This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

**U.S. GOVERNMENT END USERS:** Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software" or "commercial computer software documentation" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

## Index

---

# Preface

This document provides a description about the Oracle system monitoring plug-in for Microsoft SQL Server, details on the versions the plug-in supports, prerequisites for installing the plug-in, and step-by-step instructions on how to download, install, verify, and validate the plug-in.

## Audience

This document is intended systems and database administrators tasked with monitoring Microsoft SQL Server through Enterprise Manager Cloud Control 13c.

## Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

### Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

## Related Documents

For information about the troubleshooting scenarios that you might encounter while working with the System Monitoring plug-ins, see the Troubleshooting the Microsoft SQL Server Plug-in in *Third-Party Database Plug-in Troubleshooting Guide*.

## Conventions

The following text conventions are used in this document:

Convention	Meaning
<b>boldface</b>	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
<code>monospace</code>	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

# Microsoft SQL Server Plug-in Overview and Prerequisites

This chapter describes the system monitoring plug-in for Microsoft SQL Server and provides a list of available features. Review the summary of prerequisites required before configuring Microsoft SQL Server for monitoring by Oracle Enterprise Manager Cloud Control.

The following topics are provided:

- [Microsoft SQL Server Plug-in Overview and Feature Summary](#)
- [Supported Versions](#)
- [Microsoft SQL Server Plug-in Prerequisites](#)
- [Downloading the Plug-in](#)
- [Deploying the Plug-in](#)
- [Upgrading the Plug-in](#)
- [Undeploying the Plug-in](#)

## Microsoft SQL Server Plug-in Overview and Feature Summary

The system monitoring plug-in for Microsoft SQL Server extends Oracle Enterprise Manager Cloud Control 13c to add support for managing Microsoft SQL Server instances. By deploying the plug-in within your Cloud Control environment, you gain the following management features:

- Monitor SQL Server instances.
- Supports both SQL Authentication and Windows Integrated Authentication.
- Gather configuration data and track configuration changes for SQL Server instances.
- Raise alerts and violations based on thresholds set on monitored metrics and configuration data.
- Provide rich out-of-box reports through Enterprise Manager's BI Publisher reports feature based on the gathered data.
- Support monitoring by a local or remote Windows Agent. Local Windows Agent is an agent running on the same host as the Microsoft SQL Server. Remote Windows Agent is an agent running on a host that is different from the host where SQL Server is running.
- Out-of-the-box monitoring templates for Microsoft SQL Server Cluster monitoring and Microsoft SQL Server AlwaysOn (HADR) monitoring.
- Oracle Enterprise Manager Jobs are made easy-to-access by being accessible from the plug-in's UI. These jobs allow for the following management of Microsoft SQL Server:
  - Backup, restore, schedule, and naming of Microsoft SQL Server database backups.
  - Start, stop, pause, and resume of SQL Server Instances.
  - Killing of sessions that are high in CPU or memory usage.

- Provide chargeback functionality for resource usage metering, consumption reports, and charge plans to define the resources to charge for and their associated rates.
- Provide inventory and usage details for inventory summaries of your Microsoft SQL Server database.
- Provide compliance management to evaluate the compliance of targets and systems.
- Failover to a specified node within a SQL Server Cluster.
- Create an index on a SQL Server table or view.

## Supported Versions

This plug-in supports the following versions of products.

**Table 1-1 Enterprise Manager (EM) (Oracle Management Server and Oracle Management Agent)**

MS SQL Server Version (Standard, Enterprise, and Workgroup Edition)	Plug-in Version 13.2.1.0.0	Plug-in Version 13.3.2.0.0	Plug-in Version 13.3.3.0.0	Additional Compatibility Details
<b>Microsoft SQL Server 2008</b>	EM 13.2, 13.3, & 13.4	EM 13.3	EM 13.3	<ul style="list-style-type: none"> <li>• 32-bit or 64-bit. (Up to EM 13.3.x)</li> <li>• Microsoft SQL Server 2008 R2 (32-bit or 64-bit) including Failover Cluster support. (Up to EM 13.3.x)</li> </ul>
<b>Microsoft SQL Server 2012</b>	EM 13.2, 13.3, & 13.4	EM 13.3, 13.4, & 13.5	EM 13.3, 13.4, & 13.5	32-bit or 64-bit including Failover Cluster and AlwaysOn Availability Groups support. (EM 13.2.1.0.0 and higher)
<b>Microsoft SQL Server 2014</b>	EM 13.2, 13.3, & 13.4	EM 13.3, 13.4, & 13.5	EM 13.3, 13.4, & 13.5	32-bit or 64-bit including Failover Cluster and AlwaysOn Availability Groups support. (EM 13.2.1.0.0 and higher)

**Table 1-1 (Cont.) Enterprise Manager (EM) (Oracle Management Server and Oracle Management Agent)**

<b>MS SQL Server Version (Standard, Enterprise, and Workgroup Edition)</b>	<b>Plug-in Version 13.2.1.0.0</b>	<b>Plug-in Version 13.3.2.0.0</b>	<b>Plug-in Version 13.3.3.0.0</b>	<b>Additional Compatibility Details</b>
<b>Microsoft SQL Server 2016</b>	EM 13.2, 13.3, & 13.4	EM 13.3, 13.4, & 13.5	EM 13.3, 13.4, & 13.5	32-bit or 64-bit including Failover Cluster and AlwaysOn Availability Groups support. (EM 13.2.1.0.0 and higher)
<b>Microsoft SQL Server 2017</b>	.	EM 13.3, 13.4, & 13.5	EM 13.3, 13.4, & 13.5	32-bit or 64-bit including Failover Cluster and AlwaysOn Availability Groups support. (EM 13.3.2.0.0 and higher)
<b>Microsoft SQL Server 2019</b>	.	EM 13.4 & 13.5	EM 13.4, & 13.5	32-bit or 64-bit including Failover Cluster and AlwaysOn Availability Groups support (EM 13.4.1.0.0 and higher)

**Note:**

Monitoring of Microsoft SQL Server Clusters are only supported with a remote monitoring configuration. The Oracle Management Agent used in monitoring cannot be installed to one of the cluster nodes.

## Microsoft SQL Server Plug-in Prerequisites

The following prerequisites must be met before you can deploy the plug-in. Patches are available from My Oracle Support (<https://support.oracle.com>):

1. Enterprise Manager Cloud Control (Oracle Management Server and Oracle Management Agent) must be installed:
  - Enterprise Manager Cloud Control 13c
2. The plug-in is only supported when running the Oracle Management Agent on 32-bit or 64-bit Windows.

3. Access privileges required for non-admin System user to perform Remote Monitoring of SQL Server instance.  
For more information, see [Configuring Remote Connections to Monitor Targets](#).
4. Windows Management Instrumentation Service is up and running.
5. Enable TCP/IP for the SQL Server instance. For more information, see [Enabling and Finding TCP/IP Port Information](#).
6. Enable SQL or Mixed Authentication on the SQL Server instance. For more information, [Enabling SQL Authentication or Mixed Authentication](#).
7. Create a suitable DB user with a sysadmin fixed server role. To monitor the SQL Server instance using non-sysadmin user, create a user with non-sysadmin role and provide the following access to it:
  - a. Execute this command to give access to the user:

```
GRANT VIEW SERVER STATE TO "login name"
```
  - b. Provide database access to the user.
  - c. Provide SQLAgentOperatorRole fixed database role in msdb to the user.
8. Preferred credentials are set and validated on all Agents where you want to deploy the plug-in.
9. The OS privileges for the user (set in the Preferred Credentials for the Agent) must meet the requirements documented in the "Setting Credentials for the Job System to Work with Oracle Enterprise Manager" section of the *Oracle Database Installation Guide for Microsoft Windows*.

 **Note:**

If you do not assign the correct privileges for users, the deployment will fail.

10. As part of JDBC URL, either IP Address or host name can be provided. Ensure that the host name can be resolved consistently on the network. Standard TCP tools such as nslookup and traceroute can be used to verify the host name. Validate using the following commands on Management Agent where plug-in is deployed:
  - nslookup <hostname>  
This returns the IP address and fully qualified host name.
  - nslookup <IP>  
This returns the IP address and fully qualified host name.
11. To enable the use of the Backup, Delete Backup, and Restore jobs, the following SQL commands must be processed on the monitored SQL Server database:

```
EXEC sp_configure 'show advanced options', 1
RECONFIGURE
EXEC sp_configure 'xp_cmdshell', 1
RECONFIGURE
```

## Downloading the Plug-in

You can download plug-ins in online or offline mode. *Online mode* refers to an environment where you have Internet connectivity, and can download the plug-in directly through Enterprise Manager from My Oracle Support. *Offline mode* refers to an environment where you do not have Internet connectivity, or where the plug-in is not available from My Oracle Support.

See the Managing Plug-ins chapter in the *Oracle Enterprise Manager Cloud Control Administrator's Guide* for details on downloading the plug-in in either mode.

## Deploying the Plug-in

You can deploy the plug-in to an Oracle Management Service instance using the Enterprise Manager Cloud Control console, or using the EM Command Line Interface (EMCLI). While the console enables you to deploy one plug-in at a time, the command line interface mode enables you to deploy multiple plug-ins at a time, thus saving plug-in deployment time and downtime, if applicable.

See the Managing Plug-ins chapter in the *Oracle Enterprise Manager Cloud Control Administrator's Guide* for instructions on deploying the plug-in.

## Upgrading the Plug-in

The Self Update feature allows you to expand Enterprise Manager's capabilities by updating Enterprise Manager components whenever new or updated features become available. Updated plug-ins are made available via the Enterprise Manager Store, an external site that is periodically checked by Enterprise Manager Cloud Control to obtain information about updates ready for download. See the Updating Cloud Control chapter in the *Oracle Enterprise Manager Cloud Control Administrator's Guide* for steps to update the plug-in.

## Undeploying the Plug-in

See the Managing Plug-ins chapter in the *Oracle Enterprise Manager Cloud Control Administrator's Guide* for steps to undeploy the plug-in.

# Configure Microsoft SQL Server for Authentication

This chapter provides the instructions for configuring Microsoft SQL Server for authentication for access through Oracle Enterprise Manager Cloud Control. Starting first with enabling and finding TCP/IP port information, the chapter ends with a set of authentication configuration scenarios that you can modify for your own environment.

The following topics are provided:

- [Enabling and Finding TCP/IP Port Information](#)
- [Modifying the Permissions for Database Authentication](#)
- [Enabling SQL Authentication or Mixed Authentication](#)
- [Authentication Configuration Scenarios](#)

## Enabling and Finding TCP/IP Port Information

The following sections provide information you require to enable the TCP/IP port and to find the TCP/IP port for a particular SQL server instance:

- [Enabling TCP/IP Port](#)
- [Finding the TCP/IP Port](#)

### Enabling TCP/IP Port

1. From the SQL Server Configuration Manager, select your appropriate SQL Server Network Configuration in the left panel and navigate to the SQL Server instance. The right panel displays all protocols for the specified SQL Server instance and their status.
2. Ensure that TCP/IP is enabled.
3. If TCP/IP is disabled, right-click **TCP/IP** and select **Properties**. The TCP/IP Properties dialog box appears.
4. In the Protocol tab, select **enabled**, and click **Apply**.
5. Restart the SQL Server instance.

### Finding the TCP/IP Port

After enabling the TCP/IP protocol, restart the SQL Server to apply the changes.

From the SQL Server Configuration Manager, select the appropriate SQL Server Network Configuration in the left panel and navigate to the SQL Server instance:

- The right panel displays all protocols for the specified SQL Server instance and their status.

- In the **IP Addresses** tab, TCP Dynamic Ports row of IP All will give the TCP/IP port of instance.

## Modifying the Permissions for Database Authentication

Modify the permissions for database authentication so that you enable SQL authentication or Windows authentication, and set sysadmin role for the database user that you are going to use for discovering the target and running jobs.

On the SQL Server, for the user you are going to use for monitoring and running jobs, set the write permissions by following these steps:

 **Note:**

If you do not have a user for Windows Authentication, then create one. To do so, from the task bar, go to **Start**, select **Settings**, and then **Control Panel**. In the Control Panel, double-click **Users and Passwords** and click **Add** in the Users tab.

1. Log in to the Microsoft SQL Server Management Studio with a predefined user account, or if one was not setup for SQL authentication, use Windows Authentication ([Figure 2-1](#)):

**Figure 2-1 Log In to Microsoft SQL Server**

2. Right-click **Logins** and select **New Login...** ([Figure 2-2](#)):

**Figure 2-2 New Login Menu**

3. Select either **Windows authentication** and select a predefined user, or select **SQL Server authentication** to specify a new user (Figure 2-3):

**Figure 2-3 Select User**

4. Under the Server Roles page, click the check box for the **sysadmin** server role (Figure 2-4):

**Figure 2-4 Select sysadmin Server Role**

5. Click **OK**.

## Enabling SQL Authentication or Mixed Authentication

1. Log in to the Microsoft SQL Server Management Studio with a predefined user account, or if one was not set up for SQL authentication, use Windows Authentication.
2. Right-click the server you wish to modify and then click **Properties**.
3. Select the **Security Page**.
4. Under the Server authentication heading choose either the desired authentication: **Windows Authentication** or **SQL Server and Windows Authentication** mode.
5. Click **OK**.
6. At this point the SQL server must be restarted. To do so, right-click the server you have just modified and select **Restart**.
7. If SQL Server Agent is running, it must also be restarted.

## Authentication Configuration Scenarios

The examples listed below describe supported configuration details for Microsoft SQL Server. Follow the examples below and choose the configuration options best suited for your environment. This version of the Microsoft SQL server plug-in does not support connecting to MS SQL via TLS v1.2.

- [Example 1: Local Monitoring with SQL Authentication](#)
- [Example 2: Local Monitoring with Windows Integrated Authentication \(WIA\)](#)
- [Example 3: Remote Monitoring with SQL Authentication](#)
- [Example 4: Remote Monitoring with Windows Integrated Authentication \(WIA\)](#)

- Example 5: Cluster Remote Monitoring with SQL Authentication
- Example 6: Cluster remote monitoring with Windows Integrated Authentication

 **Note:**

Before proceeding with target discovery, manually verify the authentication mode used by manually logging in to the target SQL Server's management tool or request WIA/SQL Authentication credentials from the SQL Server administrator.

## Example 1: Local Monitoring with SQL Authentication

EM Agent	:	MACHINE_1
JDBC URL	:	jdbc:sqlserver://MACHINE_1:<PORT>
Database Username	:	Database_Username
Password of Database User	:	Database_Password
System Password	:	<BLANK>
System Username	:	<BLANK>
Connect Using WIA (Yes/No)	:	No

Database\_Username can manually log in to the SQL Server management tool and be granted Sysadmin or correct SQL Server privileges.

Windows OS user is configured to run the Enterprise Manager Agent service and is granted advanced privileges.

## Example 2: Local Monitoring with Windows Integrated Authentication (WIA)

EM Agent	:	MACHINE_1
JDBC URL	:	jdbc:sqlserver://MACHINE_1:<PORT>
Database Username	:	<BLANK>
Password of Database User	:	<BLANK>
System Password	:	<BLANK>
System Username	:	<BLANK>
Connect Using WIA (Yes/No)	:	Yes

Windows OS User can manually log in to the SQL Server management tool using WIA, is configured to run Enterprise Manager Agent service, is granted advanced privileges, and is granted Sysadmin or correct SQL Server privileges.

## Example 3: Remote Monitoring with SQL Authentication

EM Agent	:	MACHINE_1
JDBC URL	:	jdbc:sqlserver://MACHINE_REMOTE:<PORT>
Database Username	:	Database_Username
Password of Database User	:	Database_Password
System Username	:	REMOTE_Windows_OS_User
System Password	:	REMOTE_Windows_OS_Password
Connect Using WIA (Yes/No)	:	No

Sysadmin or SQL Server privileges are granted to the Database\_Username.

Advanced privileges granted to REMOTE\_Windows\_OS\_User within the SQL Server host machine, and can log in to SQL Server host machine.

## Example 4: Remote Monitoring with Windows Integrated Authentication (WIA)

```
EM Agent : MACHINE_1
JDBC URL : jdbc:sqlserver://
MACHINE_REMOTE:<PORT>
Database Username : <BLANK>
Password of Database User : <BLANK>
System Username : REMOTE_Windows_OS_User
System Password : REMOTE_Windows_OS_Password
Connect Using WIA (Yes/No) : Yes
```

REMOTE\_Windows\_OS\_User can log in to SQL Server host machine, can manually login to the SQL Server management tool using WIA, granted advanced privileges, granted sysadmin or correct SQL Server privileges, and must be a Windows Domain account with access to OMA host and target database.

The host with the Oracle Management Agent (OMA) must be a member of the same Windows domain as the SQL Server host.

## Example 5: Cluster Remote Monitoring with SQL Authentication

```
Cluster = SQLServer_Cluster_Hostname
Nodes   = Node1_Hostname
          Node2_Hostname
          etc..

EM Agent : ANY MACHINE
JDBC URL : jdbc:sqlserver://
SQLServer_Cluster_Hostname:<PORT>
Database Username : Database_Username
Password of Database User : Database_Password
System Username : REMOTE_Windows_OS_User
System Password : REMOTE_Windows_OS_Password
Connect Using WIA (Yes/No) : No
```

Sysadmin or SQL Server privileges are granted to the Database\_Username.

REMOTE\_Windows\_OS\_User granted advanced privileges within the SQL Server nodes and can log in to SQL Server cluster hostname. Test the login by using Windows Remote Desktop.

SQLServer\_Cluster\_Hostname is virtual hostname or IP of the SQL Server Clustered Service and not the Windows Cluster Hostname.

## Example 6: Cluster remote monitoring with Windows Integrated Authentication

```
Cluster = SQLServer_Cluster_Hostname
Nodes   = Node1_Hostname
          Node2_Hostname
          etc..

EM Agent : ANY MACHINE
JDBC URL : jdbc:sqlserver://
```

```
SQLServer_Cluster_Hostname:<PORT>
Database Username           : <BLANK>
Password of Database User   : <BLANK>
System Username             : REMOTE_Windows_OS_User
System Password              : REMOTE_Windows_OS_Password
Connect Using WIA (Yes/No)    : Yes
```

REMOTE\_Windows\_OS\_User can log in to SQL Server cluster hostname, can manually login to the SQL Server management tool using WIA, granted advanced privileges, granted Sysadmin or correct SQL Server privileges, and must be a Windows Domain account with access to OMA host and target database.

SQLServer\_Cluster\_Hostname is virtual hostname or IP of the SQL Server Clustered Service and not the Windows Cluster Hostname.

 **Note:**

Where a User account requires Advanced Privileges, this includes the following Operation System rights:

- Act as part of the operating system.
- Adjust memory quotas for a process.
- Log on as batch job.
- Replace a process-level token.

The host with the Oracle Management Agent (OMA) must be a member of the same windows domain as the SQL Server host.

# Discovery of the Microsoft SQL Server Target

This chapter describes how to add a Microsoft SQL Server target to Enterprise Manager Cloud Control.

The following topics are provided:

- [Discovering Targets](#)
- [Adding Targets with EMCLI](#)
- [Verifying and Validating the Plug-in](#)

## Discovering Targets

After successfully deploying the plug-in, follow these steps to add the plug-in target to Cloud Control for central monitoring and management:

1. From the **Setup** menu, select **Add Target** and then **Add Targets Manually** as shown in [Figure 3-1](#):

**Figure 3-1 Add Targets Manually Menu**

2. In the Add Targets Manually page, select **Add Targets Declaratively by Specifying Target Monitoring Properties**, select **Target Type** as **Microsoft SQL Server**, select a **Monitoring Agent** and click **Add Manually**.

In the Add Microsoft SQL Server page ([Figure 3-2](#)), provide the following information for the properties:

- **Target Name:** Unique target name across all Cloud Control targets, such as MSSQL\_Hostname. This is the display name in Cloud Control. It represents this SQL Server target across all user interfaces within Cloud Control.
- **Monitoring Database Host Credentials**
  - **Target System Username** (Needed when SQL Server is at remote location): Valid host user name. Required only for remote Agent monitoring. When using

WIA remotely this account must be a Windows Domain account with access to the OMA host and target database. For more information, see [Configuring Remote Connections to Monitor Targets](#). The system user name must be fully qualified. For example:

hostname.domainname.com\Administrator

- **Target System Password:** Password for the System Username. Required only for remote Agent monitoring.
- **Confirm Target System Password:** Confirm the password entered for the System Username.
- **Monitoring Database Credentials**
  - **Database Username** (Required for SQL Authentication): Valid user for the database in sysadmin fixed server role.
  - **Database Password** (Required for SQL Authentication): Corresponding password for the database user.
  - **Confirm Database Password** (Required for SQL Authentication): Confirm the password entered for the database user.
  - **Database Role** (Optional): Role assigned to the database user.
  - **Confirm Database Role:** Confirm database role entered for database user.
- **Properties**
  - **Backup path (optional for backup and restore jobs):** Insert a path, encapsulated in single quotes, that backups generated with the Microsoft SQL Server Plug-in for OEM should be generated to.
  - **Connect Using Windows Integrated Authentication** (Yes/No): Select **Yes** for Windows Integrated Authentication, or select **No** for SQL Authentication.
  - **JDBC Driver:** (Optional) Microsoft SQL Server JDBC driver class name.  
For example,  
`com.microsoft.sqlserver.jdbc.SQLServerDriver`
  - **JDBC URL:** URL for JDBC. It is recommended that the host name provided in the JDBC URL should be a fully qualified domain name (FQDN). The default port number for Microsoft SQL Server is **1433**. You can specify either IP Address or host name. If you are monitoring a Microsoft SQL Server Cluster, then specify the IP address or host name of the virtual SQL server of the cluster (**Note:** this is not the same as the IP address or host name of the Windows cluster). For example:  
`jdbc:sqlserver://<hostname.domainname.com>:<port>`

You do not need to include the port number if your instance is using the default of **1433**.

 **Note:**

Specifying a Named Instance is possible for the URL of the JDBC, however consider the following when building the JDBC URL string:

- Microsoft recommend method for SQL Server hosts with multiple instances of SQL Server installed is to specify unique port numbers for each instance and only specify `hostname:port` for each URL string.
- Optionally, to make use of the Instance Name in the URL use the following supported URL format:  
`jdbc:sqlserver://hostname:port;instanceName=nameofinstance`
- Building JDBC connection URLs with backslashes "\\" or without the port number, is not supported by the Microsoft SQL Server plug-in.

3. Click **Test Connection** to make sure the parameters you entered are correct.

Figure 3-2 Add Microsoft SQL Server

**Add: Microsoft SQL Server**

Add a target to be monitored by Enterprise Manager by specifying target monitoring properties

**Target**

\* Target Name

Target Type Microsoft SQL Server

Host mssql\_host1.example.com

Agent https://mssql\_host1.example.com:1832/emd/main/

**Monitoring Database Credentials**

Credential type DBCreds

Database Username

Connect Using Windows Integrated Authentication (Yes/No) No

JDBC Driver (Optional) com.microsoft.sqlserver.jdbc.SQLServerDriver

\* JDBC URL (Example : jdbc:sqlserver://<host>:<port>)

► Global Properties

## Adding Targets with EMCLI

To add Microsoft SQL Server targets with EMCLI, use the `add_target` verb, as shown in [Example 3-1](#).

You will need to specify the following options:

- **Target name:** \*-name\*

It must begin with an alphabetic character contain only alphanumeric characters, multibyte characters, a space, -, \_, ., :, /, (, ) and have a maximum length of 256 characters.

- **Target type:** \*-type\*

Always use "microsoft\_sqlserver\_database" (including the quotes).

- **Host name:** \*-host\*

Network name of the machine running the Management Agent that is collecting data for this target instance.

- **Target instance properties:** \*-properties\*

Name-value pair list of properties for the target instance. The available property names are as follows.

```
SysUserName  
SysPassword  
DBUserName  
DBpassword  
Role  
dbBackupPath  
WinSecurityEnabled  
jdbcdriver  
url
```

- **Properties separator delimiter:** \*-separator=properties\*

Specify a string delimiter to use between name-value pairs for the value of the -properties option. The default separator delimiter is ":".

- **Properties subseparator delimiter:** \*-subseparator=properties\*

Specify a string delimiter to use between name and value in each name-value pair for the value of the -properties option. The default subseparator delimiter is ":". For the SQL Server plug-in, it is recommended that a plus "+" sign be used.

### Example 3-1 Adding Microsoft SQL Server Targets Using EMCLI

```
emcli.bat add_target  
    -name="SqlServerTarget"  
    -type="microsoft_sqlserver_database"  
    -host="HostTargetName"  
    -  
    properties="jdbcdriver+com.microsoft.sqlserver.jdbc.SQLServerDriver;  
              url+jdbc:sqlserver://  
              SqlServerHost.domain.localnet:1433;  
              DBUserName+sa;DBpassword+password;  
  
              SysUserName+SqlServerHost.domain.localnet\Administrator;  
              SysPassword+password;WinSecurityEnabled+No;"  
    -subseparator=properties)+"
```

## Verifying and Validating the Plug-in

After waiting a few minutes for the plug-in to start collecting data, use the following steps to verify and validate that Enterprise Manager is properly monitoring the plug-in target:

- Click the Microsoft SQL Server target link from the All Targets page. The Microsoft SQL Server home page appears as shown in [Figure 3-3](#):

**Figure 3-3 Microsoft SQL Server Target Home Page**

- Verify that no metric collection errors are reported by clicking **Monitoring** and then **Metric Collection Errors** from the **Target** menu.
- Ensure that reports can be seen and no errors are reported by clicking **Information Publisher Reports** in the **Target** menu and viewing reports for the Microsoft SQL Server target type.
- Ensure that configuration data can be seen by clicking **Configuration** and then **Last Collected** in the **Target** menu. If configuration data does not immediately appear, click **Refresh** in the Latest Configuration page.
- View the Database Page by selecting the **Microsoft SQL Server** drop down under the target name and selecting **Database**. The database page appears ([Figure 3-4](#)). The database page contains database specific performance and configuration metrics as well as backup and restore functionality. The database will be selected from a dropdown menu.

**Figure 3-4 Microsoft SQL Server Database Page**

6. View the Performance Page by selecting the **Microsoft SQL Server** drop down under the target name and selecting **Performance**. The Performance page appears ([Figure 3-5](#)). The performance page contains convenient performance graphs built from collected metrics.

**Figure 3-5 Microsoft SQL Server Performance Page**

7. View the Analysis Page by selecting the **Microsoft SQL Server** drop down under the target name and selecting **Analysis**. The Analysis page appears (Figure 3-6). The analysis page displayed SQL query and session information, as well as the "Kill Session" job button to quickly end any problematic sessions.

**Figure 3-6 Microsoft SQL Server Analysis Page**

8. View the indexes page by selecting the Microsoft SQL Server drop down under the target name and selecting **Indexes**. The indexes page appears (Figure 3-7). The indexes page displays metric graphs and tables about the database indexes. It also includes a Missing Indexes table that recommends indexes to be created. Click **Create Index** to create an index.

**Figure 3-7 Microsoft SQL Server Index Page**

# 4

## Configuring Connections

This chapter provides details about configuring connections for monitoring targets and executing jobs.

The following topics are provided:

- [Configuring Remote Connections to Monitor Targets](#)
- [Configuring Connections to Execute Jobs](#)

### Configuring Remote Connections to Monitor Targets

If you want to monitor targets using remote Agents, then Oracle recommends that you do the following security configurations on every system where SQL Server target resides.

1. Set WMI namespace security.
2. Restrict access to the registry from a remote computer.
3. Set DCOM Security to allow user to access remotely.
4. Set privileges for System User to access Windows performance counters remotely as follows:
  - a. Locally on the Microsoft Windows node hosting the Agent, open the **Local Security Settings** Windows Tool. Go to **Start**, select **Control Panel**, and then select **Administrative Tools**, select **Computer Management**, select **System Tools**, then **Local Users and Groups**, and select **Groups**.)
  - b. Add System Username to **Performance Monitor Group** as shown in [Figure 4-1](#):

**Figure 4-1 Performance Group**

5. Set access privileges of SQL Server Services to allow user to access a computer remotely.
  6. Set privileges for System User of target on Oracle Management Agent for Windows Integrated Authentication based monitoring.
    - a. Locally on the Microsoft Windows node hosting the Agent, open the **Local Security Settings** Windows Tool. Go to **Start**, select **Control Panel**, and then select **Administrative Tools**, and select **Local Security Policy**.
    - b. Click on **Local Policies** and then **User Rights Assignment**.
    - c. Assign the following right to the System User of the target:
- Logon as batch job
7. Configure **Allow Remote Administration Exception in Windows Firewall** if Windows firewall is enabled on the SQL Server target system.
  8. When using WIA remotely, the OMA host must be a member of the same Windows Domain.

## Configuring Connections to Execute Jobs

If you want to execute jobs using local or remote Agents, then Oracle recommends that you do the following security configurations on every system where SQL Server target resides.

- Set WMI namespace security.
- Set DCOM Security to allow user to access a computer remotely.

For configuration details, refer to the following:

- Microsoft Help and Support web site:  
<http://support.microsoft.com>
- *How To Troubleshoot Microsoft SQL Server Plug-In Issues* (Document 367797.1) on My Oracle Support:  
<https://support.oracle.com/rs?type=doc&id=367797.1>

# 5

## Inventory and Usage Details

This chapter describes the features and how to access the Inventory and Usage Details page ([Figure 5-1](#)) for the Microsoft SQL Server.

**Figure 5-1 Microsoft SQL Server Inventory and Usage Details Page**

## Inventory and Usage Details Page Feature Summary

With the Inventory and Usage Details page you can:

- View inventory summaries for your Microsoft SQL Server databases.
- View inventory summary information in the context of different dimensions such as version, platform, OS version and vendor, life cycle, department, location, and cost center.
- Drill down multiple levels of inventory details.
- View to a pie chart to break down the inventory data for the roll-up option by color-coded percentages.
- Repeatedly revise selections to refresh chart and details based on new selections.
- Export deployment and details tables as a .csv file.

## Accessing the Inventory and Usage Details Page

To view inventory and usage details:

1. From the **Enterprise** menu, select **Configuration**, and then select **Inventory and Usage Details**.

Alternatively, you can click **Details** in the Inventory and Usage region of the Enterprise Summary page.

2. Select the entity you want to examine and choose a roll-up option. For example, show all deployed hosts rolled up by platform. The page refreshes automatically upon selection.
3. In any given row in the top table, there is a count bar next to the count that represents a percentage of the maximum count. For example, if the maximum number of hosts by platform is four, the bar for hosts represented on two platforms would be half as long. Click the bar to refresh the details table and chart for the row.

## Additional Information

For further information, see the Working with Inventory and Usage Details section of the *Oracle Enterprise Manager Lifecycle Management Administrator's Guide*.

# 6

# Creating, Editing, and Using Jobs

This chapter describes how to create and edit jobs in Enterprise Manager Cloud Control for the Microsoft SQL Server.

The following topics are provided:

- [Creating and Editing Jobs](#)
- [Using the Backup and Restore Jobs](#)

## Creating and Editing Jobs

To create and edit jobs, follow these steps:

1. In Enterprise Manager Cloud Control 13c, click **Enterprise**, then **Job**, then click **Activity**.
2. On the Job Activity page ([Figure 6-1](#)), select a job type from the **Create Job** menu and click **Go**.

Select one of the following:

- Microsoft SQL Server and/or SQL Agent Start
- Microsoft SQL Server and/or SQL Agent Stop
- Microsoft SQL Server Pause or Resume
- Microsoft SQL Server Kill Session
- Microsoft SQL Server Backup Database
- Microsoft SQL Server Delete Backup Database
- Microsoft SQL Server Restore Database
- Microsoft SQL Server Create Index
- Microsoft SQL Server Cluster Failover
- Microsoft SQL Server Restore Database (Full Model)

**Figure 6-1 Microsoft SQL Server Jobs Page**

The screenshot shows the Microsoft SQL Server Jobs page. At the top, there are summary statistics: 0 Problems, 268 Job Runs, 17 Scheduled, and 1559 Job Plans. Below this is a search bar and a 'Create Job' button. The main area displays a table of jobs. One job, 'BACKUP DATABASE 1', is listed with a status of 'Success' (green checkmark) and 1 execution. The table includes columns for Name, Run, Status, Executions, Scheduled Time, Targets, Target Type, Owner, and Job Type. A sidebar on the left lists 'Available Criteria' such as Name, Owner, Status, Start Time, Job Type, Job Run, and Target Type, with 'Name' currently selected. A target dropdown at the bottom shows 'msodl-win-sql.local.1001'.

3. In the **General** tab of the Create <Job Type> Job page, provide a name for the job and add the individual targets or one composite target such as a Group.

 **Note:**

If you are editing a job, then modify the job name and the selected targets.

4. In the **Parameters** tab of the Create <Job Type> Job page, from the **Options** menu, select an appropriate option to make the job function accordingly when it starts.

You can select one of these options as shown in [Table 6-1](#):

**Table 6-1 Job Parameters Options**

Job Type	Available Options
Microsoft SQL Server and/or SQL Agent Start	<ul style="list-style-type: none"> <li>• Start SQL Server and SQL Server Agent services (You will select this option when both, SQL Server and SQL Server Agent, are stopped or when SQL Server is running but the SQL Server Agent is stopped)</li> <li>• Start SQL Server service (You will select this option when both, SQL Server and SQL Server Agent, are stopped and if you want to start only the SQL Server)</li> </ul>
Microsoft SQL Server and/or SQL Agent Stop	<ul style="list-style-type: none"> <li>• Stop SQL Server and SQL Server Agent services. You will select this option:             <ul style="list-style-type: none"> <li>- When both SQL Server and SQL Server Agent are running.</li> <li>- When SQL Server is paused but the SQL Server Agent is running.</li> <li>- When SQL Server is running/paused but the SQL Server Agent is stopped.</li> </ul> </li> <li>• Stop SQL Server Agent service. (You will select this option when you want to stop a running SQL Server Agent)</li> </ul>
Microsoft SQL Server Pause or Resume	<ul style="list-style-type: none"> <li>• Pause SQL Server service (You will select this option when you want to pause a running SQL Server)</li> <li>• Resume SQL Server service (You will select this option when you want to resume a paused SQL Server)</li> </ul>
Microsoft SQL Server Kill Session	<ul style="list-style-type: none"> <li>• End a single active SQL Server user session. (You will select this option to end an active user session by specifying the session ID)</li> </ul>
Microsoft SQL Server Backup Database	<ul style="list-style-type: none"> <li>• Creates a backup of the database specified by Database Name in the Parameters section of the job.</li> <li>• Unless specified by editing the monitoring configuration of a deployed target in the Backup Path value, the database backup files will be saved to the default SQL Server backup location. The path specified must not end in a backslash.</li> <li>• The Backup job is also available as a button on the Database page in the Backup Management section as <b>Backup Now</b>. (You will select this job when you want to take a backup of the specified database.)</li> <li>• The Backup job comes with Full, Differential, or Transaction Log options.</li> <li>• If running a Transaction Log backup job, all of the databases in the job need to utilize Microsoft SQL Server Full Recovery Model.</li> <li>• The Backup job also comes with the option to backup all databases on an instance. This option is available when creating the backup job from the Job Activity page (<a href="#">Figure 6-1</a>).</li> <li>• This option will back up all databases except master, model, msdb, and tempdb.</li> </ul>

**Table 6-1 (Cont.) Job Parameters Options**

<b>Job Type</b>	<b>Available Options</b>
Microsoft SQL Server Delete Backup Database	<ul style="list-style-type: none"> <li>Removes the backup file from the SQL Server by specifying Media Set ID and full path to the backup file in the Job Parameters section.</li> <li>The Delete Backup job is also available as a button on the Database page in the Backup Management section as <b>Delete</b>. (You will select this job when you want to remove backup file that is no longer needed)</li> </ul>
Microsoft SQL Server Restore Database	<ul style="list-style-type: none"> <li>Restores a database from backup by specifying the full path to the backup file as well as the database name in the Job Parameters section.</li> <li>The Restore Database jobs is also available as a button on the Database page in the Backup Management section as <b>Restore</b>. (You will select this option when you want to restore a database from a backup taken using the Microsoft SQL Server Backup Database job.)</li> <li>The restore job may be run with a full backup file or a full backup file plus a differential backup file.</li> </ul>
Microsoft SQL Server Restore Database (Full Model)	<ul style="list-style-type: none"> <li>Restores a database from backups utilizing the Full Recovery Model by specifying the database name as well as the date and time desired to be restored to.</li> <li>The Restore Database (Full Model) job is also able to be executed from the Database page in the Backup Management section.</li> </ul>
Microsoft SQL Server Cluster Failover	<ul style="list-style-type: none"> <li>Allows for a controlled failover to a new node in the Microsoft SQL Server Cluster.</li> <li>Specifying the target node is optional, if not specified, Microsoft SQL Server will choose the best node.</li> </ul>

Cloud Control starts the SQL server and agent services according to the selection made.

5. In the **Credentials** tab of the Create <Job Type> Job page, select an appropriate option for credentials.

You can choose to use the preferred credentials that are already set or override the preferred credentials with new credentials. In either case, you need to provide the credentials for agent host and database host.

To set the preferred credentials, click **Preferences** at the top-right corner of the Cloud Control console. From the left-vertical navigation bar, click **Preferred Credentials**. Cloud Control displays the Preferred Credentials page. On this page, you can set the preferred credentials

6. In the **Schedule** tab of the Create <Job Type> Job page, schedule the job.
7. In the **Access tab** of the Create <Job Type> Job page, define or modify the access you want other users to have to this job.
8. Click **Submit** to create the job.

 **Note:**

- To enable use of the Job buttons found in the Summary section of the Target home page and the Backup Management buttons found in the Database page, be sure to set the Preferred Credentials with SQL Server Authentication for the Microsoft SQL Server target type.
- Regardless of the authentication used for monitoring, the Kill Session, Backup, Delete Backup, and Restore jobs require SQL Server Authentication. To use these jobs be sure to specify credentials for SQL Server authentication.
- The Microsoft SQL Server Pause or Resume job is only supported for stand-alone Microsoft SQL Server instances. Pause or Resume Jobs submitted for Microsoft SQL Server 2008, 2012, 2014, and 2016 cluster instances will fail with the appropriate error message.

## Using the Backup and Restore Jobs

To use the backup and restore jobs:

1. From the Targets, select **All Targets**, then select the **Microsoft SQL Server** target.
2. From the Microsoft SQL Server menu, select **Database** as shown in [Figure 6-2](#):

Figure 6-2 Microsoft SQL Server Database Menu

3. Use the drop down to select the database you wish to back up as shown in [Figure 6-3](#).

**Figure 6-3 Select a Database**

Several options are available using the Backup Management Region.

4. Click **Backup Now** to create a backup immediately ([Figure 6-4](#)).

**Figure 6-4 Backup Microsoft SQL Database**

Backup Management			
<a href="#">Backup Now</a> <a href="#">Schedule Backup</a> <a href="#">Restore Backup</a> <a href="#">Delete Backup</a>			
Name	Type	Position	Size
masterbak_28-Aug-2020_02-47-18PM_Full.bak	Full	1	3.95 MB

If you want to give your backup a custom name, then use the **Backup Name** text box. Select either **Full**, **Differential**, or **Transaction Log** (only supported with Microsoft SQL Server Databases using the full recovery model), for the Backup Type ([Figure 6-5](#)). Click **Backup** to confirm.

Figure 6-5 Backup Type

When the backup is complete, it will appear in the list (Figure 6-6):

Figure 6-6 Completed Backup

Backup Management			
Backup Now	Schedule Backup	Restore Backup	Delete Backup
Name	Type	Position	Size
masterbak_28-Aug-2020_02-47-18PM_Full.bak	Full	1	3.95 MB

5. You can also create a backup schedule by clicking **Schedule Backup**.
6. Click **Yes** to confirm that you would like to go to Enterprise Manager's job creation system where you can complete the scheduling process.

7. Give the Job a name (Figure 6-7):

Figure 6-7 Microsoft SQL Server Job Name

The screenshot shows the 'Create 'Microsoft SQL Server Backup Database' Job' dialog in Oracle Enterprise Manager. The 'General' tab is selected. The 'Name' field contains 'TESTBACKUPJOB'. The 'Automatic Attempts' dropdown is set to '<none>' with a value of 1. The 'Target Type' is 'Microsoft SQL Server'. In the 'Target' section, 'MSSQL16\_Target' is selected. The 'Maximum Parallel Executions' field is empty.

8. Click on **Parameters** and specify the name of the database you wish to backup.
9. Optionally, you can specify a custom backup name and use the Backup Type drop down to select **Full**, **Differential**, or **Transaction Log**. Users also have the option to back up all user databases on the instance by selecting **True** for Backup All User Databases. Otherwise, only the specified database is backed up.
10. Select or enter credentials as shown in Figure 6-8. If you've configured Preferred Credentials for the target, you can select **SYSADMIN Database Credentials**, **Target System Credentials**, and **Agent Host Credentials**.

Figure 6-8 Enter Credentials

11. Use Enterprise Manager's built-in scheduling options to define the time and recurrence of the schedule as shown in [Figure 6-9](#):

**Figure 6-9 Scheduling Options**

12. Click **Submit**. The schedule will be shown in the Job Activity view (Figure 6-10).

**Figure 6-10 Microsoft SQL Server Job Activity View**

Jobs							
Available Criteria		Actions		Status		Last 24 hrs	
<input type="checkbox"/> Name	TESTBACKUPJOB	<input type="button" value="Edit"/>	<input type="button" value="Create Job"/>	<input checked="" type="checkbox"/> Run	<input checked="" type="checkbox"/> Executions	<input checked="" type="checkbox"/> Scheduled Time	<input checked="" type="checkbox"/> Targets
<input type="checkbox"/> Owner							

Jobs with Problems in the Last 24 hrs: 4 Problems

Activity in Last 24 hrs: 27 Job Runs

Jobs Scheduled for Next 24 hrs: 12 Scheduled

My Jobs: 17 Job Runs

Page Refreshed Aug 28, 2020 3:02:01 PM EDT

### Note:

You can only restore backups that meet the following criteria. The backup is:

- File backup (not tape)
- MS SQL Server knows this backup (that is, the backup is in the list of known backups, list comes from query, seen below)
- Not password protected
- Of the type 'SIMPLE' or 'FULL'
- Not damaged

# Using Reports and Monitoring Templates

This chapter describes how to use the reports and monitoring templates that the system monitoring plug-in for Microsoft SQL Server provides. Use the available out-of-the-box reports to further aid administrators with critical tasks such as problem diagnosis, trend analysis, and capacity planning. Monitoring templates simplify the task of setting up monitoring for large numbers of targets by allowing you to specify the monitoring and metric and collection settings once and applying them to many groups of targets as often as needed. The following topics are provided:

- [Using the Microsoft SQL Server Plug-in Reports](#)
- [Deploying Reports After BI Publisher is Configured](#)
- [Using the Microsoft SQL Server Plug-in Monitoring Templates](#)

## Using the Microsoft SQL Server Plug-in Reports

The Microsoft SQL Server plug-in includes 12 out-of-box reports ([Figure 7-1](#)):

**Figure 7-1 Microsoft SQL Server Reports**

To generate a new report from one of the out-of-the-box reports provided by Oracle, follow these steps:

1. From the Enterprise menu, select **Reports**, then **BI Publisher Enterprise Reports** as shown in [Figure 7-2](#):

**Figure 7-2 BI Publisher Enterprise Reports Menu**

2. Scroll down to the Microsoft SQL Server section, find the desired report, and click the report title hyperlink.
3. After the reports have been sorted to Microsoft SQL Server reports only, find the desired report and click on the report title hyperlink.

After clicking the report title hyperlink, the desired report will generate as shown in the example in [Figure 7-3](#):

**Figure 7-3 Microsoft SQL Server BI Publisher Report Example**

[Table 7-1](#) shows the BI Publisher Reports that are provided by Oracle:

**Table 7-1 Microsoft SQL Server Plug-in Reports**

Report Name	Report Description
Microsoft SQL Server Database Configuration	Displays Configuration Information for the various Databases.

**Table 7-1 (Cont.) Microsoft SQL Server Plug-in Reports**

Report Name	Report Description
Microsoft SQL Server System Configuration	Displays Configuration Information for the SQL Server System.
Microsoft SQL Server Database Backups and Jobs	Displays Information about the Database Backups and Jobs.
Microsoft SQLServer Memory Statistics	Displays Information about the Memory in SQL Server.
Microsoft SQLServer Performance	Displays Information about the Performance of the SQL Server.
Microsoft SQL Server Query Performance	Displays information about the Performance of the Most Active Queries of the SQL Server.
Microsoft SQL Server Session Performance	Displays information about the Performance of the Most Active Sessions of the SQL Server.
Microsoft SQL Server Statistics	Displays Statistical Information for SQL Server.
Microsoft SQL Server Cluster	Displays Information about the SQL Server Cluster.
Microsoft SQL Server Space Usage	Displays Information about Space Usage in the Database.
Microsoft SQL Server System Process Info and Locks	Displays information about the System Processes and locks of the SQL Server.
Microsoft SQL Server System Cache and Buffer	Displays information about the System Cache and Buffer of the SQL Server.
Microsoft SQL Server Availability Groups	Displays Information about the Availability Groups for SQL Server.
Microsoft SQL Server Database Mirroring	Displays Database Mirroring Information for SQL Server.
Microsoft SQL Server Database Performance	Displays Database Performance Information for SQL Server.

## Deploying Reports After BI Publisher is Configured

If the Microsoft SQL Server plug-in is deployed or upgraded after BI Publisher is already configured and the reports were not deployed automatically, then run the following command:

```
emcli deploy_bipublisher_reports -pluginid="oracle.em.smss" -
pluginversion="12.1.0.6.0" -force
```

## Using the Microsoft SQL Server Plug-in Monitoring Templates

To view the out-of-box templates, from the **Enterprise** menu, select **Monitoring** and then **Monitoring Templates**. Using the Target Type drop down, select **Microsoft SQL Server** and press the arrow button.

A complete list of all out-of-box monitoring templates will be available for use as follows (also, see [Figure 7-4](#)):

- **Basic MS SQL Monitoring Template** - Recommended basic template for monitoring SQL Server.

- **Cluster Template** - Recommended template for monitoring errors in a clustered SQL Server environment.
- **High Availability Disaster Recovery Template** - Recommended template for monitoring errors in a HADR (Always On) SQL Server environment.

**Figure 7-4 Microsoft SQL Server Monitoring Templates**

The screenshot shows a table of monitoring templates. The columns are: Name, Target Type, Owner, Status (Passed, Pending, Failed), and Description. The rows include:

Name	Target Type	Owner	Status	Description
Basic IBM DB2 Monitoring Template	IBM DB2 Database	SYSMAN	0 Passed, 0 Pending, 0 Failed	Recommended basic template for monitoring IBM DB2.
Basic MS SQL Monitoring Template	Microsoft SQL Server	SYSMAN	0 Passed, 0 Pending, 0 Failed	Recommended basic template for monitoring SQL Server.
Cluster Template	Microsoft SQL Server	SYSMAN	0 Passed, 0 Pending, 0 Failed	Recommended template for monitoring errors in a clustered SQL Server environment.
High Availability Disaster Recovery Template	Microsoft SQL Server	SYSMAN	0 Passed, 0 Pending, 0 Failed	Recommended template for monitoring errors in a HADR (Always On) SQL Server environment.
IBM DB2 I/O Monitoring Template	IBM DB2 Database	SYSMAN	0 Passed, 0 Pending, 0 Failed	Recommended template for monitoring IBM DB2 I/O.
IBM DB2 Lock Monitoring Template	IBM DB2 Database	SYSMAN	0 Passed, 0 Pending, 0 Failed	Recommended template for monitoring locks and deadlocks in IBM DB2.
Sybase ASE Efficiency Monitoring Template	Sybase Adaptive Server ...	SYSMAN	0 Passed, 0 Pending, 0 Failed	Recommended template for monitoring Sybase ASE efficiency.
Sybase ASE Traffic Monitoring Template	Sybase Adaptive Server ...	SYSMAN	0 Passed, 0 Pending, 0 Failed	Recommended template for monitoring Sybase ASE traffic.
Sybase ASE Utilization Monitoring Template	Sybase Adaptive Server ...	SYSMAN	0 Passed, 0 Pending, 0 Failed	Recommended template for monitoring Sybase ASE utilization.

To apply a monitoring template to a SQL Server Target, perform the following actions:

1. Click the desired monitoring template to select it.
2. Click the **Actions** button and select **Apply**.
3. Choose to either *replace* or *override* existing thresholds with the **Apply Options** option.
4. Click **Add** to add the SQL Server Targets to apply the template to. Follow the prompts through the target Search and Select Targets screen.
5. Click **Ok** and a confirmation message will appear at the top of the page notifying of a successful application.

The **Actions** button found on the Monitoring Templates screen will also give access to setting a selected template as "Default" for all new SQL Server Target deployments, or Edit an existing template's threshold values.

See the *Using Monitoring Templates* section in the *Enterprise Manager Cloud Control Administrator's Guide* for more information on how to use Monitoring Templates in Enterprise Manager 13c.

# Chargeback Functionality

This chapter provides the instructions for configuring chargeback functionality for Microsoft SQL Server.

This chapter contains the following sections:

- [About Chargeback](#)
- [Chargeback Plug-in Deployment](#)
- [Configuring Global Settings for Chargeback](#)
- [Configuring a Charge Plan](#)
- [Revising Extended Charge Plans](#)
- [Configuring a Cost Center](#)
- [Configuring an Entity](#)
- [Generating and Distributing Chargeback Reports](#)
- [Additional Information for Chargeback](#)

## About Chargeback

**Chargeback**, as the name implies, is a tool of accountability. The application's primary uses can generally be described as follows:

- Provide resource usage metering by aggregating and normalizing the enormous amount of metric data Enterprise Manager collects.
- Provide IT with a means to "charge" a currency amount to the consumers of resources.
- Provide consumers with reports detailing their consumption and associated charges.

## Chargeback Plug-in Deployment

In order to use the Chargeback functionality, it is necessary to deploy the Chargeback plug-in (from the **Setup** menu, select **Extensibility**, and then select **Plug-ins**).

For information on how to deploy the Chargeback Plug-in for Oracle Enterprise Manager, see the *Enterprise Manager 12c Cloud Control Metering and Chargeback White Paper*:

<http://www.oracle.com/technetwork/oem/cloud-mgmt/wp-em12c-chargeback-final-1585483.pdf>

## Configuring Global Settings for Chargeback

To configure the global settings for chargeback:

1. From the **Enterprise** menu, select **Chargeback**, as shown in [Figure 8-1](#):

Figure 8-1 Chargeback Menu Item

2. If you have not already configured global settings for currency symbol and uptime calculations, select the **Settings** subtab on the bottom of the **Home** tab.

- **Currency Symbol**

To change the default currency (USD), click in the currency symbol text box and enter the desired currency symbol. The new selection becomes the default currency across all charge plans; that is, the universal plan and all extended charge plans. All reports, including historical reports, reflect the new currency.

**Note:**

No rate conversion occurs when you change the currency; that is, the numbers stay the same. For example, a change from dollars to euros means that a one dollar charge becomes a one euro charge.

- **Uptime Calculations**

Select the appropriate radio button to ignore or include uptime in charge calculations. The default is to include uptime as a consideration. Including uptime has an impact on all fixed and configuration-based charge calculations for all entities.

Chargeback prorates charges and discounts accordingly. So, for example, if an entity was available 22.5 hours in a 24-hour period, the daily charge would be adjusted 1.5 hours. A change in the uptime setting is effective from the beginning of the current report cycle, but does not impact previous report cycles; that is, charges in historical reports are not prorated based on a change made to the setting in the current cycle.

3. Click **Save** to update the settings.

# Configuring a Charge Plan

A **charge plan** defines the resources to charge for and their associated rates. There are two types of charge plan: the **universal** charge plan and the **extended** charge plan.

The universal plan establishes rates for three basic metrics (CPU, memory, and storage). If you have not configured the universal charge plan, refer to the Chargeback Administration section of the *Oracle Enterprise Manager Cloud Administration Guide*.

An extended charge plan enhances the universal plan to include entity-specific metrics. It allows you to implement charges that relate to specific characteristics of an entity. The entity type determines the items for which rates can be charged.

Following the steps below to create an extended charge plan for Microsoft SQL Server:

1. From the **Charge Plans** tab, select **Create**, and then select **Plan** as shown in [Figure 8-2](#). This will bring you to the Create Plan page.

**Figure 8-2 Create Chargeback Plan**

The screenshot shows the Oracle Enterprise Manager Cloud Control 13c interface. The top navigation bar includes Home, Charge Plans (which is selected), Cost Centers, Entities, and Reports. Below the navigation is a toolbar with Create, Set Rates..., Delete..., Estimate..., Plan Advisor, Import, Export, and Charge Item Library. On the left, a sidebar titled 'Chargeback' lists 'Plan...', 'Revision...', 'View', and two entries: 'Universal Charge Plan' (selected) and 'Sample Charge Plan'. The main content area displays a table titled '★ Universal Charge Plan: Oct 1, 2015 - Onward' with columns for Metric, Type, and Rate. The table data is as follows:

Metric	Type	Rate
CPU Usage	Default CPU Architecture	\$0.00 / CPU / Hour
Memory Allocation	Generic	\$0.00 / GB / Month
Storage Allocation	Generic	\$0.00 / GB / Month

2. On the Create Plan page, you can name your plan at the top. In the left panel labeled "Entity Types" click **Add** and select **Microsoft SQL Server** as your Entity type.
3. Next, select **Add Item** in the center menu ([Figure 8-3](#)) to add the different items you can charge for. You can choose between the following four charge items or add them all:
  - Base Charge
  - Database Base Charge
  - Disk Space Usage
  - Memory Usage

**Figure 8-3 Charge Items**

The screenshot shows the 'Chargeback' interface under 'Create Plan: Example Plan'. The 'Entity Types' section lists 'Microsoft SQL Server'. The main area displays a table of charge items:

Item	Default Configuration	
	Charge	
Base Charge	\$1.00 / Week	(radio button)
Database Base Charge	\$50.00 / Instance / Quarter	(radio button)
Disk Space Usage	\$3.00 / GB / Day	(radio button)
Memory Usage	\$ 4.00	/ Month
Recovery Cost		

- Once you have selected the types you wish to include in your Charge Plan, set the rate and frequency. You can set the frequency for each item by hour, day, week, month, quarter or year. After you have set the charge items, click **Save** located at the top right of the screen. This will bring you back to the Charge Plans tab and give you confirmation at the top of your screen ([Figure 8-4](#)) that your plan was saved. You should now see it listed in the left hand panel.

At this point you will have created a Charge Plan.

**Figure 8-4 Charge Plan Confirmation**

The screenshot shows the 'Chargeback' interface with a confirmation message: 'Example Plan has been saved successfully.' The 'Charge Plans' section lists 'Example Plan' with 'Oct 1, 2015 - Onward' selected. The 'Entity Type' table shows 'Microsoft SQL Server' with 1 configuration.

Entity Type	Configurations
Microsoft SQL Server	1

## Revising Extended Charge Plans

You can update an extended charge plan in the following ways:

- Make changes to the charge rates in effect for the current or a future cycle.
- Create a plan revision for the next or a later report cycle, based on an existing plan.

To make changes to the charge rates in effect for the current or a future cycle:

1. Select the plan revision in the navigation pane and click **Set Rates**.
2. Make adjustments to the charge items and rates in effect.
3. Click **Save** to update the plan revision.

 **Note:**

When changing charge rates for the current cycle, the changes are retroactive to the beginning of the cycle.

To create a plan revision for the next or a later report cycle, based on an existing plan revision:

1. Select a plan in the navigation pane, and then select **Revision** from the Create menu.
2. In the dialog that opens, select the effective date of the revision. The default date is the first month after the most recently added revision. For example, if the current cycle is for May and a June revision already exists, July 01 is the default effective date. Click **OK**.
3. In the familiar create-like model, the configurations, charge items, and rate adjustments for the plan you selected in the navigation pane appear in the plan details table on the right.

Edit the plan details as desired:

- Add and remove entity types.
- Add and remove configurations.
- Add, change, and delete charge items.
- Make adjustments to metric rates.

4. When done, click **Save** to complete the plan revision.

## Configuring a Cost Center

**Cost centers** can be an individual or department within an organization that spreads charges across an enterprise.

The next step to setting up chargeback functionality is to configure a cost center.

Follow the steps below to create a cost center:

1. From the Cost Centers tab, select **Add** as shown in [Figure 8-5](#):

**Figure 8-5 Add a Cost Center**

The screenshot shows the Chargeback application interface. The top navigation bar includes Home, Charge Plans, Cost Centers (which is the active tab), Entities, and Reports. A date range selector shows 'May 1, 2015 - May 31, 2015'. Below the navigation is a table titled 'Cost Center' with columns for Action, View, Cost Center, Display Name, and Category. One row is visible: 'Default Cost Center' with 'Default Cost Center' as the display name and 'System' as the category.

2. In the box that appears, give your cost center a unique identifier and a display name. In the example shown below (Figure 8-6), **ACCT** was used as the identifier and the name was **Accounting Department**. For the Level value, select either **Top Level (Root)** or **Member of** depending on its position in the hierarchy.

**Figure 8-6 New Cost Center Name and Display Name**

The dialog box is titled 'New Cost Center'. It contains fields for 'Cost Center' (ACCT) and 'Display Name' (Accounting Department). A 'Level' section has a selected radio button for 'Top Level (Root)'. At the bottom are 'OK' and 'Cancel' buttons.

3. Once you have selected the names, click **OK**. You should now see your cost center listed (Figure 8-7).

You will now have successfully created a cost center.

**Figure 8-7 Cost Center Confirmation**

The screenshot shows the Chargeback application interface after adding a new cost center. The top navigation bar and date range selector are the same as in Figure 8-5. The main area displays a hierarchical tree of cost centers under 'Root'. The 'Default Cost Center' is a child of 'Root', and 'Accounting Department' is another child. Both entries show 'Consumer' as the category and 'All Users' as the consumer. The 'Default Cost Center' is categorized as 'System' and 'Manual'. A message at the top says 'Cost center Accounting Department has been successfully added.'

# Configuring an Entity

For each chargeback **entity** (target), the administrator is able to assign a charge plan to a target and a target to a cost center.

The following steps are used to setup your entities:

1. From the Entities tab, select **Add Entities** (Figure 8-8). This will take you to the Add Entities page.

**Figure 8-8 Add Entities**

The screenshot shows the Chargeback application interface. At the top, there's a navigation bar with links for Home, Charge Plans, Cost Centers, Entities (which is highlighted in blue), and Reports. Below the navigation bar, a date range selector shows "Oct 1, 2015 - Oct 31, 2015". On the left, a "Refine Search" sidebar lists "Entity Types" with options for Cost Centers, Charge Plans, and Collection Status. The main content area is titled "Cost Center and Charge Plan Assignment for Entities". It features a table with columns: Action, View, + Add, Remove, Assign Plan, Assign Cost Center, Entity Name, Entity Type, Charge Plan, Cost Center, Latest Collection Status, and Charge Trend. A message below the table says "No data to display". Under the table, there's a section titled "Entity:" with the sub-instruction "Select a metered target to view details."

2. From the Add Entities page, click **Add**. In the box that appears (Figure 8-9), select **Microsoft SQL Server** for the target type and then select the target you would like to add. You can also search the target's name to find it, if it does not appear in the list.

**Figure 8-9 Select an Entity Target**

The screenshot shows a modal dialog box titled "Select Targets". It has a search section with fields for "Target Type" (set to "All"), "Target Name", "On Host", and "Member of". Below the search section is a table listing targets. The table has columns: Target Name, Target Type, On Host, and Status. Three entries are listed:

- mssql-host1.example.com (Host, mssql8-win-sup..., Up)
- mssql-host2.example.com (Host, nod-s157-rh5.bl..., Up)
- PaaS\_mssql8\_1001 (PaaS Infrastructure, N/A, N/A)

At the bottom of the dialog, there are buttons for "Rows Selected" (1), "Mode Multi-Select", and "Select" (highlighted in blue) and "Cancel".

3. Once you have found the target you would like to add, click **Select**. It should now appear in the list of targets located at the center of the page (Figure 8-10). Click **Next**.

**Figure 8-10 Added Target**

Target Name	Target Type	Usage Mode	Charge Entity Type	Members	Valid
mssql-host1.example.com	Host	Metered by In	Host	0	

**Chargeback Entities**  
You must select the targets that will be configured for Chargeback. Chargeback is available on the following basic target types:  
• Host  
• VM Guest

4. Assign a plan to your entity. Select the target and click **Assign Plan**. In the Assign Plan pop-up (Figure 8-11), choose the charge plan you would like to assign to the entity and select **OK**.

**Figure 8-11 Assign a Charge Plan**

Charge Plan	Start Date
Universal Charge Plan	Oct 1, 2015

**Tip** Changes apply from the beginning of the reporting cycle (2015-10-01)  
**Tip** Choosing 'Propagate' option will propagate selected charge plan to its member entities having no charge plan assigned. Choosing 'Override' option will override the charge plan for all the member entities with selected charge plan.

5. Assign a cost center to your entity. In the Assign Cost Center pop-up (Figure 8-12), choose the cost center that you would like to assign the entity to. After you have assigned both a charge plan and cost center, click **Next**.

**Figure 8-12 Assign a Cost Center**

- Review your selections. If everything appears correct, click **Submit**. At the top of the Chargeback page you should see confirmation that the entity was added correctly (Figure 8-13):

**Figure 8-13 Entity Confirmation**

From the Entities tab, you can change the cost center or charge plan associated with a specific entity by selecting the entity and clicking either **Assign Plan** or **Assign Cost Center**, depending on which one you want to change. To delete the entity, click **Remove Entities**.

## Generating and Distributing Chargeback Reports

Chargeback summary reports are a powerful analytical tool for tracking resource usage and charge distributions. These summary reports show information related to charge or resource utilization broken down by cost center, entity type, and resource. They enable you to quickly assess the entities or cost centers with the greatest charges or resource utilization. Summary reports are primarily useful for drill-down purposes.

Data collection occurs once a day. The daily data collection job for the current cycle is based on charge plan and cost center assignments. The reporting cycle defines the time period for which to calculate charges. The cycle is for the current month starting on the first day of the month.

To generate ad hoc reports:

1. From the Enterprise menu, select **Chargeback**.
2. Select the **Reports** tab.
3. Design your report from the following options:
  - Use the current report cycle or customize a date range to report on.
  - Choose between summary and trend report types. A **summary** report presents a pie-chart breakdown, while a **trend** report uses a y-axis multiple bar chart to denote usage trends.
  - Select specific cost centers or report on all users.
  - Select specific entities or entity types or report on all entities within all entity types.
  - Choose the metric to report on.

Click **View Report** to see the results.

The report displays color-coded graphs summarizing charges by cost center, entity type, and resource, with details displayed in the table at the bottom. Click a color box link in the respective graph to recalculate the report contents for the color-coded selection, for example memory in the resource graph.

**Figure 8-14** shows an example of a summary report showing charges for the current reporting cycle for all cost centers and entity types, with a breakdown by resource.

**Figure 8-14 Chargeback Summary Report**

4. Filter the details by choosing from the drop-down list; the default is **All**. Use the query-by-example feature ( ) to search report details. The icon acts as a toggle; clicking it alternately shows or hides text and selection boxes above the table columns. The feature is also available in the **View** menu. Enter search criteria in various combinations by selecting a date and by typing values in the respective columns. Click **Enter** to activate the search.

5. Click the Export icon ( ) in the details region to export report contents to a file.
6. Click **Publish Report** to make report contents public. This action integrates with BI Publisher, where you can:
  - Save reports in a variety of formats (Excel, PowerPoint, HTML, PDF).
  - Distribute generated reports to e-mail lists (users who do not have access to Enterprise Manager, for example) on a defined schedule.

For information on BI Publisher setup, see the Configuring BI Publisher with Enterprise Manager chapter in the *Enterprise Manager Cloud Control Advanced Installation and Configuration Guide*.

## Additional Information for Chargeback

For further information regarding Chargeback, see the Chargeback Administration section of the *Oracle Enterprise Manager Cloud Administration Guide*.

# Compliance Management

This chapter provides the instructions for configuring Compliance Management for Microsoft SQL Server.

This chapter contains the following sections:

- [About Compliance Management](#)
- [Managing Compliance Framework](#)
- [Configuring the SQL Server Configuration Compliance Standard](#)
- ["Create Like" Compliance Standard](#)
- [Editing a Compliance Standard](#)
- [Evaluating Compliance](#)
- [Using Trend Overview](#)
- [Using Compliance Reports](#)
- [Managing Compliance Violations](#)
- [Additional Information](#)

## About Compliance Management

**Compliance management** allows the ability to evaluate the compliance of targets and systems. This is accomplished by defining, customizing, and managing compliance frameworks, compliance standards, and compliance standard rules.

A **compliance framework** is a hierarchical structure where any node can be mapped to one or more compliance standards, compliance standard rule folders, and compliance standard rules.

A **compliance standard** is a collection of checks or rules. It is a compliance control that must be tested against some set of IT infrastructure to determine if the control is being followed.

## Managing Compliance Framework

To manage compliance frameworks, follow these steps:

1. From the **Enterprise** menu, select **Compliance**, and then select **Library**.
2. Click the **Compliance Frameworks** tab.
3. Highlight the compliance framework you want to manage and choose the action you want to perform.

## Configuring the SQL Server Configuration Compliance Standard

Follow the steps below to configure the Microsoft SQL Server configuration compliance standard:

1. From the **Enterprise** menu, select **Compliance**, then select **Library**.
2. Click the **Compliance Standards** tab.
3. Refine your search, by using the Search option (Figure 9-1). On the Compliance Standard line, enter **SQL Server Configuration Compliance Standard**, and click **Search**. This action will narrow the list down to the SQL Server Compliance Standard.

**Figure 9-1 Refined Compliance Search**

The screenshot shows the 'Compliance Results' interface. At the top, there are tabs for 'Compliance Frameworks', 'Compliance Standards' (which is selected), and 'Target Compliance'. Below the tabs is a search bar with 'Evaluation Results' and 'Errors' options. The search criteria include 'Match' set to 'All', a search term 'SQL Server Configuration Compliance Standard', a target name field, and an average compliance score of 100. There are also 'Target Type' and 'Advanced' buttons. Below the search area is a table with columns: Compliance Standards, Applicable To, Compliance Standard State, Target Evaluations (with icons for red X, yellow triangle, green checkmark), Violations (with icons for red X, yellow triangle, green checkmark), Average Score (%), and Author. A single row is shown for the 'SQL Server Configuration Compliance Standard' associated with 'Microsoft SQL Server' in 'Production' state, with an average score of 97% and author 'ORACLE'.

4. Highlight the compliance standard and select **Associate Targets**. This will take you to the Compliance Standard Target Association page, as shown in Figure 9-2:

**Figure 9-2 Compliance Standard Target Association**

The screenshot shows the 'Compliance Standard Target Association' dialog box. It has a title bar 'Compliance Standard Target Association' and a sub-title 'Target Association for Compliance Standard: SQL Server Configuration Compliance Standard'. A message below states 'This table lists the targets that are associated with the compliance standard selected in the Compliance Standard Library.' At the top are buttons for 'OK' and 'Cancel'. Below the buttons is a toolbar with 'View', 'Add...', 'Remove', 'Edit...', 'Enable', and 'Disable' buttons. A table lists one target: 'Target Name: mssql14-c1', 'Target Type: Microsoft SQL Server', 'Evaluation Status: Enabled', 'Customized: ', 'Transfer Status: Successfully Done', and 'Association Time Stamp: May 27, 2015 1:32:33 PM'.

5. Click **Add**. The Select Targets menu will appear with a list of targets that you can select to associate with the SQL Server Compliance Standard (Figure 9-3). If you do not see the target you would like to select, use the Target Name search bar at the top. Once you have chosen the targets you would like to associate, click **Select**.

**Figure 9-3 Select Targets**

- The targets that you selected will now appear in the Target Association table (Figure 9-4). Once targets are in the table you can edit the parameters, remove, enable, or disable them.

**Figure 9-4 Added Targets**

Compliance Standard Target Association					
Target Association for Compliance Standard: SQL Server Configuration Compliance Standard					
This table lists the targets that are associated with the compliance standard selected in the Compliance Standard Library.					
View	Add...	Remove	Edit...	Enable	Disable
Target Name	Target Type	Evaluation Status	Customized	Transfer Status	Association Time Stamp
nod-mssql5-win8	Microsoft SQL Server	Enabled		Successfully Done	May 27, 2015 1:32:33 PM
mssql14-c1	Microsoft SQL Server	Enabled			

- Once you are finished selecting targets, click **OK**. In the box that appears select **Yes** to save your changes. A box will appear advising that the compliance standard was submitted to the target for processing (Figure 9-5). Click **OK**.

**Figure 9-5 Compliance Standard Confirmation**

Your target will now be associated with the SQL Server Compliance Standard. It will begin evaluation based on metric collection from that target.

## "Create Like" Compliance Standard

To create a compliance standard like another compliance standard, follow these steps:

- From the **Enterprise** menu, select **Compliance**, then select **Library**.
- Click the **Compliance Standards** tab.

3. Click **Create Like**  **Create Like...**

4. Customize the fields as needed.

The name of the compliance standard you are creating **must be different** than an existing compliance standard.

5. Click **Save**.

## Editing a Compliance Standard

You can customize compliance standards by editing the existing compliance standard rule settings.

 **Note:**

You cannot edit an Oracle-provided compliance standard; so, you should create a compliance standard like the compliance standard you wish to edit. See "["Create Like" Compliance Standard](#)".

Once you have created the like compliance standard you can make the customized changes.

To edit a compliance standard, follow these steps:

1. From the **Enterprise** menu, select **Compliance**, then select **Library**.
2. Click the **Compliance Standards** tab.
3. Highlight the standard you want to edit and click **Edit** ( **Edit...**).
4. Update the parameters as needed.
5. Click **Save**.

## Evaluating Compliance

**Compliance evaluation** is the process of testing the compliance standard rules mapped to a compliance standard against a target and recording any violations in the Management Repository.

By evaluating a target against a compliance standard, you are determining whether a target complies with the checks of the standard. To ensure compliance you should regularly perform the following actions:

- Regularly monitor the compliance dashboard to find areas that may indicate your organization has a low compliance score or is at risk.
- Study Oracle-provided reports.
- View the results of an evaluation.
- Study the trend overview as a result of the evaluation.

## Using Trend Overview

Use the graphs in the Trend Overview pages to visually determine whether the targets are adhering to or distancing themselves from the compliance best practices.

To access the Trend Overview pages for compliance standards:

1. From the **Enterprise** menu, select **Compliance**, and then select **Results**.
2. From the Compliance Standards tab, choose **Evaluation Results**.
3. On the Evaluation Results page, choose the compliance standard you want to investigate and click **Show Details**.
4. On the resulting details page, click the **Trend Overview** tab ([Figure 9-6](#)).

**Figure 9-6** Compliance Trend Overview

## Using Compliance Reports

Enterprise Manager Cloud Control provides reports specific to compliance. To access these reports:

1. From the **Enterprise** menu, select **Reports**, and then select **BI Publisher Enterprise Reports**.
2. Scroll to the **Compliance Section**.

Here you will find a number of reports relating to evaluations against compliance standards and compliance frameworks, as shown in [Figure 9-7](#):

Figure 9-7 Compliance Summary Report

Name	Author	Target Type	Compliance Score	Critical Targets	Warning Targets	Compliant Targets	Critical Rules	Warning Rules	Minor Warning Rules
SQL Server Configuration Compliance Standard	ORACLE	microsoft_sqlserver_database	97	0	0	1	0	1	5
Security Recommendations For Oracle Products	ORACLE	host	87.75	1	0	3	1	0	0

## Managing Compliance Violations

You can use the Managing Violations feature to suppress, unsuppress, and clear manual violations:

- **Accessing the Managing Violations feature (Figure 9-8)**
  1. From the **Enterprise** menu, select **Compliance**, and then select **Results**.
  2. From the Compliance Standards tab, choose **Evaluation Results**.
  3. On the Evaluation Results page, choose the compliance standard you want to investigate and click **Manage Violations**.

Figure 9-8 Manage Violations

Rule	Target Name	Applicable To	Keywords	Severity	Recommendation
Maximum Degree of Par...	mssql8-win-sup...	Microso...	Configuration	Minor Warning	Set the value to 1/2 the number of logical processors.
Disable xp_cmdshell	mssql8-win-sup...	Microso...	Configuration,S...	Minor Warning	Disable xp_cmdshell if it is not explicitly needed.
Auto Growth On	mssql8-win-sup...	Microso...	Configuration	Minor Warning	Enable auto growth of a reasonable amount on all files.
Transaction Log Books	mssql8-win-sup...	Microso...	Configuration	Minor Warning	Backup transaction log regularly between full database

- **Unsuppressed Violations tab**

Use this tab to suppress violations:

1. Select one or more violations.

2. Click **Suppress Violations**.
3. On the Violation Suppressed Confirmation pop-up, you can suppress the violation indefinitely or provide a date by which the suppression will end. Optionally, you can provide an explanation for the suppression.
4. Click **OK**.

This submits a job to do the suppression asynchronously and returns you to the Result Library page. A suppression adds an annotation to the underlying event stating that the violation is suppressed along with the reason (if a reason was provided).

 **Note:**

The job results are not instantaneous. It may take a few minutes for the results to be displayed.

- **Suppressed Violations tab**

Use this tab to unsuppress violations:

1. Select one or more violations.
2. Click **Unsuppress Violations**.
3. On the Violation Unsuppressed Confirmation pop-up, you can provide an explanation for the unsuppression.
4. Click **OK**.

This submits a job to do the unsuppression asynchronously and returns you to the result library. An unsuppression adds an annotation to the underlying event that the violation is unsuppressed along with the reason (if a reason was provided).

 **Note:**

The job results are not instantaneous. It may take a few minutes for the results to be displayed.

- **Manual Rule Violations tab**

To clear a manual rule violation:

1. Select one or more manual rule violations.
2. Click **Clear Violations**.
3. On the Clear Violations Confirmation pop-up, you can clear the violation indefinitely or provide a date by which the clear will end. Optionally, you can provide an explanation for the clear.
4. Click **OK**.

This submits a job to do the manual rule violations clearing asynchronously and returns you to the Result Library page. Clearing manual rule violations also clears the underlying violation event.

 **Note:**

The job results are not instantaneous. It may take a few minutes for the results to be displayed.

## Additional Information

For further information regarding Compliance Management, see the Managing Compliance section of the *Oracle Enterprise Manager Lifecycle Management Administrator's Guide*.
