Preface

Oracle Database Appliance is an optimized, prebuilt database system that is easy to deploy, operate, and manage. By integrating hardware and software, Oracle Database Appliance eliminates the complexities of nonintegrated, manually assembled solutions. Oracle Database Appliance reduces the installation and software deployment times from weeks or months to just a few hours while preventing configuration and setup errors that often result in suboptimal, hard-to-manage database environments.

Audience

This guide is intended for anyone who configures, maintains, or uses Oracle Database Appliance:

- System administrators
- Network administrators
- Database administrators
- Application administrators and users

This book does not include information about Oracle Database architecture, tools, management, or application development that is covered in the main body of Oracle Documentation, unless the information provided is specific to Oracle Database Appliance. Users of Oracle Database Appliance software are expected to have the same skills as users of any other Linux-based Oracle Database installations.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information about Oracle Database Appliance, go to http://www.oracle.com/goto/oda/docs and click the appropriate release.

For more information about using Oracle Database, go to http://docs.oracle.com/database/ and select the database release from the menu.

For more information about Oracle Integrated Lights Out Manager 3.2, see https://docs.oracle.com/cd/E37444_01/.

For more details about other Oracle products that are mentioned in Oracle Database Appliance documentation, see the Oracle Documentation home page at http://docs.oracle.com.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action or terms defined in the text.
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
`monospace`	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.
# prompt	The pound (#) prompt indicates a command that is run as the root user.

Disaster Recovery on Oracle Database Appliance Using Oracle Data Guard

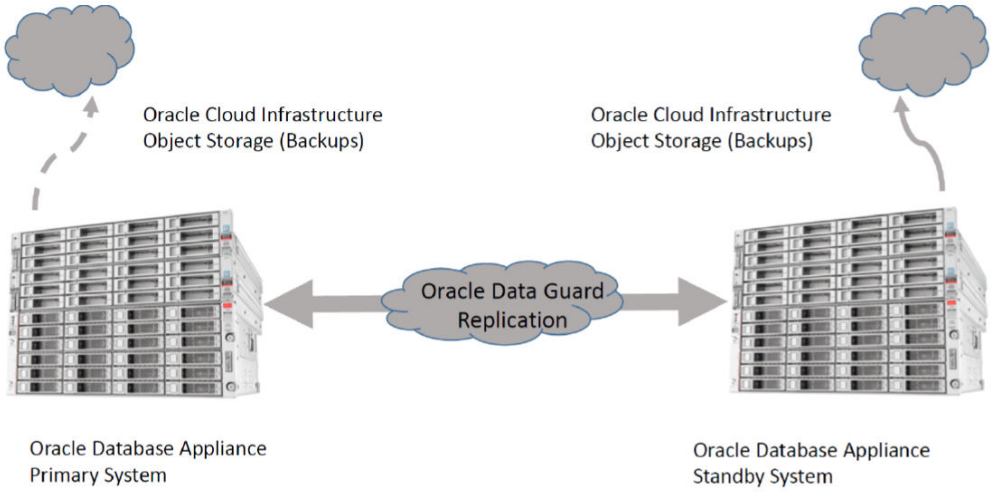
This document provides a step-by-step guide to utilize Oracle Data Guard technology on Oracle Database Appliance. It provides guidelines to protect production systems while leveraging standby computing power.

- Introduction to Oracle Database Appliance
  Oracle Database Appliance is a pre-built, ready to deploy platform for Oracle Database.
- Data Protection Using Oracle Active Data Guard
  Understand how Oracle Database Appliance can provide data protection using Oracle Active Data Guard.
- Benefits of Using Oracle Data Guard and Oracle Active Data Guard
  Oracle Data Guard provides numerous benefits and enables greater efficiency and efficacy for the deployed architecture.
- Best Practices for Configuring Oracle Data Guard on Oracle Database Appliance
  This section describes the best practices for setting up Oracle Data Guard on Oracle Database Appliance.

Introduction to Oracle Database Appliance

Oracle Database Appliance is a pre-built, ready to deploy platform for Oracle Database.

Oracle Database Appliance systems are pre-built, pre-tuned, and ready-to-use non-clustered and clustered database systems that include servers, storage, networking, and software in an optimized configuration that makes them easy to deploy, operate, and manage. Oracle Database Appliance is a complete and ideal database platform for small, medium, and large-sized database implementations and incorporates robust, time-tested Oracle technologies, including the world-leading Oracle Database, the best-selling Oracle Real Application Clusters (Oracle RAC) database option, Oracle Clusterware, and Oracle Automatic Storage Management (Oracle ASM). By integrating hardware and software, Oracle Database Appliance eliminates the complexities inherent in non-integrated, manually assembled database solutions, reducing deployment time from weeks or months to just a few hours, while preventing configuration and setup errors that often result in sub-optimal, hard-to-manage database environments.



Data Protection Using Oracle Active Data Guard

Understand how Oracle Database Appliance can provide data protection using Oracle Active Data Guard.

The Oracle Database Appliance is a highly available system in itself. However, a standby database environment can provide data protection and reduces planned and unplanned downtime if the primary database environment becomes unavailable or corrupted. Therefore, a standby database is an integral component of Maximum Availability Architecture (MAA) to provide additional high availability and data protection for any mission-critical production system.With Oracle Maximum Availability Architecture (MAA) Gold Tier best practices, the standby database can be synchronized with the primary database, thereby minimizing database downtime for planned maintenance activities such as database upgrades and unplanned outages such as data corruptions, database failures, cluster failures, power outage, or natural disaster.

The two metrics that need to be considered to develop and implement the appropriate recovery plan are Recovery Point Objective (RPO) and Recovery Time Objective (RTO). Oracle Data Guard is the most comprehensive solution available to eliminate single points of failure for mission-critical Oracle Databases. The MAA Gold Tier prevents data loss (zero RPO) and downtime (zero RTO) in the simplest and most economical manner by maintaining a synchronized physical replica of a production database at a remote location. If the production database is unavailable for any reason, client connections can quickly, and in some configurations transparently, failover to the synchronized replica to restore service.

Oracle Active Data Guard enables administrators to improve performance by offloading processing from the primary database to a physical standby database that is open read-only while it applies updates received from the primary database. Offload capabilities of Oracle Active Data Guard include read-only reporting with the occasional write or update (through DML Re-direct in Oracle Database 19c) and ad-hoc queries (including DML to global temporary tables and unique global or session sequences), data extracts, fast incremental backups, redo transport compression, efficient servicing of multiple remote destinations, and the ability to extend zero data loss protection to a remote standby database without impacting primary database performance.

Oracle Active Data Guard also increases high availability by performing automatic block repair and enabling High Availability Upgrades (utilizing database rolling upgrade automation to bypass the need for downtime while still maintaining a highly available environment). In addition, it includes application continuity which extends data protection to in-flight transactions that may not have been committed. Oracle recommends using a separate, dedicated Oracle Database Appliance system to host the Data Guard standby system for a mission-critical production system running on the primary Oracle Database Appliance system. The MAA best practice is to have a local (synchronous replication) standby database in a nearby data center that has some level of isolation and a remote standby which is routinely maintained through asynchronous replication. This provides protection from disasters which may impact an entire region such as a large scale power outage while still maintaining a RPO of zero in the majority of unplanned outages.

Benefits of Using Oracle Data Guard and Oracle Active Data Guard

Oracle Data Guard provides numerous benefits and enables greater efficiency and efficacy for the deployed architecture.

Even though Oracle Data Guard itself does provide significant protection, MAA Gold Tier requires Oracle Active Data Guard because without Automatic Block Repair, Application Continuity and DBMS_ROLLING, the RTO/RPO included in Maximum Availability Architecture (MAA) reference architecture cannot be reached.

With the use of Oracle Active Data Guard, the standby database environment does not need to be idle or at dark capacity. Instead, the standby database can actively serve many useful purposes. These additional uses greatly increase the overall return on effort and investment.

Migration to Oracle Database Appliance - If you plan to migrate existing databases to Oracle Database Appliance, then Oracle Data Guard enables an easy approach for migration of your databases to Oracle Database Appliance. You can set up a physical standby database on your Oracle Database Appliance and switch over operations from the legacy environment to the new Oracle Database Appliance environment. This includes migration across certain platforms as well. For example, to migrate your databases currently running on the Windows platform to Oracle Database Appliance, a Linux platform, you can set up Oracle Data Guard between the two environments and perform a switch over. This approach to platform migration provides the flexibility to switchback, if for any reason you choose to do so after testing. Refer to My Oracle Support (MOS) note 413484.1: *Data Guard Support for Heterogeneous Primary and Physical Standbys in Same Data Guard Configuration*, for more information about platform migration using Oracle Data Guard.

> **Note:**
>
> Oracle Data Guard also allows you to migrate across database versions using a transient logical standby database.

Disaster Recovery - Oracle Data Guard physical standby database provides an ideal solution for disaster protection. The most common example of a disaster that occurs is a regional power outage, but disaster scenarios vary from burst water or steam pipes, fire, hurricanes, vandalism, to earthquakes, floods, and acts of terrorism. Oracle Data Guard Physical Standby Database maintains a block-for-block copy of the production database. In the event the primary environment becomes unavailable due to any reason, the standby

environment can be quickly activated to maintain continued database availability for your applications.

High Availability – Standby database and Oracle RAC can also be useful in maintaining availability during planned and unplanned outages and downtimes. Such events may include configuration changes, hardware replacements, as well as data corruption, failures resulting from human errors, and other unexpected system component or complete system failures.

Standby-First Patching – With Oracle Active Data Guard, the standby database can provide additional protection by first applying any hardware, operating system, Oracle Grid Infrastructure, and qualified database software updates. Validation can occur for hours, days, or even weeks, providing additional assurance before applying the same changes in Oracle RAC rolling manner on the primary database or by issuing an Oracle Data Guard role transition. This additional protection can prevent an outage due to bad patch or high-availability or performance regression due to the patch. The only downtime for the databases is the short period of time required to change roles between primary and standby. For more information, see My Oracle Support (MOS) note 1265700.1: *Oracle Patch Assurance - Data Guard Standby-First Patch Apply*.

Database Rolling Upgrade – With Active Data Guard and transient logical standby, you can use the standby database to minimize downtime by applying a non-rolling software change such as a major database upgrade on the standby and then subsequently switching over. Downtime is minimized to a couple of seconds due to the Data Guard switchover. For more details, refer to technical briefs: *Database Rolling Upgrade using Data Guard* and *MAA Automated Database Upgrades using Oracle Active Data Guard and DBMS_ROLLING* for Oracle databases 12.1 and later.

Auto Block Repair – One of the benefits of the physical standby database is its ability to automatically repair physical block corruptions. In a primary and standby configuration, a corrupt block can be automatically repaired, and this operation can be completely seamless to the application and database administrator. The Block Repair feature is part of the Oracle Active Data Guard option.

Application Continuity (AC) – This feature is available with the Oracle Real Application Clusters (RAC), Oracle RAC One Node and Oracle Active Data Guard options that masks outages from end users and applications by recovering the in-flight database sessions following recoverable outages. It masks outages from end users and applications by recovering the in-flight work for impacted database sessions following outages. Application Continuity performs this recovery beneath the application so that the outage appears to the application as a slightly delayed execution. Application Continuity improves the user experience for both unplanned outages and planned maintenance. It enhances the fault tolerance of systems and applications that use an Oracle database. For an example configuration of Oracle Data Guard with Application Continuity on Oracle Database Appliance, see *Configuring Transparent Application Continuity* in this publication.

Offloading Workload and Activities – Despite its name, the standby environment does not have to be idle. It can be actively used to maximize the overall return on your investment. With a physical standby database in place, several key activities can be offloaded to the standby environment. These include:

- **Read-Only Workload** – Using Oracle Active Data Guard option, the standby database can be open for read-only query workload while being in the standby mode and accepting redo log updates from the primary database. In many cases, offloading read-only workloads to the standby database can dramatically reduce

the production workload, thereby increasing the overall available capacity for the production system.

- **Backups** – Because the Oracle Data Guard physical standby database is a physical copy of the primary database, database backups can be completely offloaded to the standby environment and these backups can be transparently used to restore and recover the primary database in the event of a failure or database loss. Note that if Oracle Active Data Guard option is licensed, then fast incremental backups can be run at the standby database, further adding to the appeal of offloading backups to the standby database.
- **Snapshot Standby** – The Snapshot Standby database is a standby database that can be updated, and provides full data protection for the primary database. It continues to receive redo data from the primary, but the apply process is halted while the standby database is open for read/write operations for testing purposes. When testing is complete, a single command reverts the standby database to its original state, discarding the changes made while it was open in read-write mode and applying the accumulated redo logs to synchronize with the current state of primary database.

Best Practices for Configuring Oracle Data Guard on Oracle Database Appliance

This section describes the best practices for setting up Oracle Data Guard on Oracle Database Appliance.

Oracle Database Appliance Bare Metal and DB Systems Configurations

Oracle Database Appliance can be configured as a bare metal platform with KVM and DB system support. Integrated Data Guard configuration with ODACLI is the preferred way on bare metal and DB system deployments. However, the manual Oracle Data Guard physical standby setup process outlined in this technical brief can be used on both Oracle Database Appliance bare metal systems and DB systems.

Oracle Real Application Clusters (Oracle RAC) and Oracle Data Guard are fundamental and essential components of Oracle Maximum Availability Architecture (MAA). While you can also setup Oracle Data Guard configuration between Oracle Database Appliance X7-2 S|M, X8-2 S|M, X9-2 S|L, X-10 S|L, X9-2-HA, and X10-HA hardware models (the smaller, single-node configurations), such configurations do not adhere to MAA guidelines because Oracle Real Application Clusters (Oracle RAC) runs only on Oracle Database Appliance high-availability hardware models (X7-2 HA, X8-2 HA, X9-2-HA, and X10-HA).

Oracle Data Guard enables you to instantly deploy an effective disaster recovery protection strategy right from the initial deployment of your Oracle Database Appliance. You can use the Oracle Data Guard Physical Standby environment for multiple purposes besides a disaster recovery solution. The physical standby configuration and setup process outlined in this

technical brief is quick, simple, and it can be completed without any downtime incurred on the primary database. Most of the standby creation steps are automated using tools such as odacli, Oracle RMAN, and Oracle Data Guard Broker.

For a complete list of general Oracle Data Guard best practices, which also apply to the Oracle Database Appliance environment, refer to Oracle Maximum Availability Architecture and Oracle Data Guard best practices available at https://www.oracle.com/database/technologies/high-availability/oracle-database-maa-best-practices.html.

Upgrade to the latest Oracle Database Appliance release – Functionality can change with Oracle releases, such as syncing up the database related metadata. Backups and some other features might not work through Oracle Database Appliance tooling without up-to-date metadata for standby databases. With Oracle Database Appliance release 19.8 and later, Oracle Data Guard is integrated with Oracle Database Appliance. You can use ODACLI commands to quickly set up and manage Oracle Data Guard with another Oracle Database Appliance.

Match the primary and standby database configuration – To maintain consistent service levels and to use the primary and standby databases transparently, it is important to match the resources, setup, and configuration of the primary and standby systems. Significant differences between the primary and standby database configuration can result in sub-optimal performance and unpredictable behavior when role transitions occur. Specifically, the following recommendations must be considered:

- **Run primary and standby database on separate Oracle Database Appliances** – It is recommended that the primary and the standby databases run on separate, dedicated Oracle Database Appliance units preferably located in a geographically distant location.
- **Run primary and standby database with the same configuration** – Three different database configurations are supported on Oracle Database Appliance; Oracle RAC database, Oracle RAC One, and Single-Instance Enterprise Edition database. The standby database should also be of the same configuration type as the primary database. Thus, if the primary database is configured as an Oracle RAC database, then the standby database should also be configured as an Oracle RAC database.
- **Keep symmetry between the primary and standby sites** – The instances on the primary and standby databases should be configured similar to each other in terms of database parameter settings including memory, CPU, networking, and storage. This helps avoid any unpredictability when the database switch roles. In addition, any operating system configuration customizations should be mirrored in the two environments.
- **Configure flashback database on both primary and standby databases** – The Flashback Database feature enables rapid role transitions and reduces the effort required to re-establish database roles after a transition. As a best practice, flashback database must be configured on both primary and the standby databases. If FLASHBACK is only deemed necessary for re-instantiation, then it would be a good practice to reduce the retention time from the default 24 hours to 2 hours. It should be noted that as of the Oracle Database 19c release, all restoration points are automatically propagated to standby databases. The Oracle Integrated Data Guard feature configures flashback database automatically.
- **Use dedicated network for standby traffic** – Oracle Database Appliance comes pre-built with multiple redundant network interfaces. If required, a separate network path can be configured for the standby traffic to minimize any

performance impact on the user and application-related workload. Note that since Oracle Data Guard needs to transport only the changes made to the primary database from the primary database to the standby database, it does not impose any unnecessary requirements on the network than is needed. Therefore, many deployments of Oracle Data Guard may not require a separate network path for redo log transport between primary and standby. However, some high volume applications or your organization's best practices and standards may require a separate network path for redo log transport. Oracle Database Appliance does provide additional network interfaces on each server node that can be used for this purpose. Refer to the documentation for additional details on configuring a dedicated network for disaster recovery purposes on Oracle Database Appliance.

- **Utilize Oracle Active Data Guard** – Oracle Active Data Guard allows for read-only standby of near current data since redo apply remain continuously active between primary and standby environments. This can help distribute or offload the read-only workload from the primary environment to the standby database, increasing the return on investment in the standby database. Note that with Oracle Active Data Guard, fast incremental backups can be run on the standby database. The fast incremental backups could potentially reduce backup windows from hours to minutes. Rolling upgrades can also be done using the standby database, reducing downtime to near-zero. Additionally, Active Data Guard with real time apply enables bi-directional auto-block corruption repair providing another layer of data protection for mission-critical applications.
- **Use Oracle Data Guard Broker** – Oracle Data Guard Broker's interfaces improve usability and centralize management and monitoring of an Oracle Data Guard configuration. It minimizes overall management, and it has inherent checks and balances for Oracle Data Guard configuration.
- **Setup Oracle Clusterware role-based services** – Refer to *Client Failover Best Practices for Highly Available Oracle Databases*.

See the topic *Oracle Database Appliance References* in this document for additional references.

2

Configuring Oracle Data Guard on Oracle Database Appliance

Depending on the version of the primary database, different methods can be used for setting up the Data Guard Physical Standby Database environment.

- Configuring Oracle Data Guard on Oracle Database Appliance Release 19.14 and Later
  Depending on the version of the primary database, use different methods for setting up the Oracle Data Guard physical standby database environment.
- Configuring Oracle Data Guard on Oracle Database Appliance Release 19.13 and Earlier
  Use Oracle RMAN to configure Oracle Data Guard on Oracle Database Appliance release 19.13 and earlier.

Configuring Oracle Data Guard on Oracle Database Appliance Release 19.14 and Later

Depending on the version of the primary database, use different methods for setting up the Oracle Data Guard physical standby database environment.

Guidelines for configuring Oracle Data Guard on Oracle Database Appliance release 19.14 and later:

- Oracle recommends running the primary and the standby databases on separate Oracle Database Appliance hardware, so ensure that you have at least two separate Oracle Database Appliance systems.
- Oracle recommends that the primary and standby systems have the same Oracle Database Appliance configuration, if possible. The databases must have a similar configuration for database shape, version, memory, networking, and storage (both must have either Oracle ASM or Oracle ACFS storage) to avoid unpredictability with the database switch roles.
- The primary and standby systems must be the same Oracle Database Appliance release, and must be on Oracle Database Appliance release 19.14 or later. Although the supported minimum release is Oracle Database Appliance release 19.14, due to critical bug fixes, it is strongly recommended that you upgrade your deployment to the latest Oracle Database Appliance release.
- If you have customized the operating system, then ensure that environments on both machines are identical.
- Ensure that your deployment follows Oracle Maximum Availability Architecture (MAA) best practices. See the *Oracle Maximum Availability Architecture (MAA)* page on Oracle Technology Network.
- If you decide to use Oracle ObjectStore for backup and recovery, then you must configure access for both the primary and standby systems.

This technical brief provides guidance for configuring Oracle Data Guard on bare metal systems. With two similarly configured bare-metal Oracle Database Appliance systems acting as primary and standby, and both running Oracle Database Appliance 19.14 or later, the recommended way to configure Oracle Data Guard is to use the built-in Oracle Database Appliance commands to manage the entire lifecycle of an Oracle Data Guard configuration in an easy and efficient way, including database upgrade and patching. Check the requirements for Integrated Oracle Data Guard with Oracle Database Appliance 19.14 for any limitation that may apply.
Oracle Database Appliance documentation library is available at:

https://docs.oracle.com/en/engineered-systems/oracle-database-appliance/index.html

Configuring Oracle Data Guard on Oracle Database Appliance Release 19.13 and Earlier

Use Oracle RMAN to configure Oracle Data Guard on Oracle Database Appliance release 19.13 and earlier.

Use the **RMAN restore from service** method if the database version is 12.1.0.2 or later. Refer to My Oracle Support Note 2283978.1 for details on how to instantiate the standby database using the **restore… from service** method. The RMAN **restore… from service** clause enables online restore and recover of primary database files to a standby database over a network. This method also allows for utilizing the SECTION SIZE clause for parallelization of the restore over multiple RMAN channels.
This document provides an example step-by-step procedure for creating a primary-standby configuration for Oracle 19c and 12c databases using Oracle Database Appliance.
When you set up your primary and standby database environments in an Oracle Data Guard configuration, adhere to the following guidelines that are specific to the Oracle Database Appliance platform.

- Oracle Enterprise Manager is not integrated with Oracle Database Appliance for instantiating a standby system. You can follow the examples provided in this document for configuring your Oracle Database Appliance 12c, 18c, or 19c environments.
- On the DCS stack, create the storage structure for your standby database with the `odacli create-dbstorage` command. For example:
  Oracle Database storage on Oracle ASM:

  ```
  # odacli create-dbstorage -n boston -u chicago
  ```

  Oracle Database storage on Oracle ACFS:

  ```
  # odacli create-dbstorage -n boston -u chicago -r ACFS
  ```

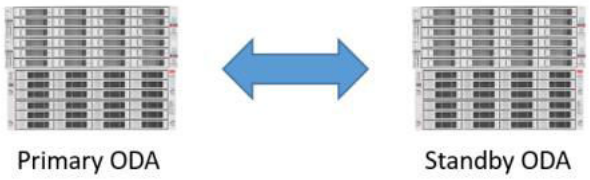
  Understand the steps to deconfigure Oracle Data Guard.
- Configuring Additional Network on Oracle Data Guard
  Understand how to set up additional network for Oracle Data Guard.

Environment

Understand the primary and standby database environment topologies used in the subsequent Data Guard setup example using Oracle Database Appliance.



Component	Primary Oracle Database Appliance	Standby Oracle Database Appliance
Host Names	proddb1, proddb2	stbydb1, stbydb2
Database Name	hun	hun
Database Unique Name	buda	pest
Instance Name	budapest1, budapest2	budapest1, budapest2
SCAN Name and IPs	proddb-scan (10.1.27.2, 10.1.27.3)	stbydb-scan (10.1.27.4, 10.1.27.5)
Grid Infrastructure Software Installation	/u01/app/19.21.0.0/grid	/u01/app/19.21.0.0/grid

Component	Primary Oracle Database Appliance	Standby Oracle Database Appliance
Oracle Database Software Installation	/u01/app/odaorahome/oracle/product/19.0.0.0/db_home1	/u01/app/odaorahome/oracle/product/19.0.0.0/db_home1
Database storage	ASM	ASM
ARCHIVELOG mode	Yes	Yes
FORCE LOGGING mode	Yes	Yes

Configuring Oracle Data Guard

Understand the steps to configure Oracle Data Guard.

Configure remote database backup for the source database either on NFS or on the cloud-based Oracle Object Store

> **Note:**
>
> If the NAS or external NFS server is not already configured, then follow the steps described in the *Configuring NFS Server on Oracle Database Appliance* topic in this document.

Prerequisites:

- The NFS file system must be mounted on all source and target nodes.
- For a TDE-enabled database, the database and TDE backup folders must be readable and writeable by the `oracle` operating system user.
- For a database without TDE encryption, the database must be readable and writeable by the `oracle` operating system user.
- The NFS file system must be shared with the `no_root_squash` option.
- When configuring the backup location on Oracle Object Storage, for a TDE-enabled database, create dedicated buckets for database and TDE backups. For database without TDE encryption, create a bucket for the database backups.

Follow these steps:

1. Create a backup configuration.
   If you use NFS file system as the backup location, then run the following command:
   - For a TDE-enabled database:

     ```
     # odacli create-backupconfig -d NFS -n nfs -cr -c /odabackup/db -
     f /odabackup/tde -w 7
     ```

   - For a non-TDE database with or without an RMAN backup password:

     ```
     # odacli create-backupconfig -d NFS -n nfs -cr -c /odabackup/db -
     w 7
     ```

If you use Oracle Object Storage as your backup location, then perform the following steps:

a. Update the DCS agent configuration with the internet proxy, if required.

```
[root@proddb1] # odacli update-agentconfig-parameters -n
HttpProxyHost -v proxy.oracle.com -n HttpProxyPort -v 80 -u
```

b. Create Object Storage credential details.

```
[root@proddb1] # odacli create-objectstoreswift -e https://
swiftobjectstorage.us-phoenix-1.oraclecloud.com/v1 -n oosswift -t
mytenant -u firstname.lastname@oracle.com
```

c. Create a backup configuration.

```
[root@proddb1] # odacli create-backupconfig -d ObjectStore -c
dbbackups -on oosswift -w 7 -f tdebackups -cr -n
backupConfig2ObjectStorage
```

2. Verify that the backup configuration is available. For example:

```
[root@proddb1] # odacli list-backupconfigs
ID Name RecoveryWindow CrosscheckEnabled BackupDestination
--------------------------------------------------------------------------------
------------------------------------------------------------
------------------ --------------------
c0bc22a2-b9c0-4b3e-a4fb-1e69c661cfbf backupConfig2ObjectStorage 7 true
ObjectStore
251aadf9-34ea-4579-aab7-d0e0c8f27dc7 nfs 7 true NFS
```

3. Assign the backup configuration to the source database.
For a TDE-enabled database:

```
[root@proddb1] # odacli modify-database -n hun -bin nfs
```

For a non-TDE database with an RMAN backup password:

```
[root@proddb1] # odacli modify-database -n hun -bin nfs -bp
```

For a non-TDE database without an RMAN backup password:

```
[root@proddb1] # odacli modify-database -n hun -bin nfs
```

Create a Level 0 database backup and keep archive logs

1. Create a backup configuration:

```
[root@proddb1] # odacli create-backup -n hun -bt Regular-L0 -ka
{ "jobId" : "2ff6931c-aa69-4529-92fa-379dda6e6a36",
"status" : "Created",
"message" : null,
"reports" : [ ],
```

```
"createTimestamp" : "March 18, 2022 16:15:57 PM CET",
"resourceList" : [ ],
"description" : "Create Regular-L0 Backup[TAG:auto][Db:hun][NFS:/
odabackup/db/orabackups/primaryODA-c/database/2894792645/buda]",
"updatedTime" : "March 18, 2022 16:15:57 PM CET" }
```

2. Verify that the job completed successfully:

```
[root@proddb1] # odacli describe-job -i 2ff6931c-
aa69-4529-92fa-379dda6e6a36
Job details
----------------------------------------------------------------
ID: 2ff6931c-aa69-4529-92fa-379dda6e6a36

CET     March 18, 2022 4:17:41 PM CET Success
Password Protected TDE Wallet Backup     March 18, 2022 4:17:41 PM
CET     March 18, 2022 4:17:42 PM CET Success
```

3. Identify the ID of the backupreport that belongs to the L0 backup.

```
[root@proddb1]# odacli list-backupreports
Backup Report Id Database Resource Id Database DbId DB Name DB
Unique Name Backup Type Backup Tag Create Time Updated Time Status
----------------------------------------
---------------------------------------- ------------- ----------
-------------- ------------ ------------
-----------------------------
13faba84-d83f-499d-ae4a-4bb451f4702c c0409b01-03da-4326-
b268-29a48d8d617f 2894792645 hun buda Regular-L0 auto March 18,
2022 4:16:14 PM CET March 18, 2022 4:17:42 PM CET Configured
```

4. Take a backup of the backup report in JSON format and copy it to the standby system backup on NFS.

```
[root@proddb1]# odacli describe-backupreport -i 13faba84-d83f-499d-
ae4a-4bb451f4702c > /odabackup/backupreport_hun_20220318.json
```

Backup on Oracle Object Storage:

```
[root@proddb1]# odacli describe-backupreport -i 13faba84-d83f-499d-
ae4a-4bb451f4702c > /tmp/backupreport_hun_20220318.json
```

Copy the JSON file to the standby system:

```
[root@proddb1]# scp /tmp/backupreport_hun_20220318.json root@stbydb1:/tmp
```

5. Verify that the Object Storage Swift or NFS was configured on the standby side. For NFS, verify with the command `df -h` that the file system is mounted on both target nodes. For Oracle Object Storage, verify with the command `odacli list-objectstoreswifts` that Swift credentials are configured.
6. Restore the database as a standby on the target. The target could be a bare metal or DB system. If the target is a DB system, then ensure that no database is configured on the DB system.
Identify the ID of the home for an existing home:

```
[root@stdbydb1 ~]# odacli list-dbhomes
ID Name DB Version Home Location Status
---------------------------------------- --------------------
---------------------------------------- ------------------------------
e8a36f29-7fcf-49fc-8575-c599dc28949d OraDB19000_home1
19.14.0.0.220118 /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1
CONFIGURED
```

Restore the database with the `odacli irestore-database` command.

Backup on NFS using an existing database home:

```
[root@stdbydb1 ~]# odacli irestore-database -r /odabackup/
backupreport_hun_20220318.json -u pest -ro STANDBY -t -dh
e8a36f29-7fcf-49fc-8575-c599dc28949d --backupLocation /odabackup/db
```

Backup on Oracle Object Storage creating a new database home:

```
[root@stdbydb1 ~]# odacli irestore-database -r
backupreport_hun_20220318.json -u pest -on odabackups -ro STANDBY -t
```

Replace `-t` with `-bp` in the above commands for a non-TDE database if the backup was protected with an RMAN password. For example:

```
[root@stdbydb1 ~]# odacli irestore-database -r /odabackup/
backupreport_hun_20220318.json -u pest -ro STANDBY -t -dh
e8a36f29-7fcf-49fc-8575-c599dc28949d --backupLocation /odabackup/db
```

```
Enter SYS user password:
Retype SYS user password:
Enter TDE wallet password:
{

```

Configure Oracle Data Guard from the first node of the primary Oracle Database Appliance system

Prerequisites:

- Listener port and port 7070 must be open to configure Oracle Data Guard between two appliances.
- Configuring Oracle Data Guard requires Oracle Database Appliance release 19.15 when either the primary or standby database, or both, are configured on a DB system.

> **Note:**
>
> On Oracle Database Appliances releases earlier than 19.21, the `odacli configure-dataguard` command requires an RMAN password even if the backup does not use it. In such cases, provide a password such as `welcome1` which allows you to proceed with Oracle Data Guard configuration.

1. Configure Oracle Data Guard:

```
[root@ proddb1]# odacli configure-dataguard
Standby site address: stbydb1
BUI username for Standby site. If Multi-user Access is disabled on
Standby site, enter 'oda-admin'; otherwise, enter the name of the user
who has irestored the Standby database (default: oda-admin):
BUI password for Standby site:
root@stbydb1's password:
Database name for Data Guard configuration:
hun Primary database SYS password:
********************************************************************************
****************
Data Guard default settings
Primary site network for Data Guard configuration:
Public-network Standby site network for Data Guard configuration:
Public-network Primary database listener port: 1521
Standby database listener port: 1521
Transport type: ASYNC
Protection mode: MAX_PERFORMANCE
Data Guard configuration name: buda_pest
Active Data Guard: disabled
Do you want to edit this Data Guard configuration? (Y/N, default:N): y
********************************************************************************
****************
Primary site network for Data Guard configuration [Public-network]
(default: Public-network):
Standby site network for Data Guard configuration [Public-network]
(default: Public-network):
Primary database listener port (default: 1521):
Standby database listener port (default: 1521):
Transport type [ASYNC, FASTSYNC, SYNC] (default: ASYNC):

Step 2: Validate Data Guard configuration request (Standby site)
Description: Validate DG Config Creation for db hun
Job ID: c9dcb3fc-90d7-495e-860d-d3fdd421aad0
Started March 18, 2022 17:02:22 PM CET
Validate create Data Guard configuration request
Finished March 18, 2022 17:02:27 PM CET
************************************************************************
**********************
Step 3: Download password file from Primary database (Primary site)
Description: Download orapwd file from Primary database
Started March 18, 2022 17:02:27 PM CET
Prepare orapwd file for Primary database hun
Finished March 18, 2022 17:02:32 PM CET
************************************************************************
**********************
Step 4: Upload password file to Standby database (Standby site)
Description: Upload orapwd file to Standby database
Started March 18, 2022 17:02:32 PM CET
Write orapwd file to Standby database hun
Finished March 18, 2022 17:02:43 PM CET
************************************************************************
**********************
Step 5: Configure Primary database (Primary site)
Description: DG Config service for db hun - ConfigurePrimary
Job ID: ed2e490d-f3e4-40b5-adee-ec5a31c6cdc6
Started March 18, 2022 17:02:44 PM CET
Configure host DNS on primary env
Configure Data Guard Tns on primary env
Enable Data Guard related Db parameters for primary env
Enable force logging and archivelog mode in primary env
Enable FlashBack
Configure network parameters for local listener on primary env
Restart listener on primary env Create services for primary db
Finished March 18, 2022 17:05:46 PM CET
************************************************************************
**********************
Step 6: Configure Standby database (Standby site)
Description: DG Config service for db hun - ConfigureStandby
Job ID: 989931fb-c7ec-4f36-9e8e-7cbe932af96c
Started March 18, 2022 17:05:47 PM CET
Configure Data Guard Tns on standby env
Configure host DNS on standby env
Clear Data Guard related Db parameters for standby env
Enable Data Guard related Db parameters for standby env
Enable force logging and archivelog mode in standby env
Populate standby database metadata
Configure network parameters for local listener on standby env
Reset Db sizing and hidden parameters for ODA best practice
Restart Listener on standby env
```

```
Create services for standby db
Finished March 18, 2022 17:07:27 PM CET
********************************************************************************

Finished March 18, 2022 17:13:00 PM CET
********************************************************************************
****************
Step 11: Create Data Guard status (Standby site)
Description: DG Status operation for db hun - NewDgconfig
Job ID: 9a70c3b8-5edb-406e-99e8-e03c44000d03
Started March 18, 2022 17:13:01 PM CET
Create Data Guard status
Finished March 18, 2022 17:13:08 PM CET
********************************************************************************
****************
Configure Data Guard buda_pest completed
********************************************************************************
****************
```

In the interactive CLI configuration steps, the parameters are as follows:

- Standby site address is IP address or host name of the standby host. Provide the fully qualified domain name and hostname if the primary and the standby systems are in the same domain and DNS is configured.

- Select Oracle Data Guard protection modes to meet availability, performance, and data protection requirements. Oracle Data Guard Protection Modes are Maximum Availability, Maximum Performance, and Maximum Protection. The log transport modes are ASYNC, SYNC, and FASTSYNC.

The following table indicates the default supported pair and the FASTSYNC mode is available only in Oracle Database 12.1 or later:

Protection Mode/ Transport Type	ASYNC	FASTSYNC	SYNC
MAXPERFORMANCE	Y	Y	Y
MAXAVAILABILITY	N	Y	Y
MAXPROTECTION	N	N	Y

Performing Switchover on Oracle Data Guard

Understand the steps to switchover Oracle Data Guard.

Follow these steps on the primary:

1. Use the `odacli list-dataguardstatus` command to verify on which system the database is running as the primary. The command also provides the ID of the Data Guard configuration which is needed in switchover and failover commands. In the following example, the system `proddb` hosts the primary database.

```
[root@proddb1]# odacli list-dataguardstatus
Updated about 2 second(s) ago
ID Name Database Name Role Protection Mode Apply Lag Transport Lag
Apply Rate Status
----------------------------------------
----------------------------------------
be217130-633b-4eef-a4b7-3192028b853c buda_pest hun PRIMARY
MAX_PERFORMANCE 0 seconds 0 seconds 14.00 KByte/s CONFIGURED
```

2. Initiate switchover. Provide the Oracle Data Guard configuration ID and the database unique name of the standby database. Run the command on the current primary system.

```
[root@proddb1 ~]# odacli switchover-dataguard -i be217130-633b-4eef-
a4b7-3192028b853c -u pest
Password for target database:
{
"jobId" : "02ddfc45-da95-4f70-8823-bcd30ce3b738",
"status" : "Created",
"message" : null,

Failover Oracle Data Guard

Understand the steps to failover Oracle Data Guard.

Follow these steps on the standby:

1. Use the `odacli list-dataguardstatus` command to verify on which system the database is running as the standby. The command also provides the ID of the Data Guard configuration which is needed in switchover and failover commands. In the following example, the system `proddb` hosts the standby database.

```
[root@proddb1]# odacli list-dataguardstatus
Updated about 2 second(s) ago
ID Name Database Name Role Protection Mode Apply Lag Transport Lag
Apply Rate Status
----------------------------------------
----------------------------------------
633b-4eef-a4b7-3192028b853c buda_pest hun STANDBY MAX_PERFORMANCE 0
seconds 0 seconds 14.00 KByte/s CONFIGURED
```

2. Initiate failover. Provide the Oracle Data Guard configuration ID and the database unique name of the current standby database. Run the command on the current standby system.

```
[root@proddb1 ~]# odacli failover-dataguard -i be217130-633b-4eef-
a4b7-3192028b853c -u buda
Password for target database:
{
"jobId" : "3dd42271-2919-4cae-a801-1a4d635c3120",
"status" : "Created",
"message" : null,
```

```

Deconfiguring Oracle Data Guard

Understand the steps to deconfigure Oracle Data Guard.

Follow these steps on the primary:

1. Use the `odacli list-dataguardstatus` command to verify on which system the database is running as the standby. The command also provides the ID of the Data Guard configuration which is needed in switchover and failover commands.

```
[root@stybydb1]# odacli list-dataguardstatus
Updated about 2 second(s) ago
ID Name Database Name Role Protection Mode Apply Lag Transport Lag Apply
Rate Status
----------------------------------------
----------------------------------------
633b-4eef-a4b7-3192028b853c buda_pest hun STANDBY MAX_PERFORMANCE 0
seconds 0 seconds 14.00 KByte/s CONFIGURED
```

2. Running Data Guard deconfiguration is an interactive process. You must run the deconfiguration operation from the primary system.

```
[root@proddb1 ~]# odacli deconfigure-dataguard -i be217130-633b-4eef-
a4b7-3192028b853c
Standby site address: stbydb1
BUI username for Standby site. If Multi-user Access is disabled on
Standby site, enter 'oda-admin'; otherwise, enter the name of the user
who has irestored the Standby database (default: oda-admin):
BUI password for Standby site:
root@stbydb1's password:
Standby database will be deleted after Data Guard configuration is
removed. Ignore warning and proceed with Data Guard deconfiguration?

Configuring Additional Network on Oracle Data Guard

Understand how to set up additional network for Oracle Data Guard.

According to MAA best practices, it is recommended to use a dedicated network interface for Oracle Data Guard related traffic. The `odacli configure-dataguard` command supports configuration of an additional network. By default, Oracle Database Appliance uses public network configuration, but a different network can be assigned to it easily. If the database runs on bare metal system, then a new interface must be configured with `Dataguard` type and attached to the database.

Follow these steps:

1. Create a new network on the desired interface.

   ```
   # odacli create-network -m network_name -n interface_name -p ip0,
   ip1 -w Dataguard -no-d -s subnet_mask -g gate_ip -vs
   vipname0:nodenumber0:vip0,vipname1:nodenumber1:vip1 -sn scan_name -
   sip scanip0,scanip1
   (optional: -t VLAN -v vlan_id)
   ```

   For example:

   ```
   # odacli create-network -m DataGuard -n bond1 -p
   "0:2.2.2.2,1:2.2.2.3" -w Dataguard -no-d -s 255.255.255.0 -g
   2.2.2.1 -vs "dg-vip1:0:2.2.2.4,dg-vip2:1:2.2.2.5" -sn dg-scan -sip
   2.2.2.6
   ```

2. Attach the network to the database.

   ```
   # odacli modify-database -in dbname -an network name
   ```

For example:

```
# odacli modify-database -in testdb -an DataGuard
```

Verify the network name with the `odacli list-networks` command.

If the database runs in a DB system, then you must configure a new virtual interface with `Dataguard` type and attached to the database:

1. Create a new vnetwork on the interface you want to configure on the bare metal system:

   ```
   # odacli create-vnetwork -n vnetwork_name -t bridged|bridgedVLAN -br
   bridge_name -gw gateway -if interface_name -ip
   ```

   For example:

   ```
   # odacli create-vnetwork -n DataGuard -t bridged -br DataGuard -gw
   2.2.2.1 -if btbond5 -ip "2.2.2.7,2.2.2.8" -nm "255.255.255.0" -u
   ```

2. Assign the new vnetwork to the DB system as a `Dataguard` type network on the bare metal system.

   ```
   # odacli modify-dbsystem -n dbsystem_name -avn vnetwork_name -gw gateway -
   ip ip0,ip1 -nm netmask -sn scan_name -sip scanip0,scanip1 -vips
   vipname0:nodenumber0:vip0,vipname1:nodenumber1:vip1 -vt network_type
   ```

   For example:

   ```
   # odacli modify-dbsystem -n dbsystem1 -avn DataGuard -gw "2.2.2.1" -ip
   "2.2.2.11,2.2.2.12" -nm "255.255.255.0" -sn dg-scan -sip
   "2.2.2.15,2.2.2.16" -vips "dg-vip1:0:2.2.2.13,dg-vip2:1:2.2.2.14" -vt
   dataguard
   ```

3. Attach the network to the database on the DB system host:

   ```
   # odacli modify-database -in dbname -an network_name
   ```

   For example:

   ```
   # odacli modify-database -in testdb -an DataGuard
   ```

   Run the steps on both the primary and the standby systems, regardless of whether the database is on the bare metal system or in a DB system.

4. Finally, provide the network name for the Oracle Data Guard configuration in the `odacli configure-dataguard` command. At the step “Do you want to edit this Data Guard configuration?” choose ‘y’ to change the Data Guard network.
   For example:

   ```
   Do you want to edit this Data Guard configuration? (Y/N, default:N): y
   …
   Primary site network for Data Guard configuration [Public-network]
   ```

```
(default: Public-network): DataGuard
Standby site network for Data Guard configuration [Public-network]
(default: Public-network): DataGuard
```

4

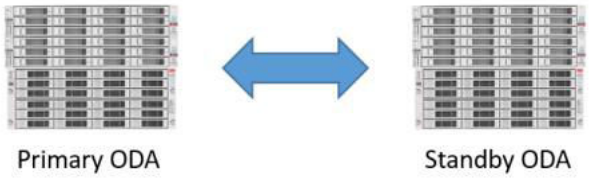
Scenario: Registering Manually Configured Oracle Data Guard with DCS

This scenario describes registering manually configured Oracle Data Guard with the DCS stack.

- Environment
  Understand the primary and standby database environment topologies used in the subsequent Data Guard setup example using Oracle Database Appliance.
- Registering Oracle Data Guard with DCS
  Understand the steps to register Oracle Data Guard with DCS.

Environment

Understand the primary and standby database environment topologies used in the subsequent Data Guard setup example using Oracle Database Appliance.



Component	Primary Oracle Database Appliance	Standby Oracle Database Appliance
Host Names	proddb1, proddb2	stbydb1, stbydb2
Database Name	hun	hun
Database Unique Name	buda	pest

Registering Oracle Data Guard with DCS

Understand the steps to register Oracle Data Guard with DCS.

Follow these steps:

1. Verify that the database is registered on the primary and the standby system.

```
[root@proddb1 ~]# odacli list-databases
ID DB Name DB Type DB Version CDB Class Shape Storage Status DbHomeID
---------------------------------------- ---------- --------
-------------------- ---------- -------- -------- ---------- ------------
--------------------
ebefcfa2-0315-4771-9881-373294a6b626 hun RAC 19.15.0.0.220419 true OLTP
odb1 ASM CONFIGURED 14402597-639a-4e87-b655-aeae36cfa3a5
```

```
[root@stdbydb1 ~]# odacli list-databases
ID DB Name DB Type DB Version CDB Class Shape Storage Status
DbHomeID
---------------------------------------- ---------- --------
-------------------- ---------- -------- -------- ----------
------------ --------------------
ebefcfa2-0315-4771-9881-373294a6b626 hun RAC 19.15.0.0.220419 true
OLTP odb1 ASM CONFIGURED 575fca61-abbc-47ed-9530-37ad7ec5caa0
```

2. Identify the home from where the database is running on the primary.

```
[root@proddb1 ~]# odacli list-dbhomes
ID Name DB Version Home Location Status
---------------------------------------- --------------------
----------------------------------------
--------------------------------------------
14402597-639a-4e87-b655-aeae36cfa3a5 OraDB19000_home1
19.15.0.0.220419 /u01/app/odaorahome/oracle/product/19.0.0.0/
dbhome_1 CONFIGURED
```

3. Verify the status of the Data Guard on the primary. Status should be healthy for the registration.

```
[oracle@proddb1 ~]$ export ORACLE_HOME=/u01/app/odaorahome/oracle/
product/19.0.0.0/dbhome_1
[oracle@proddb1 ~]$ export PATH=$ORACLE_HOME/bin:$PATH
[oracle@proddb1 ~]$ dgmgrl sys/WElcome_12##@pest
DGMGRL for Linux: Release 19.0.0.0.0 - Production on Fri May 6
13:41:52 2022
Version 19.15.0.0.0
Copyright (c) 1982, 2019, Oracle and/or its affiliates. All rights
reserved.
Welcome to DGMGRL, type "help" for information.
Connected to "pest"
Connected as SYSDBA.
DGMGRL> show configuration
Configuration - buda_pest
Protection Mode: MaxPerformance
Members:
buda - Primary database
pest - Physical standby database
Fast-Start Failover: Disabled
Configuration Status:
SUCCESS (status updated 38 seconds ago)
DGMGRL> validate database pest
Database Role: Physical standby database
Primary Database: buda
Ready for Switchover: Yes
Ready for Failover: Yes (Primary Running)
Managed by Clusterware:
buda: YES
pest: YES
DGMGRL> exit
```

Ensure that the Oracle Data Guard configuration name is in the format *db_unique_name_of_primary_ db_unique_name_of_standby*. If multiple Oracle Data Guard configurations have the same name in `dgmgrl`, then you can only register the first Oracle Data Guard configuration with DCS. Subsequent registrations with the same name fail because each Oracle Data Guard configuration name must be unique.

```
Before renaming:
DGMGRL> show configuration
Configuration - dgconfig
Protection Mode: MaxPerformance

Members:
buda - Primary database
pest - Physical standby database
Fast-Start Failover: DISABLED
Configuration Status:
SUCCESS (status updated 6 seconds ago)

After renaming:
DGMGRL> EDIT CONFIGURATION RENAME TO buda_pest;
Succeeded.

DGMGRL> show configuration
Configuration - buda_pest
Protection Mode: MaxPerformance
Members:
buda - Primary database
pest - Physical standby database
Fast-Start Failover: DISABLED
Configuration Status:
SUCCESS (status updated 37 seconds ago)
```

On Oracle Database Appliance release 19.15 and earlier, the `odacli register-database` command expects VIPs in the tnsnames.ora and not the SCAN.
The `$ORACLE_HOME/network/admin/tnsnames.ora` file must be similar to the following:

```
BUDA =
(DESCRIPTION =
(ADDRESS = (PROTOCOL = TCP)(HOST = proddb1-vip)(PORT = 1521))
(ADDRESS = (PROTOCOL = TCP)(HOST = proddb2-vip)(PORT = 1521))
(CONNECT_DATA =
(SERVER = DEDICATED)
(SERVICE_NAME = buda.domain.com)
)
)
PEST =
(DESCRIPTION =
(ADDRESS = (PROTOCOL = TCP)(HOST = stdbydb1-vip)(PORT = 1521))
(ADDRESS = (PROTOCOL = TCP)(HOST = stdbydb2-vip)(PORT = 1521))
(CONNECT_DATA =
(SERVER = DEDICATED)
(SERVICE_NAME = pest.domain.com)
```

```
)
)
```

4. Register Oracle Data Guard in DCS on the first node of the primary. If the primary runs on a DB system, then register Oracle Data Guard with the first node of the DB system.

```
[root@proddb1 ~]# odacli register-dataguard

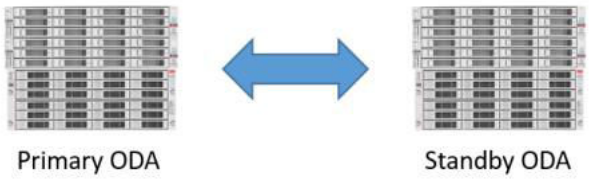
Scenario: Patching Integrated Oracle Data Guard

This scenario describes how to patch Integrated Oracle Data Guard on Oracle Database Appliance on the DCS stack.

- Environment
  Understand the primary and standby database environment topologies used in the subsequent Data Guard setup example using Oracle Database Appliance.
- Patching Integrated Oracle Data Guard
  This scenario describes patching a database with ODACLI that you configured Oracle Data Guard with `odacli configure-dataguard` or if you registered Oracle Data Guard using `odacli register-dataguard`.

Environment

Understand the primary and standby database environment topologies used in the subsequent Data Guard setup example using Oracle Database Appliance.



Component	Primary Oracle Database Appliance	Standby Oracle Database Appliance
Host Names	proddb1, proddb2	stbydb1, stbydb2
Database Name	texas	texas
Database Unique Name	austin	houston
Instance Name	texas1, texas2	texas1, texas2
Grid Infrastructure Software Installation	/u01/app/19.18.0.0/grid	/u01/app/19.18.0.0/grid
Source Oracle Database Software Installation	/u01/app/odaorahome/oracle/product/19.0.0.0/db_home4	/u01/app/odaorahome/oracle/product/19.0.0.0/db_home1
Target Oracle Database Software Installation	/u01/app/odaorahome/oracle/product/19.0.0.0/db_home5	/u01/app/odaorahome/oracle/product/19.0.0.0/db_home5

Patching Integrated Oracle Data Guard

This scenario describes patching a database with ODACLI that you configured Oracle Data Guard with `odacli configure-dataguard` or if you registered Oracle Data Guard using `odacli register-dataguard`.

Prerequisites:

- Patching individual Oracle databases on Oracle Database Appliance is available in Oracle Database Appliance release 19.17 and later.
- Server and optionally, storage are already patched to the latest version on the source and target Oracle Database Appliance bare metal system.
- If database runs on a DB system, the server level of DB system is patched to the latest release on the source and target systems.
- Repository is updated with the target database clone files on the source and target appliances.

Notes for patching server and storage:

- Patch server and storage on the standby Oracle Database Appliance, switchover the database, patch the former primary server and storage, switch back the database
- Server and storage prepatch reports provide information about whether local patching is applicable. If local patching is available, then patch the primary and the standby server and storage in a rolling fashion: node by node using the `--local` flag.

Follow these steps to patch the database:

1. Create a new database home using the new database version on source and target systems.

```
# odacli create-dbhome -v 19.18.0.0.230117
```

Primary:

```
[root@proddb1 ]# odacli list-dbhomes

ID                                       Name                 DB
Version                                Home
Location                                 Status
---------------------------------------- --------------------
---------------------------------------

product/19.0.0.0/dbhome_5 CONFIGURED
```

2. Verify the Oracle Database Appliance system where the standby database is running.

```
[root@stbydb1 ~]# odacli list-dataguardstatus

Updated about 3 day(s) ago

It can take up to several minutes to update Data Guard status. You can re-
run the command to obtain the latest status.

ID                                       Name
Database Name        Role       Protection Mode    Apply Lag
Transport Lag   Apply Rate      Status

---------------------------------------- --------------------------------
-------------------- ---------- ------------------ ---------------

Scenario: Upgrading Integrated Oracle Data Guard

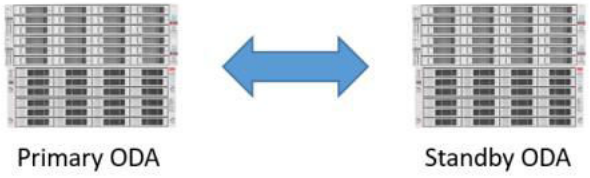
This scenario describes how to upgrade Integrated Oracle Data Guard on Oracle Database Appliance on the DCS stack.

> **Note:**
>
> Starting with Oracle Database Appliance release 19.17, you cannot manage Oracle Database releases earlier than release 19c using ODACLI or BUI. Use Oracle Database Upgrade Assistance (DBUA) or the Auto Upgrade tool to upgrade your databases of releases Oracle Database 12.1, 12.2, 18c manually on Oracle Database Appliance release 19.17 or later. Similarly, upgrade Oracle Data Guard configurations on earlier releases.

- Environment
  Understand the primary and standby database environment topologies used in the subsequent Data Guard setup example using Oracle Database Appliance.
- Upgrading Integrated Oracle Data Guard
  This scenario describes upgrading a database with ODACLI that you configured Oracle Data Guard with `odacli configure-dataguard` or if you registered Oracle Data Guard using `odacli register-dataguard`.

Environment

Understand the primary and standby database environment topologies used in the subsequent Data Guard setup example using Oracle Database Appliance.



Component	Primary Oracle Database Appliance	Standby Oracle Database Appliance
Host Names	proddb1, proddb2	stbydb1, stbydb2
Database Name	croatia	croatia
Database Unique Name	zadar	split
Instance Name	croatia1, croatia2	croatia1, croatia2
Grid Infrastructure Software Installation	/u01/app/19.19.0.0/grid	/u01/app/19.19.0.0/grid

Component	Primary Oracle Database Appliance	Standby Oracle Database Appliance
Source Oracle Database Software Installation	/u01/app/odaorahome/oracle/product/12.1.0.2/db_home1	/u01/app/odaorahome/oracle/product/12.1.0.2/db_home1
Target Oracle Database Software Installation	/u01/app/odaorahome/oracle/product/19.0.0.0/db_home5	/u01/app/odaorahome/oracle/product/19.0.0.0/db_home5

Upgrading Integrated Oracle Data Guard

This scenario describes upgrading a database with ODACLI that you configured Oracle Data Guard with `odacli configure-dataguard` or if you registered Oracle Data Guard using `odacli register-dataguard`.

Prerequisites:

- Server and optionally, storage are already patched to the latest version on the source and target Oracle Database Appliance bare metal system.
- Server must be on Oracle Database Appliance release 19.19 or later to ensure that when you run the `odacli update-registry` command, the DCS metadata is intact.
- Repository is updated with the target database clone files on the source and target appliances.

Notes for patching server and storage:

- Patch server and storage on the standby Oracle Database Appliance, switchover the database, patch the former primary server and storage, switch back the database
- Server and storage prepatch reports provide information about whether local patching is applicable. If local patching is available, then patch the primary and the standby server and storage in a rolling fashion: node by node using the `--local` flag.

Follow these steps to upgrade the database:

1. Verify the primary and standby Oracle Database Appliance systems.

```
[root@proddb1 ~]# odacli list-dataguardstatus
Updated about 9 day(s) ago
It can take up to several minutes to update Data Guard status. You
can re-run the command to obtain the latest status.

12.1.0.2.220719                EE         /u01/app/odaorahome/oracle/
product/12.1.0.2/dbhome_1    CONFIGURED
```

Standby:

```
[root@stbydb1 ~]# odacli list-dbhomes
ID                                       Name                 DB
Version                     DB Edition Home
Location                                             Status
---------------------------------------- --------------------
----------------------------- ----------
------------------------------------------------------------ ----------
fe72fa84-b609-4cea-b040-4fd7308008c8     OraDB19000_home5
19.18.0.0.230117               EE         /u01/app/odaorahome/oracle/
product/19.0.0.0/dbhome_5    CONFIGURED
d5d63d8d-91c7-416e-a8af-3e957420aafa     OraDB12102_home1
12.1.0.2.220719                EE         /u01/app/odaorahome/oracle/
product/12.1.0.2/dbhome_1    CONFIGURED
```

5. Log in as operating system user `oracle` on the primary, and disable `SSHCleanerJob` and configure SSH user equivalence between both nodes for Oracle Database Appliance high-availability system.
Primary:

```
[root@proddb1 ~]# odacli list-schedules|grep "Name\|SSH"
ID                                       Name
Description
CronExpression                 Disabled
44ad4fe2-4893-4c7d-a61c-15845cb74aa5     SSHCleanerJob              SSH
cleaner job to clean up stale SSH keys         0 0/30 * 1/1 * ?
*             false

[root@proddb1 ~]# odacli modify-schedule -i 44ad4fe2-4893-4c7d-
a61c-15845cb74aa5 -d
Modify job schedule success

[root@proddb1 ~]# odacli list-schedules|grep "Name\|SSH"
```

```
ID                                       Name
Description
CronExpression                 Disabled
44ad4fe2-4893-4c7d-a61c-15845cb74aa5     SSHCleanerJob
SSH cleaner job to clean up stale SSH keys         0 0/30 * 1/1 * ?
*             true

[oracle@proddb1 ~]$ /u01/app/odaorahome/oracle/product/19.0.0.0/
dbhome_5/deinstall/sshUserSetup.sh -user oracle -hosts "proddb1
proddb2" -noPromptPassphrase
```

6. Create the autoupgrade configuration file as operating system user `oracle` on the primary on `proddb1`.

```
[oracle@proddb1 ~]$ cat autoupgrade.conf
global.autoupg_log_dir=/u01/app/odaorabase/oracle/autoupgrade
upg1.dbname=croatia
upg1.start_time=NOW
upg1.source_home=/u01/app/odaorahome/oracle/product/12.1.0.2/
dbhome_1
upg1.target_home=/u01/app/odaorahome/oracle/product/19.0.0.0/
dbhome_5
upg1.sid=croatia1
upg1.log_dir=/u01/app/odaorabase/oracle/autoupgrade/croatia
upg1.upgrade_node=localhost
upg1.target_version=19
upg1.run_utlrp=yes
upg1.timezone_upg=no
```

7. Change Fast Recovery Area to ACFS on the primary if the database was created on Oracle ASM as follows.
Note: Run this step to avoid the error:

```
AutoUpgrade tool upg> "Database check failed with a runtime
exception" (conName="CDB$ROOT", stage="PRECHECKS",
checkName="DISK_SPACE_FOR_RECOVERY_AREA")
```

   a. Verify whether the dbstorage of the database is ACFS or ASM.

```
[root@proddb1 ~]# odacli list-databases
ID                                       DB Name    DB Type  DB

-------------------  ---------------  ---------------
------------------------------  ----------  ----------  ----------
----------  ----------------------------------
------------------------  -------------------------
tempfra              DATA             TEMPFRA          /dev/asm/
tempfra-18            250.00 GB   1.09 GB     0.44%       248.91
```

```
GB   /u05/app/sharedrepo/tempfra          2023-04-18 19:05:55
CEST  2023-04-18 19:05:55 CEST
```

c. Create a folder on the VM storage and change ownership of the folder to oracle:dba

```
[root@proddb1 ~]# mkdir /u05/app/sharedrepo/tempfra/croatia
[root@proddb1 ~]# chown oracle:dba /u05/app/sharedrepo/tempfra/
croatia
```

d. Change `db_recovery_file_dest` to ACFS.

```
SQL> alter system set db_recovery_file_dest='/u05/app/sharedrepo/
tempfra/croatia/' scope=both;
```

8. Run prechecks and review the findings.

```
[oracle@proddb1 ~]$ /u01/app/odaorahome/oracle/product/19.0.0.0/

---- Drop GRP at your convenience once you consider it is no longer
needed ----
Drop GRP from croatia1: drop restore point
AUTOUPGRADE_9212_ZADAR121020

Please check the summary report at:
/u01/app/odaorabase/oracle/autoupgrade/cfgtoollogs/upgrade/auto/
status/status.html
/u01/app/odaorabase/oracle/autoupgrade/cfgtoollogs/upgrade/auto/
status/status.log

Note: once you confirmed that database was running as expected from
all perspective and downgrade surely would not be needed, drop the
restore point which was created by AutoUpgrade tool as the output
also instructed

---- Drop GRP at your convenience once you consider it is no longer
needed ----
Drop GRP from croatia1: drop restore point
AUTOUPGRADE_9212_ZADAR121020
```

12. Upgrade the standby database.
    Standby:

```
[oracle@stbydb1 ~]$ export ORACLE_HOME=/u01/app/odaorahome/oracle/
product/12.1.0.2/dbhome_1
[oracle@stbydb1 ~]$ export PATH=$ORACLE_HOME/bin:$PATH
[oracle@stbydb1 ~]$ srvctl stop database -d split

[oracle@stbydb1 ~]$ export ORACLE_HOME=/u01/app/odaorahome/oracle/
product/19.0.0.0/dbhome_5
[oracle@stbydb1 ~]$ export PATH=$ORACLE_HOME/bin:$PATH
[oracle@stbydb1 ~]$ srvctl upgrade database -d split -
oraclehome /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_5

[oracle@stbydb1 ~]$ srvctl start database -d split
```

13. Enable Oracle Data Guard Broker on the primary and on the standby.
    Primary:

```
[oracle@proddb1 ~]$ export ORACLE_HOME=/u01/app/odaorahome/oracle/
product/19.0.0.0/dbhome_5
[oracle@proddb1 ~]$ export ORACLE_SID=croatia1
[oracle@proddb1 ~]$ export PATH=$ORACLE_HOME/bin:$PATH
```

```
[oracle@proddb1 ~]$ sqlplus / as sysdba
SQL> alter system set dg_broker_start=true scope=both;
```

Standby:

```
[oracle@stbydb1 ~]$ export ORACLE_HOME=/u01/app/odaorahome/oracle/product/
19.0.0.0/dbhome_5
[oracle@stbydb1 ~]$ export PATH=$ORACLE_HOME/bin:$PATH
[oracle@stbydb1 ~]$ srvctl upgrade database -d split -oraclehome /u01/app/
odaorahome/oracle/product/19.0.0.0/dbhome_5

[oracle@stbydb1 ~]$ sqlplus / as sysdba
SQL> alter system set dg_broker_start=true scope=both;
```

14. Stop the database on the primary and the standby.
    Primary:

```
[oracle@proddb1 ~]$ srvctl stop database -d
```

Standby:

```
[oracle@stbydb1 ~]$ srvctl stop database -d
```

15. Copy the `tnsnames.ora` and `sqlnet.ora` files from the old home to the new home on the primary and the standby.
    Primary:

```
[oracle@proddb1 ~]$ cp /u01/app/odaorahome/oracle/product/12.1.0.2/
dbhome_1/network/admin/* /u01/app/odaorahome/oracle/product/19.0.0.0/
dbhome_5/network/admin/
```

Standby:

```
[oracle@stbydb1 ~]$ cp /u01/app/odaorahome/oracle/product/12.1.0.2/
dbhome_1/network/admin/* /u01/app/odaorahome/oracle/product/19.0.0.0/
dbhome_5/network/admin/
```

16. Restore Oracle Data Guard Broker configuration files on both sides.
    Primary:

```
[oracle@proddb1 ~]$ cp /u02/app/oracle/oradata/zadar/dbs/
dr1zadar.dat.bkp /u02/app/oracle/oradata/zadar/dbs/dr1zadar.dat
[oracle@proddb1 ~]$ cp /u02/app/oracle/oradata/zadar/dbs/
dr2zadar.dat.bkp /u02/app/oracle/oradata/zadar/dbs/dr2zadar.dat
```

Standby:

```
[oracle@stbydb1 ~]$ cp /u02/app/oracle/oradata/split/dbs/
dr1split.dat.bkp /u02/app/oracle/oradata/split/dbs/dr1split.dat
[oracle@stbydb1 ~]$ cp /u02/app/oracle/oradata/split/dbs/
dr2split.dat.bkp /u02/app/oracle/oradata/split/dbs/dr2split.dat
```

17. Start primary and standby databases.
Primary:

```
[oracle@proddb1 ~]$ srvctl start database -d zadar
```

Standby:

```
[oracle@stbydb1 ~]$ srvctl start database -d split
```

18. Enable Oracle Data Guard configuration on the primary.
Primary:

```
[oracle@proddb1 ~]$ dgmgrl /
DGMGRL for Linux: Release 19.0.0.0.0 - Production on Tue Apr 18
11:48:58 2023
Version 19.18.0.0.0

reserved.

Welcome to DGMGRL, type "help" for information.
Connected to "zadar"
Connected as SYSDG.
DGMGRL> show configuration

Configuration - zadar_split

  Protection Mode: MaxPerformance
  Members:
  zadar - Primary database
    split - Physical standby database

Fast-Start Failover:  Disabled

Configuration Status:
DISABLED

DGMGRL> enable configuration
Enabled.

DGMGRL> show configuration

Configuration - zadar_split

  Protection Mode: MaxPerformance
  Members:
  zadar - Primary database
    split - Physical standby database
      Warning: ORA-16853: apply lag has exceeded specified threshold

Fast-Start Failover:  Disabled

Configuration Status:
WARNING   (status updated 17 seconds ago)
```

```
DGMGRL> show database split;

Database - split

  Role:               PHYSICAL STANDBY
  Intended State:     APPLY-ON
  Transport Lag:      0 seconds (computed 1 second ago)
  Apply Lag:          53 minutes 54 seconds (computed 1 second ago)
  Average Apply Rate: 34.18 MByte/s
  Real Time Query:    OFF
  Instance(s):
    croatia1 (apply instance)
    croatia2

  Database Warning(s):
    ORA-16853: apply lag has exceeded specified threshold

Database Status:
WARNING

Note: It might take some time to sync up the standby

DGMGRL> show database split;

Database - split

  Role:               PHYSICAL STANDBY
  Intended State:     APPLY-ON
  Transport Lag:      0 seconds (computed 0 seconds ago)
  Apply Lag:          0 seconds (computed 0 seconds ago)
  Average Apply Rate: 16.42 MByte/s
  Real Time Query:    OFF
  Instance(s):
    croatia1 (apply instance)
    croatia2

Database Status:
SUCCESS
```

19. Enable `SSHCleanerJob` and remove SSH user equivalence between both nodes for Oracle Database Appliance high-availability system on the primary.

```
root@proddb1 ~]# odacli list-schedules|grep "Name\|SSH"
ID                                       Name
Description
CronExpression                 Disabled
44ad4fe2-4893-4c7d-a61c-15845cb74aa5     SSHCleanerJob             SSH
cleaner job to clean up stale SSH keys         0 0/30 * 1/1 * ?
*             true

[root@proddb1 ~]# odacli modify-schedule -i 44ad4fe2-4893-4c7d-
a61c-15845cb74aa5 -e
Modify job schedule success
```

```
[root@proddb1 ~]# odacli list-schedules|grep "Name\|SSH"
ID                                       Name
Description
CronExpression                 Disabled
44ad4fe2-4893-4c7d-a61c-15845cb74aa5     SSHCleanerJob
SSH cleaner job to clean up stale SSH keys         0 0/30 * 1/1 * ?
*             false
```

Remove local and remote node from `/home/oracle/.ssh/authorized_keys` files on both nodes as operating system user `oracle` using the `vi` command.

```
[oracle@proddb1 ~]$ vi /home/oracle/.ssh/authorized_keys
[oracle@proddb2 ~]$ vi /home/oracle/.ssh/authorized_keys
```

Remove all `id*` files under `/home/oracle/.ssh` as operating system user `oracle` on both nodes.

```
[oracle@proddb1 ~]$ rm /home/oracle/.ssh/id*
[oracle@proddb2 ~]$ rm /home/oracle/.ssh/id*
```

20. Sync up DCS metadata on the primary.
Primary:

```
[root@proddb1 ~]# odacli list-dbhomes

23. If the `db_recovery_file_dest` file was changed in step 7, revert that change.

```
[oracle@proddb1 ~]$ export ORACLE_HOME=/u01/app/odaorahome/oracle/product/
19.0.0.0/dbhome_5
[oracle@proddb1 ~]$ export PATH=$ORACLE_HOME/bin:$PATH
[oracle@proddb1 ~]$ export ORACLE_SID=croatia1
[oracle@proddb1 ~]$ sqlplus / as sysdba

SQL> alter system set
db_recovery_file_dest='+RECO(FG$FILEGROUP_TEMPLATE_MIRROR)' scope=both;
```

24. Take a full backup.

```
[oracle@proddb1 ~]# odacli create-backup -n croatia -bt Regular-L0
```

25. Remove the temporary VM storage.

```
[oracle@proddb1 ~]# odacli delete-vmstorage -n tempfra
```

26. Test switchover, failover, and reinstate operations after the upgrade using ODACLI commands.

7

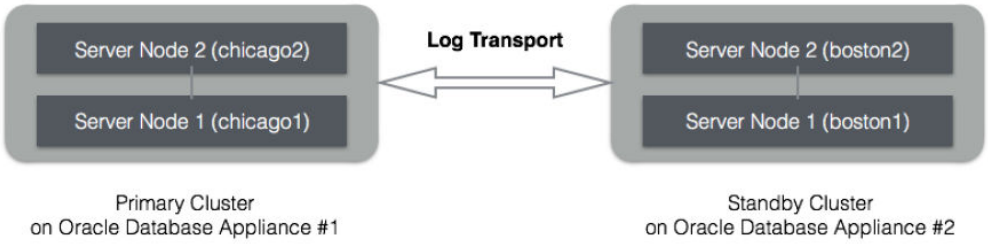
Scenario: Configure Oracle Data Guard Manually on the DCS Stack

This scenario describes setting up Oracle Data Guard on Oracle Database Appliance on the DCS stack.

- Environment
  Understand the primary and standby database environment topologies used in the subsequent Data Guard setup example using Oracle Database Appliance.
- Configuring Oracle Data Guard
  Understand the steps to configure Oracle Data Guard manually. it is highly recommended to configure Oracle Data Guard with Oracle Data Guard Broker.

Environment

Understand the primary and standby database environment topologies used in the subsequent Data Guard setup example using Oracle Database Appliance.



Component	Primary Oracle Database Appliance	Standby Oracle Database Appliance
Appliance Name	appliance#1	appliance#2
Host Names	proddb1, proddb2	stbydb1, stbydb2
Database Name	chicago	chicago
Database Unique Name	chicago	boston
Instance Name	chicago1, chicago2	boston1, boston2
SCAN Name and IPs	proddb-scan (10.1.27.2, 10.1.27.3)	stbydb-scan (10.1.27.4, 10.1.27.5)
Grid Infrastructure Software Installation	/u01/app/19.21.0.0/grid	/u01/app/19.21.0.0/grid
Oracle Database Software Installation	/u01/app/odaorahome/oracle/product/19.0.0.0/db_home1	/u01/app/odaorahome/oracle/product/19.0.0.0/db_home1
Database storage	ASM	ASM
ARCHIVELOG mode	Yes	Yes
FORCE LOGGING mode	Yes	Yes

Configuring Oracle Data Guard

Understand the steps to configure Oracle Data Guard manually. it is highly recommended to configure Oracle Data Guard with Oracle Data Guard Broker.

Follow these steps:

1. Create Standby Redo Logs.
   Standby Redo Logs (SRLs) receives redo data from the primary database in real time minimizing transport and apply lag. In advance of the primary standby setup, Oracle recommends that standby redo logs be created on the primary database as well so that it is immediately ready to receive redo data following a Data Guard role transition. Create Standby Redo Logs (SRL) on the primary database. Each thread of the standby redo log must have at least one more redo log group than the corresponding thread of the online redo log. For example:

   ```
   SQL> alter database add standby logfile thread 1 group 7 size 1G,
   group 8 size 1G, group 9 size 1G;
   SQL> alter database add standby logfile thread 2 group 11 size
   1G,group 12 size 1G, group 13 size 1G;
   ```

   To check the number of online redo logs and their sizes, use the following query:

   ```
   SQL> select thread#, group#, bytes/1024/1024/1024 SIZE_IN_GB,
   status from v$log;
   ```

   Note that the size of the standby redo logs must match the size of the redo logs. On the Oracle Database Appliance platform, the standby redo logs must be created on the REDO disk group which resides on the solid state disks. On Oracle Database Appliance Small/Medium/Large and on X8-2 HA models the control file and online logs are stored in RECO diskgroup as there is no REDO disk group. To validate the size of each log file and number of log groups in the standby redo log, use the following query:

   ```
    SQL> select group#, thread#, bytes/1024/1024/1024 SIZE_IN_GB from
   v$standby_log;
   ```

2. Enable archivelog mode on primary database.

   > **Information:**
   >
   > Archiving is the process of saving and protecting redo information in the form of archive files before the redo logs of an active database are overwritten in a circular manner. Databases created on Oracle Database Appliance have archiving turned on by default.

   Verify that the primary database is running in ARCHIVELOG mode.

   ```
   SQL> archive log list
   ```

If the primary database is not running in ARCHIVELOG mode, then enable ARCHIVELOG mode as follows:

a. Shut down both instances on Oracle Database Appliance.

```
$ srvctl stop database -d chicago
```

b. Start and mount one instance in exclusive mode.

```
SQL> startup mount exclusive;
```

c. Turn on archiving.

```
SQL> alter database archivelog;
```

d. Shut down the instance.

```
SQL> shutdown immediate;
```

e. Restart the database.

```
$ srvctl start database -d chicago
```

3. Enable FORCE LOGGING mode.
Force logging enables you to capture database operations performed with the NOLOGGING attribute. This ensures integrity of your standby database. Verify if FORCE LOGGING has already been enabled on your primary database.

```
SQL> select force_logging from v$database;
```

If FORCE LOGGING is not enabled, then enable it using the following commands:

```
SQL> alter database force logging;
```

4. Configure Flashback Database feature.
The Oracle Flashback Database feature provides a fast alternative to performing incomplete database recovery. Although using the Flashback Database feature is optional, it can be very useful for faster reinstating of the old primary database after a failover. Thus, if you do a failover to the standby and the old primary can be repaired, you do not have to rebuild the old primary database as a standby database but simply flashback and let Oracle Data Guard resynchronize from that point onwards. Check if the primary database has Flashback Database enabled, and if required, enable it.

```
SQL> select flashback_on from v$database;
SQL> alter database flashback on;
```

Note that enabling Flashback Database requires additional space consumption in the Fast Recovery Area, that is, RECO disk group. The space used by flashback logs can be

controlled by setting the parameter `DB_FLASHBACK_RETENTION_TARGET` to a desired value. This value is specified in minutes. For example:

```
SQL> alter system set DB_FLASHBACK_RETENTION_TARGET=120 scope=both
sid='*';
```

5. Enable standby file management.
When the primary database adds or drops a datafile, the corresponding action must also be automatically taken on the standby database. This operation can be enabled using automated standby file management.

```
SQL> alter system set STANDBY_FILE_MANAGEMENT=AUTO scope=both
sid='*';
```

6. Create the database home on the standby if it does not exist. For example:

```
[root@stbydb1]# odacli create-dbhome -v 19.14.0.0.220118
```

The database home version on the standby must be identical to database home version on the primary.

7. Setup TNS entries and listeners.
Oracle Net Service Names must be configured to enable redo transportation across the databases. Update `tnsnames.ora` file to include the TNS alias for both primary and standby databases. Note that in the Oracle Database Appliance, the `tnsnames.ora` file is located in the `network/admin` directory of the Oracle database home.

```
$ vi $ORACLE_HOME/network/admin/tnsnames.ora
Primary
chicago =
(DESCRIPTION =
 (ADDRESS = (PROTOCOL = TCP)(HOST = proddb-scan)(PORT = 1521))
 (CONNECT_DATA = (SERVER = DEDICATED) (SERVICE_NAME =
chicago.oracle.com)
  )
 )

boston =
(DESCRIPTION =
 (ADDRESS = (PROTOCOL = TCP)(HOST = stbydb-scan)(PORT = 1521))
 (CONNECT_DATA = (SERVER = DEDICATED) (SERVICE_NAME =
boston.oracle.com)
  )
 )
Standby
chicago =
(DESCRIPTION =
 (ADDRESS = (PROTOCOL = TCP)(HOST = proddb-scan)(PORT = 1521))
 (CONNECT_DATA = (SERVER = DEDICATED) (SERVICE_NAME =
chicago.oracle.com)
  )
 )
boston =
```

```
(DESCRIPTION =
 (ADDRESS = (PROTOCOL = TCP)(HOST = stbydb-scan)(PORT = 1521))
(CONNECT_DATA = (SERVER = DEDICATED) (SERVICE_NAME = boston.oracle.com)
 ) )
```

8. Setup Redo Transport Service in deferred mode. This step is not needed if Oracle Data Guard Broker is configured.
   The Oracle Data Guard redo transport mechanism uses Oracle Net connections to send the redo between the databases. Redo transport is enabled by setting the `LOG_ARCHIVE_DEST_n` parameter. For example, the following setup enables log shipping and uses LGWR based transmission in asynchronous mode.

   ```
   SQL> alter system set log_archive_dest_2='SERVICE=boston LGWR ASYNC
   REGISTER VALID_FOR=(online_logfile,primary_role)
   REOPEN=60 DB_UNIQUE_NAME=boston' scope=both sid='*';
   SQL> alter system set log_archive_dest_state_2='defer' scope=both sid='*';
   ```

   For more information about redo log transmission options, see the *Oracle Data Guard Concepts and Administration Guide*.

9. Setup Fetch Archive Log Server. This step is not needed if Oracle Data Guard Broker is configured.
   When the database is in standby role and the primary is unable to send any missing log files, then the standby database can use the FAL_SERVER setting to pull those missing log files. The FAL_SERVER parameter is uses the Oracle Net service name.

   ```
   SQL> alter system set FAL_SERVER=boston scope=both sid='*';
   ```

10. Create a `pfile` from the `spfile` on the primary database.

    ```
    [oracle@proddb1]$ export ORACLE_HOME=u01/app/odaorahome/oracle/product/
    19.0.0.0/dbhome_1
    [oracle@proddb1]$ export ORACLE_SID=chicago1
    [oracle@proddb1]$ export PATH=$ORACLE_HOME/bin:$PATH
    [oracle@proddb1]$ sqlplus / as sysdba
    SQL> create pfile='/tmp/chicago.pfile' from spfile;
    ```

11. Add or modify the parameters on the primary and standby.
    Primary:

    ```
    *.db_block_checking=FULL
    *.db_block_checksum=FULL
    *.db_lost_write_protect=TYPICAL
    *.db_unique_name=boston
    *.listener_networks='((NAME=net1)
    (LOCAL_LISTENER=(DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=standby node0
    vip) (PORT=1521)))))','((NAME=net1)
    (LOCAL_LISTENER=( DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=standby node1
    vip)(PORT=1521) ))))','((NAME=net1)(REMOTE_LISTENER=standby scan
    name:1521))'
    *.log_archive_dest_1='LOCATION=USE_DB_RECOVERY_FILE_DEST
    VALID_FOR=(ALL_LOGFILES,ALL_ROLES) MAX_FAILURE=1 REOPEN=5
    DB_UNIQUE_NAME=boston ALTERNATE=log_archive_dest_10'
    *.log_archive_dest_10='LOCATION=+DATA/db19c/arc10
    ```

```
VALID_FOR=(ALL_LOGFILES,ALL_ROLES) DB_UNIQUE_NAME=boston
ALTERNATE=log_archive_dest_1'
# if DB is TDE enabled
*.wallet_root='+DATA/CHICAGO'
```

Standby:

```
chicago2.instance_number=2
chicago1.instance_number=1
chicago2.thread=2
chicago1.thread=1
chicago2.undo_tablespace='UNDOTBS2'
chicago1.undo_tablespace='UNDOTBS1'
*.audit_file_dest='/u01/app/oracle/admin/boston/adump'
*.db_block_checking=FULL
*.db_block_checksum=FULL
*.db_lost_write_protect=TYPICAL
*.db_unique_name=boston

(LOCAL_LISTENER=(DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=standby
node0 vip) (PORT=1521))))),'((NAME=net1)
(LOCAL_LISTENER=( DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=standby
node1 vip)(PORT=1521) ))))','((NAME=net1)(REMOTE_LISTENER=standby
scan name:1521))'
*.log_archive_dest_1='LOCATION=USE_DB_RECOVERY_FILE_DEST
VALID_FOR=(ALL_LOGFILES,ALL_ROLES) MAX_FAILURE=1 REOPEN=5
DB_UNIQUE_NAME=boston ALTERNATE=log_archive_dest_10'
*.log_archive_dest_10='LOCATION=+DATA/db19c/arc10
VALID_FOR=(ALL_LOGFILES,ALL_ROLES) DB_UNIQUE_NAME=boston
ALTERNATE=log_archive_dest_1'
# if DB is TDE enabled
*.wallet_root='+DATA/BOSTON'
```

Set data protection parameters. Refer to *My Oracle Support Note 1302539.1 - Best Practices for Corruption Detection, Prevention, and Automatic Repair - in a Data Guard Configuration On ODA Small/Medium/Large* On Oracle Database Appliance X8-2-HA models, the controlfile and online logs are stored in the RECO disk group as there is no REDO disk group. Databases use listener_networks instead of local_listener and remote_listener parameters starting from Oracle Database Appliance release 19.6 on bare metal systems.

12. Create storage structures for the database on the standby.

```
[root@stbydb1]$ # odacli create-dbstorage -n chicago -u boston
{

"resourceList" : [ ],
"description" : "Database storage service creation with db name:
chicago",
"updatedTime" : "October 18, 2021 14:14:11 PM CEST"
```

```
}
[root@stbydb1]# odacli describe-job -i "054dac68-9efe-4f0d-
a027-5515d46ada8a"
Job details
----------------------------------------------------------------
ID: 054dac68-9efe-4f0d-a027-5515d46ada8a
Description: Database storage service creation with db name: chicago
Status: Success
```

13. Copy the password file from the primary database to the first standby system.

```
[oracle@proddb1]$ srvctl config database -d chicago |grep Password
Password file: +DATA/CHICAGO/PASSWORD/pwdchicago.386.1086365117
[oracle@proddb1 ~]$ asmcmd --privilege sysdba
ASMCMD> pwcopy +DATA/CHICAGO/PASSWORD/pwdchicago.386.1086365117 /tmp/
pwdchicago
copying +DATA/CHICAGO/PASSWORD/pwdchicago.386.1086365117 -> /tmp/
pwdchicago
[oracle@proddb1]$ scp /tmp/pwdchicago oracle@stbydb1:/u01/app/odaorahome/
oracle/product/19.0.0.0/dbhome_1
/dbs/orapwchicago
```

14. Copy the modified pfile to the first standby host and mount the standby database. Make a note of the path where the standby control file is created.

```
[oracle@proddb1]$ scp /tmp/chicago.pfile oracle@stbydb1.oracle.com:/tmp/
boston.pfile
[oracle@stbydb1]$ export ORACLE_HOME=/u01/app/odaorahome/oracle/product/
19.0.0.0/dbhome_1
[oracle@stbydb1]$ export ORACLE_SID=chicago1
[oracle@stbydb1]$ export PATH=$ORACLE_HOME/bin:$PATH
[oracle@stbydb1]$ cp /u01/app/odaorahome/oracle/product/19.0.0.0/
dbhome_1/dbs/orapwboston /u01/app/odaorahome/oracle/product/19.0.0.0/
dbhome_1/dbs/orapwboston1
[oracle@stbydb1]$ rman target /
RMAN> startup nomount pfile='/tmp/boston.pfile';
RMAN> restore standby controlfile from service chicago;
Starting restore at 19-OCT-21
using target database control file
instead of recovery catalog
allocated channel: ORA_DISK_1
channel ORA_DISK_1: SID=483 instance=boston1 device type=DISK
channel ORA_DISK_1: starting datafile backup set restore
channel ORA_DISK_1: using network backup set from service chicago
channel ORA_DISK_1: restoring control file
channel ORA_DISK_1: restore complete, elapsed time: 00:00:02 output file
name=+FLASH/BOSTON/CONTROLFILE/current.256.1086380745
Finished restore at 19-OCT-21
```

15. Update the Control File parameter Edit the pfile `/tmp/chicago.pfile` and replace the `control_files` parameter to show the new path from the previous output. For example:

```
control_files= '+RECO/BOSTON/CONTROLFILE/current.256.1086380745'
```

16. Start the standby instance in **nomount** mode using the modified pfile. Create the spfile and restart the instance with the spfile.

```
[oracle@stbydb1$ export ORACLE_HOME=/u01/app/odaorahome/oracle/
product/19.0.0.0/dbhome_1
[oracle@stbydb1$ export ORACLE_SID=chicago1
[oracle@stbydb1$ export PATH=$ORACLE_HOME/bin:$PATH
[oracle@stbydb1]$ sqlplus / as sysdba
SQL> create spfile='+DATA/BOSTON/PARAMETERFILE/spfilechicago' from
pfile='/tmp/chicago.pfile';
SQL> !echo "spfile='+DATA/BOSTON/PARAMETERFILE/spfilechicago'"
> /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1/dbs/
initchicago1.ora
SQL> !echo "spfile='+DATA/BOSTON/PARAMETERFILE/spfilechicago'"
> /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1/dbs/
initchicago2.ora
SQL> startup mount force;
```

17. For TDE-enabled databases, copy the TDE wallet from the primary system:

    a. Take a backup of the wallet on the primary. Log in as `oracle` user. and create an empty keystore.

```
 mkdir -p /tmp/backup/
[oracle@stbydb1$ export ORACLE_HOME=/u01/app/odaorahome/oracle/
product/19.0.0.0/dbhome_1
[oracle@stbydb1$ export ORACLE_SID=chicago1
[oracle@stbydb1$ export PATH=$ORACLE_HOME/bin:$PATH

sqlplus / as sysdba
SQL> administer key management create keystore '/tmp/backup/'
identified by "WELcome_12##";
keystore altered.
```

    b. Merge the keystore of the database into the file system keystore. For example:

```
SQL>  administer key management merge keystore '+DATA/<db
unqique name>/tde/' identified by "<password>" into existing
keystore '/tmp/backup/' identified by "password" with backup;
keystore altered.
```

    c. Create a new keystore on the standby and merge the keystore of the primary into it.

```
mkdir /tmp/backup
scp oracle@<primary db host>:/tmp/backup/* /tmp/backup/
sqlplus / as sysdba

[oracle@stbydb1$ export ORACLE_HOME=/u01/app/odaorahome/oracle/
product/19.0.0.0/dbhome_1
[oracle@stbydb1$ export ORACLE_SID=boston1
[oracle@stbydb1$ export PATH=$ORACLE_HOME/bin:$PATH
SQL> ADMINISTER KEY MANAGEMENT CREATE KEYSTORE identified by
"password";
```

d. Merge the keystore from the primary into the newly-created keystore.

```
SQL> administer key management merge keystore '/tmp/backup/'
identified by "WELcome_12##" into existing keystore
'+DATA/MILAN/tde' identified by "WELcome_12##" with backup;
```

e. Create auto login.

```
SQL> administer key management create auto_login keystore from
keystore identified by "WELcome_12##";
keystore altered.
```

18. Enable parallelism and set `SECTION SIZE=64MB`. To use parallelism during the restore, determine the number of CPUs on your server by running the following:

```
[oracle@stbydb1]$ grep -c ^processor /proc/cpuinfo 20
```

Make the following RMAN configuration changes on the standby database. The following example uses 8 preconfigured channels for RMAN to use during the recovery process.

```
[oracle@stbydb1]$ rman target /
RMAN> CONFIGURE DEFAULT DEVICE TYPE TO DISK;
RMAN> CONFIGURE DEVICE TYPE DISK PARALLELISM 8;
```

19. Restore the Standby Database from the primary database service Backing up a single large file in parallel, The multi section backup and restore capability in RMAN improves backup and recovery rates. RMAN divides the work among multiple channels and each channel acts upon a file section in a file. If you specify a small section size that would produce more than 256 sections, then RMAN increases the section size to a value that results in exactly 256 sections. The Section size clause depends on various factor such as network bandwidth, number of channels, sizes of data files, and application datafile sizes.

```
oracle@stbydb1]$ sqlplus system/welcome1@chicago
SQL> select TABLESPACE_NAME, bytes/1024/1024/1024 SIZE_IN_GB from
dba_data_files;
TABLESPACE_NAME SIZE_IN_GB
------------------------------ ----------
UNDOTBS1 .102539063
SYSTEM .947265625
SYSAUX .91796875
UNDOTBS2 .024414063
USERS .004882813
```

For example, when you run the following command on the standby system, you specify a backup section size of 64MB.

```
[oracle@stbydb1]$ rman target /
RMAN> restore database from service chicago section size 64M;
RMAM> recover database from service chicago;
RMAN> backup spfile;
```

20. Enable log shipping on the primary. Run this step only if you have not configured Oracle Data Guard Broker.

```
[oracle@proddb1]$ sqlplus / as sysdba
SQL> alter system set log_archive_dest_state_2='enable' scope=both;
```

21. Enable Flashback Database on the standby and adjust retention as required. Run this step only if you have not configured Oracle Data Guard Broker.

```
SQL> alter database flashback on;
SQL> alter system set DB_FLASHBACK_RETENTION_TARGET=120;
```

22. Start managed recovery on the standby. Run this step only if you have not configured Oracle Data Guard Broker.

```
[oracle@stbydb1]$ sqlplus / as sysdba
SQL> ALTER DATABASE RECOVER MANAGED STANDBY DATABASE DISCONNECT
FROM SESSION;
```

23. Register the standby database with Oracle Clusterware. Note that the instance name on the primary and standby must be the same. Specify the instance name in the format *dbname*[0|1] on Oracle RAC databases and *dbname* for single-instance databases.

```
[oracle@stbydb1]$ export ORACLE_HOME=/u01/app/odaorahome/oracle/
product/19.0.0.0/dbhome_1
[oracle@stbydb1]$ export PATH=$ORACLE_HOME/bin:$PATH

Example with single-instance Oracle Database:
[oracle@stbydb1]$ srvctl add database -db boston -
oraclehome /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1 -
dbtype SINGLE -instance chicago -node stbydb1 -dbname chicago -
diskgroup 'DATA,RECO,FLASH' -role physical_standby -spfile '+DATA/
BOSTON/PARAMETERFILE/spfileboston' -startoption mount -acfspath
'/u01/app/odaorahome,/u01/app/odaorabase0,/u01/app/odaorabase1'

Example with Oracle RAC Database:
[oracle@stbydb1]$ srvctl add database -db boston -
oraclehome /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1 -
dbtype RAC -dbname chicago -diskgroup 'DATA,RECO,FLASH' -role
physical_standby -spfile '+DATA/BOSTON/PARAMETERFILE/spfileboston' -
startoption mount -acfspath '/u01/app/odaorahome,/u01/app/
odaorabase0,/u01/app/odaorabase1'
[oracle@stbydb1]$ srvctl add instance -db boston -instance chicago1
-node stbydb1
[oracle@stbydb1]$ srvctl add instance -db boston -instance chicago2
-node stbydb2
```

24. Copy the password file to Oracle ASM and verify that the password file points to Oracle ASM.

```
[oracle@stbydb1]$ export ORACLE_HOME=/u01/app/odaorahome/oracle/
product/19.0.0.0/dbhome_1
[oracle@stbydb1]$ export ORACLE_SID=chicago1
```

```
[oracle@stbydb1]$ export PATH=$ORACLE_HOME/bin:$PATH
[oracle@stbydb1 ~]$ asmcmd --privilege sysdba
ASMCMD>mkdir +DATA/BOSTON/PASSWORDFILE
ASMCMD> pwcopy /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1/dbs/
orapwboston +DATA/BOSTON/PASSWORDFILE/pwdboston --dbuniquename boston
copying /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1/dbs/
orapwboston -> +DATA/BOSTON/PASSWORDFILE/pwdboston
[oracle@stbydb1]$ srvctl config database -db boston|grep Password
```

25. Set the parameters and create the Oracle Data Guard Broker configuration.
Note: Flashback database is required to re-instantiate a failed primary after a failover role transition. Optionally enable flashback on both primary and standby. The standby database can begin using flashback with the PostCR script as follows:

```
[oracle@stbydb1]$ sqlplus / as sysdba
alter system set dg_broker_config_file1='+DATA/BOSTON/dr1.dat'
scope=both;
alter system set dg_broker_config_file2='+DATA/BOSTON/dr2.dat'
scope=both;
alter system set db_flashback_retention_target=120 scope=spfile;
alter database flashback on;
alter system set dg_broker_start=true;
[oracle@stbydb1]$ srvctl stop database -db boston
[oracle@stbydb1]$ srvctl start database -db boston -startoption mount
[oracle@stbydb1]$ sqlplus sys/welcome1@chicago as sysdba
alter system set dg_broker_config_file1='+DATA/CHICAGO/dr1.dat'
scope=both;
alter system set dg_broker_config_file2='+DATA/CHICAGO/dr2.dat'
scope=both;
alter system set dg_broker_start=TRUE;
Wait 1 min
[oracle@stbydb1]$ dgmgrl sys/welcome1@chicago
CREATE CONFIGURATION dgconfig AS PRIMARY DATABASE IS CHICAGO CONNECT
IDENTIFIER IS CHICAGO;
ADD DATABASE BOSTON AS CONNECT IDENTIFIER IS BOSTON ;
ENABLE CONFIGURATION
```

If `ALTER DATABASE FLASHBACK ON` failed with `ORA-38788`, let the standby sync up and run the following steps to enable flashback after that:

```
[oracle@stbydb1]$ sqlplus / as sysdba
SQL> ALTER DATABASE RECOVER MANAGED STANDBY DATABASE CANCEL;
SQL> alter database flashback on;
SQL> ALTER DATABASE RECOVER MANAGED STANDBY DATABASE DISCONNECT;
```

26. Verify using SQL*Plus and SRVCTL.

```
[oracle@stbydb1]$ srvctl config database -d chicago
[oracle@stbydb1]$ srvctl config database -d boston
[oracle@stbydb1]$ sqlplus / as sysdba
SQL> select FORCE_LOGGING, FLASHBACK_ON, OPEN_MODE, DATABASE_ROLE,
SWITCHOVER_STATUS, DATAGUARD_BROKER, PROTECTION_MODE from v$database;
SQL> select PROCESS,PID,DELAY_MINS from V$MANAGED_STANDBY;
```

27. Verify Oracle Data Guard using DGMGRL.

```
$ dgmgrl DGMGRL> connect sys/welcome1@boston
DGMGRL> show configuration verbose
DGMGRL> show database verbose chicago
DGMGRL> show database verbose boston
DGMGRL> validate database chicago
DGMGRL> validate database boston
```

The `DGMGRL> show database verbose boston` command displays the following:

```
Database Warning(s):
ORA-16789: standby redo logs configured incorrectly
ORA-16789: standby redo logs configured incorrectly
Drop all standby logs on the standby side and recreate them.
SQL> alter database recover managed standby database cancel;
SQL> select group# from v$standby_log;
SQL> alter database drop logfile group X; -- group# is coming from
the previous query
SQL> alter database add standby logfile thread 1 group 5 size 1G,
group 6 size 1G, group 7 size 1G;
SQL> alter database add standby logfile thread 2 group 8 size 1G,
group 9 size 1G, group 10 size 1G;
SQL> alter database recover managed standby database disconnect
from session;
```

28. Setup Oracle Clusterware Role Based Services. Refer to *Client Failover Best Practices for Highly Available Oracle Databases*.

29. Register the databases:

```
[oracle@stbydb1]$ dgmgrl sys/welcome1@boston as sysdba
DGMGRL> edit database 'boston' set state='apply-off'; Succeeded.
DGMGRL> sql 'ALTER DATABASE OPEN READ ONLY'; Succeeded.

```

For TDE enabled databases, specify the `-tp` option:

```
# odacli register-database -c OLTP -s odb2 -sn boston.us.oracle.com
-nn Public-network -t RAC -tp
Enter SYS, SYSTEM and PDB Admin user password:
Retype SYS, SYSTEM and PDB Admin user password:
Enter TDE wallet password:
Retype TDE wallet password:
{
  "jobId" : "fb2b8a1f-bd5a-4f9b-8ba1-8070ba63c508",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "December 09, 2023 13:45:51 PM CET",
  "resourceList" : [ ],
  "description" : "Database service registration with DB service
name: boston.us.oracle.com",
  "updatedTime" : "December 09, 2023 13:45:51 PM CET",
  "jobType" : null
}
```

Note that opening the database in read-only mode is a one-time operation required for registration with Oracle Database Appliance and complies with Oracle Active Data Guard licensing permissions.

30. Enable log shipping again and restart the standby database.

```
[oracle@stbydb1]$ dgmgrl sys/welcome1@boston as sysdba
DGMGRL> edit database 'boston' set state='apply-on';
Succeeded.
[oracle@stbydb1]$ srvctl stop database -db boston
[oracle@stbydb1]$ srvctl start database -db boston
```

31. Verify switchover operation with Oracle Data Guard:

```
$ dgmgrl DGMGRL> connect sys/welcome1@boston
DGMGRL> switchover to boston
DGMGRL> connect sys/welcome1@chicago
DGMGRL> switchover to chicago;
```

32. Verify failover operation with Oracle Data Guard.
Connect to standby before failover:

```
$ dgmgrl DGMGRL> connect sys/welcome1@boston
DGMGRL> failover to boston
DGMGRL> reinstate database chicago
```

Connect to former primary before failover:

```
DGMGRL> connect sys/welcome1@chicago
DGMGRL> failover to chicago;
DGMGRL> reinstate database boston
```

8

Scenario: Configuring Transparent Application Continuity

This scenario describes configuring Transparent Application Continuity (TAC) with Oracle Data Guard on Oracle Database Appliance.

Application Continuity (AC) is available with Oracle Real Application Clusters (Oracle RAC), Oracle RAC One Node, and Oracle Active Data Guard options. It masks outages from end users and applications by recovering the in-flight work for impacted database sessions following outages. AC performs this recovery beneath the application, so that the outage appears to the application as a slightly delayed execution. It improves user experience for both unplanned outages and planned maintenance. It enhances the fault tolerance of systems and applications that use an Oracle database. Note that depending on the latency, bandwidth between the primary and the standby, complete site failover may be required, otherwise the response time of the applications that are still running on the primary site may suffer from network latency between the two sites. For more details, refer to the *Continuous Availability* technical brief. All options described in that technical brief are applicable to Oracle Database Appliance.

- Environment
  Understand the environment to setup Transparent Application Continuity (TAC) in a two-node primary Oracle RAC database and two-node standby Oracle RAC database environment.
- Configuring Oracle Data Guard
  Understand the steps to configure Oracle Data Guard with Application Continuity.

Environment

Understand the environment to setup Transparent Application Continuity (TAC) in a two-node primary Oracle RAC database and two-node standby Oracle RAC database environment.

Component	Primary Oracle Database Appliance	Standby Oracle Database Appliance
Database Type	two-node Oracle RAC database	two-node Oracle RAC database
Database Name	racwtac	racwtac
Database Unique Name	racwtac_pri	racwtac_stby
pluggable database (PDB) to be protected by TAC	buda	buda

Configuring Oracle Data Guard

Understand the steps to configure Oracle Data Guard with Application Continuity.

Follow these steps:

1. Verify that Oracle Active Data Guard is configured between the primary and standby appliances:

```
# odacli list-dataguardstatus
Updated about 1 minute(s) ago
It can take up to several minutes to update Data Guard status. You
can re-run the command to obtain the latest status.
ID
Name                                Database Name        Role
Protection Mode    Apply Lag       Transport Lag   Apply Rate
Status
----------------------------------------
-------------------------------- -------------------- ----------
----------------- --------------- --------------- ---------------
----------
9511c5cc-365c-4e85-9dee-8a55ae6f01fa
racwtac_pri_racwtac_stby         racwtac              PRIMARY
MAX_PERFORMANCE    0 seconds       0 seconds       2.00 KByte/s
CONFIGURED
```

2. On the primary system, log in as the `oracle` user on any of the nodes and configure a role-based Transparent Application Continuity type of service:

```
$ export ORACLE_HOME=path_of_the_RDBMS_home
$ $ORACLE_HOME/bin/srvctl add service -db racwtac_pri -service
tacservice -pdb buda -preferred racwtac1,racwtac2 -failover_restore
AUTO -commit_outcome TRUE -failovertype AUTO -replay_init_time 600 -
retention 86400 -notification TRUE -drain_timeout 300 -stopoption
IMMEDIATE -role PRIMARY
```

   where failovertype = AUTO or TRANSACTION for Application Continuity, commit_outcome = TRUE for Transaction Guard, failoverretry = Number of connection retries per replay, failoverdelay = Delay in seconds between connection retries.

3. Start the service on the primary:

```
$ $ORACLE_HOME/bin/srvctl start service -s tacservice -d racwtac_pri

$ $ORACLE_HOME/bin/srvctl status service -s tacservice -d
racwtac_pri
Service tacservice is running on instance(s) racwtac1,racwtac2

$ORACLE_HOME/bin/srvctl config service -d racwtac_pri -s tacservice
Service name: tacservice
Server pool:
Cardinality: 2
Service role: PRIMARY
Management policy: AUTOMATIC
DTP transaction: false
AQ HA notifications: true
Global: false
Commit Outcome: true
Failover type: AUTO
```

```
Failover method:
Failover retries: 30
Failover delay: 10
Failover restore: AUTO
Connection Load Balancing Goal: LONG
Runtime Load Balancing Goal: NONE
TAF policy specification: NONE
Edition:
Pluggable database name: buda
Hub service:
Maximum lag time: ANY
SQL Translation Profile:
Retention: 86400 seconds
Replay Initiation Time: 600 seconds
Drain timeout: 300 seconds
Stop option: immediate
Session State Consistency: AUTO
GSM Flags: 0
Service is enabled
Preferred instances: racwtac1,racwtac2
Available instances:
CSS critical: no
Service uses Java: false
```

4. On the standby system, log in as the `oracle` user on any of the nodes and configure the same role-based Transparent Application Continuity type of service:

```
$ $ORACLE_HOME/bin/srvctl add service -db racwtac_stby -service
tacservice -pdb buda -preferred racwtac1,racwtac2 -failover_restore AUTO -
commit_outcome TRUE -failovertype AUTO -replay_init_time 600 -retention
86400 -notification TRUE -drain_timeout 300 -stopoption IMMEDIATE -role
PRIMARY
```

5. Following is the JDBC connect string that our application must use to access all the benefits that TAC provides:

```
jdbc:oracle:thin:@(DESCRIPTION=(CONNECT_TIMEOUT=90)
(TRANSPORT_CONNECT_TIMEOUT=3)(RETRY_COUNT=50)(RETRY_DELAY=3)
(ADDRESS_LIST=(LOAD_BALANCE=ON)(ADDRESS=(PROTOCOL = TCP)(HOST = primary-
scan.oracle.com)(PORT = 1521)))(ADDRESS_LIST=(LOAD_BALANCE=ON)
(ADDRESS=(PROTOCOL = TCP)(HOST = standby-scan.oracle.com)(PORT = 1521)))
(CONNECT_DATA=(SERVER = DEDICATED)(SERVICE_NAME = tacservice.oracle.com)))
```

9

Scenario: Upgrading and Patching Database with Manually Configured Oracle Data Guard

This scenario describes upgrading and patching a database with manually configured Oracle Data Guard on Oracle Database Appliance on the DCS stack.

> **Note:**
>
> The following section does not apply for Oracle Data Guard set up with ODACLI commands. Use ODACLI commands to upgrade the databases.

- Upgrading All Components
  Upgrading an Oracle Database Appliance environment consists of upgrading DCS, server, storage, and database components.
- Upgrading Oracle Database
  The purpose of this section is to provide a high-level overview of the upgrade process in a primary-standby setup.
- Patching Oracle Database
  Patching databases on Oracle Database Appliance is an online operation. The following steps describe how to patch databases on a standby configuration. These steps apply to databases on bare metal systems and databases on DB systems.

Upgrading All Components

Upgrading an Oracle Database Appliance environment consists of upgrading DCS, server, storage, and database components.

When upgrading an Oracle Database Appliance environment where a standby system is already implemented, you can use the standby system to reduce the downtime required for completing the upgrade activities. The purpose of this section is to provide a high-level overview of the upgrade process in a primary-standby setup.

1. Verify that the system is operating correctly by running pre-checks, validating hardware and system processes, and verifying system configuration using ORAChk.
2. Take a backup of the operating system, Oracle Grid Infrastructure, Oracle homes, and databases in the primary environment. Refer to *My Oracle Support Note 2466177.1 - ODA (Oracle Database Appliance): ODABR a System Backup/Restore Utility*.
3. Upgrade DCS and server components on the standby Oracle Database Appliance system.
4. Switchover the primary database role and application connections to the standby system.
5. Upgrade DCS and server components on the current standby, that is, the former primary system.

6. For deployments with Oracle Database Appliance release earlier than 19.14, patch or upgrade the database. On bare metal deployments with Oracle Database Appliance release 19.14 and later, refer to the *Oracle Database Appliance Deployment and User's Guide* for the steps to patch the databases using ODACLI commands. ODACLI provides complete lifecycle management for Oracle Data Guard environments including database patching and upgrade if your Oracle Data Guard deployment was configured using ODACLI commands.

With this upgrade process, the downtime during the upgrade is minimized and system availability is affected only for the duration of upgrade or patching of the database component.

Upgrading Oracle Database

The purpose of this section is to provide a high-level overview of the upgrade process in a primary-standby setup.

Upgrading DCS, server, operating system, Oracle Grid Infrastructure, and general firmware, storage with switchover and switchback can help reduce downtime during upgrade. If you are only upgrading the database component, then unless you are using a zero downtime solution such as active-active Oracle GoldenGate solution, some downtime is expected for the application. Following is the process for database upgrade when a standby configuration exists:

1. Verify that the system is operating correctly by running pre-checks, validating hardware and system processes, and verifying system configuration using ORAChk.
2. Stop the standby database.

```
[oracle@stbydb1]$ srvctl stop database -d boston
```

3. Create a new database home or use an existing one on the standby with the version that you want to upgrade the database to on the primary.

```
[oracle@stbydb1]# odacli create-dbhome -v 19.14.0.0.220118
```

4. Stop log shipping on the primary.

```
[oracle@ proddb1] dgmgrl connect sys/welcome1@chicago
DGMGRL> SHOW DATABASE 'boston' 'LogShipping'; LogShipping = 'ON'
DGMGRL> edit database 'boston' SET PROPERTY 'LogShipping'='OFF';
Property "LogShipping" updated
DGMGRL> SHOW DATABASE 'boston' 'LogShipping'; LogShipping = 'OFF'
```

5. Create a new database home or use an existing database home on the primary with the version that you want to upgrade the database.

```
# odacli create-dbhome -v 19.14.0.0.220118
```

6. Stop the application.
7. Upgrade the primary database using the `odacli upgrade database` command.

```
[root@proddb1]# odacli list-databases
ID DB Name DB Type DB Version CDB Class Shape Storage Status
```

```
DbHomeID
---------------------------------------- ---------- --------

---------------------------------
713b68d3-8c43-4d10-973e-90a3fa88a84a chicago Rac 19.14.0.0.220118 false
Oltp Odb1 Asm Configured
863c8cbe-1c5f-450e-866c-15c384580ad3
```

8. Start the application.
9. Copy the `tnsnames.ora` file on the standby from the old Oracle home to the new on all nodes.
10. Copy the password file from the primary to the standby.

```
[oracle@proddb1]$ srvctl config database -d chicago |grep Password
Password file: +DATA/CHICAGO/PASSWORD/pwdchicago.277.1023633847
[grid@proddb1 ~]$ asmcmd
ASMCMD> pwcopy +DATA/CHICAGO/PASSWORD/pwdchicago.277.1023633847 /tmp/
pwdboston
copying +DATA/CHICAGO/PASSWORD/pwdchicago.277.1023633847 -> /tmp/
pwdboston
[oracle@proddb1]$ scp /tmp/pwdboston oracle@stbydb1: /u01/app/odaorahome/
oracle/product/19.0.0.0/dbhome_1/dbs/orapwboston
[grid@stbydb1 ~]$ asmcmd
ASMCMD> pwcopy /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1/dbs/
orapwboston +DATA/BOSTON/PASSWORDFILE/pwdboston
copying /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1/dbs/
orapwboston -> +DATA/BOSTON/PASSWORDFILE/pwdboston
```

11. Remove the Oracle database from Oracle Clusterware on the standby.

```
[oracle@ stbydb1]# srvctl remove database -db boston
Remove the database boston? (y/[n]) y
```

12. Add the database back to the Clusterware on the standby. The Oracle home must point to the new version of the home.

```
Example with single-instance Oracle Database:
[oracle@stbydb1]$ srvctl add database -db boston -
oraclehome /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1 -
dbtype SINGLE -instance boston1 -node stbydb1 -dbname chicago -
diskgroup 'DATA,REDO,RECO' -role physical_standby -spfile '+DATA/
BOSTON/PARAMETERFILE/spfileboston' -pwfile '+DATA/BOSTON/
PASSWORDFILE/pwdboston' -startoption mount

Example with Oracle RAC Database:
[oracle@stbydb1]$ srvctl add database -db boston -
oraclehome /u01/app/odaorahome/oracle/product/19.0.0.0/dbhome_1 -
dbtype RAC -dbname chicago -diskgroup 'DATA,RECO,REDO' -role
physical_standby -spfile '+DATA/BOSTON/PARAMETERFILE/spfileboston' -
pwfile '+DATA/BOSTON/PASSWORDFILE/pwdboston' -startoption mount
[oracle@stbydb1]$ srvctl add instance -database boston -instance
boston1 -node stbydb1
[oracle@stbydb1]$ srvctl add instance -database boston -instance
boston2 -node stbydb2
[oracle@stbydb1]$ srvctl start instance -db boston -instance
boston1 -o mount
[oracle@stbydb1]$ srvctl start instance -db boston -instance
boston2 -o mount
```

13. Enable log shipping and validate Oracle Data Guard configuration.

```
[oracle@stbydb1]$ dgmgrl
DGMGRL> connect sys/welcome1@chicago
DGMGRL> edit database 'boston' SET PROPERTY 'LogShipping'='ON';
Property "LogShipping" updated
DGMGRL> SHOW DATABASE 'boston' 'LogShipping'; LogShipping = 'ON'
DGMGRL> show configuration verbose
DGMGRL> show database verbose chicago
DGMGRL> show database verbose boston
DGMGRL> validate database chicago DGMGRL> validate database boston
```

14. Verify switchover and failover operations.
Switchover tests are as follows:

```
$ dgmgrl DGMGRL> connect sys/welcome1@boston
DGMGRL> switchover to boston
DGMGRL> connect sys/welcome1@chicago
DGMGRL> switchover to chicago;
```

Failover tests are as follows:

```
//Connect to standby before failover:
$ dgmgrl
DGMGRL> connect sys/welcome1@boston
DGMGRL> failover to boston
DGMGRL> reinstate database chicago
```

```
//Connect to former primary before failover:
DGMGRL> connect sys/welcome1@chicago
DGMGRL> failover to chicago;
DGMGRL> reinstate database boston

//Health check:
DGMGRL> show database verbose chicago
DGMGRL> show database verbose boston
DGMGRL> validate database chicago
DGMGRL> validate database boston
```

15. Sync up the registry on the standby system:

```
[root@ stbydb1~]# odacli list-databases

ID DB Name DB Type DB Version CDB Class Shape Storage Status DbHomeID
---------------------------------------- ---------- --------
-------------------- ---------- ---
e6450a56-5a7d-4dab-9ca9-25b004b66646 chicago Rac 18.11.0.0.200714 false
Oltp Odb1 Asm Configured 755b4b5d-6211-4d94-81e8-cf611868fe39

Sync up registry entries:

[root@ stbydb1~]#  odacli update-registry -n db -u chicago
Job details
----------------------------------------------------------------
            ID:  e4bbd7cc-6d0a-406d-8525-556f192b9f7a
            Description:  Discover Components : db
            Status:  Created
            Created:  March 09, 2023 15:08:41 PM CET
           Message:

[root@ stbydb1~]# odacli describe-job -i
e4bbd7cc-6d0a-406d-8525-556f192b9f7a

Job details
----------------------------------------------------------------
                     ID:  e4bbd7cc-6d0a-406d-8525-556f192b9f7a
            Description:  Discover Components : db
                 Status:  Success
                Created:  March 9, 2023 3:08:41 PM CET
                Message:

Task Name                                Node Name                 Start
Time                          End Time                          Status
---------------------------------------- -------------------------
---------------------------------- ---------------------------
Discover DBHome                          stdby1              March 9, 2023
3:08:41 PM CET       March 9, 2023 3:08:43 PM CET       Success
Discover DB: chicago                     stdby1               March 9,
2023 3:08:43 PM CET       March 9, 2023 3:08:55 PM CET       Success
```

Confirm the changes in the registry:

```
[root@ stbydb1~]# odacli list-databases

ID DB Name DB Type DB Version CDB Class Shape Storage Status
bHomeID
---------------------------------------- ---------- --------
------------------- ----
e6450a56-5a7d-4dab-9ca9-25b004b66646 chicago Rac 19.14.0.0.220118
false Oltp Odb1 Asm Configured 17f68bbf-b812-42e5-96ba-1433c30f75ed
```

The total downtime requirement is the duration of the database upgrade. A switchover and switchback is not required for a database upgrade. Note that the update registry operation removes backup, dbdomain, CPU pools and associated network settings for all databases. Backup, CPU pools and associated network settings can be added again with the `odacli modify-database` command.

Patching Oracle Database

Patching databases on Oracle Database Appliance is an online operation. The following steps describe how to patch databases on a standby configuration. These steps apply to databases on bare metal systems and databases on DB systems.

Note that if the database uses, Oracle JVM, then you cannot patch the standby system first. Refer to *My Oracle Support Note 2217053.1 - RAC Rolling Install Process for the "Oracle JavaVM Component Database PSU/RU"* to confirm OJVM usage. In such a case, defer log shipping on the primary system and patch the primary system first.

Follow these steps:

1. Verify that the system is operating correctly by running pre-checks, validating hardware and system processes, and verifying system configuration using ORAChk.
2. Take a backup of the database.
3. Stop log shipping on the primary.

```
$ dgmgrl DGMGRL> connect sys/welcome1@chicago
DGMGRL> edit database 'CHICAGO' SET STATE="LOG-TRANSPORT-OFF";
DGMGRL> SHOW DATABASE 'boston' 'LogShipping'; LogShipping = 'ON'
DGMGRL> edit database 'boston' SET PROPERTY 'LogShipping'='OFF';
Property "LogShipping" updated
DGMGRL> SHOW DATABASE 'boston' 'LogShipping'; LogShipping = 'OFF'
```

4. Stop the standby database and restart it in `read only` mode.

```
[oracle@stbydb1]$ srvctl stop database -d boston
[oracle@stbydb1]$ srvctl start database -db boston -o "read only"
```

5. Patch the standby database first. Identify the Oracle home of the database.

```
[root@ocboda10 ~]# odacli list-databases
ID DB Name DB Type DB Version CDB Class Shape Storage Status
DbHomeID
```

```
---------------------------------------- ---------- --------
------------------- ---------- ---------------------------------

```

6. Patch the primary database, similar to the steps for patching the standby database.
7. Start log shipping on the primary and verify Oracle Data Guard configuration.

```
DGMGRL> connect sys/welcome1@chicago
DGMGRL> edit database 'boston' SET PROPERTY 'LogShipping'='ON';
Property "LogShipping" updated
DGMGRL> SHOW DATABASE 'boston' 'LogShipping'; LogShipping = 'ON'
DGMGRL> show configuration verbose
DGMGRL> show database verbose chicago
DGMGRL> show database verbose boston
DGMGRL> validate database chicago
DGMGRL> validate database boston
```

10

Configuring NFS Server on Oracle Database Appliance

If either NAS or Oracle Object Storage is not an option, then configure NFS on one of the Oracle Database Appliance to take a backup of the source database and to restore it as a standby on the target system.

NFS server must be configured on the bare system location of the primary and the standby, for both Oracle Data Guard on bare metal system or DB system.

Follow these steps:

1. Create an ADVM volume on source bare metal system `node0` as the `grid` operating system user.

```
[grid@odabm1 ~]$ asmcmd
asmcmd> volcreate -G data -s 100G backup
ASMCMD> volinfo -G data backup
Diskgroup Name: DATA
Volume Name: BACKUP
Volume Device: /dev/asm/backup-322
State: ENABLED
Size (MB): 102400
Resize Unit (MB): 64
Redundancy: HIGH
Stripe Columns: 8
Stripe Width (K): 4096
Usage: Mountpath:
```

2. Format the volume as Oracle ACFS.

```
[grid@odabm1 ~]$ mkfs -t acfs /dev/asm/backup-322
mkfs.acfs: version = 19.0.0.0.0
mkfs.acfs: on-disk version = 46.0
mkfs.acfs: volume = /dev/asm/backup-322
mkfs.acfs: volume size = 107374182400 ( 100.00 GB )
mkfs.acfs: Format complete.
```

3. Create a mount point on both nodes. Run the command on both nodes on the bare metal system:

```
# mkdir /backup
```

4. Register the file system with Oracle Clusterware and start it as `root` operating system user.

```
[root@odabm1 ~]# /u01/app/19.15.0.0/grid/bin/srvctl add filesystem -
d /dev/asm/backup-322 -path /backup -mountowner oracle -mountgroup dba
```

```
[root@odabm1 ~]# /u01/app/19.15.0.0/grid/bin/srvctl start
filesystem -d /dev/asm/backup-322
```

5. Append to `/etc/exports` on `node0` on the bare metal system and make it active.

```
[root@odabm1 ~]# vi /etc/exports
/backup *(rw,sync,no_root_squash)

//or add each source and target nodes separately:
/backup primary1(rw,sync,no_root_squash)
/backup primary2(rw,sync,no_root_squash)
/backup standby1(rw,sync,no_root_squash)
/backup standby2(rw,sync,no_root_squash)

//where primary1, primary2 nodes refer to the nodes hosting the
primary database and standby1,
//standby2 refer to the nodes hosting the standby
[root@odabm1 ~]# exportfs -a
[root@odabm1 ~]# exportfs -v
...
/backup
*(sync,wdelay,hide,no_subtree_check,sec=sys,rw,secure,no_root_squash
,no_all_squash)
```

6. Create a mount point on the source and the target nodes using the same mount point name.

```
# mkdir /odabackup
```

7. Mount the file system on both nodes using the public IP address of `node0` on the source bare metal system.

```
# mount -t nfs 192.168.17.2:/backup /odabackup
```

8. As the `oracle` user ID may be different between the source and target, create a subfolder under `/odabkp` and change the ownership to `oracle:dba` on it.

```
# mkdir /odabackup/db

If the DB is TDE enabled, then one more folder is required:
# mkdir /odabackup/tde
# chown -R oracle:dba /odabackup
```

9. After configuring NFS on both source and target, follow the Oracle Data Guard configuration process till the step to restore the database as a standby.
10. Before restoring the database, change the ownership to `oracle:dba` on the target. The user and group IDs may be different between the source and target.

```
# chown -R oracle:dba /odabackup
```

11. Complete the Oracle Data Guard configuration.
12. After configuring Oracle Data Guard, revert all NFS-related changes.

a. Unmount `/odabackup` on source and target nodes.

```
# unmount /odabackup
```

b. Unmount `/backup` on all bare metal system nodes.

```
# unmount /backup
```

c. Remove `/backup` from `/etc/exports`.

d. Update the NFS configuration on the first bare metal system node.

```
[root@odabm1 ~]# exportfs -a
```

e. Delete the backup Oracle ACFS file system from the Oracle Clusterware configuration.

```
[root@odabm1 ~]# /u01/app/19.15.0.0/grid/bin/srvctl stop filesystem -
d /dev/asm/backup-322
[root@odabm1 ~]# /u01/app/19.15.0.0/grid/bin/srvctl remove filesystem
-d /dev/asm/backup-322
```

f. Delete the backup related Oracle ADVM volume as the `grid` operating system user on the bare metal system node.

```
[grid@odabm1 ~]$ asmcmd
ASMCDM> voldelete -G data backup
```

g. Reassign the original backup configuration to the primary database. By default, the value is `default`.

```
[root@proddb1 ~]# odacli modify-database -in databasename -bin default
```
