

Use ODACLI commands to configure and manage Oracle Data Guard in your Oracle Database Appliance deployment.

Enabling Oracle Active Data Guard on Existing Configurations

Understand how you can enable Oracle Active Data Guard on existing configurations.

Oracle Active Data Guard is licensed option to the Oracle Database Enterprise Edition and enables advanced capabilities that extend the basic Oracle Data Guard functionality.

Oracle Active Data Guard function requires database to be open as read-only while enabling the *redo log apply* option. Follow these steps to enable Oracle Active Data Guard on existing configurations:

1. Modify database to have read-only start option:

```
srvctl modify database -d standby_db_unique_name -startoption "read only"
srvctl stop database -d standby_db_unique_name
srvctl start database -d standby_db_unique_name
```

To check if Oracle Data Guard has read-only start option set, run the following command:

```
srvctl config database -d standby_db_unique_name | grep "Start options"
```

2. Enable redo log apply by running the following PL/SQL commands:

```
ALTER DATABASE RECOVER MANAGED STANDBY DATABASE CANCEL;
ALTER DATABASE RECOVER MANAGED STANDBY DATABASE DISCONNECT FROM
SESSION;
```

Registering Oracle Data Guard on Oracle Database Appliance

Oracle Database Appliance enables you to migrate Oracle Data Guard configuration that were manually configured, and register the configuration metadata with Oracle Database Appliance using ODACLI commands.

Prerequisites for Oracle Database Guard Registration

Before you begin:

- Oracle recommends running the primary and the standby databases on separate Oracle Database Appliance hardware, so ensure that you have at least two separate Oracle Database Appliance machines.
- Oracle recommends that the primary and standby systems have the same Oracle Database Appliance configuration. The database must have identical configuration for database version and storage (both must have either Oracle ASM or Oracle ACFS storage) to avoid any unpredictability with the database switch roles.
- The primary and standby systems must be the same Oracle Database Appliance release, and must be on Oracle Database Appliance release 19.15 or later.
- If you have customized the operating system, then ensure that environments on both machines are identical.
- Ensure that your deployment follows Oracle Maximum Availability Architecture (MAA) best practices. See the Oracle Maximum Availability Architecture (MAA) page on Oracle Technology Network.

Registering Oracle Data Guard using ODACLI commands

Follow these steps:

1. Register Oracle Data Guard with Oracle Database Appliance, in one of the following ways:

Register Oracle Data Guard using interactive mode:

```
[root@node1 ~]# odacli register-dataguard
Standby site address: test_domain
BUI username for Standby site (default: oda-admin):
BUI password for Standby site:
root@node1's password:
Database name for Data Guard configuration: provdbl
Primary database SYS password:
*****
*****
Data Guard default settings
Primary site network for Data Guard configuration: Public-network
Standby site network for Data Guard configuration: Public-network
```

```

Primary database listener port (TCP): 1521
Standby database listener port (TCP): 1521
Transport type: ASYNC
Protection mode: MAX_PERFORMANCE
Data Guard configuration name: provdb1_sproddb
Does the above Data Guard configuration match your actual configuration?
(Y/N, default:N): y
*****
*****
Register Data Guard provdb1_sproddb started

- [About Over-Subscribed CPU Pools](#)
Configure virtual machines so that they do not subscribe to more CPU resources than the resources available in CPU pools.

About CPU Pools

CPU pools enable management of CPU resources on Oracle Database Appliance on both bare metal and KVM deployments. There are three types of CPU pools, that is, BM, VM, and DB system.

Use the BM CPU pool to ensure that the database on a bare metal host runs exclusively on the CPU lists specified in the CPU pool. All Oracle processes are bound to the CPUs in this CPU pool and run only on these CPUs. The bare metal CPU pool is assigned to database by updating the `init.ora` parameter `processor_group_name`.

Use the VM CPU pools to cage and manage CPU resource allocations to workloads for virtual machines. Workloads are isolated by creating CPU pools and assigning or pinning virtual machines to a specific CPU pool. When you pin a virtual machine to a CPU pool, you ensure that the virtual machine uses CPUs in only that CPU pool.

The DB system CPU pool is similar to the VM CPU pool, but it only applies to a DB system.

Resources in CPU pools cannot overlap, that is, CPU pools cannot share CPUs. But one CPU pool can be assigned to multiple databases (BM CPU pool), or VMs (VM CPU pools), or DB systems (shared DB system CPU pools).

Oracle Database Appliance provides ODACLI commands to create, update, modify, and delete CPU pools.

By default, the first core of the socket is reserved and cannot be used by the VM and DB system CPU pools for optimal performance. This behavior is available from release 19.12 and later when NUMA is enabled. If you want to use the first core of the socket in your CPU pool, then use the `--use-reserved-cores` option to enable use of the first core of socket for VM and DB system CPU pools.

About Bare Metal CPU Pools

For new databases, you can attach the new CPU pool using the `create-database` command. For existing databases, use the `modify-database` command to attach the CPU pool to the database. Restart the database manually for changes to take effect. Clone, `irestore` and recover database operations will also try to use the same CPU pool if the CPU pool is used by the source database. Specify the `--cpupool` option to use the new CPU pool. The standby database uses the CPU pool configured for the primary database. Specify the `--cpupool` option in the `irestore-database` command when restoring the backup to the standby site if you want to use a separate CPU pool on the standby site. For more details about the command syntax, see the *Oracle Database Appliance Command Line Interface* chapter in this guide.

About VM CPU Pools

For new VMs, you can attach the new CPU pool using the `create-vm` command. For existing VMs, use the `modify-vm` command to attach or update the CPU pool. Use the `--live` option to apply the changes to a running VM, and use the `--config` parameter to persist the change. For more details about the command syntax, see the *Oracle Database Appliance Command Line Interface* chapter in this guide.

About DB System CPU Pools

Creating a DB system automatically creates an internal DB system CPU pool associated with this DB system. The internal DB system CPU pool is created and managed internally. It cannot be created, modified, or deleted manually. Starting with Oracle Database Appliance release 19.11, you can create a new type of shared DB system CPU pool which can be shared among DB systems. For more details, see the topic *Managing Shared CPU Pool with Database System in a KVM Deployment* in this guide.

About Audit Records for CPU Pools

CPU pool operations history are recorded in audit records metadata and system log for audit purposes. The CPU pool changes include create, modify, delete operations, and attach and detach operations from VMs and databases. The CPU pool audit

records can be queried using `odacli list-auditrecords` and `odacli describe-auditrecord` commands but they can not be changed or deleted. For more details about the command syntax, see the *Oracle Database Appliance Command Line Interface* chapter in this guide.

Understanding the Effect of Changing the CPU Cores on CPU Pool Allocation

You may have changed the CPU core count on Oracle Database Appliance using the `odacli update-cpucore` command. You must assign cores in multiples of two, with a minimum of two cores. If you change the CPU core count, then you can subsequently only increase the CPU core count.

If you change the CPU core count in an Oracle Database Appliance environment which has CPU pools, then the following behavior is seen:

- `odacli create-cpupool` and `odacli modify-cpupool` will always select the online CPUs. Therefore, on both bare metal and KVM deployments, any CPU pool created after running the `odacli update-cpucore` command, will select from the available online CPUs.
- For existing CPU pools on bare metal and KVM deployments, some CPUs can become offline when you run the `odacli update-cpucore` command. Check the CPU pools for any offline CPUs using the `odacli describe-cpupool` command. You can then update the CPU pool to use available ONLINE CPUs by using the `odacli modify-cpupool` command.
- If the databases use a CPU pool and some CPUs become offline, then use the `odacli modify-cpupool` command to update the CPU pool. Restart the databases to use the updated CPU pool.

Related Topics

- [Managing Shared CPU Pool with Database System in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to manage shared CPU pool with database system in a KVM deployment.
- [Oracle Database Appliance Command-Line Interface](#)
The command-line interface has different classes of tools to manage Oracle Database Appliance.

Creating a CPU Pool in a Bare Metal or KVM Deployment

Use ODACLI commands or the Browser User Interface to create a CPU pool in a bare metal or KVM deployment.

Using ODACLI to Create a CPU Pool

Use the command `odacli create-cpupool` to create a CPU pool.

Create a VM CPU pool named `cpupool1` with 6 cores associated to it.

```
# odacli create-cpupool -n cpupool1 -c 6 -vm
```

Using Browser User Interface to Create a CPU Pool

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **CPU Pool** to display the CPU Pool page.
4. Click **Create CPU Pool**.
5. In the Create CPU Pool page, specify the following:
 - **CPU Pool Name:** Name of the CPU pool
 - **CPU Pool Type:** Specify if the CPU pool is for bare metal or virtual system.
 - **Number of CPU Cores:** Number of CPU cores allocated to the pool
 - **Socket to Use:** Specify the sockets to use for the CPU pool.
 - **Configure on:** For high-availability deployments, select the nodes where you want to configure the CPU pool.
 - **Use Reserved CPU Cores:** Select this option to use reserved CPU cores.
6. Click **Create**.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

- [Remapping CPU Pools in a Bare Metal or KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to remap CPU pools in a bare metal or KVM deployment.

Remapping CPU Pools in a Bare Metal or KVM Deployment

Use ODACLI commands or the Browser User Interface to remap CPU pools in a bare metal or KVM deployment.

Using ODACLI to Remap CPU Pools

When you patch the bare metal system to Oracle Database Appliance release 19.12 and later, NUMA is enabled after patching. Then, use the command `odacli remap-cpupools` to remap CPU pools.

See the topic *About Enabling NUMA on Oracle Database Appliance* for more information.

Using Browser User Interface to Remap CPU Pools

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **CPU Pool** to display the CPU Pools page.
4. Click **Remap CPU Pool** on the page. This will remap all CPU pools for NUMA allocation.
5. In the confirmation dialog, select **Force Run** if you want to force the remap operation. Select **Use Reserved CPU Cores** to use reserved CPU cores.
6. Click **Yes** to confirm the action.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Use the `odacli create-cpupool` command to create a new CPU pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Viewing CPU Pools in a Bare Metal or KVM Deployment

Use ODACLI commands or the Browser User Interface to view all CPU pools or details about a CPU pool in a bare metal or KVM deployment.

Using ODACLI to View CPU Pools

The command `odacli describe-cpupool` displays details about a CPU pool. Use the command `odacli list-cpupools` to view all CPU pools in the deployment.

```
# odacli list-cpupools
```

```
# odacli describe-cpupool -n cpupool1
```

Using Browser User Interface to View CPU Pools

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **CPU Pool** to display the CPU Pool page.
4. You can view the list of all configured CPU pools.
5. To view the details of a CPU pool, click on the CPU pool or click on the Actions drop down and select View Details.

Modifying a CPU Pool in a Bare Metal or KVM Deployment

Use ODA CLI commands or the Browser User Interface to modify a CPU pool in a bare metal or KVM deployment.

Using ODA CLI to Modify CPU Pool

Use the command `odacli modify-cpupool` to modify a CPU pool.

```
# odacli modify-cpupool -n cpupool1 -c 10
```

Restart the associated databases to use the updated CPU pool.

Using Browser User Interface to Modify CPU Pool

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **CPU Pool** to display the CPU Pools page.
4. From the Actions drop down list for the CPU pool you want to modify, select **Modify**.
5. In the Modify CPU Pool page, specify any changes in the Number of CPU Cores, and select if you want to apply the changes to running VMs or if you want to force the modify operation. Then click **Modify**.
6. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
7. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Deleting a CPU Pool in a Bare Metal or KVM Deployment

Use ODACLI commands or the Browser User Interface to delete a CPU pool in a bare metal or KVM deployment.

Using ODACLI to Delete CPU Pool

Use the command `odacli delete-cpupool` to delete a CPU Pool.

Delete a CPU pool named `cpupool1`.

```
# odacli delete-cpupool -n cpupool1
```

Using Browser User Interface to Delete CPU Pool

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **CPU Pool** to display the CPU Pool page.
4. From the Actions drop down list for the CPU pool you want to delete, select **Delete**.
5. Click Yes to confirm your choice.
6. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
7. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Viewing CPU Pool Audit Records in a Bare Metal or KVM Deployment

Use ODACLI commands or the Browser User Interface to delete a CPU pool in a bare metal or KVM deployment.

Using ODACLI to View Audit Record Details for CPU Pools

Use the `odacli list-auditrecords` command to list the audit records for a CPU Pool:

```
# odacli list-auditrecords
```

Use the `odacli describe-auditrecord` command to describe the audit record for a CPU Pool.

```
# odacli describe-auditrecord
```

Using Browser User Interface to View Audit Record Details for CPU Pools

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Security** tab.
3. Select **Show Advanced Search** and specify the filters for the CPU audit records details such as the From and To dates, Resource type, Resource name, DCS user name, Operation type, and the number of records to display the CPU Pool details.
4. From the list of audit records displayed, click on the audit record ID for which you to drill down for more details.

About Over-Subscribed CPU Pools

Configure virtual machines so that they do not subscribe to more CPU resources than the resources available in CPU pools.

A CPU resource can belong to one, and only one, CPU pool. You can assign multiple virtual machines to a CPU pool. A CPU pool becomes oversubscribed when the virtual machines that are active in the pool require more CPUs than you configured for the pool. For example, if a CPU pool has four CPUs, then you can start two virtual machines that are defined to use four CPUs each. In this case, the CPU pool is oversubscribed, because each of the four CPUs is supporting two virtual machines.

If you stop one of those virtual machines, but start another one that requires two CPUs, then the CPU pool is still oversubscribed. This is because two of the CPUs are supporting both virtual machines. When oversubscribing a CPU pool, assess the performance of the virtual machines in that pool. Reassign one or more virtual machines to a different CPU pool if sharing an oversubscribed pool degrades performance to unacceptable levels.

Managing an Oracle Database Appliance KVM Deployment

KVM virtualization uses a kernel-based virtual machine (KVM) to create a virtualized environment for your Linux applications.

Understand the Oracle Database Appliance KVM architecture, and procedures to deploy a guest virtual machine, manage high availability, manage CPU pools, and configure network settings for Oracle Database Appliance KVM deployment.

 **Note:**

You cannot enable multi-user access on Oracle Database Appliance DB systems. DB systems do not require role separation since you can create only one database on each DB system.

About Oracle Database Appliance KVM Deployment

You can use Oracle KVM to optimize your system resource use for databases and applications.

You can deploy a Kernel-based Virtual Machine (KVM) virtual platform on Oracle Database Appliance. With Oracle Database Appliance KVM deployments, you can use the capabilities of Oracle KVM to effectively allocate resources to databases and applications running on the same physical Oracle Database Appliance. Rather than simply disabling unnecessary server cores, you can use the excess capacity to host other workloads. This enables consolidation of both databases and applications, while retaining the ease of deployment and management associated with Oracle Database Appliance.

See Also:

For more information about supported operating systems, see the *Oracle Linux KVM User's Guide*: <https://docs.oracle.com/en/operating-systems/oracle-linux/kvm-user/index.html>

The KVM feature provides a set of modules that enable you to use the Oracle Linux kernel as a hypervisor. KVM supports x86_64 processor architecture. By default, KVM is built into the Unbreakable Enterprise Kernel (UEK) release. KVM features are actively developed and may vary depending on platform and kernel release. If you are using Unbreakable Enterprise Kernel, you should refer to the release notes for the kernel release of your Oracle Database Appliance to obtain information about features and any known issues or limitations that may apply. KVM is supported on Oracle Linux 7.

What are the differences between KVM and Oracle VM Virtualization?

Oracle KVM makes it easy to setup and manage the virtualized environment with little virtualization expertise. With the KVM deployment, you can consolidate entire multi-tier environments within a single Oracle Database Appliance system.

The following are some of the advantages of deploying Oracle Database Appliance with the KVM option:

- Deploy database and applications in a single hardware environment.
- Use your CPU cores (and memory) efficiently.
- Use virtual local area networks (VLANs) to provide separate networks to different virtual machines.
- Use VM storage to grow storage for the virtual machine repository.
- Enables easy resource management per VM and maintenance of quality of service (QoS)
- Provides solution-in-a-box with application, middleware, and databases.
- Improves data center efficiency by increasing space utilization and reducing energy consumption and cooling costs.
- Oracle KVM virtualization is available on bare metal deployments of Oracle Database Appliance, whereas Oracle VM virtualization on Oracle Database Appliance requires Virtualized Platform setup.
- Oracle Database Appliance supports KVM on all hardware models, whereas Virtualized Platform deployments using Oracle VM are supported on only Oracle Database Appliance High-Availability models.
- Oracle Database Appliance KVM deployments use Type 2 host operating system-based hypervisor, whereas Oracle Database Appliance Virtualized Platform deployments use Type 1 bare metal hypervisor.
- KVM is the virtualization technology used in Oracle Cloud Infrastructure (OCI), whereas Oracle Database Appliance Virtualized Platform is based on Xen technology.

About Oracle Database Appliance KVM Virtualization Architecture

Review this topic to understand how Oracle Database Appliance KVM deployment works with Oracle Database Appliance hardware.

Oracle Database Appliance KVM deployment provides virtualization technology that enables multiple applications to share the same physical server. The Oracle Database Appliance KVM architecture is engineered specifically to leverage the Oracle Database Appliance hardware capabilities. Oracle Database Appliance KVM stack is integrated with Oracle Clusterware. The KVM resources such as VM storages and Virtual Machines are registered as CRS resources and are automatically managed by CRS for high availability.

The Oracle Database Appliance KVM virtualization architecture uses the virtual machine components shown in the following illustration:

About Virtual Machines and Oracle Database Appliance KVM Deployments

Oracle Database Appliance KVM deployment is designed to run and deploy virtual machines to manage system resources.

Configure virtual machines on Oracle Database Appliance KVM deployment to manage the use of resources, such as the CPU pool, memory, and other shared resources by your application.

Understand the terminology of the various components you need to set up for an Oracle Database Appliance KVM deployment. The ODA CLI tooling handles all the required configuration for your Oracle Database Appliance KVM deployment.

VM Storage

A VM storage is a central location for storing resources that are essential to creating and managing virtual machines. These resources include ISO files (virtual DVD images), virtual machine configuration files, and virtual disks. The VM storage is configured on an Oracle Automatic Storage Management Cluster File System (Oracle ACFS). Oracle Database Appliance KVM uses VM storage to optimize available disk space usage in the environment, and for easy reallocation of virtual machines if a physical server fails. The virtual machine files can be stored on shared disks, providing shared storage for the virtual machines. You can:

- Create one or more virtual machines on the VM storage.
- Use ODA CLI commands to create and manage VM storage, virtual disks, and their virtual machines, and the underlying architecture shown in the illustration.

Virtual Networks

Oracle Database Appliance KVM virtual network supports two type of networks, bridged and bridged-vlan. The above figure is an example of the KVM virtual network on Oracle Database Appliance X8-2 hardware models.

In a bridged network, a Linux bridge is created and the network interface or bond interface, is attached to the bridge. A default bridge network named `pubnet` is created on the public network selected during the appliance deployment. Any VM that wants to access this public network can be attached to this `pubnet` vnetwork. This `pubnet` vnetwork cannot be modified or deleted. In the above diagram, `btbond1` is used for the public network, and default vnetwork `pubnet` is created with `btbond1`. `eth0` of VMs are attached to this `pubnet` vnetwork. Except for the default `pubnet` bridge, no other bridged network is allowed to be created on this public network interface. Additional bridged vnetwork can be created on other interfaces that are not used for the public network. In the above diagram, the `mgmtNet` bridged network is created with `btbond2`. `eth1` of VM3 is attached to this `mgmtNet` vnetwork.

For example:

```
odacli create-vnetwork --name mgmtNet --bridge mgmtNet --type bridged
--interface btbond2 --ip ip_address --gateway gateway --netmask netmask
```

In a bridged-vlan network, VLAN can be created on all available public interfaces, including the interface where public network is already configured. For example, you can create a VLAN on both `btbond1` and `btbond2`. Follow proper procedures to configure the VLAN on the switch before creating the bridged-vlan network. In the figure above, `backupVlan` and `AppsVlan1` are created from `btbond1` and attached to `eth1` and `eth2` of VM1 and VM2 respectively.

For example:

```
odacli create-vnetwork --name backupvlan --bridge backupvlan --type
bridged-vlan --vlan-id 12 --interface btbond1 --ip ip_address --
gateway gateway --netmask netmask
```

vnetwork is not supported on private interfaces and secondary interfaces of the bond interface.

Virtual Disks

In addition to virtual machines, you can create virtual disks in VM storage. Virtual disks provide additional storage options for virtual machines by enabling you to attach additional block storage to your virtual machines. Similarly, you can detach the disk if you no longer need the additional space. You can use virtual disks to expand existing file system storage inside the virtual machine by adding the new virtual disk to an existing logical volume, or by creating a new file system on a virtual disk. Virtual disks can optionally be attached to multiple virtual machines.

Virtual Machines

A *virtual machine* is granted virtual resources, and can be started, stopped, cloned, and restarted independently. By default, virtual machines are created with `autostart` and `failover` enabled for high-availability models. During failover, the VM is automatically started, and there will be attempt to restart once before failing over to a different node on high-availability models. You can enable or disable `autostart` and `failover` using the `odacli modify-vm` command options. The option to `autostart` is also available on single-node Oracle Database Appliance models.

About KVM DB Systems on Oracle Database Appliance

Understand how you can deploy KVM-based DB systems on Oracle Database Appliance to run your Oracle Database environments.

About KVM DB Systems

KVM DB systems enable hard partitioning for Oracle Database licensing, where each KVM DB system has its own CPU pool that is automatically assigned during KVM DB system creation. Oracle Database Appliance simplifies the management of KVM DB systems with the built-in Browser User Interface (BUI) or ODA CLI Command Line Interface (ODACLI).

About KVM DB System Architecture

You can provision and configure a DB system on an Oracle KVM. The database can be a single-instance Oracle Database or an Oracle RAC Database with two instances.

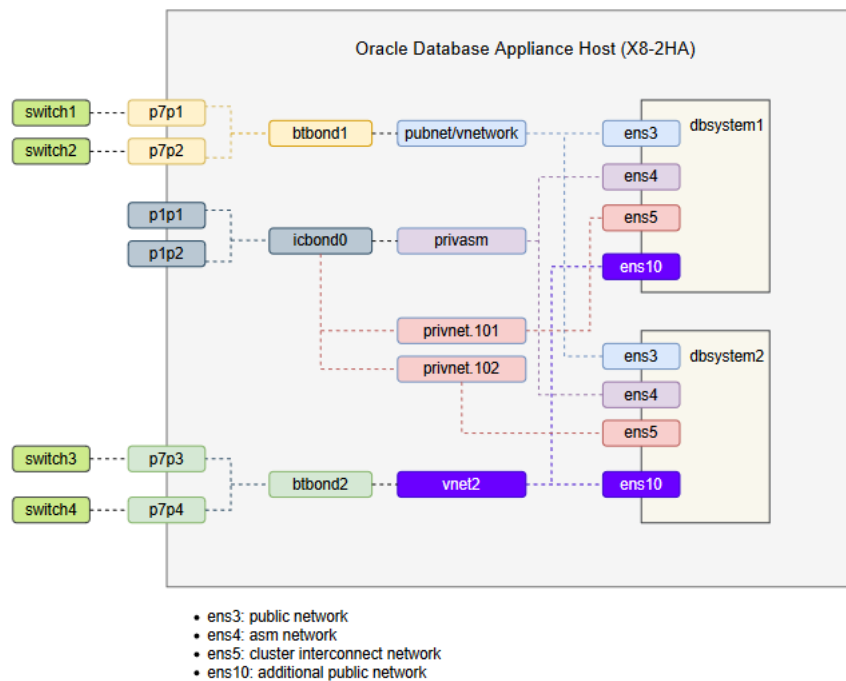

About KVM DB System Networks

Each Oracle Database Appliance DB system on KVM has the following networks created by default:

- **Public network:** The default vnetwork pubnet is created on the bare metal system, based on the public interface you select for Oracle Grid Infrastructure provisioning. When you create a DB system, the public network of the DB system is attached to the pubnet vnetwork created on the bare metal system. The pubnet network is selected by default as the public network of the DB system. You can also create a different vnetwork and use it as public network for the db system.
- **Oracle ASM network:** Oracle Database Appliance DB system uses Oracle ASM to manage the database storage. The Oracle ASM instance runs on bare metal systems,

but not on the DB system. The database on the DB System uses the Oracle ASM listener running on the bare metal system to communicate with Oracle ASM. The Oracle ASM network for example, `privasm` in the network diagram below, is created to facilitate this communication between the database on the DB system and the Oracle ASM listener on the bare metal system. This network is also used for communications between the DCS agent on the DB system and DCS agent on the bare metal system, and for enabling sharing of the central repository on bare metal system with the DB systems.

- **DB system cluster interconnect network:** When DB system is created as a two-node cluster on high-availability model, a cluster interconnect network is created automatically and it is deleted when the DB system is deleted. Each cluster owns its cluster interconnect. Different DB system cannots communicate with each other using cluster interconnect network. `192.168.16.0/24` and `192.168.17.0/24` are reserved for the use of these two internal networks. So, ensure that the IP CIDR `192.168.16.0/24` and `192.168.17.0/24` are available for use by Oracle Database Appliance DB system on KVM.
- Starting with Oracle Database Appliance release 19.12, you can create a vnetwork, either a bridged or bridged-vlan vnetwork, such as `vnet2` in the image below, and then use the `odacli modify-dbsystem` command to attach the vnetwork to the `dbssystem`.

Restrictions When Deploying KVM DB System

The following restrictions apply when you deploy KVM DB system on Oracle Database Appliance:

- You can create only one database for each DB system.
- The shape of the DB system is derived from the shape you select for the database. The CPU cores for the DB system are set as defined in the database

shape. For example, if you select odb4 as the database shape, in which the database uses 4 cores, then the DB system is created with 4 cores. By default, the DB system memory is set to 8 times the CPU cores if not specified during DB system creation. odb1s and odb1 shapes are not supported by the DB system.

- You cannot use Oracle ACFS for storage within the DB system. The database running inside the dbssystem uses Oracle ASM storage. The VM is created on Oracle ACFS based storage.
- On Oracle Database Appliance DB systems, the Oracle Grid Infrastructure software installed is of the same version as the Oracle Database version you install. The version is specified in the DB system JSON payload, with the attribute `version` for `database`.
- You cannot configure CPU pools or run VM commands within the DB system.

Managing Database Systems in KVM Deployment

Use ODACLI to create, list, describe, start, stop, and delete database systems in an Oracle Database Appliance KVM deployment.

- [Creating a DB System in a KVM Deployment](#)

Understand the Oracle Data Guard operations supported on a database system in a KVM deployment.

Creating a DB System in a KVM Deployment

Use ODACLI commands or the Browser User Interface to create a database system in a KVM deployment.

! Important:

Oracle Grid Infrastructure of the same version as the database version is installed in the DB system. Use the command `odacli describe-dbsystem-image` to check the supported database versions for the DB system.

NOT_SUPPORTED:

To create the database system, access control must be enabled in Oracle ASM running on bare metal system. When the bare metal system is newly provisioned or patched to Oracle Database Appliance release 19.20.0.1, access control is already enabled, which is a prerequisite for setting appropriate file ownerships for all the files created in DB systems and on the bare metal system. Before you create the database system, the files on Oracle ASM disk groups that do not have file ownership must be set up with ownership. If ownership is not set, then creation of database system fails. Use the `odacli modify-dbfileattributes` command to set up the file ownerships.

Using ODACLI to Create a KVM Database System

Use the command `odacli create-dbsystem` to create a KVM database system.

Follow these steps:

1. Download the Oracle Database Appliance KVM DB System Image (patch 32451228) from My Oracle Support to a temporary location on an external client. Refer to the release notes for details about the software for the latest release.

```
p32451228_1920010_Linux-x86-64.zip
```

2. Unzip the software — it contains README.html and one or more zip files for the patch.

```
unzip p32451228_1920010_Linux-x86-64.zip  
odacli-dcs-19.20.0.1.0-date-ODAVM-19.20.0.0.zip
```

- Update the repository with the image. The database system version must be the same as the Oracle Database Appliance version.

```
# /opt/oracle/dcs/bin/odacli update-repository -f /tmp/odacli-
dcs-19.20.0.1.0-date-ODAVM-19.20.0.0.zip
```

- Run the `odacli describe-dbsystem-image` command to query the supported Oracle Grid Infrastructure and Oracle Database versions for this database system KVM image. The Oracle Grid Infrastructure version that supports the Oracle Database version is installed.

```
# odacli describe-dbsystem-image
DB System Image details

```

- If the `odacli describe-dbsystem-image` command output shows any component as `not-available` on the system, then download the component with supported versions and run the `odacli update-repository` to import the component to the repository.

To deploy Oracle Database release 19.20.0.1, deploy Oracle Grid Infrastructure release 19.20.0.1. To deploy Oracle Database release 21.8, deploy Oracle Grid Infrastructure release 21.8.

6. Create the `prov.json` file as per examples provided in this chapter. Oracle Database 21c supports only Container Databases (CDB). Ensure that you set the parameter `"isCdb": true`, and provide both the `pdbName` and `pdbAdminUser` in the JSON file if provisioning an Oracle Database 21c dbsystem.
7. Run the `odacli create-dbsystem` command with the `prov.json` file on the host.

```
# odacli create-dbsystem -p prov.json
```

8. If the `odacli create-dbsystem` command prompts ASM ACL setup is not completed, please run `'odacli modify-dbfileattributes'` command, then run the `odacli modify-dbfileattributes` command, and make sure the job finishes successfully before running the `odacli create-dbsystem` command.
9. If the `odacli create-dbsystem` command prompts `css_critical` configuration should be different on both nodes on a high-availability environment, then follow the instructions below to set `css_critical` and ensure that the dbsystem functions properly when interconnect fails.
 - a. Run `crsctl set server css_critical yes` on the first bare metal host. You must restart the Oracle Clusterware stack on the node for the values to take effect.
 - b. Run `crsctl set server css_critical no` on the second bare metal host. You must restart the Oracle Clusterware stack on the node for the values to take effect.
 - c. Run `crsctl get server css_critical` to verify the value. Refer to *Oracle Clusterware Administration and Deployment Guide* for more details about setting `css_critical`.

Using Browser User Interface to Create a KVM Database System

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **DB Systems** to display the DB Systems page.
4. In the page, click **Create DB System**.
5. In the Create DB System page, provide the DB system values.
6. If you want to use an existing configuration file, click **Browse** and select the configuration file. The system information from the file is populated in the relevant fields.
7. In the System Information tab, specify the values as follows.
 - **DB System Name:** Enter the DB System name. The name cannot end with a dash (-). Do not exceed 15 characters.

- **Domain Name:** Enter the domain name.
 - **Region:** Select the region of the world where the Oracle Database Appliance is located.
 - **Time Zone:** Select the time zone where the Oracle Database Appliance is located.
 - **Disk Group for VM Storage:** Select the disk group that is used for hosting the KVM storage. Note that this is different from the database file storage for the database that runs in the KVM, which is displayed automatically from the correct Oracle ASM disk group based on the database file type.
 - **CPU Pool Name:** Select the CPU pool to be associated with the DB system.
 - Select **Force Run** if you want to force the operation. Select **Use Reserved CPU Cores** to use reserved CPU cores.
 - **Memory Size:** Specify the memory to be allocated to the DB system. The memory size can be in KB, MB, GB, or TB. The default is GB.
 - **VM Storage Redundancy:** Specify the redundancy for the VM storage, either **Mirror** or **High**.
 - **System Password** and **Confirm Password:** Enter the system password in both fields. The system password is the password set for UNIX and `root` users. The password must contain at least two characters each from: uppercase letters, lowercase letters, numbers (0-9), and allowed special characters #, - or `_`. The password must have a minimum of 9 characters and a maximum of 30 characters.
 - (Optional) **DNS Servers:** Enter addresses for one or more DNS servers.
 - (Optional) **NTP Servers:** Enter addresses for one or more NTP servers.
 - **Public Network:** Select from the existing virtual networks.
8. In the Network Information tab, specify the client access network details, depending on whether it is a single-node or two-node DB system deployment:
- **Node Name:** For Node0, enter the host name for the primary client access network.
 - **IP Address:** Enter the virtual IP address that is shared between the nodes.
 - **Subnet Mask:** Enter the subnet mask address for the primary client access network.
 - **Gateway:** Enter the gateway address for the primary client access network.
- For two-node deployments, provide the above values for both nodes. In addition, you must also specify the following:
- **Preferred Node:** Select the preferred node for the DB system to be created. Select **Set Failover** to choose the node for failover. When you select the preferred node, the Network Information tab displays host name, IP address, subnet mask, and gateway for the selected node.
 - **VIP Name** and **VIP Address:** Specify the Virtual IP name and address.
 - **SCAN Name** and **SCAN IP Address:** Specify the Single Client Access Name (SCAN) and SCAN IP address.
9. In the User and Group Selection tab, configure your users and groups and specify whether or not you want to allow operating system role separation:
- Two users with six groups: Customize Users and Groups, select **No**. Allow OS Role Separation, select **Yes**. This is the default configuration.

- Two customized users with six customized groups: Customize Users and Groups, select **Yes**. Allow OS Role Separation, select **Yes**.
 - Single user with two groups: Customize Users and Groups, select **No**. Allow OS Role Separation, select **No**.
 - Single user with six groups: Customize Users and Groups, select **Yes**. Allow OS Role Separation, select **No**.
 - Specify the **GI User, DB User, Install Group, DBA Oper Group, DBA Group, ASM Admin Group, ASM Oper Group, ASM DBA Group**, and the User and Group IDs.
10. In the Database Information tab, specify the following information to configure the database:
- **DB Name:** Enter a name for the database. The name must contain alphanumeric characters and cannot exceed 8 characters.
 - **DB Version:** Specify the database version.
 - (Optional) **DB Unique Name:** Enter a globally unique name for the database. Databases with the same DB Name within the same domain (for example, copies of a database created for reporting or a physical standby) must have a different DB Unique Name that is unique within the enterprise. The name must begin with a lowercase or uppercase letter, and contain only alphanumeric characters and underscores(_). The name must not contain dollar (\$), and pound (#) characters. The name cannot exceed 30 characters.
 - **CDB:** Select **Yes** or **No** to specify whether or not you want a Container Database (CDB).
 - **PDB Name:** Enter a name for the pluggable database (PDB).
 - **PDB Admin User:** Enter an Admin user name for the pluggable database (PDB). The name must begin with an alphanumeric character. You can specify alphanumeric characters and underscore (_) in the name.
 - **Database Edition:** Select the Oracle Database edition, either Standard Edition and Enterprise Edition. Your license determines which database edition you are eligible to create in the DB System.
 - **Deployment:** Select the type of Deployment, whether **RAC, RAC One**, or **SI**. For Standard Edition Oracle Database 19c or later, you can only create single-instance Oracle Database. For Standard Edition Oracle Database 19.6 or later, you can choose to enable high availability for single-instance database.

For Enterprise Edition Oracle Database 19.15 or later or Oracle Database 21.6 or later, you can choose to enable high availability for single-instance databases. For Enterprise Edition Oracle Database 19.15 or later or Oracle Database 21.6 or later, if you choose to create a single-instance database, then the high availability feature is disabled by default. To enable high-availability, set the value in the **Enable High Availability** field to **Yes**.
 - **Sys and PDB Admin User Password and Confirm Password:** Provide a password for the database.
 - **Shape:** Select a database shape from the list.
 - In the **Database Class** field, select a database class from the drop-down list. If an option is not available in the list, it is not supported for the database edition on the Oracle Database Appliance or the version that you selected. The default is OLTP.

- **Configure EM Express:** Select **Yes** or **No**. Select **Yes** to configure the Oracle Enterprise Manager Database Express (EM Express) console.
 - **Character set:** Select a character set.
 - **National Characterset:** Select a national character set.
 - **Language:** Select the database language.
 - **Territory:** Select a territory or location from the list.
 - For Oracle Database Enterprise Edition 19c or later, you can choose to enable Transparent Database Encryption (TDE). Select **Yes** or **No** in the **Enable TDE** option. Specify and confirm the **TDE Password**. By default, the TDE option is disabled.
 - **Data Files on Flash Storage:** Select **Yes** or **No**. This option is only available if the high-availability system has HDD storage drives.
11. Click **Create**.
 12. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
 13. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Describing a Database System in a KVM Deployment

Use ODACLI commands or the Browser User Interface to describe a database system in a KVM deployment.

Using ODACLI to Describe a KVM Database System

Use the command `odacli describe-dbsystem` to describe a KVM database system.

```
# odacli describe-dbsystem -n dbsystem_name
```

Using Browser User Interface to Describe a KVM Database System

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **DB Systems** to display the DB Systems page.
4. In the page, click on the DB System for which you want to view details or click on the **Actions** drop down and select **View Details** to view the DB System details.
5. Click on the System Information tab for the DB System details, associated CPU Pool, Storage details, and associated VMs.
6. Click on the Database Information tab to view the associated database details.
7. Click on the Network Information tab to view the network details for single node or high-availability deployments.

Related Topics

- [odacli describe-dbsystem](#)
Use the `odacli describe-dbsystem` command to describe a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Modifying a DB System in a KVM Deployment

Use ODACLI commands or the Browser User Interface to modify a database system in a KVM deployment.

Using ODACLI to Modify a KVM DB System

Use the command `odacli modify-dbsystem` to change the database shape, the CPU pool association for the KVM DB system, attach or detach a network, or increase the memory of the DB system.

```
# odacli modify-dbsystem -n name [-cp cpu_pool_name] [-no-cp] [-avn v_network] [-dvn v_networks_to_detach] [-en] [-gw gateway] [-ip ip_address] [-nm netmask] [-sip scan_ip_address] [-sn scan_name] [-s shape] [-vips vip_address] [-vt v_network_type] [-m custom_memory_size]
```

You can attach a CPU pool to the DB system, or remove the CPU pool from the DB system.

Use the command `odacli modify-dbsystem` to increase the DB system memory. This does not change the database memory configuration. You must manually update the database memory configuration such as SGA, PGA, and others to utilize the increased memory. The command does not support reducing DB system memory. Changing the shape of the DB system after you change the DB system memory resets the memory of the DB system and the database to match the shape of the dbsystem.

You can increase the DB system memory with the `odacli modify-dbsystem` command using the `-m` option.

```
# odacli modify-dbsystem -n dbsystem_name -m 24G
```

To reduce the DB system memory, use the `--shape` option with the command `odacli modify-dbsystem`. The DB system is automatically restarted for the new shape to take effect.

```
# odacli modify-dbsystem --name dbsystem1 --shape odb4
```

Use the command `odacli modify-dbsystem` to attach or detach a new network to the DB system. This new network can be used for database backup, Oracle Data Guard setup or other purposes in the DB system.

You can use `odacli modify-dbsystem` to attach or detach the shared DB system CPU pool. Attaching shared DB system CPU pool removes the internal CPU pool created when the DB system is created. When detaching shared CPU pool from the DB system, an internal CPU pool is automatically created and attached to the DB system. One shared dbsystem CPU pool can be attached to multiple DB systems. Oversubscribing to shared DB system CPU pool is allowed, but there could be potential performance impact if shared CPU pool is oversubscribed.

 **Note:**

The `odacli modify-dbsystem -s shape` command only works on Oracle Database Appliance release 19.13 and later DB systems. The CPU pool commands are available on Oracle Database Appliance release 19.11 and later DB systems.

Using Browser User Interface to Modify a KVM DB System

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **DB Systems** to display the DB Systems page.
4. In the page, click on the DB System for which you want to view details or click on the **Actions** drop down and select **Modify** to change the following:
 - DB System shape
 - Attach or detach CPU pool for the DB system
 - Attach or detach networks
 - Enable or disable NUMA for the DB system
 - Memory size allocated to the DB system
 - VM storage redundancy (either Mirror or High)
5. Select the new shape and CPU pool and click **Modify**.
6. Click **Enable NUMA** to set NUMA capabilities, and click **Modify**.
7. Click the Detach Networks field to view the networks, select the network you want to detach, and click **Modify**.
8. To attach a network, specify the **Name**, **IP Address**, **Subnet Mask**, **Gateway**, **Network Type**, **Default Network**, and click **Modify**.
9. Confirm your action to submit the job to modify the DB System. You can manually run the `odacli modify-database` command inside the DB system to change the database shape.

Attaching and Detaching a Network for a Database System in a KVM Deployment

Use ODACLI commands to attach or detach networks for database system in a KVM deployment.

Using ODACLI to Attach or Detach a Network to a KVM Database System

You can attach a new vnetwork to the dbssystem and use it for database backup, Oracle Data Guard configuration, and other options. Use the `odacli modify-dbssystem` to attach or detach network for a dbssystem in a KVM deployment. The vnetwork must exist before you can attach it to the dbssystem.

Follow these steps to attach a network to a DB System:

1. Identify the name of vnetwork bridge to attach to the dbssystem using the `odacli list-vnetworks` and `odacli describe-vnetwork -n vnetwork_name` commands.
2. Use the `odacli modify-dbssystem` command to attach network to dbssystem:

```
# odacli modify-dbssystem -n dbssystem1 -avn vnet2 -t Dataguard -ip
192.168.10.119,192.168.10.120 -nm 255.255.240.0 -gw 192.168.10.1 -sn
scan1 -sip 192.168.10.30,192.168.10.31 -vips
vip1:0:192.168.15.57,vip2:1:192.168.15.58
```

The IP address, netmask (nm) and gateway (gw) values are used to configure the new interface of the dbssystem. The SCAN name (sn), SCAN IP address (sip) and Virtual IP address (vip) are used when the network type is `database` or `dataguard`.

To detach a network in the DB system, run the following command:

```
# odacli modify-dbssystem -n name -dvn vnetwork_name
```

Using Browser User Interface to Modify a KVM Database System

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **DB Systems** to display the DB Systems page.
4. In the page, click on the DB System for which you want to view details or click on the **Actions** drop down and select **Modify** to attach or detach networks for the DB system.
5. Click the Detach Networks field to view the networks, select the network you want to detach, and click `Modify`.
6. To attach a network, specify the **Name**, **IP Address**, **Subnet Mask**, **Gateway**, **Network Type**, **Default Network**, and click `Modify`.

7. Confirm your action to submit the job to modify the DB System.

Starting a Database System in a KVM Deployment

Use ODACLI commands or the Browser User Interface to start a database system in a KVM deployment.

Using ODACLI to start a KVM Database System

Use the command `odacli start-dbsystem` to start a KVM database system.

```
# odacli start-dbsystem -n dbsystem_name
```

Using Browser User Interface to Start a KVM Database System

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **DB Systems** to display the DB Systems page.
4. In the page, click on the DB System which you want to start.
5. Click on the System Information tab and then click **Start**.
6. For high-availability deployments, select the node on which you want to start the DB System. Click **Yes**.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.
9. When the DB System starts, the state displays as ONLINE.

Use the `odacli stop-dbsystem` command to stop a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Deleting a Database System in a KVM Deployment

Use ODACLI commands or the Browser User Interface to delete a database system in a KVM deployment.

Using ODACLI to Delete a KVM Database System

Use the command `odacli delete-dbsystem` to delete a KVM database system.

```
# odacli delete-dbsystem -n dbsystem_name -f
```

If you do not specify the `-f` option, then the operation deletes the database system and Oracle Clusterware files, and retains the database files. With the `-f` option, the operation deletes the database system, Oracle Clusterware files, and the database files.

Using Browser User Interface to Delete a KVM Database System

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **DB Systems** to display the DB Systems page.

4. In the page, for DB System which you want to delete, click on the **Actions** drop down list and select **Delete**.
5. Confirm that you want to delete the DB System. Select **Force Delete** if you want to delete the database system, Oracle Clusterware files, and the database files during the delete operation. Click **Yes**.
6. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
7. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

- [odacli delete-dbsystem](#)
Use the `odacli delete-dbsystem` command to delete a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Managing Shared CPU Pool with Database System in a KVM Deployment

Use ODACLI commands or the Browser User Interface to manage shared CPU pool with database system in a KVM deployment.

Using ODACLI to Manage Shared CPU Pool with Database System

Creating a `dbsystem` automatically creates an internal `dbsystem` CPU pool associated with this `dbsystem`. The internal `dbsystem` CPU pool is created and managed internally. It cannot be created, modified, or deleted manually. Starting with release 19.11, you can create a new type of shared CPU pool using the `odacli create-cpupool --dbsystem/-dbs -n cores` command. Similarly to VM and BM types, this CPU pool must not overlap with other CPU pools. In high-availability environments, the `dbsystem` CPU pool cannot be local, it must exist on both nodes always.

Associating Shared DB System CPU Pool

A shared `dbsystem` CPU pool can be associated to a new `dbsystem` or existing `dbsystem`. To create a new `dbsystem` with shared `dbsystem` CPU pool, add the "cpuPoolName" parameter in the `create-dbsystem json` file. The associated internal CPU pool is deleted after a shared CPU pool is attached to a db system. Use the `odacli modify-dbsystem` command to associate the CPU pool to an existing `dbsystem`.

```
# odacli modify-dbsystem -n dbsystem_name -cp dbspool1
```

The cores of the DB System (based on its shape) must fit into the shared DB System CPU pool. Associating a shared `dbsystem` CPU pool to an existing `dbsystem` removes the internal CPU pool associated to the `dbsystem`. A single shared DB System CPU pool can be shared by multiple DB Systems. Oversubscription to the `dbsystem` CPU pool is allowed, but performance may be impacted if the CPU pool is oversubscribed. The list of associated DB systems can be queried using `odacli list-cpupool` or `odacli describe-cpupool` commands.

Use `odacli describe-dbsystem` to check the details of the CPU pool associated to the `dbsystem`:

```
# odacli describe-dbsystem -n dbs4e912c
CPU Pool
-----
                Name: ce3f42bb28
      Number of cores: 2

                Host: n1
Effective CPU set: 9-10,29-30
      Online CPUs: 9, 10, 29, 30
      Offline CPUs: NONE

                Host: n2
Effective CPU set: 9-10,29-30
      Online CPUs: 9, 10, 29, 30
      Offline CPUs: NONE
```

Use `odacli list-cpupools` to view the `dbsystem` CPU pool type and associated `dbsystems`. The internal `dbsystem` CPU pool has type "DB_SYSTEM" and shared `dbsystem` CPU pool has type "DB_SYSTEM_SHARED".

```
# odacli list-cpupools
Name          Type          Configured on          Cores

```

Dissociating Shared DB System CPU Pool

A DB System with a shared DB System CPU pool could have the shared CPU pool detached from it and an internal DB System CPU Pool is created. If the internal DB system CPU pool cannot be created, then the `odacli modify-dbsystem` command fails.

Dissociating shared DB System CPU Pool:

```
# odacli modify-dbsystem -n dbs4e912c -no-cp
```

Modifying Shared DB System CPU Pool

A shared DB System CPU pool could be resized if all the associated DB systems shapes still fit into the cores of the pool (CPU pool size \geq individual DB system size). The change is effective immediately on running DB System VMs.

Modifying a DB System while associated to a Shared DB System CPU Pool

If a DB System is associated with a shared DB System CPU Pool and its shape is modified with the `odacli modify-dbsystem` command, then the new shape of the DB System must fit into the cores of the pool.

Deleting Shared DB System CPU Pool

A shared DB system CPU Pool can be deleted using the `odacli delete-cpupool` command only if it has no associated DB systems.

Managing Backup, Restore, and Recovery on a Database System in a KVM Deployment

Understand the backup, restore, and recovery operations supported on a database system in a KVM deployment.

About Backup, Restore, and Recovery on a Database System

Similar to the bare metal systems, you can use ODACLI commands to configure and perform backup, restore, and recovery operations on Database Systems. Since only one database is supported per `dbsystem`, you must delete the database using `odacli delete-database` in the standby `dbsystem` before restoring the database to the `dbsystem` using `iRestore`. For information about backup, restore, and recovery on Oracle Database Appliance, see the chapter *Backup, Recover and Restore* in this guide.

Managing Oracle Data Guard on a Database System in a KVM Deployment

Understand the Oracle Data Guard operations supported on a database system in a KVM deployment.

About Using Oracle Data Guard on a Database System

Similar to the bare metal systems, you can configure and use Oracle Data Guard on Database Systems using ODACLI commands. Since only one database is supported per DB system, you must delete the database in the standby DB system using `odacli delete-database`, before restoring the standby database, and then configuring Oracle Data Guard. You can set up Oracle Data Guard between the bare metal system and DB system, or

between two DB systems. Integrated Oracle Data Guard can also be used for migrating from bare metal system to DB system, or between two DB systems. For information about Oracle Data Guard on Oracle Database Appliance, see the chapter *Using Oracle Data Guard for Disaster Management and Recovery on Oracle Database Appliance* in this guide.

Creating a VM Storage in a KVM Deployment

Use ODACLI commands or the Browser User Interface to create a VM storage in a KVM deployment.

Using ODACLI to Create VM Storage

Use the command `odacli create-vmstorage` to create a VM Storage.

Create a VM storage named `share1` of 8 GB.

```
# odacli create-vmstorage -n share1 -s 8G
```

Using Browser User Interface to Create VM Storage

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **Show VM Instances** to display the VM Instances page.
4. In the page, select the **Create VM Storage** option and click **Next**.
5. In the Create VM Storage page, specify the following:
 - Storage Name: Name of the VM storage
 - Storage Size: Size of the storage to be allocated
 - ASM Disk group: Select the Oracle ASK disk group
 - Redundancy: Select the VM storage redundancy, either Mirror or High
6. Click **Create**.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Viewing VM Storage in a KVM Deployment

Use ODACLI commands or the Browser User Interface to view all VM storage or details about a VM storage in a KVM deployment.

Using ODACLI to View VM Storage

The command `odacli describe-vmstorage` displays details about VM storage. Use the command `odacli list-vmstorages` to view all VM storages in the deployment.

```
# odacli list-vmstorages
```

```
# odacli describe-vmstorage
```

Using Browser User Interface to View VM Storage

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show VM Storage** tab to view the list of all configured VM storages.
5. Click on a VM Storage to view the details of the VM storage.

Modifying VM Storage in a KVM Deployment

Use ODACLI commands or the Browser User Interface to modify VM storage in a KVM deployment.

Using ODACLI to Modify VM Storages

Use the command `odacli modify-vmstorage` to modify VM storage.

Increase the size of a VM storage named `share1` by 10 gigabytes.

```
# odacli modify-vmstorage -n share1 -i 10G
```

Decrease the size of a VM storage named `share1` by 5 gigabytes.

```
# odacli modify-vmstorage -n share1 -s 5G
```

Using Browser User Interface to Modify VM Storage

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show VM Storage** tab.
5. In the page, select a VM Storage, select the **Modify** option and click **Next**.
6. In the Modify VM Storage page, specify **Increment** in size, the VM storage **Redundancy** as either **Mirror** or **High**, and click **Modify**.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Deleting a VM Storage in a KVM Deployment

Use ODACLI commands or the Browser User Interface to delete a VM storage in a KVM deployment.

Using ODACLI to Delete VM Storage

Use the command `odacli delete-vmstorage` to delete a VM storage.

Delete a VM storage named `vs1`.

```
# odacli delete-vmstorage -n vs1
```

Using Browser User Interface to Modify VM Storage

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show VM Storage** tab.
5. In the page, select a VM Storage, select the **Delete** option.
6. Click Yes to confirm your choice.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Managing Virtual Networks in KVM Deployment

Use ODACLI to create, view, start, stop, and delete virtual networks in an Oracle Database Appliance KVM deployment.

- [Creating a Virtual Network in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to create a virtual network in a KVM deployment.
- [Viewing Virtual Networks in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to view all virtual networks or details about a virtual network in a KVM deployment.
- [Starting and Stopping Virtual Networks in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to start or stop virtual networks in a KVM deployment.
- [Modifying a Virtual Network in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to modify a virtual network in a KVM deployment.
- [Deleting a Virtual Network in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to delete a virtual network in a KVM deployment.

Creating a Virtual Network in a KVM Deployment

Use ODACLI commands or the Browser User Interface to create a virtual network in a KVM deployment.

Using ODACLI to Create Virtual Network

Use the command `odacli create-vnetwork` to create a virtual network.

Create a VM network of type `bridged` using the interface `btbond2`.

```
# odacli create-vnetwork --name mgmtNet --bridge mgmtNet --type  
bridged --interface btbond2 --ip 192.168.120.26 --gateway  
192.168.120.1 --netmask 255.255.255.0
```

Create a VM network of type `bridged-vlan` using the interface `btbond1`.

```
# odacli create-vnetwork --name backupvlan --bridge backupvlan --type  
bridged-vlan --vlan-id 12 --interface btbond1 --ip 192.168.100.10 --  
gateway 192.168.100.1 --netmask 255.255.255.0
```

Using Browser User Interface to Create Virtual Network

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **Show VM Instances** to display the VM Instances page.
4. In the page, select the **Create Virtual Network** option and click **Next**.
5. In the Create Virtual Network page, specify the following:
 - Name: Name of the virtual network
 - IP Address: Virtual network IP address
 - Subnet Mask and Gateway: Virtual network subnet mask and gateway
 - Network Type: Virtual network type
 - Interface: Virtual network interface
 - Bridge Name: Name of the network bridge
 - VLAN ID: ID of the VLAN network
6. Click **Create**.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Viewing Virtual Networks in a KVM Deployment

Use ODACLI commands or the Browser User Interface to view all virtual networks or details about a virtual network in a KVM deployment.

Using ODACLI to View Virtual Networks

The command `odacli describe-vnetwork` displays details about a virtual network. Use the command `odacli list-vnetworks` to view all virtual networks in the deployment.

```
# odacli list-vnetworks

# odacli describe-vnetwork -n vnet1
```

Using Browser User Interface to Create Virtual Networks

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```
2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show Virtual Networks** tab to view the list of all configured virtual networks.
5. Click on a Virtual Network to view the details of the virtual network.

Starting and Stopping Virtual Networks in a KVM Deployment

Use ODACLI commands or the Browser User Interface to start or stop virtual networks in a KVM deployment.

Using ODACLI to Start and Stop Virtual Networks

The command `odacli start-vnetwork` starts a virtual network. Use the command `odacli stop-vnetwork` to stop a virtual network in the deployment.

```
# odacli start-vnetwork -n vnet1
```

```
# odacli stop-vnetwork -n vnet1
```

Using Browser User Interface to Start and Stop Virtual Networks

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show Virtual Networks** tab to view the list of all configured virtual networks.
5. To start a virtual network, click on a Virtual Network, and then click **Start**.
6. To stop a virtual network, click on a virtual network, and then click **Stop**.

Modifying a Virtual Network in a KVM Deployment

Use ODACLI commands or the Browser User Interface to modify a virtual network in a KVM deployment.

Using ODACLI to Modify Virtual Network

Use the command `odacli modify-vnetwork` to modify a virtual network.

```
# odacli modify-vnetwork -n vnet1 -g 10.11.44.41
```

Using Browser User Interface to Modify Virtual Network

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.

4. Click the **Show Virtual Networks** tab.
5. In the page, select a Virtual Network, select the **Modify** option and click **Next**.
6. In the Modify Virtual Network page, specify any changes in the Subnet Mask, Gateway, or IP Address, and click **Modify**.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Deleting a Virtual Network in a KVM Deployment

Use ODACLI commands or the Browser User Interface to delete a virtual network in a KVM deployment.

Using ODACLI to Delete Virtual Networks

Use the command `odacli delete-vnetwork` to delete a virtual network.

Delete a virtual network named `vnet1`.

```
# odacli delete-vnetwork -n vnet1
```

Using Browser User Interface to Modify Virtual Networks

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show Virtual Networks** tab.
5. In the page, select a virtual network, select the **Delete** option.
6. Click Yes to confirm your choice.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Managing Virtual Disks in KVM Deployment

Use ODACLI to create, view, clone, modify, and delete virtual disks on Oracle Database Appliance KVM deployment.

- [Creating a Virtual Disk in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to create a virtual disk in a KVM deployment.

- [Viewing Virtual Disks in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to view all virtual disks or details about a virtual disk in a KVM deployment.
- [Cloning a Virtual Disk in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to clone a virtual disk in a KVM deployment.
- [Modifying a Virtual Disk in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to modify a virtual disk in a KVM deployment.
- [Deleting a Virtual Disk in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to delete a virtual disk in a KVM deployment.

Creating a Virtual Disk in a KVM Deployment

Use ODACLI commands or the Browser User Interface to create a virtual disk in a KVM deployment.

Ensure that a VM storage exists before you create a virtual disk.

Using ODACLI to Create Virtual Disks

Use the command `odacli create-vdisk` to create a virtual disk.

Specify the name of the virtual disk in the command `odacli create-vdisk -n name`. Identify the storage in which you create the virtual disk by using the `-st storage` option. Use the option `-s size` to specify the virtual disk size. If you want to configure the virtual disk as a shared disk, then use the option `-sh`.

Create a 2 GB non-sparse and shareable virtual disk named `vdisk1` inside the VM storage `vms1`.

```
odacli create-vdisk -n vdisk1 -st vms1 -s 2G -sh
```

Using Browser User Interface to Create Virtual Disks

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the Virtual Disk page.
4. Click **Create Virtual Disk**.
5. In the page, select the **Create Virtual Disk** option and click **Next**.
6. In the Create Virtual Disk page, specify the following:
 - Virtual Disk Name: Name assigned to the virtual disk that is unique within the name repository
 - VM Storage Name: Name of the VM storage where the virtual disk will be created

- Disk Size: Size of the virtual disk
 - Shared: Specify if you want to share the virtual disk
 - Sparse or Shared: Specify if the virtual disk is sparse
7. Click **Create**.
 8. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
 9. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Viewing Virtual Disks in a KVM Deployment

Use ODACLI commands or the Browser User Interface to view all virtual disks or details about a virtual disk in a KVM deployment.

Using ODACLI to View Virtual Disks

The command `odacli describe-vdisk` displays details about a virtual disk. Use the command `odacli list-vdisks` to view all virtual disks in the deployment.

```
# odacli list-vdisks
```

```
# odacli describe-vdisk -n vdisk_name
```

Using Browser User Interface to Create Virtual Disks

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show Virtual Disks** tab to view the list of all configured virtual disks.
5. Click on a virtual disk to view the details of the virtual disk.

Cloning a Virtual Disk in a KVM Deployment

Use ODACLI commands or the Browser User Interface to clone a virtual disk in a KVM deployment.

Using ODACLI to Clone Virtual Disks

Use the command `odacli clone-vdisk` to clone an existing virtual disk.

Specify the source `vdisk` from which you want to clone with the `-n` option, and specify the name of the cloned virtual disk with the `-cn` option.

Create a clone of a virtual disk named `vdisk1`, with the name `vdisk1_clone`. The cloned disk is created on the same storage as `vdisk1`.

```
# odacli clone-vdisk -n vdisk1 -cn vdisk1_clone
```

Using Browser User Interface to Create Virtual Disks

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the Virtual Disk page.
4. Click **Create Virtual Disk**.
5. In the page, select the **Clone Virtual Disk** option and click **Next**.
6. In the Clone Virtual Disk page, specify the following:
 - Select the Source Virtual Disk you want to clone
 - Specify the name of the cloned virtual disk
7. Click **Create**.
8. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
9. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Modifying a Virtual Disk in a KVM Deployment

Use ODA CLI commands or the Browser User Interface to modify a virtual disk in a KVM deployment.

Using ODA CLI to Modify Virtual Disks

Use the command `odacli modify-vdisk` to increase the size of a virtual disk.

Increase the size of a virtual disk named `vdisk1` by 4 gigabytes.

```
# odacli modify-vdisk -n vdisk1 -i 4G
```

Using Browser User Interface to Modify Virtual Disks

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.

4. Click the **Show Virtual Disks** tab.
5. In the page, select a Virtual Disk, select the **Modify Virtual Disk** option and click **Next**.
6. In the Modify Virtual Disk page, specify Increment in size and if you want to share the virtual disk.
7. Click **Modify**.
8. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
9. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Deleting a Virtual Disk in a KVM Deployment

Use ODACLI commands or the Browser User Interface to delete a virtual disk in a KVM deployment.

Using ODACLI to Delete Virtual Disks

Use the command `odacli delete-vdisk` to delete a virtual disk.

Delete a virtual disk named `vdisk1`.

```
# odacli delete-vdisk -n vdisk1
```

Using Browser User Interface to Modify Virtual Disks

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show Virtual Disks** tab.
5. In the page, select a Virtual Disk, select the **Delete** option.
6. Click Yes to confirm your choice.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Managing Virtual Machines in KVM Deployment

Use ODACLI to create, view, clone, modify, start, stop, and delete virtual machines in an Oracle Database Appliance KVM deployment.

- [Creating a Virtual Machine in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to create a virtual machine in a KVM deployment.

- [Cloning a Virtual Machine in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to clone a virtual machine instance in a KVM deployment.
- [Modifying a Virtual Machine in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to modify a virtual machine in a KVM deployment.
- [Viewing Virtual Machines in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to view all virtual machines or details about a virtual machine in a KVM deployment.
- [Starting and Stopping Virtual Machines in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to start or stop virtual machines in a KVM deployment.
- [Deleting a Virtual Machine in a KVM Deployment](#)
Use ODACLI commands or the Browser User Interface to delete a virtual machine in a KVM deployment.

Creating a Virtual Machine in a KVM Deployment

Use ODACLI commands or the Browser User Interface to create a virtual machine in a KVM deployment.

Ensure that a VM storage exists before you create a VM instance.

Using ODACLI to Create Virtual Machine Instance

Use the command `odacli create-vm` to create a VM instance. Specify the preferred node on which to start the virtual machine after creation (`-pn` option).

Following is an example command to create a VM named `vm1` with 8 vcpus and 8 GB memory. A VM disk of size 10 GB is created automatically as `/dev/vda` inside the VM for the operating system installation. The VM disk is stored in the VM storage `vms1`. The source used for the installation is located on `/u01/OL7.iso`. If you want to attach an additional virtual disk to the VM, you can specify `--vdisks vdisk_name`, where `vdisk_name` is an existing virtual disk. This virtual disk when attached, is shown as `/dev/vdb` inside the VM.

```
# odacli create-vm -n vm1 -vc 8 -m 8G -vms vms1 -src /u01/OL7.iso -  
size 10G
```

To use a kickstart configuration file to create the VM instance, include the file in the `--extra-args` parameter. Create a kickstart configuration file, including the network configuration for the guest VM. Ensure that you specify the network details in the `--extra-args` parameter so that the VM bootstrap can use it to access the kickstart configuration file in this format `"dns=dns ip ip=ip::gateway:netmask:hostname:interface:none"`. The IP must belong to the vnetwork to be attached to the VM, and the kickstart configuration must be available over this vnetwork.

For example:

```
odacli create-vm --name odaksvm --vnetwork pubnet --memory 4G --  
source /u01/kvm/images/OL77_x86_64.iso --vmstorage myvms --size 10G --
```

```
vcpus 2 --extra-args "dns=dns_IP
ip=vm_IP::gateway_IP:netmask:vm_hostname:eth0:none console=tty0
console=ttyS0,115200 ks=http://Webserver_IP:portnumber/ks.txt"
```

If you do not use a kickstart configuration file to create the VM instance, then complete the VM instance creation as follows:

1. Run the `odacli create-vm` command and check that it completes successfully.
2. Use the `odacli describe-vm` command to check the VNC port.
3. Log in to the VM instance using the VNC port: `host:vncport`. See the section *Connecting to the VM instance Using VNC* for the steps to connect to the VM instance using VNC.
4. Complete the installation process by providing your values for the installation screens.
5. Log in again to the VM instance using the VNC port: `host:vncport`. See the section *Connecting to the VM instance Using VNC* for the steps to connect to the VM instance using VNC.
6. If you specified `--vnetwork` in the `odacli create-vm` command, then you can run `ifconfig -a` to view the network interface in the VM. Configure the network as you would on a Linux system.
7. After the network is configured, log into the VM using the network and customize the VM instance.
8. If you did not specify `--vnetwork` in the `odacli create-vm` command, then the VM network is created using the default Network Address Translation (NAT) based KVM bridge `virbr0`. `eth0` is configured as DHCP inside the VM.

Connecting to the VM instance Using VNC: Method 1

1. Find out the VNC display port of the VM from the command `odacli describe-vm -n vm_name: 127.0.0.1:1`

```
# odacli describe-vm -n vm1
VM details
-----
-----
                ID: c280af13-997c-49b1-97ce-0617610535f1
                Name: vm1
                ...
Graphics settings: vnc,listen=127.0.0.1
                Display Port: 127.0.0.1:1 <<<<
                ...
```

2. Run `vncserver` on the Oracle Database Appliance host. Note down the `vncserver` address `odahost:11`.

```
# vncserver
New 'odahost:11 (root)' desktop is odahost:11
```

3. Launch `vncviewer` from your desktop, login to the Oracle Database Appliance host using the `vncserver` address created in step 2: `odahost:11`. This launches a `vncviewer` that logs into the Oracle Database Appliance host.

- From `vncviewer` launched in step 3, run the `vncviewer` command with the display port from the `odacli describe-vm` output. For example, in the previous step, the `odacli describe-vm` command shows the display port is `127.0.0.1:1`, so type `vncviewer 127.0.0.1:1`.

Connecting to the VM instance Using VNC: Method 2

- Find out the VNC display port of the VM from the command `odacli describe-vm`. For example, the Display Port is `Display Port: 127.0.0.1:1`, and the current node `myodahost1`.

```
# odacli describe-vm -n vm1
VM details
-----
ID: c280af13-997c-49b1-97ce-0617610535f1
Name: vm1
...
Graphics settings: vnc,listen=127.0.0.1
Display Port: 127.0.0.1:1 <<<<
...
Status
-----
Current node: myodahost1 <<<
Current state: ONLINE
Target state: ONLINE
```

- On Linux or macOS operating systems where you want to launch the `vncviewer`, use the following command to create the SSH tunnel:

```
ssh -L localhost:127.0.0.1:vncport root@odahost
```

where `localhost` is an available port number greater than 1024 on your local machine (for example, 12345) where `vnc viewer` is launched. `vncport` is the VNC port displayed in the `odacli describe-vm` command plus 5900. For example, if `odacli describe-vm` returns the display port as `127.0.0.1:1`, then use 5901 as the VNC port. `odahost1` is the host name of the Oracle Database Appliance host where the VM is running. `127.0.0.1` is the address where `vnc server` is listening at. Do not change the `127.0.0.1` address. For example:

```
ssh -L 12345:127.0.0.1:5901 root@odahost1
```

On Windows, use PuTTY to create the SSH tunnel.

- Launch `vncviewer` from your desktop, enter VNC server address as `localhost:localhost`, where `localhost` is one used in the SSH tunnel in step 2 (such as 12345). For example:

```
vncserver: localhost:12345
```

How to find VM network interface attached to the vnetwork

If you specified `--vnetwork` in the `odacli create-vm` command, then you can run `ifconfig -a` to view the network interface in the VM. Find out the VM network interface name that is attached to the vnetwork by matching the interface MAC address to the MAC address displayed in the `odacli describe-vm` command.

For example:

```
# odacli describe-vm -n vm1
VM details
-----
---
                                ID: c280af13-997c-49b1-97ce-0617610535f1
                                Name: vm1
...
Parameters
-----
...
                                Config Live
                                -----
-----
                                Memory: 2.00 GB 2.00 GB
                                Max Memory: 2.00 GB 2.00 GB
...
                                vNetworks: pubnet:52:54:00:15:b5:c4 pubnet:52:54:00:15:b5:c4
<<<<
```

Run "ip link show" inside the VM, find the interface name whose MAC address (the link/ether field in the ip command output: link/ether 52:54:00:15:b5:c4) that matches the vnetwork MAC address in the describe-vm output "pubnet:52:54:00:15:b5:c4", in this case it is eth0. So eth0 is the interface attached to the vnetwork "pubnet".

```
# ip link show
...
3: eth0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc fq_codel state UP
mode DEFAULT group default qlen 1000
    link/ether 52:54:00:15:b5:c4 brd ff:ff:ff:ff:ff:ff
```

Configure the network interface eth0 as you would on a Linux system.

Using Browser User Interface to Create Virtual Machine Instance

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **Show VM Instances** to display the VM Instances page.
4. In the page, select the **Create VM Instance** option and click **Next**.

5. In the Create Virtual VM page, specify the following:
 - VM Name: Name assigned to the VM instance that is unique within the name repository
 - VM Storage Name: Name of the VM storage where the VM instance will be created
 - Source Installation: The source from which you want to create the VM
 - Preferred Node: Node where you want to run the VM instance
 - Memory Size: Size of the memory to be allocated
 - CPU Pool Name: Select the CPU Pool
 - Number of vCPUs to Use: Number of virtual CPUs to be allocated
6. Click **Create**.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Cloning a Virtual Machine in a KVM Deployment

Use ODACLI commands or the Browser User Interface to clone a virtual machine instance in a KVM deployment.

Using ODACLI to Clone Virtual Machine Instance

Use the command `odacli clone-vm` to clone an existing virtual machine.

The name of the VM you create is defined by the command `odacli clone-vm -cn name`. Specify the source VM from which you want to clone.

Create a clone of a virtual machine named `vm1`, with the name `vm1_clone`. The cloned VM is created on the same storage as `vm1`.

```
# odacli clone-vm -n vm1 -cn vm1_clone
```

Using Browser User Interface to Clone Virtual Machine Instance

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```
2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Instance page.
4. Click **Create VM Instance**.
5. In the page, select the **Clone VM Instance** option and click **Next**.
6. In the Clone VM Instance page, specify the following:
 - Select the Source VM you want to clone

- Specify the name and description of the cloned VM instance
7. Click **Create**.
 8. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
 9. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Modifying a Virtual Machine in a KVM Deployment

Use ODACLI commands or the Browser User Interface to modify a virtual machine in a KVM deployment.

Using ODACLI to Modify Virtual Machines

Use the command `odacli modify-vm` to modify a virtual machine.

Update the configuration of a VM named `vm1`, setting the CPU count to 6 and the maximum memory to 6 gigabytes on both the running VM and subsequent boots.

```
# odacli modify-vm -n vm1 -c 6 -mm 6G --live --config
```

Modify a VM to attach a vnetwork:

```
# odacli modify-vm -n vm_name -avn vnetwork_name
```

- When an application VM is created, a default network interface is created by default in the VM. This interface is attached to the default kvm bridge (`virbr0`) at the host. This interface is intended for convenient communication between the host and VM. This interface does not attach to any physical network interface at the host. Do not configure this interface to use for any external communication.
- You must create a vnetwork using the command `odacli create-vnetwork` and attach the vnetwork (`odacli modify-vm -avn`) to the VM. This creates a second interface in the VM. Configure this network interface for your network requirement.
- The network interface name in the VM depends on the operating system.

Using Browser User Interface to Modify Virtual Machines

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show VM Instances** tab.
5. In the page, select a Virtual Machine, select the **Modify** option and click **Next**.
6. In the Modify VM page, specify Increment in size, and if you want to Auto Start, Set Failover, or Enable NUMA.

7. You can also modify the CPU Pool, Number of vCPUs to use, Memory Size, and attach and detach virtual disks and virtual networks.
8. Select if you want to save the configuration or apply the configuration to the running VM.
9. Click **Modify**.
10. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
11. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

Viewing Virtual Machines in a KVM Deployment

Use ODACLI commands or the Browser User Interface to view all virtual machines or details about a virtual machine in a KVM deployment.

Using ODACLI to View Virtual Machines

The command `odacli describe-vm` displays details about a virtual machine. Use the command `odacli list-vms` to view all virtual machines in the deployment.

```
# odacli list-vms
```

```
# odacli describe-vm -n vm_name
```

Using Browser User Interface to Create Virtual Machines

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```
2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show VM Instances** tab to view the list of all configured virtual machines.
5. Click on a VM Instance to view the details of the virtual machine.

Starting and Stopping Virtual Machines in a KVM Deployment

Use ODACLI commands or the Browser User Interface to start or stop virtual machines in a KVM deployment.

Using ODACLI to Start and Stop Virtual Machines

The command `odacli start-vm` starts a virtual machine. Use the command `odacli stop-vm` to stop a virtual machine in the deployment.

If `pref-node` is defined for the VM, then the VM starts on the `pref-node`. If `pref-node` is not defined for the VM, then the VM can start on any node, in a high-availability deployment. However, if you specify the node name `-n`, then the VM starts on the specified node, even if the preferred node is defined.

```
# odacli start-vm -n vm1
```

```
# odacli stop-vm -n vm1
```

Using Browser User Interface to Start and Stop Virtual Machines

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show VM Instances** tab to view the list of all configured virtual machines.
5. To start a virtual machine, click on a VM Instance, and then click **Start** and select the node to start the virtual machine.
6. To stop a virtual machine, click on a VM Instance, and then click **Stop** to stop the virtual machine. Click **Force Stop** to close all running processes and stop the virtual machine.

Deleting a Virtual Machine in a KVM Deployment

Use ODACLI commands or the Browser User Interface to delete a virtual machine in a KVM deployment.

Using ODACLI to Delete Virtual Machines

Use the command `odacli delete-vm` to delete a virtual machine.

Delete a virtual machine named `vm1`.

```
# odacli delete-vm -n vm1
```

Using Browser User Interface to Modify Virtual Machines

Follow these steps:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Appliance** tab.
3. Click **VM Instances** to display the VM Details page.
4. Click the **Show VM Instances** tab.
5. In the page, select a VM Instance, select the **Delete** option.

6. Click Yes to confirm your choice.
7. When you submit the job, the job ID and a link to the job appears. Click the link to display the job status and details.
8. Validate that the job completed. You can track the job in the **Activity** tab in the Browser User Interface, or run the command `odacli describe-job` with the job ID.

About Overcommitting Memory or CPUs in an Oracle Database Appliance KVM System

Understand performance and other considerations before overcommitting CPU and memory for application KVM.

Oracle Database Appliance does not restrict overcommitting of CPU and memory for application KVM. However, it is not recommended to overcommit CPU or memory. Overcommitting CPU can lead to slow performance of the VMs and the host. Overcommitting memory can cause the system to run out of memory (OOM), which may lead to the Linux kernel shutting down important system processes. Before you decide to overcommit CPU or memory, ensure that you test your systems. When sizing the application VMs, it is recommended to reserve at least 24 GB memory and 2 CPU cores for bare metal system KVM host when there is no database running on the bare metal system host.

Oracle Database Appliance validates oversubscription of shared CPU pools for DB systems as well as memory associated with DB systems. Starting with Oracle Database Appliance release 19.15, the commands `odacli start-dbsystem`, `odacli modify-dbsystem`, `odacli create-dbsystem`, and `odacli modify-cpupool` display errors if the operations result in overcommitting of the CPU pool or memory for the DB system. You can use the `--force/-f` option to allow overcommit of resources for DB systems. This check applies to DB systems only, not for application VMs.

Example JSON File to Create a Single-Node DB System

Follow the JSON file example to create a JSON file to deploy a single-node DB System, with role separation, with the command `odacli create-dbsystem`.

Use the example JSON file to create a file for your environment.

Note:

It is important to review the readme and the examples carefully before creating your JSON file.

Example 14-1 JSON File to Create a Single-Node Oracle KVM Database System with Role Separation

The following is an example of a JSON file that creates a single-node Oracle KVM Database System on Oracle Database Appliance bare metal platform. The example uses role separation. When using the example to create your JSON file, change the

definitions to match your environment. The password must meet password requirements.

```
{
  "system": {
    "name": "test_example",
    "shape": "odb2",
    "customMemorySize": "24G",
    "timeZone": "America/Los_Angeles",

}
}

```

Example 14-3 JSON File to Create a Single-Node Oracle KVM Database System with the `--template/-t` option

The following is an example of a JSON file template sample that creates a single-node Oracle KVM Database System on Oracle Database Appliance bare metal platform. This template sample is generated when you run the `odacli create-dbsystem` command with the `--template/-t` option. When using the example to create your JSON file, change the definitions to match your environment. The password must meet password requirements.

```

{
  "system": {
    "name": "test_dbsystem",
    "shape": "odb2",
    "customMemorySize": "24G",
    "timeZone": "America/Los_Angeles",
    "diskGroup": "DATA",
    "cpuPoolName": "shared_dbsystem_cpupool",
    "enableRoleSeparation": true,
    "customRoleSeparation": {
      "groups": [
        {
          "name": "oinstall",
          "id": 1001,
          "role": "oinstall"
        }
      ],
      "users": [
        {
          "name": "grid",
          "id": 1000,
          "role": "gridUser"
        },
        {
          "name": "oracle",
          "id": 1001,
          "role": "oracleUser"
        }
      ]
    }
  }
}

```

```

    }
  },
  "database": {
    "name": "dbtest",
    "uniqueName": "dbtest",
    "domainName": "example.com",
    "version": "19.16.0.0.220719",
    "edition": "EE",
    "type": "SI",
    "dbClass": "OLTP",
    "shape": "odb2",

```

Example JSON File to Create a High-Availability DB System

Follow the JSON file example to create a JSON file to deploy a two-node DB System, with role separation, with the command `odacli create-dbsystem`.

Use the example JSON file to create a file for your environment.

Example 14-5 JSON File to Create Two-Node Oracle KVM Database System without Role Separation

The following is an example of a JSON file that creates two-node Oracle KVM Database System on Oracle Database Appliance bare metal platform, without role separation. When using the example to create your JSON file, change the definitions to match your environment. The password must meet password requirements.

```
{
  "system": {
    "name": "test_system",
    "shape": "odb2",
    "customMemorySize": "24G",
    "timeZone": "America/Los_Angeles",
    "diskGroup": "DATA",
    "cpuPoolName": "shared_dbsystem_cpupool",
  },
  "database": {
    "name": "dbtest",
    "uniqueName": "dbtest",

    "diskGroup" : "DATA",            ---> The ASM
disk group to be used for the DB System volumes. Allowed options:
<DATA>, <RECO>, <REDO>
    "cpuPoolName" : "shared_dbsystem_cpupool", ---> The CPU
Pool for the DB System
    "useReservedCores" : false,      ---> Whether or
not to use reserved CPU cores. Allowed options: <true>, <false>
    "enableRoleSeparation" : true,   ---> Whether or
not to enable Role Separation. If true, need to specify 6 groups and
two users. 'groupName' and 'userName' can be customized. If false,
need to specify 2 groups and one user. 'groupName' and 'userName' can
be customized. Allowed options: <true>, <false>
    "customRoleSeparation" : {
      "groups" : [
        {
          "name" : "oinstall",        ---> Name of
the group to create, must be unique
          "id" : 1001,                ---> ID of the
group to create, must be unique
          "role" : "oinstall",       ---> Role of
the group
        }
      ],
      "users" : [

```

```

        {
            "name" : "grid",           ---> Name of the user
to create, must be unique
            "id" : 1000,             ---> ID of the user
to create, must be unique
            "role" : "gridUser",     ---> Role of the
user
        },
        {
            "name" : "oracle",       ---> Name of the user
to create, must be unique
            "id" : 1001,             ---> ID of the user
to create, must be unique
            "role" : "oracleUser",   ---> Role of the
user
        }
    ]
},
"database" : {
    "name" : "dbtest",             ---> Name for the DB
System database
    "uniqueName" : "dbtest",       ---> The unique name
for the DB System database
    "domainName" : "example.com",  ---> The domain name
that the DB System database will have
    "version" : "19.20.0.0.230720", ---> The version for
the DB System database. Execute 'odacli describe-dbsystem-image' to get the
supported version
    "edition" : "EE",             ---> Enter 'EE' for
Enterprise Edition, or 'SE' for Standard Edition
    "type" : "SI",                ---> Enter a database
deployment type. Allowed options: <RAC>, <RACOne>, <SI> (single instance
database)
    "dbClass" : "OLTP",           ---> The class for
the DB System database. Standard Edition only supports OLTP. Allowed
options: <OLT>, <DSS>, <IMDB>
    "shape" : "odb2",            ---> The DB System
database shape, it must be same as the DB System shape
    "role" : "PRIMARY",          ---> The role for the
DB System database. Allowed options: <PRIMARY>, <STANDBY>
    "dbStorage" : "ASM",         ---> Storage type of
the DB System database. The default value is ASM. Allowed options: <ASM>,
<PMEM>
    "level0BackupDay" : "wednesday", ---> Backup day of
the DB System database. Allowed options: <monday>, <tuesday>, <wednesday>,
<thursday>, <friday>, <saturday>, <sunday>
    "targetNodeNumber" : "0",    ---> Use '0' for
Node0 and '1' for Node1. For RAC or RACOne use null. The default is '0' for
Node0
    "enableDbConsole" : false,   ---> Whether or not
to create dbconsole or EM express. By default, dbconsole is disabled.
Allowed options: <true>, <false>
    "enableFlashStorage" : false, ---> Whether or not
to enable the flash storage for the DB System database. Allowed options:

```

```

<true>, <false>
    "enableFlashCache" : false,          ---> Whether or
not to enable the flash cache for the DB System database. Allowed
options: <true>, <false>
    "enableUnifiedAuditing" : true,      ---> Whether or
not to enable unified auditing for the DB System database. Allowed
options: <true>, <false>
    "enableEEHA" : true,                 ---> Whether or
not to enable HA for EE SI database. enableEEHA is only valid when the
edition is EE. Allowed options: <true>, <false>
    "enableSEHA" : false,                ---> Whether or
not to enable HA for SE SI database. enableSEHA is only valid when the
edition is SE. Allowed options: <true>, <false>
    "redundancy" : "MIRROR",             ---> If
diskgroup redundancy is FLEX, then database redundancy must be set to
one of 'HIGH' or 'MIRROR', otherwise, can be null
    "characterSet" : {
        "characterSet" : "AL32UTF8",      ---> The
character set for the DB System database
        "nlsCharacterSet" : "AL16UTF16",  ---> The NLS
character set for the DB System database
        "dbTerritory" : "AMERICA",       ---> The
territory for the DB System database
        "dbLanguage" : "AMERICAN",      ---> The
language for the DB System database
    },
    "enableTDE" : false,                 ---> Whether or
not to enable TDE. Allowed options: <true>, <false>
    "isCdb" : true,                       ---> Enter
'true' if this database is container DB. For 21c and above, cdb must
be true. Enter 'false' if this is non-cdb. Allowed options: <true>,
<false>
    "pdbName" : "pdb1",                   ---> Enter
pdbName if isCdb parameter is 'true', use 'null' if isCdb is
'false'
    "pdbAdminUser" : "pdbadmin",         ---> Enter PDB
admin user name, use 'null' if isCdb parameter is 'false'
    },
    "network" : {
        "domainName" : "example.com",    ---> The domain
name for the DB System network
        "ntpServers" : [
            "xxx.xxx.xxx.xxx"
        ],
        "dnsServers" : [
            "xxx.xxx.xxx.xxx"
        ],
        "nodes" : [
            {
                "name" : "node1",          ---> The name
used to configure the hostname
                "ipAddress" : "xxx.xxx.xxx.xxx", ---> The IP
address for this node
                "netmask" : "xxx.xxx.xxx.xxx", ---> The mask
of the network for this node
            }
        ]
    }

```

```

        "gateway" : "xxx.xxx.xxx.xxx",          ---> The gateway
address for this node
        "number" : 0,                          ---> 0 (Use 0 for the
first node of the DB System instance)
        "vipName" : "node1-vip",              ---> The VIP name for
this first node, only for HA case
        "vipAddress" : "xxx.xxx.xxx.xxx",      ---> The VIP address
for this first node, only for HA case
    },
    {
        "name" : "node2",                      ---> The name used to
configure the hostname
        "ipAddress" : "xxx.xxx.xxx.xxx",       ---> The IP address
for this node
        "netmask" : "xxx.xxx.xxx.xxx",        ---> The mask of the
network for this node
        "gateway" : "xxx.xxx.xxx.xxx",        ---> The gateway
address for this node
        "number" : 1,                          ---> 1 (Use 1 for the
second node of the DB System instance)
        "vipName" : "node2-vip",              ---> The VIP name for
this second node, only for HA case
        "vipAddress" : "xxx.xxx.xxx.xxx",      ---> The VIP address
for this second node, only for HA case
    }
],
    "publicVNetwork" : "vnet1",                ---> The name of the
public virtual network. The ipAddress, vipAddress and scanIps must be on
this publicVNetwork
    "scanName" : "dbtest-scan",                ---> The scan name of
the DB System. It should resolve to the IPs defined in the scanIps. Only for
HA case
    "scanIps" : [
        "xxx.xxx.xxx.xxx",
        "xxx.xxx.xxx.xxx"
    ]
},
    "grid" : {
        "language" : "en",                     ---> The language
used for GI (Grid Infrastructure) installation
        "enableAFD" : true,                    ---> Whether or not
to enable ASM Filter Driver, enabled by default. Allowed options: <true>,
<false>
    }
}

```

Oracle Database Appliance Command-Line Interface

The command-line interface has different classes of tools to manage Oracle Database Appliance.

- [About Oracle Database Appliance Command-Line Interface](#)
Three classes of tools are available to perform deployment, lifecycle management, and system administration on Oracle Database Appliance.
- [Managing ODACLI Privileges and Security with SUDO](#)
Oracle Appliance Manager command-line utility requires `root` system privileges for most administration actions. You may want to use SUDO as part of your system auditing and security policy.
- [ODACLI Command Changes with Multi-User Access on Oracle Database Appliance](#)
Understand the ODACLI command changes when you enable multi-user access.
- [odacli Network Commands](#)
Use the `odacli network` commands to list and describe network interfaces.
- [odacli Multi-User Access Commands](#)
Use `odacli` commands to enable multi-user access for the appliance.
- [odacli Apply Patch and Update Commands](#)
Use the commands `odacli update` and `apply patch` to apply patches and update the appliance.
- [Data Preserving Reprovisioning Commands](#)
Understand commands to upgrade the appliance using the Data Preserving Reprovisioning feature.
- [odacli Appliance Commands](#)
Use the `odacli appliance` commands to perform lifecycle activities for the appliance.
- [odacli Backup and Recovery Commands](#)
Use the `odacli backup` and `recover` commands to backup to and restore from Oracle Cloud Infrastructure Object Storage or disk or NFS.
- [odacli Oracle Data Guard Commands](#)
Use ODACLI commands to configure and manage Oracle Data Guard in your Oracle Database Appliance deployment.
- [odacli CPU Core Commands](#)
Use the CPU Core commands to enable CPU cores and display current and historical CPU core configurations.
- [odacli CPU Pool Commands for Bare Metal and KVM](#)
Use `odacli` commands to manage resource allocations on Oracle Database Appliance for bare metal and KVM deployments.
- [odacli Database Commands](#)
Use the `odacli database` commands to perform database lifecycle operations.

- [odacli DBHome Commands](#)
Use the `odacli DBHome` commands to manage database Home operations.
- [odacli Database Storage Commands](#)
Use the Database Storage commands to list, describe, create, and delete Oracle database storage.
- [odacli Job Commands](#)
Use the `odacli list-jobs` and `odacli describe-job` commands to display job details.
- [Adaptive Classification and Redaction \(ACR\) Commands](#)
Understand Adaptive Classification and Redaction (ACR) commands.
- [Log Commands](#)
Use the `odacli log` commands to specify the options to collect and delete logs.
- [odacli Oracle Auto Service Request Commands](#)
Use the Oracle Auto Service Request (Oracle ASR) commands to configure, update, test, and delete Oracle ASR on the system.
- [odacli OS Commands](#)
Use the `odacli OS` commands to list and update operating system (OS) parameters.
- [odaadmcli Hardware Monitoring Commands](#)
Use the `hardware monitoring` commands to display hardware configurations.
- [Storage Commands](#)
Understand the commands to perform storage operations and diagnostics.

About Oracle Database Appliance Command-Line Interface

Three classes of tools are available to perform deployment, lifecycle management, and system administration on Oracle Database Appliance.

The command-line interface (CLI) is an alternative to Oracle Database Appliance Browser User Interface for some appliance configuration and patching tasks, database management, and job activity.

Oracle Database Appliance uses a role-based command-line interface. Use the `odacli` commands to perform lifecycle management tasks and the `odaadmcli` commands to perform storage and hardware monitoring maintenance. Many tasks related to managing Oracle Databases are also required with databases on Oracle Database Appliance. Tasks common to Oracle Database generally are described in the Oracle Database documentation library. However, to simplify tasks, use the Oracle Database Appliance command-line interface. The `odacli` and `odaadmcliutilities` combine the capabilities of the `SYS` database administrator role and the operating system Superuser (`root` user). Always perform administrative tasks using the Oracle Database Appliance Browser User Interface or CLI utilities.

The following classes of commands are available:

- **Deployment and Configuration:** Use the deployment and configuration commands as part of the initial deployment of the appliance and to configure CPU cores.
- **Lifecycle management:** Use `odacli` commands to perform database and system administration tasks for the appliance. The `odacli` commands are the primary interface to perform life cycle activities for the appliance.

- Administration: Use `odaadmcli` commands to perform hardware administration tasks for the appliance. The `odaadmcli` commands are the interface for infrequent administration activities needed to manage appliance hardware components, storage, and VLAN.

You can perform the following deployment and configuration tasks:

- Configure the first network in the appliance
- Unzip and copy the Oracle Database Appliance software to the correct locations
- Set the number of CPU Cores for the system

You can perform the following appliance lifecycle tasks with `odacli` commands:

- Create and describe the appliance
- Create, list, describe, and delete databases
- Create, list, describe, and delete Oracle Database Homes
- Create, list, and describe the networks
- List and describe the jobs

You can perform the following appliance administration tasks with `odaadmcli` commands:

- Show storage, disks, diskgroups, and controllers
- Display storage diagnostics for disks and NVM Express (NVMe)s
- Show server, memory, processor, power, cooling, and network details

Depending on your version of Oracle Appliance Manager and your hardware, some of the `odacli` commands may not be available to you. To see which commands are supported on your version of Oracle Appliance Manager and your hardware, run the `odacli help` command: `odacli -h`.

Command-Line Interface Syntax

The command-line interface commands and parameters are case-sensitive.

An `odacli` or `odaadmcli` command uses the following command syntax:

```
odacli command [options]
```

- *command* is an action you want to perform on the appliance. For example: `odacli list-networks` or `odacli describe-jobs`.
- *options* are optional parts of the `odacli` command. Options can consist of one or more options that extend the use of the `odacli` command carried out on an object. Options include additional information about the action that you want to perform on the object. Option names are preceded with a dash. Some options require the name of an object for the command to perform the action that you want to carry out. If an option is preceded with an * (asterisk), this information is required to submit the command. When appending `-j` to the `odacli` command, the output is returned in JSON format. The help option (`-h`) is an option that is available with almost all commands. When you include the `-h` option, you can obtain additional information about the command that you want to perform.

Oracle Database Appliance Manager Command-Line Interface Help

Run the `-h` command to see the usage information for all commands available for your Oracle Database Appliance. For example:

```
odacli -h
```

Run `odacli command -h` to see detailed help about a specific command. For example, to see detailed help for the `odacli describe-dbhome` command, use the following:

```
odacli describe-dbhome -h
```

Managing ODACLI Privileges and Security with SUDO

Oracle Appliance Manager command-line utility requires `root` system privileges for most administration actions. You may want to use SUDO as part of your system auditing and security policy.

For most tasks, Oracle recommends that you log in as `root` to use the Oracle Appliance Manager command-line interface on Oracle Database Appliance. If you are not logged in as `root`, then you cannot carry out most actions on the appliance. For example, if you are not logged in as `root`, then you can view storage information, but you cannot modify the storage.

Allowing Root User Access Using SUDO

In environments where system administration is handled by a different group than database administration, or where security is a significant concern, you may want to limit access to the `root` user account and password. SUDO enables system administrators to grant certain users (or groups of users) the ability to run commands as `root`, while logging all commands and arguments as part of your security and compliance protocol.

A SUDO security policy is configured by using the file `/etc/sudoers`. Within the `sudoers` file, you can configure groups of users and sets of commands to simplify and audit server administration with SUDO commands.

Caution:

Configuring SUDO to allow a user to perform any operation is equivalent to giving that user `root` privileges. Consider carefully if this is appropriate for your security needs.

Example 15-1 SUDO Example 1: Allow a User to Perform Any ODACLI Operation

This example shows how to configure SUDO to enable a user to perform any ODACLI operation. You do this by adding lines to the commands section in the `/etc/sudoers` file:

```
## The commands section may have other options added to it.
##
Cmdnd_Alias ODACLI_CMDS=/opt/oracle/dcs/bin/odacli *
jdoe ALL = ODACLI_CMDS
```

In this example, the user name is `jdoe`. The file parameter setting `ALL= ODACLI_CMDS` grants the user `jdoe` permission to run all `odacli` commands that are defined by the command alias `ODACLI_CMDS`. After configuration, you can copy one `sudoers` file to multiple hosts. You can also create different rules on each host.

Note:

Before database creation, you must set up user equivalency with SSH for the root user on each server. If you do not set up user equivalency and configure SSH on each server, then you are prompted to provide the root password for each server during database creation.

After you configure the `sudoer` file with the user, the user `jdoe` can run the set of `odacli` commands configured with the command alias `ODACLI_CMDS`. For example:

```
odacli create-database --dbname newdb
Enter new 'SYS, SYSTEM and PDB Admin user' password:
Confirm 'SYS, SYSTEM and PDB Admin user' password:

Job details
-----
                ID: 1bc31577-f910-4d3f-b6ff-8e3fccd30141
Description: Database service creation with db name: newdb
                Status: Created
                Created: November 30, 2018 9:23:57 AM PST
                Message:

Task Name Start Time End Time Status
-----
```

Example 15-2 SUDO Example 2: Allow a User to Perform Only Selected ODACLI Operations

To configure SUDO to allow a user to perform only selected ODACLI operations, add lines to the commands section in the `/etc/sudoers` file as follows:

```
## DCS commands for oracle user
Cmnd_Alias DCSCMDS = /opt/oracle/dcs/bin/odacli describe-appliance
oracle ALL=          DCSCMDS
```

```
$ sudo /opt/oracle/dcs/bin/odacli describe-appliance
```

```
Appliance Information
```

```
-----
                          ID: a977bb04-6cf0-4c07-8e0c-91a8c7e7ebb8
                          Platform: OdaliteL
Data Disk Count: 6
CPU Core Count: 20
Created: October 24, 2017 6:51:52 AM HDT
```

```
System Information
```

```
-----
                          Name: system1001
                          Domain Name: example.com
                          Time Zone: America/Adak
                          DB Edition: EE
DNS Servers: 10.200.76.198 10.200.76.199 192.0.2.254
NTP Servers: 10.200.0.1 10.200.0.2
```

```
Disk Group Information
```

```
-----
DG Name          Redundancy          Percentage
-----
Data             Normal              90
Reco             Normal              10
```

In this example, the user `jdoue2` tries to run the `sudo odacli list-databases` command, which is not part of the set of commands that is configured for that user. SUDO prevents `jdoue2` from running the command.

```
[jdoue2@servernode1 ~]$ sudo /opt/oracle/dcs/bin/odacli list-databases
```

```
Sorry, user jdoue2 is not allowed to execute '/opt/oracle/dcs/bin/odacli list-databases' as root on servernode1.
```

ODACLI Command Changes with Multi-User Access on Oracle Database Appliance

Understand the ODACLI command changes when you enable multi-user access.

About the `odacli-view` command

In a multi-user access-enabled environment, to run automated scripts, that is, to generate a system report based on the output of `odacli` commands, you may need to provide the user credentials when prompted by the system. In such cases, the automation of scripts may fail. In such cases, use the `odacli-view` command instead of the `odacli` command. The `odacli-view` command allows you to run read-only `odacli` commands as root user without providing user credentials. Read-only `odacli` commands include commands to list, describe, get, read, or ping.

However, the security of the system is not compromised because the user credentials of a securely-generated internal user are used for this purpose. The `odacli-view` command can be used in Oracle Database Appliance deployments with or without multi-user access. In an Oracle Database Appliance environment where multi-user access is not enabled, `odacli-view` has the same functionality as `odacli`. In a multi-user access-enabled environment, `odacli-view` provides the information about all the resources in a system. For example, `odacli-view list-databases` command lists all the databases in the system.

Usage:

```
/opt/oracle/dcs/bin/odacli-view command_name
```

For example:

```
/opt/oracle/dcs/bin/odacli-view list-dbhomes  
/opt/oracle/dcs/bin/odacli-view list-databases  
/opt/oracle/dcs/bin/odacli-view list-users
```

ODACLI Command Usage and Entitlement Requirements When Multi-User Access is Enabled

Note:

If you have enabled multi-user access, then you can run all supported ODACLI commands on KVM and DB systems, after logging in as `odaadmin`.

 **Note:**

The authentication token support for ODACLI session management is linked to a multi-user access user account. Since `root` is an operating system administrative user and not a multi-user access user, auth token based session management system is not supported when a user logs in as `root`. Therefore, you must provide an Oracle Database Appliance account user name and password to run any ODACLI command.

The following table describes the ODACLI commands that have changes for multi-user access and the entitlements required to run the commands.

ODACLI Command	Roles Required	Changes in command option
<code>odacli configure-firstnet</code>	ODA-ADMINISTRATOR	No change
<code>odacli create-network</code>	ODA-ADMINISTRATOR	No change
<code>odacli delete-network</code>	ODA-ADMINISTRATOR	No change
<code>odacli delete-networkinterface</code>	ODA-ADMINISTRATOR	No change
<code>odacli describe-network</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli describe-networkinterface</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli list-networks</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli list-networkinterfaces</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli update-network</code>	ODA-ADMINISTRATOR	No change
<code>odacli cleanup-patchrepo</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli create-prepatchreport</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli describe-prepatchreport</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli list-prepatchreports</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli delete-prepatchreport</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli list-availablepatches</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli describe-component</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli describe-latestpatch</code>	ODA-ADMINISTRATOR, ODA-DB	No change
<code>odacli list-agentconfig-parameters</code>	ODA-ADMINISTRATOR	No change
<code>odacli update-agentconfig-parameters</code>	ODA-ADMINISTRATOR	No change

ODACLI Command	Roles Required	Changes in command option
odacli delete-agentconfig-parameters	ODA-ADMINISTRATOR	No change
odacli update-dbhome	ODA-ADMINISTRATOR, ODA-DB	User odaadmin with the role of ODA-ADMINISTRATOR can update any database home. A custom user with the role of ODA-DB can only update a database home that they have primary access (as the creator) or shared access (as a user who is granted access by odaadmin).
odacli update-dcsadmin	ODA-ADMINISTRATOR	No change
odacli update-dcsagent	ODA-ADMINISTRATOR	No change
odacli update-dcscomponents	ODA-ADMINISTRATOR	No change
odacli update-registry	User with any role	No change
odacli update-repository	ODA-ADMINISTRATOR, ODA-DB	No change
odacli update-server	ODA-ADMINISTRATOR	No change
odacli update-storage	ODA-ADMINISTRATOR	No change
odaadmcli orachk	ODA-ADMINISTRATOR	No change
odacli set-credential	ODA-ADMINISTRATOR, ODA-DB	Not supported when multi-user access is enabled. When multi-user access is enabled, log in as a custom user and use odacli change-password instead.
odacli create-appliance	ODA-ADMINISTRATOR	Add an attribute called "isMultiUserAccessEnabled": true in the provision.json file. When you run the command, you are prompted to enter and confirm passwords for odaadmin, oracle and grid users and the provisioning job is submitted.
odacli describe-system	User with any role	No change
odacli list-featuretracking	ODA-ADMINISTRATOR	No change
odacli create-backup	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli create-backupconfig	ODA-ADMINISTRATOR, ODA-DB	If creating backupconfig based on ObjectStoreSwift, user must be the creator of the ObjectStoreSwift.
odacli create-objectstoreswift	ODA-ADMINISTRATOR, ODA-DB	No change

ODACLI Command	Roles Required	Changes in command option
odacli delete-backup	ODA-ADMINISTRATOR, ODA-DB	User must have primary (creator of that database) or shared access (granted by odaadmin) on the database whose backup is being deleted.
odacli delete-backupconfig	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli describe-backupreport	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli delete-objectstoreswift	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli describe-schedule	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli irestore-database	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli list-backupconfigs	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli list-backupreports	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli list-objectstoreswifts	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli list-schedules	ODA-ADMINISTRATOR, ODA-DB	No changes
odacli list-tdebackupreports	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli recover-database	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli restore-archivelog	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli restore-tdewallet	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli update-backupconfig	ODA-ADMINISTRATOR, ODA-DB	Must have primary or shared access
odacli update-schedule	ODA-ADMINISTRATOR, ODA-DB	No change
odacli configure-dataguard	ODA-ADMINISTRATOR, ODA-DB	The creator of the primary database and the standby database could be the same or different users. The default is oda-admin.
odacli deconfigure-dataguard	ODA-ADMINISTRATOR, ODA-DB	The creator of the primary database and the standby database could be the same or different users. The default is oda-admin.
odacli describe-dataguardstatus	ODA-ADMINISTRATOR, ODA-DB	No change

ODACLI Command	Roles Required	Changes in command option
odacli failover-dataguard	ODA-ADMINISTRATOR, ODA-DB	No change
odacli list-dataguardstatus	ODA-ADMINISTRATOR, ODA-DB	No change
odacli reinstate-dataguard	ODA-ADMINISTRATOR, ODA-DB	No change
odacli switchover-dataguard	ODA-ADMINISTRATOR, ODA-DB	No change
odacli list-cpucores	ODA-ADMINISTRATOR	No change
odacli describe-cpucore	ODA-ADMINISTRATOR	No change
odacli update-cpucore	ODA-ADMINISTRATOR	No change
odacli create-cpupool	ODA-ADMINISTRATOR	Only odaadmin can create it but a non-admin user with role of ODA-DB can use them.
odacli remap-cpupools	ODA-ADMINISTRATOR	No change
odacli list-cpupools	ODA-ADMINISTRATOR, ODA-DB	A non-admin user with the role of ODA-DB can run the odacli list-cpupools command to view all available CPU pools.
odacli describe-cpupool	ODA-ADMINISTRATOR, ODA-DB	A non-admin user with the role of ODA-DB can run the odacli describe-cpupool command to view details of the CPU pool.
odacli modify-cpupool	ODA-ADMINISTRATOR	No change
odacli delete-cpupool	ODA-ADMINISTRATOR	No change
odacli list-auditrecords	ODA-ADMINISTRATOR	No change
odacli describe-auditrecord	ODA-ADMINISTRATOR	No change
odacli clone-database	ODA-ADMINISTRATOR, ODA-DB	User must have primary or shared access to the database home and the source database being cloned. A user with shared access to source database gets only shared access to the cloned database. Hence, the primary owner of the source database remains the primary owner of the cloned database in this case.

ODACLI Command	Roles Required	Changes in command option
odacli create-database	ODA-ADMINISTRATOR, ODA-DB	For database creation in an existing database home, the user must have primary or shared access to the database home. A user with shared access to the database home gets only shared access to the new database, whose primary owner remains the primary owner of the database home. When using existing database storage for the new database, the user must have primary or shared access to that database storage.
odacli delete-database	ODA-ADMINISTRATOR, ODA-DB	Can access only those databases where the user has primary or shared access
odacli describe-database	ODA-ADMINISTRATOR, ODA-DB	Can access only those databases where the user has primary or shared access
odacli list-databases	ODA-ADMINISTRATOR, ODA-DB	User can only view listing of the databases for which they have primary or shared access. Use the <code>-all</code> option to view all databases and request access.
odacli modify-database	ODA-ADMINISTRATOR, ODA-DB	User should have primary or shared access to the database and the backupconfig being attached. Additionally, the primary owner (creator) of the database and backupconfig should be the same.
odacli move-database	ODA-ADMINISTRATOR, ODA-DB	User must have primary or shared access to the source database that is being moved and the target database home. Additionally, the primary owner of the source and target database home must be the same.
odacli register-database	ODA-ADMINISTRATOR, ODA-DB	User must be the primary owner (creator) of the database home on which this database is to be registered.

ODACLI Command	Roles Required	Changes in command option
odacli upgrade-database	ODA-ADMINISTRATOR, ODA-DB	User must have primary or shared access to the source database (the database being upgraded) and the target database home. Additionally, the owner of the source and target database home must be the same.
odacli update-database	ODA-ADMINISTRATOR, ODA-DB	User must have primary or shared access to the source database (the database being updated) and the target database home. Additionally, the owner of the source and target database home must be the same.
odacli configure-dbhome-storage	ODA-ADMINISTRATOR	No change
odacli list-dbhome-storages	ODA-ADMINISTRATOR	No change
odacli describe-dbhome-storage	ODA-ADMINISTRATOR	No change
odacli modify-dbhome-storage	ODA-ADMINISTRATOR	No change
odacli create-dbhome	ODA-ADMINISTRATOR, ODA-DB	Can access only those database homes where the user has primary or shared access.
odacli delete-dbhome	ODA-ADMINISTRATOR, ODA-DB	Can access only those database homes where the user has primary or shared access.
odacli describe-dbhome	ODA-ADMINISTRATOR, ODA-DB	Can access only those database homes where the user has primary or shared access.
odacli list-dbhomes	ODA-ADMINISTRATOR, ODA-DB	Can access only those database homes where the user has primary or shared access. Use the <code>-all</code> option to view all database homes and request access.
odacli create-dbstorage	ODA-ADMINISTRATOR	Can access only those dbstorages where the user has primary or shared access.
odacli delete-dbstorage	ODA-ADMINISTRATOR	Can access only those dbstorages where the user has primary or shared access.
odacli describe-dbstorage	ODA-ADMINISTRATOR	Can access only those dbstorages where the user has primary or shared access.
odacli list-dbstorages	ODA-ADMINISTRATOR	Can access only those dbstorages where the user has primary or shared access.

ODACLI Command	Roles Required	Changes in command option
odacli modify-dbstorage	ODA-ADMINISTRATOR	Can access only those dbstorages where the user has primary or shared access.
odacli update-dgstorage	ODA-ADMINISTRATOR	No change
odacli create-jobdata-retention-policy	ODA-ADMINISTRATOR	No change
odacli create-purge-jobdata-job	ODA-ADMINISTRATOR	No change
odacli delete-jobdata-retention-policy	ODA-ADMINISTRATOR	No change
odacli describe-job	User with any role	No change
odacli list-jobs	User with any role	No change
odacli list-jobdata-retention-policy	ODA-ADMINISTRATOR	No change
odacli list-purge-jobdata-job	ODA-ADMINISTRATOR	No change
odacli list-scheduled-executions	ODA-ADMINISTRATOR	No change
odaadmcli manage diagcollect	ODA-ADMINISTRATOR	No change
odacli create-auto-logclean-policy	ODA-ADMINISTRATOR	No change
odacli create-logcleanjob	ODA-ADMINISTRATOR	No change
odacli describe-logcleanjob	ODA-ADMINISTRATOR	No change
odacli list-auto-logclean-policy	ODA-ADMINISTRATOR	No change
odacli list-logcleanjobs	ODA-ADMINISTRATOR	No change
odacli list-logspaceusage	ODA-ADMINISTRATOR	No change
odacli configure-asr	ODA-ADMINISTRATOR	No change
odacli delete-asr	ODA-ADMINISTRATOR	No change
odacli describe-asr	ODA-ADMINISTRATOR	No change
odacli test-asr	ODA-ADMINISTRATOR	No change
odacli update-asr	ODA-ADMINISTRATOR	No change
odacli list-osconfigurations	ODA-ADMINISTRATOR	No change
odacli update-osconfigurations	ODA-ADMINISTRATOR	No change
odaadmcli show cooling	root	No change
odaadmcli show env_hw	root	No change
odaadmcli show fs	root	No change
odaadmcli show memory	root	No change
odaadmcli show network	root	No change
odaadmcli show power	root	No change
odaadmcli show processor	root	No change
odaadmcli show server	root	No change
odaadmcli asmops diskgroup	root	No change
odaadmcli expand storage	root	No change
odacli list-dgdisks	ODA-ADMINISTRATOR, ODA-DB	No change

ODACLI Command	Roles Required	Changes in command option
odacli validate-storage topology	ODA-ADMINISTRATOR	No change
odaadmcli power disk	root	No change
odaadmcli show controller	root	No change
odaadmcli show disk	root	No change
odaadmcli show diskgroup	root	No change
odaadmcli show raidsyncstatus	root	No change
odaadmcli show storage	root	No change
odaadmcli stordiag	root	No change

odacli Network Commands

Use the `odacli network` commands to list and describe network interfaces.

- [odacli configure-firstnet](#)
Use the command `odacli configure-firstnet` to configure the first network in the appliance after racking and connecting the power and network cables.
- [odacli create-network](#)
Use the `odacli create-network` command to create a network.
- [odacli delete-network](#)
Use the command `odacli delete-network` to delete a network.
- [odacli delete-networkinterface](#)
Use the command `odacli delete-networkinterface` to delete a network interface on Oracle Database Appliance X8-2 hardware models.
- [odacli describe-network](#)
Use the `odacli describe-network` command to display the details of a specific network.
- [odacli describe-networkinterface](#)
Use the `odacli describe-networkinterface` command to display the details of any network interface.
- [odacli list-networks](#)
Use the `odacli list-networks` command to display networks.
- [odacli list-networkinterfaces](#)
Use the `odacli list-networkinterfaces` command to display network interfaces.
- [odacli modify-network](#)
Use the `odacli modify-network` command to update an existing network configuration.
- [odacli update-network](#)
Use the `odacli update-network` command to update an existing network configuration.

odacli configure-firstnet

Use the command `odacli configure-firstnet` to configure the first network in the appliance after racking and connecting the power and network cables.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# /opt/oracle/dcs/bin/odacli configure-firstnet
```

Usage Notes

This command ensures that the system is available in the network, enabling you to manage the deployment through the Oracle Appliance Manager Browser User Interface.

- **Bonded network configuration:** Bonded dual-ported interface. With the bonded configuration, you can only enable one of the interfaces. The bonded configuration supports VLANs. The bonded network configuration uses `btbond1` on Oracle Database Appliance hardware models other than X8-2. On Oracle Database Appliance X8-2, the bonded network configuration uses `btbond1` to `btbond6`. This is the default setting.
- **Non-bonded network configuration (on Oracle Database Appliance hardware models other than X8-2):** Two separate physical network interfaces, this configuration does not support VLANs. The non-bonded network configuration uses `em2` and `em3` as public interfaces. Note that Oracle Database Appliance X8-2 does not support non-bonded network configuration.
- To change a non-bonded network configuration to a bonded configuration, run the Oracle Database Appliance Cleanup Script and redeploy the appliance.
- You can choose to enable Link Aggregation Control Protocol (LACP) on the bonding interface when you run `odacli configure-firstnet`.
- You can use the `-o` option with the `odacli configure-firstnet` command to configure the network speed for Oracle Dual Port 25 Gb Ethernet Adapter.
- You can also use the `-o` option with the `odacli configure-firstnet` command to enable or disable LACP on a bonding interface after deployment.

Enabling LACP on a bonding interface after deployment:

```
# odacli configure-firstnet -o
INFO: Configure network option
Select the Interface to configure the network on (btbond1 btbond3
btbond5) [btbond1]:btbond3
Use LACP bonding on btbond3 (yes/no) [no]: yes
INFO: network interface [btbond3] setup in LACP mode
```

Disabling LACP on a bonding interface after deployment:

```
# odacli configure-firstnet -o
INFO: Configure network option
Select the Interface to configure the network on (btbond1 btbond3
btbond5) [btbond1]:btbond3
Use LACP bonding on btbond3 (yes/no) [yes]: no
INFO: network interface [btbond3] setup in active-backup mode
```

Example 15-3 Configuring the First Network as a Bonded Network

Configure the first network to use a `btbond1` interface without configuring DHCP. Complete the IP address, netmask address, and gateway address.

Values that you need to provide are shown in *italic font*, with the exception of the `net1` gateway address; the program obtains the gateway IP address. The program derives this gateway address using the network information you provided for the other IP addresses. Accept this value, unless your network administrator provides an alternative gateway address that is different from the default that the appliance command-line interface detects.

The following is an example of the command on a single node platform:

```
# /opt/oracle/dcs/bin/odacli configure-firstnet

Select the Interface to configure the network on (btbond1): btbond1
Configure DHCP on btbond1 (yes/no): no
INFO: You have chosen Static configuration
Enter the IP address to configure: 10.1.10.2
Enter the Netmask address to configure: 255.255.255.0
Enter the Gateway address to configure: 10.1.10.1
INFO: Plumbing the IPs now
INFO: Restarting the network
Shutting down interface btbond1: bonding: btbond1: Removing slave em2.
bonding: btbond1: releasing active interface em2
bonding: btbond1: making interface em3 the new active one.
bonding: btbond1: Removing slave em3.
bonding: btbond1: releasing active interface em3
:::~::~:
```

Example 15-4 Configuring the First Network as a Non-Bonded Network

The following is an example of a non-bonded configuration. For a non-bonded configuration, answer `no` to using a bonding public interface. Note that Oracle Database Appliance X8-2 does not support non-bonded network configuration.

```
# /opt/oracle/dcs/bin/odacli configure-firstnet
Using bonding public interface (yes/no) [yes]: no
INFO: Breaking the bonding on btbond1
INFO: remove bonding module: rmmmod bonding
INFO: remove slave setup in /etc/sysconfig/network-scripts/ifcfg-em2
INFO: remove slave setup in /etc/sysconfig/network-scripts/ifcfg-em3
INFO: Restarting the network
Shutting down interface em1: [ OK ]
Shutting down loopback interface: [ OK ]
Bringing up loopback interface: [ OK ]
```

```
Bringing up interface em1: [ OK ]
Bringing up interface em2: [ OK ]
Bringing up interface em3: [ OK ]
INFO: Restarting the DCS agent
initdcsagent stop/waiting
initdcsagent start/running, process 57629
Select the Interface to configure the network on (em2 em3) [em2]:
Configure DHCP on em2 (yes/no) [no]:
INFO: You have chosen Static configuration
Enter the IP address to configure : 10.31.102.101
Enter the Netmask address to configure : 255.255.240.0
Enter the Gateway address to configure[10.31.96.1] :
INFO: Plumbing the IPs now
INFO: Restarting the network
Shutting down interface em1: [ OK ]
Shutting down interface em2: [ OK ]
Shutting down interface em3: [ OK ]
Shutting down loopback interface: [ OK ]
Bringing up loopback interface: [ OK ]
Bringing up interface em1: [ OK ]
Bringing up interface em2: Determining if ip address 10.31.102.101 is
already in use for device em2...
[ OK ]
Bringing up interface em3: [ OK ]
```

Example 15-5 Configuring the Speed of the Network Interface

The following is an example of setting the speed of the network card manually.

```
# odacli configure-firstnet -o
INFO: Configure network option
Select the Interface to configure the network on (btbond1 btbond2
btbond3) [btbond1]:btbond3

Use LACP bonding on btbond3 (yes/no) [no]:
Set the network speed on btbond3 to 1) AUTO, 2) 1G, 3) 10G, 4) 25G
[AUTO]: 3
INFO: The speed of the network port is set to '10G'
INFO: Please set the speed for the connected ports in the switch
INFO: stop the network 'btbond3'
INFO: start the network 'btbond3'
INFO: Network interface btbond3 (p2p1, p2p2) has been set to using
speed '10G'
```

odacli create-network

Use the `odacli create-network` command to create a network.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli create-network [-d|-no-d] -n name -f interface -p ipaddress -w
{Public|Dataguard|Database|Management|Backup|Other} -s subnetmask -g
gateway[-h] [-sip] [-sn] [-vs] [-j]
```

Parameters

Parameter	Description
--defaultnetwork, -d	Identifies the default network.
--gateway, -g	Defines the network gateway. The gateway is required for the default network.
--help, -h	(Optional) Displays help for using the command.
--interface, -f	Defines the name of the network interface.
--interfacetype, -t	Defines the network interface type (BOND PHYSICAL VLAN INTERNAL) (non case-sensitive).
--ipaddress, -p	Defines the network IP address. This can be specified in the format IPAddress or nodeNumber0:IPAddress0,nodeNumber1:IPAddress1,...
--json, -j	(Optional) Displays JSON output.
--networktype, -w	Defines the type of network. Options are: {Public Dataguard Database Management Backup Other}. The default is Other.
--name, -n	Name of the network.
--no-defaultnetwork, no-d	Identifies a network as not the default network. Use --defaultnetwork -d to identify a default network.
--subnetmask, -s	Defines the Network Subnet Mask.
--scanips, -sip	Defines the SCAN IP addresses (in the format scanip0,scanip1,...)
--scanname, -sn	Defines the SCAN name.
--nodeNumber, -u	Defines the node number for High-Availability deployments. Note: This option is deprecated and will be desupported in a future release.
--vips, -vs	List of virtual IP addresses. They can be specified in the format vipname0:nodeNumber0:vip0,vipname1:nodenummer1:vip1, ...
--vlanid, -v	Add VLAN as a new network. This option is available for for High-Availability deployments.

Usage Notes

- Network of `public` type can only be defined when deploying the appliance or when running `odacli configure-firstnet` during initial provisioning.
- Use this command to create an additional network not done in `create-appliance`.
- You are only allowed to create a network on the bond interface.

- On Oracle Database Appliance non-High Availability systems, you cannot specify Virtual IP addresses. The Virtual IP address is set to the same value as the IP address.
- Single Client Access Name (SCAN) cannot be set up on Oracle Database Appliance non-High Availability systems.

Example 15-6 Creating a Network

The following example creates a new network, `sfpbond1`, with IP address `192.0.2.15`. The network is an additional network that uses subnet mask `255.255.255.0` and is not a default network.

```
# odacli create-network -n network1 -f sfpbond1 -p 192.0.2.15 -w
Backup -s 255.255.255.0 -no-d
```

Example 15-7 Creating a VLAN Network

```
odacli create-network -g 10.31.131.129 -f btbond1 -t VLAN -p
0:10.31.131.132,1:10.31.131.133 -n vlan150 -w Database -no-d -sip
10.31.131.134,10.31.131.135 -sn scaoda702c1-vlan150-scan -s
255.255.255.128 -vs n1-vlan150-vip:0:10.31.131.136,n2-vlan150-
vip:1:10.31.131.137 -v 150
```

odacli delete-network

Use the command `odacli delete-network` to delete a network.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To delete a network:

```
odacli delete-network -i id [-n] [-h] [-j]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Defines the network identity.
<code>--name, -n</code>	Specifies the network name.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

You cannot delete the Public-network or Private-network after the system is deployed.

On High-Availability systems, if the node number is not specified in the `odacli delete-network` command, then the network on both nodes is deleted.

Example 15-8 Deleting a Network

The following example deletes a backup network with a network ID of 55db39db-d95c-42c5-abbd-b88eb99b83ec.

```
# odacli delete-network -i 55db39db-d95c-42c5-abbd-b88eb99b83ec

"jobId" : "c26d217e-419b-4a91-8680-7b06bcfe9828",

}
```

odacli delete-networkinterface

Use the command `odacli delete-networkinterface` to delete a network interface on Oracle Database Appliance X8-2 hardware models.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To delete a network interface:

```
odacli delete-networkinterface -i id -n name [-h]
```

Parameters

Parameter	Description
--id, -i	Defines the network interface ID.
--name, -n	Defines the network interface name.
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output.

Usage Notes

You cannot delete the network interface card in slot 7.

Example 15-9 Deleting a Network Interface

```
[root@oak ~]/opt/oracle/dcs/bin/odacli delete-networkinterface -n
btbond4
{
  "jobId" : "a81066e2-417e-4df6-b810-08df24c646c1",
  "status" : "Running",
  "message" : null,
  "reports" : ,
  "createTimestamp" : "August 8, 2023 00:01:09 AM UTC",
  "resourceList" : ,
  "description" : "Network Interface Deletion with name btbond4",
  "updatedAt" : "August 8, 2023 00:01:09 AM UTC"
}
```

Example 15-10 Deleting btbond1 Network Interface is Not Allowed

```
[root@oak ~]# /opt/oracle/dcs/bin/odacli delete-networkinterface -n
btbond1
DCS-10001:Internal error encountered: Delete operation is not allowed
on network interface : btbond1.
```

Example 15-11 Deleting Network Interface When Network Exists is Not Allowed

```
[root@oak ~]# opt/oracle/dcs/bin/odacli delete-networkinterface -n
btbond3
DCS-10001:Internal error encountered: Delete operation is not allowed
- networks {[Public-network]} found on interface btbond3. Please delete
the network first.
```

odacli describe-network

Use the `odacli describe-network` command to display the details of a specific network.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To display the details of a specific network:

```
odacli describe-network -i id -n name [-j][-u][-h]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Identifies the network ID. Use the <code>odacli list-networks</code> command to obtain the <code>id</code> .
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--name, -n</code>	Specifies the network name.
<code>--node-number, -u</code>	(Optional) Displays the network interface information for the specified node. Note: This option is deprecated and will be desupported in a future release.

Example 15-12 Displaying Network Details

Enter the following command to display the details of the public network:

```
# odacli describe-network -n Public-network
```

```
Network details
```

```
-----
                ID: a11573f1-cad4-41fc-9dd0-3ba958b605f8
                Name: Public-network
                NIC: btbond1
Interface Type: BOND
Subnet Mask: 255.255.255.0
Gateway: 10.31.116.1
VLAN ID:
Type: Public
Default: true

```

Example 15-13 Displaying Network Details

Enter the following command to display the details of network ID 93c07043-3002-494a-8fa0-f3ae932fb4c5:

```
# odacli describe-network -i 93c07043-3002-494a-8fa0-f3ae932fb4c5 -u 1

Network details
-----
                ID: 93c07043-3002-494a-8fa0-f3ae932fb4c5
                Name: Private-network
                NIC: ibbond0
InterfaceType: BOND
                IP Address: 192.168.16.25
                Subnet Mask: 255.255.255.0
                Gateway:
                VlanId:
                Type: Private
                Default: false
                Created: November 18, 2018 10:54:16 PM PST
```

odacli describe-networkinterface

Use the `odacli describe-networkinterface` command to display the details of any network interface.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To display the details of a specific network interface:

```
odacli describe-networkinterface -i id -n name [-j][-h][-u]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Identifies the network interface ID. Use the <code>odacli list-networks</code> command to obtain the <code>id</code> .
<code>--name, -n</code>	Specifies the network interface name.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--nodeNumber, -u</code>	(Optional) Displays the network interface information for the specified node. Note: This option is deprecated and will be desupported in a future release.

Usage Notes

By default, this command always displays the network interface description of the local node. To display the description of another node, specify the node number option (-u).

Example 15-14 Displaying Network Details

Enter the following command to display the details of network interface with ID fe1bf0a7-f56e-44cd-9a84-f374c0aa4b61:

```
# /opt/oracle/dcs/bin/odacli describe-networkinterface
-i fe1bf0a7-f56e-44cd-9a84-f374c0aa4b61 -u 1

Network Interface details
-----
                ID: fe1bf0a7-f56e-44cd-9a84-f374c0aa4b61
                Name: eth2
                NIC: eth2
                Type: PHYSICAL
                Members: eth2
Slave Interface: true
                Created: October 16, 2018 1:16:59 PM PDT
```

odacli list-networks

Use the `odacli list-networks` command to display networks.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-networks [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--nodeNumber, -u</code>	(Optional) Displays the network interface information for the specified node. Note: This option is deprecated and will be desupported in a future release.

Example 15-15 Displaying a List of Networks

Use the `odacli list-networks` command to display a list of networks:

```
# odacli list-networks
ID Name NIC Interface Type Subnet Mask Gateway VLAN ID Node Networks
-----
-----
```

```

-----
30012eeb-1205-4cb6-9fc0-488972b2e420 Private-network priv0 INTERNAL
255.255.255.240 [IP Address on node0: 192.168.16.24]
75d01d4f-e940-4d0f-a4fe-ee04f5a90c73 Public-network btbond1.370 VLAN
255.255.255.0 10.209.10.241 370 [IP Address on node0: 10.209.10.244]

```

odacli list-networkinterfaces

Use the `odacli list-networkinterfaces` command to display network interfaces.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-networkinterfaces [-j] [-h] [-u]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--nodeNumber, -u</code>	(Optional) Displays the network interface information for the specified node. Note: This option is deprecated and will be desupported in a future release.

Example 15-16 Displaying a List of Network Interfaces

Use the `odacli list-networkinterfaces` command to display a list of network interfaces:

```

# odacli list-networkinterfaces -u 1
ID                                     Name
NIC          Type
-----

a31cfd63-fb90-4cbb-a2fb-382c5e33983b    ibbond0    ibbond0
BOND

```

odacli modify-network

Use the `odacli modify-network` command to update an existing network configuration.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To update a network:

```

odacli modify-network -i id -n name [-p IP address] [-w {Public|Dataguard|
Database|Management|Backup|Other} ] [-s network subnet mask] [-g network
gateway] [-sip] [-sn] [-vs] [-j] [-h]

```

Parameters

Parameter	Description
<code>--id, -i</code>	Defines the network identity.
<code>--name, -n</code>	Defines the network name.
<code>--gateway, -g</code>	(Optional) Defines the network gateway.
<code>--ipaddress, -p</code>	(Optional) Defines the network IP address. This can be specified in the format IPAddress or nodeNumber0:IPAddress0,nodeNumber1:IPAddress1,...
<code>--networktype, -w</code>	(Optional) Defines the type of network. {Public Dataguard Database Management Backup Other}
<code>--scanips, -sip</code>	Defines the SCAN IP addresses (in the format scanip0,scanip1,...)
<code>--scanname, -sn</code>	Defines the SCAN name.
<code>--subnetmask, -s</code>	(Optional) Defines the Network Subnet Mask.
<code>--vips, -vs</code>	List of virtual IP addresses. They can be specified in the format vipname0:nodeNumber0:vip0,vipname1:nodenummer1:vip1,...
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- You cannot modify the Public and Private-interfaces after the system is deployed.
- On Oracle Database Appliance non-High Availability systems, you cannot update Virtual IP addresses. The Virtual IP address is set to the same value as the IP address.
- Single Client Access Name (SCAN) cannot be set up on Oracle Database Appliance non-High Availability systems.
- On Oracle Database Appliance High Availability systems, you cannot update network of type Database to other types of network (such as backup, management and so on). You

can, however, update IP address, Virtual IP address, Gateway, and Subnet mask for all network types.

- The system has both SFP+ and 10GBaseT bonded pairs, which means that one of them is used for the public, and you can configure the other after deployment if you want additional connectivity. For example, if you want a backup network.

Example 15-17 Modifying a Network

The following example updates the network ID 192.0.0.2 and designates the network as a backup network:

```
# odacli modify-network -i 192.0.0.2 -w Backup
```

odacli update-network

Use the `odacli update-network` command to update an existing network configuration.

Note:

This command is deprecated in Oracle Database Appliance release 19.20 and will be desupported in a future release.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To update a network:

```
odacli update-network -i id -n name [-p IP address] [-w {Public|Dataguard|Database|Management|Backup|Other} ] [-s network subnet mask] [-g network gateway] [-sip] [-sn] [-vs] [-j] [-h]
```

Parameters

Parameter	Description
--id, -i	Defines the network identity.
--name, -n	Defines the network name.
--gateway, -g	(Optional) Defines the network gateway.
--ipaddress, -p	(Optional) Defines the network IP address. This can be specified in the format IPAddress or nodeNumber0:IPaddress0,nodeNumber1:IPaddress1,...
--json, -j	(Optional) Displays JSON output.
--networktype, -w	(Optional) Defines the type of network. {Public Dataguard Database Management Backup Other}
--scanips, -sip	Defines the SCAN IP addresses (in the format scanip0,scanip1,...)

Parameter	Description
<code>--scanname, -sn</code>	Defines the SCAN name.
<code>--subnetmask, -s</code>	(Optional) Defines the Network Subnet Mask.
<code>--vips, -vs</code>	List of virtual IP addresses. They can be specified in the format vipname0:nodeNumber0:vip0,vipname1:nodenumber1:vip1
<code>--help,-h</code>	(Optional) Displays help for using the command.

Usage Notes

- You cannot modify the Public and Private-interfaces after the system is deployed.
- On Oracle Database Appliance non-High Availability systems, you cannot update Virtual IP addresses. The Virtual IP address is set to the same value as the IP address.
- Single Client Access Name (SCAN) cannot be set up on Oracle Database Appliance non-High Availability systems.
- On Oracle Database Appliance High Availability systems, you cannot update network of type Database to other types of network (such as backup, management and so on). You can, however, update IP address, Virtual IP address, Gateway, and Subnet mask for all network types.
- The system has both SFP+ and 10GBaseT bonded pairs, which means that one of them is used for the public, and you can configure the other after deployment if you want additional connectivity. For example, if you want a backup network.

Example 15-18 Updating a Network

The following example updates network ID 192.0.0.2 and designates the network as a backup network:

```
# odacli update-network -i 192.0.0.2 -w Backup
```

odacli Multi-User Access Commands

Use `odacli` commands to enable multi-user access for the appliance.

Note:

For Oracle Database Appliance release 19.13, the multi-user access feature is available for standalone Oracle Database Appliance systems. During provisioning, a single domain and tenancy is created by default and all users are created within the default domain and tenancy.

- [odacli list-domains](#)
Use the `odacli list-domains` command to list all multi-user access domains.
- [odacli describe-domain](#)
Use the `odacli describe-domain` command to describes a multi-user access domain.

- [odacli list-tenants](#)
Use the `odacli list-tenants` command to list all tenants in a multi-user access domain.
- [odacli describe-tenant](#)
Use the `odacli describe-tenant` command to describe a tenant in a multi-user access domain.
- [odacli create-user](#)
Use the `odacli create-user` command to create a user in a multi-user access system.
- [odacli activate-user](#)
Use the `odacli activate-user` command to activate a user in a multi-user access system.
- [odacli list-users](#)
Use the `odacli list-users` command to list all users in a multi-user access system.
- [odacli describe-user](#)
Use the `odacli describe-user` command to describe a user in a multi-user access system.
- [odacli authorize-user](#)
Use the `odacli authorize-user` command in a multi-user access system to unlock a user account that is locked due to multiple failed login attempts or where the password has expired, and authorize the user to reset their password to reactivate their account.
- [odacli delete-user](#)
Use the `odacli delete-user` command in a multi-user access system to delete a user account.
- [odacli list-user-roles](#)
Use the `odacli list-user-roles` command to list user roles in a multi-user access system.
- [odacli describe-user-role](#)
Use the `odacli describe-user-role` command to describe a user role in a multi-user access system.
- [odacli list-user-entitlements](#)
Use the `odacli list-user-entitlements` command to list all entitlements in a multi-user access system.
- [odacli describe-user-entitlement](#)
Use the `odacli describe-user-entitlement` command to describe an entitlement in a multi-user access system.
- [odacli list-user-operations](#)
Use the `odacli list-user-operations` command to list all operations in a multi-user access system.
- [odacli describe-user-operation](#)
Use the `odacli describe-user-operation` command to describe an operation in a multi-user access system.
- [odacli list-resources-access](#)
Use the `odacli list-resources-access` command to list access to DCS resources in a multi-user access system.

- [odacli describe-resource-access](#)
Use the `odacli describe-resource-access` command to describe access to a DCS resource in a multi-user access system.
- [odacli grant-resource-access](#)
Use the `odacli grant-resource-access` command to grant shared access to a DCS resource in a multi-user access system.
- [odacli revoke-resource-access](#)
Use the `odacli revoke-resource-access` command to revoke access to a DCS resource in a multi-user access system.
- [odacli reset-password](#)
Use the `odacli reset-password` command to reset the password for a user, after it is unlocked, in a multi-user access system.
- [odacli change-password](#)
Use the `odacli change-password` command to change the password for a user in a multi-user access system.

odacli list-domains

Use the `odacli list-domains` command to list all multi-user access domains.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli list-domains [-j] [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- The `odaadmin` user can run this command to view all the multi-user access domains.

Example 15-19

```
[odaadmin@oda1 bin]$ odacli list-domains
ID                               Name                Description         Is Active
-----
811f176a-26c9-4480-afb3-2c735d565d91  odalocal.com      Default domain     true
```

odacli describe-domain

Use the `odacli describe-domain` command to describes a multi-user access domain.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-domain -dn domain_name [-j] [-h]
```

Parameters

Parameter	Description
<code>--domain-name, -dn</code>	(Required) Specifies the multi-user access domain.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- The `odaadmin` user can run this command to view details of the multi-user access domain.

Example 15-20

```
# odacli describe-domain -dn odalocal.com
Domain details
-----
                ID: 811f176a-26c9-4480-afb3-2c735d565d91
                Name: odalocal.com
Description: Default domain
Is Active: true
Created: November 22, 2021 7:39:50 PM UTC
Last Updated: November 22, 2021 7:39:50 PM UTC
```

odacli list-tenants

Use the `odacli list-tenants` command to list all tenants in a multi-user access domain.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-tenants -dn domain_name [-j] [-h]
```

Parameters

Parameter	Description
<code>--domain-name, -dn</code>	(Optional) Specifies the multi-user access domain name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- The `odaadmin` user can run this command to view the tenants in a multi-user access domain.

Example 15-21

```
[odaadmin@odal bin]$ odacli list-tenants
ID Domain Name          Tenant Name  Tenant  Description  Is
Active
-----
1656723b-f614-4539-9634-d9013e611015 odalocal.com odalocal Default tenant
true
```

odacli describe-tenant

Use the `odacli describe-tenant` command to describe a tenant in a multi-user access domain.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-tenant -tn tenant_name -dn domain_name [-j] [-h]
```

Parameters

Parameter	Description
<code>--tenant-name, -tn</code>	(Required) Specifies the multi-user access tenant name.
<code>--domain-name, -dn</code>	(Optional) Specifies the multi-user access domain name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- The `odaadmin` user can run this command to view the tenant details in a multi-user access domain.

Example 15-22

```
[odaadmin@odal bin]$ odacli describe-tenant -tn odalocal
Tenant details
-----
                ID: 1656723b-f614-4539-9634-d9013e611015
    Domain Name: odalocal.com
    Tenant Name: odalocal
Tenant Description: Default tenant
    Is Active: true
        Created: November 22, 2021 7:39:50 PM UTC
    Last Updated: November 22, 2021 7:39:50 PM UTC
```

odacli create-user

Use the `odacli create-user` command to create a user in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli create-user -u user_id -r roles [-gc] [-j] [-h]
```

Parameters

Parameter	Description
<code>--user-id, -u</code>	(Required) Specifies the user whose details are being created.
<code>--user-roles, -r</code>	(Required) Specifies the role to be assigned to the user. Use commas to specify multiple roles.
<code>--generate-cert, -gc</code>	(Optional) This option generates and registers a pair of certificates, one for the client and the other for the server (DCS agent). After these certificates are mutually exchanged and authenticated, the client and server can communicate with each other using mTLS (mutual Transport Layer Security). This attribute is optional and must be enabled only when you need to connect to the DCS agent with mTLS in addition to Basic Authentication.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to create a user in a multi-user access system. After `odaadmin` creates a user and generates temporary login credentials, the new user must activate their account by connecting to the appliance with the temporary password. Run the `odacli activate-user` command and provide the temporary password and then specify the new password. You can also activate the user from the Browser User Interface.

Example 15-23

```
[odaadmin@odal bin]$ odacli create-user -u dcsdb2 -r ODA-DB
Enter ODA account password for user 'dcsdb2':
Retype ODA account password for user 'dcsdb2':
```

```

odacli activate-user

Use the `odacli activate-user` command to activate a user in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli activate-user [-j] [-h]
```

Parameters

Parameter	Description
<code>--domain-name, -d</code>	(Optional) Specifies the name of the domain in which the user exists.
<code>--tenant-name, -t</code>	(Optional) Specifies the tenancy in which the user exists.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Parameter	Description
--json, -j	(Optional) Displays JSON output.

Usage Notes

- Use the command to activate a user in a multi-user access system. To activate a user, the user to be activated must connect to the Oracle Database Appliance system through SSH and then run the command.

Example 15-24

```
[dcsdb2@odal bin]$ odacli activate-user
Enter your ODA account password:
Enter new password for your ODA account:
Retype new password for your ODA account:
User 'dcsdb2' activated successfully.
```

odacli list-users

Use the `odacli list-users` command to list all users in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-users [-d domain_name] [-t tenant_name] [-u user_id] [-j]
[-h]
```

Parameters

Parameter	Description
--domain-name, -d	(Optional) Specifies the name of the domain in which the user exists.
--tenant-name, -t	(Optional) Specifies the tenancy in which the user exists.
--user-id, -u	(Optional) Specifies the user for whom the list is being generated.
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output.

Usage Notes

- The `odaadmin` user can run this command to view all the users in a multi-user access system.

Example 15-25

```
[odaadmin@odal bin]$ odacli list-users
```

```

ID                               DCS User Name  OS User Name

```

odacli describe-user

Use the `odacli describe-user` command to describe a user in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-user [-u user_id] [-d domain_name] [-rd] [-t tenant_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--user-id, -u</code>	(Required) Specifies the user whose details are being viewed.
<code>--domain-name, -d</code>	(Optional) Specifies the name of the domain in which the user exists.
<code>--role-details, -rd</code>	(Optional) Specifies the entitlements and operations associated with the user role.
<code>--tenant-name, -t</code>	(Optional) Specifies the tenancy in which the user exists.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to view details about a user in a multi-user access system.

Example 15-26

```
[odaadmin@odal bin]$ odacli describe-user -u dcsdb1

User details
-----

```

odacli authorize-user

Use the `odacli authorize-user` command in a multi-user access system to unlock a user account that is locked due to multiple failed login attempts or where the password has expired, and authorize the user to reset their password to reactivate their account.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli authorize-user -u user_id [-d domain_name] [-t tenant_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--user-id, -u</code>	(Required) Specifies the user whose account is locked.
<code>--domain-name, -d</code>	(Optional) Specifies the name of the domain in which the user exists.
<code>--tenant-name, -t</code>	(Optional) Specifies the tenancy in which the user exists.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to authorize a user in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-27

```
[odaadmin@oda1 bin]$ odacli authorize-user -u dcsdb2
Enter your ODA account password:
Enter new password for user 'dcsdb2':
Retype new password for user 'dcsdb2':
User 'dcsdb2' authorized successfully.
User can now login with the temporary password assigned to them by the
system administrator
and reset their password by executing 'odacli reset-password' command or via
BUI.
```

odacli delete-user

Use the `odacli delete-user` command in a multi-user access system to delete a user account.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli delete-user -u user_id [-d domain_name] [-t tenant_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--user-id, -u</code>	(Required) Specifies the user account to be deleted.
<code>--domain-name, -d</code>	(Optional) Specifies the name of the domain in which the user exists.
<code>--tenant-name, -t</code>	(Optional) Specifies the tenancy in which the user exists.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to delete a user in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.
- The user can be deleted only if there are no resources currently being held in their name.

Example 15-28

```
[odaadmin@oda1 bin]$ odacli delete-user -u dcsdb2
```

```

odacli list-user-roles

Use the `odacli list-user-roles` command to list user roles in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-user-roles [-n role_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--role-name, -n</code>	(Optional) Displays the list for the specified role.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to view all the roles in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-29

```
[odaadmin@odal bin]$ odacli list-user-roles
```

```

Role Name          Role Description          Is Admin
Role Is Internal  Is Active
-----
-----
ODA-DB             Role with DB provisioning related entitlements
false             false             true
ODA-GRID           Role with GRID provisioning related entitlements
false             true              true
ODA-DBVMINFRA     Role with DBVM user related entitlements false
true              true
ODA-ADMINISTRATOR System Administrator role with all entitlements
true              true              true
ODA-OAKDROOT      Role with OAKD related entitlements
false             true              true

```

odacli describe-user-role

Use the `odacli describe-user-role` command to describe a user role in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-user-role [-n role_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--role-name, -n</code>	(Required) Specifies the user role for which you want to list the details.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to describe a user role in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-30

```

[odaadmin@odal bin]$ odacli describe-user-role -n ODA-DB
Role details
-----
Name: ODA-DB
Description: Role with DB provisioning related entitlements
Is Admin Role: false
Is Internal: false
Is Active: true

```

Mapped Entitlement(s): PROVISIONDB-MGMT, BACKUPDB-MGMT, PATCHDB-MGMT, DATAGUARD-MGMT, DBSTORAGE-MGMT, OBJSTORESWIFT-MGMT, RMANREPORT-MGMT, SCHEDULE-MGMT, ORACHK-MGMT, ASM-RDBMS-INSTANCE-MGMT, CPUPOOLVIEW-MGMT, COMMON-ALL

odacli list-user-entitlements

Use the `odacli list-user-entitlements` command to list all entitlements in a multi-user access system.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli list-user-entitlements [-ao] [-n entitlement_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--active-only, -ao</code>	(Optional) Lists the active entitlements.
<code>--entitlement-name, -n</code>	(Optional) Displays the list for the specified entitlement.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to view all entitlements in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-31

```
[odaadmin@odal bin]$ odacli list-user-entitlements
```

```
Entitlement Name      Entitlement
Description                                     Is Active
-----
TOKEN-MGMT           Entitlement for performing user token
management operations      true
OSCONFIGS-MGMT       Entitlement for performing os configurations
related operations         true
FEATURETOGGLE-MGMT   Entitlement for performing feature enable/
diabile management operations true
SERVER-MGMT          Entitlement for performing server related
operations                 true
HAT-MGMT             Entitlement for performing HAT Administrative
operations                 true
ASM-RDBMS-INSTANCE-MGMT Entitlement for performing ASM/RDBMS instance
related operations         true
RMANREPORT-MGMT      Entitlement for performing RMAN report(s)
```

```

related operations          true
DBHOME-MGMT                Entitlement for performing DBHomes (on ACFS) related
operations                 true
DCSCOMPS-MGMT              Entitlement for performing DCS component related
operations                 true
KVM-MGMT-INTERNAL          Entitlement for performing blackbox KVM related
internal operations        true
...

```

odacli describe-user-entitlement

Use the `odacli describe-user-entitlement` command to describe an entitlement in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-user-entitlement -n entitlement_name [-j] [-h]
```

Parameters

Parameter	Description
<code>--entitlement-name, -n</code>	(Required) Displays the details for the specified entitlement.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to view an entitlement in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-32

```
[odaadmin@odal bin]$ odacli describe-user-entitlement -n PROVISIONDB-MGMT
```

```
Entitlement details
```

```

-----
Name: PROVISIONDB-MGMT
Description: Entitlement for performing DB provision related
operations
Is Active: true
Mapped Operation(s): clone-database, create-database, delete-
database, describe-database, list-databases, modify-database, move-
database, register-database, update-database, upgrade-database, create-
dbhome, delete-dbhome, describe-dbhome, list-dbhomes, describe-
netsecurity, update-netsecurity, list-supported-dbversions, get-db-
shapes, restore-archivelog, restore-tdewallet, modify-dbfileattributes

```

odacli list-user-operations

Use the `odacli list-user-operations` command to list all operations in a multi-user access system.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli list-user-operations [-ao] [-n operations_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--active-only, -ao</code>	(Optional) Lists the active multi-user access operations.
<code>--operation-name, -n</code>	(Optional) Displays the list for the specified operation.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to view operations in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-33

```
[odaadmin@oda1 bin]$ odacli list-user-operations
```

Operation Name	Operation Description	Is Active
<code>migrate-ovm2kvm</code>	Migrate OVM to KVM	true
<code>list-orachkreports</code>	List orachkreports	true
<code>list-osconfigurations</code>	List os configurations	true
<code>describe-database</code>	Describe database	true
<code>retrieveall-resources</code>	Retrieve all resources	true
<code>modify-dbsystem-vm</code>	Modify DB System VMs	true
<code>list-backupconfigs</code>	List backup configurations	true

odacli describe-user-operation

Use the `odacli describe-user-operation` command to describe an operation in a multi-user access system.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli describe-user-operation [-n operation_name] [-j] [-h]
```

Parameters

Parameter	Description
--operation-name, -n	(Optional) Displays the details for the specified operation.
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output.

Usage Notes

- Use the command to view an operation in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-34

```
[odaadmin@oda1 bin]$ odacli describe-user-operation -n create-database
Operation details
-----
                Name: create-database
        Description: Create database
                Is Active: true
```

odacli list-resources-access

Use the `odacli list-resources-access` command to list access to DCS resources in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-resources-access [-ao] [-rn resource_name] [-rt resource_type] [-j] [-h]
```

Parameters

Parameter	Description
--active-only, -ao	(Optional) Lists the active resources.
--resource-name, -rn	(Optional) Displays the list by resource name.
--resource-type, -rt	(Optional) Displays the list for the specified resource type, for example, <code>oda_dbhome</code> , <code>oda_db</code> , <code>oda_dbstorage</code> , <code>oda_objstoreswift</code> , and <code>oda_backupconfig</code> .
--help, -h	(Optional) Displays help for using the command.

Parameter	Description
--json, -j	(Optional) Displays JSON output.

Usage Notes

- Use the command to view access to resources in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-35

```
[odaadmin@odal bin]$ odacli list-resources-access

Resource ID                               Resource Name   Resource

```

odacli describe-resource-access

Use the `odacli describe-resource-access` command to describe access to a DCS resource in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-resource-access [-ri resource_ID] [-j] [-h]
```

Parameters

Parameter	Description
<code>--resource-ID, -ri</code>	(Required) Specifies the resource ID.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to view access to a resource in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-36

```
[odaadmin@odal bin]$ odacli describe-resource-access -ri cfc65e00-5d9e-4c00-a7a0-f7ea37884e06
```

```
Resource Access details
```

```
-----
Resource ID: cfc65e00-5d9e-4c00-a7a0-f7ea37884e06
Resource Name: asmtde1
Resource Location: 53f434fe-598e-46a0-bbdc-a456404da0c9
Resource Type: ODA_DB
Primary Owner: odadb1
Shared Access: odaadmin
Is Active: true
Created: November 17, 2021 1:31:55 PM UTC
Last Updated: November 17, 2021 1:31:55 PM UTC
```

odacli grant-resource-access

Use the `odacli grant-resource-access` command to grant shared access to a DCS resource in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli grant-resource-access [-ri resource_ID] [-u user_ID] [-j] [-h]
```

Parameters

Parameter	Description
<code>--resource-ID, -ri</code>	(Required) Specifies the resource ID.
<code>--user-ID, -u</code>	(Required) Specifies the user name to be granted shared access.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Parameter	Description
--json, -j	(Optional) Displays JSON output.

Usage Notes

- Use the command to grant access to a resource in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-37

```
[odaadmin@odal bin]$ odacli grant-resource-access -ri
cfc65e00-5d9e-4c00-a7a0-f7ea37884e06 -u odadb2
Shared access of resource granted to user successfully...
[odaadmin@odal bin]$ odacli describe-resource-access -ri
cfc65e00-5d9e-4c00-a7a0-f7ea37884e06
Resource Access details
-----
Resource ID: cfc65e00-5d9e-4c00-a7a0-f7ea37884e06
Resource Name: asmtde1
Resource Location: 53f434fe-598e-46a0-bbdc-a456404da0c9
Resource Type: ODA_DB
Primary Owner: odadb1
Shared Access: odaadmin, odadb2
Is Active: true
Created: November 17, 2021 1:31:55 PM UTC
Last Updated: November 19, 2021 12:46:55 PM UTC
```

odacli revoke-resource-access

Use the `odacli revoke-resource-access` command to revoke access to a DCS resource in a multi-user access system.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli revoke-resource-access [-ri resource_ID] [-u user_ID] [-j] [-h]
```

Parameters

Parameter	Description
--resource-ID, -ri	(Required) Specifies the resource ID.
--user-ID, -u	(Required) Specifies the user name whose shared access is to be revoked.
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output.

Usage Notes

- Use the command to revoke access to a resource in a multi-user access system. Only the system administrator `odaadmin` has the necessary privileges to run this command.

Example 15-38

```
[odaadmin@oda1 bin]$ odacli revoke-resource-access -ri cfc65e00-5d9e-4c00-
a7a0-f7ea37884e06 -u dcsdb2
Shared access of resource to the user revoked successfully...
[odaadmin@oda1 bin]$ odacli describe-resource-access -ri cfc65e00-5d9e-4c00-
a7a0-f7ea37884e06
Resource Access details
-----
Resource ID: cfc65e00-5d9e-4c00-a7a0-f7ea37884e06
Resource Name: asmtde1
Resource Location: 53f434fe-598e-46a0-bbdc-a456404da0c9
Resource Type: ODA_DB
Primary Owner: odadb1
Shared Access: odaadmin
Is Active: true
Created: November 17, 2021 1:31:55 PM UTC
Last Updated: November 19, 2021 12:53:43 PM UTC
```

odacli reset-password

Use the `odacli reset-password` command to reset the password for a user, after it is unlocked, in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli reset-password [-d domain_name] [-t tenant_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--domain-name, -d</code>	(Optional) Specifies the name of the domain in which the user exists.
<code>--tenant-name, -t</code>	(Optional) Specifies the tenancy in which the user exists.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to reset the password for a user in a multi-user access system. The password of a user must be reset either when the user account is locked due to multiple failed login attempts or if the password has expired. The `odaadmin` must first unlock the

user account by running the `odacli authorize-user` command. The user can then log in with the temporary password assigned by `odaadmin`, run the `odacli reset-password` command, provide the temporary password, and then specify the new password. You can also reset the password from the Browser User Interface.

Example 15-39

```
[dcsdb2@odal bin]$ odacli reset-password
Enter your ODA account password:
Enter new password for your ODA account:
Retype new password for your ODA account:
Password reset for user 'dcsdb2' successful...
```

odacli change-password

Use the `odacli change-password` command to change the password for a user in a multi-user access system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli change-password [-d domain_name] [-t tenant_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--domain-name, -d</code>	(Optional) Specifies the name of the domain in which the user exists.
<code>--tenant-name, -t</code>	(Optional) Specifies the tenancy in which the user exists.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- This command must be run by the active user who wants to change the password. To reset the password of a locked or expired account, use the `odacli reset-password` command.

Example 15-40

```
[dcsdb2@odal bin]$ odacli reset-password
Enter your ODA account password:
Enter new password for your ODA account:
Retype new password for your ODA account:
Password reset for user 'dcsdb2' successful...
```

odacli Apply Patch and Update Commands

Use the commands `odacli update` and `apply patch` to apply patches and update the appliance.

- [odacli cleanup-patchrepo](#)
Use the `odacli cleanup-patchrepo` command to delete obsolete or old patches from the repository.
- [odacli create-prepatchreport](#)
Use the `odacli create-prepatchreport` command to run pre-checks for patching.
- [odacli describe-prepatchreport](#)
Use the `odacli describe-prepatchreport` command to display the pre-check report, with a list of pre-checks run with status and comments.
- [odacli list-prepatchreports](#)
Use the `odacli list-prepatchreports` command to display all pre-check reports, with a list of pre-checks run with status and comments.
- [odacli delete-prepatchreport](#)
Use the `odacli delete-prepatchreport` command to delete any pre-check report.
- [odacli list-availablepatches](#)
Use the `odacli list-availablepatches` command to display all available patches for Oracle Database Appliance.
- [odacli describe-component](#)
Use the `odacli describe-component` command to display the installed version and the latest available version for each component.
- [odacli describe-latestpatch](#)
Use the `odacli describe-latestpatch` command to display a list of the latest supported patch versions for each component.
- [odacli list-agentconfig-parameters](#)
Use the `odacli list-agentconfig-parameters` command to list configuration variables used by the appliance.
- [odacli modify-agentconfig-parameters](#)
Use the `odacli modify-agentconfig-parameters` command to modify configuration variables used by the appliance.
- [odacli update-agentconfig-parameters](#)
Use the `odacli update-agentconfig-parameters` command to modify configuration variables used by the appliance.
- [odacli delete-agentconfig-parameters](#)
Use the `odacli delete-agentconfig-parameters` command to delete configuration variables used by the appliance.
- [odacli update-database](#)
Use the `odacli update-database` command to update a database to a specific database home with later version, and within the same major release.
- [odacli update-dbhome](#)
Use the `odacli update-dbhome` command to update a specific database home to the latest patch bundle version.

- **odacli update-dcsadmin**
Use the `odacli update-dcsadmin` command to update the DCS admin for DCS components upgrade.
- **odacli update-dcsagent**
Use the `odacli update-dcsagent` command to update the agent.
- **odacli update-dcscomponents**
Use the `odacli update-dcscomponents` command to update the DCS components such as the DCS agent, CLI, and controller.
- **odacli update-registry**
Use the `odacli update-registry` command to update the metadata for the components that are already present in the registry. For database home and grid home, this command updates the patch information, when you apply patches manually.
- **odacli update-repository**
Use the `odacli update-repository` command to update the repository with the new Oracle Database Appliance software.
- **odacli update-server**
Use the `odacli update-server` command to update the operating system, firmware, Oracle Appliance Kit, Oracle Clusterware, and all other infrastructure components.
- **odacli update-storage**
Use the `odacli update-storage` command to update the storage.
- **odacli update-server-postcheck**
Use the `odacli update-server-postcheck` command to perform deployment health checks after upgrading the operating system from Oracle Linux 6 to Oracle Linux 7.
- **odaadmcli orachk**
Use the `odaadmcli orachk` command to check configuration settings for Oracle Database Appliance components.

odacli cleanup-patchrepo

Use the `odacli cleanup-patchrepo` command to delete obsolete or old patches from the repository.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli cleanup-patchrepo [-cl clones] | [-v version [-comp component]] | [-l local|-n NodeID]
```

Parameters

Parameter	Description
<code>--clones, -cl</code>	Specifies the option to clean up clone files (DB and GI) from the repository <code>/opt/oracle/oak/pkgrepos/orapkgs/clones/</code> .
<code>--version, -v</code>	Defines the Oracle Database Appliance release you want to delete. You cannot delete the initial or current release files. For example, 12.2.1.4.0.
<code>--component, -comp</code>	A comma-separated list of components as {DB,GI} to cleanup for a specific Oracle Database Appliance patch version. The default is both {DB,GI}.
<code>--local, -l</code>	(Optional) Cleans up the repository on the local node.
<code>--node, -n</code>	(Optional) Cleans up the repository on the specified nodes.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Use the command to free up space in the patch repository.
- This command does not delete the current patches or latest installed patch repository.

Example 15-41 Deleting RDBMS and GI components for a specific release

```
# odacli cleanup-patchrepo -cl -comp db,gi -v 12.2.1.4.0
{
  "jobId" : "d915ffc0-c7f6-49cf-8ddd-ab5d2ad9072f",
  "status" : "Created",
  "message" : null,
  "reports" : ,
  "createTimestamp" : "April 17, 2019 06:44:28 AM UTC",
  "resourceList" : ,
  "description" : "Cleanup patchrepos",
  "updatedAtTime" : "April 17, 2019 06:44:28 AM UTC"
}
```

Example 15-42 Deleting Clone Files

```
# odacli cleanup-patchrepo -cl
{
  "jobId" : "5d8549a2-1a5e-4b4f-9867-c1f671c659c4",
  "status" : "Created",
  "message" : null,
  "reports" : ,
  "createTimestamp" : "April 17, 2019 06:43:45 AM UTC",
  "resourceList" : ,
  "description" : "Cleanup patchrepos",
  "updatedAtTime" : "April 17, 2019 06:43:45 AM UTC"
}
```

odacli create-prepatchreport

Use the `odacli create-prepatchreport` command to run pre-checks for patching.

Patching pre-checks help identify and remedy any problems before patching is attempted, and ensure all components are ready for updates.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli create-prepatchreport [-db] [-dbid database_id] [-dp] [-d] [-i dbhome_id] [-f files] [-l] [-u node_number] [-os] [-r] [-s] [-sko] [-st] [-to dest_db_home_id] [-v version] [-j] [-h]
```

Parameters

Parameter	Description
<code>--database, -db</code>	(Optional) Specifies the database component for running the pre-checks. This option cannot be used with the <code>-dp</code> and <code>-d</code> options.
<code>--databaseid, -dbid</code>	(Optional) Specifies the ID of the database to be updated and for which you want to run the pre-checks.
<code>--datapatch, -dp</code>	(Optional) Specifies the datapatch component for running the pre-checks. This option cannot be used with the <code>-db</code> and <code>-d</code> options.
<code>--dbhome, -d</code>	(Optional) Specifies the database home component for running the pre-checks. This option cannot be used with the <code>-dp</code> and <code>-db</code> options.
<code>--dbhomeid, -i</code>	(Optional) Specifies the IDs of the database homes to be updated and for which you want to run the pre-checks.
<code>--files, -f</code>	(Optional) Specifies files required to update repository, comma-separated if multiple files are required.
<code>--operating-system, -os</code>	(Optional) Specifies the operating system components. Use this option to run operating system upgrade. If you specify <code>-c</code> , then the only option is <code>os</code> . If you specify <code>-c os</code> , then you can also specify <code>-local</code> (optional).
<code>--node-number, -u</code>	(Optional) Runs patch pre-checks on specified nodes. The value can be 0 or 1.
<code>--local, -l</code>	(Optional) Runs patch pre-checks on local node only.
<code>--operating-system, -os</code>	(Optional) Specify this option to run the patch pre-checks for the operating system components.
<code>--repo, -r</code>	(Optional) Specify this option to run the patch pre-checks for the repository components.
<code>--server, -s</code>	(Optional) Specify this option to run the patch pre-checks for the server components.

Parameter	Description
<code>--storage, -st</code>	(Optional) Specify this option to run the patch pre-checks for the storage components.
<code>--version, -v</code>	(Optional) Specifies the version for running the pre-checks.
<code>--to-home, -to</code>	(Optional) Specifies the destination Oracle Database Home on the target database for the update. Note that you must use this option with the <code>-db</code> option.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

Use the `odacli create-prepatchreport` command to generate a pre-check report. Use the `--node` or `--local` option to run the patch pre-checks on specific nodes or the local node.

Example 15-43 Creating Pre-Check Report

```
# odacli create-prepatchreport -v 19.20.0.0.0 -s

odacli describe-prepatchreport

Use the `odacli describe-prepatchreport` command to display the pre-check report, with a list of pre-checks run with status and comments.

Patching pre-checks help identify and remedy any problems before attempting to patch, and ensure all components are ready for updates.

File Path

`$ORACLE_HOME/opt/oracle/dcs/bin/odacli`

Syntax

`odacli describe-prepatchreport -i`

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--jobid, -i</code>	Specifies the Job ID for the pre-check report.

Usage Notes

Use the `odacli describe-prepatchreport` command to display the pre-check report.

The pre-checks report indicates whether the server patching can be rolling or not.

Example 15-45 Patch pre-checks report with rolling mode patching supported when Expander or Controller upgrade is not required

```
[root@node1 bin]# odacli describe-prepatchreport -i 83e41cc6-bd0e-4c53-a9fe-c3f6b7ecd47b
```

Patch pre-check report

odacli list-prepatchreports

Use the `odacli list-prepatchreports` command to display all pre-check reports, with a list of pre-checks run with status and comments.

Patching pre-checks help identify and remedy any problems before attempting to patch, and ensure all components are ready for updates.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-prepatchreports [-h] [-j]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

Use the `odacli list-prepatchreports` command to display all pre-check reports.

Example 15-50 Displaying All Patch Pre-Checks Reports

```
# odacli list-prepatchreports
ID      Description      Created              Status
-----
8a8a14b5-1b5e-4eeb-8ba9-c8136fb4eea1      Patch pre-checks for [DB]:
DbHome is OraDB12102_home1
May 16, 2018 7:00:56 PM PDT              Running
2c9a747d-a452-4e48-bcab-9c7cd9f5f35b      Patch pre-checks for
[STORAGE]
May 16, 2018 6:53:23 PM PDT              Success
f3b9c7c1-3061-4577-848d-645669d71f72      Patch pre-checks for [OS,
ILOM, GI]
May 16, 2018 7:00:56 PM PDT              Running
```

odacli delete-prepatchreport

Use the `odacli delete-prepatchreport` command to delete any pre-check report.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli delete-prepatchreport -i Report ID
```

Parameters

Parameter	Description
<i>Report ID</i>	Describes the ID of the report to be deleted.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

Use the `odacli delete-prepatchreport` command to delete pre-check reports.

Example 15-51 Deleting A Patch Pre-Checks Report

```
# odacli delete-prepatchreport -i 741f635b-7c75-4832-8813-782367f1e6fd
```

odacli list-availablepatches

Use the `odacli list-availablepatches` command to display all available patches for Oracle Database Appliance.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

`odacli list-availablepatches [-h] [-j]`

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

Use the `odacli list-availablepatches` command to display all available patches for Oracle Database Appliance.

Example 15-52 Displaying All Available Patches on Bare Metal System

```
# odacli list-availablepatches

odacli describe-component

Use the `odacli describe-component` command to display the installed version and the latest available version for each component.

If there are multiple DB Homes installed in Oracle Database Appliance, then the output displays the version details for each of the installed homes and the databases in each database home. You can use this command to check the component version after applying a patch.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-component [-d] [-j] [-h] [-s] [-v] [-l] [-n]
```

Parameters

Parameter	Description
<code>--dbhomes, -d</code>	(Optional) Lists the database home versions and available versions.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Parameter	Description
<code>--local, -l</code>	(Optional) Describes the components for the local node. Use to display details on the local node of multi-node high availability (HA) systems. This option is not needed to display component details on single-node systems.
<code>--node, -n</code>	(Optional) Describes the components for a specific node on high availability (HA) systems. This option is not needed to display component details on single node systems. {0 1}
<code>--server, -s</code>	(Optional) Lists the server components and versions and the available versions to which you can patch them.
<code>--systemversion, -v</code>	(Optional) Displays only the system version. This option is available only on high-availability systems.

Usage Notes

Use the `odacli describe-component` command to get component details. On a multi-node environment, the command provides details across all nodes. Use the `--node` or `--local` option to get component details for a specific node.

The `odacli describe-component` command displays the local and shared storage components and the updates required for them separately.

Example 15-54 Displaying patch details for components for High-Availability Oracle Database Appliance Systems for a release

```
# odacli describe-component

odacli describe-latestpatch

Use the `odacli describe-latestpatch` command to display a list of the latest supported patch versions for each component.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-latestpatch [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Example 15-57 Listing the Latest Supported Versions

```

odacli list-agentconfig-parameters

Use the `odacli list-agentconfig-parameters` command to list configuration variables used by the appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-agentconfig-parameters [-h] [-j] [-n] [-t]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--name, -n</code>	Specifies the name of the parameter.
<code>--type, -t</code>	(Optional) Specifies the configuration value for the given type. The default value is PUBLIC.

Usage Notes

Use the `odacli list-agentconfig-parameters` command to list configuration variables used by the appliance.

Example 15-58 Displaying the HttpProxyPort

```
./odacli list-agentconfig-parameters -n HttpProxyPort
```

```
Name      Value      Description
Updated
-----
HttpProxyPort  Http proxy server port    August 8, 2023 4:14:10 AM
UTC
```

Example 15-59 Displaying the agent configuration

```
# odacli list-agentconfig-parameters
```

```
Name      Value      Description
Updated
-----
HttpProxyHost  Http proxy server host    August 8, 2023 4:14:10 AM
```

```
UTC
HttpProxyPort Http proxy server port August 8, 2023 4:14:10 AM UTC
HttpsProxyHost Https proxy server host August 8, 2023 4:14:10 AM
UTC
HttpsProxyPort Https proxy server port August 8, 2023 4:14:10 AM UTC
```

Example 15-60 Displaying Oracle ASM configuration

```
# odacli list-agentconfig-parameters -t ASM
Name Value Description Updated
-----
-----
-----
asm_power_limit 4 June 22, 2021 12:13:10 AM UTC
```

Related Topics

- [Configuring Agent Proxy Settings for Object Store Access](#)
If the Object Store IP address is accessible only through proxy setup by the Oracle Database Appliance server, then define the proxy setting for the agent, so that the agent can access the Object Store.

odacli modify-agentconfig-parameters

Use the `odacli modify-agentconfig-parameters` command to modify configuration variables used by the appliance.

File Path

/opt/oracle/dcs/bin/odacli

Syntax

```
odacli modify-agentconfig-parameters -n name_param [-adbs] [-a] [-bm] [-c
comment_param] [-dbs dbsys_param] [-d description_param] [-r] [-t
type_param] [-u] [-v value_param] [-j] [-h]
```

Parameters

Parameter	Description
--append, -a	(Optional) Appends the parameter values. For example, -n p1 -v v1 -n p2 -v v2 -a.
--all-dbsystems, -adbs	(Optional) Dynamic parameter update for all DB systems.
--bm-only, -bm	(Optional) Dynamic parameter update for bare metal systems only.
--comment, -c	(Optional) Specifies the comment for the parameter.

Parameter	Description
<code>--dbsystem, -dbs</code>	(Optional) DB system name for dynamic parameter update.
<code>--description, -d</code>	(Optional) Specifies the description of the parameter.
<code>--name, -n</code>	Specifies the name of the parameter. Provide multiple parameter values in the format <code>-n p1 -v v1 -n p2 -v v2</code> .
<code>--reset, -r</code>	Resets the parameter to the default value. For example: <code>-n p1 -n p2 -r</code> .
<code>--update, -u</code>	Replaces the parameter with the specified value. For example: <code>-n p1 -v v1 -n p2 -v v2 -u</code> .
<code>--value, -v</code>	Specifies the value of the parameter. Provide multiple parameter values in the format <code>-n p1 -v v1 -n p2 -v v2</code> .
<code>--type, -t</code>	(Optional) Specifies the type of the parameter.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

Use the `odacli modify-agentconfig-parameters` command to modify configuration variables used by the appliance. The supported configuration parameters are `HttpsProxyHost` and `HttpsProxyPort`.

Multiple values can be specified. For High-Availability models, the command sets the parameter values on both nodes in the cluster.

For a DB system, dynamic parameter value specified using the `-dbs` flag has more priority than the parameter value specified using the `-adbbs` flag, which in turn has a higher priority than the case where the parameter was updated without using any flag from the bare metal system.

Example 15-61 Setting Multiple Parameters

```
# odacli modify-agentconfig-parameters -n HttpsProxyPort -v 80 -d
"Http proxy port"
-n HttpsProxyPort -v 80 -d "Https proxy port" -u

modify-agentconfig-parameters -n HttpsProxyPort -n HttpProxyPort -r

modify-agentconfig-parameters -n HttpsProxyHost -v 90 -a

modify-agentconfig-parameters -n OSPatchRepos -v
```

Example 15-62 Setting Oracle RDBMS Parameters

```
# odacli modify-agentconfig-parameters -t RDBMS -n processes -v 300 -u
The value of processes will be set to 300 in BM and all the DBVMs.
```

```
# odacli list-agentconfig-parameters -t RDBMS -n processes
```

Name	Value	Description
Updated		

--		
processes	300	August 8, 2023 5:24:45 PM UTC

Example 15-63 Updating the RDBMS Parameter for all DB systems in the Bare Metal System

```
# odacli modify-agentconfig-parameters -t RDBMS -n processes -v 400 -u -adbs
```

In the bare metal system, the value of the `processes` parameter is not changed:

```
# odacli list-agentconfig-parameters -t RDBMS -n processes
```

Name	Value	Description
Updated		

processes	300	August 8, 2023 12:08:15 AM UTC

In all DB systems, the value of `processes` is changed:

```
# odacli list-agentconfig-parameters -t RDBMS -n processes
```

Name	Value	Description
Updated		

processes	400	August 8, 2023 12:08:15 AM UTC

You can set the value for a specific DB system:

```
# odacli modify-agentconfig-parameters -t RDBMS -n processes -v 700 -u -dbs DBSYSTEM1
```

Value is changed on `DBSYSTEM1`:

```
# odacli list-agentconfig-parameters -t RDBMS -n processes
```

Name	Value	Description
Updated		

processes	700	August 8, 2023 12:08:15 AM UTC

odacli update-agentconfig-parameters

Use the `odacli update-agentconfig-parameters` command to modify configuration variables used by the appliance.

Note:

This command is deprecated in Oracle Database Appliance release 19.20 and will be desupported in a future release.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli update-agentconfig-parameters
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--append, -a</code>	(Optional) Appends the parameter values. For example, <code>-n p1 -v v1 -n p2 -v v2 -a</code> .
<code>--all-dbsystems, -adbs</code>	(Optional) Dynamic parameter update for all DB systems.
<code>--bm-only, -bm</code>	(Optional) Dynamic parameter update for bare metal systems only.
<code>--comment, -c</code>	(Optional) Specifies the comment for the parameter.
<code>--dbsystem, -dbs</code>	(Optional) DB system name for dynamic parameter update.
<code>--description, -d</code>	(Optional) Specifies the description of the parameter.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--name, -n</code>	Specifies the name of the parameter. Provide multiple parameter values in the format <code>-n p1 -v v1 -n p2 -v v2</code> .
<code>--reset, -r</code>	Resets the parameter to the default value. For example: <code>-n p1 -n p2 -r</code> .
<code>--update, -u</code>	Replaces the parameter with the specified value. For example: <code>-n p1 -v v1 -n p2 -v v2 -u</code> .

Parameter	Description
<code>--value, -v</code>	Specifies the value of the parameter. Provide multiple parameter values in the format <code>-n p1 -v v1 -n p2 -v v2</code> .
<code>--type, -t</code>	(Optional) Specifies the type of the parameter.

Usage Notes

Use the `odacli update-agentconfig-parameters` command to modify configuration variables used by the appliance. The supported configuration parameters are `HttpsProxyHost` and `HttpsProxyPort`.

Multiple values can be specified. For High-Availability models, the command sets the parameter values on both nodes in the cluster.

For a DB system, dynamic parameter value specified using the `-dbs` flag has more priority than the parameter value specified using the `-adbs` flag, which in turn has a higher priority than the case where the parameter was updated without using any flag from the bare metal system.

Example 15-64 Setting Multiple Parameters

```
# odacli update-agentconfig-parameters -n HttpsProxyPort -v 80 -d "Http
proxy port"
-n HttpsProxyPort -v 80 -d "Https proxy port" -u

update-agentconfig-parameters -n HttpsProxyPort -n HttpProxyPort -r

update-agentconfig-parameters -n HttpsProxyHost -v 90 -a

update-agentconfig-parameters -n OSPatchRepos -v
```

Example 15-65 Setting Oracle RDBMS Parameters

```
# odacli update-agentconfig-parameters -t RDBMS -n processes -v 300 -u
The value of processes will be set to 300 in BM and all the DBVMs.
```

```
# odacli list-agentconfig-parameters -t RDBMS -n processes
```

Name	Value	Description
Updated		

processes	300	November 22, 2021 5:24:45 PM UTC

Example 15-66 Updating the RDBMS Parameter for all DB systems in the Bare Metal System

```
# odacli update-agentconfig-parameters -t RDBMS -n processes -v 400 -u -adbs
```

In the bare metal system, the value of the `processes` parameter is not changed:

```
# odacli list-agentconfig-parameters -t RDBMS -n processes
```

Name	Value	Description
Updated		

processes	300	June 10, 2023
12:08:15 AM UTC		

In all DB systems, the value of `processes` is changed:

```
# odacli list-agentconfig-parameters -t RDBMS -n processes
```

Name	Value	Description
Updated		

processes	400	June 10, 2023
12:08:15 AM UTC		

You can set the value for a specific DB system:

```
# odacli update-agentconfig-parameters -t RDBMS -n processes -v 700 -u  
-dbs DBSYSTEM1
```

Value is changed on `DBSYSTEM1`:

```
# odacli list-agentconfig-parameters -t RDBMS -n processes
```

Name	Value	Description
Updated		

processes	700	June 10, 2023
12:08:15 AM UTC		

Related Topics

- [Configuring Agent Proxy Settings for Object Store Access](#)
If the Object Store IP address is accessible only through proxy setup by the Oracle Database Appliance server, then define the proxy setting for the agent, so that the agent can access the Object Store.

odacli delete-agentconfig-parameters

Use the `odacli delete-agentconfig-parameters` command to delete configuration variables used by the appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli delete-agentconfig-parameters -n name_param [-adbs] [-bm] [-dbs  
dbs_param] [-t type_param] [-j] [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--name, -n</code>	(Mandatory) Specifies the name of the parameter.
<code>--type, -t</code>	(Optional) Deletes the configuration value for the given type.
<code>--all-dbsystems, -adbs</code>	(Optional) Deletes the dynamic parameter updated for DB systems, using the <code>-ad</code> option in the <code>odacli update-agentconfig-parameters</code> command.
<code>--bm-only, -bm</code>	(Optional) Deletes the dynamic parameter only from the bare metal systems.
<code>--dbssystem, -dbs</code>	(Optional) Deletes the dynamic parameter for a specific DB system.

Usage Notes

Use the `odacli delete-agentconfig-parameters` command to delete configuration values. For High-Availability models, the command deletes the parameter values on both nodes in the cluster.

Example 15-67 Deleting configuration parameters

```
# odacli delete-agentconfig-parameters -n HttpProxyHost
```

```
Job details
```

```

# odacli delete-agentconfig-parameters -t rdbms -n processes
odacli list-agentconfig-parameters -t RDBMS -n processes
No result found

```

Note: Parameters updated using `-adbs`, `-dbs` flags should be deleted using the same corresponding flags.

```

# odacli delete-agentconfig-parameters -t rdbms -n processes -dbs
DBSYSTEM1

# odacli delete-agentconfig-parameters -t rdbms -n processes -adbs

```

odacli update-database

Use the `odacli update-database` command to update a database to a specific database home with later version, and within the same major release.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli update-database [-a] [-dp] [-f] [-i db_id] [-imp] [-l] [-n
db_name] [-ni node] [-r] [-to db_home_id] [-j] [-h]
```

Parameters

Parameter	Description
<code>--to-home, -to</code>	(Optional) Specifies the destination Oracle Database Home ID. The <code>-to</code> option is not a mandatory option if you want to apply datapatch using the <code>odacli update-database</code> command. The <code>-to</code> option is only required when you want to use the <code>odacli update-database</code> command to patch a specific database to a specific database home.
<code>--abort, -a</code>	(Optional) Aborts the unfinished or failed patching operation.
<code>--name, -n</code>	(Optional) Specifies the database name the patch.

Parameter	Description
<code>--ignore-missing-patch, -imp</code>	(Optional) Ignores all missing patches and forces the operation.
<code>--force, -f</code>	(Optional) Ignores precheck error and forces the operation.
<code>--local, -l</code>	(Optional) Updates the database locally.
<code>--node-id, -ni</code>	(Optional) Specifies the node number to be updated. The valid values are 0 or 1.
<code>--id, -i</code>	(Optional) Specifies the database ID to be patched.
<code>--datapatch, -dp</code>	(Optional) Applies only the datapatch.
<code>--revert, -r</code>	(Optional) Reverts the unfinished or failed patching operation.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

- You must run the patching pre-checks at least once before running the `odacli update-database` command. Analyze any failed pre-checks, fix them, and rerun pre-checks. If any of the failed pre-checks can be ignored, only then run the `odacli update-database` command with the `-f` option.
- The `update-database` command patches a database to a specific database home with later version, and within the same major release.
- To patch a database to a specific database home, the database must be running.
- To patch a database, it must have the status `Configured`. Use the `odacli list-database` command to see a list of configured databases. Patch requests for target databases in any other status are rejected during patching.
- You can patch only the database homes in the `Configured` status. Use the `odacli list-dbhomes` command to see a list of configured database homes. Patch requests for target database homes in any other status are rejected during patching.
- The `--datapatch` option applies the datapatch to the specific database. This option is helpful for databases that have moved to a destination database home without the datapatch. Examples of using the `--datapatch` option are as follows:
 - When you patch the database as a standby database and then switch the database as the primary database.
 - When you must apply additional or one-off data patches after patching your Oracle Database Appliance deployment.

Example 15-69 Updating an Oracle Database

To patch a specific database to a specific database home:

```
# odacli update-database -i e5b60db5-2ee9-4cfc-93ee-179302ee6ebc -to
dc98eaa9-289c-4710-a898-ca6287a07a9c
```

When the database home version is earlier than the target database version, an error is encountered:

```
# odacli update-database -i c05458c7-0f1d-4260-8e62-003b3ec26d74 -to
7ef2449d-3583-47fd-a57a-6ba3fd224119
DCS-10045:Validation error encountered: Target database's version is
higher than destination dbhome, no need to patch.
```

odacli update-dbhome

Use the `odacli update-dbhome` command to update a specific database home to the latest patch bundle version.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli update-dbhome -i dbhome_id -v version [-f] [-imp] [-p] [-l] [-u
node_number] [-j] [-h]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Defines the Oracle Database Home to update.
<code>--help-h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--precheck, -p</code>	(Optional) Analyzes the patch.
<code>--force, -f</code>	(Optional) Ignores precheck error and forces the operation.
<code>--local, -l</code>	(Optional) Updates the Database Home locally.
<code>--node-number, -u</code>	(Optional) Specifies the node number to be updated. The valid values are 0 or 1.
<code>--version, -v</code>	Defines the Oracle Database Appliance version to update. For example, 19.17.0.0.0.
<code>--ignore-missing-patch, -imp</code>	(Optional) Ignores missing patch error and forces the operation.

Usage Notes

- You must run the patching pre-checks at least once before running the `odacli update-dbhome` command. Analyze any failed pre-checks, fix them, and rerun pre-checks. If any of the pre-checks fail, then run the `odacli update-dbhome` command with the `-f` option.
- The `update-dbhome` command applies the latest release update (RU) for Oracle Database home.
- To be updated with the latest patches, the database must be running.
- Only databases in the `Configured` status are updated. Use the `odacli list-database` command to see a list of configured databases. Databases in any other status are skipped during the update.
- When you use the `--local` option, you can patch in the following way. Note that you can patch the nodes in any order, for example, you can patch the instance on `node1` first, and then the instance on `node0`.
 - Run `--local/--node 0` on `node0`, then `--node 1` on `node0`.
 - Or, run `--local/--node 0` on `node0`, then `-local/--node 1` on `node1`.
 - Or, run `--local/--node` on either of the nodes, and then update the database home without using the `--local/--node` on either of the nodes.

Example 15-70 Updating an Oracle Database Home

To apply the latest patch bundle to update an Oracle Database:

```
# odacli update-dbhome -i ad6c7326-e460-411e-94df-230dedbef743 -v 19.20.0.0.0
```

odacli update-dcsadmin

Use the `odacli update-dcsadmin` command to update the DCS admin for DCS components upgrade.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli update-dcsadmin -v version [-j] [-h]
```

Parameters

Parameter	Description
<code>--version, -v</code>	Defines the Oracle Database Appliance version after update.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

The `update-dcsadmin` command sets up the `dcsadmin` and other components. Run the `update-dcsadmin` command only after you update the DCS agent.

Example 15-71 Updating DCS Admin

```
# odacli update-dcsadmin -v 19.20.0.0.0
{
  "jobId" : "4c238b93-e641-4f9d-9f86-93d0574dd234",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "August 8, 2023 03:11:53 AM UTC",
  "resourceList" : [ ],
  "description" : "DcsAdmin patching",
  "updatedAt" : "August 8, 2023 03:11:53 AM UTC"
}
```

odacli update-dcsagent

Use the `odacli update-dcsagent` command to update the agent.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli update-dcsagent -v version [-j] [-h]
```

Parameters

Parameter	Description
<code>--version, -v</code>	Defines the Oracle Database Appliance version after update.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

The `update dcsagent` command updates the `dcs-agent` to the RPM package that is located in the *location* and restarts the `dcs-agent`. After the update is applied, the agent automatically restarts. It will take a few minutes to reconnect to the `dcs-agent`. Wait until the agent shuts down and completes restarting before performing any tasks.

**Note:**

Before updating the agent, ensure that you do not have any jobs running or pending during the update window.

Example 15-72 Updating the Agent

To update the `dc-agent` to version 19.20.0.1:

```
# odacli update-dcsagent -v 19.20.0.1
{
  "jobId" : "77e454d3-eb68-4130-a247-7633f8d6192b",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "August 8, 2023 14:09:24 PM CST",
  "description" : "DcsAgent patching",
  "updatedAtTime" : "August 8, 2023 14:09:24 PM CST"
}
```

odacli update-dcscomponents

Use the `odacli update-dcscomponents` command to update the DCS components such as the DCS agent, CLI, and controller.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli update-dcscomponents -v version [-j] [-h]
```

Parameters

Parameter	Description
<code>--version, -v</code>	Defines the Oracle Database Appliance version after update.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

The `update-dcscomponents` command sets up the `dcscomponents` such as the DCS agent, CLI, and controller.

Example 15-73 Updating DCS Components

```
# odacli update-dcscomponents -v 19.20.0.0.0
```

```
{
  "jobId" : "4c238b93-e641-4f9d-9f86-93d0574dd234",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "August 8, 2023 03:11:53 AM UTC",
  "resourceList" : [ ],
  "description" : "DcsComponents patching",
  "updatedAt" : "August 8, 2023 03:11:53 AM UTC"
}
```

odacli update-registry

Use the `odacli update-registry` command to update the metadata for the components that are already present in the registry. For database home and grid home, this command updates the patch information, when you apply patches manually.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli update-registry -n component [-u db_unique_name] [-f] [-j] [-h]
```

Parameters

Parameter	Description
<code>--component, -n</code>	Defines the Oracle Database Appliance component for the registry update. When you specify <code>system</code> , then the components discovered include <code>gihome</code> , <code>dbnode</code> , <code>sysinstance</code> . When you specify <code>all</code> , then the components discovered include <code>dbhome</code> , <code>db</code> , <code>dbstorage</code> , <code>asr</code> . You can also specify the individual component to be refreshed. The individual options include <code>gihome</code> , <code>dbnode</code> , <code>sysinstance</code> , <code>dbhome</code> , <code>DB</code> , <code>dbstorage</code> , <code>ASR</code> .
<code>--db-unique-name, -u</code>	(Optional) Specifies the global unique name for the database. This option is only applicable for components <code>DB</code> or <code>dbstorage</code> .
<code>--force, -f</code>	This option is deprecated.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Starting with Oracle Database Appliance release 19.18, the `odacli update-registry` command does not require the `-force` option for metadata refresh of a component that already exists in the registry metadata. If the metadata for the

component to be updated already exists in the appliance registry metadata, then the command rediscovers the attributes from the environment and updates the system registry.

- The following attribute cannot be discovered with the `odacli update-registry` command:
 - **DB component:** `rmanBkupPassword`, `enableEEHA`, `isBcfgInSync`, `dbConsoleEnable`, `cpupool`, `dbClass`, `backupConfigId`, `cloudStorageContainer`, `isAutoBackupDisabled`, `registerOnly`, `entitySource`, `instanceOnly`, `dbShape`, `enableSEHA`.
- Use the `--db-unique-name`, `-u` option to update the appliance registry metadata for a specific database or `dbstorage`. The `odacli update-registry` command then modifies only the registry metadata for the database or `dbstorage` associated with the database unique name. For example:

```
odacli update-registry -n db -u db_unique_name
odacli update-registry -n dbstorage -u db_unique_name
```

- The `odacli update-registry` command discovers and updates the metadata in the registry only for databases created using ODACL CLI commands or the Browser User Interface (BUI). An error is displayed when you run the `odacli update-registry` command to update the metadata for databases that were not created using ODACL CLI commands or BUI. Hence, for database migration cases, do not use the `odacli update-registry` command. Instead, use the `odacli register-database` command. For example:

```
# odacli update-registry -n db -u provddb
DCS-10131: Database 'provddb' cannot discover because metadata does not exist
```

```
# dcserr 10131
10131, Discover_New_Database_Not_Supported, "Database ''{0}'' cannot discover because metadata does not exist."
// *Cause: The database did not support discovery of new entities.
// *Action: Use the 'odacli register-database' command.
```

- Similarly, if you run the `odacli update-registry -n dbstorage` command to update the metadata for databases or `dbstorage` that were not created using ODACL CLI commands or BUI, then an error is displayed. While migrating a database, if the database runs on the appliance and `dbstorage` also exists, but the corresponding appliance registry metadata does not exist, then you cannot run the `odacli update-registry -n dbstorage` command to discover the registry metadata. Instead, use the `odacli create-dbstorage` command.

```
# odacli update-registry -n dbstorage -u newstorage
DCS-10132: Dbstorage 'newstorage' cannot discover because metadata does not exist
```

```
# dcserr 10132
10132, Discover_New_Dbstorage_Not_Supported, "Dbstorage ''{0}'' cannot discover because metadata does not exist."
// *Cause: The database storage did not support discovery of new entities.
// *Action: Use the 'odacli create-dbstorage' command.
```

- The `odacli update-registry` command rediscovers only the following DCS components:
 - System resources : Oracle Grid Infrastructure (`gihome`), Oracle Database node (`dbnode`), System instance (`sysinstance`)
 - Database Home (`dbhome`)
 - Database (`db`)
 - Database storage (`dbstorage`)
 - Oracle ASR (`asr`)

The `odacli update-registry` command does not rediscovers any other components not mentioned in the above list.

- If a TDE database is created without using Oracle Database Appliance tooling and the registry is updated for database components, then this database is added to the DCS metadata. If the TDE Wallet Management of the database is ODA, then the TDE password of the database must be updated in the DCS metadata by modifying the database with the same option you use to change the TDE password. You can specify the same password for both the current and new TDE password to ensure that the TDE password is updated in the DCS metadata.
- A report is generated after the `odacli update-registry` command completes running. This report displays the values present before the command was run and the updated values. The report is saved in the location `/opt/oracle/dcs/logs/discoveryReport.txt`. If the command is run again, then the new report is appended to the same file along with the timestamp of the latest run of the command.

Example 15-74 Update Registry Report

```
# odacli update-registry -n system
-----Begin Discovery at 2023-01-24_12-06-28.0666-----

odacli update-repository

Use the `odacli update-repository` command to update the repository with the new Oracle Database Appliance software.

Prerequisites

Before updating the repository, you must upload the Oracle Database Appliance software to the appliance. If the patch contains more than one zip file, then extract and concatenate the zip files before updating the repository.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To unpack and copy the patch bundle to the correct locations in the file system:

```
odacli update-repository -f filename [-j] [-h]
```

Parameters

Parameter	Description
<code>--filename, -f</code>	Defines the zip filename of patch bundle or RDBMS clones downloaded from My Oracle Support. Provide a comma-separated list of absolute file paths of the end user and patch bundles.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- Before updating the repository, ensure that you do not have any jobs running or pending during the update window.
- Upload the patches to `dom0` on Node0. On multi-node systems, the DCS-Agent copies the patch to Node1 and updates the patch repository on both nodes.
- Starting with Oracle Database Appliance release 19.12, a new Oracle ACFS file system is created to store the Oracle Database and Oracle Grid Infrastructure clone files. The DATA disk group provides a space of 150 GB for the file system. When provisioning a system with Oracle Database Appliance release 19.12, the file system is created after Oracle Grid Infrastructure software is configured. When patching a system with Oracle Database Appliance release 19.12, the file system

is created when you run the `odacli update-server` command. If you run the command `odacli update-repository` after this file system is configured during provisioning or patching, then the `odacli update-repository` command fails if Oracle Clusterware is not running. The following error is displayed:

```
DCS-10626:Cannot update the repository as the Clusterware is down. Some files need to be stored on an ACFS file system.
```

Example 15-75 Updating the Repository

The server patch zip file is located in the `/u01/tmpdir` directory. The following example updates the repository with the latest server patch and then lists the job to verify that the update is successful:

```
# /opt/oracle/dcs/bin/odacli update-repository -f /tmp/oda-sm-19.20.0.0.0-
date-server.zip,/tmp/oda-sm-19.20.0.0.0-date-server.zip
{
  "jobId" : "d3510276-da05-447b-990e-6d30964f8f79",
  "status" : "Created",
  "message" : "/u01/tmpdir/oda-sm-12.2.1.1.0-171031-server.zip",
  "reports" : [ ],
  "createTimestamp" : "August 8, 2023 14:13:45 AM CST",
  "description" : "Repository Update",
  "updatedAtTime" : "August 8, 2023 14:13:45 AM CST"
}
[root@oak1 tmpdir]# ./odacli list-jobs
# odacli list-jobs
ID                               Description
Created                          Status
-----
6f27a29a-959f-44e1-b984-7473e3c918ad  Server Patching   August 8, 2023
14:19:05 AM CST   Success
```

odacli update-server

Use the `odacli update-server` command to update the operating system, firmware, Oracle Appliance Kit, Oracle Clusterware, and all other infrastructure components.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli update-server [-c] -v version [-f][-ng] [-l] [-n node_number] [-j]
[-h]
```

Parameters

Parameter	Description
<code>--version, -v</code>	(Mandatory) Defines the version to update.

Parameter	Description
<code>--component, -c</code>	(Optional) Component that is to be upgraded. Supported value is OS.
<code>--force, -f</code>	(Optional) Ignores precheck error and forces the patching operation.
<code>--local, -l</code>	(Optional) Updates the server on the local node.
<code>--node, -n</code>	(Optional) Specifies the node number to be updated. The valid values are 0 or 1.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- The `update-server` command applies the patches to various infrastructure components and Oracle Clusterware.
After the update is applied, the agent automatically restarts. It will take a few minutes to reconnect to the server. Wait until the agent shuts down and completes restarting before performing any tasks. Allow at least two (2) minutes before running the next command.
- You must run the patching pre-checks at least once before running the `odacli update-server` command. Analyze any failed pre-checks, fix them, and rerun pre-checks. If any of the pre-checks fail, then run the `odacli update-server` command with the `-f` option.
- When you use the `--local` option, you can patch in the following way. Note that you can patch the nodes in any order, for example, you can patch the instance on `node1` first, and then the instance on `node0`.
 - Run `--local/--node 0` on `node0`, then `--node 1` on `node0`.
 - Or, run `--local/--node 0` on `node0`, then `-local/--node 1` on `node1`.
 - Or, run `--local/--node` on either of the nodes, and then update the server without using the `--local/--node` on either of the nodes.

Note:

Before updating the server, ensure that you do not have any jobs running or pending during the update window. You must run the `odacli create-prepatchreport` command before you patch your server; otherwise, the `odacli update-server` command fails with an error message prompting you to run the patching pre-checks. You can use the `-f` option to override precheck failures and complete the server patching.

Example 15-76 Updating the Server

Run the `odacli update-server` command to update the server to 19.20.0.0.0. On a high-availability system, run the command on one node. The patches are applied automatically to both nodes.

```
# odacli update-server -v 19.20.0.0.0
{
  "jobId" : "6f27a29a-959f-44e1-b984-7473e3c918ad",
  "status" : "Created",
  "message" : "Success of Server Update may trigger reboot of node after 4-5
minutes.
Please wait till node restart",
  "reports" : [ ],
  "createTimestamp" : "August 8, 2023 14:13:45 PM CST",
  "resourceList" : [ ],
  "description" : "Server Patching",
  "updatedAtTime" : "August 8, 2023 14:13:45 PM CST"
}
```

odacli update-storage

Use the `odacli update-storage` command to update the storage.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli update-storage -v version [-h] [-j] [-r]
```

Parameters

Parameter	Description
<code>--version, -v</code>	Defines the version to update.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--rolling, -r</code>	(Optional) Enables to patch shared disks in rolling fashion without stopping Oracle Clusterware. The shared disks must be online.

Usage Notes

- If the FIRMWAREEXPANDER Installed Version is lower than or equal to the Available Version, then you cannot use rolling mode to update the storage.
- If the FIRMWARECONTROLLER Installed Version is lower than or equal to the Available Version, then you cannot use rolling mode to update the storage.

Example 15-77 Updating the Storage

```
# odacli update-storage -v 19.20.0.0.0
```

odacli update-server-postcheck

Use the `odacli update-server-postcheck` command to perform deployment health checks after upgrading the operating system from Oracle Linux 6 to Oracle Linux 7.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli update-server-postcheck -v version [-j] [-h]
```

Parameters

Parameter	Description
<code>--version, -v</code>	(Required) Specifies the version to update.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--help, -h</code>	(Optional) Displays help for using the command.

odaadmcli orachk

Use the `odaadmcli orachk` command to check configuration settings for Oracle Database Appliance components.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To perform diagnostic checks of components:

```
odaadmcli orachk [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
Components such as <code>-a</code> , <code>-acchk</code> , <code>-applypatch</code> , <code>-autostop</code>	(Optional) Specifies the comma-separated list of components for which you want to collect data. Specify the component to be checked in the command. For example: <pre># odaadmcli orachk -a</pre>

Parameter	Description
<code>--verbose</code>	Displays detailed message.

Usage Notes

The `odaadmcli orachk` command invokes `orachk` from the directory `opt/oracle.SupportTools/orachk`.

Example 15-78 Running `odaadmcli orachk`

```
[root@oak bin] # ./odaadmcli orachk
INFO: 2019-09-04 16:41:26: Running orachk under /opt/oracle.SupportTools/
orachk
```

Example 15-79 Running `odaadmcli orachk` for a component

```
[root@oak bin] # ./odaadmcli orachk -a
INFO: 2019-09-19 10:45:16: Running orachk under /usr/bin/orachk
Checking ssh user equivalency settings on all nodes in cluster for root
```

Data Preserving Reprovisioning Commands

Understand commands to upgrade the appliance using the Data Preserving Reprovisioning feature.

- [odaupgradeutil](#)
Use the `odaupgradeutil` utility to upgrade the appliance using data preserving reprovisioning feature.
- [odaupgradeutil run-prechecks](#)
Run the `odaupgradeutil run-prechecks` command to run the required prechecks when you upgrade the appliance using the data preserving reprovisioning feature.
- [odaupgradeutil describe-precheck-report](#)
Run the `odaupgradeutil describe-precheck-report` command to view the prechecks report when you upgrade the appliance using the data preserving reprovisioning feature.
- [odaupgradeutil detach-node](#)
Run the `odaupgradeutil detach-node` command to start the node detach process when you upgrade the appliance using the data preserving reprovisioning feature.
- [odaupgradeutil reinitialize](#)
Run the `odaupgradeutil reinitialize` command to regenerate the init params for `odaupgradeutil`. This command must be run when the basic system configuration has changed such as after a patch or upgrade.
- [odacli restore-node](#)
Use the `odacli restore-node` command to reprovision the Oracle Database Appliance deployment with Oracle Grid Infrastructure and Oracle databases.

odaupgradeutil

Use the `odaupgradeutil` utility to upgrade the appliance using data preserving reprovisioning feature.

File Path

`/opt/oracle/odaupgradeutil/odaupgradeutil`

Syntax

```
odaupgradeutil command [option] [-V] [-h]
```

Parameters

Parameter	Description
<code>--version, -V</code>	(Optional) Specifies the <code>odaupgradeutil</code> version.
<code><i>command</i> [<i>option</i>]</code>	(Optional) Specifies the command option you want to run with this utility. The options can be <code>run-prechecks</code> , <code>describe-precheck-report</code> , <code>detach-node</code> , or <code>reinitialize</code> .
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. Available with the <code>describe-precheck-report</code> command option.

odaupgradeutil run-prechecks

Run the `odaupgradeutil run-prechecks` command to run the required prechecks when you upgrade the appliance using the data preserving reprovisioning feature.

File Path

`/opt/oracle/odaupgradeutil/odaupgradeutil`

Syntax

```
odaupgradeutil run-prechecks [-h]
```

Parameters

Parameter	Description
<code>odaupgradeutil run-prechecks</code>	(Optional) Runs the prechecks before the upgrade. This runs prechecks for operating system, Oracle Grid Infrastructure, OAK, and networking.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Tips

The command runs the prechecks for components required to successfully detach the current node of the Oracle Database Appliance system. If there are failures or warnings reported, review the same in the report and take appropriate action. The precheck report is generated in the directory `/opt/oracle/odaupgradeutil/prechecks/precheck_report.json`. The log of the precheck operation is saved in `/opt/oracle/odaupgradeutil/logs/odaupgradeutil_prechecks_timestamp.log`. Use the `odaupgradeutil describe-precheck-report` command to view the prechecks report for the upgrade.

Example 15-80

```
[root@node1 odaupgradeutil]# ./odaupgradeutil run-prechecks
```

```

odaupgradeutil describe-precheck-report

Run the `odaupgradeutil describe-precheck-report` command to view the prechecks report when you upgrade the appliance using the data preserving re provisioning feature.

File Path

/opt/oracle/odaupgradeutil/odaupgradeutil

Syntax

odaupgradeutil describe-precheck-report [-h] [-j]

Parameters

Parameter	Description
<code>odaupgradeutil describe-precheck-report</code>	(Optional) Displays the prechecks report.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Tips

Use the `odaupgradeutil describe-precheck-report` command to view the prechecks report for the upgrade.

Example 15-81

```
[root@node1 odaupgradeutil]# ./odaupgradeutil describe-precheck-report

```

odaupgradeutil detach-node

Run the `odaupgradeutil detach-node` command to start the node detach process when you upgrade the appliance using the data preserving reprovisioning feature.

File Path

```
/opt/oracle/odaupgradeutil/odaupgradeutil
```

Syntax

```
odaupgradeutil detach-node [-f] [-h]
```

Parameters

Parameter	Description
<code>odaupgradeutil detach-node</code>	(Optional) Runs the prechecks before the upgrade. This runs prechecks for operating system, Oracle Grid Infrastructure, OAK, and networking.
<code>--force, -f</code>	(Optional) Ignores non-critical precheck failures and detaches the node forcefully. This option also ignores the databases for which metadata discovery fails. These databases are not be restored. Use the <code>-f</code> option carefully.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Tips

The command saves metadata and deconfigures Oracle software on the current Oracle Database Appliance node. You must run the `odaupgradeutil run-prechecks` command before you run the `odaupgradeutil detach-node` command.

Example 15-82

```
[root@node1 odaupgradeutil]# ./odaupgradeutil detach-node

*****
ODAUPGRADEUTIL
-----
Version : 19.20.0.0.0
  Build : 19.20.0.0.0.230629
*****
[root@scaoda415c1n1 odaupgradeutil]# ./odaupgradeutil describe-precheck-
report

*****
IMPORTANT
*****
'odaupgradeutil detach-node' command will bring down the databases and grid
services on the system. The files that belong to the databases, which are
stored on ASM or ACFS, are left intact on the storage. The databases will be
started up back after re-imaging the ODA system using 'odacli restore-node'
commands.
As a good precautionary measure, please backup all the databases on the
system before you start this process. Do not store the backup on this ODA
machine since the local file system will be wiped out as part of the re-
image.
In contrast, 'odaupgradeutil run-precheck' command runs the prechecks only
and
doesn't modify the system state.
*****

odaupgradeutil reinitialize

Run the `odaupgradeutil reinitialize` command to regenerate the init params for `odaupgradeutil`. This command must be run when the basic system configuration has changed such as after a patch or upgrade.

File Path

```
/opt/oracle/odaupgradeutil/odaupgradeutil
```

Syntax

```
odaupgradeutil reinitialize [-h]
```

Parameters

Parameter	Description
<code>odaupgradeutil reinitialize</code>	(Optional) Regenerates the init params for <code>odaupgradeutil</code>
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

If `odaupgradeutil` is installed on an unsupported Oracle Database Appliance release, for example, release 19.7 for OVM, then the `odaupgradeutil prechecks` report displays information about the unsupported release. You can then choose to patch to a supported release and retry. In such a case, the configuration parameters for `odaupgradeutil` need to be reset using the `reinitialize` command option.

Example 15-83

```

[root@node1 oдаupgradeutil]# ./odaupgradeutil reinitialize
*****
ODAUPGRADEUTIL
-----
Version : 19.20.0.0.0
Build : 19.20.0.0.0.230629

```

odacli restore-node

Use the `odacli restore-node` command to re provision the Oracle Database Appliance deployment with Oracle Grid Infrastructure and Oracle databases.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli restore-node [-g] [-d] [-j] [-h]
```

Parameters

Parameter	Description
<code>--grid, -g</code>	(Optional) Restores Oracle Grid Infrastructure software.
<code>--database, -d</code>	(Optional) Restores Oracle Grid Database software.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Example 15-84

```
[root@oak clones]# odacli restore-node -g
Enter new system password:
Retype new system password:
{
  "jobId" : "ff692319-49a8-4d75-8fcf-d56d84046396",
  "status" : "Created",
```

```

    "message" : "The system will reboot, if required, to enable the licensed
number of CPU cores",

odacli Appliance Commands

Use the `odacli` appliance commands to perform lifecycle activities for the appliance.

- [odacli set-credential](#)
Use the `odacli set-credential` command to change the `oda-admin` or `oda-cliadmin` user credentials on a deployment where multi user access is not enabled.

- [odacli create-appliance](#)
Use the `odacli create-appliance` command in a JSON file format to provision Oracle Database Appliance.
- [odacli describe-system](#)
Use the `odacli describe-system` command to display details about components installed on the system.
- [odacli ping-agent](#)
Use the `odacli ping-agent` command to ping the DCS agent resource.
- [odacli list-nodes](#)
Use the `odacli list-nodes` command to list all nodes in the deployment.
- [odacli list-featuretracking](#)
Use the `odacli list-featuretracking` command to display the latest feature tracking report.

odacli set-credential

Use the `odacli set-credential` command to change the `oda-admin` or `oda-cliadmin` user credentials on a deployment where multi user access is not enabled.

Syntax

To reset the `oda-admin` or `oda-cliadmin` user credentials in interactive mode:

```
odacli set-credential --username username [-j] [-h]
```

Parameters

Parameter	Description
<code>--username, -u</code>	User name credentials that you want to reset. The user name can be <code>oda-admin</code> or <code>oda-cliadmin</code> . The <code>oda-admin</code> user credentials allow access to the BUI and the <code>oda-cliadmin</code> user credentials allow ODACLI to communicate with the DCS agent internally.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

Only the `root` user can reset the `oda-admin` or `oda-cliadmin` user credentials.

Example 15-85 Resetting the `oda-admin` Password in Interactive Mode

To reset the `oda-admin` user password to a new password in interactive mode:

```
# odacli set-credential --username oda-admin
Enter 'user' password:
Retype 'user' password:
```

odacli create-appliance

Use the `odacli create-appliance` command in a JSON file format to provision Oracle Database Appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To view help for the `odacli create-appliance` command:

```
odacli create-appliance -r requestjson [-j] [-h]
```

Note:

The `odacli create-appliance` command only supports a JavaScript Object Notation (JSON) file format. An example JSON files and a readme are available in an appendix in this document and in the `/opt/oracle/dcs/sample` directory.

Parameters

Parameter	Description
<code>--requestjson, -r</code>	JSON input for appliance creation.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- For example JSON files, see the chapter *Creating an Appliance Using a JSON File* in this publication.
- The SNMP user name and password are optional for configuring ASR when provisioning. You can specify `"snmpUserName"` and `"snmpUserPassword"` in the provisioning JSON file. If you do not specify these parameters, then a default username is used as the SNMP user name and a random strong password is generated and used as the SNMP user password. An example of SNMP user name and password input in the provisioning JSON file is as follows:

```
"snmpUserName" : "snmpUsr1"  
"snmpUserPassword" : "xxxxx"
```

odacli describe-system

Use the `odacli describe-system` command to display details about components installed on the system.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

To list jobs and view job details and status:

```
odacli describe-system [-h] [-b] [-d] [-j]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--bom, -b</code>	(Optional) Displays the bill of materials for the installed components on the appliance.
<code>--details, -d</code>	(Optional) Display on the command-line, the details of all installed components on the appliance.

Usage Notes

Do not provide both options `-b` and `-d` at the same time, in the command.

Example 15-86 Example Command to View the Bill of Materials from the Command Line for Bare Metal Deployments

```
# odacli describe-system -b

odacli ping-agent

Use the `odacli ping-agent` command to ping the DCS agent resource.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

`odacli ping-agent [-j] [-h]`

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output.

Example 15-87

```
# odacli ping-agent
```

odacli list-nodes

Use the `odacli list-nodes` command to list all nodes in the deployment.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-nodes [-j] [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output.

Example 15-88

```
# odacli list-nodes
```

odacli list-featuretracking

Use the `odacli list-featuretracking` command to display the latest feature tracking report.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

Use the `odacli list-featuretracking` command to display the latest feature tracking report.

```
odacli list-featuretracking [-h] [-j]
```

Parameters

Parameter	Description
--json, -j	(Optional) Displays JSON output.
--help, -h	(Optional) Displays help for using the command.

Example 15-89 Example Command to View the Features Report from the Command Line

```
# odacli list-featuretracking
                                DCS Feature Tracking Report

odacli Backup and Recovery Commands

Use the `odacli backup` and `recover` commands to backup to and restore from Oracle Cloud Infrastructure Object Storage or disk or NFS.

- [odacli create-backup](#)
Use the command `odacli create-backup` to create a Level 0, Level 1, archivelog, or Longterm backup.
- [odacli create-backupconfig](#)
Use the command `odacli create-backupconfig` to create a backup configuration.
- [odacli create-objectstoreswift](#)
Use the command `odacli create-objectstoreswift` to create and store the Oracle credential details required to backup to Oracle Object Store.
- [odacli describe-backupconfig](#)
Use the command `odacli describe-backupconfig` to describe a backup configuration.
- [odacli delete-backup](#)
Use the command `odacli delete-backup` to delete obsolete backups and backup reports.
- [odacli delete-backupconfig](#)
Use the command `odacli delete-backupconfig` to delete a backup configuration.
- [odacli describe-backupreport](#)
Use the command `odacli describe-backupreport` to display details of a specific backup report.

- [odacli describe-objectstoreswift](#)
Use the command `describe-objectstoreswift` to describe a Swift ObjectStore.
- [odacli delete-objectstoreswift](#)
Use the command `odacli delete-objectstoreswift` to delete the credentials for the ObjectStore account.
- [odacli describe-schedule](#)
Use the command `odacli describe-schedule` to display details for a specific schedule.
- [odacli irestore-database](#)
Use the command `odacli irestore-database` to restore a database from one system to other system from an external FRA (NFS) or Object Store location based on a BackupReport.
- [odacli list-backupconfigs](#)
Use the command `odacli list-backupconfigs` to list all backup configurations.
- [odacli list-backupreports](#)
Use the command `odacli list-backupreports` to display a list of all backup reports.
- [odacli list-objectstoreswifts](#)
Use the command `odacli list-objectstoreswifts` to display a list of credentials for the ObjectStore account.
- [odacli list-schedules](#)
Use the command `odacli list-schedules` to display all of the schedules in the system, including database backup schedules and some internal maintenance schedules.
- [odacli list-tdebackupreports](#)
Use the `odacli list-tdebackupreports` command to view TDE Wallet backup reports.
- [odacli recover-database](#)
Use the `odacli recover-database` command to recover or restore a database from backup.
- [odacli restore-archivelog](#)
Use the `odacli restore-archivelog` command to restore archivelog from one SCN to another SCN, or from one timestamp to another timestamp.
- [odacli restore-tdewallet](#)
Use the `odacli restore-tdewallet` command to restore TDE wallet from the backup location.
- [odacli modify-backupconfig](#)
Use the command `odacli modify-backupconfig` to update a backup configuration.
- [odacli update-backupconfig](#)
Use the command `odacli update-backupconfig` to update a backup configuration.
- [odacli modify-objectstoreswift](#)
Use the command `odacli modify-objectstoreswift` to change the credentials for the ObjectStore account.
- [odacli update-objectstoreswift](#)
Use the command `odacli update-objectstoreswift` to change the credentials for the ObjectStore account.

- [odacli modify-schedule](#)
Use the command `odacli modify-schedule` to update the schedule for a database, or to disable the database backup schedule.
- [odacli update-schedule](#)
Use the command `odacli update-schedule` to update the schedule for a database, or to disable the database backup schedule.

odacli create-backup

Use the command `odacli create-backup` to create a Level 0, Level 1, archive log, or Longterm backup.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli create-backup [-i Database Resource ID | -n Database
Resource Name] [-h] [-j]
```

Parameters

Parameter	Description
<code>--backupType, -bt {Regular-L0 Regular-L1 Longterm archive log}</code>	Defines the type of backup. The options are not case sensitive.
<code>--component, -c {Database TDEWallet}</code>	(Optional) Defines the component. The supported options are Database and TDE Wallet. The options are not case-sensitive. The default value is Database. If you specify the value as Database, then a backup of both the database and TDE Wallet is taken.
<code>--name, -n</code>	Defines the database name.
<code>--id, -i</code>	Defines the Database Resource ID.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--keep-archive log, -ka</code>	Keeps archive logs.
<code>--keepDays, -k</code>	Defines the Keep Days. For Longterm Backup Type only.
<code>--tag, -t</code>	Defines the name of the backup. A tag is alphanumeric, up to 30 characters. Required for Longterm Backup Type. The tag must be wrapped in single quotes when special characters are used.

Usage Notes

- Use the command `odacli create-backup` for a specified Database Resource ID and provide a tag for the backup name. Use up to 30 alphanumeric characters for the backup name tag. Three types of backups are available:

- Level 0: An RMAN incremental backup that backs up all data blocks in the data files being backed up. An incremental backup at level 0 is identical in content to a full backup, but unlike a full backup, the level 0 backup is part of an incremental backup strategy.
 - Level 1: An RMAN incremental backup that includes only those blocks that have been changed since the "parent" backup was taken. A parent backup can be either a level 0 or a level 1 backup.
 - Longterm: Longterm backups are available when backing up to NFS (External FRA) or Oracle Cloud Infrastructure Object Storage (Oracle Object Storage).
 - Archivelog: This option is used to perform backup of all archivelogs not yet backed up to the backup destination, such as Internal FRA, External FRA (NFS location), or Object Store.
- The Backup Type must be specified in most cases, when you run the `odacli create-backup` command. If the Backup Component is TDE Wallet, then you need not specify the Backup Type.
 - This command creates a Backup Report with a Resource ID. To get the ID, use the command `odacli describe-job -i job_id -j` and look for the `resourceId` attribute in `resourceList`.

Example 15-90 Create a Manual Database Backup

Create a long term backup that is kept for 90 days and named q12018HR.

```
# odacli create-backup -i Database Resource ID -bt Longterm -c database -k 90 -t q12018HR
```

Example 15-91 Create a Level 0 Database Backup

Create a Level 0 backup named 2017Dec22ProductionLevel0 for resource ID 20576eb1-bc32-4e34-bf97-fda0b60ca15b

```
# odacli create-backup -i 20576eb1-bc32-4e34-bf97-fda0b60ca15b -bt Regular-L0 -t 2017Dec22ProductionLevel0
```

Example 15-92 Create a Backup of only the TDE Wallet

```
# odacli create-backup -n testdb -c TDEWallet
```

Example 15-93 Create a Backup of the database and TDE Wallet

```
# odacli create-backup -n testdb -bt regular-l0
```

odacli create-backupconfig

Use the command `odacli create-backupconfig` to create a backup configuration.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli create-backupconfig -n backup configuration name -d backup destination{Disk|ObjectStore|NFS|None} [-c] [-cr] [-h] [-j] [-no-cr] [-o] [-w] [-f] [-ca] [-dc] [-ec] [-on]
```

Parameters

Parameter	Description
--backupdestination, -d {Disk ObjectStore NFS None}	Defines the backup destination. The options are not case sensitive.
--container, -c	(Optional) Defines the object store container.
--crosscheck, -cr	(Optional) Enable crosscheck.
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output. The default is false.
--name, -n	Defines the backup configuration name.
--no-crosscheck, -no-cr	(Optional) Disable crosscheck.
--objectstoreswiftId, -o	(Optional) Defines the swift object store credential ID.
--tde-container, -f	(Optional) Defines the container or backup location to backup the TDE Wallet. Must be the absolute path to the parent directory when the backup target is NFS, and must be the container name when the backup target is Objectstore.
--recoverywindow, -wDisk: {1-14} ObjectStore: {1-31}	(Optional) Defines the Recovery Window in days. {1-14} days for Disk and {1-31} days for Object Storage in the cloud.
--compression-algo, -ca	(Optional) Defines the compression algorithm {basic low medium high} that RMAN must use. (default: basic(disk/NFS), medium(ObjectStore))
--disable-compression, -dc	(Optional) Disables compression for the backups. Compression is enabled by default.
--enable-compression, -ec	(Optional) Enables compression for the backups. Compression is enabled by default.
--objectstoreswiftName, -on	(Optional) Defines the Objectstore Swift resource name. Specify the Objectstore Swift resource name or Objectstore Swift ID.

Usage Notes

- To backup a TDE-enabled database, backup configuration with separate TDE Wallet backup location and Database backup location is mandatory.
- To backup a non-TDE database, backup configuration with either single database backup location or backup configuration with both database backup location and TDE Wallet backup location can be used.

- For Disk backup configuration, TDE Wallet backup location is by default, Fast Recovery Area (FRA), but in a separate path from the Database backup path within FRA. Hence, TDE Wallet backup location need not be specified when creating the Disk backup configuration.
- The recovery window that is defined in the backup configuration determines when backups are considered obsolete. The following are guidelines:
 - Disk: 1-14 days
 - Object Storage: 1-31 days

Example 15-94 Create a Backup Configuration for disk

Create a backup configuration named `production` that backs up to disk with a 14 day recovery window.

```
# odacli create-backupconfig -d Disk -n production -w 14
```

Example 15-95 Create a Backup Configuration for NFS location

Create a backup configuration that backs up to NFS with a 2 day recovery window.

```
# odacli create-backupconfig -d NFS -n NfsPolicy1 -c /tmp/Nfsbackps -w 2
```

Example 15-96 Create a Backup Configuration with separate backup locations for database backup and TDE Wallet backup

```
# odacli create-backupconfig -n bcfg1 -d Objectstore -w 1 -c location1-on  
oss1 -f location2
```

Example 15-97 Create a Backup Configuration with single backup location for database backup

```
# odacli create-backupconfig -n bcfg2 -d Objectstore -w 1 -c testb2 -on oss2
```

odacli create-objectstoreswift

Use the command `odacli create-objectstoreswift` to create and store the Oracle credential details required to backup to Oracle Object Store.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli create-objectstoreswift -e swift end point URL [-h] [-j] -n Object  
Store Swift name -t Object Store tenant name -u Object Store user name
```

Parameters

Parameter	Description
<code>--endpointurl, -e</code>	Defines the swift end point URL.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--name, -n</code>	Defines the Object Store Swift name.
<code>--tenantname, -t</code>	Defines the Object Store Swift tenant name.
<code>--username, -u</code>	Defines the Object Store Swift user name.

Usage Notes

The command creates and stores the Oracle Cloud Infrastructure Object Storage credential details in the system and stores the password in an encrypted Oracle wallet. You can attach the credentials to one or more backup configurations.

The credentials are validated during Object Store backup configuration creation against the endpoint URL and tenancy.

odacli describe-backupconfig

Use the command `odacli describe-backupconfig` to describe a backup configuration.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-backupconfig [-i backup_configuration_id] [-n name] [-h] [-j]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Specifies the backup configuration identifier (ID).
<code>--name, -n</code>	Specifies the backup configuration name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Example 15-98 Describing a Backup Configuration

Describe a backup configuration named `production`

```
# odacli describe-backupconfig -n production
```

odacli delete-backup

Use the command `odacli delete-backup` to delete obsolete backups and backup reports.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli delete-backup -i Database Resource ID -n name [-br] [-h] [-j]
```

Parameters

Parameter	Description
<code>--backupreport, -br</code>	(Optional) Defines the backup report. To delete a Long Term backup, use a JSON input file for the backupreport.
<code>--id, -i</code>	Defines the Database Resource Identifier (ID). To delete obsolete level 0, level 1 and archive log backups and backup reports, use the database resource ID.
<code>--name, -n</code>	Defines the Database resource name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

- Delete older, obsolete level 0 and level 1, archive log backups and backup reports with the Database Resource ID. The recovery window that is defined in the backup configuration determines when backups are considered obsolete.
- Delete long term backups and backup report from Oracle Object Storage or NFS backup location using a JSON file with the `--backupreport` option.
- To locate the database ID, view the databases in the Browser User Interface or use the command `odacli list-databases`.

Example 15-99 Delete a Level 0 or Level 1 Backup

```
# odacli delete-backup -i 20576eb1-bc32-4e34-bf97-fda0b60ca15b
```

Example 15-100 Delete a Long Term Backup Report

Delete a Long Term backup using a JSON input file for the Backup Report. In this example, backupreport.json is the JSON input for the backupreport.

```
# odacli delete-backup -i 20576eb1-bc32-4e34-bf97-fda0b60ca15b -br
backupreport.json
```

odacli delete-backupconfig

Use the command `odacli delete-backupconfig` to delete a backup configuration.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli delete-backupconfig -n name -i backup configuration id [-h]
[-j]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--id, -i</code>	Defines the Backup Config identifier (ID).
<code>--name, -n</code>	Defines the Backup Config name.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

You cannot delete a backup configuration if it is attached to a database.

Example 15-101 Deleting a Backup Configuration

Delete a backup configuration named `production`

```
# odacli delete-backupconfig -n production
```

odacli describe-backupreport

Use the command `odacli describe-backupreport` to display details of a specific backup report.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-backupreport [-h] [-j] [-i]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output. The default is false.
--id, -i	Defines the backup report ID.

Example 15-102 Display Details of a Specific Backup Report

```

odacli describe-objectstoreswift

Use the command `describe-objectstoreswift` to describe a Swift ObjectStore.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli describe-objectstoreswift -i Object Store Swift id -n Object Store Swift name [-h] [-j]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Specifies the Object Store Swift identifier (ID).
<code>--name, -n</code>	Specifies the Object Store Swift name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Example 15-103 Describing the Swift Object Store

```
# odacli describe-objectstoreswift -i Object Store Swift id
```

odacli delete-objectstoreswift

Use the command `odacli delete-objectstoreswift` to delete the credentials for the ObjectStore account.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli delete-objectstoreswift -i Object Store Swift id -n Object Store Swift name [-h] [-j]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output. The default is false.
--id, -i	Defines the Object Store Swift identifier (ID).
--name, -n	Defines the Object Store Swift name.

Usage Notes

You cannot delete the Object Store credentials if they are attached to a backup configuration.

Example 15-104 Deleting the Oracle Object Store Credentials

```
# odacli delete-objectstoreswift -i Object Store Swift id
```

odacli describe-schedule

Use the command `odacli describe-schedule` to display details for a specific schedule.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli describe-schedule [-h] [-j] [-i]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output. The default is false.
--id, -i	Defines the schedule with an identifier (ID).

Example 15-105 Display Schedule Details

```
# odacli describe-schedule -i scheduleid
```

odacli irestore-database

Use the command `odacli irestore-database` to restore a database from one system to other system from an external FRA (NFS) or Object Store location based on a BackupReport.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli irestore-database -r [-g] [-th] [-n] [-bp] [-cl] [-nn] [-co] [-s] [-ro] [-dr] [-y] [-c] [-oid] [-tf] [-bl] [-t] [-tl] [-cp] [-dh] [-dn] [-de] [-f] [-rd] [-on] [-ha|no-ha] [-h] [-j]
```

Parameters

Parameter	Description
<code>--backupPassword(s), -bp</code>	(Optional) Defines the RMAN password for recovery. You can provide more than one password, but the passwords must be separated by a comma(,).
<code>--backupReport, -r</code>	JSON input for a backup report.
<code>--dbClass, -cl {EE: OLTP/DSS/IMDB, SE: OLTP}</code>	(Optional) Defines the Database class.
<code>--dbConsoleEnable, -co</code>	(Optional) Enables the Database Console.
<code>--dbShape, -s {odb1,odb2, and so on}</code>	(Optional) Defines the database shape.
<code>--dbStorage, -dr {ACFS ASM}</code>	(Optional) Defines the database storage. Database Storage {ACFS ASM} (non case-sensitive). The default is ASM.
<code>--dbType, -y</code>	(Optional) Defines the type of database. For high-availability deployments, the values can be RAC RACOne SI, with the default as RAC. For single-node deployments, the value is SI.
<code>--dbEdition, -de</code>	(Optional) Defines the Database Edition (SE or EE).
<code>--databaseHome, -dh</code>	(Optional) Defines the database home.
<code>--dbName, -n</code>	(Optional) Defines the database name.
<code>--dbUniqueName, -u</code>	(Optional) Defines the database unique name.
<code>--dbDomainName, -dn</code>	Defines the database domain name.
<code>--dbrole, -ro</code>	Defines the database role for Oracle Data Guard operations. The options are PRIMARY STANDBY.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--targethost, -th</code>	(Optional) Specifies the target host name (applicable only for Oracle RAC One Node Database and single-instance Oracle Database, where supported). This option is available for Oracle Database Appliance high-availability deployments.

Parameter	Description
<code>--targetnode, -g</code>	(Optional) Specifies the target node number (applicable only for Oracle RAC One Node Database and single-instance Oracle Database, where supported). The values are 0 or 1. This option is available for Oracle Database Appliance high-availability deployments.
<code>--enable-tde, -t</code>	(Optional) Specifies whether you want to enable TDE on the target database.
<code>--tde-backup-location, -tl</code>	(Optional) Specifies the backup location for TDE wallet.
<code>--noOfRmanChannels, -c</code>	(Optional) Defines the number of RMAN channels (parallelism) Default: SE Edition: 1, Other Enterprise Editions: 5
<code>--objectStoreId, -oid</code>	Defines the Swift Object Store credential ID.
<code>--objectStoreName, -on</code>	Defines the Swift Object Store resource name.
<code>--backuplocation, -bl</code>	(Optional) Specifies the NFS or local directory path where backups are available.
<code>--dbRedundancy, -rd</code>	<p>Specifies the database redundancy value, that is, {HIGH MIRROR}. To specify the <code>dbRedundancy</code> option for an Oracle ASM or ACFS storage-based database, at least one disk group of FLEX redundancy must exist. To specify the <code>dbRedundancy</code> option for an Oracle ASM storage database, the <code>dbVersion</code> or <code>dbHomeVersion</code> must be 12.2 or later.</p> <p>The precedence logic for setting the <code>dbRedundancy</code> is:</p> <ol style="list-style-type: none"> 1. <code>dbRedundancy</code> that is specified in the <code>irestore-database</code> command. 2. <code>dbRedundancy</code> in the backup report. 3. If the disk group redundancy is FLEX, then the default <code>dbRedundancy</code> value is MIRROR.
<code>--associated-networks, -nn</code>	Specifies the associated network names (in the format <code>networkName1,networkName2,...</code>).
<code>--dbOnFlashStorage, -f</code>	(Optional) Specifies whether to enable data on Flash storage.
<code>--no-dbOnFlashStorage, -no-f</code>	(Optional) Specifies whether to disable data on Flash storage.
<code>--disable-ha, -no-ha</code>	(Optional) Disables High Availability for single-instance Oracle Database 19c and later.
<code>--enable-ha, -ha</code>	(Optional) Enables High Availability for single-instance Oracle Database 19c and later.

Usage Notes

▲ Caution:

When you create a database with Transparent Data Encryption (TDE) enabled, you are prompted to set a password for the TDE wallet. Provide a strong password for security compliance. Set the password carefully, and ensure that this password is available to you at all times for database management operations. Failure to provide the TDE wallet password when prompted, will cause an error in accessing encrypted data.

- The command `odacli irestore-database` restores a database to a system using the Backup Report that is in the Oracle Object Store or External FRA (NFS) location. You can restore a database from one appliance to another appliance, or to the same appliance after the source database is deleted.
- An Oracle wallet (ObjectStoreSwift credentials) must be created to access the backups in Oracle Object Store. This command performs the environment checks, validation checks, and tasks needed to restore a database to an Oracle Database Appliance system.
- If `-cp` parameter is provided as part of the command, the database is associated with the particular CPU pool.
- If `-cp` parameter is not provided as part of the command, and if the backup report has information about the associated CPU pool, then the command validates the CPU pool specified in the backup report. If the validation fails, then an error message is displayed.
- If the backup report does not have information about any associated CPU pool, then the database is created without being associated with any CPU pool.
- To restore a TDE-enabled database, the TDE wallet password must be provided.
- If source database is TDE enabled, then the target database which was restored will also have TDE enabled.
- Specify the TDE wallet location if the backup report does not have TDE wallet location or if the backup report is inaccessible or unavailable.

Example 15-106 Restoring a Database to the Same System

Run the command `odacli irestore-database` with the backup report. Enter the SYS user password when prompted.

```
# odacli irestore-database -r backupreport.json -oid Object Store ID
```

Example 15-107 Restoring a Database to a Different System

To restore to a different system, copy the backup report to the other machine's `\bin` folder (or provide the complete path to the backup report), then run the command `odacli irestore-database` with the backup report. Enter the SYS user password when prompted.

```
# odacli irestore-database -r backupreport.json -oid Object Store ID
```

Example 15-108 Restoring a Database with TDE Wallet backup from a backup report

```
# odacli irestore-database -r backupreport.json -on oss1 -t
Enter SYS user password:
Retype SYS user password:
Enter TDE wallet password:
```

Example 15-109 Restoring a Database with TDE Wallet backup specified on the CLI

```
# odacli irestore-database -r backupreport.json -tl https://
swiftobjectstorage.us-ashburn-1.oraclecloud.com/v1/paas_test/tde_Backups/
test2-c/database/91276171/tdbacf2/tdewallet/ewallet_2020021714442745.p12 -on
oss2 -p -m
Enter SYS user password:
Retype SYS user password:
Enter TDE wallet password:
```

Example 15-110 Restoring to a standby database when Oracle Data Guard is configured

```
# odacli irestore-database -r backup_report.json -u dbUniqueName -ro STANDBY
```

Example 15-111 Recovering a Database that was associated with a CPU Pool

```
# odacli irestore-database -n irmendb3 -r dbcpupllong.json -on ostore -bp -
dh 45156cc5-e768-4817-8b52-2a0a482be18f
Enter SYS user password:
Retype SYS user password:
Enter RMAN backup encryption password:
Do you want to provide another RMAN backup encryption password? [y/n]
(default 'n'): n

```

odacli list-backupconfigs

Use the command `odacli list-backupconfigs` to list all backup configurations.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-backupconfigs [-h] [-j]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output. The default is false.

Example 15-112 Displaying a List of Backup Configuration

Display a list of backup configurations.

```
# odacli list-backupconfigs
```

odacli list-backupreports

Use the command `odacli list-backupreports` to display a list of all backup reports.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli list-backupreports [-h] [-j]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output. The default is false.

Usage Notes

Displays a list of all database backup reports generated from the command `odacli create-backup`.

Example 15-113 Display a List of all Backup Reports

```
# odacli list-backupreports
```

odacli list-objectstoreswifts

Use the command `odacli list-objectstoreswifts` to display a list of credentials for the ObjectStore account.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli list-objectstoreswifts [-h] [-j]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Example 15-114 Displaying a List of ObjectStore Swift Credentials

```
# odacli list-objectstoreswifts
```

odacli list-schedules

Use the command `odacli list-schedules` to display all of the schedules in the system, including database backup schedules and some internal maintenance schedules.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli list-schedules [-h] [-j]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

The command lists all of the schedules in the system, including database backup schedules and some internal maintenance schedules.

Starting with Oracle Database Appliance release 19.16, DCS software provides a cron job for cleaning up SSH equivalence that was set up by DCS. The SSH cleaner job runs every 30 minutes. If the SSH cleaner job finds that there are currently no DCS jobs which use SSH, then it cleans up SSH keys, and removes passwordless SSH equivalence across the Oracle Database Appliance nodes on high-availability systems. It also deletes any SSH keys (`id_rsa` and `id_rsa.pub`) present in the `/root/.ssh` and `/home/operating_system_user/.ssh` directories. The SSH cleaner job ensures that DCS jobs are thread safe because jobs (threads) do not interleave while operating on shared resources, such as SSH. To retain the SSH equivalence, or the SSH keys, you can disable the SSH cleaner job using the `odacli update-schedule` command.

Example 15-115 Display a List of Scheduled Database Backups

Display a list of all scheduled database backups and details.

```
# odacli list-schedules

ID                               Name
Description
CronExpression                   Disabled
-----
-----
072dceea-9f09-4c1c-a155-6aa4e3d64669      AgentState metastore cleanup
internal agentstateentry metastore maintenance      0 0 0 1/1 * ?
*                               false
76e530bf-50db-4598-8b9b-6aa89e58b7d7      bom maintenance
bom reports generation                        0 0 1 ? * SUN
*                               false
7b2a8981-fb88-480f-8280-90d463fcbff8      feature_tracking_job
Feature tracking job                          0 0 20 ? * WED
*                               false
af5bc954-c867-4ba4-b587-c9d527cbe07b      Log files Cleanup
Auto log file purge bases on policy          0 0 3 1/1 * ?
*                               false

SSH cleaner job to clean up stale SSH keys    0 0/30 * 1/1 * ?
*                               false
```

odacli list-tdebackupreports

Use the `odacli list-tdebackupreports` command to view TDE Wallet backup reports.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli list-tdebackupreports [-h] [-j]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output. The default is false.

Usage Notes

The TDE backup report saves the latest TDE Wallet backup location of a TDE-enabled database, when a database backup or a TDE Wallet backup is taken for that database.

Example 15-116 Viewing the TDE backup report

```
# odacli list-tdebackupreports
DbResID                               OraDbId
BackupLocation
-----

```

odacli recover-database

Use the `odacli recover-database` command to recover or restore a database from backup.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli recover-database [-i] [-br] [-h] [-j] [-r] [-t] [-p] [-s] [-n] [-tp] [-tl] [-tz] [-cp]
```

Parameters

Parameter	Description
<code>--backupReport, -br{Regular-L0 Regular-L1 Longterm}</code>	(Optional) JSON input for a backup report.
<code>--name, -n</code>	Defines the database name.
<code>--id, -i</code>	Defines the Database Resource ID.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--tde-backup-location, -tl</code>	(Optional) Specifies the backup location for TDE wallet. If not specified, the latest known TDE backup location is used.
<code>--recoveryTimeStamp, -r</code>	(Optional) Defines the date and time of the backup. The Recovery Timestamp (in format mm/dd/yyyy hh:mm:ss) is required when the recovery is a point in time recovery (PITR).
<code>--recoverytype, -t {Latest PITR SCN}</code>	(Optional) Defines the recovery type. Do not provide the recovery type if you define the Backup Report.
<code>--rmanrecoverypassword(s), -p</code>	(Optional) Defines the password for recovery. You can provide more than one password, but the passwords must be within single quote separated by comma(,).
<code>--scn, -s</code>	(Optional) Defines the SCN recovery type. Required when the RecoveryType is SCN.
<code>--cpupool, -cp</code>	(Optional) Specifies the CPU pool name.
<code>--timeZone, -tz</code>	(Optional) Specifies the recovery time zone, in a format similar to {area}/{city} such as america/los_angeles. This option is required when the recovery type is a point in time recovery (PITR).

Usage Notes

Recovers a database to the latest, a point in time recovery (PITR), or System Change Number (SCN) as input. You can also recover a database from a Backup Report provided as JSON input file.

This command performs various environment and validation checks in order to attempt to ensure that recovery of database is successful. If non-TDE database backups are in ObjectStore, the RMAN recovery passwords are needed to recover the database. This includes RMAN restore and recovery.

This command always performs a full RMAN database restore and recovery. This command is most useful when there is a complete database loss or when the majority of the database files are lost. If you do not require a full RMAN restore, you can perform a manual recovery. For example, a single data file loss or control file loss.

- If `-cp` parameter is provided as part of the command, recovered database is associated with the particular CPU pool.
- If `-cp` parameter is not provided as part of the command, and if the backup report has information about the associated CPU pool, then the recovered database is also associated with the same CPU pool.

- If the original database does not have any associated CPU pool, then the recovered database is also not associated with any CPU pool.

Example 15-117 Recovering a Database to a Point-in-Time

```
# odacli recover-database -i b5fc646e-01a6-4c8b-8286-7633346c4 -t PITR -r
11/08/2017 12:57:33 -p
```

Example 15-118 Recovering a Database to the latest

```
# odacli recover-database -i b5fc646e-01a6-4c8b-8286-7633346c4 -t Latest -p
```

Example 15-119 Recovering a Database to an SCN

```
# odacli recover-database -i b5fc646e-01a6-4c8b-8286-7633346c4 -t SCN -s
392375947
```

Example 15-120 Restoring the TDE Wallet while performing database recovery, if TDE wallets are lost

```
# odacli recover-database -n db1 -t latest -tp -tl /u01/NFS_TDE/testbackups/
test2-c/database/91276171/tdbacf2/tdewallet/ewallet_2020021714442745.p12
Enter TDE wallet password:
```

Example 15-121 Recovering a Database that was associated with a CPU Pool

```
# odacli recover-database -t latest -n irmendb4 -cp testcpupool3
{
  "jobId" : "b09f2d3f-2b01-4dbb-9797-122ba786e0e4",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "May 10, 2023 14:56:57 PM UTC",
  "resourceList" : [ ],
  "description" : "Create recovery-latest for db : irmendb4",
  "updatedAt" : "May 10, 2023 14:56:57 PM UTC"
}
```

odacli restore-archivelog

Use the `odacli restore-archivelog` command to restore archivelog from one SCN to another SCN, or from one timestamp to another timestamp.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli restore-archivelog -n database_name -i DB_ID -fs from_scn -ts
to_scn -ft from_timestamp -tt to_timestamp [-h] [-j]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the Database Name.
<code>--id, -i</code>	(Optional) Specifies the Database resource ID.
<code>--from-scn, -fs</code>	(Optional) Specifies the start SCN of archivelog restore.
<code>--from-timestamp, -ft</code>	(Optional) Specifies the start time of archivelog restore (in the format mm/dd/yyyy hh:mi:ss).
<code>--to-scn, -ts</code>	(Optional) Specifies the end SCN of archivelog restore.
<code>--to-timestamp, -tt</code>	(Optional) Specifies the end time of archivelog restore (in the format mm/dd/yyyy hh:mi:ss).
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

You can restore archivelog for all supported database versions and database types for an Oracle Database Appliance release.

Example 15-122 Restoring archivelog

```
# odacli restore-archivelog -fs from_scn -ts to_scn
# odacli restore-archivelog -ft from_timestamp -tt to_timestamp
```

odacli restore-tdewallet

Use the `odacli restore-tdewallet` command to restore TDE wallet from the backup location.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli restore-tdewallet [-i] [-n] [-tl] [-h] [-j]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the Database Name.
<code>--id, -i</code>	Specifies the Database ID.
<code>--tde-backup-location, -tl</code>	(Optional) Specifies the backup location for TDE wallet.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

▲ Caution:

When you create a database with Transparent Data Encryption (TDE) enabled, you are prompted to set a password for the TDE wallet. Provide a strong password for security compliance. Set the password carefully, and ensure that this password is available to you at all times for database management operations. Failure to provide the TDE wallet password when prompted, will cause an error in accessing encrypted data.

- This command prompts for TDE wallet password. When prompted, enter the password of the TDE wallet. This password is the one you created or last updated using the modify-database command.
- TDE Wallet backup location is optional. If no TDE Wallet backup location is provided, then the latest TDE Wallet backup of the database known to the system is used for restoring the TDE Wallet.

Example 15-123 Restoring TDE wallet for a database from a backup location

```
# odacli restore-tdewallet -n testdb -tl /u01/NFS_TDE/testbackups/test2-c/
database/91276171/tdbacf2/tdewallet/ewallet_2020021714442745.p12
Enter TDE wallet password:
```

odacli modify-backupconfig

Use the command `odacli modify-backupconfig` to update a backup configuration.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli modify-backupconfig [-i] [-n] [-ca] -d backup destination{Disk|
ObjectStore|None} [-c] [-cr][no-cr] [-dc] [-ec] [-o] [-w] [-h] [-j]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Defines the Backup Config ID.
<code>--name, -n</code>	Defines the Backup Config name.
<code>--backupdestination, -d{Disk ObjectStore None}</code>	Defines the backup destination. The options are not case sensitive. Applicable to System type backup config.
<code>--compression-algo, -ca{BASIC LOW MEDIUM HIGH}</code>	Defines the Compression Algorithm that RMAN must use. The default is BASIC for Disk and NFS backup and MEDIUM for ObjectStore backup.

Parameter	Description
<code>--container, -c</code>	(Optional) Defines the object store container or absolute path to the parent directory of NFS destination for backups.
<code>--crosscheck, -cr</code>	(Optional) Enable Crosscheck. Applicable to Database type backup config.
<code>--name, -n</code>	Defines the backup configuration name.
<code>--no-crosscheck, -no-cr</code>	(Optional) Disable crosscheck.
<code>--objectstoreswiftid, -o</code>	(Optional) Defines the swift object store credential ID.
<code>--recoverywindow, -w</code> Disk: {1-14} ObjectStore: {1-30}	(Optional) Defines the Recovery Window in days. {1-14} days for Disk and {1-30} days for Object store. Applicable to Database type backup config.
<code>--disable-compression, -dc</code>	(Optional) Disables compression for the backups.
<code>--enable-compression, -ec</code>	(Optional) Enables compression for the backups.
<code>--objectstoreswiftname, -on</code>	(Optional) Describes the Swift Object Store credential name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

- The recovery window that is defined in the backup configuration determines when backups are considered obsolete. The following are guidelines:
 - Disk: 1-14 days
 - ObjectStore in Casper: 1-30 days

Example 15-124 Revise a Backup Configuration for Disk

Create a backup configuration named `production` that backs up to disk with a 14 day recovery window.

```
# odacli modify-backupconfig -d Disk -n production -w 14
```

odacli update-backupconfig

Use the command `odacli update-backupconfig` to update a backup configuration.

Note:

This command is deprecated in Oracle Database Appliance release 19.20 and will be desupported in a future release.

File Path

/opt/oracle/dcs/bin/odacli

Syntax

```
odacli update-backupconfig [-i] [-n] [-ca] -d backup destination{Disk|ObjectStore|None} [-c] [-cr] [-h] [-j] [-no-cr] [-dc] [-ec] [-o][-w]
```

Parameters

Parameter	Description
--id, -i	Defines the Backup Config ID.
--name, -n	Defines the Backup Config name.
--backupdestination, -d{Disk ObjectStore None}	Defines the backup destination. The options are not case sensitive. Applicable to System type backup config.
--compression-algo, -ca{BASIC LOW MEDIUM HIGH}	Defines the Compression Algorithm that RMAN must use. The default is BASIC for Disk and NFS backup and MEDIUM for ObjectStore backup.
--container, -c	(Optional) Defines the object store container or absolute path to the parent directory of NFS destination for backups.
--crosscheck, -cr	(Optional) Enable Crosscheck. Applicable to Database type backup config.
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output. The default is false.
--name, -n	Defines the backup configuration name.
--no-crosscheck, -no-cr	(Optional) Disable crosscheck.
--objectstoreswiftId, -o	(Optional) Defines the swift object store credential ID.
--recoverywindow, -w Disk: {1-14} ObjectStore: {1-30}	(Optional) Defines the Recovery Window in days. {1-14} days for Disk and {1-30} days for Object store. Applicable to Database type backup config.
--disable-compression, -dc	(Optional) Disables compression for the backups.
--enable-compression, -ec	(Optional) Enables compression for the backups.
--objectstoreswiftname, -on	(Optional) Describes the Swift Object Store credential name.

Usage Notes

- The recovery window that is defined in the backup configuration determines when backups are considered obsolete. The following are guidelines:
 - Disk: 1-14 days
 - ObjectStore in Casper: 1-30 days

Example 15-125 Revise a Backup Configuration for Disk

Create a backup configuration named `production` that backs up to disk with a 14 day recovery window.

```
# odacli update-backupconfig -d Disk -n production -w 14
```

odacli modify-objectstoreswift

Use the command `odacli modify-objectstoreswift` to change the credentials for the ObjectStore account.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli modify-objectstoreswift [-n name] [-i id] [-p swiftpassword]
[-u Object Store user name] [-h] [-j]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Defines the Object Store Swift identifier (ID).
<code>--name, -n</code>	Defines the Object Store Swift name.
<code>--swiftpassword, -p</code>	(Optional) Defines the Object Store Swift password.
<code>--username, -u</code>	(Optional) Defines the Object Store Swift user name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

Use this command to update the password when it is changed for an ObjectStore account. The command updates the Oracle ObjectStore credential details in the system and stores the password in an encrypted Oracle wallet.

The credentials are validated during the command `odacli update-backupconfig` with `objectstore` as the destination. The credentials are not validated against endpoint URL and tenancy.

Example 15-126 Changing the Oracle Casper ObjectStore Password

```
# odacli modify-objectstoreswift -i Object Store Swift id -p
```

Example 15-127 Changing the Oracle ObjectStore User Name

```
# odacli modify-objectstoreswift -i Object Store Swift id -u Object Store
user name
```

odacli update-objectstoreswift

Use the command `odacli update-objectstoreswift` to change the credentials for the ObjectStore account.

**Note:**

This command is deprecated in Oracle Database Appliance release 19.20 and will be desupported in a future release.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli update-objectstoreswift [-h] [-j] [-n] [-i] [-p] [-u] Object Store
user name
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--id, -i</code>	Defines the Object Store Swift identifier (ID).
<code>--name, -n</code>	Defines the Object Store Swift name.
<code>--swiftpassword, -p</code>	(Optional) Defines the Object Store Swift password.
<code>--username, -u</code>	(Optional) Defines the Object Store Swift user name.

Usage Notes

Use this command to update the password when it is changed for an ObjectStore account. The command updates the Oracle ObjectStore credential details in the system and stores the password in an encrypted Oracle wallet.

The credentials are validated during the command `odacli update-backupconfig` with `objectstore` as the destination. The credentials are not validated against endpoint URL and tenancy.

Example 15-128 Changing the Oracle Casper ObjectStore Password

```
# odacli update-objectstoreswift -i Object Store Swift id -p
```

Example 15-129 Changing the Oracle ObjectStore User Name

```
# odacli update-objectstoreswift -i Object Store Swift id -u Object
Store user name
```

odacli modify-schedule

Use the command `odacli modify-schedule` to update the schedule for a database, or to disable the database backup schedule.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli modify-schedule [-i] [-x cronExpression] [-t description] [-d] [-e] [-h] [-j]
```

Parameters

Parameter	Description
<code>--scheduleid, -i</code>	Defines the schedule with an identifier (ID).
<code>--cronExpression, -x</code>	(Optional) Specifies the cron expression. Use 5 fields or 6 fields cron expression only.
<code>--description, -t</code>	(Optional) Provides a description for the update schedule.
<code>--disable, -d</code>	(Optional) Disables the schedule.
<code>--enable, -e</code>	(Optional) Enables a disabled schedule.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

Backups incur overhead on the system. When possible, do not schedule backups to run when users are trying to access data.

Starting with Oracle Database Appliance release 19.20, the DCS agent supports only 5 fields cron expressions or 6 fields cron expressions by default, in job schedules. When you patch your deployment from Oracle Database Appliance release 19.19 or earlier, the DCS agent automatically converts all 7 fields cron expression from existing job schedules into an equivalent 6 fields cron expression.

Example 15-130 Modify the Time the Backup Occurs

Edit the cron expression to change the time of scheduled backups for a given schedule ID.

```
# odacli modify-schedule -i scheduleid -x "0 0 13 1/1 * *" -e
```

Example 15-131 Disable Scheduled Database Backups

```
# odacli modify-schedule -i scheduleid -d
```

odacli update-schedule

Use the command `odacli update-schedule` to update the schedule for a database, or to disable the database backup schedule.

**Note:**

This command is deprecated in Oracle Database Appliance release 19.20 and will be desupported in a future release.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli update-schedule [-x] [-t] [-d] [-e] [-h] [-j] [-id]
```

Parameters

Parameter	Description
<code>--cronExpression, -x</code>	(Optional) Specifies the cron expression. Use 5 fields or 6 fields cron expression only.
<code>--description, -t</code>	(Optional) Provides a description for the update schedule.
<code>--disable, -d</code>	(Optional) Disables the schedule.
<code>--enable, -e</code>	(Optional) Enables a disabled schedule.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--scheduleid, -id</code>	Defines the schedule with an identifier (ID).

Usage Notes

Backups incur overhead on the system. When possible, do not schedule backups to run when users are trying to access data.

Example 15-132 Change What Time the Backup Occurs

Edit the cron expression to change the time of scheduled backups for a given schedule ID.

```
# odacli update-schedule -i scheduleid -x "0 0 13 1/1 * *" -e
```

Example 15-133 Disable Scheduled Database Backups

```
# odacli update-schedule -i scheduleid -d
```

odacli Oracle Data Guard Commands

Use ODACLI commands to configure and manage Oracle Data Guard in your Oracle Database Appliance deployment.

- [odacli configure-dataguard](#)
Use the command `odacli configure-dataguard` to configure Oracle Data Guard on Oracle Database Appliance.
- [odacli deconfigure-dataguard](#)
Use the command `odacli deconfigure-dataguard` to deconfigure Oracle Data Guard on Oracle Database Appliance.
- [odacli describe-dataguardstatus](#)
Use the command `odacli describe-dataguardstatus` to view Oracle Data Guard status on Oracle Database Appliance.
- [odacli failover-dataguard](#)
Use the command `odacli failover-dataguard` on the standby system to failover the Oracle Data Guard primary database to the standby database.
- [odacli list-dataguardstatus](#)
Use the command `odacli list-dataguardstatus` to verify Oracle Data Guard status on both primary and standby databases.
- [odacli reinstate-dataguard](#)
Use the command `odacli reinstate-dataguard` on the new primary system to reinstate a failed primary database after a failover and convert it to a new standby database.
- [odacli register-dataguard](#)
Use the command `odacli register-dataguard` to register Oracle Data Guard with Oracle Database Appliance.
- [odacli switchover-dataguard](#)
Use the command `odacli switchover-dataguard` on the primary system to reverse the Oracle Data Guard primary and standby database roles on Oracle Database Appliance.

odacli configure-dataguard

Use the command `odacli configure-dataguard` to configure Oracle Data Guard on Oracle Database Appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli configure-dataguard [-h] [-j] [-i] [-r] [-s]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--requestjson, -r</code>	(Optional) Specifies the JSON file for creating the appliance.
<code>--skip-password-copy, -s</code>	(Optional) Specifies that step to copy the password from primary database to standby database can be skipped.

Usage Notes

If the database `orapwd` file is not in the typical location, then an error may occur in the configuration process. In such a case, manually copy the `orapwd` file from the primary database to the standby database in advance, and configure Oracle Data Guard with the `--skip-password-copy` option.

Example 15-134 Configuring Oracle Data Guard interactively on the command line

```
# odacli configure-dataguard
Standby site address: test_domain
BUI username for Standby site (default: oda-admin):
BUI password for Standby site:
TrustStore path for Standby DCS server: /cacerts.a
TrustStore password for Standby DCS server: <TrustStore_Password>
Database name for Data Guard configuration: cpub
Primary database syspassword:
*****
*****
Data Guard default settings
Primary site network for Data Guard configuration: Public-network
Standby site network for Data Guard configuration: Public-network
Primary database listener port: 1521
Standby database listener port: 1521
Transport type: ASYNC
Protection mode: MAX_PERFORMANCE
Data Guard configuration name: pcpub_scpub
```

```
Active Data Guard: disabled
Do you want to edit this Data Guard configuration? (Y/N, default:N):
The TrustStore of the Standby site should be removed unless it is
necessary for some other purpose. Do you want to delete it? (Y/N,
default:Y): n
As a requirement, Standby database's SYS password will be set to
Primary database's after Data Guard configuration. Are you sure you
want to proceed with Data Guard configuration? (Y/N): y
*****

    }
  ],
  "transportType": "ASYNC"
}
]
}

```

odacli deconfigure-dataguard

Use the command `odacli deconfigure-dataguard` to deconfigure Oracle Data Guard on Oracle Database Appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli deconfigure-dataguard [-h] [-j] -i [-f]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--id, -i</code>	Specifies the Oracle Data Guard Configuration ID.
<code>--force, -f</code>	Forces the deconfiguration of Oracle Data Guard.

Usage Notes

For deconfiguring Oracle Data Guard, you must specify the Oracle Data Guard Configuration ID. Run the `odacli list-dataguardstatus` command to find the Oracle Data Guard Configuration ID.

Example 15-137 Deconfiguring Oracle Data Guard on the Primary Machine

```
# odacli deconfigure-dataguard -i 8396aac4-f7e7-42e4-a2e8-0cbbc89ce31b
Standby site address: test_domain
BUI username for Standby site (default: oda-admin):
BUI password for Standby site:
TrustStore path for Standby DCS server : /cacerts.a
TrustStore password for Standby DCS server: TrustStore_Password
The TrustStore of the Standby site should be removed unless it is
necessary for some other purpose. Do you want to delete it? (Y/N,
default:Y): n
Standby database will be deleted after Data Guard configuration is
removed. Are you sure you want to proceed? (Y/N): y

odacli describe-dataguardstatus

Use the command `odacli describe-dataguardstatus` to view Oracle Data Guard status on Oracle Database Appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli describe-dataguardstatus -i [-h] [-j] [-s]
```

Parameters

Parameter	Description
<code>--id, -i</code>	(Mandatory) Specifies the Oracle Data Guard Status ID.
<code>--synchronous, -s</code>	(Optional) Obtains the latest Oracle Data Guard status synchronously.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

Example 15-138 Viewing Oracle Data Guard configuration status

```
# odacli describe-dataguardstatus -i 5f0ed48a-366d-454c-a389-fe367772dbb7
```

odacli failover-dataguard

Use the command `odacli failover-dataguard` on the standby system to failover the Oracle Data Guard primary database to the standby database.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli failover-dataguard [-h] [-j] [-i] [-u]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output. The default is false.
--id, -i	Specifies the Oracle Data Guard Status ID.
--databaseUniqueName, -u	Specifies the unique name of the database to failover to.

Usage Notes

After performing the failover, view the status with the `odacli list-dataguardstatus` command.

Example 15-139 Performing Failover Oracle Data Guard

```
# odacli failover-dataguard -i 75f23ce0-006a-4aeb-ba6d-b4b60275c19 -u
houdg02
```

odacli list-dataguardstatus

Use the command `odacli list-dataguardstatus` to verify Oracle Data Guard status on both primary and standby databases.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli list-dataguardstatus [-s] [-h] [-j]
```

Parameters

Parameter	Description
--synchronous, -s	(Optional) Obtains the latest Oracle Data Guard status synchronously.
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output. The default is false.

Usage Notes

Example 15-140 Viewing Oracle Data Guard status on primary and standby databases

```
# odacli list-dataguardstatus
```

odacli reinstate-dataguard

Use the command `odacli reinstate-dataguard` on the new primary system to reinstate a failed primary database after a failover and convert it to a new standby database.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli reinstate-dataguard [-h] [-j] [-i] [-u]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--id, -i</code>	Specifies the Oracle Data Guard Status ID.
<code>--databaseUniqueName, -u</code>	(Optional) Specifies the unique name of the database to reinstate.

Usage Notes

After completing the reinstate operation, view the status with the `odacli list-dataguardstatus` command.

Example 15-141 Performing reinstate operation on Oracle Data Guard

```
# odacli reinstate-dataguard -i 75f23ce0-006a-4aeb-ba6d-b4b60275c19 -u  
houdg02
```

odacli register-dataguard

Use the command `odacli register-dataguard` to register Oracle Data Guard with Oracle Database Appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli register-dataguard [-h] [-j] [-r json_input_file]
```

Parameters

Parameter	Description
<code>--requestjson, -r</code>	Specifies the JSON input for creation of Oracle Data Guard configuration in the advanced option.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

odacli switchover-dataguard

Use the command `odacli switchover-dataguard` on the primary system to reverse the Oracle Data Guard primary and standby database roles on Oracle Database Appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli switchover-dataguard [-h] [-j] [-i] [-u]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--id, -i</code>	Specifies the Oracle Data Guard Status ID.
<code>--databaseUniqueName, -u</code>	(Optional) Specifies the unique name of the database to switchover to.

Usage Notes

After performing the switchover, view the status with the `odacli list-dataguardstatus` command.

Example 15-142 Switching over Oracle Data Guard

```
# odacli switchover-dataguard -i 75f23ce0-006a-4aeb-ba6d-b4b60275c19 -u houdg02
```

odacli CPU Core Commands

Use the CPU Core commands to enable CPU cores and display current and historical CPU core configurations.

- [odacli list-cpucores](#)
Use the `odacli list-cpucores` command lists the history of core configuration changes in the system.
- [odacli describe-cpucore](#)
Use the `odacli describe-cpucore` command to display the current core configuration and the modification date and time.
- [odacli modify-cpucore](#)
Use the `odacli modify-cpucore` command to enable the number of CPU cores in the system.
- [update-cpucore](#)
Use the `odacli update-cpucore` command to enable the number of CPU cores in the system.

odacli list-cpucores

Use the `odacli list-cpucores` command lists the history of core configuration changes in the system.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-cpucores [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-143 Displaying a List of Cores

```
# odacli list-cpucores
```

```
Node  Cores  Modified                               Job Status
-----
0      10     July 22, 2016 12:06:08 PM SGT          Configured
0       8     July 25, 2016 9:39:59 AM SGT          Configured
```

odacli describe-cpucore

Use the `odacli describe-cpucore` command to display the current core configuration and the modification date and time.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-cpucore [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-144 Displaying the Current Core Configuration

```
# odacli describe-cpucore
```

Node	Cores	Modified	Job Status
0	8	July 25, 2016 9:39:59 AM SGT	Configured

odacli modify-cpucore

Use the `odacli modify-cpucore` command to enable the number of CPU cores in the system.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli modify-cpucore -c cores [-j] [-h]
```

Parameters

Parameter	Description
<code>--cores, -c</code>	Defines the number of cores to be enabled in the system.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- The number of cores you enable must be a multiple of 2.
- After the initial configuration, you cannot reduce the number of cores. You can only increase the number of cores.
- When you run the command, you are prompted to confirm the operation with the following message:

```
Modifying the enabled number of CPU requires a reboot of all nodes in the
ODA system. Are you sure you want to proceed with this operation? (Y/N):
```

- Nodes are restarted after modifying the cores in the BIOS. Note this results in database outage as all the nodes in the cluster are restarted at the same time. Once the system is restarted, the system is updated with the correct number of cores.

Example 15-145 Enabling CPU Cores

The following command enables 8 CPU cores.

```
# odacli modify-cpucore -c 32
Modifying the enabled number of CPU requires a reboot of all nodes in the
ODA system. Are you sure you want to proceed with this operation? (Y/N): y
{
  "jobId" : "1a59d182-79f0-4847-81e6-ab3ebf779096",

WARNING: Reducing the number of enabled cores may set offline any of the CPUs
used by a CPU Pool. Thus, please review the status of all the CPU Pools after
this operation using the 'describe-cpupool' command. In case of any CPU from
a CPU Pool was offline please run 'modify-cpupool' to update the list of CPUs
and use only online CPUs.
WARNING: All the nodes in this ODA system will reboot after this operation
```

update-cpucore

Use the `odacli update-cpucore` command to enable the number of CPU cores in the system.

Note:

This command is deprecated in Oracle Database Appliance release 19.20 and will be desupported in a future release.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli update-cpucore -c cores [-h]
```

Parameters

Parameter	Description
<code>--cores, -c</code>	Defines the number of cores to be enabled in the system.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- The number of cores you enable must be a multiple of 2.
- After the initial configuration, you cannot reduce the number of cores. You can only increase the number of cores.
- When you run the command, you are prompted to confirm the operation with the following message:

```
Modifying the enabled number of CPU requires a reboot of all nodes
in the ODA system. Are you sure you want to proceed with this
operation? (Y/N):
```

- Nodes are restarted after modifying the cores in the BIOS. Note this results in database outage as all the nodes in the cluster are restarted at the same time. Once the system is restarted, the system is updated with the correct number of cores.

Example 15-146 Enabling CPU Cores

The following command enables 8 CPU cores.

```
# odacli update-cpucore -c 32
Modifying the enabled number of CPU requires a reboot of all nodes in
the ODA system. Are you sure you want to proceed with this operation?
(Y/N): y

WARNING: All the nodes in this ODA system will reboot after this operation

odacli CPU Pool Commands for Bare Metal and KVM

Use odacli commands to manage resource allocations on Oracle Database Appliance for bare metal and KVM deployments.

CPU pools enable management of CPU resources in both bare metal and KVM environments. There are two types of CPU pools, that is, BM and VM.

Use the BM CPU pool to ensure that the database on a bare metal host runs exclusively on the CPUs specified in the CPU pool.

Use the VM CPU pools to cage and manage CPU resource allocations to workloads for virtual machines. Workloads are isolated by creating CPU pools and assigning or pinning virtual machines to a specific CPU pool. When you pin a virtual machine to a CPU pool, you ensure that the virtual machine uses CPUs in only that CPU pool.

Resources in CPU pools cannot overlap, that is, CPU pools cannot share CPUs.

- [odacli create-cpupool](#)
Use the `odacli create-cpupool` command to create a new CPU pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli remap-cpupools](#)
Use the `odacli remap-cpupools` command to remap CPU pools to NUMA allocation on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli list-cpupools](#)
Use the `odacli list-cpupools` command to list all CPU Pools on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli describe-cpupool](#)
Use the `odacli describe-cpupool` command to describe CPU Pools on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli modify-cpupool](#)
Use the `odacli modify-cpupool` command to modify a CPU Pool configuration on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli delete-cpupool](#)
Use the `odacli delete-cpupool` command to delete a CPU Pool configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli list-auditrecords](#)
Use the `odacli list-auditrecords` command to list the audit records for a CPU Pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

- [odacli describe-auditrecord](#)
Use the `odacli describe-auditrecord` command to describe the audit record for a CPU Pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

odacli create-cpupool

Use the `odacli create-cpupool` command to create a new CPU pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli create-cpupool -n name -c number_of_cores {-bm|-vm} [-nn node_name] [-s socket] [-dbs] [-urc] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the CPU Pool name.
<code>--cores, -c</code>	Specifies the CPU Pool cores.
<code>--bm, -bm</code>	(Optional) Specifies the CPU Pool as Bare Metal.
<code>--vm, -vm</code>	(Optional) Specifies the CPU Pool as Virtual Machine.
<code>--dbsystem, -dbs</code>	(Optional) Specifies the CPU Pool type as DB System.
<code>--socket, -s</code>	(Optional) Specifies the socket to use. If not specified, then use all available sockets.
<code>--use-reserved-cores, -urc</code>	(Optional) Specifies to use reserved CPU cores.
<code>--node-name, -nn</code>	(Optional) Specifies the node where the CPU Pool will be created. On High-Availability deployment, if this option is not specified, then the CPU pool is created on both nodes.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- Attach the BM CPU pool to databases. Bare metal CPU pools can be assigned to multiple databases.
- Attach VM CPU pool VM to guest machines. VM CPU pools can be assigned to multiple VMs.
- Attach dbsystem CPU pool to DB systems. dbsystem CPU pool can be assigned to multiple DB systems. After you create a dbsystem CPU pool, you can create a new DB system with this CPU pool by adding the new CPU pool parameter in the `create-dbsystem json` file, or `modify-dbsystem` to attach CPU pool to an existing DB system.
- Resources in CPU pools cannot overlap, that is, CPU pools cannot share CPUs.
- After you create a BM CPU pool, you can associate this CPU pool to a database using the `create-database` or `modify-database` command.

- After you create a VM CPU pool, you can associate this CPU pool to a VM using the `create-vm` or `modify-vm` command.
- Number of cores must be an even number between 2 and the total number of available cores on the system.
- By default, a CPU in the CPU pool is allocated across two sockets in release 19.12 and later. Optionally, you can choose to allocate the CPU based on the socket number (0 or 1). This is especially useful to support Standard Edition licensing. It is recommended that you use the default allocation and do not mix two types of allocation.
- By default, the first core of the socket is reserved and cannot be used by the VM and DB system CPU pools for optimal performance. Use the `--use-reserved-cores` option to enable use of the first core of socket for VM and DB system CPU pools.

Example

Create a BM CPU pool named `cpupool1` with 6 cores associated to it.

```
# odacli create-cpupool -n cpupool1 -c 6 -bm
```

Create a VM CPU pool named `cpupool2` with 6 cores associated to it.

```
# odacli create-cpupool -n cpupool2 -c 6 -vm
```

Create a DB System CPU pool named `cpupool3` with 6 cores associated to it.

```
# odacli create-cpupool -n cpupool3 -c 6 -dbs
```

Create a DB System CPU pool named `cpupool4` with 4 cores of CPUs allocated from socket 0.

```
# odacli create-cpupool -n cpupool4 -dbs -s 0 -c 4
```

odacli remap-cpupools

Use the `odacli remap-cpupools` command to remap CPU pools to NUMA allocation on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli remap-cpupools -f -urc [-j] [-h]
```

Parameters

Parameter	Description
<code>--force, -f</code>	(Optional) Specifies to force the operation.
<code>--use-reserved-cores, -j</code>	(Optional) Specifies to use reserved CPU cores.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

If the `odacli remap-cpupools` command fails with the error `DCS-10001:Internal error encountered: Not enough physical CPUs available for CPU Pool 'cpupool_name' on node 'node_name'`, run the `odacli remap-cpupools` command again with the `--use_reserved-cores` option.

Use the `--force` option to remap CPU pools even if the CPU pool is marked as NUMA-enabled. You must use `odacli remap-cpupools` command, after updating the bare metal CPU cores with the command `odacli update-cpucore`s for CPU core number changes.

By default, the first core of the socket is reserved and cannot be used by the VM and DB system CPU pools for optimal performance. Use the `--use-reserved-cores` option to enable use of the first core of socket for VM and DB system CPU pools.

Example

```
# odacli remap-cpupools
```

Related Topics

- [odacli modify-vm](#)
Use the `odacli modify-vm` command to modify a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli remap-cpupools](#)
Use the `odacli remap-cpupools` command to remap CPU pools to NUMA allocation on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli modify-dbsystem](#)
Use the `odacli modify-dbsystem` command to modify a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli create-cpupool](#)
Use the `odacli create-cpupool` command to create a new CPU pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

odacli list-cpupools

Use the `odacli list-cpupools` command to list all CPU Pools on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli list-cpupools [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

```
# odacli list-cpupools
```

odacli describe-cpupool

Use the `odacli describe-cpupool` command to describe CPU Pools on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli describe-cpupool -n name [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the name of the CPU Pool.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example: Describing a CPU pool named `cpupool1`

```
# odacli describe-cpupool -n cpupool1
```

odacli modify-cpupool

Use the `odacli modify-cpupool` command to modify a CPU Pool configuration on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli modify-cpupool -n name -c cores -f -l [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the CPU Pool name
<code>--cores, -c</code>	Specifies the new number of CPU cores
<code>--force, -f</code>	(Optional) Forces the operation
<code>--live, -l</code>	(Optional) Applies the changes to running VMs
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

For VM CPU pool, if `--live` is not specified, then the changes are applied to the VM configuration file and will be activated next time the VM is started. If `--live` is specified, then the changes will be applied to both VM configuration file and to the running VM.

Example

Set the size of a CPU Pool `cpupool1` to 10. If `--live` is not specified, the change is applied to the VM configuration file and will be activated next time the VM is started.

```
# odacli modify-cpupool -n cpupool1 -c 10
```

odacli delete-cpupool

Use the `odacli delete-cpupool` command to delete a CPU Pool configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli delete-cpupool -n name -f [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the CPU Pool name to be deleted
<code>--force, -f</code>	(Optional) Forces deletion.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Delete a CPU pool named `cpupool1`.

```
# odacli delete-cpupool -n cpupool1
```

odacli list-auditrecords

Use the `odacli list-auditrecords` command to list the audit records for a CPU Pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli list-auditrecords -du dcs-username -f from_date-range -l latest -n node_ID -ot operation_type -ou OS_username -rn resource_name -rt resource_type -t to_date-range [-j] [-h]
```

Parameters

Parameter	Description
<code>--dcs-user, -du</code>	(Optional) Specifies the DCS user name.
<code>--from, -f</code>	(Optional) Specifies the <i>from</i> date in the date range for the CPU pool audit records.
<code>--latest, -l</code>	(Optional) Specifies the latest number of CPU pool audit records.
<code>--node-id, -n</code>	(Optional) Specifies the node ID.
<code>--op-type, -ot</code>	(Optional) Specifies the type of operation.

Parameter	Description
--os-user, -ou	(Optional) Specifies the operating system user.
--rsc-name, -rn	(Optional) Specifies the resource name.
--rsc-type, -rt	(Optional) Specifies the resource type.
--to, -t	(Optional) Specifies the <i>to</i> date in the date range for the CPU pool audit records.
--json, -j	(Optional) Displays output in JSON format.
--help, -h	(Optional) Displays help for using the command.

Example

```
# odacli list-auditrecords
ID                               Resource type      Resource name
Operation type  DCS username      OS username       Timestamp

```

odacli describe-auditrecord

Use the `odacli describe-auditrecord` command to describe the audit record for a CPU Pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli describe-auditrecord -i [-j] [-h]
```

Parameters

Parameter	Description
--id, -i	Describes the ID of the audit record.
--json, -j	(Optional) Displays output in JSON format.
--help, -h	(Optional) Displays help for using the command.

Example

```
# odacli describe-auditrecord -i 41295d99-f263-4284-b6d9-2aff1ae0f850
Audit Record details
```

```
-----

```

odacli Database Commands

Use the `odacli` database commands to perform database lifecycle operations.

- [odacli clone-database](#)
Use the `odacli clone-database` command to clone a new database from a source database.
- [odacli create-database](#)
Use the `odacli create-database` command to create a new database.
- [odacli delete-database](#)
Use the `odacli delete-database` command to delete a database.
- [odacli describe-database](#)
Use the `odacli describe-database` command to display database details.
- [odacli list-databases](#)
Use the `odacli list-databases` command to list all databases on the appliance.
- [odacli modify-database](#)
Use the `odacli modify-database` command to modify the configuration of a database, such as backup configuration, database class, and database type, and to change TDE wallet management from `EXTERNAL` to `ODA`.
- [odacli move-database](#)
Use the command `odacli move-database` to move a database from one Oracle home to another home of the same database version.
- [odacli register-database](#)
Use the `odacli register-database` command to register a migrated database with the appliance.
- [odacli upgrade-database](#)
You can use the `odacli upgrade-database` command to upgrade a database from a supported release.

odacli clone-database

Use the `odacli clone-database` command to clone a new database from a source database.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli clone-database [-u] [-n] [-dh] [-nh] [-ro] [-s] [-t] [-j] [-f] [-nn]
[-p] [-h] [-sh|-no-sh] [-ha|-no-ha] [-cp]
```

Parameters

Parameter	Description
<code>--databaseUniqueName, -u</code>	Defines a unique name for the database.
<code>--dbname, -n</code>	Defines the name given to the new database (<code>dbname</code>).
<code>--dbhomeid, -dh</code>	Specifies the database home ID of the new database.
<code>--newhome, -nh</code>	Specifies that a new database home must be created.
<code>--readonly, -ro</code>	(Optional) Specifies to open the database in read-only mode.
<code>--dbshape, -s</code>	(Optional) Identifies the database shape (template) and determines the total memory allocated to the database. For example, <code>odb1</code> and <code>odb2</code> . The default is <code>odb1</code> .
<code>--dbtype, -t [RAC RACOne SI]</code>	(Optional) Defines the database type. The default database type is the source database type, if the option is not specified. For high-availability deployments, the values can be <code>RAC RACOne SI</code> , with the default as <code>RAC</code> . For single-node deployments, the value is <code>SI</code> .
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--sourcedbname, -f</code>	Specifies the name of the source database
<code>--associated-networks, -nn</code>	(Optional) Specifies the associated network names (in the format <code>networkName1,networkName2,...</code>).
<code>--disable-seha, -no-sh</code>	(Optional) Specifies whether you want to disable Standard Edition High-Availability for Oracle Database Standard Edition 19c and later single-instance databases. Note: This option is deprecated and will be desupported in a future release.
<code>--enable-seha, -sh</code>	(Optional) Specifies whether you want to enable Standard Edition High-Availability for Oracle Database Standard Edition 19c and later single-instance databases. Note: This option is deprecated and will be desupported in a future release.

Parameter	Description
--disable-ha, -no-ha	(Optional) Disables High Availability for single-instance Oracle Database 19c and later.
--enable-ha, -ha	(Optional) Enables High Availability for single-instance Oracle Database 19c and later.
--cpupool, -cp	(Optional) Specifies the CPU pool name.
--tdepassword, -p	(Optional) Specifies the TDE password of the source database.

Usage Notes

- The source database must be up and running.
- The source database must be opened in either read-write mode, or read-only mode if it is a primary database. A standby database can be in mounted or read-only open mode.
- The source database must use Oracle ACFS storage.
- The source database must not be a multitenant container database (CDB)
- If `-cp` parameter is provided as part of the command, cloned database is associated with the particular CPU pool.
- If `-cp` parameter is not provided as part of the command, and if the parent database has an associated CPU pool, then the cloned database is also associated with the same CPU pool as that of parent database.
- If `-cp` parameter is not provided as part of the command, and if the parent database does not have any associated CPU pool, then the cloned database is also not associated with any CPU pool.
- All data files of the source database must be in the same Oracle ACFS directory.

Example 15-147 Cloning a Database in a new database home

```
# odacli list-databases

ID                               DB Name  DB Type  DB

Related Topics

- [Cloning an Oracle ACFS Database](#)
Create a database from an existing Oracle ACFS database using ODACLI commands or BUI.

odacli create-database

Use the `odacli create-database` command to create a new database.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli create-database -n database_name -cs characterset -cl {OLTP|DSS|IMDB}
-l dblanguage -s dbshape -r {ACFS|ASM} -dt dbterritory
-y dbtype -ns nationalscharacterset -d pdadmin -p pdname -v version
[-u databaseUniqueName] [-dh Database Home ID] [-c|-no-c] [-co|-no-co]
[-bi backupconfigid] [-io] [-dn] [-j] [-nn] [-h] [-rd] [-sh|-no-sh] [-ha|-no-
ha] [-t] [-cp]
```

Parameters

Parameter	Description
<code>--backupconfigid, -bi</code>	(Optional) Defines the backup configuration identifier for future use.
<code>--cdb, -c</code>	(Optional) Creates the database as a container database. Use the <code>-c</code> flag to create a container database and use the <code>-no-c</code> flag to create a non-CDB database. The default is <code>-no-c</code> .
<code>--characterset, -cs</code>	Defines the character set. The default is AL32UTF8.
<code>--databaseUniqueName, -u</code>	(Optional) Defines a unique name for the database.
<code>--dbdomainname, -dn</code>	Defines the database domain name.

Parameter	Description
<code>--cpupool, -cp</code>	Defines the CPU pool name. The CPU pool must be of type bare metal (BM).
<code>--dbEdition, -de</code>	Defines the Database Edition.
<code>--dbclass, -cl {OLTP DSS IMDB}</code>	Defines the database class. The default is OLTP. The options are as follows: <ul style="list-style-type: none"> Enterprise Edition: OLTP, DSS, or IMDB. Standard Edition: OLTP
<code>--dbconsole, -co</code>	(Optional) Enables the Database Console. Use the <code>-no-co</code> flag to disable the Database Console. If not selected, the default is no database console.
<code>--dbhomeid, -dh</code>	(Optional) Identifies the existing Database Home ID.
<code>--dblanguage, -l</code>	Defines the database language. The default language is AMERICAN.
<code>--dbname, -n</code>	Defines the name given to the new database (dbname.)
<code>--dbshape, -s</code>	Identifies the database shape (template) and determines the total memory allocated to the database. For example, odb1 and odb2. The default is odb1. You cannot specify the database shape when you create a instance-only database.
<code>--dbstorage, -r{ACFS ASM}</code>	Defines the Database Storage, either Oracle ACFS or Oracle ASM. The default value is Oracle ASM.
<code>--dbterritory, -dt</code>	Defines the database territory. The default territory is AMERICA.
<code>--dbtype, -y [RAC RACOne SI]</code>	Defines the database type. For high-availability deployments, the values can be RAC RACOne SI, with the default as RAC. For single-node deployments, the value is SI.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--instanceonly, -io</code>	(Optional) Creates a database instance, password file and also the underlying Oracle ACFS mount point. You can use the instance as an auxiliary instance for RMAN duplicate.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--nationalscharacterset, -ns</code>	Defines the NLS National Character Set. The default is AL16UTF16.
<code>--no-cdb, -no-c</code>	(Optional) Creates a database that is <i>not</i> a container database. Use this flag when you want to create a non-CDB database. Use the <code>-c</code> flag to create a container database.
<code>--no-dbconsole, -no-co</code>	(Optional) Disables Database Console. Use the <code>-co</code> flag to enable Database Console.
<code>--pdbadmin, -d</code>	Defines the Pluggable Database (PDB) Admin User.
<code>--pdbname, -p</code>	Defines the Pluggable Database (PDB) name. The default value is pdb1.
<code>--version, -v</code>	Defines the database bundle patch number. To install the latest bundle patch for a release, specify the release version. To specify a specific supported bundle, use the 5 digit format.

Parameter	Description
<code>--dbRedundancy, -rd</code>	Specifies the database redundancy value, that is, {HIGH MIRROR}. To specify the <code>dbRedundancy</code> option for an Oracle ASM or ACFS storage-based database, all disk groups must have FLEX redundancy. To specify the <code>dbRedundancy</code> option for an Oracle ASM storage database, the <code>dbVersion</code> or <code>dbHomeVersion</code> must be 12.2 or later.
<code>--associated-networks, -nn</code>	Specifies the associated network names (in the format <code>networkName1,networkName2,...</code>).
<code>--enable-tde, -t</code>	Specifies whether to enable Transparent Data Encryption (TDE) which uses Software Keystore.
<code>--disable-seha, -no-sh</code>	Specifies whether you want to disable Standard Edition High-Availability for Oracle Database Standard Edition 19c and later single-instance databases. Note: This option is deprecated and will be desupported in a future release.
<code>--enable-seha, -sh</code>	Specifies whether you want to enable Standard Edition High-Availability for Oracle Database Standard Edition 19c and later single-instance databases. Note: This option is deprecated and will be desupported in a future release.
<code>--targethost, -th</code>	(Optional) Specifies the target host name (applicable only for Oracle RAC One Node Database and single-instance Oracle Database, where supported).
<code>--targetnode, -g</code>	(Optional) Specifies the target node number (applicable only for Oracle RAC One Node Database and single-instance Oracle Database, where supported). The values are 0 or 1.
<code>--levelzerobackupday, -lb</code>	(Optional) Specifies the level zero backup day. The values can be Monday Tuesday Wednesday... Sunday. The default is Sunday.
<code>--backupconfigname, -bn</code>	(Optional) Specifies the name of the backup configuration.
<code>--bkuppassword, -bp</code>	(Optional) Specifies the RMAN backup encryption password.
<code>--enableFlashCache, -fc</code>	(Optional) Specifies whether to enable Flash Cache.
<code>--no-enableFlashCache, -no-fc</code>	(Optional) Specifies whether to disable Flash Cache.
<code>--dbOnFlashStorage, -f</code>	(Optional) Specifies whether to enable data on Flash storage.
<code>--no-dbOnFlashStorage, -no-f</code>	(Optional) Specifies whether to disable data on Flash storage.
<code>--disable-ha, -no-ha</code>	(Optional) Disables High Availability for single-instance Oracle Database 19c and later.
<code>--enable-ha, -ha</code>	(Optional) Enables High Availability for single-instance Oracle Database 19c and later.

Usage Notes

- If the disk group redundancy is FLEX, then the default `dbRedundancy` value is MIRROR.
- Flash cache is disabled by default.
- You cannot mix Oracle Database Standard Edition and Enterprise Edition databases on the same appliance.

- For Standard Edition Oracle Database 19c or later, you cannot create Oracle RAC Or Oracle RAC One Node Database. For Standard Edition, you can only deploy single-instance Oracle Database with or without high-availability enabled.
- Transparent Data Encryption (TDE) is an Advanced Security Option (ASO) available with Oracle Database Enterprise Edition.
- TDE is not configured by default during database creation.
- The `dbname` and `databaseUniqueName` can contain underscores (-), lowercase and uppercase alphabet (a-zA-Z, and numeric characters (0-9), must start with an alphabet, and must not exceed 8 characters in length. Underscores are not permitted only if the `--dbname` is set to `RACOne`, as it is used as a delimiter to identify the database instance. The `dbname` and `databaseUniqueName` must not also be an Oracle reserved key word.
- Use the `--cdb` or `--no-cdb` flag to indicate whether or not the database is a container database. When neither flag is specified, the default database created is a non-CDB database.
- When `--dbhomeid` is not provided, the `create-database` command creates a new Oracle Database Home.
- When `--dbhomeid` is provided, the `create-database` command creates the database using the existing Oracle Home. Use the `odacli list-dbhomes` command to obtain the `dbhomeid`.
- When you use the command to create an instance-only database, then you cannot specify the database shape (template).
- When you specify both the `--version` and the `--dbhomeid`, the version is ignored and the database is created against the existing database home.
- Oracle Database 12.1 or later is supported on both Oracle Automatic Storage Management (Oracle ASM) and Oracle ASM Cluster file system (ACFS). The default is Oracle ASM.
- When databases are created in Oracle ACFS, each database is configured with its own Oracle ACFS file system for the datafiles and uses the following naming convention: `/u02/app/db user/oradata/db unique name`. The default size of this mount point is 100 GB.

 **Note:**

Oracle recommends not sharing the mount point across different databases.

- Online logs are stored in the `/u03/app/db user/redo/` directory.
- Oracle Fast Recovery Area (FRA) is located in the `/u03/app/db user/fast_recovery_area` directory.
- For the version, you can specify the database version, for example, 19.11.0.0, 18.8.0.0, 12.2.0.1, or 12.1.0.2, or you can use a 5 digit format to specify a specific patch bundle version. If you use the database version without specifying the bundle patch number, the latest bundle patch is used.

▲ Caution:

When you create a database with Transparent Data Encryption (TDE) enabled, you are prompted to set a password for the TDE wallet. Provide a strong password for security compliance. Set the password carefully, and ensure that this password is available to you at all times for database management operations. Failure to provide the TDE wallet password when prompted, will cause an error in accessing encrypted data.

Example 15-153 Creating a TDE-enabled database

```
# odacli create-database -n test -t
Enter new 'SYS, SYSTEM and PDB Admin user' password:
Confirm 'SYS, SYSTEM and PDB Admin user' password:
Enter new 'TDE wallet' password:
Confirm 'TDE wallet' password:
```

Example 15-154 Creating a Database in Interactive Mode

This example creates a 19.20.0.0 OLTP container database named `hrdb` with shape `odb2` and enables you to provide the password interactively.

```
# odacli create-database -n hrdb -c -cl OLTP -s odb2 -p pdb1

Enter new 'SYS, SYSTEM and PDB Admin user' password:
Confirm 'SYS, SYSTEM and PDB Admin user' password:
{
  "jobId" : "f12485f2-dcbe-4ddf-aeel-de24d37037b6",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "August 8, 2023 03:54:03 AM EDT",
  "description" : "Database service creation with db name: hrdb",
  "updatedAtTime" : "August 8, 2023 03:54:03 AM EDT"
}
```

Example 15-155 Creating a Database Against a Different Version

Either of the following statements creates a database against a home with Oracle Database Bundle applied:

```
# odacli create-database -n hrmsdb1 -v 19.20.0.0.0
# odacli create-database -n hrmsdb2 -v 19.20.0.0.230720
```

The following statement creates a new database against a home with a specific Oracle Database Bundle:

```
# odacli create-database -n hrmsdb3 -v 19.20.0.0.230720
```

Example 15-156 Creating a Database associated with a CPU Pool

The following command creates a new database associated with a CPU pool:

```
# odacli create-database -j -n dbcpupl -r ACFS -cp testdbcpupool
```

odacli delete-database

Use the `odacli delete-database` command to delete a database.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To delete a database:

```
odacli delete-database -i dbid -n name [-ea] [-h] [-j] [-fd]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Identifies the database home identifier (ID) to display. Use the <code>odacli list-databases</code> command to obtain the <code>--id</code> .
<code>--name, -n</code>	Defines the database name.
<code>--force, -fd</code>	(Optional) Forces the delete operation.
<code>--eraseAll, -ea</code>	(Optional) Removes all files.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage **Note:**

The `odacli delete-database` command deletes the database, the file system, and the underlying `advm` volumes assigned to the database. For example, deleting a database named `hrdb` also deletes the file system `/u02/app/oracle/oradata/hrdb`. Do not keep any other files on this database file location. If you have manually added static entries for the database you want to delete in your `listener.ora` file, then remove these entries before running the `odacli delete-database` command.

Example 15-157 Deleting a Database Named `hrmsdb`

In this example we want to delete a database named `hrmsdb`. Before we can delete the database, we need to know the database home identifier (`dbid`). This example shows

how to run the `odacli list-databases` command to list the databases and their associated *dbid*, then how to delete database `hrmsdb`.

```
# odacli list-databases

ID                               DB Name  DB Version  CDB  Class
-----
a3f4a6c0-a0c9-4c79-bad7-898afcf9de46  hrmsdb  12.1.0.2    true  OLTP
7e28bf52-1a09-49fd-9391-841838d2c42f  crmdb   12.1.0.2    false OLTP

(continued)
Shape      Storage  Status
-----
odbl       ACFS     Configured
odbl       ACFS     Configured

# odacli delete-database -i a3f4a6c0-a0c9-4c79-bad7-898afcf9de46
```

odacli describe-database

Use the `odacli describe-database` command to display database details.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To display database details:

```
odacli describe-database -i dbid -n name [-h] [-j]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Identifies the database home identifier (ID) to display. Use the <code>odacli list-databases</code> command to obtain the <code>--id</code> .
<code>--name, -n</code>	Defines the database name.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-158

Display information for a database.

```
# odacli describe-database -n odacn
```

```
Database details
```

```
-----
ID: 896238139
```

```
Description: odacn
DB Name: odacn

```

odacli list-databases

Use the `odacli list-databases` command to list all databases on the appliance.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

To display a list of all databases:

```
odacli list-databases [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>-all</code>	(Optional) This option is available only when multi-user access is enabled. Provides a read-only view of all the databases in the system.

Example 15-160 Displaying a List of Databases

Display a list of databases:

```
# odacli list-databases
```

```

ID                               DB Name    DB Version  CDB
-----
ad6c7326-e460-411e-94df-230dedbef743  rdb121a   19.20.0.0.0  true
fb4d02f3-2413-47ca-8584-a768e23ec2e7  ee12db    19.20.0.0.0  false

```

(Continued)

```

Class   Shape  Storage  Status
-----
OLTP    odb1    ACFS     Configured
IMDB    odb1    ASM      Configured

```

odacli modify-database

Use the `odacli modify-database` command to modify the configuration of a database, such as backup configuration, database class, and database type, and to change TDE wallet management from `EXTERNAL` to `ODA`.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli modify-database [-i] [-dn] [-no-sh] [-sh] [-no-ha] [ha] [-lb] [-no-bkp] [-th] [-g] [-cl] [-rd] [-s] [-an] [-ctm] [-bi] [-bin] [-bp] [-id] [-n] [-y] [-cp] [-no-cpupool] [-rkt] [-ctp] [-h] [-j]
```

Parameters

Parameter	Description
--name, -n	Defines the database name to be updated. Specify either --name or --id.
--id, -i	Defines the database ID to be updated. Specify either --name or --id.
--dbRedundancy, -rd	(Optional) Specifies the database redundancy value, that is, {HIGH MIRROR}. To specify the dbRedundancy option for an Oracle ASM or ACFS storage-based database, at least one disk group of FLEX redundancy must exist. To specify the dbRedundancy option for an Oracle ASM storage database, the dbVersion or dbHomeVersion must be 12.2 or later.
--levelzerobackupday, -lb	(Optional) Specifies the Level zero Backup Day. For example, Monday Tuesday Wednesday... Sunday
--backupconfigid, -bi	(Optional) Defines the backup configuration identifier for future use.
--backupconfigname, -bin	(Optional) Specifies the name of the backup configuration.
--bkuppassword, -bp	(Optional) Specifies the RMAN backup encryption password.
--no-backup, -no-bkp	(Optional) Disables database backups. Specify this option to also remove the database backup and archivelog backup schedulers. To enable database backups again, you must update the database with a backupconfig object.
--dbclass, -cl	(Optional) Defines the database class. The default is OLTP. The options are OLTP, DSS, or IMDB.
--dbshape, -s	(Optional) Identifies the database shape (template) and determines the total memory allocated to the database. For example, odb1 and odb2. The default is odb1. You cannot specify the database shape for an instance-only database.
--attachnetworks, -an	(Optional) Specifies the name of the networks to be attached. Specify the networks in the format <i>network_name1, network_name1, network_name1</i> .
--detachnetworks, -dn	(Optional) Specifies the name of the networks to be detached. Specify the networks in the format <i>network_name1, network_name1, network_name1</i> .

Parameter	Description
--dbtype, -y	Defines new database type. The only option is SI. The conversion to single-instance database is available only for Oracle Database Standard Edition.
--disable-seha, -no-sh	Disables Standard Edition High Availability for single-instance Oracle Database 19c and later. Note: This option is deprecated and will be desupported in a future release.
--enable-seha, -sh	Enables Standard Edition High Availability for single-instance Oracle Database 19c and later. Note: This option is deprecated and will be desupported in a future release.
--disable-ha, -no-ha	(Optional) Disables High Availability for single-instance Oracle Database 19c and later.
--enable-ha, -ha	(Optional) Enables High Availability for single-instance Oracle Database 19c and later.
--targethost, -th	(Optional) Specifies the target host name (applicable only for Oracle RAC One Node Database and single-instance Oracle Database, where supported).
--targetnode, -g	(Optional) Specifies the target node number (applicable only for Oracle RAC One Node Database and single-instance Oracle Database, where supported). The values are 0 or 1.
--cpupool, -cp	(Optional) Specifies the CPU pool name. Use this option to associate a CPU pool to a database that does not use any CPU pool or to change the existing association of a CPU pool to a new CPU pool for a database.
--no-cpupool	(Optional) Removes the attached CPU pool.
--change-tde-password, -ctp	(Optional) When specified, you are prompted for the current and new TDE Wallet password.
--change-tdewallet-mgmt, -ctm	(Optional) When specified, the TDE wallet is changed from <code>external</code> to ODA.
--rekey-tde, -rkt	(Optional) When specified, current TDE Wallet password is prompted to rekey the TDE master encryption key.
--help, -h	(Optional) Displays help for using the command.
--json, -j	(Optional) Displays JSON output.

Usage Notes

▲ Caution:

When you change the TDE wallet password for a database with Transparent Data Encryption (TDE) enabled, you are prompted to set a password for the TDE wallet. Provide a strong password for security compliance. Set the password carefully, and ensure that this password is available to you at all times for database management operations. Failure to provide the TDE wallet password when prompted, will cause an error in accessing encrypted data.

Example 15-161 Modifying the Database Shape (Template) and Database Class

```
# odacli modify-database -s database_shape -cl database_class -i dbid
odacli modify-database -i 1941d594-c777-4eca-9fce-18b778d5c153 -s odb2
-cl DSS
{
  "jobId" : "833d43a7-bcc6-48a7-9f98-b42ffdab3fe1",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "May 16, 2023 06:48:58 AM UTC",
  "resourceList" : [ ],
  "description" : "modify-database service with db ids: 1941d594-
c777-4eca-9fce-18b778d5c153",
  "updatedAt" : "May 16, 2023 06:48:58 AM UTC"
}
```

Example 15-162 Converting Oracle RAC or Oracle RAC One Node Database to Single-instance Oracle Database

```
# odacli modify-database -n db18 -y SI
For moving a database between homes please use the command 'move-
database'.
{
  "jobId" : "4b548365-dac5-4557-a6a8-2f65c2b725e7",
  "status" : "Created",
  "message" : "Modify database",
  "reports" : [ ],
  "createTimestamp" : "May 21, 2023 00:32:55 AM UTC",
  "resourceList" : [ {
    "resourceId" : "de2a7959-e31b-4dee-b600-6b16dfb78c34",
    "resourceType" : "DB",
    "resourceNewType" : null,
    "jobId" : "4b548365-dac5-4557-a6a8-2f65c2b725e7",
    "updatedAt" : "May 21, 2023 00:32:55 AM UTC"
  } ],
  "description" : "Modify database : db18",
  "updatedAt" : "May 21, 2023 00:32:55 AM UTC"
}
```

Example 15-163 Specifying the target node when converting database

```
# odacli modify-database -n db18 -y SI -g node_number
# odacli modify-database -n db18 -y SI -th node_name
```

Example 15-164 Changing the TDE Wallet Password

```
# odacli modify-database -n testdb -ctp
Enter current 'TDE wallet' password:
Enter new 'TDE wallet' password:
Confirm 'TDE wallet' password:
```

Example 15-165 Re-keying the TDE Master Encryption Password

```
# odacli modify-database -n testdb -rkt
Enter current 'TDE wallet' password:
```

Example 15-166 Removing a CPU pool

```
# odacli modify-database -n dbcpupin -cp testdbcpupool2
DB will be restarted as part of CPU Pool operation. Do you want to continue
[y/n]:y
For moving a database between homes please use the command 'move-database'.
{
  "jobId" : "c1d05fb3-828a-4644-af9a-9d82b4ef5a89",

  } ],
  "description" : "Modify database : dbcpupin",
  "updatedAt" : "May 09, 2023 16:18:54 PM UTC"
}
```

odacli move-database

Use the command `odacli move-database` to move a database from one Oracle home to another home of the same database version.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli move-database [-i dbid] [-imp] [-nr] [-n dbname] [-dh dest-  
dbhome-id] [-dhn dest-dbhome-name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--id, -i</code>	(Optional) Defines the database ID.
<code>--name, -n</code>	(Optional) Defines the database name.
<code>--non-rolling, -nr</code>	(Optional) Specifies whether you want to move the target database in non-rolling manner. By default, the value is false and the database is moved in a rolling manner.
<code>--ignore-missing-patch, -imp</code>	(Optional) Ignores all missing patches and forces the operation.
<code>--dest-db-home-id, -dh</code>	(Optional) Defines the destination database home ID.
<code>--dest-dbhome-name, -dhn</code>	(Optional) Defines the destination database home name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

Starting with Oracle Database Appliance release 19.19, when you run the `odacli move-database`, the database is moved in a rolling manner, unless you specify the `--non-rolling, -nr` option.

Example 15-167 Moving a Database from one Oracle home to another

```
# ./odacli move-database -i database_ID -dh  
destination_database_home_ID
```

odacli register-database

Use the `odacli register-database` command to register a migrated database with the appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli register-database -c {OLTP|DSS|IMDB} -s dbshape -t dbtype SI|RACOne|
RAC -o hostname -sn servicename [-bi backupconfigid] [-co|-no-co] [-nn] [-
tp] [-ha|-no-ha] [-h] [-j] [-sh|-no-sh]
```

Parameters

Parameter	Description
--backupconfigid, -bi	(Optional) Defines the backup configuration identifier for future use.
--dbclass, -c {OLTP DSS IMDB}	Defines the database class. The database class setting determines the database SGA memory and instance PGA memory configuration. The options are as follows: <ul style="list-style-type: none"> Enterprise Edition: OLTP, DSS, or IMDB. Standard Edition: OLTP
--dbconsole, -co	(Optional) Enables the Database Console. Use the <code>-no-co</code> flag to disable the Database Console. If not selected, the default is no Database Console.
--dbshape, -s	Identifies the database shape (template) and determines the total memory allocated to the database. For example, odb1 and odb2. The default is odb1.
--dbtype, -t [SI RACOne RAC]	Defines the type of database. For high-availability deployments, the values can be RAC RACOne SI, with the default as RAC. For single-node deployments, the value is SI.
--help, -h	(Optional) Displays help for using the command.
--hostname, -o	Defines the host name. Default: local host name
--json, -j	(Optional) Displays JSON output.
--no-dbconsole, -no-co	(Optional) Disables Database Console. Use the <code>-co</code> flag to enable Database Console.
--servicename, -sn	Defines the Database Service Name. Using this service name, the EZCONNECT String is derived for connecting to the database. For example, <code>hostname:port/servicename</code> . The Port number is the port configured for the listener, as part of the deployment.
--associated-networks, -nn	Specifies the associated network names (in the format <code>networkName1,networkName2,...</code>).
--disable-seha, -no-sh	Specifies whether you want to disable Standard Edition High-Availability for Oracle Database Standard Edition 19c and later single-instance databases. Note: This option is deprecated and will be desupported in a future release.

Parameter	Description
<code>--enable-seha, -sh</code>	Specifies whether you want to enable Standard Edition High-Availability for Oracle Database Standard Edition 19c and later single-instance databases. Note: This option is deprecated and will be desupported in a future release.
<code>--disable-ha, -no-ha</code>	(Optional) Disables High Availability for single-instance Oracle Database 19c and later.
<code>--enable-ha, -ha</code>	(Optional) Enables High Availability for single-instance Oracle Database 19c and later.
<code>--tde-wallet-passwd, -tp</code>	Specifies the password for the TDE wallet.

Usage Notes

Note:

It is a good practice to use Easy Connect (EZCONNECT) to test the database connectivity before registering the database. Log in as the `sys` user and enter the following command:

```
sqlplus sys/password@//hostname:1521/service name
```

- The `odacli register-database` command is supported on the primary and the standby database. For the standby database, only the database is registered with Oracle Database Appliance. Oracle Data Guard is not registered with Oracle Database Appliance.
- The migrated database is registered with the listener configured during the provisioning of the appliance. The migrated database must be in read-write or read-only mode for the registration to succeed.
- The `register-database` command validates the `datafile` and log file locations and moves the `controlfile` and `spfile` to the correct locations.
- Some `init.ora` parameters are set, or reset, as part of the registration. Review the parameter changes before and after registration.

The following are examples of changes implemented as part of registration:

- The `memory_target` is reset.
- The `sga_target/pga_aggregate_target/log_buffer/inmemory_size` is configured based on the database class and database shape settings used during registration.
- The registration process sets or resets the recommended appliance-specific parameters. The database is restarted as part of the register database operation.

- The database being registered must use Oracle Managed Files and the file location must match the DATA Location, REDO Location and RECO Location of the `odacli describe-dbstorage` command.
- As part of the registration process, the database is registered with Oracle Clusterware. Only the primary database is registered with Oracle Clusterware.
- TDE-enabled database can also be registered. If TDE is configured using software keystore and the database version is 18c and higher, then TDE wallet management is also supported similar to a TDE database created using the Oracle Database Appliance framework.

Example 15-168 Registering a Migrated Database

The following is the syntax to register a single instance OLTP database that is using shape odb1.

```
odacli register-database -c OLTP -s odb1 -sn crmdb.example.com
Enter new 'SYS user' password:
Confirm 'SYS user' password:
{
  "jobId" : "317b430f-ad5f-42ae-bb07-13f053d266e2",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "August 8, 2023 05:55:49 AM EDT",
  "description" : "Database service registration with db service name:
crmdb.example.com",
  "updatedAt" : "August 8, 2023 05:55:49 AM EDT"
}
rpsandrap: ]# odacli describe-job -i "317b430f-ad5f-42ae-bb07-13f053d266e2"
```

Job details

```
-----
                ID: 317b430f-ad5f-42ae-bb07-13f053d266e2
        Description: Database service registration with db service name:
crmdb.example.com
                Status: Success
                Created: August 8, 2023 5:55:49 AM EDT
                Message:
```

Task Name	Start Time
restore control file	August 8, 2023 5:55:49 AM EDT

```

odacli upgrade-database

You can use the `odacli upgrade-database` command to upgrade a database from a supported release.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To upgrade an Oracle Database:

```
odacli upgrade-database -i Comma separated list of database ids -n
Comma separated list of database names -from source dbhome id -to
destination dbhome id | -fn source dbhome name -tn destination dbhome
name [-ctm] [-j] [-h] [-sh|-no-sh] [-ha|-no-ha]
```

Parameters

Parameter	Description
<code>--ids, -i</code>	(Optional) Defines the Database IDs to upgrade. You can use a comma separated list of database IDs.
<code>--names, -n</code>	(Optional) Defines the names of the databases to upgrade.
<code>--dest-dbhome-id, -to</code>	The DB HOME ID of the destination database home.
<code>--dest-dbhome-name, -tn</code>	The DB HOME name of the destination database home.
<code>--source-dbhome-id, -from</code>	The DB HOME ID of the source database home.
<code>--source-dbhome-name, -fn</code>	The DB HOME name of the source database home.
<code>--change-tdewallet-mgmt, -ctm</code>	(Optional) When specified, the TDE wallet management attribute is changed from External to ODA.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--disable-seha, -no-sh</code>	(Optional) Specifies whether you want to disable Standard Edition High-Availability for Oracle Database Standard Edition 19c and later single-instance databases. Note: This option is deprecated and will be desupported in a future release.
<code>--enable-seha, -sh</code>	(Optional) Specifies whether you want to enable Standard Edition High-Availability for Oracle Database Standard Edition 19c and later single-instance databases. Note: This option is deprecated and will be desupported in a future release.
<code>--disable-ha, -no-ha</code>	(Optional) Disables High Availability for single-instance Oracle Database 19c and later.

Parameter	Description
<code>--enable-ha, -ha</code>	(Optional) Enables High Availability for single-instance Oracle Database 19c and later.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

You cannot upgrade Oracle RAC or Oracle RAC One Node Database to a destination database home of Standard Edition 19c or later. You must first convert Oracle RAC or Oracle RAC One Node Database to single-instance Oracle Database using the `odacli modify-database` command and then upgrade the single-instance Oracle Database to a destination database home of Standard Edition 19c or later.

You have the following options for defining the databases to upgrade:

- When you define a single database ID, only the database of the source database home is upgraded.
- When you define more than one database ID, only those databases of the source database home are upgraded.
- When you do not define a database ID, all of the databases under the source database home are upgraded.

You can upgrade databases of the following releases:

- Oracle Database 12.2 to 19c
- Oracle Database 12.1 to 19c
- Oracle Database 12.1 to 12.2

Example 15-169 Upgrading an Oracle Database

In this example, a single database is upgraded. Use the command `odacli list-databases` to display the database ID, then use the command `odacli upgrade-databases` to upgrade the database. After the upgrade is complete, you can run the command `odacli list-databases` again to verify the upgrade.

```
# odacli list-databases
```

```
ID                               DB Name   DB Version  CDB
-----
fb4d02f3-2413-47ca-8584-a768e23ec2e7 ee12db    12.1.0.2   false
```

```
(Continued)
```

```
Class   Shape   Storage   Status
-----
OLTP    odb1    ACFS      Configured
IMDB    odb1    ASM       Configured
```

```
# odacli upgrade-database -i ad6c7326-e460-411e-94df-230dedbef743 -from fa4321f5-0543-477d-bb54-a429dcc8ee8d -to d752df28-ecdd-4af4-9454-38085ea17f8b
{
  "jobId" : "1bbe8boe-acb0-4296--9c8b-473b69da0c18",

```

odacli DBHome Commands

Use the `odacli DBHome` commands to manage database Home operations.

- [odacli configure-dbhome-storage](#)
Use the `odacli configure-dbhome-storage` command to configure the database home storage.
- [odacli list-dbhome-storages](#)
Use the `odacli list-dbhome-storages` command to view the database home storage resources after the volumes for `ORACLE_HOME` and `ORACLE_BASE` are created.
- [odacli describe-dbhome-storage](#)
Use the `odacli describe-dbhome-storage` command to view information such as how much space is available (at a volume or diskgroup level).
- [odacli modify-dbhome-storage](#)
Use the `odacli modify-dbhome-storage` command to modify database home storage and add additional disk space.
- [odacli create-dbhome](#)
Use the `odacli create-dbhome` command to create an Oracle Database Home.
- [odacli delete-dbhome](#)
Use the `odacli delete-dbhome` command to delete database home that is not associated with a database.
- [odacli describe-dbhome](#)
Use the `odacli describe-dbhome` command to display Oracle Database Home details.
- [odacli list-dbhomes](#)
Use the `odacli list-dbhomes` command to display a list of Oracle Home directories.

odacli configure-dbhome-storage

Use the `odacli configure-dbhome-storage` command to configure the database home storage.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli configure-dbhome-storage -dg disk_group [-s volume_size] [-j] [-h]
```

Parameters

Parameter	Description
<code>--diskgroup, -dg</code>	(Mandatory) Defines the name of the disk group.
<code>--size, -s</code>	(Optional) Defines the size, in gigabytes (GB), of the ORACLE_HOME volume. The default is: 80 GB. The minimum value that can be specified is 25GB and the maximum value is 1024GB.
<code>--json, -j</code>	(Optional) Displays the output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- Valid values for the `--diskgroup` option vary depending on the hardware. For the X5-2, X6-2 and X7-2 HA platforms, you can select between the DATA or RECO diskgroup. For all other platforms such as X8-2, you must select only the DATA diskgroup. With later hardware, you must still run the `odacli configure-dbhome-storage` command.
- When you run the command to create a new database home, it also creates the volumes to hold the database homes. Till the volumes are created, you can run the `odacli configure-dbhome-storage` command to change the diskgroup or the initial size of the volume. Once the volumes for this feature are created, running this command results in an error:

```
# odacli configure-dbhome-storage -dg RECO
DCS-10606:Database homes storage has already been created, no changes are
allowed.
```

Example 15-170 Creating Database Home Storage

```
# odacli configure-dbhome-storage -dg DATA
{
  "jobId" : "553bfef9-0092-4d73-bbd4-43fcb590886f",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "May 11, 2021 06:48:12 AM GMT",
  "resourceList" : [ ],
```

```

    "description" : "Configure database home storage",
    "updatedAt" : "May 11, 2021 06:48:12 AM GMT"
}

```

odacli list-dbhome-storages

Use the `odacli list-dbhome-storages` command to view the database home storage resources after the volumes for `ORACLE_HOME` and `ORACLE_BASE` are created.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-dbhome-storages [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays the output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- Starting with Oracle Database Appliance release 19.20.0.1, Oracle Database homes are no longer created on the local disk. New Oracle Database homes are created on an Oracle ACFS-managed file system. To create an Oracle ACFS file system, ADVM volumes are created.
- The command lists the resource ID, the node on which the volume is created, and the diskgroup on which the volume is created.

Example 15-171 Listing Database Home Storage on a Single-Node System

```

# odacli list-dbhome-storages

=====
=====
ID                               Node Description      Disk
Group Volume      Size (GB)  Status

=====
=====
```

odacli describe-dbhome-storage

Use the `odacli describe-dbhome-storage` command to view information such as how much space is available (at a volume or diskgroup level).

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-dbhome-storage -i db_home_id [-j] [-h]
```

Parameters

Parameter	Description
<code>--ohomeid, -i</code>	(Mandatory) Specifies the Oracle home storage ID. This is the ID listed in the <code>odacli list-dbhome-storages</code> command output.
<code>--json, -j</code>	(Optional) Displays the output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-173 Describing Database Home Storage

```
odacli describe-dbhome-storage -i 67622ce6-0a00-4fec-b948-7a0ba7922311
ORACLE_HOME storage details:

            Free Space: 12.83 TB
=====
    
```

odacli modify-dbhome-storage

Use the `odacli modify-dbhome-storage` command to modify database home storage and add additional disk space.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli modify-dbhome-storage -i db_home_id -s size[-j] [-h]
```

Parameters

Parameter	Description
<code>--ohomeid, -i</code>	(Mandatory) Specifies the Oracle home storage ID. This is the ID listed in the <code>odacli list-dbhome-storages</code> command output.
<code>--size, -s</code>	(Mandatory) Specifies the new size in GB. The minimum value that can be specified is 25GB and the maximum value is 1024GB.
<code>--json, -j</code>	(Optional) Displays the output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-174 Modifying Database Home Storage

```

odacli modify-dbhome-storage -i 9b9c9e0f-db04-4985-be48-3f1e263cd73a -
s 30
{
  "jobId" : "badfad81-cfc1-4c82-a181-69ebdfb11c22",
  "status" : "Created",
  "message" : null,
}
    
```

```

    "reports" : [ ],
    "createTimestamp" : "May 11, 2021 14:04:09 PM CST",
    "resourceList" : [ ],
    "description" : "Modify database home storage",
    "updatedAt" : "May 11, 2021 14:04:09 PM CST"
  }

```

odacli create-dbhome

Use the `odacli create-dbhome` command to create an Oracle Database Home.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

To create an Oracle Database Home:

```
odacli create-dbhome -v version [-j] [-h]
```

Parameters

Parameter	Description
<code>-v <i>version number</i></code>	Defines the database bundle patch number.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

For the version number, you can specify the database version, such as 18.7.0.0, 18.5.0.0, 12.2.0.1, or 12.1.0.2, or you can use a 5 digit format to specify a specific patch bundle version. For example, 19.20.0.0.230720. If you use the database version without specifying the bundle patch number, then the latest bundle patch is used.

Example 15-175 Creating an Oracle Database Home

The following example creates an Oracle Database Home version 19.20.0.0.230720.

```
# odacli create-dbhome -v 19.20.0.0.230720
```

odacli delete-dbhome

Use the `odacli delete-dbhome` command to delete database home that is not associated with a database.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli delete-dbhome -i db_home_ID | -n db_home_name [-h]
```

Parameters

Parameter	Description
--id, -i	Identifies the database home using a database identifier (ID).
--name, -n	Identifies the database home using a database name.
--help, -h	(Optional) Displays help for using the command.

Usage Notes

- Use the `odacli list-dbhomes` command to locate the identifier.
- To delete, or uninstall, a database home (dbhome), there must not be any associated databases in the dbhome.
- Use the `odacli delete-database` command to delete an existing database.

Example 15-176 Deleting an Empty Database Home

```
# odacli delete-dbhome -i 0ce547ca-3df2-4178-a7e6-eefa613aeab4
```

odacli describe-dbhome

Use the `odacli describe-dbhome` command to display Oracle Database Home details.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To display details about Oracle Database Home:

```
odacli describe-dbhome -i dbhomeid -n name [-h] [-j] [-v]
```

Parameters

Parameter	Description
--id, -i	Identifies the database home ID. Use the <code>odacli list-dbhomes</code> command to get the <i>id</i> .
--name, -n	Identifies the database home name. Use the <code>odacli list-dbhomes</code> command to get the database name.
--help, -h	(Optional) Displays help for using the command.

Parameter	Description
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--dbversion, -v</code>	(Optional) Identifies the Database Home Version. Use the <code>odacli list-dbhomes -v</code> command to get the <i>dbversion</i> .

Example 15-177 Displaying Oracle Database Home Details

The following output is an example of using the display Oracle Database Home details command:

```
# odacli describe-dbhome -i b727bf80-c99e-4846-ac1f-28a81a725df6

DB Home details
-----
                        ID: b727bf80-c99e-4846-ac1f-28a81a725df6
                        Name: OraDB19_home1
                        Version: 19.19.0.0.0
Home Location: /u01/app/orauser/product/19/dbhome_1
Created: Jun 2, 2023 10:19:23 AM
```

odacli list-dbhomes

Use the `odacli list-dbhomes` command to display a list of Oracle Home directories.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

To display a list of Oracle Home directories:

```
odacli list-dbhomes [-h] [-j]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>-all</code>	(Optional) This option is available only when multi-user access is enabled. Provides a read-only view of all the database homes in the system.

Example 15-178 Displaying a List of Oracle Home Directories

Run the following command to display a list of Oracle Home directories:

```
# odacli list-dbhomes
```

ID	Name	DB Version
b727bf80-c99e-4846-ac1f-28a81a725df6	OraDB12102_home1	12.1.0.2

(continued)

Home Location

/u01/app/orauser/product/12.1.0.2/dbhome_1

odacli Database Storage Commands

Use the Database Storage commands to list, describe, create, and delete Oracle database storage.

- [odacli create-dbstorage](#)
Use the `odacli create-dbstorage` command to create the file system for database migrations.
- [odacli delete-dbstorage](#)
Use the `odacli delete-dbstorage` command to delete database storage that is not associated with a database.
- [odacli describe-dbstorage](#)
Use the `odacli describe-dbstorage` command to display storage configuration details.
- [odacli describe-dgstorage](#)
Use the `odacli describe-dgstorages` command to display the disk group information.
- [odacli list-dbstorages](#)
Use the `odacli list-dbstorages` command to display a list of all of the database storage configured in the appliance.
- [odacli list-dgstorages](#)
Use the `odacli list-dgstorages` command to display the disk group information.
- [odacli modify-dbstorage](#)
Use the `odacli modify-dbstorage` command to resize the database storage.
- [odacli modify-dgstorage](#)
Use the `odacli modify-dgstorage` command to release disks.
- [odacli update-dgstorage](#)
Use the `odacli update-dgstorage` command to release disks.

odacli create-dbstorage

Use the `odacli create-dbstorage` command to create the file system for database migrations.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli create-dbstorage -n dbname -s dataSize -u databaseUniqueName -r [ASM|ACFS] -rd [high|mirror] [-h]
```

Parameters

Parameter	Description
<code>--dbname, -n</code>	Defines the name of the database.
<code>--dataSize, -s</code>	(Optional) Defines the size, in gigabytes (GB), of the filesystem for storing database files and temp files. The default is: 100 GB. The minimum size is 10 GB. When entering the size, do not include GB. For example, for 50 GB, use 50.
<code>--databaseUniqueName, -u</code>	(Optional) Defines a unique name for the database. Specify only if the database unique name is different than the database name. The command creates the following mount point: <code>/u02/app/oracle/oradata/db <i>unique name</i></code>
<code>--dbstorage, -r [ASM ACFS]</code>	(Optional) Defines the type of database storage, either ASM or ACFS. When you select ASM, the command only creates the supporting directory structure for storing non-database files. The default is ASM.
<code>--db-redundancy, -rd</code>	(Optional) Defines the database redundancy. The values can be high or mirror. The database redundancy is not applicable to database storages of Oracle ASM type, or database storages on normal or high redundancy disk groups. For database storages of Oracle ACFS type, specifying this option creates volumes of the specified redundancy on Oracle ASM disk groups of flex redundancy.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- The `odacli create-dbstorage` command registers the storage metadata with the Appliance Manager.
- Oracle Database is supported on both Oracle Automatic Storage Management (Oracle ASM) and Oracle ASM Cluster file system (ACFS). The default is Oracle ASM.

- When you create ACFS database storage, the command creates a separate ACFS file system and creates the directory structure for other database files, such as archives and online logs.
- When you create ASM database storage, the command only creates the corresponding directories for non-database files.

Example 15-179 Creating Database Storage

The following statement creates 50 GB ACFS database storage for the APPSDB database.

```
# odacli create-dbstorage -n APPSDB -s 50 -r ACFS
{
  "jobId" : "fc6bf8fd-60c2-44f3-b8b7-efd0e9a2149f",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "August 09, 2016 06:19:35 AM WSST",
  "description" : "Database storage service creation with db name:
APPSDB",
  "updatedAt" : "August 09, 2016 06:19:35 AM WSST"
}
```

odacli delete-dbstorage

Use the `odacli delete-dbstorage` command to delete database storage that is not associated with a database.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli delete-dbstorage -i ID -n name [-h] [-j]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Identifies the database storage using a database identifier (ID).
<code>--name, -n</code>	Specifies the database storage name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- You can only use the `delete-dbstorage` when the storage is not associated with any databases.
- Use the `delete-database` command to delete an existing database.

- Use the `list-dbstorages` command to locate the identifier.

Example 15-180 Deleting Empty Database Storage

```
# odacli delete-dbstorage -i 9fe39332-cc1a-4b4b-8393-165524a6ef6b
```

odacli describe-dbstorage

Use the `odacli describe-dbstorage` command to display storage configuration details.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-dbstorage -i ID -n name [-j] [-h]
```

Parameters

Parameter	Description
<code>--id, -i</code>	Specifies the database storage ID.
<code>--name, -n</code>	Specifies the database storage name.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- Use the `odacli list-dbstorages` command to get the database storage identifier (ID).
- The DATA Location corresponds to the `init.ora` parameter `db_create_file_dest`.
- RECO Location corresponds to the `init.ora` parameter `db_recovery_file_dest`
- REDO Location corresponds to the `init.ora` parameter `db_create_online_log_dest_1`

Example 15-181 Displaying Database Oracle ACFS Storage Details

The following example displays Oracle ASM Cluster file system (ACFS) storage details:

```
# odacli describe-dbstorage -i 9fe39332-cc1a-4b4b-8393-165524a6ef6b
```

```
DBStorage details
```

```
-----
ID: 9fe39332-cc1a-4b4b-8393-165524a6ef6b
DB Name: rdb121a
DBUnique Name: rdb121a
DB Resource ID: ad6c7326-e460-411e-94df-230dedbef743
Storage Type: Acfs
DATA Location: /u02/app/oracle/oradata/rdb121a
RECO Location: /u03/app/oracle/fast_recovery_area/
```

```
REDO Location: /u03/app/oracle/redo/
State: ResourceState(status=Configured)
Created: July 22, 2016 12:07:12 PM SGT

UpdatedTime: July 22, 2016 1:13:52 PM SGT
```

odacli describe-dgstorage

Use the `odacli describe-dgstorages` command to display the disk group information.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-dgstorage -d diskgroup -h
```

Parameters

Parameter	Description
<code>--diskgroup, -d</code>	Specifies the disk group for which information is displayed.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

This command displays the storage information for all the databases backed by a disk group, for each disk group present in the system.

Example 15-183 Displaying Disk Group Storage

```
# odacli list-dgstorages -r redundancy
Diskgroup storage details

-----
-----

Diskgroup: DATA

          Redundancy: extern|normal|high|flex

          Physical Free Space: wGB

          Physical Total Space: xGB

          Database Unique Name: rdbx

          Location: /u02/app/test/test1/rdbx

          Used Space: dGB (acfsutil.total -
acfsutil.freespace)

          Free Space: dGB (acfsutil.freespace)

          Database Unique Name: rdby

          Location: +DATA/rdby

          Used Space: zGB (v$asm_file.bytes)

          Free Space: xGB (PhyFree/redundancy)

          Physical Space:

Physical Reserved : uGB(Lookup
Table)

```

odacli list-dbstorages

Use the `odacli list-dbstorages` command to display a list of all of the database storage configured in the appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli list-dbstorages [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Usage Notes

This command displays a list of all of the filesystems that are configured with the `create-database` command and the `create-dbstorage` command.

Example 15-184 Displaying a List of all Database Storage

```
# odacli list-dbstorages
```

ID Type	DBUnique	Name	Status
9fe39332-cc1a-4b4b-8393-165524a6ef6b	Acfs	rdb121a	Configured
4f2a1b59-ca66-4d80-951c-425ab7b0acae	Asm	ee12db	Configured
0266edac-c729-4539-861f-3f3d543be9e4	Acfs	db12SE	Configured

odacli list-dgstorages

Use the `odacli list-dgstorages` command to display the disk group information.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-dgstorages -r redundancy -h
```

Parameters

Parameter	Description
<code>--redundancy, -r</code>	Specifies the disk group redundancy for FLEX disk group.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- The command displays the storage-related information for all the disk groups present in the system.
- The redundancy option is valid only for FLEX disk groups. For all disk groups that are not FLEX, logical free space is calculated using the redundancy obtained from `v$asm_diskgroup` rather than the CLI option.
- Redundancy option can take the values MIRROR | HIGH. Use one of these options to specify the database redundancy for FLEX disk groups.
- In the example below, Physical Total Space is the total space in the disk group. (`V$ASM_DISKGROUP.total_mb`) Physical Reserved Space is the reserved space required to handle disk failures. Physical Free Space is the free space in the disk group. (`V$ASM_DISKGROUP.free_mb`) Logical Free Space is the logical free space in the diskgroup. (`V$ASM_DISKGROUP.free_mb / redundancy`)

This command displays the storage information for all the databases backed by a disk group, for each disk group present in the system.

Example 15-185 Displaying Disk Group Storage

```
# odacli list-dgstorages -r redundancy
Diskgroup Redundancy Physical Total Space Physical Reserved Space
Physical Free Space Logical Free
Space

-----
-----
DATA          FLEX          xGB
yGB
          zGB          uGB

REDO          HIGH          xGB
yGB
          zGB          uGB

RECO          NORMAL        xGB
yGB
          zGB          uGB
```

odacli modify-dbstorage

Use the `odacli modify-dbstorage` command to resize the database storage.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli modify-dbstorage [-ds] [-in] [-fs] [-rcs] [-rds] [-h] [-j]
```

Parameters

Parameter	Description
<code>--datasize, -ds</code>	(Optional) Specifies the extendable size in GB for the DATA volume. Specify at least one size from FLASH, RECO, REDO, or DATA volumes.
<code>--dbname, -in</code>	Defines the database name on which you want to extend the volumes.
<code>--flashsize, -fs</code>	(Optional) Specifies the extendable size in GB for the FLASH volume.
<code>--recoresize, -rcs</code>	(Optional) Specifies the extendable size in GB for the RECO volume.
<code>--redosize, -rds</code>	(Optional) Specifies the extendable size in GB for the REDO volume.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- The command can resize DATA, RECO, REDO, and FLASH volumes.
- Database name is a mandatory parameter. All other parameters are optional, however, one of the volume sizes must be specified. If you only provide the DATA size, then the DCS agent calculates the recommended RECO size for the given DATA size is internally calculated. The storage is then extended with the recommended values.
- The mounted Oracle ACFS and its underlying Oracle ADVM storage is resized to match the new size specified.
- To check the result of the resize operation, use the `odacli list-dbstorages` command.
- After database resize operation is completed, use the `odacli describe-dbstorage` command to display storage configuration details.

Example 15-186 Modifying the Database Storage

```
# odacli modify-dbstorage -ds 10 -rcs 15 -n amdb1
{
  "jobId" : "e6d54155-ed4c-4fd6-a3f6-454120fa5c18",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "June 03, 2019 06:06:42 AM UTC",
  "resourceList" : [ ],
  "description" : "Database storage modify operation",
  "updatedAtTime" : "June 03, 2019 06:06:42 AM UTC"
}
```

odacli modify-dgstorage

Use the `odacli modify-dgstorage` command to release disks.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To release disks:

```
odacli modify-dgstorage [-f] [-rd list] [-j] [-h]
```

Parameters

Parameter	Description
<code>--force, -f</code>	(Optional) Forces release of specified disks. When this option is specified, the check to verify that all disk groups are mounted on the current node is skipped.

Parameter	Description
<code>--release-disk, -rd</code>	Specifies the disks to release. Generally, this specifies a single storage device with partitions on different disk groups. You can also specify a comma-separated list of disks to release.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- Run the `odacli list-dgdisks` to view details of the disk, before running the `odacli update-dgstorage` command.
- The `odacli modify-dgstorage` command runs a precheck to ensure all disk groups are mounted on the node. You can use the `-f` option to override the precheck.

Example 15-187 Releasing a physical disk `HDD_E0_S10_577135552` which has two logical partitions on two different disk groups

```
# odacli modify-dgstorage -rd HDD_E0_S10_577135552
```

```
Job details
```

```
-----
ID: 46bc736c-417b-4ac2-826e-aa857db50e29
Description: Release disks: [HDD_E0_S10_577135552]
Status: Running
Created: August 8, 2023 6:24:27 PM PDT
Message: Release ASM disks
```

Verifying the result of the Release Disks operation:

```
# odacli describe-job -i 46bc736c-417b-4ac2-826e-aa857db50e29
```

```
Job details
```

```
-----
ID: 46bc736c-417b-4ac2-826e-aa857db50e29
Description: Release disks: [HDD_E0_S10_577135552]
Status: Success
Created: August 8, 2023 6:24:27 PM PDT
Message: Release ASM disks
```

odacli update-dgstorage

Use the `odacli update-dgstorage` command to release disks.

Note:

This command is deprecated in Oracle Database Appliance release 19.20 and will be desupported in a future release.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To release disks:

```
odacli update-dgstorage [-h] [-f] [-rd] [-j]
```

Parameters

Parameter	Description
--json, -j	(Optional) Displays JSON output.
--help, -h	(Optional) Displays help for using the command.
--force, -f	(Optional) Forces release of specified disks. When this option is specified, the check to verify that all disk groups are mounted on the current node is skipped.
--release-disk, -rd	Specifies the disks to release. Generally, this specifies a single storage device with partitions on different disk groups. You can also specify a comma-separated list of disks to release.

Usage Notes

- Run the `odacli list-dgdisks` to view details of the disk, before running the `odacli update-dgstorage` command.
- The `odacli update-dgstorage` command runs a precheck to ensure all disk groups are mounted on the node. You can use the `-f` option to override the precheck.

Example 15-188 Releasing a physical disk HDD_E0_S10_577135552 which has two logical partitions on two different disk groups

```
# odacli update-dgstorage -rd HDD_E0_S10_577135552
```

```
Job details
```

```
-----
ID: 46bc736c-417b-4ac2-826e-aa857db50e29
Description: Release disks: [HDD_E0_S10_577135552]
Status: Running
Created: July 7, 2023 6:24:27 PM PDT
Message: Release ASM disks
```

Verifying the result of the Release Disks operation:

```
# odacli describe-job -i 46bc736c-417b-4ac2-826e-aa857db50e29
```

```
Job details
```

```
-----
ID: 46bc736c-417b-4ac2-826e-aa857db50e29
Description: Release disks: [HDD_E0_S10_577135552]
Status: Success
```

Created: July 7, 2023 6:24:27 PM PDT
Message: Release ASM disks

odacli Job Commands

Use the `odacli list-jobs` and `odacli describe-job` commands to display job details.

- [odacli create-jobdata-retention-policy](#)
Use the `odacli create-jobdata-retention-policy` command to create job data retention policy for default DCS jobs and specific auto scheduled jobs.
- [odacli create-purge-jobdata-job](#)

odacli create-jobdata-retention-policy

Use the `odacli create-jobdata-retention-policy` command to create job data retention policy for default DCS jobs and specific auto scheduled jobs.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To create job data retention policy:

```
odacli create-jobdata-retention-policy [-j] [-h] [-w] [-s]
```

Parameters

Parameter	Description
--json, -j	(Optional) Displays JSON output.
--help, -h	(Optional) Displays help for using the command.
--retentionWindow, -w	(Optional) Describes the time interval to retain the job data. Default is 30 days if not specified.
--retentionWindowUnit, -u	(Optional) Describes the unit for the retentionWindow. Possible values are Day Hour Minute. Default is Day if no value is specified.
--scheduleIds, -s	(Optional) Specifies the IDs, delimited by commas, of the scheduled jobs similar to the odacli list-schedules result. Use Default for all DCS jobs.

Usage Notes

- Once a policy is created, an auto scheduled job is created to start purging DCS job records regularly, for example, every day at 4 AM, based on the retention policies you define.

Example 15-189 Creating a default policy to purge all the jobs and scheduled executions older than 30 days

```
# odacli create-jobdata-retention-policy

odacli create-purge-jobdata-job

Use the `odacli create-purge-jobdata-job` command to create a job to delete data for default DCS jobs and specific auto scheduled jobs.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To create job data purge:

```
odacli create-purge-jobdata-job [-j] [-h] [-i] [-o] [-u] [-s]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Parameter	Description
--jobIds, -i	(Optional) Purges data for given DCS job IDs, delimited by commas.
--olderThan, -o	(Optional) Purges job data older than the specified time. If not specified, use the existing <code>retentionWindow</code> value.
--olderThanUnit, -u	(Optional) Describes the unit for the <code>OlderThan</code> option. Possible values are <code>Day Hour Minute</code> . If not specified, use the existing <code>retentionWindow</code> value.
--scheduleIds, -s	(Optional) Specifies the IDs, delimited by commas, of the scheduled jobs similar to the <code>odacli list-schedules</code> result.

Example 15-191 Creating a job to purge job data

```
# odacli create-purge-jobdata-job

odacli delete-jobdata-retention-policy

Use the `odacli delete-jobdata-retention-policy` command to delete job data retention for default DCS jobs and specific auto scheduled jobs.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To delete job data retention:

```
odacli delete-jobdata-retention-policy [-j] [-h][-s]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--scheduleIds, -s</code>	(Optional) Specifies the IDs applied by the job data retention policy. If not supplied, delete all the existing policies.

Example 15-195 Deleting the job data retention policies

```
# odacli delete-jobdata-retention-policy

Job details
-----
ID: ab819d57-9e35-4f55-bd5e-d26fc6372448

remove auto job data schedule                 April 23, 2020 7:34:05 PM
PDT      April 23, 2020 7:34:05 PM PDT      Success
```

```
[root@oda1]# odacli list-jobdata-retention-policy
```

```
DCS-10032:Resource JobDataRetentionPolicy is not found.
```

odacli describe-job

Use the `odacli describe-job` command to display details about a specific job, including the job ID, status, tasks, and the job created date and time stamp.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To view a specific job, status, and tasks:

```
odacli describe-job -i id [-e] [-n parent_task] [-sd sorted_by_duration]
[-s status] [-j] [-h]
```

Parameters

Parameter	Description
<code>--id, -i</code>	(Mandatory) Identifies the job. To get the job identifier (jobid), run the <code>list-jobs</code> command.
<code>--ecr, -e</code>	(Optional) Specifies to display the error correlation report.
<code>--number, -n</code>	(Optional) Specifies the number of parent tasks.
<code>--sort-duration, -sd</code>	(Optional) Sorts tasks by duration, either ascending (<code>asc</code>) or descending (<code>desc</code>).
<code>--status, -s</code>	(Optional) Specifies the status of the task, such as <code>running</code> , <code>failure</code> , <code>success</code> .
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-196 Displaying Details for a Job

To display details of a specific job with job ID `02df22c8-c21f-4162-8265-97f7826c243a`:

```
# odacli describe-job -i 02df22c8-c21f-4162-8265-97f7826c243a
```

Example 15-197 Viewing Error Correlation Report

To view error correlation report using ODACLI command:

```
# odacli describe-job -i cb6faa85-d2b4-441a-864a-17a8532cf78d --ecr
ODA Assistant - Error Correlation report

odacli list-jobs

Use the `odacli list-jobs` command to display a list of jobs, including the job IDs, status, and the job created date and time stamp. The default number of jobs listed is 50 from the earliest to the latest.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To list jobs and view job details and status:

```
odacli list-jobs [-all] [-ec] [-j] [-h] [-o] [-f] [-t] [-hd] [-tl] [-k] [-s] [-l]
```

Parameters

Parameter	Description
<code>--all-jobs, -all</code>	(Optional) Displays jobs created by both DCS and error correlation framework.

Parameter	Description
<code>--ec-jobs, -ec</code>	(Optional) Displays jobs created by the error correlation framework.
<code>--for, -o</code>	(Optional) Describes a job created on a specific date. In the format YYYY-MM-DD, such as 2018-01-01. Example: <pre># odacli list-jobs -o 2018-08-09</pre>
<code>--from, -f</code>	(Optional) Describes a job created since a specific date. In the format YYYY-MM-DD or YYYY-MM-DD HH:mm:ss, such as 2018-01-01 or 2018-01-01 01:00:00. Examples: <pre># odacli list-jobs -f 2018-08-27 # odacli list-jobs -f "2018-08-27 03:00:00"</pre>
<code>--head, -hd</code>	(Optional) Describes the maximum number of older jobs to be displayed, values can be 1 to 200. Example: <pre>odacli list-jobs -hd 10</pre>
<code>--to, -t</code>	(Optional) Describes a job created ahead of a specific date. In the format YYYY-MM-DD or YYYY-MM-DD HH:mm:ss, such as 2018-01-01 or 2018-01-01 01:00:00. Example: <pre># odacli list-jobs -t 2018-08-07</pre>
<code>--last, -l</code>	(Optional) Describes jobs created from last 'n' time unit - where n can be any integer and time unit can be d for days, h for hours or m for minutes.
<code>--tail, -tl</code>	(Optional) Describes the maximum number of latest jobs to be displayed, values can be 1 to 200. Example: <pre># odacli list-jobs -tl 10</pre>

Parameter	Description
<code>--keyword, -k</code>	(Optional) Specifies the keyword that the job description contains. Example: # odacli list-jobs -k OraDB
<code>--status, -s</code>	(Optional) Specifies the status of the job, such as Created, Scheduled, Running, Failure, Success, InternalError, Waiting. Example: # odacli list-jobs -s Success
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-198 Displaying a List of Jobs

To display a list of jobs:

```
# odacli list-jobs
```

```
ID                               Description                       Created
-----

```

odacli list-pendingjobs

Use the `odacli list-pendingjobs` command to list all pending jobs.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-pendingjobs [-j] [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Example 15-201

```
# odacli list-pendingjobs
```

odacli list-jobdata-retention-policy

Use the `odacli list-jobdata-retention-policy` command to list job data retention policy for default DCS jobs and specific auto scheduled jobs.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To list jobs and view job details and status:

```
odacli list-jobdata-retention-policy [-j] [-h]
```

Parameters

Parameter	Description
--json, -j	(Optional) Displays JSON output.
--help, -h	(Optional) Displays help for using the command.

Example 15-202 Listing all job retention policies

```
# odacli list-jobdata-retention-policy

Schedule Id Retention Window Unit Modified
-----
-----
Default      30 Days      April 23, 2020 6:16:59 PM PDT
284a22b5-41e6-4be1-a916-048eac74e076  10 Days      April 23, 2020
6:22:14 PM PDT
```

odacli list-purge-jobdata-jobs

Use the `odacli list-purge-jobdata-jobs` command to list purge job data for default DCS jobs and specific auto scheduled jobs.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To list job data purge policy:

```
odacli list-purge-jobdata-jobs [-j] [-h]
```

Parameters

Parameter	Description
--json, -j	(Optional) Displays JSON output.
--help, -h	(Optional) Displays help for using the command.

Usage Notes

The command describes the files that are purged, the purged count, the purged file size, and the time of purge.

Example 15-203 Listing history, statistics, and rules for job data purge jobs

```
# odacli list-purge-jobdata-jobs
```

```
Purge By Job                               Purged Object

```

odacli list-scheduled-executions

Use the command `odacli list-scheduled-executions` to display a list of jobs that were executed.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-scheduled-executions [-e] [-l] [-j] [-h]
```

Parameters

Parameter	Description
<code>--executionid, -e</code>	(Optional) Displays the execution ID.
<code>--scheduleid, -i</code>	(Optional) Displays the Schedule ID.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Example 15-204 Displaying a List of Scheduled and Executed Jobs

Display a list of scheduled tasks, the status, and the date and time that the task was executed. In the following example, three (3) scheduled tasks were executed. One task, Schedule ID 04b5750c-0d13-42cf-aba3-85416e8edafb, was executed twice.

```
# odacli list-scheduled-executions

ID                               ScheduledId
JobId
-----
9890508c-ff6d-4307-972f-7962ec390871  04b5750c-0d13-42cf-

Adaptive Classification and Redaction (ACR) Commands

Understand Adaptive Classification and Redaction (ACR) commands.

- [odacli describe-acr](#)
Use the `odacli describe-acr` command to check the status of ACR.
- [odacli enable-acr](#)
Use the `odacli enable-acr` command to enable ACR across all nodes, causing redaction of files during Oracle Trace File Analyzer diagnostic collections to occur.
- [odacli redact-acr](#)
Use the `odacli redact-acr` command to enable ACR across all nodes, causing redaction of files during Oracle Trace File Analyzer diagnostic collections to occur.
- [odacli list-acr](#)
Use the `odacli list-acr` command to print reverse map of sanitized entities.

- [odacli disable-acr](#)
Use the `odacli disable-acr` command to disable ACR across all nodes. Redaction of files during Oracle Trace File Analyzer diagnostic collections, then, does not occur.

odacli describe-acr

Use the `odacli describe-acr` command to check the status of ACR.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli describe-acr [-j] [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Example 15-205

```
# odacli describe-acr
```

odacli enable-acr

Use the `odacli enable-acr` command to enable ACR across all nodes, causing redaction of files during Oracle Trace File Analyzer diagnostic collections to occur.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli enable-acr [-j] [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Example 15-206

```
# odacli enable-acr
```

odacli redact-acr

Use the `odacli redact-acr` command to enable ACR across all nodes, causing redaction of files during Oracle Trace File Analyzer diagnostic collections to occur.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli redact-acr -i path_name -m mode [-j] [-h]
```

Parameters

Parameter	Description
<code>--inpath, -i</code>	(Required) Specifies the path of input file to be redacted.
<code>--mode, -m</code>	(Required) Specifies the redaction mode. The values can be <code>mask</code> or <code>sanitize</code> .
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Example 15-207

```
# odacli redact-acr -i path_name -m sanitize
```

odacli list-acr

Use the `odacli list-acr` command to print reverse map of sanitized entities.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-acr -l list [-j] [-h]
```

Parameters

Parameter	Description
<code>--list, -l</code>	(Required) Specifies the list of sanitized entities.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Example 15-208

```
# odacli list-acr -l list
```

odacli disable-acr

Use the `odacli disable-acr` command to disable ACR across all nodes. Redaction of files during Oracle Trace File Analyzer diagnostic collections, then, does not occur.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli disable-acr [-j] [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Example 15-209

```
# odacli disable-acr
```

Log Commands

Use the `odacli log` commands to specify the options to collect and delete logs.

- [odaadmcli manage diagcollect](#)
Use the `odaadmcli manage diagcollect` command to collect diagnostic logs for Oracle Database Appliance components.
- [odacli create-auto-logclean-policy](#)
Use the `odacli create-auto-logclean-policy` command to create a policy for a job to automatically purge log files for a specified time period when certain criteria are met.
- [odacli delete-auto-logclean-policy](#)
Use the `odacli delete-auto-logclean-policy` command to delete a policy for a job to automatically purge log files for a specified time period when certain criteria are met.
- [odacli create-logcleanjob](#)
Use the `odacli create-logcleanjob` command to create a job to purge log files for a specified time period.
- [odacli describe-logcleanjob](#)
Use the `odacli describe-logcleanjob` command to describe a log cleanup job.

- [odacli list-auto-logclean-policy](#)
Use the `odacli list-auto-logclean-policy` command to list the jobs to purge log files.
- [odacli list-logcleanjobs](#)
Use the `odacli list-logcleanjobs` command to list the jobs to purge log files.
- [odacli list-logspaceusage](#)
Use the `odacli list-logspaceusage` command to display the log file usage.

odaadmcli manage diagcollect

Use the `odaadmcli manage diagcollect` command to collect diagnostic logs for Oracle Database Appliance components.

File Path

`/opt/oracle/oak/bin/odaadmcli`

Syntax

To collect diagnostic logs for components:

```
odaadmcli manage diagcollect [-h] [--dataMask] [--dataSanitize] [--fromTime] [--toTime] [--Components]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--dataMask</code>	(Optional) Masks sensitive data. The default is No.
<code>--dataSanitize</code>	(Optional) Sanitizes (redacts) sensitive data. The default is No.
<code>--fromTime</code>	(Optional) Specifies the time from when you want to collect data. The timestamp formats can be of the type: <code>mon/dd/yyyy hh:mm:ss</code> , or <code>yyyy-mm-dd hh:mm:ss</code> , or <code>yyyy-mm-ddThh:mm:ss</code> , or <code>yyyy-mm-dd</code> .
<code>--toTime</code>	(Optional) Specifies the time till when you want to collect data. The timestamp formats can be of the type: <code>mon/dd/yyyy hh:mm:ss</code> , or <code>yyyy-mm-dd hh:mm:ss</code> , or <code>yyyy-mm-ddThh:mm:ss</code> , or <code>yyyy-mm-dd</code> .

Parameter	Description
<code>--Components</code>	(Optional) Specifies the comma-separated list of components for which you want to collect data. The supported values are: <code>all, ips, oda, odalite, dcs, odabackup, odapatching, odadataguard, odaprovisioning, odaconfig, odasystem, odastorage, database, asm, crsclient, dbclient, dbwlm, tns, rhp, procinfo, afd, crs, cha, wls, emagent, oms, ocm, emplugins, em, acfs, install, cfgtools, os, ashhtml, ashtext, awrhtml, awrtext</code>
<code>--verbose</code>	Displays detailed message.

Usage Notes

The following types of sensitive information can be redacted using the `--dataMask` or the `--dataSanitize` option:

- Host names
- IP addresses
- Database names
- Tablespace names
- Service names
- Ports
- Operating System user names

For example, when the `--dataMask` option is used, all instances of a sensitive name such as a database name called "payrolldb" are replaced with "*****" in the TFA collection.

For example, when the `--dataSanitize` option is used, all instances of a sensitive name such as a database name called "payrolldb" are replaced with another string, such as "oCjIN7F8P", in the TFA collection.

Example 15-210 Masking Sensitive Data in Log Collection

```
# /opt/oracle/oak/bin/odaadmcli manage diagcollect --dataMask
DataMask is set as true
TFACTL command is: /opt/oracle/tfa/tfa_home/bin/tfactl
Data mask is set.
Collect data within last 12 hours as default
Please wait for several minutes for the collection to complete.
```

odacli create-auto-logclean-policy

Use the `odacli create-auto-logclean-policy` command to create a policy for a job to automatically purge log files for a specified time period when certain criteria are met.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli create-auto-logclean-policy [-h] [-c] [-o] [-u] [-uMB] [-f]
[-uPer]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--components, -c</code>	(Optional) Specifies the list of components, separated by comma. The values are <code>gi database dcs</code> . For example, <code>gi dcs</code> .
<code>--olderthan, -o</code>	(Optional) Cleans logs older than specified time interval. Default is 30 if it is not specified.
<code>--olderThanUnit, -u</code>	(Optional) Unit for the <code>--olderthan</code> parameter. Default is <code>Day</code> if it is not specified.
<code>--freeSpaceBelowPercentage, -f</code>	Starts purge when free disk space is below the specified number of percentage of the total partition size. Valid range is 20-50. Default is 20.
<code>--usageOverMB, -uMB</code>	Starts purge when log usage is over the specified number of MB. Valid range is 10%-50% of partition size.
<code>--usageOverPercentage, -uPer</code>	Starts purge when log usage is over the specified number of percentage of total partition space. Valid range is 10-50.

Example 15-211 Creating Automatic Jobs to Purge Logs

To create a policy for automatic jobs to purge logs:

```
# odacli create-auto-logclean-policy -c 'dcs' -o 30 -uPer 30
Component UsageOverPercentage freeSpaceBelowPercentage UsageOverMB
OlderThan OlderThanUnit
```

```
-----
-----
dcs          30          20
0           30          Day
```

odacli delete-auto-logclean-policy

Use the `odacli delete-auto-logclean-policy` command to delete a policy for a job to automatically purge log files for a specified time period when certain criteria are met.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli odacli delete-auto-logclean-policy [-c] [-h] [-j]
```

Parameters

Parameter	Description
<code>--components, -c</code>	(Optional) Specifies the list of components, separated by comma. The values are <code>gi database dcs</code> . For example, <code>gi dcs</code> .
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is <code>false</code> .

odacli create-logcleanjob

Use the `odacli create-logcleanjob` command to create a job to purge log files for a specified time period.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

To list jobs and view job details and status:

```
odacli create-logcleanjob [-h] [-c] [-o] [-u]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--components, -c</code>	(Optional) Specifies the list of components, separated by comma. The values are <code>gi database dcs</code> . For example, <code>gi, dcs</code> .
<code>--olderthan, -o</code>	(Optional) Cleans logs older than specified time interval. Default is 30 if it is not specified.
<code>--unit, -u</code>	(Optional) Unit for the <code>--olderthan</code> parameter. Default is <code>Day</code> if it is not specified.

Example 15-212 Creating Jobs to Purge Logs

To create jobs to purge logs:

```
# odacli create-logcleanjob
Job details
```

```
-----
ID: e03d90b5-41dd-45e0-8b7a-1480d6d7f86f
Description: log file cleanup
Status: Created
Created: July 25, 2018 8:06:56 PM UTC
Message:
```

```
Task Name Start Time End Time Status
```

```
-----
# ./odacli describe-job -i e03d90b5-41dd-45e0-8b7a-1480d6d7f86f
```

```
Job details
```

```
-----
ID: e03d90b5-41dd-45e0-8b7a-1480d6d7f86f
Description: log file cleanup
Status: Success
Created: July 25, 2018 8:06:56 PM UTC
Message:
```

```
Task Name Start Time End Time Status
```

```
-----
Clean TFA logs July 25, 2018 8:06:56 PM UTC July 25, 2018 8:06:59
PM UTC Success
```

```
Clean DCS logs July 25, 2018 8:06:56 PM UTC July 25, 2018 8:06:56
PM UTC Success
```

odacli describe-logcleanjob

Use the `odacli describe-logcleanjob` command to describe a log cleanup job.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

To list jobs and view job details and status:

```
odacli describe-logcleanjob -i [-h] [-j]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--id, -i</code>	Displays the summary of the log cleanup with the specified job ID.

Example 15-213 Displaying Log Cleanup Jobs

To display log cleanup jobs:

```
# odacli describe-logcleanjob -i e03d90b5-41dd-45e0-8b7a-1480d6d7f86f

odacli list-auto-logclean-policy

Use the `odacli list-auto-logclean-policy` command to list the jobs to purge log files.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

To list jobs and view job details and status:

```
odacli list-auto-logclean-policy [-h] [-c]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.
--components, -c	(Optional) Specifies the list of components, separated by comma. The values are <code>gi database dcs</code> . For example, <code>gi,dcs</code> .

Example 15-214 Listing Jobs to Purge Logs

To list jobs to purge logs:

```
# odacli list-auto-logclean-policy
Component UsageOverPercentage freeSpaceBelowPercentage UsageOverMB
OlderThan OlderThanUnit
--- -----
-----
gi          40          20
0          60          Day
database    40          20
0          60          Day
dcs         30          20
0          30          Day
```

odacli list-logcleanjobs

Use the `odacli list-logcleanjobs` command to list the jobs to purge log files.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

To list jobs and view job details and status:

```
odacli list-logcleanjobs [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Example 15-215 Listing Jobs to Purge Logs

To list jobs to purge logs:

```
# odacli list-logcleanjobs
JobId   Files Deleted   Size Freed   Component   Top Path   TimeStamp
-----
-----a8ef8315-02e8-4979-ab1f-30251818c6eb

July 25, 2018 8:06:56 PM UTC
-----
```

odacli list-logspaceusage

Use the `odacli list-logspaceusage` command to display the log file usage.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To list jobs and view job details and status:

```
odacli list-logspaceusage [-c] [-h]
```

Parameters

Parameter	Description
--components, -c	Describes the list of components delimited by comma. The values can be <code>gi database dcs</code> . For example, <code>gi,dcs</code> .
--help, -h	(Optional) Displays help for using the command.

Example 15-216 Displaying a List of Logs

To display log file space usage for a list of components:

```
root@node1 ~]# odacli list-logspaceusage

                        Timestamp: January 13, 2022 8:38:32 AM UTC

odacli Oracle Auto Service Request Commands

Use the Oracle Auto Service Request (Oracle ASR) commands to configure, update, test, and delete Oracle ASR on the system.

- [odacli configure-asr](#)
- [odacli delete-asr](#)
- [odacli describe-asr](#)
- [odacli test-asr](#)
- [odacli modify-asr](#)
- [odacli update-asr](#)

odacli configure-asr

Use the `odacli configure-asr` command to configure Oracle Auto Service Request (Oracle ASR) after deploying the appliance.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli configure-asr -u username [-r proxyserver] [-t proxyport]
[-y proxyuser] [-s snmpversion] -i[asrip] -e [internal|external] [-su
snmpUserName] [-j] [-h]
```

Parameters

Parameter	Description
<code>--asrip, -i</code>	(Optional) Identifies the external Oracle ASR Manager IP address.
<code>--asrtype, -e {internal external}</code>	Defines the Oracle ASR Configuration Type. The default is internal.
<code>--snmp-user, -su</code>	(Optional) Specifies the SNMP user name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--proxyport, -t</code>	(Optional) Defines the proxy server port.
<code>--proxyserver, -r</code>	(Optional) Defines the Proxy Server Address.
<code>--proxyuser, -y</code>	(Optional) Defines the proxy user name needed to authenticate the proxy server.
<code>--snmpversion, -s [V3]</code>	(Optional) Defines Simple Network Management Protocol (SNMP) Version 3.
<code>--username, -u</code>	Defines the Oracle ASR user name. The user name is the My Oracle Support user name under which the server is registered.

Usage Notes

- All log files for Oracle ASR are located in the `/var/opt/asrmanager/log/` directory.
- To configure an external Oracle ASR Manager, you must define the Oracle ASR Configuration Type as external (`-e external`). For example, `odacli configure-asr -e external -i 198.51.100.1`.
- The SNMP user name is an optional parameter for the command, however, the SNMP user password is always prompted when you run the command.

Example 15-217 Configuring Oracle ASR with a Proxy Server

This example configures Oracle ASR for user name john.smith1@example.com. A proxy server, www-proxy.example.com, and port 80 are defined.

```
# odacli configure-asr -u john.smith1@example.com -t 80 -r www-
proxy.example.com
Enter ASR user's password:
Retype ASR user's password:
Enter SNMP User's Password:
Retype SNMP User's Password:
```

Job details

```

Example 15-218 Configuring an External Oracle ASR

This example configures Oracle Database Appliance to use an external Oracle ASR instance at IP address 10.20.30.40.

```
# odacli configure-asr --asrip 10.20.30.40 --asrtype External
{
  "jobId" : "ea054a2f-d18d-4253-83bc-b57434e3598e",
  "status" : "Created",
  "message" : "Please run the script '/tmp/activateExternalAssets.pl'
on the ASRManager host once the current job is successful.",
  "reports" : [ ],
  "createTimestamp" : "August 8, 2023 22:12:34 PM EST",
  "description" : "Configure ASR",
  "updatedAtTime" : "August 8, 2023 22:12:34 PM EST"
}
```

When the job completes successfully, run the /tmp/activateExternalAssets.pl script on the Oracle ASR Manager host.

odacli delete-asr

Use the `odacli delete-asr` command to remove the Oracle Auto Service Request (Oracle ASR) configuration from the system.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli delete-asr [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Example 15-219 Deleting Oracle ASR From the System

```
# odacli delete-asr
{
  "jobId" : "5d70bd17-ec4a-48da-8196-1364105db99d",
  "status" : "Running",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : 1469409622451,
  "description" : "Delete ASR",
  "updatedAtTime" : 1469409622458
}
```

odacli describe-asr

Use the `odacli describe-asr` command to display Oracle Auto Service Request (Oracle ASR) configuration details.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
describe-asr [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Example 15-220 Displaying Oracle ASR Details

```
# odacli describe-asr

ASR details
-----
ID: e841d74a-687b-4e87-9548-1baa2090d48e
Name: UserName: scott.tiger@example.com
ProvyServerName: www-proxy.example.com
```

```
ProxyPort: 80
ProxyUserName:
SnmpVersion: V3
State: N/A
Created: July 15, 2016 8:53:54 AM PST
Updated: July 15, 2016 8:53:54 AM PST
```

odacli test-asr

Use the `odacli test-asr` command to test the Oracle Auto Service Request (Oracle ASR) configuration. When the command is run, an email alert is sent to each host and Oracle ILOM registered with Oracle ASR Manager.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
# odacli test-asr [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-221 Testing the Oracle ASR Configuration

```
# odacli test-asr
```

```
Job details
```

```
-----
                ID: 51522c07-1b32-4874-9bc7-bbee5885f1e5

-----
Test ASR  October 20, 2022 1:02:50 PM UTC October 20, 2022 1:02:50 PM
UTC Success
```

odacli modify-asr

Use the `odacli modify-asr` command to make changes to Oracle Auto Service Request (Oracle ASR) configuration details after deploying the appliance.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli modify-asr -u username [-r proxyserver] [-t proxyport] [-y proxyuser]
[-su snmpUserName] [-s snmpversion] -i[asrip] -e [internal|external] [-j] [-h]
```

Parameters

Parameter	Description
<code>--asrip, -i</code>	(Optional) Identifies the external Oracle ASR Manager IP address.
<code>--asrtype, -e [<i>internal external</i>]</code>	Defines the Oracle ASR configuration type. The default is <code>internal</code> .
<code>--snmp-user, -su</code>	(Optional) Specifies the SNMP user name to send SNMP messages.
<code>--proxyport, -t</code>	(Optional) Defines the proxy server port.
<code>--proxyserver, -r</code>	(Optional) Defines the proxy server address.
<code>--proxyuser, -y</code>	(Optional) Defines the proxy user name needed to authenticate the proxy server.
<code>--snmpversion, -s [<i>v3</i>]</code>	(Optional) Defines Simple Network Management Protocol (SNMP) Version 3.
<code>--username, -u</code>	Defines the Oracle ASR user name. The user name is the My Oracle Support user name under which the server is registered.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.

Usage Notes

- Enter the ASR user password during Oracle ASR configuration.
- All log files for Oracle ASR are located in the `/var/opt/asrmanager/log/` directory.
- You cannot use the `modify-asr` command to change the Oracle ASR type. For example, from `internal` to `external`. To change the Oracle ASR type, delete the existing configuration using the `odacli delete-asr` and then re-configure Oracle ASR using the `odacli configure-asr` command.
- To configure an external Oracle ASR Manager, you must define the Oracle ASR Configuration Type as `external` (`-e external`). For example, `odacli modify-asr -e external -i 198.51.100.1`.

- The SNMP user name is an optional parameter for the command, however, the SNMP user password is always prompted when you run the command.

Example 15-222 Modifying Oracle ASR to use a New Proxy Server

This example updates Oracle ASR for user name `scott.tiger@example.com`. The password is not defined in the command-line. You are prompted to enter the password during configuration. The proxy server is updated to `www-proxy2.example.com`.

```
# odacli modify-asr -u scott.tiger@example.com --proxyserver www-
proxy2.example.com --proxyport 80
Enter ASR user's password:
Retype ASR user's password:
Enter SNMP User's Password:
Retype SNMP User's Password:
```

odacli update-asr

Use the `odacli update-asr` command to make changes to Oracle Auto Service Request (Oracle ASR) configuration details after deploying the appliance.

Note:

This command is deprecated in Oracle Database Appliance release 19.20 and will be desupported in a future release.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
update-asr -u username [-r proxyserver] [-t proxyport] [-y
proxyuser] [-su snmpUserName] [-s snmpversion] -i[asrip] -e [internal|
external] [-j] [-h]
```

Parameters

Parameter	Description
<code>--asrip, -i</code>	(Optional) Identifies the external Oracle ASR Manager IP address.
<code>--asrtype, -e [internal external]</code>	Defines the Oracle ASR Configuration Type. The default is internal.
<code>--snmp-user, -su</code>	(Optional) Specifies the SNMP user name.
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output.
<code>--proxyport, -t</code>	(Optional) Defines the proxy server port.
<code>--proxyserver, -r</code>	(Optional) Defines the Proxy Server Address.
<code>--proxyuser, -y</code>	(Optional) Defines the proxy user name needed to authenticate the proxy server.
<code>--snmpversion, -s [v3]</code>	(Optional) Defines Simple Network Management Protocol (SNMP) Version 3.
<code>--username, -u</code>	Defines the Oracle ASR user name. The user name is the My Oracle Support user name under which the server is registered.

Usage Notes

- Enter the ASR user password during Oracle ASR configuration.
- All log files for Oracle ASR are located in the `/var/opt/asrmanager/log/` directory.
- You cannot use the `update-asr` command to change the Oracle ASR type. For example, from internal to external. To change the Oracle ASR type, delete the existing configuration using the `odacli delete-asr` and then re-configure Oracle ASR using the `odacli configure-asr` command.
- To configure an external Oracle ASR Manager, you must define the Oracle ASR Configuration Type as external (`-e external`). For example, `odacli update-asr -e external -i 198.51.100.1`.
- The SNMP user name is an optional parameter for the command, however, the SNMP user password is always prompted when you run the command.

Example 15-223 Updating Oracle ASR with a New Proxy Server

This example updates Oracle ASR for user name `scott.tiger@example.com`. The password is not defined in the command-line. You are prompted to enter the password during configuration. The proxy server is updated to `www-proxy2.example.com`.

```
# odacli update-asr -u scott.tiger@example.com --proxyserver www-
proxy2.example.com --proxyport 80
Enter ASR user's password:
Retype ASR user's password:
Enter SNMP User's Password:
Retype SNMP User's Password:

odacli OS Commands

Use the `odacli OS` commands to list and update operating system (OS) parameters.

- [odacli list-osconfigurations](#)
Use the command `odacli list-osconfigurations` to display the current HugePage and memlock values and view suggested values based on the total available space.
- [odacli modify-osconfigurations](#)
Use the command `odacli modify-osconfigurations` to update the HugePage and memlock values.
- [odacli update-osconfigurations](#)
Use the command `odacli update-osconfigurations` to update the HugePage and memlock values.

odacli list-osconfigurations

Use the command `odacli list-osconfigurations` to display the current HugePage and memlock values and view suggested values based on the total available space.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli list-osconfigurations [-h] [-j]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.

Usage Notes

The command displays the configured values for HugePage and memlock from the `/etc/sysctl.conf` and `/etc/security/limits.conf` files. Based on the total available space, suggested values are calculated for the parameters.

Example 15-224 Displaying a List of Configured and Suggested Memlock and HugePage Configurations

```
# odacli list-osconfigurations
```

Parameter	User	ConfiguredValue	SuggestedValue
Memlock	grid	295971180KB	289034355KB
Memlock	oracle	295971180KB	289034355KB
HugeSpace	default	101430MB	101161MB

odacli modify-osconfigurations

Use the command `odacli modify-osconfigurations` to update the HugePage and memlock values.

File Path

`/opt/oracle/dcs/bin/odacli`

Syntax

```
odacli modify-osconfigurations [-hs hugepage] [-m memlock] [-nhp
number_of_hugepages] [-j] [-h]
```

Parameters

Parameter	Description
<code>--memlock, -m</code>	(Optional) Updates only the memlock value.
<code>--hugespace, -hs</code>	(Optional) Updates only the HugePage value.
<code>--number-hugepages, -nhp</code>	(Optional) Updates HugePages value.
<code>--json, -j</code>	(Optional) Displays JSON output. The default is false.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

The command updates memlock in the `/etc/security/limits.conf` file and HugePage in the `/etc/sysctl.conf` file with the suggested values.

You can modify memlock or hugepage. If no option is provided, then both parameters are updated to the suggested values.

Example 15-225 Updating the HugePage and Memlock Parameters to the Suggested Values

```
odacli modify-osconfigurations
{
"jobId" : "954cf7a5-9cad-451c-8820-3140a716af26",

```

odacli update-osconfigurations

Use the command `odacli update-osconfigurations` to update the HugePage and memlock values.

**Note:**

This command is deprecated in Oracle Database Appliance release 19.20 and will be desupported in a future release.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli update-osconfigurations [-hs] [-m] [-nhp number_of_hugepages] [-j] [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.

Parameter	Description
--hugespace, -hs	(Optional) Updates only the HugePage value.
--number-hugepages, -nhp	(Optional) Updates HugePages value.
--json, -j	(Optional) Displays JSON output. The default is false.
--memlock, -m	(Optional) Updates only the memlock value.

Usage Notes

The command updates memlock in the `/etc/security/limits.conf` file and HugePage in the `/etc/sysctl.conf` file with the suggested values.

You can update memlock or hugepage. If no option is provided, then both parameters are updated to the suggested values.

Example 15-226 Updating the HugePage and Memlock Parameters to the Suggested Values

```
odacli update-osconfigurations
{
  "jobId" : "954cf7a5-9cad-451c-8820-3140a716af26",

odaadmcli Hardware Monitoring Commands

Use the hardware monitoring commands to display hardware configurations.

- [odaadmcli show localdisk](#)
Use the `odaadmcli show localdisk` command to show cooling details.
- [odaadmcli show cooling](#)
Use the `odaadmcli show cooling` command to show cooling details.
- [odaadmcli show env_hw](#)
Use the `odaadmcli show env_hw` command to display information about the environment and hardware.

- [odaadmcli show fs](#)
Use the `odaadmcli show fs` command to display filesystem details.
- [odaadmcli show memory](#)
Use the `odaadmcli show memory` command to display memory details.
- [odaadmcli show network](#)
Use the `odaadmcli show network` command to show network details.
- [odaadmcli show power](#)
Use the `odaadmcli show power` command to display power supply details.
- [odaadmcli show processor](#)
Use the `odaadmcli show processor` command to display processor details.
- [odaadmcli show server](#)
Use the `odaadmcli show server` command to display server details.

odaadmcli show localdisk

Use the `odaadmcli show localdisk` command to show cooling details.

File Path

`/opt/oracle/oak/bin/odaadmcli`

Syntax

To show cooling details:

```
odaadmcli show localdisk [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

```
# odaadmcli show localdisk
      NAME          PATH          TYPE
STATUS          STATE_IN_ILOM
      lpd_0         /dev/sda     SSD
PredictiveFailure OK
      lpd_1         /dev/sdb     SSD

```

odaadmcli show cooling

Use the `odaadmcli show cooling` command to show cooling details.

File Path

`/opt/oracle/oak/bin/odaadmcli`

Syntax

To show cooling details:

```
odaadmcli show cooling [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

odaadmcli show env_hw

Use the `odaadmcli show env_hw` command to display information about the environment and hardware.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To display environment and hardware details:

```
odaadmcli show env_hw [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Example 15-227 Displaying Environment and Hardware Details

To display the hardware details, enter the command `odaadmcli show env_hw`. The results show a bare metal Oracle Database Appliance system.

```
# odaadmcli show env_hw
```

```
BM X7-2 Medium
```

odaadmcli show fs

Use the `odaadmcli show fs` command to display filesystem details.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To display filesystem details:

```
odaadmcli show fs [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Example 15-228 Displaying Filesystem Details

```
# odaadmcli show fs

Type      Total Space  Free Space   Total DG Space  Free DG Space

odaadmcli show memory

Use the `odaadmcli show memory` command to display memory details.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To show memory details:

```
odaadmcli show memory [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Example 15-229 Display Memory Details

```
# odaadmcli show memory
```

odaadmcli show network

Use the `odaadmcli show network` command to show network details.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To show network details:

```
odaadmcli show network [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Example 15-230 Showing Network Details

```
# odaadmcli show network
```

NAME	HEALTH	HEALTH_DETAILS	LOCATION	PART_NO	MANUFACTURER

```

odaadmcli show power

Use the `odaadmcli show power` command to display power supply details.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

Run this command on the first node, to display power supply details on Oracle Database Appliance High-Availability (HA) models:

```
odaadmcli show power [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-231 Displaying Power Supply Details

```

# odaadmcli show power

NAME           HEALTH HEALTH_DETAILS PART_NO.  SERIAL_NO.
Power_Supply_0 OK      -           7079395  476856Z+1514CE056G

degree C

```

odaadmcli show processor

Use the `odaadmcli show processor` command to display processor details.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To show processor details:

```
odaadmcli show processor [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Example 15-232 Displaying Processor Details

```
# odaadmcli show processor

NAME          HEALTH HEALTH_DETAILS PART_NO. LOCATION MODEL
CPU_0         OK      -              060F P0 (CPU 0) Intel(R) Xeon(R) CPU

```

odaadmcli show server

Use the `odaadmcli show server` command to display server details.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To show server details:

```
odaadmcli show server [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Example 15-233 Displaying Server Details

```
# odaadmcli show server

Power State : On
Open Problems : 0
Model : ORACLE SERVER X7-2
Type : Rack Mount
```

Part Number : 7320190
Serial Number : 1605NM10JJ
Primary OS : Not Available
ILOM Address : 10.209.8.215
ILOM MAC Address : 00:10:E0:95:98:F0
Description : Oracle Database Appliance X7-2 Small 1606NM1s02
Locator Light : Off
Actual Power Consumption : 135 watts
Ambient Temperature : 24.250 degree C
Open Problems Report : System is healthy

Storage Commands

Understand the commands to perform storage operations and diagnostics.

- [odaadmcli asmops diskgroup](#)
Use the `odaadmcli asmops diskgroup` command to manage Oracle ASM disk group.
- [odaadmcli expand storage](#)
Use the `odaadmcli expand storage` command to expand storage.
- [odacli list-dgdisks](#)
Use the `odacli list-dgdisks` command to display details about the available disks.
- [odacli validate-storagetopology](#)
Use the `odacli validate-storagetopology` command to check the cable connections between the system controllers and the storage shelf, as well as the cable connection to the storage expansion shelf (if one is installed).
- [odaadmcli power disk](#)
Use the `odaadmcli power disk` command to power a disk on or off for NVMe drives only.
- [odaadmcli show controller](#)
Use the `odaadmcli show controller` command to display details of the controller.
- [odaadmcli show disk](#)
Use the `odaadmcli show disk` command to display the status of a single disk or of all disks on the system.
- [odaadmcli show diskgroup](#)
Use the `odaadmcli show diskgroup` command to list configured diskgroups or display a specific diskgroup configuration.
- [odaadmcli show raidsyncstatus](#)
Use the `odaadmcli show raidsyncstatus` command to display the RAID SYNC status.
- [odaadmcli show storage](#)
Use the `odaadmcli show storage` command to show the storage controllers, expanders, and disks.
- [odaadmcli stordiag](#)
Use the `odaadmcli stordiag` command to collect detailed information for each disk or NVMe.

odaadmcli asmops diskgroup

Use the `odaadmcli asmops diskgroup` command to manage Oracle ASM disk group.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

```
odaadmcli asmops diskgroup -G diskgroup_name -o {add|remove|offline|  
online} -p path -D disk_name -f -w -t timeout [-h]
```

Parameters

Parameter	Description
-G	(Mandatory) Specifies the disk group name.
-o	(Mandatory) Specifies the operation to be performed on Oracle ASM disk. Add disk to disk group, remove from disk group, offline the disk or online the disk.
-p	(Mandatory for addition of disks) Specify the disk path during addition of disk to Oracle disk group.
-D	(Mandatory) Specify Oracle ASM disk name or alias.
--help, -h	(Optional) Displays help for using the command.
-f	(Optional) Specifies if you want to force the operation.
-w	(Optional) Specifies if you want to wait for the operation to complete. This option is valid for the disk online operation.
-t	(Optional) Specifies the duration after which the disks are dropped by Oracle ASM after a disk offline operation. The time out values can be specified in the format 35m, 2h, and so on. This option is valid for the disk offline operation.

Usage Notes

Run the command on the Oracle Database Appliance system to manage Oracle ASM disk group.

odaadmcli expand storage

Use the `odaadmcli expand storage` command to expand storage.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

```
odaadmcli expand storage -ndisk number of disks to be added -
enclosure {0|1} [-h]
```

Parameters

Parameter	Description
--enclosure {0 1}	Defines the JBOD or shelf number. The base storage shelf is 0. The storage expansion shelf is 1. This option is only available for multi-node platforms. It is not supported on Oracle Database Appliance single node platforms.
--help, -h	(Optional) Displays help for using the command.
-ndisk	Defines the number of disks to be added in the enclosure.

Usage Notes

On high-availability (HA) Oracle Database Appliance hardware models, run the command only on the first node.

Various storage options are available. On multi-node platforms, the base storage is SSD and you can choose to add either SSD or HDD disks. When adding a storage expansion shelf, all disks must be the same type (you cannot combine SSD and HDD disks).

Note:

In addition to reviewing the `expand storage` command, it is important to follow the procedures for adding storage. Cabling validation and disk placement is important. In some cases, you must move disks to different slots to successfully expand storage.

odacli list-dgdisks

Use the `odacli list-dgdisks` command to display details about the available disks.

File Path

```
/opt/oracle/dcs/bin/odacli
```

Syntax

To list available disk details:

```
odacli list-dgdisks [-h] [-dg] [-dp] [-j]
```

Parameters

Parameter	Description
--json, -j	(Optional) Displays JSON output.
--help, -h	(Optional) Displays help for using the command.
--diskgroup, -dg	(Optional) Displays all disks in the specified disk group. The possible values are: ALL, DATA, RECO, REDO, FLASH. If no value is specified, then ALL disks are displayed.
--diskpath, -dp	(Optional) Displays all disks that contains the specified value in the path. If no value is specified, then all disks are displayed.

Usage Notes**Example 15-234 Listing All Available Disks on the System**

```
# odacli list-dgdisks -dg ALL
```

```
Name                               Group Mount St Group Num Mode St State

```

odacli validate-storagetopology

Use the `odacli validate-storagetopology` command to check the cable connections between the system controllers and the storage shelf, as well as the cable connection to the storage expansion shelf (if one is installed).

Oracle recommends that you run the `odacli validate-storagetopology` command before deploying the system to ensure that the cabling is correct. This will avoid and prevent problems during deployment due to incorrect or missing cable connections. If the cabling is not correct, you will see errors in your output.

File Path

```
$ORACLE_HOME/opt/oracle/dcs/bin/odacli
```

Syntax

```
odacli validate-storagetopology [-h]
```

Parameters

Parameter	Description
<code>--help, -h</code>	(Optional) Displays help for using the command.

odaadmcli power disk

Use the `odaadmcli power disk` command to power a disk on or off for NVMe drives only.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To power an NVMe disk on or off:

```
odaadmcli power disk {on|off|status} disk_name [-h]
```

Parameters

Parameter	Description
<i>disk_name</i>	Defines the disk resource name. The resource name format is <code>pd_[0..3]</code> .
{on off status}	Power on a disk, power off a disk, display status.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-236 Powering a Disk Off

This example shows how to power off a disk.

```
# odaadmcli power disk off pd_00
Disk 'pd_00' is already part of ASM

Are you sure you want to power OFF the disk?: 'pd_00'?
[yes/no]:
yes
Powered OFF pd_00
```

Example 15-237 Checking the Disk Status

This example shows how to get the status of disk pd_00.

```
# odaadmcli power disk status pd_00
The disk is powered ON
```

odaadmcli show controller

Use the `odaadmcli show controller` command to display details of the controller.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To display details of the controller:

```
odaadmcli show controller id [-h]
```

Parameters

Parameter	Description
<code>controller_id</code> , <i>id</i>	Defines the controller.
<code>--help</code> , <code>-h</code>	(Optional) Displays help for using the command.

Example 15-238 Showing Controller Details

```
# odaadmcli show controller 1
Controller [1] information:
sun-controller-id = nvme:1b:00.00
sun-id = nvme:1b:00.00
sun-controller-manufacturer = Samsung
pci-vendor-id = 0x0000144d
sun-controller-model = 0xa821
pci-device-id = 0x0000a821
sun-controller-type = NVMe
sun-card-manufacturer = Sun Microsystems
pci-subvendor-id = 0x0000108e
```

```

sun-card-model = 0xa803
pci-subdevice-id = 0x0000a803
pci-address = 1b:00.0
sun-version-firmware = KPYA7R3Q
sun-serial-number = S2LHNAAH101008
sun-product-name = MS1PC2DD3ORA3.2T
pci-slot-number = 11
nvme-power-control = 1
sun-nac-name = /SYS/DBP/NVME1

```

odaadmcli show disk

Use the `odaadmcli show disk` command to display the status of a single disk or of all disks on the system.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To display the status of all disks on the system:

```
odaadmcli show disk [-h]
```

To display the status of a single disk:

```
odaadmcli show disk disk_name [-h]
```

Parameters

Parameter	Description
<i>disk_name</i>	(Optional) Define the disk resource name. The resource name format is <code>pd_[0..3]</code> .
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-239 Displaying the Status of All Disks

To display the status of all the disks on the system:

```

# odaadmcli show disk
NAME          PATH          TYPE      STATE    STATE_DETAILS
pd_00        /dev/nvme0n1 NVD       ONLINE   Good
pd_01        /dev/nvme1n1 NVD       ONLINE   Good

```

Example 15-240 Displaying the Status of a Single Disk

To display the status of a disk named `pd_00`:

```
# odaadmcli show disk pd_00
```

```
The Resource is : pd_00
```

```

```

odaadmcli show diskgroup

Use the `odaadmcli show diskgroup` command to list configured diskgroups or display a specific diskgroup configuration.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To list configured diskgroups:

```
odaadmcli show diskgroup [-h]
```

To display DATA configurations:

```
odaadmcli show diskgroup [DATA] [-h]
```

To display RECO configurations:

```
odaadmcli show diskgroup [RECO] [-h]
```

Parameters

Parameter	Description
DATA	(Optional) Displays the DATA diskgroup configurations.
RECO	(Optional) Displays the RECO diskgroup configurations.
--help, -h	(Optional) Displays help for using the command.

Example 15-241 Listing All Diskgroups

```
# odaadmcli show diskgroup

DiskGroups
-----
DATA
RECO
```

Example 15-242 Displaying DATA Configurations

```
# odaadmcli show diskgroup DATA

ASM_DISK  PATH                                DISK  STATE  STATE_DETAILS

data_00   /dev/NVD_S00_S2LHNAAH101026p1  pd_00  ONLINE  Good
data_01   /dev/NVD_S01_S2LHNAAH101008p1  pd_01  ONLINE  Good
```

odaadmcli show raidsyncstatus

Use the `odaadmcli show raidsyncstatus` command to display the RAID SYNC status.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To display the status of RAID SYNC:

```
odaadmcli show raidsyncstatus [-h]
```

Parameters

Parameter	Description
--help, -h	(Optional) Displays help for using the command.

Example 15-243 Displaying the RAID SYNC Status

To display the RAID SYNC details and status:

```
# odaadmcli show raidsyncstatus

Raid Type   Raid Device   Raid Status   maintainPdFailHistory   Rebuildrate
H/W Raid    /dev/sda      Optimal       ON                       30%
```

odaadmcli show storage

Use the `odaadmcli show storage` command to show the storage controllers, expanders, and disks.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To display the storage controllers, expanders, and disks:

```
odaadmcli show storage [-h]
```

To show storage errors:

```
odaadmcli show storage -errors [-h]
```

Parameters

Parameter	Description
--errors	(Optional) Shows storage errors.
--help, -h	(Optional) Displays help for using the command.

Example 15-244 Displaying Storage Devices

The following example displays details about the storage devices on an appliance.

```
# odaadmcli show storage

==== BEGIN STORAGE DUMP =====
Host Description: Oracle Corporation:ORACLE SERVER X6-2
Total number of controllers: 2
  Id = 0
  Pci Slot = 10
  Serial Num = S2LHNAAH101026
  Vendor = Samsung
  Model = MS1PC2DD3ORA3.2T

==== END STORAGE DUMP =====
```

odaadmcli stordiag

Use the `odaadmcli stordiag` command to collect detailed information for each disk or NVMe.

File Path

```
/opt/oracle/oak/bin/odaadmcli
```

Syntax

To collect storage diagnostics for disks and NVM Express (NVMe):

```
odaadmcli stordiag [-n] [-h]
```

Parameters

Parameter	Description
<code>-ndisk_name</code>	Defines the disk resource name. The resource name format is <code>pd_[0..3]</code> .
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example 15-245 Displaying NVMe Details

To display detailed information for NVMe `pd_00`:

```
# odaadmcli storddiag pd_00
```

Oracle Database Appliance Command-Line Interface for KVM

Use `odacli` commands to manage Oracle Linux Kernel-based Virtual Machine (KVM) on Oracle Database Appliance.

Note:

If you have enabled multi-user access, then you can run all supported ODACLI commands on KVM and DB systems, after logging in as `odaadmin`.

- [About Command-Line Interface for Kernel-Based Virtual Machine \(KVM\)](#)

About Command-Line Interface for Kernel-Based Virtual Machine (KVM)

The `odacli` commands are the primary method for performing database and system administration on Oracle Database Appliance Kernel-Based Virtual Machine (KVM).

You can perform the following tasks with ODACLI commands on Kernel-Based Virtual Machine (KVM):

- Manage VM instances
- Manage VM storage
- Manage virtual disks
- Manage virtual network
- Manage CPU pools

ODACLI Command Location and Path Configuration

The `odacli` command-line interface is in the following directory:

```
/opt/oracle/dcs/bin/odacli
```

Configure the `root` user account on your Oracle Database Appliance servers to have the `PATH` variable defined to search for `odacli` commands in the path `/opt/oracle/dcs/bin/odacli`.

ODACLI Syntax

Oracle Appliance Manager command-line interface commands and parameters are case-insensitive.

An `odacli` command uses the following command syntax:

```
odacli command object [options]
```

- *command* is an action you want to perform on the appliance. For example: `show`, `locate`, `apply`.
- *object* is the target or object on which the `odacli` command performs the operation. For example, you issue a command to create or configure a virtual disk, or a network, or perform other system or software administration. You can also use object abbreviations.
- *options* are optional parts of the `odacli` command. Options can consist of one or more options that extend the use of the `odacli` command carried out on an object. Options include additional information about the action that you want to perform on the object. Option names are preceded with a dash. Many options require the name of an object for the command to perform the action that you want to carry out. The help option (`-h`) is an option that is available with every command. When you include the `-h` option, you can obtain additional information about the command that you want to perform.

Oracle Appliance Manager Command-Line Interface Help

Run the following command to see the usage information for all `odacli` commands available for your Oracle Database Appliance:

```
odacli -h
```

Run the following command to see detailed help about a specific `odacli` command:

```
odacli command -h
```

Run the following command to see detailed help about a specific `odacli` command carried out on an object, and the options that are available for you to use with that object.

```
odacli command object -h
```

About ODACLI Commands Supported on Oracle KVM Database System

Understand the `odacli` commands supported on Oracle Database Appliance Kernel-Based Virtual Machine (KVM) Database System in this release.

This release of Oracle Database Appliance supports the provisioning of Oracle KVM database system through `odacli create-dbsystem` or the Browser User Interface. The following ODACLI commands are supported on Oracle KVM Database System on Oracle Database Appliance:

- `odacli ping-agent`
- `odacli delete-agentconfig-parameters`
- `odacli list-agentconfig-parameters`
- `odacli update-agentconfig-parameters`
- `odacli restore-archivelog`
- `odacli create-auto-logclean-policy`
- `odacli delete-auto-logclean-policy`
- `odacli list-auto-logclean-policy`
- `odacli list-availablepatches`
- `odacli create-backup`
- `odacli delete-backup`
- `odacli create-backupconfig`
- `odacli delete-backupconfig`
- `odacli describe-backupconfig`
- `odacli list-backupconfigs`

- `odacli update-backupconfig`
- `odacli describe-backupreport`
- `odacli describe-component`
- `odacli set-credential`
- `odacli create-database`
- `odacli delete-database`
- `odacli describe-database`
- `odacli irestore-database`
- `odacli list-databases`
- `odacli modify-database`
- `odacli recover-database`
- `odacli register-database`
- `odacli configure-dataguard`
- `odacli deconfigure-dataguard`
- `odacli failover-dataguard`
- `odacli reinstate-dataguard`
- `odacli switchover-dataguard`
- `odacli describe-dataguardstatus`
- `odacli list-dataguardstatus`
- `odacli create-dbhome`
- `odacli delete-dbhome`
- `odacli describe-dbhome`
- `odacli list-dbhomes`
- `odacli create-dbstorage`
- `odacli delete-dbstorage`
- `odacli describe-dbstorage`
- `odacli list-dbstorages`
- `odacli describe-job`
- `odacli list-jobs`
- `odacli create-jobdata-retention-policy`
- `odacli delete-jobdata-retention-policy`
- `odacli list-jobdata-retention-policy`
- `odacli describe-latestpatch`
- `odacli create-logcleanjob`
- `odacli describe-logcleanjob`

- `odacli list-logcleanjobs`
- `odacli list-logspaceusage`
- `odacli describe-network`
- `odacli list-networks`
- `odacli describe-networkinterface`
- `odacli list-networkinterfaces`
- `odacli list-nodes`
- `odacli create-objectstoreswift`
- `odacli delete-objectstoreswift`
- `odacli describe-objectstoreswift`
- `odacli list-objectstoreswifts`
- `odacli update-objectstoreswift`
- `odacli list-osconfigurations`
- `odacli update-osconfigurations`
- `odacli list-pendingjobs`
- `odacli create-prepatchreport`
- `odacli delete-prepatchreport`
- `odacli describe-prepatchreport`
- `odacli list-prepatchreports`
- `odacli create-purge-jobdata-job`
- `odacli list-purge-jobdata-jobs`
- `odacli describe-schedule`
- `odacli list-schedules`
- `odacli update-schedule`
- `odacli list-scheduled-executions`
- `odacli describe-systemcomponent`
- `odacli list-tdebackupreports`
- `odacli restore-tdewallet`

 **Note:**

No other ODACLI commands than the ones above are supported on Oracle Database Appliance KVM Database System, in this release.

odacli Database System Commands for KVM

Use the odacli database system commands to manage databases on Oracle Database Appliance for Oracle KVM.

- [odacli create-dbsystem](#)
Use the `odacli create-dbsystem` command to create a new database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli modify-dbsystem](#)
Use the `odacli modify-dbsystem` command to modify a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli modify-dbfileattributes](#)
Use the `odacli modify-dbfileattributes` command to properly set the file attributes (permissions and ownership) of files on Oracle ASM disk group on a bare metal host to support a dbsystem. Only run this command if prompted by the `odacli create-dbsystem` command.
- [odacli list-dbsystems](#)
Use the `odacli list-dbsystems` command to view the database systems on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli describe-dbsystem](#)
Use the `odacli describe-dbsystem` command to describe a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli describe-dbsystem-image](#)
Use the `odacli describe-dbsystem-image` command to view the supported Oracle Grid Infrastructure and Oracle Database versions and the availability of the clone files and Database System KVM image in the Oracle Database Appliance system.
- [odacli start-dbsystem](#)
Use the `odacli start-dbsystem` command to start a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli stop-dbsystem](#)
Use the `odacli stop-dbsystem` command to stop a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli delete-dbsystem](#)
Use the `odacli delete-dbsystem` command to delete a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

odacli create-dbsystem

Use the `odacli create-dbsystem` command to create a new database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli create-dbsystem [-f] [-p json_payload_path] [-t template] [-ta] [-j] [-h]
```

Parameters

Parameter	Description
<code>--params, -p</code>	(Optional) Specifies the input parameters file path for DB system creation.
<code>--force, -f</code>	(Optional) Forces the operation with the specified parameters.
<code>--template, -t</code>	(Optional) Specifies the path where the template with sample values will be created.
<code>--template-annotated, -ta</code>	(Optional) Displays the DB system template with field descriptions.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

For example JSON files that you can use to create the DB system, see the *Example JSON File to Create a High-Availability DB System* and *Example JSON File to Create a Single-Node DB System* topics in this guide.

Example

Create a KVM database system using a JSON file for input parameters.

```
# odacli create-dbsystem -p example_system.json
```

Job details

Related Topics

- [Example JSON File to Create a High-Availability DB System](#)
Follow the JSON file example to create a JSON file to deploy a two-node DB System, with role separation, with the command `odacli create-dbsystem`.
- [Example JSON File to Create a Single-Node DB System](#)
Follow the JSON file example to create a JSON file to deploy a single-node DB System, with role separation, with the command `odacli create-dbsystem`.
- [odacli describe-dbsystem-image](#)
Use the `odacli describe-dbsystem-image` command to view the supported Oracle Grid Infrastructure and Oracle Database versions and the availability of the clone files and Database System KVM image in the Oracle Database Appliance system.

odacli modify-dbsystem

Use the `odacli modify-dbsystem` command to modify a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli modify-dbsystem -n name [-cp cpu_pool_name] [-no-cp] [-r] [-avn v_network] [-dvn v_networks_to_detach] [-en] [-gw gateway] [-ip ip_address] [-nm netmask] [-sip scan_ip_address] [-sn scan_name] [-s shape] [-vips vip_address] [-vt v_network_type] [-m] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	(Mandatory) Describes the name of the DB system.
<code>--redundancy, -r</code>	(Optional) Specifies the VM storage redundancy for a DB system. The value can be HIGH or MIRROR. This option is not supported for DB systems on non-FLEX disk group. The options can be MIRROR or HIGH. The default option is MIRROR.
<code>--attach-vnetwork, -avn</code>	(Optional) Specifies the name of the vnetwork to attach.
<code>--cpupool, -cp</code>	(Optional) Specifies the shared DB System CPU Pool name.
<code>--detach-vnetwork, -dvn</code>	(Optional) Specifies the name of the vnetworks to detach.
<code>--enable-numa, -en</code>	(Optional) Enables NUMA configuration for the DB System.
<code>--gateway, -gw</code>	(Optional) Specifies the network gateway.
<code>--ip, -ip</code>	(Optional) Specifies the network IP address.
<code>--netmask, -nm</code>	(Optional) Specifies the netmask of the network.
<code>--no-cpupool, -no-cp</code>	(Optional) Specifies to dissociate the current DB System CPU Pool name.
<code>--scan-ips, -sip</code>	(Optional) Specifies the SCAN IP of the network.
<code>--scan-name, -sn</code>	(Optional) Specifies the SCAN of the network.
<code>--shape, -s</code>	(Optional) Specifies the new shape. You can specify a higher or lower value than the current shape.
<code>--vips, -vips</code>	(Optional) Specifies the virtual IP of the network in the format <code>vip_name_0:0:vip_ip_0,vip_name_1:1:vip_ip_1</code> .
<code>--vnetwork-type, -vt</code>	(Optional) Specifies the vnetwork type to attach.
<code>--memory, -m</code>	(Optional) Defines the memory size. The format is M G.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- The `odacli modify-dbsystem` command supports the following use cases:
 - attach or detach the shared dbsystem cpupools.

Attaching a CPU pool:

```
odacli modify-dbsystem --name dbssystem_name -cp cpupool
```

Detaching a CPU pool:

```
odacli modify-dbsystem --name dbssystem_name --no-cp
```

- Change database shape, that is, scale up (increase) or scale down (decrease):

```
odacli modify-dbsystem -n dbssystem_name -s new_shape
```

- Enable NUMA for the existing dbssystem. NUMA is enabled on Oracle Database Appliance release 19.12. For existing dbssystems created before release 19.12, use the `odacli modify-dbsystem --enable_numa` command to enable the NUMA for the dbssystem. This command includes enabling the NUMA for the VM configuration, operation system, and the database inside the dbssystem.

```
odacli modify-dbsystem --name dbssystem_name --enable_numa
```

- Attach or detach new network to the dbssystem. Before attaching a vnetwork, ensure that the vnetwork exists. You must specify the IP address and netmask to configure the new network interface inside the dbssystem. If the network type is database or dataguard, specify the VIPs, SCAN name, and SCAN IPs.

```
odacli modify-dbsystem -n dbssystem1 -avn vnet2 -t Dataguard -ip  
192.168.10.119,192.168.10.120 -nm 255.255.240.0 -gw 192.168.10.1 -sn  
scan1 -sip 192.168.10.30,192.168.10.31 -vips  
vip1:0:192.168.15.57,vip2:1:192.168.15.58
```

To detach a network from dbssystem:

```
odacli modify-dbsystem -n dbssystem1 -dvn vnet2
```

Example: Modify a KVM DB system

```
# odacli modify-dbsystem -n example_system1 -cp example_pool -s new_shape
```

Example: Increase the DB System memory to 24 GB

The command supports increasing the DB system memory. To reduce the DB system memory, use the `--shape` option with the command `odacli modify-dbsystem`.

```
# odacli modify-dbsystem -n dbssystem_name -m 24G
```

Related Topics

- [odacli remap-cpupools](#)
Use the `odacli remap-cpupools` command to remap CPU pools to NUMA allocation on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

- [odacli create-cpupool](#)
Use the `odacli create-cpupool` command to create a new CPU pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

odacli modify-dbfileattributes

Use the `odacli modify-dbfileattributes` command to properly set the file attributes (permissions and ownership) of files on Oracle ASM disk group on a bare metal host to support a dbssystem. Only run this command if prompted by the `odacli create-dbsystem` command.

Syntax

```
odacli modify-dbfileattributes [-in db_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--dbname, -in</code>	(Optional) Describes the name of the database for which you want to modify the file attributes.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- To create the database system, access control must be enabled in Oracle ASM running on bare metal system. When the bare metal system is newly provisioned or patched to Oracle Database Appliance release 19.20.0.1, access control is already enabled. This helps you set appropriate file ownerships for all the files created in DB systems and on bare metal.
- Before you create the database system, the files on Oracle ASM disk groups that do not have file ownership must be set up with ownership. The creation of dbssystem fails, and you are prompted to run the `odacli modify-dbfileattributes` command to set up the file ownership and permission. Since there can be many files on Oracle ASM disk group, the user can run this step at their own convenience. Use the `odacli modify-dbfileattributes` command to set up the file ownerships.
- This command sets the file attributes (permissions and ownership) of all files on Oracle ASM disk group. The files include database files and also Oracle Clusterware files such as OCR (Oracle Clusterware Registry). Before creating the first DB system, set up attributes for files owned by both Oracle Grid Infrastructure and Oracle Database by running the `odacli modify-dbfileattributes` command with no arguments.
- If the overall operation was successful for many files, but failed for some files, then you can run the command again by specifying the database names.

Example

Modify the file attributes of the databases.

```
# odacli modify-dbfileattributes -in example_db_name
```

odacli list-dbsystems

Use the `odacli list-dbsystems` command to view the database systems on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli list-dbsystems [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

List the KVM database systems.

```
# odacli list-dbsystems
Name                Shape        Cores  Memory  Status
Created            Updated
-----            -
dbsystem1          odb4         4      32.00 GB  CONFIGURED  2020-12-08
17:39:00 CST  2020-12-08 17:39:00 CST
dbsystem2          odb2         2      16.00 GB  CREATING    2020-12-16
09:28:03 CST  2020-12-16 09:28:03 CST
```

odacli describe-dbsystem

Use the `odacli describe-dbsystem` command to describe a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli describe-dbsystem -n db_system_name [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	(Mandatory) Describes the name of the DB system.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

Image version is the version which the DB System was created from. Current version is the current version of the DB system. For instance, if the DB System was created on 19.19 and it was patched to 19.20.0.1, the output is as follows:

```
Image version: 19.19.0.0.0
Current version: 19.20.0.0.0
```

Example

View details of a KVM database system on a single-node system.

```

odacli describe-dbsystem-image

Use the `odacli describe-dbsystem-image` command to view the supported Oracle Grid Infrastructure and Oracle Database versions and the availability of the clone files and Database System KVM image in the Oracle Database Appliance system.

Syntax

```
odacli describe-dbsystem-image [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

View details of a KVM database system image

```

# odacli describe-dbsystem-image
DB System Image details
-----
-----
Component Name Supported Versions Available Versions
-----

```

```

DBVM          19.10.0.0.0          19.10.0.0.0
GI            19.10.0.0.210119     19.10.0.0.210119
DB            19.10.0.0.210119     19.10.0.0.210119

```

View details of a system where KVM database system image is not available

```

# odacli describe-dbsystem-image
DB System Image details
-----
---
Component Name Supported Versions Available Versions
-----
DBVM          19.10.0.0.0          not-available
GI            19.10.0.0.210119     19.10.0.0.210119
DB            19.10.0.0.210119     19.10.0.0.210119

```

The output shows that the KVM Database System image is not yet available on the system. Download the image and run the `odacli update-repository` to import the image to the repository. The output shows that the Oracle Grid Infrastructure and Oracle Database clones are already available on the system.

odacli start-dbsystem

Use the `odacli start-dbsystem` command to start a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli start-dbsystem -n dbsystem_name [-nn node_name] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	(Mandatory) Describes the name of the DB system.
<code>--node-name, -nn</code>	(Optional) Specifies the bare metal system node name on which to start the DB system VM.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Start a KVM database system.

```
# odacli start-dbsystem -n example_system
```

```
Job details
```

```

odacli stop-dbsystem

Use the `odacli stop-dbsystem` command to stop a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli stop-dbsystem -n dbsystem_name [-nn node_name] [-f] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	(Mandatory) Describes the name of the DB system.
<code>--force, -f</code>	(Optional) Forces the operation to stop the DB system.
<code>--node-name, -nn</code>	(Optional) Specifies the bare metal system node name on which to stop the DB system VM.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Stop a KVM database system.

```
# odacli stop-dbsystem -n example_system
```

Job details

```

-----
ID: 68044afa-d3cc-4024-9dc8-50fcf847642c

```

odacli delete-dbsystem

Use the `odacli delete-dbsystem` command to delete a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli delete-dbsystem -n dbsystem_name [-f] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	(Mandatory) Describes the name of the DB system.
<code>--force, -f</code>	(Optional) If specified, then the operation deletes the database system, Oracle Clusterware files, and the database files.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- If you do not specify the `-f` option, then the operation deletes the database system and Oracle Clusterware files, and retains the database files. With the `-f` option, the operation deletes the database system, Oracle Clusterware files, and the database files.

Example

Delete a KVM database system.

```
# odacli delete-dbsystem -n example_system
WARNING: Use --force option to delete the database and datafiles.
Do you confirm delete DB System 'example_system'? (Options: y/n, default: n):

odacli Commands for Migration from Virtualized Platform to KVM

Use the odacli database system commands to migrate from Virtualized Platform to KVM.

- [odacli migrate-ovm2kvm](#)
Use the `odacli migrate-ovm2kvm` command to migrate an Oracle Database Appliance virtualized platform deployment to Kernel-based Virtual Machine (KVM).
- [odacli describe-ovm2kvm](#)
Use the `odacli describe-ovm2kvm` command to view the migration report for the Oracle Database Appliance virtualized platform migration to Kernel-based Virtual Machine (KVM).

odacli migrate-ovm2kvm

Use the `odacli migrate-ovm2kvm` command to migrate an Oracle Database Appliance virtualized platform deployment to Kernel-based Virtual Machine (KVM).

Syntax

```
odacli migrate-ovm2kvm [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Migrating a virtualized platform to KVM system.

```
# odacli migrate-ovm2kvm
```

```

odacli describe-ovm2kvm

Use the `odacli describe-ovm2kvm` command to view the migration report for the Oracle Database Appliance virtualized platform migration to Kernel-based Virtual Machine (KVM).

Syntax

```
odacli describe-ovm2kvm -i job_id [-j] [-h]
```

Parameters

Parameter	Description
--job-id, -i	(Required) Describes the job ID of the migration process.
--json, -j	(Optional) Displays output in JSON format.
--help, -h	(Optional) Displays help for using the command.

Example

Migration report for virtualized platform to KVM system migration.

```
# odacli describe-ovm2kvm -i ed891da5-f9b5-4a5d-91c0-7a5b8b792990

odacli VM Storage Commands for KVM

Use the odacli virtual machine storage commands to manage storage on Oracle Database Appliance for Oracle KVM.

- [odacli create-vmstorage](#)
Use the `odacli create-vmstorage` command to create a new VM storage on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli list-vmstorages](#)
Use the `odacli list-vmstorages` command to list all VM storages on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli describe-vmstorage](#)
Use the `odacli describe-vmstorage` command to describe VM storage on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli modify-vmstorage](#)
Use the `odacli modify-vmstorage` command to modify VM storage configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

- [odacli delete-vmstorage](#)
Use the `odacli delete-vmstorage` command to delete a vmstorage configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

odacli create-vmstorage

Use the `odacli create-vmstorage` command to create a new VM storage on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli create-vmstorage -n name -s size -dg disk_group [-r {MIRROR|HIGH}] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Name assigned to the VM storage.
<code>--size, -s</code>	Specifies the storage size. Format is K M G T. Minimum Size is 1024M (1G)
<code>--diskgroup, -dg</code>	(Optional) Defines the ASM disk group of the VM storage (Default: DATA).
<code>--redundancy, -r</code>	(Optional) Specifies the VM storage redundancy for a DB system. The value can be HIGH or MIRROR. This option is not supported for DB systems on non-FLEX disk group. The options can be MIRROR or HIGH. The default option is MIRROR.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Create a VM storage named `share1` of 8 GB.

```
# odacli create-vmstorage -n share1 -s 8G
```

odacli list-vmstorages

Use the `odacli list-vmstorages` command to list all VM storages on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli list-vmstorages [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

```
# odacli list-vmstorages
```

odacli describe-vmstorage

Use the `odacli describe-vmstorage` command to describe VM storage on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli describe-vmstorage -n name [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the name of the VM storage.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example: Describing a VM Storage named share1

```
# odacli describe-vmstorage -n share1
```

odacli modify-vmstorage

Use the `odacli modify-vmstorage` command to modify VM storage configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli modify-vmstorage -n name -i increment [-r {MIRROR|HIGH}] [-s decrement] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the virtual disk name
<code>--increment, -i</code>	(Optional) Defines the size to grow the VM storage. Format is K M G T
<code>--shrink, -s</code>	(Optional) Defines the size to shrink the VM storage. Format is K M G T
<code>--redundancy, -r</code>	(Optional) Specifies the VM storage redundancy for a DB system. The value can be HIGH or MIRROR. This option is not supported for DB systems on non-FLEX disk group. The options can be MIRROR or HIGH. The default option is MIRROR.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Increase the size of a VM storage named `share1` by 10 gigabytes.

```
# odacli modify-vmstorage -n share1 -i 10G
```

odacli delete-vmstorage

Use the `odacli delete-vmstorage` command to delete a `vmstorage` configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli delete-vmstorage -n name [-f] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the <code>vmstorage</code> name to be deleted
<code>--force, -f</code>	(Optional) Specifies the force option
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Delete a VM storage named `share1`.

```
odacli delete-vmstorage -n share1
```

odacli Virtual Disk Commands for Oracle KVM

Use the `odacli` virtual disk commands to manage virtual disks on Oracle Database Appliance for Oracle KVM.

- [odacli create-vdisk](#)
Use the `odacli create-vdisk` command to create a new virtual disk in a VM storage on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli list-vdisks](#)
Use the `odacli list-vdisks` command to list all virtual disks on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli describe-vdisk](#)
Use the `odacli describe-vdisk` command to describe a virtual disk on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli modify-vdisk](#)
Use the `odacli modify-vdisk` command to modify a virtual disk on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli clone-vdisk](#)
Use the `odacli clone-vdisk` command to clone a virtual disk on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

- [odacli delete-vdisk](#)
Use the `odacli delete-vdisk` command to delete a virtual disk on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

odacli create-vdisk

Use the `odacli create-vdisk` command to create a new virtual disk in a VM storage on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli create-vdisk -n name -vms vmstorage_name -s size -sh -sp [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Name assigned to the virtual disk that is unique within the name repository
<code>--vmstorage, -vms</code>	Name of the VM storage where the virtual disk will be created
<code>--size, -s</code>	Amount of storage to be assigned from the shared repository to the shared disk. The default unit is G (for gigabytes) and the minimum size is 500 M (for megabytes). Format is K M G T
<code>--shareable, -sh</code>	(Optional) Sets the option of allowing the virtual disk to be shared by more than one virtual machine (<code>shared</code>)
<code>--sparse, -sp</code>	(Optional) Creates a sparse vdisk
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Create a 2 GB non-sparse and shareable Virtual Disk named `vdisk1` inside the VM storage `vms1`.

```
odacli create-vdisk -n vdisk1 -vms vms1 -s 2G -sh
```

odacli list-vdisks

Use the `odacli list-vdisks` command to list all virtual disks on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli list-vdisks [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

```
odacli list-vdisks
```

odacli describe-vdisk

Use the `odacli describe-vdisk` command to describe a virtual disk on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli describe-vdisk -n name [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the name of the virtual disk.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example: Describing a Virtual Disk named `vdisk1`

```
odacli describe-vdisk -n vdisk1
```

odacli modify-vdisk

Use the `odacli modify-vdisk` command to modify a virtual disk on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli modify-vdisk -n name -i [-no-s|-s] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the virtual disk name
<code>--increment, -i</code>	Defines the size to increase the virtual disk. Format is <i>value units</i> , units are K M G T
<code>-no-shareable, --no-s</code>	(Optional) Set the Virtual Disk as non-shareable
<code>--shareable, -s</code>	(Optional) Set the Virtual Disk as shareable
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Increase the size of a virtual disk named `vdisk1` by 4 gigabytes.

```
# odacli modify-vdisk -n vdisk1 -i 4G
```

odacli clone-vdisk

Use the `odacli clone-vdisk` command to clone a virtual disk on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli clone-vdisk -n name -cn clone_name [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the virtual disk name to be cloned
<code>--clone-name, -cn</code>	Specifies the name of the cloned virtual disk
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Create a clone of a virtual disk named `vdisk1`, with the name `vdisk1_clone`. The cloned disk is created on the same storage as `vdisk1`.

```
# odacli clone-vdisk -n vdisk1 -cn vdisk1_clone
```

odacli delete-vdisk

Use the `odacli delete-vdisk` command to delete a virtual disk on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli delete-vdisk -n name [-f] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the virtual disk name to be deleted
<code>--force, -f</code>	(Optional) Specifies the force option
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Delete a virtual disk named `vdisk1`.

```
# odacli delete-vdisk -n vdisk1
```

odacli CPU Pool Commands for Bare Metal and KVM

Use odacli commands to manage resource allocations on Oracle Database Appliance for bare metal and KVM deployments.

CPU pools enable management of CPU resources in both bare metal and KVM environments. There are two types of CPU pools, that is, BM and VM.

Use the BM CPU pool to ensure that the database on a bare metal host runs exclusively on the CPUs specified in the CPU pool.

Use the VM CPU pools to cage and manage CPU resource allocations to workloads for virtual machines. Workloads are isolated by creating CPU pools and assigning or pinning virtual machines to a specific CPU pool. When you pin a virtual machine to a CPU pool, you ensure that the virtual machine uses CPUs in only that CPU pool.

Resources in CPU pools cannot overlap, that is, CPU pools cannot share CPUs.

- [odacli create-cpupool](#)
Use the `odacli create-cpupool` command to create a new CPU pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli remap-cpupools](#)
Use the `odacli remap-cpupools` command to remap CPU pools to NUMA allocation on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli list-cpupools](#)
Use the `odacli list-cpupools` command to list all CPU Pools on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli describe-cpupool](#)
Use the `odacli describe-cpupool` command to describe CPU Pools on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli modify-cpupool](#)
Use the `odacli modify-cpupool` command to modify a CPU Pool configuration on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli delete-cpupool](#)
Use the `odacli delete-cpupool` command to delete a CPU Pool configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli list-auditrecords](#)
Use the `odacli list-auditrecords` command to list the audit records for a CPU Pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli describe-auditrecord](#)
Use the `odacli describe-auditrecord` command to describe the audit record for a CPU Pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

odacli create-cpupool

Use the `odacli create-cpupool` command to create a new CPU pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli create-cpupool -n name -c number_of_cores {-bm|-vm} [-nn node_name] [-s socket] [-dbs] [-urc] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the CPU Pool name.
<code>--cores, -c</code>	Specifies the CPU Pool cores.
<code>--bm, -bm</code>	(Optional) Specifies the CPU Pool as Bare Metal.
<code>--vm, -vm</code>	(Optional) Specifies the CPU Pool as Virtual Machine.
<code>--dbsystem, -dbs</code>	(Optional) Specifies the CPU Pool type as DB System.
<code>--socket, -s</code>	(Optional) Specifies the socket to use. If not specified, then use all available sockets.
<code>--use-reserved-cores, -urc</code>	(Optional) Specifies to use reserved CPU cores.
<code>--node-name, -nn</code>	(Optional) Specifies the node where the CPU Pool will be created. On High-Availability deployment, if this option is not specified, then the CPU pool is created on both nodes.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- Attach the BM CPU pool to databases. Bare metal CPU pools can be assigned to multiple databases.
- Attach VM CPU pool VM to guest machines. VM CPU pools can be assigned to multiple VMs.
- Attach dbsystem CPU pool to DB systems. dbsystem CPU pool can be assigned to multiple DB systems. After you create a dbsystem CPU pool, you can create a new DB system with this CPU pool by adding the new CPU pool parameter in the create-dbsystem json file, or modify-dbsystem to attach CPU pool to an existing DB system.
- Resources in CPU pools cannot overlap, that is, CPU pools cannot share CPUs.
- After you create a BM CPU pool, you can associate this CPU pool to a database using the `create-database` or `modify-database` command.
- After you create a VM CPU pool, you can associate this CPU pool to a VM using the `create-vm` or `modify-vm` command.
- Number of cores must be an even number between 2 and the total number of available cores on the system.
- By default, a CPU in the CPU pool is allocated across two sockets in release 19.12 and later. Optionally, you can choose to allocate the CPU based on the socket number (0 or

1). This is especially useful to support Standard Edition licensing. It is recommended that you use the default allocation and do not mix two types of allocation.

- By default, the first core of the socket is reserved and cannot be used by the VM and DB system CPU pools for optimal performance. Use the `--use-reserved-cores` option to enable use of the first core of socket for VM and DB system CPU pools.

Example

Create a BM CPU pool named `cpupool1` with 6 cores associated to it.

```
# odacli create-cpupool -n cpupool1 -c 6 -bm
```

Create a VM CPU pool named `cpupool2` with 6 cores associated to it.

```
# odacli create-cpupool -n cpupool2 -c 6 -vm
```

Create a DB System CPU pool named `cpupool3` with 6 cores associated to it.

```
# odacli create-cpupool -n cpupool3 -c 6 -dbs
```

Create a DB System CPU pool named `cpupool4` with 4 cores of CPUs allocated from socket 0.

```
# odacli create-cpupool -n cpupool4 -dbs -s 0 -c 4
```

odacli remap-cpupools

Use the `odacli remap-cpupools` command to remap CPU pools to NUMA allocation on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli remap-cpupools -f -urc [-j] [-h]
```

Parameters

Parameter	Description
<code>--force, -f</code>	(Optional) Specifies to force the operation.
<code>--use-reserved-cores, -j</code>	(Optional) Specifies to use reserved CPU cores.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

If the `odacli remap-cpupools` command fails with the error `DCS-10001:Internal error encountered: Not enough physical CPUs available for CPU Pool`

'*cpupool_name*' on node '*node_name*', run the `odacli remap-cpupools` command again with the `--use_reserved-cores` option.

Use the `--force` option to remap CPU pools even if the CPU pool is marked as NUMA-enabled. You must use `odacli remap-cpupools` command, after updating the bare metal CPU cores with the command `odacli update-cpucores` for CPU core number changes.

By default, the first core of the socket is reserved and cannot be used by the VM and DB system CPU pools for optimal performance. Use the `--use-reserved-cores` option to enable use of the first core of socket for VM and DB system CPU pools.

Example

```
# odacli remap-cpupools
```

Use the `odacli modify-vm` command to modify a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli remap-cpupools](#)
Use the `odacli remap-cpupools` command to remap CPU pools to NUMA allocation on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.
- [odacli modify-dbsystem](#)
Use the `odacli modify-dbsystem` command to modify a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli create-cpupool](#)
Use the `odacli create-cpupool` command to create a new CPU pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

odacli list-cpupools

Use the `odacli list-cpupools` command to list all CPU Pools on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli list-cpupools [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

```
# odacli list-cpupools
```

odacli describe-cpupool

Use the `odacli describe-cpupool` command to describe CPU Pools on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli describe-cpupool -n name [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the name of the CPU Pool.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example: Describing a CPU pool named `cpupool1`

```
# odacli describe-cpupool -n cpupool1
```

odacli modify-cpupool

Use the `odacli modify-cpupool` command to modify a CPU Pool configuration on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli modify-cpupool -n name -c cores -f -l [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the CPU Pool name
<code>--cores, -c</code>	Specifies the new number of CPU cores
<code>--force, -f</code>	(Optional) Forces the operation
<code>--live, -l</code>	(Optional) Applies the changes to running VMs
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

For VM CPU pool, if `--live` is not specified, then the changes are applied to the VM configuration file and will be activated next time the VM is started. If `--live` is specified, then the changes will be applied to both VM configuration file and to the running VM.

Example

Set the size of a CPU Pool `cpupool1` to 10. If `--live` is not specified, the change is applied to the VM configuration file and will be activated next time the VM is started.

```
# odacli modify-cpupool -n cpupool1 -c 10
```

odacli delete-cpupool

Use the `odacli delete-cpupool` command to delete a CPU Pool configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli delete-cpupool -n name -f [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the CPU Pool name to be deleted
<code>--force, -f</code>	(Optional) Forces deletion.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Delete a CPU pool named `cpupool1`.

```
# odacli delete-cpupool -n cpupool1
```

odacli list-auditrecords

Use the `odacli list-auditrecords` command to list the audit records for a CPU Pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli list-auditrecords -du dcs-username -f from_date-range -l latest -n node_ID -ot operation_type -ou OS_username -rn resource_name -rt resource_type -t to_date-range [-j] [-h]
```

Parameters

Parameter	Description
<code>--dcs-user, -du</code>	(Optional) Specifies the DCS user name.
<code>--from, -f</code>	(Optional) Specifies the <i>from</i> date in the date range for the CPU pool audit records.
<code>--latest, -l</code>	(Optional) Specifies the latest number of CPU pool audit records.
<code>--node-id, -n</code>	(Optional) Specifies the node ID.
<code>--op-type, -ot</code>	(Optional) Specifies the type of operation.

Parameter	Description
--os-user, -ou	(Optional) Specifies the operating system user.
--rsc-name, -rn	(Optional) Specifies the resource name.
--rsc-type, -rt	(Optional) Specifies the resource type.
--to, -t	(Optional) Specifies the to date in the date range for the CPU pool audit records.
--json, -j	(Optional) Displays output in JSON format.
--help, -h	(Optional) Displays help for using the command.

Example

```
# odacli list-auditrecords
ID                               Resource type      Resource
name          Operation type    DCS username      OS username

odacli describe-auditrecord

Use the `odacli describe-auditrecord` command to describe the audit record for a CPU Pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

Syntax

```
odacli describe-auditrecord -i [-j] [-h]
```

Parameters

Parameter	Description
--id, -i	Describes the ID of the audit record.

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

```
# odacli describe-auditrecord -i 41295d99-f263-4284-b6d9-2aff1ae0f850

odacli VM Network Commands for KVM

Use the odacli virtual machine network commands to manage network on Oracle Database Appliance for Oracle KVM.

- [odacli create-vnetwork](#)
Use the `odacli create-vnetwork` command to create a new network on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli list-vnetworks](#)
Use the `odacli list-vnetworks` command to list all virtual networks on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli describe-vnetwork](#)
Use the `odacli describe-vnetwork` command to describe virtual networks on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli start-vnetwork](#)
Use the `odacli start-vnetwork` command to start a virtual network on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli stop-vnetwork](#)
Use the `odacli stop-vnetwork` command to stop a virtual network on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli modify-vnetwork](#)
Use the `odacli modify-vnetwork` command to modify a network on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

- [odacli delete-vnetwork](#)
Use the `odacli delete-vnetwork` command to delete a virtual network configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

odacli create-vnetwork

Use the `odacli create-vnetwork` command to create a new network on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli create-vnetwork -n name -if interface-name -t type -br bridge -g gateway
-ip IP-address -nm netmask -u uniform -vlan VLAN-network ID [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the virtual network name.
<code>--interface-name, -if</code>	Specifies the the network interface on the host. This can be physical interface or bonded interface.
<code>--type, -t</code>	Specifies the virtual network type. Values are bridged or bridged-vlan.
<code>--bridge, -br</code>	(Optional) Specifies the name of the bridge.
<code>--gateway, -gw</code>	(Optional) Specifies the virtual network gateway
<code>--ip, -ip</code>	(Optional) Specifies the virtual network addresses. For more than one address, use the format " <i>node0_ip,node1_ip,...</i> ".
<code>--netmask, -nm</code>	(Optional) Specifies the virtual network netmask
<code>--uniform, -u</code>	(Optional) Specifies whether the virtual network is created on both nodes in a high-availability deployment
<code>--vlan-id, -vlan</code>	(Optional) Specifies the VLAN network ID
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

If you did not specify the IP address, or netmask, or gateway during vnetwork creation, then you can add them later using the `odacli modify-vnetwork` command.

Example

Create a VM network of type `bridged` using the interface `btbond2`.

```
# odacli create-vnetwork -n vnet1 -if btbond2 -type bridged
```

odacli list-vnetworks

Use the `odacli list-vnetworks` command to list all virtual networks on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli list-vnetworks [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

```
# odacli list-vnetworks
```

odacli describe-vnetwork

Use the `odacli describe-vnetwork` command to describe virtual networks on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli describe-vnetwork -n [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the name of the virtual network.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example: Describing a VM Network named `vnet1`

```
# odacli describe-vnetwork -n vnet1
```

odacli start-vnetwork

Use the `odacli start-vnetwork` command to start a virtual network on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli start-vnetwork -n name [-j] [-h]
```

Parameters

Parameter	Description
--name, -n	Specifies the virtual machine name to be stopped
--json, -j	(Optional) Displays output in JSON format.
--help, -h	(Optional) Displays help for using the command.

Example

Start a virtual network named `vnet1`.

```
# odacli start-vnetwork -n vnet1
```

odacli stop-vnetwork

Use the `odacli stop-vnetwork` command to stop a virtual network on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli stop-vnetwork -n name [-j] [-h]
```

Parameters

Parameter	Description
--name, -n	Specifies the virtual network to be stopped
--json, -j	(Optional) Displays output in JSON format.
--help, -h	(Optional) Displays help for using the command.

Example

Stop a virtual network named `vnet1`.

```
# odacli stop-vnetwork -n vnet1
```

odacli modify-vnetwork

Use the `odacli modify-vnetwork` command to modify a network on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli modify-vnetwork -n name -if -t -br -gw -ip -nm -u -vlan [-j] [-h]
```

Parameters

Parameter	Description
--name, -n	Specifies the virtual network name.
--gateway, -gw	(Optional) Specifies the virtual network gateway

Parameter	Description
<code>--ip, -ip</code>	(Optional) Specifies the virtual network addresses. For more than one address, use the format " <i>node0_ip,node1_ip,...</i> ". Specify the value as <code>none</code> to remove the IP address.
<code>--netmask, -nm</code>	(Optional) Specifies the virtual network netmask
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Modify a VM network to specify the gateway.

```
# odacli modify-vnetwork -n vnet1 -g 10.11.44.41
```

odacli delete-vnetwork

Use the `odacli delete-vnetwork` command to delete a virtual network configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli delete-vnetwork -n name [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the vnetwork name to be deleted
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Delete a VM network named `vnet1`.

```
# odacli delete-vnetwork -n vnet1
```

odacli Virtual Machine Commands for Oracle KVM

Use the `odacli virtual machine` commands to manage virtual machines on Oracle Database Appliance for Oracle KVM.

- [odacli create-vm](#)
Use the `odacli create-vm` command to create a new virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli list-vm](#)
Use the `odacli list-vm` command to list all virtual machines on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

- [odacli describe-vm](#)
Use the `odacli describe-vm` command to describe a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli modify-vm](#)
Use the `odacli modify-vm` command to modify a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli start-vm](#)
Use the `odacli start-vm` command to start a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli stop-vm](#)
Use the `odacli stop-vm` command to stop a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli migrate-vm](#)
Use the `odacli migrate-vm` command to migrate a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli clone-vm](#)
Use the `odacli clone-vm` command to clone a virtual machine configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli delete-vm](#)
Use the `odacli delete-vm` command to delete a virtual machine configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

odacli create-vm

Use the `odacli create-vm` command to create a new virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli create-vm -n name -m memory -src source -vc vcpus -vms vmstorage -cp
cpupool -d description -g graphics
-mm max-mem-size -mvc max-vcpu-count -ost os-type -osv os_variant -pn
preferred_node -s disk_size -vd vdisks
-vn virtual_networks -esrc extra_srcs [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the VM name
<code>--memory, -m</code>	Specifies the size of the VM memory. The format is "value_unit". Unit is M G.
<code>--source, -src</code>	Specifies the source installation. If local, it can be an ISO or a bootable disk image. If remote, it can be an URI pointing to an install tree hosted remotely over HTTP, HTTPS, FTP or NFS.
<code>--vcpus, -vc</code>	Specifies the number of vCPUs to use.
<code>--vmstorage, -vms</code>	Specifies the VM storage name
<code>--cpupool, -cp</code>	(Optional) Specifies the CPU pool name
<code>--extra-srcs, -esrc</code>	(Optional) Specifies the extra sources for the guest VM that are mounted as CDROM devices

Parameter	Description
<code>--description, -d</code>	(Optional) Specifies the VM description
<code>--extra-args, -ea</code>	(Optional) Specifies the extra arguments for the VM installer.
<code>--graphics, -g</code>	(Optional) Specifies the graphics settings for the VM
<code>--max-memory, -mm</code>	(Optional) Specifies the maximum size of the VM memory. The format is "value_unit". Unit is M G.
<code>--max-vcpus, -mvc</code>	(Optional) Specifies the maximum number of VCPUs
<code>--os-variant, -osv</code>	(Optional) Specifies the operating system variant. Use the command <code>osinfo-query os</code> to get the list of the accepted OS variants.
<code>--pref-node, -pn</code>	(Optional) Specifies the preferred node to run the VM
<code>--size, -s</code>	(Optional) Specifies the size of the VM. The format is "value_unit". Unit is K M G T.
<code>--vdisks, -vd</code>	(Optional) Specifies the names of the vdisks to use
<code>--vnetworks, -vn</code>	(Optional) Specifies the names of the virtual networks to use
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- Use the `--extra-args` parameter to add kickstart configuration file, kernel parameters for example, serial console. For example: `--extra-args "console=tty0 console=ttyS0,115200 ks=http://192.168.122.100:80/ks.txt"`

Example

Create a VM named `vm1` with 8 vcpus and 8 GB memory. The VM is stored in the VM Storage `vms1`. The source used for the installation is located on `/u01/OL7.iso`.

```
# odacli create-vm -n vm1 -vc 8 -m 8G -vms vs1 -src /u01/OL7.iso
```

Example

If the installation source is located through network, the network configuration of the VM must be provided by `--extra-args` so that the network can be setup at the bootstrap of the VM, to reach the installation source over the network. For example, to create a VM from source `https://example.com/iso/OracleLinux/OL7/u9/x86_64/OracleLinux-R7-U9-Server-x86_64-dvd/`:

```
# odacli create-vm -vn pubnet -m 4G -vc 8 -src https://example.com/iso/OracleLinux/OL7/u9/x86_64/OracleLinux-R7-U9-Server-x86_64-dvd/ -vd vmstorage_vdisk2 -vms vmstore -g vnc,listen=0.0.0.0,port=5949 -n vm1 -s 20G --extra-args "dns=<dns_server_ip_addr> ip=<vm1_ip_addr>:<gateway_ip>:<netmask>:<vm1_hostname>:ens3:none"
```

odacli list-vms

Use the `odacli list-vms` command to list all virtual machines on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli list-vms [-j] [-h]
```

Parameters

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

```
# odacli list-vms
```

odacli describe-vm

Use the `odacli describe-vm` command to describe a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli describe-vm -n name [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the name of the virtual machine.
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example: Describing a Virtual Machine named `vm1`

```
# odacli describe-vm -n vm1
```

odacli modify-vm

Use the `odacli modify-vm` command to modify a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli modify-vm -n name -as -en -bo boot_option -cfg -avd attach_vdisks -avn attach_vnetworks -dev device -d description -dn -dvd detach_vdisk -dvn detach_vnetworks -mm max-memory -mvc max-vcpus -m memory -no-cp -pn preferred-node -vc vcpu_count -di disk-increment -en -fo -g graphics -l -no-as [-f] [-g] [-j] [-h]
```

Parameters

Parameter	Description
--name, -n	Specifies the VM name
--autostart, -as	(Optional) Specifies if the auto-start option must be set for the VM
--no-autostart, -no-as	(Optional) Disables the auto-start option for the VM
--boot-option, -bo	(Optional) Specifies the the boot option to use
--config, -cfg	(Optional) Specifies whether the changes persist.
--live, -l	(Optional) Indicates whether the specified changes take place live (true) or after the next boot (false). Default is false
--enable-numa, -en	(Optional) Enables NUMA configuration for the VM.
--disable-numa, -dn	(Optional) Disables NUMA configuration for the VM.
--cpu-pool, -cp	(Optional) Specifies the CPU pool name
--description, -d	(Optional) Specifies the VM description
--failover, -fo	(Optional) Specifies the configuration for the failover
--no-failover, -no-fo	(Optional) Specifies the configuration for the failover
--vcpus, -vc	(Optional) Specifies the number of vCPUs.
--memory, -m	(Optional) Specifies the memory size of the VM. The format is "value_unit". Unit is M G.
--max-memory, -mm	(Optional) Specifies the maximum memory size of the VM. The format is "value_unit". Unit is M G.
--max-vcpus, -mvc	(Optional) Specifies the maximum number of vCPUs.
--no-cpupool, -no-cp	(Optional) Dissociates the associated CPU Pool
--detach-vdisk, -dvd	(Optional) Specifies the names of the virtual disks to detach
--detach-vnetworks, -dvn	(Optional) Specifies the names of the virtual networks to detach
--pref-node, -pn	(Optional) Specifies the preferred node to run the VM
--disk-increment, -di	Specifies the change in size of the VM. The format is "value_unit". Unit is K M G T.
--attach-vdisks, -avd	(Optional) Specifies the names of the vdisks to attach
--attach-vnetworks, -avn	(Optional) Specifies the names of the virtual networks to attach
--device, -dev	(Optional) Modifies the device as specified in the expression: Where device_expression = [vdisk=vdisk_name,] [bus=bus_type,][target=target_device] vdisk_name: If specified, must refer to an attached vDisk name. Otherwise it refers to the VM image. bus_type: The value can be ide, virtio, scsci, fdc, xen, usb, sata or sd. target_device: Must be a device name compatible with the bus_type. For example: vda, hda, sda.
--force, -f	(Optional) Specifies to force the operation.
--graphics, -g	(Optional) Defines the graphics settings for the VM. The supported graphics setting is VNC. For example, vnc,listen=127.0.0.1,port=5901.

Parameter	Description
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Tips

- `--live`: The change is applied to the running VM instance, but does not persist after the VM stops.
- `--enable-numa`: Use this option to enable NUMA for an existing VM.
- `--config`: The change persists in the configuration of VM instance and takes effect on subsequent reboots.
- If neither `--live` or `--config` is specified, then the default behavior is `--config`.
- You can specify both the `--live` or `--config` options if you want the modification to take effect immediately and on subsequent boots.
- When an application VM is created, a default network interface is created by default in the VM. This interface is attached to the default kvm bridge (`virbr0`) at the host. This interface is intended for convenient communication between the host and VM. This interface does not attach to any physical network interface at the host. Do not configure this interface to use for any external communication.
- You must create a vnetwork using the command `odacli create-vnetwork` and attach the vnetwork (`odacli modify-vm -avn`) to the VM. This creates a second interface in the VM. Configure this network interface for your network requirement.
- The network interface name in the VM depends on the operating system.

Modifying CPU Count and Memory for a VM

Update the configuration of a VM named `vm1`, setting the CPU count to 6 and the maximum memory to 6 gigabytes on both the running VM and subsequent boots.

```
# odacli modify-vm -n vm1 -vc 6 -mm 6G --live --config
```

Enabling NUMA

Use `--enable-numa` to enable NUMA for the VM configuration. The command `odacli modify-dbsystem --enable-numa` is only supported on application VMs with even number of CPU cores so that CPU cores can be evenly distributed to NUMA nodes. In Oracle Database Appliance, one CPUcore is equal to 2 vCPU. For more information, see *About Enabling NUMA on Oracle Database Appliance*.

```
# odacli modify-vm --name name --enable-numa
```

Modifying a VM to attach a vnetwork

Modify a VM to attach a vnetwork:

```
# odacli modify-vm -n vm_name -avn vnetwork_name
```

Modifying a VM to change the bus type for the VM image

Modify the bus type for the VM image from virtio to ide. This is useful when the VM image does not support the virtio driver, for example, a Windows VM without virtio driver installed:

```
# odacli modify-vm -dev "bus=ide" -n winvm
```

Use the `odacli modify-dbsystem` command to modify a database system on Oracle Database Appliance Kernel-based Virtual Machine (KVM).
- [odacli create-cpupool](#)
Use the `odacli create-cpupool` command to create a new CPU pool on Oracle Database Appliance Bare Metal or Kernel-based Virtual Machine (KVM) deployment.

odacli start-vm

Use the `odacli start-vm` command to start a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli start-vm -n name -nn [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the virtual machine name to be stopped
<code>--node-name, -nn</code>	(Optional) Specifies the node name where the virtual machine will be started
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Usage Notes

- If `pref-node` is defined for the VM, then the VM starts on the `pref-node`. If `pref-node` is not defined for the VM, then the VM can start on any node, in a high-availability deployment.
- If you specify the node name `-n`, then the VM starts on the specified node, even if the preferred node is defined.

Example

Start a virtual machine named `vm1`.

```
# odacli start-vm -n vm1
```

odacli stop-vm

Use the `odacli stop-vm` command to stop a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli stop-vm -n name [-f] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the virtual machine name to be stopped
<code>--force, -f</code>	(Optional) Specifies the force option
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Stop a virtual machine named `vm1`.

```
# odacli stop-vm -n vm1
```

odacli migrate-vm

Use the `odacli migrate-vm` command to migrate a virtual machine on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli migrate-vm -n name -to node [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the virtual machine name to be migrated
<code>--target-node, -to</code>	Specifies the destination node
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Migrate a virtual machine named `vm1` to node `n1`.

```
odacli migrate-vm -n vm1 -to n1
```

odacli clone-vm

Use the `odacli clone-vm` command to clone a virtual machine configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
# odacli clone-vm -n name_of_vm_to_clone_from -cn clone_name [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the virtual machine name to be cloned
<code>--clone-name, -cn</code>	Specifies the name of the cloned virtual machine
<code>--description, -d</code>	(Optional) Specifies the description of the virtual machine
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Create a clone of a virtual machine named `vm1`, with the name `vm1_clone`. The cloned VM is created on the same storage as `vm1`.

```
# odacli clone-vm -n vm1 -cn vm1_clone
```

odacli delete-vm

Use the `odacli delete-vm` command to delete a virtual machine configuration on Oracle Database Appliance Kernel-based Virtual Machine (KVM).

Syntax

```
odacli delete-vm -n name [-f] [-j] [-h]
```

Parameters

Parameter	Description
<code>--name, -n</code>	Specifies the virtual machine name to be deleted
<code>--force, -f</code>	(Optional) Specifies the force option
<code>--json, -j</code>	(Optional) Displays output in JSON format.
<code>--help, -h</code>	(Optional) Displays help for using the command.

Example

Delete a virtual machine named `vm1`.

```
odacli delete-vm -n vm1
```

Configuring and Using Oracle Auto Service Request (Oracle ASR)

Configure and use Oracle ASR to automatically generate a service request for specific hardware faults.

- [About Configuring Oracle ASR](#)
Configure Oracle Auto Service Request (Oracle ASR) to automatically generate service requests for specific hardware faults.
- [Configuring Internal Oracle ASR](#)
Use the Browser User Interface (BUI) to configure Oracle Auto Service Request (Oracle ASR) in Oracle Database Appliance.
- [Registering with External Oracle ASR Manager](#)
Use the Browser User Interface to register Oracle Database Appliance with an existing Oracle Auto Service Request (Oracle ASR) Manager.
- [Testing Oracle ASR](#)
Use the `odacli test-asr` command to confirm that your Oracle ASR configuration is working.
- [Managing an Oracle ASR Configuration](#)
Use the command-line to review an existing configuration, make changes to a configuration, or delete a configuration.
- [Additional Resources for Oracle ASR](#)
Refer to these sections for more information about Oracle ASR.

About Configuring Oracle ASR

Configure Oracle Auto Service Request (Oracle ASR) to automatically generate service requests for specific hardware faults.

Oracle ASR is a secure support feature that can improve system availability through expedited diagnostics and priority service request handling. You can configure Oracle ASR on Oracle Database Appliance to use its own ASR Manager (**internal Oracle ASR**) or use Oracle ASR Manager configured on another server in the same network as your appliance (**external Oracle ASR**). If you already have Oracle ASR Manager configured in your environment, you can register Oracle Database Appliance with your existing Oracle ASR Manager.

 **Note:**

With an internal Oracle ASR Manager, an alert is not sent when the server goes down. If a critical event occurs on Oracle Database Appliance with an external Oracle ASR Manager, then an alert can still be sent to Oracle.

You can configure Oracle ASR as part of deploying the appliance, or you can use the Browser User Interface (BUI) or command-line interface to configure or edit an Oracle ASR after deployment.

You need the following items to support Oracle ASR:

- Oracle Database Appliance hardware must be associated with a Support Identifier (SI) in My Oracle Support.
- If a proxy server is required for Internet access to Oracle, then you must also provide the name of the proxy server. You can optionally configure Oracle ASR to use Simple Network Management Protocol (SNMP) Version 3.
- To configure an internal Oracle ASR Manager, you need a My Oracle Support account user name (e-mail address) and password associated with the My Oracle Support account under which the server is registered.
- To register with an external Oracle ASR Manager, you need the IP address of the Oracle ASR Manager.

Related Topics

- [Configuring Internal Oracle ASR](#)
Use the Browser User Interface (BUI) to configure Oracle Auto Service Request (Oracle ASR) in Oracle Database Appliance.
- [Configuring External Oracle ASR](#)
Use the Browser User Interface to register Oracle Database Appliance with an existing Oracle Auto Service Request (Oracle ASR) Manager.
- [odacli configure-asr](#)

Configuring Internal Oracle ASR

Use the Browser User Interface (BUI) to configure Oracle Auto Service Request (Oracle ASR) in Oracle Database Appliance.

You can register with an internal Oracle ASR Manager at any time, or edit an existing registration. Before configuring, verify that the Oracle Database Appliance hardware is associated with a Support Identifier (SI) in My Oracle Support.

You need the following information to configure Oracle ASR:

- The e-mail address associated with the My Oracle Support account under which the server is registered
- The password associated with the My Oracle Support account under which the server is registered
- If a proxy server is required for Internet access to Oracle, then you must also provide the name of the proxy server

1. Open a browser and enter the following URL to access BUI:

```
https://ip-address:7093/mgmt/index.html
```

2. Login as `oda-admin`.
3. Click the **Appliance** tab.
4. Click the Oracle ASR menu.

5. If Oracle ASR is already configured, then in the Configure ASR page, provide the Oracle ASR configuration values.
6. Select **Internal** in the **ASR Type** field.
7. In the **ASR User Name** field, enter e-mail address associated with the My Oracle Support account under which the server is registered.
8. In the **ASR Password** field, enter the password associated with the My Oracle Support account under which the server is registered.
9. Select **V2** or **V3** for the **SNMP Version**. V3 is the default and recommended version.
10. Specify the **SNMP User Name** and **SNMP Password**.
11. (Optional) If you are using an HTTP Proxy for upload to Oracle ASR, complete the following:
 - a. **HTTP Proxy used for Upload to ASR:** Select **Yes**.
 - b. **Proxy User Name:** If you are using a proxy for upload, enter the proxy user name.
 - c. **Proxy Port:** If you are using a proxy for upload, enter the proxy port.
 - d. **(Optional) HTTP Proxy Requires Authentication:** If you are using a proxy for upload, select **Yes** if you require authentication. If you do not require authentication, select **No**.
 - e. **(Optional) Proxy Password:** If you are using a proxy for upload and require authentication, enter the proxy password.
12. Click **Create**.

Registering with External Oracle ASR Manager

Use the Browser User Interface to register Oracle Database Appliance with an existing Oracle Auto Service Request (Oracle ASR) Manager.

You can register with an external Oracle ASR Manager at any time.

Before configuring, verify that the Oracle Database Appliance hardware is associated with a Support Identifier (SI) in My Oracle Support.

To configure Oracle ASR, you need the IP Address for the Oracle ASR Manager:

1. Open a browser and enter the following URL to access BUI:
`https://ip-address:7093/mgmt/index.html`
2. Login as `oda-admin`.
3. Click the **Appliance** tab.
4. Click the Oracle ASR menu.
5. If Oracle ASR is already configured, then in the Configure ASR page, provide the Oracle ASR configuration values.
6. Select **External** from the ASR Type menu.
7. Enter the IP Address for the Oracle ASR Manager in the ASR Manager IP field.
8. Select **V2** or **V3** for the **SNMP Version**. V3 is the default and recommended version.
9. Specify the **SNMP User Name** and **SNMP Password**.
10. Click **Create**.

Testing Oracle ASR

Use the `odacli test-asr` command to confirm that your Oracle ASR configuration is working.

When you run the command, a test alert is sent to Oracle ASR manager from both Oracle ILOM and the host registered with Oracle ASR. The registered email ID receives an email about the test alert for the registered Oracle ILOM and host.

Attempting to test the configuration outside of the `odacli test-asr` command might not provide the expected test result.

1. Log in as `root` user.
2. Run the `odacli test-asr` command.

```
# odacli test-asr

Job details
-----
                ID: 51522c07-1b32-4874-9bc7-bbee5885f1e5
Description: Test ASR
              Status: Success
              Created: October 20, 2022 1:02:49 PM UTC
              Message:

Task Name Start Time End Time Status
-----
Test ASR October 20, 2022 1:02:50 PM UTC October 20, 2022 1:02:50
PM UTC Success
```

3. If the results are not as expected, then use the `odacli show-asr` command to review your Oracle ASR configuration.

Managing an Oracle ASR Configuration

Use the command-line to review an existing configuration, make changes to a configuration, or delete a configuration.

You can view and edit the configuration details, but you cannot change the Oracle ASR type. For example, from internal to external. To change the Oracle ASR type, delete the existing configuration and then re-configure Oracle ASR.

All log files for Oracle ASR are located in the `/var/opt/asrmanager/log/` directory.

1. To display Oracle Auto Service Request (Oracle ASR) configuration details, use the `odacli describe-asr` command.

```
# odacli describe-asr

ASR details
-----
```

```
ID: e841d74a-687b-4e87-9548-1baa2090d48e
Name: UserName: scott.tiger@example.com
ProvyServerName: www-proxy.example.com
ProxyPort: 80
ProxyUserName:
SnmpVersion: V3
State: N/A
Created: July 15, 2022 8:53:54 AM PST
Updated: July 15, 2022 8:53:54 AM PST
```

2. (Optional) To make changes to Oracle ASR configuration details after deploying the appliance, use the `odacli update-asr` command.
3. (Optional) To remove the Oracle ASR configuration from the system, use the `odacli delete-asr` command.

```
# odacli delete-asr
{
  "jobId" : "5d70bd17-ec4a-48da-8196-1364105db99d",
  "status" : "Running",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : 1469409622451,
  "description" : "Delete ASR",
  "updatedAtTime" : 1469409622458
}
```

- [Preparing Log Files for Oracle Support Services](#)
If you have a system fault that requires help from Oracle Support Services, then you may need to provide log records to help Oracle support diagnose your issue.

Viewing Oracle Database Appliance Error Correlation Reports

Understand how to view Error Correlation Report and how to interpret the report to troubleshoot your appliance.

About Error Correlation Reports

If a DCS job fails, an Error Correlation job is created automatically to generate an Error Correlation report. You can access and review the generated Error Correlation report from the BUI to explore possible ways of error resolution.

The Error Correlation Report contains the following:

- **Log Messages:** Errors, exceptions and warnings from various log files.
- **Failed Task Messages:** Error message displayed when the DCS job failed.
- **Release Notes:** Relevant Known Issues from *Oracle Database Appliance Release Notes* to help resolve the issue.
- **Documentation:** Relevant topics from the Oracle Database Appliance Documentation Library to help resolve the error.

The Error Correlation Report is generated for every failed DCS job and can be accessed from the BUI. On Oracle Database Appliance high-availability deployments, the Error Correlation report contains the error information derived from log files of both the nodes.

Viewing Error Correlation Reports using ODA CLI Commands

You can view the Error Correlation report of a failed DCS job by running the `odacli describe-job -i failed_dcs_job_id --ecr` command. For an example output, see the topic *odacli describe-job* in this guide.

Viewing Error Correlation Reports from the BUI

To view the Error Correlation Report from the Activities page in the BUI:

1. Log into the Browser User Interface:

```
https://host-ip-address:7093/mgmt/index.html
```

2. Click the **Activity** tab.
3. In the Activities page, click the **Failure** or **InternalError** link in the failed DCS job for which you want to view the Error Correlation report. Note that only failed DCS jobs have associated Error Correlation Reports.
4. You can also view the Error Correlation Report for the failed DCS job when you click the **Actions** menu, and select **View Error Correlation Report**.
5. The Error Correlation Report contains the following tabs:
 - **Log Messages:** Displays the logs for DCS agent, DCS admin, Oracle HAMI, MySQL, and Oracle FPP. You can expand each section to view the details. Only components that have logs are displayed. If no errors are found, then the

message No errors or exceptions found in logs is displayed in the Log Messages section.

- **Failed Task Messages:** Displays the specific error message displayed when the task failed.
- **Release Notes:** Displays relevant Known Issues from *Oracle Database Appliance Release Notes* to help resolve the issue. You can click each of these links to view the Release Notes entry. If no relevant Known issues are found, then the message No matching results were found. is displayed.
- **Documentation:** Displays relevant topics from the Oracle Database Appliance Documentation Library to help resolve the error. You can click each of these links to view the documentation topic from the Oracle Database Appliance documentation.

To view the Error Correlation Report from the Diagnostics page in the BUI:

1. In the BUI, click the **Diagnostics** tab.
2. In the Diagnostics page, click **Collect Diagnostic Data** for a failed job.
3. The Collect Diagnostics page displays the Error Correlation Report and Job Details in separate tabs for the failed DCS job. Click the **Report File Name** link to download the Error Correlation Report to your local system.
4. The Job details tab displays the steps in the job and the Error Correlation Report contains the **Log Messages**, **Failed Task Messages**, **Release Notes**, and **Documentation** tabs.

Use the `odacli describe-job` command to display details about a specific job, including the job ID, status, tasks, and the job created date and time stamp.

About Enabling Linux Kernel Core Extractor for Troubleshooting

Understand how to manage Linux Kernel Core Extractor to troubleshoot your appliance.

About Linux Kernel Core Extractor

A Linux kernel panic can occur due to various reasons such as faulty hardware, driver crashes, or software bugs. To identify the cause of kernel panic, it is essential to collect and analyze the vmcore of the crashed kernel. The kdump service is used to collect the vmcore after the first kernel crash. This process is slow for systems with high memory and often fails to generate vmcore when the available space is not sufficient. When Linux Kernel Core Extractor is enabled on Oracle Database Appliance bare metal systems, the crash utility in the kdump kernel collects useful information for troubleshooting without generating vmcore.

Linux Kernel Core Extractor Commands

List generated crash reports:

```
# /usr/sbin/oled lkce list
Followings are the crash*out found in /var/oled/lkce dir:
/var/oled/lkce/crash_20220307-154542.out
```

Purge existing all but last three crash reports:

```
# /usr/sbin/oled lkce clean
lkce deletes all but last three /var/oled/lkce/crash*out files. do you
want to proceed(yes/no)? [no]:
```

Purge all crash reports:

```
# /usr/sbin/oled lkce clean --all
lkce removes all the files in /var/oled/lkce dir. do you want to
proceed(yes/no)? [no]:
```

By default, the crash report contains output for the following crash commands. You can add other crash commands to the `/etc/oled/lkce/crash_cmds_file`.

```
#
# This is the input file for crash utility. You can edit this manually
# Add your own list of crash commands one per line.
#
bt
bt -a
bt -FF
dev
kmem -s
foreach bt
log
mod
mount
net
ps -m
ps -S
runq
quit
```

By default, vmcore generation is disabled. You can enable vmcore generation as follows:

```
# oled lkce configure --vmcore=yes
Restarting kdump service... done!
lkce: set vmcore to yes
```

For additional Linux Kernel Core Extractor commands, refer to the Linux Kernel Core Extractor help.

```
# oled lkce help
Usage: lkce options
options:
  report report-options -- Generate a report from vmcore
  report-options:
    --vmcore=/path/to/vmcore      - path to vmcore
    [--vmlinux=/path/to/vmlinux]  - path to vmlinux
    [--crash_cmds=cmd1,cmd2,cmd3,..] - crash commands to include
```

```
    [--outfile=/path/to/outfile]      - write output to a file

configure [--default]  -- configure lkce with default values
configure [--show]    -- show lkce configuration -- default
configure [config-options]
config-options:
    [--vmlinux_path=/path/to/vmlinux] - set vmlinux_path
    [--crash_cmds_file=/path/to/file]  - set crash_cmds_file
    [--kdump_report=yes/no]            - set crash report in kdump kernel
    [--vmcore=yes/no]                  - set vmcore generation in kdump kernel
    [--max_out_files=<number>]         - set max_out_files

enable  -- enable lkce in kdump kernel
disable -- disable lkce in kdump kernel
status  -- status of lkce

clean [--all]  -- clear crash report files
list          -- list crash report files
```

Viewing Details About DCS Error Messages

Understand how to view details about DCS errors for troubleshooting them.

About Viewing Information About DCS Errors

To view more details about any errors during DCS operations, use the command `dc serr error_code`.

```
# /opt/oracle/dcs/bin/dcserr
dc serr error_code

# dc serr 10001
10001, Internal_Error, "Internal error encountered: {0}."
// *Cause: An internal error occurred.
// *Action: Contact Oracle Support Services for assistance.
/
# dc serr 1001
Unknown error code
```

To view more details about DCS errors in the Browser User Interface (BUI), you can provide the DCS error code in the Search box in the BUI. The Search results display the Cause and Action of DCS error codes.

Collecting Diagnostics Data Using the BUI

Understand how to collect diagnostics data to troubleshoot errors.

About Collecting Diagnostics Data

Use the **Diagnostics** tab in the Browser User Interface to view diagnostic information about your deployment and the installed components.

In the Diagnostic Collection page, you can view the available diagnostics collections. Click **Collect Diagnostic Data** to start diagnostics collection. Once the data is collected, click on the collection file path to download the file.

In the Collect Diagnostics page, specify the Job ID for the diagnostics data collection. Optionally, specify a tag and a description for the collection. The details of the Job ID are displayed. Click **Collect** to start the diagnostics data collection.

You can also collect diagnostics from the Activity page, by selecting **Collect Diagnostics** from the **Actions** drop down for a specific job. Click **Collect** to start the diagnostics data collection.

To delete a diagnostic collection, from the Diagnostic Collection page, select the specific collection, and click **Delete**.

This diagnostic collection feature does not replace the `odaadmcli manage diagcollect` command. You can use the `odaadmcli manage diagcollect` command also to enable diagnostics collections, independently of this new feature from the BUI. The `odaadmcli manage diagcollect` command and the diagnostics collection from BUI use the `tfactl` command internally. The diagnostics collection from BUI is aimed to collect other data from DCS metadata that is not collected through `tfactl` and provide greater context for root cause analysis of related DCS jobs failures.

Resolving Errors When Updating DCS Components During Patching

Understand how to troubleshoot errors when updating DCS components during patching.

About DCS Components

When you run the `odacli update-dcscomponents` command during patching, pre-checks for MySQL installation are automatically verified before update of Oracle HAMI, MySQL, and DCS components. If any of the pre-checks fail, then the command errors out with a reference to the pre-check report log file location `/opt/oracle/dcs/log/jobfiles/jobId/dcscomponentsPreCheckReport.log`. Review the pre-check report and take corrective actions and then rerun the `odacli update-dcscomponents` command. If there are no pre-check errors, then the patching process proceeds with updating Oracle HAMI, MySQL, and DCS components such as the DCS Agent, DCS CLI, and DCS Controller.

Note:

Run the `odacli update-dcsadmin` command prior to running the `odacli update-dcscomponents` command.

When the `odacli update-dcscomponents` command completes successfully:

The command output is as follows:

```
# ./odacli update-dcscomponents -v 19.20.0.0.0
{
  "jobId" : "3ac3667a-fa22-40b6-a832-504a56aa3fdc",
  "status" : "Success",
  "message" : "Update-dcscomponents is successful on all the node(s):DCS-
Agent
shutdown is successful. MySQL upgrade is done before. Metadata migration is
successful. Agent rpm upgrade is successful. DCS-CLI rpm upgrade is
successful.
DCS-Controller rpm upgrade is succ",
  "reports" : null,
  "createTimestamp" : "August 8, 2023 02:37:37 AM CST",
  "description" : "Update-dcscomponents job completed and is not part of
Agent
job list",
  "updatedAtTime" : "August 8, 2023 02:39:10 AM CST"
}
```

The pre-check report log file at the location `/opt/oracle/dcs/log/jobfiles/jobId/dcscomponentsPreCheckReport.log` contains the following:

```
Pre-check Name: Space check
Status: Success
Comments: Required space 3 GB is available in /opt

Pre-check Name: Port check
Status: Success
Comments: Port 3306 is available for running ODA MySQL

Pre-check Name: ODA MySQL rpm installation dry-run check
Status: Success
Comments: ODA MySQL rpm dry-run passed

Pre-check Name: Check for the existence of MySQL connector/J library
Status: Success
Comments: ODA MySQL connector/J library found

Pre-check Name: Check for the existence of Metadata migration utility
Status: Success
Comments: Metadata migration utility found

dcs-admin version:
Pre-check Name: dcs-admin version validation
Status: Success
Comments: dcs-admin is already updated :19.20.0.0.0

Config File Exist dcscontroller:
Pre-check Name: Check DCS config files exists for dcscontroller
Status: Success
```

Comments: Files /opt/oracle/dcs/conf/dcs-controller.yml and /opt/oracle/dcs/conf/dcs-controller-logback.xml exist

Config File Exist dcsagent:

Pre-check Name: Check DCS config files exists for dcsagent

Status: Success

Comments: Files /opt/oracle/dcs/conf/dcs-agent.yml and /opt/oracle/dcs/conf/dcs-agent-logback.xml exist

Validate scheduler cron expressions:

Pre-check Name: Validate scheduler cron expressions

Status: Success

Comments: Scheduler cron expressions for existing job schedules are up to date

When the `odacli update-dcscomponents` command fails:

On Oracle Database Appliance single-node systems, the command output is as follows:

```
# ./odacli update-dcscomponents -v 19.20.0.0.0

DCS-10008:Failed to update DCSComponents: 19.19.0.0.0
Internal error while patching the DCS components :
DCS-10231:Cannot proceed. Pre-checks for update-dcscomponents failed.
Refer to
/opt/oracle/dcs/log/jobfiles/jobId/dcscomponentsPreCheckReport.log
on node 0 for details.
```

On Oracle Database Appliance high-availability systems, the command output is as follows:

```
# ./odacli update-dcscomponents -v 19.20.0.0.0

Internal error while patching the DCS components :
DCS-10231:Cannot proceed. Pre-checks for update-dcscomponents failed.
Refer to
/opt/oracle/dcs/log/jobfiles/jobId/dcscomponentsPreCheckReport.log
on node 0 and /opt/oracle/dcs/log/jobfiles/jobId/
dcscomponentsPreCheckReport.log
on node 1 for details.
```

The command runs all pre-checks one by one, and errors out at the end if any of the pre-checks is marked as Failed. When a pre-check fails, the error message is displayed on to the console along with the reference to pre-check report log location. The pre-check report log file is at the location `/opt/oracle/dcs/log/jobfiles/jobId/dcscomponentsPreCheckReport.log`.

Pre-check Name: Space check

Status: Failed

Comments: Available space in /opt is 2 GB but minimum required space in /opt is 3 GB

Pre-check Name: Port check
Status: Success
Comments: Port 3306 is available for running ODA MySQL

Pre-check Name: ODA MySQL rpm installation dry-run check
Status: Success
Comments: ODA MySQL rpm dry-run passed

Pre-check Name: Check for the existence of MySQL connector/J library
Status: Success
Comments: ODA MySQL connector/J library found

Status: Success
Comments: Scheduler cron expressions for existing job schedules are up to date

When the `odacli update-dcscomponents` command displays a warning due to scheduler cron expression:

When patching from Oracle Database Appliance release 19.19 or earlier to the latest release, and you run the `odacli update-dcscomponents` command, there may be a warning in the precheck report log file if the default cron expressions from the existing list of job schedules are modified. The pre-check report log contains the following:

Pre-check Name: Space check
Status: Success
Comments: Required space 3 GB is available in /opt

Pre-check Name: Port check
Status: Success
Comments: Port 3306 is available for running ODA MySQL

Pre-check Name: ODA MySQL rpm installation dry-run check
Status: Success
Comments: ODA MySQL rpm dry-run passed

Pre-check Name: Check for the existence of MySQL connector/J library
Status: Success
Comments: ODA MySQL connector/J library found

Pre-check Name: Check for the existence of Metadata migration utility
Status: Success
Comments: Metadata migration utility found

dc-admin version:
Pre-check Name: dcs-admin version validation
Status: Success
Comments: dcs-admin is already updated :19.20.0.0.0

Config File Exist dcscontroller:
Pre-check Name: Check DCS config files exists for dcscontroller
Status: Success
Comments: Files /opt/oracle/dcs/conf/dcs-controller.yml and /opt/oracle/dcs/conf/dcs-controller-logback.xml exist

Config File Exist dcsagent:
Pre-check Name: Check DCS config files exists for dcsagent
Status: Success
Comments: Files /opt/oracle/dcs/conf/dcs-agent.yml and /opt/oracle/dcs/conf/dcs-agent-logback.xml exist

Validate scheduler cron expressions:
Pre-check Name: Validate scheduler cron expressions
Status: Warning
Comments: Following cron expressions in the scheduler were modified from their default values. Starting 19.20, DCS Agent converts 7 fields cron expression into 6 fields cron expression. No further action

```
needed.  
Schedule ID : 3f671ee7-1a03-43fd-b98b-ce33eb09de08 , Custom cron  
expression : 10  
25 * 1/1 * ? 2023
```

Note that the `Status: Warning` means the `update-dcscomponents` pre-check has detected custom cron expressions from the existing list of job schedules. The DCS agent automatically converts from the 7 fields custom cron expression to the equivalent 6 fields cron expression after patching DCS components.

Viewing Component Information on the Appliance

View details of all the components installed on the appliance, and the RPM drift information.

Collecting and Viewing the Bill of Materials in the Browser User Interface

Use the Appliance tab in the Browser User Interface to collect and view information about your deployment and the installed components. The Advanced Information tab displays information about the following components:

- Grid Infrastructure Version, and the home directory
- Database Version, Home location, and Edition
- Location and details about the databases configured
- All patches applied to the appliance
- Firmware Controller and Disks
- ILOM information
- BIOS version
- List of RPMs

In the List of RPMs section, click **Show** and then click **RPM Drift** to view the differences between the RPMs installed on the appliance, and the RPMs shipped in the latest Oracle Database Appliance Patch Bundle Update release.

Click **Collect Bill of Materials** to initiate a collection and submit the job. The job ID is displayed. After the collection is complete, click **Refresh** to refresh the information.

Click **Download** to save the components report. You can use this report to help diagnose any deployment issues.

Viewing the Bill of Materials from the Command Line

The bill of materials is also available through the command line for bare metal and virtualized platforms deployments. The information about the installed components is collected according to a set schedule, and stored in the location `/opt/oracle/dcs/Inventory/` for bare metal deployments and in the `/opt/oracle/oak/Inventory/` directory for virtualized platforms. The file is stored in the format `oda_bom_TimeStamp.json`. Use the command `describe-system` to view the bill of materials on the command line. See the *Oracle Database Command-Line Interface* chapter for command options and usage notes.

Example 18-1 Example Command to View the Bill of Materials from the Command Line for Bare Metal Deployments

```

Errors When Logging into the Browser User Interface

If you have problems logging into the Browser User Interface, then it may be due to your browser or credentials.

**Note:**

Oracle Database Appliance uses self-signed certificates. Your browser determines how you log into the Browser User Interface. Depending on the browser and browser version, you may receive a warning or error that the certificate is invalid or not trusted because it is self-signed, or that the connection is not private. Ensure that you accept the self-signed certificate for the agent and Browser User Interface.

Follow these steps to log into the Browser User Interface:

1. Open a browser window.
2. Go to the following URL: `https://ODA-host-ip-address:7093/mgmt/index.html`
3. Get the security certificate (or certificate), confirm the security exception, and add an exception.
4. Log in with your Oracle Database Appliance credentials.
If you have not already set the `oda-admin` password, then a message is displayed, advising you to change the default password to comply with your system security requirements.
5. If you have not added an exception for the agent security certificate, then a message about accepting agent certificate is displayed.
6. Using a different tab in your browser, go to the following URL: `https://ODA-host-ip-address:7070/login`
7. Get the security certificate (or certificate), confirm the security exception, and add an exception.
8. Refresh the Browser User Interface URL : `https://ODA-host-ip-address:7093/mgmt/index.html`

**Note:**

If you have any issues logging into the Oracle Database Appliance Browser User Interface on browsers such as macOS Catalina and Google Chrome, then you may need to use any workaround as described on the official site for the product.

Errors when re-imaging Oracle Database Appliance

Understand how to troubleshoot errors that occur when re-imaging Oracle Database Appliance.

If re-imaging Oracle Database Appliance fails, with old header issues such as errors in storage discovery, or in running GI root scripts, or disk group RECO creation, then use the force mode with `cleanup.pl`.

```
# cleanup.pl -f
```

To ensure that re-imaging is successful, remove the old headers from the storage disks by running the secure erase tool. Verify that the OAK/ASM headers are removed.

```
# cleanup.pl -erasedata  
# cleanup.pl -checkHeader
```

Retry the re-imaging operation.

Enable and disable trace file redaction, redact files, and show or hide sanitized entities using the Browser User Interface.
- [Sanitizing Sensitive Information in Oracle ORAchk Output](#)
You can sanitize Oracle ORAchk output.

About Installing Oracle Autonomous Health Framework

Oracle Autonomous Health Framework is installed automatically when you provision or patch to Oracle Database Appliance release 19.20.0.1.

When you provision or patch your appliance to Oracle Database Appliance release 19.20.0.1, Oracle Autonomous Health Framework is installed in the path `/opt/oracle/dcs/oracle.ahf`.

You can verify that Oracle Autonomous Health Framework is installed by running the following command:

```
[root@oak ~]# rpm -q oracle-ahf
oracle-ahf-193000-#####.x86_64
```

Note:

When you provision or patch to Oracle Database Appliance release 19.20.0.1, Oracle Autonomous Health Framework automatically provides Oracle ORAchk Health Check Tool and Oracle Trace File Analyzer Collector.

Oracle ORAchk Health Check Tool performs proactive health checks for the Oracle software stack and scans for known problems. Oracle ORAchk Health Check Tool

audits important configuration settings for Oracle RAC deployments in the following categories:

- Operating system kernel parameters and packages
- Oracle Database Database parameters, and other database configuration settings
- Oracle Grid Infrastructure, which includes Oracle Clusterware and Oracle Automatic Storage Management

Oracle ORAchk is aware of the entire system. It checks the configuration to indicate if best practices are being followed.

Oracle Trace File Collector provides the following key benefits and options:

- Encapsulation of diagnostic data collection for all Oracle Grid Infrastructure and Oracle RAC components on all cluster nodes into a single command, which you run from a single node
- Option to "trim" diagnostic files during data collection to reduce data upload size
- Options to isolate diagnostic data collection to a given time period, and to a particular product component, such as Oracle ASM, Oracle Database, or Oracle Clusterware
- Centralization of collected diagnostic output to a single node in Oracle Database Appliance, if desired
- On-Demand Scans of all log and trace files for conditions indicating a problem
- Real-Time Scan Alert Logs for conditions indicating a problem (for example, Database Alert Logs, Oracle ASM Alert Logs, and Oracle Clusterware Alert Logs)

Using the Oracle ORAchk Health Check Tool

Run Oracle ORAchk to audit configuration settings and check system health.

Note:

Before running ORAchk, check for the latest version of Oracle Autonomous Health Framework, and download and install it. See My Oracle Support Note 2550798.1 for more information about downloading and installing the latest version of Oracle Autonomous Health Framework.

Running ORAchk on Oracle Database Appliance 19.20.0.1 Baremetal Systems for New Installation

When you provision or upgrade to Oracle Database Appliance 19.20.0.1, ORAchk is installed using Oracle Autonomous Framework in the directory `/opt/oracle/dcs/oracle.ahf`.

To run orachk, use the following command:

```
[root@oak bin]# orachk
```

When all checks are finished, a detailed report is available. The output displays the location of the report in an HTML format and the location of a zip file if you want to upload the report. For example, you can choose the filter to show failed checks only, show checks with a Fail, Warning, Info, or Pass status, or any combination.

Review the Oracle Database Appliance Assessment Report and system health and troubleshoot any issues that are identified. The report includes a summary and filters that enable you to focus on specific areas.

Running ORAchk on Oracle Database Appliance 19.20.0.1 Virtualized Platform

When you provision or upgrade to Oracle Database Appliance 19.20.0.1, ORAchk is installed using Oracle Autonomous Framework in the directory `/opt/oracle.ahf`.

To run `orachk`, use the following command:

```
[root@oak bin]# oakcli orachk
```

Generating and Viewing Oracle ORAchk Health Check Tool Reports in the Browser User Interface

Generate Oracle ORAchk Health Check Tool reports using the Browser User Interface.

1. Log into the Browser User Interface with the `oda-admin` username and password.

```
https://Node0-host-ip-address:7093/mgmt/index.html
```

2. Click the **Monitoring** tab.

3. In the Monitoring page, on the left navigation pane, click **ORAchk Report**.

On the ORAchk Reports page, a list of all the generated ORAchk reports is displayed.

4. In the Actions menu for the ORAchk report you want to view, click **View**.

The Oracle Database Appliance Assessment Report is displayed. It contains details of the health of your deployment, and lists current risks, recommendations for action, and links for additional information.

5. **To create an on-demand ORAchk report:** On the ORAchk Reports page, click **Create** and then click **Yes** in the confirmation box.

The job to create an ORAchk report is submitted.

6. Click the link to view the status of the job. Once the job completes successfully, you can view the Oracle Database Appliance Assessment Report on the ORAchk Reports page.

7. **To delete an ORAchk report:** In the Actions menu for the ORAchk report you want to delete, click **Delete**.

Generating and Viewing Database Security Assessment Reports in the Browser User Interface

Generate and view Database Security Assessment Reports using the Browser User Interface.

1. Log into the Browser User Interface with the `oda-admin` username and password.

```
https://Node0-host-ip-address:7093/mgmt/index.html
```

2. Click the **Security** tab.
3. In the Security page, on the left navigation pane, click **DBSAT Reports**.
On the Database Security Assessment Reports page, a list of all the generated DBSAT reports is displayed.
4. In the Actions menu for the ORAchk report you want to view, click **View**.
The Oracle Database Security Assessment Report is displayed. It contains details of the health of your deployment, and lists current risks, recommendations for action, and links for additional information.
5. **To create a DBSAT report:** On the DBSAT Reports page, click **Create** and then click **Yes** in the confirmation box.
The job to create a DBSAT report is submitted.
6. Click the link to view the status of the job. Once the job completes successfully, you can view the Oracle Database Appliance Assessment Report on the DBSAT Reports page.
7. **To delete a DBSAT report:** In the Actions menu for the DBSAT report you want to delete, click **Delete**.

Running Oracle Trace File Analyzer (TFA) Collector Commands

Understand the installed location of `tfactl` and the options for the command.

About Using `tfactl` to Collect Diagnostic Information

When you provision or upgrade to Oracle Database Appliance 19.20.0.1, Oracle Trace File Analyzer (TFA) Collector is installed in the directory `/opt/oracle.ahf/bin/tfactl`. You can invoke the command line utility for TFA, `tfactl` from the directory `/opt/oracle.ahf/bin/tfactl`, or simply type `tfactl`.

You can use the following command options to run `tfactl`:

```
/opt/oracle.ahf/bin/tfactl diagcollect -ips|-oda|-odalite|-dcs|-odabackup|
-odapatching|-odadataguard|-odaprovisioning|-odaconfig|-odasystem|-
odastorage|-database|
-asm|-crsclient|-dbclient|-dbwlm|-tns|-rhp|-procinfo|-afd|-crs|-cha|-wls|
-emagent|-oms|-ocm|-emplugins|-em|-acfs|-install|-cfgtools|-os|-ashhtml|-
ashtext|
-awrhtml|-awrtext -mask -sanitize
```

Table 18-1 Command Options for `tfactl` Tool

Option	Description
<code>-h</code>	(Optional) Describes all the options for this command.
<code>-ips</code>	(Optional) Use this option to view the diagnostic logs for the specified component.

Table 18-1 (Cont.) Command Options for tfactl Tool

Option	Description
-oda	(Optional) Use this option to view the logs for the entire Appliance.
-odalite	(Optional) Use this option to view the diagnostic logs for the odalite component.
-dcs	(Optional) Use this option to view the DCS log files.
-odabackup	(Optional) Use this option to view the diagnostic logs for the backup components for the Appliance.
-odapatching	(Optional) Use this option to view the diagnostic logs for patching components of the Appliance.
-odadataguard	(Optional) Use this option to view the diagnostic logs for Oracle Data Guard component of the Appliance.
-odaprovisioning	(Optional) Use this option to view provisioning logs for the Appliance.
-odaconfig	(Optional) Use this option to view configuration-related diagnostic logs.
-odasystem	(Optional) Use this option to view system information.
-odastorage	(Optional) Use this option to view the diagnostic logs for the Appliance storage.
-database	(Optional) Use this option to view database-related log files.
-asm	(Optional) Use this option to view the diagnostic logs for the Appliance.
-crsclient	(Optional) Use this option to view the diagnostic logs for the Appliance.
-dbclient	(Optional) Use this option to view the diagnostic logs for the Appliance.
-dbwlm	(Optional) Use this option to view the diagnostic logs for the specified component.
-tns	(Optional) Use this option to view the diagnostic logs for TNS.
-rhp	(Optional) Use this option to view the diagnostic logs for Rapid Home Provisioning.
-afd	(Optional) Use this option to view the diagnostic logs for Oracle ASM Filter Driver.
-crs	(Optional) Use this option to view the diagnostic logs for Oracle Clusterware.
-cha	(Optional) Use this option to view the diagnostic logs for the Cluster Health Monitor.
-wls	(Optional) Use this option to view the diagnostic logs for Oracle WebLogic Server.
-emagent	(Optional) Use this option to view the diagnostic logs for the Oracle Enterprise Manager agent.

Table 18-1 (Cont.) Command Options for tfactl Tool

Option	Description
-oms	(Optional) Use this option to view the diagnostic logs for the Oracle Enterprise Manager Management Service.
-ocm	(Optional) Use this option to view the diagnostic logs for the specified component.
-emplugins	(Optional) Use this option to view the diagnostic logs for Oracle Enterprise Manager plug-ins.
-em	(Optional) Use this option to view the diagnostic logs for Oracle Enterprise Manager deployment.
-acfs	(Optional) Use this option to view the diagnostic logs for Oracle ACFS storage.
-install	(Optional) Use this option to view the diagnostic logs for installation.
-cfgtools	(Optional) Use this option to view the diagnostic logs for the configuration tools.
-os	(Optional) Use this option to view the diagnostic logs for the operating system.
-ashhtml	(Optional) Use this option to view the diagnostic logs for the specified component.
-ashtext	(Optional) Use this option to view the diagnostic logs for the Appliance.
-awrhtml	(Optional) Use this option to view the diagnostic logs for the Appliance.
-awrtext	(Optional) Use this option to view the diagnostic logs for the specified component.
-mask	(Optional) Use this option to choose to mask sensitive data in the log collection.
-sanitize	(Optional) Use this option to choose to sanitize (redact) sensitive data in the log collection.

Usage Notes

You can use Trace File Collector (the `tfactl` command) to collect all log files for the Oracle Database Appliance components.

You can also use the command `odaadmcli manage diagcollect`, with similar command options, to collect the same diagnostic information.

For more information about using the `-mask` and `-sanitize` options, see the next topic.

Sanitizing Sensitive Information in Diagnostic Collections

Oracle Autonomous Health Framework uses Adaptive Classification and Redaction (ACR) to sanitize sensitive data.

After collecting copies of diagnostic data, Oracle Trace File Analyzer and Oracle ORAchk use Adaptive Classification and Redaction (ACR) to sanitize sensitive data in the collections. ACR uses a Machine Learning based engine to redact a pre-defined set of entity types in a given

set of files. ACR also sanitizes or masks entities that occur in files and directory names. Sanitization replaces a sensitive value with random characters. Masking replaces a sensitive value with a series of asterisks ("**").

ACR currently sanitizes the following entity types:

- Host names
- IP addresses
- MAC addresses
- Oracle Database names
- Tablespace names
- Service names
- Ports
- Operating system user names

ACR also masks user data from the database appearing in block and redo dumps.

Example 18-4 Block dumps before redaction

```
14A533F40 00000000 00000000 00000000 002C0000 [.....,..]
14A533F50 35360C02 30352E30 31322E37 380C3938 [..650.507.2189.8]
14A533F60 31203433 37203332 2C303133 360C0200 [34 123 7310,..6]
```

Example 18-5 Block dumps after redaction

```
14A533F40 ***** ***** ***** ***** [*****]
14A533F50 ***** ***** ***** ***** [*****]
14A533F60 ***** ***** ***** ***** [*****]
```

Example 18-6 Redo dumps before redaction

```
col 74: [ 1] 80
col 75: [ 5] c4 0b 19 01 1f
col 76: [ 7] 78 77 06 16 0c 2f 26
```

Example 18-7 Redo dumps after redaction

```
col 74: [ 1] **
col 75: [ 5] ** ** ** ** ** 
col 76: [ 7] ** ** ** ** ** ** ** ** ** ** ** ** **
```

Redaction of Literal Values in SQL Statements in AWR, ASH and ADDM Reports

Automatic Workload Repository (AWR), Active Session History (ASH), and Automatic Database Diagnostic Monitor (ADDM) reports are HTML files, which contain sensitive entities such as hostnames, database names, and service names in the form of HTML tables. In addition to these sensitive entities, they also contain SQL statements, that can contain bind variables or literal values from tables. These literal values can be sensitive personal information (PI) stored in databases. ACR processes such reports to identify and redact both usual sensitive entities and literal values present in the SQL statements.

Sanitizing Sensitive Information Using odaadmcli Command

Use the `odaadmcli manage diagcollect` command to collect diagnostic logs for Oracle Database Appliance components. During collection, ACR can be used to redact (sanitize or mask) the diagnostic logs.

```
odaadmcli manage diagcollect [--dataMask|--dataSanitize]
```

In the command, the `--dataMask` option blocks out the sensitive data in all collections, for example, replaces `myhost1` with `*****`. The default is `None`. The `--dataSanitize` option replaces the sensitive data in all collections with random characters, for example, replaces `myhost1` with `orzhmvl`. The default is `None`.

Enabling Adaptive Classification and Redaction (ACR)

Oracle Database Appliance supports Adaptive Classification and Redaction (ACR) to sanitize sensitive data.

After collecting copies of diagnostic data, Oracle Database Appliance use Adaptive Classification and Redaction (ACR) to sanitize sensitive data in the collections. You can use the commands `odacli enable-acr` and `odacli disable-acr` to enable or disable ACR across both nodes, not just on the local node.

See Also:

For more information about setting up the staging server for Adaptive Classification and Redaction (ACR), see My Oracle Support note 2882798.1.

Example 18-8 Describing current status of ACR

```
bash-4.2# odacli describe-acr
Trace File Redaction: Enabled
```

Example 18-9 Enabling ACR:

```
bash-4.2# odacli enable-acr

Job details
-----
ID: 12bbf784-610a-40a8-b409-e74c58bc35aa
Description: Enable ACR job
Status: Created
Created: April 8, 2021 3:04:13 AM PDT
```

Example 18-10 Disabling ACR

```
bash-4.2# odacli disable-acr

Job details
-----
```

```
ID: 1d69f8b3-3989-4192-bbb9-6518e425061a
Description: Disable ACR job
Status: Created
Created: April 8, 2021 3:04:13 AM PDT
```

Example 18-11 Enabling ACR during provisioning of the appliance

You can enable ACR during provisioning of the appliance by adding the `acr` option to the JSON file used for provisioning. Specify `true` or `false` for the field `acrEnable` in the JSON file. If the `acr` option is not specified, then ACR is disabled.

```
"acr": {
  "acrEnable": true
}
```

Sanitizing Sensitive Information in Oracle Trace File Analyzer Collections

You can redact (sanitize or mask) Oracle Trace File Analyzer diagnostic collections.

Enabling Automatic Redaction

To enable automatic redaction, use the command:

```
tfactl set redact=[mask|sanitize|none]
```

In the command, the `-mask` option blocks out the sensitive data in all collections, for example, replaces `myhost1` with `*****`. The `-sanitize` option replaces the sensitive data in all collections with random characters, for example, replaces `myhost1` with `orzhmvl`. The `none` option does not mask or sanitize sensitive data in collections. The default is `none`.

Enabling On-Demand Redaction

You can redact collections on-demand, for example, `tfactl diagcollect -srdc ORA-00600 -mask` or `tfactl diagcollect -srdc ORA-00600 -sanitize`.

1. To mask sensitive data in all collections:

```
tfactl set redact=mask
```

2. To sanitize sensitive data in all collections:

```
tfactl set redact=sanitize
```

Example 18-12 Masking or Sanitizing Sensitive Data in a Specific Collection

```
tfactl diagcollect -srdc ORA-00600 -mask
tfactl diagcollect -srdc ORA-00600 -sanitize
```

Redacting and Sanitizing Entities in the BUI

Enable and disable trace file redaction, redact files, and show or hide sanitized entities using the Browser User Interface.

1. Log into the Browser User Interface with the `oda-admin` username and password.

```
https://Node0-host-ip-address:7093/mgmt/index.html
```

2. Click the **Security** tab.
3. In the Security page, on the left navigation pane, click **Trace File Redaction**.
4. Click the **Trace File Redaction Status** tab.
The current ACR status is displayed.
5. You can enable or disable ACR status based on the current ACR status. For example, if the ACR status is disabled, then click **Enable** to enable ACR. The job to change the ACR status is submitted.
6. Click **Refresh Status** to refresh the ACR status display.
7. Click the **Redact Files** tab.
8. Specify the **Input File Path** of the file to be redacted. The file must be in the `.tar`, or `.gz`, or `.zip` file format.
9. Select either **Sanitize** or **Mask** for the **Redaction Mode**.
10. Click **Redact**. The job to redact files is submitted.
11. Click the **Show Sanitized Entities** tab.
12. Specify the **List of sanitized entities** and click **Show**. The list of sanitized entities are displayed.

Sanitizing Sensitive Information in Oracle ORAchK Output

You can sanitize Oracle ORAchK output.

To sanitize Oracle ORAchK output, include the `-sanitize` option, for example, `orachk -profile asm -sanitize`. You can also sanitize post process by passing in an existing log, HTML report, or a zip file, for example, `orachk -sanitize file_name`.

Example 18-13 Sanitizing Sensitive Information in Specific Collection IDs

```
orachk -sanitize comma_delimited_list_of_collection_IDs
```

Example 18-14 Sanitizing a File with Relative Path

```
orachk -sanitize new/orachk_node061919_053119_001343.zip
orachk is sanitizing
/scratch/testuser/may31/new/orachk_node061919_053119_001343.zip. Please
```

```
wait...

Sanitized collection is:
/scratch/testuser/may31/orachk_aydv061919_053119_001343.zip
orachk -sanitize ../orachk_node061919_053119_001343.zip
orachk is sanitizing
/scratch/testuser/may31/./orachk_node061919_053119_001343.zip. Please
wait...

Sanitized collection is:
/scratch/testuser/may31/orachk_aydv061919_053119_001343.zip
```

Example 18-15 Sanitizing Oracle Autonomous Health Framework Debug Log

```
orachk -sanitize new/orachk_debug_053119_023653.log
orachk is sanitizing /scratch/testuser/may31/new/
orachk_debug_053119_023653.log.
Please wait...

Sanitized collection is: /scratch/testuser/may31/
orachk_debug_053119_023653.log
```

Example 18-16 Running Full Sanity Check

```
orachk -localonly -profile asm -sanitize -silentforce

Detailed report (html) -
/scratch/testuser/may31/orachk_node061919_053119_04448/
orachk_node061919_053119_04448.html

orachk is sanitizing /scratch/testuser/may31/
orachk_node061919_053119_04448.
Please wait...

Sanitized collection is: /scratch/testuser/may31/
orachk_aydv061919_053119_04448

UPLOAD [if required] - /scratch/testuser/may31/
orachk_node061919_053119_04448.zip
```

To reverse lookup a sanitized value, use the command:

```
orachk -rmap all|comma_delimited_list_of_element_IDs
```

You can also use `orachk -rmap` to lookup a value sanitized by Oracle Trace File Analyzer.

Example 18-17 Printing the Reverse Map of Sanitized Elements

```
orachk -rmap MF_NK1, fcb63u2
```

```
| Entity Type | Substituted Entity Name | Original Entity Name |
```

```
| dbname      | MF_NK1          | HR_DB1          |
| dbname      | fcb63u2         | rac12c2         |
```

```
orachk -rmap all
```

Running the Disk Diagnostic Tool

Use the Disk Diagnostic Tool to help identify the cause of disk problems.

The tool produces a list of 14 disk checks for each node. To display details, where *n* represents the disk resource name, enter the following command:

```
# odaadmcli storddiag n
```

For example, to display detailed information for NVMe *pd_00*:

```
# odaadmcli storddiag pd_00
```

Running the Oracle Database Appliance Hardware Monitoring Tool

The Oracle Database Appliance Hardware Monitoring Tool displays the status of different hardware components in Oracle Database Appliance server.

The tool is implemented with the Trace File Analyzer collector. Use the tool both on bare-metal and on virtualized systems. The Oracle Database Appliance Hardware Monitoring Tool reports information only for the node on which you run the command. The information it displays in the output depend on the component that you select to review.

Bare Metal Platform

You can see the list of monitored components by running the command `odaadmcli show -h`

To see information about specific components, use the command syntax `odaadmcli show component`, where *component* is the hardware component that you want to query. For example, the command `odaadmcli show power` shows information specifically about the Oracle Database Appliance power supply:

```
# odaadmcli show power
```

```
NAME           HEALTH HEALTH_DETAILS PART_NO.    SERIAL_NO.
Power_Supply_0 OK          -           7079395    476856Z+1514CE056G
```

```
(Continued)
```

```

LOCATION      INPUT_POWER  OUTPUT_POWER  INLET_TEMP
EXHAUST_TEMP
PS0          Present      112 watts     28.000 degree C   34.938
degree C

```

Virtualized Platform

You can see the list of monitored components by running the command `oakcli show -h`

To see information about specific components, use the command syntax `oakcli show component`, where *component* is the hardware component that you want to query. For example, the command `oakcli show power` shows information specifically about the Oracle Database Appliance power supply:

```
# oakcli show power
```

```

NAME          HEALTH HEALTH_DETAILS PART_NO. SERIAL_NO.
Power Supply_0 OK      -              7047410 476856F+1242CE0020
Power Supply_1 OK      -              7047410 476856F+1242CE004J

```

(Continued)

```

LOCATION      INPUT_POWER  OUTPUT_POWER  INLET_TEMP          EXHAUST_TEMP
PS0          Present      88 watts     31.250 degree C    34.188 degree C
PS1          Present      66 watts     31.250 degree C    34.188 degree C

```

Note:

Oracle Database Appliance Server Hardware Monitoring Tool is enabled during initial startup of ODA_BASE on Oracle Database Appliance Virtualized Platform. When it starts, the tool collects base statistics for about 5 minutes. During this time, the tool displays the message "Gathering Statistics..." message.

Configuring a Trusted SSL Certificate for Oracle Database Appliance

The Browser User Interface and DCS Controller use SSL-based HTTPS protocol for secure communication. Understand the implications of this added security and the options to configure SSL certificates.

The Browser User Interface provides an added layer of security using certificates and encryption, when an administrator interacts with the appliance. Encryption of data ensures that:

- Data is sent to the intended recipient, and not to any malicious third-party.
- When data is exchanged between the server and the browser, data interception cannot occur nor can the data be edited.

When you connect to the Browser User Interface through HTTPS, the DCS Controller presents your browser with a certificate to verify the identity of appliance. If the web browser finds that the certificate is not from a trusted Certificate Authority (CA), then the browser assumes it has encountered an untrusted source, and generates a security alert message. The security alert dialog boxes display because Browser User Interface security is enabled through HTTPS and SSL, but you have not secured your Web tier properly with a trusted matching certificate from a Certificate Authority. It is possible to purchase commercial certificates from a Certificate Authority or create your own and register them with a Certificate Authority. However, the server and browser certificates must use the same public certificate key and trusted certificate to avoid the error message produced by the browser.

To configure your certificates, create your own key and Java keystore, ensure it is signed by a Certificate Authority (CA) and then import it for use.

 **Note:**

For Oracle Database Appliance High-Availability hardware models, run the configuration steps on **both** nodes.

- [Creating a Key and Java Keystore and Importing a Trusted Certificate](#)
Use `keytool`, a key and certificate management utility, to create a keystore and a signing request.
- [Configuring the DCS Server to Use Custom Keystore](#)
After packaging or converting your keystore into Java keystore, configure the DCS server to use your keystore.
- [Configuring the DCS Agent for Custom Certificate](#)
After you import the certificate into the keystore, configure the DCS agent to use the same certificate.

Creating a Key and Java Keystore and Importing a Trusted Certificate

Use `keytool`, a key and certificate management utility, to create a keystore and a signing request.

1. Create the keystore:

```
keytool -genkeypair -alias your.domain.com -storetype jks -keystore
your.domain.com.jks -validity 366 -keyalg RSA -keysize 4096
```

2. The command prompts you for identifying data:

1. What is your first and last name? *your.domain.com*
2. What is the name of your organizational unit? *yourunit*
3. What is the name of your organization? *yourorg*
4. What is the name of your City or Locality? *yourcity*
5. What is the name of your State or Province? *yourstate*
6. What is the two-letter country code for this unit? *US*

3. Create the certificate signing request (CSR):

```
keytool -certreq -alias your.domain.com -file your.domain.com.csr
-keystore your.domain.com.jks -ext san=dns:your.domain.com
```

4. Request a Certificate Authority (CA) signed certificate:

a. In the directory where you ran Step 1 above, locate the file *your.domain.com.csr*.

b. Submit the file to your Certificate Authority (CA).

Details vary from one CA to another. Typically, you submit your request through a website. Then the CA contacts you to verify your identity. CAs can send signed reply files in a variety of formats, and CAs use a variety of names for those formats. The CA's reply must be in PEM, PKCS#7, or P7B format.

c. There may be a waiting period for the CA's reply.

5. Import the CA's reply. The CA's reply will provide one PKCS file, or P7B file, or multiple PEM files.

a. Copy the CA's files into the directory where you created the keystore in Step 1 above.

b. Use `keytool` to import the keystore certificate and the CA reply files:

To import the P7B file, run the command:

```
keytool -importcert -alias your.domain.com -file CAreply.p7b -
keystore your.domain.name.jks -trustcacerts
```

To import the PKCS file, run the command:

```
keytool -importcert -trustcacerts -alias your.domain.com -file
CAreply.pkcs -keystore /opt/oracle/dcs/conf/dcs-ca-certs
```

CAreply.pkcs is the name of the PKCS file provided by the CA and *your.domain.com* is the complete domain name of your server.

If the CA sent PEM files, then there may be one file, but most often there are two or three. Import the files to your keystore with commands in the order shown below, after substituting your values:

```
keytool -importcert -alias root -file root.cert.pem -
keystore /opt/oracle/dcs/conf/dcs-ca-certs -trustcacerts
keytool -importcert -alias intermediate -file
intermediate.cert.pem /opt/oracle/dcs/conf/dcs-ca-certs -
trustcacerts
keytool -importcert -alias intermediat2 -file
intermediat2.cert.pem /opt/oracle/dcs/conf/dcs-ca-certs -
trustcacerts
keytool -importcert -alias your.domain.com -file
server.cert.pem /opt/oracle/dcs/conf/dcs-ca-certs -trustcacerts
```

root.cert.pem is the name of the root certificate file and *intermediate.cert.pem* is the name of the intermediate certificate file. The

root and intermediate files link the CA's signature to a widely trusted root certificate that is known to web browsers. Most, but not all, CA replies include roots and intermediates. *server.cert.pem* is the name of the server certificate file. The file links your domain name with your public key and the CA's signature.

Configuring the DCS Server to Use Custom Keystore

After packaging or converting your keystore into Java keystore, configure the DCS server to use your keystore.

1. Login to the appliance.

```
ssh -l root oda-host-name
```

2. Generate the obfuscated keystore password:

```
/opt/oracle/dcs/java/java_version/bin/java -cp /opt/oracle/dcs/bin/dcs-controller-n.n.n.n.n.jar com.oracle.oda.dcs.password.utils.OBFCredentials keystore-password
```

For example:

```
# /opt/oracle/dcs/java/java_version/bin/java -cp /opt/oracle/dcs/bin/dcs-controller-19.20.0.0.0.jar com.oracle.oda.dcs.password.utils.OBFCredentials test OBF:"1z0f1vu91vv11z0f"
```

Copy the obfuscated password that starts with OBF:.

3. Update the following in `/opt/oracle/dcs/conf/dcs-controller.yml`:

```
ssl:
  key-store:
    path: file:/opt/oracle/dcs/conf/custom_dcsKey.jks
    type: "JKS"
    password: "obfuscated keystorepassword"
  trust-store:
    path: file:/opt/oracle/dcs/conf/dcs-ca-certs
  key:
    alias: "your.domain.com"
```

4. Restart the DCS controller.

```
systemctl stop initdcscontroller
systemctl start initdcscontroller
```

The DCS controller log file `/opt/oracle/dcs/log/dcs-controller.log` displays the following lines:

```
2022-05-13 04:23:37,266 INFO [main] [] c.o.o.c.DCSControllerSSLConfig: Custom keystore password is set
```

```
2022-05-13 04:23:37,266 INFO [main] []  
c.o.o.c.DCSControllerSSLConfig: Custom truststore password is set
```

5. Access the Browser User Interface at `https://oda-host-name:7093/mgmt/index.html`.

Configuring the DCS Agent for Custom Certificate

After you import the certificate into the keystore, configure the DCS agent to use the same certificate.

1. Update the DCS agent configuration file:

```
cd /opt/oracle/dcs/conf
```

Update the following parameters in the `dcs-agent.yml` file:

```
ssl:  
  key-store:  
    path: file:/opt/oracle/dcs/conf/custom_dcsKey.jks  
    type: "JKS"  
    password: "obfuscated keystorepassword"  
  trust-store:  
    path: file:/opt/oracle/dcs/conf/dcs-ca-certs  
  key:  
    alias: "your.domain.com"
```

2. Restart the DCS agent:

```
systemctl stop initdcsagent  
systemctl start initdcsagent
```

3. Access the agent at `https://oda-host-name:7070`.
4. Update the CLI certificates.

```
cp -f /opt/oracle/dcs/conf/dcs-ca-certs /opt/oracle/dcs/dcscli/dcs-ca-certs
```

5. Update the DCS command-line configuration files:

```
[root@]# cd /opt/oracle/dcs/dcscli
```

Update the following parameters in `dcscli-adm.conf` and `dcscli.conf`:

```
TrustStorePath=/opt/oracle/dcs/dcscli/dcs-ca-certs  
TrustStoreKeyPassword=keystore_password
```

Disabling the Browser User Interface

You can also disable the Browser User Interface. Disabling the Browser User Interface means you can only manage your appliance through the command-line interface.

1. Log in to the appliance:

```
ssh -l root oda-host-name
```

2. Stop the DCS controller. For High-Availability systems, run the command on both nodes.

```
systemctl stop initdcscontroller
```

Preparing Log Files for Oracle Support Services

If you have a system fault that requires help from Oracle Support Services, then you may need to provide log records to help Oracle support diagnose your issue.

You can collect diagnostic information for your appliance in the following ways:

- Use the Bill Of Materials report saved in the `/opt/oracle/dcs/Inventory/` directory, to enable Oracle Support to help troubleshoot errors, if necessary.
- You can use Trace File Collector (the `tfactl` command) to collect all log files for the Oracle Database Appliance components.
- Use the command `odaadmcli manage diagcollect` to collect diagnostic files to send to Oracle Support Services.
- Use the Error Correlation report available in the `/opt/oracle/dcs/da/da_repo` directory.

The `odaadmcli manage diagcollect` command consolidates information from log files stored on Oracle Database Appliance into a single log file for use by Oracle Support Services. The location of the file is specified in the command output.

Example 18-18 Collecting log file information for a time period, masking sensitive data

```
# odaadmcli manage diagcollect --dataMask --fromTime 2019-08-12 --toTime  
2019-08-25  
DataMask is set as true  
FromTime is set as: 2019-08-12  
ToTime is set as: 2019-08-25  
TFACTL command is: /opt/oracle/tfa/tfa_home/bin/tfactl  
Data mask is set.  
Collect data from 2019-08-12  
Collect data to 2019-08-25
```

Directory Paths for Oracle Database Appliance

Understand the storage and mount configuration file paths for Oracle Database Appliance.

Oracle homes on Oracle Database Appliance follow Optimal Flexible Architecture guidelines.

Directory Paths for Oracle Database Appliance

Item	Directory Path
Grid home	<i>/u01/app/release-specific_name/gi owner</i>
Grid base	<i>/u01/app/gi owner</i>
Oracle home	<i>/u01/app/odaorahome/rdbms owner/ product/rdbms_version/ dbhome_home_sequence_number</i>
Oracle base	<i>/u01/app/odaorabase/rdbms owner</i>
Oracle Inventory	<i>/u01/app/oraInventory</i>
Java Runtime Environment (JRE)	<i>/opt/oracle/dcs/java/ release_specific_JRE_version/</i>
Java SDK	<i>/opt/oracle/dcs/odajavasdk/</i>
Oracle ACFS file system	<i>/opt/oracle/oak/pkgrepos/orapkg/clones</i> Starting with Oracle Database Appliance release 19.12, a new Oracle ACFS file system is created to store the Oracle Database and Oracle Grid Infrastructure clone files. The DATA disk group provides a space of 150 GB for the file system.

Port Numbers and Protocols of Oracle Database Appliance Components

Understand the port numbers and protocols of Oracle Database Appliance components.

Table A-1 Port Numbers and Protocols of Oracle Database Appliance Components

Component	Description	Default Port Number	Protocol	Network
BUI	A web-based application to administer and manage the Oracle Database Appliance.	7093	TCP	public
dcs-agent	The DCS agent is a REST application that performs various operations on the appliance.	7070, 7071	TCP	public and private
dcs-admin	This application performs lifecycle management operations on the DCS agent, DCS controller, ODA CLI, and other components.	7060	TCP	public and private
MySQL	The metadata store used by DCS agent.	3306	TCP	private
Oracle HAMI	Oracle High Availability Metadata Infrastructure service providing distributed services required by DCS including locking and synchronizing configuration details in the cluster.	22001	TCP	private
oakd	Managing the storage components of Oracle Database Appliance.	Dynamic	TCP	private

Table A-1 (Cont.) Port Numbers and Protocols of Oracle Database Appliance Components

Component	Description	Default Port Number	Protocol	Network
Oracle ASR Manager	Oracle Auto Service Request. Refer to Oracle Auto Service Request documentation for other ports used by ASR Manager.	16161	TCP	public
Oracle ILOM/IPMI	Oracle ILOM for Oracle Database Appliance servers.	623	UDP	public
Oracle Database listeners	Database listeners, including local listener and SCAN listener.	1521	TCP	public
Oracle ASM Listener	Oracle ASM listener	1525	TCP	private
EM Express	Oracle Enterprise Manager Database Express (EM Express).	5500 and increment one per database	TCP	public
ssh	SSH connection to the Oracle Database Appliance servers.	22	SSH over TCP	public and private
VNC Server	The VNC server created by KVM for KVM virtual guest machines	5900+	TCP	localhost (127.0.0.1)
NFS	The central repository on bare metal system is shared by the DB Systems using NFS. Refer to the Oracle Linux documentation to identify ports used by NFS.	2049 - nfs	TCP	private

Note: IP addresses of the private network that Oracle Database Appliance uses are 192.168.16.0/24 and 192.168.17.0/24.

Oracle Real Application Clusters Installation Guide for Linux and UNIX for port numbers and protocols used by Oracle Database components

Location of Log Files

Log files are available for actions performed in the command-line interface and Browser User Interface and are useful when you need to track and debug jobs.

You can also use the Oracle Appliance Manager Browser User Interface to view job activity, including the tasks that make up the job. The status of each task appears in the Browser User Interface and you can drill down to get greater details.

If you log a Service Request, upload all of the logs in the `/opt/oracle/dcs/log`, `/opt/oracle/dcs/da/da_repo`, and `/opt/oracle/dcs/dcscli/log` directories.

Patching Log Files

All patching-related information is logged in the `dcs-agent` log in the directory `/opt/oracle/dcs/log/`.

Error Correlation Reports

If a DCS job fails, an Error Correlation report is generated and is available in the `/opt/oracle/dcs/da/da_repo` directory.

DCS Agent Log Directories

Agent-specific activities are logged in the `dcs-agent` log.

The DCS Agent, controller, and command-line interface output are stored in the directory `/opt/oracle/dcs/log/`.

If an error occurs in the command-line interface layer, then the output will show in the `/opt/oracle/dcs/dcscli/log/dcscli.log` file first.

DCS Components Log Directories

The Oracle HAMI logs are stored in the directory `/opt/oracle/hami/base`, `/opt/oracle/hami/obase`, and `/opt/oracle/dcs/hami/log`. The Oracle HAMI logs are `hamiws_pid_n.trc`, `hamictl_timestamp_pid.log`, and `hamiwsmkwallets_pid.trc`.

The MySQL logs are stored in the log `/opt/oracle/dcs/mysql/log/mysqlldb.log`. The log contains information about MySQL such as startup, shutdown, connection transaction details, and errors encountered when running MySQL.

Storage Logs

Storage-related activity is logged in the `oakd` log file.

`/opt/oracle/oak/log/hostname/oak/oakd.log`

For example, `/opt/oracle/oak/log/myhost/oak/oakd.log`

Use the `odaadmcli manage diagcollect` command to collect diagnostic logs for storage components. The files are saved in the `oakdiag` directory.

`/opt/oracle/oak/log/hostname/oakdiag/file name.tar.gz`

For example, `/opt/oracle/oak/log/myhost/oakdiag/oakStorage-myhost-20161120_2217.tar.gz`

Upgrade using Data Preserving Re provisioning Logs

The `odaupgradeutil` utility logs are stored at `opt/oracle/oak/restore/log`.

Database Logs

Online logs are stored in the `/u03/app/db_user/redo/` directory.

Oracle Fast Recovery Area (FRA) is located in the `/u03/app/db_user/fast_recovery_area` directory.

Database alert logs are stored in the location `$ORACLE_BASE/diag/rdbms/database_unique_name`.

Oracle Auto Service Request (Oracle ASR) Log Files

All log files for Oracle ASR are located in the `/var/opt/asrmanager/log/` directory.

Oracle Groups and User Configurations for Oracle Database Appliance

Review the groups and default users created when you deploy the appliance. All passwords are set to the password that you define during deployment.

Default Operating System Groups and User Configurations

Table A-2 Default Operating System Groups and Users Configuration for Oracle Database Appliance

Groups and Users	Default Value
Oracle Grid Infrastructure installation owner	grid, UID 1001
Oracle Database installation owner	oracle, UID 1000
Oracle Database system administrator	sys
Oracle Database generic administrator	system

Table A-2 (Cont.) Default Operating System Groups and Users Configuration for Oracle Database Appliance

Groups and Users	Default Value
Oracle Inventory system privileges group	oinstall, GID 1001
Oracle ASM Administrators system privileges	asmadmin, GID 1004
Oracle ASM Users system privileges	asmdba, GID 1006
Oracle ASM Operator system privileges	asmoper, GID 1005
Oracle Database Administrators system privileges	dba, GID 1003
Oracle Database Operator system privileges	dbaoper, GID 1002

Oracle Groups and User Configurations

You can use the Browser User Interface or the `odacli create-appliance` command and a JSON file to deploy the appliance. The following configurations are supported:

- 2 Users with 6 groups (operating system role separation)
- Single User with 6 groups (no operating system role separation)
- Single user with 2 groups (no operating system role separation)

You can customize `groupname`, `username`, and `UID`.

Review the table for the approximate amount of usable space for high performance and high capacity storage on Oracle Database Appliance X10-HA.
- [Usable Free Space with Oracle ASM](#)
When Oracle ASM calculates usable Free Space, it determines the amount of space to reserve in the case of a disk failure.

About Database File Storage

Use Oracle Automatic Storage Management (Oracle ASM) or Oracle Automatic Storage Management Cluster File System (Oracle ACFS) for database files storage.

Database file systems are used exclusively for storing database files, and they include separate file systems for data files and archive files or backups. You determine the type of database storage when you create the database.

About Oracle ASM Database Storage

With Oracle ASM, database datafiles are stored in DATA disk group. On X8-2, X7-2S, X7-2M, and X6-2 S/M/L systems, which do not have REDO disk group, redo and archive files are stored in RECO disk group. X7-2-HA and other older High-Availability systems have dedicated disks for REDO disk group; redo logs are stored in the REDO disk group.

Reserved storage is the amount of Oracle Automatic Storage Management (Oracle ASM) storage required to restore redundancy in the event of a disk failure. If you use the reserve storage capacity, then the system continues to run, and it is protected through Oracle ASM mirroring. However, in the event of a disk failure, the system is then running in a non-protected and degraded mode. In this event, you must replace disks immediately. If there is no reserved space available, then rebalance cannot restore redundancy after a disk failure.

If you specify mirroring for a file, then Oracle ASM automatically stores redundant copies of the file extents in separate failure groups. Failure groups apply to normal, high, and flex redundancy disk groups. You can define the failure groups for each disk group when you create or alter the disk group.

 **See Also:**

Oracle Automatic Storage Management Administrator's Guide in the Oracle Database documentation library for information about Oracle ASM Mirroring and Disk Group Redundancy.

About Oracle ACFS Database Storage

With Oracle ACFS, an Oracle ACFS file system is created from DATA disk group for each database to store datafiles, and an Oracle ACFS file system is created from RECO disk group for redo and fast recovery area for all databases.

Each database created under ACFS has its own mount points, `/u02/app/oracle/oradata/dbid`. When you delete a database, you should clean up the files.

Storage Configuration Options

When Oracle Database Appliance is deployed, you can configure how the storage capacity is shared between DATA disk group and RECO disk group. You can choose anywhere from 10% to 90% for DATA and the remainder for RECO. The amount of usable storage is determined by the percentage configured for DATA. You can run the command `asmcmd lsdg` to determine the usable storage on the DATA disk group. You can also run the command `odacli list-dbstorages` command to determine the storage available.

Oracle ACFS Mount Points and Storage Space

Review Oracle ASM Cluster file system (ACFS) mount points for Oracle Database Appliance.

If you select Oracle Automatic Storage Management (Oracle ASM) for database storage when you create a database, then an Oracle ASM Cluster file system (ACFS) is not created. All files are in an Oracle ASM disk group.

If you select Oracle ACFS for database storage, then each database has its own Oracle ACFS mount point:

- DATA disk group: `/u02/app/oracleuser/oradata/db_name`
- RECO disk group: `/u03/app/oracleuser`.
- REDO disk group: `/u04/app/oracleuser/redo/db_name`

With Oracle ACFS, the following are created:

- A 100G ACFS is created from +DATA diskgroup for each database. This Oracle ACFS automatically extends the space on demand.
- A common Oracle ACFS with 25% of +RECO diskgroup is created with auto extension on. This file system is used for fast recovery area.

- For Oracle Database Appliance single-node and High-Availability High Performance systems, the REDO volume is created on the RECO disk group. For Oracle Database Appliance High-Availability High Capacity system, the REDO volume is created on FLASH disk group. The REDO volume stores redo logs.

Table B-1 Oracle ACFS Mount Points and Related Oracle ASM Disk Groups and Volume Information

File System	Oracle ASM Disk Group	Oracle ASM Dynamic Volume	Mount Point
DATA	+DATA	/dev/asm/datdbname- <i>nnn</i> For example: /dev/asm/ datodacn-123	/u02/app/oracleuser/oradata/ dbname For example: /u02/app/example/ oradata/odacn
RECO	+RECO	/dev/asm/reco- <i>nn</i>	/u03/app/oracleuser This mount point is shared by all databases for fast_recovery_area and redo logs. For fast_recovery_area, the path is: /u03/app/oracleuser/ fast_recovery_area/db_name
REDO	+RECO/ +FLASH depending on environment type (High Capacity or High Performanc e)	/dev/asm/rdo/dbName- <i>nnn</i>	/u04/app/oracleuser/reco/db_name For example: /u04/app/oracle/reco/mydb

Example B-1 Oracle ACFS Storage Space

When the Oracle ACFS file systems are created, they do not initially consume all of the storage in the appliance. Space is preserved for additional repositories, or in some cases, database files stored directly in Oracle ASM. You can check for available storage space in your file systems by running the operating system command `df -k` as shown in the following example.

```
# df -k
Filesystem                1K-blocks  Used    Available  Use%    /
Mounted on
/dev/mapper/VolGroupSys-LogVolRoot 30963708 14203568 15187276   49%     /
tmpfs                      65952292  647800  65304492
1% /dev/shm
/dev/sda1                   495844    43872   426372    10%     /
boot
/dev/mapper/VolGroupSys-LogVolOpt  61927420 18594420 40187272   32%     /opt
/dev/mapper/VolGroupSys-LogVolU01 103212320 49621560 48347880   51%     /u01

```

```
1%      /u02/app/oracle/oradata/ndb11
/dev/asm/datndb12-268      104857600      247160      104610440
1%      /u02/app/oracle/oradata/ndb12
```

Displaying Mounted Disk Details

Use the Oracle Automatic Storage Management `lsdgm` command to display mounted disk groups and their information for Oracle Database Appliance.

To display information about a specific disk group, specify the disk group in the command.

1. Log in as a `grid` user.
2. Run the Oracle Automatic Storage Management `lsdgm` command.

Example B-2 Determining Storage on the DATA Disk Group

```
ASMCMD [+] > lsdgm data
```

State	Type	Rebal	Sector	Block	AU	Total_MB	Free_MB
Req_mir_free_MB	Usable_file_MB						
MOUNTED	NORMAL	N	512	4096	4194304	12288	
8835		1117		3859

0	N	DATA

Usable Space on Oracle Database Appliance X10-S and X10-L

Review the table for the approximate amount of usable space for Oracle Database Appliance X10-S and X10-L.

Oracle Database Appliance X10-S and X10-L use 6.8TB NVMe. The storage capacity is the aggregate for DATA and RECO disk groups. The raw storage capacity in the table is based on disk hardware terabytes (based on 1 kilobyte equals 1000 bytes). Approximate usable storage capacity is shown in software storage terabytes (based on 1 kilobyte equals 1024 bytes). Approximate usable storage also accounts for 15% reserved space required to restore full redundancy in case of disk failure (not applicable to the two-drive configuration). The high redundancy values in the table describe the space needed to recover from one failure only.

Note:

The usable storage space described in this topic are approximate values, and may vary as per your deployment.

Table B-2 Usable Disk Capacity on Oracle Database Appliance X10-S and X10-L

Number of Drives	Raw Storage	Usable Storage with Normal Redundancy (Double Mirroring)	Usable Storage with High Redundancy (Triple Mirroring)
X10-S/X10-L (2 drives)	13.6 TB	6.2 TB	Not Applicable
X10-L (4 drives)	27.2 TB	10.5 TB	7.0 TB
X10-L (6 drives)	40.8 TB	15.8 TB	10.5 TB
X10-L (8 drives)	54.4 TB	21.0 TB	14.0 TB

Usable Space on Oracle Database Appliance X10-HA

Review the table for the approximate amount of usable space for high performance and high capacity storage on Oracle Database Appliance X10-HA.

Usable Space for High Performance

Note:

The usable storage space described in this topic are approximate values, and may vary as per your deployment.

Oracle Database Appliance X10-HA with high performance configuration uses 7.68TB solid state drives (SSDs). The storage capacity is the aggregate for DATA and RECO disk groups. The raw storage capacity in the table is based on disk hardware terabytes (based on 1 kilobyte equals 1000 bytes). Approximate usable storage capacity is shown in software storage terabytes (based on 1 kilobyte equals 1024 bytes). Approximate usable storage also accounts for 15% reserved space required to restore full redundancy in case of disk failure. The high redundancy values in the table describe the space needed to recover from one failure only.

Table B-3 Usable Disk Capacity for High Performance on Oracle Database Appliance X10-HA

Number of Drives	Raw Storage	Usable Storage with Normal Redundancy (Double Mirroring)	Usable Storage with High Redundancy (Triple Mirroring)
6 SSD drives	46 TB	17.8 TB	11.9 TB
12 SSD drives	92 TB	35.6 TB	23.7 TB
18 SSD drives	138 TB	53.4 TB	35.6 TB
24 SSD drives	184 TB	71.2 TB	47.5 TB
48 SSD drives	369 TB	142.5 TB	95.0 TB

Usable Space for High Capacity

Oracle Database Appliance X10-HA with high capacity configuration uses 7.68TB solid state drives (SSDs) and 22TB hard disk drives (HDDs). SSD storage capacity is allocated to the FLASH disk group. HDD storage capacity is the aggregate for DATA and RECO disk groups.

The raw storage capacity in the table is based on disk hardware terabytes (based on 1 kilobyte equals 1000 bytes). Approximate usable storage capacity is shown in software storage terabytes (based on 1 kilobyte equals 1024 bytes). Approximate usable storage also accounts for 15% reserved space required to restore full redundancy in case of disk failure. The high redundancy values in the table describe the space needed to recover from one failure only.

Note:

The usable storage space described in this topic are approximate values, and may vary as per your deployment.

Table B-4 Usable Disk Capacity for High Capacity on Oracle Database Appliance X10-HA

Number of Drives	Raw Storage	Usable Storage with Normal Redundancy (Double Mirroring)	Usable Storage with High Redundancy (Triple Mirroring)
6 SSD drives and 18 HDD drives	SSDs: 46 TB HDDs: 396 TB	SSDs: 17.8 TB HDDs: 153.1 TB	SSDs: 11.9 TB HDDs: 102 TB
12 SSD drives and 36 HDD drives	SSDs: 92 TB HDDs: 792 TB	SSDs: 35.6 TB HDDs: 306.1 TB	SSDs: 23.7 TB HDDs: 204.1 TB

Usable Free Space with Oracle ASM

When Oracle ASM calculates usable Free Space, it determines the amount of space to reserve in the case of a disk failure.

For Oracle Database Appliance with 2 or 4 NVMe drives, this reserved space is not required. When you query Oracle ASM or Oracle Database Appliance commands to view the amount of storage available, the `usable_file_MB` value may report a negative number.

Table B-5 Oracle ASM Calculations

Number of Drives	Redundancy	Total_MB	Free_MB	Req_mir_free_MB	Usable_file_MB	Name
2	NORMAL	4894016	4893372	0	1220644	RECO/
4	NORMAL	1231176	1230996	610468	305150	RECO/

Note:

Note: 1TB = MB divided by 1024²

How Oracle ASM and Oracle Database Appliance Define Capacity

The following table describes how capacity terms are defined by Oracle ASM and Oracle Database Appliance.

Table B-6 Definition of Terminology

Term	Oracle ASM Definition	Oracle Database Appliance Definition
Total_MB	Size of the disk group in MB	Total usable storage. For example, for 2 NVMe drives, total usable storage is 5.8TB.
Free_MB	Free space in the disk group in MB, without regard to redundancy.	Total usable storage after formatting to Oracle ASM disk groups. For example, for 2 NVMe drives, total usable storage is 5.8TB.
Req_mir_free_MB	Amount of space that must be available in the disk group to restore full redundancy after the worst failure that can be tolerated by the disk group.	Amount of space that must be available in the disk group to restore full redundancy after the most severe failure that can be tolerated by the disk group. This is the <code>REQUIRED_MIRROR_FREE_MB</code> column from the <code>V\$ASM_DISKGROUP</code> view.
Usable_file_MB	Amount of free space, adjusted for mirroring, that is available for new files.	Total usable space taking into consideration the mirroring level. Oracle ASM also calculates the amount of space required.

C

Creating an Appliance Using JSON File

Understand the process to create an appliance using the command `odacli create-appliance` and view an example JSON file.

- [Loading and Saving Appliance Configurations](#)
You can load a saved JSON file and use it to configure your appliance, and save an existing configuration as a JSON file from the Browser User Interface.
- [Readme for the Command `odacli create-appliance`](#)
If you want to create the appliance outside of the Browser User Interface, then review the readme file for details on how to create a JSON file to use with the command-line interface.
- [Example JSON Files to Create a Single Node Appliance with the CLI](#)
Follow these JSON file examples to create a JSON file to deploy a single node appliance with the command `odacli create-appliance`.
- [Example JSON File to Create a Multi-Node Appliance with the CLI](#)
Follow the JSON file example to create a JSON file to deploy a multi-node appliance with the command `odacli create-appliance`.

Loading and Saving Appliance Configurations

You can load a saved JSON file and use it to configure your appliance, and save an existing configuration as a JSON file from the Browser User Interface.

Using a Saved Configuration to Create a New Appliance in the Browser User Interface

You can load a saved configuration from your client machine, and create a new appliance.

1. Log into the Browser User Interface.
2. In the Create Appliance page, click **Browse** next to Load Configuration.
3. Select the JSON file from the local machine, being used to access the Browser User Interface.
4. The appliance configuration values from the JSON file are populated in the fields on the Create Appliance page.
5. Make any changes required, and submit the request to create the appliance
Note that for security requirements, you must enter passwords manually.

Saving an Appliance Configuration from the Browser User Interface

You can save an appliance configuration and use it to create another appliance.

1. Log into the Browser User Interface.
2. If you have already configured your appliance, then in the Create Appliance page, click **Save Configuration**.

3. The configuration is saved as a JSON file on the local machine, being used to access the Browser User Interface.

Readme for the Command `odacli create-appliance`

If you want to create the appliance outside of the Browser User Interface, then review the readme file for details on how to create a JSON file to use with the command-line interface.

You can use the command `odacli create-appliance` and a JSON file that includes your appliance configuration settings to deploy the appliance instead of using the Browser User Interface.

Note:

It is important to review the readme and the examples carefully before creating your JSON file. If you do not enter your network and Oracle ILOM information correctly based on your setup, you will lose network access to both the host and Oracle ILOM.

Readme

The readme is located in the `/opt/oracle/dcs/sample` directory. Review the readme carefully along with the provided JSON example files. Create a JSON file with the necessary changes based on your environment and requirements.

Example JSON Files to Create a Single Node Appliance with the CLI

Follow these JSON file examples to create a JSON file to deploy a single node appliance with the command `odacli create-appliance`.

Use the example JSON files and the information located in the readme as a template to create a file for your environment. Examples and the readme are located in the `/opt/oracle/dcs/sample` directory.

Note:

If you do not enter your network and Oracle ILOM information correctly based on your setup, then network access is lost to both the host and Oracle ILOM.

When using the example to create your JSON file, change the definitions to match your environment. The password must meet password requirements.

Example C-1 JSON File to Create a Single Node Oracle Database Appliance with Role Separation

The following is an example of a JSON file that creates a single node appliance on Oracle Database Appliance. The example uses role separation.

```
{
  "instance" : {
    "name" : "odambox",
    "instanceBaseName" : "odambox-c",
    "dbEdition" : "EE",
    "timeZone" : "UTC",
    "ntpServers" : ["10.0.3.14"],
    "dnsServers" : ["10.0.4.10","10.0.4.11","10.0.4.12"],
    "domainName" : "example.com",
    "isRoleSeparated" : true,
    "osUserGroup" : {
      "groups" : [ {
        "groupId" : 1001,
        "groupName" : "oinstall",
        "groupRole" : "oinstall"
      }, {
        "groupId" : 1002,
        "groupName" : "dbaoper",
        "groupRole" : "dbaoper"
      }, {
        "groupId" : 1003,
        "groupName" : "dba",
        "groupRole" : "dba"
      }, {
        "groupId" : 1004,
        "groupName" : "asmadmin",
        "groupRole" : "asmadmin"
      }, {
        "groupId" : 1005,
        "groupName" : "asmoper",
        "groupRole" : "asmoper"
      }, {
        "groupId" : 1006,
        "groupName" : "asmdba",
        "groupRole" : "asmdba"
      } ],
      "users" : [ {

```

Example JSON File to Create a Multi-Node Appliance with the CLI

Follow the JSON file example to create a JSON file to deploy a multi-node appliance with the command `odacli create-appliance`.

Use the example JSON files and the information located in the readme as a template to create a file for your environment. Examples and the readme are located in the `/opt/oracle/dcs/sample` directory.

 **Note:**

It is important to review the readme and the examples carefully before creating your JSON file. If you do not enter your network and Oracle ILOM information correctly based on your setup, then network access is lost to both the host and Oracle ILOM.

Example C-3 JSON File to Create a Multi-Node Oracle Database Appliance with Role Separation

The following is an example of a JSON file that creates a multi-node appliance on Oracle Database Appliance bare metal platform. The example uses role separation. When using the example to create your JSON file, change the definitions to match your environment. The password must meet password requirements.

```
{

Database Shapes for Oracle Database Appliance

Use the information in this appendix to select database shapes, or templates, for your planned databases.

- [About Database Shapes and Classes](#)
Review this information to help determine the database shape (also known as a database template) and class to use based on the common workload your databases perform.
- [Database Shapes for the OLTP Class](#)
Use Oracle Database Appliance OLTP Database Shapes if your database workload is primarily online transaction processing (OLTP).
- [Database Shapes for the In-Memory Class](#)
Use Oracle Database Appliance In-Memory (IMDB) database shapes if your database workload can fit in memory, and can benefit from in-memory performance capabilities.
- [Database Shapes for the DSS Class](#)
Use DSS database shapes if your database workload is primarily decision support services (DSS) or data warehousing.

About Database Shapes and Classes

Review this information to help determine the database shape (also known as a database template) and class to use based on the common workload your databases perform.

Oracle Database Appliance shapes define databases with parameters selected specifically to optimize performance on Oracle Database Appliance. In addition, these shapes help you to set up appropriate instance caging.

Oracle Database Appliance enables you to consolidate many databases into a single system. Consolidation can minimize idle resources, maximize efficiency, and lower costs. By using instance caging in conjunction with Oracle Database Resource Manager (the Resource Manager), you can provide desired levels of service across multiple instances on a single Oracle Database Appliance.

Oracle Database Appliance shapes are already tuned for the size of each database instance workload. They are designed to run on a specific number of cores. Caging ensures that each database workload is restricted to the set of cores allocated by the shape, enabling multiple databases to run concurrently with no performance degradation, up to the capacity of Oracle Database Appliance. You can select database shape sizes larger than your current needs to provide for planned growth, which you accommodate later by adjusting System Global Area (SGA) and Program Global Area (PGA) sizes as well as the number of cores.

 **Note:**

Oracle strongly recommends that you use the Oracle Database Appliance shapes, because they implement best practices and are configured specifically for Oracle Database Appliance.

 **Important:**

Except for odb1, odb1s, and the largest database shape, all other database shapes supported on the Oracle Database Appliance bare metal system are also supported on Oracle Database Appliance DB system.

Choosing a Database Shape

Database shapes are configured specifically for the type of database workload that you want to carry out on your databases on Oracle Database Appliance. Choose the shape that best matches the common workload your databases perform (OLTP, DSS, In-Memory).

The database sizing tables provide shape names and sizing based on the number of CPUs and memory attributes for each type of database workload.

Identify the shape type that is appropriate to your database workload and hardware:

- Use Oracle Database Appliance OLTP Database Shapes if your database workload is primarily online transaction processing (OLTP).
- Use Oracle Database Appliance DSS database shapes if your database workload is primarily decision support services (DSS) or data warehousing.
- Use Oracle Database Appliance In-Memory (IMDB) database shapes if your database workload can fit in memory, and can benefit from in-memory performance capabilities.

Use the database shape tables to help select the best shapes for your databases.

When using these tables remember the following:

- The information in the tables assumes that you are creating local disk backups. Consider the space requirements for your database and the policy for local disk backups versus external backups. Typically, external backups have more space available for the database than local backups.
- The log file size assumes three (3) REDO log groups for each instance with a log switch every 15 minutes when the system is running at full capacity.

Database Shapes for the OLTP Class

Use Oracle Database Appliance OLTP Database Shapes if your database workload is primarily online transaction processing (OLTP).

The tables list the online transaction processing (OLTP) database shape sizes for Oracle Database Appliance X10-2S, X10-2L, and X10-2-HA.

The information in the table assumes the following:

- You are creating local disk backups. Consider the space requirements for your database and the policy for local disk backups versus external backups. Typically, external backups have more space available for the database than local backups.

Table D-1 Oracle Database Appliance X10-S OLTP Database Shapes

Shape	CPU Cores	SGA (GB)	PGA (GB)	Processes	Redo log file size (GB)	Log buffer (MB)	DB System Memory (GB) Applicable only for DB Systems
odb1s	1	2	1	200	4	32	Not supported
odb1	1	4	2	200	4	32	Not supported
odb2	2	8	4	400	4	32	16
odb4	4	16	8	800	4	64	32

odb28	28	112	56	5600	16	256	224

Table D-2 (Cont.) Oracle Database Appliance X10-L and X10-HA OLTP Database Shapes

Shape	CPU Cores	SGA (GB)	PGA (GB)	Processes	Redo log file size (GB)	Log buffer (MB)	DB System Memory (GB) Applicable only for DB Systems
odb32	32	128	64	6400	16	256	256
odb36	36	144	72	7200	32	256	288
odb42	42	168	84	8400	32	256	336
odb48	48	192	96	9600	32	256	384
odb56	56	224	112	11200	32	256	448
odb64	64	256	128	12800	32	256	Not supported

Database Shapes for the In-Memory Class

Use Oracle Database Appliance In-Memory (IMDB) database shapes if your database workload can fit in memory, and can benefit from in-memory performance capabilities.

The tables list the In-Memory database shape sizes for Oracle Database Appliance X10-2S, X10-2L, and X10-2-HA.

The information in the table assumes the following:

- You are creating local disk backups. Consider the space requirements for your database and the policy for local disk backups versus external backups. Typically, external backups have more space available for the database than local backups.

Table D-3 Oracle Database Appliance X10-S In-Memory Database Shapes

Shape	CPU Cores	SGA (GB)	PGA (GB)	Processes - M e m o r y	Redo log file size (GB)	Log buffer (MB)	DB System Memory (GB) Applicable only for DB Systems
odb1s	1	2	1	200	4	32	Not supported
odb1	1	4	2	200	4	32	Not supported
odb2	2	8	4	400	4	32	16

odb56	56	224	112	1120012	32	256	448
odb64	64	256	128	1280028	32	256	Not supported

Database Shapes for the DSS Class

Use DSS database shapes if your database workload is primarily decision support services (DSS) or data warehousing.

The tables list the DSS database shape sizes for Oracle Database Appliance X10-S, X10-L, and X10-HA.

The information in the table assumes the following:

- You are creating local disk backups. Consider the space requirements for your database and the policy for local disk backups versus external backups. Typically, external backups have more space available for the database than local backups.

Table D-5 Oracle Database Appliance X10-S DSS Database Shapes

Shape	CPU Cores	SGA (GB)	PGA (GB)	Processes	Redo log file size (GB)	Log buffer (MB)	DB System Memory (GB) Applicable only for DB Systems
odb1s	1	1	2	200	4	32	Not supported
odb1	1	2	4	200	4	32	Not supported
odb2	2	4	8	400	4	32	16
odb4	4	8	16	800	4	64	32
