

Oracle® Communications

Cloud Native Unified Data Repository

Installation and Upgrade Guide

Release 1.7.1

F32752-03

August 2020

The Oracle logo, consisting of a solid red square with the word "ORACLE" in white, uppercase, sans-serif font centered within it.

ORACLE®

Copyright © 2019, 2020, Oracle and/or its affiliates.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software" or "commercial computer software documentation" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

My Oracle Support

My Oracle Support (<https://support.oracle.com>) is your initial point of contact for all product support and training needs. A representative at Customer Access Support can assist you with My Oracle Support registration.

Call the Customer Access Support main number at 1-800-223-1711 (toll-free in the US), or call the Oracle Support hotline for your local country from the list at <http://www.oracle.com/us/support/contact/index.html>. When calling, make the selections in the sequence shown below on the Support telephone menu:

1. Select **2** for New Service Request.
2. Select **3** for Hardware, Networking and Solaris Operating System Support.
3. Select one of the following options:
 - For Technical issues such as creating a new Service Request (SR), select **1**.
 - For Non-technical issues such as registration or assistance with My Oracle Support, select **2**.

You are connected to a live agent who can assist you with My Oracle Support registration and opening a support ticket.

My Oracle Support is available 24 hours a day, 7 days a week, 365 days a year.

What's New in This Guide

This section shares the list of new features introduced in every OCUDR release. For more release specific information, you can refer to its release notes.

Patch Release 1.7.1

In this patch release, UDR can be deployed with service mesh like Aspen. This helps in controlling and monitoring the data flow within UDR microservices and outside as well.

Release 1.7

The following new features are introduced in this release:

- Extension of SLF provisioning with SLFGroupName on both UDR and ProvGw
- Supports enablement of various features of UDR
- Supports Helm test for NF deployment
- Supports customized labels and annotations in the Helm charts
- Supports CSAR packaging
- Integrated with Egress API gateway
- Integrated with CNC-Console for configuration of UDR
- Supports 4G policy data storage
- Support Diameter Sh interface for subscriber profile

1

Introduction

This document provides information for installing Cloud Native Unified Data Repository product.

Overview

The 5G Unified Data Repository (UDR) is one of the main key components of the 5G Service Based Architecture. It is implemented as a cloud native function and offers a unified database for storing application, subscription, authentication, service authorization, policy data, session binding and Application state information. It provides a HTTP2 based RESTful interface for other NF's and provisioning clients to access the stored data.

Oracle's 5G UDR:

- Leverages a common Oracle Communications Cloud Native Framework
- Is compliant to 3GPP 29.505 Release 15 specification UDM
- Is compliant to 3GPP 29.519 Release 16 (backward compatible with Release 15) specification for PCF
- Has tiered architecture providing separation between the connectivity, business logic and data layers
- Uses Oracle MySQL NDB Cluster CGE Edition as backend database in the Data Tier.
- Registers with NRF in the 5G network so that the other NFs in the network can discover UDR through NRF.
- Registers UDR with services like DR-SERVICE and GROUP-ID-MAP.

As per 3GPP, UDR supports following functionality:

- Storage and retrieval of subscription data by the UDM.
- Storage and retrieval of policy data by the PCF.
- Storage and retrieval of structured data for exposure.
- Storage and retrieval of SLF information, consumed by NRF.
- Application data (including Packet Flow Descriptions (PFDs) for application detection, AF request information for multiple UEs), by the NEF.
- Subscription and Notification feature.

Unstructured Data Storage Function (UDSF) is a part of Oracle's 5G UDR solution. It supports storage and retrieval of unstructured data by any 5G NF. The specifications of UDSF are presently not defined by 3GPP.

5G SLF functionality is also a part of Oracle's 5G UDR solution. It:

- Supports Nudr-groupid-map service as defined by 3GPP
- Registers with NRF for Nudr-groupid-map service

- Is compliant with 3GPP Release 16 for APIs to be consumed by 5G NRF
- Supports REST/JSON based provisioning APIs for SLF data

Architecture

The Cloud Native Unified Data Repository architecture has following three tiers:

Connectivity Tier

- Ingress API Gateway (Spring Cloud Gateway [SCG] based) is used as an API gateway that receives all requests and forwards them to the Nudr-drservice service of Business Tier.
- It load balances the traffic and provides required authentication.
- It provides TLS support.
- It runs on Kubernetes/OCCNE as a microservice.
- It uses Egress API Gateway for Egress traffic arising from UDR (notifications and NRF management APIs).

Business Tier

- Provides the business logic of 5G Unified Data Repository.
- It has following micro services:
 - **nudr-drservice:** The core service that handles flexible URI support, runtime schema validation and connects to Data Tier for DB operations. It provides SLF lookup functionality.
 - **nudr-nrf-client-service:** Handles registration, heartbeat, update and deregistration with Network Repository Function (NRF).
 - **nudr-notify-service:** Handles notification messages to Policy Control Function (PCF) and Unified Data Management (UDM) for data subscriptions.
 - **nudr-config:** Handles all request from CNC-Console and redirects all requests to appropriate REST API of the config server. It allows users to configure UDR for all micro services.
 - **nudr-config-server:** Handles all the requests from nudr-config and updates the database.
 - **nudr-diameterproxy service:** Supports Diameter Sh interface for 4G policy data for the subscriber profile.

Data Tier

- Uses Oracle MySQL NDB Cluster, CGE edition as backend database in the DB tier. This provides HA and geo-redundcancy capabilities.
- Users can build database on either Bare metal, virtualized or on kubernetes platform (kubevirt based).

References

You can refer to the following documents for better understanding of Unified Data Repository and its related network functions.

- Unified Data Repository User's Guide

- Provisioning Gateway Guide
- CNE Installation Guide
- Policy Installation Guide
- NRF Installation Guide

Acronyms

The following table provides information about the acronyms used in the document.

Field	Description
5G-AN	5G Access Network
5GC	5G Core Network
5G-GUTI	5G Globally Unique Temporary Identifier
5GS	5G System
AMF	Access and Mobility Management Function
ASM	Aspen Service Mesh
AUSF	Authentication Server Function
NEF	Network Exposure Function
NF	Network Function
NRF	Network Repository Function
NSI ID	Network Slice Instance Identifier
NSSAI	Network Slice Selection Assistance Information
NSSF	Network Slice Selection Function
NSSP	Network Slice Selection Policy
PCF	Policy Control Function
REST	Representational State Transfer
SEPP	Security Edge Protection Proxy
SLF	Subscriber Location Function
SMF	Session Management Function
UDM	Unified Data Management
UDR	Unified Data Repository
UDSF	Unstructured Data Storage Function

2

Installing Unified Data Repository

This section provides instructions on installing Unified Data Repository.

Planning Your Installation

Before installing UDR, perform the following pre-installation tasks:

- Checking the software requirements
- Checking the environment setup

Checking the Software Requirements

Before installing Unified Data Repository (UDR), install the following softwares on your system.

Software	Version
Kubernetes	v1.13.3
HELM	v2.12.3

Additional softwares that needs to be deployed as per the requirement of the services are:

Software	Version	Notes
elasticsearch	1.21.1	Needed for Logging Area
elastic-curator	1.2.1	Needed for Logging Area
elastic-exporter	1.1.2	Needed for Logging Area
logs	2.0.7	Needed for Logging Area
kibana	1.5.2	Needed for Logging Area
grafana	2.2.0	Needed for Metrics Area
prometheus	8.8.0	Needed for Metrics Area
prometheus-node-exporter	1.3.0	Needed for Metrics Area
metallb	0.8.4	Needed for External IP
metrics-server	2.4.0	Needed for Metric Server
tracer	0.8.3	Needed for Tracing Area

Note:

The above softwares are available in the **Oracle Communications Cloud Native Environment (OCCNE)**. If you are deploying UDR in any other environment, then the above softwares must be installed before installing UDR.

To check the installed software items, execute the following command:

```
helm ls
```

Some systems may need to use helm command with **admin.conf** file as follows:

```
helm --kubeconfig admin.conf
```

 **Note:**

Some of the above mentioned software(s) are updated frequently. Their later versions than those listed above should work with UDR 1.7. Some UDR features and services work differently depending on the software being used

Checking the Environment Setup

Before installing UDR, the system environment should have the following:

- **Access to OpenStack Environment:** User should have access to an existing OpenStack environment including the OpenStack Desktop. This environment is configured with appropriate resource flavors and network resources that allows its users to allocate resources to the virtual machines created via this procedure.
- **Availability of a pub key:** Users must have a pub key for logging into the Bootstrap Host. This key should be placed into the customer OpenStack Environment using **Import Key** tab on the **Launch Instance** → **Key Pair** dialog or via the **Compute** → **Access and Security**.
- **OCUDR Software:** User must install Kubernetes v1.13.3 and HELM v2.12.3. UDR consists of:
 - **Helm Charts** that reflect the OCUDR software version. It is a zipped tar file that you need to unzip.
 - **Docker images of the micro-services** that are shared as tar file. You need to untar it.

 **Note:**

For more details about OCUDR Software, see [Checking the Software Requirements](#).

- **Create Database User/Group:** The Database administrator should create a user in the MYSQL DB using MySQL NDB cluster. UDR uses an NDB MySQL database to store the subscriber information. NDB MySQL database provides HA and geo-redundancy capabilities. The database administrator should also provide user with necessary permissions to access the tables in the NDB cluster. The steps to create a user and assign permissions are as follows:
 1. Login to the server where the ssh keys are stored and SQL nodes are accessible.
 2. Connect to the SQL nodes.
 3. Login to the Database as a root user.

4. Create a user on all sql nodes and assign it to a group having necessary permissions to access the tables on all sql nodes. Also, create a database on only one sql node.

```
CREATE USER '<username>'@'%' IDENTIFIED BY '<password>';
DROP DATABASE if exists <db_name>;
CREATE DATABASE <db_name> CHARACTER SET utf8;
CREATE DATABASE udr_release CHARACTER SET utf8;
```

 **Note:**

DB Name used in the above command should be same as releaseDbName configuration under global section in values.

```
GRANT SELECT, INSERT, CREATE, ALTER, DROP, LOCK TABLES,
CREATE TEMPORARY TABLES, DELETE, UPDATE, EXECUTE, INDEX,
REFERENCES ON
<db_name>.* TO '<user>'@'%' ;
GRANT SELECT, INSERT, CREATE, ALTER, DROP, LOCK TABLES, CREATE
TEMPORARY TABLES,
DELETE, UPDATE, EXECUTE, INDEX, REFERENCES ON udr_release.* TO
'<user>'@'%' ;
USE <db_name>;
```

 **Note:**

You need this database name, username and password at the time of creating Kubernetes secrets.

- **Network Access:** The Kubernetes cluster hosts must have network access to:
 - Local docker image repository where the Oracle Communications Unified Data Repository images are available.
To check if the Kubernetes cluster hosts has network access to the local docker image repository, try to pull any image with tag name to check connectivity by executing:

```
docker pull <docker-repo>/<image-name>:<image-tag>
```

- Local helm repository where the Oracle Communications Unified Data Repository helm charts are available.
To check if the Kubernetes cluster hosts has network access to the local helm repository, execute:

```
helm repo update
```

 **Note:**

Some of the systems may need to use helm command with `helm --kubeconfig admin.conf`

 **Note:**

All the kubectl and helm commands (used in this document) must be executed on a system depending on the infrastructure of the deployment. It can be any client machine like virtual machine, server, local desktop and so on.

- **Laptop/Desktop Client Software:** A laptop/desktop where the user executes deployment commands should have:
 - Network access to the helm repository and docker image repository
 - Configuration of Helm repository on the client
 - Network access to the Kubernetes cluster
 - Necessary environment settings to run the `kubectl` commands. The environment should have privileges to create namespace in the Kubernetes cluster.
 - Helm client installed with the **push** plugin. The environment should be configured so that the `'helm install'` command deploys the software in the Kubernetes cluster.

 **Note:**

All the kubectl and helm commands (used in this document) must be executed on a system depending on the infrastructure of the deployment. It can be any client machine like virtual machine, server, local desktop and so on.

Installation Sequence

The installation sequence of UDR is as follows:

1. [Installation Preparation](#)
2. [OCUDR Namespace Creation](#)
3. [Service Account, Role, and RoleBinding Creation](#)
4. Creating Kubernetes Secrets for storing:
 - [DBName, Username, Password and EncryptionKey](#)
 - [Private Keys and Certificate for IngressGateway](#)
5. [ocudr-custom-values.yaml File Configuration](#)
6. [UDR Deployment](#)
7. [Post Installation Sanity Check - Helm Test](#)

Installation Preparation

This phase of installation includes downloading and loading the required files to the system.

1. Download the following UDR package file from Oracle Software Delivery Cloud (OSDC).

```
<nfname>-pkg-<marketing-release-number>.tgz
```

For example:ocudr-pkg-1.7.1.tgz

2. Untar the UDR Package File. Execute the following command to untar UDR Package File.

```
tar -xvf ocudr-pkg-1.7.1.tgz
```

This command results into ocudr-pkg-1.7.1 directory. The directory consists of following:

- **UDR Docker Images File:** ocudr-images-1.7.1.tar
- **Helm File:** ocudr-1.7.1.tgz
- **Readme txt File:** The Readme.txt contains cksum and md5sum of tarballs.

3. Verify the checksums of tarballs in the following file.

```
Readme.txt
```

4. Load the tarballs to docker images. Execute the following command:

```
# docker load --input /root/ocudr-images-1.7.1.tar
```

5. Check if all the images are loaded. Execute the following command:

```
docker images | grep ocudr
```

6. Tag the docker images to docker registry. Execute the following command:

```
docker tag <image-name>:<image-tag> <docker-repo>/<image-name>:<image-tag>
```

7. Push the docker images to docker registry. Execute the following command:

```
docker push <docker-repo>/<image-name>:<image-tag>
```

Sample Tag and Push Commands:

```
# docker tag ocudr/nudr_datarepository_service:1.7.1 <customer repo>/nudr_datarepository_service:1.7.1
```

```
# docker push <customer repo>/nudr_datarepository_service:1.7.1
```

```
# docker tag ocudr/nudr_nrf_client_service:1.7.1 <customer repo>/nudr_nrf_client_service:1.7.1
```

```
# docker push <customer repo>/nudr_nrf_client_service:1.7.1
```

```
# docker tag ocudr/nudr_notify_service:1.7.1 <customer repo>/nudr_notify_service:1.7.1
```

```
# docker push <customer repo>/nudr_notify_service:1.7.1
```

```
# docker tag ocudr/nudr_diameterproxy:1.7.1 <customer repo>/nudr_diameterproxy:1.7.1
```

```
# docker push <customer repo>/nudr_diameterproxy:1.7.1
```

```
# docker tag ocudr/nudr_prehook:1.7.1 <customer repo>/nudr_prehook:1.7.1
```

- ```
docker push <customer repo>/nudr_prehook:1.7.1

docker tag ocudr/nudr_config:1.7.1 <customer repo>/
nudr_config:1.7.1

docker push <customer repo>/nudr_config:1.7.1

docker tag ocudr/ocingress_gateway:1.7.7 <customer repo>/
ocingress_gateway:1.7.7

docker push <customer repo>/ocingress_gateway:1.7.7

docker tag ocudr/ocegress_gateway:1.7.7 <customer repo>/
ocegress_gateway:1.7.7

docker push <customer repo>/ocegress_gateway:1.7.7

docker tag ocudr/configurationinit:1.2.0 <customer repo>/
configurationinit:1.2.0

docker push <customer repo>/configurationinit:1.2.0

docker tag ocudr/configurationupdate:1.2.0 <customer repo>/
configurationupdate:1.2.0

docker push <customer repo>/configurationupdate:1.2.0

docker tag ocudr/ocpm_config_server:1.7.0 <customer repo>/
ocpm_config_server:1.7.0

docker push <customer repo>/ocpm_config_server:1.7.0

docker tag ocudr/readiness-detector:latest <customer repo>/
readiness-detector:latest

docker push <customer repo>/readiness-detector:latest

docker tag ocudr/nf_test:1.7.1 <customer repo>/nf_test:1.7.1

docker push <customer repo>/nf_test:1.7.1
```
8. Untar Helm Files. Execute the following command:  

```
tar -xvzf ocudr-1.7.1.tgz
```
  9. Download the Unified Data Repository (UDR) Custom Template ZIP file from OHC. The steps are as follows:
    - a. Go to the URL, [docs.oracle.com](https://docs.oracle.com)
    - b. Navigate to **Industries->Communications->Cloud Native Core**.
    - c. Click the Unified Data Repository (UDR) Custom Template link to download the zip file.
    - d. Unzip the template to get ocudr-custom-configTemplates-1.7.1 file that contains the following:
      - **UDR\_Dashboard.json**: This file is used by grafana.

- **ocudr-custom-values-1.7.1.yaml**: This file is used during installation.
- **ProvGw\_Dashboard.json**
- **provgw-custom-values-1.7.1.yaml**

Following are the OCUDR Images.

| Pod                                            | Image                                                                           |
|------------------------------------------------|---------------------------------------------------------------------------------|
| <helm_release_name>-nudr-drservice             | ocudr/nudr_datarepository_service                                               |

| <helm_release_name>-nudr-nrf-client-service    | ocudr/nudr_nrf_client_service                                                   |
| <helm_release_name>-ingressgateway             | ocudr/ocingress_gateway<br>ocudr/configurationinit<br>ocudr/configurationupdate |
| <helm_release_name>-egressgateway              | ocudr/ocegress_gateway<br>ocudr/configurationinit<br>ocudr/configurationupdate  |
| <helm_release_name>-nudr-config                | ocudr/nudr_config                                                               |
| <helm_release_name>-nudr-config-server         | ocudr/ocpm_config_server<br>ocudr/readiness-detector                            |
| <helm_release_name>-nudr-diameterproxy-service | ocudr/nudr_diameterproxy                                                        |
| <helm_release_name>-test                       | ocudr/nf_test                                                                   |
| <helm_release_name>-nudr-preinstall            | ocudr/nudr_prehook                                                              |

 **Note:**

**<helm\_release\_name>-nudr-notify-service** and **<helm\_release\_name>-nudr-diameterproxy-service** are not required for SLF deployment. So, set its flag value as 'enabled - false' in the **values.yaml** file. For more details, see User Configurable Parameter [ocudr-custom-values.yaml File Configuration](#).

## OCUDR Namespace Creation

In this section, you will learn to verify the existence of a required namespace in the system. If a namespace does not exist, you must create it. The steps to verify and create a namespace are as follows:

1. Execute the following command to verify the existence of required namespace in system:  

```
kubectl get namespace
```
2. If the required namespace does not exist, then execute the following command to create a namespace:  

```
kubectl create namespace <required namespace>
```

**For example:** `kubectl create namespace ocudr`

 **Note:**

This is an optional step. In case required namespace already exists, proceed with next procedures.

## Service Account, Role and RoleBinding Creation

In this section, you will learn to create a service account, role and rolebinding resources.

A sample command to create the resources is as follows:

```
kubectl -n <ocudr-namespace> create -f ocudr-sample-resource-template.yaml
```

A sample template to create the resources is as follows:

 **Note:**

You need to update the <helm-release> and <namespace> values with its respective ocudr namespace and ocudr helm release name.

```
#
Sample template start
#
apiVersion: v1
kind: ServiceAccount
metadata:
 name: <helm-release>-serviceaccount
 namespace: <namespace>

apiVersion: rbac.authorization.k8s.io/v1
kind: Role
metadata:
 name: <helm-release>-role
 namespace: <namespace>
rules:
- apiGroups:
 - "" # "" indicates the core API group
 resources:
 - services
 - configmaps
 - pods
 - secrets
 - endpoints
 verbs:
 - get
 - watch
 - list

```

```

apiVersion: rbac.authorization.k8s.io/v1beta1
kind: RoleBinding
metadata:
 name: <helm-release>-rolebinding
 namespace: <namespace>
roleRef:
 apiGroup: rbac.authorization.k8s.io
 kind: Role
 name: <helm-release>-role
subjects:
- kind: ServiceAccount
 name: <helm-release>-serviceaccount
 namespace: <namespace>

#

## Kubernetes Secret Creation - DBName, Username, Password and Encryption Key

In this section, you will learn to create a secret to store database name, username, password, and encryption key.

To create a Kubernetes secret:

1. Create a yaml file with dbname, dbusername, dbpassword, encryptionKey using the syntax given below:

```

ocudr-secret.yaml
apiVersion: v1
kind: Secret
metadata:
 name: ocudr-secrets
type: Opaque
data:
 dbname: dWRyZGI=
 dsusername: dWRydXNlcg==
 dspassword: dWRycGFzc3dk
 encryptionkey: TXkgc2VjcmV0IHBhc3NwaHJhc2U=

```

### Note:

The **name** used to define a secret above should be same as given in the **dbCredSecretName** configuration under global section in values.yaml.

The values of dbname, dsusername, dspassword, encryptionKey are base64 encoded. These are created by executing the following commands:

```

echo -n "<db name>" | base64
echo -n "<db username>" | base64

```

```
echo -n "<db password>" | base64
echo -n "<encryptionKey string>" | base64
```

 **Note:**

You will create a secret using this yaml file.

2. Execute the following command to create a namespace where deployment is done.

```
kubectl create namespace <namespace>
```

 **Note:**

To create a secret, you need a namespace where deployment is done.

3. Execute the following command to create a secret:

```
kubectl create -f <secret File Name> -n <namespace>
```

4. Execute the following command to verify a secret creation:

```
kubectl describe secret <secret name> -n <namespace>
```

## Kubernetes Secret Creation - Private Keys and Certificates for IngressGateway

In this section, you will learn to create a secret to store private keys and certificates for IngressGateway.

 **Note:**

It is a user or operator discretion to create the private keys and certificates for IngressGateway and it is not in the scope of UDR. This section shares only samples to create them.

To create a secret to store private keys and certificate for IngressGateway:

1. Generate RSA private key by executing the following command:

```
openssl req -x509 -nodes -sha256 -days 365 -newkey rsa:2048 -keyout
rsa_private_key -out rsa_certificate.crt -config ssl.conf -passin
pass:"keystorepasswd" -passout pass:"keystorepasswd"
```

2. Convert the private key to **.pem** format by executing the following command:

```
openssl rsa -in rsa_private_key -outform PEM -out
rsa_private_key_pkcs1.pem -passin pass:"keystorepasswd" -passout
pass:"keystorepasswd"
```

3. Generate certificate using the private key by executing the following command:

```
openssl req -new -key rsa_private_key -out apigatewayrsa.csr -config
ssl.conf -passin pass:"keystorepasswd" -passout pass:"keystorepasswd"
```

 **Note:**

You can use **ssl.conf** to configure default entries along with storage area network (SAN) details for your certificate.

A sample `ssl.conf` file is given below:

```
ssl.conf
#ssl.conf
[req]
default_bits = 4096
distinguished_name = req_distinguished_name
req_extensions = req_ext
[req_distinguished_name]
countryName = Country Name (2 letter code)
countryName_default = IN
stateOrProvinceName = State or Province Name (full name)
stateOrProvinceName_default = Karnataka
localityName = Locality Name (eg, city)
localityName_default = Bangalore
organizationName = Organization Name (eg, company)
organizationName_default = Oracle
commonName = Common Name (e.g. server FQDN or YOUR name)
commonName_max = 64
commonName_default = localhost
[req_ext]
subjectAltName = @alt_names
[alt_names]
IP = 127.0.0.1
DNS.1 = localhost
```

4. Create a root Certificate Authority (CA) by executing the following set of commands:

```
openssl req -new -keyout cakey.pem -out careq.pem -config ssl.conf -
passin pass:"keystorepasswd" -passout pass:"keystorepasswd"
```

```
openssl x509 -signkey cakey.pem -req -days 3650 -in careq.pem -out
caroot.cer -extensions v3_ca -passin pass:"keystorepasswd" echo 1234 >
serial.txt
```

5. Sign the server certificate with root CA private key by executing the following command:

```
openssl x509 -CA caroot.cer -CAkey cakey.pem -CAserial serial.txt -
req -in apigatewayrsa.csr -out apigatewayrsa.cer -days 365 -extfile
ssl.conf -extensions req_ext -passin pass:"keystorepasswd"
```

6. Generate ECDSA private key by executing the following set of commands:

```
openssl ecpkcs8 -genkey -name prime256v1 -noout -out
ecdsa_private_key.pem
```

```
openssl pkcs8 -topk8 -in ecdsa_private_key.pem -inform pem -out
ecdsa_private_key_pkcs8.pem -outform pem -nocrypt
```

7. Generate certificate using the private key by executing the following set of commands:

```
openssl req -new -key ecdsa_private_key_pkcs8.pem -x509 -nodes -days
365 -out ecdsa_certificate.crt -config ssl.conf
```

```
openssl req -new -key ecdsa_private_key_pkcs8.pem -out
apigatewayecdsa.csr -config ssl.conf -passin pass:"keystorepasswd" -
passout pass:"keystorepasswd"
```

8. Sign the server certificate with root CA private key by executing the following command:

```
openssl x509 -CA caroot.cer -CAkey cakey.pem -CAserial serial.txt -req
-in apigatewayecdsa.csr -out apigatewayecdsa.cer -days 365 -extfile
ssl.conf -extensions req_ext -passin pass:"keystorepasswd"
```

9. Create a key.txt file by entering any password.

Example: `echo "keystorepasswd" > key.txt`

10. Create a trust.txt file by entering any password.

Example: `echo "truststorepasswd" > trust.txt`

11. Create a Secret by executing the following set of commands:

```
kubectl create ns NameSpace
```

```
kubectl create secret generic ocudr-gateway-secret
--from-file=apigatewayrsa.cer --from-file=caroot.cer --from-
file=apigatewayecdsa.cer --from-file=rsa_private_key_pkcs1.pem --
from-file=ecdsa_private_key_pkcs8.pem --from-file=key.txt --from-
file=trust.txt -n <Namespace>
```

## ocudr-custom-values.yaml File Configuration

In this section, you will learn to configure docker Registry path, DB connectivity service fqdn and port details and UDR details based on deployment.

UDR uses MySQL database to store the configuration and run time data. Before deploying the UDR in Kubernetes Cluster, update the following parameters in the **ocudr-custom-values-1.7.1.yaml** file:

**Table 2-1 ocudr-custom-values-1.7.1.yaml Parameters**

| Section | Parameter                                                                                     | Services                                                                                                                                                   |
|---------|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global  | mysql                                                                                         | <ul style="list-style-type: none"> <li>• <b>dbServiceName</b> : mysql-connectivity-service.occne-infra.</li> <li>• <b>port</b>: "&lt;Port&gt;".</li> </ul> |
|         | <b>dockerRegistry</b> : allows to configure docker Registry from where the images are pulled. | ocudr-registry.us.oracle.com:5000                                                                                                                          |

Table 2-1 (Cont.) ocudr-custom-values-1.7.1.yaml Parameters

| Section   | Parameter | Services                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Unified Data Repository Deployment

In this section, you will learn to deploy Unified Data Repository.

You can deploy UDR either with **HELM repository** or with **HELM tar**. To deploy UDR in Kubernetes cluster:

1. Use **ocudr-custom-values-1.7.1.yaml** file, which is modified in the ocudr-custom-values.yaml section. Execute the following command to deploy UDR:

```
helm install <helm chart> [--version <OCUDR version>] --name <release>
--namespace <k8s namespace> -f <ocudr-custom-values-1.7.1.yaml>
```

In the above command:

- **<helm chart>** - is the name of the chart, which is of the form <helm repo>/ocudr.
- **<OCUDR version>** - is the software version (helm chart version) of the OCUDR. This is optional. If omitted, the default is **latest** version available in helm repository.
- **<release>** - is a name of user's choice to identify the helm deployment. From 1.7.1 release onwards, all pod names, service name, deployment name are prepended by this release name.

- `<k8s namespace>` - is a name of user's choice to identify the kubernetes namespace of the Unified Data Repository. All the Unified Data Repository micro services are deployed in this kubernetes namespace.
- `<ocudr-custom-values-1.7.1.yaml>` - is the customized **ocudr-custom-values-1.7.1.yaml** file. The **ocudr-custom-values-1.7.1.yaml** file is a part of customer documentation. Users needs to download the file and modify it as per the user site.

 **Note:**

If helm3 is used, execute the following command for installation:  
`helm install -name <release> --namespace <k8s namespace> -f <ocudr-custom-values-1.7.1.yaml> <helm chart> [--version <OCUDR version>]`

2. (Optional) Customize the Unified Data Repository by overriding the default values of various configurable parameters. See [Customizing Unified Data Repository](#)

### Verifying UDR Deployment

After deploying UDR, you need to verify whether all the services and pods are up and running.

## Post Installation Sanity Check - Helm Test

**Helm Test** is a feature that validates successful installation of UDR along with its readiness (Readiness probe url configured is checked for success) of all the pods. The pods that are checked are based on the namespace and label selector configured for the helm test configurations.

This test also checks for all the PVCs to be in bound state under the Release namespace and label selector configured.

**Note:** You can use Helm Test feature only if you have Helm3.

To execute the Helm test functionality:

 **Note:**

Before executing the Hem Test command, it is important to do the following configurations.

- Configure the helm test configurations under the Global section of the values.yaml file as follows:

```
global:
 # Helm test related configurations
 test:
 nfName: ocudr
 image:
 name: ocudr/nf_test
 tag: 1.7.1
```

```
config:
 logLevel: WARN
 timeout: 40
```

For more details, refer to the [Configuring User Parameters](#)

- Ensure the label given below is part of all microservice deployments. The Helm Test feature takes the labelSelector internally, along with the helm release namespace, to select the pods and pvcs for verification.  
**app.kubernetes.io/instance: {{ .Release.Name }}**

Usually, it is one of the Engineering labels present in the template of all NF charts. If it is not present, you need to add this label so that the helm test can work on specific helm release.

- Execute the following Helm Test command:  
`helm test <helm_release_name> -n <k8s namespace>`

Wait for the helm test job to complete. Check the output whether the test job is successful or not.

 **Note:**

Readiness probe for all kubernetes deployment defined under the umbrella chart should be configured with **httpGet** parameter with proper url. If it is not configured, helm test for that pod is considered success. And if the Pod/PVC list to be verified, is fetched based on namespace and labelSelector is empty, then the Helm Test is success. If the Helm Test fails with errors, then you can refer to the [Troubleshooting Unified Data Repository](#)

# 3

## Customizing and Configuring Unified Data Repository

This section provides information on customizing and configuring Unified Data Repository.

### Customizing Unified Data Repository

You can customize the Unified Data Repository deployment by overriding the default values of various configurable parameters.

In the `ocudr-custom-values.yaml` File Configuration section, MySQL host is customized.

The [ocudr-custom-values.yaml](#) file can be prepared by hand to customize the parameters.

Following is an example of Unified Data Repository customization file.

 **Note:**

All the configurable parameters are mentioned in the [Configuring User Parameters](#)

## Configuring User Parameters

The UDR micro services have configuration options. The user should be able to configure them via deployment values.yaml.

 **Note:**

The default value of some of the settings may change.

 **Note:**

- **NAME:** is the release name used in helm install command
- **NAMESPACE:** is the namespace used in helm install command
- **K8S\_DOMAIN:** is the default kubernetes domain (svc.cluster.local)

**Default Helm Release Name:-** ocudr

**Global Configuration:** These values are suffixed to all the container names of OCNRF. These values are useful to add custom annotation(s) to all non-Load Balancer Type Services that OCNRF helm chart creates.

Following table provides the parameters for **global configurations**.

| Parameter            | Description                                          | Default value                             | Range or Possible Values (If applicable) | Notes                                                                                             |
|----------------------|------------------------------------------------------|-------------------------------------------|------------------------------------------|---------------------------------------------------------------------------------------------------|
| dockerRegistry       | Docker registry from where the images will be pulled | ocudr-registry.us.oracle.com:5000         | Not applicable                           |                                                                                                   |
| mysql.dbService Name | DB service to connect                                | mysql-connectivity-service.occne-infra    | Not applicable                           | This is a CNE service used for db connection. Default name used on CNE is the same as configured. |
| mysql.port           | Port for DB Service Connection                       | 3306                                      | Not applicable                           |                                                                                                   |
| udrTracing.enable    | Flag to enable udr tracing on Jaeger                 | false                                     | true/false                               |                                                                                                   |
| udrTracing.host      | Jaeger Service Name installed in CNE                 | occne-tracer-jaeger-collector.occne-infra | Not applicable                           |                                                                                                   |

| Parameter                    | Description                                                                                                                                                            | Default value      | Range or Possible Values (If applicable) | Notes                                                                                                                                         |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| udrTracing.port              | Jaegar Service Port installed in CNE                                                                                                                                   | 14268              | Not applicable                           |                                                                                                                                               |
| dbenc.shavalue               | Encryption Key size                                                                                                                                                    | 256                | 256 or 512                               |                                                                                                                                               |
| serviceAccountName           | Service account name                                                                                                                                                   | null               | Not Applicable                           | The serviceaccount, role and rolebindings required for deployment should be done prior installation. Use the created serviceaccountname here. |
| egress.enabled               | Flag to enable outgoing traffic through egress gateway                                                                                                                 | true               | true/false                               |                                                                                                                                               |
| configServerEnable           | Flag to enable config-server                                                                                                                                           | true               | true/false                               |                                                                                                                                               |
| initContainerEnable          | Flag to disable init container for config-server. This is not required because the pre install hooks take care of DB tables creation and connectivity is also verified | false              | true/false                               |                                                                                                                                               |

| udrServices                  | Services supported on the UDR deployment, This config will decide the schema execution on the udrdb which is done by the nudr-preinstall hook pod.                     | nudr-group-id-map  | All/nudr-dr/nudr-group-id-map            | This release is specifically for SLF, so default value is nudr-group-id-map                                                                   |

| Parameter                   | Description                                                                                                                 | Default value | Range or Possible Values (If applicable)   | Notes |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------|---------------|--------------------------------------------|-------|
| udsfEnable                  | Flag to enable UDSF services on the deployment                                                                              | false         | true/false                                 |       |
| test.nfName                 | NF name on which the helm test is performed. For UDR the default value is UDR. Will be used in container name as suffix     | ocudr         | Not applicable                             |       |
| test.image.name             | Image name for the helm test container image                                                                                | ocudr/nf_test | Not Applicable                             |       |
| test.image.tag              | Image version tag for helm test                                                                                             | 1.7.1         | Not Applicable                             |       |
| test.config.logLevel        | Log level for helm test pod                                                                                                 | WARN          | Possible Values -<br>WARN<br>INFO<br>DEBUG |       |
| test.config.timeout         | Timeout value for the helm test operation. If exceeded helm test will be considered as failure                              | 120           | Range: 1-300<br>Unit:seconds               |       |
| preinstall.image.name       | Image name for the nudr-prehook pod which will take care of DB and table creation for UDR deployment.                       | ocudr/prehook | Not Applicable                             |       |
| preinstall.image.tag        | Image version for nudr-prehook pod image                                                                                    | 1.7.1         | Not Applicable                             |       |
| preinstall.config.logLevel  | Log level for preinstall hook pod                                                                                           | WARN          | Possible Values -<br>WARN<br>INFO<br>DEBUG |       |
| hookJobResources.limits.cpu | CPU limit for pods created kubernetes hooks/jobs created as part of UDR installation. Applicable for helm test job as well. | 2             | Not Applicable                             |       |

| Parameter                                | Description                                                                                                                    | Default value | Range or Possible Values (If applicable)                                                                          | Notes                                                                                                                |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| hookJobResources.limits.memory           | Memory limit for pods created kubernetes hooks/jobs created as part of UDR installation. Applicable for helm test job as well. | 2Gi           | Not Applicable                                                                                                    |                                                                                                                      |
| hookJobResources.requests.cpu            | CPU requests for pods created kubernetes hooks/jobs created as part of UDR installation. Applicable for helm test job as well. | 1             | Not Applicable                                                                                                    | The cpu to be allocated for hooks during deployment                                                                  |
| hookJobResources.requests.memory         | Memory requests for pods created k8s hooks/jobs created as part of UDR installation. Applicable for helm test job as well.     | 1Gi           | Not Applicable                                                                                                    | The memory to be allocated for hooks during deployment                                                               |
| customExtension.allResources.labels      | Custom Labels that needs to be added to all the OCUDR kubernetes resources                                                     | null          | Not Applicable                                                                                                    | This can be used to add custom label(s) to all k8s resources that will be created by OCUDR helm chart.               |
| customExtension.allResources.annotations | Custom Annotations that needs to be added to all the OCUDR kubernetes resources                                                | null          | Not Applicable<br><b>Note:</b> ASM related annotations needs to be added under ASM Specific Configuration section | This can be used to add custom annotation(s) to all k8s resources that will be created by OCUDR helm chart.          |
| customExtension.lbServices.labels        | Custom Labels that needs to be added to OCUDR Services that are considered as Load Balancer type                               | null          | Not Applicable                                                                                                    | This can be used to add custom label(s) to all Load Balancer Type Services that will be created by OCUDR helm chart. |

| Parameter                                 | Description                                                                                                                    | Default value | Range or Possible Values (If applicable)                                                                          | Notes                                                                                                                                                                      |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| customExtension.lbServices.annotations    | Custom Annotations that needs to be added to OCUDR Services that are considered as Load Balancer type                          | null          | Not Applicable                                                                                                    | This can be used to add custom annotation(s) to all Load Balancer Type Services that will be created by OCUDR helm chart.                                                  |
| customExtension.lbDeployments.labels      | Custom Labels that needs to be added to OCUDR Deployments that are associated to a Service which is of Load Balancer type      | null          | Not Applicable                                                                                                    | This can be used to add custom label(s) to all Deployments that will be created by OCUDR helm chart which are associated to a Service which if of Load Balancer Type.      |
| customExtension.lbDeployments.annotations | Custom Annotations that needs to be added to OCUDR Deployments that are associated to a Service which is of Load Balancer type | null          | Not Applicable<br><b>Note:</b> ASM related annotations needs to be added under ASM Specific Configuration section | This can be used to add custom annotation(s) to all Deployments that will be created by OCUDR helm chart which are associated to a Service which if of Load Balancer Type. |
| customExtension.nonlbServices.labels      | Custom Labels that needs to be added to OCUDR Services that are considered as not Load Balancer type                           | null          | Not Applicable                                                                                                    | This can be used to add custom label(s) to all non-Load Balancer Type Services that will be created by OCUDR helm chart.                                                   |
| customExtension.nonlbServices.annotations | Custom Annotations that needs to be added to OCUDR Services that are considered as not Load Balancer type                      | null          | Not Applicable                                                                                                    | This can be used to add custom annotation(s) to all non-Load Balancer Type Services that will be created by OCUDR helm chart.                                              |

| Parameter                                    | Description                                                                                                                        | Default value | Range or Possible Values (If applicable)                                                                    | Notes                                                                                                                                                                          |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| customExtension.nonlbDeployments.labels      | Custom Labels that needs to be added to OCUDR Deployments that are associated to a Service which is not of Load Balancer type      | null          | Not Applicable                                                                                              | This can be used to add custom label(s) to all Deployments that will be created by OCUDR helm chart which are associated to a Service which if not of Load Balancer Type.      |
| customExtension.nonlbDeployments.annotations | Custom Annotations that needs to be added to OCUDR Deployments that are associated to a Service which is not of Load Balancer type | null          | Not Applicable<br><b>Note:</b> ASM related annotations to be added under ASM Specific Configuration section | This can be used to add custom annotation(s) to all Deployments that will be created by OCUDR helm chart which are associated to a Service which if not of Load Balancer Type. |
| k8sResource.container.prefix                 | Value that will be prefixed to all the container names of OCUDR.                                                                   | null          | Not Applicable                                                                                              | This value will be used to prefix to all the container names of OCUDR.                                                                                                         |
| k8sResource.container.suffix                 | Value that will be suffixed to all the container names of OCUDR.                                                                   | null          | Not Applicable                                                                                              | This value will be used to prefix to all the container names of OCUDR.                                                                                                         |

Following table provides the parameters for **nudr-drservice micro service**.

| Parameter        | Description                                              | Default value                     | Range or Possible Values (If applicable)             | Notes |
|------------------|----------------------------------------------------------|-----------------------------------|------------------------------------------------------|-------|
| image.name       | Docker Image name                                        | ocudr/nudr_datarepository_service | Not applicable                                       |       |
| image.tag        | Tag of Image                                             | 1.7.1                             | Not applicable                                       |       |
| image.pullPolicy | This setting will tell if image need to be pulled or not | Always                            | Possible Values -<br>Always<br>IfNotPresent<br>Never |       |

| Parameter               | Description                                   | Default value | Range or Possible Values (If applicable)                  | Notes                                                                                                                    |
|-------------------------|-----------------------------------------------|---------------|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| subscriber.autocreate   | Flag to enable auto creation of subscriber    | true          | true/false                                                | This flag will enable auto creation of subscriber when creating data for a non existent subscriber.                      |
| validate.smdata         | Flag to enable correlation feature for smdata | false         | true/false                                                | This flag will control the correlation feature for smdata. This flag must be false if using v16.2.0 for PCF data.        |
| logging.level.root      | Log Level                                     | WARN          | Possible Values -<br>WARN<br>INFO<br>DEBUG                | Log level of the nudr-drservice pod                                                                                      |
| deployment.replicaCount | Replicas of nudr-drservice pod                | 2             | Not applicable                                            | Number of nudr-drservice pods to be maintained by replica set created with deployment                                    |
| minReplicas             | Minimum Replicas                              | 2             | Not applicable                                            | Minimum number of pods                                                                                                   |
| maxReplicas             | Maximum Replicas                              | 8             | Not applicable                                            | Maximum number of pods                                                                                                   |
| service.http2enabled    | Enabled HTTP2 support flag for rest server    | true          | true/false                                                | Enable/Disable HTTP2 support for rest server                                                                             |
| service.type            | UDR service type                              | ClusterIP     | Possible Values-<br>ClusterIP<br>NodePort<br>LoadBalancer | The kubernetes service type for exposing UDR deployment<br>Note: Suggested to be set as ClusterIP (default value) always |
| service.port.http       | HTTP port                                     | 5001          | Not applicable                                            | The http port to be used in nudr-drservice service                                                                       |
| service.port.https      | HTTPS port                                    | 5002          | Not applicable                                            | The https port to be used for nudr-drservice service                                                                     |
| service.port.management | Management port                               | 9000          | Not applicable                                            | The actuator management port to be used for nudr-drservice service                                                       |

| Parameter                       | Description                                                                    | Default value | Range or Possible Values (If applicable) | Notes                                                                   |
|---------------------------------|--------------------------------------------------------------------------------|---------------|------------------------------------------|-------------------------------------------------------------------------|
| resources.requests.cpu          | Cpu Allotment for nudr-drservice pod                                           | 3             | Not applicable                           | The cpu to be allocated for nudr-drservice pod during deployment        |
| resources.requests.memory       | Memory allotment for nudr-drservice pod                                        | 4Gi           | Not applicable                           | The memory to be allocated for nudr-drservice pod during deployment     |
| resources.limits.cpu            | Cpu allotment limitation                                                       | 3             | Not applicable                           |                                                                         |
| resources.limits.memory         | Memory allotment limitation                                                    | 4Gi           | Not applicable                           |                                                                         |
| resources.target.averageCpuUtil | CPU utilization limit for autoscaling                                          | 80            | Not Applicable                           | CPU utilization limit for creating HPA                                  |
| notify.port.http                | HTTP port on which notify service is running                                   | 5001          | Not applicable                           |                                                                         |
| notify.port.https               | HTTPS port on which notify service is running                                  | 5002          | Not applicable                           |                                                                         |
| hikari.poolsize                 | Mysql Connection pool size                                                     | 25            | Not applicable                           | The hikari pool connection size to be created at start up               |
| vsaLevel                        | The data level where the vsa which holds the 4G Policy data is added.          | smpolicy      | Not applicable                           |                                                                         |
| tracingEnabled                  | Flag to enable/disable jaeger tracing for nudr-drservice                       | false         | true/false                               |                                                                         |
| service.customExtension.labels  | Custom Labels that needs to be added to nudr-drservice specific Service.       | null          | Not Applicable                           | This can be used to add custom label(s) to nudr-drservice Service.      |
| service.customExtensions        | Custom Annotations that needs to be added to nudr-drservice specific Services. | null          | Not Applicable                           | This can be used to add custom annotation(s) to nudr-drservice Service. |

| Parameter                              | Description                                                                      | Default value | Range or Possible Values (If applicable) | Notes                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------|---------------|------------------------------------------|----------------------------------------------------------------------------|
| deployment.customExtension.labels      | Custom Labels that needs to be added to nudr-drservice specific deployment.      | null          | Not Applicable                           | This can be used to add custom label(s) to nudr-drservice Deployment.      |
| deployment.customExtension.annotations | Custom Annotations that needs to be added to nudr-drservice specific deployment. | null          | Not Applicable                           | This can be used to add custom annotation(s) to nudr-drservice deployment. |

Following table provides the parameters for **nudr-notify-service micro service**.

| Parameter               | Description                                              | Default value             | Range or Possible Values (If applicable)          | Notes                                                                                                                                                                     |
|-------------------------|----------------------------------------------------------|---------------------------|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enabled                 | flag for enabling or disabling nudr-notify-service       | false                     | true or false                                     | For SLF deployment, this micro service must be disabled.                                                                                                                  |
| image.name              | Docker Image name                                        | ocudr/nudr_notify_service | Not applicable                                    |                                                                                                                                                                           |
| image.tag               | Tag of Image                                             | 1.7.1                     | Not applicable                                    |                                                                                                                                                                           |
| image.pullPolicy        | This setting will tell if image need to be pulled or not | Always                    | Possible Values - Always<br>IfNotPresent<br>Never |                                                                                                                                                                           |
| notification.retrycount | Number of notifications to be attempted                  | 3                         | Range: 1 - 10                                     | Number of notification attempts to be done in case of notification failures.<br>Whether retry should be done will be based on notification.retryerrorcodes configuration. |

| Parameter                    | Description                                                   | Default value     | Range or Possible Values (If applicable)   | Notes                                                                                                                                                                     |
|------------------------------|---------------------------------------------------------------|-------------------|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| notification.retryinterval   |                                                               | 5                 | Range: 1 - 60<br>Unit: Seconds             | The retry interval for notifications in case of failure. Unit is in seconds.<br>Whether retry should be done will be based on notification.retryerrorcodes configuration. |
| notification.retryerrorcodes | Notification failures eligible for retry                      | "400,429,500,503" | Valid HTTP status codes comma separated    | Comma separated error code should be given. These error codes will be eligible for retry notifications in case of failures.                                               |
| hikari.poolsize              | Mysql Connection pool size                                    | 25                | Not applicable                             | The hikari pool connection size to be created at start up                                                                                                                 |
| tracingEnabled               | Flag to enable/disable jaeger tracing for nudr-notify-service | false             | true/false                                 |                                                                                                                                                                           |
| http.proxy.port              | Port to connect to egress gateway                             | 8080              | Not applicable                             |                                                                                                                                                                           |
| logging.level.root           | Log Level                                                     | WARN              | Possible Values -<br>WARN<br>INFO<br>DEBUG | Log level of the notify service pod                                                                                                                                       |
| deployment.replicaCount      | Replicas of nudr-notify-service pod                           | 2                 | Not applicable                             | Number of nudr-notify-service pods to be maintained by replica set created with deployment                                                                                |
| minReplicas                  | Minimum Replicas                                              | 2                 | Not applicable                             | Minimum number of pods                                                                                                                                                    |
| maxReplicas                  | Maximum Replicas                                              | 4                 | Not applicable                             | Maximum number of pods                                                                                                                                                    |
| service.http2enabled         | Enabled HTTP2 support flag                                    | true              | true/false                                 | This is a read only parameter. Do not change this value                                                                                                                   |

| Parameter                       | Description                                                                   | Default value | Range or Possible Values (If applicable)                  | Notes                                                                                                                    |
|---------------------------------|-------------------------------------------------------------------------------|---------------|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| service.type                    | UDR service type                                                              | ClusterIP     | Possible Values-<br>ClusterIP<br>NodePort<br>LoadBalancer | The kubernetes service type for exposing UDR deployment<br>Note: Suggested to be set as ClusterIP (default value) always |
| service.port.http               | HTTP port                                                                     | 5001          | Not applicable                                            | The http port to be used in notify service to receive signals from nudr-notify-service pod.                              |
| service.port.https              | HTTPS port                                                                    | 5002          | Not applicable                                            | The https port to be used in notify service to receive signals from nudr-notify-service pod.                             |
| service.port.management         | Management port                                                               | 9000          | Not applicable                                            | The actuator management port to be used for notify service.                                                              |
| resources.requests.cpu          | Cpu Allotment for nudr-notify-service pod                                     | 3             | Not applicable                                            | The cpu to be allocated for notify service pod during deployment                                                         |
| resources.requests.memory       | Memory allotment for nudr-notify-service pod                                  | 3Gi           | Not applicable                                            | The memory to be allocated for nudr-notify-service pod during deployment                                                 |
| resources.limits.cpu            | Cpu allotment limitation                                                      | 3             | Not applicable                                            |                                                                                                                          |
| resources.limits.memory         | Memory allotment limitation                                                   | 3Gi           | Not applicable                                            |                                                                                                                          |
| resources.target.averageCpuUtil | CPU utilization limit for autoscaling                                         | 80            | Not Applicable                                            | CPU utilization limit for creating HPA                                                                                   |
| service.customExtension.labels  | Custom Labels that needs to be added to nudr-notify-service specific service. | null          | Not Applicable                                            | This can be used to add custom label(s) to nudr-notify-service Service.                                                  |

| Parameter                              | Description                                                                           | Default value | Range or Possible Values (If applicable) | Notes                                                                           |
|----------------------------------------|---------------------------------------------------------------------------------------|---------------|------------------------------------------|---------------------------------------------------------------------------------|
| service.customExtension.annotations    | Custom Annotations that needs to be added to nudr-notify-service specific services.   | null          | Not Applicable                           | This can be used to add custom annotation(s) to nudr-notify-service Service.    |
| deployment.customExtension.labels      | Custom Labels that needs to be added to nudr-notify-service specific deployment.      | null          | Not Applicable                           | This can be used to add custom label(s) to nudr-notify-service deployment.      |
| deployment.customExtension.annotations | Custom Annotations that needs to be added to nudr-notify-service specific deployment. | null          | Not Applicable                           | This can be used to add custom annotation(s) to nudr-notify-service deployment. |

Following table provides the parameters for **nudr-nrf-client-service micro service**.

| Parameter          | Description                                            | Default value                                                                | Range or Possible Values (If applicable)   | Notes                                             |
|--------------------|--------------------------------------------------------|------------------------------------------------------------------------------|--------------------------------------------|---------------------------------------------------|
| enabled            | flag for enabling or disabling nudr-nrf-client-service | true                                                                         | true/false                                 |                                                   |
| host.baseurl       | NRF url for registration                               | http://ocnrf-ingressgateway.mynrf.svc.cluster.local/nnrf-nfm/v1/nf-instances | Not applicable                             | Url used for udr to connect and register with NRF |
| host.proxy         | Proxy Setting                                          | NULL                                                                         | nrfClient.host                             | Proxy setting if required to connect to NRF       |
| ssl                | SSL flag                                               | false                                                                        | true/false                                 | SSL flag to enable SSL with udr nrf client pod    |
| logging.level.root | Log Level                                              | WARN                                                                         | Possible Values -<br>WARN<br>INFO<br>DEBUG | Log level of the UDR nrf client pod               |
| image.name         | Docker Image name                                      | ocudr/nudr_nrf_client_service                                                | Not applicable                             |                                                   |
| image.tag          | Tag of Image                                           | 1.7.1                                                                        | Not applicable                             |                                                   |

| Parameter             | Description                                              | Default value                                         | Range or Possible Values (If applicable)                            | Notes                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------|-------------------------------------------------------|---------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| image.pullPolicy      | This setting will tell if image need to be pulled or not | Always                                                | Possible Values -<br>Always<br>IfNotPresent<br>Never                |                                                                                                                                                                                                                                |
| heartBeatTimer        | Heart beat timer                                         | 90                                                    | Unit: Seconds                                                       |                                                                                                                                                                                                                                |
| udrGroupld            | Group ID of UDR                                          | udr-1                                                 | Not applicable                                                      |                                                                                                                                                                                                                                |
| capacityMultiplier    | Capacity of UDR                                          | 500                                                   | Not applicable                                                      | Capacity multiplier of UDR based on number of UDR pods running                                                                                                                                                                 |
| supirange             | Supi Range supported with UDR                            | [{"start": "10000000000", "end": "20000000000"}]      | Valid start and end supi range                                      |                                                                                                                                                                                                                                |
| priority              | Priority                                                 | 10                                                    | Priority to be sent in registration request                         | Priority to be sent in registration request                                                                                                                                                                                    |
| fqdn                  | UDR FQDN                                                 | ocudr-ingressgateway.<br>myudr.svc.cluster.<br>.local | Not Applicable                                                      | FQDN to used for registering in NRF for other NFs to connect to UDR.<br><br>Note: Be cautious in updating this value. Should consider helm release name, namespace used for udr deployment and name resolution setting in k8s. |
| gpsirange             | Gpsi Range supported with UDR                            | [{"start": "10000000000", "end": "20000000000"}]      | Valid start and end gpsi range                                      |                                                                                                                                                                                                                                |
| livenessProbeMaxRetry | Max retries of liveness probe failed                     | 5                                                     | This should be changed based on how many times do you want to retry | This should be changed based on how many times do you want to retry if liveness fails                                                                                                                                          |
| udrMasterIpv4         | Master IP of which we deployed                           | 10.0.0.0                                              | This should be changed with the master ip which we deployed         | udrMasterIpv4 is used to send the ipv4 address to the nrf while registration.                                                                                                                                                  |

| Parameter                              | Description                                                                       | Default value                         | Range or Possible Values (If applicable)                                                                    | Notes                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------|---------------------------------------|-------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
| plmnvalues                             | Plmn values range that it supports                                                | {{\"mnc\": \"14\", \"mcc\": \"310\"}} | This values can be changed that the range it supports                                                       | Plmn values are sent to nrf during registration from UDR.                   |
| scheme                                 | scheme in which udr supports                                                      | http                                  | This can be changed to https.                                                                               | scheme which we send to NRF during registration                             |
| resources.requests.cpu                 | Cpu Allotment for nudr-notify-service pod                                         | 1                                     | Not applicable                                                                                              | The cpu to be allocated for nrf client service pod during deployment        |
| resources.requests.memory              | Memory allotment for nudr-notify-service pod                                      | 2Gi                                   | Not applicable                                                                                              | The memory to be allocated for nrf client service pod during deployment     |
| resources.limits.cpu                   | Cpu allotment limitation                                                          | 1                                     | Not applicable                                                                                              |                                                                             |
| resources.limits.memory                | Memory allotment limitation                                                       | 2Gi                                   | Not applicable                                                                                              |                                                                             |
| http.proxy.port                        | Port to connect egress gateway                                                    | 8080                                  | Not applicable                                                                                              |                                                                             |
| service.customExtension.labels         | Custom Labels that needs to be added to nudr-nrf-client specific service.         | null                                  | Not Applicable                                                                                              | This can be used to add custom label(s) to nudr-nrf-client service.         |
| service.customExtension.annotations    | Custom Annotations that needs to be added to nudr-nrf-client specific services.   | null                                  | Not Applicable                                                                                              | This can be used to add custom annotation(s) to nudr-nrf-client service.    |
| deployment.customExtension.labels      | Custom Labels that needs to be added to nudr-nrf-client specific deployment.      | null                                  | Not Applicable                                                                                              | This can be used to add custom label(s) to nudr-nrf-client deployment.      |
| deployment.customExtension.annotations | Custom Annotations that needs to be added to nudr-nrf-client specific deployment. | null                                  | Not Applicable<br><b>Note:</b> ASM related annotations to be added under ASM Specific Configuration section | This can be used to add custom annotation(s) to nudr-nrf-client deployment. |

Following table provides the parameters for **nudr-config micro service**.

| Parameter                              | Description                                                                   | Default value     | Range or Possible Values (If applicable)             | Notes                                                                              |
|----------------------------------------|-------------------------------------------------------------------------------|-------------------|------------------------------------------------------|------------------------------------------------------------------------------------|
| deployment.customExtension.annotations | Custom Annotations that needs to be added to nudr-config specific Deployment. | null              | Not applicable                                       | This can be used to add custom annotation(s) to nudr-config Deployment.            |
| deployment.customExtension.labels      | Custom Labels that needs to be added to nudr-config specific Deployment.      | null              | Not applicable                                       | This can be used to add custom label(s) to nudr-config Deployment.                 |
| deployment.replicaCount                | Replicas of nudr-config pod                                                   | 1                 | Not applicable                                       | Number of nudr-config pods to be maintained by replica set created with deployment |
| image.name                             | Docker Image name                                                             | ocudr/nudr_config | Not applicable                                       |                                                                                    |
| image.pullPolicy                       | This setting indicates whether image needs to be pulled or not                | Always            | Possible Values -<br>Always<br>IfNotPresent<br>Never |                                                                                    |
| image.tag                              | Tag of Image                                                                  | 1.7.1             | Not applicable                                       |                                                                                    |
| logging.level.root                     | Log Level                                                                     | WARN              | Possible Values -<br>WARN<br>INFO<br>DEBUG           | Log level of the nudr-config pod                                                   |
| maxReplicas                            | Maximum Replicas                                                              | 1                 | Not applicable                                       | Maximum number of pods                                                             |
| minReplicas                            | Minimum Replicas                                                              | 1                 | Not applicable                                       | Minimum number of pods                                                             |
| resources.limits.cpu                   | Cpu allotment limitation                                                      | 2                 | Not applicable                                       |                                                                                    |
| resources.limits.memory                | Memory allotment limitation                                                   | 2Gi               | Not applicable                                       |                                                                                    |
| resources.requests.cpu                 | Cpu Allotment for nudr-drservice pod                                          | 2                 | Not applicable                                       | The cpu to be allocated for nudr-config pod during deployment                      |
| resources.requests.memory              | Memory allotment for nudr-drservice pod                                       | 2Gi               | Not applicable                                       | The memory to be allocated for nudr-config pod during deployment                   |

| Parameter                           | Description                                                                 | Default value | Range or Possible Values (If applicable)                  | Notes                                                                                                                           |
|-------------------------------------|-----------------------------------------------------------------------------|---------------|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| resources.target.averageCpuUtil     | CPU utilization limit for autoscaling                                       | 80            | Not Applicable                                            | CPU utilization limit for creating HPA                                                                                          |
| service.customExtension.annotations | Custom Annotations that needs to be added to nudr-config specific Services. | null          | Not applicable                                            | This can be used to add custom annotation(s) to nudr-config Service.                                                            |
| service.customExtension.labels      | Custom Labels that needs to be added to nudr-config specific Service.       | null          | Not applicable                                            | This can be used to add custom label(s) to nudr-config Service.                                                                 |
| service.http2enabled                | Enabled HTTP2 support flag for rest server                                  | true          | true/false                                                | Enable/Disable HTTP2 support for rest server                                                                                    |
| service.port.http                   | HTTP port                                                                   | 5001          | Not applicable                                            | The http port to be used in nudr-config service                                                                                 |
| service.port.https                  | HTTPS port                                                                  | 5002          | Not applicable                                            | The https port to be used for nudr-config service                                                                               |
| service.port.management             | Management port                                                             | 9000          | Not applicable                                            | The actuator management port to be used for nudr-config service                                                                 |
| service.type                        | UDR service type                                                            | ClusterIP     | Possible Values-<br>ClusterIP<br>NodePort<br>LoadBalancer | The kubernetes service type for exposing UDR deployment<br><b>Note:</b> Suggested to be set as ClusterIP (default value) always |

Following table provides the parameters for **nudr-config-server** Micro service.

| Parameter          | Description | Default value | Range or Possible Values (If applicable)   | Notes                                   |
|--------------------|-------------|---------------|--------------------------------------------|-----------------------------------------|
| envLoggingLevelApp | Log Level   | WARN          | Possible Values -<br>WARN<br>INFO<br>DEBUG | Log level of the nudr-config-server pod |

| Parameter                   | Description                                                   | Default value                   | Range or Possible Values (If applicable)                  | Notes                                                                                                                    |
|-----------------------------|---------------------------------------------------------------|---------------------------------|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| replicas                    | Replicas of nudr-config-server pod                            | 1                               | Not applicable                                            | Number of nudr-config-server pods to be maintained by replica set created with deployment                                |
| resources.requests.cpu      | Cpu Allotment for nudr-dr-service pod                         | 2                               | Not applicable                                            | The cpu to be allocated for nudr-config-server pod during deployment                                                     |
| service.type                | UDR service type                                              | ClusterIP                       | Possible Values-<br>ClusterIP<br>NodePort<br>LoadBalancer | The kubernetes service type for exposing UDR deployment<br>Note: Suggested to be set as ClusterIP (default value) always |
| resources.requests.memory   | Memory allotment for nudr-dr-service pod                      | 512Mi                           | Not applicable                                            | The memory to be allocated for nudr-config-server pod during deployment                                                  |

Following table provides parameters for **ocudr-ingressgateway micro service (API Gateway)**

| Parameter                          | Description                                                                                                           | Default value                              | Range or Possible Values (If applicable)                  | Notes |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------|-----------------------------------------------------------|-------|
| global.type                        | ocudr-ingressgateway service type                                                                                     | ClusterIP                                  | Possible Values-<br>ClusterIP<br>NodePort<br>LoadBalancer |       |
| global.metallbAllocationEnabled    | Enable or disable Address Pool for Metallb                                                                            | true                                       | true/false                                                |       |
| global.metallbAllocationAnnotation | Address Pool for Metallb                                                                                              | metallb.universe.tf/address-pool:signaling | Not applicable                                            |       |
| global.staticNodePortEnabled       | If Static node port needs to be set, then set staticNodePortEnabled flag to true and provide value for staticNodePort | false                                      | Not applicable                                            |       |
| global.publicHttpSignalingPort     | Port used on which ingressgateway listens for incoming http requests.                                                 | 80                                         | Valid Port                                                |       |
| global.publicHttpSignallingPort    | Port used on which ingressgateway listens for incoming https requests.                                                | 443                                        | Valid Port                                                |       |
| image.name                         | Docker image name                                                                                                     | ocudr/ocingress_gateway                    | Not applicable                                            |       |
| image.tag                          | Image version tag                                                                                                     | 1.7.7                                      | Not applicable                                            |       |
| image.pullPolicy                   | This setting will tell if image need to be pulled or not                                                              | Always                                     | Possible Values -<br>Always<br>IfNotPresent<br>Never      |       |
| initContainersImage.name           | Docker Image name                                                                                                     | ocudr/configurationinit                    | Not applicable                                            |       |
| initContainersImage.tag            | Image version tag                                                                                                     | 1.2.0                                      | Not applicable                                            |       |
| initContainersImage.pullPolicy     | This setting will tell if image need to be pulled or not                                                              | Always                                     | Possible Values -<br>Always<br>IfNotPresent<br>Never      |       |

| Parameter                              | Description                                              | Default value                 | Range or Possible Values (If applicable)             | Notes                              |

| Parameter                              | Description                                                                      | Default value | Range or Possible Values (If applicable) | Notes                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------|---------------|------------------------------------------|----------------------------------------------------------------------------|
| service.customExtension.labels         | Custom Labels that needs to be added to ingressgateway specific service.         | null          | Not Applicable                           | This can be used to add custom label(s) to ingressgateway service.         |
| service.customExtension.annotations    | Custom Annotations that needs to be added to ingressgateway specific services.   | null          | Not Applicable                           | This can be used to add custom annotation(s) to ingressgateway service.    |
| deployment.customExtension.labels      | Custom Labels that needs to be added to ingressgateway specific deployment.      | null          | Not Applicable                           | This can be used to add custom label(s) to ingressgateway deployment.      |
| deployment.customExtension.annotations | Custom Annotations that needs to be added to ingressgateway specific deployment. | null          | Not Applicable                           | This can be used to add custom annotation(s) to ingressgateway deployment. |

Following table provides parameters for **ocudr-egressgateway micro service (API Gateway)**

| Parameter                | Description                                              | Default value           | Range or Possible Values (If applicable)             | Notes |
|--------------------------|----------------------------------------------------------|-------------------------|------------------------------------------------------|-------|
| enabled                  | Configuration flag to enable/disable egress gateway      | true                    | true/false                                           |       |
| image.name               | Docker image name                                        | ocudr/ocgress_gateway   | Not applicable                                       |       |
| image.tag                | Image version tag                                        | 1.7.7                   | Not applicable                                       |       |
| image.pullPolicy         | This setting will tell if image need to be pulled or not | Always                  | Possible Values -<br>Always<br>IfNotPresent<br>Never |       |
| initContainersImage.name | Docker Image name                                        | ocudr/configurationinit | Not applicable                                       |       |
| initContainersImage.tag  | Image version tag                                        | 1.2.0                   | Not applicable                                       |       |

| Parameter                            | Description                                                                                  | Default value                 | Range or Possible Values (If applicable)             | Notes |
|--------------------------------------|----------------------------------------------------------------------------------------------|-------------------------------|------------------------------------------------------|-------|
| initContainersImage.pullPolicy       | This setting will tell if image need to be pulled or not                                     | Always                        | Possible Values -<br>Always<br>IfNotPresent<br>Never |       |
| updateContainerImage.name            | Docker Image name                                                                            | ocudr/<br>configurationupdate | Not applicable                                       |       |
| updateContainerImage.tag             | Image version tag                                                                            | 1.2.0                         | Not applicable                                       |       |
| updateContainerImage.pullPolicy      | This setting will tell if image need to be pulled or not                                     | Always                        | Possible Values -<br>Always<br>IfNotPresent<br>Never |       |
| resources.limits.cpu                 | Cpu allotment limitation                                                                     | 3                             | Not applicable                                       |       |
| resources.limits.memory              | Memory allotment limitation                                                                  | 4Gi                           | Not applicable                                       |       |
| resources.limits.initServiceCpu      | Maximum amount of CPU that Kubernetes will allow the egress-gateway init container to use.   | 1                             | Not applicable                                       |       |
| resources.limits.initServiceMemory   | Memory Limit for egress-gateway init container                                               | 1Gi                           | Not applicable                                       |       |
| resources.limits.updateServiceCpu    | Maximum amount of CPU that Kubernetes will allow the egress-gateway update container to use. | 1                             | Not applicable                                       |       |
| resources.limits.updateServiceMemory | Memory Limit for egress-gateway update container                                             | 1Gi                           | Not applicable                                       |       |
| resources.requests.cpu               | Cpu allotment for ocudr-egressgateway pod                                                    | 3                             | Not applicable                                       |       |
| resources.requests.memory            | Memory allotment for ocudr-egressgatewaypod                                                  | 4Gi                           | Not applicable                                       |       |

| Parameter                              | Description                                                                                                                                                               | Default value | Range or Possible Values (If applicable) | Notes                              |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------------------------------|------------------------------------|
| resources.requests.initServiceCpu      | The amount of CPU that the system will guarantee for the egress-gateway init container, and Kubernetes will use this value to decide on which node to place the pod       |               | Not Applicable                           |                                    |
| resources.requests.initServiceMemory   | The amount of memory that the system will guarantee for the egress-gateway init container, and Kubernetes will use this value to decide on which node to place the pod    |               | Not Applicable                           |                                    |
| resources.requests.updateServiceCpu    | The amount of CPU that the system will guarantee for the egress-gateway update container, and Kubernetes will use this value to decide on which node to place the pod.    |               | Not Applicable                           |                                    |
| resources.requests.updateServiceMemory | The amount of memory that the system will guarantee for the egress-gateway update container, and Kubernetes will use this value to decide on which node to place the pod. |               | Not Applicable                           |                                    |
| resources.target.averageCpuUtil        | CPU utilization limit for autoscaling                                                                                                                                     | 80            | Not applicable                           |                                    |
| service.ssl.tlsVersion                 | Configuration to take TLS version to be used                                                                                                                              | TLSv1.2       | Valid TLS version                        | These are service fixed parameters |

| Parameter                                 | Description                                                                                     | Default value               | Range or Possible Values (If applicable) | Notes |
|-------------------------------------------|-------------------------------------------------------------------------------------------------|-----------------------------|------------------------------------------|-------|
| service.initialAlgorithm                  | Algorithm to be used<br>ES256 can also be used, but corresponding certificates need to be used. | RSA256                      | RSA256/ES256                             |       |
| service.ssl.privateKey.k8SecretName       | name of the secret which stores keys and certificates                                           | ocudr-gateway-secret        | Not applicable                           |       |

| Parameter                              | Description                                                                     | Default value | Range or Possible Values (If applicable) | Notes                                                                     |
|----------------------------------------|---------------------------------------------------------------------------------|---------------|------------------------------------------|---------------------------------------------------------------------------|
| deployment.customExtension.annotations | Custom Annotations that needs to be added to egressgateway specific Deployment. | null          | Not applicable                           | This can be used to add custom annotation(s) to egressgateway deployment. |

Following table provides parameters for **nudr-diameterproxy micro service**.

| Parameter               | Description                                              | Default value            | Range or Possible Values (If applicable)          | Notes                                                                                     |
|-------------------------|----------------------------------------------------------|--------------------------|---------------------------------------------------|-------------------------------------------------------------------------------------------|
| enabled                 | To enable service.                                       | false                    | Not applicable                                    | Used to enable or disable service.                                                        |
| image.name              | Docker Image name                                        | ocudr/nudr_diameterproxy | Not applicable                                    |                                                                                           |
| image.tag               | Tag of Image                                             | 1.7.1                    | Not applicable                                    |                                                                                           |
| image.pullPolicy        | This setting will tell if image need to be pulled or not | Always                   | Possible Values - Always<br>IfNotPresent<br>Never |                                                                                           |
| logging.level.root      | Log Level                                                | WARN                     | Possible Values - WARN<br>INFO<br>DEBUG           | The log level of the nudr-diameterproxy server pod                                        |
| deployment.replicaCount | Replicas of the nudr-diameterproxy pod                   | 2                        | Not applicable                                    | Number of nudr-config-server pods to be maintained by replica set created with deployment |
| minReplicas             | min replicas of nudr-diameterproxy                       | 2                        | Not applicable                                    | Minimum number of pods                                                                    |
| maxReplicas             | max replicas of nudr-diameterproxy                       | 4                        | Not applicable                                    | Maximum number of pods                                                                    |
| service.http2enabled    | Enabled HTTP2 support flag for rest server               | true                     | true/false                                        | Enable/Disable HTTP2 support for rest server                                              |

| Parameter                 | Description                                 | Default value | Range or Possible Values (If applicable)                  | Notes                                                                                                                       |
|---------------------------|---------------------------------------------|---------------|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| service.type              | UDR service type                            | ClusterIP     | Possible Values-<br>ClusterIP<br>NodePort<br>LoadBalancer | The Kubernetes service type for exposing UDR deployment<br>Note: Suggested to be set as ClusterIP (default value) always    |
| service.diameter.type     | Diameter service type                       | LoadBalancer  | Possible Values-<br>ClusterIP<br>NodePort<br>LoadBalancer | The Kubernetes service type for exposing UDR deploymentdiameter traffic goes via diameter-endpoint, not via ingress-gateway |
| service.port.http         | HTTP port                                   | 5001          | Not applicable                                            | The HTTP port to be used in nudr-diameterproxy service                                                                      |
| service.port.https        | HTTPS port                                  | 5002          | Not applicable                                            | The https port to be used for nudr-diameterproxy service                                                                    |
| service.port.management   | Management port                             | 9000          | Not applicable                                            | The actuator management port to be used for nudr-diameterproxy service                                                      |
| service.port.diameter     | Diameter port                               | 6000          | Not applicable                                            | The diameter port to be used for nudr-diameterproxy service                                                                 |
| resources.requests.cpu    | Cpu Allotment for nudr-diameterproxy pod    | 3             | Not applicable                                            | The CPU to be allocated for nudr-diameterproxy pod during deployment                                                        |
| resources.requests.memory | Memory allotment for nudr-diameterproxy pod | 4Gi           | Not applicable                                            | The memory to be allocated for nudr-diameterproxy pod during deployment                                                     |
| resources.limits.cpu      | Cpu allotment limitation                    | 3             | Not applicable                                            | The CPU to be max allocated for nudr-diameterproxy pod                                                                      |

| Parameter                       | Description                                    | Default value   | Range or Possible Values (If applicable) | Notes                                                                                                                                                   |
|---------------------------------|------------------------------------------------|-----------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| resources.limits.memory         | Memory allotment limitation                    | 4Gi             | Not applicable                           | The memory to be max allocated for nudr-diameterproxy pod                                                                                               |
| resources.target.averageCpuUtil | CPU utilization limit for autoscaling          | 80              | Not Applicable                           | CPU utilization limit for creating HPA                                                                                                                  |
| drservice.port.http             | HTTP port on which dr service is running       | 5001            | Not Applicable                           | dr-service port is required in diameterproxy application                                                                                                |
| drservice.port.https            | HTTPS port on which dr service is running      | 5002            | Not Applicable                           | dr-service port is required in diameterproxy application                                                                                                |
| diameter.realm                  | Realm of the diameterproxy microservice        | oracle.com      | String value                             | Host realm of diameterproxy                                                                                                                             |
| diameter.identity               | FQDN of the diameterproxy in diameter messages | nudr.oracle.com | String value                             | identity of the diameterproxy                                                                                                                           |
| diameter.strictParsing          | Strict parsing of Diameter AVP and Messages    | false           | Not Applicable                           | strict parsing                                                                                                                                          |
| diameter.IO.threadCount         | Number of thread for IO operation              | 0               | 0 to 2* CPU                              | Number of threads to handle IO operations in diameterproxy pod<br>if threadcount is 0 then application choose the threadCount based on pod profile size |
| diameter.IO.queueSize           | Queue size for IO                              | 0               | 2048 to 8192                             | the count should be the power of 2<br>if queueSize is 0 then application choose the queueSize based on pod profile size                                 |

| Parameter                          | Description                               | Default value                                                                                                                    | Range or Possible Values (If applicable) | Notes                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| diameter.messageBuffer.threadCount | Number of threads for process the message | 0                                                                                                                                | 0 to 2* CPU                              | Number of threads to handle messages in diameterproxy pod<br>if threadcount is 0 then application choose the threadCount based on pod profile size                                                                                                                                                                                                                                                     |
| diameter.peer.setting              | Diameter peer setting                     | reconnectDelay: 3<br>responseTimeout: 4<br>connectionTimeout: 3<br>watchdogInterval: 6<br>transport: 'TCP'<br>reconnectLimit: 50 | Not Applicable                           | <ol style="list-style-type: none"> <li>1. reconnect delay for diameter reconnect (in seconds).</li> <li>2. total turnaround time for process the diameter messages. (in sec)</li> <li>3. TCP connection timeout time. (in sec)</li> <li>4. DWR and DWA messages every number of time (in sec)</li> <li>5. Transport layer</li> <li>6. reconnect the number of time if diameter peer is down</li> </ol> |

| Parameter                              | Description                                                                          | Default value                                                                                                                                                                                          | Range or Possible Values (If applicable) | Notes                                                                                                                         |
|----------------------------------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| diameter.peer.nodes                    | diameter server peer nodes list                                                      | - name: 'seagull'<br>responseOnly: false<br>namespace: 'seagull1'<br>host: '10.75.185.158'<br>domain: 'svc.cluster.local'<br>port: 4096<br>realm: 'seagull1.com'<br>identity: 'seagull1a.seagull1.com' | Not applicable                           | the diameter server peer node information<br>*it should be yaml list<br>*default values are template , how to add peer nodes. |
| diameter.peer.clientNodes              | diameter client peers                                                                | - identity: 'seagull1a.seagull1.com'<br>realm: 'seagull1.com'<br>- identity: 'seagull1.com'<br>realm: 'seagull1.com'                                                                                   | Not applicable                           | the diameter client node information<br>*it should be yaml list<br>*default values is template, how to add peer nodes.        |
| service.customExtension.labels         | Custom Labels that needs to be added to nudr-diameterproxy specific Service.         | null                                                                                                                                                                                                   | Not applicable                           | This can be used to add custom label(s) to nudr-diameterproxy Service.                                                        |

| deployment.customExtension.labels      | Custom Labels that needs to be added to nudr-diameterproxy specific Deployment.      | null                                                                                                                                                                                                   | Not applicable                           | This can be used to add custom label(s) to nudr-diameterproxy Deployment.                                                     |
| deployment.customExtension.annotations | Custom Annotations that needs to be added to nudr-diameterproxy specific Deployment. | null                                                                                                                                                                                                   | Not applicable                           | This can be used to add custom annotation(s) to nudr-diameterproxy Deployment.                                                |

# 4

## Upgrading an Existing Unified Data Repository Deployment

 **Note:**

**IF YOU HAVE ENABLED SERVICE MESH THEN YOU HAVE TO INSTALL UDR. YOU CANNOT UPGRADE FROM UDR 1.7.0 TO UDR 1.7.1. HOWEVER, IF THE SERVICE MESH IS NOT ENABLED THEN YOU CAN UPGRADE FROM UDR 1.7.0 TO UDR 1.7.1 BY FOLLOWING THE HELM UPGRADE SECTION DIRECTLY. WHILE UPGRADING, YOU CAN SKIP THE DB SCHEMA UPGRADE SECTION.**

To upgrade an existing UDR deployment, first upgrade the DB schema and then, perform the helm upgrade.

User should stop the Provisioning traffic while performing the upgrade procedure.

 **Note:**

For SLF, upgrade feature is not supported from 1.7.0 to 1.7.1. Hence, these instructions are not applicable for the same.

### DB Schema Upgrade

You should install `mysql-connector` and `Python3` before upgrading the DB schema. If `Python3` is not available, then execute the commands given below on one of the sql nodes for dbschema upgrade.

```
yum install gcc openssl-devel bzip2-devel sqlite-devel
cd /usr/src/
wget https://www.python.org/ftp/python/3.6.10/Python-3.6.10.tgz
tar xzf Python-3.6.10.tgz
cd Python-3.6.10
./configure --enable-optimizations
make altinstall
python3.6 -V (To check if installation is OK)
```

To install `mysql-connector` using `pip`, execute the following commands on the sql node.

```
python3.6 -m pip install -U setuptools
python3.6 -m pip install -U wheel
python3.6 -m pip install -U mysql-connector-python-rf
```

Modify username, password and db name in the script as per requirement.

#### Note:

You can refer to the Oracle Help Center for **upgrade.py** script to upgrade to 1.7.0 schema.

For db upgrade, execute the following command:

```
python3.6 upgrade.py
```

### Helm Upgrade

Upgrading an existing deployment replaces the running containers and pods with new containers and pods. If there is no change in the pod configuration, it is not replaced. Unless there is a change in the service configuration of a micro service, the service endpoints remain unchanged. For example, ClusterIP.

- To upgrade, follow instructions given in the Deploying OCUDR section to extract the required OCUDR software components. If required, re-tag and push the images to customer's repository. For more information, see UDR Deployment.
- Take a backup of 1.6.0 version's **ocudr-custom-values.yaml** file before changing any configuration.
- Modify the **ocudr-custom-values-1.7.0.yaml** file parameters as per site requirement. For more information on updating the **ocudr-custom-values-1.7.0.yaml** file, see **ocudr-custom-values.yaml** File Configuration.

Execute the following command to upgrade an existing Unified Data Repository deployment. For the parameters that are configurable, see [. Customizing Unified Data Repository](#)

```
$ helm upgrade <release> <helm chart> [--version <OCUDR version>] -f
<ocudr-custom-values-1.7.0.yaml>
```

<release> could be found in the output of 'helm list' command  
 <chart> is the name of the chart in the form of <repository/ocudr> e.g.  
 reg-1/ocudr or cne-repo/ocudr

### Rollback Instructions

Execute the following command to check if the pods are successfully started.

```
kubectl get pods -n <namespace_name>
```

If there are issues that a user cannot recover on checking logs and describe on pods, rollback using the steps below:

#### Schema Rollback:

1. Rollback schema to 1.6.0.
2. Use the **rollback.py** script to downgrade to 1.6.0 schema, modify username, password and db name as per requirement.  

```
python rollback.py
```

 **Note:**

You can refer to the Oracle Help Center site for the **rollback.py** script.

**Image Rollback using Helm:**

1. Use the backed up customized 1.6.0 version's **ocudr-values.yaml** file to rollback to previous version.

2. Execute the helm rollback command.

```
helm rollback <helm release name> <revision_no>
```

To obtain the revision number, execute the following command :

```
helm history <helm release name>
```

# 5

## Troubleshooting Unified Data Repository

In this chapter, you will learn about the known issues that you may encounter while installing or working on Unified Data Repository and the techniques to troubleshoot these issues. It covers:

- [Generic Checklist](#)
- [Verifying UDR Registration with NRF](#)
- [Verifying Container Logs](#)
- [Verifying OCUDR Micro Services Logs](#)
- [Debugging Errors from Egress Gateway](#)
- [Debugging Errors from Ingress Gateway](#)
- [Debugging Helm Test Issues](#)
- [Debugging HPA Issues](#)
- [Debugging HTTPS Support related Issues](#)
- [Debugging Notification Issues](#)
- [Debugging Pod Creation Failure](#)
- [Debugging UDR Registration with NRF Failure](#)

### Generic Checklist

The following generic checklist helps you to ensure that your system is configured properly and there is no issue with basic system setup:

- Execute the following command to **check the installation of kubectl**.  

```
$ kubectl
```

If Kubectl is not installed, you can visit <https://kubernetes.io/docs/tasks/tools/install-kubectl/>
- Execute the following command to **check the installation of helm**.  

```
$ helm ls
```

If helm is not installed, execute the following set of commands one after another to install helm:

  1. 

```
curl -o /tmp/helm.tgz https://storage.googleapis.com/kubernetes-helm/helm-v2.9.1-linux-amd64.tar.gz
```

. Replace with appropriate http link.
  2. 

```
tar -xzvf /tmp/helm.tgz -C /usr/local/bin --strip-components=1 linux-amd64/helmr -f /tmp/helm.tgz
```
  3. 

```
kubectl create serviceaccount --namespace kube-system tiller
```
  4. 

```
kubectl create clusterrolebinding tiller-cluster-rule --clusterrole=cluster-admin --serviceaccount=kube-system:tiller
```
  5. 

```
helm init --service-account tiller
```

6. `kubectl get po -n kube-system` # Wait for tiller pod to be up
  7. `helm ls` # Does not return an error. Try again if returns an error as tiller pod may be coming up.
  8. `helm install`. If this command fails immediately with syntax error, check the syntax and values in the `values.yaml` file. [If `values.yaml` file is used in `helm install` command, else contact the UDR development team.]
- Execute the following command to **check the installation of UDR**.  
\$ `kubectl get pods -n <ocudr-namespace>`

Figure 5-1 Sample Output: UDR Pods Status

```
[root@master ~]# kubectl get pods -n myudr
```

| NAME                                           | READY | STATUS  | RESTARTS | AGE |
|------------------------------------------------|-------|---------|----------|-----|
| ocudr-egressgateway-79fcffcd6b-2x85v           | 1/1   | Running | 0        | 13h |
| ocudr-ingressgateway-b48cc8bc4-qzstd           | 1/1   | Running | 0        | 13h |
| ocudr-nudr-config-64b8d8b9db-zzc7w             | 1/1   | Running | 0        | 13h |
| ocudr-nudr-config-server-cbd98d94f-pq8pf       | 1/1   | Running | 0        | 13h |
| ocudr-nudr-diameterproxy-f5f6494c6-lsx2d       | 1/1   | Running | 0        | 13h |
| ocudr-nudr-drservice-894f8f857-qvvrk           | 1/1   | Running | 0        | 13h |
| ocudr-nudr-notify-service-55db555984-bm5w5     | 1/1   | Running | 0        | 13h |
| ocudr-nudr-nrf-client-service-5986795678-vxd18 | 1/1   | Running | 0        | 13h |

In the figure given above, the **STATUS** of all the pods is 'Running'.

- Execute the following command to **view all the events** related to a particular namespace.  
`kubectl get events -n <ocudr-namespace>`
- **Verify UDR Pods:** Execute the following command to verify whether UDR specific pods are working as expected:  
\$ `kubectl get pods -n <ocudr-namespace>`

Figure 5-2 Sample Output: UDR Pods Status

```
[root@master ocudr]# kubectl get pods -n udr1-1
```

| NAME                                           | READY | STATUS  | RESTARTS | AGE   |
|------------------------------------------------|-------|---------|----------|-------|
| ocudr-ingressgateway-57b576cb94-wrmb4          | 1/1   | Running | 0        | 9m56s |
| ocudr-nudr-drservice-799484d597-dckwr          | 1/1   | Running | 0        | 9m56s |
| ocudr-nudr-notify-service-76f54c64bd-w5wtl     | 1/1   | Running | 0        | 9m56s |
| ocudr-nudr-nrf-client-service-65567975c4-vc6ps | 1/1   | Running | 0        | 9m56s |

In the figure given above, you can see that the status of all the pods is 'Running'.

#### Note:

The number of pods for each service depends on helm configuration. In addition, all pods should be in ready state and you need to ensure that there are no continuous restarts.

- **Verify Database Connectivity:** After verifying UDR pods, login to NDB cluster and verify the creation of `udrdb` with all the tables. To check the entries in the database tables, you need to execute following command:  
`select count(*) from RESOURCE_MAP`

It ensures that the connection is fine and the database is created successfully. This count differs based on the **udrServices** option selected under global section in values. But this table cannot be empty.

**Figure 5-3 Sample Output: Verifying Table Entries in Database**

```
mysql> select count(*) from RESOURCE_MAP;
+-----+
| count(*) |
+-----+
| 70 |
+-----+
1 row in set (0.01 sec)
```

- **Verify Subscribers:** To verify UDR subscribers, you need to verify the provisioning flow on UDR. You can use the following provisioning URL supported on UDR to verify the provisioning flow:
  - If you use external tools like postman and http2 curl, then follow this URL:  
`http://<ocudr-ingress-gateway-ip>:<http-external-port>/nudr-dr-prov/v1/profile-data/msisdn-1111111113`  
 In case of curl, the client should support a http2 curl utility.
  - If https is enabled in UDR ingress gateway, then follow this URL:  
`https://<ocudr-ingress-gateway-ip>:<https-external-port>/nudr-dr-prov/v1/profile-data/msisdn-1111111113`

Verifying provisioning flow on UDR also confirms udrdb status on the NDB cluster.

- **Verify Logs:** Check the logs of nudr-nrf-client-service for no 503 errors. This helps to find out if all the fqdn configured, as part of helm configurations, in values are resolvable.
- **Verify NRF registration:** Once the deployment has passed the above checks, verify the **udr\_nrf\_registration\_success\_total** metric on prometheus after couple of minutes of UDR deployment.

## Verifying UDR Registration with NRF

Execute the following commands to verify whether UDR is registered with NRF.

- **With HTTP1 messaging**  
`curl -v -X GET --url 'http://<FQDN:PORT of NRF-API_Gateway>/nnrf-nfm/v1/nf-instances?nf-type=UDR'`  
**Example:** `curl -v --http2-prior-knowledge -X GET --url 'http://ocnrf-ingressgateway.ocnrf/nnrf-nfm/v1/nf-instances?nf-type=UDR'`
- **With HTTP2 messaging**  
`curl -v --http2-prior-knowledge -X GET --url 'http://<FQDN:PORT of NRF-API_Gateway>/nnrf-nfm/v1/nf-instances?nf-type=UDR'`  
**Example:** `curl -v --http2-prior-knowledge -X GET --url 'http://ocnrf-ingressgateway.ocnrf/nnrf-nfm/v1/nf-instances?nf-type=UDR'`

 **Note:**

User should have curl version that supports `--http2-prior-knowledge` option.

## Verifying Container Logs

You can check the container logs in the `/var/log/containers` location on the appropriate nodes where the pods are running.

**Figure 5-4 Container Logs**

```
[root@olslave2 containers]# ls | grep nudr
ocudr-nudr-notify-service-74ddf64b5-46d7b_default_ocudr-nudr-notify-service-3f99b648224db59ff5d2b5af15a2c125d5d107092a66a85a3
5eff28719bb8009.log
ocudr-nudr-nrf-client-service-9c59d9f7b-ckt8j_default_ocudr-nudr-nrf-client-service-7ac9715d072d204a3969b17e90b44067316cb673ff
86b084390f472e42444c70.log
[root@olslave2 containers]# pwd
/var/log/containers
[root@olslave1 ~]# cd /var/log/containers/
[root@olslave1 containers]#
[root@olslave1 containers]#
[root@olslave1 containers]#
[root@olslave1 containers]# ls | grep nudr
ocudr-nudr-drservice-646495555d-q7mlf_default_ocudr-nudr-drservice-d17386177f17dba7d4756f98d49779327b1be2bd2cdc88eebbad43c54a9
a5bce.log
```

## Verifying OCUDR Microservices Logs

In this section, you will learn to check logs of the following microservices:

- OCUDR-NUDR-DRSERVICE
- NRF-CLIENT-SERVICE
- NUDR-NOTIFY-SERVICE
- NUDR-CONFIG-SERVICE
- NUDR-CONFIG-SERVER
- NUDR-DIAMETERPROXY Service

### Checking Logs in OCUDR-NUDR-DRSERVICE

**OCUDR-NUDR-DRSERVICE** dumps all the header while processing messages. User should search for "Before Request/After Request" header in the messages.

If `nudr-drservice` requests are failing, check the count of **`udr_schema_operations_failure_total` measurement**. If this count is increasing:

- Check the content of incoming requests
- Ensure that the incoming json data blob is proper
- Connectivity between microservices are mysql DB nodes
- Try not to insert duplicate keys
- Ensure DB nodes have enough resources available

To view logs, execute the following command:

```
kubectl logs -f <nudr-drservice pod> -n <ocudr-namespace>
```

To check logs directly on the pods, execute the following command:

```
kubectl exec -it ocudr-nudr-drservice-779c67b9f-sjcmv bash
```

To change logging level in the ocudr-nudr-drservice using helm:

1. Open the latest ocudr\_value.yaml file that is used at the time of ocudr installation/upgrade.
2. Change the value of "logging level root" attribute under "ocudr" to "INFO".

 **Note:**

OCUDR supports logging level values: DEBUG, INFO, WARN and ERROR.

3. Execute the following helm upgrade command to change the log level:
 

```
helm upgrade ocudr ocudr-helm-repo/ocudr -f <updated values.yaml with logging level as INFO> --version <helm version>
```

### Checking Logs in NUDR-NRF-CLIENT-SERVICE

If the count of **udr\_nrf\_livenessProbe\_failure\_total measure** increases, you need to ensure that helm charts configuration for "nudr-nrf-client-service" is correct and NRF server is up and running fine.

If nudr-nrf-client-service is not able to register with NRF and there is a difference between "**udr\_nrf\_registration\_requests\_total**" and "**udr\_nrf\_registration\_success\_total**", then you need to ensure that helm charts configuration for "nudr-nrf-client-service" are correct.

If nudr-nrf-client-service is not able to de-register with NRF and there is a difference between "**udr\_nrf\_deregistration\_requests\_total**" and "**udr\_nrf\_deregistration\_success\_total**", then you need to ensure that helm charts configuration for "nudr-nrf-client-service" are correct.

To view the NUDR-NRF-CLIENT-SERVICE logs, execute the following command:

```
kubectl logs <nrf-client-pod pod> -n <ocudr-namespace>
```

To check logs directly on the pods, refer to the screen given below:

**Figure 5-5 NRF-Client-Service Logs**

```
[admusr@olmaster ~]$ kubectl get pods | grep nudr
ocudr-nudr-drservice-779c67b9f-sjcmv 1/1 Running 0 157m
ocudr-nudr-notify-service-77f74ffbc-v7714 1/1 Running 0 157m
ocudr-nudr-nrf-client-service-6d9854fbd4-2mhmp 1/1 Running 0 157m
[admusr@olmaster ~]$ kubectl exec -it ocudr-nudr-nrf-client-service-6d9854fbd4-2mhmp bash
bash-4.2$ cd /home/udruser/
bash-4.2$ ls -l
total 908
drwxr-xr-x 1 udruser udruser 36 Oct 7 09:27 app
-rw-r--r-- 1 udruser udruser 906279 Oct 9 08:20 application.log
-rwxrwxr-x 1 root root 219 Oct 7 09:21 healthcheck.sh
-rwxrwxr-x 1 root root 222 Oct 7 09:21 runService.sh
```

To change logging level in the nrf-client-service using helm:

1. Open the latest ocudr\_value.yaml file that is used at the time of ocudr installation/upgrade.

2. Change the value of "logging level root" attribute under "nrfclient" to "INFO".

 **Note:**

nudr-nrf-client-service supports logging level values: DEBUG, INFO, WARN and ERROR.

3. Execute the following helm upgrade command to change the log level:  
helm upgrade ocudr ocudr-helm-repo/ocudr -f <updated values.yaml with logging level as INFO> --version <helm version>

### Checking Logs in NUDR-NOTIFY-SERVICE

Measurements like **nudr\_notif\_notifications\_ack\_2xx\_total**, **nudr\_notif\_notifications\_ack\_4xx\_total**, and **nudr\_notif\_notifications\_ack\_5xx\_total** gives information about the response code returned in the notification response. If the count of **nudr\_notif\_notifications\_send\_fail\_total** measurement increases, then you need to ensure that the notification server mentioned in the NOTIFICATION\_URI during subscription request is up and running.

To view the NUDR-NOTIFY-SERVICE logs, execute the following command:

```
kubectl logs <nudr-notify-service pod> -n <ocudr-namespace>
```

To check logs directly on the pods, refer to the screen given below:

**Figure 5-6 NUDR-NOTIFY-SERVICE Logs**

```
[admusr@olmaster ~]$ kubectl get pods | grep nudr
ocudr-nudr-drbservice-779c67b9f-sjcmv 1/1 Running 0 161m
ocudr-nudr-notify-service-77f74ffbc-v7714 1/1 Running 0 161m
ocudr-nudr-nrf-client-service-6d9854fbd4-2mhmp 1/1 Running 0 161m
[admusr@olmaster ~]$ kubectl exec -it ocudr-nudr-notify-service-77f74ffbc-v7714 bash
bash-4.2$ cd /home/udruser/
bash-4.2$ ls -l
total 16
drwxr-xr-x 1 udruser udruser 37 Oct 7 09:25 app
-rw-r--r-- 1 udruser udruser 5955 Oct 9 05:45 application.log
-rw-rw-r-- 1 root root 219 Oct 7 09:21 healthcheck.sh
-rwxrwxr-x 1 root root 378 Oct 7 09:21 runService.sh
```

To change logging level in the nudr-notify-service using helm:

1. Open the latest ocudr\_value.yaml file that is used at the time of ocudr installation/upgrade.
2. Change the value of "logging level root" attribute under "ocudr" to "INFO".

 **Note:**

nudr-notify-service supports logging level values: DEBUG, INFO, WARN and ERROR.

3. Execute the following helm upgrade command to change the log level:  
helm upgrade ocudr ocudr-helm-repo/ocudr -f <updated values.yaml with logging level as INFO> --version <helm version>

## Checking Logs in NUDR-CONFIG-SERVICE

To view logs, execute the following command:

```
kubectl logs <nudr-config pod> -n <ocudr-namespace>
```

To check logs directly on the pods, refer to the screen given below:

**Figure 5-7 NUDR-CONFIG-SERVICE Logs**

```
[root@master ~]# kubectl get pods -n myudr
NAME READY STATUS RESTARTS AGE
ocudr-egressgateway-79fcffcd6b-2x85v 1/1 Running 0 14h
ocudr-ingressgateway-b48cc8bc4-qzstd 1/1 Running 0 14h
ocudr-nudr-config-64b8d8b9db-zzc7w 1/1 Running 0 14h
ocudr-nudr-config-server-cbd98d94f-pq8pf 1/1 Running 0 14h
ocudr-nudr-diameterproxy-f5f6494c6-lsx2d 1/1 Running 0 14h
ocudr-nudr-drservice-894f8f857-qvxxrk 1/1 Running 0 14h
ocudr-nudr-notify-service-55db555984-bm5w5 1/1 Running 0 14h
ocudr-nudr-nrf-client-service-5986795678-vxd18 1/1 Running 0 14h
[root@master ~]# kubectl exec ocudr-nudr-config-64b8d8b9db-zzc7w -it bash -n myudr
bash-4.2$ cd home/udruser/
bash-4.2$ ls
app application.log runService.sh
```

To change logging level in the ocudr-nudr-config service using helm:

1. Open the latest ocudr\_value.yaml file that is used at the time of ocudr installation/upgrade.
2. Change the value of "logging level root" attribute under "ocudr" to "INFO".

### Note:

OCUDR supports logging level values: DEBUG, INFO, WARN and ERROR.

3. Execute the following helm upgrade command to change the log level:  
helm upgrade ocudr ocudr-helm-repo/ocudr -f <updated values.yaml with logging level as INFO> --version <helm version>

## Checking Logs in NUDR-CONFIG-SERVER

To view logs, execute the following command:

```
kubectl logs <nudr-config-server pod> -n <ocudr-namespace>
```

To change logging level in the ocudr-nudr-config-server service using helm:

1. Open the latest ocudr\_value.yaml file that is used at the time of ocudr installation/upgrade.
2. Change the value of "logging level root" attribute under "ocudr" to "INFO".

### Note:

OCUDR supports logging level values: DEBUG, INFO, WARN and ERROR.

3. Execute the following helm upgrade command to change the log level:  

```
helm upgrade ocudr ocudr-helm-repo/ocudr -f <updated values.yaml with logging level as INFO> --version <helm version>
```

### Checking Logs in NUDR-DIAMETERPROXY Service

Debug errors from **ocudr-nudr-diameterproxy**:

- If diameterproxy rejects any request or you are not able to send any request from seagull machines, it means the dictionary file is not loaded correctly to the application. You need to check the dictionary path and change it, if required and redeploy the diameterproxy service. (The dictionary file path should be `"/home/udruser/app/diameter"`).
- If diameterproxy answers CEA message with **DIAMETER\_UNKNOWN\_PEER**, it means client peer is not configured correctly. To resolve this, configure client peer of nudr-diameterproxy service.
- If diameterproxy answers CEA message success and other SH message response as **DIAMETER\_UNABLE\_TO\_COMPLY**, it means the dr-service pod is not up and running or sent sh message is invalid. You can check dr-service failure using **nudr\_diameterproxy\_rest\_failure\_res\_msgs\_total** metrics name and invalid sh message, if **nudr\_diameterproxy\_total\_requests\_total** metric is not increasing .
- If there are many error logs in diameterproxy micro service stating connection refused with some IP Address and port, it means specified server peer in helm charts is not running and diameterproxy retries to connect with that peer.
- If you are not getting any PNR messages then check whether dr-service and notify-service is up and running. You need to ensure that server peer configuration is correct.

To view NUDR-DIAMETERPROXY service logs, execute the following command:  
`kubectl logs <nudr-diameterproxy pod> -n <ocudr-namespace>`

To change logging level in the ocudr-nudr-diameterproxy service using helm:

1. Open the latest ocudr\_value.yaml file that is used at the time of ocudr installation/upgrade.
2. Change the value of "logging level root" attribute under "ocudr" to "INFO".

 **Note:**

OCUDR supports logging level values: DEBUG, INFO, WARN and ERROR.

3. Execute the following helm upgrade command to change the log level:  

```
helm upgrade ocudr ocudr-helm-repo/ocudr -f <updated values.yaml with logging level as INFO> --version <helm version>
```

 **Note:**

You can use kibana also to view logs.

## Debugging Errors from Egress Gateway

If the traffic is not routed via Egress Gateway, you need to check the following:

- Check whether Egress Gateway is enabled or not from global values file.
- Check whether Egress pod is running from kubectl. To check, execute the following command:  
`kubectl get pods -n <Release.name>`
- To enable the outgoing traffic using HTTPS, you need to make the following configuration as true:

**Figure 5-8 Enabling Egress Traffic using HTTPS**

```
---- HTTPS Configuration - BEGIN ----
initssl: false
enableOutgoingHttps: false
```

- Create certs and keys uniquely for all Egress and respective Ingress NF's. For more details, check the IngressGateway Container Stuck section in Init State/Failed. It is same as [Ingress debugging](#).

## Debugging Errors from Ingress Gateway

The possible errors that you may encounter from Ingress Gateway are:

- **Check for 500 Error:** If the request fails with 500 status code without Problem Details information, it means that the flow ended in ocudr-ingressgateway pod without route. You can confirm the same in the errors/exception section of the ocudr-ingressgateway pod logs. You also need to check the values.yaml file for the essential route configuration as shown below:

Figure 5-9 Snapshot of Values.yaml file

```
routesConfig:
- id: traffic_mapping_http
 uri: http://{{ .Release.Name }}-nudr-drservice:5001
 path: /nudr-dr/**
 order: 1
- id: traffic_mapping_http_prov
 uri: http://{{ .Release.Name }}-nudr-drservice:5001
 path: /nudr-dr-prov/**
 order: 2
- id: traffic_mapping_http_mgmt
 uri: http://{{ .Release.Name }}-nudr-drservice:5001
 path: /nudr-dr-mgm/**
 order: 3
- id: traffic_mapping_http_udsf
 uri: http://{{ .Release.Name }}-nudr-drservice:5001
 path: /nudsf-dr/**
 order: 4
- id: traffic_mapping_http_group
 uri: http://{{ .Release.Name }}-nudr-drservice:5001
 path: /nudr-group-id-map/**
 order: 5
- id: traffic_mapping_http_group_prov
 uri: http://{{ .Release.Name }}-nudr-drservice:5001
 path: /nudr-group-id-map-prov/**
 order: 6
- id: traffic_mapping_http_slf_group_prov
 uri: http://{{ .Release.Name }}-nudr-drservice:5001
 path: /slf-group-prov/**
 order: 7
```

- **Check for 503 Error:** If the request fails with 503 status code with "SERVICE\_UNAVAILABLE" in Problem Details, then it means that the nudr-drservice pod is not reachable due to some reason.

Figure 5-10 503 Error Code

The screenshot shows a web browser's developer tools interface. The 'Body' tab is selected, and the status bar at the top right indicates 'Status: 503 Service Unavailable'. The response body is displayed in JSON format, showing the following structure:

```
1 {
2 "type": null,
3 "title": null,
4 "status": 503,
5 "detail": "SERVICE_UNAVAILABLE",
6 "instance": null,
7 "cause": null,
8 "invalidParams": null
9 }
```

You can confirm the same in the errors/exception logs of the ocudr-ingressgateway pod. Check for ocudr-nudr-drservice pod status and fix the issue.

## Debugging Helm Test Issues

To debug Helm Test issues:

- Execute the following command to get the Helm Test pod name.  
kubectl get pods -n <deployment-namespace>
- Check for the Helm Test pod that is in error state.

Figure 5-11 Helm Test Pod

```
[root@master ~]# kubectl get pods -n ocudr
NAME READY STATUS RESTARTS AGE
ocudr-egressgateway-595d796-n99r9 1/1 Running 0 2m7s
ocudr-ingressgateway-74c94967e5-kmcfz 1/1 Running 0 2m7s
ocudr-nudr-config-65d8946986-pm56l 1/1 Running 0 2m7s
ocudr-nudr-config-server-5c9fb996c7-nwj7h 1/1 Running 0 2m7s
ocudr-nudr-diameterproxy-6bf67d8d8d-6mlkb 1/1 Running 0 2m7s
ocudr-nudr-drservice-595bf9877d-jg58b 0/1 Pending 0 2m7s
ocudr-nudr-notify-service-65cf544955-dgpxgq 1/1 Running 0 2m7s
ocudr-nudr-nrf-client-service-64774d996-6s64s 1/1 Running 0 2m7s
ocudr-test-twjqh 0/1 Error 0 82s
```

- Execute the following command to check the Helm Test pod:  
kubectl logs <helm\_test\_pod\_name> -n <deployment\_namespace>

In the logs, concentrate on ERROR and WARN level logs. There can be multiple reasons for failure. Some of them are shown below:

Figure 5-12 Helm Test in Pending State

```
{
 "thread": "main",
 "level": "ERROR",
 "loggerName": "com.oracle.ocudr.udr.services.client.MyNFClient$$EnhancerBySpringCGLIB$$c5eed3d4",
 "message": "Pod check failed, current state: Pending, PodName: ocudr-nudr-drservice-595bf9877d-jg58b",
 "endOfBatch": false,
 "loggerFqcn": "org.apache.logging.slf4j.Log4jLogger",
 "instant": {
 "epochSecond": 1594631490,
 "nanoOfSecond": 283784000
 },
 "threadId": 1,
 "contextMap": { },
 "threadPriority": 5
}
```

In this case, check for CPU and Memory availability in the kubernetes cluster.

Figure 5-13 Pod Readiness Failed

```
{
 "thread": "main",
 "level": "ERROR",
 "loggerName": "com.oracle.ocudr.udr.services.client.MyNFClient$$EnhancerBySpringCGLIB$$c5eed3d4",
 "message": "Liveness check failed for URL: http://10.244.2.62:9000/actuator/health, PodName: ocudr-nudr-notify-service-65cf544955-dgpxgq",
 "endOfBatch": false,
 "loggerFqcn": "org.apache.logging.slf4j.Log4jLogger",
 "instant": {
 "epochSecond": 1594631490,
 "nanoOfSecond": 287018000
 },
 "threadId": 1,
 "contextMap": { },
 "threadPriority": 5
}
```

In this case, check for readiness probe url correctness in the particular microservice helm charts under charts folder. In the above case, check for charts

of notify service [OR] check if the pod is crashing for some reason when the url configured for readiness probe is correct.

- There are few other cases where the **httpGet** parameter is not configured for Readiness probe. In this case, Helm Test is considered as success for that pod. And if the Pod/PVC list is fetched based on namespace and labelSelector is empty, the helm test is considered as success.

## Debugging HPA Issues

There can be scenarios where HPA running on `nudr-drservice` deployment and `nudr_notify_service` might not get the CPU metrics successfully from the pods. Execute the following command to view the HPA details:

```
kubectl get hpa
```

In this scenario, you need to check the following:

- Check whether metrics server is running on the kubernetes cluster. If it is running, even then the CPU usage pod might not be accessible. In this case, you need to check the metrics-server values yaml file for the args passed as shown below:

**Figure 5-14 metrics-server yaml file**

```
args:
 - --kubelet-preferred-address-types=InternalIP
 - --kubelet-insecure-tls
```

- If it requires any update, then do the same and restart the metrics server pod. You have to wait for couple of minutes after starting the metrics server to see the CPU usage update. For this, execute the `kubectl get hpa` command.

**Figure 5-15 CPU Usage Update**

```
[admsr@olmaster templates]$ kubectl get hpa
NAME REFERENCE TARGETS MINPODS MAXPODS REPLICAS AGE
ocudr-nudr-drservice Deployment/ocudr-nudr-drservice 0%/80% 1 1 1 18h
ocudr-nudr-notify-service Deployment/ocudr-nudr-notify-service 42%/80% 1 1 1 18h
```

## Debugging HTTPS Support related Issues

UDR supports HTTPS and its validations are done at Ingress Gateway of UDR. You may encounter issues related to HTTPS when:

- **HTTPS port is not exposed:** Execute the following command to figure out whether HTTPS port is exposed or not:  
`kubectl get svc --n <ocudr-namespace>`

Figure 5-16 HTTPS Port Exposed

```
[root@master ocudr]# kubectl get svc -n ocudr
NAME TYPE CLUSTER-IP EXTERNAL-IP PORT(S)
ocudr-ingressgateway LoadBalancer 10.102.65.118 <pending> 80:32659/TCP,443:30500/TCP,
5701:30245/TCP
ocudr-nudr-drservice ClusterIP None <none> 5002/TCP,9000/TCP,5001/TCP
ocudr-nudr-notify-service ClusterIP None <none> 9000/TCP,5001/TCP,5002/TCP
ocudr-nudr-nrf-client-service ClusterIP None <none> 9000/TCP
udrdbservice ClusterIP 10.111.252.140 <none> 3306/TCP
```

 **Note:**

In the above screen, the secure port is 443.

If the HTTPS port is not exposed, then enable the configuration information highlighted in the following screen under the ingressgateway section of the values.yaml file.

Figure 5-17 Configuration Info under Ingressgateway

```
#Server Configuration for http and https support
#Server side http support
enableIncomingHttp: true
#Server side https support
enableIncomingHttps: false
#Client side https support
enableOutgoingHttps: false
```

- **IngressGateway Container is stuck in Init State/Failed:**The IngressGateway Container can stuck due to any one of the following reasons:
  - When config initssl is enabled under ingressgateway section of the values.yaml file.

Figure 5-18 config initssl

```
To Initialize SSL related infrastructure in init/update container
initssl: false
```

- If config initssl is enabled, then you need to check whether secrets are created with all required certificates. The following screenshot shows the commands that you need to execute to check whether secrets are present and have all the required data.

Figure 5-19 Commands to check Secrets

```
[root@master ocudr]# kubectl get secret -n ocudr
NAME TYPE DATA AGE
default-token-g75q7 kubernetes.io/service-account-token 3 13d
ocudr-secrets Opaque 4 3m35s
ocudr-serviceaccount-token-lwh8k kubernetes.io/service-account-token 3 2m44s
ocudrgateway-secret Opaque 7 43m
[root@master ocudr]# kubectl describe secret ocudrgateway-secret -n ocudr
Name: ocudrgateway-secret
Namespace: ocudr
Labels: <none>
Annotations: <none>

Type: Opaque

Data
====
apigatewayecdsa.cer: 1277 bytes
apigatewayrsa.cer: 1554 bytes
caroot.cer: 1858 bytes
ecdsa_private_key_pkcs8.pem: 241 bytes
key.txt: 15 bytes
rsa_private_key_pkcs1.pem: 1679 bytes
trust.txt: 17 bytes
```

- **Config-Server Container Stuck in Hooks Init State:** The UDR installation sticks in Hooks Init state when there is database connection failure.

Figure 5-20 Config Server Container Status

```
Every 2.0s: kubectl get pods -n myudr Wed Jun 17 05:20:20 2020
NAME READY STATUS RESTARTS AGE
ocudr-ocpm-config-pre-install-47mpc 0/1 CreateContainerConfigError 0 10m
```

## Debugging Notification Issues

If UDR does not generate any notification, check the notify service port configuration in the values.yaml file. These ports should be same as ports on which notify service is running.

```
nudr-drsservice:
...
...
...
 notify:
 port:
 http: 5001
 https: 5002
```

## Debugging Pod Creation Failure

A pod creation can fail due to various reasons. Some of the possible scenarios are explained below:

- **Verifying pod image correctness:** To verify pod image correctness:
  - Verify whether any of the pod is in ImagePullBackOff state.
  - To check whether the image name used for any pod is not correct, verify the values given below in the values.yaml file.

```
nudr-drsservice:
...
```

```

 image:
 repository: reg-1:5000/ocudr/
nuds_datarepository_service
 tag: 1.6.0

nuds-nrf-client-service:
...
 image:
 repository: reg-1:5000/ocudr/nrf_client_service
 tag: 1.6.0

nuds-notify-service:

...
 image:
 repository: reg-1:5000/ocudr/nuds_notify_service
 tag: 1.6.0

nuds-config:

...
 image:
 repository: reg-1:5000/ocudr/nuds_config
 tag: 1.6.0

nuds-config-server:

...
 image:
 repository: reg-1:5000/ocudr/ocpm_config_server
 tag: 1.6.0

```

- After updating the values.yaml file, execute the following command for helm upgrade:
 

```
helm upgrade <helm chart> [--version <OCUDR version>] --name <release> --namespace <ocudr-namespace> -f <ocudr_values.yaml>
```
- **Verifying Resource Allocation Failure:** To verify resource allocation failure:
  - Verify whether any of the pod is in Pending state. If it is there, execute the following command:
 

```
kubectl describe <nuds-drservice pod id> --n <ocudr-namespace>
```
  - Verify whether any warning on Insufficient CPU exists in the describe output of the respective pod. If it exists, it means there are insufficient CPU for the pods to start. You have to either fix the hardware issue or reduce the number of CPUs allotted to a pod in the values.yaml file.

```

nuds-drservice:
...
...
...
resources:

 limits:

```

```
 cpu: 3

 memory: 4Gi

 requests:

 cpu: 3

 memory: 4Gi

nuds-notify-service:
...
...
...

resources:

 limits:

 cpu: 3

 memory: 4Gi

 requests:

 cpu: 3

 memory: 4Gi

nuds-config:
...
...
...

resources:

 limits:

 cpu: 3

 memory: 4Gi

 requests:

 cpu: 3

 memory: 4Gi
```

```
nudr-config-server:
...
...
...

resources:

 limits:

 cpu: 2

 memory: 2Gi

 requests:

 cpu: 2

 memory: 512Mi

ingress-gateway:
...
...
...

resources:

 limits:

 cpu: 3

 memory: 4Gi

 requests:

 cpu: 3

 memory: 4Gi
```

- After updating the values.yaml file, execute the following command for helm upgrade:  
helm upgrade <helm chart> [--version <OCUDR version>] --name <release> --namespace <ocudr-namespace> -f <ocudr\_values.yaml>
- **Verifying SQL Exception Failures with nudr-prehook pod:**  
**nudr-prehook** pod is added as part of 1.7 release. It creates UDR DB along with the tables required. If it does not creates the DB, then to debug the pod failure perform the following steps:
  - Verify whether **helm install** command hangs for longer time or fails with BackOffLimit exceeded error.
  - Watch the **kubecttl get pods** command based on the release namespace.
  - Check whether **nudr-preinstall** pod is going to error state. This means the DB creation has failed or connection to DB is not successful.

- Execute the following command on logs:  
kubect1 logs <nudr-prehook pod id> --n <ocudr-namespace>
- Check the log output of the pods for any warning or SQL exceptions using above command continuously. If any warning or SQL exception is found, it means there is an issue with the SQL connection or the SQL Node. Examine each exception thoroughly to find the root cause.
- Verify the following information in the values.yaml file.

```
global:
 ...
 ...
 ...
mysql:
 dbServiceName: "mysql-connectivity-service.occne-infra" #This
 is a read only parameter. Use the default value.
 port: "3306"
```

- Ensure that the following service is available in the CNE.

**Figure 5-21 Service Availability in CNE**

```
[root@master ocudr]# kubect1 get svc -n occne-infra
NAME TYPE CLUSTER-IP EXTERNAL-IP PORT(S) AGE
mysql-connectivity-service ClusterIP 10.109.123.205 <none> 3306/TCP 3h49m
```

- Check whether kubernetes secrets are present. If secrets exist, then check its encrypted details like username, password and DB name. If these details does not exist, then update the secrets.
- After making any changes, execute the following command to upgrade helm.  
helm upgrade <helm chart> [--version <OCUDR version>] --name <release> --namespace <ocudr-namespace> -f <ocudr\_values.yaml>

For more details, you can refer to [Kubernetes Secret Creation - DBName, Username, Password and Encryption Key](#).

## Debugging UDR Registration with NRF Failure

UDR registration with NRF may fail due to various reasons. Some of the possible scenarios are as follows:

- **Verify pod status:** Verify whether all the pods are running or not. Ensure atleast one replica for each microservice is up and running. If it is not running, check for possible reasons. Once the issue resolves, UDR registers successfully with NRF.
- **Verify NRF url correctness:** Execute the following command to check the logs of the ocudr-nudr-nrf-client-service pod:  
kubect1 logs <nrf-client-service pod id> --n <ocudr-namespace>

If the logs state that the connection with NRF fails as shown below:

```
10:07:01.335 [scheduling-1] WARN
ocudr.udr.services.client.RestClient
- Got error response
{nfInstanceId=3fd8556a-7804-4abd-8143-640904042d89,
answerStr=java.net.UnknownHostException: ocnrf-
```

```

ingressgateway.mynrf.svc.cluster.local,
 response=<503,java.net.UnknownHostException: ocnrf-
ingressgateway.mynrf.svc.cluster.
local,[]>, nrfBaseUrl=http://ocnrf-
ingressgateway.mynrf.svc.cluster.local/nnrf-nfm/
v1/nf-instances, header={Content-Type=[application/json]},
uri=http://ocnrf-ingressgateway.mynrf.svc.cluster.local/nnrf-nfm/v1/
nf-instances/3fd8556a-7804-4abd-8143-640904042d89}

```

```

10:07:01.340 [scheduling-1] WARN
ocudr.udr.services.client.RestClient -
Got error response {answerStr=java.net.UnknownHostException: ocnrf-
ingressgateway.
mynrf.svc.cluster.local, headerMap={Content-Type=[application/
json]}, response=<503,
java.net.UnknownHostException: ocnrf-
ingressgateway.mynrf.svc.cluster.local,[]>,
profile={"nfInstanceId":"3fd8556a-7804-4abd-8143-640904042d89","nfTy
pe":"UDSF",
"nfStatus":"REGISTERED","fqdn":"ocudr-
ingressgateway.myudr.svc.cluster.local",
"udrInfo":{"supiRanges":[{"start":"1000000000

```

Then, verify the baseUrl used for NRF in the values.yaml file (as shown below), which is used for connection with NRF.

```

nudr-nrf-client-service:
...
...
...
 host:
 baseUrl: "http://ocnrf-ingressgateway.mynrf.svc.cluster.local/
nnrf-nfm/v1/nf-instances"

```

- **Verify UDR fqdn correctness:** Execute the following command to check the logs of the nrf-client-service pod:

```
kubectl logs <nrf-client-service pod id> --n <ocudr-namespace>
```

If the logs state that the FQDN used is not correct then the UDR registration with NRF fails. You need to check the FQDN used in the values.yaml file as follows:

```

nudr-nrf-client-service:
...
...
...
 fqdn: "ocudr-ingressgateway.myudr.svc.cluster.local"

```

This helps to connect with NRF.

- **Check for livenessProbeFailure:** Execute the following command to check the logs of the nrf-client-service pod.

```
kubectl logs <nrf-client-service pod id> --n <ocudr-namespace>
```

If the logs state that the livenessProbe failed, check for similar logs as shown below:

```
19:38:42.770 [scheduling-1] ERROR o.u.s.c.NRFRegistrationScheduler -
NFService liveness probe failed, ignore registration/update operation
{livenessProbeRetry=19}
```

```
19:39:12.772 [scheduling-1] WARN ocudr.udr.services.client.RestClient
- Got error response {answerStr=java.net.UnknownHostException:
nudr-drservice.myudr.svc.cluster.local: Temporary
failure in name resolution, uri=http://nudr-
drservice.myudr.svc.cluster.local:9000/actuator/health, url=http://
nudr-drservice.myudr.svc.cluster.local:9000/actuator/health,
headerMap=null, response=<503, java.net.UnknownHostException: nudr-
drservice.myudr.svc.cluster.local: Temporary failure in name
resolution,[]>}
```

In the values.yaml file, check the livenessProbeUrl, which is used for connection with NRF.

```
nudr-nrf-client-service:
...
...
...
 livenessProbeUrl: ""
```

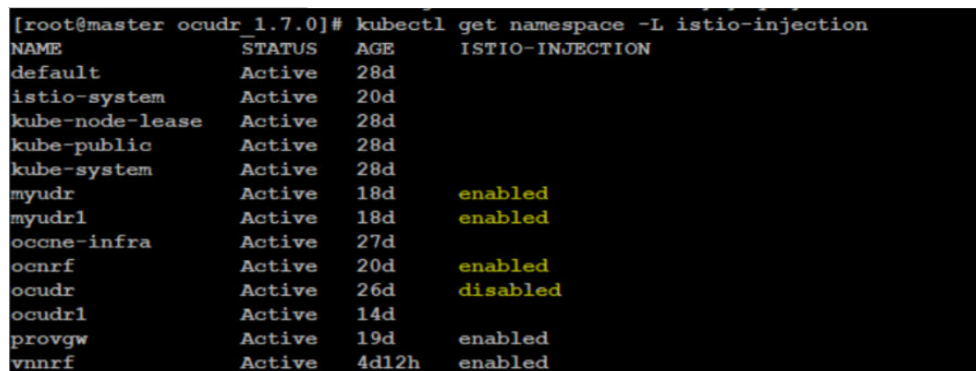

## Debugging UDR with Service Mesh Failure

There are some known failure scenarios that you may encounter while installing UDR with service mesh. The scenarios along with their solutions are as follows:

- **Istio-Proxy side car container not attached to Pod:** This particular failure arise when istio injection is not enabled on the NF installed namespace. Execute the following command to verify the same:

```
kubectl get namespace -L istio-injection
```

**Figure 5-22 Verifying Istio-Proxy**

```
[root@master ocudr 1.7.0]# kubectl get namespace -L istio-injection
NAME STATUS AGE ISTIO-INJECTION
default Active 28d
istio-system Active 20d
kube-node-lease Active 28d
kube-public Active 28d
kube-system Active 28d
myudr Active 18d enabled
myudr1 Active 18d enabled
ocne-infra Active 27d
ocnrf Active 20d enabled
ocudr Active 26d disabled
ocudr1 Active 14d
provgw Active 19d enabled
vnnrf Active 4d12h enabled
```

To enable the istio injection, execute the following command:

```
kubectl label --overwrite namespace <nf-namespace> istio-
injection=enabled
```

Other possible reason for this error could be that the below highlighted annotation is missing from the deployment.

**Figure 5-23 Global Section - Istio-Proxy Info**

```

 labels: {}
 annotations:
 sidecar.istio.io/inject: "\"true\""
 oracle.com/cnc: "\"true\""

```

You need to add the highlighted annotation as shown above to the global section for **lbDeployments** and **nonlbDeployments** parameters.

- **UDR registration with NRF failed:** This can be due to NF liveness probe failure. You can confirm this on `nudr-nrf-client-service` pod logs. In this case, you need to ensure that the management port of all UDR microservices are excluded from sidecar envoy usage. You have to configure proper port as suggested in the below annotation under `nudr-nrf-client-service` section.

**Figure 5-24 Annotation to Configure Port**

```

deployment:
 customExtension:
 labels: {}
 annotations:
 traffic.sidecar.istio.io/excludeOutboundPorts: "\"9000,9090\"" #Should be configured with the man
ports used for UDR microservices and actuatorPort used for IOB/IOB

```

- If there are issues in viewing UDR metrics on OSO prometheus then you have to add the annotation given below to all the deployments for the NF.

Figure 5-25 Annotation to View UDR Metrics

```

***** Sub-Section Start: Custom Extension Global Parameters *****
#*****
customExtension:
 allResources:
 labels: {}
 annotations:
 sidecar.istio.io/inject: "\"false\""

 lbServices:
 labels: {}
 annotations: {}

 lbDeployments:
 labels: {}
 annotations:
 sidecar.istio.io/inject: "\"true\""
 oracle.com/cnc: "\"true\""

 nonlbServices:
 labels: {}
 annotations: {}

 nonlbDeployments:
 labels: {}
 annotations:
 sidecar.istio.io/inject: "\"true\""
 oracle.com/cnc: "\"true\""
***** Sub-Section End: Custom Extensions Global Parameters *****
#*****

```

## Using Logs

The following table helps you to understand the logs you need to look into, to handle different UDR debugging issues:

| SNO | Scenarios                               | Pod                | Logs to be searched                                               | Log Level |
|-----|-----------------------------------------|--------------------|-------------------------------------------------------------------|-----------|
| 1   | Registration with NRF Successful        | nrf-client-service | Register completed successfully / "nfServiceStatus": "REGISTERED" | INFO      |
| 2   | Heartbeat message log                   | nrf-client-service | Update completed successfully                                     | INFO      |
| 3   | NRF configurations reloading            | nrf-client-service | NRF client config reloaded                                        | INFO      |
| 4   | Check for exiting NF Instance Entry     | nrf-client-service | No registered NF instance exists                                  | WARN      |
| 5   | Started Application                     | nrf-client-service | Successful application start                                      | INFO      |
| 6   | Started Application                     | nudr-drservice     | Successful application start                                      | INFO      |
| 7   | NRF Client Config Initialized           | nrf-client-service | Initialize NRF client configuration                               | INFO      |
| 8   | FQDN/BASEURL/ livenessProbeUrl Improper | nrf-client-service | response=<503.java.net.UnknownHostException                       | WARN      |

| SNO | Scenarios                                | Pod                | Logs to be searched                                  | Log Level |
|-----|------------------------------------------|--------------------|------------------------------------------------------|-----------|
| 9   | nudr-drservice liveness probe failure    | nrf-client-service | NFService liveness probe failed                      | WARN      |
| 10  | SQL Exception during start up            | nudr-drservice     | java.sql.SQLException                                | WARN      |
| 11  | DB connection pool Established           | nudr-drservice     | HikariPool-1 - Start completed                       | INFO      |
| 12  | Error Code Mapping configurations loaded | nudr-drservice     | Loaded Error Code Mapping Configuration              | INFO      |
| 13  | Error Code Mapping configurations loaded | nudr-drservice     | Loaded Error Reason Mapping Configuration            | INFO      |
| 14  | Error Code Mapping configurations loaded | nudr-drservice     | Loaded Error Title Mapping Configuration             | INFO      |
| 15  | Error Code Mapping configurations loaded | nudr-drservice     | Loaded Error Type Mapping Configuration              | INFO      |
| 16  | Check if Ports successfully listening    | nudr-drservice     | Undertow started on port(s)                          | INFO      |
| 17  | Check for message received               | nudr-drservice     | Before request [uri=<uri-sent excluding ip and port> | DEBUG     |
| 18  | Check for message processed              | nudr-drservice     | After request [uri=<uri-sent excluding ip and port>  | DEBUG     |
| 19  | URI Pattern not supported                | nudr-drservice     | None match pattern found for URL                     | WARN      |
| 20  | Check if Ports successfully listening    | nrf-client-service | Undertow started on port(s)                          | INFO      |
| 21  | Pod exit                                 | nudr-drservice     | HikariPool-1 - Shutdown completed                    | INFO      |
| 22  | DB username/ DB password invalid         | nudr-drservice     | Access denied for user                               | WARN      |
| 23  | Registration with NRF failed             | nrf-client-service | Register failed                                      | ERROR     |
| 24  | De registration with NRF successful      | nrf-client-service | Deregister completed successfully                    | INFO      |
| 25  | De registration with NRF failed          | nrf-client-service | Deregister failed                                    | ERROR     |
| 26  | NF Profile update failed                 | nrf-client-service | Update failed                                        | ERROR     |

# 6

## Uninstalling Unified Data Repository

To uninstall or completely delete the Unified Data Repository (UDR) deployment, execute the following command: `helm del --purge <helm_release_name_for_ocudr>`

 **Note:**

In case you are using helm3, execute the following command to uninstall UDR:

```
helm uninstall <helm_release_name_for_ocudr> --namespace
<ocudr_namespace>
```

# A

## ASM Specific Configuration

To configure ASM, you have to:

- Add the following annotation under **Global section** of UDR deployment.

```
***** Sub-Section Start: Custom Extension Global Parameters

#*****

global:
 customExtension:
 allResources:
 labels: {}
 annotations:
 sidecar.istio.io/inject: "\"false\""

 lbServices:
 labels: {}
 annotations: {}

 lbDeployments:
 labels: {}
 annotations:
 sidecar.istio.io/inject: "\"true\""
 oracle.com/cnc: "\"true\""

 nonlbServices:
 labels: {}
 annotations: {}

 nonlbDeployments:
 labels: {}
 annotations:
 sidecar.istio.io/inject: "\"true\""
 oracle.com/cnc: "\"true\""

***** Sub-Section End: Custiom Extensions Global Parameters

#*****

```

- Enable Service Mesh Flag under **ingressgateway section**.

```
ingressgateway:
 # Mandatory: This flag needs to set it "true" is Service Mesh
 would be present
```

```

where UDR will be deployed
serviceMeshCheck: true

```

- Change Ingress Gateway Service Type to ClusterIP under **ingressgateway** section.

```

ingressgateway:
 global:
 # Service Type
 type: ClusterIP

```

- Exclude actuator ports from Aspen Mesh to avoid traffic through side car. These ports are used as actuator ports (used for readiness/liveness checks) for Ingress Gateway and UDR microservices. The default actuator port (service.port.management) used for UDR microservices is 9000 and Ingress/Egress Gateway is 9090 (ingressgateway.ports.actuatorPort). If there is no change in default ports, you can use the annotation given below.

```

nudr-nrf-client-service:
 deployment:
 customExtension:
 labels: {}
 annotations:
 traffic.sidecar.istio.io/excludeOutboundPorts:
 "\"9000,9090\""

```

- Create a destination rule and service entry to enable MySQL connectivity service to establish a connection between UDR/SLF and NDB cluster. This is outside ASM. The sample templates are as follows:  
**Creating a Service for External MySQL instance**

```

apiVersion: v1
kind: Endpoints
metadata:
 name: mysql-connectivity-service-headless
 namespace: <ocudr-namespace>
subsets:
- addresses:
 - ip: <sql-node1-ip>
 - ip: <sql-node2-ip>
 ports:
 - port: 3306
 protocol: TCP

apiVersion: v1
kind: Service
metadata:
 name: mysql-connectivity-service-headless
 namespace: <ocudr-namespace>
spec:
 clusterIP: None
 ports:
 - port: 3306
 protocol: TCP

```

```

 targetPort: 3306
 sessionAffinity: None
 type: ClusterIP

apiVersion: v1
kind: Service
metadata:
 name: mysql-connectivity-service
 namespace: <ocudr-namespace>
spec:
 externalName: mysql-connectivity-service-headless.<ocudr-
namespace>.svc.cluster.local
 sessionAffinity: None
 type: ExternalName

```

### Creation of Service Entry and DestinationRule for External DB instance

```

apiVersion: networking.istio.io/v1alpha3
kind: ServiceEntry
metadata:
 name: mysql-external-se
 namespace: <ocudr-namespace>
spec:
 hosts:
 - mysql-connectivity-service-headless.<ocudr-
namespace>.svc.cluster.local
 ports:
 - number: 3306
 name: mysql
 protocol: MySQL
 location: MESH_EXTERNAL

apiVersion: networking.istio.io/v1alpha3
kind: DestinationRule
metadata:
 name: mysql-external-dr
 namespace: <ocudr-namespace>
spec:
 host: mysql-connectivity-service-headless.<ocudr-
namespace>.svc.cluster.local
 trafficPolicy:
 tls:
 mode: DISABLE

```
