Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un-000-127

sna-000-15

mna-000-31

bei (optional)

Broadcast exception indicator. This parameter specifies whether the STP broadcasts network management messages to adjacent signaling points.

Note

The network management messages contain information about the indicated cluster and any of that cluster's member signaling points that are on its exception list. The messages whose broadcast is determined by this parameter are:

- TFP—transfer prohibited
- TCP—transfer cluster prohibited
- TFA—transfer allowed
- TCA—transfer cluster allowed

Range:**yes**

Network management messages are not broadcast

no

Network management messages are broadcast

Default:

yes —If the DPC is a member whose associated cluster destination has *bei=yes* specified.

no —for DPCs in the cluster or if the DPC is a member whose associated cluster destination has *bei=no* specified or the *bei* parameter is not specified.

c1li (optional)

The Common Language Location Identifier assigned to this destination.

Range:

aaaaaaaaaaaa

1 alphabetic character followed by 10 alphanumeric characters

Default:

Null string

domain (optional)

The network in which the destination entity or node exists.

Range:

ss7

Default:

ss7

e1ei (optional)

Exception-list exclusion indicator, for cluster destinations only. This parameter specifies whether the system excludes or includes (maintains) a dynamic status exception list (x-list) for each cluster route used to reach the member signaling points that make up the cluster.

Range:**yes**

Do not maintain a dynamic status x-list

no

Maintain a dynamic status x-list

Default:

no

homescp (optional)

This parameter specifies whether the destination point code (DPC) is considered a Home SCP when performing SCCP processing for messages with no Global Title Address Digits (Global Title Indicator (GTI) is set to zero)

This parameter can only be set to "yes" for full DPCs.

Range:**yes**

the DPC is considered a Home SCP

no

the DPC is not considered a Home SCP

System Default:

no

homesmsc (optional)

This parameter specifies whether the DPC is considered a Home SMSC when performing SCCP processing for messages with no Global Title Address Digits (GTI is set to zero). This parameter can only be set to "yes" for full DPCs.

Range:**yes**

the DPC is considered a Home SMSC

no

the DPC is not considered a Home SMSC

System Default:

no

ncai (optional)

Nested cluster allowed indicator. Specifies whether the route to the cluster point code can be different for provisioned members of the cluster. A point code is a member of a cluster point code if it has the same network identifier (NI) and network cluster (NC) values as the cluster point code. This parameter can be specified only for cluster point codes. Nested cluster routing is allowed if this parameter is set to *yes* and the CRMD and NCR features are turned on.

Range:**yes**

The cluster point code is a nested cluster point code. Point codes that are members of this cluster point code can be assigned to route sets that are different from the route set assigned to the cluster point code.

no

The cluster point code is not a nested cluster point code. Point codes that are members of this cluster point code must be assigned to the same route set assigned to the cluster point code.

Default:

no

nprst (optional)

NM bits reset. This parameter specifies whether the NM bits should be set to 00. This parameter applies only to ITU IAM messages. The `nptype=nm` parameter must be specified (see the `chg-tifopts` command) before this parameter can be specified.

Range:**off**

Do not set NM Bits to 00 in an ITU IAM message if the TIFOPTS nptype option value is *nm*

on

Set the NM Bits to 00 in an ITU IAM message if the TIFOPTS nptype option value is *nm*

System Default:

off

ppc/ppca/ppci/ppcn/ppcn24/ppcn16 (optional)

Proxy point code.

The proxy point code must be a full point code.

ppc (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

The proxy point code must be a full point code.

Synonym:

ppca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

ppci (optional)

ITU international proxy point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

ppcn (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt1* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

ppcn24 (optional)

24-bit ITU national proxy point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

ppcn16 (optional)

16-bit ITU national proxy point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000-127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un-000-127

sna-000-15

mna-000-31

prx (optional)

Proxy point code indicator. This parameter specifies whether a destination is used as a proxy point code.

Range:

yes

The destination is used as a proxy point code.

no

The destination is not used a proxy point code.

Default:

no

Will not be used as a proxy point code.

rcause (optional)

Release cause. The condition that triggers the sending of a Release message.

Note

If the `r_lcopc` parameter is specified (see the `chg-tifopts` command), and a value of 0 - 127 is specified for the `rcause` parameter, then the `rcause` parameter value overrides the values specified for the TIFOPTS table's `rcausenp` and `rcausepfx` parameters.

Range:

0 - 127, *none*

none —use the values specified for the TIFOPTS table's `rcausenp` and `rcausepfx` parameters

System Default:

none

sccpmsgcnv (optional)

SCCP UDT(S)/XUDT(S) Message Conversion Indicator. The type of conversion performed on messages for the specified destination.

Range:

none

conversion is not required on messages for the destination

udt2xudt

convert all UDT(S) messages for the destination to XUDT(S) messages

xudt2udt

convert all non-segmented XUDT(S) messages for the destination to UDT(S) messages

sxudt2udt

convert all segmented and non-segmented XUDT(S) messages for the destination to UDT(S) messages

Default:

none

spc/spca/spci/spcn/spcn24/spcn16 (optional)

Secondary point code.

spc (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

spca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni* = 000 is not valid.

When `chg-sid:pctype=ansi` is specified, *nc* = 000 is not valid if *ni* = 001–005.

When `chg-sid:pctype=ansi` is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

spci (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

spcn (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

spcn24 (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

spcn16 (optional)

16-bit ITU national secondary point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* indicates a private point code (*prefix-un-sna-mna*).

Range:

p-, 000-127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p**un--000---127**sna---000---15**mna---000---31***splitiam (optional)**

This parameter specifies when and how to split an ITU IAM message into 1 IAM message + 1 SAM message.

This parameter applies only to ITU IAM messages.

Range:*15-31, none*

15-31 - Maximum number of CdPN digits allowed in the IAM message before splitting occurs. The remaining digits, up to a total of 32, are encoded in the SAM message.

none -the value specified for the TIFOPTS table's *splitiam* parameter is used to determine when to split the IAM message

System Default:*none***Example**

To add destination 8-1-1 with CLLI of systest1:

```
ent-dstn:dpc=8-1-1:clli=systest1:bei=yes
```

To add destination 8 with ITU and national aliases:

```
ent-dstn:dpc=8-8-8:aliasi=1-2-3:aliasn=124
```

To add cluster 20-2-*:

```
ent-dstn:dpc=20-2-*:elei=yes:bei=yes
```

To add a destination with an SPC of 100:

```
ent-dstn:dpc=20-2-2:spc=100-100-100
```

To add nested cluster 21-2-*:

```
ent-dstn:dpc=21-2-*:elei=yes:bei=yes:ncai=yes
```

To add network routing destination 21-*-*:

```
ent-dstn:dpc=21-*-*
```

To add ITU national destination 7654 with a group code of FR and secondary point code of 7050:

```
ent-dstn:dpcn=7654-fr:spc=7050-fr
```

To add ITU-N 24-bit destination 15-100-10:

```
ent-dstn:dpcn24=15-100-10:bei=no
```

To add a 24-bit ITU-N destination with a 24-bit ITU-N secondary point code of 99:

```
ent-dstn:dpcn24=12-12-12:spcn24=99-99-99
```

To add destination 1-6-1 with a 24-bit ITU-N alias:

```
ent-dstn:dpci=1-6-1:aliasn24=4-4-4
```

To add private ANSI destination point code p-100-100-101 with spare point code alias s-1-123-1:

```
ent-dstn:dpca=p-100-100-101:spca=2-2-3:aliasi=s-1-123-1:aliasn=128
```

To add spare ITU-I destination point code s-2-100-1 with ANSI alias point code 121-120-120 and ITU-N alias spare point code s-129:

```
ent-dstn:dpci=s-2-100-1:spci=s-2-129-9:aliasa=121-120-120:aliasn=s-129
```

To add spare ITU-N destination point code s-231 with ITU-N secondary point code 129, ANSI alias point code 120, and ITU-I alias spare point code s-2-123-2:

```
ent-dstn:dpcn=s-231:spcn=129:aliasa=120-120-122:aliasi=s-2-123-2
```

To define a destination as a proxy point code:

```
ent-dstn:dpc=11-11-11:prx=yes
```

To associate a proxy point code with a destination point code:

```
ent-dstn:dpc=11-11-11:ppc=2-7-2
```

To add ITU-I destination point code 3-30-3 with ITU-I spare alias s-3-30-3:

```
ent-dstn:dpci=3-30-3:aliasi=s-3-30-3
```

To add ITU-N destination point code 8199-aa with ITU-I aliases s-4-0-7 and 4-0-7:

```
ent-dstn:dpcn=8199-aa:aliasi=s-4-0-7,4-0-7
```

To add destination 11 with SCCPMSGCNV type as UDT2XUDT:

```
ent-dstn:dpc=11-11-11:sccpmsgcnv=udt2xudt
```

To add ITU-N 16-bit destination 121-10-5:

```
ent-dstn:dpcn16=121-10-5
```

Dependencies

Note

A full point code contains numerical values for all three segments of the point code.

The ANSI self-ID destination point code for the STP must be defined before ANSI destinations can be entered.

The ITU-I self-ID destination point code for the STP must be defined before ITU-I destinations can be entered.

The ITU-N self-ID or SPCN destination point code for the STP must be defined before ITU-N destinations can be entered.

The 24-bit ITU-N self-ID or SPCN24 destination point code for the STP must be defined before 24-bit ITU-N destinations can be entered. (See the `chg-sid` command.)

The Destination point code table can contain up to 2000 entries.

The destination address must be a full point code or a cluster point code.

The specified destination address cannot already exist in the Destination entity set.

A destination address cannot already be defined as an alias address.

The Spare Point Code Support feature must be enabled before the spare point code prefix (s-) can be specified for an ITU-I or ITU-N destination, secondary, or alias point code.

The specified dpc value cannot match the point code, secondary point code, or capability point code of the system.

A destination can have up to two alias point codes. A destination alias point code type (ANSI, ITU-I, ITU-N, ITU-N24) must not match that destination's true point code type. If both alias point codes are defined, the point code types of the aliases must not match.

Alias point codes are supported only for full point code destinations.

Alias point codes for destinations must be full point codes.

An alias point code cannot already be defined as a destination point code.

The format of the specified dpcn or aliasn parameter must match the format that was assigned with the chg-stpopts:npcfmti parameter.

If the 7000 Routesets or 8000 Routesets feature is enabled, then the total number of provisioned aliases in the system cannot exceed 8000. If the 10,000 Routesets feature is enabled, then the total number of provisioned aliases in the system cannot exceed 10000.

If an ANSI or ITU-I point code is specified, the aliasn or the aliasn24 parameter can be specified, but not both.

A 24-bit ITU-N point code cannot have:

- A 14-bit ITU-N alias point code
- An ANSI alias point code

A 24-bit ITU-National point code can have an ITU-I point code alias. This allows conversion of 14-bit ITU-I routing label to 24-bit routing label and vice versa.

An ITU-I point code can have either a 14-bit ITU-N alias or a 24-bit ITU-N alias, but not both.

A 14-bit ITU-N point code cannot have a 24-bit ITU-N alias point code.

An ANSI point code cannot have a 24-bit ITU-N alias point code.

The CRMD feature must be turned on before a cluster destination point code (ni-nc-*) can be specified.

A cluster destination cannot be defined using the same network identifier (ni) and network cluster (nc) subfields of any previously defined alias ANSI point codes.

The CRMD (Cluster Routing and Management Diversity) and NCR (Nested Cluster Routing) features must be turned on before the ncai parameter can be specified.

If the ncai=yes parameter is specified, then the maximum number of provisioned nested clusters must be no greater than 500.

When a cluster point code is specified, the collection of signaling points sharing the same network identifier (ni) and network cluster (nc) subfields must have the same route set.

Cluster DPCs are not allowed to inherit cluster members that have routes with A or E linkset types.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

When using network routing, if the destination point code has a value of * in the *nc* subfield, the *ncm* subfield must also be * (e.g., *dpc=21-*-**).

The *nci* parameter can be specified only for cluster destinations.

Alias ANSI point codes cannot have the same network identifier (*ni*) and network cluster (*nc*) subfields as a cluster point code that is already defined.

The CRMD feature must be turned on before the *elei* parameter can be specified.

The *elei* parameter can be specified only for cluster destinations (e.g., *dpc=ni-nc-**).

The CLLI of the destination point code cannot match the CLLI of the system.

A reserved word cannot be specified for the destination identifier (*clli*).

If the corresponding destination for the specified destination point code is an adjacent signaling point (matched a Far End point code in its linkset entity set), the CLLI of the specified destination point code cannot be assigned to any other destination address.

The value of the *dpc* parameter must be a valid point code.

If specified, the *spc* parameter value must be already be configured as a secondary point code in the Secondary Point Code table.

The value specified for the *spc* parameter must be a full point code.

If the *spc* parameter is specified, the *domain=ss7* parameter must be specified.

If the *spc* parameter is specified, then the value specified for the *dpc* parameter must be a full point code.

The network type of the value specified for the *spc* parameter must match the network type of the value specified for the *dpc* parameter.

If an ITU national destination is provisioned and the ITUDUPPC feature is turned on, and if the destination does not use an SPC, the group code of the destination must be the same as the group code of the ITU national true point code.

For example, if the ITU national true point code has a group code of *ee*, then you can add destinations with group codes of *ee* without using an SPC. Destinations with a group code of *ff*, however, must use an SPC with a group code of *ff*.

The Route table cannot be full.

If an ITU national destination is provisioned and the ITUDUPPC feature is turned on, and if the destination uses an SPC, then the group code of the destination must match the group code of the SPC.

For example, if the ITU national true point code has a group code of *ee*, then you can add destinations with group codes of *ee* without using an SPC. Destinations with a group code of *ff*, must use an SPC with a group code of *ff*.

The *nci* parameter can be specified only for cluster destinations (for example (*dpc=ni-nc-**)).

The value of the *clli* parameter cannot already exist in the Route table.

The ICNP feature must be turned on before the *icnpxlat*, *cgpafmt*, and *cdpafmt* parameters can be specified.

The NCR feature must be enabled before the *nci* parameter can be enabled.

The MAS configuration table is corrupt or cannot be found.

The route table is corrupt or cannot be found.

If the 6000 Routesets feature is turned on, and the destination point code to be provisioned is above 5000, then the GPSM-II OAM cards must be used.

The `alias` parameter must be specified with a different point code type than the `dpc` parameter.

The `aliasa` and `dpca` parameters cannot be specified together in the command. The `aliasi` and `dpci` parameters and the `aliasn` and `dpcn` parameters cannot be specified together in the command if the *prefix* subfields are the same (both are spare or both are non-spare).

The Proxy Point Code feature must be enabled before the `prx=yes` parameter can be specified.

The Proxy Point Code feature must be enabled before the `ppc` parameter can be specified.

If the `ppc` parameter or the `prx=yes` parameter is specified, then the value specified for the `dpc` parameter must be a full point code.

The `spc` and `ppc` parameters cannot be specified together in the command.

The values specified for the `dpc` and `ppc` parameters must have the same network type.

The values specified for the `dpc` and `ppc` parameters must have the same group code.

The number of proxy destinations cannot exceed the value given by the enabled Proxy Point Code quantity feature.

If the value of the `dpc` parameter is a private point code, then the `prx=yes` parameter cannot be specified.

If the value of the `dpc` parameter is a private point code, then the `ppc` parameter cannot be specified.

The `dpc` parameter and the `prx=yes` parameter must be specified before the `ppc` parameter can be specified.

The total number of proxy destinations cannot exceed the total capacity (100) of the Proxy Point Code feature.

The `prx` parameter must have a value of *yes* or *no*.

Cluster destination point codes cannot inherit cluster members that have routes using proxy linksets.

The spare ITU-I self-ID destination point code for the STP must be defined before spare ITU-I destinations can be entered.

The spare ITU-N self-ID destination point code for the STP must be defined before spare ITU-N destinations can be entered.

A maximum of two aliases can be specified per destination point code.

If the `dpci` parameter is specified, then a combination of ITUI and ANSI aliases cannot be specified. If the `dpcn` parameter is specified, then a combination of ITUN and ANSI aliases cannot be specified.

Two ITUI or two ITUN aliases can be specified for the same destination point code only if the aliases have different prefixes. One alias must be spare and one non-spare.

The TIF Number Portability feature must be enabled before the `rcause` or `nprst` parameter can be specified.

A TIF feature must be enabled before the `splitiam` parameter can be specified.

The XUDT UDT Conversion feature must be turned on before the `sccpmsgcnv` parameter can be specified.

The value specified for the `ppc` parameter must already exist in the DSTN table and the `prx=yes` parameter must be assigned.

ITU-N16 destination cannot be provisioned if ITU-N16 site id is not provisioned.

The J7 Support feature must be enabled before the `aliasn16` parameter can be specified.

If the J7 Support feature is enabled then the `aliasa` and `aliasn24` parameters cannot be specified.

Spare point codes for `aliasn 1` and `aliasn 2` must be different, and spare point codes for `aliasi 1` and `aliasi 2` must be different.

Notes

Upon initial installation of the system, the self point code must be entered before you enter any destination.

When you define a DPC with the unique destination signaling point of a provisioned cluster, the DPC automatically inherits the route set of its cluster if the `ncai=no` parameter is specified. If the `ncai=yes` parameter is specified, the provisioned members can have a different route set.

When you define a cluster point code for previously defined destination signaling points, the cluster automatically inherits the unique route set of its members.

For ITU national duplicate point codes, you cannot change a destination's group code. To move a destination from one group to another, provision a new destination that uses the new group code and delete the old destination.

The system requires that the destination point code of each routeset be entered in the database. For example, to enter 6000 routesets in the database, 6000 destination point codes must be entered in the database.

If you have turned on the 5000 Routes feature, prior to provisioning the additional routing table entries, you must issue the `chg-stpopts` command to specify the maximum number of allowed DPCs and dynamic x-list entries.

If the 6000, 7000, 8000, or 10,000 Routesets feature is enabled, then in order to enter more than 2000 destination point codes, the maximum number of point codes that can be configured on the system must be changed to 6000, 7000, 8000, or 10000 respectively, using the `mtdpdcq` parameter of the `chg-stpopts` command.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (s-). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-). Aliases do not support the private (internal) point code prefix.

If the Proxy Point Code feature is enabled, then the value specified for the `ppc` or `dpc` parameter (when the destination point code is designated as a proxy point code) must be full point codes. Cluster point codes and private point codes are not supported.

One of `dpc/dpci/dpci/dpcn/dpcn24/dpcn16` is mandatory and they are mutually exclusive.

Only one of aliasa/aliasi/aliasn/aliasn24/aliasn16 can be specified as they are mutually exclusive.

Only one of spc/spca/spci/spcn/spcn24/spcn16 can be specified as they are mutually exclusive.

Output

This example shows the output with the NCR, NRT, and CRMD features off and all Routes and Routesets features off:

```
ent-dstn:dpc=8-8-8:aliasi=1-2-3:aliasn=124
```

```
rlghncxa03w 04-08-17 15:35:05 EST EAGLE 31.8.0
Destination table is (10 of 2000) 1% full
Alias table is (8 of 12000) 1% full
ENT-DSTN: MASP A - COMPLTD
;
```

This example shows the output with the NCR, NRT, and CRMD features off and the DSTN5000 (5000 Routes) feature on:

```
ent-dstn:dpc=8-8-8:aliasi=1-2-3:aliasn=124
```

```
rlghncxa03w 04-08-18 08:29:15 EST EAGLE 31.8.0
Destination table is (10 of 5000) 1% full
Alias table is (8 of 12000) 1% full
ENT-DSTN: MASP A - COMPLTD
;
```

This example shows the output with one or more of the NCR, NRT, or CRMD features on and the DSTN5000 (5000 Routes) feature on:

```
ent-dstn:dpc=8-8-8:aliasi=1-2-3:aliasn=124

ent-e1

Use this command to enter an interface into the system for E5-E1T1-B or SLIC cards used as an E1 or SE-HSL cards.

Any of the 8 ports can be specified when the card is used as a standard E1 card. No more than 2 ports on the E5-E1T1-B and no more than 3 ports on the SLIC can have defined E1 interfaces as HSL.

Parameters

e1port (mandatory)

E1 card port number. The value must be an E1 port for which an interface has not been configured on the specified E1 card.

Range:

1 - 8

Any 2 of the 8 ports on an E5-E1T1-B card can be specified when the card is used as an SE-HSL card.

Any 3 of the 8 ports on an SLIC card can be specified when the card is used as an SE-HSL card.

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

crc4 (optional)

CRC4 enable or disable indicator.

Range:

on

off

Default:

on

encode (optional)

Indicator for use of HDB3 or AMI encoding/decoding.

Range:

hdb3

ami

Note

AMI encoding is supported for cards that are used as E1 cards (not as SE-HSL cards).

Default:

hdb3

Linkclass (optional)

Link class for links that are assigned to E1 cards ("channelized" links) or SE-HSL cards ("unchannelized" links).

Range:

chan

unchan

Default:

chan

minsurate (optional)

Minimum signal unit rate. The minimum number of SUs present on a link uniformly distributed. This parameter is valid only when the `linkclass=unchan` parameter is specified for an SE-HSL card.

Range:

500 - 2000

Default:

1000

si (optional)

Value of two Spare International bits of NFAS data.

Range:

0 - 3

Default:

0

sn (optional)

Value of five Spare International bits of NFAS data.

Range:

0 - 31

Default:

0

t1tsel (optional)

Timing source.

Range:

line - slave timing source

external - master timing source

Default:*line***Example**

```
ent-e1:loc=1205:e1port=1:crc4=off:encode=hdb3:si=2:sn=12
```

```
ent-e1:loc=1205:e1port=2:encode=ami
```

```
ent-
```

```
e1:loc=1203:crc4=on:e1port=2:encode=hdb3:linkclass=unchan:minsrate=2000
```

```
ent-e1:loc=1205:e1port=1:crc4=off:encode=hdb3:e1tsel=external:si=2:sn=12
```

```
ent-e1:loc=1205:e1port=1:crc4=off:encode=hdb3:e1tsel=line: si=2:sn=12
```

Dependencies

The card location specified by the `loc` parameter must be equipped.

The card specified by the `loc` parameter must be an LIME1 card type.

The E1/T1 table is corrupt or cannot be found.

The Card (IMT) table is corrupt or cannot be found.

The port specified by the `e1port` parameter cannot already be equipped with an E1 interface.

The `minsrate` parameter can be specified only when the `linkclass=unchan` parameter is specified.

Only 2 ports can be used for E1 interfaces on an E5-E1T1-B or SLIC card that is used as an SE-HSL card. Any 2 of the 8 ports can be used on the SE-HSL card.

The shelf FAN bit must be turned ON for the shelf on which an E5-E1T1-B or SLIC card is being used as an E1 or SE-HSL card.

HIPR2 cards must be equipped in card locations `xy09` and `xy10` (`x` is the frame, `y` is the shelf) on each EAGLE shelf that contains one or more E5-E1T1-B or SLIC cards that are used as E1 or SE-HSL cards.

An SE-HSL feature quantity must be enabled before the `linkclass=unchan` parameter can be specified for an SE-HSL card.

Channelized and unchannelized E1 ports (mixed mode) are not allowed on a single card (the card cannot be used as an E1 card and an SE-HSL card at the same time).

Card locations 1113 - 1118 (E5-MASP and E5-MDAL cards) cannot be specified as values for the `loc` parameter.

The `encode=ami` parameter is supported only for cards used as E1 cards (not as SE-HSL cards).

Locations `xy09` and `xy10`, where `x` is the frame and `y` is the shelf, cannot be specified as values for the `loc` parameter.

Notes

One or two E1 interfaces must be defined on an E1 card after the E1 card type (LIME1) is defined in the database (see the `ent -card` command), and before the signaling links and associated timeslots are defined for the E1 card (see the `ent -slk` command).

External timing is derived from the EAGLE High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Up to 8 E1 interfaces can be defined on a card used as an E1 card after the E1 card type (LIME1) is defined in the database (with the `ent -card` command), and before the signaling links and associated timeslots are defined for the E1 card.

For an SE-HSL card, the `minsrate` parameter indicates the least number of SUs present on a link uniformly distributed. The number of SUs present is the `minsrate` parameter value (without link traffic) or the `minsrate` parameter value minus the number of MSUs (with link traffic).

Output

```
ent-e1:loc=1205:e1port=1:crc4=off:encode=hdb3:si=2:sn=12
```

```

ent-enum-acl

Use this command to make an entry in the ENUM Access Control List (ACL) Table. The ENUM ACL Table supports the provisioning information related to the allowed IP Addresses for the ENUM application.

Parameters

ipaddr (mandatory)

This is a TCP/IP address expressed in standard dot notation. It specifies allowed IP addresses for the ENUM application.

Range:

Four numbers separated by dots, with each number in the range of 0-255, *.

Note

It also supports wildcard characters as follows:

```
xxx.xxx.xxx.*
xxx.xxx.*.*
xxx.*.*.*
```

where xxx can be any number in range of 0-255.

*for octet 1 xxx can be any number in range of 1-223.

System Default:

0.0.0.0

Example

```
ent-enum-acl:ipaddr=10.248.13.9
ent-enum-acl:ipaddr=10.248.13.*
ent-enum-acl:ipaddr=10.248.*.*
ent-enum-acl:ipaddr=10.*.*.*
ent-enum-acl:ipaddr6="2003:db8::*"
ent-enum-acl:ipaddr6="2004:1234:abcd::3456:abc6"
ent-enum-acl:ipaddr6="2005:*:*:*:*:*:*:*"
```

Dependencies

The ENUM ACL Table should be accessible.

An overlapping IP Address cannot be provisioned in the ENUM ACL Table.

The IP Address specified by the IPADDR parameter must be a valid IP address.

A maximum of 100 IP addresses can be defined in the ENUM ACL Table.

The IP address specified by the IPADDR parameter must be unique.

Notes

Wildcard IP addresses are allowed to support the ranges of IP addresses.

Output

```
ent-enum-acl:ipaddr=10.248.13.*

tekelecstp 14-05-28 15:04:28 EST EAGLE 46.1.0
ent-enum-acl:ipaddr=10.248.13.*
Command entered at terminal #4.

ent-enum-prof

Use this command to configure the data used to generate the ENUM response for three supported resource record formats such as NAPTR, NS and CNAME. The ENUM Profile Table is used to configure the resource record data.

Parameters

prn (mandatory)

Profile name. This parameter specifies the unique logical name assigned to the profile entry used to generate the ENUM response.

Range:

zzzzzzzzzz

A string of alphanumeric characters, beginning with a letter and up to 10 characters in length. Valid values are a..z, A..Z, 0..9.

rtrype (mandatory)

Response type. This parameter specifies the response type for the profile. It identifies the profile used to generate the ENUM response for each resource record type.

Range:

naptr

cname

ns

Default:

No change to the current value

System Default:

naptr

pref (optional)

Preferred Response. This parameter will decide the values for the Order and Preference fields to be encoded for each NAPTR resource record. The values of these fields are only applicable when there are two NAPTR resource records in the ENUM response. This parameter is only valid for the NAPTR response type.

Range:

yes

no

Default:

No change to the current value

System Default:

No

rpdomain (optional)

Replacement domain name. This parameter specifies the domain name present in the replacement field of the NAPTR record, the domain name of the name server in the NS

record, and the Canonical Name of the domain server in the CNAME record. This parameter is valid for all three response types.

Range:

ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ

A string of characters, beginning with a letter and comprising up to 32 characters in length. Valid values are (0-9, A-Z, a-z), . (period), - (hyphen).

rrdomain (optional)

Domain name present in regular expression. This parameter specifies the domain name used in SIP URI for both ported and non-portable numbers. This parameter is only valid for the NAPTR response type.

Range:

////////////////////////////////////

A string of characters, beginning with a letter and comprising up to 32 characters in length. Valid values are (0-9, A-Z, a-z), . (period), - (hyphen).

sparm (optional)

Service parameter. This parameter specifies the supported ENUM services. The ENUM application shall only support three ENUM services.

Range:

pstntel

pstnsip

sip

Default:

No change to the current value

System Default:

pstntel

prefix (optional)

This parameter specifies the prefix digits to be appended as routed number (RN) in NAPTR regex response. This parameter is only valid for NAPTR response type.

Range:

0 - ffffff

Upto 5 hexa-decimal digits allowed.

Default:

No change to the current value

System Default:

None

Example

```
ent-enum-prof:prn=pr1:rtype=naptr:rrdomain=abc.oracle.com:sparm=sip
```

ent-enum-
prof:prn=pr2:rtype=naptr:rrdomain=abc1.oracle.com:pref=yes:sparm=sip

```

ent-enum-prof:prn=pr3:rtype=ns:rpdomain=def.oracle.com
ent-enum-prof:prn=pr4:rtype=cname:rpdomain=cname.123
ent-enum-prof:prn=pr5:rtype=naptr:rrdomain=abc2.oracle.com:sparm=sip
ent-enum-
prof:prn=pr6:rtype=naptr:rrdomain=sr71.blackbird.com:sparm=pstnsip
ent-enum-prof:prn=prof1:sparm=pstntel:rtype=naptr
ent-enum-prof:rtype=naptr:
prn=pr7:sparm=sip:rrdomain=a.b.com :prefix=7

```

Dependencies

The ENUM Profile Table should be accessible.

The domain name for regular expression (RRDOMAIN) can be specified only with RTYPE=NAPTR.

For RTYPE=NS or CNAME, the replacement domain name (RPDOMAIN) must be specified.

The SPARM, PREF and RRDOMAIN parameters are valid only for RTYPE=NAPTR.

The RRDOMAIN parameter is valid for SPARM=SIP or SPARM=PSTNSIP.

A unique profile name must be specified for a new profile.

A maximum of 1024 entries can be provisioned in the ENUM Profile Table.

The RRDOMAIN parameter must be specified with either SPARM=SIP or SPARM=PSTNSIP.

A profile name of "none" cannot be specified.

Notes

The requirement of using PREFIX in the regular expression is only for PSTN-SIP (NAPTR query). As such, PREFIX will not be applied for PSTN-TEL and SIP (NAPTR queries).

PREFIX can be configured for PSTN-TEL and SIP profiles, but it will not be used.

Range:

zzzzzzzzzz

A string of alphanumeric characters, beginning with a letter and with a maximum length of 10 characters. Valid values are a..z, A..Z, 0..9.

Note

Response type of specified profile must be NAPTR

sdn (optional)

Start Dialed Number

Range:

5-15 digits

Example

```
ent-enum-  
profsel:entityid=12345:prn1=ns1:prn2=cname1:prn3=naptr1:prn4=naptr2
```

```
ent-enum-  
profsel:sdn=12345:edn=12400:prn1=ns1:prn2=cname1:prn3=naptr1:prn4=naptr2
```

Dependencies

The ENUM Profile Selection Table should be accessible.

The ENUM DN Block Table should be accessible.

The ENUM Profile Table should be accessible.

Either ENTITYID or SDN and EDN must be specified.

ENTITYID cannot be specified with SDN or EDN.

At least one profile must be specified.

The profile name specified by the prnX (x=1,2,3,4) parameter must be provisioned in the ENUM Profile Table.

SDN and EDN digit length must be the same.

EDN must be greater than or equal to SDN.

The response type specified by profile name prn1, prn2, prn3 and prn4 should be NS, CNAME, NAPTR and NAPTR respectively.

The entity ID value must be unique in the ENUM Profile Selection Table.

NAPTR profile names must be unique.

A maximum of 1024 entries can be provisioned in the ENUM Profile Selection Table.

A maximum of 1024 entries can be provisioned in the ENUM DN Block Table.

The SDN and EDN cannot already be provisioned in the ENUM Profile Selection Table.

The default profile cannot be associated with any profile selection entry.

If SDN is specified then EDN must be specified or vice-versa.

Overlapping SDN and EDN cannot already be provisioned in the ENUM DN Block Table.

Notes

Response type specified by profile name prn1, prn2, prn3 and prn4 should be NS, CNAME, NAPTR and NAPTR respectively.

Entity Id and SDN/EDN are mutually exclusive.

SDN must be specified with EDN and vice-versa.

Output

This example displays output when entity id specified:

```
ent-enum-
profsel:entityid=1234:prn1=ns1:prn2=cname1:prn3=naptr1:prn4=naptr2
```

```
tekelecstp 14-05-28 15:04:28 EST EAGLE 46.1.0
ent-enum-
profsel:entityid=1234:prn1=ns1:prn2=cname1:prn3=naptr1:prn3=naptr2
Command entered at terminal #4.
ENT-ENUM-PROFSEL: MASP A - COMPLTD
;
```

This example displays output when SDN and EDN specified:

```
ent-enum-
profsel:sdn=12345:edn=23456:prn1=ns1:prn2=cname1:prn3=naptr1:prn4=naptr2
```

```
tekelecstp 14-05-28 15:04:28 EST EAGLE 46.1.0
```

```
ent-enum-  
profsel:sdn=12345:edn=23456:prn1=ns1:prn2=cname1:prn3=naptr1:prn3=naptr2  
Command entered at terminal #4.  
ENT-ENUM-PROFSEL: MASP A - COMPLTD  
;
```

ent-frm-pwr

Use this command to add a new entry to the Frame Power Threshold (FPT) table. The frame-level power threshold value in the table is compared with the current calculated maximum power consumption for a particular frame, and appropriate alarms are raised if that consumption exceeds the threshold limit.

The entries in the Frame Power Threshold table contain a Frame ID and the corresponding power threshold value. You can use the following commands to display the threshold and calculated maximum power consumption for the frames in the system.

- The `rtrv-frm-pwr` command displays the current provisioned frame power threshold for each provisioned frame.
- The `rtrv-stp:display=power` command displays the provisioned frame power threshold for each provisioned frame, and displays the maximum calculated power consumption for each frame, based on card population.
- The `rtrv-stp:display=power:frm=xxxx` command displays the provisioned frame power threshold for the specified frame, the maximum calculated power consumption for the frame based on card population, and the maximum power consumption for each card in the frame and for a fan assembly for each shelf.

Note

The frame-level power threshold value needs to be determined from the capacity in Amps of the fuse alarm panel (FAP) for the frame. Contact your site engineer to determine the FAP capacity.

Parameters

frm (mandatory)

Frame ID.

Range:

cf00

Control frame

ef00

First extension frame

ef01

Second extension frame

ef02

Third extension frame

ef03

Fourth extension frame

ef04

Fifth extension frame

thrshld (optional)

Threshold. The frame-level power threshold value, in Amps. This value is compared with the current calculated maximum power consumption for a particular frame (use the `rtv-stp:display=power:frm=` command to obtain the maximum power consumption value), and the appropriate alarms are raised if current consumption exceeds the threshold limit. The value of the `thrshld` parameter needs to be determined from the capacity of the fuse alarm panel (FAP) for the frame. Contact your site engineer to determine the frame FAP capacity.

Range:

30 - 65

Default:

30

Example

Enter the frame power threshold value for the first extension frame.

```
ent-frm-pwr:frm=ef00:thrshld=55
```

Dependencies

A valid value must be specified for the `frm` parameter.

The valid range for the `thrshld` parameter is 30-65 Amps.

The specified power threshold value (`thrshld` parameter) cannot already be provisioned for the specified frame.

The specified frame (`frm` parameter) must be a provisioned frame.

The Frame Power Threshold table must be accessible.

Notes

The maximum calculated power for a frame is based on the cards that are populated in the system, and includes a fan tray assembly for every shelf (the system cannot detect the presence or absence of a fan tray, and assumes presence for the calculation). These values are typically much higher than the actual power being drawn; the values cannot be used as a gauge of the actual power consumption of the EAGLE.

Output

```
ent-frm-pwr:frm=ef00:thrshld=55
```

```
tekelecstp 06-04-11 15:18:41 EST EAGLE 35.0.0

ent-ftp-serv

Use this command to write an entry into the FTP Server table for an FTP Server.

① Note

The FTP Server table entry for the Oracle Communications EAGLE FTP Table Base Retrieval (FTRA) is entered through input from FTRA. Though the entry can be made with this command at the EAGLE, the information entered at the EAGLE will be overwritten by the information sent by FTRA.

Parameters

app (mandatory)

Application. This parameter specifies the FTP Client application that interfaces with the FTP server.

Range:

db

Database Backup\Restore application

dist

EAGLE Software Release Distribution application

meas

Measurements Platform application

sflog

SS7 Firewall Logging application

user

Oracle Communications EAGLE FTP Table Base Retrieval (FTRA)

secu

EAGLE seculog report transfer application

ipaddr (mandatory)

IP Address of the FTP Server.

login (mandatory)

FTP Server Username (A prompt for entering a password appears on a separate line.)

Range:

zzzzzzzzzzzzzzzzzzzz

1 to 15 alphanumeric characters; mixed-case is allowed

path (mandatory)

FTP path used to locate the file that will be sent.

Range:

zzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzz (up to 100)

Up to 100 characters; mixed-case string in double quotes with valid FTP path format

prio (mandatory)

Priority of this FTP server when there is more than one FTP Server for this application.

Range:

1 - 10

security (optional)

The parameter specifies whether the FTP connection is secure or not.

Range:

on

Set the FTP connection to be secure.

off

Set the FTP connection to be unsecure.

System Default:

on

Example

```
ent-ftp-  
serv:app=meas:ipaddr=1.255.0.102:login=ftpmeas1:path=~meas":prio=1
```

```
ent-ftp-  
serv:app=user:ipaddr=1.255.0.102:login=tekpersion1:path=~\data":prio=1
```

```
ent-ftp-serv:app=dist:ipaddr=192.168.53.195:
```

```
login=pvftp:prio=1:path="/remote/labftp1/pvftp/dallen2ftp"
```

ent-ftp-serv:app=db:ipaddr=192.168.53.195:

```
login=pvftp:prio=1:path="/remote/labftp1/pvftp/aholden"
```

```
ent-ftp-serv:ipaddr=10.248.13.9:app=meas:login=root:path="/  
root":prio=5:security=on
```

```
ent-ftp-serv:ipaddr=10.248.13.9:app=sflog:login=root:path="/  
root":prio=1:security=on
```

```
ent-ftp-serv:ipaddr=10.75.140.252:app=secu:prio=5:login=pv105:path="/  
export/ho  
me/mgtsusers/pv105/aft"
```

Dependencies

A separate prompt appears for you to enter the FTP server password that will be used with the FTP Server Username (login). You must enter a password that is at least 1 and not more than 20 characters long. If you enter an invalid password (you press the Return key without entering a password, or you enter more than 20 characters), you must enter the entire command again to cause the password prompt to appear again. The password that you enter is not displayed as you enter it.

An entry for the specified application ID at the specified priority cannot already exist.

An entry for the specified application ID at the specified IP address cannot already exist.

The app parameter must specify an application that uses the FTP Support feature.

The ipaddr parameter must specify a valid IP address for the FTP server.

The path parameter value must be in a valid FTP path format.

The prio parameter specifies a priority for use of an FTP server by an application when the application has more than one FTP server defined in the table. Each FTP server defined for use by the application must have a priority from 1 to 10 assigned. The available FTP server with the highest priority (smallest number) will be used first by the application.

The FTP Server table can contain entries for a maximum of 10 FTP servers: however, the number of FTP servers supported by an application may be less than 10. Entries that are made for an application cannot be made for more than the maximum number of FTP servers supported by the application.

- The Measurements Platform application (app=meas) supports 3 FTP servers.
- The FTP-based Table Retrieve Application (FTRA) (app=user) supports 2 FTP servers.
- The Database (app=db) and Software Distribution (app=dist) applications each support 1 FTP server.
- The SS7 Firewall Logging application (app=sflog) supports 2 FTP servers.
- EAGLE seculog report transfer application (app=secu)_ supports 1 FTP server

The security parameter must be set with value ON when the SS7 Firewall Logging application (app=sflog) is configured.

Notes

The same FTP server can be defined more than once, but the specified application must be different for each entry.

The FTP connection will be secure when the security parameter is ON. The secure FTP connection (SFTP) uses port 22, which must be opened in the customer's network.

Output

```
ent-ftp-
serv:app=meas:ipaddr=1.255.0.102:login=ftpmeas1:path=~meas":prio=1
```

```

ent-gen-name

Use this command to add a generic name into the database.

Parameters**gname (mandatory)**

Generic name. Each Generic name must be unique in the system. Maximum 15 characters can be provisioned. Valid values are (0-9, A-Z), *, SPACE, all special characters.

Range:

ZZZZZZZZZZZZZZZZ

ZZZZZZ

ZZZ*

***ZZZ**

ZZ*ZZ

ZZ

settype (mandatory)

Set Type. Set to which generic name belong.

Range:

SetA

SetB

Both

None

Example

Add generic name POLICE with settype BOTH:

```
ent-gen-name:gname="POLICE":settype=BOTH
```

Add generic name HOSP* with settype SETB:

```
ent-gen-name:gname="HOSP*":settype=SETB
```

Add generic name *ICE with settype SETA:

```
ent-gen-name:gname="*ICE":settype=SETA
```

Add generic name EOC CANADA with settype NONE:

```
ent-gen-name:gname="EOC CANADA":settype=NONE
```

Dependencies

Missing mandatory parameter

Generic name entered is invalid i.e. Generic name in following format is restricted:

- Name with more than two ASTERIK(*) i.e. zz*zz*zz*zz
- Two consecutive ASTERIK(*) i.e. zzz**zz
- Two ASTERICK(*) if they are not at extremes i.e. zz*zz*

Unable to read generic name table

Subset or Superset of the generic name entered already exist in the database

Generic name table is full

Notes

Maximum 5000 unique generic name can be provisioned.

The generic name supports wildcarding using ASTERIK (*)

If gname="*" is provisioned as first entry than no more generic name can be configured. Also gname="*" cannot be configured, if atleast one entry is already provisioned.

Output

```
ent-gen-name:gname="hosp*":settype=both
```

```
tekelecstp 19-10-04 02:44:06 EST  EAGLE 46.9.0.0.0-76.4.0

ent-gserv-data

Use this command to enter translation type, originating point code, or global title address data in the GSERV table. These values are used to determine whether a Send Routing Information

(SRI) request should receive G-Port SRI Query for Prepaid service or normal G-Port SRI service.

Parameters

① Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

gta (optional)

Global title address. Use this parameter to specify a calling party (CgPA) global title address.

Range:

1 - 21 digits

opc (optional)

ANSI originating point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*.

Synonym:

opca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code 000-000-000 is not a valid point code.

opc/opca/opci/opcn/opcn24 (optional)

Originating point code. Use these parameters to specify message transfer part (MTP) originating point codes.

opci (optional)

ITU international originating point code with subfields *zone-area-id*.

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

opcn (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range:*s-*, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps**nnnnn*—0-16383*gc*—*aa-zz**m1-m2-m3-m4*—0-14 for each member; values must sum to 14**opc24 (optional)**24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).**Range:***p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p**msa*—000-255*ssa*—000-255*sp*—000-255**tt (optional)**

Translation type. Use this parameter to specify a called party (CdPA) translation type.

Range:

0 - 255

Example`ent-gserv-data:tt=26``ent-gserv-data:opc=1-1-1``ent-gserv-data:gta=9194605500`**Dependencies**

Duplicate entries cannot exist in the GSERV table.

The system is busy, or the GSERV table is corrupted.

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

A new entry cannot be added to the GSERV table because all available space is in use. A maximum of 256 *tt* values, 50 *gta* values, and 50 *opc* values can be entered in the GSERV table.The *tt*, *opc*, and *gta* parameters cannot be specified within the same command.

The G-Port feature must be enabled before this command can be entered.

Notes

A translation type, originating point code, or global title address value must be entered in the GSERV table and must match the corresponding SRI Query parameter for an SRI message to receive the G-Port SRI Query for Prepaid service.

The G-Port SRI Query for Prepaid feature must be on before entries in the GSERV table can be used to affect a G-Port SRI query

Output

```
ent-gserv-data:tt=26
```

```
mystp 06-07-27 22:58:17 EST EAGLE 35.2.0  
ENT-GSERV-DATA: MASP A - COMPLTD
```

Related Topics

- [dlt-gserv-data](#)
- [rtv-gserv-data](#)

ent-gsmmap-scrn

Use this command to assign the GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening entries that filter or allow TCAP messages for certain MAP operation codes. The messages are filtered or allowed based on CgPA GTA+NPV+NAIV, CdPA GTA+NPV+NAIV, and forbidden (forbid) parameters. Each CgPA entry is associated with one or more CdPA entries and one or more CgPA entries are associated with a MAP Opcode. This command provisions both CgPA and CdPA entries into the database.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

cgsr (mandatory)

CGPA screening reference. This parameter specifies a CGPA entry for an OPNAME.

Range:

ayyy

1 alphabetic character and up to 3 optional alphanumeric characters

opname (mandatory)

Operation code name. This parameter references the operation code (opcode) defined with the ent-gsms-opcode command. GSM Map Screening is performed on the specified address or addresses for the referenced operation code.

Range:

ayyyyyyy

Up to 8 alphanumeric characters

action (optional)

The screening action to take if a message is forbidden as defined by the forbid parameter.

Range:***atierr***

Generate an ATI reject message. This option is only valid for ATI MAP operation codes.

discard

Discard the MSU

dupdisc

Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is discarded.

duplicate

Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

forward

Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

pass

Route the message as normal to the destination.

route

Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

Default:

discard

cdsr (optional)

CDPA screening reference. A CDPA entry for a combination of CGSR and OPNAME.

Range:

ayyy

1 alphabetic character and up to 3 optional alphanumeric characters

eaddr (optional)

Ending CDPA address. This parameter is used with the *npv*, *naiv*, *cgsr*, and *cdsr* parameters.

Range:

1-15 digits

Valid digits are 0–9, a–f, A–F

forbid (optional)

Forbidden parameter value. A forbidden parameter for the entered address. If a forbidden parameter is detected, then the message is rejected by the action defined by the *action* parameter.

Range:***all***

All parameters are forbidden. Take the specified screening action defined by the `action` parameter for messages arriving at the system.

none

None of the parameters are forbidden. Route the message to its destination.

state

Take the specified screening action defined by the `naction` parameter for messages arriving at the system that contain `state` as the forbidden parameter for the entered address/operation code combination.

Note

The `state` parameter is valid only for GSM ATI messages.

location

Take the specified screening action defined by the `naction` parameter for messages arriving at the system that contain `location` as the forbidden parameter for the entered address/operation code combination.

Note

The `location` parameter is valid only for GSM ATI messages.

Default:

all

force (optional)

Check Mated Application Override. This parameter must be used to complete command execution if the `pc/pca/pci/pcn/pcn24` and `ssn` parameter combination (if the `ssn` parameter has a value other than *none*) specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range:

yes

no

Default:

no

mapset (optional)

MAP set ID.

Range:

1 - 36000, dflt

dflt —Default MAP set

naiv (optional)

Nature of Address value for the address or range of CgPA and CdPA addresses. If a message is screened and does not contain matching npv and naiv values, the message is rejected. The message is rejected with the default action defined by the ent-gsms-opcode command for the operation code (opcode) parameter entry referenced by the operation name (opname) parameter.

This parameter must be specified with the npv parameter.

Range:

0 - 127, *

Default:

*

npv (optional)

Numbering Plan value for the address or range of CgPA and CdPA addresses. If a message is screened and does not contain matching npv and naiv values, the message is rejected. The message is rejected with the default action defined by the ent-gsms-opcode command for the operation code (opcode) parameter entry referenced by the operation name (opname) parameter.

This parameter must be specified with the naiv parameter.

Range:

0 - 15, *

Default:

*

pc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When chg-sid:pctype=ansi is specified, *ni* = 000 is not valid.

When chg-sid:pctype=ansi is specified, *nc* = 000 is not valid if *ni* = 001–005.

When chg-sid:pctype=ansi is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

pc/pca/pci/pcn/pcn24 (optional)

Point code. The Point Code and SSN parameters are used to enter the node to which the input message will be routed.

pci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s
zone—0-7
area—000-255
id—0-7

The point code 0-000-0 is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

ri (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

This parameter can be specified only when the value specified for the `action` parameter is *forward*, *duplicate*, or *dupdisc*.

Range:

gt

ssn

System Default:

ssn

saddr (optional)

Starting origination address.

With the `npv`, `naiv`, and `cgsr` parameters, this parameter is for a single CGPA entry or the starting CGPA address in the range to be screened.

With the `npv`, `naiv`, and `cdsr` parameters, this parameter is for a single CDPA entry or the starting CDPA address in the range to be screened.

Range:

1-15 digits, *

Valid digits are 0–9, a–f, A–F

Default:

*

ssn (optional)

Subsystem Number. The Point Code and SSN are used to change the defined node where the input message will be routed.

Range:

002 - 255, none

Default:

none

tt (optional)

Translation type. The value that the CdPA TT is set to as the result of Enhanced GSM Map Screening.

This parameter can be specified only if the value specified for the `action` parameter is *forward*, *duplicate*, or *dupdisc*.

Range:

0 - 255, none

Default:

none

Example

The following example adds a MAP OPNAME of ATI with a range of allowed addresses, defines a forbidden parameter for that range of addresses and an action to take if the forbidden parameter is detected, and sets the NPV and NAIV values. This example is wrapped to the next line for readability:

```
ent-gsmmap-
scrn:saddr=919461:eaddr=919462:opname=ati:action=discard:forbid=state
:npv=1:naiv=4:cgsr=fela
```

The following example adds a MAP OPNAME of ATI of with a range of allowed addresses, defines a forbidden parameter for that range of addresses and an action to take if the forbidden parameter is detected, and sets the NPV and NAIV values. The command also defines an ITU International Point Code with Subsystem Number 5, and forbids by location messages that have an action of *forward*. This example is wrapped to the next line for readability:

```
ent-gsmmap-
scrn:saddr=919461:eaddr=919462:opname=ati:action=forward:pci=1-1-1:ss
n=5:force=yes:forbid=location:cgsr=fela
```

The following example adds a MAP OPNAME of XYZ with an allowed hexadecimal address of abcdefabcdefabc, defines the action *discard* to take if a forbidden parameter is detected, and sets the NPV and NAIV values. The command also defines a CGSR of FELA. This example is wrapped to the next line for readability:

```
ent-gsmmap-
scrn:opname=xyz:saddr=abcdefabcdefabc:npv=10:naiv=10:cgsr=fela :action
=discard
```

```
ent-gsmmap-  
scrn:opname=test2:cgsr=t1:cdsr=cd3:saddr=125:pci=s-1-1-1:ssn=10 :action=duplicate  
  
ent-gsmmap-  
scrn:opname=test2:cgsr=cg1:cdsr=cd1:saddr=125:pci=1-1-1:ssn=10 :action=duplicate:mapset=11  
  
ent-gsmmap-  
scrn:opname=test3:cgsr=ad:action=forward:pc=1-1-2:ssn=12:ri=gt  
  
ent-gsmmap-  
scrn:opname=test4:cgsr=ksl:action=forward:mapset=df1t:pc=1-2-3 :ssn=12:tt=11
```

Dependencies

The GSM Map Screening feature must be turned on before this command can be entered.

The EGMS feature must be turned on before:

- The saddr=* parameter can be specified.
- Values for the saddr and eaddr parameters can contain hexadecimal digits.
- The cdsr parameter can be specified.
- The pc/pca parameter can be specified.

If the eaddr parameter is specified, the saddr parameter must be specified.

If the eaddr parameter is specified, then its value must contain the same number of digits as the value of the saddr parameter.

If the eaddr parameter is specified, its value must be greater than the saddr parameter value.

If the saddr=* parameter is specified, then the eaddr parameter cannot be specified.

If the opname parameter is specified, its value must exist in the GSM MAP Op-Code table.

A value of *state* or *location* cannot be specified for the forbid parameter unless the operation code (opcode) referenced by the opname parameter is 71.

The action=atierr parameter cannot be specified unless the operation code (opcode) referenced by the opname parameter is 71.

The GSM MAP Screening table cannot be full.

The GSM MAP Screening table must have at least two free entries to provision a CgPA entry, because a default wildcard CdPA entry is created for each CgPA entry.

If a single entry is specified for the CgPA/CdPA (the eaddr parameter is not specified), then the combination of saddr/npv/naiv and opname parameters cannot already exist in the GSM MAP screening table.

If a range entry is specified for the CgPA/CdPA (the eaddr parameter is specified), then the saddr/eaddr/npv/naiv and opname combination cannot already exist or overlap another range entry in the GSM MAP screening table.

If a CdPA entry is being created, then the CGSR must already exist for the specified OPNAME.

If a CgPA entry is being created, the CGSR cannot already exist for the specified OPNAME.

The specified `cdsr` cannot already exist for the specified `cgsr`.

If specified, the `pc/pca/pci/pcn/pcn24` parameter must be a full point code.

If the `action` parameter is specified with a value of *forward*, *duplicate*, or *dupdisc*, the `pc/pca/pci/pcn/pcn24` and `ssn` parameters must be specified.

The `pc/pca/pci/pcn/pcn24` and `ssn` parameters can be specified only if the `action` parameter is specified with a value of *forward*, *duplicate*, or *dupdisc*.

The `force` parameter can be specified only if the `pc/pca/pci/pcn /pcn24` and `ssn` parameters are specified.

If the `pc/pca/pci/pcn/pcn24` and `ssn` parameters are specified, and the `force` parameter is not specified as `yes`, then the PC/SSN must be populated in the SCCP Application entity set (Remote Point Code/MAP Table).

The values for the `npv` and `naiv` parameters must both be numbers or asterisks (*).

The GSM Map screening table must be accessible.

The GSM Map Op-Code table must be accessible.

The Route table must be accessible.

If specified, the `pc/pca/pci/pcn/pcn24` parameter value must exist as a destination in the Ordered Route entity set or reside in a cluster (ANSI only) that exists as a destination in the Ordered Route entity set (for global title routing).

The `opname` parameter must consist of alphanumeric characters.

The `opname` parameter must be entered.

The `cgsr` parameter must be entered.

The `saddr` and `eaddr` parameters must each be between 1 - 15 digits in length.

The `npv` parameter must be in range (0 - 15, *).

The `naiv` parameter must be in range (0 - 127, *).

The `saddr` parameter must have valid hexadecimal digits (0 – 9, a-f, A-F, or *).

The `eaddr` parameter must have valid hexadecimal digits (0 – 9, a - f, A - F).

The `cgsr` and `cdsr` parameters must each begin with an alphabetic character.

The `cgsr` and `cdsr` parameters must each consist of 1-4 alphanumeric characters.

If the `action` parameter has a value of *forward*, *duplicate*, or *dupdisc*, then the `mapset` parameter must be specified.

If the `mapset`, `ri`, or `tt` parameter is specified, then the value specified for the `action` parameter must be *forward*, *duplicate*, or *dupdisc*.

The Flexible GTT Load Sharing feature must be enabled before the `mapset` parameter can be specified.

The specified MAP set must exist.

If the value of the `mapset` parameter is not *dfllt*, then the specified PC/SSN must exist in the specified MAP set.

If the `mapset=df1t` parameter is specified, and the `force` parameter is not specified as `yes`, then the specified PC/SSN must exist in the specified MAP set.

The MAP Table must be accessible.

If the `action` parameter has a value of *forward*, *duplicate*, or *dupdisc*, then the value specified for the `pc/pca/pai/pcn/pcn24` parameter cannot be associated with a proxy point code.

If the `ri=ssn` parameter is specified, then the `ssn=none` parameter cannot be specified.

If the `forbid=none` parameter is specified, then the `action=pass` parameter must be specified.

If the FGTTLS feature is enabled, the `mapset` parameter is specified, and the `ssn` parameter is not specified or has a value of *none*, then the specified MAPSET/PC combination must already exist in the MAP table.

If the FGTTLS feature is not enabled and the `ssn` parameter is not specified or has a value of *none*, then the specified point code must already exist in the MAP table.

Notes

GSM screening entries are handled differently from other screening entries such as GWS (gateway screening) in the system database. The following differences apply to provisioning GSM screening entries:

- GSM screening entries can be either single entries or range entries.
- Single entries have precedence in screening over range entries. Thus the single entries are searched first and if a match is found, the range entries are never searched.
- Range entries can overlap single entries.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```

ent-gsms-opcode

Use this command to assign the concerned GSM (Global System for Mobile Telecommunication) MAP (mobile application part) screening operation codes and the default screening action for the operation code. This command allows the craftsman to provision a list of all operation codes that the system uses in performing GSM screening.

Parameters

① Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

opcode (mandatory)

MAP operation code. This parameter refers to the actual decimal value of the MAP operation codes from the TCAP layer of GSM MAP messages.

Range:

0 - 255, *

If a decimal Map Opcode is not found in the database, then the asterisk (wildcard *), if provisioned, will constitute a match when screening the MSUs.

opname (mandatory)

Operation code name. The opname value is defined with the ent-gsmmap-scrn command.

Range:

ayyyyyyy

Up to 8 alphanumeric characters

dfltact (optional)

Default screening action for a MAP operation code. The default screening action is used when a matching CGPA address+NPV+NAIV entry is not found in the GSM MAP screening table.

Range:***atierr***

Do not route the MSU. An ATI (Any Time Interrogation) reject message is generated. This option is only valid for ATI MAP operation codes.

discard

Do not route the MSU. The MSU is discarded (thrown away) and an appropriate UIM is issued.

dupdisc

Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is discarded.

duplicate

Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

forward

Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

pass

Route the message as normal to the destination.

route

Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

Default:

discard

force (optional)

Check Mated Application Override. This parameter must be used to complete command execution if the pc/pca/pci/pcn/pcn24 and ssn parameter combination (if the ssn parameter has a value other than *none*) specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range:

yes

no

Default:

no

mapset (optional)

MAP set ID.

Range:*1 - 36000, dfft**dfft* —Default MAP set**pc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:*pca***Range:***000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

pc/pca/pci/pcn/pcn24 (optional)

Point code. The *pc/pca/pci/ncn/pcn24* and *ssn* parameters allow the user to change the defined node to which the input message will be routed.

pci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:*s-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:*s-, 0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-**nnnnn—0-16383**gc—aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

ri (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

Note

This parameter can be specified only when the value specified for the `dfltact` parameter is *forward*, *duplicate*, or *dupdisc*.

Range:

gt

ssn

System Default:

ssn

ssn (optional)

Subsystem Number. The `pc/pca/pci/pcn/pcn24` and `ssn` parameters are used to change the defined node where the input message will be routed.

Range:

002 - 255

Default:

none

tt (optional)

Translation type. The value that the CdPA TT is set to as the result of Enhanced GSM Map Screening.

The parameter can be specified only if the value specified for the `dfltact` parameter is *forward*, *duplicate*, or *dupdisc*.

Range:

0 - 255, *none*

Default:

none

Example

This example adds a MAP operation code of 71 with a name of ATI with a default action of DISCARD:

```
ent-gsms-opcode:opcode=71:opname=ati:dfltact=discard
```

This example adds a MAP operation code of 71 with a name of ATI, a default action of FORWARD, an international point code of 1, a subsystem number of 5, and forces:

```
ent-gsms-  
opcode:opcode=71:opname=ati:dfltact=forward:pci=1-1-1:ssn=5:force=yes
```

This example adds a MAP operation code of 71 with a name of ATI, a default action of DUPLICATE, an international point code of 1, a subsystem number of 5, and forces:

```
ent-gsms-  
opcode:opcode=71:opname=ati:dfltact=duplicate:pci=1-1-1:ssn=5:force=yes
```

This example adds a MAP operation code of 71 with a name of ATI, a default action of DUPDISC, an international point code of 1, a subsystem number of 5, and forces:

```
ent-gsms-  
opcode:opcode=71:opname=ati:dfltact=dupdisc:pci=1-1-1:ssn=5:force=yes
```

This example adds a MAP operation code of * with a name of XYZ, a default action of DUPLICATE, an ANSI point code of 8, a subsystem number of 20:

```
ent-gsms-opcode:opcode=:opname=xyz:pca=8-8-8:dfltact=duplicate:ssn=20
```

This example adds a MAP operation code of 22 with a name of ATI with a default action of DISCARD:

```
ent-gsms-opcode:opcode=22:opname=ati:dfltact=discard
```

This example shows a spare point code:

```
ent-gsms-  
opcode:opname=test3:opcode=3:pci=s-1-1-1:dfltact=duplicate:ssn=10:force
```

This example shows a MAP set value. The Flexible GTT Load Sharing feature is ON.

```
ent-gsms-  
opcode:opname=test3:opcode=3:pc=1-1-1:dfltact=duplicate:ssn=10:mapset=7
```

This example adds a MAP operation code of 27 with a name of TEST3, a default action of FORWARD, an ANSI point code of 1, a subsystem number of 12 and a routing indicator of GT:

```
ent-gsms-  
opcode:opname=test3:opcode=27:dfltact=forward:pca=1-1-2:ssn=12:ri=gt
```

This example shows a translation type value:

```
ent-gsms-  
opcode:opname=test4:opcode=32:dfltact=forward:mapset=dfmt:pc=1-2-3:ssn=12:tt=11
```

Dependencies

The GSM Map Screening feature must be turned on before this command can be entered.

A valid value must be specified for the dfltact parameter.

The opcode parameter value must be specified as a number in the range 0-255 or as *.

The reserved word *none* cannot be specified as a value for the *opname* parameter.

The *pc/pca/pci/pcn/pcn24* and *ssn* parameters can be specified only if the *dfltact* parameter is specified and its value is *forward*, *duplicate*, or *dupdisc*.

If the *dfltact* parameter is specified with a value of *forward*, *duplicate*, or *dupdisc*, then the *pc/pca/pci/pcn/pcn24* and *ssn* parameter must be specified.

The *force* parameter can be specified only if the *pc/pca/pci/pcn/pcn24* and the *ssn* parameters are specified.

The *dfltact=atierr* parameter cannot be specified unless the value of the operation code referenced by the *opname* parameter is 71. The *atierr* option is valid only for ATI MAP operation codes, and the *opcode=71* parameter signifies an ATI MAP operation code.

The value specified for the *opcode* parameter cannot already exist in the GSM Map Op-Code table.

The value specified for the *opname* parameter cannot already be used in the GSM Map Op-Code table.

If the *pc/pca/pci/pcn/pcn24* and *ssn* parameters are specified, and the *force* parameter is not specified as *yes*, then the PC-SSN must exist in the SCCP Application entity set (Remote Point Code / Mated Application Table).

The Enhanced GSM Map Screening feature must be enabled and turned on before the *opcode=** parameter can be specified.

If specified, the *pc/pca/pci/pcn /pcn24* parameter value must be a full point code.

The GSM MAP Op-Code table must be accessible.

The Route table must be accessible.

If specified, the *pc/pca/pci/pcn/pcn24* parameter value must exist as a destination in the Ordered Route entity set or reside in a cluster (ANSI only) that exists as a destination in the Ordered Route entity set (for global title routing).

The Enhanced GSM Map Screening feature must be enabled and turned on when the PC/PCA is specified.

The *opname* parameter must consist of alphanumeric characters.

The *opname* parameter must be no more than 8 characters in length.

If the *mapset*, *ri*, or *tt* parameter is specified, then the value specified for the *dfltact* parameter must be *forward*, *duplicate*, or *dupdisc*.

If the *dfltact* parameter is specified as *forward*, *duplicate*, or *dupdisc*, then the *mapset* parameter must be specified.

The Flexible GTT Load Sharing feature must be enabled before the *mapset* parameter can be specified.

The specified MAP set must exist.

If the *mapset* parameter is not specified as *dflt*, or if the *mapset=dflt* parameter is specified, and the *force* parameter is not specified as *yes*, then the specified PC/SSN must exist in the specified MAP set.

The MAP table must be accessible.

If the `dfltact` parameter has a value of *forward*, *duplicate*, or *dupdisc*, then the value specified for the `pc/pca/pci/pcn/pcn24` parameter cannot be associated with a proxy point code.

If the `ri=ssn` parameter is specified, then the `ssn=none` parameter cannot be specified.

If the FGTTLS feature is enabled, the `mapset` parameter is specified and the `ssn` parameter is not specified or has a value of *none*, then the specified MAPSET/PC combination must already exist in the MAP table.

If the FGTTLS feature is not enabled and the `ssn` parameter is not specified or has a value of *none*, then the specified point code must already exist in the MAP table.

Notes

Origination Addresses are considered to be the SCCP CGPA address as well as the Numbering Plan and Nature of Address values.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
ent-gsms-
opcode:opname=test3:opcode=3:pc=1-1-1:dfltact=duplicate:ssn=10:mapset=

ent-gsmssn-scrn

Use this command to provision origination and destination SSNs (subsystem numbers) to be screened using the GSM (Global System for Mobile Telecommunication) MAP (mobile application part) screening feature. The value of the *ssn* parameter that is entered with this command is added to the GSM SSN screening table. All the MAP messages with the originating or destination SSN entered are screened using the GSM Map screening feature.

Parameters

ssn (mandatory)

Subsystem number.

Range:

000 - 255

type (mandatory)

Subsystem type.

Range:

dest

destination SSN

orig

origination SSN

Example

The following example adds an originating subsystem of 10 to the GSM SSN Screening table:

```
ent-gsmssn-scrn:ssn=10:type=orig
```

Dependencies

The GSM Map Screening feature must be turned on before this command can be entered.

The GSM SSN screening table is corrupt or cannot be found.

A value for the *ssn* and *type* parameter combination cannot be specified that already exists in the GSM SSN screening table.

The *ssn* value must be a valid numeric between **0** and **255**

The *type* parameter value must be *orig* or *dest*.

Notes

None

Output

```
ent-gsmssn-scrn:ssn=10:type=orig
```

```
rlghncxa03w 04-01-10 11:43:04 EST  EAGLE 31.3.0
ENT-GSMSSN-SCRN: MASP A - COMPLTD
;
```

- [rtrv-gsmssn-scrn](#)

ent-gta

Use this command to specify the GTA (global title address) information for applicable global title selectors required to specify a global title entry.

This command adds the routing object (a destination address and a subsystem number) for messages requiring a global title translation. The translation is performed on the basis of the global title address (GTA), global title indicator (GTI), numbering plan (NP), nature of address indicator (NAI), and translation type (TT) of each SS7 SCCP message directed to the STP with a routing indicator of 0, indicating a GTT is required.

Note

If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrvgttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrvgta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. It is not recommended to run ent/dlt/rtrv-tt & ent/chg/dlt/rtrv-gtt commands as it may cause the advance GTA fields of GTT entry to be reset to the default values.

Parameters**Note**

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

gttsn (mandatory)

GTT set name. The entity to which global title addresses and selectors are assigned.

Range:

ayyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters

xlat (mandatory)

Translate indicator. This parameter specifies translation actions and routing actions.

Range:

dpc

dpcngt

dpcssn

none

acn (optional)

Application context name. This parameter specifies the ITU TCAP *acn* field in the incoming MSU.

Range:

0 - 255, *, *none*

The *acn* supports up to 7 subfields separated by dash (e.g., 1-202-33-104-54-26-007)

*—any valid value in the ITU TCAP *acn* field in the incoming MSU

none—there is no ITU TCAP *acn* field in the incoming MSU

actsn (optional)

GTT Action Set Name.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters

ccgt (optional)

Cancel called global title indicator.

Range:

yes

no

Default:

no

cdseLid (optional)

CdPA Selector ID.

Range:

0 - 65534

cdssn (optional)

Starting CdPA subsystem number.

Range:

0 - 255

cgcnavsn (optional)

CgPA conversion set name.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters

cggtmod (optional)

Calling party GT modification indicator. This parameter specifies whether calling party global title modification is required.

Range:

yes

no

Default:*no***cgpc (optional)**

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:*cgpca***Range:***0-255, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001–005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006–255*.

When *chg-sid:pctype=ansi* is specified, *ni-*. ** is valid if *ni =006–255*.

The point code *000-000-000* is not a valid point code.

cgpcaction (optional)

This parameter is used to provide the required abilities, indicating what any particular translation needs to do with CgPA PC.

Range:*dflt*

protocol will be allowed to perform all the required processing/conversion with CGPC.

ignore

CGPC will be left as it was in incoming MSU.

remove

CGPC will be removed from outgoing MSU.

Default:*dflt***cgpci (optional)**

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:*s-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

cgpcn (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

cgpcn24 (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

cgpcn16 (optional)

16-bit ITU national CgPA point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

cgselectorid (optional)

CgPA Selector ID.

Range:

0 - 65534

cgssn (optional)

Starting CgPA subsystem number.

Range:

0 - 255

defmapvr (optional)

Default MAP version for MBR opcodes. This parameter is used to provide the default MAP version for supported MBR opcodes if Application Context Name (ACN) is not present in an incoming MAP message.

Range:

v1

v2

v3

Default:

v3

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

dpca

Range:

0-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001–005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006–255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni =006–255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Point Code.

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

dpcn (optional)

ITU destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-**nnnnn—0-16383**gc—aa-zz**m1-m2-m3-m4—0-14* for each member; values must sum to 14**dpcn24 (optional)**24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa—000-255**ssa—000-255**sp—000-255***dpcn16 (optional)**16-bit ITU national destination point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).**Range:**

000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un---000---127**sna---000---15**mna---000---31***eaddr (optional)**

End Address (similar to EGTA). This parameter specifies the end of a range of MAP digits (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA).

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default:

Same as the specified SADDR value

ecdssn (optional)

Ending CdPA subsystem number.

Range:

0 - 255

ecgssn (optional)

Ending CgPA subsystem number.

Range:

0 - 255

egta (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default:

Same as the specified gta value

fallback (optional)

Fallback option. The action taken when the final translation does not match while performing GTT using a FLOBR-specific GTT mode.

Range:**yes**

perform GTT based on the last matched entry

no

GTT fails and the MSU is discarded

sysdflt

use the system-wide default fallback option in the SCCPOPTS table

Default:

sysdflt

family (optional)

The ANSI TCAP*family* field in the incoming MSU.

Range:

0 - 255, *, none

* —any valid value in the ANSI TCAP *family* field in the incoming MSU

none —there is no value in the ANSI TCAP *family* field in the incoming MSU

force (optional)

Check mated application override. This parameter must be used to complete command execution if the pci/pcn and ssn parameter combination specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range:**yes****no**

Default:*no***gta (optional)**

Global title address. The beginning of a range of global title digits.

Range:*1 - 21 digits*

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

gtmodid (optional)

Global title modification identifier.

Range:*ayyyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

Default:*none***loopset (optional)**

SCCP loopset name. This parameter associates a translation set with a loopset.

Range:*ayyyyyyy*

1 leading alphabetic character and up to 7 following alphanumeric characters.

none —There is no association between the translation set and any loopset.

Default:*none***mapset (optional)**

MAP set ID. This parameter specifies the Mated Application set ID.

Range:*1 - 36000, dflt*

dflt —Default MAP set

mrnset (optional)

MRN set ID. The Mated Relay Node set ID.

Range:*1 - 3000, dflt, none*

dflt —Default MRN set

none —The GTA translation does not participate in any load sharing

opc (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:*opca*

Range:

0-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001–005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006–255*.

When *chg-sid:pctype=ansi* is specified, *ni-*.** is valid if *ni =006–255*.

The point code *000-000-000* is not a valid point code.

opc/opca/opci/opcn/opcn24/opcn16 (optional)

Originating Point Code

opci (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

opcn (optional)

ITU originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-**nnnnn—0-16383**gc—aa-zz**m1-m2-m3-m4—0-14* for each member; values must sum to 14**opcn24 (optional)**

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa—000–255**ssa—000–255**sp—000–255*

opcn16 (optional)

16-bit ITU national originating point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

Range:

000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

opcodetag (optional)

The ITU TCAP opcodetag field in the incoming MSU.

Range:

none, local, global, any

none —there is no value in the ITU TCAP opcodetag field in the incoming MSU

local —The opcodetag is local in the ITU TCAP opcodetag field in the incoming MSU

global —The opcodetag is global in the ITU TCAP opcodetag field in the incoming MSU

any — any valid value in the ITU TCAP opcodetag field in the incoming MSU

Default:

any

opcsn (optional)

The OPC GTT set name.

Range:

ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

optsn (optional)

Optional gtt set name.

Range:

ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

pc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

pca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001-005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006-255`.

The point code `000-000-000` is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (optional)

Point code.

pci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

pcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:*p*, 000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p**un---*000---127*sna---*000---15*mna---*000---31**pkgtype (optional)**

The ANSI and ITU TCAP package type.

Range:***ituuni***

ITU unidirectional

qwp

Query with Permission

qwop

Query without Permission

resp

Response

cwp

ANSI TCAP Package Types

ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any

ITU TCAP Package Types

bgn, ituabort, ituuni, any, end, cnt

ppmeasreqd (optional)

This parameter specifies whether Per Path measurements are required.

Range:**yes**

per path measurements are required

no

per path measurements are not required

Default:

No change to the current value

prio (optional)

This parameter assigns priority to an OPCODE GTTSET based translation.

Range:

1 - 1024

1 is the highest priority and 1024 the lowest

Default:

1024

ri (optional)

Routing indicator.

Range:**gt**

Allow a called party address with a routing indicator value of "global title."

ssn

Allow a called party address with a routing indicator value of "DPC/SSN."

saddr (optional)

Start Address (similar to GTA). This parameter specifies the beginning of a range of MAP digits (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA).

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

ssn (optional)

New translated subsystem number.

Range:

002 - 255

Default:

none

testmode (optional)

This parameter is used to invoke a field-safe Test Tool in order to debug the FLOBR/TOBR rules.

 Caution

If the testmode=on parameter is specified, then the rule is used only by test messages. The rule is ignored by 'live' traffic. If the testmode=off parameter is specified, then both test and live messages use the rule. Changing from testmode=off to testmode=on is equivalent to deleting the rule for live traffic.

Range:**on**

Process the translation rules defined in the test message

off

Perform standard GTT behavior

Default:

off

transmeasrqd (optional)

GTT Translation Measurement Required. This parameter specifies whether to perform per GTT Translation Measurements.

Range:**yes**

perform per GTT Translation Measurements

no

do not perform per GTT Translation Measurements

Default:

no

Example

Dependencies

The EGTT feature must be turned on before this command can be entered.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated PC that is of a different domain than the GTT set specified by the `gttsn` parameter can be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated PC and a translation type in different network types can be specified.

The `gttsn` parameter must be specified and must match an existing `gttsn`.

The `pc/pca/pci/pcn/pcn24/pcn16` parameter cannot be out of range.

If the `egta/eaddr` parameter is specified, then the values of the `gta/saddr` and `egta/eaddr` parameters must be the same length.

The length of the specified `gta/saddr` parameter must match the number of digits provisioned for the specified GTT set (`gttsn`) when VGTT is OFF. If the VGTT (variable length GTT) feature is turned on, then up to 10 GTA/SADDR lengths can exist per GTT set. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA/SADDR lengths can exist per GTT set.

The specified `gta/egta` or `saddr/eaddr` range must exist for the specified GTT set in the STP active database. While an exact match is not required, you cannot specify an overlap with another range. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to enter a global title address range (such as 8005550000 to 8005559999) that overlaps an

existing range. The overlapping links must match. If they do not, the error message displays the list of overlapped global title addresses:

```
The following GTA ranges overlap the input GTA range
START GTA END GTA
8005550000 8005551999 8005552000 8005553999 8005554000 8005555999 ENT-GTA:
MASP A - Command Aborted
```

If the translated point code is of type ANSI, the `ngti` parameter of the referred GTMOD cannot be 4. For ANSI PCs, the `ngti` value must be 2.

If the new or existing `pc/pca/pci/pcn/pcn24/pcn16` parameter is the STP point code or capability point code, then the `ccgt=no` parameter must be specified.

If the `xlat=dpcngt` parameter is specified, then the `ri=gt` parameter must be specified.

If the `ssn` parameter is specified, then the `xlat=dpcssn` parameter must be specified.

If the `xlat=dpcssn` parameter is specified, then the `ssn` parameter must be specified.

If the value specified for the `pc/pca/pci/pcn/pcn24/pcn16` parameter is the STP's true point code, the `xlat=dpcssn` and `ri=ssn` parameters must be specified.

If the value specified for the `pc/pca/pci/pcn/pcn24/pcn16` parameter is the STP's true point code and the `ssn` parameter is specified, the `ssn` parameter must exist in the SS-APPL table.

Unless the PC is the STP true PC, the value specified for the `pc/pca/pci/pcn/pcn24/pcn16` parameter must exist as a destination in the Route table or reside in a cluster that exists as a destination in the Route table (for global routing).

If a final GTT (the `ri=ssn` parameter is specified with the `xlat=dpc` parameter and without the `force=yes` parameter), then the PC (`pc/pca/pci/pcn/pcn24/pcn16`) must exist in the Remote Point Code/MAP table. The `force=yes` parameter can be specified to execute the command when the PC is not in the table; the following warning message is displayed in the scroll area of the terminal:

CAUTION: DPC DOES NOT EXIST IN MATED APPLICATION TABLE.

If the `ccgt=yes` parameter is specified, then the `ri=ssn` parameter must be specified.

If the `ri=gt` parameter is specified, then the `ccgt=no` parameter must be specified.

If the `pc/pca/pci/pcn/pcn24/pcn16` parameter is any of the STP's PCs or CPCs, then the `ccgt=no` parameter must be specified.

If the XGTT feature is enabled, the GTT table can contain up to either 400,000 or 1,000,000 entries, depending on the controlled feature Part Number that is enabled. If XGTT is not enabled, the GTT table can contain up to 269,999 user entries. An error message is displayed if a command entry would result in more than the allowed maximum number of entries in the table.

If the `egta/eaddr` parameter is specified, then the value of the `egta/eaddr` parameter must be greater than or equal to the value of the `gta/saddr` parameter.

The GTT Set Name must not be *none*.

The `pc/pca/pci/pcn/pcn24/pcn16` parameter must be a full PC.

If the VGTT feature is turned on, then up to 10 GTA/SADDR lengths can exist per GTT set. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA/SADDR lengths can exist per GTT set.

The GTT Selector table is corrupt or cannot be found.

The GTT Set table is corrupt or cannot be found.

The GTA table is corrupt or cannot be found.

The GTT DBMM table is corrupt or cannot be found.

A severe system fault has occurred, and the command was rejected.

The Site ID table is corrupt or cannot be found.

The SS-APPL table is corrupt or cannot be found.

The Route table is corrupt or cannot be found.

The MRN table is corrupt or cannot be found.

The MAP table is corrupt or cannot be found.

If the `ri=ssn` parameter is specified, then the `mrnset` parameter must not be specified.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

The `mrnset` parameter can only be specified when the Flexible GTT Load-Sharing feature is enabled.

If the `ri=gt` parameter is specified, then the `mrnset` parameter must be specified.

The `mapset` parameter can only be specified if the Flexible GTT Load Sharing feature is enabled, and the `ri=ssn` parameter is specified. If the `ri=ssn` parameter is specified, the `mapset` parameter must be specified. If the `ri=gt` parameter is specified, the `mapset` parameter cannot be specified.

The Flexible GTT Load Sharing feature must be enabled before the `mapset` parameter can be specified.

The specified PC and SSN must exist in the specified MAP set.

The specified MAP set must exist in the database.

If the `xlat=dpc` parameter is specified, and the `force` parameter is not specified as `yes`, then the specified PC and MAP set must exist in the MAP table.

The MAP table is corrupt or cannot be found.

The `gta`, `cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16`, `opc/opca/opci/opcn/opcn24/opcn16`, `cgssn`, `cdssn`, `opcode/acn/pkgtype`, `opcode/family/pkgtype`, `dpc/dpca/dpci/dpcn/dpcn24/dpcn16`, or `saddr` parameter must be specified.

The `cdselid`, `cgselid`, and `optsn` parameters cannot be specified together in the command. If the GTT set has a set type of `cdgta`, `cdssn`, or `opcode`, then the `opcsn` parameter can be specified with one of the above parameters.

If the `cgssn` parameter is specified, then the `optsn` and `cgselid` parameters cannot be specified.

The *cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16*, *opc/opca/opci/opcn/opcn24/opcn16* and *dpc/dpca/dpci/dpcn/dpcn24/dpcn16* parameters must have a valid value within the range for each subfield.

The value specified for the *ecgssn* or *ecdssn* parameter must be greater than the value specified for the *cgssn* or *cdssn* parameter.

The OBSR feature must be enabled before the *opcsn*, *optsn*, *cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16*, *opc/opca/opci/opcn/opcn24/opcn16*, or *(e)cgssn* parameters can be specified.

If the GTT set specified by the *gttsn* parameter (GTTSN set) has a set type of *cdgta* (see the *ent-gttset* command), then the *optsn* parameter cannot specify a GTT set (OPTSN set) with a set type of *cgssn*.

If the GTTSN set has a set type of *cdgta*, then the OPTSN set must have a set type of *cggta* or *cgpc*.

The FLOBR feature must be turned on before a GTTSN set with a set type of *cgpc*, *cggta*, or *opc* can be specified with an OPTSN with a set type other than *cgssn*.

If the FLOBR feature is turned on, and the GTTSN set has a set type of *cdgta* or *cdssn*, then the OPTSN set cannot have a set type of *opc*.

If the TOBR feature is turned on, and the GTTSN set has a set type of *opcode*, then the OPTSN set cannot have a set type of *opc*.

If the GTTSN set has a set type of MBR (*imei/imsi/vlrnb/msisdn/smrpda/smrpoa*), then the OPTSN set type cannot have the same set type as GTTSN.

If the OPTSN set has a set type of MBR (*imei/imsi/vlrnb/msisdn/smrpda/smrpoa*), then the GTTSET must have a set type of MBR (*imei/imsi/vlrnb/msisdn/smrpda/smrpoa*) or *opcode*.

The GTA must be specified if the GTTSN set type has a value of *cdgta* or *cggta*. The GTA cannot be specified for other set types.

If the GTTSN set type has a value of *cgpc*, the *cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16* parameter must be specified. This parameter cannot be specified for other set types.

The *opc/opca/opci/opcn/opcn24/opcn16* parameter must be specified if the GTTSN set type has a value of *opc*. These parameters cannot be specified for other set types.

If the GTTSN set type has a value of *cgssn*, the *cgssn* parameter must be specified. The *cgssn* parameter cannot be specified for GTTSN of other types.

The range specified by the *cdssn/ecdssn* and *cgssn/ecgssn* parameters cannot overlap a currently existing range for the specified GTT set.

The GTT set name specified by the *opcsn* parameter must have a set type of *opc* (see the *ent-gttset* command).

The OPC subsystem number set domain must be the same as the GTTSN set domain. If the GTT subsystem number set domain is ANSI, then the OPC subsystem number set domain must be ANSI. If the GTT subsystem number set domain is ITU, then the OPC subsystem number set domain must be ITU.

The translation entry specified by the *cgpc*, *opcode*, *opc*, or *dpc* parameters cannot already exist.

The *cgpc*, *cgssn*, *gta*, *opc*, *cdssn*, *opcode*, *dpc*, and *saddr* parameters cannot be specified together in the command.

If the `cgssn` and `cdssn` parameters are both specified in the same command (in any order), then only the value for the last of the two parameters specified is used during processing.

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the `gta/saddr` or `egta/eaddr` parameter.

The value of the `loopset` parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The `loopset` table is corrupt or cannot be found.

The value specified for the `pc` parameter cannot be associated with a proxy point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cggtmod` parameter can be specified.

The FLOBR feature must be turned on before the `fallback`, `cdselid`, `cdssn`, `ecdssn`, or `dpc` parameter can be specified.

The FLOBR feature must be turned on before the `gttsn` parameter can specify a GTT set with a set type other than `cdgta` (see the `ent-gttset` command) in the same command with the `cgselid` parameter.

The OBSR feature must be enabled or the FLOBR feature must be turned on before the `cgselid` parameter can be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the GTT set specified by the `optsn` parameter can have a different domain than the GTT set specified by the `gttsn` parameter.

A TOBR quantity feature must be turned on before the `opcode`, `pkgtype`, `acn`, `family`, `saddr`, `eaddr`, or `defmapvr` parameter can be specified.

The `opcode`, `pkgtype`, and `family` parameters must be specified together for ANSI TCAP translations. The `opcode`, `pkgtype`, and `acn` parameters must be specified together for ITU TCAP translations.

If the `opcodetag` is specified by `opcodetag` parameter, then the `pkgtype`, `opcode` and `acn` must be specified.

E3701 Cmd Rej: PkgType, Opcode and ACN must be specified.

If the GTT set specified by the `gttsn` parameter has a set type of *opcode* (see the `ent-gttset` command), then the `opcode/acn/pkgtype` or `opcode/family/pkgtype` parameter must be specified. These parameters cannot be specified for GTT sets of any other set types.

If the GTT set specified by the `gttsn` parameter has a set type of *cdssn* (see the `ent-gttset` command), then the `cdssn` parameter must be specified. This parameter cannot be specified for GTT sets with other set types.

The maximum number of OP CODE translation entries cannot exceed the value that is set by the associated TOBR quantity feature.

The GTT set specified by the `gttsn` parameter must have a set type of *cdgta*, *opcode*, or *cdssn* (see the `ent-gttset` command) before the `opcsn` parameter can be specified.

The same value cannot be specified for the `gttsn` and `optsn` parameters.

The ANSI/ITU SCCP conversion feature must be enabled and the FLOBR feature must be turned on before the `cgcnsn` parameter can be specified.

The GTT set specified by the `gttsn` parameter must have a set type of `cdgta` or `cggtta` (see the `ent-gttset` command) before the `cgcnsn` parameter can be specified.

If the `cgssn` parameter is specified, then the `ecdssn` parameter cannot be specified. If the `cdssn` parameter is specified, then the `ecgssn` parameter cannot be specified.

The GTT set specified by the `gttsn` parameter cannot be the same as the GTT set specified by the `cgcnsn` parameter.

If the `family` parameter is specified, then a value of *ansiuni*, *qwp*, *qwop*, *resp*, *cwp*, *cwop*, *ansiabort*, or *any* must be specified for the `pkgtype` parameter.

If the `acn` parameter is specified, then a value of *bgn*, *ituabort*, *ituuni*, *any*, *end*, or *cnt* must be specified for the `pkgtype` parameter.

The GTT set specified by the `optsn`, `opcsn`, and `cgcnsn` parameters must match an existing GTT set.

If the `pkgtype=ituabort` parameter is specified, then a value of *none* must be specified for the `acn`, `opcode` and `opcodetag` parameters.

If the `pkgtype=ansiabort` parameter is specified, then a value of *none* must be specified for the `family` and `opcode` parameters.

E5144 Cmd Rej: PKGTYPE abort requires ACN/FAMILY/OPCODE/OPTAG value none.

If the `family` and `opcode` parameters are specified in the command, then either both parameters must have a value of *none* or neither parameter can have a value of *none*.

The OBSR feature must be enabled or the FLOBR feature must be turned on before the `optsn` parameter can be specified.

The specified GTT Action Set must already exist in the database.

Failure while reading GTT Action Set Table.

The `actsn=none` parameter cannot be specified.

The `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter must be specified if the GTTSN set type is `dpc` (see the `ent-gttset` command). If the GTT set has a set type other than `dpc`, then the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter cannot be specified.

If the `xlat=none` parameter is specified, then the `ri`, `pc/pca/pci/pcn/pcn24/pcn16`, `force`, `ssn` and `ccgt` parameters cannot be specified.

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

The GTMOD table is corrupt or cannot be found.

The `gtmodid=none` parameter cannot be specified.

If the FGTTLS feature is enabled, and the `xlat=none` parameter is specified, then the `mrnset` or `mapset` parameter must be specified.

The specified GTT set must have a set type of *opcode* (see the `ent-gttset` command) before the `opcode/acn/pkgtype` or `opcode/family/pkgtype` parameters can be specified. The specified GTT set must have a set type of *cdssn*, *cgssn*, *cdgta/cgta*, *opc*, or *cgpc* before the `cdssn`, `cgssn`, `gta`, `opc`, or `cgpc` parameter, respectively, can be specified.

The acn and famlly parameters cannot be specified together in the command.

If the opc or dpc parameter is specified, then the (e)gta, (e)cgssn, (e)cdssn, eaddr, and opcode parameters cannot be specified.

The J7 Support feature must be enabled before the cgpcn16/opcn16/dpcn16 parameters can be specified.

The J7 Support feature must not be enabled before the cgpcn24/opcn24/dpcn24/cgpca/opca/dpca parameters can be specified.

The saddr parameter must be specified if the GTT set specified by the gtt sn parameter is of MBR type (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA).

If the GTT set specified by the opt sn parameter is of MBR type (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA) in the GTA command for the ITU opcode entry, then the package type specified via the pkgtype parameter must be ITU BGN/CNT/END.

The defmapvr parameter can be specified in the GTA command for the ITU opcode entry if the GTT set specified by the opt sn parameter is of MBR type (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA).

The PRI0 parameter can be specified with OPCODE GTT set types only.

If the GTA/EGTA parameter is specified, then the EADDR parameter cannot be specified.

If the SADDR parameter is specified, then the ECGSSN/ECDSSN parameter cannot be specified.

If the OPCODE parameter is specified, then the EADDR/EGTA/ ECGSSN/ECDSSN parameter cannot be specified.

If the CGPC parameter is specified, then the EADDR/EGTA/ECGSSN/ECDSSN parameter cannot be specified.

If the ECGSSN/ECDSSN parameter is specified, then the EADDR/EGTA parameter cannot be specified.

SSN configured for SFAPP cannot be used in any command for any configuration

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

When the Flexible GTT Load Sharing feature and the Intermediate GTT Load Sharing feature are on, multiple relationships can be defined among set of destination point codes in the MRN table, which already exists in the EAGLE. The relationship used in a particular translation is based on the GTA digits used for translation. The MRN set and the post-translation PC create a key that is used to perform lookups in the MRN table. The lookup results in a set of alternate PCs, one of which is selected, based on PC relative cost, to route the MSU in the most cost effective way.

When the Flexible GTT Load Sharing feature is enabled, multiple relationships can be defined among a set of PC/SSNs in the existing MAP table. The relationship used in a particular translation is based on the GTA digits used for translation.

When the Origin-based SCCP Routing feature is turned on, the CdPA GTA, CgPA GTA, CgPA PC, CgPA SSN, and OPC entries can be provisioned. When provisioning, the following rules apply:

- The Advanced CdPA GTA entry can associate with CgPA GTA set, CgPA PC set, or SELID and OPC set.
- The CgPA GTA, CgPA PC, or OPC entry can associate with the CgPA SSN set.
- The CgPA SSN entry cannot associate with any other GTT set.
- The Advanced CdPA GTA entry may contain SELID, which is (together with the CgPA information) derived from incoming MSU to search the Selector table again for the CgPA GTA or CgPA PC Set.

When the Origin-based SCCP Routing feature is enabled, the GTA and EGTA can be used for the CgPA translation as well as the CdPA GTA translation.

The Flexible GTT Load Sharing feature introduces the `mrnset` parameter. The MRN set and the post-translation PC create a key that is used to perform look ups in the MRN table. This lookup results in a set of alternate PCs, from which one is selected, based on PCs relative cost, to route the MSU in the most cost effective way.

A loopset consists of a set of point codes that form a routing loop in the network. If the SCCP Loop Detection feature is enabled, then the loopset can be associated with or disassociated from specified translation entries. Loopsets that are associated with translation entries are checked during intermediate and final GTT traffic routing. If a loop exists, then the system can be notified with or without discarding the associated traffic.

The maximum length of the resulting GTA string must not exceed 21 digits when translation is complete.

If the FLOBR GTT hierarchy is provisioned on a linkset, then translations do not have to be searched in a predetermined manner. If a translation points to another GTTSET/SELID, then database searches continue. The number of searches is limited by the following conditions:

- The same GTT set name cannot be referred more than once.
- Up to 7 database searches can be performed.
- For MBR, the same GTT set type (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA) cannot be referred more than once.

If the FLOBR feature is turned on, then any translation can point to any GTTSETS other than that specified by the GTTSN. The CdPA GTA and CdPA SSN translations can also point to an OPCODE. For CdPA GTA and CdPA SSN translations, if an OPTSN GTTSET/SELID is provisioned apart from an OPCODE, then the OPTSN GTTSET/SELID takes precedence over the OPCODE.

The MBR GTT set type translation entries (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA) can be configured only when the TOBR feature is turned on. The GTT sets of the types mentioned above are allowed to be provisioned ONLY in GTA entries from a GTT set of the type OPCODE or one of the other GTT set types supported by this feature (SS7 Firewall).

Translations, supporting ANSI or ITU opcodes, associated with the TOBR feature:

- ANSI Opcode—ANSI opcode specifier, ANSI TCAP Package type, and Family
- ITU Opcode—ITU opcode, ITU TCAP Package Type, Opcodetag and ACN

Translations associated with the FLOBR feature:

- CdPA SSN Translations—Can be configured with routing and flexible routing data. The provisioning rules for CdPA SSN translations are the same as CgPA SSN translations in OBSR.
- DPC Translations—The provisioning rules for DPC translations are the same as OPC translations except that the OPCODE parameter cannot be configured for DPC translations.

Use this command to provision the Default Global Title Conversion table. The table is used during conversion for MTP-routed cross network SCCP UDT(S), XUDT(S) and SCCP Management messages. It is also used during conversion for GT routed messages when a matching entry exists in the Global Title address table but the NGTI value is not provisioned.

Parameters**dir (mandatory)**

Direction of conversion.

Range:***atoi***

ANSI to ITU conversion

itoa

ITU to ANSI conversion

both

conversion in both directions

gtixlat (mandatory)

Global Title Indicator conversion. This parameter is expressed in the form of the ANSI GTI and the ITU GTI.

Range:**22**

Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 2 or an incoming ITU GTI 2 to an outgoing ANSI GTI 2

24

Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2

tta (mandatory)

ANSI translation type.

Range:

0 - 255, *

tti (mandatory)

ITU translation type.

Range:

0 - 255, *

nai (optional)

Nature of address indicator. This parameter is mandatory when gtixlat=24 is specified, and not specified when gtixlat=22 is specified.

Range:

0 - 63, *

Default:

Not set

np (optional)

Numbering plan. This parameter is mandatory when gtixlat=24 is specified, and not specified when gtixlat=22 is specified.

Range:*0 - 15, ****Default:**

Not set

npdd (optional)

New prefix digits to be deleted. The number of new prefix digits to be deleted. These digits will be replaced with the new prefix digits string (npds).

Range:*0 - 21***Default:***0***npds (optional)**

New prefix digits string. The new prefix digits string that will replace the received prefix digits string.

Range:*1 - 21 digits*

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are *0-9*

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are *0-9, a-f, A-F*

Default:

No digits

nsdd (optional)

New suffix digits to be deleted. This parameter identifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

Range:*0 - 21***Default:***0***nsds (optional)**

New suffix digits string. The new suffix digits string that will replace the received suffix digits string.

Range:*1 - 21 digits*

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are *0-9*

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are *0-9, a-f, A-F*

Default:

No digits

Example

The following example assigns an entry used for ANSI to ITU conversion where the conversion is from GTI 2 to GTI 2.

```
ent-gtcnv:dir=atoi:gtixlat=22:tta=10:tti=5
```

The following example assigns an entry used for ANSI to ITU conversion where the conversion is from GTI 2 to GTI 4. The nsdd parameter specifies that the last 3 digits are to be removed from the end of the address digits, and the nsds parameter specifies that the digits 123 are to be appended to the end of the remaining address digits.

```
ent-gtcnv:dir=atoi:gtixlat=24:tta=11:tti=7:nai=8:np=6:nsdd=3:nsds=123
```

The following example assigns an entry used for ITU to ANSI conversion where the conversion is from GTI 2 to GTI 2. The npdd parameter specifies that the first 3 digits are to be deleted from the beginning of the address digits, and the npds parameter specifies that the digits 407 should be appended to the beginning of the remaining address digits.

```
ent-gtcnv:dir=ittoa:gtixlat=22:tta=11:tti=7:npdd=3:npds=407
```

The following example assigns an entry used for ITU to ANSI conversion where the conversion is from GTI 2 to GTI 4. The nsds parameter specifies that the digits 45667 are to be appended to the end of the address digits.

```
ent-gtcnv:dir=ittoa:gtixlat=24:tta=11:tti=7:nai=8:np=6:nsds=45667
```

The following example assigns an entry used for ANSI/ITU conversion in both directions where the conversion is from GTI 2 to GTI 2.

```
ent-gtcnv:dir=both:gtixlat=22:tta=11:tti=7
```

The following example assigns an entry used for ANSI/ITU conversion where an incoming ANSI GTI 2 is converted to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2.

```
ent-gtcnv:dir=both:gtixlat=24:tta=12:tti=9:nai=6:np=4
```

The following example assigns a default entry for ANSI to ITU conversion where the conversion is from GTI 2 to GTI 2.

```
ent-gtcnv:dir=atoi:gtixlat=24:tta=*:tti=4:nai=6:np=5
```

The following example assigns a default entry for ITU to ANSI where the conversion is from GTI 2 to GTI 4. The npds parameter specifies that the digits 919 are to be appended to the beginning of the address digits.

```
ent-gtcnv:dir=ittoa:gtixlat=24:tta=17:tti=*:nai=*:np=*:npds=919
```

The following example specifies hexadecimal digits for the *npds* parameter.

```
ent-gtcnv:dir=atoi:gtixlat=22:tta=*:tti=4:npdd=3:npds=abcdef0123456789
```

The following example assigns a default entry for ITU to ANSI where the conversion is from GTI 2 to GTI 4. The npds parameter specifies that the digits 123 are to be appended to the beginning of the address digits and the nsds parameter specifies that the digits 407 are to be appended to the end of the address digits

```
ent -
```

```
gtcnv:dir=ittoa:gtixlat=24:tta=17:tti=*:nai=*:np=*:npds=123:nsds=407
```

Dependencies

The ANSI/ITU SCCP Conversion feature must be enabled before this command can be entered.

If the *gtixlat=22* parameter is specified, then the *nai* and *np* parameters cannot be specified.

If the `gtxlat=24` parameter is specified, then the `nai` and `np` parameters must be specified.

If the `dir=both` parameter is specified, then a wildcard value (*) cannot be specified for any of the other parameters.

If the `dir=atoi` parameter is specified, then a wildcard value (*) can be specified only for the `tta` parameter.

If the `dir=itoe` parameter is specified, then a wildcard value (*) must be specified for the `tti`, `np`, and `nai` parameters.

The specified `dir`, `tta`, `tti`, `np`, and `nai` parameter combination cannot already exist in the database.

The `nsdd/nsds` and `npdd/npds` parameters cannot be specified together in the command.

The Default Global Title Conversion table can contain a maximum of 1000 entries.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the `npds` and `nsds` parameters.

Notes

The use of asterisks (wildcards) is allowed only once for each direction of ANSI to ITU and ITU to ANSI. This provides a configurable default.

In the conversion direction of ANSI to ITU, an asterisk can be specified only for the ANSI `tta` parameter.

In the conversion direction of ITU to ANSI, the asterisk value must be specified for the `itu`, `tti`, `np`, and `nai` parameters.

Asterisks are not allowed when conversion is in both directions (`dir=both`).

The suffix digit manipulation parameters `nsdd` and `nsds` cannot be specified in the same command with the prefix digit manipulation parameters `npdd` and `npds` parameters. The `npdd` and `nsdd` parameters specify how many digits to delete, if any, from the beginning or end respectively of the Global Title address digits. The `npds` and `nsds` parameters specify what digits, if any, to append to the beginning or end respectively of the Global Title address digits.

The `gtxlat` parameter is expressed in the form of the ANSI GTI and the ITU GTI. The `gtxlat` parameter is used to indicate the conversion of the Global Title Indicator between the ANSI and ITU standards. For example: A `gtxlat` value of 24 converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2.

Output

```
ent-gtcnv:dir=atoi:gtxlat=22:tta=10:tti=5
```

```
rlghncxa03w 04-01-07 11:43:07 EST EAGLE 31.3.0

ent-gtmod

Use this command to enter GT Modification (GTMOD) data in the GTMOD table. The GTMOD entry consists of a GTMOD ID and GTMOD specific data. After the GTMOD ID is provisioned, it can be used in GTT and GTT Action commands.

Parameters

Note

Definitions for the feature options specified by the `on` and `off` parameters are located in the Notes section.

gtmodid (mandatory)

GTMOD identifier.

Range:

ayyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

cgpassn (optional)

Calling party subsystem number. This parameter specifies the calling party subsystem address that receives the message.

Range:

002 - 255

ngti (optional)

New global title indicator. This parameter specifies whether a new GTI translation format is type 2 or type 4.

Range:

2

4

nnaï (optional)

New nature of address indicator. The value that replaces the received NNAI.

Range:

0 - 127

nnp (optional)

New numbering plan. The value that is used to replace the received numbering plan.

Range:

0 - 15

npdd (optional)

Number of prefix digits to be deleted. The number of digits to be deleted from the prefix of the received GT address.

Range:

1 - 21

npds (optional)

New prefix digits string. The digits to be prefixed to the received GT address.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F

nsdd (optional)

Number of suffix digits to be deleted. The number of digits to be deleted from the suffix of the received GT address.

Range: 1 - 21

nsds (optional)

New suffix digits string. The digits to be suffixed to the received GT address.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F

ntt (optional)

New Translation type. This parameter specifies the value that replaces the received Translation Type.

Range:

0 - 255

off (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range:

gt0fill

on (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range:

gt0fill

precd (optional)

Precedence. This parameter specifies whether the prefix or suffix takes precedence while modifying the received GT address.

Range:***pfx***

if the npdd and npds parameters are specified

sfx

if the nsdd and nsds parameters are specified

Example

```
ent-gtmod:gtmodid=set1:npdd=5:npds=123:off=gt0fill:ntt=10
```

```
ent-gtmod:gtmodid=gtmodset4:npdd=5:npds=123:nsdd=2:
```

```
nsds=1234:ngti=4:on=gt0fill:nnai=12:nnp=5:precd=sfx
```

```
ent-gtmod:gtmodid=setntt:ntt=12
```

Dependencies

If the ngti=4 parameter is specified, then the nnp and nnai parameters must be specified.

If the ngti=2 parameter is specified, the nnp and nnai parameters cannot be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the ngti parameter can be specified.

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the npds or nsds parameters.

The GTMOD table cannot contain more than 100000 entries.

The GTMOD table is corrupt or cannot be found.

At least one optional parameter must be specified.

The AMGTT, AMGTT CdPA Only, or AMGTT CgPA Upgrade feature must be turned on before any parameter except the ntt parameter can be specified.

The value specified for the gtmodid parameter cannot already exist in the GTMOD table.

The combined digit length of the values specified for the npds and nsds parameters cannot be greater than 21.

If the npdd/npds and nsdd/nsds parameters are specified, then the precd parameter must be specified.

The gtmodid=none parameter cannot be specified.

If the precd parameter is specified, then the npdd, npds, nsdd, or nsds parameter must be specified.

If the on=gt0fill parameter is specified, then the ngti parameter must be specified.

The same value cannot be specified for the on and off parameters.

SSN configured for SFAPP cannot be used in any command for any configuration

Notes**on/off options**

- *gtOfill* —GT zero fill. Specifies whether the last 0 of the GTA is a treated as a valid digit (OFF) or as filler (ON) during GT Modification for the gti(x)=2 to gti(x)=4 scenario.

Output

```
ent-gtmod:gtmodid=set5:ngti=4:nnp=4:nnai=2:on=gt0fill
```

```
tekelecstp 10-03-08 14:43:31 EST EAGLE 42.0.0
```

```
GTMOD table is (2 of 50000) 1% full
```

```
ENT-GTMOD: MASP A - COMPLTD
```

ent-gtt

Use this command to add the routing object, DPC, and subsystem number for messages requiring global title translation. The translation is performed on the basis of the global title address (GTA) and translation type (TT) for each SS7 SCCP message directed to the STP's self-identity DPC or CPC with a routing indicator of 0, indicating a GTT is required.

Note

If the EGTT feature is turned on, then the GTT Selector (`ent/chg/dlt/rtrvgttset`), GTT Set (`ent/dlt/rtrv-gttset`), and GTA (`ent/chg/dlt/rtrvgta`) commands replace the Translation Type (`ent/dlt/rtrv-tt`) and Global Title Translation (`ent/chg/dlt/rtrv-gtt`) commands. It is not recommended to run `ent/dlt/rtrv-tt` & `ent/chg/dlt/rtrv-gtt` commands as it may cause the advance GTA fields of GTT entry to be reset to the default values.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

gta (mandatory)

Global title address. The beginning of a range of global title digits.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

pc (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

pca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code 000-000-000 is not a valid point code.

pc/pca/pci/pcn/pcn24 (mandatory)

Point code.

pci (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

pcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000–255

ssa—000–255

sp—000–255

ri (mandatory)

Route indicator. This parameter specifies whether a subsequent global title translation is required.

Range:

gt

Subsequent translation is required.

ssn

Subsequent translation is not required.

xlat (mandatory)

Translate indicator. The type of global title translation to be performed.

Range:

dpc

dpcssn

dpcngt

cggmtmod (optional)

Calling party GT modification indicator. This parameter specifies whether calling party global title modification is required.

Range:

yes

no

Default:

no

egta (optional)

Global title end address. The end of a range of global title digits.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default:

the gta value

force (optional)

When a final GTT is specified, the DPC and subsystem number must be configured in the mated application table (xlat=dpc and ri=ssn). The force=yes parameter overrides this restriction.

Range:

yes

no

Default:

no

gtmodid (optional)

Global title modification identifier.

Range:

aaaaaaaa

1 leading alphabetic character followed by up to 8 alphanumeric characters

Default:

none

loopset (optional)

SCCP loopset name. This parameter associates a translation set with a loopset.

Range:

aaaaaaaa

1 alphabetic character followed by up to 7 alphanumeric characters.

none —There is no association between the translation set and any loopset

Default:

none

mapset (optional)

MAP set ID.

Range:

1 - 36000, dflt

dflt —Default MAP set

mrnset (optional)

MRN set ID.

Range:

1 - 3000, dflt, none

dflt —Default MRN Set ID

none —Removes the specified MRN Set ID from the MRN table

ssn (optional)

Subsystem number. The subsystem address that will receive the message.

This parameter is required and can only be specified if the xlat=dpcssn parameter is specified.

Range:

002 - 255

ttn (optional)

Translation type name. The name is of local significance only, and is related to the translation type.

Range:

ayyyyyyy

1 alphabetic character followed by up to 8 alphanumeric characters

Default:

No translation name is given

type/typea/typei/typen/typen24/typeis/typens (optional)

Translation type. This parameter identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The type and typea parameters specify an ANSI network.

The typei parameter specifies an ITU-international network.

The typen parameter specifies an ITU-national network.

The typen24 parameter specifies a 24-bit ITU-national network.

The typeis parameter specifies an ITU-international spare network.

The typens parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as an ANSI type (type/typea) and as an ITU type (typei/typen/typen24/typeis/typens). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range:

000 - 255

Default:

No translation type is specified

Example

The lines in the following examples are wrapped for readability:

ent-gtt:xlata=dpc:ri=gt:pcn=s-111:gta=123456:typens=5

```

Dependencies

The end address must be greater than or equal to the start address.

The *pcn* parameter format must match the format that was assigned with the *chg-stpopts:npcfmti* parameter.

Point code entries must be full point codes. Partial point codes are not allowed.

The start global title address length must be equal to the number of digits specified by the given translation type. If the VGTT (variable length GTT) feature is turned on, then up to 10 GTA lengths per translation type can be provisioned. When this command is entered to create entries, the software keeps track of the lengths and allows only 10 different lengths. The global title address specified for the translation type must then have the same number of digits as an existing GTA.

If the end global title address is specified, its length must equal the length of the start global title address.

The maximum length of the resulting GTA string must not exceed 21 digits when translation is complete.

If the translation type is specified, then it must already exist and cannot be an alias.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated PC and a translation type in different network types can be specified.

When the translated point code is of type ANSI, the `ngt.i` parameter of the referred GTMOD cannot have a value of 4. For ANSI PCs, the `ngt.i` parameter must have a value of 2.

The range, as specified by the start and end global title addresses, cannot exist in the global title translation data for the specified translation type. Each range may be contained completely within a previously defined range, in which case splitting is performed. However, if the ranges overlap, splitting cannot occur, the command is rejected, and a list of overlapped global title addresses is displayed. An example follows that shows what happens when the user attempts to enter a global title address range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, error message E2401 is generated displaying the list of overlapped global title addresses:

```
The following GTA ranges overlap the input GTA range
START GTA END GTA 8005550000 8005551999 8005552000 8005553999 8005554000
8005555999 ENT-GTT: MASP A - Command Aborted
```

If a final GTT is specified with the `ri=ssn` parameter and the `xlat=dpc` parameter, and if the value of the `force` parameter is not yes, the point code must be configured in the Remote Point Code/MAP Table.

The `xlat=dpcssn` parameter must be specified before the `ssn` parameter can be specified.

If the `xlat=dpcssn` parameter is specified, then the `ssn` parameter must be specified.

[Table 4-24](#) shows the valid combinations for the `xlat`, `ri`, and `ssn` parameters. All other combinations are rejected.

Table 4-24 Valid ent-gtt Routing Parameter Combinations

XLAT Value	RI Value	Routing Action	SSN Value
DPC	GT	Translate DPC only and route on GT	Cannot specify
DPC	SSN	Translate DPC only and route on SSN	Cannot specify
DPCSSN	GT	Translate DPC and SSN and route on GT	Must specify
DPCSSN	SSN	Translate DPC and SSN and route on SSN	Must specify
DPCNGT	GT	Translate DPC only and route on GT	Cannot specify

If the XGTT feature is enabled, then the GTT table can have up to either 400,000 or 1,000,000 entries, depending on the controlled feature Part Number that is enabled. If XGTT is not enabled, then the GTT table can contain up to 269,999 user entries.

To enter this command, the Remote Point Code table cannot be full.

To enter this command, the subsystem table for primary remote point codes cannot be full.

If the `ri=ssn` parameter is specified, the `mrnset` parameter cannot be specified.

If the Flexible GTT Load Sharing feature is enabled, the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

The Flexible GTT Load Sharing feature must be enabled before the `mrnset` parameter can be specified.

If the `ri=gt` parameter is specified, then the `mrnset` parameter must be specified.

The MRN table is corrupt or cannot be found.

If the `ri=gt` parameter is specified, the `mapset` parameter cannot be specified.

The Flexible GTT Load Sharing feature must be enabled before the `mapset` parameter can be specified.

The `mapset` parameter can only be specified if the Flexible GTT Load Sharing feature is enabled, and the `ri=ssn` parameter is specified. If the `ri=ssn` parameter is specified, the `mapset` parameter must be specified. If the `ri=gt` parameter is specified, the `mapset` parameter cannot be specified.

The specified PC and SSN must exist in the specified MAP set.

At least one entry must be provisioned in the specified MAP set in the MAP table.

If the `xlat=dpc` parameter is specified, and the `force` parameter is not specified as `yes`, the specified PC and MAP set must exist in the MAP table.

The MAP table is corrupt or cannot be found.

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the `gta` or `egta` parameters.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The value of the `loopset` parameter must already exist in the database.

The `tt` or the `ttn` parameter must be specified.

The value specified for the `pc/pca/pci/pcn/pcn24` parameter must be a valid point code.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The value of the `loopset` parameter must exist in the Loopset table.

If the value of the `pc/pca/pci/pcn/pcn24` parameter is the True Point Code, then the `xlat=dpcssn` parameter and the `ri=ssn` parameter must be specified.

If the `ssn` parameter is specified, and if the value of the `pc/pca/pci/pcn/pcn24` parameter is the True Point Code, then the value of the `ssn` parameter must exist in the SS-APPL table.

The value of the `pc/pca/pci/pcn/pcn24` parameter must exist as a destination in the ordered route entity set or must reside in a cluster (ANSI only) that exists as a destination in the ordered route entity set (for global title routing).

If the VGTT feature is turned on, then up to 10 GTA lengths can exist per translation type. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA lengths can exist per translation type.

The value of the `tt` parameter must not be defined as an alias.

If both the translation type (`tt`) and translation type name (`ttn`) are specified, the translation type name (`ttn`) must match that of the specified translation type (`tt`).

If the `tt` parameter is not specified, then the value of the `ttn` parameter must match the value of a `tt` parameter in the STP database.

If the `xlat=dpcngt` parameter is specified, then the `ri=gt` parameter must be specified.

The site identification table is corrupt or cannot be found.

The Route table is corrupt or cannot be found.

The Loopset table is corrupt or cannot be found.

The database is corrupt or cannot be found.

The GTT table cannot be full.

The value specified for the `pc` parameter cannot be associated with a proxy point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cgtmod` parameter can be specified.

The GTT set associated with the translation type specified by the `ttn` parameter must have a set type of `cdgta` (see the `ent-gttset` command).

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

The GTMOD table is corrupt or cannot be found.

The `gtmodid=none` parameter cannot be specified.

The network domain of the translation type specified by the `ttn` parameter cannot be CROSS (see the `ent-gttset` command).

The `ttn=none` parameter cannot be specified.

The length of the specified `gta` parameter must match the number of digits provisioned for the specified GTT set (`gttsn`) when the VGTT feature is turned off. If the VGTT feature is turned on, then up to 10 GTA lengths can exist per GTT set. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA lengths can exist per GTT set.

SSN configured for SFAPP cannot be used in any command for any configuration

Notes

The routing indicator provides routing instructions to the receiving signaling point. If the routing indicator specifies global title, global title translation then needs to be performed at another signaling point.

Up to 200,000 entries are allowed for an individual translation type if all SCCP cards are E5-TSM cards or DSM cards.

The ANSI point code 0 and the ITU-I point code 0-000-0 are not valid point codes.

The EAGLE does not require a MAP table entry to be configured prior to provisioning a GTT entry. The EAGLE assumes that the GTT entry is for a solitary point code/subsystem and automatically creates a MAP entry for the point code/subsystem.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

When the Flexible GTT Load Sharing (FGTTLS) feature and the Intermediate GTT Load Sharing feature are on, multiple relationships can be defined among a set of destination point codes in the MRN table that exists in the EAGLE. The relationship used in a particular translation is based on the GTA digits used for translation. The MRN set and the post-translation PC creates a key that is used to perform lookups in the MRN table. The lookup results in a set of alternate PCs, one of which is selected, based on the PCs relative cost, to route the MSU in the most cost-effective way.

The FGTTLS feature introduces the `mrnset` parameter. The MRNSET and post-translation PC create a key that is used to perform lookup tasks in the MRN table. This lookup results in a set of alternate PCs, from which one is selected, based on the PCs relative cost, to route the MSU in the most cost-effective way.

When the FGTTLS feature is turned on, multiple relationships can be defined among set of PC/SSNs in the existing MAP table. The relationship used in a particular translation is based on the GTA digits used for translation.

When the FGTTLS feature is ON, the `mapset` parameter is used. The MAP set and PC/SSN creates a key that is used to perform lookup tasks in the MAP table. The lookup into the MAP table results in a set of mate PC/SSNs, from which one is selected to route the MSU in the most cost-effective way.

If the AMGTT feature is turned off, then the Default GT Conversion Table is used for conversion.

A loopset consists of a set of point codes that form a routing loop in the network. If the SCCP Loop Detection feature is enabled, then the loopset can be associated with or disassociated from specified translation entries. Loopsets that are associated with translation entries are checked during intermediate and final GTT traffic routing. If a loop exists, then the system can be notified with or without discarding the associated traffic.

If the OBSR or FLOBR feature is turned on, then this command can provision only translation entries with a set type of CdGTA.

If the EGTT feature is turned on, then the following occurs:

- For ANSI, if the GTT selector of a true entry is deleted using the `dlt-gttset` command, then a GTT entry cannot be created for that translation type.
- For ITU, if a true GTT selector entry (GTI=2 or GTI=4) is deleted using the `dlt-gttset` command, or if the GTT set name of an entry is changed using the `chg-gttset` command, then a GTT entry cannot be created for that translation type.

Output

ent-gttact

Use this command to enter a Global Title Translations (GTT) Action entry. A GTT Action entry consists of an Action ID, an action, and action-specific data. The action specified in the entry determines the actions performed the MSU during translation.

Parameters

Note

Definitions for the feature options specified by the `on` and `off` parameters are located in the Notes section.

act (mandatory)

Action. The action applied to the message.

Range:

disc

discard message with no return error

dup

route a copy of the message to a specified duplicate node

fwd

route the original message to a specified forward node instead of the destination indicated by the GTT/ DB data

scpval

perform the SCCP MAP validation on MO/MT-FSM messages

sflog

send a copy of original message to SFLOG card

sfthrot

discard message if threshold exceeded

srvc

apply service (GPORT/GFLEX/SMSMR) on the message

tcaperr

discard message that has a specified TCAP error

udts

discard message and send UDTS/XUDTS

sfapp

route message to SFAPP card

actid (mandatory)

This parameter specifies the Action ID associated with the GTT action entry.

Range:

ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

atcaperr (optional)

ANSI TCAP Error Cause. The reason for discarding the message containing the ANSI TCAP portion that is associated with the TCAPERR GTT Action.

Range:

0 - 255

atirescgmodid (optional)

Calling party global title modification identifier for ATI. The GTMOD ID to be associated with the calling party of a SFAPP GTT Action entry.

Range:

ayyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

Default:

None

bursts (optional)

This parameter signifies the number of previous 30-second windows from which the unused capacity can be carried over to the current window.

Range:

0 - 2

Default:

0

cdgtmodid (optional)

Called party global title modification identifier. The GTMOD ID to be associated with the called party of a GTT Action entry.

Range:

ayyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

Default:

None

cggtmodid (optional)

Calling party global title modification identifier. The GTMOD ID to be associated with the calling party of a GTT Action entry.

Range:

ayyyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

Default:

None

cgpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

cgpca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

cgpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

cgpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

cgpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

cgpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p, 000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

cgpcogmsg (optional)

The data that is used as the Calling Party Point Code in the outgoing message.

Range:

dflt

Default. The standard Global Title Translation process supplies the CgPA PC.

cgpcicmsg

CgPA PC data from the incoming MSU

opcicmsg

OPC data from the incoming MSU

provcgpc

provisioned CGPC/CGPCA/CGPCI/CGPCN/CGPCN24/CGPCN16 data in the GTT Action

remove

CGPC will be removed from outgoing MSU

Default:

dflt

defactid (optional)

Default Action ID. The default action that is performed when the *fwd* GTT Action fails to route the MSU or when the *sfthrot* or *scpval* GTT Action fails.

Range: ayyyyyyyy

1 leading alphabetic character followed by 8 alphanumeric characters

The *defactid* parameter can take one of the following values:

- GTT Action ID with a GTT Action of *disc*, *udts*, or *tcaperr* (see the *act* parameter). This value must already be defined in the GTT Action table.
- *fallback* —The MSU is routed using routing data in the translated MSU when action is *fwd* . When action is set to *scpval/sfthrot*, the MSU is discarded.

Default:

fallback

failactid (optional)

Fail Action ID. The default action that is performed to route the message when the VLR Validation fails on Stateful App.

Range:

aaaaaaaa

1 leading alphabetic character followed by 8 alphanumeric characters

The *failactid* parameter can take one of the following values:

- GTT Action ID with a GTT Action of *disc*, *udts* or *tcaperr* (see the *act* parameter). This value must already be defined in the GTT Action table.
- *fallback* -The MSU is discarded.

Default:

fallback

fdggtt (optional)

Forward GTT. The forward GTT Action ID that is to be used to route the MSU.

Range:

aaaaaaaa

hlraddr (optional)

It is used to address the HLR for the ATI message.

Range:

USECDPA --- Use the CDPA GTA from the query message

TCAPPARM --- GTT translation shall be performed on MAP Parameter. MAP parameter will be used in SCCP CDPA for GTT translation

FWDACT --- Route the message to a specified forward node indicated in FWD GTT Action ID

Default:*USECDPA***itcaperr (optional)**

ITU TCAP Error Cause. The reason for discarding the message containing the ITU TCAP portion that is associated with the TCAPERR GTT Action.

Range:*0 - 255***loopset (optional)**

SCCP loopset name. The loopset associated with a GTT action.

Range:*ayyyyyyy*

1 leading alphabetic character and up to 7 following alphanumeric characters.

none —There is no association between the screening action and any loopset.

Default:*none***mapset (optional)**

MAP Set ID. This parameter specifies the Mated Application Set ID.

Range:*1 - 36000, dflt*

dflt —Default MAP set

mrnset (optional)

MRN Set ID. The Mated Relay Node Set ID.

Range:*1 - 3000, dflt, none*

dflt —Default MRN Set ID

none —The GTT Action does not participate in any load sharing.

ndgt (optional)

Number of digits to be matched. This parameter is used to specify the number of digits that must be matched between the SCCP parameter and MAP parameter.

Range:*1 - 21, all*

all —All the digits present in the SCCP parameter and MAP parameter are matched.

Default:*all***off (optional)**

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range:*uimreqd**useicmsg*

handlresp**on (optional)**

Enables or turns on the specified feature options. A comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range:*uimreqd**useicmsg**handlresp***pc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:*pca***Range:***p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code 000-000-000 is not a valid point code.

pci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:*s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps**zone—0-7**area—000-255**id—0-7*

The point code 0-000-0 is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s-*, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

pcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p*

*un---*000---127

*sna---*000---15

*mna---*000---31

psirescgmodid (optional)

Calling party global title modification identifier for PSI. The GTMOD ID to be associated with the calling party of a SFAPP GTT Action entry.

Range:

ayyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

Default:

None

ri (optional)

Routing indicator. The routing indicator in the SCCP called party address of the duplicated copy of MSU.

Range:

gt

ssn

route by subsystem number

Default:

ssn

scfaddr (optional)

GSM SCFAddressparameter must be specified when sfapp action needs to be performed.

Range:

2 digits - 18 digits

snaï (optional)

The service nature of address indicator.

Range:

Sub --- Subscriber Number

Natl --- National significant number

intl --- International number

rnidn --- Routing number prefix and international dialed/directory number

rnndn --- Routing number prefix and national dialed/directory number

rnsdn --- Routing number prefix and subscriber dialed/directory number

ccrndn --- Country code, routing number, and national directory number

snp (optional)

The service numbering plan.

Range:

e164 --- E.164 numbering plan

e212 --- E.212 numbering plan

e214 --- E.214 numbering plan

sprm (optional)

SCCP Parameter. This parameter is used to determine whether the SCCP GTA, NP, and NAI (if GTI=4 and NP/NAI is present) will be picked up from CDPA or CGPA and used for comparison.

Range:

CDPA --- SCCP CDPA GTA, NP, and NAI (if GTI=4 and NP/NAI is present) will be used for comparison

CGPA --- SCCP CGPA GTA, NP, and NAI (if GTI=4 and NP/NAI is present) will be used for comparison

Default:

CDPA

svccerr (optional)

The action to be taken when the Service triggered by GTT Action Service fails. The MSU can be processed by either applying the results of the pre-Service GTT, or continue with the specific Service error.

Range:

SRVC --- Continue with specific service error

GTT --- Apply the result of pre-GTT service

Default:

SRVC

srvcname (optional)

Service to be applied on the MSU when *act* is set to *svrc*.

Range:

GFLEX, *GPORT*, *SMSMR*

ssn (optional)

Subsystem number. The subsystem number in the SCCP called party address of the MSU.

Range:

2 - 255

Default:

none

threshold (optional)

If the number of MSUs serviced by the SFTHROT action exceeds this value, MSUs are discarded.

Range:

1- 42949676295

Default:

1

tprm (optional)

TCAP Parameter. This parameter is used to determine whether the MAP digits, NP, and NON (if NP and NON are present) will be picked up from SMRPDA or SMRPOA and used for comparison.

Range:

SMRPDA --- MAP digits, NP, and NON (if NP and NON are present) from SMRPDA will be used for comparison

SMRPOA --- MAP digits, NP, and NON (if NP and NON are present) from SMRPOA will be used for comparison

Default:

SMRPDA

tt (optional)

New Translation Type

Range:

0 - 255

udtserr (optional)

UDTS Error Cause. The reason associated with the UDTS GTT Action for discarding the message.

Range:

0 - 255

valtype (optional)

Validation Type. This parameter is used to decide whether SCCP/TCAP parameter should be used for the validation of the MSU or IR21.xml file data should be used for the validation of the MSU. This parameter is mandatory when act=scpval.

Range:

sccptotcap

ir21totcap

Dependencies

A value of *disc*, *udts*, *tcaperr*, *scpval*, or *sfapp* must be specified for the *act* parameter before a value of *uimreqd* can be specified for the *on* or *off* parameter.

The GTT Action table cannot contain more than 2000 entries.

The GTT Action table is corrupt or cannot be found.

If a value of *dup* or *fwd* is specified for the *act* parameter then the *pc/pca/pci/pcn/pcn24/pcn16* parameter must be specified.

If the *ri=ssn* parameter is specified, then the *ssn* parameter must be specified.

If the value of the *cgpcogmsg=provcgpc* parameter is specified, then the *cgpc/cgpc/cgpci/cgpcn/cgpcn24/cgpcn16* parameter must be specified.

The *sprm* and *tprm* parameters must be specified when *act* is set to *scpval*.

If the *hlraddr=tcapparm* parameter is specified, then the *tt* parameter must be specified.

If the *hlraddr=fwdact* parameter is specified, then the *fwdgtt* parameter must be specified.

The GTT Action - DISCARD feature must be enabled before a value of *disc*, *udts*, or *tcaperr* can be specified for the *act* parameter.

The GTT Action - DUPLICATE feature must be enabled before the *act=dup* parameter can be specified.

The specified PC and SSN must already exist in the specified MAP set.

If the *ri=ssn* parameter is specified, then the *mrnset* parameter cannot be specified.

The Flexible GTT Load-Sharing feature must be enabled before the *mrnset* parameter can be specified.

If the *ri=gt* parameter is specified, then the *mapset* parameter cannot be specified.

The Flexible GTT Load Sharing feature must be enabled before the `mapset` parameter can be specified.

The specified MAP set must already exist in the database.

The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, the specified PC must already exist in the specified MRN set.

The point code specified for the `pc/pca/pci/pcn/pcn24/pcn16` and `cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16` parameters must be within the range specified by the parameter definition.

The point code specified for the `pc/pci/pcn/pcn24/pcn16` parameter must be a full point code.

A value of *dup* or *fwd* must be specified for the `act` parameter before the `pc/pca/pci/pcn/pcn24/pcn16`, `cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16`, `ssn`, `ri`, `mrnset`, `mapset`, `loopset`, `cgpcogmsg`, `cdgtmodid`, or `cggmodid` parameter can be specified and before a value of *useicmsg* can be specified for the `on` or `off` parameter.

The `act=tcaperr` parameter must be specified before the `atcaperr` and `itcaperr` parameters can be specified.

The `act=udts` parameter must be specified before the `udtserr` parameter can be specified.

The `act=fwd/sfthrot/scpval/sfapp` parameter must be specified before the `defactid` parameter can be specified.

The Service Numbering Plan (*snp*), Service Nature of Address Indicator (*snai*), Service name (*svcname*) and Service Error Cause (*svcerr*) parameters can only be specified if action type is *svrc*.

The `threshold` or `bursts` parameter can only be specified when `act=sfthrot` is specified.

The `tprm`, `sprm`, and `ndgt` parameters can only be specified if action type is *scpval/sfapp*.

The `scfaddr`, `hlraddr`, `tt`, `failactid` and `fwdggt` parameters can only be specified if action type is *sfapp*.

A value of *none* or *fallback* cannot be specified for the `actid` parameter.

The GTT Action entry specified by the `actid` parameter cannot already exist in the database.

If the value specified for the `pc/pca/pci/pcn/pcn24/pcn16` parameter is the STP true point code, then the value specified for the `ssn` parameter must already exist in the SS-APPL table.

The value specified for the `pc/pca/pci/pcn/pcn24/pcn16` parameter must already exist as a destination in the Route table.

The value specified for the `pc` parameter cannot be associated with a proxy point code.

The MAP table is corrupt or cannot be found.

If the `pc/pca/pci/pcn/pcn24/pcn16`, `ri=ssn` and `ssn` parameters are specified, then the PC/SSN must be populated in the SCCP Application entity set (Remote Point Code/MAP Table).

The SS-APPL table is corrupt or cannot be found.

The Route table is corrupt or cannot be found.

The STP Self-identity table is corrupt or cannot be found.

The MRN table is corrupt or cannot be found.

If the value specified for the `pc/pca/pci/pcn/pcn24/pcn16` parameter is the STP's true point code, then the `ri=ssn` parameter must be specified.

The value specified for the `loopset` parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The Loopset table is corrupt or cannot be found.

The GTT Action - FORWARD feature must be enabled before the `act=fwd` parameter can be specified.

The GTMOD table is corrupt or cannot be found.

The value specified for the `pc/pca/pci/pcn/pcn24/pcn16` parameter must be a point code that is already associated with a valid route.

The AMGTT feature must be enabled before the `cggtmodid` parameter can be specified.

The value specified for the `cdgtmodid` and `cggtmodid` parameters must already exist in the GTMOD table.

A value of *none* cannot be specified for the `cdgtmodid` or `cggtmodid` parameter.

A value of *disc*, *utds*, or *tcaperr* must be specified for the `defactid/failactid` parameter.

The GTT Action ID specified by the `defactid` or `failactid` parameter must already exist.

The values specified for the `pc/pca/pci/pcn/pcn24/pcn16` and `cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16` parameters must have the same domain.

The `loopset=none` parameter cannot be specified.

The `defactid=none` or `failactid=none` parameter cannot be specified.

The same value cannot be specified for the `on` and `off` parameters.

The `snp`, `snaI`, and `srvcname` parameters must be specified when `act` is set to *srvc*.

The GFLEX Feature must be activated if the GFLEX service is entered with the SRVCNAME parameter.

The GPORT Feature must be activated if the GPORT service is entered with the SRVCNAME parameter.

When the service specified is GFLEX, SNAI must be specified as subscriber, national or international.

The Portability Check for Mobile Originated SMS feature/PPSMS feature must be turned ON, or the MO SMS ASD/MO SMS B-Party Routing/MO SMS GRN/MO SMS IS41-to-GSM Migration/MO-based GSM SMS NP/MO-based IS41 SMS NP feature must be ENABLED before the SMSMR Service is entered with SRVCNAME parameter.

When service is specified as GPORT or SMSMR, the SNP must be specified as E164.

The GTT Action - FORWARD/DISCARD/DUPLICATE feature must be enabled before the `act=srvc` parameter can be specified.

The GTT destination must exist in the DSTN table.

More than 32 SFTHROT GTT Actions are not permitted.

A value of *fwd*, *dup*, or *scpval* must be specified for the *act* parameter before a value of *useicmsg* can be specified for the *on* or *off* parameter.

The EGTT feature must be on before the SCPVAL GTT Action can be entered.

A value of *none* cannot be specified for the *atirescgmodid* and *psirescgmodid* parameter.

The value specified for the *atirescgmodid* and *psirescgmodid* parameters must already exist in the GTMOD table.

AMGTT feature must be enabled, if *atirescgmodid* or *psirescgmodid* is specified.

Notes

on/off options

- *uimreqd* —UIM required. Specifies whether a UIM should be generated.
- *useicmsg* —Use Incoming Message. Specifies whether to apply GTT Action data to the message as the message was received (OFF) or after any EPAP or GTT translation/modification data has been applied (ON).
- *handlresp* —Specifies whether the ATI/PSI response will be sent to SFAPP card or not.

GTI, TT and NPDS must be provisioned in GTMOD table to associate *gtmodid* with *ATIRESCGMODID* or *PSIRESCGMODID*.

ent-gttapath

Use this command to enter a GTT Action path entry. A GTT Action path consists of pairs of "setname + value" for Opcode/CgGTA/CdGTA. Each "setname + value" pair must already be defined in the GTT translation table.

Parameters

gttpn (mandatory)

GTT Path name.

Range:

ayyyy

1 leading alphabetic character and up to 4 following alphanumeric characters

acn (optional)

Application context name. The ITU TCAP *acn* field in the incoming MSU.

Range:

0 - 255, none

none—there is no ITU TCAP *acn* field in the incoming MSU

cdgta (optional)

Called Party Global Title Address.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F

cdgttsn (optional)

GTT set name (CDPA type).

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters

cggta (optional)

Calling Party Global Title Address.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F

cgttsn (optional)

GTT set name (CGPA type).

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters.

family (optional)The ANSI TCAP *family* field in the incoming MSU.**Range:**

0 - 255, none

none —there is no value in the ANSI TCAP *family* field in the incoming MSU**opcode (optional)**This parameter specifies the TCAP *opcode* field in the incoming MSU.**Range:**

0 - 255, none

none—there is no value in the TCAP *opcode* field in the incoming MSU**opgttsn (optional)**

GTT set name (Opcode type).

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters

pkgtype (optional)

The ANSI and ITU TCAP package type.

Range:***ituuni***

ITU unidirectional

qwp

Query with Permission

qwop

Query without Permission

resp

Response

cwp

Conversation with Permission

cwop

Conversation without Permission

any

Wildcard value

bgn

Begin

end

End

cnt

Continue

ituabort

ITU abort

ansiabort

ANSI abort

ansiuni

ANSI unidirectional

ANSI TCAP Package Types—*ansiuni*, *qwp*, *qwop*, *resp*, *cwp*, *cwop*, *ansiabort*, *any*ITU TCAP Package Types—*bgn*, *ituabort*, *ituuni*, *any*, *end*, *cnt***Example**

ent-

```
gttapath:gttpn=path1:opgttsn=opsn1:acn=111-111-111-111-111-111-111:

: cggtsn=cgsn3:cggta=987654:cdgttsn=cdsn1:cdgta=123456
```

Dependencies

If the `family` parameter is specified, then a value of *ansiuni*, *qwp*, *qwop*, *resp*, *cwp*, *cwop*, *ansiabort*, or *any* must be specified for the `pkgtype` parameter.

If the `acn` parameter is specified, then a value of *bgn*, *ituabort*, *ituuni*, *any*, *end*, or *cnt* must be specified for the `pkgtype` parameter.

If the `pkgtype=ituabort` parameter is specified, then a value of *none* must be specified for the `acn` and `opcode` parameters.

If the `pkgtype=ansiabort` is specified then a value of *none* must be specified for the `family` and `opcode` parameters.

The `opcode`, `pkgtype`, and `family` parameters must be specified together for ANSI TCAP translations. The `opcode`, `pkgtype`, and `acn` parameters must be specified together for ITU TCAP translations.

If the `family` and `opcode` parameters are specified in the command, then both parameters must have a value of *none* or neither parameter can have a value of *none*.

The GTA table is corrupt or cannot be found.

The GTT DBMM table is corrupt or cannot be found.

A value of *none* cannot be specified for the `opgttsn`, `cggttsn`, or `cdgttsn` parameter.

The GTT Action Path table cannot contain more than 10000 entries.

The GTT Action Path table is corrupt or cannot be found.

The path specified cannot already exist in the GTT Action Path table.

The `acn` and `family` parameters cannot be specified together in the command.

The GTT Action - DISCARD, GTT Action - FORWARD, or GTT Action - DUPLICATE feature must be enabled before this command can be entered.

A translation entry corresponding to the specified (`opgttsn` + `opcode` + `pkgtype` + `acn/family`)/(`cggttsn` + `cggtta`)/(`cdgttsn` + `cdgtta`) parameters must already exist.

At least one GTT set-value combination must be specified.

The value specified for the `opgttsn`, `cggttsn`, or `cdgttsn` parameter must match an existing GTT setname.

The GTT set name specified by the `opgttsn`, `cggttsn`, and `cdgttsn` parameters must have set types of `opcode`, `cggtta`, and `cdgtta`, respectively.

The GTT Set table must be accessible.

The GTA value specified by the `cggtta` or `cdgtta` parameter must be the start GTA in the translation entry.

The GTT path name specified by the `gttpn` parameter must not exist in the GTT Action Path table.

The value specified for the `gttpn` parameter cannot be a reserved word.

Output

```
ent-  
gttpath:gttpn=path2:cggtttn=cgsn2:cggta=45673:opgttn=opsn2:opcode=12  
4:family=2: pkgtype=ansiuni
```

ent-gttaset

Use this command to enter a Global Title Translations (GTT) Action Set. A GTT Action Set consists of an Action Set name and a group of actions. The specified actions determine what actions that applied to the MSU during translation.

Parameters

Note

Definitions for the feature options specified by the on and off parameters are located in the Notes section.

actsn (mandatory)

GTT Action Set Name.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters

actid1 (optional)

GTT Action ID 1. The first action ID associated with the GTT action set.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters

actid2 (optional)

GTT Action ID 2. The second action ID associated with the GTT action set.

Range:

ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid3 (optional)

GTT Action ID 3. The third action ID associated with the GTT action set.

Range:

ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid4 (optional)

GTT Action ID 4. The fourth action ID associated with the GTT action set.

Range:

ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid5 (optional)

GTT Action ID 5. The fifth action ID associated with the GTT action set.

Range:

ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid6 (optional)

GTT Action ID 6. The sixth action ID associated with the GTT action set.

Range:

ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

off (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range:

testmode

on (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range:

testmode

Example

```
ent-gttaset:actsn=asetdisc1:actid1=disc1
```

```
ent-gttaset:actsn=aset2:actid1=dup1:actid2=disc1
```

```
ent-gttaset:actsn=aset3:actid1=actfwd:actid2=actdup1:on=testmode
```

ent-gttaset:actsn=aset4:actid1=dup1:actid2=actsrv

ent-gttaset:actsn=aset5:actid1=dup1:actid2=scpval1:actid3=fwd1

Dependencies

The GTT Action table must be accessible.

The Action ID specified by the actid1/actid2/actid3/actid4/actid5/actid6 parameter(s) must already exist in the GTT Action table.

At least one Action ID in the Action Set must be associated with an action other than *none* or *fallback*.

The value specified by the actid parameter cannot already exist in a GTT Action Set.

The GTT Action Set table cannot contain more than 20000 entries

Failure while reading the GTT Action Set table.

The actsn=none parameter cannot be specified.

Only one Action ID in an Action Set can be associated with an action of *disc*, *udts*, *srv*, *sflog*, *sfthrot*, or *tcaperr*.

If an Action ID associated with an action of *fwd* is specified, then no other Action ID in the Action Set can be associated with an action of *disc*, *udts*, *tcaperr*, *srv*, or *fwd*.

If an Action ID associated with an action of *srv* is specified, then no other Action ID in the same Action Set can be associated with an action of *fwd*, *disc*, *udts*, *tcaperr*, or *srv*.

If the Action Set contains 5 Action IDs associated with an action of *dup*, then the remaining action ID cannot be associated with an action of *dup*.

Action IDs associated with an action of *disc*, *udts*, *tcaperr*, or *fwd* must be the last actions in an Action Set.

Action IDs associated with an action of *sfthrot* must be the first action in an Action Set.

If the Action Set contains 2 Action IDs associated with an action of *scpval*, then the remaining Action ID cannot be associated with an action of *scpval*.

One of the optional parameters must be specified.

The actid1/actid2/actid3/actid4/actid5/actid6 parameters must each specify a unique GTT Action ID in the command.

The EGTT feature must be on before this command can be entered.

The same values cannot be specified for the on and off parameters.

A maximum of 2 SCPVAL GTT Actions are allowed in an Action Set. Both Action Sets should have a different combination of SPRM and TPRM.

Notes

on/off options

- *testmode* —invokes a field-safe Test Tool used to debug the GTT Action Set rules

Output

```
ent-

ent-gttset

Use this command to assign applicable global title selectors to a GTT set for enhanced global title translations. If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Parameters

Note

The nature of address indicator parameters (naiv or nai) and the numbering plan parameters (npv or np) can be specified using a mnemonic or an explicit value. Either the mnemonic or the explicit value can be specified; however, both values cannot be specified at the same time for the same parameter. [NAIV/NAI Mapping](#) shows the mapping between the naiv and nai values. [NPV/NP Mapping](#) shows the mapping between the npv and np values.

gti/gtia/gtii/gtin/gtin24/gtiis/gtins/gtin16 (mandatory)

Global title indicator.

For all EGTT selector commands, the domain is defined as GTI and GTIA (ANSI), GTII (ITU international), GTIN (ITU national), GTIN24 (24-bit ITU national), GTIIS (ITU international spare), GTINS (ITU national spare) and GTIN16 (16-bit ITU National).

For the selector commands, `gti` and `gtia` are equivalent. GTT selectors can be provisioned for the same translation type (TT) with different ITU domains. GTT selectors are provisioned independently for each domain. For example, if an entry with `gtii=2` and `tt=4` already exists, an entry with `gtin=2` and `tt=4` can be specified.

Range:

0, 2, 4

Supported values for ANSI: `gti=0, 2` and `gtia=0, 2`

Supported values for ITU: `gtii/gtin/gtin24/gtiis/gtins/gtin16=0, 2, 4`

cdgtasn (optional)

CdPA GTA GTT set name.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters

cdgttsn (optional)

CdPA GTT set name.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters

cggtasn (optional)

CgPA GTA GTT set name.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters

cggttsn (optional)

CgPA GTT set name.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters

cgpcsn (optional)

CgPA PC GTT set name.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters

cgssn (optional)

CgPA subsystem number.

Range: 0 - 255

eaglegen (optional)

This parameter specifies whether the selector is used by EAGLE generated messages.

Range:

yes

Indicates selector used only by Eagle generated MSU.

gttsn (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range:

ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters

lsn (optional)

Linkset name.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

msgtype (optional)

SCCP message type.

Allow one or more SCCP message types (UDT/UDTS/XUDT/XUDTS) for every GTT Selector entry. This will help in screening different message types differently.

Range:

sub

u

us

x

xs

all

Default

all

nai (optional)

Nature of address indicator.

Range:

sub

rsvd

natl

intl

naiv (optional)

Nature of address indicator value.

Range:

0 - 127

np (optional)

Numbering plan.

Range:**e164****generic****x121****f69****e210****e212****e214****private****npv (optional)**

Numbering plan value.

Range:

0 - 15

selid (optional)

Selector ID.

Range:

0 - 65534

tt (optional)

Translation type.

Range:

0 - 255

```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The np and npv parameters cannot be specified in the same command.

The nai and naiv parameters cannot be specified in the same command.

The gti, gtia=4, gti(x)=1, and gti(x)=3 parameters cannot be specified.

If the gti/gtia/gtii/gtin/gtin24/gtiis/gtins/gtin16=2 parameter is specified, then the np/npv and nai/naiv parameters cannot be specified.

If the gtii/gtin/gtin24/gtiis/gtins/gtin16=4 parameter is specified, the np(v) and nai(v) parameters must be specified. These parameters can be specified in any combination: np/naiv, npv/nai, np/nai, or npv/naiv.

A value of *none* cannot be specified for the gttsn, cdgtasn, cggtasn, cgpcsn, cdgttsn, and cggtsn parameters.

The GTT Selector table must be accessible.

The GTT Set table must be accessible.

At least one GTT set name parameter must be specified. These parameters include:

- cdgtasn, cggtasn, or cgpcsn if the OBSR feature is enabled
- cdgttsn or cggtsn if the FLOBR feature is turned on
- gttsn if the OBSR feature is not enabled and the FLOBR feature is not turned on

The OBSR feature must be enabled before the cggtasn, cgpcsn, cgssn, or cdgtasn parameters can be specified.

The SSNSELID Table cannot contain more than 100,000 entries.

The SSNSELID table must be accessible.

The linkset specified by the lsn parameter must already exist.

The Linkset table is corrupt or cannot be found.

The FLOBR feature must be turned on before the lsn, eaglegen, cdgttsn, and cggtsn parameters can be specified.

If the FLOBR feature is turned on, then the `cdgtasn`, `cggtasn`, and `cgpcsn` parameters cannot be specified.

The value specified for the `cdgtasn` or `gttsn` parameter must match the name of an existing GTT set.

The GTT set specified by the `cdgtasn` or `gttsn` parameter must have a set type of `cdgta` (see the `ent-gttset` command).

An entry cannot already exist that matches the `eaglegen`, `gti`, `tt`, and `np(v)`, and `nai(v)` parameter combination for the specified CdPA and/or CgPA selector. If a GTT Selector entry is already provisioned for the given `gti`, `tt`, `np(v)` and `nai(v)` combination with `msgtype=all`, another entry for the same combination but different `msgtype` (`u/us/x/xs`) is not allowed.

The GTT set specified by the `gttsn`, `cdgtasn`, or `cdgttsn` parameter must already exist in the GTT Set table.

The network domain of the specified GTT selector must match the domain of the GTT set that is specified by the `gttsn`, `cdgtasn`, or `cdgttsn` parameter, unless the domain of the GTT set has a value of `cross`.

The GTT set specified by the `cggttsn`, `cggtasn` or `cgpcsn` parameter must already exist in the GTT Set table.

The network domain of the GTT set that is specified by the `cggttsn`, `cggtasn`, or `cgpcsn` parameter must match the domain specified by the `gti(x)` parameter.

The set type of the GTT set specified by the `cggtasn` or `cgpcsn` parameter must match the set type of the corresponding entry in the GTT Set table.

The GTT Set specified by the `cdgtasn` or `gttsn` parameter must have a set type of `cdgta` (see the `ent-gttset` command).

The `gttsn` parameter cannot be specified if the OBSR feature is enabled or the FLOBR feature is turned on.

The GTTDBMM Table cannot contain more than 42,502 entries.

The GTTDBMM table is corrupt or cannot be found.

A database error occurred while trying to access the SSNSELID table.

If the `gti(x)=4` parameter is specified, then the GTT selector table cannot have more than 5 `nai` entries per `tt/np` combination.

The `cggtasn`, `cgpcsn`, and `cggttsn` parameters cannot be specified together in the command.

The `gttsn`, `cdgtasn`, and `cdgttsn` parameters cannot be specified together in the command.

If the `gttsn`, `cdgttsn`, or `cdgtasn` parameter is specified, then the `cgssn` parameter cannot be specified. If the `cggtasn`, `cgpcsn` or `cggttsn` parameter is specified, then the `cgssn` parameter must be specified.

If the `cdgttsn` or `cggttsn` parameter is specified, then the `lsn` parameter must be specified.

If the `eaglegen=yes` parameter is specified, then the `msgtype`, `lsn`, `selid`, `gttsn`, `cdgtasn`, `cgssn`, `cggttsn`, `cggtasn`, and `cgpcsn` parameters cannot be specified.

If the `gti(x)=0` parameter is specified, then the `eaglegen`, `tt`, `np/npv`, and `nai/naiv` parameters cannot be specified.

If a value of 2 or 4 is specified for the `gti(x)` parameter, then the `tt` parameter must be specified.

For existing TTs with `gtii/gtin/gtin24/gtiis/gtins/gtin16=4`, the domain of the new entry must match the existing domain.

The MBR supported GTT set types (IMEI/IMSI/MSISDN/VLRNB/SMRPDA/SMRPOA) cannot be referenced by GTT selectors.

SSN configured for SFAPP cannot be used in any command for any configuration

Notes

For `gtii/gtin=4`, DFLT may appear in the `rtrv-gttset` output, but `dflt` cannot be specified as value for the `np` or `nai` parameters when the `ent-gttset` command is entered. If a new GTT selector is specified that matches an existing GTT selector's GTI and TT and the existing selector has `dflt` as the value for the `np` and/or `nai` parameters, a new entry is created with the new `np` and `nai` parameter values. The existing GTT selector entry with the `dflt` value is also retained. The `np/nai` parameter value `dflt` can be specified for the `chg/dlt/rtrv-gttset` commands.

The Origin-based SCCP Routing feature allows two GTT sets to be assigned to a GTT selector: CDGTASN and CGGTASN or CDGTASN and CGPCSN. The CGGTASN and CGPCSN GTT sets are mutually exclusive and cannot be assigned to the same GTT selector.

There is no J7 FAK dependency on the GTIA/GTIN16/GTIN24 parameters. The command can be entered successfully whether the J7 FAK is enabled or not enabled.

GTT Selector entries configured using the GTIN24/GTIN16 parameters shall be treated as ITU-N24 entries if the J7 FAK is disabled and shall be treated as ITU-N16 entries if the J7 FAK is enabled.

In the `msgtype` parameter, the parameter values correspond to SCCP message types as given in the following list:

- 'u' implies SCCP UDT message
- 'us' implies SCCP UDTS message
- 'x' implies SCCP XUDT message
- 'xs' implies to SCCP XUDTS messages, and
- 'all' implies all SCCP messages

Using this parameter, a GTT Selector entry can be made to select one or more types of messages. For similar `gti(x)`, `tt`, `np` and `nai` values but different `msgtype` values, different selector entries will be made.

The user cannot enter a selector with an existing message type again. For example, if the user is trying to add a selector with message type as "xs, u" and an existing message type is "xs, x", it cannot be added because the selector with message type "xs" already exists and the message type is a part of a key to the GTT Selector table and cannot be changed.

To enter a selector with message type xs, u either delete the existing xs, x entry and enter a selector again with "xs, x, u" as the message type, or add an another entry with the message type as "u". Please refer the output for example.

ent-gttset

Use this command to specify the attributes of a new GTT set (a set of global title translations). A GTT set consists of a GTT set name, the number of digits allocated for the GTA (global title address), the domain of the point codes used in the translation, and a pointer to a GTA tree. After the GTT set is provisioned, you can enter subsequent GTT Selector commands and GTA commands.

Parameters**gttsn (mandatory)**

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range:

ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

netdom (mandatory)

Network domain. This command does not distinguish between ITU national or ITU international because the Enhanced Global Title Translation (EGTT) feature does not discriminate between the ITU-I and ITU-N translations.

This parameter refers to the incoming message network domain.

Range:*ansi**itu**cross***checkmulcomp (optional)**

This option indicates whether or not to find translation for multiple components (up to 3 components, if present) of a TCAP message.

Range:*on*

Perform lookup for translation for multiple components.

off

Perform lookup for translation for first component only.

Default:

No change to the current value

gttsetmeasrqd (optional)

GTTSET Measurement required. This parameter specifies whether to perform per GTTSET measurements.

Range:**yes**

perform per GTTSET Measurements

no

do not perform per GTTSET Measurements

pertrans

perform per GTT Translation Measurements

Default:

No change to the current value

ndgt (optional)

Number of digits. This parameter specifies the number of digits required for GTAs associated with the GTT set.

Range:

1 - 21

Default:

6

npsn (optional)

GTT set name (Not Present Set Name). This parameter can have IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA GTT set types.

Range:

ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

settype (optional)

GTT set type.

Range:

cdgta

cdssn

cggta

cgpc

cgssn

dpc

*imei**imsi**msisdn**opc**opcode**smrpda**smrpoa**vlrnb***sxudt (optional)**

Segmented XUDT. This parameter specifies whether TOBR will support the processing of segmented XUDT message.

Range:*yes*

perform decoding of segmented XUDT message

no

do not perform decoding of segmented XUDT message

Default:*no***Example**

```
ent-gttset:gttsn=lidb:ndgt=10:netdom=ansient-
gttset:gttsn=t800:netdom=ansi
```

```
ent-gttset:gttsn=setint000:netdom=itu:ndgt=15

ent-gttset:gttsn=imsi1:settype=imsi:netdom=itu:gttsetmeasrqd=pertrans  
ent-gttset:gttsn=op1:settype=opcode:netdom=itu:sxudt=yes
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The GTT Set table cannot contain more than 2000 entries.

The gttsn=none parameter cannot be specified.

If the VGTT (Variable Length GTT) feature is turned on, the ndgt parameter cannot be specified.

The gttsn parameter must be specified and must not match an existing gttsn.

The GTT Set table must be accessible.

The GTT DBMM table must be accessible.

If the settype parameter has a value of *cgssn*, *opc*, *cgpc*, *cdssn*, *opcode*, or *dpc*, then the ndgt parameter cannot be specified.

The netdom=cross parameter can be specified if the settype=cdgta/imei/imsi/msisdn/vlrnb/smrpoa/smrpda parameter is specified.

The Origin-based SCCP Routing feature must be turned on if the value of the settype parameter is *cgga*, *cgssn*, *opc*, or *cgpc*.

If the OBSR feature is enabled or the FLOBR feature is turned on, then the settype parameter must be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the netdom=cross parameter can be specified.

The TOBR feature must be turned on before the settype=opcode/imei/imsi/msisdn/vlrnb/smrpoa/smrpda parameter can be specified.

The OBSR feature must be enabled or the FLOBR feature must be turned on before the settype parameter can be specified and before more than 950 GTT set entries can be provisioned.

The FLOBR feature must be turned on before a value of *cdssn* or *dpc* can be specified for the settype parameter.

The NPSN parameter must be specified with the IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA GTT set types.

NPSN must be of MBR set type only.

The GTT set type of the GTT set entry referred to by the NPSN parameter should be different from the GTT set type referred to by the GTTSN parameter.

The value specified for the NPSN parameter must match the name of an existing GTT set of IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA set types.

The GTTSET domain and associated NPSN set domain must match when the SCCP conversion feature is not ON.

CHECKMULCOMP parameter can be specified with OP CODE GTT set types only.

The SXUDT parameter must be specified with the OP CODE GTT set type only.

Notes

When the Origin-based SCCP Routing feature is turned on, VGTT is supported only for CdPA GTA and CgPA GTA. The *cross* network domain is supported for CdPA GTA and IMEI/IMS/MSISDN/VLRNB/SMRPOA/SMRPDA GTT set type entries.

ent-gws-redirect

Use this command to provision the gateway screening redirect function. The Redirect table must be provisioned before configuring gateway screening to redirect received MSUs. The values that are specified with this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected. For example, if the `ri=gt` parameter is specified, the value `gt` is set for the routing indicator in the called party address (CDPA) of the MSU being redirected.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

dpc (mandatory)

Specifies the value used to set the ANSI destination point code field in the routing label of the MSU that is being redirected. The ANSI point code has subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

dpca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001-005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (mandatory)

Destination point code.

dpci (mandatory)

Specifies the value used to set the ITU international destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

dpcn (mandatory)

Specifies the value used to set the ITU national destination point code field in the routing label of the MSU that is being redirected. The point code is in the format of a 5-digit number

(nnnnn); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) when the `chg-stpopts:npcfmti` flexible point code option is on. A group code (*gc*) must be specified when the ITUDUPPC feature is on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range:

0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (mandatory)

Specifies the value used to set the 24-bit ITU national destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (mandatory)

Specifies the value used to set the 16-bit ITU national destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

gta (mandatory)

Specifies the value used to set the global title address (dialed digits) in the SCCP called party address of the MSU being redirected.

Range:

1 - 21 digits

ri (mandatory)

Specifies the value used to set the routing indicator in the SCCP called party address of the MSU being redirected. Use the *gt* value to route by global title digits or use the *ssn* value to route by subsystem number.

Range:*gt**ssn***ssn (mandatory)**

Specifies the value used to set the subsystem number (SSN) in the SCCP called party address of the MSU being redirected. This number is the SSN of the SCP to which all MSUs meeting the redirect criteria are to be redirected.

Range:000 - 255**tt (mandatory)**

Identifies the type of the global title translation (GTT). This value is the decimal representation of the 1-byte field used in SS7 and is used to set the type of the GTT in the SCCP called party address of the MSU being redirected.

Range: 000 - 255**enabled (optional)**

Specifies whether MSUs that have passed gateway screening are to be redirected (*enabled=on*) or routed as normal (*enabled=off*).

Range:*on**off***Default:***on***Example**

```
ent-gws-redirect:dpc=1-40-1:ri=gt:ssn=10:tt=1:gta=180833:enabled=on
```

```
ent-gws-redirect:dpc=1-40-1:ri=ssn:ssn=10:tt=1:gta=1800833:enabled=off
```

```
ent-gws-redirect:dpcn16=1-14-0:ri=gt:ssn=10:tt=10:gta=1:enabled=on
```

Dependencies

The dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameter must be defined in the Destination table or defined as the STP site point code.

If the dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameter is defined as a destination, it must have at least one route defined.

The redirect function data can be entered only once.

Notes

The SCCP screening functions (CGPA, TT, CDPA, and AFTPC) cannot select an MSU to be redirected.

Do not apply a Redirect Stop Action on the Adjacent Node point code for the BLKOPC and OPC screening functions.

Do not apply a Redirect Stop Action for an allowed DPC screen rule if the rule contains the self-identity point code of the EAGLE where the screening rule is applied. This is because the

redirection of SLTAs and SLTMs (Signal Link Test Messages and Acknowledgements) will not return to the originating EAGLE and will cause the link to fail.

If gwsa=off and gwsn=off are specified for all linksets, gateway screening and the GWS redirect function for the DTA feature are disabled.

Output

```
ent-gws-redirect:dpc=1-40-1:ri=gt:ssn=10:tt=1:gta=180833:enabled=on
```

```
rlghncxa03w 03-11-10 11:43:04 EST EAGLE 31.6.0

ent-home-smsc

Use this command to enter HOME SMSC specific addresses, currently used to identify Short Message Service Centers in the database. This command updates the HOME SMSCADDR table.

Parameters

smsc (mandatory)

Identifies the type of the Short Message Service Center address.

Range:

1-21 hexadecimal digits. Valid digits are 0-9, a-f, A-F .

Example

```
ent-home-smsc:smc=256489
```

```
ent-home-smsc:smc=256489a98bccee56ad237
```

Dependencies

The Portability Check for Mobile Originated SMS (MNPSMS) feature must be turned on or one of the following features must be enabled before this command can be entered.

- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MT-Based GSM SMS NP
- MT-Based IS41 SMS NP

The specified HOME SMSC address cannot already exist in the HOME SMSCADDR table.

The HOME SMSCADDR table can contain a maximum of 500 entries.

The HOME SMSCADDR table must be accessible.

The GSM DBMM table must be accessible.

Notes

None

Output

```
ent-home-smsc:smc=256489
```

```
rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
ENT-HOME-SMSC: MASP A - COMPLTD
;
```

ent-homern

Use this command to enter up to 100 routing number prefixes for the operating network into the HOMERN table.

Parameters

rn (mandatory)

The home routing number prefix.

Range:

1-15 hexadecimal digits. Valid digits are 0-9, a-f, A-F .

Example

```
ent-homern:rn=C441234
```

Dependencies

The HOMERN table cannot be full.

The routing number must not already exist in the HOMERN table.

The rn=none parameter cannot be specified.

The A-Port, AINPQ, G-Port, INP, or V-Flex feature must be turned on before this command can be entered.

The HOMERN table must accessible.

Notes

None

Dependencies

SIPNP Feature must be enabled before entering any SIP connection information.

At least one ENUM card must be provisioned before entering any ENUM connection information.

At least one IPS card with SFLOG=yes must be provisioned before entering any TCP connection information on IPS.

At least one SCCP/SFAPP card must be provisioned before entering any Visualization connection information.

IPCONN table should be accessible.

A unique CNAME must be specified for a new connection.

The value specified for the HOST parameter must begin with an alphabetic character and can contain a..z, A..Z, 0..9, - (hyphen), or . (period).

New connections cannot be made if the Number of CNAMES or TCP/UDP connections have reached the maximum limit.

Duplicate LHOST, RHOST, LPORT and RPORT entry combination is not allowed.

Connections can only be made with a LHOST that is configured on a SIP card.

Remote IP address (RHOST) must not exist in the IPLINK table.

The TCP protocol is not supported for ENUMHC; only the UDP protocol is supported.

Only one UDP can be provision per interface (lhost).

The UDP protocol is not supported for SCCP/SFAPP/IPS card with SFLOG; only the TCP protocol is supported.

Visualization connection supports on Port c on SCCP and SFAPP card.

Valid LPORT values are from range 1024 to 65535. ENUM application support one extra LPORT value that is 53.

3702 Cmd Rej: LPORT must be in range 1024-65535 or 53 (only for ENUM)

Notes

The ent -ip -host command should be used to define local host names and remote host names for IP addresses. This is an existing command and will be used to configure the local host and remote host for an IP address prior to adding any SIP connection.

Maximum of 16 connections can be provisioned against a local host.

If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

LPORT=53 must be allowed only for ENUM application. LPORT 54 to 1023 must not be supported for any of the application and the command should be rejected with MTT number 3702.

For LPORT value below 53 and above 65535, command should be rejected with MTT number 2017.

A string of characters, beginning with a letter and comprising up to 60 characters in length. Valid values are *a..z*, *A..Z*, *0..9*, *-* (*dash*), *.* (*period*).

type (optional)

The residency attribute of the host entry.

Range:***local***

The IP host name and IP address resides on the IP card in this EAGLE.

remote

The IP host name and IP address resides on equipment not in this EAGLE.

Default:

local

Example

```
ent-ip-host:host=gw100.nc.tekelec.com:ipaddr=150.001.001.001
```

```
ent-ip-  
host:host=gw100.nc.tekelec.com:ipaddr=150.001.001.001:type=local
```

```
ent-ip-host:host="gw100.nc-tekelec.com":ipaddr=150.001.001.001
```

```
ent-ip-host:host=abc:ipaddr=250.001.001.001:type=remote:realm=xyz
```

Dependencies

The value specified for the IP Address parameter cannot already exist in the IP Host table.

A valid value must be specified for the *host* parameter. If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

The *ipaddr=0.0.0.0* parameter cannot be specified.

The value specified for the *host* parameter cannot already exist in the IP Host table.

The IP Host table can have a maximum of 4096 host entries.

If a remote host is used (the *type=remote* parameter is specified), then the value specified for the IP Address cannot already exist in the IP Link table.

If a local host is used (the *type=local* parameter is specified), then the value specified for the IP Address must already exist in the IP Link table.

A valid value must be specified for the *realm* parameter. If the realm contains a hyphen, then the realm must be enclosed within quotation marks.

HOST and REALM must be specified together for the host associated with diameter connection.

Notes

If the realm contains a hyphen, then the realm must be enclosed within quotation marks.

Realm is mandatory for all the IP hosts associated with diameter connections.

Output

```
ent-ip-  
host:host=gw100.nc.tekelec.com:ipaddr=150.001.001.001:type=local
```

```
rlghncxa03w 05-07-17 15:35:05 EST EAGLE 34.0.0  
ENT-IP-HOST: MASP A - COMPLTD  
;
```

Related Topics

- [dlt-ip-host](#)
- [rtrv-ip-host](#)

ent-ip-node

Use this command to define the IP address of a node.

Parameters

cap (mandatory)

The maximum percentage of Ethernet capacity for the node connection. This capacity is added to other connections to this node for the total capacity of the node.

Note

The value specified for this parameter can be used to calculate throughput for E5-ENET-B cards. Refer to the *Notes* section for more information.

Range:

1 - 100

ipaddr (mandatory)

The node's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is *192.126.100.5*, where *192.126.100* is the network number and *5* is the machine's host number.

Range:

4 numbers separated by dots
1-233-first number
0-255-the other three numbers

ipappl (mandatory)

The IP application supported by the node.

Range:

ipport (mandatory)

The logical IP port that addresses the application on the node.

Range:

1024 - 5000

loc (mandatory)

The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

iprte (optional)

The default router IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

Range:

4 numbers separated by dots

1-233-first number

0-255-the other three numbers

Example**Dependencies**

The shelf and card must be equipped.

The node IP address cannot be 127.x.x.x, where x is a number from 1 to 254.

The specified card location must be equipped with a TCP/IP data link.

The IP address must be unique to the TCP/IP link table and to the TCP/IP nodes.

Only one node can be connected for each data link and each application. The IP address, IP application, and card location combination must be unique in the database.

The IP port on each node cannot already be assigned to another application.

The class of the IP address (ipaddr) must match the class of the assigned TCP/IP data link's IP address. The system supports three classes of IP addresses, Class A, Class B, and Class C. Class A IP addresses can contain only the values 1 - 126 in the first field of the IP address. Class B IP addresses can contain only the values 128 - 191 in the first field of the IP address. Class C IP addresses can contain only the values 192 - 223 in the first field of the IP address.

The network portion of the IP address (ipaddr) must match the network portion of the IP address assigned to the TCP/IP data link. The network portion of the IP address is based on the class of the IP address. If the IP address is a Class A IP address, the first field is the network portion of the IP address. If the IP address is a Class B IP address, the first two fields are the network portion of the IP address. If the IP address is a Class C IP address, the first three fields are the network portion of the IP address.

If the network portion and class of the IP address of the TCP/IP node matches the class of the assigned TCP/IP data link's IP address, the iprte parameter cannot be specified. The iprte parameter can be specified only with the ent -ip -node command when the network portion and class of the TCP/IP node does not match the class of the assigned TCP/IP data link's IP

address. The values of the `ipaddr` parameter, the IP address of the TCP/IP node, and the `iprte` parameter cannot be the same.

The capacity of all connections to the given node cannot be greater than 100%.

The router's IP address must not be assigned to a local TCP/IP data link.

The router's IP address must be in the same network as the node's IP address.

Notes

If the IP address is a Class A IP address, do not use the IP addresses `127.x.x.x`, where `x` is a number from 1 - 254. These addresses are reserved for loopback.

Using the CAP Value to Calculate Throughput for E5-ENET-B Cards

The value specified for the `cap` parameter can be used to calculate the throughput in transactions per second (TPS) for E5-ENET-B cards. The TPS value is the smaller of the following values:

- `GPL_CARD_CAPACITY`
 - E5-ENET-B card—15000
- `175 [or 17.5] * cap parameter value`

Caution

The 175 multiplier is used only when the link negotiates to 100 Mbits/second full duplex. If the link is a different value than 100 Mbits/second full duplex, then a multiplier of 17.5 is used.

Output

ent-ip-rte

Use this command to configure the destination IP address, subnet mask, and the gateway IP address for the specified card in the Static IP Route table.

Parameters

loc (mandatory)

Card location. The unique identifier of a specific IP card in the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

dest (mandatory)

Destination IP Address. The IP Address of a remote destination host or network to be reached.

Range:

4 numbers separated by dots, with each number in the range of 0–255.
The IP address 0.0.0.0 is not valid.

gtwy (optional)

Gateway IP Address. The IP address assigned to the gateway router that will properly forward IP datagrams with the destination IP address (dest) to the next-hop gateway router or final destination host.

Range:

4 numbers separated by dots, with each number in the range of 0–255.
The IP address 0.0.0.0 is not valid.

submask (mandatory)

The subnet mask of the destination IP address, in the form of an IP address with a restricted range of values. This parameter is required if the `ipaddr` parameter is entered.

Range:

The value must be valid for the class of the entered IP address.

Valid for Class A Networks

- 255.0.0
- 255.192.0
- 255.224.0
- 255.240.0
- 255.248.0
- 255.252.0
- 255.254.0
- 255.255.128.0

Valid for Class A or B Networks

- 255.255.0.0
- 255.255.192.0
- 255.255.224.0
- 255.255.240.0
- 255.255.248.0
- 255.255.252.0
- 255.255.254.0
- 255.255.255.128

Valid for Class A, B, or C Networks

- 255.255.255.0
- 255.255.255.192
- 255.255.255.224
- 255.255.255.240
- 255.255.255.248
- 255.255.255.252

Note

The value 255.255.255.255 must be specified if the destination IP address represents a host address. If the destination IP address represents a network address, a value must be specified that identifies the network ID and host ID portions of the address.

Example

```
ent-ip-rte:loc=1301:dest=128.252.10.5:submask=255.255.255.255:  
gtwy=140.188.13.33
```

Dependencies

The specified destination IP address (dest parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)
- Must be unique per card
- Must not reside on any local network on the card

The specified gateway IP address (gtwy parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)
- Must correspond to a host IP address that resides on any local network on the card

The IP address must be defined for any or all networks for the card before this command can be entered. (See the [chg-ip-lnk](#) command.)

Each destination IP address entered into the Static IP Route table must be unique for the card.

A maximum of 64 static IP routes can be defined for a card.

A maximum of 2048 static IP routes can be defined in the IP Route table.

The network address specified by the dest and submask parameters must be different from the network address specified by the pvn and pvnmask, fcna and fcnamask, and fcnb and fcnbmask parameters of the NETOPTS table.

Notes

The Static IP Route table is used to store static IP route entries. Static routes are maintained across card initialization, failures, and reloads. These types of routes are used when the IP Layer cannot determine routes dynamically. Static IP route entries can be added or deleted dynamically.

Output

```
ent-ip-rte:loc=1301:dest=128.252.10.5:submask=255.255.255.255:
gtwy=140.188.13.33
```

```

ent-j1

Use this command to enter a J1 interface on a T1 card.

Parameters**loc (mandatory)**

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

j1port (mandatory)

J1 port number.

The value must be a J1 port for which an interface has not been configured on the specified J1 card.

Range:

1-8

encode (optional)

Indicator for use of B8ZS or AMI encoding/decoding.

Range:

b8zs

ami

Default:

b8zs

j1tsel (optional)

Timing source

Range:*line*

slave timing source

external

master timing source

Default:*line***l1 (optional)**

T1 cable length in feet between the EAGLE and the connecting node.

Range:

0-655

Default:

133

Example

```
ent-j1:loc=1101:j1port=1:encode=ami:j1tsel=external
```

```
ent-j1:loc=1102:j1port=1:j1tsel=line
```

```
ent-j1:loc=1103:j1port=2
```

Dependencies

The specified card location (loc parameter) must be equipped.

The J1 table must be accessible.

The Card (IMT) table must be accessible.

The port specified by the j1port parameter must not be already equipped with a J1 interface.

Card locations 1113 - 1118 (OAM, TDM, MDAL cards) cannot be specified as values for the loc parameter.

The specified card location must be provisioned with type as limt1 and appl as ccs7itu.

The card must not be provisioned with any E1/T1 ports.

The j1port parameter must be in the range from 1 to 8.

IMT card location cannot be specified.

The J7 support feature must be enabled before the J1 port can be provisioned.

Notes

There is not a new card type for J1. The J1 interface will be provisioned on a T1.

Once the J1 interface is provisioned on it, no T1 interface will be allowed on the T1 card.

This card will be treated as a J1 card.

Output

```
ent-j1:loc=1101:j1port=1:encode=ami:j1tsel=external
```

```
tekelecstp 13-12-20 12:12:36 EST 46.0.0-65.3.0

ent-lbp

Use this command to assign a far-end loopback point for testing data signaling link elements in a SS7 transmission path.

Parameters**lbp (mandatory)**

Loopback point ID. A far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

Range:

1 - 32

lfst (mandatory)

Link fault sectionalization test. The type of link fault sectionalization loopback test to be performed.

Range:

llt

latching loopback test

nlt

nonlatching loopback test

link (mandatory)

SS7 signaling link. The SS7 signaling link that is to be tested.

Synonym:

port

Range:

a, b, a1 - a31, b1 - b31

Not all card types support all link parameter values.

See [Table A-1](#) for valid Link parameter range values for each type of card that can have assigned signaling link ports.

loc (mandatory)

Card location. The unique identifier of a specific application subsystem located in the STP.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

rle (mandatory)

Remote link element. The link element to be looped back for testing.

Range:

ds0

ocu

csu

dsu

nei

clli (optional)

The Common Language Location Identifier (CLLI) code, or other mnemonic identifier, used to refer to the given loopback point.

Range:

aaaaaaaaaaaa

1 alphabetic character followed by up to 10 alphanumeric characters

rep (optional)

Repetition count. The number of link elements of the same type (not including the target device) that lie between the STP and the link element to be tested.

Range:

0 - 31

Default:

0—If the link element to be looped back for testing is NEI (*rle=nei* is specified)

0—If the LFS test is NLT (non-latched); *lfst=nlt* is specified

0—If no other LBP for this link has the same *rle* value

1–30—Next sequential number for subsequent loopback points of the link to be tested (*rle* is specified as anything but *nei*)

Example

```
ent - lbp: loc=1101: link=a: lbp=1: rle=ds0: lfst=llt: rep=0: clli=rlghncxa05w
```

```
ent - lbp: loc=1101: port=a: lbp=2: rle=nei: lfst=llt
```

```
ent - lbp: loc=1205: port=a1: lbp=1: rle=ds0: lfst=llt: clli=rlghncxa05w: rep=1
```

Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The card location (loc parameter) must be equipped.

The rle=ds0 parameter and the rle=nei parameter cannot be specified when the lfst=llt parameter is specified. The DS0 and Network Element Interface (NEI) link elements do not support non-latching loopbacks.

If the rle=nei parameter is specified, the rep=0 parameter must be specified.

The rep parameter can be specified only if the lfst=llt parameter is specified.

Each specified rep parameter value must be greater than any previously specified rep value and less than any subsequent specified rep value.

The specified cli cannot be a reserved word.

The loopback point (LBP) cannot have been previously defined.

The value specified for the lbp parameter cannot exceed the lbp parameter value previously defined for a loopback point with rle=nei specified.

For each SS7 signaling link, only one loopback point with rle=nei specified can be defined.

The rep parameter must be specified if taking the default value results in duplicate rep values for loopback points.

The loopback point with rle=nei specified must be the terminating SS7 signaling link element.

The card location must contain a provisioned E5-E1T1-B card, provisioned with the LIMT1 card type, that is running either the SS7ANSI or CCS7ITU application.

The card location (loc parameter) must not be reserved by the system.

The Link Fault Sectionalization database Loopback Point (LBP) table is not accessible.

The values specified for the loc and link parameters must already exist in the database.

Notes

None

Output

```
ent-lbp:loc=1101:link=a:lbp=2:rle=nei:lfst=llt
```

```
rlghncxa03w 05-02-17 15:35:05 EST EAGLE5 33.0.0
ENT-LBP: MASP A - COMPLTD

ent-lg-card

Use this command to create a new LG card. An LG Card is associated with a single LG Group. The command class is TKLC_INTERNAL inheriting properties of DEBUG class. The Load Generator is supported on IPSG, IPLHC, IPGHC and SS7HC GPLs.

Parameters

grp (mandatory)

LG group name

Range:

aaaaaaaa Up to 10 alphanumeric characters; the first character must be a letter.

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
ent - lg-card: loc=1301: grp=lggroup1
```

Dependencies

The card location must not be 1113-1118, or xy09 and xy10 where x is the frame and y is the shelf.

The valid card types are DCM, ENET, LIME1, and LIMT1.

The specified group name value must exist in the database.

The card location specified in the `loc` parameter must not be associated with another LG group.

The LG Card table is corrupt or cannot be found.

The card in the specified card location must be a LIM and must exist.

The card location specified in the `loc` parameter must be equipped.

The LG Group table is corrupt or cannot be found.

The `loc` and `grp` parameters are mandatory

The IMT table is corrupt or cannot be found.

Only E-5 Class cards are supported card types for a card to be an LG card

ent-lg-engine

Use this command to create an LG engine. An LG Engine is associated with a single LG Card. The command class is TKLC_INTERNAL inheriting properties of DEBUG class. The Load Generator is supported on IPSG, IPLHC, IPGHC and SS7HC GPLs.

Parameters

engine (mandatory)

Range: aaaaaaaaaa

Up to 10 alphanumeric characters; the first character must be a letter.

event (mandatory)

Range: aaaaaaaaaa

Up to 10 alphanumeric characters; the first character must be a letter

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

action (optional)

Transmitting and receiving actions of a LG Engine.

Range:

snk

Rx Action: Sink Mode

ret

Rx Action: Return Mode

retl2

Rx Action: Return by L2 Mode

cong

Rx Action: Congestion

cap

Rx Action: capture mode

pbk

Tx Action: Playback mode

port (optional)

The signaling link on the card specified in the `loc` parameter. The links can be specified in any sequence or pattern.

Synonym:*link***Range:***a, b, a1 - a31, b1 - b31*

Not all card types support all link parameter values.

See [Summary of Range Values for :link Parameter](#) for valid link parameter range values for each type of card that can have a location specified in the `loc` parameter.

rxengine (optional)

Receiving LG Engine name.

Range:*aaaaaaaa*

Up to 10 alphanumeric characters; the first character must be a letter.

txrate (optional)

Transmission rate of a LG Engine.

Range:*0 - 10000***Example**

```
ent-lg-
engine:engine=txengine1:loc=1302:event=txisup1:port=a:txrate=100

ent-lg-engine:engine=rxengine1:loc=1302:event=rxisup1:action=cap

ent-lg-
engine:engine=txengine2:loc=1302:event=txisup2:action=pbk:rxengine=rxe
ngine1
```

Dependencies

The value specified for the engine parameter cannot already exist in the LG Engine table.

The LG Engine table is corrupt or cannot be found.

The number of engines associated with a card should not exceed the max limit.

The number of events associated with a engine should not exceed the max limit.

The `txrate` parameter cannot be specified with the parameter event of Rx type.

The `action` parameter of type PBK can only be assigned to Tx event direction.

The engine name specified shouldn't be an Eagle reserved name

The action parameter of type SNK/RET/RETL2/CONG/CAP can only be assigned to RX event direction.

The card location specified in the loc parameter must be of a provisioned LG card.

The port specified in the command must be provisioned.

The rxengine parameter cannot be specified with the action parameter of type other than PBK.

The specified **Rx** engine parameter value must be associated with the card.

The Rxengine specified must pre-exist in the LG Engine table.

Engine specified in RxEngine parameter must of Rx Type.

The LG Event name specified in the command must exist in the table

The LG Engine table cannot already be full.

SIF Size > 272 not supported on ss7hc

The Rx Event can not be associated to more than one Engine on the same LG card

The LG Card and Event specified in the command must belong to same network

The port parameter cannot be specified with the parameter event of Rx type.

ent-lg-event

Use this command to create a new LG event. The command class is TKLC_INTERNAL inheriting properties of DEBUG class. The Load Generator is supported on IPSC, IPLHC, IPGHC and SS7HC GPLs.

Parameters

dir (mandatory)

Type of Event (Tx or Rx)

Range:

Tx

Transmit Event

Rx

Receive Event

dpc (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:*dpca***Range:***p-*, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk value (*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code 000-000-000 is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24 (mandatory)

Destination point code

dpci (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:*s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps**zone—0-7**area—000-255**id—0-7*

The point code 0-000-0 is not a valid point code.

dpcn (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt1* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s-*, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps**nnnnn—0-16383**gc—aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000–255

ssa—000–255

sp—000–255

```

```
ent -lg-event:event=txisup1:dir=tx:si=5:dpc=4-4-4:opc=3-3-3
```

ent -lg-event :event=rxisup1:dir=rx:dpc=3-3-3

Dependencies

If the mincic/maxcic parameter is specified, the si parameter must be 4 (*tup*), 5 (*isup*) or 13 (*bicc*).

If the tt/ssn/sgta/egta parameter is specified, the si=3 (sccp) parameter must be specified.

If the h0h1/cnglvl/cause/usrid/cpc parameter is specified, the si=0 (snm) parameter must be specified.

When failed to read LG Event table.

The event name specified shouldn't be an Eagle reserved name

The event and dir parameters must be specified.

The dpc parameter is mandatory with Rx event type

The opc, dpc, and si parameters are mandatory with Tx event.

The h0h1 parameter is mandatory for si=0 (snm) Tx event.

The mincic specified must be less than maxcic.

The minsize specified must be less than maxsize.

The minsls specified must be less than maxsls.

The value specified for the event parameter cannot already exist in the LG Event table.

ITU SLS must be less than 15.

The LG Event Table cannot be full.

A valid SIF size must be specified with SI value.

The same dpc parameter cannot be assigned to more than one Event of Rx type.

When other optional parameters are specified with Rx event

When sgta/egta/tt parameters are specified with RI=SSN for Tx event

The network type for the opc and dpc parameters must match.

If the ri=gt parameter is specified, then the sgta/egta parameters must be specified.

The lengths of the sgta and egta parameters must match.

The egta and sgta parameters must be specified together in the command.

The value specified for the egta parameter must be greater than or equal to the value specified for the sgta parameter.

Notes

Mandatory and optional event parameters can be organized into two groups: generic and event type specific parameters. The generic parameters are applicable to any event type whereas event type specific are applicable only to a specific event type.

Generic event parameters are shown below:

Table 4-25 ENT-LG-EVENT Generic Parameters

Parameter	Description	Mand/Opt	Applicable Event Direction	Valid Values
event	event name	M	Any	
dir	transmit or receive	M	Any	Tx, Rx
class	internal or external	O	Tx	INT Default : INT
type	event type (msu)	O	Any	MSU Default: MSU

Configurable parameters specific to each type of event are shown below:

Common MSU related configuration parameters when DIR (direction) parameter is Rx, are as follows:

Table 4-26 ENT-LG-EVENT Rx MSU Event Type common Parameters

Parameter	Description	Mand/Opt	Valid Values
dpca	Destination PC (ANSI)	M	
dpci	Destination PC (ITU)	M	
dpcn	Destination PC (ITU National)	M	
dpcn24	Destination PC (24 bit ITU national)	M	

Common MSU related configuration parameters when DIR (direction) parameter is Tx, are as follows:

Table 4-27 ENT-LG-EVENT Tx MSU Event Type common Parameters

Parameter	Description	Mand/Opt	Valid Values
dpca	Destination PC (ANSI)	M	
dpci	Destination PC (ITU)	M	
dpcn	Destination PC (ITU National)	M	
dpcn24	Destination PC (24 bit ITU national)	M	
opca	Origination PC (ANSI)	M	
opci	Origination PC (ITU)	M	
opcn	Origination PC (ITU National)	M	
opcn24	Origination PC (24 bit ITU national)	M	
priority	Service message priority	O	
minsls	Minimum SLS selector	O	
maxsls	Maximum SLS selector	O

minsize	Minimum service message SIF size	O	0 – 4095
maxsize	Maximum service message SIF size	O	0 – 4095
si	MSU service indicator	M	0-SNM, 1,2, 6-12, 14 - TEST 3-SCCP, 4-TUP, 5-ISUP, 13-BICC 15-H248

For MSU event type, Service indicators (SI) can have different formats, and consequently unique parameters. Following tables list these parameters related to MSU event type and SI.

Table 4-28 ENT-LG-EVENT Tx MSU Event Type Specific Parameters (SI = 0)

Parameter	Description	Mand/Opt	Valid Values
h0h1	SNM type	M	TFA, TFP, TFC, TFR, RCT or UPU
cpca	concerned destination (ANSI)	O	
cpci	concerned destination (ITU)	O	
cpcn	concerned destination (ITU National)	O	
cpcn24	concerned destination (24 bit ITU National)	O	
cnglvi	congestion level for TFCs	O	0-3
cause	cause code for UPUs	O	0-15
usrid	user ID for UPUs	O	0-15

Table 4-29 ENT-LG-EVENT Tx MSU Event Type Specific Parameters (SI = 1, 2, 6-12, 14, 15)

Parameter	Description	Mand/Opt	Valid Values
None			

Table 4-30 ENT-LG-EVENT Tx MSU Event Type Specific Parameters (SI = 3)

Parameter	Description	Mand/Opt	Valid Values
tt	Translation Type	O	0 – 255
ssn	Sub System Number	O	0 – 255
sgta	Start of global title address	O	1-21 digits

Table 4-30 (Cont.) ENT-LG-EVENT Tx MSU Event Type Specific Parameters (SI = 3)

egta	End of global title address	O	1-21 digits
sclass	Class of service	O	0 – 1
ri	Routing Indicator (GT or SSN)	O	GT, SSN

Table 4-31 ENT-LG-EVENT Tx MSU Event Type Specific Parameters (SI = 4, 5, 13)

Parameter	Description	Mand/Opt	Valid Values
mincic	Minimum CIC selector	O	0..4294967295
maxcic	Maximum CIC selector	O	0..4294967295

Output

ent-lg-grp

Use this command to create an LG group. The command class is TKLC_INTERNAL inheriting properties of DEBUG class. The Load Generator is supported on IPSC, IPLHC, IPGHC and SS7HC GPLs.

Parameters

grp (mandatory)

Range:

aaaaaaaaaa

Up to 10 alphanumeric characters; the first character must be a letter

Example

```
ent - lg - grp : grp = lggroup1
```

Dependencies

The group name specified shouldn't be an Eagle reserved name

An LG group with the specified name shouldn't pre-exist in the system.

The LG Group table cannot be full.

The LG Group table is corrupt or cannot be found.

grp is mandatory parameter for this command

ent-lnp-serv

Use this command to reserve an LNP translation type for a unique LNP service. The available services include up to six query services (*ain*, *in*, *pcs*, *lnpqs*, *wnp*, and *lnnqt*) and any combination of six message relay or user-defined services. Translation type names can also be defined and are defaulted to the corresponding reserved service type names.

Note

LNP Translation Type name referenced in the ENT-LNP-SERV command is different from the Translation Type name referenced in ENT-TT command.

A maximum of 10 LNP services can be assigned in systems with up to 12 million numbers, and a maximum of 15 LNP services can be assigned in systems with more than 12 million numbers (using ELAP). Two of these assigned services will always be reserved for administration of AIN and IN Translation Types. Administration of Message Relay user defined services will also be allowed.

Parameters**serv (mandatory)**

Reserved service type name.

Range:

ain

in

pcs

wnp

class

lidx

cnam

isvm

lnpqs

wsmc

udf1

udf2

udf3

udf4

lnqt

alias (optional)

Alias translation type.

Range:

000 - 255

dfltact (optional)

This parameter specifies the default action associated with the LNP TT Service entry.

Range:

ayyyyyyy

1 leading alphabetic followed by up to 8 alphanumeric characters. This parameter can have one of the following values:

- a valid GTT Action ID of type *disc/udts/tcaperr* that already exists in the GTT Action table
- *fallback* —Fallback to the relay data for MSUs relayed by LNP using relay data from the LNP database provided by the LNP Message Relay service. For an LNP Query message, the MSU is sent to the LNP local subsystem.
- *falltogtt* —Fallback to GTT. The GTT selector search is performed again, using *gttselid=none*.

Default:

fallback

dv (optional)

Digits valid.

Range:

sccp

tcap

Default:

sccp —If *serv* has a value of *class*, *lidx*, *cnam*, *isvm*, *wsmc*, *udf1*, *udf2*, *udf3*, *udf4*

tcap —If *serv* has a value of *ain*, *in*, *pcs*, *wnp*, *lnpqs*, *lnqt*

gttselid (optional)

GTT Selector ID. This parameter specifies the ID used to perform GTT on the MSU processed by the LNP Message Relay or LNP Query Service.

Range:

0 - 65534

Default:

none

off (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 10 feature options can be specified in the list.

Range:*gttrqd***on (optional)**

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 10 feature options can be specified in the list.

Range:*gttrqd***rqdtb1nop (optional)**

The action performed with a message that arrives at an SCCP card that does not have the necessary LNP table, and the current message routing is subsystem.

Range:*udts*

generate UDTs for the processed MSU

disc

discard the processed MSU

Default:

No change to the current value

tt (optional)

Translation type.

Range:

000 - 255

ttn (optional)

User defined LNP Translation Type name.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters, the value *none* is not allowed.

Default:Reserved service type name (*serv* parameter)**Example**

```
ent-lnp-  
serv:serv=class:tt=10:ttn=class1:dftact=disc1:on=gttrqd:gtselid=100  
  
ent-lnp-serv:serv=lidb:tt=16:dv=tcap:ttt=mr lidb
```

ent-lnp-serv:serv=lrnqt:tt=239:dv=tcap

Dependencies

The same value cannot be specified for the on and off parameters.

The df ltact=none parameter cannot be specified.

The EGTT feature must be turned on before the gtt selid, df ltact, or on/off=gttrqd parameter can be specified.

If a GTT Action ID is specified as the value for the df ltact parameter, then the Action ID must already exist in the GTT Action table.

If a GTT Action ID is specified as a value for the df ltact parameter, then the GTT Action ID must be associated with an action of *disc/udts/tcaperr* .

The LNP feature must be turned on before this command can be entered.

The PLNP feature must be turned on before the serv=pcs parameter can be specified.

The WNP feature must be turned on before the serv=wnp parameter can be specified.

The LNP SMS feature must be turned on before the serv=wsmc parameter can be specified.

If a value of *udf1*, *udf2*, *udf3*, or *udf4* is specified for the serv parameter, then the df ltact, gtt selid and on/off=gttrqd parameters cannot be specified.

The tt parameter must be specified if the alias parameter is not specified.

The tt n=none parameter cannot be specified.

If a value of *udf1*, *udf2*, *udf3*, *udf4*, or *wsmc* is specified for the serv parameter, then the dv=sccp parameter must be specified.

If the *lnpqs*, *ain*, *in*, *pcs*, *wnp*, or *lrnqt* value is specified for the serv parameter, then the dv=tcap parameter must be specified.

A reserved service type name can be specified for the tt n parameter only if it matches the serv parameter value.

The value of the tt parameter cannot already exist in the LNP database.

If the tt parameter is specified, then the value of the serv parameter cannot exist in the LNP database.

A maximum of 6 Message Relay services are allowed.

If the alias parameter is specified, then the serv parameter must already have an assigned translation type.

When the alias parameter is specified, its value cannot already exist in the LNP database as a true translation type for this service.

If the alias parameter is specified, then the specified alias cannot be in use.

The LNP database is corrupt or cannot be found.

If the tt parameter is specified, then its value cannot already exist in the LNP database as an alias for this service.

The LNP TT SERV table is corrupt or cannot be found.

The value of the tt n parameter cannot exist in the LNP database.

The LRNQT feature must be turned on before the `serv= lrnqt` parameter can be specified.

If the `alias` parameter is specified, then the `tt`, `ttn`, and `dv` parameters cannot be specified.

The GTT Action table is corrupt or cannot be found.

The `nrqdtb lnop` parameter requires that the Dual ExAP Config feature is enabled.

The `defactid=none` parameter cannot be specified.

Notes

on/off options

gttrqd —GTT required. Specifies whether GTT is performed after the successful completion of an LNP Message Relay service and before initiation of an LNP Query service. This option has a default of OFF.

Translation type names must be unique for LNP services.

A translation type name can be a reserved service type name only if it matches the specified service.

TTN

LNP Translation type name referenced in the ENT-LNP-SERV command is different from the Translation type name referenced in ENT-TT command.

Output

```
ent - lnp - serv : tt = 1 : serv = lidb : on = gttrqd : dfltact = falltogett
```

```
rlghncxa03w 10-11-08 08:50:12 EST EAGLE 43.0.0

ent-loopset

Use this command to enter the loopset information into the database. This command updates the Loopset table.

Parameters

name (mandatory)

Loopset name. This parameter specifies an entry in the Loopset table.

The *name=none* parameter cannot be specified.

Range:

ayyyyyyy

1 alphabetic and up to 7 alphanumeric characters

pc l (mandatory)

ANSI point code list with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*). This parameter allows up to 6 comma-delimited entries in the point code list.

Synonym:

pcla

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pc li (mandatory)

ITU international point code list with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

pc ln (mandatory)

ITU national point code list in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pc1n24 (mandatory)

24-bit ITU national point code list with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. This parameter allows up to 6 comma-delimited entries in the point code list.

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000–255

ssa—000–255

sp—000–255

pc1n16 (mandatory)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. This parameter allows up to 6 comma-delimited entries in the point code list.

Range:

p---, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (--).

prefix---p

un---000---127

sna---000---15

mna---000---31

mode (optional)

Mode of operation. This parameter specifies whether the message is discarded when an SCCP loop is detected.

Range:

notify

Generates a UIM without discarding the message.

discard

Generates a UIM and discards the message.

Default:

notify

Example

This example creates a new loopset using the default mode of *notify*.

```
ent-loopset:name=rtp1:pc1=3-3-3,5-5-5,7-7-7,3-4-3
```

This example creates a new loopset and sets the mode to *discard*.

```
ent-loopset:name=rtp2:mode=discard:pc1=3-3-3,5-5-5,7-7-7,3-4-3
```

This example creates a new loopset with four 16-bit ITU-N point codes.

```
ent-loopset:name=rtp1:pc1n16=3-3-3,5-5-5,7-7-7,3-4-3
```

Dependencies

The value of the name parameter cannot already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

The Loopset table can hold a maximum of 1,000 loopset entries, with each entry containing up to 12 point codes. Additional loopset entries and point codes cannot be added when the table is full.

The Loopset table must be accessible.

The values for the `pc l` parameter must be unique.

The name=none parameter cannot be specified.

At least one valid point code must be specified as a value for the `pc l` parameter.

The values for the `pc l` parameter cannot consist of any invalid point codes. The valid point codes must be consecutively specified and separated by commas.

Notes

There is no J7 FAK dependency on the `apc ln16/rpc ln16/pc1n16/npc1n16/pc2n16/npc2n16` parameters. The command can be entered successfully when the J7 FAK is not enabled.

There is no J7 FAK dependency on the `apc ln24/rpc ln24/pc1n24/npc1n24/pc2n24/npc2n24` parameters. The command can be entered successfully when the J7 FAK is enabled.

There is no J7 FAK dependency on the `apc l/ apc la/rpc la/pc1a/npc1a/pc2a/npc2a` parameters. The command can be entered successfully when the J7 FAK is enabled.

Output

The following example creates a new loopset and sets the mode to *discard*. `ent - loopset:name=rtp2:mode=discard:pc l=3-3-3,5-5-5,7-7-7,3-4-3`

```
rlghncxa03w 07-02-10 08:31:28 EST  EAGLE Rel 35.6.0
LOOPSET table is (12 of 1000) 1% full
ENT-LOOPSET: MASP A - COMPLTD
;

ent-ls

Use this command to add a linkset, with its assigned far-end point code and other linkset attributes, to the database.

Parameters

① Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

apc (mandatory)

ANSI adjacent destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

apca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix-p-

When *chg-sid:pctype=ansi* is specified, *ni* = 000 is not valid.

When *chg-sid:pctype=ansi* is specified, *nc* = 000 is not valid if *ni* = 001-005.

When *chg-sid:pctype=ansi* is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

apc/apca/apci/apcn/apcn24/apcn16 (mandatory)

Adjacent point code. The DPC of the adjacent signaling node at the far end of the linkset.

apci (mandatory)

ITU international adjacent destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s--, *p--*, *ps--*, 0--255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix--s--, *p--*, *ps*

zone--0-7

area--000--255

id--0--7

The point code 0--000--0 is not a valid point code.

apcn (mandatory)

ITU national adjacent destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s--, *p--*, *ps--*, 0--16383, *aa--zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix--s--, *p--*, *ps*

nnnnn--0--16383

gc--aa--zz

m1--m2--m3--m4---0--14 for each member; values must sum to 14

apcn24 (mandatory)

24-bit ITU national adjacent destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p---, *000---255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix--p

msa---000---225

ssa---000---225

sp---000---225

apcn16 (mandatory)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, *000--127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000--127

sna---000--15

mna---000--31

lsn (mandatory)

Linkset name. Each linkset name must be unique in the system.

Range:

aaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters

lst (mandatory)

Linkset type. The linkset type of the specified linkset as defined in Telcordia GR-246-CORE, T1.111.5.

Range:

a
Access links

b
Bridge links

c
Cross links

d
Diagonal links

e
Extended links

prx
Proxy links

adapter (optional)

The adapter layer for links provisioned in an IPSG linkset.

Range:

m3ua

m2pa

Default:

m2pa

apcntype (optional)

ITU-N Adjacent Point Code Type. The format used for changeover and changeover acknowledgement messages.

Range:

itun
ITU National Adjacent Point Code Type

itunchina
ITU National China Adjacent Point Code Type

Default:

itun

as18 (optional)

Adjacent SLS 8-bit indicator. This parameter specifies whether the adjacent node is sending MSUs with 8-bit SLSSs.

Range:

yes

no

Default:

no

asnotif (optional)

AS notification. This parameter specifies whether AS notifications should be sent for IPSG-M3UA linkset.

Range:

yes

no

Default:

yes

bei (optional)

Broadcast exception indicator. This parameter specifies whether TFP (transfer prohibited) messages are allowed to be broadcast on the linkset.

Range:

yes

TFPs are not broadcast

no

TFPs are broadcast

Default:

no

cggtpmod (optional)

Calling party GT modification indicator. This parameter specifies whether calling party global title modification is required for the specified linkset.

Range:

yes

no

Default:

no

cgpnblset (optional)

Calling party blacklist set

Range:

1-255, none

System Default:

none

chgntp3opc (optional)

Change MTP3 OPC. This parameter specifies whether to change MTP3 OPC with SPC. With this parameter off, OPC-to-SPC conversion will not take place and the outgoing MSU will have the original OPC.

Range:*on**off***Default:***on***clli (optional)**

Far-end Common Language Location Identifier (CLLI). The CLLI assigned to the linkset.

Range:*aaaaaaaaaa*

1 alphabetic character followed by up to 10 alphanumeric characters

Default:

CLLI of the adjacent point code

gnameset (optional)

Generic Name Set type. The new settype for an IPSG-M3UA linkset.

Range:*seta**setb**both**none***System Default:***none***gsmscrn (optional)**

GSM MAP screening. This parameter specifies whether GSM MAP screening is allowed.

Range:*on**off***Default:***off***gttmode (optional)**

Global title translation mode. The GTT Mode hierarchy for each link set.

Range:*cd*

CdPA GTT only

cg

CgPA GTT only

acdcd

Advanced CdPA GTT, CdPA GTT

acdcdcg

Advanced CdPA GTT, CgPA GTT, CdPA GTT

acdcdcdg

Advanced CdPA GTT, CdPA GTT, CgPA GTT

cgacdcd

CgPA GTT, Advanced CdPA GTT, CdPA GTT

cgcd

CgPA GTT, CdPA GTT

sysdflt

System wide default value

fcd

FLOBR CdPA only

fcg

FLOBR CgPA only

fcgfc

FLOBR CgPA, FLOBR CdPA

fcdfcg

FLOBR CdPA, FLOBR CgPA

cdcg

CdPA GTT, CgPA GTT

Default:

sysdflt

gwsa (optional)

Gateway screening action. This parameter specifies whether gateway screening is on or off for the specified linkset.

Range:

on

off

Default:

on —if *scrn* is specified

off —if *scrn* is not specified

gwsd (optional)

Gateway screening MSU discard. This parameter specifies whether the discarding of MSUs that bypass the gateway screening function due to load-shedding is on or off. This parameter is also used with the redirect function; MSUs that cannot be screened are discarded if *gwsd=on* is specified.

Range:*on**off***Default:***off***gwsn (optional)**

Gateway screening messaging. This parameter specifies whether messages are generated for each message screened by gateway screening.

Range:*on, off***Default:***off***ipsg (optional)**

IP signaling gateway adjacent point code. This parameter specifies whether a linkset is entered for an IPSG card. The specified adjacent point code is an IP gateway adjacent point code.

Range:*yes**no***Default:***no***islsrsb (optional)**

Incoming rotated signaling link selection (SLS) bit. The bit (1–4 for ITU and 1 – 8 for ANSI linksets) to rotate as the new SLS LSB (Least Significant Bit) of the incoming linkset. The SLS is not modified in the outgoing message.

[Table 4-32](#) shows how the rotation affects the four bits of the ITU SLS during linkset selection:

If This Bit is Selected...	Then Bit Locations 4 3 2 1 Are Rotated To...	Description
Bit 4	3 2 1 4	SLS = 0110 becomes Rotated SLS = 1100 SLS = 1011 becomes Rotated SLS = 0111
Bit 3	2 1 4 3	SLS = 0110 becomes Rotated SLS = 1001 SLS = 1011 becomes Rotated SLS = 1110
Bit 2	1 4 3 2	SLS = 0110 becomes Rotated SLS = 0011 SLS = 1011 becomes Rotated SLS = 1101
Bit 1	No rotation is performed because bit 1 is the existing LSB	-

[Table 4-33](#) shows how the rotation affects the eight bits of the ANSI SLS during linkset selection:

If This Bit is Selected...	Then Bit Locations 8 7 6 5 4 3 2 1 Are Rotated To...	
Bit 8	7 6 5 4 3 2 1 8	SLS = 10010110 becomes Rotated SLS = 00101101 SLS = 11001011 becomes Rotated SLS = 10010111
Bit 7	6 5 4 3 2 1 8 7	SLS = 10010110 becomes Rotated SLS = 01011010 SLS = 11001011 becomes Rotated SLS = 00101111
Bit 6	5 4 3 2 1 8 7 6	SLS = 10010110 becomes Rotated SLS = 10110100 SLS = 11001011 becomes Rotated SLS = 01011110
Bit 5	4 3 2 1 8 7 6 5	SLS = 10010110 becomes Rotated SLS = 01101001 SLS = 11001011 becomes Rotated SLS = 10111100
Bit 4	3 2 1 8 7 6 5 4	SLS = 10010110 becomes Rotated SLS = 11010010 SLS = 11001011 becomes Rotated SLS = 01111001
Bit 3	2 1 8 7 6 5 4 3	SLS = 10010110 becomes Rotated SLS = 10100101 SLS = 11001011 becomes Rotated SLS = 11110010
Bit 2	1 8 7 6 5 4 3 2	SLS = 10010110 becomes Rotated SLS = 01001011 SLS = 11001011 becomes Rotated SLS = 11100101
Bit 1	No rotation is performed because bit 1 is the existing LSB.	

This parameter is used for ITU or ANSI messages on a per-linkset basis.

Range:

1 - 8

ITU linksets— 1 - 4

ANSI linksets— 1 - 8

The `rsls8=yes` parameter must be specified (see the `chg-lsopts` command) before a value greater than 5 can be specified for the `islsrsb` parameter.

Default:

1

itutfr (optional)

ITU TFR (Transfer Restricted) procedure indicator. This parameter specifies whether the TFR procedure is on or off on a per-linkset basis. This parameter is valid for ITU national linksets only.

Range:*on**off***Default:***off***l3tset (optional)**

Link timer set. This parameter value is the value that is defined with the `chg - l3t` command.

Range:*1***Default:***1***lsusealnm (optional)**

IPTPS linkset alarm threshold percent. The percent of the linkset TPS (IPTPS) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured IPTPS value for the linkset.

Range:*10 - 100***Default:***100***maxslktps (optional)**

Maximum per signaling link TPS. The maximum capacity a link is permitted when sufficient unused capacity is present on the host card.

Note

This parameter can only be specified for links in IPSEG linksets.

Note

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000. If the HIPR2 High Rate Mode and 1M System TPS features are turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 1,000,000.

Note

At the Tx side, we observed that the link is able to send more traffic than MAXSLKTPS if there are available/unused card capacity present and the receiving end of this traffic can process more than MAXSLKTPS of Tx end.

Range:

25 - 12,000

Note

The maximum value that can be specified for this parameter depends on the type of IPSC card that is used:

- E5-ENET-B card when the E5-ENET-B IPSC High Throughput feature is turned off-6500 TPS
- E5-ENET-B card when the E5-ENET-B IPSC High Throughput feature is turned on-9500 TPS
- SLIC card - 12,000 TPS

System Default:

value of slktps/rsvds1ktps parameter

mtprse (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

Range:

yes
equipped

no
not equipped

Default:

no

multgc (optional)

Multiple group codes. This parameter specifies whether multiple group codes can be specified.

Range:

yes

no

Default:

no

nis (optional)

Network Indicator Spare. This parameter specifies whether the Network Indicator Spare option is on or off for the specified linkset. When this option is enabled, the Network Spare value for network indicator for both ANSI and ITU-National (ITU-N) links is supported by the system.

Range:*on**off***Default:***off***ppc (optional)**

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

The proxy point code must be a full point code.

Synonym:*ppca***Range:***000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

ppc/ppca/ppci/ppcn/ppcn24/ppcn16 (optional)

Proxy Point Code

The proxy point code must be a full point code.

ppci (optional)

ITU international proxy point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code.

Range:*s-, 0-255, none*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255**id—0-7*

Enter *none* to delete the point code.

The point code *0-000-0* is not a valid point code.

ppcn (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:*s-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-**nnnnn*—0-16383*gc*—*aa-zz**m1-m2-m3-m4*—0-14 for each member; values must sum to 14**ppcn24 (optional)**24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255*ssa*—000-255*sp*—000-255**ppcn16 (optional)**16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*.**Range:**

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127*sna*---000---15*mna*---000---31**randsls (optional)**

Random SLS (signaling link selection). This parameter is used to apply random SLS generation for the specified linkset.

The *randsls=per ls* parameter must be specified in the *chg-stpopts* command before specifying the *randsls* parameter in the *ent-ls* command to enable random SLS generation on a per linkset basis.**Range:****off**

Disables random SLS generation on a specified linkset.

class0

Enables random SLS generation for Class0 SCCP traffic on a specified linkset.

all

Enables random SLS generation for Class0 and Class1 SCCP traffic on a specified ITU linkset and for Class0 and ISUP traffic on a specified ANSI linkset.

Default:*off***rcontext (optional)**

Routing context. The new routing context for an IPSG-M3UA linkset.

Range:*0 - 4294967295***System Default:***none***scrn (optional)**

Gateway screening screen set. The gateway screening screen set assigned to this linkset.

Range:*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

none —Deletes screen set association with the linkset

slktps (optional)

Reserved per signaling link TPS for IPSG Linkset. The capacity guaranteed to each link in the linkset.

Note

This parameter is required for each link in an IPSG linkset. The parameter cannot be specified for links in non-IPSG linksets. The guaranteed capacity for the links hosted by an IPSG card cannot exceed the IPSG card capacity.

Note

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000. If the HIPR2 High Rate Mode and 1M System TPS features are turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 1,000,000.

Synonym:*rsvdslktps***Range:***0 - 12,000*

Note

The maximum value that can be specified for this parameter depends on the type of IPSPG card that is used:

- E5-ENET-B card when the E5-ENET-B IPSPG High Throughput feature is turned off-6500 TPS
- E5-ENET-B card when the E5-ENET-B IPSPG High Throughput feature is turned on-9500 TPS
- SLIC card - 12,000 TPS

slkusealm (optional)

IPTPS signaling link alarm threshold percent. The percent of the link TPS at which an alarm is generated to indicate that the actual link TPS is approaching the alarmed IPTPS (slktps/ rsvdslktps or maxslktps) configured for the link.

System Default:

80

slsci (optional)

5-bit to 8-bit SLS conversion indicator. This parameter specifies whether the 5-bit to 8-bit SLS conversion feature is used to select links for outgoing messages direct to the given linkset. When enabled, the system replaces any 5-bit SLS values contained in received messages, with a random 8-bit value before the 5-bit SLS values are used by the STP to select the outgoing link in that linkset.

Range:

yes
enabled

no
disabled

Default:

no

slsocbit (optional)

Other CIC (Circuit Identification Code) Bit. If the SLSOCB feature is turned on, this parameter specifies whether the Other CIC Bit option is to be used during link selection. If the option is to be used, specify which bit (5– 16) of the CIC is to be used as the other CIC bit. During link selection, the specified bit acts as the most significant bit of the new SLS and bits 2 through 4 of the received CIC become the least significant bits of the new SLS. This parameter is used for ITU-ISUP messages. The SLS is not modified in the outgoing message. The following example shows a received CIC where bit 9 is the other CIC bit (slsocbit=9). The new SLS is 0100.

16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
0	0	0	0	1	0	0	0	1	0	0	1	1	0	0	1
New SLS							0					1	0	0	

Range:

5 - 16, none

Default:*none***slsrsb (optional)**

Rotated signaling link selection (SLS) bit. The bit (1–4) to rotate as the new SLS Least Significant Bit (LSB). The SLS is not modified in the outgoing message. [Table 4-35](#) shows how the rotation affects the four bits of the SLS during linkset selection:

If This Bit is Selected...	Then Bit Locations 4 3 2 1 Are Rotated To...	Description
Bit 4	3 2 1 4	SLS = 0110 becomes Rotated SLS = 1100 SLS = 1011 becomes Rotated SLS = 0111
Bit 3	2 1 4 3	SLS = 0110 becomes Rotated SLS = 1001 SLS = 1011 becomes Rotated SLS = 1110
Bit 2	1 4 3 2	SLS = 0110 becomes Rotated SLS = 0011 SLS = 1011 becomes Rotated SLS = 1101
Bit 1	No rotation is performed because bit 1 is the existing LSB	-

This parameter is used for ITU messages on a per-linkset basis.

Range:*1 - 4***Default:***1***sltset (optional)**

SLTM record. The SLTM record to be associated with the linkset.

Range:*0 - 20*

0 –sets the linkset to SLT reflect mode

Default:*1 - ANSI**2 - ITU***spc (optional)**

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range:*000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006–255`.
The point code `000-000-000` is not a valid point code.

spc/spca/spci/spcn/spcn24/spcn16 (optional)

Secondary point code.

spci (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

spcn (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfnt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

spcn24 (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

spcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

tpsa1mtype (optional)

IPSG IPTPS threshold alarm type. The IPTPS threshold that can be alarmed.

Range:

slktps

the SLKTPS/RSVDSLKTPS threshold is alarmed

maxslktps

the MAXSLKTPS threshold is alarmed

System Default:

slktps

visualizedata (optional)

Linkset based Visualization option.

Range:

off

Visualization is off on this linkset

risky

Only risky opcodes (based on FS11) will be visualize on this linkset

all

All opcodes will be visualize on this linkset

System Default:

off

Example

Adds linkset WY64438 with APC 144-201-1 AND LIST C:

```
ent-ls:lsn=wy644368:apc=144-201-001:lst=c
```

Adds linkset LSITUA1 with APCN 5 and LST C. The APCN uses a four-part format where the maximum number of bits in each position is defined by the `chg-stpopts:npcfmt.i` parameter:

```
ent-ls:lsn=lsitua1:apcn=5-5-5-1:lst=c
```

Adds linkset EXP123 with APCN 2-3-4-5-aa, which has a duplicate point code group of aa and linkset type a. The ITU national duplicate point code (ITUDUPPC) feature is turned on, so the ITU national point code contains a group code:

```
ent-ls:lsn=exp123:apcn=2-3-4-5-aa:lst=a
```

Add a linkset in which all applicable MSUs arriving on the linkset are screened using the GSM MAP screening feature:

```
ent-ls:lsn=lsitu1:apcn=5000:lsta:gmscrn=on
```

Adds linkset LSN24 with 24-bit ITU-N APCN24 10-100-10 and linkset type a:

```
ent-ls:lsn=lsn24:apcn24=10-100-10:lsta
```

Adds linkset LSA2 with private APC p-1-2-4:

```
ent-ls:lsta:lsn=lsa2:apc=p-1-2-4
```

Adds linkset LSN410234 with private and spare APCN ps-1-1-1-2047-aa:

```
ent-ls:lsta:lsn=lsn410234:apcn=ps-1-1-1-2047-aa
```

Adds linkset LSI00001 with spare APCI s-1-1-209-7:

```
ent-ls:lsta:lsn=lsi00001:apci=s-1-1-209-7
```

Adds linkset LSN24 with APCN24 10-100-10 with an APCNTYPE of *itunchina* and linkset type a:

```
ent-ls:lsn=lsn24:apcn24=10-100-10:lsta:apcntype=itunchina
```

Adds linkset LSA using the global title translation mode CGACDCD:

```
ent-ls:lsn=lsa:lsta:apca=1-1-1:ggtmode=cgacdcd
```

Enables random SLS generation for Class0 and Class1 SCCP traffic on ITU linkset LSA:

```
ent-ls:lsn=lsa:lsta:apci=1-1-2:randsls=all
```

Adds a linkset in which calling party global title modification is required for all GT routed MSUs arriving on the linkset:

```
ent-ls:lsn=ls2:apc=2-2-2:lsta:cggmod=yes
```

Adds an IPSP-M3UA linkset:

```
ent-ls:lsn=ls1201:apc=10-10-10:lsta:adapter=m3ua:ipsg=yes:slktps=100
```

Adds an IPSP-M2PA linkset:

```
ent-ls:lsn=lsm2pa:apc=5-6-7:lsta:ipsg=yes:slktps=300
```

Adds a linkset and sets the Incoming SLS Bit Rotation on the 2nd Bit:

```
ent-ls:lsn=lsa:lsta:apci=1-1-2:islsrsb=2
```

Adds linkset LSA using GTT mode FCDFCG when the Flexible Option Based Routing (FLOBR) feature is turned on:

```
ent-ls:lsn=lsa:lsta:apca=1-1-1:ggtmode=fcdfcg
```

Adds ANSI linkset LSA and sets the Incoming SLS Bit Rotation to the 6th bit (the 6th bit in the SLS is used as the LSB):

```
ent-ls:lsn=lsa:lsta:apca=1-1-1:islsrsb=6
```

Converts the linkset to SLT reflect mode:

```
ent-ls:lsn=ls1:lsta:apca=1-1-1:sltset=0
```

Add linkset LS1 with 16-bit ITU-N APCN16 120-11-12 and sets linkset to SLT reflect mode:

```
ent-ls:lsn=ls1:lsta:apcn16=120-11-12:sltset=0
```

Add linkset ls113 with gnameset=seta

```
ent - ls : lsn=ls113:gnameset=seta
```

Add linkset ls113 with cgpnblset=5

```
ent - ls : lsn=ls113:cgpnblset=5
```

Dependencies

The value specified for the `apc` parameter must be a full point code.

The specified adjacent point code cannot exist as an alias point code.

If the `gwsa=on`, `gwsn=on`, and `gwsd=on` parameters are specified, the `scrn` parameter must be specified.

The specified adjacent point code cannot be the same as the self-ID destination point code of the STP.

The specified adjacent point code cannot be the same as any self-ID capability point codes of the STP.

If the system is configured for ANSI point codes, and the `nc=0` parameter is specified, then the value of the `ni` parameter must be 6 or greater.

The specified linkset name cannot already exist in the database.

The specified adjacent point code cannot be assigned to any other linkset.

The maximum number of linksets that can be defined in the system is 1024.

The specified screen set (`scrn` parameter) must exist in the database.

If the `gwsd=on` parameter is specified, the `gwsa=on` parameter must be specified.

If a destination point code matching the specified far-end point code exists, the far-end CLLI for the given linkset must match the destination identifier (DI) of that matching destination.

The `mtprse` parameter can be specified only if the MTP Restart feature `MTPRS` (for ANSI) is turned on. The `rtrv-feat` command can be used to verify whether the feature is turned on (`mtprs=yes` in the output).

If the `ipgwapc=yes` parameter is specified or the `ipsg=yes` and the `adapter=m3ua` parameters are specified, then the `mtprse=yes` parameter cannot be specified.

The `asl8=yes` parameter can be assigned only to an ANSI linkset (a linkset containing an adjacent point code in the SS7 domain).

The `apcntype` parameter can be specified only for ITU-N and ITU-N24 linksets.

The Other CIC (Circuit Identification Code) Bit Used feature (`SLSOCB`) feature must be turned on before the `slsocbit` parameter can be specified.

The `slsocbit` parameter is valid only for ITU linksets.

The `slsrbs` parameter is valid only for ITU linksets.

The GSM Map Screening feature must be turned on (see the `enable/chg-ctrl-feat` commands) before the `gmscrn` parameter can be specified.

The `itutfr` parameter is valid only for ITU linksets.

The ITU National Duplicate Point Code (`ITUDUPPC`) feature must be turned on before the `multgc=yes` parameter can be specified.

The `multgc=yes` parameter is valid only for ITU-N or ITU-I point codes.

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000. If the HIPR2 High Rate Mode and 1M System TPS features are turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 1,000,000.

The `ipgwpc=yes` or the `ipsg=yes` parameter must be specified before the `lsusealm` parameter can be specified.

The `ipgwpc=yes` or the `ipsg=yes` parameter must be specified before the `slkusealm` parameter can be specified.

The Enhanced GSM Map Screening feature must be turned on before the `gmscrn=on` parameter can be specified for an ANSI linkset.

The `mtprse` parameter can be specified only if the MTP Restart feature ITUMTPRS (for ITU), is turned on. The `rt rv-feat` command can be used to verify whether the feature is turned on (`itumtps=yes` in the output).

The STP Site ID table is corrupt or cannot be found.

The Linkset table is corrupt or cannot be found.

The Route table is corrupt or cannot be found.

The MAS Configuration table is corrupt or cannot be found.

A point code cannot be assigned to a linkset as an APC if the point code has been provisioned with exception routes.

The Route Exception table is corrupt or cannot be found.

The Origin-based SCCP Routing feature must be turned on before the `gt tmode` parameter can have a value of `acdcd`, `cgacdcd`, `acdcdcg`, `acdcdcg`, `cgcd`, `cdcg`, or `cg`.

If APCN is specified for the Adjacent Point Code then the format of APCN must match the format dictated by the NPCFMTI parameter via the CHG-STPOPTS command.

The value of the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter must exist in the Destination Point Code table.

The `gmscrn` parameter can be specified only for ITU linksets.

The value specified for the `spc` parameter must be a full point code.

If the Multiple Linksets to a Single Adjacent Point Code (MLS) feature is enabled and turned on, then a maximum of 6 non-IPGW linksets can be created using the same adjacent point code.

The values specified by the `spc` and `apc` parameters must have the same network type.

The Multiple Linksets to a Single Adjacent Point Code (MLS) feature must be turned on before the `spc` parameter can be specified.

The value specified by the `spc` parameter must already exist in the SPC table.

The SPC table must be accessible.

The specified combination of the `apc` and `spc` parameters must be unique for each linkset.

The value specified for the `spc` parameter cannot already be specified as a secondary point code for an adjacent destination point code.

The Proxy Point Code feature must be enabled before the `lst=prx` parameter can be specified.

The Proxy Point Code feature must be enabled before the `ppc` parameter can be specified.

The value specified for the `ppc` parameter must be a full point code.

The `lst=prx` parameter must be specified before the `ppc` parameter can be specified. If the `lst=prx` parameter is specified, then the `ppc` parameter must be specified.

The values specified for the `apc` and `ppc` parameters must have the same network type.

The values specified for the `apc` and `ppc` parameters must have the same group code.

The `spc` and `ppc` parameters cannot be specified together in the command.

The `ppc` parameter cannot be specified for more than 10 linksets.

Two adjacent point codes cannot reference each other as proxy point codes.

The `apc` parameter and the `prx=yes` parameter must be specified before the `ppc` parameter can be specified.

A valid value must be specified for the `lst` parameter.

The `spc` and `ppc` parameters cannot be specified together in the command.

All of the linksets for an adjacent destination point code must be of the same type.

The specified combination of the `apc` and `ppc` parameters must be unique for each linkset.

The value specified for the proxy point code must be defined in the Destination table before the `lst=prx` parameter can be specified.

If multiple linksets are defined for the `apc` parameter, and if a proxy point code is defined for the `apc` parameter, then the first linkset defined in the `ent-ls` command must use the proxy point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cgtmod` parameter can be specified.

The `ipsg=yes` parameter must be specified before the `adapter` parameter can be specified.

The `ipsg=yes` and `adapter=m3ua` parameters must be specified before the `asnotif` parameter can be specified.

The `ipsg=yes` and the `adapter=m3ua` parameters must be specified before the `rcontext` parameter can be specified.

If the `ipsg=yes` parameter is specified, then the `slktps/rsvdslktps` or `maxslktps` parameter must be specified.

The `ipsg=yes` parameter must be specified before the `slktps/rsvdslktps` or `maxslktps` parameter can be specified.

The `ipsg=yes` and `adapter=m3ua` parameters must be specified before the `lst=a` parameter can be specified.

A maximum of one IPGW linkset or a maximum of 6 of any other linksets are allowed between any APC and the EAGLE.

If the `ipsg=yes` and `adapter=m3ua` parameters are specified, then the `multgc=yes` parameter cannot be specified.

The ISLSBR feature must be enabled before the `islsrsb` parameter can be specified.

The FLOBR feature must be turned on before a value of `fcd`, `fcg`, `fcgfcg`, or `fcdfcg` can be specified for the `gtmode` parameter.

The SAPC table is corrupt or cannot be found.

The `rsls8=yes` parameter (see the `chg-lsopts` command) must be specified for an ANSI linkset before a value greater than 5 can be specified for the `islsrsb` parameter.

If an ITU linkset is used, then a value of 1 – 4 must be specified for the `islsrsb` parameter.

The value specified for the `slktps/rsvdslktps` parameter must be less than or equal to the value specified for the `maxslktps` parameter.

The value specified for the `ppc` parameter must already exist in the DSTN table and the `prx=yes` parameter must be assigned (see the `ent-dstn` command).

The `sltset=0` parameter can be specified only for a type A linkset (`lst=a`).

The value specified for the `slktps/rsvdslktps` and `maxslktps` parameters must be within the allowed range.

The ITUTFR **cannot** be specified for a linkset to be configured for APCN16.

The NIS **cannot** be specified for a linkset to be configured for APCN16.

The PPC specified must not be a private point code.

The MTP Restart Equipped (MTPRSE) parameter is only valid for adjacent ANSI nodes in the SS7 domain.

The adapter type specified must be either `m3ua` or `m2pa`.

Notes

Of the 1024 maximum linksets supported, up to 255 of the linksets can be gateway linksets.

The system supports a maximum of 2800 links and all of them can be used at one time.

The links that directly connect the system with an adjacent node are grouped into one or more linksets. A linkset can contain up to 8 (international standards) or 16 (national standards) signaling links, depending on how the system was configured when the network was created.

Each linkset must be assigned the same physical links at both ends of the link (local and adjacent signaling points) and each link must be assigned the same link number.

Signaling link acknowledgments (SLTA) are the same type of maintenance message as the SLTMs received on the link.

If the `gwsa=off` and `gwsn=off` parameters are specified, all MSUs are passed.

If the `gwsa=off` and `gwsn=off` parameters are specified for all linksets, gateway screening and the GWS redirect function for the DTA feature are disabled.

If the `gwsa=off` and `gwsn=on` parameters are specified, all MSUs pass, but MRNs are generated if an MSU matches a screening condition.

If the `gwsa=on` and `gwsn=off` parameters are specified, MSUs are screened but messages are not generated.

If the `gwsa=on` and `gwsn=on` parameters are specified, MSUs are screened and MRNs are generated at the rate of one MRN every 20 seconds per link.

If the `asl8=yes` parameter is specified with the `lst=a` parameter (a linkset containing access signaling links), this indicates that the originator of the MSUs is generating 8-bit SLSs. For other linkset types, the `asl8=yes` parameter indicates that the adjacent STP is converting 5-bit SLSs to 8-bit SLSs. The SLS in MSUs received by the system on a linkset that has the `asl8=yes` parameter assigned to it will not be converted. These MSUs are assumed to contain 8-bit SLSs.

The Network Indicator Spare (`nis`) parameter can be specified only for ANSI and ITU-N links.

The `mtprse` parameter value can be specified independently of the value specified on the `mtprsi` parameter of the `chg-stpopts` command.

The MTP restart option (`mtprse`) is not a valid option on point-to-multipoint IP links (DCM cards equipped as SS7IPGW links).

When two linksets are used as a combined linkset, each linkset must have the same `slsci` and `asl8` values and the same `slsobit` and `islsrsb/slrsb` values.

 Caution

This is not enforced in the system and there is no warning mechanism if the values of these parameters are not the same for each linkset.

MTP restart provides an orderly process for bringing signaling links back into service after the system has been isolated and restarted. A greater preference is given to restoring the STP to network service in an orderly fashion than to the speed of recovery. The time required is system dependent as shown:

- up to 64 LIMs—62 seconds (Link Alignment Delay)
- 64 - 127 LIMs—97 seconds
- 128 - 191 LIMs—132 seconds
- more than 191 LIMs—167 seconds

The `slrsb` parameter alone does not provide an even distribution of ITU-ISUP messages across all links within a linkset. The system uses all four bits of the SLS to determine the actual link to route messages. Because the static bit is simply rotated within the SLS, all possible values of the SLS field are still not realized. The `slsobit` parameter must also be specified to provide an even distribution across all links within the linkset. If both parameters are specified for a given linkset, the SLS field is processed in the following order.

- The SLS is modified using the Other CIC Bit option.
- The modified SLS is modified again using the Rotated SLS Bit option.
- The modified SLS is used by the existing linkset and link selection algorithms to select a link
- The ISUP message is sent out the link containing the original, unmodified SLS field.

If the ITU National Duplicate Point Code (ITUDUPPC) feature is turned on, for each group that is defined, a separate ITU national C linkset must be provisioned. The C linkset is used as the alternate route for point codes in the group.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All point code types support the private (internal) point code subtype prefix (p-).

The ITU National and ITU National China Adjacent Point Code types indicate the format that is used for changeover and changeover acknowledgement messages. China specifies a 16-bit field for data in changeover messages. The FSN occupies the first 12 bits. The trailing 4 bits are spare and are coded as 0. ITU uses a 24-bit field for data in the extended changeover/changeover acknowledgement messages. The FSN is encoded in the first 12 bits. The last 12 bits of the field are spare and are coded as zero.

The `randsls` parameter value applies to SCCP ITU-T messages and Class0 and ISUP ANSI messages when random SLS generation is set to occur on a per linkset basis (the `randsls=perls` parameter is specified in the `chg-stpopts` command).

If the `randsls=perls` parameter is specified in the `chg-stpopts` command, it is recommended that the linksets in a combined linkset be provisioned with the same `randsls` value to avoid undesired SLS distribution.

The value specified for the `ppc` parameter must be a full point code. Cluster point codes and private point codes are not supported.

Invalid point codes (ANSI network = 0) can be used for the adjacent point code of an IPGWx linkset. Private point codes (p-) can be used for IPGWx linksets, as adjacent point codes (`ent-ls:apc=xxx`) or internal point codes (`ent-rmt-app1:ipc=xxx`). Ordinary point codes can be used in all cases as APCs or IPCs.

If the ISLSBR feature is turned on, and Incoming SLS Bit Rotation is applied to an MSU, then the outgoing SLS bit rotation is not applied for that MSU. If the ISLSBR feature is turned off, or Incoming SLS Bit Rotation is not applied to an MSU, then the outgoing SLS bit rotation is applied for that MSU.

The valid ISLSRSB values for ITU link sets are 1 – 4 and for ANSI link sets are 1 – 8.

The `randsls` parameter is applied on an incoming linkset for ANSI messages and on an outgoing linkset for ITU messages.

The `chgntp3opc` parameter is applied on the outgoing linkset.

The `chgntp3opc` parameter will be nullified if the `sccpopts:mtprgtt` option is set to `fullgtt`.

Output

```
ent-ls:lsn=lsa:lst=a:apca=1-1-1:gttmode=fcdfcg
```

ent-map

Use this command to create new entries in the MAP table, which allow the assignment of mated applications and Alternate RI Mate searches for use with SCCP network management. A mated application is used if the local application becomes unavailable. An Alternate RI Mate is used if all mated applications within a MAP Set become unavailable or congested.

Note

A MAP set is a logical grouping of a set of PC/SSNs that already exist in the EAGLE MAP table. The Flexible GTT Load Sharing (FGTTLS) feature allows a PC/SSN combination to be part of more than one load-sharing group, with each PC/SSN combination defined by a different MAP set.

Note

If the FGTTLS feature is enabled, then all existing entries in the MAP table and all existing GTA translations in the GTT table with ri=ssn are stored in default MAP sets. Additional MAP sets can be provisioned, and GTT entries can be associated to the MAP sets.

Note

The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled to provision Alternate RI Mates.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

pc (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001–005*.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006–255`.
The point code `000-000-000` is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (mandatory)

Primary remote point code.

pci (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

pcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pcn16 (mandatory)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (--).

un---000---127

sna---000---15

mna---000---31

ssn (mandatory)

Subsystem number. The application's subsystem number. This attribute is composed of the decimal representation of the 1-byte field used in the SS7 protocol.

Range:

2 - 255

grp (optional)

Concerned point code broadcast list (CSPC) group name. The name of a group of point codes that should be notified of the subsystem status. A different CSPC group can be assigned to each mated PC/SSN. For ANSI, the EAGLE broadcasts SSP or SSA to the mate subsystem only if the mate's point code is provisioned as part of the CSPC group to receive an SSP or SSA. This parameter must be provisioned for a node if the node is to receive SSP or SSA broadcasts, even if the node is a mated application.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

Default:

Current value.

Note

If the *grp* parameter value is specified, and the specified point code and SSN is assigned to multiple mated applications, the *grp* value for all mated applications containing the specified point code and SSN will be changed to the values specified in this procedure.

mapset (optional)

MAP Set ID.

Range:

dflt

new

Default:

dflt if the FGTTLS feature is not enabled

materc (optional)

Mate relative cost. The RC assigned to the mate PC/SSN that is being added to the entity set. The EAGLE determines the multiplicity mode based on the relative costs (the *rc* and *materc* parameters) of the subsystem.

Range:

0 - 99

Default:

50

mpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:*mpca***Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

Default:

000

mpc/mpca/mpci/mpcn/mpcn24/mpcn16 (optional)

Mate remote point code.

mpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:*s-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

Default:

0-000-0

mpcn (optional)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code.

Range:*s-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-**nnnnn—0-16383**gc—aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default:

00000

mpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa—000–255**ssa—000–255**sp—000–255***Default:**

000

mpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (--).

*un---000---127**sna---000---15**mna---000---31***Default:**

000

mrc (optional)

Message routing under congestion. This parameter indicates whether Class 0 messages to the specified PC/SSN can be routed to the next preferred node/subsystem when that PC/SSN is congested.

Range:*yes**no***Default:***yes —if ANSI**no —if ITU***mrnpc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:*mrnpca*

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, `ni = 000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001–005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006–255`.

The point code `000-000-000` is not a valid point code.

Default:

000

mrnpc/mrnpca/mrnpai/mrnpai/mrnpai/mrnpai24/mrnpai16 (optional)

Alternate RI Mate point code.

mrnpai (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s*zone*—0-7*area*—000-255*id*—0-7

The point code `0-000-0` is not a valid point code.

Default:

0-000-0

mrnpai (optional)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code.

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-*nnnnn*—0-16383*gc*—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default:

00000

mrnpai24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255
ssa—000–255
sp—000–255

Default:
000

mrnpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:
000--127

Specify a valid value for each subfield of the point, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000--31

Default:
000

mrnset (optional)

Alternate RI Mate MRN Set ID. The MRN Set where the Alternate RI Mate search is performed.

Range:
1 - 3000, dflt
dflt —default MRN Set

If the *mrnpc* parameter is specified, and the *mrnset* parameter is not specified, then the value for the *mrnset* parameter is automatically set to *dflt*.

mssn (optional)

Mate subsystem number. The mate application's subsystem number. This attribute is the decimal representation of the one-byte field used in the SS7 protocol.

Range:
2 - 255

Default:
Parameter is not used

mwt (optional)

Mate point code weight. The weight assigned to the mate PC/SSN that is being added to a weighted entity set.

Range:
1 - 99

rc (optional)

Relative cost. The EAGLE determines the multiplicity mode based on the relative costs (the *rc* and *materc* parameters) of the subsystem. (See *Notes* for additional information on multiplicity modes).

Range:*0 - 99***Default:***10***srm (optional)**

Subsystem routing messages. This parameter specifies whether subsystem routing messages (SBR, SNR) are transmitted between the mated applications.

Note

This value can be provisioned in any of the multiplicity modes, but its value only affects traffic if the multiplicity mode is *DOM* or *COM*. See the *Notes* section for more information on multiplicity modes.

Range:*yes**no***Default:***yes* —if ANSI*no* —if ITU**sso (optional)**

Subsystem status option. This parameter specifies whether or not the PC/SSN is to initiate a subsystem test when a RESUME is received for the PC.

Range:*on**off***Default:***off***thr (optional)**

Threshold. The in-service threshold assigned to each PC/SSN in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Note

If this parameter is not specified, a value of 1% is assigned to each weighted PC/SSN.

Range:*1 - 100*

wt (optional)

Weight. The weight assigned to the primary PC/SSN that is being added to the weighted entity set.

Range:

1 - 99

Example

In this example, the rc parameter is not required for a solitary PC/SSN pair. If the rc parameter is not specified, the relative cost defaults to 10.

```
ent-map:pc=1-1-1:ssn=10:grp=xyz
```

This example enters 1 and 1 into the MAP table. The rc and materc parameters are required for this command, which defines a map group.

```
ent-
```

```
map:pc=1-1-0:ssn=10:rc=10:mpc=1-1-1:mssn=10:materc=20:grp=xyz:srm=on
```

These examples enter a solitary point code in the MAP table with the Subsystem Status Option set to ON:

```
ent-map:pc=1-1-3:ssn=20:grp=abc:sso=on
```

```
ent-map:pc=2-2-3:ssn=20:grp=abc
```

This example sets the Subsystem Status Option to ON for the primary and mate:

```
ent-map:pc=1-1-4:ssn=10:rc=10:mpc=1-1-1:mssn=10:materc=20:sso=on
```

This example enters a solitary point code in the MAP table with the Subsystem Status Option set to OFF (the default):

```
ent-map:pc=1-1-6:ssn=10:rc=10:mpc=1-1-7:mssn=10:materc=20
```

This example creates a new MAP Set with Alternate RI Mate 1-1-3/1:

```
ent-
```

```
map:pc=1-1-1:ssn=15:rc=10:mpc=1-1-2:mssn=25:materc=20:mapset=new:mrnset=1:mrnpc=1-1-3
```

The following example creates a new MAP set, and enters 1 and 1 into the newly created MAP set:

```
ent-map:pc=1-1-1:ssn=10:rc=10:mpc=1-1-2:mssn=20:materc=20:mapset=new
```

The following example enters 1 and 1 into the default MAP set:

```
ent-map:pc=1-1-1:ssn=15:rc=10:mpc=1-1-2:mssn=25:materc=20:mapset=df lt
```

The following example creates a new MAP set and enters a solitary PC/SSN value of 1:

```
ent-map:pc=1-1-1:ssn=10:mapset=new
```

This example enters a solitary PC/SSN of 1 into the default MAP set:

```
ent-map:pc=1-1-2:ssn=15:mapset=df lt
```

This example creates a new MAP set and enters a solitary PC/SSN 1 with the subsystem option ON. It specifies the sso=on parameter for all instances of PC/SSN 1:

```
ent-map:pc=1-1-1:ssn=10:sso=on:mapset=new
```

This example enters a solitary PC/SSN of 1 into the default MAP set with the subsystem option ON. The sso=on parameter is specified for all instances of PC/SSN 1:

```
ent-map:pc=1-1-3:ssn=15:sso=on:mapset=df lt
```

These examples create a weighted shared PC/SSN pair:

```
ent-map:pc=1-1-1:ssn=10:rc=20:wt=30:mpc=1-2-1:mssn=10:materc=20:mwt=20
```

```
ent-
```

```
map:pc=1-1-1:ssn=10:rc=20:wt=30:mpc=1-2-1:mssn=10:materc=20:mwt=20:thr=40
```

This example creates a new MAP Set with a different ITU network type point code for the Alternate RI Mate PC:

```
ent-
```

```
map:pci=1-001-1:ssn=15:rc=10:mpci=1-001-2:mssn=25:materc=20:mapset=new:mrnpcn=00126:mrnset=2
```

Example for 16 bit PC:

```
ent-
```

```
map:pcn16=1-2-3:ssn=10:rc=20:wt=30:mpcn16=1-1-1:mssn=10:materc=20:mwt=20:thr=40
```

Dependencies

The PC/SSN pair cannot already exist in the MAP table.

The specified MPC/MSSN pair cannot already exist in the MAP table.

The apca and pcn24/pcn16 parameters cannot be specified for the same MAP set. The pci and pcn parameters cannot be specified for the same MAP set if the MAP set contains a true point code.

If a subsystem is configured for a subsystem number (SSN) value in the SS-APPL table, then the specified MAP table entry for that subsystem must be a valid point code type for that subsystem. The following point code types are not valid for the indicated subsystems:

- For the INP subsystem, the True Point code cannot be an ITU-I point code.
- For the AIQ, ATINPQ, VFLEX, and EIR subsystems, the True Point code cannot be an ITU-N24 point code.

The ANSI/ITU SCCP Conversion feature must be enabled before the network type of the CPC broadcast group can be different from the network type of the point code.

If the pci, pcn, or pcn24/pcn16 parameter is specified, then the srm=yes parameter cannot be specified.

The primary remote point code must already exist in the Route table, as a destination in the ordered route entity set, or in a cluster destination for which ordered routes are specified.

If a CSPC broadcast list group name is specified, it must already exist.

A maximum of 1024 unique remote point codes are allowed.

A maximum of 12 SSNs per remote point code can be entered.

The primary subsystem DPCs must be full point codes.

The mate subsystem DPCs must be full point codes.

The LNP, V-Flex, EIR, or INP feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before a value that is a true point code can be specified for the pca/mpca parameter.

The AINPQ, EIR, INP, or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before a value that is a true point code can be specified for the `pcn/mpcn` parameter.

The EIR or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before a value that is a true point code can be specified for the `pci/mpci` parameter.

If the `mpc/mpca/mpci/mpcn/mpcn24/mpcn16` parameter is specified, then the value must exist in the Routing table.

If the `mssn` or `materc` parameter is specified, then the `mpc` parameter must be specified.

If the `pc` parameter value is an EAGLE true point code, the subsystem must have a lower relative cost than all other mated subsystems in the group.

The `sso` parameter cannot be specified with a point code value that is the system true point code.

A true point code cannot be routed to itself.

The `mpc` and `mssn` parameters cannot have the same values as the `pc` and `ssn` parameters.

The point code must already exist in the Concerned Point Code (CSPC) group.

The number of MPC Subsystem entries must not exceed the table capacity.

The Route table is corrupt or cannot be found.

The Site Identification table is corrupt or cannot be found.

If the Flexible GTT Load Sharing feature is not enabled, then the `mapset` parameter cannot be specified. If the Flexible GTT Load Sharing feature is enabled, then the `mapset` parameter must be specified.

The EAGLE True PC can be provisioned only in the default MAP set.

The Weighted GTT Loadsharing feature must be turned on before the `wt`, `mwt`, or `thr` parameters can be specified.

If the `thr` parameter is specified, the `wt` and `mwt` parameters must be specified.

If the `mpc` parameter is specified, the `rc` parameter must be specified.

The `wt` and `mwt` parameters must be specified together in the same command.

If the `materc` parameter value equals the `rc` parameter value, a Loadshared Group is indicated, and the `rc`, `mpc`, `materc`, and `mwt` parameters must be specified.

If the `chg-sid:pctype=ansi` command is entered, a value of `ni=000` cannot be specified.

If the `chg-sid:pctype=ansi` command is entered, and a value of `ni=001 – 005` is specified, a value of `nc=000` cannot be specified.

If the `mpc` parameter value is a true point code, the subsystem must have a lower RC than all other mated subsystems in the entity set.

The maximum number of entries in the MAP table cannot be exceeded.

The maximum number of possible entries in the MAP table for the specified True Point Code cannot be exceeded. Maximum entries for the ANSI, ITU-I, and ITU-N point codes are:

- ANSI—2 (ANS41 AIQ and LNP), 4 (ANSI41 AIQ, ATINPQ, INP, and V-FLEX)
- ITU-I—4 (ANSI41 AIQ, ATINPQ, EIR, V-FLEX)

- ITU-N—5 (ANSI41 AIQ, ATINPQ, EIR, INP, and V-FLEX)

Note

LNP is mutually exclusive with ATINPQ and V-FLEX, unless the Dual ExAP Config feature is enabled.

If the `mwt` parameter is specified, the `mpc` parameter must be specified.

If the `mpc` parameter is specified, the `mssn` and `materc` parameters must be specified.

The entity set being created must be either solitary or dominant to use the true point code as a point code.

The MAP table is corrupt or cannot be found.

If the `thr` parameter is specified, the `rc1`, `rc2`, `rc3`, and `rc4` parameters must be of equal value.

If the `mpc` parameter is specified, then the `mssn` parameter must be specified.

SRM=YES cannot be entered with ITU point codes.

If the `mpc` or `mssn` parameter is specified, then the `materc` parameter must be specified.

If the `pc/ssn` parameters and the `mpc/mssn` parameters are specified, then the `rc` parameter must be specified.

If the `pcn` or `mpcn` parameter is specified, then the format of the parameter must match the format dictated by the `chg-stpopts:npcfmti` command.

A True PC cannot be routed to itself.

The Spare Point Code Support feature must be enabled to allow provisioning of an ITU-I or ITU-N spare point code.

The True Point Code can be provisioned only in the default MAPSET.

Unable to access database. Severe database failure.

Failed reading SS APPL table.

The values specified for the `pc` and `mpc` parameters cannot be associated with proxy point codes.

If the `mrnset` parameter is specified, then the `mrnpc` parameter must be specified.

The GTT LS ARI feature must be enabled before the `mrnset` or `mrnpc` parameters can be specified.

The value specified for the `mrnpc/mrnpca/mrnpai/mrnpai/mrnpai/mrnpai/mrnpai` parameter must be a full point code.

The point codes and alternate RI Mate point codes must have the same network type as shown:

- ITUI, ITU-N, ITU-I spare, ITU-N-spare—ITUI, ITU-N, ITU-I spare, ITU-N-spare
- ANSI—ANSI
- ITUN-24—ITUN-24

- ITUN-16 ---ITUN-16

The value specified for the `mrnset` parameter must already exist in the MRN table.

The MRN table is corrupt or cannot be found.

The value specified for the `mrnpc` parameter must already exist in the specified MRN Set.

The `mrnset` parameter cannot be specified if the MAP Set specified by the `mapset` parameter contains a True Point Code.

The `ent -map` command will reject provisioning of local subsystem for ITUN16 SID, so that ITUN16 MSUs won't be forwarded to Local Subsystems.

SSN configured for SFAPP cannot be used in any command for any configuration

Notes

Up to 128 PC/SSN pairs can be entered into a mated PC/SSN group.

Multiplicity Modes

For the `-map` commands, an entity set consists of a group of PC/SSNs that are used for traffic distribution, and an RC group consists of PC/SSNs within an entity set that have the same RC. In *loadsharing* mode, an entity set contains 1 RC group. In *combined loadsharing/dominant* mode, an entity set can contain multiple loadsharing groups.

① Note

For *dominant* and *combined loadsharing/dominant* modes, the PC/SSN in the MAP table where traffic distribution initializes is determined by the result of GTT translation and is referred to as the preferred PC/SSN. The preferred PC/SSN may not be the lowest cost entry.

The EAGLE supports the following multiplicity modes for nodes/subsystems:

- When a PC/SSN pair is not replicated, the pair is in *solitary* (SOL) mode. The subsystem acts as the only application, with no backup. If this subsystem fails, messages routed to it are discarded and SCCP management returns "Subsystem Unavailable" messages to the originator.
- A group of replicated PC/SSN pairs are in *dominant* (DOM) mode if each PC/SSN pair in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup.
- A group of replicated PC/SSN pairs are in *load sharing* (SHR) mode if each PC/SSN pair in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. If failure occurs, the non-affected subsystem assumes the load of its failed mate.
- The *combined load sharing/dominant* (COM) mode supports a combination of load sharing and dominant mode. A group of PC/SSN pairs are in COM mode when at least two of the PC/SSN pairs have the same RC and another node subsystem in the group has a different RC.

If the XMAP feature is enabled, the MAP table can have up to either 2000 or 3000 entries, depending on the controlled feature Part Number that is enabled. If XMAP is not enabled, the MAP table can contain up to 1024 user entries.

The sso parameter changes the initialization of the subsystem status (“prohibited” or “allowed”) for PC/SSN MAP entries. The EAGLE previously marked the subsystem status “allowed” for each PC/SSN entry. The sso parameter marks the subsystem status “prohibited” for each new entry that has sso=on. This causes the EAGLE to generate an SST to the remote point-code when an MTP-RESUME is received. Upon reception of an SSA, the subsystem status is marked “allowed”.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

When the Flexible GTT Load Sharing feature is on, MAP load sharing sets are supported. Each set is identified by the mapset parameter.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN.

When the GTT Load Sharing with Alternate Routing Indicator feature is enabled, an Alternate RI Mate can be provisioned.

ent-mate-stp

Use this command to enter mate or self PC (point code) into the database.

Note

This command is used to populate the mate STP table, and is used to route responses to queries generated by the EAGLE for SFAPP UC #3/4 back to the originating EAGLE if a member of a set of EAGLES is forming a gateway. For messages to be routed properly, the table in each of the members of the set must have the same entries.

Parameters**pc (mandatory)**

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

pca

Range:

000-255The point code 000-000-000 is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (mandatory)

Point code.

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

pci (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix-s

zone-0-7

area-000-255

id-0-7

The point code *000-000-000* is not a valid point code.

pcn (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range:

s-, *0-16383*, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix-s

nnnnn-0-16383

gc-aa-zz

m1-m2-m3-m4-0-14 for each member; values must sum to 14

pcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa-000-255

ssa-000-255

sp-000-255

pcn16 (mandatory)

16-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

Example

This example adds a point code:

`ent-mate-stp:pc=10-20-30`

This example adds a 24-bit ITU-N secondary point code:

```
ent-mate-stp:pcn24=99-99-99
```

This example adds a spare ITU-N secondary point code:

```
ent-mate-stp:pcn=s-12345
```

This example adds a 16-bit ITU-N secondary point code:

```
ent-mate-stp:pcn16=121-5-10
```

Dependencies

Mate STP point code must be present in either destination table or SID table.

Point code already exist in mate STP table.

Point code entered must be in same network as other existing point codes.

Mate stp table is full.

Notes

- The command is rejected when the point code is in invalid format.
- The command is rejected when point code is of a different network than the existing point codes/code's network.
- The command is rejected when the stp_table is full, as in, there are 16 point codes in the table already.
- The command is rejected when the point code specified already exists in the table.
- The command is rejected when no DPC (destination point code) exists for the specified point code. To add a new point code in the STP table, either it should be in the SID table or it should exist in the destination point code table.

Output

```
ent-mate-stp:pci=3-3-1
```

```
Searching destination table on disk - please wait...

ent-mrn

Use this command to assign point codes and Alternate RI Mates in the Mated Relay Node (MRN) table. The Intermediate GTT Loadsharing feature must be on before this command can

be entered. The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled to provision Alternate RI Mates.

If the Flexible GTT Loadsharing feature is enabled, use this command to create a new MRN set, or to add entries to an existing MRN set in the MRN table. If the Flexible GTT Loadsharing feature is turned on, then MRN sets are used.

 Note

If only the Intermediate GTT Loadsharing feature is turned on, the MRN table can contain a maximum of 3000 entries. If the Intermediate GTT Loadsharing feature is on and the Flexible GTT Loadsharing feature is enabled, the MRN table can contain a maximum of 6000 entries.

 Caution

If any entries are provisioned in the SCCP-SERV table, the maximum number of entries that the MRN table can contain is reduced by that amount. Check the `rt rv-sccp-serv` command output to see if entries exist in the SCCP-SERV table.

 Note

An MRN set is a logical grouping of PCs that already exist in the EAGLE MRN table. The Intermediate GTT Loadsharing feature allows PCs to be part of more than one load-sharing group, with each PC defined by a different MRN set. If the Intermediate GTT Loadsharing feature is enabled, then all existing entries in the MRN table and all existing GTA translations in the GTT table with `ri=gt` are stored in default MRN sets. Additional MRN sets can be provisioned, and GTT entries can be associated to the MRN sets.

Parameters

 Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

If a point code is being added to an existing weighted entity set, and the `df ltw` parameter is not specified, the `wt1/wt2/wt3/wt4` parameter must be specified. The `wt1/wt2/wt3/wt4` parameter can only be specified if at least two of the `rc/rc1/rc2/rc3/rc4` parameters are equal, creating a weighted entity set.

pc (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, `ni = 000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001–005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006–255`.

The point code `000-000-000` is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (mandatory)

Post-GTT-translated point code.

pci (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s*zone*—0-7*area*—000-255*id*—0-7

The point code `0-000-0` is not a valid point code.

pcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-*nnnnn*—0-16383*gc*—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255*ssa*—000–255*sp*—000–255

pcn16 (mandatory)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

df1wt (optional)

Default weight. The weight to be assigned to a specified PC that is not assigned a weight with the *wt/wt1/wt2/wt3/wt4* parameter.

Note

If a PC weight is specified with the *wt/wt1/wt2/wt3/wt4* parameter and the *df1wt* parameter is specified, the default weight is ignored, and the PC is assigned the weight specified by its respective weight parameter.

Range:

1 - 99

mappc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

mappca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

Default:

000

mappc/mappca/mappci/mappcn/mappcn24/mappcn16 (optional)

Alternate RI Mate point code.

mappci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:*s*-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s**zone*—0-7*area*—000-255*id*—0-7

The point code 0-000-0 is not a valid point code.

Default:

0-000-0

mappcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-*nnnnn*—0-16383*gc*—*aa-zz**m1-m2-m3-m4*—0-14 for each member; values must sum to 14**Default:**

The point code *000-000-000* is not a valid point code.

pc3/pca3/pci3/pcn3/pcn243/pcn163 (optional)

Alternate post-GTT-translated point code.

pc4 (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

pca4

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

pc4/pca4/pci4/pcn4/pcn244/pcn164 (optional)

Alternate post-GTT-translated point code.

pci1 (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

pci2 (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

pci3 (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

pci4 (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

pcn1 (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn2 (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn241 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

pcn242 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255
ssa—000–255
sp—000–255

pcn243 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255
ssa—000–255
sp—000–255

pcn244 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255
ssa—000–255
sp—000–255

pcn3 (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
nnnnn—0-16383
gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn4 (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
nnnnn—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn161 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

pcn162 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

pcn163 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

pcn164 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:*000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un---000---127**sna---000---15**mna---000---31***rc (optional)**

Relative cost. The relative cost of the route for the primary PC.

Range:*0 - 99***rc1 (optional)**

Relative cost 1. The relative cost of the route for mate PC 1.

Range:*0 - 99***rc2 (optional)**

Relative cost 2. The relative cost of the route for mate PC 2.

Range:*0 - 99***rc3 (optional)**

Relative cost 3. The relative cost of the route for mate PC 3.

Range:*0 - 99***rc4 (optional)**

Relative cost 4. The relative cost of the route for mate PC 4.

Range:*0 - 99***thr (optional)**

Threshold. The in-service threshold of all PCs in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Note

If a threshold value is not specified when creating a new RC group in an existing entity set, the new RC group is assigned a threshold value of 1%.

Range:*1 - 100***wt (optional)**

Weight. The weight assigned to the primary PC.

Note

If PCs are being added to an existing entity set, the `wt` parameter cannot be specified. If a new entity set is being created, the `wt` parameter can only be specified if at least two of the specified RC values are equal, which creates a weighted entity set.

Range:

1 - 99

wt1 (optional)

Weight 1. The weight assigned to the mate PC 1 that is being added to the weighted entity set.

Range:

1 - 99

wt2 (optional)

Weight 2. The weight assigned to the mate PC 2 that is being added to the weighted entity set.

Range:

1 - 99

wt3 (optional)

Weight 3. The weight assigned to the mate PC 3 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range:

1 - 99

wt4 (optional)

Weight 4. The weight assigned to the mate PC 4 that is being added to the weighted entity set.

Range:

1 - 99

Example

This example enters point code 1 into the MRN table with a relative cost of 10 and associates point code 1 with it as a point code with a relative cost of 20.

```
ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20
```

This example updates the group containing point code 1 in the MRN table, to add point code 1 with relative cost of 20 and point code 1 with relative cost of 30 to the group.

```
ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20:pc2=1-1-10:rc2=30
```

These examples include spare point codes:

```
ent-mrn:pci=s-2-2-1:rc=10:pci1=s-2-2-2:rc1=11:pci2=2-100-1:rc2=12
```

```
ent-mrn:pcn=s-1-1-1-123-aa:rc=1:pcn1=1-1-1-235-aa:rc1=2:pcn2=s-1-1-1-235-aa:rc2=3
```

```
ent-mrn:pc=1-1-1:rc=10:pc1=1-1-2:rc1=10:mrnset=dflt
```

```
ent-
```

```
mrn:pc=1-1-1:rc=10:pc1=1-1-2:rc1=20:pc2=1-1-3:rc2=30:apc3=1-1-4:rc3=40  
:apc4=1-1-5:rc4=50:mrnset=new
```

```
ent-mrn:pc=1-1-3:pc1=1-1-6:rc1=60:pc2=1-1-7:rc2=70:mrnset=111
```

These examples create a new weighted entity set:

```
ent-mrn:pc=1-1-0:rc=10:wt=30:pc1=1-1-1:rc1=10:wt1=10
```

```
ent-mrn:pc=1-1-0:rc=10:wt=30:pc1=1-1-1:rc1=10:wt1=10:thr=50
```

```
ent-
```

```
mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=10:pc2=1-3-2:rc2=20:wt2=30:pc3=1-10-2  
:rc3=20:dfwt=20
```

```
ent-
```

```
mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=10:wt1=30:pc2=1-3-2:rc2=10:dfwt=20:  
thr=60
```

```
ent-
```

```
mrn:pc=1-1-0:pc1=2-2-2:rc1=20:pc2=1-1-10:rc2=30:pc3=1-3-2:rc3=10:wt3=2  
0:dfwt=30
```

```
ent-
```

```
mrn:pc=1-1-0:pc1=2-2-2:rc1=20:wt1=10:pc2=1-1-10:rc2=20:wt2=40:thr=30
```

```
ent-
```

```

```

Dependencies

The Intermediate Global Title Translation Loadsharing feature must be turned on before this command can be entered.

The apca and pcn24/pcn16 parameters cannot be specified for the same MRN set.

When a point code parameter is specified, its relative cost parameter must be specified.

Point codes cannot have the same value as the EAGLE SID.

The same point code value cannot be entered more than once in the MRN table.

ITU-N point codes must be in the format set by the `npcfmt.i` parameter of the `chg-stpopts` command. (Use the `rtrv-stpopts` command to display the STP option settings.)

Remote point codes must already exist as destinations in the Ordered Route entity set or reside in a cluster destination for which ordered routes are specified.

One or more point codes in the command will exceed the maximum number of point codes that can be entered into the MRN table (3000 if the IGTTLS feature is turned on and 6000 if the IGTTLS and FGTTLS features are turned on)..

The Flexible GTT Load-Sharing feature must be enabled before the `mrnset` parameter can be specified.

If the Flexible GTT Loadsharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

When creating a new weighted entity set, the `mrnset=new` or `mrnset=dflt` parameter must be specified.

Each point code group can contain a maximum of 128 point codes.

The Weighted GTT Loadsharing feature must be turned on before the `wt/wt1/wt2/wt3/wt4`, `thr`, and `dfldwt` parameters can be specified.

If the `wt/wt1/wt2/wt3/wt4` parameter is specified, the corresponding `pc/pc1/pc2/pc3/pc4` parameter must be specified.

When creating or modifying a weighted entity set, the `dfldwt` parameter must be specified, or an individual weight must be specified for each PC.

Entity sets in a solitary or dominant loadsharing mode cannot have weights assigned to the PCs. When creating an entity set, if all of the RC values are unique, the `wt/wt1/wt2/wt3/wt4` and `thr` parameters cannot be specified.

If the `thr` parameter is specified, the `rc1`, `rc2`, `rc3`, and `rc4` parameters must be of equal value.

If the `thr` parameter is specified, the associated `wt/wt1/wt2/wt3/wt4` parameter or the `dfldwt` parameter must be specified.

At least one additional point code must be specified.

Any specified point code must be a full point code.

If the `chg-sid:pctype=ansi` command is entered, a value of `ni=000` cannot be specified.

If the `chg-sid:pctype=ansi` command is entered, and a value of `ni=001 – 005` is specified, a value of `nc=000` cannot be specified

The SID table is corrupt or could not be found by the system.

If a new point code is being added to the MRN table, the `pc` and `rc` parameters must be specified together in the command.

If the Flexible GTT Loadsharing feature is enabled, and the `mrnset=new` parameter is specified, the `pc` and `rc` parameters must be specified together in the command.

The Route table is corrupt or could not be found by the system.

If the `pc1/pc2/pc3/pc4` parameter is specified, the `pc` parameter value must already exist in the MRN table.

A new point code that is specified in the command must not already exist in the MRN table.

If the `rc` parameter is not specified, the `wt` parameter cannot be specified.

If PCs are being added to a weighted entity set, the `wt/wt1/wt2/wt3/wt4` parameter or the `df1wt` parameter must be specified.

If PCs are being added to a non-weighted entity set, the `wt/wt1/wt2/wt3/wt4` and the `df1wt` parameters cannot be specified.

At least one optional parameter must be specified.

If the `wt/wt1/wt2/wt3/wt4` parameters are specified, the `df1wt` parameter cannot be specified.

The value specified for the `pc/pc1/pc2/pc3/pc4` parameter cannot be associated with a proxy point code.

The GTT LS ARI feature must be enabled before the `mapset`, `mappc`, or `mapssn` parameter can be specified.

The value specified for the `mappc/mappca/mappci/mappcn/mappcn24/mappcn16` parameter must be a full point code.

The point codes and alternate RI Mate point codes must have the same network type as shown:

- ITUI, ITU-N, ITU-I spare, ITU-N-spare—ITU-I, ITU-N, ITU-I spare, ITU-N-spare
- ANSI—ANSI
- ITUN-24—ITUN-24
- ITUN-16---ITUN-16

The specified MAPSET must already exist in the MAP table.

If the `mapset` parameter is specified, then the `mappc` and `mapssn` parameters must be specified.

The `mappc` and `mapssn` parameters must be specified together in the command.

The values specified for the `mappc` and `mapssn` parameters must already exist in the specified MAP Set.

The values specified for the `mapset` and `mappc` parameters must already exist in the MAP table.

The value specified for the `mappc` parameter cannot match an STP point code.

The `ent-mrn` command cannot be used to change an Alternate RI Mate that has already been specified for an MRN Set. Use the `chg-mrn` command to modify the Alternate RI Mate.

SSN configured for SFAPP cannot be used in any command for any configuration

Notes

For the `-mrn` commands, an entity set consists of a group of PCs that are used for traffic distribution, and an RC group consists of PCs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

The EAGLE supports the following modes for nodes and subsystems:

- A group of replicated PCs are in *dominant* mode if each PC in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PCs are in *load sharing* mode if each PC in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PCs are in combined load sharing/dominant mode when at least two of the PCs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC.

The ent -mrn command cannot be used to change the relative cost value for a point code; the chg-mrn command must be used.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

If the ent -mrn command is used to add PCs to an existing weighted entity set, and the threshold is specified, all RC group values specified with rc/rc1/rc2/rc3/rc4 parameters for the alternate post-GTT-translated point codes must be equal.

The following rules apply when the ent -mrn command is used to add PCs to RC groups:

- If a threshold value is specified and the PCs are being added to an existing RC group in the existing entity set, the RC group threshold is changed to the specified threshold value and both pre-existing and new PCs in the RC group assume the new threshold value.
- If a threshold value is specified and the PCs are creating a new RC group in the existing entity set, the new RC group assumes the specified threshold value.
- If a threshold value is not specified and the PCs are being added to an existing RC group in the existing entity set, the RC group threshold does not change and the PC assumes the threshold value of the existing RC group.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC.

Entries cannot be provisioned in the MRN table unless routes are also provisioned for corresponding point codes. However, an entry without a configured route may result from upgrading to a new EAGLE release. If such an entry occurs, then traffic will not be routed to the corresponding point code. The entry can be deleted, or a route for the entry can be configured.

When a node is marked congested in the MRN or MAP table, traffic continues to be routed to that node. When the congested node becomes prohibited, traffic is diverted to another node.

ent-na

Use this command to enter a new network appearance in the Network Appearance table.

Parameters

na (mandatory)

Network appearance.

Range:

0 - 4294967295

type (mandatory)

Type of the network appearance.

Range:

ansi

itui

ituis

itun

ituns

itun24

itun16

gc (optional)

Group Code of the network appearance.

Range:

yy

Example

```
ent-na:type=ansi:na=10
```

```
ent-na:type=itun:na=11:gc=fr
```

Dependencies

The value specified for the na parameter cannot already exist in the Network Appearance table.

The Network Appearance table can contain a maximum of 45 entries.

The value specified for the gc or na parameter cannot already be equipped.

A value of *itun* or *ituns* must be specified for the type parameter before the gc parameter can be specified.

If the ITUDUPPC feature is turned on, and a value of *itun* or *ituns* is specified for the type parameter, then the gc parameter must be specified.

If the ITUDUPPC feature is turned off, then the gc parameter cannot be specified.

The value specified for the gc parameter must already exist in the SID or SPC table.

The Spare Point Code Support feature must be enabled before the *ituis* or *ituns* network type can be specified.

The J7 Support feature must be enabled before the *type=itun16* parameter is specified.

If the J7 support feature is enabled then the *type=(ansi or itun24)* parameter can not be specified.

Notes

Network Appearance identifies the SS7 network context of the message, for the purposes of logically separating signaling traffic between the SGP and ASP over a common SCTP association. A unique network appearance value can be associated with ANSI, ITUI, 14-bit ITU-N or 24-bit ITU-N networks. When the ITUDUPPC (ITU National Duplicate Point Code) feature is turned on, network appearance can be associated with a specific 14-bit ITU-N group code.

Output

ent-npp-as

Use this command to enter a Numbering Plan Processor (NPP) Action Set (AS). An AS is a collection of Conditioning Actions (CAs), Service Actions (SAs), and Formatting Actions (FAs).

Parameters

Note

CAs and FAs are processed in the order that they are specified in the comma-separated list.

Note

CAs and FAs are processed in consecutive order.

Note

SAs are processed in order of high-to-low precedence and must be specified in high-to-low precedence order in the comma-separated list. The SAs cannot be duplicated in the list. If multiple SAs in the list have the same precedence, then those SAs are processed in the order in which they appear in the list.

Note

SAs are processed in order of high-to-low precedence. The SAs must be specified in high-to-low precedence order in the list, and cannot be duplicated in the comma separated list. If multiple SAs in the list have the same precedence, then those SAs are processed in the order in which they appear in the list.

Note

The *ac**, *dn**, *sn**, and *cc** values refer to all CAs that begin with *ac*, *dn*, *sn*, or *cc*, respectively.

Note

Refer to the *Numbering Plan Processor (NPP) Overview* and to the Feature Manual for the feature of interest for more information on provisioning Action Sets and for definitions for the CA, FA, and SA values.

Note

The sa(X)dgts parameters are currently not supported by any feature.

Note

The sa(X)val parameters are used by the TIF Range CgPN Blacklist, TIF Subscriber CgPN Blacklist, and TIF Selective Screening features. Up to 2 numerical values can be specified in each list.

Note

Support of a numerical values list (sa(X)val parameter) is specific to the Service and Service Action.

asn (mandatory)

Action set name. The name of the AS.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

ca (optional)

Conditioning Action list. A comma-separated CA list that can be applied to an incoming digit string. Up to 12 CAs can be specified in the list. The CAs are processed in the order in which they are specified in the list.

Range:

ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, accgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8, acdef, aclac, cc1, cc2, cc3, ccdef, cccgpn, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn11, dn12, dn13, dn14, dn15, dnx, fpx, ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, znx

fa (optional)

Formatting Action list. A comma-separated FA list that can be applied to the outgoing digit string. Up to 12 FAs can be specified in the list. The FAs are processed in the order they are specified in the list and cannot be duplicated.

Range:

ac, asd, asdothor, cc, dlma, dlmb, dlmc, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, dn, fpx, grn, grnothor, orig, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, rn, rnospodn, rnosposn, rnospoz, sn, sp, sfrimsi, vmid, zn

Default:

orig

ofnai (optional)

Outgoing filter nature of address indicator. This parameter specifies the filter nature of address indicator (FNAI) class of the outgoing digit string.

Range:***intl***

intl value provisioned in the `chg-npp-serv` command

natl

natl value provisioned in the `chg-npp-serv` command

nai1

nai1 value provisioned in the `chg-npp-serv` command

nai2

nai2 value provisioned in the `chg-npp-serv` command

nai3

nai3 value provisioned in the `chg-npp-serv` command

unkn

unkn value provisioned in the `chg-npp-serv` command

inc

NAI of the incoming digit string

Default:

inc

sa (optional)

Service Action list. A comma-separated SA list that can be applied to an incoming digit string. Up to 8 SAs can be specified in the list. The SAs must be specified in high-to-low precedence order in the list, and cannot be duplicated in the list.

Note

SAs are service-specific.

Range:

asdlkup, blklstqry, blklstly, blnfndrls, blrls, cdial, ccncchk, cdpnnp, cgpnasdrqd, cgpngnrqd, cgpnnp, cgpnrtg, cgpnsvcrqd, crp, fpxrls, fraudchk, fwdscs, grnlkup, inprtg, lacck, migrate, nocgpnrls, npnrls, nprelay, nprls, nscgpn, nscdpn, pprelay, rtdbtrn, rtdbtsp, rtdbtrns, skgtartg, snscgpn, selscr, tifgnbl, tifsbl, tifdnbl

sa1dgts (optional)

Service Action 1 digit string. This parameter specifies a digit string that can be used with the first SA.

Range:

1 - 8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa1val (optional)

Service Action 1 numerical values list. A comma-separated numerical values list that can be used with the first SA.

Range:

0 - 65534

sa2dgt (optional)

Service Action 2 digit string. A digit string that can be used with the second SA.

Range:

1 - 8 hexadecimal digits Valid digits are *0-9, a-f, A-F*.

sa2val (optional)

Service Action 2 numerical values list. A comma-separated numerical values list that can be used with the second SA.

Range:

0 - 65534

sa3dgt (optional)

Service Action 3 digit string. A digit string that can be used with the third SA.

Range:

1-8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa3val (optional)

Service Action 3 numerical values list. A comma-separated numerical values list that can be used with the third SA.

Range:

0 - 65534

sa4dgt (optional)

Service Action 4 digit string. A digit string that can be used with the fourth SA.

Range:

1-8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa4val (optional)

Service Action 4 numerical values list. A comma-separated numerical values list that can be used with the fourth SA.

Range:

0 - 65534

sa5dgt (optional)

Service Action 5 digit string. A digit string that can be used with the fifth SA.

Range:

1-8 hexadecimal digits. Valid digits are *0-9, a-f, A-F*.

sa5val (optional)

Service Action 5 numerical values list. A comma-separated numerical values list that can be used with the fifth SA.

Range:

0 - 65534

sa6dgt5 (optional)

Service Action 6 digit string. A digit string that can be used with the sixth SA.

Range:

1-8 hexadecimal digits. Valid digits are 0-9, a-f, A-F.

sa6val (optional)

Service Action 6 numerical values list. A comma-separated numerical values list that can be used with the sixth SA.

Range:

0 - 65534

sa7dgt5 (optional)

Service Action 7 digit string. a digit string that can be used with the seventh SA.

Range:

1-8 hexadecimal digits. Valid digits are 0-9, a-f, A-F.

sa7val (optional)

Service Action 7 numerical values list. A comma-separated numerical values list that can be used with the seventh SA.

Range:

0 - 65534

sa8dgt5 (optional)

Service Action 8 digit string. A digit string that can be used with the eighth SA.

Range:

1-8 hexadecimal digits. Valid digits are 0-9, a-f, A-F.

sa8val (optional)

Service action 8 numerical values list. A comma-separated numerical values list that can be used with the eighth SA.

Range:

0 - 65534

ent-npp-as:asn=tifcd7:ca=znx:sa=selscr,cgpnnp:sa1va1=12,none:fa=zn

ent-npp-as:asn=set1:ca=znx:sa=tifgnbl

Dependencies

The value specified for the `asn` parameter cannot already exist in the NPP AS table.

One of the following combinations of Conditioning Actions must be specified for the AS:

- `znx`
- `cc*`, `dn*`
- `cc*`, `ac*`, `sn*`

The Formatting Actions specified for the AS must contain the corresponding Formatting Action that a Conditioning Action will populate or load.

The AS must contain a CA that can load or populate the specified FA.

The CAs within an AS cannot condition more than 32 digits.

The AS cannot contain CAs that load or populate the same FA.

Conditioning Actions must be specified for inclusion in an individual Action Set using valid number conditioning rules:

- If the ZNX Conditioning Action is specified, then the CC*, AC*, SN*, DN*, and DNX Conditioning Actions cannot be specified.
- If the CC* AND DN* or DNX Conditioning Actions are specified, then the AC*, SN*, SNX, and ZNX Conditioning Actions cannot be specified.
- If the CC*, AC*, AND SN* or SNX Conditioning Actions are specified, then the DN*, DNX, and ZNX Conditioning Actions cannot be specified.

The AS cannot contain the following combinations of FAs:

- If the DN FA is specified, then the AC, SN, and ZN FAs cannot be specified.
- If the ZN FA is specified, then the AC, CC, SN, and DN FAs cannot be specified.
- If the SN FA is specified, then the ZN and DN FAs cannot be specified.
- If the RNOSPODN, RNOSPOSN, or RNOSPOZN FA is specified, then the RN, SP, SN, DN, and ZN FAs cannot be specified.
- The RNOSPODN, RNOSPOSN, and RNOSPOZN FAs cannot be specified together in the command.

If specified, the FPFx CA must be the first value (*fpfx*) in the `ca` list.

If specified, the ZNX, SNX, or DNX CA must be the final value (*znx*, *snx*, or *dnx*) in the `ca` list.

A maximum of 1024 (1K) AS entries can be specified in the NPP system.

If no Service Actions are provisioned, then the `sa1va1` parameter cannot be specified.

If less than 2 Service Actions are provisioned, then the `sa2va1` parameter cannot be specified.

If less than 3 Service Actions are provisioned, then the `sa3va1` parameter cannot be specified.

If less than 4 Service Actions are provisioned, then the sa4val parameter cannot be specified.

If less than 5 Service Actions are provisioned, then the sa5val parameter cannot be specified.

If less than 6 Service Actions are provisioned, then the sa6val parameter cannot be specified.

If less than 7 Service Actions are provisioned, then the sa7val parameter cannot be specified.

If less than 8 Service Actions are provisioned, then the sa8val parameter cannot be specified.

If no Service Actions are provisioned, then the sa1dgt s parameter cannot be specified.

If less than 2 Service Actions are provisioned, then the sa2dgt s parameter cannot be specified.

If less than 3 Service Actions are provisioned, then the sa3dgt s parameter cannot be specified.

If less than 4 Service Actions are provisioned, then the sa4dgt s parameter cannot be specified.

If less than 5 Service Actions are provisioned, then the sa5dgt s parameter cannot be specified.

If less than 6 Service Actions are provisioned, then the sa6dgt s parameter cannot be specified.

If less than 7 Service Actions are provisioned, then the sa7dgt s parameter cannot be specified.

If less than 8 Service Actions are provisioned, then the sa8dgt s parameter cannot be specified.

Notes

Note

When a new Action Set is entered using the ent -npp-as command, the FANF, FASP, FARN, FANE, FASCRCD, and FASCRCG FA lists are unpopulated. These lists are populated using the chg -npp-as command.

Output

```
ent-npp-as:asn=asn6:ca=znx:sa=nscdpn,nscgpn:fa=zn:ofnai=intl
```

```
tekelecstp 09-08-18 11:25:31 EAGLE 41.1.0  
NPP-AS table is (5 of 1024) 1% full.
```

```

ent-npp-srs

Use this command to enter a Numbering Plan Processor (NPP) Service Rule Set entry. A Service Rule Set (SRS) is a collection of NPP Rules that are associated with a NPP Service. A NPP Rule is an association between a single NPP filter and a single NPP Action Set.

Parameters

asn (mandatory)

Action set name. The name of the AS.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

fdl (mandatory)

Filter digit length. This parameter specifies the number of digits on the incoming digit string that is filtered by the NPP.

Range:

1 - 32, *

* —multiple lengths of digit strings can be filtered

fnai (mandatory)

Filter nature of address indicator. The filter Nature of Address Indicator (NAI) class.

Range:

intl

filter messages with NAI=INTL

natl

filter messages with NAI=NATL

nai1

filter messages with NAI=NAI1

nai2

filter messages with NAI=NAI2

nai3

filter messages with NAI=NAI3

unkn

filter messages when NAI=UNKN

The `chg-npp-serv` command is used to assign values to the various FNAI classes.

fpfx (mandatory)

Filter prefix. The prefix used to filter incoming digit strings.

Range:

1-16 digits *, ?

1 - 16 hexadecimal digits inclusive of single digit wildcard (?); or wildcard (*) matching the entire digit string; valid digits are ?, 0-9, a-f, A-F.

srvn (mandatory)

Service name. The name of the NPP service.

The value specified for the `asn` parameter must exist in the NPP AS table.

The AS specified by the `asn` parameter cannot contain Conditioning Actions that are not supported by the service specified by the `svrn` parameter.

The AS specified by the `asn` parameter cannot contain Service Actions that are not supported by the service specified by the `svrn` parameter.

The AS specified by the `asn` parameter cannot contain Formatting Actions that are not supported by the service specified by the `svrn` parameter.

The AS specified by the `asn` parameter cannot contain Service Actions that do not conform to the precedence order supported by the service specified by the `svrn` parameter.

The Conditioning Actions in the AS specified by the `asn` parameter cannot condition more digits than allowed by the `fdl` parameter.

If the `fdl=*` parameter is specified, then the AS specified by the `asn` parameter must contain Conditioning Actions that support variable digit string conditioning.

A maximum of 8192 (8K) rules can be specified in the NPP system.

A maximum of 4096 (4K) service rules can be specified in the NPP system.

The NPP Rule cannot already exist within the NPP Rule table.

If a values other than `*` is specified for the `fpfx` and `fdl` parameters, then the value specified for the `fpfx` parameter cannot be greater than the value specified for the `fdl` parameter.

All of the features that are associated with the Service Actions in the AS specified by the `asn` parameter must be turned on before the AS can be used.

The Service Actions in the AS specified by the `asn` parameter cannot violate mutual exclusivity rules defined by the service specified by the `svrn` parameter.

The AS specified by the `asn` parameter cannot contain an OFNAI class with a value of *none*.

At least one TIF feature must be turned on before an AS containing the CDIAL Service Action can be specified as a value for the `asn` parameter.

The TIF SCS Forwarding feature must be turned on before an AS containing the FWDSCS Service Action can be specified.

The TIF Simple Number Substitution feature must be turned on before an AS containing the SNSCGPN Service Action can be specified as a value for the `asn` parameter.

The TIF Number Portability feature must be turned on before an AS containing the CRP, NPNRLS, CGPNNPRQD, NPVELA, or NPRLS Service Action can be specified as a value for the `asn` parameter.

The IDPR ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD Service Action can be specified as a value for the `asn` parameter with the IDPRCDPN(X) or IDPRCGPN service.

The IDPR GRN feature must be enabled before an AS containing the GRNLKUP or GPNGRNRQD Service Action can be specified as a value for the `asn` parameter with the IDPRCDPN(X) or IDPRCGPN service.

An AS containing the ASDLKUP and CGPNASDRQD and SAs cannot be specified as a value for the `asn` parameter.

An AS containing the GRNLKUP and GPNGRNRQD Service Actions cannot be specified as a value for the `asn` parameter.

The TIF GRN feature must be enabled before an AS containing the GRNLKUP or GPNGRNRQD SAs can be specified as a value for the `asn` parameter with the TIF services.

The TIF ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD SA can be specified as a value for the `asn` parameter with the TIF services.

If a value of *mosmsgcdpn*, *mosmsgcgpn*, *mosmsicdpn*, or *mosmsicgpn* is specified for the `srvn` parameter, then the MO SMS ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD Service Action can be specified as a value for the `asn` parameter.

If a value of *mosmsgcdpn*, *mosmsgcgpn*, *mosmsicdpn*, or *mosmsicgpn* is specified for the `srvn` parameter, then the MO SMS GRN feature must be enabled before an AS containing the GPNGRNRQD or GRNLKUP Service Action can be specified as a value for the `asn` parameter.

If the `fpx=*` parameter is specified, then an AS containing the FPFX Conditioning Action cannot be specified as value for the `asn` parameter.

The value specified for the `fpx` parameter cannot have a `?` as the final character.

The TIF Number Substitution feature must be enabled before an AS containing the NSCGPN or NSCDPN Service Action can be specified.

The AS specified by the `asn` parameter cannot contain both the NSCGPN and SNSCGPN Service Actions.

If a value of *mosmsgcdpn* or *mosmsgcgpn* is specified for the `srvn` parameter, then the Prepaid SMS Intercept Ph1 feature must be enabled before an AS containing the PPRELAY Service Action can be specified as a value for the `asn` parameter.

If the `srvn=mosmsgcgpn` parameter is specified, then the Portability Check for MO SMS feature must be enabled before an AS containing the FRAUDCHK Service Action can be specified as a value for the `asn` parameter.

If the `srvn=mosmsicdpn` parameter is specified, then the MO SMS IS41-to-GSM Migration feature must be enabled before an AS containing the MIGRATE Service Action can be specified as a value for the `asn` parameter.

If the `srvn=mosmsicdpn` parameter is specified, then the MO-based IS41 SMS NP feature must be enabled before an AS containing the CDPNNP Service Action can be specified as a value for the `asn` parameter.

If the `srvn=mosmsgcdpn` parameter is specified, then the MO-based GSM SMS NP feature must be enabled before an AS containing the CDPNNP Service Action can be specified as a value for the `asn` parameter.

The IDP A-Party Routing feature must be enabled before the AS specified by the `asn` parameter can contain the CGPNRTG Service Action.

The IDP A-Party Blacklist feature must be enabled before the AS specified for the `asn` parameter can contain the BLKLSTQRY or BLKLSTRLY Service Action.

If the AS specified by the `asn` parameter contains the BLKLSTQRY Service Action, then the AS cannot contain any other Service Actions.

The NPP Unlimited SDWC Characters feature must be turned on before a single digit wildcard (?) can be specified as a value for the `fpx` parameter more than 25 times across all of the rules for an NPP service.

If the `srvn=idprcdpn(X)` parameter is specified, then the Action Set specified by the `asn` parameter cannot contain both the ACCGPN* and the CCCGPN Conditioning Actions.

If a value of `iarcdpn` or `iargcpn` is specified for the `srvn` parameter, then the IAR ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD Service Action can be specified as a value for the `asn` parameter.

If a value of `iarcdpn` or `iargcpn` is specified for the `srvn` parameter, then the IAR GRN feature must be enabled before an AS containing the GRNLKUP or CGPNGRNRQD Service Action can be specified as a value for the `asn` parameter.

If a value of `iarcdpn` or `iargcpn` is specified for the `srvn` parameter, then the IAR Base feature must be enabled before an AS containing the CCNCCHK, CDIAL, or CGPNRVRQD Service Action can be specified as a value for the `asn` parameter.

If a value of `iarcdpn` or `iargcpn` is specified for the `srvn` parameter, then the IAR NP feature must be enabled before an AS containing the CDNNP or CGNNP Service Action can be specified as a value for the `asn` parameter.

If the NPP Service specified by the `srvn` parameter does not support invoking another NPP Service, then only a value of `none` can be specified for the `invkserv` parameter.

If the NPP Service specified by the `srvn` parameter can invoke the TIFCGPN NPP Service, then only a value of `tifcgpn` or `none` can be specified for the `invkserv` parameter.

If the NPP Service specified by the `srvn` parameter can invoke the TIFCGPN2 NPP Service, then only a value of `tifcgpn2` or `none` can be specified for the `invkserv` parameter.

If the NPP Service specified by the `srvn` parameter can invoke the TIFCGPN3 NPP Service, then only a value of `tifcgpn3` or `none` can be specified for the `invkserv` parameter.

If the AS specified by the `asn` parameter contains the ASDOTHER or GRNOTHER Formatting Action, then the `invkserv=none` parameter cannot be specified.

If the AS specified by the `asn` parameter contains the CGPNASDRQD, CGPNGRNQD, CGPNSVCRQD, NSCGPN, or SNSCGPN Service Action, then only a value of *none* can be specified for the `invkserv` parameter.

The TIF Range CgPN Blacklist feature must be enabled before:

- an AS containing the NOCGPNRLS Service Action can be specified as a value for the `asn` parameter and a value of *tif*, *tif2*, or *tif3* can be specified for the `srvn` parameter
- an AS containing the FPFXRLS Service Action can be specified as a value for the `sn` parameter and a value of *tifcgnp*, *tifcgnp2*, or *tifcgnp3* can be specified for the `srvn` parameter.

If the AS specified by the `asn` parameter contains the FPFXRLS Service Action, then no other Service Action can be specified in the AS.

If the AS specified by the `asn` parameter contains the FPFXRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the `asn` parameter contains the TIFLSBL Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the `asn` parameter contains the TIFGNBL Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the `asn` parameter contains the FPFXRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between 0-127.

If the AS specified by the `asn` parameter contains the TIFLSBL Service Action, then the 2 numerical values specified by the numerical values list must each be between 0-127.

If the AS specified by the `asn` parameter contains the TIFGNBL Service Action, then the 2 numerical values specified by the numerical values list must each be between 0-127.

If the AS specified by the `asn` parameter contains the NOCGPNRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the `asn` parameter contains the NOCGPNRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between 0-127.

The TIF Subscr CgPN Blacklist feature must be enabled before an AS containing the BLRLS or BLNFNDRLS Service Action can be specified as a value for the `asn` parameter, and a value of *tifcgnp*, *tifcgnp2*, or *tifcgnp3* can be specified as a value for the `srvn` parameter.

If the AS specified by the `asn` parameter contains the BLRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the `asn` parameter contains the BLRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between 0-127.

If the AS specified by the `asn` parameter contains the BLNFNDRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the `asn` parameter contains the BLNFNDRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between 0-127.

If the Service specified by the `srvn` parameter does not support a numerical value list for the first Service Action in the AS specified by the `asn` parameter, then the `sa1val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the second Service Action in the AS specified by the `asn` parameter, then the `sa2val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the third Service Action in the AS specified by the `asn` parameter, then the `sa3val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the fourth Service Action in the AS specified by the `asn` parameter, then the `sa4val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the fifth Service Action in the AS specified by the `asn` parameter, then the `sa5val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the sixth Service Action in the AS specified by the `asn` parameter, then the `sa6val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the seventh Service Action in the AS specified by the `asn` parameter, then the `sa7val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a numerical value list for the eighth Service Action in the AS specified by the `asn` parameter, then the `sa8val` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the first Service Action in the AS specified by the `asn` parameter, then the `sa1dgt s` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the second Service Action in the AS specified by the `asn` parameter, then the `sa2dgt s` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the third Service Action in the AS specified by the `asn` parameter, then the `sa3dgt s` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the fourth Service Action in the AS specified by the `asn` parameter, then the `sa4dgt s` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the fifth Service Action in the AS specified by the `asn` parameter, then the `sa5dgt s` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the sixth Service Action in the AS specified by the `asn` parameter, then the `sa6dgt s` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the seventh Service Action in the AS specified by the `asn` parameter, then the `sa7dgt s` parameter in the AS can only have a value of *none*.

If the Service specified by the `srvn` parameter does not support a digit string for the eighth Service Action in the AS specified by the `asn` parameter, then the `sa8dgt s` parameter in the AS can only have a value of *none*.

If the NPP Unlimited SDWC Characters feature is turned on, then the value specified for the **fpfx** parameter cannot contain more than three single digit wildcards (?).

If the NPP Unlimited SDWC Characters feature is turned on, then the value specified for the **fpfx** parameter can contain single digit wildcards (?) within only the first six digits.

The TIF Selective Screening feature must be enabled before an AS containing the SELSCR, FPFURLS, BLURLS, or BLNFNDRLS Service Action can be specified as a value for the **asn** parameter, and a value of *tif*, *tif2*, or *tif3* can be specified as a value for the **srvn** parameter.

If the AS specified by the **asn** parameter contains the SELSCR Service Action, then no TIF Number Substitution (NSCGPN or NSCDPN) Service Action can be specified in the AS.

If the AS specified by the **asn** parameter contains the SELSCR Service Action, then the 2 numerical values specified by the numerical values list must be none or between 0-127.

Only one call type can be specified for the SELSCR SA. If the AS specified by the **asn** parameter contains the SELSCR SA, the corresponding SA Digit String specified must be none or between 1-FF.

The CGPNSVCRQD and NPNRLS Service Actions cannot exist within the same Action Set.

SUBCDPN must be configured in TIFOPTS in order to apply TIFRDNBL SA.

ASD related SAs cannot be configured in same srs.

Notes

None.

The following error messages were deleted in release 41.1 for PR 135911: E4856 and E4958. These two error messages were re-added and slightly modified for PR 194229 that is in releases 42.1 and 44.0 (and later). These two error messages are NOT in release 43.0.

Output

ent-pct

Use this command to enter Point Code and CIC Translations.

Parameters

epc (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

epca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

epci (mandatory)

ITU international destination point code with subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

epcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range:

0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

realpc (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym:

realpca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, `ni = 000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001-005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006-255`.

The point code `000-000-000` is not a valid point code.

realpci (mandatory)

ITU international destination point code with subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

realpcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range:0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

ecice (optional)

The end of the Emulated Circuit Identification Code range.

Range:**0-4095**

ITU TUP/ISUP

0-16383

ANSI ISUP

0-4294967295

ANSI Q.BICC

*

Default:

*

ecics (optional)

The start of the Emulated Circuit Identification Code range.

Range:

0-4095
ITU TUP/ISUP

0-16383
ANSI ISUP

0-4294967295
ANSI Q.BICC

*

Default:

*

filtpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

filtpca

Range:

0-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

filtpci (optional)

ITU international destination point code with subfields *zone-area-id*.

Range:

0-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

filtpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range:

0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

rcice (optional)

The end of the Real Circuit Identification Code range.

Range:

0-4095

ITU TUP/ISUP

0-16383

ANSI ISUP

0-4294967295

ANSI Q.BICC

*

Default:

Example

```
ent-pct:epc=1-1-1:realpc=2-2-2:si=5:ecics=100:ecice=200
```

```
ent-pct:epc=1-1-2:realpc=2-2-3:si=3:ssn=10:filtpc=5-5-5
```

Dependencies

If the `ecice` or `rcice` parameter is specified, then the `ecics` or `rcics` parameter must be specified, respectively.

The value specified for the `ecice/rcice` parameter must be equal to or greater than the value specified for the `ecics/rcics` parameter, respectively.

Full point codes must be specified as the values for the `realpc/realpca/realpci/realpcn` and `epc/epca/epci/epcn` parameters.

The PCT table is corrupt or cannot be found.

The PCT table cannot contain more entries than the amount specified by the FAK for the PCT quantity feature.

The `si=3` parameter must be specified before the `ssn` parameter can be specified.

The values specified for the `realpc/realpca/realpci/realpcn` and `filtpc/filtpca/filtpci/filtpcn` parameters must already exist in the Route table.

The Route table is corrupt or cannot be found.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters must have the same domain.

A PCT quantity feature must be enabled before this command can be specified.

If the `ssn` or `ecics` parameter is specified, then the `si` parameter must be specified.

Duplicate values for the following Key combinations are not allowed:

- `epc/epca/epci/epcn + filtpc/filtpca/filtpci/filtpcn + si + ssn/(ecics/ecice)`
- `realpc/realpca/realpci/realpcn + filtpc/filtpca/filtpci/filtpcn + si + ssn/(rcics/rcice)`

The values specified for the `realpc/realpca/realpci/realpcn` and `filtpc/filtpca/filtpci/filtpcn` parameters must have at least one route for each value defined in the Route table.

If the ITUDUPPC feature is turned on, and ITU-N Point codes are specified, then the values specified for the `epcn`, `realpcn`, and `filtpcn` parameters must have the same group code.

A total of 250 unique `epc` and `rpc` values are supported in the PCT table.

A total of 100 PCT Translations with a single `epc` and `realpc` value are supported in the PCT table.

A spare point code cannot be specified as a value for the `epci/epcn`, `filtpci/filtpcn`, and `realpci/realpcn` parameters.

The `ecics` parameter must be specified before the `relcause` parameter can be specified.

A value of 4, 5, or 13 must be specified for the `si` parameter before the `ecice/ecics` and `rcice/rcics` parameters can be specified.

If the `rcics` parameter is specified, then the `ecics` parameter must be specified.

If the `ecics`, `ecice`, and `rcics` parameters are specified, then the `rcice` parameter must be specified.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters cannot be the same as the STP point code.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters cannot be the same as the STP capability point code.

The value specified for the `ecics/ecice` and `rcics/rcice` parameters must be within the range specified by the parameter definition.

The difference between the values specified for the `ecice` and `ecics` parameters must be equal to the difference between the values specified for the `rcice` and `rcics` parameters.

A value of 5 or 13 must be specified for the `si` parameter before the `relcause` parameters can be specified.

The `ssn` and `cic` parameters cannot be specified together in the command.

If the `ecics`, `rcics`, and `rcice` parameters are specified, then the `ecice` parameter must be specified.

If the same value is specified for the `epc` and `realpc` parameters, then the values specified for the `ecics/ecice` and `rcics/rcice` parameters cannot indicate the same range.

Only one of the `filtpc/filtpca/filtpci/filtpcn` parameters can be specified in the command.

The value specified for the `epc/epci/epcn` parameter cannot be the same as a secondary point code.

Output

```
ent-pct:epc=1-1-1:realpc=5-5-5:si=13:ecics=10:ecice=20:relcause=15
```

```
tekelecstp 10-08-10 18:29:41 EST EAGLE 43.0.0

ent-rmt-appl

Use this command to assign user parts to an internal point code that, in turn, assigns user parts to an End Office node.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

ipc (mandatory)

ANSI point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (prefix-ni-nc-ncm).

Synonym:

ipca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*-

When `chg-sid:pctype=ansi` is specified, *ni* = 000 is not valid.

When `chg-sid:pctype=ansi` is specified, *nc* = 000 is not valid if *ni* = 001-005.

When `chg-sid:pctype=ansi` is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

ipc/ipca/ipci/ipcn/ipcn24/ipcn16 (mandatory)

End Node's internal point code.

ipci (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

ipcn (mandatory)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

ipcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000-255

ipcn16 (mandatory)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

si (mandatory)

Service indicator value that designates which user part is assigned to the IPC.

Range:

3 - 15

ssn (optional)

SCCP subsystem number. Valid only if si=3. Use ssn as the starting value of the range if ssne is specified.

Range:

0 - 255

ssne (optional)

The end of the range of subsystem numbers.

Range:

1 - 255

Example

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5
```

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5:ssne=100
```

```
ent-rmt-appl:ipc=0-0-1:si=5
```

```
ent-rmt-appl:ipcn24=1-100-1:si=5
```

```
ent-rmt-appl:ipc=p-1-1-1:si=3:ssn=5:ssne=102
```

```
ent-rmt-appl:ipci=ps-2-2-2:si=5
```

```
ent-rmt-appl:ipcn16=1-2-1:si=5
```

Dependencies

Partial point codes are not allowed.

The ssn parameter is required if si=3.

The ssn and ssne parameters are not allowed unless si=3.

The ssne parameter value must be greater than the ssn parameter value.

The specified IPC must be previously defined in the destination table.

The new entry cannot conflict with an existing entry.

Notes

To specify a range of subsystem numbers, specify the ssn parameter value as the start of the range and the ssne parameter value as the end of the range.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Output

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-RMT-APPL: MASP A - COMPLTD
;
```

ent-rte

Use this command to add a route to the system.

Caution

When using the Network Routing feature, limited network management is provided for point codes not covered by full point code routing, Cluster Routing, or Nested Cluster Routing.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

lsn (mandatory)

The linkset name associated with this route.

Range:

aaaaaaaaa

1 alphabetic character followed by 9 alphanumeric characters

rc (mandatory)

The relative cost of the route

Range:

0 - 99

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:*p*-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*-

The asterisk value (*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni* = 000 is not valid.

When *chg-sid:pctype=ansi* is specified, *nc* = 000 is not valid if *ni* = 001–005.

When *chg-sid:pctype=ansi* is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:*s*-, *p*-, *ps*-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps**zone*—0-7*area*—000-255*id*—0-7

The point code 0-000-0 is not a valid point code.

dpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s*-, *p*-, *ps*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps**nnnnn*—0-16383*gc*—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:*p*-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p**msa*—000-255

ssa—000—255
sp—000—255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p*

*un---*000---127

*sna---*000---15

*mna---*000---31

force (optional)

This parameter allows a route to be added to the database even if the linkset to be assigned to the route does not have any signaling links in it.

Range:

yes

Example

Adds route for DPC 1 to linkset WE123642:

```
ent-rte:dpc=1-1-1:lsn=we123642:rc=25
```

Adds route for DPC 21-*-* to linkset WE123642:

```
ent-rte:dpc=21-*-*:lsn=we123642:rc=25
```

Adds route for DPCN24 10-100-14 to linkset WE123624:

```
ent-rte:dpcn24=10-100-14:lsn=we123624:rc=10
```

Adds route for private DPC p-1-1-1 to linkset WE123642:

```
ent-rte:dpc=p-1-1-1:lsn=we123642:rc=25
```

Adds route for private and spare DPCN ps-4082-ge to linkset E1NITUN:

```
ent-rte:dpc=ps-4082-ge:lsn=e1ntitun:rc=10
```

Adds route for private DPCN24 p-10-100-14 to linkset WE123642:

```
ent-rte:dpcn24=p-10-100-1:lsn=we123642:rc=10
```

Adds route for private and spare DPCI s-1-100-1 to linkset UE123642:

```
ent-rte:dpci=s-1-100-1:lsn=ue123642:rc=10
```

Adds route for DPCN16 121-10-15 to linkset WE123642:

```
ent-rte:dpcn16=121-10-15:lsn=we123642:rc=10
```

Dependencies

The value of the `lns` parameter must exist in the STP database.

The DPC must be in the Destination Point Code table.

The destination point code of a route must be a full point code (*ni-nc-ncm*), a cluster point code (*ni-nc-**), or a network point code (*ni-*-**).

If the specified destination address is a full point code address (*ni-nc-ncm*) and is a member of a provisioned cluster (*ni-nc-**), whether ordered routes can be assigned is determined by the destination address's NCAI (nested cluster allowed indicator). The `ncai=yes/no` parameter is set with the `ncai` parameter of the `ent/chg-dstn` commands.

- If the `ncai=no` parameter is specified, destinations comprising a cluster inherit their ordered routes from the cluster.
- If the `ncai=yes` parameter is specified, then the destination address is a member of a provisioned nested cluster where ordered routes can be assigned to a provisioned member.

If the specified destination address is a network cluster address (*ni-nc-**), the assignment of the specified ordered route attributes is determined by the setting of the destination address's NCAI (nested cluster allowed indicator). The `ncai=yes/no` parameter is set with the `ncai` parameter of the `ent/chg-dstn` commands.

- If the `ncai=no` parameter is specified, the collection of signaling point codes having the same network identifier (the `ni` parameter) and network cluster (the `nc` parameter) code are assigned the specified ordered route.
- If the `ncai=yes` parameter is specified, then the specified destination is a network cluster address where provisioned members's signaling point codes can be assigned the same or different ordered routes from the cluster.

If the `dpcn` parameter is specified, the format of the point code(s) must match the format that was assigned with `chg-stpopts:npfmt1`.

The `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter cannot be specified with a private point code (-p) unless the route is an IPGW route.

The route destination's type must match the route's linkset adjacent point code or the route's linkset secondary adjacent point code type.

If the `ipgwapc=yes` parameter is specified for the linkset, then the associated `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter cannot have a cluster route assigned.

The linkset must be defined with at least one link. To override this requirement, specify `force=yes`.

The 6-Way Loadsharing on Routesets feature must be turned on before more than 2 routes can be provisioned with the same relative cost.

A linkset can be entered only once as a route for each destination or for a routeset.

If the specified destination address is a network address (*ni-*-**), or network cluster address (*ni-nc-**), the linkset type (see the `chg-ls` command) used in the route must be *b*, *c*, or *d*.

All routes with ANSI DPCs must use ANSI linkset APCs. A route with an ITU-I DPC can go over an ITU-N APC and an ITU-N DPC can go over an ITU-I APC.

If the link set name (the `lsn` parameter) references a link set that has the `ipgwapc=yes` parameter specified, the DPC must not be a cluster route.

The NRT feature must be turned on before the dpc/dpca parameter can be specified using the asterisk (*) in the nc or ncm subfields.

When using network routing, if the DPC has a value of * in the nc field, the ncm field must also be * (for example, dpc=21-*-*).

The Route table is corrupt or cannot be found.

The STP Site ID table is corrupt or cannot be found.

The Linkset table is corrupt or cannot be found.

The value of the dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameter cannot be the same as the EAGLE point code.

The value of the dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameter cannot be the same as the EAGLE capability point code.

The value of the dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameter cannot have already been assigned to an APC or SAPC for an IPGWx linkset. The entered route must include the APC or SAPC's linkset with the destination equal to the APC or SAPC.

If dpcn is specified then the format of dpcn must match the format dictated by the chg-stpropts:npcfmt command

The ITU-N ordered route destination's group code must match the route's Link Set Adjacent PC's group code for all linksets other than IPGWI and IPLHC.

The group code must match for all linksets because the ITU Duplicate Point Code feature is on.

All linksets in a routeset must have the same network type. The network type of the routeset must be the same as the network type of the destination point code.

If multiple routes are defined for the destination point code, and if a proxy point code is assigned to the destination point code, then the first route defined in the ent-rte command must use the proxy linkset.

If the dpc parameter has a network cluster address (ni-nc-*) or network address (ni-*-*), then the lst=prx parameter cannot be specified.

The SAPC table is corrupt or cannot be found.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Output

```
ent-rte:dpc=1-1-1:lsn=we123642:rc=25
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0

ent-rtx

Use this command to enter an exception route entry. An exception route is associated with an entry in the Routing table. When the Origin-Based MTP Routing feature is enabled and turned on, the least cost route available for an MSU to be routed to a Destination Point Code over a specified linkset is used.

Up to 6 routes can be defined to a single entry in the Routing table. Up to 8000 routesets can be defined for an STP. This total must include at least one normal route (not an exception route). The remaining 7999 routesets can include any combination of normal and exception routes.

Note

A routeset is a collection of routes to a destination. Each routeset can have up to 6 routes, with 16 links on each route. An exception routeset is a collection of up to 6 exception routes that have the same DPC, exception class, and criteria.

Parameters

dpc (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (mandatory)

Destination point code.

dpci (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

dpcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmiti* flexible point code option. A group code must be specified when the ITUDUPDC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (mandatory)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p-, 000-127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

un---000---127

sna---000---15

mna---000---31

lsn (mandatory)

Linkset Name. The name of the linkset that is associated with the specified exception route.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

rc (mandatory)

Relative Cost. The relative cost associated with the specified exception route.

Range:

0 - 99

cic (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the *ecic* parameter as exception routing criteria for the specified exception route.

Range:

0 - 16383

ecic (optional)

Ending Circuit Identification Code. This parameter, together with the *cic* parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range:

0 - 16383

force (optional)

The *force=yes* parameter must be specified when the *ilsn* parameter value is the same as the *lsn* parameter value.

Range:

yes

ilsn (optional)

Incoming Link Set Name. The name of the originating linkset. This value is used as part of the exception routing criteria for the specified exception route.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

opc (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

opca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

opc/opca/opci/opcn/opcn24/opcn16 (optional)

Originating Point Code

opci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

opcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt* flexible point code option. A group code must be specified when the ITUDUPPDC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, *0-16383*, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, *000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000-255

opcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, *000--127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (--).

prefix---p

un--000---127

sna--000--15

mna--000--31

si (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range:

3 - 15

Example

```
ent-rtx:dpc=1-1-1:opca=2-3-3:lsn=lset1:rc=30
```

```
ent-rtx:dpc=1-3-1:ilsn=lset2:lsn=lset3:rc=20
```

```
ent-rtx:dpc=2-100-1:si=5:lsn=lset5:rc=50
```

Dependencies

Only one of the *opc*, *ilsn*, *cic*, or *si* parameters can be specified for a exception route entry.

For an ANSI origination point code that is defined using asterisks (*nnn-*-**), the value of the *network identifier* subfield (*nnn*) must be greater than 5.

If the *ecic* parameter is specified, the *cic* parameter must also be specified.

The *ecic* parameter value cannot be less than the *cic* parameter value.

The *opc/opca/opci/opcn/opcn24/opcn16* parameter value cannot be the same as the *dpc* parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The point code specified by the *dpc/dpca/dpci/dpcn/dpcn24/dpcn16* parameter must already exist in the Route table.

The value specified for the *dpc* parameter cannot already be used as an adjacent point code (APC).

The linkset name, as defined by the *ilsn* or *lsn* parameter, must exist.

An exception route entry cannot already exist with the same input parameter values, other than the relative cost.

The 6-Way Loadsharing on Routesets feature must be turned on before more than 2 routes can be provisioned with the same relative cost for a given exception route criteria.

A maximum of 6 exception routes can be associated with the specified DPC and criteria.

A maximum total of 8000 exception routes and normal routes can be defined for the EAGLE. At least one route must be a normal (not exception) route. The remaining routes (up to 7999) can be all normal routes, all exception routes, or any combination of normal and exception routes.

The network domain of the adjacent point code in the linkset or of the routes in the specified routeset must be the same as the network domain of the specified destination point code or its alias.

The adjacent or secondary point code type and group code of the linkset or linksets in the specified routeset must match the point code type and group code of the destination point code.

The specified CIC/ECIC range must not overlap an existing range.

The Linkset table is corrupt or cannot be found.

The Route table is corrupt or cannot be found.

The Route Exception table is corrupt or cannot be found.

If the `ilsn` and `lsn` parameters have the same value, or if the value specified for the `opc/opca/opci/opcn/opcn24/opcn16` parameter is the same as the APC of the linkset specified by the `lsn` parameter, then the `force=yes` parameter must be specified.

The `opcn` parameter must be in the same ITU-N group as the `dpcn` parameter.

The Group Code of the APCN in the `ilsn` parameter must be the same as the Group Code of the `dpcn` parameter.

ANSI network routing and cluster point codes as OPC exception route criteria are not allowed for ITU destinations.

ITU point codes as OPC exception route criteria are not allowed for ANSI Network and Cluster destination.

If the `lsn` parameter is specified, then the `rc` parameter must be specified.

If a proxy destination is used, then this command cannot be entered.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

The destination point code specified by the `dpc` parameter must have routes provisioned.

The Nested Cluster Routing feature must be turned on before an exception route can be assigned to cluster members.

The STPOPTS table is corrupt or cannot be found.

The value specified for the `opc/opca/opci/opcn/opcn24/opcn16` parameter cannot be the same as the adjacent point code of the linkset specified by the `lsn` parameter.

The J7 Support feature must be enabled before the `dpcn16/opcn16` parameter can be specified.

Output

```
ent-rtx:dpci=2-100-1:si=5:lsn=lsn5:rc=50
```

```
stdcfg2b 06-05-19 18:20:11 EST EAGLE 35.0.0

ent-scr-aftpc

Use this command to add a specific allowed affected point code (AFTPC) screening reference in the AFTPC entity set.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

nsfi (mandatory)

The next screening category that is used in the gateway screening process.

Range:

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. The point code's unique screening reference name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

ssn (mandatory)

Subsystem number.

Range:

0 - 255, *

*—the full range of values from 0–255

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

0 - 255, *

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:

0 - 7, *

*—the full range of values from 0–255

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0---31, *

*---the full range of values from 0--31

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

npc (optional)

ITU national point code.

Note

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *

*—the full range of values from 0–16383

nsr (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (*nsf i*) is to be used in the screening process.

Range:

yyyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No change to the current value

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0---15, *

*---the full range of values from 0--15

sp (optional)

24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *

*---the full range of values from 0--127

zone (optional)

ITU international zone. The *zone* in the point code represented by *zone-area-id*.

Range:

0 - 7, *

*—the full range of values from 0–255

Example

```
ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop
```

```
ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop:actname=copy
```

```
ent-scr-aftpc:nsfi=stop:sr=af01:ssn=1:msa=255:ssa=255:sp=255
```

```
ent-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s
```

```
ent-scr-aftpc:nsfi=stop:sr=af02:ssn=1:un=10:sna=2:mna=5
```

Dependencies**Caution**

Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the five point code parameter combinations: `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, `un-sna-mna`, or `npc`.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

The character `c` is not a valid value for the `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

If `area=*` is specified, `id=*` must be specified.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `ssa=*` is specified, `sp=*` must be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If `sna=*` is specified, `mna=*` must be specified.

If specified, the `nsfi` parameter value must be `stop`.

If the `nsfi=stop` parameter is specified, the `nsr` parameter cannot be specified.

If the screening reference exists, the new affected point code and subsystem number to be added cannot already exist in the AFTPC entity set.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` and `npcst` parameters cannot be specified for ANSI, ITU-N24 and ITU-N16 point codes.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

The Gateway Screening Stop Action table must be accessible.

The J7 support feature must be enabled before the `un`, `sna`, or `mna` parameters can be specified.

The J7 support feature must not be enabled before the `msa`, `ssa`, or `sp` parameters can be specified.

The GWSOA parameter combination should be known and valid.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

If the screening reference is valid, but does not exist, a new AFTPC screen is created.

If the screening reference exists, a new rule is added to the AFTPC screening table.

If asterisks or ranges are specified for the allowed AFTPCs, nothing that matches the specified range of AFTPCs can already exist in the AFTPC screen for the screening reference.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-aftpc` command.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix to has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., `ni`, `nc`, `ncm`. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

```
ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop
```

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0

ent-scr-blkdpc

Use this command to add a specific blocked destination point code (BLKDPC) screening reference, and associated attributes, to the BLKDPC's table. The associated attributes are: destination point code, next screening function identifier, and next screening reference. The destination point codes listed on this screen are prohibited from sending SS7 messages to the network.

Parameters

nsfi (mandatory)

The next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

cgpa

Allowed CGPA is the next screening category.

destfld

Allowed destination field (DESTFLD) is the next screening category.

fail

Discard the received message.

isup

ISUP message type (ISUP) is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. The point code's unique screening reference name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:

0 - 7, *, C

*—the full range of values from 0–7

C—continue

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0---31, *, C

*---the full range of values from 0--31

C -- continue

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ncm (optional)

Network cluster member value. This parameter specifies one or more ncm values for the network indicator and network cluster values identified in the ni and nc parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ni (optional)

Network indicator value. This parameter specifies one or more ni values for the network cluster and network cluster member values identified in the nc and ncm parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

npc (optional)

ITU national point code.

 Note

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A for information on converting the point code format.

Range:

0 - 16383, *, C

*—the full range of values from 0–16383

C—continue

nsr (optional)

Next screening reference. This parameter specifies which screening reference in the screening category (nsf1) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:*none**s***Default:***none***sna (optional)**16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.**Range:***0---15, *, C***---the full range of values from 0--15**C -- continue***sp (optional)**24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.**Range:***0 - 255, *, C***—the full range of values from 0–255**C—continue***ssa (optional)**24-bit ITU national sub signaling area. ```

Dependencies

Caution

Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gwsn=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

A complete point code must be specified, using the `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or `npc` combination unless a value of `c` is specified.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

At least one optional parameter must be specified.

When a blocked screening reference is created, the first entry for the `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, or `un-sna-mna` must be `c-c-c` or `npc=c` must be specified. Subsequent entries can be specific point codes.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `msa=c` parameter is specified, then the `ssa` and the `sp` parameters must have a value of `c` or cannot be specified. If the `msa=c` parameter is specified, and the `ssa` and the `sp` parameters are not specified, then the `ssa` and `sp` parameters default to a value of `c`.

If the `un=c` parameter is specified, then the `sna` and the `mna` parameters must have a value of `c` or cannot be specified. If the `un=c` parameter is specified, and the `sna` and the `mna` parameters are not specified, then the `sna` and `mna` parameters default to a value of `c`.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

If the `ni=c` parameter is specified, then the `nc` and `ncm` parameters must have a value of `c` or cannot be specified. If the `ni=c` parameter is specified, and the `nc` and the `ncm` parameters are not specified, then the `nc` and `ncm` parameters default to a value of `c`.

If the specified `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` is not equal to `c-c-c`, or if the `npc=c` parameter is not specified, then the `nsfi=fail` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `nsfi` parameter has a value other than *stop* or *fail*, the `nsr` parameter must be specified and must exist.

The `nsfi` and `nsr` parameters must point to an existing screen, or the `nsfi=stop` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `sr` does not exist, then the `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` parameters must equal `c-c-c`, or the `npc=c` parameter must be specified, and the `nsfi=fail` parameter cannot be specified.

If the specified screening reference exists:

- The `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` must equal `c-c-c` or `npc` cannot equal `c`.
- The `nsfi` parameter must have a value of *fail*.
- The `nsr` parameter cannot be specified.
- The blocked DPC, given by `ni-nc-ncm`, `zone-area-id`, or `npc`, to be added to the BLKDPC screening table for the blocked DPC screening reference cannot exist as defined or within an existing range of DPCs.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The `pcst` parameter cannot be specified with `c` for a blocked screen reference (`sr`).

The spare point code subtype prefix (`s-`) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 and ITU-N24 point codes.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

If the `zone=*` parameter is specified, then the `area=*` and the `id=*` parameters must be specified.

If the `zone=c` parameter is specified, then the `area` and `id` parameters must have a value of `c` or cannot be specified. If the `zone=c` parameter is specified, and the `area` and `id` parameters are not specified, then the `area` and `id` parameters default to a value of `c`.

The value of the `nsfi` parameter must be valid for the BLKDPC entity type.

If a blocked screening reference exists, then the `ni`, `zone`, `msa`, `un`, and `npc` parameters cannot have a value of `c`.

The Gateway Screening Stop Action table is corrupt or cannot be found.

The J7 support feature must be enabled before the un/sna/mna parameters are specified.

The J7 support feature must not be enabled before the msa,ssa,sp parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

When a blocked DPC screening reference is created, the first entry for a point code must be `c-c`, or `c` for the `npc` parameter. Subsequent entries must be specific point codes.

The character `c` is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, `nsfi`, and `nsr`. The point code is in the form of `npc=c`, or of subfields equal to `c-c-c`. When the character `c` is specified, the `nsfi` and `nsr` parameters must be specified.

If the character `c` is specified for the parameters `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp`, the character `c` is the only value that can be specified for all three parameters. No other values can be used. For example, a point code `c-c-255` is not allowed. The point code must be `c-c-c`. The asterisk value cannot be used with the character `c` (for example, a point code `c-c-*` is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code `c-c-c` or `npc=c`. The `nsfi` and `nsr` in this entry are examined to determine the next step in the screening process.

If the current `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` is equal to `c-c-c` or `npc=c`, only the `nsfi` and `nsr` parameters can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (`&&`); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-blkdpc` command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix (`s-`) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., `ni`, `nc`, `ncm`. The command can be entered successfully whether the J7 feature is enabled or not enabled.

ent-scr-blkopc

Use this command to add a specific blocked originating point code (BLKOPC) screening reference and associated attributes OPC, *nsfi*, and *nsr* to the BLKOPC entity set. Any messages received on the link assigned to this screening reference that match the attributes in this table are blocked from entering the network.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

blkdpc

Blocked DPC is the next screening category.

cgpa

Allowed CGPA is the next screening category.

dpc

Allowed DPC is the next screening category.

fail

Discard the received message.

sio

Allowed SIO is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. The point code's unique screening reference name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* of the point code represented by *zone-area-id*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

id (optional)

ITU international ID. This parameter specifies the *ID* of the point code represented by *zone-area-id*.

Range:

0 - 7, *, C

*—the full range of values from 0–255

C—continue

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0---31, *, C

*---the full range of values from 0--31

C ---continue

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

npc (optional)

ITU national point code.

Note

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *, C

*—the full range of values from 0–255

C—continue

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0---15, *, C

*---the full range of values from 0--15

C ---continue

sp (optional)

24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*---the full range of values from 0--255

C---continue

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*---the full range of values from 0--255

C---continue

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *, C

*---the full range of values from 0--127

C ---continue

zone (optional)

ITU internationalzone. The *zone* in the point code represented by *zone-area-id*.

Range:

0 - 7, *, C

*---the full range of values from 0--255

C---continue

Dependencies

Caution

Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

A complete point code must be specified, using the `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or `npc` combination unless a value of `c` is specified.

The ANSI point code value 000-000-000 and the ITU-International point code value 0-000-0 cannot be specified.

At least one optional parameter must be specified.

When a blocked screening reference is created, the first entry for the `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp` or `un-sna-mna` must be `c-c-c` or `npc=c` must be specified. Subsequent entries can be specific point codes.

If asterisks or ranges are specified for the blocked OPCs, nothing that matches the specified range of blocked OPCs can already exist in the BLKOPC screening table for the screening reference.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must exist in the Gateway Screening Stop Action table.

If `area=*` is specified, `id=*` must be specified.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If the `msa=c` parameter is specified, then the `ssa` and `sp` parameters must have a value of `c` or cannot be specified. If the `msa=c` parameter is specified, and the `ssa` and the `sp` parameters are not specified, then the `ssa` and `sp` parameters default to a value of `c`.

If the `un=c` parameter is specified, then the `sna` and `mna` parameters must have a value of `c` or cannot be specified. If the `un=c` parameter is specified, and the `sna` and the `mna` parameters are not specified, then the `sna` and `mna` parameters default to a value of `c`.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

If the `ni=c` parameter is specified, then the `nc` and the `ncm` parameters must have a value of `c` or cannot be specified. If the `ni=c` parameter is specified, and the `nc` and the `ncm` parameters are not specified, then the `nc` and `ncm` parameters default to a value of `c`.

If the specified `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` is not equal to `c-c-c`, or if the `npc=c` parameter is not specified, then the `nsfi=fail` parameter must be specified, and the `nsr` parameter cannot be specified.

If the value of the `nsfi` parameter is not `stop` or `fail`, then the `nsr` parameter must be specified.

The `nsfi` and `nsr` parameters must point to an existing screen, or the `nsfi=stop` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `sr` does not exist, then the `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` parameters must equal `c-c-c`, or the `npc=c` parameter must be specified, and the `nsfi=fail` parameter cannot be specified.

If the specified screening reference exists:

- The `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` must equal `c-c-c` or `npc=c` cannot be specified.
- The `nsfi` parameter must be `fail`.
- The `nsr` parameter cannot be specified.
- The blocked OPC, specified by `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or `npc`, to be added to the BLKOPC screening table for the blocked OPC screening reference cannot exist as defined or within an existing range of OPCs.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The `pcst` parameter cannot be specified with `c` for a blocked screen reference (`sr`).

The spare point code subtype prefix (`s-`) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `sna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 and ITU-N24 point codes.

If `ssa=*` is specified, `sp=*` must be specified.

If `sna=*` is specified, `mna=*` must be specified.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

If the `zone=c` parameter is specified, then the `area` and `id` parameters must have a value of `c` or cannot be specified. If the `zone=c` parameter is specified, and the `area` and the `id` parameters are not specified, then the `area` and `id` parameters default to a value of `c`.

The specified `nsfi` parameter value must be valid for the BLKOPC entity type.

The Gateway Screening Stop Action table is corrupt or cannot be found.

If a blocked screening reference exists, then the `ni`, `zone`, `msa`, `un` and `npc` parameters cannot have a value of `c`.

The J7 support feature must be enabled before the `un/ sna/ mna` parameters are specified.

The J7 support feature must not be enabled before the msa, ssa, sp parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

When a blocked DPC screening reference is created, the first entry for a point code must be c-c-c, or the npc=c parameter must be specified. Subsequent entries must be specific point codes.

The character *c* is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, nsfi, and nsr. The point code is in the form of npc=c or subfields equal to c-c-c. When the character *c* is specified, the nsfi and nsr parameters must be specified.

If the character *c* is specified for the parameters ni-nc-ncm, zone-area-id, un-sna-mna or msa-ssa-sp, the character *c* is the only value that can be specified for all three parameters. For example, a point code c-c-255 is not allowed. The point code must be c-c-c. The asterisk value cannot be used with the character *c* (for example, a point code c-c-* is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code c-c-c or npc=c. The nsfi and nsr in this entry are examined to determine the next step in the screening process.

If the current ni-nc-ncm, zone-area-id, un-sna-mna or msa-ssa-sp is equal to c-c-c or npc=c, only the nsfi and nsr can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, ni=025&&100 specifies all network indicators for ANSI point codes from 25 - 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original ent-scr-blkopc command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The pcst parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., ni, nc, ncm. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

```
ent-scr-blkopc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wrds5
```

- [rtrv-scr-blkopc](#)

ent-scr-cdpa

Use this command to add a specific allowed called party address (CDPA) screening reference in the CDPA entity set.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

aftpc

Allowed affected point code is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. This parameter specifies the screening reference name for the CdPA.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

ssn (mandatory)

Subsystem number

Range:

*0 - 255, **

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

0 - 255, *

*—the full range of values from 0–255

id (optional)ITU international ID. The *ID* in the point code represented by *zone-area-id*.**Range:**

0 - 7, *

*—the full range of values from 0–7

mna (optional)16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.**Range:**

0---31, *

*---the full range of values from 0--31

msa (optional)24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.**Range:**

0 - 255, *

*—the full range of values from 0–255

nc (optional)Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.**Range:**

0 - 255, *

*—the full range of values from 0–255

ncm (optional)Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.**Range:**

0 - 255, *

*—the full range of values from 0–255

ni (optional)Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.**Range:**

0 - 255, *

*—the full range of values from 0–255

npc (optional)

ITU national point code.

Note

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *

*—the full range of values from 0–16383

nsr (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (*nsf i*) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (*s-*).

Range:

none

s

Default:

none

scmgfid (optional)

SCMG Format ID. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS.

Range:

1 - 255, *

*—the full range of values from 1–255

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0--15, *

*--the full range of values from 0--15

sp (optional)

24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

un (optional)

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

Range:

0---127, *

*---the full range of values from 0--127

zone (optional)

ITU international zone. The *zone* in the point code represented by *zone-area-id*.

Range:

0 - 7, *

*—the full range of values from 0–7

Example

```
ent-scr-cdpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftp:nsr=wr5
```

```
ent-scr-cdpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=stop:actname=copy
```

```
ent-scr-
```

```
cdpa:sr=cdp1:zone=1:area=2:id=3:ssn=1:nsfi=stop:scmgfid=1:pcst=s
```

```
ent-scr-cdpa:sr=cdp2:un=1:sna=2:mna=1:ssn=1:nsfi=stop
```

Dependencies **Caution**

Even though gateway screening is in the screen test mode, as defined by the *gwsa=off* and *gwsn=on* parameters, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

A complete point code must be specified, and must be one and only one of the five point code parameter combinations: *ni-nc-ncm*, *zone-area-id*, *un-sna-mna*, *msa-ssa-sp*, or *npc*.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

At least one optional parameter must be specified.

The new CDPA entry to be added cannot match any specific, range, or asterisk entry already existing in the specified screening table.

The character *c* is not a valid value for the *ni*, *nc*, *ncm*, *zone*, *area*, *id*, *msa*, *ssa*, *sp*, *una*, *sna*, *mna*, and *npc* parameters.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

When the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and the `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

If the `nnc` parameter is specified as a range, the `nncm` parameter must be specified as an asterisk or as the full range.

When `nsfi=aftpc` is specified, the `ssn=1` parameter must be specified.

When `nsfi` is a value other than `stop`, the `nsr` parameter must be specified.

When `nsfi=stop` is specified, the `nsr` parameter cannot be specified.

When `ssn=1` is specified, the `scmgfid` parameter must be specified.

When `ssn` is not 1, the `scmgfid` parameter cannot be specified.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

The specified value for the `nsfi` parameter is not valid for `cdpa` screen.

The Gateway Screening Stop Action table must be accessible.

The next screening function identifier (`nsfi`) and the next screening reference (`nsr`) must point to an existing screen, or the `nsfi=stop` parameter must be specified and the `nsr` parameter cannot be specified.

The J7 support feature must be enabled before the `un/sna/mna` parameters are specified.

The J7 support feature must not be enabled before the `msa/ssa/sp` parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

If the screening reference is valid, but does not exist, a new CDPA screen is created.

If the screening reference exists, a new rule is added to the CDPA screening table.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent - scr - cdpa` command.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., `ni`, `nc`, `ncm`. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

```
ent - scr - cdpa: sr=iec: ni=240: nc=010: ncm=*: ssn=224: nsfi=aftpc: nsr=wrds
```

```

ent-scr-cgpa

Use this command to add a specific allowed calling party address (CGPA) screening reference in the CGPA entity set.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

cdpa

Allowed called party address is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

tt

Allowed translation type is the next screening category.

ri (mandatory)

Routing indicator. This parameter provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range:**dpc**

Allow a called party address with a routing indicator value of "DPC/SSN."

gt

Screening stops and gateway screening is bypassed as a forced pass.

A full range of values.

sr (mandatory)

Screening reference. The screening reference name for the CgPA.

Range:**ayyy**

1 alphabetic character followed by up to 3 alphanumeric characters

ssn (mandatory)

Subsystem number

Range:

1 - 255, *

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:**ayyyyy**

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

0 - 255, *

*—the full range of values from 0–255

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:

0 - 7, *

*—the full range of values from 0–7

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0---31, *

*---the full range of values from 0--31

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

npc (optional)

ITU national point code.

Note

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:*none**s***Default:***none***sccpmt (optional)**

SCCP message type

Range:**9**

UDT

10

UDTS

17

XUDT

18

XUDTS

*******Default:*********sna (optional)**

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0--15, *

*---the full range of values from 0--15

sp (optional)

24-bit ITU national signaling point. The *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *

*—the full range of values from 0–255

un (optional)16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.**Range:**

0---127, *

*---the full range of values from 0--127

zone (optional)ITU international zone. The *zone* in the point code represented by *zone-area-id*.**Range:**

0 - 7, *

*—the full range of values from 0–255

Example

```
ent-scr-
cgpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wrds:ri=dpc

ent-scr-
cgpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=stop:ri=dpc:actname=copy

ent-scr-
cgpa:sr=cdp1:ni=5:nc=5:ncm=5:ssn=1:ri=dpc:sccpmt=9:nsfi=sdpa:nsr=cdp1

ent-scr-
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:nsfi=stop:pcst=s

ent-scr-cgpa:sr=cgp1:un=1:sna=2:mna=1:ssn=1:sccpmt=9:nsfi=stop:ri=*
```

Dependencies**Caution**

Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

A complete point code must be specified, and must be one, and only one of the five point code parameter combinations: `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or `npc`.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

The new CGPA point code, `ri`, `sccpmt`, and `ssn` to be added can not already exist in the CGPA entity set.

The character `c` is not a valid value for the `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

When the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

If `area=*` is specified, `id=*` must be specified.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

The screen referenced by `nsfi` and `nsr` must already exist.

The `nsr` parameter must be specified, if `nsfi` is not equal to `stop`.

When `nsfi=stop` is specified, the `nsr` parameter cannot be specified.

The `nsfi=tt` parameter can be specified only if the `ri=gt` parameter or the `ri=*` parameter is specified.

The `nsfi=cdpa` parameter can be specified only if the `ri=dpc` parameter or the `ri=*` parameter is specified.

If `ssa=*` is specified, `sp=*` must be specified.

If `sna=*` is specified, `mna=*` must be specified.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

The specified value for the `nsfi` parameter is not valid for `cgpa` screen.

The Gateway Screening Stop Action table must be accessible.

Valid values must be specified for the `nscpmt` and `scpmt` parameters.

The J7 Support feature must be enabled before the `un/ sna/ mna` parameters are specified.

The J7 Support feature must not be enabled before the `msa/ ssa/ sp` parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100 .

If the screening reference is valid, but does not exist, a new CGPA screening table is created.

If the screening reference exists, a new rule is added to the CGPA screening table. Only one rule may exist for a given `ni-nc-ncm/ssn/ri/sccpmt` (or `zone-area-id` or `npc`) combination. This implies that for a given combination, only one value of `ri` may be specified. The `ri` for a given combination can be `dpc`, `gt`, or `*`, but not `dpc` and `gt` independently.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-cgpa` command.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., `ni`, `nc`, `ncm`. The command can be entered successfully whether the J7 Support feature is enabled or not enabled.

Output

```

ent-scr-destfld

Use this command to add an allowed affected destination field (DESTFLD) screening reference and associated attributes (destination point code, next screening function identifier, and next screening reference) to the allowed DESTFLD entity set. One or more point codes can be associated with the allowed DESTFLD screening reference. MTP Network Management messages regarding the DESTFLDs listed in this entity set are accepted from another network.

Parameters

nsfi (mandatory)

This parameter indicates that the gateway screening process should stop.

Range:

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. The point code's unique screening reference name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters.

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

*0 - 255, **

*—the full range of values from 0–255

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:

*0 - 7, **

*—the full range of values from 0–7

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

*0---31, **

*---the full range of values from 0--31

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

*0 - 255, **

*—the full range of values from 0–255

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *

*—the full range of values from 0–255

npc (optional)

ITU national point code.

Note

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *

*—the full range of values from 0–16383

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsf i*) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:*none**s***Default:***none***sna (optional)**16-bit ITU national sub number area. The *zone* in the point code represented by *zone-area-id*.**Range:***0 - 7***—the full range of values from 0–7***Example**`ent-scr-destfld:sr=iec:ni=240:nc=010:ncm=010-012:nsfi=stop``ent-scr-destfld:sr=iec1:ni=1:nc=1:ncm=1:nsfi=stop:actname=copy``ent-scr-destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s``ent-scr-destfld:sr=iec:un=120:sna=10:mna=15:nsfi=stop`

Dependencies

Caution

Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

The destination point code specified by `ni-nc-ncm`, `zone-area-id`, `un-sna-mna`, `msa-ssa-sp`, or the `npc` parameter must not already exist in the screening reference or within an existing range of DPCs.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

The `nsfi=stop` parameter must be specified in the command.

If the `nsfi=stop` parameter is specified, then the `nsr` parameter cannot be specified.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

If the `zone=*` parameter is specified, then the `area=*` and the `id=*` parameters must be specified.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` and `npcst` parameters cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `nsfi=fail` parameter is specified, then the `nni`, `nc`, `nncm`, `narea`, `nzone`, `nid`, `nmsa`, `nssa`, `nsp`, `nun`, `nsna`, `nmna`, and `npc` parameters cannot have a value of `c`.

The Gateway Screening Stop Action table must be accessible.

The J7 support feature must be enabled before the `un/ sna/ mna` parameters are specified.

The J7 support feature must not be enabled before the `msa/ ssa/ sp` parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25-100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-destfld` command.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., `ni`, `nc`, `ncm`. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

```
ent-scr-destfld:sr=iec:ni=240:nc=010:ncm=010-012:nsfi=stop
```

ent-scr-dpc

Use this command to add an allowed DPC screening reference and associated attributes (destination point code, next screening function identifier, next screening function reference) to the allowed DPC entity set. One or more DPCs may be associated with the allowed DPC screening reference. The DPCs listed in this entity set are allowed to receive SS7 messages from another network.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

blkdpc

Blocked DPC is the next screening category.

cgpa

Allowed CGPA is the next screening category.

destfld

Allowed destination field (DESTFLD) is the next screening category.

isup

ISUP message type (ISUP) is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Allowed DPC screening reference name. A set of one or more allowed destination point codes.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

*0 - 255, *, C*

*—the full range of values from 0–255

C—continue

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*.

Range:

*0 - 7, *, C*

*—the full range of values from 0–7

C—continue

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0---31, *, C

*---the full range of values from 0--31

C ---continue

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

000 - 255, *, C

*—the full range of values from 0–255

C—continue

ncm (optional)

Network cluster member value. This parameter specifies one or more *ncm* values for the network indicator and network cluster values identified in the *ni* and *nc* parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ni (optional)

Network indicator value. This parameter specifies one or more *ni* values for the network cluster and network cluster member values identified in the *nc* and *ncm* parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

npc (optional)

ITU national point code.

Note

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *, C

*—the full range of values from 0–16383

C—continue

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

Range:

yyyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:

none

s

Default:

none

sna (optional)

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

Range:

0---15, *, C

*---the full range of values from 0--15

C ---continue

sp (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ssa (optional)

24-bit ITU national sub signaling area. The *ssa* in the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

un (optional)16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.**Range:**

0---127, *, C

*---the full range of values from 0--127

C ---continue

zone (optional)ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*.**Range:**

0 - 7, *, C

*—the full range of values from 0–7

C—continue

Example`ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=cncf``ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=blkdpc:nsr=bdp1``ent-scr-dpc:sr=dpc1:zone=1:area=2:id=3:nsfi=fail:pcst=none``ent-scr-dpc:sr=dpc1:zone=2:area=2:id=3:nsfi=fail:pcst=s``ent-scr-dpc:sr=dpc1:npc=128:nsfi=fail:pcst=s``ent-scr-dpc:sr=dpc2:un=1:sna=2:mna=1:nsfi=stop`**Dependencies** **Caution**

Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

The destination point code specified by `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, `un-sna-mna`, or the `npc` parameter must not already exist in the screening reference or within an existing range of DPCs.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

The `nsfi` and `nsr` parameters must point to an existing screen, or the `nsfi=stop` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `nsfi=stop` parameter is not specified, then the `nsr` parameter must be specified.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

If the `zone=*` parameter is specified, then the `area=*` and `id=*` parameters must be specified.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `nsfi=fail` parameter is specified, then the `ni`, `nc`, `ncm`, `area`, `zone`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters cannot have a value of `c`.

The value of the `nsfi` parameter must be valid for the BLKDPC entity type.

The Gateway Screening Stop Action table is corrupt or cannot be found.

The J7 support feature must be enabled before the `un/ sna/ mna` parameters are specified.

The J7 support feature must not be enabled before the `msa/ ssa/ sp` parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

When a DPC screening reference is created, the first entry for a point code must be `c-c-c`, or `c` for the `npc` parameter. Subsequent entries must be specific point codes.

The character `c` is used in the DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the DPC screens. When

screening for a DPC and the point code being screened does not match any of the point codes in the DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, `nsfi`, and `nsr`. The point code is in the form of `npc=c` or subfields equal to `c-c-c`. When the character `c` is specified, the `nsfi` and `nsr` parameters must be specified.

If the character `c` is specified for the parameters `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp`, the character `c` is the only value that can be specified for all three parameters. For example, a point code `c-c-255` is not allowed. The asterisk (*) value cannot be used with the character `c` (for example, a point code `c-c-*` is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code `c-c-c` or `npc=c`. The `nsfi` and `nsr` in this entry are examined to determine the next step in the screening process.

If the current `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` is equal to `c-c-c` or `npc=c`, only the `nsfi` and `nsr` can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

An asterisk cannot be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-dpc` command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., `ni`, `nc`, `ncm`. The command can be entered successfully whether the J7 feature is enabled or not enabled.

ent-scr-isup

Use this command to add an allowed ISUP or TUP screening reference to the Allowed ISUP entity set. One or more message types can be associated with the allowed ISUP screening reference. The ISUP message types listed in this entity set are accepted from another network.

Parameters

isupmt/tupmt (mandatory)

ISUP or TUP message type.

Range:

0 - 255, *

*—the full range of values from 0–255

sr (mandatory)

Individual ISUP screening reference to which this rule will be added. If the specified sr does not exist, it will be created.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

nsfi (optional)

This parameter specifies the next screening category that is used in the gateway screening process.

Range:

stop

The gateway screening process ends and the message proceeds through normal routing.

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (`nsfi`) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Example

```
ent-scr-isup:sr=iec:isupmt=1:nsfi=stop
```

```
ent-scr-isup:sr=ibig:isupmt=1&&128:nsfi=stop
```

```
ent-scr-isup:sr=iall:isupmt=*:nsfi=stop
```

```
ent-scr-isup:tupmt=20:sr=tu01:nsfi=stop
```

Dependencies

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

The specified `isupmt` parameter or `tupmt` parameter value must not already exist in the specified `sr`.

If the `nsfi` parameter is specified, the value must be `stop`.

The `nsr` parameter cannot be specified if the `nsfi=stop` parameter is specified.

The GWSOA parameter combination should be known and valid.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

Notes

A range of values can be specified for the `isupmt` or `tupmt` parameter by separating the values that define the range by two ampersands (&&); for example, `isupmt=025&&100` specifies all ISUP message types from 25-100. The value to the left of the && must be less than the value to the right of the && in the range.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-isup` command.

TUP does not apply to SEAS. ISUP Message Type is the default.

To use TUP message type screening, an SIO screening reference with `si=04` (TUP) must exist in the SIO table. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (`nsr`) value.

To use ISUP message type screening, an SIO screening reference with `si=05` (ISUP) must exist in the SIO table. The ISUP screening reference specifies the ISUP SIO screening reference as the next screening reference parameter (`nsr`) value.

To screen for TUP and ISUP message types using a combined ISUP/TUP screen set, the SIO screening reference with `si=4` and the SIO screening reference with `si=5` must be two different screening references. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (`nsr`) value, and the ISUP screening reference specifies the SIO ISUP screening reference as the next screening reference parameter (`nsr`) value.

Output

When a screen reference is specified that is not yet associated with a screen set, the following output appears:

```
ent-scr-isup:sr=iec:isupmt=1:nsfi=stop
```

```
tekelecstp 04-09-02 09:39:13 EST EAGLE 31.3.0

ent-scr-opc

Use this command to add an allowed OPC screening reference and associated attributes (originating point code, next screening function identifier, next screening function reference) to the allowed OPC entity set. One or more OPCs may be associated with the allowed OPC screening reference. Each OPC listed in this entity set is allowed to send SS7 messages to the customer's network.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

blkdpc

Blocked DPC is the next screening category.

blkopc

Blocked OPC is the next screening category.

cgpa

Allowed CGPA is the next screening category.

dpc

Allowed DPC is the next screening category.

sio

Allowed SIO is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. A set of one or more allowed OPCs.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

area (optional)

ITU international area. The *area* in the point code represented by *zone-area-id*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

id (optional)

ITU international ID. The *ID* in the point code represented by *zone-area-id*. A

Range:

0 - 7, *, C

*—the full range of values from 0–7

C—continue

mna (optional)

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

Range:

0---31, *, C

*---the full range of values from 0--31

C—continue

msa (optional)

24-bit ITU-national main signaling area value. The *msa* of the point code represented by *msa-ssa-sp*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

nc (optional)

Network cluster value. This parameter specifies one or more *nc* values for the network indicator and network cluster member values specified in the *ni* and *ncm* parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ncm (optional)

Network cluster member value. This parameter specifies one or more ncm values for the network indicator and network cluster values identified in the ni and nc parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—the full range of values from 0–255

C—continue

ni (optional)

Network indicator value. This parameter specifies one or more ni values for the network cluster and network cluster member values identified in the nc and ncm parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*.

Range:

0 - 255, *, C

*—full range of values from 0-255

C—continue

npc (optional)

ITU national point code.

Note

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) for information on converting the point code format.

Range:

0 - 16383, *, C

*—full range of values from 0-255

C—continue

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (nsf1) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

pcst (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range:*none**s***Default:***none***sna (optional)**16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.**Range:***0--15, *, C***--the full range of values from 0--15**C—continue***sp (optional)**24-bit ITU national signaling point. ```

```
ent-scr-opc:sr=opc1:npc=128:nsfi=fail:pcst=s
```

```
ent-scr-opc:sr=opc2:un=1:sna=2:mna=1:nsfi=stop
```

Dependencies

Caution

Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gwsn=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

A complete point code must be specified, using the `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, `un-sna-mna` or `npc` combination unless a value of `c` is specified.

The OPC specified by `ni-nc-ncm`, `zone-area-id`, `msa-ssa-sp`, `un-sna-mna` or the `npc` parameter must already exist in the screening reference or within an existing range of OPCs.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 0–255, the `ni` and `nc` parameters must be specified with a single value.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range.

The `nsfi` and `nsr` parameters must point to an existing screen, or the `nsfi=stop` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `nsfi=stop` parameter is not specified, then the `nsr` parameter must be specified.

The `nsr` parameter must be specified if `nsfi` is not equal to `stop`.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

If the `zone=*` parameter is specified, then the `area=*` and `id=*` parameters must be specified.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `nsfi=fail` parameter is specified, then the `nni`, `nc`, `nncm`, `narea`, `nzone`, `nid`, `nmsa`, `nssa`, `nsp`, `nun`, `nsna`, `nmna`, and `npc` parameters cannot have a value of `c`.

The value of the `nsfi` parameter must be valid for the OPC entity type.

The Gateway Screening Stop Action table is corrupt or cannot be found.

The J7 support feature must be enabled before the `un/ sna/ mna` parameters are specified.

The J7 support feature must not be enabled before the `msa/ ssa/ sp` parameters are specified.

The GWSOA parameter combination should be known and valid.

Notes

When an OPC screening reference is created, the first entry for a point code must be `c-c-c` or `c` for the `npc` parameter. Subsequent entries must be specific point codes.

The character `c` is used in the OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the OPC screens. When screening for a DPC and the point code being screened does not match any of the point codes in the DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the OPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, `nsfi`, and `nsr`. The point code is in the form of `npc=c` or subfields equal to `c-c-c`. When the character `c` is specified, the `nsfi` and `nsr` parameters must be specified.

If the character `c` is specified for the parameters `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp`, the character `c` is the only value that can be specified for all three parameters. For example, a point code `c-c-255` is not allowed. The point code must be `c-c-c`. The asterisk value cannot be used with the character `c` (for example, a point code `c-c-*` is not allowed).

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code `c` or `npc=c`. The `nsfi` and `nsr` in this entry are examined to determine the next step in the screening process.

If the current `ni-nc-ncm`, `zone-area-id`, `un-sna-mna` or `msa-ssa-sp` is equal to `c-c-c` or `npc=c`, only the `nsfi` and `nsr` can be changed. Otherwise, only the OPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-opc` command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

There is no feature dependency on ANSI point code parameters, i.e., `ni`, `nc`, `ncm`. The command can be entered successfully whether the J7 feature is enabled or not enabled.

Output

```
ent-scr-opc:sr=iec:nsfi=stop

ent-scr-sio

Use this command to add an allowed SIO screening reference and associated attributes (network indicator, service indicator, message priority, H0 heading code, H1 heading code, next screening function identifier, next screening function reference) to the allowed SIO entity set.

Note

To use TUP message type screening, an SIO screening reference with `si=04` (TUP) must be defined in the SIO table. This SIO screening reference is specified in the `ent-scr-isup` command as the next screening reference (`nsr`) value in a screening reference for TUP message types

Parameters

nic (mandatory)

Network indicator code. NIC for the SIO screening reference specified in the `sr` parameter. The NIC is the last 2 bits of the subservice field of an SIO.

Range:

0 - 3, *

*—full range of values from 0-3

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:***blkdpc***

Blocked DPC is the next screening category.

cdpa***cgpa***

Allowed CGPA is the next screening category.

destfld

Allowed destination field (DESTFLD) is the next screening category.

dpc

Allowed DPC is the next screening category.

isup

ISUP message type (ISUP) is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

pri (mandatory)

Message priority. A single priority, or the beginning of a range of priorities for the SIO screening reference specified by the *sr* parameter .

Range:

0 - 3, *

*—full range of values from 0-3

si (mandatory)

Service indicator. SI for the SIO screening reference specified in the *sr* parameter. The SI is the first 4 bits of an SIO. The SS7 code directs the message to the MTP-user at the destination code.

Range:

00 - 15

sr (mandatory)

The allowed SIO screening reference name. This parameter specifies a set of one or more *si/nic/pri* combinations.

Range:

ayyy

1 alphabetic character followed by up to 5 alphanumeric characters

actname (optional)

Name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

h0 (optional)

H0 heading code. New H0 heading code for the screening reference specified in the `sr` parameter.

Range:

0 - 15, *

*—full range of values from 0-15

Default:

Value given if `si` value is `00`, `01`, `02`

h1 (optional)

H1 Heading Code. H1 heading code for the screening reference specified in the `sr` parameter.

Range:

0 - 15, *

*—full range of values from 0-15

Default:

Value given if `si` value is `00`, `01`, `02`

nsr (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (`nsfi`) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Example

```
ent-scr-sio:sr=iec:nic=1:si=1:h0=01&&03:h1=*:pri=*:nsfi=dpc:nsr=abc
```

```
ent-scr-sio:sr=iec:nic=1:si=3:pri=2:nsfi=stop
```

```
ent-scr-sio:sr=iec:nic=1:si=4:pri=3:nsfi=stop:actname=cncf
```

Dependencies **Caution**

Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gwsn=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `si` parameter is equal to 00, 01, or 02, the `h0` and `h1` parameters must be specified. Otherwise, the `h0` parameter cannot be specified.

Valid combinations for the `h0/h1` and `nh0/nh1` parameters are:

- `h0` is a single value—`h1` can be a single value, range, or an asterisk
- `h0` is a range— `h1` can be an asterisk
- `h0` is an asterisk— `h1` can be an asterisk

If the screening reference exists, the `nic`, `si`, `h0/h1`, and priorities to be added to the allowed SIO entity set for the SIO screening reference cannot exist in that allowed SIO entity set.

If asterisks or ranges are specified for the heading codes, nothing that matches the combination of `nic`, `si`, and the specified heading codes can already exist in the allowed SIO entity set for the screening reference.

If the screening reference does not exist, a new screening reference for the allowed SIO entity set is created.

The `nsfi` and `nsr` parameters must point to an existing screen, or the `nsfi=stop` parameter must be specified, and the `nsr` parameter cannot be specified.

The values specified for the `nsfi` and `si` parameters must meet the mapping requirements as shown:

- `nsfi=destfld` — `si=00`
- `nsfi=cdpa` — `si=03`
- `nsfi=cgpa` — `si=03`
- `nsfi=isup` — `si=05`

Use [Table 4-36](#) to determine the acceptable combination of the specified parameter values:

Table 4-36 Additional Valid ent-scr-sio Parameter Combinations

si value:	nic value	pri value	h0 value:	h1 value:
00	s, *	s, *, r	s	s, *, r
00	s, *	s, *, r	*, r	*
01, 02	s, *	s, *, r	s	s, *, r
01, 02	s, *	s, *, r	*, r	*
03-15	s, *	s, *, r	u	u
Legend				
• s = single value • r = range • * = asterisk • u = unspecified				

The Gateway Screening Stop Action table must be accessible.

If the `nsfi` parameter has a value other than `stop` or `fail`, the `nsr` parameter must be specified and must exist.

If the `nsfi=stop` parameter is specified, then the `nsr` parameter must be specified.

If the `si` parameter is greater than 2, the `h0` and `h1` parameters must not be specified.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

The GWSOA parameter combination should be known and valid.

For SEAS commands, the `pri` parameter specified must be in the range 0-3, *.

For SEAS commands, the `h0` parameter specified must be in the range 0-15, *.

For SEAS commands, the `h1` parameter specified must be in the range 0-15, *.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `pri=0&&2` specifies all message priorities for the range 0 - 2.

If the screen set reaches 100% capacity (indicated by the **100% Full** message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

To use TUP message type screening, an SIO screening reference with `si=04` (TUP) must be defined in the SIO table. To use ISUP message type screening, a rule with `si=05` (ISUP) must be defined in the SIO table. To use a combined ISUP/TUP screen set for TUP and ISUP message screening, the SIO screening reference with `si=4` and the SIO screening reference with `si=5` must be two different screening references.

The `h0` and `h1` parameters cannot be specified if `si` is not equal to 00, 01, or 02.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-sio` command.

Output

```
ent-scr-sio:sr=iec:nic=1:si=1:h0=01&&03:h1=*:pri=*:nsfi=dpc:nsr=abc
```

```

ent-scr-tt

Use this command to add a specific allowed translation type (TT) screening reference in the TT entity set.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

cdpa

Allowed CDPA is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

sr (mandatory)

Screening reference. The point code's unique screening reference name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

type (mandatory)

Translation type. The GTT type value in the CdPA. This value is the decimal representation of the 1-byte field used in SS7.

Range:

*000 - 255, **

*—full range of values from 0-255

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

Example

```
ent-scr-tt:sr=iec:type=012:nsfi=cdpa:nsr=wr5
```

```
ent-scr-tt:sr=iec:type=012:nsfi=stop:actname=copy
```

Dependencies

Caution

Even though gateway screening is in the screen test mode, as defined by the `gwsa=off` and `gws=on` parameters, the gateway screening action in the stop action set specified by the `actname` parameter of the screen set will be performed at the end of the screening process.

If the screening reference is valid, but does not exist, a new TT screen is created.

If the screening reference exists, a new rule is added to the TT screening table.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original `ent-scr-tt` command.

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command.

If the `nsfi=stop` parameter is specified, the `nsr` parameter cannot be specified.

If the `nsfi` parameter has a value other than `stop`, the `nsr` parameter must be specified.

If the `nsr` parameter is specified, the specified screening reference must exist.

If the screening reference (`sr`) exists, the single value or range specified for the allowed `type` to be added to the TT screen for the allowed TT screening reference must not already exist in that TT screen.

If an asterisk is specified for the allowed `type`, nothing can already exist in the TT screen for the screening reference.

The Gateway Screening Stop Action table is corrupt or cannot be found.

The specified value for the `nsfi` parameter is not valid for TT screen.

The screen referenced by `sfi` and `nsr` must already exist.

The Gateway Screening Rules table can contain a maximum of 360,600 rules.

The value specified for the `type` parameter must be within the allowed range.

The GWSOA parameter combination should be known and valid.

Notes

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

Output

```
ent-scr-tt:sr=iec:type=012:nsfi=cdpa:nsr=wr5
```

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0

ent-scrset

Use this command to create a new screen set and point it to its first screen. A screen set is a set of screens (filters) that can be assigned to a linkset. SS7 messages transmitted on a linkset assigned to a screen set require screening by the system, if screening is enabled.

Parameters

nsfi (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range:

blkdpc

Blocked DPC is the next screening category.

blkopc

Blocked OPC is the next screening category.

dpc

Allowed DPC is the next screening category.

opc

Allowed OPC is the next screening category.

sio

Allowed SIO is the next screening category.

stop

The gateway screening process ends and the message proceeds through normal routing.

scrn (mandatory)

Screenset name.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the *actname* parameter in conjunction with the gateway screening stop action table (see *chg-gws-actset* and *rtrv-gws-actset*).

Range:

ayyyyy 1 alphabetic character followed by up to 5 alphanumeric characters.

destfld (optional)

This parameter turns on and off the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is ON, the automatic screening is applied at the end of the provisioned screen set.

Range:

yes

no

Default:

yes

nsr (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

Range:

ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default:

No value given

Example

```
ent-scrset:scrn=ss01:nsfi=opc:nsr=iee
```

```
ent-scrset:scrn=ss02:nsfi=stop
```

```
ent-scrset:scrn=empt:nsfi=stop:destfld=yes
```

```
ent-scrset:scrn=scr1:nsfi=stop:actname=copy
```

Dependencies

Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gwsn=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set will be performed at the end of the screening process.

The *nsfi=stop* parameter must be specified before the *actname* parameter can be specified.

The value of the *actname* parameter must already be defined in the Gateway Screening Stop Action table with the *chg-gws-actset* command. These values are shown in the *ACT NAME* field of the *rtrv-gws-actset* command output.

If the `nsfi=stop` parameter is specified, then the `nsr` parameter cannot be specified.

The specified screen set name cannot be in use by another screen set.

A maximum of 63 user-defined screen sets can be defined in the database.

The `nsfi` and `nsr` parameters must point to one or more existing entities in another entity set, or the `nsfi=stop` parameter must be specified, and the `nsr` parameter cannot be specified.

If the `nsfi=stop` parameter is not specified, then the `nsr` parameter must be specified.

The Gateway Screening (GWS) Stop Action Set table must be accessible.

The `nsfi` parameter must be valid for the SCRSET entity.

The Gateway Screening (GWS)/Global Title Translation (GTT) shared database resource (DBMM.TBL) cannot be full.

The GWSOA parameter combination should be known and valid.

Notes

Entering a new screen set may take a few minutes of processor time. The following message appears in the scroll area:

```
Extended processing time required-please wait
```

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

Output

```
ent-scrset:scrn=ss01:nsfi=opc:nsr=iec
```

```

ent-serial-num

Use this command to enter and lock the NT serial number into the database for an EAGLE STP.

You must enter the serial number at least once without specifying the *lock* parameter. As long as you enter the command without the *lock* parameter, you can enter the system serial number as many time as needed. After the correct serial number is entered, you must use the *lock=yes*

parameter to lock the serial number table. You cannot change the serial number with administration commands after the table is locked.

Parameters

serial (mandatory)

The system NT Serial Number.

Range:

aayyyyyyyy

Up to 10 alphanumeric characters; mixed case is allowed.

The first two characters (the prefix) must be letters. The remaining characters must be numbers. The serial number cannot contain spaces or special characters.

lock (optional)

This parameter is used to lock the Serial Number table when the serial number is entered for the system.

Caution

After the serial number is locked, you cannot enter it again or change it in the database. You can use the command without the `lock` parameter to enter the serial number as many times as needed; then enter the command with the `lock` parameter and the correct serial number to lock the serial number table.

Range:

yes

Default:

Not locked

Example

```
ent-serial-num:serial=nt00000123
```

```
ent-serial-num:serial=nt00000123:lock=yes
```

Dependencies

The serial number must be entered at least once without specifying the `lock` parameter.

The system serial number that is entered when the `lock` parameter is specified must match the serial number that was previously entered in the Serial Number table by using the command without the `lock` parameter.

The system serial number cannot be entered again after the Serial Number table is locked.

The system serial number must start with two alphabetical characters.

The format of the serial number should be AANNNNNNNN where NNNNNNNN must be numeric digits (0 - 9).

The format of the serial number needs to be 2 alphabetical letters followed by 8 numbers (e.g., NT01234567.)

Notes

None

Output

```
ent-serial-num:serial=nt00000123
```

```
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0

ent-shlf

Use this command to add an equipment shelf to the database.

Parameters**loc (mandatory)**

The location of the shelf.

Range:

1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300,
6100, 6200, 6300

type (mandatory)

The type of equipment shelf to be configured.

Range

ext, fpb

fan (optional)

This parameter turns ON/OFF the FAN option. If it is turned ON, the FAN power for this shelf will be added to the Frame Power Budget.

Range

off,

on

Example

```
ent-shlf:type=ext:loc=1200
```

```
ent-shlf:type=imtswh:loc=6100
```

```
ent-shlf:type=fpb:loc=6200:fan=on
```

Dependencies

The frame and shelf values of the shelf location parameter (loc) must be within the valid range (xyzz, where x=frame and y=shelf; zz is always 00 for this command).

The specified shelf location must not have been configured previously.

The Shelf table is corrupt or cannot be found by the system.

A shelf cannot be provisioned at location 1100. This location is reserved for the control shelf.

The shelf locations 6200 and 6300 are reserved for shelf type FPB only. However, shelf with type=fpb can be provisioned in any shelf location from 1200 to 6300.

Notes

None

Output

```
ent-shlf:type=ext:loc=1200
```

ent-sid

Use this command to define additional true point codes for an STP. This command allows newly defined true point codes to be distributed to the cards without requiring system initialization.

Parameters

pc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

pca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001–005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006–255`.

The point code `000-000-000` is not a valid point code.

pc/pca/pci/pcn/pcn24/pcn16 (optional)

STP true point code.

pci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

Example

To create a site identification STP PC for ITU-N and ITU-I:

```
ent-sid:pcn=123:pci=1-1-1
```

To create a site identification STP PC for ITU-N Spare and ITU-I Spare:

```
ent-sid:pcn=s-123:pci=s-1-1-1
```

To create a site identification STP PC for ITU-N16:

```
ent-sid:pcn16=125-1-6
```

Dependencies

At least one optional parameter must be specified.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be specified.

If the system is configured for ANSI format point codes, the specified network indicator value (*ni*) of the *pc* parameter must be 6 or greater when the specified cluster value is 0 (*nc*).

The *pcn* and *pcn24* parameters cannot be specified together in the command.

The specified STP point code must not have been previously defined as a capability point code.

An STP point code cannot exist that is the same type (ANSI, ITU-I, ITU-N, ITU-N24, ITU-N16, ITU-ISpare, or ITU-NSpare) as the specified STP point code or must not have been previously defined as a capability point code.

The value of the *pc/pca/pci/pcn/pcn24/pcn16* parameter must be a full point code.

The SID table is corrupt or cannot be found.

ITU-N STP destination point codes can be specified only as full point codes.

Invalid parameter was specified.

ANSI or ITUN-24 SID cannot be provisioned if the J7 feature is enabled.

Notes

The SID Table can simultaneously contain the node's true point codes of any following point code types: ANSI, ITU-I, ITU-N or ITU-N24, ITU-ISpare, and ITU-NSpare. (Only ITU-N or ITU-N24, not both, can be defined in the SID Table.)

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (*s-*).

Feature 53120 introduces Spare Point Code Support.

When the J7 feature is enabled, ANSI and ITUN-24 point codes are not allowed for the SID table.

Output

ent-sid:pcn=123:pci=1-1-1

```

      rlgncxa03w 05-01-07 11:11:28 EST  EAGLE 31.12.0

ent-sip-npp

Use this command to configure number normalization rules (SIPPHCXT and SIPNNPFX). SIPPHCXT table will be used to provision the phone-context. SIPNNPFX table will be used to configure the prefixes against each phone context and it will also contain number of digits to be deleted (NPDD) and new prefix to be added (NPDS).

Parameters

phctxt (mandatory)

Phone Context

Range:

[illegible]

A string of 1 to 64 characters. Valid values are (0-9, A-Z), +, *, #, .(period), @ or DFLT (default).

npdd (optional)

Number of prefix digits to be deleted from the incoming digit string. If NPDD is zero then no digits are deleted.

Range:

ZZZZZZZZZZZZZZZZZZZZ

An integer in the range of 0 to 15.

Default:

No change to the current value.

System Default:

0

npds (optional)

New prefix digits to be substituted to digit string after deleting the NPDD. If NPDS is NONE then no digits are prepended.

Range:

ZZZZZZZZZZZZZZZZ

A string of 1 to 15 characters. Valid values are hex digits (0-9, A-F) and NONE.

Default:

No change to the current value

System Default:

none

pfx (mandatory)

Prefix

Range:

ZZZZZZZZZZZZZZZZ

A string of 1 to 15 characters. Valid values are hex digits (0-9, A-F), +, *, -, #.

Example

```
ent-sip-npp:phctxt=abc.com:pfx=101
```

```
ent-sip-npp:phctxt=abc.com:pfx=121:npdd=5:npds=2f
```

```
ent-sip-npp:phctxt=a*bc.com:pfx=91*:npdd=5:npds=af1
```

```
ent-sip-npp:phctxt=df1t:pfx=*121#
```

Dependencies

SIPNP Feature must be enabled before entering any number normalization rules.

SIP Phone Context table (SIPPHCXT) should be accessible.

SIP Prefix table (SIPNPNFX) should be accessible.

SIP DBMM 2 table should be accessible.

A maximum of 101 entries can be added in the SIP Phone Context table (SIPPHCXT).

A maximum of 50 prefixes for each phone context can be added in the SIP Prefix table (SIPNPNFX).

Prefixes must be unique. Duplicate Prefix entries are not allowed.

Phone Contexts must be unique. Duplicate Phone Context entries are not allowed.

At least one NPDD or NPDS must be specified with non-default (other than 0, NONE) value.

SIPPHCXT table can have a maximum of 101 Phone Contexts which includes 100 Unique and 1 DFLT.

A valid Phone Context/Prefix value should be given.

The PHCTXT parameter value must contain no more than 64 characters and the PFX parameter value must contain no more than 15 characters.

Notes

None.

Output

This example displays the output when all the parameters are specified:

```
ent-sip-npp:phctxt=a*bc.com:pfx=91:npdd=5:npds=af1
```

```
tekelecstp 12-07-16 10:05:45 EST EAGLE 45.0.0
ent-sip-npp:phctxt=a*bc.com:pfx=91:npdd=5:npds=af1
Command entered at terminal #4.
PHCTXTID table is (2 of 101) 2% full.
ENT-SIP-NPP: MASP A - COMPLTD
;
```

This example displays the output when just the phctxt and pfx parameters are specified:

```
ent-sip-npp:phctxt=linea.com:pfx=*121#
```

```
tekelecstp 12-07-09 18:59:31 EST 45.0.0-64.35.0
ent-sip-npp:phctxt=linea.com:pfx=*121#
Command entered at terminal #4.
PHCTXTID table is (1 of 101) 1% full.
ENT-SIP-NPP: MASP A - COMPLTD
;
```

ent-slk

Use this command to add a low-speed or high-speed (ATM or IP) signaling link to a linkset in the database.

Signaling links are the only elements in the database directly supported by a hardware device. When a link is added to a linkset, the link remains in the state OOS-MT-DSBLD (out of service maintenance disabled) until it is activated.

For E5-E1T1-B or SLIC cards, use this command to associate a signaling link and a timeslot with the E1, T1 or J1 interface that will service the timeslot.

For E5-E1T1-B cards used for SE-HSL links, use this command to assign links A and B on any 2 of the 8 E5-E1T1-B card ports.

For SLIC cards used for SE-HSL links, use this command to assign HSL links A, A1 and B on any 3 of the 8 SLIC card ports.

Up to 64 signaling links can be assigned to one E5-E1T1-B card, allowing links A, A1 - A31, B, and B1 - B31 to be provisioned.

Up to 96 signaling links can be assigned to one SLIC card running SS7HC69 application, allowing links A, A1 - A47, B, and B1 - B47 to be provisioned.

Up to 128 signaling links can be assigned to SLIC cards running IPSP application, allowing links A, A1 - A63, B, and B1 - B63 to be provisioned.

Up to 3 signaling links can be assigned to an E5-ATM-B card, allowing links A, A1, and B to be provisioned.

Note

The `link` parameter has been added as a synonym for the `port` parameter. Either port or link can be used for a few more EAGLE releases; then the `port` parameter will be removed.

Parameters

link (mandatory)

The signaling link on the card specified in the `loc` parameter. The links can be specified in any sequence or pattern.

Synonym:

port

Range:

a, b, a1 - a63, b1 - b63

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have a location specified in the `loc` parameter.

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

lsn (mandatory)

Linkset name. The linkset name must be unique.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

slc (mandatory)

Signaling link code. The SLC must be unique within the linkset. It must be the same at both the system location and the distant node.

Range:

0 - 15

aname (optional)

Association name. The association assigned to the signaling link added in an IPSG linkset.

Range:

aaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

atmtsel (optional)

ATM timing selector. The timing source for the ATM signaling link—internal, line, or external. Internal timing is derived from an internal clock source operating at 1.544 MHz $\pm$ 200 Hz for ANSI links and 2.048 MHz $\pm$ 103 Hz for ITU links. External timing is derived from the High-Speed Master Clock (T1 or E1). Line timing is derived from its received data stream, if present.

 Caution

The internal timing source is used for debug purposes only, and is not to be used for production operation.

If you are using the 2.048 MHz reference clock as the timing source for E1 signaling links, the `atmtsel=external` parameter must be specified for high-speed ATM signaling links. The `atmtsel` parameter is not valid in the command when the `e1port` parameter is specified for an E1 signaling link. For information on the E1 interface, see the *Database Administration - SS7 User's Guide*.

Range:

external

internal

line

Default:

line

bps (optional)

Transmission rate for the link in bits per second.

 Note

Links with different speeds can be mixed within a linkset. Mixing of high speed links and low speed links in a linkset is supported for migration purposes and is not recommended for standard provisioning.

Range:

1536000, 1544000, 1984000, 2048000, 56000, 64000

The value specified for the `bps` parameter must be supported for the associated card application:

- SS7ANSI—56000 or 64000
- CCS7ITU—56000 or 64000
- ATMANSI—1544000
- SS7ANSI, CCS7ITU (E1 SE-HSL cards)—1984000
- SS7ANSI, CCS7ITU, (T1 SE-HSL-A cards)—1536000
- ATMITU—2048000
- CCS7ITU, (J1 cards) --- 64000

Default:
56000

Default: (For J1 links)
64000

e1atmcrc4 (optional)

CRC4 multi-frame structure enable/disable indicator.

Range:

on

off

Default:
on

e1atmsi (optional)

Value of two Spare International bits of NFAS data.

Range:
0 - 3

Default:
3

e1atmsn (optional)

Value of five Spare National bits of NFAS data.

Range:
0 - 31

Default:
0

e1port (optional)

Port for the E1 interface on the E1 card where a signaling link and timeslot or an SE-HSL link is being assigned.

Range:
1 - 8

Any 2, but no more than 2, of the 8 ports on an E5-E1T1-B card can be specified when the card is used as an SE-HSL card.

Default:
1

ecm (optional)

Error correction method.

Range:

basic

pcr

Default:

basic

j1port (optional)

Port for the J1 interface on the J1 card where a signaling link and timeslot is being assigned.

Range:

1-8

Ports 1 through 8 can be specified for E5-E1T1B cards.

Default:

1

l2tset (optional)

Level 2 timer set

A signaling link can be assigned to any of the thirty-five timer sets.

Range:

1 - 40

1-10 —ANSI low speed links

11-20 —ITU low speed links

21-25 —ITUN China high speed links

26-30 —ITUN Q703.A high speed links

31-35 —Unchannelized T1 high speed links

36 --40---- ITUN16 Japan low speed links

Default:

1 — ANSI low speed links

11 — ITU low speed links

21 — ITUN China high speed links (SE-HSL link in a linkset defined with the *apcntype=ituchina* parameter)

26 — ITUN Q703.A high speed links (SE-HSL link in a linkset defined with the *apcntype=itun* parameter)

31 — Unchannelized T1 high speed links

36---- ITUN16 Japan low speed links

l1 (optional)

ATM line length in feet.

Range:

0 - 7

0 —0-110 feet

1 —110-220 feet

2 —220-330 feet

3 —330-440 feet

4 —440-550 feet

- 5 —550-660 feet
- 6 —More than 660 feet
- 7 —Allows use of external line buildout networks

Default:

0

lpset (optional)

Link parameter set identifier

Range:

1 - 30

Default:

1 — ANSI

21 — ITU

pcrn1 (optional)

Threshold of the number of MSUs available for retransmission. If the error correction method being used is PCR and this threshold is reached, no new MSUs or FISUs are sent. The retransmission cycle is continued up to the last MSU entered into the retransmission buffer in the order in which they were originally transmitted.

Range:

1 - 1023

low speed E1/T1 links: 1 - 127

unchannelized T1 links: 1 - 1023

Default:

76 — low speed E1/T1 links.

608 — unchannelized T1 links.

pcrn2 (optional)

Threshold of the number of MSU octets available for retransmission. If the error correction method being used is PCR, and this threshold is reached, no new MSUs or FISUs are sent. The retransmission cycle is continued up to the last MSU entered into the retransmission buffer in the order in which they were originally transmitted.

Range:

300 - 287744

low speed E1/T1 links: 300 -35500

unchannelized T1 links: 7200 -287744

Default:

3800 — low speed E1/T1 links.

32224 — unchannelized T1 links.

t1port (optional)

Port for the T1 interface on the T1 card where a signaling link and timeslot or an ST-HSL-A link is being assigned.

Range:

1 - 8

Any 2, but no more than 2, of the 8 ports on an E5-E1T1-B card can be specified when the card is used as an ST-HSL-A card.

Default:

1

ts (optional)

E1 or T1 timeslot for the assigned signaling link.

Range:

1 - 31

E1 range:

1-31

T1 range:

1 - 24

J1 range:

1-24

vci (optional)

Virtual channel identifier.

Range:

5, 32 - 65535

0-4 and 6-31 are reserved values; they cannot be specified in the command.

Default:

5

vpi (optional)

Virtual path identifier.

Range:

0 - 4095

Default:

0

Example

ent-

slk: loc=1201: link=a: slc=3: lsn=c1201001: l2tset=3: bps=64000: ecm=basic

ent-

slk: loc=1201: link=a: slc=3: lsn=c1201001: l2tset=3: ecm=pcr: pcrn1=50: pcrn2=4000

This example adds signaling link A to linkset LSHCAP:

ent-slk: loc=1304: link=a: slc=0: lsn=lshcap: lpset=3: vci=5: vpi=15

ent-

slk: loc=1302: link=a: slc=5: lsn=atm1302a: lpset=3: vci=10: vpi=15: ll=0: atmt sel=external

This example adds a link to linkset LS1 at 56 KB:

ent-slk: loc=1205: link=a1: slc=0: lsn=ls1

This example assigns a timeslot for the signaling link on an E1 card that uses E1 port 1:

ent-slk: loc=1206: link=a: slc=0: lsn=e1jwk: ts=1

This example assigns a timeslot for a signaling link on an E1 card that uses E1 port 2:

```
ent-slk:loc=1205:link=b:slc=0:lsn=e1typ:ts=1:e1port=2
```

This example adds a timeslot for a signaling link using E1 port 2 and signaling link B2:

```
ent-slk:loc=1205:link=b2:slc=0:lsn=e1typ:ts=1:e1port=2
```

This example adds a timeslot for a signaling link using signaling link A2. The T1 interface defaults to the interface defined for T1 port 1 (t1port parameter not specified):

```
ent-slk:loc=1207:link=a2:slc=0:lsn=t1jwk:bps=64000:ts=1
```

This example adds a timeslot for a signaling link using T1 port 2 and signaling link B2:

```
ent-slk:loc=1207:link=b2:slc=0:lsn=t1typ:ts=1:t1port=2
```

This example adds a signaling link to linkset LS1 at 2048000 bps for an ATM card that will use the CRC4 multi-frame structure:

```
ent-slk:loc=1205:link=a:slc=0:lsn=ls1:bps=2048000:atmsel=line:e1atmcrc4=on
```

This example adds a link to linkset LS1 at 56 Kbps for a card that is provisioned as an E1 card:

```
ent-slk:loc=1205:link=a31:slc=0:lsn=ls1:e1port=4:ts=4
```

This example adds a link to linkset LS2 at 64 Kbps for a card provisioned as a T1 card:

```
ent-slk:loc=1207:link=b27:slc=3:lsn=ls2:t1port=8:ts=6:bps=64000
```

This example adds signaling link B to linkset LSE5ATM on an E5-ATM-B card:

```
ent-slk:loc=1305:link=b:slc=1:lsn=lse5atm:lpset=3:vci=5:vpi=15
```

This example adds signaling link A1 to linkset L2E5ATM on an E5-ATM-B card:

```
ent-slk:loc=1303:link=a1:slc=1:lsn=l2e5atm:lpset=3:vci=5:vpi=15
```

This example assigns a timeslot for the signaling link on a J1 card that uses the J1 port:

```
ent-slk:lsn=ls2:j1port=2:slc=9:port=a3:loc=1102:ts=5:bps=64000:ecm=basic
```

Dependencies

Card locations 1113 - 1118 cannot be specified.

The ecm=pcr parameter must be specified before the pcrn1 and pcrn2 parameters can be specified for the SS7ANSI and CCS7ITU applications.

The value specified for the bps parameter must be supported for the associated card application.

If the card application is SS7ANSI or CCS7ITU, then a value of 56000 or 64000, respectively, must be specified for the bps parameter. If SE-HSL or ST-HSL-A cards are used, then a value of 1984000 or 1536000, respectively, must be specified for the bps parameter.

A value of 1544000 must be specified for the bps parameter if the card application is ATMANSI.

A value 2048000 must be specified for the bps parameter if the card type is LIME1ATM.

The card application must be ATMANSI before the bps=1544000 parameter can be specified. The card application must be ATMITU before the bps=2048000 parameter can be specified.

A value of 1984000 or 1536000 must be specified for the `bps` parameter if the card is an E5-E1T1-B card used for SE-HSL or ST-HSL-A links (the `linkclass=unchan` parameter is specified in the `ent-e1` or `ent-t1` command) respectively.

The values 0 - 4 and 6 - 31 cannot be specified for the `vci` parameter; these values are reserved system values.

The linkset type must be valid for the card:

- The linkset adjacent point code (APC) type must be the same as the card application type (ANSI or ITU).
- IPSPG-M2PA linksets cannot contain IPGWx and IPSPG-M3UA link types. During migration to an IPSPG-M2PA linkset, link types other than IPGWx or IPSPG-M3UA can be added to the linkset. After the linkset is transitioned to IPSPG-M2PA, only IPSPG-M2PA and IPLIMx links can be added.
- IPSPG-M3UA linksets cannot contain SS7IPGW, IPGWI, and IPGHC link types. After the linkset is transitioned to IPSPG-M3UA, only IPSPG-M3UA links can be added to the linkset.

The specified linkset name must exist in the database.

The value of the `slc` parameter cannot be used by more than one link in the linkset.

A card must be equipped in the specified card location.

The card in the specified card location must be a LIM or MIM and must exist.

A link cannot be already assigned to the specified port.

The parameters that are specified for the command must be valid for the type of card in the specified card location.

If a low-speed link is assigned to a card (card application is not ATMANSI or ATMITU), then the ATM high-speed link and E1 ATM parameters (`atmtsel`, `e1atmcrc4`, `etatmsi`, `e1atmsn`, `ll`, `lpset`, `vci`, and `vpi`) cannot be specified.

If an ATM high-speed link is assigned to a card (card application is ATMANSI), then the low-speed link parameters (`ecm`, `l2tset`, `pcrn1`, and `pcrn2`) cannot be specified.

If an IP link is assigned to a card (card application is SS7IPGW, IPGWI, or IPLIMI), then the following low-speed link parameters, ATM high-speed link parameters, and E1 ATM high-speed link parameters cannot be specified: `lpset`, `vci`, `vpi`, `ll`, `atmtsel`, `e1atmcrc4`, `e1atmsi`, `e1atmsn`, `ecm`, `l2tset`, `pcrn1`, and `pcrn2`.

The value specified for the `link` parameter must be valid for the specified card type and application:

- A4 - A-15 and B4 - B15—card type is LIME1 or LIMT1 for an E5-E1T1-B card, and the card application is SS7ANSI or CCS7ITU
- A16 - A31 and B16 - B31 --- card type is LIME1 or LIMT1 for an E5-E1T1-B card used as an E1 or T1 card, and the card application is SS7ANSI or CCS7ITU.
- A4 - A31 and B4 - B31—cannot be specified for an SE-HSL or an ST-HSL-A card
- A - A7 and B - B7—E5-ENET-B cards running the IPLIMI application
- A - A15 and B - B15—E5-ENET-B, or SLIC cards running the IPSPG application
- A, A1 - A63 and B, B1 - B63-SLIC card running the IPSPG application

HIPR2 cards must be in card locations `xy09` and `xy10` on any shelf that contains one or more E5-E1T1-B, E5-ENET-B, or SLIC cards. When links A4 - A31 or B4 - B31 are specified, the

system verifies that HIPR2 cards are in card locations xy09 and xy10 on the same shelf with the specified E5-E1T1-B, E5-ENET-B, or SLIC card.

If the card application is SS7IPGW or IPGWI, then the `link=a` parameter must be specified.

If an E5-E1T1-B card is used for SE-HSL or ST-HSL-A links, then only the `link=a` parameter or `link=b` parameter can be specified.

If the specified linkset has a mate linkset, only 1 SS7IPGW or IPGWI signaling link can be assigned to the specified linkset. The assigned link must be an SS7IPGW or IPGWI link.

Up to 8 IPGWx signaling links can be assigned to one linkset if the linkset is not mated.

If an IP link is assigned to a card running the SS7IPGW application, then the `lsn` parameter must reference a linkset that specifies an IP gateway adjacent point code.

If an IP link is assigned to a card running the IPGWI application, then the `lsn` parameter must reference a linkset that specifies an IP gateway adjacent point code.

If the `multgc=yes` parameter is specified, then all links assigned to the linkset must be of the same type.

If `multgc=yes` parameter is specified, then the card in the specified location must be running the IPGWI, IPLIMI, or IPSG application.

Linksets with 14-bit ITU-N and 24-bit ITU-N APCs or SAPCs can contain only IPGWI or IPLIMI M3UA links. These links support 14-bit ITU-N and 24-bit ITU-N traffic simultaneously.

Linksets containing 24-bit ITU-N APCs or SAPCs cannot contain E1 ATM links. These links do not support 24-bit ITU-N traffic.

A maximum of 1200, 1500, 2000, or 2800 links is allowed in the system. The maximum depends on the enabled Large System # Links quantity (see the `rtrv-ctrl-feat` command output). A FAK is required to enable support for more than 1200 links. A mixture of T1 ATM high-speed, E1 ATM high-speed, SE-HSL, IP, and low-speed signaling links is supported.

If a card location is specified for an E1, T1, or Channel card (card type LIME1, LIMT1, or LIMCH), then the `ts` parameter must be specified.

A specific timeslot can be assigned in the `ts` parameter to only one E1 signaling link for the E1 interface that services that timeslot.

A specific timeslot can be assigned in the `ts` parameter to only one T1 signaling link for the T1 interface that services that timeslot.

The `ts` parameter value for a T1 link must be in the range 1-24.

The `ts` parameter cannot be specified for E5-E1T1-B cards that are used for SE-HSL or ST-HSL-A links (the `linkclass=unchan` parameter is specified in the `ent-e1` or `ent-t1` command).

The Card (IMT) table is corrupt or cannot be found.

The Link table is corrupt or cannot be found.

The Linkset table is corrupt or cannot be found.

The E1/T1 table is corrupt or cannot be found.

The Extended Link table is corrupt or cannot be found.

If the card is an IPSG card, then the `ipsg=yes` parameter must be specified (see the `ent-ls` command).

If an IPSG linkset and card are used, then the `aname` parameter must be specified.

If the `aname=m3ua` parameter is specified, then a maximum of 16 signaling links can be assigned.

If the `aname=m2pa` parameter is specified, then only one signaling link can be assigned.

The total TPS of all signaling links configured for an IPSG card cannot exceed 6500 TPS for an E5-ENET-B or SLIC card when the `type=enetb` parameter is specified (see the `ent-card` command).

The total TPS of all signaling links configured for an IPSG card cannot exceed 10,000 TPS for a SLIC card when the `type=slc` parameter is specified (see the `ent-card` command).

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values must be less than or equal to 750,000. If the HIPR2 High Rate Mode and 1M System TPS features are turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 1,000,000. The total provisioned system TPS is equal to SIGTRAN TPS + ATM TPS.

The value specified for the `aname` parameter must already exist in the database.

The adapter assigned to the association must be the same as the adapter assigned to the linkset.

The value specified for the `aname` parameter must be associated with the value specified for the `loc` parameter.

Linksets must have same routing context to share an association.

The `aname` parameter can be specified only for IPSG links.

The specified parameter must be valid for the card type and use:

- `e1port` —E5-E1T1-B cards used as E1 cards
- `t1port` —E5-E1T1-B cards used as T1 cards
- `j1port` —E5-E1T1-B cards used as J1 cards
- `ts` —E5-E1T1-B cards used as E1/T1 cards
- `lsn`, `slc`, `loc`, `port`, `bps`, `lpset`, `atmsel`, `vci`, `vpi`, `e1atmcrc4`, `e1atmsi`, and `e1atmsn` —E5-ATM-B cards. Low-speed link parameters (`ecm`, `l2tset`, `pcrn1`, and `pcrn2`) cannot be specified.
- `e1port` and `l2tset` —E5-E1T1-B cards used as SE-HSL cards
- `t1port` and `l2tset` —E5-E1T1-B cards used as ST-HSL-A cards

The E1 interface for the card at the location specified by the `loc` parameter must be defined (see the `ent-e1` command) before a signaling link can be assigned to the port.

The card location specified by the `e1loc` parameter must contain an E5-E1T1-B card that is used as an E1 card.

The specified card slot must be equipped with the valid card type.

The value specified for the `ts` parameter cannot already be in use by the E1 card.

The T1 interface of the T1 card specified by the `loc` parameter must already be defined (see the `ent-t1` command) before a signaling link can be assigned to the card.

If a multi-port LIM card is used, then the `bps=56000` parameter must be specified.

If the `loc` parameter indicates an ST-HSL-A card, then the `t1port` parameter must be specified.

If the `loc` parameter indicates an SE-HSL card, then the `e1port` parameter must be specified.

If the link is In-Service, then this command cannot be entered.

Links must be available in the linkset that is specified by the `lsn` parameter.

The domain of the linkset specified by the `lsn` parameter must match the domain of the link specified by the `link` parameter.

The link capacity cannot exceed the maximum allowed by the SE-HSL or ST-HSL-A FAK.

The L2 timer range must be valid for the type of signaling link being provisioned as shown:

- ANSI LSL—1 - 10
- ITU LSL—11 - 20
- E1-HSL (China)—21 - 25
- E1-HSL (ITUN)—26 - 30
- T1-HSL-A—31 - 35
- J1 LSL ---- 36-40

The same value cannot be specified for the `aname` parameter for multiple links in the same linkset.

The same value must be specified for the `ecm` parameter for all links in a linkset.

The T1 interface on the card at the location specified by the `loc` parameter must be defined (see the `ent - t1` command) before a signaling link can be assigned to the port.

The N1/N2 thresholds for PCR Error Correction Mode (ECM) specified by the `pcrn1` and `pcrn2` parameters must be within the range specified for the link type. Only low speed E1/T1 (LSL) and Unchannelized T1 links support PCR ECM.

E5-ATM-B cards must be inhibited before the card can support an A1 link.

If a 3 Links per Card feature quantity is enabled, and an E5-ATM-B card is used, then the value specified for the `vc1` parameter must be less than or equal to 16383.

A 3 Links per Card feature quantity must be enabled before the `link=a1` parameter can be specified for an E5-ATM-B card.

The maximum number of E5-ATM-B cards with 3 links cannot exceed the value that is set by the 3 Links per Card quantity feature.

The value specified for the `link` parameter when an ATM card is used must be valid:

- `a-a1`, `b`—E5-ATM-B card running the ATMANSI or ATMITU application

The BPS parameter value must be 64000 for J1 links. By default, BPS is 64000 for J1 links.

The Time Slot parameter value must not be greater than 24 for J1 links. The range for the Time Slot is 1 - 24.

The ECM parameter value must be BASIC for J1 links. By default, ECM is BASIC for J1 links.

The J1 table must be accessible.

A specific timeslot can be assigned in the `ts` parameter to only one J1 signaling link for the J1 interface that services that timeslot.

The value specified for the `SLC` parameter must be in the range of 0 to 15.

The value specified for `TS` parameter must be in the range of 0 to 15.

Notes

The `ll` parameter is not available in the SEAS database.

If a signaling link is assigned to a card that is running the ATMANSI or ATMITU application, and the `bps`, `vci`, `vpi`, `e1atmcrc4`, `e1atmsi`, `e1atmsn`, `ll`, `atmsel`, and `lpset` parameters are not specified, then the ATM default values are assigned for these parameters.

The MTP Level 2 timers (`l2tset` parameter) are not valid for IP links or for ATM links.

A link is equipped when it is physically operational, that is, when the hardware is in place that is needed to support the link.

Signaling Links for E5-E1T1-B Cards

An E5-E1T1-B card can be used for E1, T1, or J1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE.

Each signaling link for an E1, T1, or J1 card must be associated with a timeslot assigned in this command. Each signaling link and timeslot assigned for an E1, T1, or J1 card must be associated with an E1, T1, or J1 interface that has been defined for one of the ports on the card (see the `ent-e1` or `ent-t1` command, respectively).

Timeslots and signaling links are defined in the `ent-slk` command by a combination of card location (`loc` parameter), the signaling link that uses the timeslot (A, A1-A31, B, B1-B31), the timeslot number (`ts`), and the port for the servicing E1, T1, or J1 interface on the E1, T1, or J1 card (`e1port` or `t1port` parameter). Timeslot numbers must be unique to the E1, T1, or J1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1, T1, or J1 interface for more than one signaling link.

Each E5-E1T1-B card used as an E1 card can have up to 64 signaling links assigned to the card. Each E1 interface on the card can service 1-31 timeslots.

Each E5-E1T1-B card used as a T1 card can have up to 64 signaling links assigned to the card. Each T1 interface on the card can service 1-24 timeslots.

Each E5-E1T1-B card used as a J1 card can have up to 64 signaling links assigned to the card. Each J1 interface on the card can service 1-24 timeslots.

Signaling Links for E5-ATM-B Cards

An E5-ATM-B card can support E1 or T1 card functions: however, the card cannot support both functions at the same time. Cards running E1 and T1 functions can coexist in the same EAGLE.

Each E5-ATM-B card can have up to 3 signaling links assigned to the card. Only the A, A1, or B link can be used. The card must be inhibited, a 3 Links per Card feature quantity must be enabled, and the value specified for the `vci` parameter must be less than or equal to 16383 before the A1 link can be provisioned.

The A, A1, and B links can be provisioned for a location if a card is not seated in that location. However, if a card other than an E5-ATM-B card is inserted in this location, then the card is auto-inhibited.

Signaling Links for IPSPG Cards

An IPSG card supports both M2PA and M3UA signaling links.

The E5-ENET-B card supports up to 32 signaling links per card, 16 M3UA links per association, and 32 associations per card.

The SLIC card supports up to 128 signaling links per card, 16 M3UA links per association, and 128 associations per card.

Multiple M3UA signaling links with routing context (different linksets/AS, up to 16) can use a single association.

Each M3UA AS-ASP instance maps to a signaling link. Signaling link state depends upon AS-ASP state, as well as administrative action.

The IPSG card can share M2PA linksets with IPLIMI, and IPLHC cards, but the card cannot share M3UA linksets with SS7IPGW, IPGWI, and IPGHC cards.

The IPSG card supports ANSI and ITU and ITUN/ITUN24 signaling links simultaneously on one card and on one association. Each signaling link resides in a set of networks determined by the APC and SAPCs of the assigned linkset.

The `slktps` parameter specified for the IPSG linkset (see the `ent/chg-ls` command) specifies the TPS for each link provisioned for that linkset.

HSL and LSL in same linkset

Mixing of high speed links and low speed links in a linkset is supported for migration purposes and is not recommended for standard provisioning.

Signaling links and scheduled UI measurement reports

If the Integrated Measurements feature is turned on, then the measurements subsystem automatically disables the scheduled UI measurements reports, including the daily scheduled reports, if the entered link causes the provisioned link count to exceed 700.

ent-snmp-host

Use this command to write an entry into the SNMP Host table to configure an SNMP northbound interface.

Parameters

host (mandatory)

Host name. This parameter specifies the logical name of the device associated with the specified IP address.

Special characters, such as hyphens, can be used in the host name if the host name is enclosed in double quotes (" ").

Range:

ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ

A string of characters, beginning with a letter and comprising up to 32 characters in length. Valid values are a..z, A..Z, 0..9, or .

ipaddr (mandatory)

The IP address associated with the host name. This is a TCP/IP address expressed in standard dot notation.

Range

4 numbers separated by dots, with each number in the range of 0-255.

cmdport (optional)

SNMP interface command port ID.

Range:

161, 1024..65535

This is the port that the SNMP agent will monitor for commands such as GET and SET.

Default:

161

System Default:

off

secLevel optional

This parameter specifies security level for SNMPv3 host.

Range:

- *noauthnopriv: Authentication and Privacy both are disabled*
- *authnopriv: Authentication is enabled and Privacy is disabled*
- *authpriv: Authentication and Privacy both are enabled*

Default:

No change to the current value

System Default:

off

authprot: optional

This parameter specifies authentication protocol for SNMPv3 host.

Range:

- *md5: HMAC-MD5-96*
- *sha: HMAC-SHA-96*

Default:

No change to the current value

System Default:

off

privprot: optional

This parameter specifies privacy protocol for SNMPv3 host.

Range:

- *aes: CFB128-AES-128*
- *des: CBC-DES*

Default:

No change to the current value

System Default:

off

Example

```
ent-snmp-host:host=snmpmgr:ipaddr=192.168.54.100
```

```
ent-snmp-host:host="linux-server":
```

```
ipaddr=10.25.60.99:hb=300:trapcomm="password"
```

Dependencies

An entry for the specified IPADDR cannot already exist.

An entry for the specified HOST cannot already exist.

A maximum of two SNMP Hosts can be configured.

The specified heartbeat value must be within the range for the HB parameter.

The SNMP feature must be enabled before an SNMP Host can be configured.

The specified PORT value must be within the allowed range.

A separate prompt appears for you to enter the Authentication and privacy password based on value of SECLEVEL that will be used with the SNMP authentication and privacy protocol. You must enter a password that is at least 8 and not more than 16 characters long. If you enter an invalid password (you press the Return key without entering a password, or you enter more than 16 characters), you must enter the entire command again to cause the password prompt to appear again. The password that you enter is not displayed as you enter it.

SNMPv3 mandatory parameters (USERNAME or SECLEVEL) are missing. AUTHPROT must be specified with "SECLEVEL=authpriv" or "SECLEVEL=authnopriv". PRIVPROT must be specified with "SECLEVEL=authpriv"

USERNAME, SECLEVEL, AUTHPROT, PRIVPROT are not valid parameter for snmpv2c. AUTHPROT and PRIVPROT must not be specified with "SECLEVEL=noauthnopriv". PRIVPROT must not be specified with "SECLEVEL=authnopriv"

An entry for the specified USERNAME is already exist.

Notes

None.

Output

ent-spc

Use this command to enter an SPC (secondary point code) into the database.

Parameters

spc (mandatory)

ANSI point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*).

Synonym:

spca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

spc/spca/spci/spcn/spcn24/spcn16 (mandatory)

Secondary point code.

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

spci (mandatory)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:*s*-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s**zone*—0-7*area*—000-255*id*—0-7

The point code 0-000-0 is not a valid point code.

spcn (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-*nnnnn*—0-16383*gc*—*aa-zz**m1-m2-m3-m4*—0-14 for each member; values must sum to 14**spcn24 (mandatory)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255*ssa*—000-255*sp*—000-255**spcn16 (mandatory)**

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127*sna*---000---15*mna*---000---31**Example**

This example adds a secondary point code:

ent - spc : spc=10-20-30

This example adds a 24-bit ITU-N secondary point code:

ent - spc : spcn24=99-99-99

This example adds a spare ITU-N secondary point code:

ent - spc : spcn=s-12345

This example adds a 16-bit ITU-N secondary point code:

ent - spc : spcn16=121-5-10

Dependencies

The Spare Point Code Support feature must be enabled before a spare point code (prefix s-) can be specified in the command.

The value specified for the spc parameter must be a full point code.

The ANSI point code range requirements have been violated for an ANSI SID. For the ANSI secondary point code with subfields *ni-nc-ncm*, the *ni* component cannot equal 000, the *nc* component cannot equal 000 if the *ni* component is 001 - 005

The specified secondary point code to be added must not already exist as a secondary point code.

A maximum of 40 secondary point codes may be defined.

The MPC feature must be turned on before a secondary point code can be added using this command.

The value specified for the spc parameter cannot already exist in the Destination table as a destination point code, true point code, or concerned point code.

The specified secondary point code cannot match an existing true point code or capability point code in the Site Identification table.

STP Site ID table must be accessible.

SPC table must be accessible.

Route Destination table must be accessible.

The value specified for the spc/spca/spci/spcn/spcn24/spcn16 parameter cannot be the same as any Emulated Point Code value in the PCT table.

The J7 support feature must be enabled before the spcn16 parameter can be specified.

The SPC/SPCA/SPCN24 parameters are not allowed if the J7 support feature is enabled.

Notes

If the spcn parameter is specified, its format must match the format that was assigned with the `chg-stpopts:npcfmt` parameter.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```

ent-srvsel

Use this command to assign the applicable service selectors required to specify a service entry for DSM services.

Parameters

Note

Definitions for the feature options specified by the on and off parameters are located in the Notes section.

Note

The nature of address indicator parameters (naiv or nai) and the numbering plan parameters (npv or np) can be specified using a mnemonic or an explicit value. Either the mnemonic or the explicit value can be specified; however, both values cannot be specified at the same time for the same parameter. [NAIV/NAI Mapping](#) shows the mapping between the naiv and nai values. [Table A-8](#) shows the mapping between the npv and np values.

gti/gtia/gtii/gtin/gtin24 (mandatory)

Global title indicator. For all service selector commands, the domain is defined as GTI and GTIA (ANSI), GTI (ITU international), and GTIN (ITU national). For the service selector commands, GTI and GTIA are equivalent.

Range:

Supported value for ANSI: gti=2 and gtia=2

Supported values for ITU: gtii= 0, 2, 4; gtin=0, 2, 4; gtin24= 0, 2, 4

serv (mandatory)

DSM service.

Note

The gport service cannot be used for the Prepaid SMS Intercept Phase 1 (PPSMS) or the Portability Check for Mobile Originated SMS feature; use the smsmr service. The mnp service includes the G-Port, A-Port, and IS41 GSM Migration services.

Range:**eir**

Equipment Identity Register

gflex

GSM flexible numbering

gport

GSM number portability

inpq

INP query

inpmr

INP message relay

smsmr

MO SMS ASD, MO SMS B-Party Routing, MO SMS GRN, MO-based GSM SMS NP, MO-based IS41 SMS NP, MO SMS IS41-to-GSM Migration, Portability Check for MO SMS, Prepaid SMS Intercept Phase 1

idps

IDP Screening for Prepaid

idpr

Prepaid IDP Query Relay

mnp

Mobile Number Portability

vflex

Voice Mail Router

atinp

ATI Number Portability Query (ATINP)

ttr

Triggerless TCAP Relay

aiq

ANSI41 Analyzed Information Query

ssn (mandatory)

Subsystem number.

Range:

0 - 255

tt (mandatory)

Translation type.

Range:

0 - 255

dfltact (optional)

This parameter specifies the default Action ID associated with the service selector entry.

Range:

ayyyyyyy

1 leading alphabetic followed by up to 8 alphanumeric characters

The `dfltact` parameter can have one of the following values:

- a GTT Action ID that exists in the GTT Action table and has an associated GTT Action of *disc/udts/tcaperr*
- *fallback* —Fallback to the Relay data. The relayed MSU is routed as per routing data provided by the service.
- *falltogtt* —Fallback to GTT. If the `gttselid` parameter has a value other than *none*, and the GTT selector search fails, then the GTT selector search is performed again using `gttselid=none`.

Default:

fallback

gttselid (optional)

The GTT Selector ID used for performing GTT on messages relayed by the service.

Range:

0 - 65534

nai (optional)

Nature of Address indicator.

Range:

sub

rsvd

natl

intl

naiv (optional)

Nature of Address indicator value.

Range:

0 - 127

np (optional)
Numbering Plan.

Range:

e164

generic

x121

f69

e210

e212

e214

private

npv (optional)
Numbering Plan value.

Range:

0 - 15

off (optional)
Disables or turns off the specified feature options. A comma-separated list of feature options that are requested to be turned off. Up to 10 feature options can be specified in the list.

Range:

gttrqd

on (optional)
Enables or turns on the specified feature options. A comma-separated list of feature options that are requested to be turned on. Up to 10 feature options can be specified in the list.

Range:

gttrqd

rqdtb1nop (optional)
The action performed if a message arrives at an SCCP card that does not have the necessary RTDB table, and the current message routing is GT.

Range:

udts

generate UDTs for the processed MSU

gtt

fall through to GTT for the processed MSU

disc

discard the processed MSU

snai (optional)

Service nature of address indicator.

Range:***natl***

National significant number

intl

International number

rnidn

Routing number prefix and international dialed/directory number

rnndn

Routing number prefix and national dialed/directory number

rnsdn

Routing number prefix and subscriber dialed/directory number

ccrndn

Country code, routing number, and national directory number

sub

Subscriber number

snp (optional)

Service numbering plan.

Range:***e164******e212******e214*****Example**

ent-srvsel:gtii=4:tt=20:np=e164:nai=intl:serv=eir:ssn=*

ent-srvsel:gtin24=4:tt=4:np=e164:nai=intl:serv=gport:snp=e164:snai=intl:ssn=9

ent-srvsel:gtii=4:tt=20:np=e164:nai=intl:serv=eir:ssn=:rqdtblnop=disc

ent-srvsel:gtii=0:tt=0:serv=idpr:ssn=*

Dependencies

The Service Selector table cannot contain more than 1024 entries.

The G-Flex feature must be turned on before the `serv=gflex` parameter can be specified.

The INP feature must be turned on before the `serv=inp` or `serv=inpq` parameter can be specified.

The G-Port feature must be turned on before the `serv=gport` parameter can be specified.

The Equipment Identity Register (EIR) feature must be turned on before the `serv=eir` parameter can be specified.

The `np` and `npv` parameters cannot be specified together in the command.

The `nai` and `naiv` parameters cannot be specified together in the command.

The `gtia=4` parameter cannot be specified.

The values 1 and 3 are not valid for the `gti/gtia/gtii/gtin/gtin24` parameters.

If the `gti/gtia/gtii/gtin/gtin24=0, 2` parameter is specified, then the `np(v)` and `nai(v)` parameter combinations cannot be specified.

If the `gtii/gtin/gtin24=4` parameter is specified, then an `np(v)` and `nai(v)` parameter combination must be specified. The parameters can be specified in the following combinations: `np/naiv`, `npv/nai`, `np/nai`, or `npv/naiv`.

If the `serv` parameter has a value of `inpmr`, `gport` or `eir`, then the `gtia` and `gti` parameters cannot be specified.

If the `serv=inp` parameter is specified, then the `snpe164` parameter must be specified.

If the `serv=inpq` parameter is specified, then the `gtii` parameter cannot be specified.

If the value specified for the `snai` parameter is `rnidn`, `rnndn`, or `rnsdn`, then the value specified for the `serv` parameter must be `inpmr`, `gport`, or `smsmr`.

If the value specified for the `serv` parameter is `gflex`, `gport`, `inpmr`, or `smsmr`, then the `snai` and `snpe164` parameters must be specified.

If the value specified for the `serv` parameter is `aiq`, `atinp`, `eir`, `idpr`, `inpq`, `ttr`, or `vflex` then the `snai` and `snpe164` parameters cannot be specified.

If the `snai=ccr` parameter is specified, then the value specified for the `serv` parameter must be `gport` or `smsmr`.

If the value specified for the `serv` parameter is `gport` or `smsmr`, then the `snpe164` parameter must be specified.

An entry cannot already exist that matches the new `gti/gtii/gtin/gtin24`, `tt`, `ssn`, `np(v)`, and `nai(v)` combination of parameters.

For the specified `gti/gtia/gtii/gtin`, `tt`, `np(v)`, `nai(v)`, and `ssn=*` parameters, an entry matching a specific `ssn` cannot already exist.

For the specified `gti/gtia/gtii/gtin`, `tt`, `np(v)`, `nai(v)`, and `ssn` parameters, an entry matching the `ssn=*` parameter cannot already exist.

If the `ansigflex` STP option is enabled (see the `chg-stpotps` command), then an ITU service selector cannot be entered.

The IDP Screening for Prepaid feature must be on before the `serv=idps` parameter can be specified.

If the `serv=idps` parameter is specified, then the supported mandatory parameters are `tt`, `serv`, `ssn`, `gtin`, and `gtii`. Supported optional parameters are `np` and `nai`.

The Prepaid IDP Query Relay feature must be turned on or the IAR Base feature must be enabled before the `serv=ttr` parameter can be specified.

If a value of `idpr` or `ttr` is specified for the `serv` parameter, then the only valid mandatory service parameters are `tt`, `serv`, `ssn`, `gtii`, and `gtin`, and the only valid optional parameters are `np` and `nai`.

If the A-Port or IGM feature is enabled, then the `serv=gport` parameter cannot be specified.

An entry cannot already exist that matches the new `gti/gtii/gtin/gtin24`, `tt`, `ssn`, `np(v)`, and `nai(v)` combination of parameters.

An entry cannot already exist that matches the new `gti/gtii/gtin/gtin24`, `tt`, `ssn`, `np(v)`, and `nai(v)` combination of parameters.

An entry cannot already exist that matches the new `gti/gtii/gtin/gtin24`, `tt`, `ssn`, `np(v)`, and `nai(v)` combination of parameters.

The V-Flex feature must be turned on before the `serv=vflex` parameter can be specified.

The ATINP feature must be enabled before the `serv=atinp` parameter can be specified.

The PPSMS or Portability Check for Mobile Originated SMS feature must be turned on, or the MO SMS ASD, MO SMS GRN, MO SMS B-Party Routing, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be enabled before the `serv=smsmr` parameter can be specified.

If a value of `aiq`, `atinp`, or `eir` is specified for the `serv` parameter, then the `gtin24` parameter cannot be specified.

The Prepaid IDP Query Relay feature must be turned on before the `serv=idpr` parameter can be specified.

The ANSI41 AIQ feature must be enabled before the `serv=aiq` parameter can be specified.

The A-Port or IGM feature must be turned on, or the A-Port or IGM feature must be enabled and the G-Port feature must be turned on before the `serv=mnv` parameter can be specified.

If a DSM4G card is active in the system, then the `on=gttrqd` parameter cannot be specified.

The `dfltact`, `gttselid`, and `on/off=gttrqd` parameters are supported for only the IDPR, TTR, MNP, GPORT, SMSMR, GFLEX, and INPMR services.

If a GTT Action ID is specified as the value for the `dfltact` parameter, then the Action ID must already exist in the GTT Action table.

The GTT Action table is corrupt or cannot be found.

A valid value must be specified for the `dfltact` parameter.

The EGTT feature must be turned on before the `gttselid` or `dfltact` parameter can be specified.

The same value cannot be specified for the `on` and `off` parameters.

The `dfltact=none` parameter cannot be specified.

The EPAP Data Split feature or the Dual ExAP Config feature must be on before the `rqdtbInop` parameter can be specified.

If a value of `inpq`, `vflex`, `atinp`, or `eir` is specified for the `serv` parameter, then the `rqdtbInop=gtt` parameter cannot be specified.

If a value of `aiq` or `idps` is specified for the `serv` parameter, then the `rqdtbInop` parameter cannot be specified.

The requested service selector entry must exist in the database.

The GSM DBMM table must be accessible.

Only for IDP Relay feature, `gtii/gtin/gtin24=0` can be specified.

If the `serv=idpr` parameter is specified and the `gti/gtia/gtii/gtin/gtin24=0, tt=0` parameter is entered, then the `gti/gtia/gtii/gtin/gtin24=2, tt=0` parameter combinations cannot be entered. The parameters can be specified in the following combinations: `gtii=0 tt=0`, or `gtii=2 tt=0`.

Notes

on/off options

- `gttrqd` —GTT required. Specifies whether GTT is required after service execution is complete and the message is relayed by the service. This option is supported for the IDPR, MNP, TTR, GPORT, SMSMR, GFLEX, and INPMR services.

Output

```
ent-srvsel:gtia=4:tt=10:ssn=25:snai=natl:serv=aiq

ent-ss-appl

Use this command to reserve a subsystem number for an application and set the application status to be online or offline. One subsystem can be defined per application. The application must be unique.

Parameters

appl (mandatory)

Application type.

Range:

lnp

inp

eir

vflex

atinpq

aiq

sfapp

ssn (mandatory)

Primary subsystem number.

Range:

2 - 255

rqdtb lnop (optional)

The action performed if a message arrives at an SCCP card that does not have the necessary RTDB table, and the current message routing is subsystem.

Range:

udts

generate UDTs for the processed MSU

disc

discard the processed MSU

stat (optional)

Status. In the case of SFAPP, stat can only have the value of online and it defaults to this value.

Range:

offline

online

Default:

offline (online in case of SFAPP)

Example

```
ent-ss-appl:appl=lnp:ssn=16:stat=online
```

```
ent-ss-appl:appl=inp:ssn=15:stat=offline:rqdtblnop=disc
```

Dependencies

The LNP feature must be turned on before the appl=lnp parameter can be specified.

The INP feature must be turned on before the appl=inp parameter can be specified.

The EIR feature must be turned on before the appl=eir parameter can be specified.

The value specified for the appl parameter cannot already be assigned.

The maximum number of applications must not already be assigned.

The LNP database is corrupt or cannot be found.

For LNP, the STP true point code and LNP subsystem must exist in the MAP table.

For INP, the STP true point code and INP subsystem must exist in the MAP table.

For EIR, the STP true point code and EIR subsystem must exist in the MAP table.

STP True Point Code must exist in MAP table

The SSAPPL table is corrupt or cannot be found (non-DBS 1.0 systems only).

The SSAPPL table is corrupt or cannot be found (DBS 1.0 systems only)

If the V-Flex feature is turned on, then the STP true point code and V-Flex subsystem must exist in the MAP table.

The V-Flex feature must be turned on before the appl=vflex parameter can be specified.

The RPC3 table is corrupt or cannot be found.

The ATINP feature must be enabled before the appl=atinpq parameter can be specified.

For ATINP, the STP true point code and ATINPQ subsystem must exist in the MAP table.

The value specified for the ssn parameter cannot already exist in the SS-APPL table.

The specified MAP table entry for a subsystem number (SSN) value in the SS-APPL table, must be a valid point code type for that subsystem. The following point code types are not valid for the indicated subsystems:

- For the INP subsystem, the True Point code cannot be an ITU-I point code.
- For the EIR subsystem, the True Point code cannot be an ANSI point code.
- For the AIQ, ATINPQ, or VFLEX subsystem, the True Point code can not be an ITU-N24 point code.

The ANSI41 AIQ feature must be enabled before the appl=aiq parameter can be specified.

The STP true point code and a MAP entry for the AIQ subsystem must be provisioned in the MAP table before the appl=aiq parameter can be specified.

The EPAP Data Split feature OR Dual ExAP Config feature must be on before the rqdtblnop parameter can be specified.

If the appl=aiq parameter is specified, then the rqdtblnop parameter cannot be specified.

If the `appl=sfapp` parameter is specified, then the `stat` parameter cannot take the value `offline`.

For SFAPP, the value specified in the `ssn` parameter should not have an existing entry in MAP table that is associated with STP's own True PC; however, it is valid if the `ssn` is associated with point codes other than the STP's own True PC in any table.

Notes

If not specified, the application subsystem status defaults to OFFLINE. When the application is OFFLINE, the application subsystem is down. For SFAPP, this defaults to ONLINE and cannot be changed to OFFLINE in any case.

The LNP application status applies to both message relay and LNP query.

Output

```
ent-ss-appl:appl=aiq:ssn=18:stat=online
```

```
tekelecstp 09-12-03 16:40:40 EST EAGLE 42.0.0
ENT-SS-APPL: MASP A - COMPLTD
;
```

ent-subnetid

Use this command to enter elements into the Subnet ID list, for the ISUP NP with EPAP feature. Each entry is identified by the Subnet ID and the Subnet number.

The Subnet ID length (`subnetidlen` parameter) must be entered first, before the command is entered the second time to enter the Subnet ID and Subnet Number.

Parameters

subnetid (optional)

Vendor Subnet ID

Range:

1 - 15 digits

Valid digits are 0-9, a-f, A-F.

Note

The number must contain the number of digits defined by the `subnetidlen` parameter.

subnetidlen (optional)

Subnet ID Length.

Range:**1 - 15**

All Subnet IDs defined for the ISUP NP with EPAP feature must contain this number of digits.

subnetnum (optional)

Subnet Number. A reference to the prefix number for the ISUP NP with EPAP feature (see the `chg-prefix` command).

Range:**1**

Corresponds to the prefix defined with prefix number 1

2

Corresponds to the prefix defined with prefix number 2

3

Corresponds to the prefix defined with prefix number 3

4

Corresponds to the prefix defined with prefix number 4

5

Corresponds to the prefix defined with prefix number 5

Example

```
ent-subnetid:subnetidlen=6
```

```
ent-subnetid:subnetid=886933:subnetnum=1
```

Dependencies

The value *none* cannot be specified for the `subnetid` parameter.

The ISUP NP with EPAP feature must be enabled before this command can be entered.

The SUBNETID table can contain a maximum of 50 entries.

The specified ID entry cannot already exist in the SUBNETID table.

The SUBNETID table is corrupt or cannot be found by the system.

All SUBNETID table entries must have the number of digits defined by the `subnetidlen` parameter value.

The prefix with the same prefix number as the specified Subnet Number must already be provisioned for the ISUP NP with EPA feature.

The Subnet ID length cannot be changed unless the SUBNETID table is empty. All Subnet IDs must be deleted from the table before a different Subnet ID length can be entered.

The Subnet ID length must be entered before any Subnet IDs can be defined.

The `subnetidlen` parameter cannot be specified in the same command with the `subnetid` and `subnetnum` parameters.

Notes

None.

Output

The Subnet ID length must be entered first.

```
ent-subnetid:subnetidlen=6
```

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
ENT-SUBNETID: MASP A - COMPLTD
;
```

The first Subnet ID and Subnet number can be entered after the Subnet ID length has been entered.

```
ent-subnetid:subnetid=886933:subnetnum=1
```

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
VENDID table is (6 of 50) 11% full
ENT-SUBNETID: MASP A - COMPLTD
;
```

ent-t1

Use this command to enter an interface for an E5-E1T1-B or SLIC card used as a T1 or ST-HSL-A card.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

t1port (mandatory)

T1 card port number. The value must be a T1 port for which an interface has not been configured on the specified T1 card.

Range:

1 - 8

Any 2 of the 8 ports on an E5-E1T1-B card can be specified when the card is used as an ST-HSL-A card.

Any 3 of the 8 ports on an SLIC card can be specified when the card is used as an ST-HSL card

encode (optional)

Indicator for use of B8ZS or AMI encoding/decoding.

Range:

b8zs

ami

Default:

b8zs

framing (optional)

Indicator for framing format. *esperf* is the framing format with performance monitoring.

Range:

sf, esf, esperf

Default:

sf

linkclass (optional)

Link class for links assigned to T1 cards (channelized links) or ST-HSL-A cards (unchannelized links).

Range:

chan

unchan

Default:

chan

l1 (optional)

T1 cable length in feet between the EAGLE and the connecting node.

Range:

0 - 655

Default:

133

minsurate (optional)

Minimum signal unit rate. The minimum number of SUs present on a link uniformly distributed.

Note

The `linkclass=unchan` parameter must be specified for an ST-HSL-A card before this parameter can be specified.

Range:

400 - 1600

Default:

1000

t1tsel (optional)

Timing source.

Range:*line - slave timing source**external - master timing source***Default:***line***Example**`ent-t1:loc=1205:t1port=1:encode=ami:framing=sf:ll=100``ent-t1:loc=1203:t1port=1``ent-t1:loc=1203:t1port=2:linkclass=unchan:minsrate=1200``ent-t1:loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100``ent-t1:loc=1205:t1port=2:encode=b8zs:t1tsel=line:framing=sf`**Dependencies**

The specified card location (loc parameter) must be equipped.

The card specified by the loc parameter must be a LIMT1 card type.

The E1/T1 table must be accessible.

The Card (IMT) table must be accessible.

The port specified by the t1port parameter must not be already equipped with a T1 interface.

HIPR2 cards must be equipped in card locations xy09 and xy10 (x is the frame, y is the shelf) on each EAGLE shelf that contains one or more /E5-E1T1-B or SLIC cards that are used as T1 cards or ST-HSL-A cards.

Card locations 1113 - 1118 (E5-MASP and E5-MDAL cards) cannot be specified as values for the loc parameter.

The linkclass=unchan parameter must be specified before the minsrate parameter can be specified.

An ST-HSL-A feature quantity must be enabled before the linkclass=unchan parameter can be specified for an ST-HSL-A card.

Channelized and unchannelized T1 ports (mixed mode) cannot be specified on a single card (the card cannot be used as a T1 card and an ST-HSL-A card at the same time).

Only 2 of the 8 ports can be used for T1 interfaces on an E5-E1T1-B or SLIC card that is used as an ST-HSL-A card.

The ST-HSL-A feature must be turned on before the framing=esfperf parameter can be specified.

Notes

One or two T1 interfaces must be defined on a T1 card after the T1 card type (LIMT1) is defined in the database, and before the signaling links and associated timeslots are defined for the T1 card.

External timing is derived from the EAGLE High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Up to 8 T1 interfaces can be defined on an /E5-E1T1-B or SLIC card used as a T1 card after the T1 card type (LIMT1) is defined in the database, and before the signaling links and associated timeslots are defined for the T1 card.

For an ST-HSL-A card, the `minsurate` parameter indicates the least number of SUs present on a link uniformly distributed. The number of SUs present is the `minsurate` parameter value (without link traffic) and the `minsurate` parameter value minus the number of MSUs (with link traffic).

Output

```
ent-t1:loc=1205:t1port=1:encode=ami:framing=sf:ll=100
```

```
rlghncxa03w 04-02-20 09:07:58 EST  EAGLE 31.3.0
ENT-T1: MASP A - COMPLTD
;
```

Related Topics

- [dlt-t1](#)
- [rtrv-t1](#)
- [tst-t1](#)

ent-tt

Use this command to add a translation type to the system database.

Note

If the EGTT feature is turned on, then the GTT Selector (`ent/chg/dlt/rtrvgttsetl`), GTT Set (`ent/dlt/rtrv-gttset`), and GTA (`ent/chg/dlt/rtrvgta`) commands replace the Translation Type (`ent/dlt/rtrv-tt`) and Global Title Translation (`ent/chg/dlt/rtrv-gtt`) commands. It is not recommended to run `ent/dlt/rtrv-tt` & `ent/chg/dlt/rtrv-gtt` commands as it may cause the advance GTA fields of GTT entry to be reset to the default values.

Parameters

type/typea/typei/typen/typen24/typeis/typens (mandatory)

The translation type and network type. This value is the decimal representation of the 1-byte field used in SS7.

The type and typea parameters specify an ANSI network.

The typei parameter specifies an ITU-international network.

The typen parameter specifies an ITU-national network.

The typen24 parameter specifies a 24-bit ITU-national network.

The typeis parameter specifies an ITU-international spare network.

The typens parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (type/typea) and as an ITU type (typei/typen/typen24/typeis/typens). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range:

000 - 255

Default:

No translation type is specified

alias (optional)

The alias of the global title translation type

Range:

000 - 255

Default:

No alias assignment is made.

ndgt (optional)

The number of digits contained in the global title translation. This parameter is not valid if the VGTT (variable length GTT) feature is turned on.

Range:

1 - 21

Default:

6 (not applicable if the VGTT feature is on)

ttn (optional)

Translation type name.

Range:

ayyyyyyy

1 alphabetic character followed by up to 8 alphanumeric characters

Default:

"set" + "ans"|"int"|"nat"|"24n"|"ins"|"nas" + 3-digit TT value

Example

```
ent-tt:type=230:ttn=lidb:ndgt=5
```

```
ent-tt:type=230:ttn=lidb:alias=007
```

ent-tt:type=2:ndgt=5

ent-tt:type=3

ent-tt:typens=2

ent-tt:typeis=1:ttn=setitu001

Dependencies

The translation type specified by type/typea/typei/typen/typen24/typeis/typens cannot already exist in the database containing the ANSI and ITU types.

The alias and ndgt parameters cannot be specified together in the command.

The translation type name must be unique.

The ndgt parameter is not valid if the VGTT (variable length GTT) feature is turned on.

The value specified for the type/typea/typei/typen/typen24/typeis/typens parameter cannot be an alias value.

The value specified for the type/typea/typei/typen/typen24/typeis/typens parameter must already exist in the database for the network type.

The value specified for the ttn parameter must already exist in the database.

The values specified for the type/typea/typei/typen/typen24/typeis/typens and ttn parameters must refer to the same entity.

The value specified for the alias parameter must be associated with the specified translation type and cannot be the value of an existing translation type.

The value specified for the alias parameter cannot be an existing alias value for the specified network type.

The network domain of the translation type specified by the ttn parameter cannot be CROSS (see the ent-gttset command) when entering an alias entry for that ttn.

The ttn=none parameter cannot be specified.

Notes

The new translation type is entered into the translation type table along with the translation name and the number of digits used by the translation type.

The ttn parameter always refers to a translation type. Aliases do not have translation type names.

If the OBR or FLOBR feature is turned on, then the ent-tt command can be used to provision only CdGTA GTT sets and GTT selectors. NP and NAI values cannot be specified for GTT selectors using the ent-tt command as gti=4 entries cannot be provisioned with this command.

If the EGTT feature is on, then the following occurs for this command:

- For ANSI, if the GTT selector of a true entry is deleted using the dlt-gttset command, a new entry using the same TTN cannot be created. If the true selector is deleted for an entry using the dlt-gttset command, then its aliases cannot be entered.
- For ITU, if a true GTT selector entry (GTI=2 or GTI=4) is deleted using the dlt-gttset command, or if the GTT set name of an entry is changed using the chg-gttset command, then a new entry for the same TTN cannot be created. If a true GTT selector

entry is deleted using the `dlt-gttset` command, or if the GTT set name of an entry is changed using the `chg-gttset` command, then its aliases cannot be created.

Output

```
ent-tt:typeis=1:ttn=setitu001
```

```

ent-ttmap

Use this command to add a mapped SS7 message translation type (TT) for a given gateway linkset name. With this command you can add to the database the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping. For example, you can use this command to add to the database that you want the SS7 message translation type 001 (before TT mapping) mapped to 254 (after TT mapping).

Parameters

ett (mandatory)

Translation type before mapping. The identification of the type of global title translation in the SS7 message *before* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range:

000 - 255

io (mandatory)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

Range:

i
incoming

o
outgoing

lsn (mandatory)

Linkset name. The unique network identifier for the gateway linkset.

Range:

ayyyyyyyyy

1 alphabetic character followed by 9 alphanumeric characters

mtt (mandatory)

Mapped translation type. The identification of the type of global title translation in the SS7 message after translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range:

000 - 255

Example

```
ent-ttmap:lsn=nc001:io=i:ett=128:mtt=16
```

Dependencies

The linkset must be defined.

The linkset table must be accessible.

The translation type mapping table must be accessible.

The Translation Type Mapping table must not be full for the linkset specified in the `lsn` parameter. Translation type mapping entries are supported for up to 255 linksets.

Notes

None

Output

```
ent-ttmap:lsn=nc001:io=i:ett=128:mtt=16
```

```
rlghncxa03w 04-02-21 13:09:27 EST  EAGLE 31.3.0

ent-user

Use this command to add a user to the database. When you first enter the command, the system prompts you for the user's password, which must follow the administered password guidelines. For security reasons, the password is not displayed. After successfully entering a user password, you are prompted to verify it by entering it again.

Parameters

① Note

Allcc(X) parameters consist of a configurable command class name (ayy), and indicator (-yes or -no) to specify whether the command class is allowed. A value of ayy-yes indicates that the value is allowed. A value of ayy-no indicates that the value is not allowed.

uid (mandatory)

User ID

Range:

azzzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters (including asterisks, single quotes, and commas)

all (optional)

This parameter specifies whether the user ID is assigned all non-configurable command classes (LINK, SA, SYS, PU, DB, DBG, LNP).

Range:

yes

no

Default:

no

cc1 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed

yes —the command class is not allowed

cc2 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed

yes —the command class is not allowed

cc3 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Command class name of 1 alphabetic character followed by 2 alphanumeric characters

no—the command class is not allowed

yes—the command class is allowed

cc4 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Command class name of 1 alphabetic character followed by 2 alphanumeric characters

no—the command class is not allowed

yes—the command class is allowed

cc5 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

no—the command class is not allowed

yes—the command class is allowed

cc6 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

no—the command class is not allowed

yes—the command class is allowed

cc7 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, ayy-no

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

no—the command class is not allowed

yes—the command class is allowed

cc8 (optional)

Configurable command class name and an indicator to specify whether the User ID can enter commands assigned to the specified command class.

Range:

ayy-yes, *ayy*-no

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

no —the command class is not allowed.

yes —the command class is allowed

db (optional)

Access to all commands in command class Database Administration.

Range:

yes

no

Default:

no

dbg (optional)

Access to all commands in command class Debug.

Range:

yes

no

Default:

no

link (optional)

Access to all commands in command class Link Maintenance.

Range:

yes

no

Default:

no

page (optional)

The maximum age of the password, in days. The STP automatically prompts the user for a new password at login if the user's password is older than the value specified for this parameter.

Range:

0-999

Default:

The value specified for the *page* parameter in the *chg-secu-dflt* command

pu (optional)

Access to all commands in command class Program Update.

Range:

yes

no

Default:

no

revoke (optional)

Revoke the user ID. The system rejects login attempts for a revoked user ID.

Range:

yes

no

Default:

no

sa (optional)

Access to all commands in command class Security Administration.

Range:

yes

no

Default:

no

sys (optional)

Access to all commands in command class System Maintenance.

Range:

yes

no

Default:

no

uout (optional)

User ID aging interval. The number of successive days a user ID can go unused (no successful login) before the system denies login of that user ID.

Range:

0 - 999

Default:

The value specified for the uout parameter in the `chg-secu-dflt` command

Example

```
ent-user:uid=john:db=yes
```

```
ent-user:uid=john*mayer:db=yes
```

```
ent-user:uid=user123:cc5=u21-yes:cc8=u32-yes
```

Dependencies

Passwords cannot be created or modified from a telnet terminal (terminal IDs 17-40) without the OA&M IP Security Enhancements feature turned on.

The specified user ID cannot already exist.

The user IDs *seas* or *none* cannot be entered because they are reserved for system use. Up to 100 users can be entered.

The *revoke=yes* parameter cannot be specified for a user ID with system administration authorization.

The Command Class Management feature must be enabled before a configurable command class name can be specified in the *cc1-cc8* parameters.

The CCCNAMES table must be accessible.

The UserID table must be accessible.

The Security Defaults table must be accessible.

The *cc1-cc8* parameter values must have valid default or provisioned configurable command class names. Default names are *u01-u32*.

Notes

To disable user ID aging, specify the *uout=0* parameter.

The *Database Administration Manual - System Management* provides a list of all commands allowed within each command class.

Up to 8 configurable command class name parameters can be specified in one command. Additional commands can be entered to assign user access for more than 8 names. To assign user access for all 32 available configurable command class names, four commands could be entered with 8 names specified in each command.

A password must be entered for the newly-created userID. The system issues a separate prompt for this password and disables character echo at the terminal so that the entered password is not displayed on the screen.

After the password has been entered, the system issues a second prompt, and the password must be entered again. This ensures that no typing mistakes were made on the first entry.

Use the following rules for creating passwords:

- A new password cannot contain more than 20 characters.
- A new password must contain at least the number of characters that is specified in the *minlen* parameter of the *chg-secu-dflt* command.
- A new password must contain at least the number of alphabetic (*alpha* parameter), numeric (*num* parameter), and punctuation (*punc* parameter) characters that is specified in the *chg-secu-dflt* command.

- A new password cannot contain the associated user ID.

As a default, the command class Basic is assigned to all users. If no other command class is assigned, the user still has access to commands in the Basic class.

Output

```
ent-user:uid=john*mayer:db=yes
```

```

ent-vendid

Use this command to enter elements into the Vendor ID list, for the GSM MAP SRI Redirect to Serving HLR (also called GSM MAP SRI Redirect) feature. Each entry is identified by the Vendor ID and the Vendor number.

The Vendor ID length (vendidlen parameter) must be entered first, before the command is entered the second time to enter the Vendor ID and Vendor Number.

Parameters

vendid (optional)

Vendor ID

Range:

1 - 15 digits

vendidlen (optional)

Vendor ID Length. All Vendor IDs defined for the GSM MAP SRI Redirect for Serving HLR feature must contain this number of digits.

Range:

1 - 15

vendnum (optional)

Vendor Number. The Vendor Number is used as a reference to the prefix for the GSM MAP SRI Redirect for Serving HLR feature.

 Note

The prefix values in the range are defined in the chg-prefix command.

Range:

1 - 128

1

Corresponds to the prefix defined with prefix number 1

2

Corresponds to the prefix defined with prefix number 2

..

..

128

Corresponds to the prefix defined with prefix number 128

vendtype (optional)

Vendor Type. The Vendor Type is used with the GSM MAP SRI Redirect for Serving HLR feature to allow multiple networks for the same equipment vendor.

Range:

1 - 32

Example

```
ent-vendidvend:len=6
```

```
ent-vendid:vendid=886933:vendnum=1:vendtype=1
```

```
ent-vendid:vendid=886939:vendnum=5:vendtype=9
```

Dependencies

The vendid=none parameter cannot be specified.

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

The VENDID table can contain a maximum of 500 entries.

The specified ID entry cannot already exist in the VENDID table.

The VENDID table is corrupt or cannot be found by the system.

All VENDID table entries must have the number of digits defined by the vendidlen parameter value.

The prefix with the same prefix number as the specified Vendor Number must already be provisioned for the GSM MAP SRI Redirect feature.

The Vendor ID length cannot be changed unless the VENDID table is empty. All Vendor IDs must be deleted from the table before a different Vendor ID length can be entered.

The Vendor ID length must be entered before any Vendor IDs can be defined.

The vendidlen parameter cannot be specified in the same command with the vendid, vendidlen, and vendtype parameters. Either the vendidlen parameter, or the vendid, vendidlen, and vendtype parameters can be specified in the command.

Notes

None.

Output

ent-vflx-cd

Use this command to provision the call decision criteria that is used to create a voice mail routing number. This command creates a new entry in the V-Flex Call Decision Table. The V-Flex feature must be enabled before this command can be entered.

Parameters**bcap (mandatory)**

The INAP/CAP bearer capabilities for the call.

The INAP/CAP bearer capabilities are used to determine the type of mail that is used by the call, such as voice, video, multimedia, etc.

Range:

0 - 31, none

none —BCAP is not present in the incoming MSU.

cdn (mandatory)

Call decision name. This parameter specifies an entry in the call decision table.

Range:

ayyy

1 alphabetic character followed by 3 alphanumeric characters

dnstat (mandatory)

Dialed number status. This parameter specifies whether the MSISDN is found in the EPAP RTDB.

Range:

fnd

DN found in RTDB

nfnd

DN not found in RTDB

It does not matter whether the DN is found in RTDB

rnidx (mandatory)

Routing number index. The index associated with the generated voice mail routing number.

Range:

0 - 9

vmDIG (mandatory)

Voice mail number or voice mail prefix digits. A voice mail number or voice mail digits for the call decision entry.

Note

If the call is redirected (the `rdi=redir` parameter is specified), then the value specified for the `vmdig` parameter represents a voice mail number. If the call is not redirected (the `rdi=dir` parameter is specified), then the value specified for the `vmdig` parameter represents a set of voice mail digits.

Range:

1 - 15

Valid digits are 0-9, A-F, a-f

rdi (optional)

Redirection indicator. This parameter specifies whether the call is redirected.

Range:

dir

call is not redirected

redir

call is redirected

Default:

dir

Example

```
ent-vflx-  
cd:dnstat=fnd:rdi=redir:bcap=31:vmdig=abcdef123456abc:rnidx=0:cdn=cdn1
```

Dependencies

The V-Flex feature must be enabled before this command can be entered.

The value specified for the `cdn` parameter cannot be a reserved word, such as *none*.

The value specified for the `cdn` parameter cannot already exist in the Call Decision table.

An entry with the specified `dnstat`, `rdi`, `bcap`, and `vmdig` parameters cannot already exist in the Call Decision table.

The Call Decision table is corrupt or cannot be found.

The value specified for the `vmdig` parameter cannot differ from a value that already exists in the Call Decision table by only the value of the `dnstat` parameter. The values specified for the `rdi` and `bcap` parameters must differ as well.

The maximum number of 25 entries cannot already be provisioned for a given `rdi`, `dnstat`, and `bcap`.

Output

```
ent-vflx-  
cd:dnstat=fnd:rdi=redir:bcap=31:vmdig=abcdef123456abc:rnidx=0:cdn=cdn1
```

ent-vflx-rn

Use this command to associate a routing number name to a set of voice mail routing numbers. This command creates an entry in the Routing Number table. The V-Flex feature must be enabled before this command can be entered.

Parameters

rn (mandatory)

Routing number. The voice mail routing number.

Range:

1 - 15 digits. Valid digits are 0-9, A-F, a-f.

rnname (mandatory)

Routing number name. The name associated with the voice mail routing number.

Range:

ayyyyyyy

1 alphabetic character followed by 7 alphanumeric characters

Example

```
ent-vflx-rn:rnname=rn01:rn=123ABCDF012
```

Dependencies

The V-Flex feature must be enabled before this command can be specified.

The Routing Number table is corrupt or cannot be found.

The Routing Number table cannot contain more than 10,000 entries.

The value specified for the rnname parameter cannot already exist in the database.

The value specified for the rn parameter cannot already exist in the database.

The value specified for the rnname parameter cannot be a reserved word, such as *none*.

Output

```
ent-vflx-rn:rnname=rn01:rn=1234ABCDF56
```

```

ent-vflx-vmsid

Use this command to provision a voice mail server ID and associate up to 10 routing number names with the ID. This command creates an entry in the VMSID table. The V-Flex feature must be enabled before this command can be entered.

Parameters

id (mandatory)

The ID of the voice mail server.

Range:

1 - 15 digits, *dflt*

Valid digits are 0-9, A-F, a-f

dflt—a set of routing numbers used when a query is received with an invalid MSISDN or an MSISDN that is not found in the RTDB

idx0 (optional)

Index 0. The routing number name for index 0.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx1 (optional)

Index 1. The routing number name for index 1.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx2 (optional)

Index 2. The routing number name for index 2.

Range:

ayyyyyyy

1 alphabetic character followed by upto 7 alphanumeric characters

idx3 (optional)

Index 3. The routing number name for index 3.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx4 (optional)

Index 4. The routing number name for index 4.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx5 (optional)

Index 5. The routing number name for index 5.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx6 (optional)

Index 6. The routing number name for index 6.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx7 (optional)

Index 7. The routing number name for index 7.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx8 (optional)

Index 8. The routing number name for index 8.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

idx9 (optional)

Index 9. The routing number name for index 9.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

Example

This example provisions a VMS ID and associates a routing number name with index 0:

```
ent-vflx-vmsid:id=123456abcdef123:idx0=RN45
```

This example provisions a VMS ID and associates routing number names with index 0 and index 5:

```
ent-vflx-vmsid:id=DADBEEFEED:idx0=rn15:idx5=rn30
```

Dependencies

The V-Flex feature must be enabled before this command can be entered.

The values specified for the `idx*` parameters must already exist in the Routing Number table.

The Routing Number table is corrupt or cannot be found.

The VMSID table is corrupt or cannot be found.

The value specified for the `id` parameter cannot already exist in the VMSID table.

The GTT DBMM table is corrupt or cannot be found.

The `idx*=none` parameter cannot be specified.

The VMSID table contains a maximum of 1000 entries.

The value specified for the `rname` parameter must already exist in the Routing Number table.

Output

```
ent-vflx-vmsid:id=123456abcdef123:idx0=rn45
```

ent-vlr-prof

Use this command to enter a Visitor Location Register (VLR) Profile for a mobile subscriber. A VLR-Profile entry helps in getting information required to locate the user while roaming and is subsequently used in VLR-ROAM table.

Parameters

vlr (mandatory)

VLR Number: Hexadecimal digit GT Number with variable length (1 to 16).

Range:

Hexadecimal digit string 1 to 16 digits

filter (optional)

Determines the category in which the number falls into.

Range:*whitelist**blacklist**graylist***Default:***graylist***ageofloc (optional)**

Determines whether the duration at which the location was last updated must be taken into consideration.

Range:*yes**no***Default:***no***lastact (optional)**

Determines whether last user activity must be taken into consideration.

Range:*yes**no***Default:***no***imeirtrv (optional)**

Determines whether the VLR challenge by the IMEI is enabled for the given profile entry's last user activity has to be taken into consideration.

Range:*yes**no***Default:***no***Example**

```
ent-vlr-prof:vlr=12345
```

```
ent-vlr-prof:vlr=4234:filter=blacklist
```

```
ent-vlr-prof:vlr=4234:filter=blacklist
```

```
ent-vlr-prof:vlr=12345:imeirtrv=no
```

Dependencies

VLR_PROF table must be accessible.

VLR parameter must be unique.

VLR parameter specified must neither be a subset of more than 2 existing vlrs present nor be a superset of more than 2 existing vlr entries in VLR-PROF table.

Output

```
ent-vlr-prof:vlr=9234:ageofloc=no:lastact=yes

ent-vlr-roaming

Use this command to enter a Visitor Location Register (VLR) roaming entry for a mobile subscriber. A VLR-Roaming entry uses existing entries for both new as well as old entries from vlr-prof table.

Parameters

oldvlr (mandatory)

VLR Number from which mobile subscriber has moved, hexadecimal digit GT number with variable length (1 to 16).

Range:

Hexadecimal digit string 1 to 16 digits

newvlr (mandatory)

VLR Number to which mobile subscriber has moved, hexadecimal digit GT number with variable length (1 to 16).

Range:

Hexadecimal digit string 1 to 16 digits

time (mandatory)

Duration for which the roaming must occur. Time is in minutes.

Range:
1-1440

Example

```
ent-vlr-roaming:newvlr=12345:oldvlr=56780:time=10
```

Dependencies

VLR_PROF table must be accessible.

VLR_DBMM table must be accessible.

VLR_ROAM table must be accessible.

OLDVLR as well as NEWVLR parameter length must be in the range 1 to 5 digits as per current restriction.

OLDVLR or NEWVLR parameter must be existing in VLR-PROF table

The entry should not be existing in VLR_ROAM table

OLDVLR as well as NEWVLR parameter must not be mentioned as blacklisted in vlr table.

Entries over 1000 are not allowed

Value for OLDVLR and NEWVLR parameter must not be same.

Output

```
ent-vlr-roaming:oldvlr=1234:newvlr=56545:time=20
```

```

flash-card

Use this command to load all flash images (GPL) supported by a specified card. This command performs the same functions as the `init-flash` and the `act-flash` commands.

Parameters

code (mandatory)

The GPL type to be loaded.

Range:

appr

Approved GPL

trial

Trial GPL

loc (mandatory)

Card address. The location of the card as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

force (optional)

This parameter is used to force the command to work on an IS-NR card. Links provisioned on the card are inhibited during command execution. The card and inhibited links are restored to their previous state when the command is completed.

Range:

yes

no

Default:

no

mode (optional)

This parameter converts the flash GPL of cards present in the Upgrade SET lists (RTRV-UPGRADE-CONFIG:DISPLAY=SETS)

Range:

migrate2

Flashes all the cards present in the Upgrade SETs that are running on BLMCAP and/or BLSLC32. Converts BLMCAP to BLDC32 and BLSLC32 to BLSLC932 respectively.

Cards running BLDC32 or BLSLC64 are not affected.

Uses the data in the SETs to decide which cards to migrate simultaneously. The migration sequence follows the same sequence as used by the Upgrade operations. The OAM cancels the links and boots the cards as the flash GPL changes occur. The use of SETs by the OAM ensures that sufficient signaling link capacity remains available at all times, and prevents disabling all links in the same linkset.

Example

```
flash-card:loc=1105:code=trial  
flash-card:loc=1105:code=appr:force=yes  
flash-card:mode=migrate2
```

Dependencies

Cards do not have to be provisioned to use the `flash-card` command. However, if the specified card is provisioned and not inhibited, use of the `force` parameter is required.

The specified card locations must be running a flashable software image.

This command cannot be used to load flash images for MUX cards. Use the `init-flash` command.

If the even-numbered E5-TDM (1114,1116) is specified, the flash occurs on the odd-numbered E5-MCAP running OAM (1113,1115).

The specified card location cannot be the active E5-MASP (either the active E5-MCAP or the active E5-TDM).

No other action command can be in progress when this command is entered.

The card specified in the location parameter must be present and able to communicate over the IMT. The card does not have to be provisioned in the database.

If the card is already running the specified code load, it cannot be loaded by this command.

This command cannot be entered if an IMT Rate Change sequence is in progress.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

The specified card must be present and able to communicate over the IMT.

A card that is already running the specified code load cannot be reflashed using the `force` parameter. The `act-flash` and `init-flash` commands must then be used to reload the same code level.

Bug 37894432 allows the customers to flash their spare SM8GB on BLMCAP to BLDC64 flash with `init-flash` command. That change is not applicable to `flash-card`.

Output

```
flash-card:code=appr:force=yes:loc=1112
```

Command Accepted - Processing

```

format-disk

Use this command to format and initialize a removable drive or standby Terminal Disk Module (TDM).

Note

The `format-disk` command leaves the disk unusable until the `chg-db` and `copy-gpl` commands are entered.

Parameters

type (mandatory)

The type of drive to format.

Range:

fixed

The standby fixed disk on the standby TDM

meas

The removable measurement drive

system

The removable system drive (latched recessed USB port on the MASP card).

usb

The flush-mounted (not-latched) USB port on the MASP card.

force (optional)

This parameter provides some protection against data loss due to reformatting a used system removable drive.

Range:

yes

no

Default:

no

loc (optional)

The location of the disk that is being formatted.

Range:

1114

The TDM

1116

The TDM

1113

The latched USB port

1115

The latched USB port

low (optional)

This parameter provides control over whether a low-level format will be performed on the target disk. Specifying `low=no` can be used to decrease formatting time.

Range:

yes

no

Default:

yes

prtnggrp (optional)

Partition group. The disk partition group to be formatted. Specifying the inactive group is relevant only when `type=fixed` is specified.

**Caution**

Do not enter the `format-disk:prtnggrp=inactive` command unless directed to by the Customer Care Center to avoid possible loss of a previously archived software release.

Range:

active

inactive

Default:
active

Example

```
format-disk:type=system
```

```
format-disk:type=meas:force=yes
```

Dependencies

The type=fixed parameter must be specified before the prtnggrp parameter can be specified.

If the prtnggrp parameter is specified, then the low=no parameter must be specified.

Measurements collection must be inhibited during execution of this command. If measurements are not inhibited, this command cannot be executed.

- Do not enter the chg-measopts:collect=on command while the format-disk command is in progress. This results in read and write errors, because the standby disk is not accessible.
- Do not enter the format-disk command until the 30 minute measurements processing or the midnight measurements processing has completed, because inhibiting measurements during these periods results in the loss of measurement data for the period being processed.

If a removable flash drive that is inserted into the latched USB port contains EAGLE data, then the force=yes parameter is required.

If a plug-in flash drive that is inserted into the flush-mounted USB port contains EAGLE data, then the force=yes parameter is required.

If the medium that is being formatted contains system data, then the force=yes parameter is required.

The force=yes parameter must be specified if the drive to be formatted is recognized as a system removable drive. This parameter is optional if the drive is not recognized as a system removable drive. Only drives that have a **dms.cfg** file are recognized as system removable drives.

A removable drive must be inserted and made ready before the type=meas or type=system parameter can be specified in the command.

If the force=yes parameter is specified, the disk should not require low-level formatting, and the format=no parameter should be specified.

The card with the standby OAM must be available when this command is entered.

The standby fixed disk could not be accessed. There could be a hardware problem.

The active fixed disk could not be accessed. There could be a hardware problem.

The source and destination disks are not compatible. There could be a hardware problem.

The system cannot determine the capacity of the disk that is being formatted.

Refer to *Database Administration - System Management User's Guide* for detailed instructions to resolve this issue.

The standby fixed disk contains security log entries that have not yet been uploaded. Upload the log entries before formatting the disk to avoid loss of log data.

The OAMHC GPL version that is running in the active OAM card location must be the same GPL version that is running in the standby OAM card location.

OAM Measurements collection cannot be in progress when this command is entered.

A value of 1114 or 1116 must be specified for the `loc` parameter before the `type=fixed` parameter can be specified.

An E5-MCAP card must be installed before the `type=usb` parameter can be specified.

The OAM card must be able to read the media being formatted.

The `format-disk` command cannot be issued when `SFAPP(P)->OAM sync` is ON.

Notes

The `low=no` parameter should be specified when upgrading a spare TDM. The `low=yes` parameter should be specified when there is a suspected hardware problem.

When the `type=meas` parameter is specified, a measurements removable drive is built.

When the `type=system` parameter is specified, a system removable drive is built.

A system removable drive can contain only GPLs and the database, not measurement data. After formatting, the drive does not contain any data, but can be used as the destination disk of the `copy-gpl` and `chg-db:action=backup:dest=remove` commands. The `copy-gpl` command copies all approved GPLs from the fixed disk on the active TDM to the system removable drive, providing a backup copy of the approved GPLs. The `chg-db:action=backup:dest=remove` command copies the database from the current partition of the fixed disk on the active TDM to a system removable drive, providing a backup copy of the database.

A measurements removable drive can contain only measurement data, not database information and GPLs. After formatting, the drive does not contain any data, but can be used as the destination disk of the `copy-meas` command. The `copy-meas` command copies all measurement data from the fixed disk on the active TDM to a measurements removable drive for offline processing of the measurement data.

The database audit and GPL audit facilities are automatically disabled during execution of this command. When this command has completed (successful or not), the database and GPL audit facilities are automatically re-enabled.

All commands that affect the database are disallowed for the duration of the command. Attempts to use such commands are rejected, and an error message is displayed explaining that the command has been rejected.

During the upgrade process, files made obsolete by the upgrade process are deleted, freeing up disk space.

If the `format-disk` command is initiated and the standby OAM initialization is not complete, command processing is delayed. If standby initialization fails, the command proceeds to allow

the standby TDM to recover from a previous format-disk or copy-disk failure. In such cases, the following messages appear:

```
Standby MASP has not finished initializing - please wait...
```

```
Standby MASP initialization timed out - continuing...
```

The *dms.cfg* file on either the active TDM or a system formatted removable drive is used by the format-disk command when formatting the target disk. The location of the *dms.cfg* file cannot be specified by the format-disk command. The value of the type parameter is used to determine the target disk to format and the location of the *dms.cfg* file on which to base the format. [Table 4-37](#) shows the location of the *dms.cfg* file based on the value of the type parameter for the format-disk command.

Table 4-37 DMS.CFG File Location for format-disk Command

Value of the type Parameter	Target Disk (Card Location)	Location of the DMS.CFG File
<i>fixed</i>	Standby TDM (1114 or 1116)	Latched USB Port (1113 or 1115)
<i>system</i>	Latched USB Port (1113 or 1115)	Active TDM (1114 or 1116)
<i>meas</i>	Latched USB Port (1113 or 1115)	Active TDM (1114 or 1116)

The format-disk command can create a maximum disk partition size of 2047 Mbytes, based on a 16-bit cluster size. A cluster is composed of 64 512-Kilobyte sectors. The physical capacity of the disk being formatted determines the formatted size of the disk and the number of partitions created on the disk.

[Table 4-38](#) shows the format capacities of each type of disk used on the system and the number of partitions created on each disk.

Table 4-38 Disk Format Capacity

Target Disk Type	Disk Location	Target Capacity	Number of Partitions	Formatted Size of Partition
Latched USB Port	1113 or 1115	2 Gigabytes	1	1.9 GB
TDM	1114 or 1116	540 Mbytes	1	507 Mbytes
TDM	1114 or 1116	2 Gigabytes	1	2014 Mbytes
TDM	1114 or 1116	4 Gigabytes	2	2047 Mbytes

inh-alm

Use this command to inhibit the reporting of alarms for the given device. Inhibited alarms will not generate unsolicited output or cause alarm indicators to be turned on. All `rept-stat-xxx` commands continue to display the alarm with an indication that the device has its alarms inhibited.

The frame alarm LEDs are off for the inhibited alarm. This command does not affect the alarm counts on the VT320 banner. The fourth box on the right of the VT320 Control Area indicates the number of devices in the system with inhibited alarms.

Parameters

① Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

dev (mandatory)

Device. The device where the reporting of alarms is to be inhibited.

Range:

applsock

IP gateway application socket

as

IP gateway Application Server

card

Cards in the database

cdt

Customer defined troubles

clock

System clock

dlk

IP ports on the VSCCP, EROUTE, MCP, and FC-capable cards

e1port

E1 port on E5-E1T1-B cards

enet

Ethernet

ls

Linksets

lsmsconn

Communication link between the LSMS and the EMS

route

Route

rtx

Exception Route

slk

Signaling links

t1port

T1 port on E5-E1T1, or E5-E1T1-B cards

tps

TPS subsystem

trm

Terminals

asname (optional)

Gateway Application Server name. Used with the dev=as parameter to inhibit alarms for the named Application Server.

Range:

aaaaaaaaaaaaaaaa

up to 15 alphanumeric characters; the first character must be a letter

cic (optional)

Starting Circuit Identification Code. Used with the ecic parameter to define the CIC range that is used as an exception routing criterion for the specified exception route.

Range:

0 - 16383

dpc (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dPCA

Range:

p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*-

The asterisk value (*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni* = 000 is not valid.

When *chg-sid:pctype=ansi* is specified, *nc* = 000 is not valid if *ni* = 001–005.

When *chg-sid:pctype=ansi* is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

dpc/dPCA/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination Point Code

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p*-, *ps*-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

dpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point*. The *prefix* subfield indicates a private point code.

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code.

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

dur (optional)

Duration. The period for which the alarms are inhibited.

Range:***perm***

permanent inhibition of an alarm

temp

temporary inhibition of an alarm

timed

inhibition of an alarm for a specified duration

Note

If the `dur=temp` parameter is specified, then an alarm inhibit lasts as long as the alarm is present. If the system boots or switches over, then the alarm inhibit is removed. If the `dur=perm` parameter is specified, then the alarm inhibit remains after the alarm is cleared or is no longer present, and after a boot/switchover. The `dur=timed` parameter behaves the same as the `dur=perm` parameter, but for a set time period.

Default:

perm

e1port (optional)

Port ID. The E1 port on the specified E1 card.

This parameter is mandatory if the `dev=e1port` parameter is specified.

Range:

1 - 8

ecic (optional)

Ending Circuit Identification Code. Used with the `cic` parameter to define the CIC range that is used as exception routing criteria for the specified exception route.

Range:

0 - 16383

edate (optional)

Expiry date. The date on which a timed alarm inhibit expires, at the time specified in the `etime` parameter value.

Note

This parameter is valid and required when the `dur=timed` parameter is specified.

Range:

101 - 991231

Specify the date in the format of *year*, followed by *month*, followed by *day* (*yyymmdd*).

etime (optional)

Expiry time. The time at which a timed alarm inhibit expires, on the date specified in the `edate` parameter value.

This parameter is valid and required when the `dur=timed` parameter is specified.

Range:

0 - 2359

Specify the time in the format of *hour* followed by *minute* (*hhmm*).**force (optional)**

Allows critical alarms to be inhibited on a device.

This parameter is mandatory if the `lvl=crit` parameter is specified.The `critalmnh` STP option must be turned on before this parameter can be specified.**Range:***yes**no***Default:***no***id (optional)**

Identification number of the customer-defined trouble. Customer-defined troubles 1 - 4 are generated critical alarms and cannot be specified as values for this parameter.

Range:

5 - 16

ilsn (optional)

Incoming Link Set Name. The name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range:

aaaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters

link (optional)Signaling link on the card specified in the `loc` parameter.**Synonym:***port***Range:***a, b, a1 - a31, b1 - b31**a1, a2, b1, b2* — `dev=lsmsconn`*a, b, a1-a31, b1-b31* — `dev=slk` for an E5-E1T1, or E5-E1T1-B*a1, b1* — `dev=dlk` for an FC-capable card*a, b* — `dev=enet`**loc (optional)**

The card location as stenciled on the shelf of the system.

Range:*1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118*

lsn (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

lvl (optional)

The alarm severity level (critical, major, or minor).

Range:

crit

majr

minr

Default:

majr

opc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

opca

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0–7

area—000–255

id—0–7

The point code 0-000-0 is not a valid point code.

opc/opca/opci/opcn/opcn24/opcn16 (optional)

Origination point code.

opci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0–7

area—000–255

id—0–7

The point code 0-000-0 is not a valid point code.

opcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

opcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

si (optional)

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

Range:

0 - 15

sname (optional)

Gateway application socket. Used with the `dev=app lsock` parameter to inhibit alarms for the named application socket.

Range:

aaaaaaaaaaaaaa

1 to 15 alphanumeric characters

t1port (optional)

Port ID. This parameter is mandatory if the `dev=t1port` parameter is specified.

Range:

1 - 8

trm (optional)

Terminal ID. The ID number of the terminal whose characteristics are to be retrieved and displayed.

Range:

1 - 40

Example

```
inh-alm:dev=route:dpc=1-1-1:dur=perm:lvl=crit:force=yes
```

```
inh-alm:dev=rtx:dpc=1-101-1:opc=4-4-4
```

```
inh-
```

```
alm:dev=route:dpc=1-1-1:dur=timed:lvl=crit:edate=050515:etime=2300:force=yes
```

```
inh-alm:dev=enet:loc=1201:port=a
```

```
inh-alm:dev=enet:loc=1101:port=a:dur=temp:lvl=minr
```

```
inh-alm:loc=1102:dev=dlk:port=a1
```

```
inh-alm:dev=rtx:dpcn16=121-10-15:opc16=121-10-16
```

Dependencies

This command is not allowed in upgrade mode.

The parameters that can be specified with the `dev` parameter vary, depending on the value specified for the `dev` parameter as shown:

- `dev=(any value)` — `dur` or `lvl`
- `dev=asname` — `as`
- `dev=dpc/dpca/dpci/dpcn/dpcn24/dpcn16` — `route`
- `dev=id` — `cdt`
- `dev=loc` — `card`, `dlk`, `e1port`, `slk`, `t1port`, `enet`
- `dev=lsn` — `ls`
- `dev=e1port` — `e1port`
- `dev=link (link=a, b)` — `dlk`, `slk`, `enet`
- `dev=link (link=a1, b1)` — `dlk` (For FC-capable cards)

- `dev=link (link=a, b, a1, a2, b1, b2, a3, b3)— slk`
- `dev=link (link=a1, a2, b1, b2)— lsmsconn`
- `dev=sname — applsock`
- `dev=t1port — t1port`
- `dev=trm — trm`

No other action command can be in progress when this command is entered.

The linkset specified by the `lsn` parameter must be equipped in the database.

This command will not execute while the signaling link is running either a Link Fault Sectionalization test or a Loopback test. An AST of LFS or LPBK must be cleared before signaling link alarms can be inhibited.

This command cannot be used to permanently inhibit XLIST point codes.

Before critical alarms can be inhibited, the STP option `criticalminh` must be enabled. The `chg-stpopts:criticalminh=yes` command enables this option.

Alarms cannot already be inhibited for the specified device.

The Device Alarm Inhibit table is corrupt or cannot be found.

The STP Options table is corrupt or cannot be found.

If the `lvl=crit` parameter is specified, the `force=yes` parameter must be specified.

When the `dev=card` parameter is specified, the `loc` parameter must be specified.

When the `dev=dlk` parameter is specified, the `loc` parameter must be specified.

When the `dev=slk` parameter is specified, the `loc` parameter and the `link` parameter must be specified.

When the `dev=e1port` parameter is specified, the `loc` and `e1port` parameters must be specified.

When the `dev=t1port` parameter is specified, the `loc` and `t1port` parameter must be specified.

When the `dev=ls` parameter is specified, the `lsn` parameter must be specified.

When the `dev=trm` parameter is specified, the `trm` parameter must be specified.

When the `dev=cdt` parameter is specified, the `id` parameter must be specified.

When the `dev=lsmsconn` parameter is specified, the `link` parameter must be specified.

When the `dev=route` parameter is specified, the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter must be specified.

When the `dev=applsock` parameter is specified, the `sname` parameter must be specified.

If the `dev=as` parameter is specified, the `asname` parameter must be specified.

If the `sname` parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

If the `dev=slk` or `dev=dlk` parameter is specified, the specified link must exist in the database.

The card location that is specified in the `loc` parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be on before the `dev=rtx` parameter can be specified.

Permanent alarm inhibit is not allowed on the cluster PC if either the cluster or a member PC of the cluster is already alarm inhibited.

When the `dur=timed` parameter is specified, the `edate` and `etime` parameters must be specified.

If the `dur` parameter has a value other than *timed*, the `edate` and `etime` parameters cannot be specified.

The `edate` parameter value must be a date equal to or later than the current system date. If the current system date is specified, then the `etime` parameter value must be a time later than the current system time. If a date later than the current system date is specified, then the `etime` parameter value can be any valid time in the format *hhmm*.

This command cannot be used to change the level of inhibition on a device.

If the `dev=enet` parameter is specified, then the `loc` and `port` parameters must be specified.

The card specified by the `loc` parameter must be provisioned with an IPS, MCP, EROUTE, VSCCP, IPSP, IPLIM, IPLIMI, SS7IPGW, or IPGWI application.

The value specified for the `e1port/t1port` parameter must be in the range 1-8.

The `link` parameter must be valid for the selected device type.

The J7 Support feature must be enabled before the `opc16/dpc16` parameters can be specified.

Notes

If critical alarms are inhibited, all alarms (critical, major, and minor) are disabled. Likewise, if major alarms are inhibited, both major and minor alarms are disabled.

The `dur` parameter allows alarms to be inhibited on a temporary basis. If a device has its alarms temporarily disabled, the device's alarms are automatically enabled after the alarm clears.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Output

```
inh-alm:dev=route:dpc=1-1-1:dur=perm:lvl=crit
```

inh-card

Use this command to change the state of the card from in-service normal (IS-NR) to Out-of-Service Maintenance-Disabled (OOS-MT-DSBLD). A user can then test the card or physically remove it from the shelf.

Parameters

e loc (optional)

End location. The location of the last card of a range of cards to be inhibited.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

force (optional)

Force indicator. This parameter is required if:

- The specified card is the last card supporting a linkset, SCCP subsystem, MPS-to-Service Module connection, E1, T1, Measurements Platform subsystem, or GLS
- The TDM contains a security log with un-uploaded entries or any other TDM process in progress
- The specified E5-E1T1-B card is in channel bridging mode
- The specified card has the last in-service SEAS terminal configured.

Range:

yes

no

Default:

no

Note

If the **force** parameter is specified in the command along with the **s loc** and **e loc** parameters, then the **force** parameter's value is applied to all the cards within the **s loc-e loc** range, including **s loc** and **e loc**.

loc (optional)

Card address. The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

sloc (optional)

Start location. The location of the first card of a range of cards to be inhibited.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
inh-card:loc=1101
```

```
inh-card:loc=1201:force=yes
```

```
inh-card:sloc=1101:eloc=1111
```

```
inh-card:sloc=1101:eloc=1111:force=yes
```

Dependencies

No other action commands can be in progress when this command is entered.

TDM and MDAL cards cannot be inhibited. E5-APP-B cards and Telco Switches cannot be inhibited. Card locations 1114, 1116, 1117, xx09, and xx10 cannot be specified as values for the loc parameter.

If the card contains signaling or data links, all links must be out of service (OOS-MT-DSBLD) before the card can be inhibited.

If the card is type LIME1, all signaling links providing timeslots serviced by the E1 interfaces assigned to the card must be deactivated, unless force=yes is specified.

If the card is type LIMT1, all signaling links providing timeslots serviced by the T1 interfaces assigned to the card must be deactivated, unless force=yes is specified.

The shelf and card must be equipped.

If the specified card is the only in-service MPS-Service Module, the force=yes parameter must be specified.

If inhibiting the Service Module card would cause less than 80% of the in-service normal (IS-NR) LIM cards to have VSCCP service (i.e., cause the system to enter an unstable loading mode), the force=yes parameter must be specified.

If the Integrated GLS feature is turned OFF and the specified card is only GLS card remaining, then the force=yes parameter is required.

The card that is specified by the loc/sloc/eloc parameter cannot be running the active OAM.

If the specified card has the last in-service SEAS Terminal configured, then the force=yes parameter must be specified to inhibit the card.

The card location (loc) must be within the allowed range.

The standby fixed disk cannot be initialized while un-uploaded security log entries exist.

The loc parameter cannot be specified with the e loc and s loc parameters.

Either the loc parameter or the e loc and s loc parameters must be specified.

The e loc and s loc parameters must be specified together in the command.

The s loc parameter value cannot be greater than the e loc parameter value.

The inh-card command cannot be issued when SFAPP(P)->OAM sync is ON.

This command cannot be entered when CAT2 IPSM to OAM syncing is in progress.

Notes

The function of this command is the same as the rmv-card command.

When this command is entered, the card is initialized and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

Caution

This command can be used to disable Measurements Platform measurements collection after the collection function has been enabled with the chg-measopts:platformenable=on command. To disable collection, ALL MCPM cards in the system must be inhibited. THIS CAN RESULT IN LOSING ALL PAST MEASUREMENT DATA ON THE CARDS. Use the alw-card command to enable measurements collection after the MCPM cards have been inhibited.

When an IPSM card is inhibited, the active SEAS terminals are set to the state OOS-MT/FLT.

Output

```
inh-card:loc=1101
```

```
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Card has been inhibited.

inh-imt

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. This command removes the IMT bus from service.

Caution

Use this command only when directed by the Customer Care Center.

Parameters

bus (mandatory)

IMT bus to be inhibited

Range:

a, b

force (optional)

This parameter forces inhibition of a specified bus where an IMT Rate change sequence is in progress.

Range:

yes

no

Default:*no***Example**`inh-imt:bus=a``inh-imt:bus=a:force=yes`**Dependencies**

Valid IMT bus entries are "A" or "B".

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.

This command cannot be entered during an IMT Fault Isolation Test or an Extended Bit Error Rate Test (BERT).

The `force=yes` parameter must be specified to inhibit a bus where an IMT Rate Change sequence is in progress.

If an IMT Rate Change sequence is in progress on the alternate bus, then this command cannot be entered.

Notes

Cards not connected to the other IMT bus will reinitialize.

All traffic is rerouted to the alternate IMT bus.

The function of this command is the same as the `rmv-imt` command.

Output`inh-imt:bus=a`

```
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Inhibit IMT Bus A command issued
```

```

inh-map-ss

Use this command to shut down (inhibit) a mated application subsystem. Currently, the AIQ, ATINPQ, EIR, INP, INPQS, LNP, and V-Flex and subsystems can be inhibited. The specified subsystem attempts a coordinated shutdown. If the coordinated shutdown fails, a UIM is issued indicating the shutdown failed. If the `force` parameter is specified, the subsystem is forced to shut down, and a coordinated shutdown is not performed.

Parameters

ssn (mandatory)

The AIQ, ATINPQ, EIR, INP, LNP or V-Flex subsystem number.

Range:

2 - 255

force (optional)

This parameter forces the shutdown of the AIQ, ATINPQ, EIR, INP, LNP or V-Flex subsystem.

Range:

yes

no

Default:

no

Example

`inh-map-ss:ssn=10`

`inh-map-ss:ssn=10:force=yes`

Dependencies

The EIR, INP, LNP, or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before this command can be entered.

No other action command can be in progress when this command is entered.

The specified `ssn` parameter value must represent the AIQ, ATINPQ, EIR, INP, LNP or V-Flex subsystem.

The EAGLE must be configured with at least one card running the SCCP application.

Notes

If the LNPQS subsystem is disabled, any GTT requiring Message Relay is also disabled because they both use the same database. This causes the EAGLE to generate a TFP for the EAGLE CPCs. Traffic is then routed to the mate. If both Message Relay GTT and non Message Relay GTT use the same CPC, this could affect the GTT.

Table 4-39 Route Set Test When LNP is Offline

Network Management	Concerned PC	Network Management
RSP	CPC	TFA concerning CPC

Table 4-39 (Cont.) Route Set Test When LNP is Offline

Network Management	Concerned PC	Network Management
RSP	LNP CPC	None
RSP	TPC	TFA concerning TPC
RSR	CPC	TFA concerning CPC
RSR	LNP CPC	TFP concerning LNP CPC
RSR	TPC	TFA concerning TPC

[Table 4-40](#) shows what actions the system takes when LNP is offline and a message arrives requiring LNP. This table assumes that SCCP cards are available.

Table 4-40 Receiving Messages when LNP is Offline

Routing Indicator in Incoming Message	DPC	Result of GTT	Message Handling	Network Management
rt-on-gt	Capability PC	rt-on-ssn, LNP subsystem	Reroute to mate	TFP concerning CPC
rt-on-gt	True PC	rt-on-ssn, LNP subsystem	Reroute to mate	None
rt-on-gt	Capability PC	Message Relay required	Generate UDTS	TFP concerning CPC
rt-on-gt	True PC	Message Relay required	Generate UDTS	None
rt-on-ssn	Capability PC	Not applicable	Generate UDTS	None
rt-on-ssn	True PC	Not applicable	Generate UDTS	SSP concerning True PC

Output

```
inh-map-ss:ssn=30
```

```
rlghncxa03w 04-02-24 10:37:22 EST EAGLE5 31.0.0
Inhibit map subsystem command sent to all SCCP cards.
Command Completed.

inh-slk

Use this command to prevent message signal units (MSU) from being transmitted on a specified, previously uninhibited signaling link.

Note

The signaling link's inhibited status is not preserved across a LIM reboot.

Parameters

link (mandatory)

The signaling link on the card that is specified in the `loc` parameter. The links can be specified in any sequence or pattern.

Synonym:

port

Range:

a, b, a1 - a63, b1 - b63

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have a location specified in the `loc` parameter.

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
inh-slk:loc=1307:link=b
```

Dependencies

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- E5-E1T1-B, card running the SS7ANSI or CCS7ITU application
- E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET-B card running the IPLIMI, or IPSG application
- SLIC card running the IPSG application

The card must contain signaling links.

The signaling link must be equipped in the database.

If an IPSP-M3UA signaling link is used, then this command cannot be entered.

This command is not valid for E5-ENET-B cards with IPGWI links.

If an ATM card is used, then a valid value must be specified for the `Link` parameter:

- `a-a1`, `b`—E5-ATM-B card running the ATMANSI or ATMITU application

This command is not supported for links associated with J7 APCs.

This command is not valid for IPSP-M3UA signaling links.

Notes

If the link is already inhibited, the system does not execute the command.

If the link is aligned, it attempts to perform a changeover to alternate links. If it is not aligned, it cannot carry traffic.

If the link is the last link in the linkset, or if the node assigned to the link is inaccessible by another route, then the SS7 changeover procedure cannot occur, the inhibit request is denied, and UIM 1150 is issued. The UIM can be retrieved from the logs or from a terminal with the appropriate TRM settings.

If the `inh-slk` command is followed by the `init-card` command, the inhibition of the signaling link is not preserved after the `init-card` command completes.

The `inh-slk` command might time out if a far-end remote does not respond to the inhibit message.

Output

```
inh-slk:loc=1301:link=a
```

```
rlghncxa03w 05-01-07 11:11:28 EST EAGLE5 33.0.0
Inhibit Link message sent to card

inh-trm

Use this command to set the primary state of a serial port to OOS-MT-DSBLD . It sets the secondary state to MANUAL . The serial port is not available to perform service functions. There is no outgoing traffic from the serial port, and all incoming traffic is ignored.

Parameters

trm (mandatory)

The ID of serial port to be inhibited

Range:

1 - 40

force (optional)

This parameter forces the removal of a specified terminal, even if it is last in-service SEAS terminal available.

Range:

yes

no

Default:

no

Example

```
inh-trm:trm=5
```

```
inh-trm:trm=1:force=yes
```

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified for the `trm` parameter.

The terminal specified by the `trm` parameter must be equipped.

This command cannot be used to inhibit the terminal from which the command is entered.

The `force=yes` parameter must be specified to inhibit the last in-service SEAS terminal.

Notes

When inhibiting an already inhibited terminal, a warning message is echoed to the scroll area, but no action is taken.

Output

```
inh-trm:trm=5
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
```

```
Inhibit message sent to terminal

init-card

Use this command to cause a soft reset of a card. It has the same result as a hard reset (card boots, application, and data load), except that connect status is not affected; that is, if a card is not connected, it stays that way.

When the command is issued, there is a 10-second wait before the card is reset. This wait period is intended to ensure that all database updates are complete before the card is reset.

Caution

Resetting more than 8 Service Module cards at once may result in an extended reload time for the Service Module cards.

Parameters

appl (optional)

Application. The type of application residing on the card.

Caution

Because the `appl` parameter causes all LIMs running the assigned application to reload, it should be used only during periods of low traffic.

Range:*xyyyyyyy*

1 alphabetic character followed by up to 6 alphanumeric characters. Valid applications are:
all—Used to reset EAGLE cards. Cannot be specified unless *serial=yes* is also specified.

atmansi—Used by E5-ATM-B cards to support high-speed ATM signaling links and T1 functions.

atmitu—Used by E5-ATM-B cards to support E1 high-speed signaling links and E1 functions.

ccs7itu—Used by E5-E1T1-B cards for ITU-TSS MTP functions.

deirhc—Used by E5-SM8G-B and SLIC cards to support the S13/S13' EIR feature.

enumhc—Used by E5-SM8G-B and SLIC cards to support the ENUM application.

eroute—Used by E5-ENET-B cards for EAGLE 5 Integrated Monitoring Support functions.

gls—Used by E5-TSM cards for downloading gateway screening to LIM cards and Service Module cards.

ipgwi—Used by E5-ENET-B cards for point-to-multipoint IP connectivity for ITU point codes. The system allows a maximum of 125 cards to be assigned the IPGWI application.

iplimi—Used by E5-ENET-B cards for point-to-point IP connectivity for ITU point codes.

ips—Used by E5-IPSM and E5-ENET-B cards for the IP User Interface feature.

ipsg—Used by E5-ENET-B cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA.

mcp—Used by E5-MCPM-B cards for the Measurements Platform feature

oam—Used by both MASP Cards running GPLs that support the OAM application

siphc—Used by E5-SM8G-B and SLIC Cards to support SIP application

ss7ansi—Used by E5-E1T1-B cards for the MTP functions

ss7ipgw—Application software for point-to-multipoint IP connectivity. The system allows a maximum of 125 cards to be assigned the SS7IPGW application.

vsccp—Used by Service Module cards to support EPAP-based features and LNP features. If no EPAP-based features or LNP features are turned on, and a Service Module card is present, the *vsccp* application processes normal GTT traffic.

Default:

The application assigned to the card

data (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card.

Note

The LNP feature or an EPAP-based feature must be turned on or the ATINP feature must be enabled before this parameter can be specified. This parameter applies only to Service Module cards that (1) run the VSCCP application and contain an RTDB.

Range:***refresh***

Causes data to be reloaded to the specified card.

persist

Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE perform a warm restart of the requested cards. The EAGLE performs various checks to ensure that all conditions necessary to initiate the warm restart are in place.

The force parameter is required if all of the specified cards do not meet the warm restart requirements. During the card initialization and loading sequence, a warm restart is performed for all cards that meet the warm restart conditions.

Default:*refresh***force (optional)**

Force indicator. Enables the command to be processed under the following conditions:

- If serial=yes and all cards of the specified GPL type are not IS-NR or OOS-MT-DSBLD.
- If initclk=yes and the TDM card specified in the loc parameter is the only good HS clock source that is currently active. A temporary clock outage will occur.
- If initclk=yes and appl=oam is specified (bitfiles on both TDMs will be initialized). A temporary clock outage will occur.

Range:*yes**no***Default:***no***initclk (optional)**

Initialize TDM Bitfile indicator. If TDM reload would cause a system clock outage, the initclk parameter cannot be specified unless force=yes is also specified.

 Caution

The resulting clock outage will probably cause loss of traffic on all links.

The following scenarios will cause such clock outages:

- Simplex MASP configuration (a system with a single TDM).
- Bad clock status on the remaining TDM.

Range:*yes, no*

If initclk=yes is specified with a single TDM card location, the bitfile for the specified TDM reloads.

If initclk=yes is specified with appl=oam and force=yes, the bitfile reloads on both TDMs.

loc (optional)

Card address. The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1116, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2301 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

When the `initclk` parameter is not specified, the listed card locations are valid.
When the `initclk` parameter is specified, card locations 1113, 1114, 1115, and 1116 are valid.
Entering locations 1114 and 1116 results in the same action as entering 1113 and 1115.

Default:

All valid card locations are initialized.

perdata (optional)

Persist a particular DB type on all cards (irrespective of the card's type).

Range:

all

Persist all data (GTT/MPS) that can be persisted on the card

mps

Persist only MPS data on the card that supports persistence of MPS DB

gtt

Persist only GTT data on the card that supports persistence of GTT DB

Default:

all

 Note

The `perdata` parameter can only be specified where `data=persist` is given.

prtnggrp (optional)

Partition group. The disk partition group that is used as the source for downloading the appropriate GPL.

A value of 1113 or 1115 must be specified for the `loc` parameter before this parameter can be specified.

Range:

active

the active partition group

inactive

the inactive partition group

Default:

active

serial (optional)

Controls the manner in which cards are initialized.

Range:

yes

cards of the specified APPL type are initialized one at a time

no

cards of the specified APPL type are initialized simultaneously

Default:*no***type (optional)**

SM Type. The type of RTDB data that can be loaded on an E5-SM8G-B or SLIC card.

Range:***dn***

initialize SM cards running the SIP64, ENUM64 or SCCP64 gpl, with SM type DN.

elap

initialize SM cards running the SIP64 or SCCP64 gpl, with SM type ELAP.

epap

initialize SM cards running the SIP64, ENUM64, or SCCP64 gpl, with SM type EPAP.

gtt

initialize SM or SLIC cards running the SCCP64, GTT enabled IPSG gpl, with SM type GTT.

imsi

initialize SM cards running the SCCP64 gpl, with SM type IMSI.

nosccp

initialize the SLIC card running the IPSG application having no GTT functionality.

Default:*none***Example**

```
init-card:loc=1113:prtnggrp=inactive
init-card:loc=1101:data=persist
init-card:loc=1113:initclk=yes
init-card:appl=oam:initclk=yes:force=yes
init-card:appl=ipsg
init-card:type=epap
init-card:appl=deirhc
init-card:appl=enumhc
init-card:appl=ipsg:type=gtt
init-card:appl=ipsg:type=nosccp
init-card:appl=ipsg:data=persist:perdata=gtt
```

Dependencies

The shelf and card must be equipped.

The *loc* or *appl* or *type* parameter must be specified in the command. The parameters cannot be specified together in the command, except for when *appl=ipsg*.

This command cannot be entered when CAT2 IPSM to OAM syncing is in progress.

Note

An exception to this MTT is when `appl=ipsg`. In this case, it is possible to specify the 'type' parameter. The legal values of the 'type' parameter with `appl=ipsg` are `type=gtt` (Initialize all GTT-enabled IPSC cards) and `type=nosccp` (Initialize all GTT-disabled IPSC cards).

The following card locations (`loc` parameter) are not allowed for this command: 1117, 1118, and all `xy09` and `xy10` card locations (where `x` is the frame and `y` is the shelf).

If the `loc` and `initclk` parameters are specified, the `loc` parameter value must be card location 1113 or 1115. If the `appl` and `initclk` parameters are specified, the `appl` parameter value must be `oam`.

The `force` parameter must be specified for the cards that are not in the In-service Normal state.

The `serial` parameter is valid only when used with the `appl` parameter.

The `appl=all` parameter can be specified only when the `serial=yes` parameter is also specified.

A valid value must be specified for the `appl` parameter.

The `initclk`, `appl`, and `data` parameters must be specified before the `force` parameter can be specified.

The `data` parameter is valid only for SCCP card locations or GPLs/MPS database (VSCCP) card locations or GPLs/SIP/ENUM card locations, GPLs, or GTT-enabled IPSC card locations.

The card location (`loc`) must be within the allowed range.

The specified card must exist in the card database and must be a logical processing element.

An EPAP-based feature or an LNP feature that is warm-restart-capable must be enabled, or SIP must be enabled, or at least one ENUM card or one GTT-enabled IPSC card must be present before this command can be entered with the `data=persist` parameter.

If the `serial=yes` parameter is specified, the `appl` parameter must specify a network type application value or must be equal to `all`.

A primary Service Module card must be provisioned.

The command cannot be executed if system maintenance is in progress.

The A-Port, EIR, G-Flex, G-Port, INP, IS41 GSM Migration (IGM), LNP ELAP Configuration, PPSMS, Prepaid IDP Relay Query (IDP Relay), or V-Flex feature must be turned on, or the ATINP feature must be enabled before the `data` parameter can be specified.

If a removable drive is inserted in the system, then the `prtngrp=inactive` parameter cannot be specified.

The `loc` parameter must be specified with a value of 1113 or 1115 before the `prtngrp` parameter can be specified.

If an Extended BERT is running, the `appl` parameter cannot be specified in this command to initialize multiple cards.

If type specified is `epap`, `elap` or `gtt` for VSCCP, then the Dual ExAP Config, SIPNP feature must be enabled. For `appl=ipsg` and `type=gtt`, no such features must be enabled.

If type specified is *imsi* or *dn* for VSCCP, then the EPAP Data Split feature must be ON.

The data parameter can only be specified for VSCCP/SIPHC/IPSG Application cards.

Note

The data parameter is valid only for SLIC IPSG cards and not for ENET/ENET-B IPSG cards.

If the IPSG application is running with SLIC H/W on the location specified by the *loc* parameter, then *type=gtt* and *type=nosccp* are the only valid values of the *type* parameter. For any other APPL, *type=nosccp* is an invalid value of the *type* parameter.

The *perdata* parameter is only valid when *data=persist* and the *loc/appl* parameter is specified. The *type* parameter with *perdata* is redundant and not allowed.

Note

- The card at the specified *loc* must either run the IPSG32 GPL or VSCCP application
- The card *appl* specified must either be IPSG or VSCCP

With IPSG/VSCCP application, the *type* parameter is allowed. For *appl=ipsg*, *type* can be *nosccp/gtt* only. And, for *appl=vscpp*, *type* can be *dn/imsi/epap/elap/gtt* only.

The *init-card* command cannot be issued when SFAPP(P)->OAM sync is ON.

Notes

The TDM card has a processor but no application.

If the *type* specified is *gtt* in the *init-card* command and only a GTT-enabled IPSG card is present in system, then the MTT 3115 will not be observed, as there is no dependency of the Dual ExAP feature on GTT-enabled IPSG card.

Table 4-41 Using init-card Parameters

SCENARIO	INIT COMMAND
Cold boot all VSCCP cards	<code>init-card:appl=vscpp</code>
Cold boot all GTT-enabled IPSG cards	<code>init-card:appl=ipsg:type=gtt</code>
Cold boot all GTT-disabled IPSG cards	<code>init-card:appl=ipsg:type=nosccp</code>
Warm boot all GTT-enabled IPSG cards	<code>init-card:appl=ipsg:type=gtt:data=persist:perdata=gtt</code>
Warm boot a GTT-enabled IPSG card location (e.g., 1106)	<code>init-card:loc=1106:data=persist:perdata=gtt</code>
Warm boot all cards of the specified application that have ExAP/DN/IMSI data (e.g., vscpp)	<code>init-card:appl=vscpp:type=dn:data=persist:perdata=mps</code>

Table 4-41 (Cont.) Using init-card Parameters

SCENARIO	INIT COMMAND
Warm boot a card that has MPS and/or GTT data (e.g., 1106)	init-card:loc=1106:data=persist:perdata=all
Boot all IPSG cards and persist GTT data on all GTT-enabled IPSG cards	init-card:appl=ipsg:data=persist:perdata=gtt
Boot all SCCP cards and persist whatever data is on those cards	init-card:appl=vscpp:data=persist:perdata=all

init-ext-stats

Use this command to cause the HIPR2 cards to collect Extended Statistics for later retrieval.

Parameters**bus (optional)**

The IMT bus that contains the HIPR2 card where extended statistics are collected.

Range:***a***

collect statistics for HIPR2 cards on the A bus

b

collect statistics for HIPR2 cards on the B bus

both

collect statistics for HIPR2 cards on both buses

Default:

both

delay (optional)

The number of milliseconds to wait before collecting HIPR2 Extended Statistics.

Range:

0 - 10000

 Note

The specified value is automatically rounded to a 10 ms boundary.

Default:

0

eloc (optional)

The ending card location for a range of HIPR2 cards where extended statistics are collected.

Note

Statistics are collected from only valid In-Service Normal HIPR2 cards within the range.

Range:

1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110

Default:

6110

loc (optional)

The location of a single HIPR2 card where statistics are collected.

Range:

1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110

Default:

all HIPR2 cards within the range specified by the sloc and eloc parameters

sloc (optional)

The starting card location for a range of HIPR2 cards where extended statistics are collected.

Note

Statistics are collected from only valid In-Service Normal HIPR2 cards within the location range.

Range:

1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110

Default:

1109

Example

```
init-ext-stats
init-ext-stats:bus=a
init-ext-stats:sloc=1109:eloc=1110
init-ext-stats:loc=1109
```

Dependencies

The value specified for the loc or sloc and eloc parameters must indicate a valid card location. See the description of the desired parameter for a list of valid values.

The range specified by the sloc and eloc parameters must include an MUX card location.

The value specified for the `loc` parameter must be a valid MUX card location or the range specified by the `sloc` and `eloc` parameters must include an MUX card location.

The value specified for the `delay` parameter must be between 0 - 10000.

A value of *a*, *b*, or *both* must be specified for the `bus` parameter.

The `loc` parameter cannot be specified in the same command with the `sloc` and `eloc` or `bus` parameters.

An `init-ext-stats` or `copy-ext-stats` command cannot already be in progress when this command is entered.

Output

`init-ext-stats`

```
e5oam 10-02-06 00:56:54 EST  EAGLE 42.0.0
init-ext-stats
Command entered at terminal #6.
;

e5oam 10-02-06 00:56:54 EST  EAGLE 42.0.0
INIT-EXT_STATS: Init msg sent to the following MUX cards:
  CARD Location: 1209
  CARD Location: 1210
  CARD Location: 1109
  CARD Location: 1110
;

e5oam 10-02-06 00:56:54 EST  EAGLE 42.0.0
Command Completed.
;
```

init-flash

Use this command to load the Board PROM to the inactive FLASH memory of a specified card or range of cards. When a card is reinitialized, it runs this version of the GPL in the card's inactive FLASH memory.

Parameters

bits (optional)

This parameter must be specified for one E5-class card in conjunction with `mode=rplcebl` or `mode=cnvrtbit`. It indicates whether the bootloader or the flash image will be converted to a 32-bit or a 64-bit image. The E5-class card must be inhibited before the bootloader or the flash image can be changed through this mode.

Range:**32 - convert to a 32-bit bootloader or flash image****64 - convert to a 64-bit bootloader or flash image****boot (optional)**

This parameter specifies whether the EPME5-class card should boot after the command successfully completes.

Multiple images can be flashed without having to boot after each flash. If multiple images are being flashed to the E5-class card, this parameter can be used to prevent the card from booting after each image is flashed. If multiple images are being flashed and the card is allowed to boot after each flash, an image that is not activated after the card boots will be lost on a subsequent reset of the card. This option does not apply to MUX cards or IMT Switch cards.

Range:**yes**

Reboot the card after the command completes successfully

no

Do not reboot the card after the command completes successfully.

Default:

yes

For E5-class cards, if the mode parameter is not specified or if mode=foregrnd, mode=imgselect or mode=pvjoy, then default value of boot parameter is yes. If the mode parameter is specified for E5-class card(s) as mode=backgrnd, then default value of boot parameter is no.

code (optional)

The version of the GPL being loaded onto the card.

Range:**appr**

The approved GPL version

trial

The trial GPL version

The code parameter must be specified if the mode parameter is not specified as mode=imgselect; the code parameter must not be specified if the mode parameter is specified as mode=imgselect.

eloc (optional)

End location. The location of the last card of a range of cards to be initialized.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

force (optional)

This parameter is required to force the flash download on the in-service card(s).

Range:

yes

no

Default:

no

gpl (optional)

Generic program load. The flash GPL type that is running on the cards in the specified range of cards.

Range:

xyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters.

Valid GPLs: *bldc32*, *bldc64*, *blmcap*, *blslc32*, *blslc64*, *hipr2*, and *multiple*.

Use " gpl=multiple " to simultaneously flash multiple E5-class cards running different GPLs, such as BLDC32, BLDC64, BLMCAP, BLSLC32, and BLSLC64. The command will then flash all E5-class cards in the specified range.

initclk (optional)

Initialize clock. If this parameter is specified, then the card location should be 1113 or 1115.

Range:

yes

no

Default:

no

loc (optional)

The location of a single card to be initialized.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

mode (optional)

If this parameter is specified for the E5-class cards, it indicates that the flashing of the E5-class card or range of cards will be performed in the specified mode. This parameter can be specified only for E5-class cards.

Range:

backgrnd

In this mode, the flash image will be copied into an inactive FLASH memory area of an E5-class card or range of cards. If the E5-class card in the specified location is provisioned, the E5-class card can be flashed without inhibiting it. The image uploaded with mode=backgrnd will run after the card boots upon receiving the command init-flash:mode=imgselct.

cnvrtbit

When used with this mode parameter value, `init-flash` will convert the E5-class card specified with the `loc` parameter to run on either a 32-bit or 64-bit flash image. The card will start running the target 32-bit or 64-bit flash image after it boots. The E5-class card must be inhibited before it can be flashed in this mode, and the `sloc`/`eloc` parameters may not be used.

foregrnd

In this mode, the flash image will be copied into an inactive FLASH memory area of an E5-class card or range of cards. After the E5-class card initializes, it runs this version of the GPL in the card's inactive FLASH memory. If the E5-class card in the specified location is provisioned, the E5-class card must be inhibited before it can be flashed in this mode.

imgselct

This mode will initialize the card(s), and load & run the image previously copied to the local FLASH memory with `mode=backgrnd`. Do not use this mode unless directed by Oracle's Customer Service.

pvjoy

In this mode, the flash image will be copied into inactive FLASH memory of an E5-class card or range of cards and the card(s) will initialize. After the E5-class card initializes, it will run the version of the GPL in the card's inactive FLASH memory. If the E5-class card in the specified location is provisioned, then the E5-class card can be flashed without inhibiting the E5-class card in the specified location. Debug must be enabled on the active OAM before this mode parameter value can be specified. Do not use this mode unless directed by Oracle's Customer Service.

rplcebl

In this mode, `init-flash` will replace the bootloader in the E5-class card specified with the `loc` parameter with either a 32-bit or 64-bit bootloader image and begin using it the next time the card boots. The E5-class card must be inhibited before the bootloader can be changed through this mode, and the `sloc`/`eloc` parameters may not be used.

Default:

foregrnd

sloc (optional)

Start location. Location of the first card of a range of cards to be initialized.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

Example

```
init-flash:loc=1105:code=trial
init-flash:loc=1113:code=appr:initclk=yes
init-flash:loc=1115:code=appr:initclk=yes:force=yes
init-flash:loc=1115:code=trial:initclk=no
init-flash:sloc=1302:eloc=1306:gpl=blisim:code=appr
```

```
init-flash:sloc=6305:eloc=6305:code=appr:gpl=blispm
init-flash:sloc=1105:eloc=1306:appr:gpl=blmcap:mode=foregrnd
init-flash:loc=1205:code=appr:mode=backgrnd
init-flash:sloc=1201:eloc=1311:code=trial:gpl=blmcap:mode=backgrnd
init-flash:sloc=1201:eloc=1311:code=trial:mode=imgselct
init-flash:loc=1301:mode=rplcebl:bits=64
init-flash:loc=1301:code=trial:mode=cnvrtbit:bits=64
init-flash:sloc=1103:eloc=1306:code=appr:gpl=blmcap
```

Dependencies

The specified card must be an E5-class card or Service Module card. A MUX card can be specified for locations xy09 and xy10 (x is the frame and y is the shelf).

Each specified card does not have to be defined in the database, but it does have to be aligned on the IMT bus.

If the card in the specified card location is provisioned, then the card must be inhibited before this command is entered (unless the card is a MUX card or E5-class card with mode set to backgrnd, imgselct or pvjoy).

If the target card is a MUX card, then both card locations specified in the sloc and eloc parameters must contain MUX cards on the same IMT bus. For these cards, the bus is implicit based on the specified location. Location xy09 specifies the MUX A Bus, and location xy10 specifies the MUX B Bus (x is the frame and y is the shelf). For example, sloc=1109:eloc=6109 specifies all MUX cards on the A Bus only; sloc=1110:eloc=6110 specifies all MUX cards on the B Bus only. MUX cards from both the A bus and B bus cannot be flash downloaded simultaneously.

The boot parameter can be specified only if the target is an E5-class card.

A card location that contains the active MASP cannot be specified for the loc, sloc, or eloc parameter.

The provisioning subsystem mode (simple, duplex) must be established prior to executing the command.

The loc parameter cannot be specified with the eloc and sloc parameters.

The loc parameter or the eloc and sloc parameters must be specified.

If the eloc and sloc parameters are specified, the gpl parameter must be specified. MUX cards in the locations specified in the sloc and eloc parameters must be running the specified general program load (gpl). If the GPL specified is not multiple, then other cards in the range of card locations can be running other GPLs, but will not be initialized and only the cards within the range that are running the specified GPL will be initialized.

The sloc parameter value must be less than the eloc parameter value, when the two parameters are specified.

The specified card cannot be running an inactive flash GPL when the command is executed. If the sloc and eloc parameters are specified, cards within the range running an inactive flash GPL will be skipped. If there are no cards in the list because all the cards are running an inactive flash GPL, then UIM 1119 (example in Notes section) will be raised and the command will be rejected.

If the `initclk` parameter is specified, the card location parameter value must be 1113 or 1115.

If TDM reload would cause a system clock outage, the `initclk` parameter cannot be specified unless `force=yes` is also specified.

 Caution

The resulting clock outage will probably cause loss of traffic on all links.

No other related command can be in progress when this command is entered.

A card location that is valid and defined in the database must be specified.

The `eloc` and `sloc` parameters must be specified together in the command.

MUX cards specified in the `sloc` and `eloc` location parameters must be running the specified GPL. For other GPLs including multiple, all cards within the range running the specified GPL will be flashed.

This command cannot be entered if an IMT Rate Change sequence is in progress.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

The `boot` parameter cannot be specified with the `mode=backgrnd`, `mode=imgselct` or `mode=pvjoy` for the E5-class card.

A card location that contains the MASP cannot be specified for the `sloc` or `eloc` parameter.

The `mode` parameter cannot be specified with the non E5-class card.

The `gpl=multiple` parameter can be specified only if the `sloc` and `eloc` parameters are specified.

The `gpl=multiple` parameter can be specified only if the card locations in the `sloc` and `eloc` parameters are E5-class cards.

The `code` parameter cannot be specified with `mode=imgselct` parameter for the E5-class card(s). If the `mode=imgselct` parameter is not specified, then the `code` parameter must be specified.

The GPL parameter cannot be specified when the `mode=rplcebl` or `mode=cnvrtbit` parameter is used with the E5-class card.

The `mode=cnvrtbit` parameter must be specified with the `loc`, `code`, and `bits` parameters. Any other parameters like `force`, `boot`, `initclk`, and `sloc/eloc` cannot be specified when the `mode=cnvrtbit` parameter is specified.

The `mode=rplcebl` parameter must be specified with the `loc` and `bits` parameters. Any other parameters like `force`, `boot`, `initclk`, `code`, and `sloc/eloc` cannot be specified when the `mode=rplcebl` parameter is specified.

The `mode=cnvrtbit` parameter can be specified only when the E5-class card is an SM8GB card type.

The `mode=rplcebl` parameter can be specified only when the E5-class card is either an SM8GB or a SLIC card type.

The `mode=cnvrtbit` parameter can be specified with the `bits=64` parameter only when the E5-class card is running a 32-bit flash image (i.e., either BLMCAP or BLSLC32).

The `mode=cnvrtbit` parameter can be specified with the `bits=32` parameter only when the E5-class card is running a 64-bit flash image (as in, BLDC64).

Notes

Card locations 1114, 1116, and 1117 are not valid and cannot be specified.

For the E5-class cards, multiple images can be flashed without having to boot the card after each flash. If multiple images are being flashed to the card the `boot=no` parameter can be used to prevent the card from booting after each image is flashed. After flashing any number of images, the card can be reset either by entering the `init-flash` command with the `boot=yes` parameter or by entering the `init-card` command. If multiple images are being flashed and the card is allowed to boot after each flash, any images that are not activated after the card boots will be lost on a subsequent reset of the card.

If E5-OAMs are being used, then the `init-flash` command can be accepted even when the cards specified in the `sloc` and `eloc` parameter range contains 1113 and/or 1115 locations in it. But the cards in 1113 and 1115 are never included in the list to flash the cards.

For example, if "`sloc=1111:eloc=1215:gpl=blmcap`", neither 1113 nor 1115 would be included in the list to flash the cards and the command will be accepted. The only way to flash an E5-OAM card is to specify `loc=1113/1115` but the card location specified cannot be the active E5-MASP.

For `mode=backgrnd` or `mode=imgselct` to be accepted, the E5-class target card must already be running a 45.0.0=64.XX.YY release version or higher.

When the `sloc` and `eloc` parameters are specified for E5-class cards and one or more cards in the range are running an inactive Flash GPL, then UIM 1119 will be raised along with the flash results. UIM 1119 will capture the first 5 card locations along with the total number of cards that have been skipped because of running an inactive Flash GPL. Example:

```
XXXX.1119    CARD <Active OAM location>      INFO    Cards out of phase with
flash procedure
              Card List: 1101, 1102, 1103, 1105, 1111, ... ( 1 others)
```

To use a 64-bit flash image, the EAGLE must be running Release 46.3 or higher. Steps for converting an E5-SM8G-B card running BLMCAP to BLDC64 GPL and vice-versa:

- Flash BLMCAP --> BLDC64:
 1. Make sure the E5-SM8G-B card is running BLMCAP Release 46.3 or higher.
 2. Replace the bootloader with the new 64-bit version:

```
init-flash:loc=xxxx:mode=rplcebl:bits=64
```

 - This command will not cause the card to boot.
 - If the card is already running the new bootloader, this command does nothing.
 3. Flash card to BLDC64:

```
init-flash:loc=xxxx:code=yyyyy:mode=cnvrtbit:bits=64
```
 4. Activate flash.
 5. The card is now running the 64-bit flash image.
- Flash BLDC64 --> BLMCAP:

1. The card is running BLDC64.
2. Flash card to BLMCAP (Release 46.3 or higher):

```
init-flash:loc=xxxx:code=yyyyy:mode=cnvrtbit:bits=32
```

3. Activate flash.
4. The card is now running the 32-bit flash image.

SLIC cards run either the 32-bit BLSLC32 flash GPL or the 64-bit BLSLC64 flash GPL.

To convert a SLIC card from the 32-bit to the 64-bit flash image:

1. Inhibit the card:

```
inh-card:loc=xxxx:force=yes
```

The card will boot and return to state OOS-MT-DSBLD.

2. Flash the card:

```
init-flash:loc=xxxx:code=appr:64gpl=blslc64
```

The card will boot and return to state OOS-MT-DSBLD.

3. Activate the 64-bit BLSLC64 flash GPL:

```
act-flash:loc=xxxx
```

The card will now accept 64-bit application GPLs from the OAM.

To convert a SLIC card from the 64-bit to the 32-bit flash image:

1. Inhibit the card:

```
inh-card:loc=xxxx:force=yes
```

The card will boot and return to state OOS-MT-DSBLD.

2. Flash the card:

```
init-flash:loc=xxxx:code=appr:gpl=blslc32
```

The card will boot and return to state OOS-MT-DSBLD.

3. Activate the 32-bit BLSLC32 flash GPL:

```
act-flash:loc=xxxx
```

The card will now accept 32-bit application GPLs from the OAM.

Output

```
init-flash:loc=1105:code=trial
```

init-imt-gpl

Use this command to load the specified IMT GPL software to the specified card and to reset that card. The application software is reloaded following IMT reset.

Parameters

code (mandatory)

The IMT GPL to load to the card.

Range:

appr

The approved GPL version

refresh

Reload approved GPL version without card reset

trial

The trial GPL version

loc (optional)

The location of the card to be initialized.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

All locations

Example

```
init-imt-gpl:loc=1201:code=trial
```

```
init-imt-gpl:code=refresh
```

```
init-imt-gpl:code=appr
```

Dependencies

The card location shelf must be within the allowed ranges as specified on the `loc` parameter. The shelf is the first two digits of the `loc` parameter.

The card location slot must be within the allowed ranges as specified on the `loc` parameter. The slot is the second two digits of the `loc` parameter.

The card location cannot contain a card with flash memory (MUX).

When this command is entered, no other action command can be in progress.

If the `code=appr` or `code=trial` parameter is specified, the `loc` parameter must be specified.

If the `code=trial` parameter is specified, the `loc` parameter must be specified, and the specified card location must be equipped and in service.

If the `code=appr` or `code=refresh` parameter is specified, the card must be connected to at least one IMT bus and communicating with the active MASP when the command is entered.

This command cannot be entered if the `clr-imt-stats`, `rept-imt-info`, `rept-imt-lvl1`, `rept-imt-lvl2`, or `tst-imt` command is running.

This command must not be entered during IMT statistics collection following an hourly boundary.

A card location that is valid and defined in the database must be specified.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

None

Output

```
init-imt-gpl:loc=1201:code=trial
```

```

init-mux

This command is used to reset an individual MUX card, or a given IMT Bus A or B (which includes all MUX cards for that bus).

The command boots the MUX card processor and brings down the respective IMT bus temporarily (approximately 10 seconds) until the MUX card(s) come back into service.

Note

When a card is disconnected from the IMT Bus, it may take several seconds for the card IMT Status to be updated. If an `init-mux` or `disc-imt` command is entered for the alternate IMT Bus before the card IMT Status is updated, then the card may reboot. After disconnecting the card from the IMT bus, use the `rept-stat-imt` or `rept-stat-card` command to determine whether the card IMT status is updated. Do not issue the `disc-imt` or `init-mux` command for the alternate IMT bus until the card status is updated.

Parameters**bus (optional)**

The MUX bus to be reset. All MUX cards on the specified bus are reset.

Range:

a

b

Default:

a

force (optional)

This parameter is specified to override normal safeguards. The `force=yes` parameter can be used to reset an entire MUX bus when the alternate bus is non-functional or to reset one MUX card during a fault isolation test (see the `tst-imt` command).

Caution

If the `force=yes` parameter is specified, and the alternate IMT bus is OOS, then all of the cards on the IMT that are running a GPL will initialize. If one or more cards are not aligned on the alternate bus, placing the alternate IMT in IS-ANR, only the non-aligned cards will initialize. Either occurrence could result in nodal isolation.

Range:

yes

no

Default:

no

hs (optional)

This parameter is specified to set the speed of the MUX bus. If the `hs=yes` parameter is specified, the MUX bus speed is set to 2.5 Gbps. If the `hs=no` parameter is specified, the MUX bus speed is set to 1 Gbps.

Range:

yes

no

Default:

yes

loc (optional)

The location of a single MUX card to be reset.

Range:

1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110,
3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210,
5309, 5310, 6109, 6110

Example

```
init-mux:bus=a
```

```
init-mux:bus=a:hs=no
```

```
init-mux:loc=1109
```

```
init-mux:loc=6202
```

Dependencies

An act/init-flash command cannot be in progress when this command is entered.

The bus or loc parameter must be specified in the command. Both parameters cannot be specified in the command.

The hs parameter can be specified only when the bus parameter is specified.

The force=yes parameter must be specified before this command can be entered during an IMT Fault Isolation test.

This command cannot be entered during an Extended Bit Error Rate Test (BERT) even if the force=yes parameter is specified.

This command is not allowed during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

This command cannot be entered if an IMT Rate Change sequence is in progress.

If one or more cards are not aligned on the alternate bus, the alternate IMT state will become IS-ANR. If the alternate bus is IS-ANR, then the force=yes parameter must be specified.

Notes

The hs parameter should be specified only as a tool to facilitate updating spare cards for releases that support MUX bus speeds of 2.5 Gbps only. The hs parameter is persistent as long as the card remains powered. If the card loses power, it will default back to 2.5 Gbps.

Output

```
init-mux:loc=1109
```

```
rlghncxa03w 05-07-13 08:15:10 EST EAGLE 31.3.0  
Command Completed.
```

```
;
```

Related Topics

- [act-flash](#)
- [init-flash](#)

init-network

Use this command to reset all the network cards. The network cards are E5- TSMs and LIMs; that is, anything not part of the Maintenance and Administration Subsystem (MAS). This command resets all the network cards by reloading GPLs and data to the cards. Use of this command requires maintenance personnel to be located at the site.

Caution

Using this command causes network nodal isolation; however, if the network nodal isolation is less than two seconds, it may not be detected and may not be reported. Also, in some cases when network nodal isolation has been detected and a large number of maintenance troubles are being reported, the network nodal isolation message may not be reported. An alarm is generated, however.

Parameters

force (optional)

Force the resetting of all the network cards.

Range:

yes

no

Default:

no

Example

```
init-network
```

Dependencies

The MASP must be in either *Upgrade Phase 3* mode or *Full Function* mode. (See the “Notes” section for this command for more information.)

The system database must be coherent when this command is entered.

At least one card with the SS7ANSI or CCS7ITU application installed must exist with an in-service active signaling link.

The force=yes parameter must be specified to override the required four-card SS7ANSI or CCS7ITU configuration. The system then selects the best available of the remaining SS7ANSI or CCS7ITU cards.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

Upgrade Phase 3

Upgrade Phase 3 mode means that the MASPs are running GPLs that match the major revision defined for the approved GPLs, but the other network processors are only prepared to be upgraded.

Full Function

Full Function mode means that all MASPs are running GPLs that match the major revision defined for the approved GPLs. *Full Function* mode is the normal operating mode for the MASP.

Output

The command output scrolls into the scroll area of your display contiguously. However, for purposes of this example, each part has an explanation preceding it.

init-sys

Use this command to reset all cards in the system (except HIPR2 cards). When this command is entered, a caution message is displayed in the scroll area requesting to re-enter the command to confirm the operation. The command must be re-entered within 30 seconds. The only valid commands that can be entered after entering this command the second time are the `login` and `act-user` commands.

Caution

This command causes a complete system reload, and should be used only during periods of low traffic. Use this command only when directed by the Customer Care Center.

Caution

When this command executes, the system does not retain the manually initiated state (for example, OOS-MT-DSBLD) for the signaling link, card, or the terminal. After the command executes, the system attempts to bring all provisioned links, cards, and terminals on line, including those that were previously out of service. Each device must be put back into its previous state after the system is back on line. It is advisable to print or electronically capture the output of the `rept-stat-slks`, `rept-stat-cards`, and `rept-stat-trms` commands for reference prior to issuing the `init-sys` command. To restore a device to its previous state, issue the appropriate inhibit/deactivate command listed in this manual in the section for each of the above `rept-stat` commands.

Parameters

data (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the G-Flex, G-Port, INP, or LNP feature is on, or the ATINP feature is enabled. This parameter is applicable only to network cards containing the MPS database (VSCCP/ENUM).

Range:

refresh

Causes data to be reloaded to the specified card.

persist

Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE perform a warm restart of the requested cards. The EAGLE performs various checks to ensure that all conditions necessary to initiate the warm restart are in place.

Default:*refresh***force (optional)**

Allows the command to be processed if the `data=persist` parameter is specified and all the network cards containing the LNP database cannot maintain a persistent LNP database over the reset.

Range:*yes**no***Default:***no***perdata (optional)**

Persist a particular DB type on all cards (irrespective of the card's type).

Range:*all*

Persist all data (GTT/MPS) that can be persisted on the card

mps

Persist only MPS data on the card that supports persistence of MPS DB

gtt

Persist only GTT data on the card that supports persistence of GTT DB

Default:*all***Note**

The `perdata` parameter can only be specified where `data=persist` is given.

Example

```
init-sys
```

```
init-sys:data=persist
```

```
init-sys:data=persist:perdata=mps
```

Dependencies

When this command is entered, another `init-sys` command cannot be in progress on another port.

An EPAP-based feature or an LNP feature that is warm-restart-capable must be enabled, or SIP must be enabled, or at least one ENUM card or one GTT-enabled IPSC card must be present before this command can be entered with the `data=persist` parameter.

The value specified for the `data` parameter for the confirmation command must be the same value that was specified the first time.

The `force` parameter is valid only with the `data` parameter.

The perdata parameter is valid only with the data parameter.

The init-sys command cannot be issued when SFAPP(P)->OAM sync is ON.

This command cannot be entered when CAT2 IPSM to OAM syncing is in progress.

Notes

When this command is entered the first time, 30 seconds are allowed to enter the command again. After the command is accepted, a delay of 10 seconds gives the system time to broadcast the information message regarding the system initialization.

From the time that the init-sys command is accepted, you must wait approximately two minutes before you can log into the system. If the system terminal is in the VT-100/VT-320 mode, the terminal display will be refreshed with nonzero alarm counts. During this 2-minute interval, an intermediate screen refresh caused by the MASPs' role change from active to standby, and from standby to active. This screen refresh is typically a partial refresh and the alarm indicators are set to zero.

If you are logged into the system in the KSR mode, you receive UAM 0009 (MASP became active) to indicate that you are now able to log into the system. UAM 0009 could be issued twice due to possible transient MASP role change (switching from active to standby). Following the execution of the init-sys command, the MASP that was active before the init-sys command was entered will be the active MASP when the system has finished reinitializing. E5-TSM cards are reloaded only in the event of power failure or hardware reboot. The execution of this command does not require E5-TSM cards to be reloaded.

When the init-sys command is given with data=persist and perdata=all, it means that all cards in the system will boot, but those that contain either MPS or GTT data as persistent will be warm booted, while others will be cold booted.

When the OA&M IP Security feature and the parameter SSH in SECUDFLT table are turned ON, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Regenerated
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

When the OA&M IP Security feature and the parameter SSH in SECUDFLT table are turned ON, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```
rlghncxa03 01-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Loaded
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

Output

This example shows the output when the `init-sys` command is entered once, then entered again within 30 seconds, causing the system to start resetting all of its cards:

`init-sys`

```
rlghncxa03w 04-01-07 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-07 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

`init-sys`

```
rlghncxa03w 04-01-07 07:05:16 EST  EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-07 07:05:17 EST  EAGLE 31.3.0
Init System command issued at terminal #3
```

This example shows the output when the `init-sys` command is entered once, and more than 30 seconds pass with no other keyboard entry:

`init-sys`

```
rlghncxa03w 04-01-05 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3.
```

```
rlghncxa03w 04-01-05 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

```
rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command aborted due to confirmation timeout
```

This example shows the output when the `init-sys` command is entered once and then the `rls-alm:lvl=minr` command is entered, letting the 30-second timer expire for the second entry of the `init-sys` command:

`init-sys`

```
rlghncxa03w 04-01-05 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-05 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
```

Re-enter command within 30 seconds to confirm.

```
rls-alm:lvl=minr
rlghncxa03w 04-01-05 07:05:10 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-05 07:05:11 EST  EAGLE 31.3.0
All the minor alarms are released

rlghncxa03w 04-01-05 07:05:12 EST  EAGLE 31.3.0
Command Completed

rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command aborted due to confirmation timeout
```

This example shows the output when the `init-sys` command is entered twice within 30 seconds, and the `data=persist` parameter is specified to perform a warm restart of the requested cards without reloading the database to the cards:

`init-sys:data=persist`

```
rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and will result in
traffic loss.
Re-enter command within 30 seconds to confirm.

init-sys:data=persist
rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Command entered at terminal #3
rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command issued at terminal #3
```

This example shows the output when the `init-sys` command is entered twice within 30 seconds, and the `force=yes` and `data=persist` parameter is specified to perform a warm restart of the requested cards without reloading the database to the cards:

`init-sys:data=persist:force=yes`

```
tekelecstp 02-01-01 21:49:15 MST  EAGLE5 46.2.0-65.42.0
init-sys:data=persist:force=yes
Command entered at terminal #17.
;

tekelecstp 02-01-01 21:49:15 MST  EAGLE5 46.2.0-65.42.0
Verifying card(s) persistent database - please wait

Command Accepted - Processing
tekelecstp 02-01-01 21:49:15 MST  EAGLE5 46.2.0-65.42.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
```

```
Re-enter command within 30 seconds to confirm.  
;  
Command Executed
```

```
init-sys:data=persist:force=yes
```

```
tekelecstp 02-01-01 21:49:20 MST EAGLE5 46.2.0-65.42.0

lock

Use this command to lock a terminal's keyboard. When the keyboard is locked, the system accepts no keyboard commands other than the `unlock` command. The keyboard remains locked until the logged on user's login password is entered at the UNLOCK prompt. When the keyboard is locked, any idle terminal monitor in effect for the terminal is suspended temporarily.

Parameters

This command has no parameters.

Example

```
lock
```

Dependencies

The terminal cannot be an MGMT terminal used for Network Surveillance.

The terminal cannot be a TELNET terminal (terminal IDs 17-40).

Notes

A locked terminal can also be unlocked by entering the `inh-trm` command, followed by the `alw-trm` command.

Output

lock

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
Terminal keyboard is locked. Enter UNLOCK command to unlock.
;
```

Related Topics

- [unlock](#)

login

Use this command to log into the system. After you enter this command, the system requests a password. For security reasons, the password is not displayed at the terminal.

Parameters

uid (mandatory)

User ID. The system prompts the user for a valid password after entering in this ID.

Range:

azzzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters

Example

```
login:uid=john
```

Dependencies

The user cannot be logged onto any terminal while changing the password.

The user ID must not be logged in to another port already, and it must not be revoked.

The user ID must have been logged in successfully within the number of days specified on the `uout` parameter of the `ent-user` command.

The OA&M IP Security Enhancements feature must be turned on before the password can be changed from a Telnet terminal (IDs 17-40) if the user is logging in with the assigned ID and password for the first time, or the password has expired.

The password can contain up to 20 characters.

The password must contain at least the number of characters specified by the `minlen` parameter in the `chg-secu-dflt` command.

The password must contain at least the number of alphabetic characters specified by the `alpha` parameter in the `chg-secu-dflt` command.

The password must contain at least the number of numeric characters specified by the `num` parameter in the `chg-secu-dflt` command.

The password must contain at least the number of punctuation characters specified by the `punc` parameter in the `chg-secu-dflt` command.

The password cannot contain the associated User ID.

The number of days specified by the `minintrvl` parameter in the `chg-secu-dflt` command must pass between password changes.

The password must contain fewer duplicate characters from the existing password than the number specified by the `pchreuse` parameter in the `chg-secu-dflt` command.

The password cannot be the same as a previous password if the limit in the password history, specified by the `preuse` parameter of the `chg-secu-dflt` command, has been reached.

The current password cannot be entered as the new password.

The values specified for the `uid` parameter and for the password must already exist.

Notes

The `act-user` command can be used in place of `login`. The `act-user` command has been provided in compliance with TL1 standards.

When a new system is shipped, the user ID and password are set to the system. These should be changed immediately to ensure system security.

At the time of login, when a password is entered for a user, only the first 20 bytes are chosen for validation.

Output

When the `login` command is entered, a password prompt occurs. If the password and User ID are valid, then the login is processed. When a password change is required, password rules are displayed, and a new password is requested. The login is granted if the change is successful, then or if no password change is necessary.

After login is granted, a banner is displayed. This banner consists of the warning text provided on the `chg-secu-dflt` command, indications about the last login, and any unsuccessful login attempts.

This example shows the output for a normal login path with no request for new password:

```
login:uid=eagle
```

```
eagle5 10-02-19 19:37:16 EST EAGLE5 42.0.0
User logged in on terminal 3.
;

eagle5 10-02-19 19:37:16 EST EAGLE5 42.0.0

logout

Use this command to end a user session. The `logout` command has the same affect as the `canc/dact-user` commands.

Parameters

This command has no parameters.

Example

```
logout
```

Dependencies

None

Notes

The `canc/dact-user` commands can be used in place of `logout`.

Output

```
logout
```

```
rlghncxa03w 06-06-05 07:05:31 EST  EAGLE 35.0.0  
Command Completed.  
;

pass

Use this command to pass a command string to an individual card for processing. This command reduces the reliance on the OAM build for card-specific or application-specific information.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

cmd (optional)

Command string including quotes (" "). The command represented in the quoted string is sent to the specified card. Maximum command string length including quotes is 132 characters.

Range:

77

Any string of characters that represent a pass-through command. The string must be enclosed in double quotation marks.

Valid pass-through commands are *arp*, *aslog*, *asplog*, *assocrtt*, *connmgr*, *drklog*, *ftptest*, *help*, *linkinfo*, *msucount*, *msuroute*, *msutrace*, *netstat*, *nslookup*, *pct*, *ping*, *sctp*, *sockrtt*, *sockstate*, *traceroute*, *ualog*, *soipdata*, *soiplog* .

Note

Pass-through commands shown in online help that are not documented in Chapter 6 are not supported at this time.

proc (optional)

Processor type.

Range:

appl

Application processor

com

Communication processor

Default:*appl***Example**

```
pass:loc=1201:cmd="ping 198.89.1.2"
```

```
pass:loc=1111:cmd="soipdata -f"
```

```
pass:loc=6312:cmd="help"
```

Dependencies

The value specified for the `loc` parameter must be valid for the card type and application:

- E5-ENET-B card running the IPGWI, IPLIMI, IPSG, or SS7IPGW application
- STC or E5-STC card running the EROUTE application
- IPSM card running the IPS application
- Service Module card running the VSCCP application
- E5-TSM card running the GLS application

The specified card location is out of range.

Syntax error found in the `pass` command.

Card is not in service

The `pass` command must include either the `cmd` or `shellcmd` parameter.

Notes

None

Output

Output is shown in the individual `Pass` commands.

rept-ftp-meas

Use this command to manually initiate generation and FTP transfer of a measurements report from the Measurements Platform MCPM or Integrated Measurements enabled E5-OAM to an FTP server.

Parameters**ent type (mandatory)**

Entity type to report on in the measurements report.

Range:*aiq*

Measurements for ANSI41 AIQ

atinpq

Measurements for ATINP

deir

Measurements for S13/S13' EIR

eir

Measurements for Equipment Identity Register

enum

Measurements for ENUM Mobile Number Portability and Tier One Address Resolution

gttapath

Measurements for GTT Actions Per-Path

gttset

Measurements per GTTSET

idpr

Measurements for IDPR

link

Measurements for signaling links

lnkset

Measurements for linksets

lnp

Measurements for local number portability

lsdestni

Measurements for linkset destination network identifiers

lsonismt

Measurements for ISUP message type screening

lsorigni

Measurements for linkset originating network identifiers

mapscrn

Measurements for GSM MAP message screening

np

Measurements for INP, INP CRP, G-Port, A-Port, MO-based GSM SMS NP, MO-based IS41 SMS NP, IGM, MT-Based GSM SMS NP, and MT-Based IS41 SMS NP

origni

Measurements for originating network identifiers greater than 5

origninc

Measurements for originating network identifiers (less than 5, small networks) for network clusters

sctpasoc

Measurements per association for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)

sctpcard

Measurements per card for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)

sfthrot

Measurements for SFTHROT GTT Action

sip

Measurements for SIP

stp

Measurements pertaining to the Signaling Transfer Point in general or summarized totals recorded on the STP

tt

Measurements for translation types

ua

Measurements per application server/association for the M3UA and SUA protocols

vflex

Measurements for V-Flex

type (mandatory)

Type of measurement report.

Range:**avl**

Availability measurements

avld

Daily availability measurements

avldth

Day to hour availability measurements.

comp

Component measurements

gtwy

Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

mtcd

Daily maintenance measurements

mtcdth

Day-to-hour maintenance measurements

mtch

Hourly maintenance measurements

mtcs

Link/linkset maintenance status

nm

Network management, on-demand

rbase

Schedule-report type record base measurements

systot

STP system totals

day (optional)

Day of the week for the specified daily measurement report.

Range:

mon

tue

wed

thu

fri

sat

sun

Default:

If not specified, the previous single day is reported.

hh (optional)

Half-hour for the specified report. The end time for the collection interval. For example, hh=0300 generates a report for the interval 2:30-3:00.

Range:

0000 - 2400

hhmm where hh=00 -24 (hour) and mm=00 or 30 (minute)

period (optional)

The relative period for the report.

Range:

active

last

specific

qh (optional)

Quarter-hour for the specified report. The end time for the collection interval. For example, qh=0315 generates a report for the interval 3:00-3:15.

Range:

0000 - 2400

hhmm where hh = 00-24 (hour) and mm = 00, 15, 30 or 45

Example

```
rept-ftp-meas:type=systot:enttype=stp
rept-ftp-meas:type=systot:enttype=sip
rept-ftp-meas:type=mtch:enttype=deir
rept-ftp-meas:type=mtch:enttype=enum
rept-ftp-meas:type=mtcd:enttype=sfthrot
rept-ftp-meas:type=mtch:enttype=gttset
```

Dependencies

This command cannot be used to specify a report type if that report type is currently printing.

A primary MCPM card must be available when this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option (`chg-measopts:collect15min=on` command) must be on before the `qh` parameter can be specified.

The LNP feature must be turned on before the `mtchlnp=on`, `mtcdlnp=on`, or `enttype=lnp` parameter can be specified.

The GSM Map Screening feature must be turned on before the `mtcdmap=on` and `enttype=mapscrn` parameters can be specified

The EIR feature must be turned on before the `enttype=eir` parameter can be specified,.

If a value of *avl*, *avld*, *comp*, *gtwy*, *mtcd*, or *systot* is specified for the `type` parameter, then the value specified for the `hh` parameter must indicate a half-hour boundary (the end of the requested half-hour for the report). If the `type=mtch` parameter is specified, then the value specified for the `hh` parameter must indicate an hourly boundary (half hours ending in 00, such as 0100, etc).

The `qh` parameter must specify a quarter-hourly boundary (the end of the requested quarter-hour for the report) for valid report types (*avld(th)*, *mtcd(th)*, *mtch*, *nm*, *rbase*, and *mtcs*) cannot be specified.

Hourly collection and report processing cannot be in progress when report type *mtch* is specified.

Day-to-hour collection and report processing cannot be in progress

- When report type *mtcd* is specified
- When report type *mtcdth* is specified

Daily collection and report processing cannot be in progress when report type *mtcd* is specified.

Half-hourly collection and report processing cannot be in progress when report type *comp*, *systot*, *avl*, or *gtwy* is specified.

Quarter-hourly collection and report processing cannot be in progress when report type *comp*, *systot*, *avl*, or *gtwy* is specified.

5-minute collection and report processing cannot be in progress when report type *nm* is specified.

The *mtcdth* report type is unavailable between midnight and 1:00 AM (0100).

The day parameter can be specified only for report type *mtcd* and entity types *aiq*, *eir*, *lnp*, *np*, *vflex*, *mapscrn*, *atinpq*, and *gttapat*.

The hh and qh parameters cannot be specified together in the command.

When the *period=last* parameter is specified, the hh, qh, and day parameter cannot be specified.

When the *period=active* parameter is specified, the hh, qh, and day parameters cannot be specified.

When the *period=specific* parameter is specified, the hh, qh, or day parameters must be specified.

[Table 4-42](#) indicates valid parameter combinations for measurements reports; invalid combinations will generate an error message.

Table 4-42 rept-ftp-meas Valid Parameter Combinations

Param . Value	avl	avld	avldth	comp	gtwy	mtcd	mtcdth	mtch	mtcs	nm	systot	rbase
entity												
aiq						X		X

Table 4-42 (Cont.) rept-ftp-meas Valid Parameter Combinations

Param	:type	Values									
. Value											
tt										X	
ua			X			X	X				
:period											
active									X		X
last	X	X	X	X	X	X	X	X		X	X
specific	X			X	X	X		X			X

An hourly boundary must be specified for report type `mtch`.

The `oamhcmcas=on` or `platformenable=on` parameter must be specified (see the `chg-measopts` command) before this command can be entered.

The V-Flex feature must be turned on before the `enttype=vflex` parameter can be specified.

The A-Port, G-Port, IS41 GSM Migration, Prepaid SMS Intercept Ph1, TIF ASD, TIF GRN, TIF Number Portability, or TIF Simple Number Substitution feature must be enabled, or the INP, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be turned on before the `mtchnp=on` or `mtcdnp=on` parameter can be specified.

The ANSI41 AIQ feature must be enabled before the `enttype=aiq` parameter can be specified.

The Integrated Measurements or Measurements Platform feature must be turned on before this command can be entered.

The GTT Action - DUPLICATE, GTT Action - DISCARD, or GTT Action - FORWARD feature must be enabled before the `enttype=gttapath` parameter can be specified.

At least one SFTHROT GTT Action must be provisioned before the `enttype=sfthrot` parameter is specified.

SIPNP Feature must be enabled before the `enttype=sip` and `type=mtcd/systot` parameters can be specified.

Period/type parameter combinations:

- If the `period=specific` parameter is specified, then a value of `avl`, `mtcd`, `comp`, `systot`, `gtwy`, or `mtch` must be specified for the type parameter.
- If the `type=mtcd` and `period=specific` parameters are specified, then a value of `lnp`, `mapscrn`, `np`, `eir`, `vflex`, `atinpq`, `aiq`, or `gttapath` must be specified for the `enttype` parameter.
- If the `period=active` parameter is specified, then a value of `mtcs` or `rbase` must be specified for the type parameter.
- If the `period=last` parameter is specified, then a value of `mtcs` or `rbase` cannot be specified for the type parameter.

At least one ENUM card must be present before the `enttype=enum` parameter can be specified.

The EGTT feature must be turned ON before `enttype=gttset` parameter can be specified.

Notes

None

Related Topics

- [rept-meas](#)

rept-imt-info

Use this command to display the following statistics:

- IMT bus error statistics currently stored in the IMT fault isolation hourly statistics
- Current IMT bus use statistics. Bus use is the percentage of the capacity of the IMT bus that is used for data during a particular time.
- MUX card error statistics

Parameters

report (mandatory)

The type of report that is generated.

Range:

err

IMT bus error statistics

hmutexerr

HMUX card error statistics

hiprerr

HIPR card error statistics

hipr2err

HIPR2 card error statistics

ebucket (optional)

End bucket. The last one-hour time period (*bucket*) for which error statistics are reported.

Range:

0 - 15

Default:

If *sbucket* is specified—current *sbucket* value; information for only that time period is displayed.

If *sbucket* is not specified—15, the report includes statistics for all 16 time periods

eloc (optional)

End location. Specifies the card location of the last card in the range for the report.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

Default:

If `sLoc` is specified—current `sLoc` value; displays information for one card

If `sLoc` is not specified—*1115*, which corresponds to IMT address 251 (e=251); displays information for entire range of locations.

erroronly (optional)

This parameter filters the output to display only non-zero counts in the error report.

Range:

yes

no

Default:

yes

esheLf (optional)

The end shelf location for MUX statistics. This shelf location is the last shelf in the range.

Range:

1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default:

`ssheLf` is specified—the report starts with the `ssheLf` value

`ssheLf` and `esheLf` are not specified—the report is generated for all shelves equipped with the specified MUX type

esLot (optional)

The end slot location for MUX statistics for the cards in the MUX shelf.

Range:

1 - 18

Default:

`ssLot` is specified—current `ssLot` value

`ssLot` is not specified—no default

mode (optional)

The display mode used in the error report.

Range:

full

Displays information for each card along with a summary report

stats

Displays only individual card statistics

summary

Displays the summary portion of the report

Default:

summary

sbucket (optional)

Start bucket. The first one-hour time period (bucket) for which error statistics are reported.

Range:*0 - 15***Default:***0***sloc (optional)**

Start location. The card location of the first card in the range for the report.

Range:

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

Default:

e loc is specified—current e loc value

e loc and s loc are not specified—displays information for entire range of card locations

sshelf (optional)

The starting shelf location for MUX statistics. This location is the first shelf in the range.

Range:

1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default:

es shelf is specified—current es shelf value

es shelf and sshelf are not specified—report is generated for all shelves equipped with the specified MUX type

sslot (optional)

The starting slot location for MUX statistics for the cards in the MUX shelf.

Range:*1 - 18***Default:**

es lot is specified—current es lot value

es lot is not specified—no default

trm (optional)

The serial port (printer location) where the report is sent.

Range:*1 - 16***Default:**

Report displays on the terminal where the command is issued

Example

```
rept-imt-info:report=err
```

```
rept-imt-info:report=err:sloc=1101:eloc=1102:mode=stats
```

```
rept-imt-info:report=err:sloc=1101:eloc=1102:mode=full:erronly=no
```

```
rept-imt-info:report=hiprerr:sbucket=0
```

```
rept-imt-info:report=hiprerr:sshelf=1100:sslot=1:eslot=2:sbucket=0
```

Dependencies

No related IMT command can be in progress when this command is entered. Only one report can be active at a time.

This command cannot be entered at a telnet terminal (terminal ID 17-40).

This command cannot be entered during an IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The ending hourly time period cannot be less than the starting hourly time period.

If the `sslot` and `eslot` parameters are specified, then the `sshelf` parameter must be specified and the `eshelf` parameter cannot be specified (slot information is reported for a single shelf).

A value of `hmutexerr`, `hiprerr`, or `hipr2err` must be specified for the `report` parameter before the `sshelf` and `eshelf` parameters can be specified.

The MUX card slots (09 and 10) cannot be specified for the `sslot` and `eslot` parameter values.

A card location that is valid and defined in the database must be specified.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

The shelf locations specified by the `sshelf` and `eshelf` parameters must be provisioned in the frame.

The `report=err` parameter must be specified before the `erronly` and `mode` parameters can be specified.

The `sshelf` parameter must be specified, and a value of `hiprerr` or `hipr2err` must be specified for the `report` parameter before the `sslot` and `eslot` parameters can be specified.

A value of `hiprerr`, `hipr2err`, or `hmutexerr` must be specified for the `report` parameter before the `sshelf` or `eshelf` parameter can be specified.

Notes

This command can be canceled using the **F9** function key or the `canc -cmd` command. See `canc -cmd` for more information.

Hourly Bucket Statistics

Hourly Bucket Statistics apply to cards on the IMT bus and to MUX cards. Each hourly time period (*bucket*) contains the statistics for a single hour. A total of 16 hourly time periods, numbered 0 - 15, exist. Hourly time period 0 is the most-recent (current), and hourly time period 15 is the least-recent (oldest).

Each hour the statistics for the current hourly time period expire, and the hourly time periods advance. That is, after the advance, the statistics previously reported in hourly time period 0 are now reported in the hourly time period 1, and so on. The statistics reported in the hourly time period 15 are no longer available after the change.

When a card is reinitialized, it begins collecting statistics in hourly time period 0 and changes to hourly time period 1 at the start of the next hour. Thus, the first statistics that a card collects after being reinitialized may be for a partial hour.

MUX Statistics

A MUX card stores the statistics separately for each card on its shelf. If the sLoc and eLoc parameters are specified, then the card sends the statistics for each card to the OAM application for display. If the sLoc and eLoc parameters are not specified, then the card sends an aggregate number to the OAM application to represent statistics for all cards on its shelf.

Low Speed Summary

Table 4-43 rept-imt-info Statistics, Low Speed Summary (rept-imt-info:report=(hmutexerr, hiprerr, or hipr2err))

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx Packet CRC Error	Receive CRC error: Bad Checksum in received IMT packet. Caused by corrupted data within the received packet. Detected by hardware.	Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact the Customer Care Center.
IMT Rx Packet Format Error	Receive Format error: Occurs when the End of Message byte of an IMT packet is found missing. Detected by hardware/software.	Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact the Customer Care Center.
IMT Rx Violation Error	Violation Error: Received an illegal character from the physical IMT transport (TAXI Interface). Detected by hardware	Card insertion, removal, or boot or defective hardware	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx Command Error	Reserved.	Reserved.	Reserved.
IMT Rx FIFO Full	Receive FIFO Full: Watermark indication that this interface receiving data off the TAXI line is receiving traffic in excess of what it can handle. Some traffic will have been discarded. May cause retransmissions, CRC errors and Format errors.	Relatively heavy traffic on this interface can cause these counts to increment. If these counts occur in the field, a software problem may exist.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx FIFO Half Full	Receive FIFO Half Full: Watermark indication that the interface receiving data off the TAXI line has received substantial traffic.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication; no action is required.

Table 4-43 (Cont.) rept-imt-info Statistics, Low Speed Summary (rept-imt-info:report=(hmutexerr, hiprerr, or hipr2err))

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Tx FIFO Full	Transmit FIFO Full: The FIFO has overflowed and data has been lost. This stat is only meaningful for MUX card columns.	Relatively heavy traffic on this interface can cause these counts to increment. This condition should never occur. These events may indicate a software problem	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Tx FIFO Half Full	Transmit FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage. This stat is only meaningful for MUX card columns.	Indicates that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is just an indication; no action is required.
CPU Rx FIFO Empty Before SOM	Occurs when valid packet data is read from the CPU Rx FIFO and the beginning (SOM) of the packet is found missing before all data was read.	The SOM was corrupted while being written into the CPU Rx FIFO from the low speed link.	None. This error will automatically empty the FIFO so it is ready to continue receiving data. If the error continues, contact the Customer Care Center.
CPU Rx FIFO Empty Before EOM	Occurs when valid packet data is read from the CPU Rx FIFO and the end (EOM) of the packet is found missing before all data was read.	The SOM was corrupted while being written into the CPU Rx FIFO or a partial packet was written into the FIFO from the low speed link.	None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the error continues, contact the Customer Care Center.
CPU Rx Packet SOM Before EOM	A Start of Message was received when an End of Message was expected from the IMT bus.	Packet was corrupted in the system (EOM lost) and has another packet appended to it.	None. If the problem persists, contact the Customer Care Center.
CPU Rx Packet CRC Error	Occurs when valid packet data is read from the CPU Rx FIFO and transferred to the processor memory and calculated CRC does NOT match the CRC word at the end of the packet.	The data was corrupted while being written into the CPU Rx FIFO or data coming from the low speed link is corrupted.	None. If the problem persists, contact the Customer Care Center.
DMA Terminal Count	Received IMT packet length is longer than the max allowed. Detected by hardware.	Card insertion/removal or boot.	None if card has booted or was just inserted. Clear the stats and if the problem persists, contact the Customer Care Center.

Table 4-43 (Cont.) rept-imt-info Statistics, Low Speed Summary (rept-imt-info:report=(hmutexerr, hiprerr, or hipr2err))

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
CPU Tx Buffer EOB	A packet that was being transmitted from the CPU Tx Buffer did not have an EOM.	The data was corrupted while being written into or being read from the FIFO.	None. If the problem persists, contact the Customer Care Center.
CPU Tx Buffer Full	Transmit Buffer Full: The Tx Buffer unexpectedly filled up.	Either the COM software attempted to transmit too much data at once or the Tx logic was unable to transmit the data.	None. If the problem persists, contact the Customer Care Center.
CPU Tx Buffer Half Full	Transmit Buffer Half Full: Watermark indication that this interface is backed up through ½ of its available storage.	Relatively heavy outbound traffic on this interface can cause these counts to increment.	None. Buffer Half Full is just an indication, no action is required.
CPU Rx FIFO Full	Receive FIFO Full: The Rx FIFO unexpectedly filled up.	Indicates that data was received at a higher rate than could be processed by the Communications processor.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
CPU Rx FIFO Half Full	Receive FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage.	Relatively heavy inbound traffic on this interface can cause these counts to increment.	None. FIFO half full is just an indication, no action is required.
IMT Bypass FIFO Full	IMT Bypass FIFO Full: The bypass FIFO unexpectedly filled up.	Relatively heavy traffic on this interface can cause these counts to increment. If these counts occur in the field, a software problem may exist.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
IMT Bypass FIFO Half Full	IMT Bypass FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage.	Relatively heavy inbound traffic on this interface can cause these counts to increment.	None. FIFO half full is just an indication, no action is required.

High Speed Summary

Table 4-44 rept-imt-info Statistics, High Speed Summary

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx Disparity Error	Fibre Channel Receive Packet with Disparity Errors: Parity error in received packet. Usually caused by corrupted data.	Should not occur in a properly functioning system and may indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx Sync Lost Error (This error count is not used in MUX card.)	Fibre Channel Receive Lost Synchronization Errors: The receiver on this interface lost synchronization.	Should not occur in a properly functioning system and may indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx Code Word Error	Fibre Channel Receive code Word Errors: Error in received packet. Caused by corrupted data.	Should not occur in a properly functioning system and may indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx Packet SOM Before EOM	Fibre Channel Receive Packet with Start of Message without a previous End of Message Errors: The software detected the start of a new packet before the end of the previous packet was detected.	Should not occur in a properly functioning system and may indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
IMT Bypass FIFO Full	Fibre Channel Bypass FIFO Full: The FIFO has over run and data has been lost. May result in significant downstream errors.	Should not occur in a properly functioning system, and may indicate a software or hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Bypass FIFO Half Full	Fibre Channel Bypass FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is just an indication: no action is required.

Table 4-44 (Cont.) rept-imt-info Statistics, High Speed Summary

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx FIFO Full	Fibre Channel Receive FIFO Full: The FIFO has over run and data has been lost. May result in significant downstream errors.	Should not occur in a properly functioning system. Indicates a software or hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
IMT Rx FIFO Half Full	Fibre Channel Receive FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Full in this case is just an indication; no action is required.
IMT Tx FIFO Full	Fibre Channel Transmit FIFO Full: Watermark indication that this interface has transmitted substantial traffic.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Full in this case is just an indication; no action is required.
IMT Tx FIFO Half Full	Fibre Channel Transmit FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is just an indication; no action is required.
CPU Rx Fifo Full	Receive FIFO Full: The Rx FIFO unexpectedly filled up.	Indicates that data was received at a higher rate than could be processed by the Communications processor.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
CPU Rx FIFO Half Full	Receive FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage.	Relatively heavy inbound traffic on this interface can cause these counts to increment.	None. FIFO half full is just an indication, no action is required.
CPU Rx FIFO Empty Before SOM	Occurs when valid packet data is read from the CPU Rx FIFO and the beginning (SOM) of the packet is found missing before all data was read.	The SOM was corrupted while being written into the CPU Rx FIFO from the high speed link.	None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the problem persists, contact the Customer Care Center.
CPU Rx FIFO Empty Before EOM	Occurs when valid packet data is read from the CPU Rx FIFO and the beginning (SOM) of the packet is found missing before all data was read.	The SOM was corrupted while being written into the CPU Rx FIFO or a partial packet was written into the FIFO from the high speed link.	None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the problem persists, contact the Customer Care Center.

Table 4-44 (Cont.) rept-imt-info Statistics, High Speed Summary

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
CPU Rx Packet SOM Before EOM	A Start of Message was received when an End of Message was expected from the Fibre Channel bus.	Packet was corrupted in the system (EOM lost) and has another packet appended to it.	None. If the problem persists, contact the Customer Care Center.
CPU Rx Packet CRC Error	Occurs when valid packet data is read from the CPU Rx FIFO and transferred to the processor memory and calculated CRC does NOT match the CRC word at the end of the packet.	The data was corrupted while being written into the CPU Rx FIFO or data coming from the high speed link is corrupted.	None. If the problem persists, contact the Customer Care Center.
DMA Terminal Count	Received IMT packet length (on Fibre Channel) is longer than the max allowed. Detected by hardware.	Card insertion/removal or boot.	None if card has booted or was just inserted. Clear the stats and if the problem persists, contact the Customer Care Center.
CPU Tx Buffer EOB	A packet that was being transmitted from the CPU Tx Buffer did not have an EOM.	The data was corrupted while being written into or being read from the FIFO.	None. If the problem persists, contact the Customer Care Center.
CPU Tx Buffer Full	Transmit Buffer Full: The Tx Buffer unexpectedly filled up.	Either the COM software attempted to transmit too much data at once or the Tx logic was unable to transmit the data.	None. If the problem persists, contact the Customer Care Center.
CPU Tx Buffer Half Full	Transmit Buffer Half Full: Watermark indication that this interface is backed up through ½ of its available storage.	Relatively heavy outbound traffic on this interface can cause these counts to increment.	None. Buffer Half Full is an indication, no action is required.
IXP Rx FIFO Full	Fibre Channel IXP Receive FIFO Full: The IXP Rx FIFO momentarily became full. This event can occur under normal conditions and it does not indicate an issue.	Relatively heavy traffic on this interface can cause these counts to increase.	None. FIFO Full in this case is just an indication; no action is required.
IXP Rx FIFO Half Full	Fibre Channel IXP Receive FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Full in this case is just an indication; no action is required.
IMT Rx Byte Per Minute AVG	Average per minute	Normal behavior	None. Information only.
IMT Rx Byte Per Second AVG	Average per second	Normal behavior	None. Information only.

Table 4-44 (Cont.) rept-imt-info Statistics, High Speed Summary

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Tx Byte Per Minute AVG	Average per minute	Normal behavior	None. Information only.

IMT Tx Errors Per Second AVG	Average per second	Normal behavior	None. Information only.
IMT Rx Safety Per Minute AVG	Average per minute	Normal behavior	None. Information only.
IMT Rx Safety Per Second AVG	Average per second	Normal behavior	None. Information only.
IMT Rx MSU Byte Per Minute AVG	Average bytes per minute received on the line card interface within reliable delivery packets.	Normal behavior	None. Information only.
IMT Rx MSU Byte Per Second AVG	Average bytes per second received on the line card interface within reliable delivery packets.	Normal behavior	None. Information only.
IMT Rx ASU Byte Per Minute AVG	Average bytes per minute received on the line card interface within acknowledgment packets.	Normal behavior	None. Information only.
IMT Rx ASU Byte Per Second AVG	Average bytes per second received on the line card interface within acknowledgment packets.	Normal behavior	None. Information only.
IMT Rx DSU Byte Per Minute AVG	Average bytes per minute received on the line card interface within best effort delivery packets.	Normal behavior	None. Information only.

Table 4-44 (Cont.) rept-imt-info Statistics, High Speed Summary

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx DSU Byte Per Second AVG	Average bytes per second received on the line card interface within best effort delivery packets.	Normal behavior	None. Information only.
IMT Rx MSU Byte Count	Number of bytes received on the line card interface within reliable delivery packets.	Normal behavior	None. Information Only
IMT Rx ASU Byte Count	Number of bytes received on the line card interface within acknowledgment packets.	Normal behavior	None. Information only.
IMT Rx DSU Byte Count	Number of bytes received on the line card interface within best effort delivery packets.	Normal behavior	None. Information only.
IMT RX HSU Byte Count	Number of bytes received on the line card interface within mux specific packets.	Normal behavior	None. Information only.
IMT Rx LSSU Byte Count	Number of bytes received on the line card interface within virtual circuit alignment packets.	Normal behavior	None. Information only.
IMT Rx TSU Byte Count	Number of bytes received on the line card interface within test data packets.	Normal behavior	None. Information only
IMT Rx SSU Byte Count	Number of bytes received on the line card interface within safety packets.	Normal behavior.	None. Information only.
IMT Rx BSU Byte Count	Number of bytes received on the line card interface within broadcast packets.	Normal behavior	None. Information only.
IMT Rx Byte Other	Number of bytes received on the line card interface within data packets other than the above.	Normal behavior	None. Information only.
IMT Rx Total Byte Count	Number of bytes received on the line card interface within all types of packets.	Normal behavior	None. Information only.
IMT Rx MSU Packet Count	Number of reliable delivery packets received on the IMT.	Normal behavior	None. Information only.

Table 4-44 (Cont.) rept-imt-info Statistics, High Speed Summary

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx ASU Packet Count	Number of acknowledgment packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx DSU Packet Count	Number of best effort delivery message data packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx HSU Packet Count	Number of mux card data packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx LSSU Packet Count	Number of virtual circuit alignment packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx TSU Packet Count	Number of test data packets received on the IMT.	Normal behavior.	None. Information only.
IMT Rx SSU Packet Count	Number of safety packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx BSU Packet Count	Number of broadcast data packets received on the IMT.	Normal behavior	None. Information only.
IMT Rx Packet Other	Number of all packets types not counted by one of the above.	Normal behavior	None. Information only.
IMT Rx Total Packet Count	Number of packets received on the IMT, all types.	Normal behavior	None. Information only.
IMT Rx MSU Packet Safety Count	Number of reliable delivery message data packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx ASU Packet Safety Count	Number of acknowledgment packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx DSU Packet Safety Count	Number of best effort delivery packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx HSU Packet Safety Count	Number of mux card packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx LSSU Packet Safety Count	Number of virtual circuit alignment packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.

Table 4-44 (Cont.) rept-imt-info Statistics, High Speed Summary

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx TSU Packet Safety Count	Number of test data packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx SSU Packet Safety Count	Number of safety packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx BSU Packet Safety Count	Number of broadcast data packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx Other Packet Safety Count	Number of other packets types not included above that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx Total Packet Safety Count	Number of all packets that did not arrive to the intended recipient on the IMT.	Normal behavior	None. Information only.
IMT Rx Packet Violation Error	Number of packets received that contained an illegal character.	Card insertion, removal, boot or defective hardware	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.
IMT Rx Packet CRC Error	Receive CRC error: Bad Checksum in received IMT packet. Caused by corrupted data within the received packet. Detected by hardware.	Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.
IMT Rx Packet Format Error	Receive Format error: Occurs when the End of Message byte of an IMT packet is found missing. Detected by hardware/software.	Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.

Table 4-44 (Cont.) rept-imt-info Statistics, High Speed Summary

Stat Label – High Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
IMT Rx Packet Discard Error	Number of packets received that were discarded by this interface.	Relatively heavy traffic on this interface can cause these counts to increment.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear then there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
IMT Tx Packet Format Error	Number of packets transmitted that were detected to contain a data format error.	Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system and indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear then there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
IMT Tx Packet Discard Error	Number of packets that were discarded by the transmit interface.	Relatively heavy traffic on this interface can cause these counts to increment.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear then there is no action to perform. If errors continue a problem may exist. Contact Customer Care Center.

Miscellaneous Summary**Table 4-45 rept-imt-info Statistics, Miscellaneous Summary**

Stat Label – Low Speed Error & Event Counts	Explanation of Stat	Probable Cause	Recommended Action
Shelf ID UART Framing Error	The Mux card at this location detected a framing error within the data stream containing its shelf address, transmitted by the MASP through the clock cable.	These errors can occur when a Mux card or a MASP has booted or been inserted/ removed from the slot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.
Shelf ID UART Overrun Error	The Mux card at this location detected a overrun error in the data stream containing its shelf address, transmitted by the MASP through the clock cable.	These errors can occur when a Mux card or a MASP has booted or been inserted/ removed from the slot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If the errors continue, a problem may exist. Contact the Customer Care Center.

Output

An asterisk (*) is appended to each statistic in the output when one or more MUX cards are unable to report statistics during the collection of IMT statistics.

IMT statistics are displayed as '-' instead of zero for counts when the IMT bus is down or inhibited in the output for rept-imt-info reports for MUX cards.

Shelf ID UART Framing Error	0123456789	0123456789
Shelf ID UART Overrun Error	0123456789	0123456789

;

This example shows the output when both IMT Bus A and Bus B are normal and all MUX cards are reporting the statistics:

```
rept-imt-info:report=hiprerr:sshelf=1100:sslot=1:eslot=2:sbucket=0
```

```
rlghncxa03w 10-01-17 00:10:20 PST EAGLE 42.0.0
```

This example shows the output when at least one card on the IMT Bus does not respond when statistics are collected:

```
rept-imt-info:report=hiprerr:sbucket=0
```

```
rlghncxa03w 10-01-27 00:10:20 PST EAGLE 42.0.0
```

HIPR Summary Report: Summed across all requested cards for each bucket

HIPR Hourly Bucket Statistics

```

Legend

IMT Statistics:

- **Bucket**—The hourly time periods (*buckets*) for which a report was requested.
- **Statistic**—The error statistic type for the IMT buses A and B.
- **Bus A Value**—The number of occurrences of the type of error displayed in the Statistic column for the IMT bus A.
- **Bus B Value**—The number of occurrences of the type of error displayed in the Statistic column for the IMT bus B.
- **Low Speed Statistic**—The error statistic type for the low speed 125 Mbps secondary rings with MUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).
- **High Speed Statistic**—The error statistic type for the high-speed 1 Gbps primary ring with MUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).
- **Misc Speed Statistics**—Shelf ID Universal Asynchronous Receiver Transmitter (UART) error counts on the MUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).
- **Bucket Summary**—The error count for each parameter for one hour for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations). (The count is for the most recent part of an hour if the card was booted within an hour of executing the `rept-imt-info` command.)
- **Cumulative**—The running total error count for each parameter since card initialization for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

MUX Statistics:

- **Bucket**—The hourly time periods (*buckets*) for which a report was requested.
- **Loc**—The card location (shelf and slot) for which information is displayed.
- **Low Speed Statistic**—The error statistic type for the low speed 125 Mbps secondary rings with MUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).
- **High Speed Statistic**—The error statistic type for the high-speed 1 Gbps primary ring with MUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).
- **Misc Speed Statistic**—The miscellaneous error statistic type.
- **Bus A**—The number of occurrences of the type of error displayed in the Statistic column for the IMT bus A.

- **Bus B**—The number of occurrences of the type of error displayed in the Statistic column for the IMT bus B.

rept-imt-lvl1

Use this command to display IMT level 1 statistics for a card or a range of cards. A summary report of totals for all cards is also generated.

Parameters

e (optional)

End address. The IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see [Table 4-46](#) to map the values by card location).

Range:

0 - 251

The value can be specified in decimal (0-251 or hexadecimal (h'00 – h'fe)

Default:

If the s parameter is specified, the default value is the s parameter value.

If the s parameter is not specified, the e parameter cannot be specified and the s loc parameter must be specified.

e loc (optional)

End location. The card location of the last card in the range.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

If s loc is specified—current s loc value; displays information for one card

If s loc is not specified— 1115, which corresponds to IMT address 251 (e=251); displays information for entire range of locations.

eshe lf (optional)

End Shelf location. The shelf location of the last shelf in the range.

Range:

1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default:

if the `ssheLf` parameter is specified—current `ssheLf` value

if the `ssheLf` parameter is not specified— `6100`, which displays information for entire range of shelves

filter (optional)

The filter that determines the information that is displayed in the report.

Range:***error***

display all error counts

perf

display performance counts

erroronly

display non-zero error counts

full

display zero and non-zero error counts and performance counts

Default:

full

hs (optional)

This parameter specifies whether to include High Speed interface counts in the report.

Range:***no***

do not include High Speed interface counts

yes

include High Speed interface counts

Default:

no

r (optional)

Report type value

Range:***full***

Displays information for each card along with a summary report.

stats

Displays only individual card statistics.

summary

Displays the summary portion of the report.

Default:

full

s (optional)

Start address. The IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see [Table 4-46](#) to map the values by card location).

Range:

0 - 251

The value can be specified in decimal (0-251) or hexadecimal (h'00 – h'fb)

sloc (optional)

Start location. The card location of the first card in the range.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

If e loc is specified—current e loc value

If e loc is not specified— 1201, which corresponds to IMT address 0 (s=0).

sshelf (optional)

Start Shelf location. The shelf location of the first shelf in the range.

Note

This parameter specified alone is the equivalent to specifying the IMT address range. For example, "sshelf=1200" is equivalent to specifying the IMT address range as "s=h'00:e=h'0f".

Range:

1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Default:

if the eshe lf parameter is specified—the current eshe lf value

if the eshe lf parameter is not specified— 1100, which displays information for the entire range of shelves

trm (optional)

This parameter specifies the terminal port where the report is sent.

Range:

1 - 40

Default:

Report displays on the terminal where the command was issued

Example

This example requests low speed interface counts.

```
rept-imt-lvl1:s=h'00:e=h'00
```

This example requests a summary report of low speed interface counts.

```
rept-imt-lvl1:s=h'00:e=h'00:r=summary
```

This example requests low speed interface counts.

```
rept-imt-lvl1:sshe1f=1200
```

This example requests low speed interface counts for individual cards.

```
rept-imt-lvl1:sshe1f=1200:r=stats
```

This example requests low speed and high speed interface counts.

```
rept-imt-lvl1:sshe1f=1200:hs=yes
```

This example requests low speed and high speed interface counts.

```
rept-imt-lvl1:s=h'00:e=h'00:hs=yes
```

This example requests an error report for non-zero error counts.

```
rept-imt-lvl1:s=h'00:e=h'00:filter=error-only
```

This example requests an error report for zero and non-zero error counts.

```
rept-imt-lvl1:s=h'00:e=h'00:filter=error
```

Dependencies

Only one report status command can be in progress at a time.

The s, sloc, or sshe1f parameter must be specified in the command.

This command cannot be entered during IMT statistics collection following an hourly boundary.

The command cannot be entered if the clr-imt-stats, rept-imt-info, rept-imt-lvl2, or tst-imt command is running.

Only one of the sloc/eloc, s/e, and sshe1f/eshe1f parameter combinations can be specified in the command.

A card location that is valid and defined in the database must be specified.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

[Table 4-46](#) maps each card location to the decimal and hexadecimal [Converting ITU National Point Code Formats](#) values that can be specified for the s and e parameters.

Table 4-46 Hexadecimal/Decimal Values for s and e Parameters

Low speed ring counts and performance counts

If an HMUX card is not present in the shelf, then HMUX low speed ring counts are not displayed. If HIPR or HIPR2 cards are not present in the shelf, then performance counts are not displayed.

[Table 4-47](#) describes the statistics that are shown in the report for each card and in the Summary of totals for all requested cards, and their possible causes and corrective actions.

These statistics are displayed when the `rept-imt-lvl1:sloc=xxxx:eloc=yyyy:r=full` command is entered.

Table 4-47 Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Rx CRC Error	Receive CRC error: Bad Checksum in received IMT packet. Caused by corrupted data within the received packet. Detected by hardware.	Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system. Indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact Customer Care Center.
Rx Format Error	Receive Format Error: Occurs when the End of Message byte of an IMT packet is found missing. Detected by hardware.	Service/Maintenance activity: Card insertion, removal, or boot. Does not occur in a normal system. Indicates a hardware failure: defective LIM card, MUX card, FC cable or backplane.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact Customer Care Center.
Rx Inv Len	Receive Packet with Invalid Length: Card received an IMT packet where the actual length of the packet did not match the length indicated in the length field. Detected by software	Software defect. Does not occur in a normal system.	Contact Customer Care Center.
Rx FIFO Half Full	Receive FIFO Half Full: Watermark indication that this interface receiving data off the TAXI line has received substantial traffic.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication; no action required.

Table 4-47 (Cont.) Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Rx FIFO Full	Receive FIFO Full: Watermark indication that this interface receiving data off the TAXI line is receiving traffic in excess of what it can handle. Some traffic will have been discarded. May cause retransmissions, CRC errors and Format errors. Detected by hardware	Relatively heavy traffic on this interface can cause these counts to increment. Seeing these counts in the field may indicate a software problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact the Customer Care Center.
CPU Rx FIFO Half Full	CPU Receive FIFO Half Full: Communication CPU on the card is becoming congested. Detected by hardware. This stat is only meaningful for cards that contain a BPxxxx GPL.	Relatively heavy traffic on this interface can cause these counts to increment. May indicate a SW problem.	None: FIFO Half Full is an indication; no action required.
CPU Rx FIFO Full	CPU Receive FIFO Full: Communication CPU on the card is becoming congested. Data has been dropped. May cause retransmissions, format and large packet errors. Detected by hardware. This stat is only meaningful for cards that contain a BPxxxx GPL.	Relatively heavy traffic on this interface can cause these counts to increment. May indicate a SW problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact Customer Care Center.
CPU Rx MSU FIFO Full	CPU Receive MSU FIFO Full: Watermark indication that the MSU traffic is in excess of what the card can handle. Traffic will have been discarded. Expect retransmissions and possibly other errors. This stat is only meaningful for cards that contain the IMTPCI GPL; the FIFO stores data determined to be a MSU with no CRC error.	Relatively heavy traffic on this interface can cause these counts to increment. May indicate a SW problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue is present. Contact Customer Care Center.

Table 4-47 (Cont.) Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
CPU Rx LSSU FIFO Full	CPU Receive LSSU FIFO Full: Watermark indication that the LSSU traffic is in excess of what the card can handle. This stat is only meaningful for cards that contain the IMTPCI GPL; the FIFO stores data determined to be a LSSU with no CRC error.	May indicate a hardware failure (i.e.: a defective board), although a software issue is also possible.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.
CPU Rx XSU FIFO Full	CPU Receive XSU FIFO Full: Watermark indication that the XSU traffic is in excess of what the card can handle. This stat is only meaningful for cards that contain the IMTPCI GPL; the FIFO stores data determined not to be a MSU, LSSU or ASU, and no CRC error. Data internal to this card has been lost.	Relatively heavy traffic on this interface can cause these counts to increment.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.
ASU Rx FIFO Half Full	CPU Receive ASU FIFO Half Full: Watermark indication that this interface has received substantial ASU traffic. This stat is only meaningful for cards that contain a BPxxxx GPL; the FIFO stores data determined to be an ASU with no CRC error.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action required.

Table 4-47 (Cont.) Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
ASU Rx FIFO Full	CPU Receive ASU FIFO Full: Watermark indication that the ASU traffic is in excess of what the card can handle. ASUs will have been lost resulting in retransmission and other possible LVL1 errors. This stat is only meaningful for cards that contain a BPxxxx or IMTPCI GPL; the FIFO stores data determined to be an ASU with no CRC error.	Relatively heavy traffic on this interface can cause these counts to increment. Seeing these counts in the field may indicate a software problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a hardware issue exists. Contact Customer Care Center.
SSU Packet Rx	Safety Packets Received: This message type detects the loss of a card in the system if virtual connections between cards are lost.	Card insertion, removal, or boot, heavy traffic, abnormal conditions and/or software/hardware problems can result in these packets being generated.	None. These counts are an indication. No action required.
ASU Safety Pkt	ASU Safety Packets: ASU Unit has timed out on the IMT.	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
TSU Safety Pkt	TSU Safety Packets: TSU Unit has timed out on the IMT	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
BSU Safety Pkt	BSU Safety Packets: BSU Unit has timed out on the IMT.	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
SSU Safety Pkt	SSU Safety Packets: SSU Unit has timed out on the IMT	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
Other Safety Pkt	Other Safety Packets Received: Possible message types are MSU, DSU, ISU, and/or HSU.	Card insertion, removal, or boot	None. These counts are only an indication. No action required.
Pri Ctrl Rx Error	Primary control receive error: Corrupted packet received. Detected by hardware	Card insertion, removal, or boot	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.

Table 4-47 (Cont.) Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Pri Ctrl Sanity Err	Primary Control Sanity Error: Internal hardware monitoring self check failed. Detected by hardware	Indicates that the hardware receive logic was unable to successfully process the incoming packet. May indicate a hardware problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
RX HW flow control event	Indicates the number of times the HW RX FIFO's backed up to a point to request the other end to HOLD until room is made available in the RX FIFO. Counts in the MUX column indicate the receiver was backed up on the MUX. Counts in the COM side indicate the LIM receiver was backed up.	Does not indicate a problem just an indication of low level congestion. Should excessive counts be seen it could indicate a problem.	None. RX HW flow control event is an indication. No action is required.
Pri Ctrl No SOM	Primary Control No Start of Message Error: Incoming data was detected without a start of message (SOM.) This stat is only meaningful for cards that contain a BPxxxx GPL.	Card insertion, removal, or boot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Pri Ctrl Tx Err	Primary Control Transmit Error: Transmit logic encountered a problem sending a packet. Detected by hardware. This stat is only meaningful for application cards.	Card insertion, removal, or boot.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Tx FIFO Half Full	Transmit FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage. This stat is only meaningful for MUX card columns.	Indicates that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is an indication. No action is required.

Table 4-47 (Cont.) Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Tx FIFO Full	Transmit FIFO Full: The FIFO has overflowed and data has been lost. This stat is only meaningful for MUX card columns.	Relatively heavy traffic on this interface can cause these counts to increment. May indicate a software problem	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Future Field	Reserved	Reserved	Reserved
Future Field	Reserved	Reserved	Reserved
IMT Tx FIFO Half Full	Transmit FIFO Half Full: Watermark indication that this interface is backed up through ½ of its available storage. This stat is only meaningful for MUX card columns.	Indicates that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is just an indication; no action is required.
IMT Tx FIFO Full	Transmit FIFO Full: The FIFO has overflowed and data has been lost. This stat is only meaningful for MUX card columns.	May indicate a software problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Tx FIFO 3/4 Full	Reserved	Reserved	Reserved
IMT By-pass FIFO Half Full	Watermark indication that this interface has backed to fill half on the FIFO. This stat is only meaningful for cards that contain a BLMCAP GPL.	May indicate that data was transmitted at a relatively high rate for a short period.	None. FIFO Half Full is an indication. No action is required.
IMT By-pass FIFO Full	By-pass FIFO overflowed data has been lost. This stat is only meaningful for cards that contain a BLMCAP GPL.	Very little if any data flows through this FIFO. May indicate a hardware problem	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center. The card may need to be replaced.
Pass thru CRC Error	Reserved	Reserved	Reserved

Table 4-47 (Cont.) Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Lost Multicast Pkt	Lost Multicast Packets: This counter increments when the interface detects that one of these packets has not been delivered to a card in the list. This stat is only meaningful for application card columns.	Card insertion, removal, or boot. These events may indicate a software problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Invalid Interrupt	The interface generated a spurious interrupt. This stat is only meaningful for cards that contain an IMTPCI GPL.	May indicate a software or hardware defect.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center. The card may need to be replaced.
Error Int Overflow	Deprecated	Deprecated	Deprecated
Large Pkt Error	Large Packet Error: The interface has detected packets larger than allowed in the data stream. This stat is meaningful for all cards except those containing the IMTPCI GPL.	Card insertion, removal, boot, or a hardware error. May indicate a hardware problem.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
MSU Retran / MUX LVL1 Cong	COM - Retransmissions occur when a transmitted MSU does not receive an acknowledgment (ASU) within an engineered timeout value. Detected by software. This stat is only meaningful for application cards. MUX - Count of occurrences that the MUX has reached level 1 congestion on the transmit path to the LIM (works in conjunction with MFC)	COM - Card insertion, removal, or boot. May indicate hardware, software or configuration problems. MUX - Nothing specific to do except for monitor for excessive counts	COM - Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center. MUX - Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.

Table 4-47 (Cont.) Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
MSU ROE / MUX LVL2 Cong	COM - MSU Returned On Error: Number of MSUs returned to the application as undeliverable. Each application is responsible for indicating their need for MSUs to be returned if undeliverable. This count is for messages that the application has deemed important and requested that they be returned if undeliverable. Detected by software. MUX - Count of occurrences that the MUX has reached level 2 congestion on the transmit path to the LIM (works in conjunction with MFC)	COM - Destination card is not available to receive packets. MUX - Nothing specific to do except monitor for excessive counts	COM - None. MSU Returned on Error is an indication. No action is required. MUX - Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
VC OS Cnt / MUX Cong Disc	COM - Virtual Circuit Out of Service Count: Count of times a Virtual Circuit (VC) on this card has gone Out of Service. Note: The A and B bus counts will be the same. For the VC to drop, communications on both busses must be lost. This stat is only meaningful for application cards. MUX - Count of occurrences that the MUX has reached congestion discard on the transmit path to the LIM. More data is being delivered to the transmit queue than can be transmitted to the slot/ LIM.	COM - Destination card is not available to receive packets, or software/hardware errors that cause the virtual connection(s) to be dropped. Could occur during normal maintenance (card replacement/upgrades, or booting). MUX - Packets are being dropped or re-transmitted internally. This should not occur.	COM - Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center. MUX - Contact Customer Care Center.

Table 4-47 (Cont.) Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
Bus Disconnect Count	Bus Disconnect Count: Counts the times that the card has been disconnected from the bus. Note: The A and B bus counts can be different. This stat is only meaningful for application cards.	Any event that disconnects the card from the bus can cause this counter to increment (e.g. connectivity problems to the IMT bus, or issuing the <code>disc-imt</code> or <code>inh-imt</code> command)	If commands that disconnect the card from the bus have not been issued, clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Violation Error	Received an illegal character from the physical IMT transport (TAXI Interface). Detected by hardware	Card insertion, removal, or boot or defective hardware	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue, a problem may exist. Contact Customer Care Center.
Info: MSU Dropped no Rept	MSU Dropped With No Report: Number of undeliverable MSUs that are not being returned to the application. Note: This statistic may be non-zero after executing the <code>rept-imt-lvl1</code> or <code>clr-imt-stats</code> command. During execution of these commands, the active MASP generates MSUs to unpopulated card slots. These MSUs result in an "MSU Dropped With No Report" count. To determine the number of unexpected "MSU Dropped With No Report" occurrences, the active MASP must be excluded from the <code>rept-imt-lvl1</code> card range.	Destination card is not available to receive packets.	None. MSU Dropped is an indication. No action is required.
GBSU Resync	The count of how many times the GBSU receive sequence numbers have been resynchronized	These counts will occur on new card insertions, removals, boots, or a hardware error.	None. GBSU Resync is an indication. No action required.

Table 4-47 (Cont.) Level 1 IMT Statistics

IMT Statistic	Explanation Of Statistic	Probable Causes	Recommended Action
GBSU Invalid Seq	The count of how many times a cards received a GBSU out of sequence.	This is unlikely but could occur on one bus (GBSU lost) and not the other bus.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear there is no action to perform. If stats continue to increase (and there are no booting cards), it is possible that the card's Dynamic Database may be inconsistent. Review the DDB status and if an issue exists, contact My Oracle Support.
GBSU Lost Packet	The count of lost GBSU packets in the system (This is received, not sent). In a clean system with counts cleared this count should stay at 0x00.	GBSUs may be occasionally lost in a congested system.	Use the LVL2 stats to determine/find the path of the lost GBSU. Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear there is no action to perform. If stats continue to increase (and there are no booting cards), there could be a problem with the system. Contact the My Oracle Support.
GBSU RX GRP Discard	This count reflects the amount of overhead that the GBSU logic adds to these cards , and it is the number of GBSU's sent to this card that the card was not subscribed for.	GBSU Discards are normal events.	None. GBSU RX GRP Discard is an indication. No action required.

Level 1 IMT Statistics, Low Speed Performance Counts

The probable cause for all Level 1 IMT Statistics, Low Speed Performance Counts is normal behavior. These counts are information only, and no action is required.

These statistics are displayed when the `rept -imt -lvl1:slc=xxxx:elc=yyyy:r=full` command is entered.

- All Packets—Number of packets transmitted on the IMT, all types
- All bytes—Number of bytes transmitted on the IMT, all types
- MSU Packets—Number of reliable delivery message data packets transmitted on the IMT
- MSU Bytes—Number of reliable delivery message data bytes transmitted on the IMT
- ASU Packets—Number of acknowledgment packets transmitted on the IMT
- ASU Bytes—Number of acknowledgment bytes transmitted on the IMT
- DSU Bytes—Number of best effort delivery message data bytes transmitted on the IMT

- HSU Packets—Number of mux card data packets transmitted on the IMT
- HSU Bytes—Number of mux card data bytes transmitted on the IMT
- TSU Bytes—Number of test bytes transmitted on the IMT
- TSU Packets—Number of test packets transmitted on the IMT
- LSSU Packets—Number of virtual circuit alignment packets transmitted on the IMT
- LSSU Bytes—Number of virtual circuit alignment bytes transmitted on the IMT
- BSU Packets—Number of broadcast data packets transmitted on the IMT
- BSU Bytes—Number of broadcast data bytes transmitted on the IMT
- SSU Packets—Number of Safety packets transmitted on the IMT
- SSU Bytes—Number of safety bytes transmitted on the IMT
- Othr Packets—Number of all packets types not counted by one of the above
- Othr Bytes—Number of all data bytes not counted by one of the above
- TAXI Util—Approximate percentage utilization of Low Speed data bus

High Speed Error Summary for Level 1 IMT Statistics

[Table 4-48](#) displays the High Speed Error Summary for Level 1 IMT Statistics.

These statistics are displayed when the `rept -imt -lvl1:slc=xxxx:elc=yyyy:r=full` command is entered.

Table 4-48 Level 1 IMT Statistics, High Speed Error Summary

Stat Label	Explanation of Stat	Probable Cause	Recommended Action
HS Rx Packet CRC Error	Fibre Channel Receive Packet with CRC Errors: Checksum error in received packet. Caused by corrupted data.	May indicate a hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact My Oracle Support.
HS Rx Packet Format Error	Fibre Channel Receive Packet with Format Errors: Format error in received packet. Usually caused by corrupted data.	May indicate a hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact My Oracle Support.
HS Rx Disparity Error	Fibre Channel Receive Packet with Disparity Errors: Error in received packet. Caused by corrupted data.	May indicate a hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact My Oracle Support.

Table 4-48 (Cont.) Level 1 IMT Statistics, High Speed Error Summary

Stat Label	Explanation of Stat	Probable Cause	Recommended Action
HS Rx Sync Lost Error	Fibre Channel Receive Lost Synchronization Errors: The interface lost sync on the received stream.	May indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact My Oracle Support.
HS Rx Code Word Error	Fibre Channel Receive code Word Errors: Error in received packet. Caused by corrupted data.	May indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact My Oracle Support.
HS Rx Packet SOM Before EOM	Fibre Channel Receive Packet with Start of Message without a previous End of Message Errors: The software received detected the start of a new packet before the end of the previous packet was detected.	May indicate a hardware failure.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact My Oracle Support.
HS Bypass FIFO Half Full	Fibre Channel Bypass FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.
HS Bypass FIFO Full	Fibre Channel Bypass FIFO Full: The FIFO has over run and data has been lost. May result is significant downstream errors.	Indicates a software or hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact My Oracle Support.
HS Rx FIFO Half Full	Fibre Channel Receive FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.

Table 4-48 (Cont.) Level 1 IMT Statistics, High Speed Error Summary

Stat Label	Explanation of Stat	Probable Cause	Recommended Action
HS Rx FIFO Full	Fibre Channel Receive FIFO Full: The FIFO has over run and data has been lost. May result in significant downstream errors.	Indicates a software or hardware failure	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact My Oracle Support.
HS Tx FIFO Half Full	Fibre Channel Transmit FIFO Half Full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.
HS Tx FIFO Full	Fibre Channel Transmit FIFO Full: Watermark indication that this interface has transmitted substantial traffic.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Full is an indication. No action is required.
IXP RX FIFO Half Full	Fibre Channel IXP Receive FIFO Half full: Watermark indication that this interface has backed up to the half way point of its capabilities.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Half Full is an indication. No action is required.
IXP Rx FIFO Full	Fibre Channel IXP Receive FIFO Full: The IXP Rx FIFO momentarily became full. This event can occur under normal conditions and it does not indicate an issue.	Relatively heavy traffic on this interface can cause these counts to increment.	None. FIFO Full is an indication. No action is required.
HS RX Large PKT Discard	A packet larger than allowed was processed on the receive path of the Fibre Channel. May result in significant downstream errors.	Indicates a software or hardware failure, unless the BUS is being brought up or being taken down.	Clear IMT stats, wait 1 hour and retrieve stats again. If stats are clear, there is no action to perform. If errors continue a problem may exist. Contact My Oracle Support.

Note

In the top portion of this sample output "Error Counts" there are three types of possible output for each field:

- 1) A decimal number (indicates a count)
- 2) “—” (indicates NO DATA)
- 3) “N/A” (indicates this field is not supported)

Legend

- **Card**—IMT address of the card in hexadecimal
- **Elapsed Time (day - h:m:s)**—Amount of time that has elapsed since a card reset has occurred or the IMT statistics were cleared with the `clr-imt-stats` command. This is shown in the format *day - h:m:s*, where *day* is the number of days that have elapsed, and *h:m:s* is the amount of time in the current day in hours, minutes, and seconds (and tenths of seconds).
- **"--"--"** in the statistics column signifies that the statistics count is not applicable for the corresponding Card type.
- **Error Count**—IMT level 1 error statistics displayed in this report.
- **Perf Count**—IMT level 1 performance statistics displayed in this report.
- **A Bus value** and **B Bus value**—Values of the IMT level 1 statistics on IMT bus A and IMT bus B. Refer to the Notes section for descriptions of the statistics that are shown in the report for each card and in the Summary of totals for all requested cards, and their possible causes and corrective actions. Contact My Oracle Support if the count is excessive in relation to other cards.

"Excessive" count is primarily determined by the operator based upon:

- Overall system behavior
- Duration of time from when the last statistics were taken
- Statistics of an individual card in relation to other cards

The following types of Packets are included in the counts:

- **Safety Packet**—When an IMT packet goes around the IMT, a pre-determined value in the packet is decremented by each card. When this value reaches zero, the card that receives the value equal to zero logs this as a safety packet and removes the IMT packet from the IMT.
- **Message Signaling Unit (MSU)**—IMT packet containing data
- **Acknowledgement Signaling Unit (ASU)**—ACK for an MSU that is sent from the destination card back to the originating card.
- **Test Signaling Unit (TSU)**—Typically used to keep the card on the bus. There are many types of TSUs one of which performs a heartbeat function.
- **Broadcast Signaling Unit (BSU)**—Function is the same as an MSU except that each card will process the BSU and then copy it to the next card for processing. Used for IMT maintenance functions.
- **Safety Signaling Unit (SSU)**—Anytime a packet times out (Safety Packet), the card that logged a safety packet sends an SSU to make sure the original destination card is still on the IMT bus.
- **Isolation Signaling Unit (ISU)**—These are only used by the Fault Isolation test (`tst-imt`), in an attempt to isolate a hard failure on an IMT bus.
- **Other Packets and Other Bytes**—These include the ISUs when Fault Isolation test (`tst-imt`) is run (IMT bus is inhibited).
- **GBSU**—GBSU Lost Packet and GBSU RX GRP Discard.

rept-imt-lvl2

Use this command to display IMT level 2 statistics for a card. This report displays IMT traffic statistics for one or both IMT busses in the system. The report can be filtered as follows:

- Report statistics between the source card (specified with the `l`oc or `l` parameter), whose statistics pool is queried for report information, and another card (specified with the `s` `l`oc or `s` parameter).
- Report statistics between the source card and a range of cards (specified with the `s` `l`oc/`e` `l`oc or `s`/`e` parameter combination).

Parameters

b (optional)

IMT bus identification.

Range:

a

Displays statistics for IMT bus A.

b

Displays statistics for IMT bus B.

both

Displays statistics for both IMT busses, A and B.

Default:

both

e (optional)

End address. The IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see [Table 4-46](#) to map the values by card location).

Range:

0 - 251

The value can be specified in decimal (0 – 251) or hexadecimal (*h'00 – h'fe*).

Default:

If the `s` parameter is specified, the default is the `s` parameter value.

If the `s` parameter is not specified, the default is 251.

eLoc (optional)

End location. Specifies the card location of the last card in the range.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

If sLoc is specified—current sLoc value; displays information for one card.

If sLoc is not specified— 1115, which corresponds to IMT address 251 (e=251); displays information for entire range of locations.

l (optional)

Source card IMT address. The IMT address of the card whose statistics pool is to be queried for report information.

Range:

0 - 251

Loc (optional)

Source card location. The location of the card whose statistics pool is to be queried for report information.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

s (optional)

Start address. The IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see [Table 4-46](#) to map the values by card location).

Range:

0 - 251

The value can be specified in decimal (0 – 251) or hexadecimal (h'00 – h'fe)

Default:

If e is specified—current l parameter value.

If e is not specified— 0.

sLoc (optional)

Start location. The card location of the first card in the range.

Range:

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

If e loc is specified—current sloc value.

If e loc is not specified—IMT address 0 (s=0).

trm (optional)

Serial port (printer location) where the report is to be sent.

Range:

1 - 40

Default:

The report displays on the terminal where the command was issued.

Example

```
rept-imt-lvl2:l=00:s=00:e=02:b=a
```

Dependencies

The s/e parameters and sloc/eloc parameters cannot be specified together in the command.

This command cannot be entered if the clr-imt-stats, rept-imt-info, rept-imt-lvl1, or tst-imt command is running.

The l or loc parameter must be specified.

This command cannot be entered during IMT statistics collection following an hourly boundary.

The l parameter or the loc parameter must be specified. Both parameters cannot be specified.

A card location must be specified that is valid and defined in the database.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

[Table 4-46](#) maps each card location to the decimal and hexadecimal values that can be specified for the s and e parameters.

[Table 40](#) maps each card location to the decimal and hexadecimal values that can be specified for the s and e parameters.

Output

If the source card location falls within the range of cards specified with the sloc/eloc or s/e parameters, then the output report for the source card shows zeros. The zeros are reported because the source card location does not use the IMT to communicate with itself and, therefore, does not report any values or pegs for traffic routed to itself. This command reports the values or pegs received, transmitted, or re-transmitted across the IMT bus.

Legend

- **Card**—IMT address of the card location specified by the **l** parameter in this command in hexadecimal

- **Bus**—IMT bus for which the IMT level 2 statistics are being reported
- **Field**—IMT level 2 statistics displayed in this report
- **00 - ef**—IMT address of the cards on the IMT bus in hexadecimal
- **Link Status**—Status of the link: ALGN (aligned) or OS (out of service)
- **OS Count**—Number of times the link has cycled between being aligned and being out of service
- **Transmit BSN**—Number of BSNs transmitted.
- **Transmit FSN**—Number of FSNs transmitted
- **Receive BSN**—Number of BSNs received
- **Receive FSN**—Sequence number for the next FSN that the source card location expects to receive
- **Unack Messages**—Number of unacknowledged messages received
- **Invalid Length**—Number of messages received with invalid length indicators
- **Invalid rx BSN**—Number of invalid BSNs received
- **Invalid rx FSN**—Number of invalid FSNs received
- **Invalid LSSU**—Number of invalid LSSUs received
- **Invalid ASU**—Number of invalid ASUs received
- **RTB Address**—Address of the retransmission buffer, in hexadecimal
- **Retx count**—Number of re-transmitted MSUs
- **Minimum ack time**—Minimum amount of time for an acknowledgment, in milliseconds
- **Maximum ack time**—Maximum amount of time for an acknowledgment, in milliseconds
- **GBSU sync count**— The count of how many times the GBSU sequence numbers have been resynced (This is received, not sent)
- **GBSU seq err**— The count of how many times a cards received a GBSU out of sequence
- **GBSU lost pkt**—The count of lost GBSU packets in the system (This is received, not sent)

rept-meas

Use this command to generate measurement reports on demand. The reports display on the UI terminal, and are not transferred to the customer FTP server when the Measurements Platform feature is enabled.

Parameters

ent type (mandatory)

Entity type to report on.

Range:

idpr

Measurements for IDPR

link

Measurements for signaling links

lnkset

Measurements for linksets

lnp

Measurements for local number portability

lsdestni

Measurements for linkset destination network identifiers

lsonismt

Measurements for ISUP message type screening

lsorigni

Measurements for linkset originating network identifiers

mapscrn

Measurements for GSM MAP message screening

origni

Measurements for originating network identifiers greater than 5

origininc

Measurements for originating network identifiers (less than 5, small networks) for network clusters

sctpasoc

Measurements per association for the SCTP protocol (used to carry M3UA, M2PA, SUA and DIAM traffic)

sctpcard

Measurements per card for the SCTP protocol (used to carry M3UA, M2PA, SUA and DIAM traffic)

sip

Measurements for SIP

stp

Measurements pertaining to the Signaling Transfer Point in general or summarized totals recorded on the STP

tt

Measurements for translation types

ua

Measurements per application server/association for the M3UA and SUA protocols

type (mandatory)

Type of measurement report.

Range:**avl**

Availability measurements

avld

Daily availability measurements

avldth

Day to hour availability measurements.

comp

Component measurements

gtwy

Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

mtcd

Daily maintenance measurements

mtcdth

Day-to-hour maintenance measurements

mtcs

Link/linkset maintenance status

nm

Network management, on-demand

rbase

Schedule-report type record base measurements

systot

STP system totals

aname (optional)

Association name. This parameter specifies the name assigned to the association in the IPAPSOCK table.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

asname (optional)

Application server name. The name of the application server.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter.

day (optional)

Day of the week for daily measurement reports.

Range:

mon

tue

wed

thu

fri

sat

sun

Default:

The previous single day report is generated.

hh (optional)

Half-hour interval. The ending time for the collection interval; for example, *hh=0300* generates a report for 2:30-3:00.

Range:

0000 - 2400

hhmm where *hh*= 00-24 (hour) and *mm*= 00 or 30 (minute)

Default:

The hh parameter value is not given.

link (optional)

The link on the card specified in the *loc* parameter

Synonym:

port

Range:

a, b, a1 - a31, b1 - b31

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have assigned signaling link ports.

Default:

none

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

none

lsn (optional)

Linkset name for the linkset where link or linkset measurements are reported.

Range:

aaaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

none

nc (optional)

Network cluster for the specified GTWY measurement report.

Range:

0 - 255

Default:

none

ni (optional)

Network indicator for the specified GTWY measurement report.

Range:

0 - 255

Default:

none

nzo (optional)

Print non-zero measurements only.

Range:

yes

no

Default:

yes for types *avl*, *avld*, and *avldth*.

This parameter is not used with the other report types.

period (optional)

Relative time period to report.

Range:***last***

The previous collection interval

specific

A specific half-hourly interval (specified with the hh parameter)

active

The current collection interval

all

All collection intervals.

Default:

none

qh (optional)

Quarter-hour interval. This parameter implies the ending time for the collection interval; for example, *qh=0315* generates a report for **3:00-3:15**.

Range:

0000 - 2400

hhmm where *hh*= 00-24 (hour) and *mm*= 00, 15, 30, or 45 (minute)

Default:

none

trm (optional)

Serial port (printer location) where the report is to be sent.

Range:

1 - 16

Default:

none

tt (optional)

Translation type to be reported.

Range:

0 - 255

Default:

none

Example

```
rept-meas:enttype=link:type=avl:loc=1201:link=a
```

```
rept-meas:type=systot:enttype=tt:tt=26
```

```
rept-meas:type=mtcd:enttype=sctpasoc:aname=assoc01
```

```
rept-meas:type=mtcdth:enttype=ua:aname=assoc01:asname=appserv01
```

```
rept-meas:enttype=sip:type=mtcd
```

Dependencies

This command cannot be used to specify a report type if that report type is currently printing.

Valid parameter combinations depend on the report type specified. These combinations are shown in [Table 4-49](#). An X in a cell indicates that the parameter is valid for the report type shown.

Table 4-49 Valid Parameter Combinations for the type Parameter

Parameter Value	Report Types (type parameter)											
	systot	comp	mtcd	mtcdth	mtch	mtcs	nm	avl	avld	avldth	gtwy	rbase
enttype:												
link		X	X	X		X	X	X	X	X		X
linkset		X	X	X		X	X				X	X
lnp			X		X							
lsdestni											X	
lsonismt											X	
lsorigni											X	
mapscrn			X		X							
origni											X	
origininc											X	
sctpcasc		X	X	X								
sctpcard		X	X	X								
sip	X		X									
stp	X		X	X		X					X	X
tt	X											
ua		X	X	X								
period:												
last	X	X	X	X	X		X	X	X	X	X	
specific	X	X			X			X			X	
active		X				X	X	X				X
all			X					X				
nzo								X	X	X		

The entity specified by the `loc` parameter must be equipped in the database.

When `enttype=link` is specified, the card in the location specified by the `loc` parameter must be a LIM.

Quarter-hourly collection and report processing cannot be in progress when report type `comp`, `systot`, `avl`, or `gtwy` is specified.

The `mtcdth` report type is unavailable between midnight and 1:00 AM (0100).

Day-to-hour collection and report processing cannot be in progress when report type *mtcd* or *mtcdth* is specified.

Daily collection and report processing cannot be in progress when report type *mtcd* is specified.

Half-hourly collection and report processing cannot be in progress when report type *comp*, *systot*, *avl*, or *gtwy* is specified.

5-minute collection and report processing cannot be in progress when report type *nm* is specified.

If the *nc* parameter is specified for origin reports, then the *ni* parameter must be specified.

If the *ni* parameter is specified for origin reports, then measurements data must be available at the time the command is entered.

The **day** parameter can be specified only for report type *mtcd* and entity types *lnp* and *mapscrn*.

A primary MCPM card must be available when the Measurements Platform collection option is enabled and this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option must be on before the *qh* parameter can be specified.

The *hh* parameter must specify a half-hourly boundary (the end of the requested half-hour for the report) for valid report types.

The *hh* and *qh* parameters cannot be specified together in the command.

When the *period=last* parameter is specified, the *hh*, *qh*, and *day* parameters cannot be specified.

If the *period=active* parameter is specified, then the *hh* and *qh* parameters cannot be specified.

When the *period=specific* parameter is specified, the *hh*, *qh*, or *day* parameter must be specified. The *hh*, *qh*, and *day* parameters can be specified only if the *period=specific* parameter is specified.

A quarter-hour boundary must be specified for the *qh* parameter.

The *hh* and *qh* parameters cannot be specified if a value of *avld*, *mtcd*, *nm*, *rbase*, or *mtcs* is specified for the *type* parameter.

If the *link* parameter is specified, the *loc* parameter must be specified.

The *lsn* and *loc* parameters cannot be specified together in the command.

If the *enttype=link* parameter is specified, then the *loc* and *port* parameters or the *lsn* parameter must be specified.

The *period=active* parameter cannot be specified when the *enttype=stp* parameter or the *enttype=tt* parameter is specified.

If a value of *idpr*, *origni*, *origininc*, *stp*, or *tt* is specified for the *enttype* parameter, or if the *type=systot* parameter is specified, then the *lsn* parameter cannot be specified.

For entity type *avl*, if *period=all* is specified, the *loc* and *port* parameters must be specified.

A value of *avl*, *avld*, or *avldth* must be specified for the *type* parameter before the *nzo=yes* parameter can be specified.

The *appl* and *loc* parameters cannot be specified in the same command.

The *type=systot* and *loc* parameters cannot be specified in the same command.

If the *type=gtwy* parameter is specified, and the value of the *enttype* parameter is *Isorigni*, *Isdestni*, or *Isonismt*, then the *ni* parameter cannot be specified for ITU linksets. The *ni* parameter is allowed only for ANSI linksets.

If the *type=gtwy* parameter is specified, and a value of *Isdestni*, *Isonismt*, or *Isorigni* is specified for the *enttype* parameter for an ITU linkset, then only the *lsn* parameter can be specified.

If the *enttype=sctpcard* parameter is specified, then the card in the location specified by the *loc* parameter must be an IPLIMx, IPGWx, or IPSG card.

The *enttype=sctpasoc* or *enttype=ua* parameter must be specified before the *aname* parameter can be specified.

The *enttype=ua* parameter must be specified before the *asname* parameter can be specified.

If the *enttype=sctpcard* parameter is specified, then the *loc* parameter must be specified.

If the *enttype=sctpcard* parameter is specified, then a card must be installed in the location specified by the *loc* parameter.

The *enttype=link* parameter must be specified before the *link* parameter can be specified.

The *type=gtwy* parameter and the *enttype=origininc* parameter must be specified before the *nc* parameter can be specified.

The *type=gtwy* parameter must be specified, and a value of *Isdestni*, *Isonismt*, *Isorigni*, *origni*, or *origininc* must be specified for the *enttype* parameter before the *ni* parameter can be specified.

The *enttype=tt* parameter must be specified before the *tt* parameter can be specified. If the *enttype=tt* parameter is specified, then the *tt* parameter must be specified.

If a value of *sctpasoc* or *ua* is specified for the *enttype* parameter, then the *aname* parameter must be specified.

The association specified by the *aname* parameter must be provisioned in the system.

If the *enttype=ua* parameter is specified, then the *asname* parameter must be specified.

The application server specified by the *asname* parameter must be provisioned in the system.

The association specified by the *aname* parameter must be assigned to the application server specified by the *asname* parameter.

The *lsn* and *link* parameters cannot be specified together in the command.

If the *period=all* parameter is specified, then the *hh* and *qh* parameters cannot be specified.

Either the specified Linkset does not exist or no link is configured for it.

The A-Port, G-Port, IS41 GSM Migration, or Prepaid SMS Intercept Ph1 feature must be enabled, or the INP, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be turned on before the `mtchnp=on` parameter or the `mtcdnp=on` parameter can be specified.

The value specified for the `appl` parameter must be a supported GPL.

If the `loc` parameter is specified, then a value of `,` `link`, or `sctpcard` must be specified for the `enttype` parameter. If the `enttype=lnkset` parameter is specified, then the `loc` parameter cannot be specified.

If the `enttype=link` parameter is specified, then the values specified for the `loc` and `link` parameters must already exist in the database.

Period/type combinations:

- If a value of `rbase` or `mtcs` is specified for the `type` parameter, then a value of `active` must be specified for the `period` parameter.
- If a value of `avld`, `avldth`, `mtcdth`, or `nm` is specified for the `type` parameter, then the `period=specific` parameter cannot be specified.
- If the `period=active` parameter is specified, then a value of `avld`, `avldth`, `mtcd`, `mtcdth`, or `systot` cannot be specified for the `type` parameter.
- The `type=avl` parameter must be specified before the `period=all` parameter can be specified.

SIPNP Feature must be enabled before the `enttype=sip` and `type=mtcd/systot` parameters can be specified.

The location specified must be in the range from 1101 to 6118, except for MUX cards.

If the `enttype=tt` parameter is specified, then the `tt` parameter must be specified.

The `type` parameter must be one of the AVL, AVLD, AVLDTH, COMP, GTWY, MTCD, MTCPTH, MTCS, NM, RBASE, or SYSTOT range values.

An entity type (ENTTYPE) of DEIR, EIR, or VFLX requires the DAY parameter to be specified.

Retrievals with the `rept-meas` command for `period= LAST`, `SPECIFIC`, and `ALL` are rejected by the EAGLE if either `measplat` or integrated measurements is not enabled.

This command cannot be entered when CAT2 IPSM to OAM syncing is in progress.

Notes

INP, GSM MAP Screening, LNP, G-Port, A-Port, and IGM measurements are available via FTP transfer only.

If an on-demand report is requested while the collection for that interval is in progress, the requested report will not be generated. The `rept-meas` command must be entered again.

If this command is executed, and one or more cards did not respond to the request for measurements because the card was Out-Of-Service, then the following warning message may appear:

Measurement data represents an incomplete interval

This message does not indicate that data was lost.

If this command is executed, and measurements data does not exist for the specified time, then the following message may appear:

LINK-COMP MEASUREMENT: LOC: 1201, LINK: A, LSN: (MTP2)
Measurement data are not current.

Default values are shown for LOC, LINK, and LSN. These values always appear in the message, no matter what values were specified in command.

Output

Note

Refer to *Measurements Reference* for rept -meas output examples.

rept-stat-alm

Use this command to provide status of all alarms.

Parameters

clli (optional)

CLLI string. Displays only alarms that pertain to a particular CLLI.

Range:

aaaaaaaaaaaa

dev (optional)

Device. The type of device for which alarms are displayed.

Range:

applsock

as

card

cdt

clock

dlk

ls

lsmsconn

route

slk

trm

rtx

e1port

t1port

tps

enet

display (optional)

Type of alarms to be displayed. When the `display=inhb` parameter is specified, the Alarm Inhibit Report appears in the command output and provides information about inhibited alarms in the system. The `dev` parameter can be specified with this parameter to display the Alarm Inhibit Report for a specific device type.

Range:

inhb

dur (optional)

Duration. This parameter indicates whether to display permanently inhibited alarms, temporarily inhibited alarms, or timed inhibited alarms. This parameter is valid only when the `display=inhb` parameter is specified.

Range:

perm

temp

timed

edate (optional)

Expiry date. This parameter allows the user to see timed alarm inhibits that will expire on the specified date.

Range:

101 - 991231

Specify the date in the format *year*, followed by *month*, followed by *day*.

Example

```
rept-stat-alm
```

```
rept-stat-alm:display=inhb:dev=card
```

```
rept-stat-alm:display=inhb:clli=slkset1:dev=ls
```

```
rept-stat-alm:display=inhb
```

```
rept-stat-alm:display=inhb:dur=timed
```

```
rept-stat-alm:display=inhb:dur=timed:edate=040520
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

The `dur` parameter can be specified only if the `display=inhb` parameter is specified.

The `dur`, `dev`, or `cli` parameter can be specified only if the `display=inhb` parameter is specified.

The `edate` parameter can be specified only if the `dur=timed` parameter is specified.

The `dev` parameter can have only the values `slk`, `ls`, or `route` if the `cli` parameter is specified.

The `dur` parameter must be compatible with the specified device.

The value specified for the `cli` parameter must already exist in the DSTN table.

The value specified for the `edate` parameter must be greater than the system date.

Notes

None

Output

This example shows the output when the system is clean and before a maintenance baseline has been established:

```

This example includes the Alarm Inhibit report for multiple device types. It includes point codes with point code subtype prefixes, and exception routes that require a second line of display to uniquely identify the exception class/criteria of the routes. A plus sign (+) following the alarm level indicates that the current alarm is not inhibited because the level of the inhibit is less than the level of the alarm.

Command Completed.

Legend

- **ALARM TRANSFER**—The destination of the alarms. LMC=Local Maintenance Center, RMC=Remote Maintenance Center.
- **ALARM MODE**—Displays whether the critical, major, and minor alarms are silent or audible
- **ALARM FRAME 1**—Number of critical, major, and minor alarms detected in the control frame CF-00 (frame 1)
- **ALARM FRAME 2**—Number of critical, major, and minor alarms detected in extension frame EF-00 (frame 2)
- **ALARM FRAME 3**—Number of critical, major, and minor alarms detected in extension frame EF-01 (frame 3)
- **ALARM FRAME 4**—Number of critical, major, and minor alarms detected in extension frame EF-02 (frame 4)
- **ALARM FRAME 5**—Number of critical, major, and minor alarms detected in extension frame EF-03 (frame 5)
- **ALARM FRAME 6**—Number of critical, major, and minor alarms detected in extension frame EF-04 (frame 6) and all the miscellaneous OAP alarms.
- Following list contains miscellaneous OAP alarms:
MPS_UNAVAILABLE EPAP_AVAILABLE
LSMS_Q3_ASSOC_UNAVAILABLE
LSMS_Q3_ASSOC_AVAILABLE
LSMS_Q3_ASSOC_BULK_LOAD_DONE

LSMS_Q3_ASSOC_BULK_LOAD_REQD
 SEAS_OAP_AVAILABLE
 SEAS_OAP_UNAVAIL
 SEAS_OAP_UAL_UNAVAIL
 LSMS_EMS_AGENT_UNAVAILABLE
 OAP_FILESYSTEM_FULL
 SEAS_OAP_ONE_TDM_UNAVAIL
 OAP_CONFIG_CHECKSUM_MISMATCH
 OAP_CONFIG_CHECKSUM_MATCH
 SEAS_X25_LINK_UNAVAIL
 SEAS_X25_UAL_UNAVAIL
 SEAS_X25_PVC_UNAVAIL
 SEAS_X25_PVC_SES_UNAVAIL
 SEAS_X25_LINK_AVAIL

- **PERM. INH. ALARMS**—Number of alarms that are permanently inhibited per alarm level
- **TEMP. INH. ALARMS**—Number of alarms that are temporarily inhibited per alarm level
- **TIMED. INH. ALARMS**—Number of alarms that are timed inhibited per alarm level
- **ACTIVE ALARMS**—Number of alarms still active per alarm level.
- **TOTAL ALARMS**—Total number of alarms per alarm level. The inhibited alarm count plus the active alarm count equals the total alarm count.
- **CRIT**—Critical alarms with silent/audible indicator
- **MAJOR**—Major alarms with silent/audible indicator
- **MINOR**—Minor alarms with silent/audible indicator

Alarm Inhibit Report:

- **DEVICE**—Device for which alarms are currently inhibited. Only devices that are alarm inhibited are shown.
- **ELEMENT**—Element of the device for which alarms are inhibited (such as card location, port, routing key, socket or association name)
- **DURATION**—Indicates whether the device is alarm inhibited permanently or temporarily or for a specific length of time
- **INH LVL**—Level in which devices are alarm inhibited (Critical, Major, Minor). The `inh-alm` command defaults the level to Major. Devices cannot be alarm inhibited at a critical level unless the `chg-stpopts` command's *critalminh* parameter is turned on.
- **ALM LVL**—Level of the current alarm on the device (Critical, Major, Minor). "None" indicates that there is currently no alarm on the device (DURATION should show "PERM"). A plus sign (+) seen following the alarm level indicates that the current alarm is not inhibited because the level of the inhibit is less than the level of the alarm.
- **DATE**—Date on which a timed inhibited alarm will automatically clear at the specified time
- **TIME**—Time at which a timed inhibited alarm will automatically clear on the specified date

rept-stat-applsock

Use this command to display the status of the IP application sockets.

Parameters

lhost (optional)

Local host name. The logical name assigned to the local host device.

Range:

[illegible]

A string of characters up to 60 characters in length. The first character must be a letter. Valid characters are a-z, A-Z, 0-9, - (dash), . (period)

Default:

Current value

port (optional)

The signaling link port associated with this socket.

Range:

a, b, a1..a63, b1..b63

Not all card types support all *port* parameter values.

See [Table A-1](#) for valid port parameter range values for each type of card that can have signaling links.

Default:

Current value

rhost (optional)

Remote host name. The logical name assigned to the remote host device.

Range:

a

A string of characters up to 60 characters in length. The first character must be a letter. Valid characters are a-z, A-Z, 0-9, - (dash), . (period)

Default:

Current value

sname (optional)

Socket name. The name of the IP application socket to be reported.

Range:

ayyyyyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

Default:

All IP application sockets are reported

Example

```
rept-stat-applsock
rept-stat-applsock:port=b
```

Dependencies

The name parameter value, if specified, must exist in the Socket table.

A valid value must be specified for the host parameter. If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

Notes

This command displays the primary states (PST) and the secondary state (SST). Primary states are:

- IS-NR—In-service normal
- IS-ANR—In-service abnormal (congested)
- OOS-MT—Out of service
- OOS-MT-DSBLD—Out-of-service maintenance-disabled (provisioned to be out of service by closing, prohibiting, or deactivation)

Secondary states are:

- ALMINH—Alarm inhibited
- OOS—Out-of-service
- NEA—Near-end allowed
- FEA—Far-end allowed
- NEP—Near-end prohibited
- FEP—Far-end prohibited

Output

```

rept-stat-as

Use this command to generate a report of the Application Server (AS) association status.

Parameters

aname (optional)

Association name to report on. This parameter causes the ASP states for a given association and all of the AS's that it is assigned to be displayed.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

asname (optional)

Application Server name; the AS name to report on. This parameter causes the the PST, SST, ASP state, and ASP-ID for each association in the AS to be displayed.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

Example

```
rept-stat-as
```

Dependencies

If an association is specified in the command, the specified association must exist in the AS table.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If the command is specified without a parameter, status for all AS associations is displayed.

This command displays the following states: ACTIVE, UP, DOWN, PENDING.

Output**rept-stat-as**

rept-stat-card

Use this command to display the card status and maintenance activity states. The output includes card location, the GPL version being used by the card, device type, device primary state, device secondary state, and device associated state.

Parameters

appl (optional)

Application. The status of cards running the specified application.

Range:

xyyyyyy

1 alphabetic character followed by up to 6 alphanumeric characters. Valid applications are:
atmansi —Used by E5-ATM-B cards to support ATM high-speed signaling links and T1 functions.

atmitu —Used by E5-ATM-B cards to support E1 high-speed signaling links and E1 functions.

ccs7itu —Used by E5-E1T1-B cards for ITU MTP functions.

deirhc —Used by E5-SM8G-B and SLIC cards to support the DEIR application.

elap —Used by E5-APP-B cards to support the ELAP application.

enumhc —Used by E5-SM8G-B cards to support the ENUM Mobile Number Portability and Tier One Address Resolution application.

epap —Used by E5-APP-B cards to support the EPAP application.

eroute —Used by STC cards and E5-STC cards for the EAGLE 5 Integrated Monitoring Support functions

gls —Used by E5-TSM cards for downloading gateway screening to LIM and Service Module cards

ipgwi —Used by E5-ENET-B cards for point-to-multipoint IP connectivity for ITU point codes. A maximum of 125 cards can be assigned the IPGWI application.

iplimi —Used by E5-ENET-B cards for point-to-point IP connectivity for ITU point codes

ips —Used by E5-IPSM and E5-ENET-B cards for the IP User Interface feature.

ipsg —Used by E5-ENET-B, and SLIC cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

lsms - Used by E5-APP-B cards to support LSMS application.

mcp —Used by E5-MCPM-B cards for the Measurements Platform feature.

nas - Used by E5-APP-B cards to support the NAS application.

siphc — Used by E5-SM8G-B cards to support the SIP application.

ss7ansi —Used by E5-E1T1-B cards for ANSI MTP functions

ss7ipgw —Used by E5-ENET-B cards for point-to-multipoint IP connectivity. The system allows a maximum of 125 cards to be assigned the SS7IPGW application.

switch - Used by Telco switch to add power consumed by Telco Switch to Frame Power Budget. This is not an application gpl.

vsccp —Used by Service Module cards to support EPAP-based features and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and a Service Module card is present, then normal GTT traffic is processed.

data (optional)

Data filter specification. The status of cards running the specified application with specified data.

Range:

nosccp

displays the status of a GTT-disabled IPSG card

gtt

displays the status of a GTT-enabled IPSG card and SM GTT card

Note

The data parameter is valid for IPSG and VS CCP applications only. If the data parameter is not specified, then both types of IPSG (GTT disabled and GTT enabled) cards will be displayed under `appl=ipsg`.

links (optional)

Filter specification. Report the maximum number of links, only equipped links, or only unequipped links on the card in the specified card location (loc).

Range:

all

Reports the maximum number of links available on the card in the specified loc

equip

Reports only links that are equipped

unequip

Reports only links that are unequipped

Default:

equip

loc (optional)

Card address. The card location as stenciled on the shelf of the system.

Range:

1101 - 1117, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118, 6201 - 6218, 6301 - 6318

Default:

A status of all cards is displayed.

mode (optional)

Mode. The type of report to display (full or summary).

Range:

full

Default:

A summary report is displayed.

stat (optional)

Primary state filter. This parameter cannot be used with the *loc* or *mode* parameters. This filter allows printing of cards in a specified state (all in-service cards, for example).

Range:

all

All of the primary states

alminh

Alarms inhibited

anr

In service abnormal (IS-ANR)

dsbld

Out of service maintenance disabled (OOS-MT-DSBLD)

mt

Out of service maintenance (OOS-MT)

nr

In service normal (IS-NR)

Default:

all

Example

rept-stat-card

rept-stat-card:loc=1201

```
rept-stat-card:loc=1201:mode=full
rept-stat-card:stat=alminh
rept-stat-card:appl=ss7ansi
rept-stat-card:appl=siphc
rept-stat-card:loc=1205:links=equip:mode=full
rept-stat-card:appl=epap
rept-stat-card:appl=switch
rept-stat-card:appl=elap
rept-stat-card:appl=lsms
rept-stat-card:appl=nas
rept-stat-card:appl=enumhc
rept-stat-card:appl=ipsg:data=gtt
rept-stat-card:appl=ipsg:data=nosccp
```

Dependencies

No other command can be in progress when this command is entered.

The mode parameter can be specified only when the loc parameter is specified.

Only one of the loc or stat parameters can be specified in the command.

Unless the appl=vcssp/ipsg, no other parameter can be specified with the appl parameter.

The shelf and card must be equipped.

The card location (loc) must be within the allowed range.

A valid value must be specified for the appl parameter.

The card location specified by the loc parameter must be equipped.

The data parameter is not valid with an APPL other than IPSP/VSCCP.

The data parameter can take nosccp as a value only when the APPL specified is IPSP.

Notes

LIM cards show MFC results for SNM, SCCP, EROUTE, INM and MTP3. SCCP cards show MFC results for SNM, INM and MTP3 when the mode=full and loc parameters are specified.

The status displayed is for the previous 5 minutes and the previous 24 hours.

The following MFC status codes are used: G to indicate service request GRANTED, D to indicate service request DENIED, and N to indicate NO OPERATIONAL SERVERS AVAILABLE.

This command can be canceled using the **F9** function key or the cancel-command command. See cancel-command for more information.

The mode=full parameter gives more information than the summary report.

A plus (+) symbol in the output indicates that the flash GPL currently being run has not yet been activated on the card. See the `act/init-flash` command for a list of flash GPLs.

E1 alarms are displayed in the alarm status field. When the `mode=full` parameter is specified, separate fields display status information from the UAM for each E1 interface on the card. For each E1 interface, the display shows the highest priority E1 failure that exists on that E1 card. When no E1 errors exist, the clearing E1 UAM text is displayed. When an E1 interface is not assigned to the card, no output is generated for that E1 position.

T1 alarms are displayed in the alarm status field. When the `mode=full` parameter is specified, separate fields display status information from the UAM for each T1 interface on the card. For each T1 interface, the display shows the highest priority T1 failure that exists on that T1 card. When no T1 errors exist, the clearing T1 UAM text is displayed. When an T1 interface is not assigned to the card, no output is generated for that T1 position.

If the `links=all` parameter is specified, then the maximum number of supported SS7 links on the card is displayed as shown. If the `links=unequip` parameter is specified, then the number of links displayed is equal to the maximum supported links minus the provisioned links. If the `links=equip` parameter is specified, then only the provisioned links are displayed.

Multiple cards of the same card type but different capacity can be installed into a slot configured with the `ent-card` command. The number of links supported cannot be determined until the card is physically installed into the configured slot.

Table 4-50 Maximum Supported Links based on Card Type and GPL

GPL with Card Type	Maximum Supported Links	
	Card Hardware Verified	Card Hardware Unknown
ATMHC on E5-ATM-B	3	3
SS7HC on E5-E1T1-B	64	64
IPLHC on E5-ENET-B	16	16
IPGHC on E5-ENET-B	1	1
IPSG on E5-ENET-B/SLIC	32	32
IPSG on SLIC	128	128
SIPHC on E5-SM8G-B/SLIC	17 (16 TCP & 1 UDP)	17 (16 TCP & 1 UDP)
ENUMHC on E5-SM8G-B/SLIC	1 (UDP)	1 (UDP)
DEIRHC on E5-SM8G-B/SLIC	32	32

The CARD WARNING field in the command output indicates a specific condition that can hinder the normal functioning of a card. For E5-E1T1-B cards, the "Obsolete Framer" warning indicates that a port configured on the card may get stuck in a Loss of Frame (LOF) state. If an E5-E1T1-B card displaying this warning is reloaded, and one of the ports on the card is reporting LOF, then the OAM reboots the card up to 5 times to attempt to clear the LOF condition when the card changes state from IS-ANR to IS-NR.

GTT-enabled IPSG cards have the IPSG application running on SLIC hardware, which is capable of SCCP (GTT) processing. GTT-disabled IPSG cards also have IPSG application running on E5-ENET-B or SLIC hardware, but they do not have SCCP (GTT) processing capability. To sort one from the other, the `data` parameter is used. The `data` parameter cannot be used with any application other than IPSG/VSCCP.

Interface A/D will be used for ExAP connectivity running SIP/ENUM application and interface B/C used for signaling network on the SLIC card running the DEIR/SIP/ENUM application.

Fast Copy Cards

E5-ENET-B, or SLIC cards running the IPSG or E5-ENET-B cards running the IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This restriction does not apply to cards running the IPSG GPL. An *FC-capable* card is considered *FC-enabled* when Fast Copy monitoring is enabled for the respective GPL.

Output

The clock status fields are reported when the mode=full report is selected. The clock status report includes a CLOCK A, CLOCK B, and CLOCK I status. The High Speed clock status report (displayed for ATM, E1 and T1 cards) includes HS CLOCK A, HS CLOCK B, and HS CLOCK I. The valid values for each clock status are *Idle*, *Active*, and *Fault*. The meanings of these values are:

- *Idle* —Clock is available but is not being used by the card
- *Active* —Clock is available and is being used by the card
- *Fault* —Clock is unavailable

Idle and *Active* are shown when the CLK or HS CLK distribution to the card is good. The *Active* value does not denote that the card is actually using the clock source for link alignment. Use the rtrv-slk, rtrv-e1, and rtrv-t1 commands to determine what clock source each card is using for link alignment.

If the mode=full parameter is specified for an FC-enabled card, and Fast Copy functionality has been provisioned for the GPL (see the chg-eisopts command), then Fast Copy status and FC Link status is shown. For an E5-ENET-B or SLIC card running the IPGHC GPL, Fast Copy and Fast Copy link status is shown only when the card is in IS-NR state.

Abbreviated output is indicated by 3 vertical dots as shown:

•
•
•

The E5-MCPM-B card is an MCPM card. The *Type* field displays MCPM.

Legend

- **CARD**—Location of the card
- **VERSION**—Version number of the application loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:
 - The card is configured but is not physically present in the system.
 - The card does not run a GPL, such as TDM or MDAL cards.
 - The card is IS-ANR or is in the process of being loaded.
- **TYPE**—Card type entered in the database.
- **APPL**—Application loaded on the card
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#) .
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#) .
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#) .

Message Flow Control status is displayed in these fields: SNM REQ STATUS (SNM messages), SCCP REQ STATUS (SCCP messages), EROUTE REQ STATUS (EROUTE messages), INM REQ STATUS (INM messages), MTP3 REQ STATUS (MTP3 messages), and SFLOG REQ STATUS.

For card type STC (EROUTE application), the MFC status is not displayed.

Message Flow Control status output is displayed as a series of these letters:

- **G**—MFC found a service with available capacity. Indicates normal system behavior.
- **D**—Servers were present in the system, but no server had available capacity. Indicates an overload, but MFC is working correctly.
- **N**—No operational server cards were available in the system for use by this card over the corresponding interval.

The HW VERIFICATION CODE field is shown only in the mode=full report. ----- is shown in the HW VERIFICATION CODE field for cards with valid hardware detected. One of the following numerical values is shown when invalid hardware is detected, and all such cards will be auto-inhibited.

* It is possible that the card will continually boot in these cases, before the alarm is ever displayed.

Table 4-51 Auto-Inhibit Hardware Verification Codes

HW Verification Code	Card or Application Code	Description	Associated UAM Code
058	SS7IPGW, IPGWI, IPLIMI	E5-ENET-B does not support > 16 associations (IPLIMx). E5-ENET-B does not support > 50 associations (IPGWx).	422

Table 4-51 (Cont.) Auto-Inhibit Hardware Verification Codes

HW Verification Code	Card or Application Code	Description	Associated UAM Code
059	VSCCP	MPS database has been detected to exceed capacity of Service Module extended memory (only for GPORT, GFLEX, INP, EIR features). UAMs 281, 283, and 285 are used for LNP and LNP ELAP Configuration features.	422
090	Various	Flash image on the card is incompatible with the current release of the EAGLE	570
099	E5-TSM	E5-TSM card equipped has one or more daughterboard.	99
102*	SS7IPGW, IPGWI	Non-DCM detected in slot.	99
103	SS7IPGW, IPGWI, IPLIMI	E5-ENET-B does not support >16 associations (IPLIMx). E5-ENET-B does not support >50 associations (IPGWx).	276
103	IPSG	E5-ENET-B does not support >32 associations (IPSG).	276
104	SS7IPGW, IPGWI,	E5-ENET-B does not support >0 sockets (IPLIMx). E5-ENET-B does not support >0 sockets (IPGWx).	276
105	SS7IPGW, IPGWI, IPLIMI	E5-ENET-B does not support > 0 (sockets + associations) (IPLIMx). E5-ENET-B does not support > 50 (sockets + associations) (IPGWx).	276
106	SS7IPGW, IPGWI, IPLIMI	E5-ENET-B does not support >3200Kb SCTP buffers (IPLIMx). E5-ENET-B does not support >3200Kb SCTP buffers (IPGWx).	276
132	IPLIMI	The actual card in the slot must be a high capacity MIM or LIME1 if card is provisioned as a LIME1 card.	99
136	E5-ATM-B	E5-ATM-B is provisioned	297
140	MCPHC	MCP card not running with D2G memory	422
141	IPS	E5-IPSM card not running with D2G memory.	422
142	MCP	E5-MCPM-B card not running with D4G memory.	422
150	various	Card is obsolete.	47

Table 4-51 (Cont.) Auto-Inhibit Hardware Verification Codes

HW Verification Code	Card or Application Code	Description	Associated UAM Code
165	VSCCP	Hardware configuration does not support configured feature set.	99
170	EROUTE	Non-E5-ENET-B card detected in slot provisioned for eroute with card type STC.	99
172	IPSG	Non-SLIC card detected in slot provisioned for IPSG and card type is SLIC with data=gtt.	99
174	IPSG	SLIC hardware detected having 32-bit flash GPL (BLSLC32) in a slot provisioned for IPSG and card type is SLIC with data=gtt.	99
179	E5-ATM-B, E5-ENET-B, E5-E1T1-B	EPM-B based card detected and MFC is OFF.	99
180	SCCP, SS7ANSI	SCCP card equipped with DCM with MOBR on.	441
	DEIR, ENUM, SIP	If ports C and D are configured, the card location must be populated with SLIC cards only.

rept-stat-cdl

Use this command to generate a report of the signaling links currently in Command Driven Loopback (CDL) testing, including the amount of time the link has been in CDL testing.

Command Driven Loopback is the ability to locally drive a signaling link into a manual line loopback. The data received on the signaling link is echoed (transmitted) back. This is effectively the reverse of the `tst -slk: loopback=lxvr` command, which loops the transmitted data back to the receive.

Parameters**Link (optional)**

SS7 signaling links. The signaling links that is being tested.

Synonym:*port***Range:***a, b, a1 - a31, b1 - b31*

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have assigned signaling link ports.

Default:

All signaling links that are in CDL testing are displayed.

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

All cards containing signaling links that are in CDL testing are displayed.

loopback (optional)

Loopback test type.

Range:*line**payload***Note**

The payload value is valid only on LIM-ATM and E1-ATM cards.

Default:

All loopback tests are displayed.

Example

```
rept-stat-cdl
```

```
rept-stat-cdl:loc=1201
```

```
rept-stat-cdl:loc=1203:link=a
```

```
rept-stat-cdl:loopback=payload
```

Dependencies

If the `link` parameter is specified, the `loc` parameter must be specified.

The card location specified in the `loc` parameter must be equipped.

The signaling link specified in the `link` parameter must be equipped.

This command is not available during upgrade.

The card location specified in the `loc` parameter cannot be reserved by the system.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

`rept-stat-cdl`

```
tekelecstp 03-11-27 01:29:06 EST EAGLE 31.3.0
SLK      CDL      CDL-TIME
1102,A1   LINE      00:04:01
1201,A    PAYLOAD   01:04:11
1203,A    LINE      00:22:21
1203,B    LINE      20:04:01
1208,A    LINE      01:05:22
1211,A    PAYLOAD   00:14:01
;
```

Legend

- **SLK**—The card and assigned signaling link that is in CDL testing
- **CDL**—Command Driven Loopback test type (LINE or PAYLOAD)
- **CDL-TIME**—Time that the signaling link has been in CDL testing. This value can be up to 99:59:59. The test can run longer than 100 hours, but this field will not record times longer than 100 hours.

rept-stat-cdt

Use this command to display the customer-defined troubles. The Customer-Definable Alarms feature can be used to connect up to 10 external devices to the system for alarm reporting. These devices are defined in the system database as customer-defined troubles, and they are monitored so that any change in the state of these devices is reported as an unsolicited alarm message (UAM).

Parameters

This command has no parameters.

Example

`rept-stat-cdt`

Dependencies

No other status command can be in progress when this command is entered.

Notes

These troubles are customer-defined and configured by the factory.

Output

rept-stat-cdt

```

rlghncxa03w 04-01-07 20:20:43 EST  EAGLE 31.3.0
ID          ALARM STATUS
1    *C 0058  Critical Customer Trouble detected
2    *C 0050  Critical Holdover Clock trouble detected
3    *C 0058  Critical Customer Trouble detected
4    *C 0058  Critical Customer Trouble detected
5    I ** 0059  Major Customer Trouble detected
6    ** 0052  Major Holdover Clock trouble detected
7    ** 0059  Major Customer Trouble detected
8    ** 0059  Major Customer Trouble detected
9    I * 0060  Minor Customer Trouble detected
10   * 0054  Minor Holdover Clock trouble detected
11   * 0060  Minor Customer Trouble detected
12   * 0060  Minor Customer Trouble detected
13   * 0060  Minor Customer Trouble detected
14   I * 0060  Minor Customer Trouble detected
15   * 0060  Minor Customer Trouble detected
16   * 0060  Minor Customer Trouble detected
;

```

Legend

- **ID**—The customer defined trouble ID number followed by the status of the customer-defined trouble.
- **ALARM STATUS**—The status of the alarm for the specified device.

rept-stat-clk

Use this command to display the clock status summary for cards in the system.

Parameters

mode (optional)

Display mode. When mode=full is specified, the "Cards with bad clock source" section of the report is displayed

Range:

full

Example

```
rept-stat-clk
```

```
rept-stat-clk:mode=full
```

Dependencies

No other rept-stat-xxx command can be in progress when this command is entered.

Notes

The clock status report includes the status of all the clocks in the system (Clock A, Clock B, Clock I, High Speed (HS) Clock A, HS Clock B, etc.).

The Time Slot Counter Synchronization (TSC) clock appears only if the Time Slot Counter Synchronization (TSCSYNC) feature is turned on. See the chg-feat command.

The Composite clock sections of the report are the *Primary Comp Clock (CLK)* and *Secondary Comp CLK* fields in the COMPOSITE SYSTEM CLOCK section: the summary of the number of cards having bad status or using COMP CLKs: and the *CLK* columns in the "Cards with bad clock source" section that appears when the mode=full parameter is specified.

The HS clock sections of the report are the *Primary HS Clock (CLK)*, *Secondary HS CLK*, *HS CLK TYPE*, and *HS CLK LINELEN* fields in the HIGH SPEED SYSTEM CLOCK section: the summary of the number of cards having bad status or using HS CLKs: and the *HS CLK* columns in the "Cards with bad clock source" section that appears when the mode=full parameter is specified.

HS clock capable cards can support a link that is provisioned to use HS Master Timing. These cards include all cards with type LIME1 or LIMT1 and all cards that run the ATMANSI or ATMITU applications. The clock status values are the same as those listed in the rept-stat-card:mode=full:loc=xxx report.

For a complete list of the cards and their applications, see [Table A-9](#).

If HS clock A and B status is included in the "Cards with bad clock source" section, then cards that cannot be provisioned to use HS Master Timing display dashes for HS clock A and B status.

The PST/SST for the Primary Composite Clock (Comp Clk) 1114, Primary Comp Clk 1116, Secondary Comp Clk 1114, Secondary Comp Clk 1116, Primary HS Clk 1114, Primary HS Clk 1116, Secondary HS Clk 1114, and Secondary HS Clk 1116 can be one of the following values:

- IS-NR/active—clock source is valid, clock chosen as source
- IS-NR/idle—clock source is valid, clock not chosen as source
- OOS-MT/fault—clock source is invalid

The PST/ SST for the Composite System Clock and High Speed System Clock can be one of the following values:

- IS-NR/Idle—all cards showing good clock, clock not required
- IS-ANR/Idle—some cards showing bad clock, clock not required
- OOS-MT/Idle—all cards showing bad clock, clock not required
- IS-NR/Active—all cards “requiring clocks” showing good clock, clocks required
- IS-ANR/Fault—some cards “requiring clocks” showing bad clock, clocks required
- OOS-MT/Fault—all cards “requiring clocks” showing bad clock, clocks required

Note

An asterisk (*) indicates that the card requires the indicated clock.

Output

Note

A TDM card can use a local clock that is generated independently on each TDM as a clock source for the corresponding internal system clock. The system does not report the “cards bad” status for these internal clocks.

Note

The use of HS CLK I is not automatic when both the high-speed primary and secondary clocks are invalid. An E5-ATM-B card must be provisioned (using the `ent - slk:atmtsel=internal` command) to use the high-speed internal clock.

Note

The *Using* field in the Composite Clock section describes all of the cards that are using the Composite Clock, not just HS clock capable cards.

The following example shows output when two GPSM-II cards are configured, and HS clock capable cards are not configured. The TSCSYNC feature is not turned on.

Legend

- **COMPOSITE SYSTEM CLOCK**—Composite System clock status
- **ALARM STATUS**—System clock alarms; "No alarms" is shown when there are no alarms.
- **PRIMARY COMP CLK**—The status of the primary Composite clock input for a particular TDM
- **SECONDARY COMP CLK**—The status of the secondary Composite clock input for a particular TDM
- **CLK A** – Internal Eagle Clock sourced by the 1114 TDM from the selected clock source.
- **CLK B** – Internal Eagle Clock sourced by the 1116 TDM from the selected clock source.
- **CLK I** – Local clock generated independently on each LIM card.
- **Prefer CLOCK x for TSC CLOCK**—The preferred clock source of the Time Slot Counter Synchronization (TSC) clock; appears only when the TSCSYNC feature is turned on.
- **HIGH SPEED SYSTEM CLOCK**—HS system clock status
- **ALARM STATUS**—HS System clock alarms; "No alarms" is shown when there are no alarms.
- **PRIMARY HS CLK**—The status of the high-speed primary clock input for a particular TDM
- **SECONDARY HS CLK**—The status of the high-speed secondary clock input for a particular TDM
- **HS CLK TYPE**—HS clock source (see the chg-stpopts command) for a particular TDM
- **HS CLK LINELEN**—HS clock line length (see the chg-stpopts command) for a particular TDM
- **HS CLK A** – Internal Eagle High Speed Clock sourced by the 1114 TDM from the selected clock source.

- **HS CLK B** – Internal Eagle High Speed Clock sourced by the 1116 TDM from the selected clock source.
- **HS CLK I** – Local clock generated independently on each LIM card. The value for the internal high-speed clock (Cards using HSCLK I) is generated differently from the internal system clock (Cards using CLK I). The internal high speed clock is generated by the XILINX on the ATM applique's card. The internal system clock is generated by the Xilinx on the LIM main board when the LIM card does not have a valid system clock source (e.g., both A system clock and B system clock are bad at the LIM card).

rept-stat-cluster

Use this command to report summary status and statistical information for all provisioned clusters. Use this command also to report detailed routeset information for a specific cluster, provisioned cluster member, or dynamically-created x-list entry.

Note

This command does not support 24-bit ITU national point codes.

Parameters

dpc (optional)

ANSI destination point code of the cluster whose status is to be reported, with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (prefix-ni-nc-ncm).

Synonym:

dpca

Range:

p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk value (*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code 000-000-000 is not a valid point code.

Default:

Display summary for all provisioned clusters

mode (optional)

The type of display. Specify `mode=full` to display additional information for the specified DPC.

Range:

full

Default:

Display summary report

stat (optional)

This parameter reports on destinations whose status is the same as the state indicated by the parameter.

Range:

all

All of the primary states

alminh

Alarms inhibited

anr

In service abnormal (IS-ANR)

dsbld

Out of service maintenance disabled (OOS-MT-DSBLD)

mt

Out of service maintenance (OOS-MT)

nr

In service normal (IS-NR)

Default:

all

Example

```
rept-stat-cluster
```

```
rept-stat-cluster:stat=alminh
```

```
rept-stat-cluster:stat=MT
```

```
rept-stat-cluster:dpc=20-2-*
```

```
rept-stat-cluster:dpc=20-2-*:mode=full
```

```
rept-stat-cluster:dpc=20-2-5
```

Dependencies

If the `mode=full` parameter is specified, the `dpc/dpca` parameter must be specified.

The `stat` parameter cannot be specified with the `dpc/dpca` parameter in the command.

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before this command can be entered.

The specified DPC must exist.

If a DPC is specified, it must be an x-list entry, a cluster DPC, or a member of a provisioned cluster.

The destination address must be a full point code or a cluster point code specified as *ni-nc-**. A DPC with *ni-nc-*** or *ni-nc-**** cannot be specified.

No other `rept-stat-xxx` command can be in progress when this command is entered.

Notes

If no parameters are specified, a summary report is produced, showing all provisioned clusters and their status.

If an FPC corresponding to a provisioned cluster member or an x-list entry is specified, then the status of only the specified FPC, along with routeset status, is displayed.

If a cluster destination is specified on the `dpc/dpca` parameter, then the status of the cluster and the routesets that have been defined for that cluster is displayed.

If the `mode=full` parameter and a DPC are specified, the Route/Destination table is searched, and all entries (cluster DPCs, provisioned cluster member DPCs, and x-list DPCs) belonging to the parent cluster are displayed along with their status. Also, if circular routing is in effect for the DPC, information useful in diagnosing and correcting the situation is displayed.

In the summary report, and in the detailed output when a cluster DPC is being reported, the number of provisioned members of the cluster, and the number of x-list entries that have been created for the cluster, are reported in the PROV and X-LIST columns, respectively.

When detailed information for an x-list entry is being reported, the reasons that the x-list entry was created, and the amount of time remaining on the x-list expiration timer, if applicable, in the format `hh:mm` is shown in the X-REASON and X-TIME columns, respectively. In x-list entries for which the expiration timer is not applicable, dashes "-----" are displayed.

MTT 4735 and 4732 deleted by MB

Output

This example shows the output when no parameters are specified. Summary information for all of the defined cluster DPCs is shown. The report shows the number of provisioned and x-list members of each cluster.

`rept-stat-cluster`

Command Completed.
;
```

If a circular routing alarm is raised for a cluster DPC, then specifying the `dpc` and `mode=full` parameters displays information pertinent to the cluster member experiencing the circular routing condition. The value for the `MEMBER` field in this example represents the cluster member that had the circular routing condition. This is the same member for which an x-list entry could not be created.

① Note

The circular routing member information shown in this output report displays as `***_***_***` if the specified DPC is not a cluster DPC or the information is not known by maintenance at the time the report is generated.

```
rept-stat-cluster:dpc=20-2-*:mode=full

Legend

- **ORIG**—Origination of the destination point code being reported. Possible values that can appear in the column are:

- **CLUST**—Entry is a provisioned cluster (*ni-nc-**) DPC
- **PROV**—Entry is a provisioned cluster member (*ni-nc-ncm*)
- **X-LIST**—Entry is a non-provisioned (i.e. dynamically-created) x-list cluster member
- **PST**—Primary state of the cluster. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the cluster. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the cluster. See [Possible Values for PST/SST/AST](#).
- **X-REASON**—Reasons that the X-LIST entries currently exist. The two-letter indicator values that can appear in this column are:
 - **RT**—X-LIST entry created due to routing
 - **CG**—X-LIST entry created due to congestion
 - **CR**—X-LIST entry created due to circular routing

The circular routing transmit/receive linkset information shown in the `mode=full` detailed output report displays as “-----” if no circular routing alarm exists for the DPC or the information is not known by maintenance at the time the report is generated.

rept-stat-db

Use this command to display a report showing various status indicators for the active and standby OAM database and the status of the database on each of the network cards.

If the A-Port, AINPQ, Diameter S13/S13' Interface for EIR, EIR, G-Flex, G-Port, INP, LNP ELAP Configuration, Prepaid SMS Intercept Ph1 (PPSMS), SIP NP, or V-Flex feature is turned on, or the ATINP feature is enabled, then the status of the MPS databases and Service Module cards is displayed.

Parameters

db (optional)

Report section or sections to display in the output. The content of each section depends on the specified or default value of the `display` parameter. MPS output appears only if a feature that uses the MPS is turned on in the system (A-Port, AINPQ, Diameter S13/S13' Interface for EIR, EIR, G-Flex, G-Port, INP, PPSMS, SIP NP, V-Flex, or the LNP ELAP Configuration controlled feature) or the ATINP feature is enabled.

Range:

all

displays database and card output for the STP and MPS report sections

mps

displays database and card output for the MPS report section

stp

displays database and card output for the STP report section

gtt

displays database and card output for the GTT-enabled IPSG card report section

Default:

all

display (optional)

Output type.

Range:***all***

Displays operational status of all databases (MASP A, MASP B, and MDAL) and all cards equipped in the database on the system.

brief

Displays operational status of databases in the active and standby MASP and of MPS databases if a feature that uses the MPS is turned on

except

Displays operational status information contained in the `display=brief` output along with the cards whose database level does not match the active fixed disk current partition or active MPS database

version

Displays the same information that is displayed with the `display=all` parameter except that the individual database status column is replaced with the database format version and status. Details of the status of the backup databases are displayed for MASP cards. No version information is shown for MPS databases; use the `rept-stat-mps` command.

Default:

brief

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115

Example

```
rept-stat-db
```

```
rept-stat-db:display=all
```

```
rept-stat-db:loc=1207
```

```
rept-stat-db:db=stp
```

```
rept-stat-db:db=gtt
```

Dependencies

The `db` and `loc` parameters cannot be specified at the same time. Also, `display=except` and `display=version` cannot be specified with `db=gtt`.

For E5-OAM cards, values of 1117 and 1118 cannot be specified for the `loc` parameter.

One of the following features must be turned on, the ATINP feature must be enabled, or at least one ENUM card must be provisioned before the `db=mps` parameter can be specified:

- A-Port
- AINPQ
- EIR
- G-Flex
- G-Port
- INP
- LNP ELAP Configuration
- Prepaid SMS Intercept Ph1
- SIP NP
- V-Flex

The shelf and card must be equipped.

The card location slot must be between 1 and 18, but not 9 or 10.

The shelf location must be 11xx, 12xx, 13xx, 21xx, 22xx, 23xx, 31xx, 32xx, 33xx, 41xx, 42xx, 43xx, 51xx, 52xx, 53xx, or 61xx.

The frame value of the shelf location parameter (`Loc`) must be within the valid range.

A valid value must be specified for the `display` parameter.

Notes

If the `display`, `db`, or `loc` parameter is specified and the database for a particular card location is not accessible, hyphens are displayed in place of the data.

The output of the `rept-stat-db` command with no parameters specified or with the `display=brief` parameter shows the following information:

- Activity status of both the active and standby MASP, the date and time the last backup was performed on the removable drive (if inserted) and the fixed disk backup partition, coherency, the number of updates (level) to the backup partition of the fixed disk, and the current partition of the fixed disk
- If the A-Port, AINPQ, Diameter S13/S13' Interface for EIR, EIR, G-Flex, G-Port, INP, PPSMS, SIPNP (if used with EPAP), or V-Flex feature is turned on, or the ATINP feature is enabled, EPAP A and EPAP B database status followed by Service Module card database status
- If the SIP NP (if used with ELAP) or LNP ELAP Configuration controlled feature is turned on, ELAP A and ELAP B database status followed by Service Module card database status
- If one or more GTT-enabled IPSG cards are configured, the GTT database status for all such cards

The output when the `display=except` parameter is specified shows the coherency and the number of updates for all the cards whose database level does not match the active fixed disk current partition, reference database level, or is incoherent. All databases that are not accessible are also displayed. In addition, the time stamp for the last database update is displayed for every card.

The output when the `display=all` parameter is specified shows the coherency and the number of updates for all of the distributed databases. In addition, the time stamp for the last database update is displayed for every card.

The output when the `display=version` parameter is specified shows the coherency and the number of updates for the active and standby databases, along with the database version and the operational status of each of these databases. If the LNP feature is turned on, the version of the LNP database is shown. No version is shown for EPAP or ELAP databases; use the `rept-stat-mps` command to display version information for these databases.

The output when the `loc` parameter specifies an equipped card shows the coherency and the number of updates to its database. In addition, the time stamp for the last database update is displayed for the specific card location.

The `db` parameter is used to limit the output of the command to the EAGLE STP information or the MPS information or GTT information for an IPSG card. The information is displayed as indicated by the `display` parameter value (`display=version` is not valid for `db=mps` and `db=gtt`; the command does not display the MPS database versions). The default `db` parameter value is *all*, which displays the information for the STP and MPS databases and cards as indicated by the `display` parameter value.

Output

Note

A status of 'OK' indicates that the database has no errors.

This example shows the output for a specified card. The disk is OFF-LINE indicating the disk has been dismounted. This is not necessarily a problem.

```
rept-stat-db:loc=1114

```

This example shows the output when the LNP ELAP Configuration feature is turned on, and ELAP is used. Card 1203 indicates a value 12 in the exception column. The value indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. More specifically, the card has encountered 12 corrupted records and has subsequently repaired them. This value persists until the card is reset.

```

E2155 Cmd Rej: Invalid parameter combination specified

Legend

- **DATABASE STATUS**—Indicates any database alarms on the MASP. Not used with `loc` parameter output.
 - **>> OK<<**—No database alarms
 - **>>NOT OK (DMS)<<**—Database DMS alarms are present
 - **>>NOT OK (DRMS)<<**—Database DRMS alarms are present
 - **>>NOT OK (DMS,DRMS)<<**—Database DMS and DRMS alarms are present
- **(ACTV MASP)**—The specified MASP is the active processor. Not used with `loc` parameter.
- **(STDBY MASP)**—The specified MASP is the standby processor. Not used with `loc` parameter.
- **(NOACCS)**—The specified processor is not accessible. Not used with `loc` parameter.
- **C**—Indicates whether the database is coherent
- **Y** —the database is coherent
- **N** —the database is not coherent
- Dash (-)—the database is not accessible
- **LEVEL**—Number of updates made to the database partitions
- **TIME LAST BACKUP**—Date and time the last change was performed on the removable drives (if inserted) and the backup partition of the fixed disk. Not used with `loc` parameter.
- **TIME LAST UPDATE**—Date and time of the last update on the card database from OAM. Not used with `loc` parameter.
- **GTT**—The Global Title Translation database on the OAM. This database is downloaded to Service Module and GTT enabled IPSPG cards. If the birthdate or level do not match the SM/GTT enabled IPSPG card, then the corresponding card generates an alarm.

- **RD BKUP**—Removable drive backup partition
- **FD BKUP**—Fixed disk backup partition
- **FD CRNT**—Fixed disk current partition. Not used with the `loc` parameter output.
- **DIFF CONTENTS**—The specified database's contents are different compared to the other database in that partition.
- **DIFF LEVEL**—The specified database's level does not match the level of the current partition of the active fixed disk (**FD CRNT**).
- **DIFF TIME**—The specified database's level matches the level of the current partition of the active fixed disk (**FD CRNT**), but the time that the database was updated, compared to the current partition of the active fixed disk (**FD CRNT**), is different. This exception indicator appears only if the time and date stamp in an update packet or in memory becomes corrupted.
- **CORRUPTED**—The specified database is corrupted.
- **INCOHERENT**—The specified database is incoherent.
- **EXCEPTION**—The following values can appear:
 - The condition of the specified database with which the system has detected a problem. These conditions are: **DIFF CONTENTS**, **DIFF LEVEL**, **DIFF TIME**, **CORRUPTED**, and **INCOHERENT**. A “-” indicates that the database was not accessible. A blank entry indicates that the database has no problems. This field is used with the `display=except`, `display=all`, and `loc` parameter outputs.
 - A value that indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. This value persists until the card is reset.
- **IN-SRVC**—Length of time the card has been in service
- **CARD/APPL**—Card type or application assigned to the card specified in the **LOC** field. Not used with the `display=brief` (default) output.
 - **TDM-BKUP**—Backup partition on the fixed disk on the TDM
 - **TDM-CRNT**—Current partition on the fixed disk on the TDM
- **LOC**—Card location of the database. Not used with `display=brief` (default) output.
- **T**—Indicates whether the specified database is in transition. A database is in transition when the database for the link interface module (LIM) or E5-TSM being loaded with the new screen set information after an update to the database, and the database has not reached the current reported database level. Not used with `display=brief` (default) output.
- **Y**—the database is in transition
- **N**—the database is not in transition.
- **TIME LAST BACKUP**—The date and time the last change was performed on the specified card and its associated database. A dash (–) in this field for the fixed drive (FD) or removable drive (RD) indicates that no backup has been created on that drive. Not used with `display=brief` (default) output.
- **VERSION**—Version number of each database (including the LNP database if the LNP feature is on)
 - **xxx-xxx-xxx**—Version number of the database
 - **UNKNOWN**—The `rept-stat-db` command can show the version number only for a database that is version 20.0.0 or later. Any database version that is earlier than

version 20.0.0 cannot be determined and UNKNOWN is displayed for the database version number.

- A dash “-” —The database is not available. Used only with *display=version* output.
- **STATUS**—Operational status of the database version. Used only with *display=version* output.
 - **NORMAL**—The database version is fully operational.
 - Blank entry—Indicates the database is not available or is unknown. A numeric value indicates the database is invalid. The value displayed is the status value found in the field and is for diagnostic purposes.
- **BIRTHDATE**—Date and time of creation for the database
- **EPAP A (ACTV)**—The active EAGLE Application Processor. This section appears only if the A-Port, AINPQ, Diameter S13/S13' Interface for EIR, G-Port, G-Flex, EIR, INP, PPSMS, SIP NP (if used with EPAP), or V-Flex features are turned on or the ATINP feature is enabled.
 - **PDB**—Provisioning database status information
 - **RTDB**—Provisioning database status information used to create the resident Realtime Database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.
 - **RTDB-EAGLE**—EPAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm. The RTDB is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires Service Module cards to be reloaded.
- **EPAP B (STDBY)**—The standby EAGLE Application Processor. This section appears only if the A-Port, AINPQ, Diameter S13/S13' Interface for EIR, G-Port, G-Flex, EIR, INP, PPSMS, SIP NP (if used with EPAP), or V-Flex features are turned on, or the ATINP feature is enabled.
 - **PDB**—Provisioning database status information
 - **RTDB**—The provisioning database status information used to create the resident Realtime Database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.
 - **RTDB-EAGLE**—EPAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm. The RTDB is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires Service Module cards to be reloaded.
- **ELAP A (ACTV)**—The active EAGLE LNP Application Processor. This section appears only if the LNP ELAP Configuration or SIP NP (if used with ELAP) feature is turned on.
 - **RTDB-EAGLE**—ELAP resident Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm.

- **TIME LAST UPDATE**—Date and time of the last update of the RTDB from the LSMS
- **ELAP B (STDBY)**—The standby EAGLE LNP Application Processor. This section appears only if the LNP ELAP Configuration or SIP NP (if used with ELAP) feature is turned on.
- **RTDB-EAGLE**—The ELAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm.
- **TIME LAST UPDATE**—Date and time of the last update of the RTDB from the LSMS

rept-stat-ddb

Use this command to obtain the most recent dynamic database (DDB) audit report. The DDB audit report displays the checksums of the Route, Linkset, Link, CM Card, CM Cluster, Mated Application, and MTP globals. The report displays the exact status of active MTP card after audit and cause of that status.

Parameters

display (optional)

This parameter specifies the type of report to display.

Range:

brief

all

Default:

brief

filter (optional)

This parameter provides a full DDB audit report for cards that meet the specified criteria.

Range:

resp

Responding cards

nrsp

Non-responding cards

incn

Inconsistent cards

cons

Consistent cards

ncons

Not-consistent cards: includes cards marked as inconsistent, DDB update in progress, having idle period less than quiet period, and sending replies marked as NO_DATA

ndat

Cards marked as "No Data" because the checksum of dynamic tables is not available

nddl

Cards marked as "No Data " because the checksum of dynamic tables is not available due to the DDL crossload being in incomplete state

nddb

Cards marked as "No Data" because the checksum of dynamic tables is not available due to non-initialization of DDB

duip

Cards returning replies marked as "DDB update in progress"

duipt

Cards returning replies marked as "DDB update in progress" due to incomplete evaluation of TSRC task

duipc

Cards returning replies marked as "DDB update in progress" due to incomplete checksum calculation

nquiet

Cards returning replies having idle period less than the quiet period

List (optional)

This parameter displays a list of cards that meet the specified criteria.

Range:***resp***

Responding cards

nrsp

Non-responding cards

incn

Inconsistent cards

cons

Consistent cards

ncons

Not-consistent cards, including cards marked as inconsistent, DDB update in progress, having idle period less than quiet period, and sending replies marked as NO_DATA

ndat

Cards marked as "No Data " because the checksum of dynamic tables is not available

nddl

Cards marked as "No Data " because the checksum of dynamic tables is not available due to the DDL crossload being in incomplete state

nddb

Cards marked as "No Data " because the checksum of dynamic tables is not available due to non-initialization of the DDB

duip

Cards returning replies marked as "DDB update in progress"

duipt

Cards returning replies marked as "DDB update in progress" due to incomplete evaluation of TSRC task

duipc

Cards returning replies marked as "DDB update in progress" due to incomplete checksum calculation

nquiet

Cards returning replies marked as having the idle period less than the quiet period

Example

```
rept-stat-ddb
rept-stat-ddb:display=all
rept-stat-ddb:list=resp
rept-stat-ddb:filter=nddb
```

Dependencies

Audit data is available only if the execution of a periodic or manual DDB audit is complete (see the `aud-data` command).

If the system is in upgrade mode, then this command cannot be entered.

The `display`, `list`, and `filter` parameters cannot be specified together in the command.

Notes

A question mark (?) indicates that the corresponding card's status is not evaluated (Inconsistent/Consistent) when system status is marked as ABORTED.

Cards having an additional status of IGNORED responded with "DDB update in progress". These cards are not considered for calculating system status.

Output

The MATED APPL field is displayed only for Service Module cards.

```
rept-stat-ddb:display=all

Legend

- **SYSTEM STATUS:**
 - **OK**—DDB is consistent on all active MTP cards or no active MTP card is present in system
 - **INCONSISTENT**—DDB is inconsistent
 - **UNKNOWN**—"All active MTP cards in the system responded without the checksum of DDB table" or "No active MTP card in the system responded to audit request"
 - **ABORTED**—"Checksums collected failed to meet the quiet period requirement" or "Number of cards responded with "DDB update in progress" greater than 25% number of cards responded with data"
- **ACTIVE MTP CARDS**—Number of active MTP cards
- **NON RESPONDING CARDS**—Number of non-responding cards
- **RESPONDING CARDS**—Number of responding cards
- **CARDS WITH NO DATA**—Cards sending replies without the checksum of dynamic tables, due to incomplete DDL crossload or DDB initialization
- **CARDS WITH DATA**—Cards sending replies with checksums
- **CARDS FAILING QUIET PRD**—Cards failing quiet time requirement
- **CARDS WITH DDB UPD IN PRG**—Cards sending replies marked as "DDB update in progress" due to DDB checksum not evaluated completely or TSRC task is incomplete
- **CARDS CONSIDERED FOR CKSM**—Cards sending correct replies. Replies are not marked with "DDB update in progress" or "Reply with no data".
- **INCONSISTENT CARDS**—Cards that are inconsistent
- **CONSISTENT CARDS**—Cards that are consistent
- **AUDIT START TIME**—Time that the audit started (*DD/MM/YYYY hh:ms:ss*format)
- **QUIET PERIOD**—Minimum DDB idle time, in milliseconds, during which no DDB updates are applied
- **RTE**—Checksum of RTE Table
- **LINK SET**—Checksum of Link Set Table
- **LINK**—Checksum of Link Table
- **CM CARD**—Checksum of CM Card
- **CM CLSTR**—Checksum of CM Cluster
- **MATED APPL**—Checksum of Mated Application
- **MTP GLOBS**—Checksum of MTP Globals Table
- **IDLE (PERIOD)**—Time elapsed, in milliseconds, since the last DDB update was received by this card
- **DDB UPD**—Total DDB updates received on the card
- **ADDN'L STATUS**—Display more information for the card, including WWA updates or whether card is considered for audit calculations

- **CAUSE**—Display the reason for sending replies of type "reply with no data " or "DDB update in progress". This value can be DDL (crossload not completed), DDB (dynamic database is not initialised), (TSRC, DDB) (TSRC task is not completed) or DDB (checksums still needs to apply on tables).
- **?**—Card status is not evaluated (inconsistent/consistent) if the system status is marked as "ABORTED"
- **IGNORED**—Card responded with "DDB update in progress" and is not considered for calculating system status
- **WWA UPD**—Number of entries that were updated by the WWA

rept-stat-deir

Use this command to display the overall status of the Diameter EIR service on the EAGLE.

Parameters

dcname (optional)

Diameter connection name. This parameter specifies the unique logical name assigned to each diameter connection. It shall display Status, TPS and Statistics of the Diameter connection specified.

Range:

aaaaaaaaaaaaaaaa

A string of alphanumeric characters, beginning with a letter and up to 15 characters in length. Valid values are a..z, A..Z, 0..9.

System Default:

null

loc (optional)

Diameter card location for which Card status, overall card TPS and total statistics of the card is to be reported.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

mode (optional)

Display Diameter connection statistics.

Range:

perf

Displays per card TPS statistics, DEIR Service statistics, and per connection TPS statistics.

stat

Displays per card TPS statistics, DEIR Service statistics, and per connection service statistics.

peakreset (optional)

Reset peak values for a card or a specified diameter connection.

Range:

yes

Reset the peak value.

no

Do not reset the peak value.

Example

```
rept-stat-deir
rept-stat-deir:loc=1207
rept-stat-deir:dcname=dc1207a
rept-stat-deir:mode=perf
rept-stat-deir:peakreset=yes:loc=1207
rept-stat-deir:mode=perf:loc=1207
rept-stat-deir:mode=stat:loc=1207
rept-stat-deir:mode=stat
```

Dependencies

S13/S13' EIR Feature must be activated before retrieving the overall status of DEIR cards.

The (1) mode and loc parameters, (2) loc and peakreset parameters, or (3) dcname and peakreset parameters can be specified together. No other combination is allowed.

The location specified with this command should be of a DEIR card running DEIRHC gpl.

At least one Diameter EIR card running the DEIRHC gpl must be configured.

The Diameter connection name specified must be present in the DCONN table.

The card at the specified location must support this command.

Diameter card location or diameter connection name must be specified with peakrest parameter.

Notes

If optional parameters are specified, only the entries that match the entered parameters are displayed.

Output

Legend

This section defines the fields of the following rept - stat - deir reports:

- rept-stat-deir
- rept-stat-deir:loc=1207
- rept-stat-deir:dcname=dc1207a
- rept-stat-deir:mode=perf
- rept-stat-deir:peakreset=yes:loc=1207
- rept-stat-deir:peakreset=yes:dcname=dc1217
- rept-stat-deir:mode=stat
- rept-stat-deir:mode=stat:loc=1101

A dash (-) in an output field indicates that the statistic does not apply.

- **CARD IS-NR** -Number of DEIR cards running the DEIRHC GPL that can be used by the system (status is In-Service Normal, IS-NR).
- **CARD**-Card location of the DEIR card running the DEIRHC GPL
- **VERSION** -Version number of the DEIRHC GPL running on the DEIR card.
- **PST** -Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**-Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST** -Associated state of the card. See [Possible Values for PST/SST/AST](#).
- **TPS** - TPS (Transactions per second) indicates the number of Diameter messages which are received on the DEIR cards or specified diameter connection.
- **RSVD-TPS**- Reserved TPS is the guaranteed TPS for a diameter connection.
- **MAX-TPS** - This is the maximum TPS for a diameter connection
- **PTPS/PEAK-TPS** ---
 - PTPS indicates the maximum TPS occurred on the card when executed with loc parameter.
 - PTPS indicates the maximum TPS occurred on a diameter connection when executed with dcname parameter.
- **PTIMESTAMP/PEAKTIMESTAMP** - The time when the PTPS occurred on the card or specified diameter connection.
- **DCNAME** -Diameter connection name.
- **STATUS** - UP or DOWN status of the diameter connection.
- **DEIR ALARM STATUS** - Displays DEIR system related alarms. If there are no system alarms present, this field displays No Alarms.
- **CARD ALARM STATUS** - Displays DEIR card specific alarms. If there are no card alarms present, this field displays No Alarms.
- **DCONN ALARM STATUS** - Displays diameter connection specific alarms. If there are no connection related alarms present, this field displays No Alarms.

- **TOTAL DEIR SERVICE STATISTICS**-System-wide view of per-service statistics. The report tracks the following information:
 - **SERVICE** --- Service running on the DEIR card. Currently only the EIR service is supported for the DEIR card.
 - **SUCCESS** -Total number of messages successfully processed by the DEIR card for the EIR service.
 - **ERROR** -Total number of messages with errors which are received by the DEIR cards for the EIR service.
 - **WARNINGS** -Total number of messages received for which either IMEI lookup failure occurred or Unknown equipment status is sent in response by the DEIR card for the EIR service.
 - **OVERFLOW** - Number of messages discarded due to congestion on a DEIR card.
 - **TOTAL** - Total number of messages received. It should be the sum of (Success + Error + Warnings) messages.
- **TPS STATISTICS**- Section of the report that provides TPS statistics on each Service Module card or diameter connection.
 - **TPS** - TPS (Transactions per second) indicates the number of Diameter messages which are received on the DEIR cards or specified diameter connection.
 - **PTPS** - PTPS indicates the maximum TPS that occurred on the card or specified diameter connection.
 - **PTIMESTAMP** - The time when the PTPS occurred on the card or specified diameter connection.
- **PER CONNECTION SERVICE STATISTICS** - Service statistics corresponds to each diameter connection
 - **DCNAME**-Diameter connection name.
 - **STATUS**- UP or DOWN status of the diameter connection.
 - **SUCCESS**-Total number of messages successfully processed on this particular Diameter connection by the DEIR card for the Diameter EIR service.
 - **WARNING**-Total number of messages received on this particular Diameter connection for which either IMEI lookup failure occurred or Unknown equipment status is sent in response by the DEIR card for Diameter EIR service.
 - **ERRORS**-Total number of messages with errors which are received on this particular Diameter connection by the DEIR cards for the Diameter EIR service.
 - **OVERFLOW**-Number of messages received on this particular Diameter connection and discarded due to congestion.
 - **TOTAL**- Total number of messages received on this particular diameter connection. It should be the sum of (Success + Warning + Errors) messages.
- **DCONN STATISTICS** -Statistics of diameter connection are displayed when DCNAME parameter is specified in rept-stat-deir command.
 - **SUCCESS**-Total number of messages successfully processed on this particular Diameter connection by the DEIR card for the Diameter EIR service.
 - **ERROR**-Total number of messages with errors which are received on this particular Diameter connection by DEIR cards for the Diameter EIR service.

- **WARNING**-Total number of messages received on this particular Diameter connection for which either IMEI lookup failure occurred or Unknown equipment status is sent in response by the DEIR card for the Diameter EIR service.
- **OVERFLOW**-Number of messages received on this particular Diameter connection and discarded due to congestion.
- **TOTAL**- Total number of messages received. It should be the sum of (Success + Error + Warning) messages.
- **PER CONNECTION TPS STATISTICS** - TPS statistics corresponds to each diameter connection.
 - **DCNAME** -Diameter connection name.
 - **STATUS** -- UP or DOWN status of the diameter connection.
 - **RSVD-TPS** - Reserved TPS is the guaranteed TPS for a diameter connection.
 - **MAX-TPS** - This is the maximum TPS for a diameter connection.
 - **TPS** - TPS (Transactions per second) indicates the number of Diameter messages which are received on the DEIR cards or specified diameter connection.
 - **Peak-TPS** - Peak-TPS indicates the maximum TPS that occurred on the card or specified diameter connection.
 - **PEAKTIMESTAMP** - The time when the Peak-TPS occurred on the card or specified diameter connection.

rept-stat-dlk

Use this command to show the status of the TCP/IP data links. The secondary state (SST) of the TCP/IP data links shows whether the link is available, unavailable, or manually removed from service.

Parameters

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

All data links are shown.

Example

```
rept-stat-dlk
```

```
rept-stat-dlk:loc=1104
```

Dependencies

No other rept - stat - xxx command can be in progress when this command is entered.

The ACM is the only valid card type for this command.

The specified card must have a TCP/IP data link assigned to it.

The card location, frame, shelf, or slot must be within the allowed range.

The data link must be equipped in the database.

A card location that is valid and defined in the database must be specified.

Notes

None

Output

rept-stat-dlk

```

rlghncxa03w 10-01-27 17:00:36 EST  EAGLE 42.0.0
DLK          PST          SST      AST
1104         IS-NR        Active    ----

rept-stat-dstn

Use this command to generate a report of the MTP point code status for provisioned point codes. Any provisioned destination can be specified, including a cluster destination (*ni-nc-**) or a network destination (*ni-*-**).

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

dpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc=000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni= 006-255*.

The point code 000-000-000 is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

dpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

mode (optional)

The type of display to produce. This parameter displays the point code's subsystem status along with the normal output.

Range:***full***

Comprehensive display of point code status, including *rtx*. If entered with a point code, status for that point code is displayed. If specified without a point code, the status of all routesets is displayed.

rtx

Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

Default:

A summary report is displayed.

stat (optional)

The primary state filter. The state of the destination for which to generate a report. To generate a report for all destinations whose state is DSBLD, specify *stat=dsbld*.

Range:***all***

All of the primary states

alminh

Alarms inhibited

anr

In service abnormal (IS-ANR)

dsbld

Out of service maintenance disabled (OOS-MT-DSBLD)

mt

Out of service maintenance (OOS-MT)

nr

In service normal (IS-NR)

Default:

all

Example

```
rept-stat-dstn
rept-stat-dstn:dpci=2-004-1:mode=full
rept-stat-dstn:dpc=9-3-6:mode=full
rept-stat-dstn:dpc=9-3-*:mode=full
rept-stat-dstn:dpc=9-3-*
rept-stat-dstn:dpc=9-3-**
rept-stat-dstn:dpc=9-3-***
rept-stat-dstn:dpc=9-3-***:stat=mt
rept-stat-dstn:dpc:9-4-***:stat=alminh
```

```
rept-stat-dstn:dpc=9-3-*:mode=rtx
```

```
rept-stat-dstn:mode=full
```

```
rept-stat-dstn:mode=rtx
```

```
rept-stat-dstn:dpc=1-1-1
```

```
rept-stat-dstn:dpcn16=1-1-1
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

If a `dpc` parameter is specified, it must be the true destination point code (not an alias) and it must be defined in the database.

The `stat` parameter can be specified with the `dpc` parameter only if the `dpc` parameter specifies one of the *ni-nc-** formats.

An x-list DPC cannot be specified in the `dpc` parameter.

The `mode=rtx` parameter cannot be specified unless the Origin-Based MTP Routing feature is enabled and on.

The `mode` parameter cannot be specified with the `dpc` parameter if the `dpc` parameter specifies one of the *ni-nc-** formats.

When the `mode=full` parameter is specified, the `dpc/dpca/dpcn/dpci/dpcn24` parameter must be specified.

The destination address must be a full point code, a network destination, or a cluster point code.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

This command does not report the x-list point codes. Use the `rept-stat-cluster` command for a report of x-list point codes.

If the `mode=rtx` parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix p-).

Summary description of the reports that are produced by the various DPC parameter syntaxes is shown:

- `rept-stat-dstn:dpc=ni-nc-ncm`—Report for fully provisioned destination *ni-nc-ncm*
- `rept-stat-dstn:dpc=ni-*-*`—Report for provisioned network destination with the specified network indicator. If *** is specified in the *nc* field, *** must be specified in the *ncm* field.
- `rept-stat-dstn:dpc=ni-**-*`—Report for the full network cluster for the specified *ni*
- `rept-stat-dstn:dpc=ni-***-*`—Report for the full network cluster and the network cluster address (if any) for the specified *ni*

- `rept-stat-dstn:dpc=ni-nc-*`—Report for provisioned cluster destination *ni-nc-**
- `rept-stat-dstn:dpc=ni-nc-**`—Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address *ni-nc-** (if it exists) is not reported.
- `rept-stat-dstn:dpc=ni-nc-***`—Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address *ni-nc-** (if it exists) is also reported.
- `rept-stat-dstn:dpcn24=msa-ssa-sp`—Report for fully provisioned 24-bit destination *main signaling area-sub signaling area-signaling point*

If the `mode=rtx` parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the `mode=full` parameter is specified with a specific destination point code, then additional linkset, route, and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the `mode=full` parameter is specified without a specific destination point code, then status is provided for all regular and exception route sets.

Output

If the `dpc` parameter is not specified:

- If the `mode` parameter is not specified, then the command output lists the status of all provisioned destination point codes (DPCs) (routesets) in the system.
- If the `mode=rtx` parameter is specified, then the output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the `mode=full` parameter is specified, then the command lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the `dpc` parameter is specified:

- If the `mode` parameter is not specified, then the output lists the status of all provisioned routes in the route set specified by that DPC.
- If the `mode=rtx` parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, and the status of all provisioned exception routesets associated with that DPC.
- If the `mode=full` parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

This example shows the output when no parameters are specified:

`rept-stat-dstn`

This example shows the circular routing alarm for a cluster destination. The alarm indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for an FPC destination.

```
rept-stat-dstn:dpc=9-3-*
```

```

rept-stat-e1

Use this command to display the E1 port status and signaling link status for cards with provisioned E1 ports.

Parameters

e1port (optional)

The E1 port number. When this parameter is specified, only the information for the specified E1 port on the card in the specified card location is displayed.

Range:

1 - 8

loc (optional)

The unique identifier of a specific LIME1 card located in the STP.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Information for all LIME1 cards is reported.

Example

```
rept-stat-e1
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

The `loc` parameter must be specified when the `e1port` parameter is specified.

The active TDM location cannot be specified in the `loc` parameter.

Card locations 1117 and 1118 and the MUX card locations (`xy09` and `xy10` where `x` is the frame and `y` is the shelf) cannot be specified in the `loc` parameter.

Notes

Specifying the command without any parameters displays E1 port status for all cards with provisioned E1 ports.

If the `loc` parameter is specified, status is displayed for all E1 ports provisioned on the card in the specified location.

If the `loc` and `e1port` parameters are specified, the E1 port status summary is displayed for all E1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified E1 port on the card.

Output

This example shows the output when no parameters are specified:

```
rept-stat-e1
```

```

rlghncxa03w 05-01-04 07:01:08 EST  EAGLE5 33.0.0

Legend

- **LOC**—Card location
- **E1PORT**—Number of the E1 port provisioned on the card in the specified location.
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#). The values *PARENT* and *PAIRED* refer to odd and even adjacent ports on the card that are provisioned in channel bridging mode.
- **ALARM STATUS**—Either "No Alarms" or current alarm number and text
- **UNAVAIL REASON**—Reason for the E1 port being unavailable
- **SLK**—Signaling link assigned to the E1 port
- **TS**—Timeslot assigned to the signaling link
- **PST**—Primary state of the signaling link. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the signaling link. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the signaling link. See [Possible Values for PST/SST/AST](#).

rept-stat-enet

Use this command to display a summary report of Ethernet status for all cards in the system that have configured Ethernet Interfaces.

Parameters

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115

Default:

All ENET data for the card location is displayed.

port (optional)

Ethernet interface port ID.

Range:

a, b, c, d

Default:

All port data for ENET is displayed.

Ports c and d are displayed for the DEIR/SIP/ENUM applications running on the SLIC card.

Example

```
rept-stat-enet
```

```
rept-stat-enet:loc=1101:port=b
```

```
rept-stat-enet:loc=1201:port=c
```

```
rept-stat-enet:loc=1201:port=d
```

Dependencies

Another command is already in progress.

The `loc` and `port` parameters must be specified together in the command.

The shelf and card must be equipped, and the card specified by the `loc` parameter must have an application of IPS, MCP, EROUTE, VSCCP, IPSG, IPLIM, IPLIMI, SS7IPGW, IPGWI, SIP, ENUM, or DEIR.

The card in the location specified by the `loc` parameter must support the port specified by the `port` parameter.

Notes

Interface A/D is used for ExAP connectivity, and interface B/C is used for signaling networks on SLIC cards running DEIR/SIP/ENUM application.

Output

This example shows the status of all configured Ethernet interfaces in the system:

rept-stat-enet

```

eagle10110 07-02-10 14:50:23 EST EAGLE 35.6.0
LOC  PORT IPADDR          PST          SST          AST
1101  A    1.1.1.1          OOS-MT      Fault        ALMINH
1101  B    123.234.222.111  IS-ANR      Active       -----
1201  A    111.1.24.200     IS-NR       Active       -----
1201  B    2.31.234.1

OOS-MT      Fault      -----

Command Completed.
;

```

This example shows the summary for a specific card location and port when the Ethernet error count exceeds the threshold value:

```
rept-stat-enet:loc=1101:port=b
```

```

eagle10110 10-01-10 14:54:23 EST EAGLE 42.0.0
LOC  PORT IPADDR          PST          SST          AST

      ALARM STATUS      = No Alarms.
```

```
Command Completed.
```

```
;
```

Legend

- CARD—Location of the card
- VERSION—Version number of the application loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:
 - The card is configured but is not physically present in the system.
 - The card does not run a GPL, such as TDM or MDAL cards.
 - The card is IS-ANR or is in the process of being loaded.
- TYPE—Card type entered in the database
- APPL—Application loaded on the card
- PST—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- SST—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- AST—Associated state of the card. See [Possible Values for PST/SST/AST](#).

rept-stat-enum

Use this command to display the overall status of the ENUM service on the EAGLE.

Parameters

loc (optional)

ENUM card location for which card status and card TPS usage data is to be reported.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

mode (optional)

It will display ENUM system alarm status and per card TPS statistics.

Range:

perf

Default:

Perf

peakreset (optional)

Reset peak values to the current TPS values.

Range:

yes

Example

```
rept-stat-enum
rept-stat-enum:peakreset=yes:loc=1101
rept-stat-enum:loc=1101
rept-stat-enum:mode=perf
```

Dependencies

The location specified with this command should be of an ENUM card running the ENUMHC gpl.

An ENUM card running the ENUMHC application must be configured before this command can be entered.

The peakreset and loc parameters can be specified together. No other combination is allowed.

The shelf and card must be equipped, and the card specified by the loc parameter must have an application of enumhc.

The peakreset parameter should be specified with the loc parameter.

Notes

If optional parameters are specified, only the entries that match the entered parameters are displayed.

Output

This example displays output when no parameter is specified:

```
rept-stat-enum
```

Command Executed

Legend

This section defines the fields of the four rept-stat-enum reports:

- rept-stat-enum
- rept-stat-enum:loc=1207
- rept-stat-enum:mode=perf
- rept-stat-enum:peakreset=yes:loc=1207

A dash (-) in an output field indicates that the statistic does not apply.

- **CARD IS-NR**—Number of ENUM cards running the ENUMHC GPL that can be used by the system (status is In-Service Normal, IS-NR).
- **CARD**—Card location of the ENUM card running the ENUMHC GPL
- **P**—P indicates the primary Service Module card. The primary Service Module card provides the MPS status to the EAGLE. This indicator is displayed between the card location and the GPL version.
- **VERSION**—Version number of the ENUMHC GPL running on the ENUM card.
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST**—Associate state of the card. See [Possible Values for PST/SST/AST](#).
- **TPS**—TPS (Transactions per second) indicates the number of ENUM messages which are received on the ENUM card.
- **PTPS/PEAK-TPS**—This field indicates the maximum TPS occurred on the card
- **PTIMESTAMP/PEAKTIMESTAMP**—It is the time when the maximum TPS occurred on the card.
- **ENUM ALARM STATUS**—Displays ENUM system-related alarms. If there are no system alarms present, this field displays No Alarms.
- **CARD ALARM STATUS**—Displays ENUM card-specific alarms. If there are no card alarms present, this field displays No Alarms.
- **TOTAL SERVICE STATISTICS**—System-wide view of per-service statistics. The report tracks the following information:
 - **SERVICE**—The service running on the ENUM card. Currently only the ENUM service is supported for the ENUM card.
 - **SUCCESS**—Total number of messages successfully processed by the ENUM cards.

- **ERRORS**—Total number of messages with errors which are received or sent by the ENUM cards.
- **TOTAL**—Total messages received. It should be the sum of (Success + Errors) messages.
- **TOTAL ERROR STATISTICS**—System-wide view of error statistics. The report tracks the following information:
 - **SERVICE**—The service running on the ENUM card. Currently only the ENUM service is supported for the ENUM card.
 - **RCODE1**—Total number of messages responded by the ENUM card for format errors.
 - **RCODE2**—Total number of messages responded by the ENUM card for server failures.
 - **RCODE3**—Total number of messages responded by the ENUM card for invalid domains.
 - **RCODE4**—Total number of messages responded by the ENUM card for requested queries which are not supported in EAGLE.
 - **RCODE5**—Total number of messages responded by the ENUM card for query types and classes which are not supported in EAGLE.
- **PER CONNECTION STATISTICS**—System-wide view of per connection statistics. The report tracks the following information:
 - **CNAME**- Name of the IP connection provisioned on ENUM card specified in LOC parameter.
 - **STATUS**- Current status of IP connection.
 - **TPS**- TPS (Transactions per second) indicates the number of ENUM messages that are received on the IP connection on a given ENUM card.
 - **PTPS**- Maximum TPS occurred on an IP connection on a given ENUM card.
 - **PTIMESTAMP**- The time when the maximum TPS occurred on an IP connection on a given card.

rept-stat-gpl

Use this command to display the version of GPLs currently running for an application, plus the approved and trial versions of the GPL that will run if the card is restarted.

Parameters

display (optional)

Display mode. Specifies whether the report displays only application GPL data for all cards, or both IMT and application GPL data.

Range:

all

gpl (optional)

Generic program load. The GPL for which to retrieve information.

Range:

xyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

atmhc/atmhc69—Used by E5-ATM-B cards to allow the card to support up to 3 signaling links*bldc32*—Flash GPL containing a tar image with all code required on E5-MCAP cards to support VxWorks6.9 32-bit application, as in OAMHC69.*bldc64*—Flash GPL containing a tar image with all code required on E5-SM8G-B cards for SCCP64, ENUM64, SIP64 and DEIR64 applications.*blmcap*—Flash GPL containing a tar image with all code required on E5-MCAP, E5-E1T1-B, E5-MCPM-B, E5-ATM-B, E5-ENET-B, and E5-SM8G-B cards*bllsc32*—Flash GPL containing a tar image with all code required on SLIC cards for 32-bit application i.e. MCPHC, IPSHC etc.*bllsc64*—Flash GPL containing a tar image with all code required on SLIC cards for 64-bit application i.e. SCCP64, ENUM64, SIP64 and DEIR64.*bll932*—Flash GPL containing a tar image with all code required on SLIC cards for 32-bit application on VxWorks6.9, as in IPSHC69 and MCPHC69.*blbw32*—Flash GPL containing a tar image with all code required on SLICV3 cards for 32-bit application i.e. MCPHC69, SS7HC69, ERTHC69, IPSG69, IPSG932.*blbw64*—Flash GPL containing a tar image with all code required on SLICV3 cards for 64-bit application i.e. SCCP64, ENUM64, SIP64 and DEIR64.*deir64*—Used by E5-SM8G-B and SLIC cards to support the S13/S13' EIR feature*enum64*—Used by E5-SM8G-B and SLIC cards to support the ENUM Mobile Number Portability and Tier One Address Resolution application*erthc/erthc69*—Used by E5-ENET-B and SLIC cards for EAGLE 5 Integrated Monitoring Support functions*hipr2*—Communication software used on the High Speed IMT Packet Router (HIPR2) card*ipsg/ipsg69*—Used by E5-ENET-B and SLIC cards to support the combined functionality of IPSP M2PA and IPSP M3UA*ipsg32/ipsg932*—Used by SLIC cards to support IPSP application with 64-bit addressing either with GTT functionality or without it.*ipshc*—Used by E5-ENET-B cards to support the IPS application*ipshc69*—Used by E5-ENET-B and SLIC cards to support the IPS application when running on VxWorks69.*mcp hc*—Used by E5-MCPM-B cards for the Measurements Platform feature*mcp hc69*—Used by E5-MCPM-B and SLIC cards for the Measurements Platform feature when running on VxWorks69.*oamhc*—Used by E5-MCAP cards for enhanced OAM functions*oamhc69*—Used by E5-MCAP cards for enhanced OAM functions, when running on VxWorks 69.*sccp64*—Used by E5-SM8G-B and SLIC cards to support EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and an E5-SM8G-B or SLIC card is present, then the GPL processes normal GTT traffic.*sfapp*—Used by SLIC cards to support the Stateful Firewall Application.*sip64*—Used by E5-SM8G-B and SLIC Cards to support the SIP application.*ss7hc/ss7hc69*—Application GPL used by E5-E1T1-B and SLIC cards to support **E1** and **T1** signaling links.**Default:**

Display all

Loc (optional)

Location. The target card address and versions of all GPLs running at the specified card location. For E5-ENET-B, or STC cards, this information includes all non-activated flash GPLs. For cards that are not STC, E5-ENET-B or E5-IPSM cards, there is no additional data: this parameter limits the report to the target card address.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

Example

```
rept-stat-gpl
rept-stat-gpl:display=all
rept-stat-gpl:loc=1201
rept-stat-gpl:gpl=hipr2
rept-stat-gpl:gpl=siphc
rept-stat-gpl:gpl=enumhc
rept-stat-gpl:gpl=ipsg32
rept-stat-gpl:gpl=sfapp
```

Dependencies

No other `rept-stat-xxxx` command can be in progress when this command is entered.

Only one of the `display=all`, `loc`, and `gpl` parameters can be specified in the command.

The value specified for the `gpl` parameter must be supported.

Notes

To check the version of the EPAP or ELAP application, use the `rept-stat-mps` command.

When this command is entered, information is displayed only for the cards that are IS-NR or IS-ANR.

Use the `chg-gpl` command to turn auditing on and off.

Use the `rt rv-gpl` command to display the audit state.

The approved GPL is the GPL that resides on the active fixed disk and was made the approved version by specifying the GPL version number while executing the `act-gpl` command.

The trial GPL is the version of the GPL that was downloaded from the removable drive, but not activated by the `act-gpl` command.

When the `act-gpl` command is executed, the version specified becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If any card is not running the active MASP system release version of a GPL, "ALM" is displayed to indicate that the card is in GPL alarm condition.

If GPL auditing is on, a minor alarm is shown, and "ALM" is displayed for each APPROVED GPL (rtrv-gpl) and for each RUNNING GPL (rept-stat-gpl) that does not match the GPL in the RELEASE column of the rtrv-gpl command output. If GPL auditing is off, the minor alarm is not activated, but "ALM" is displayed for each GPL that does not match the GPL in the RELEASE column.

If no gpl parameter is specified, the approved and trial versions for all GPLs are displayed.

If a GPL is not found, a version of "-----" is displayed. This should happen only for the OAM GPL when the plug-in USB flash drive is not inserted.

If the removable drive is inserted, an "*" (asterisk) is displayed next to the OAM trial version. The asterisk serves as a reminder that the trial version of a GPL is loaded when the card that is running the OAM is restarted. All other cards load their approved versions of GPLs when they are restarted.

If a card is inhibited, "-----" is displayed for the running version.

When the gpl parameter is not specified, the default is to display all application GPLs that are running on provisioned cards. The flashable GPLs (those loaded on the card by using the init-flash command) are not displayed.

A plus (+) symbol in the output indicates that the flash GPL currently being run has not yet been activated on the card. See the act-flash or init-flash command for a list of flash GPLs.

When a GPL is specified in the gpl parameter, the specified GPL for each card connected to the IMT is displayed.

Output

The output of the rept-stat-gpl command is site- and configuration-specific. The output examples show typical output for the commands that are entered; the output that is shown can differ from output that appears for a particular system.

This example shows the output when no parameters are defined. All GPLs for the card are listed:

rept-stat-gpl

```

Legend

- **GPL**—GPL associated with the cards in the display
- **CARD**—Card location
- **RUNNING**—GPL version the card is running. If the card is not running the active MASP system release GPL, ALM appears after the GPL version number in this column.
- **APPROVED**—GPL version that is the approved GPL
- **TRIAL**—GPL version that is the trial GPL
- **ACTIVE**—GPL version downloaded using the `init -flash` command and activated using the `act -flash` command
- **INACTIVE**—GPL version downloaded using the `init -flash` command but not activated
- **-----**(dashes)—GPL is not present at the specified location
- *****—The trial version will run if the card boots (shown to the right of the TRIAL column)
- **ALM**—Alarm indicator showing the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.
- **+**—Currently running flash GPL has not been activated (shown between the RUNNING and APPROVED columns)

rept-stat-imt

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to display the primary, secondary, and associated maintenance states of the IMT bus. The primary state indicates whether the bus is normal, abnormal, or OOS for maintenance activity. The secondary state indicates the active/inhibited status of a card for a particular IMT bus.

Parameters

mode (optional)

Use this parameter to provide additional output listing the cards that currently have IMT alarm conditions outstanding. The additional output is repeated for each IMT bus following the bus status information. If no alarms are active on a given bus, no additional output is generated.

Range:

full

Default:

Do not display additional information.

Example

```
rept-stat-imt
```

```
rept-stat-imt:mode=full
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

Notes

The card locations are stored only by the active MASP. The information is lost if the system switches from the active to the standby MASP.

The trouble locations are displayed sorted by card location.

Output

```
rept-stat-imt
```

```
rlghncxa03w 10-12-17 11:58:39 EST EAGLE 43.0.0
```

```

rept-stat-ipconn

Use this command to display the dynamic status of SIP transport/ENUM/SCCP/SFAPP/IPS with SFLOG.

Parameters

This command has no parameters.

Example

```
rept-stat-ipconn
```

Dependencies

The SIPNP Feature must be enabled before retrieving the dynamic status of SIP transport.

At least one ENUM card must be provisioned before retrieving the dynamic status of ENUM connections.

At least one IPS card with SFLOG=yes must be provisioned before entering any TCP connection information on IPS.

At least one SCCP/SFAPP card must be provisioned before entering any Visualization connection information.

A SIP/ENUM/IPS with SFLOG card running the SIPHC/ENUMHC/IPS card with SFLOG=yes application must be configured before this command can be entered.

Notes

None

Output

rept-stat-ipconn

```
tekelecstp 12-06-25 16:14:24 EST EAGLE 45.0.0
rept-stat-ipconn
Command entered at terminal #4.
```

rept-stat-iptps

Use this command to display current and peak IPTPS usage for each IPSP / IPGWx linkset in the system or for each link in the IPSP / IPGWx linkset.

Parameters

history

This parameter specifies whether to report the history of IP TPS usage data on IPSP linksets for the last 60 seconds.

Range:

yes

no

Default:

no

link

The link on the card specified in the `loc` parameter.

Synonym:

port

Range:

a, a1-a63, b, b1-b63

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have assigned signaling link ports.

loc

The IPSG card location for which IP TPS usage data is to be reported.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

lsn (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

All linksets are displayed

peakreset (optional)

Reset peak values to the current TPS values.

Range:

yes

no

Default:

no

tpscost

This parameter specifies whether to report IP TPS usage data for IPSG linksets relative to network conditions, including average MSU size, association RTT, number of links provisioned on the card, and the protocol used (M2PA or M3UA).

Range:

yes

no

Default:*no***Example**

```
rept-stat-iptps
```

```
rept-stat-iptps:lsn=lsgw1101
```

```
rept-stat-iptps:peakreset=yes
```

```
rept-stat-iptps:lsn=lsm2pa1:tpscost=yes
```

```
rept-stat-iptps:loc=1305:tpscost=yes
```

```
rept-stat-iptps:loc=1305:history=yes
```

```
rept-stat-iptps:loc=1305:link=a3:history=yes
```

Dependencies

If the linksets are not IPGWx or IPSG, then this command cannot be entered.

The specified linkset name must exist in the database.

The history, link, loc, and tpscost parameters can be specified for only IPSG cards.

If the history parameter is specified, then the loc parameter must be specified.

If the tpscost parameter is specified, then the loc or lsn parameter must be specified.

If the loc parameter is specified, then the tpscost, history, or peakreset parameter must be specified.

Only one of the history, tpscost, and peakreset parameters can be specified in the command.

The loc and lsn parameters cannot be specified together in the command.

The specified linkset must be type IPSG.

Notes

Traffic peak data are stored only in OAM memory and are not preserved when the card that is running the OAM boots, or in the case of an active/standby switchover.

IPSG linksets have SLKTPS linksets configured rather than IPTPS. SLKTPS configures the transactions per second for each link assigned to the IPSG linkset as opposed to IPTPS which configures the combined transactions per second for the entire IPGW linkset. For an IPSG linkset, the calculated IP TPS value (shown under the 'CONFIG' column in the report) is made up of the aggregate calculated SLKTPS of all of the provisioned links in the linkset. Non-IPSG hosted links are not counted in the calculation as they do not support SLKTPS.

If a linkset contains a mixture of IPLIMx M2PA and IPSG-M2PA links, then the command does not report any data below the TPS header or raise alarms.

For IPSG-M3UA and IPGWx-M3UA links, the rept-stat-iptps command also counts the received DAUD messages and transmitted SNMs in response to DAUD audits (along with the other transmitted SNMs).

The process of updating the IP TPS counts for DAUD and DAUD response SNMs is:

- Rcv IP TPS count is updated with the total number of valid DAUD messages that are successfully queued for response processing based on the combination of RCs (Routing Contexts) and APCs (Affected Point Codes) received in the M3UA DAUD message.
- In reply to DAUD, based on the response generated (DUNA or (DAVA/DRST + SCON)), Tx IP TPS counts are updated for each RC/APC combination (either the same as the Rcv counts or twice the Rcv counts respectively).
- If no RC is present, then the Tx/Rcv IP TPS is incremented for the associated link corresponding to the lowest PORT ID for IPSPG-M3UA links for the same association.
- For IPGWx-M3UA links, Tx/Rcv IP TPS are always incremented on the default PORT Index (since only one link can be configured in IPGWx GPL).
- For IPGWx-M3UA links, Rcv IP TPS count are also updated with the number of valid and non discarded Deviated DAUD message received (since Deviated DAUD always contains single RC and APC combination).

All of the transmitted SNMs are pegged in IPTPS Tx counts and are considered in the TPS algorithms.

Output

The `rept-stat-iptps` command reports on IPSPG and IPGWx linkset IP TPS. The report includes the following information for the system and for each IPSPG or IPGWx linkset:

- Configured IP TPS alarm threshold
- Configured IP TPS
- Current IP TPS transmit and receive usage for 15 seconds
- Peak IP TPS transmit and receive usage and timestamp for all 15 second periods since last reset

As of Release 44.0, the `rept-stat-iptps` command is enhanced to report derived IP TPS usage for IPSPG linksets.

- Current derived IP TPS transmit and receive usage over a window of 15 seconds
- Peak IP TPS transmit and receive usage and timestamp for all 15 second periods since last reset
- 60 seconds history of the IP TPS transmit and receive usage

The derived IP TPS is calculated by adding the costs for factors such as average MSU size, association round trip time, number of provisioned links on card and protocol used (M2PA or M3UA). The derived TPS has valid values if:

- The specified card location indicates an E5-ENET-B/SLIC IPSPG card or the links in the specified linkset are hosted on E5-ENET-B or SLIC card,
- the E5-ENET-B IPSPG High Throughput feature is turned ON,
- the actual traffic rate running on the IPSPG card > 6500 TPS and
- the network configuration or traffic characteristics exceeds optimal configuration limits as shown in [Table 4-53](#).

Table 4-53 Baseline Configuration Changes for the E5-ENET-B Card

E5-ENET-B Card Baseline Configuration	E5-ENET-B IPSPG High Throughput feature OFF	E5-ENET-B IPSPG High Throughput feature ON
TPS	6500	9500

Table 4-53 (Cont.) Baseline Configuration Changes for the E5-ENET-B Card

E5-ENET-B Card Baseline Configuration	E5-ENET-B IPSP High Throughput feature OFF	E5-ENET-B IPSP High Throughput feature ON
Max RTT (ms)	120	50
Avg. MSU size (bytes)	0-272	0-120
Number of associations/links	16	4
Protocol	M2PA and M3UA	M2PA

For all other conditions, including the use instead of an E5-ENET-B card, the derived IP TPS values is invalid and is denoted by dashes (---) in the *Derived TPS* and column.

The following table shows values for Max rsvdsktps and Max maxsktps:

Table 4-54 MaxTPS Per Card

E5-ENET-B IPSP High Throughput FAK	Max RSVDSLKTPS			Max MAXSLKTPS		
	E5-ENET-A	E5-ENET-B	SLIC	E5-ENET-A	E5-ENET-B	SLIC
FAK is OFF	5000	6500	10000	5000	6500	10000
FAK is ON	5000	9500	10000	5000	9500	10000

If the linkset is specified, then the command reports the same information for the individual links in the linkset.

If the peakreset=yes parameter is specified, then the command resets all the stored peak values to the current actual usage for each link, and recalculates linkset and system peaks before reporting usage.

If the linkset is specified with the peakreset=yes parameter, then the command recalculates peaks for the specified linkset and resets all the stored peak values to the current actual usage for each link contained in the linkset before reporting usage.

The peaks for transmit and receive, and for link, and linkset IP TPS may all occur at different times.

The IP TPS value shown in the command may contain one extra MSU if the linkset is specified. Because the alarm calculations are implemented using integer math, rounding may occur at each entity (link, linkset) if the IP TPS value for the entity is not evenly divisible by 15. This could occur when performing an IPTPS report for a linkset that has more than one link configured.

For mixed IPLIMx-M2PA and IPSP-M2PA linksets, the command does not report any data or raise alarms.

IPGW linksets display dashes in the *CONFIG/MAX* column.

Asterisk sign indicates that parameter (CONFIG/RSVD or CONFIG/MAX) is used to generate TPS alarm for IPSP links/linkset.

This example shows the output for an IPGW linkset:

```
rept-stat-iptps:lsn=ls1307a
```

rept-stat-j1

Use this command to display the J1 port status and signaling link status for cards with provisioned J1 ports.

Parameters

loc (optional)

Card address. The unique identifier of a specific LIMT1 card located in the STP.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Information for all LIMT1 cards having J1 interfaces is reported.

j1port (optional)

J1 port number. This parameter displays information for a J1 port on the card in the specified card location.

Range:

1-8

Example

```
rept-stat-j1
```

```
rept-stat-j1:loc=1101
```

```
rept-stat-j1:loc=1101:j1port=1
```

Dependencies

No other rept-stat-xxx command can be in progress when this command is entered.

The loc parameter must be specified when the j1port parameter is specified.

The OAM card location cannot be specified for the loc parameter.

MUX card locations (xy09 and xy10 where x is the frame and y is the shelf) cannot be specified for the loc parameter.

Card location 1118 cannot be specified.

Notes

Specifying the command without any parameters displays J1 port status for all cards with provisioned J1 ports.

If the loc parameter is specified, status is displayed for all J1 ports provisioned on the card in the specified location.

If the loc and j1port parameters are specified, the J1 port status summary is displayed for all J1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified J1 port on the card.

Output

This example shows the output when no parameters are specified:

rept-stat-j1

```

rept-stat-lfs

Use this command to generate a report of all the SS7 links that are under LFS test. Along with the link identification information, the command output lists the current LBP, the test pattern, the maximum bit-errors threshold, the bit-errors since the beginning of this test, the maximum test time, and the time elapsed since the beginning of the test.

Parameters

link (optional)

The signaling link port on the card specified in the Loc parameter.

Synonym:

port

Range:

a, b, a1 - a31, b1 - b31

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have assigned signaling link ports.

loc (optional)

This parameter is mandatory when the link parameter is specified.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1212, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
rept-stat-lfs
```

```
rept-stat-lfs:loc=1201
```

```
rept-stat-lfs:loc=1201:link=a1
```

Dependencies

The LFS feature must be turned on before this command can be entered.

The card location specified in the `loc` parameter must be equipped.

The signaling link that is specified in the `link` parameter must be assigned to the card in the `loc` parameter location.

Card locations 1113, 1114, 1115, 1116, 1117, 1118, and all `xy09` and `xy10` locations (`x` is the frame and `y` is the shelf) cannot be specified in the `loc` parameter.

The card location (`loc` parameter) must be an E5-E1T1-B card, provisioned with the LIMT1 card type, configured with either the SS7ANSI or CCS7ITU application.

If the `link` parameter is specified, the `loc` parameter must be specified.

This command cannot be entered during upgrade.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

If no parameters are specified, all links that are in LFS test are displayed.

```
rept-stat-lfs
```

rept-stat-lg

Use this command to display measurement and statistics of all the LG objects on Eagle node. The command class is `TKLC_INTERNAL` inheriting properties of `DEBUG` class. The Load Generator is supported on `IPSG`, `IPLHC`, `IPGHC` and `SS7HC` GPLs.

Parameters

display (optional)

Display mode of reporting the output.

Range:***brief***

Displays the summary statistics information for LG object's and its child hierarchy i.e. brief of system level stats will show only brief level of system->group->card->engine statistics

all

Displays the detailed statistics information for LG object's and its child hierarchy i.e. system level stats will show its system->group->card->engine statistics

Default:

brief

engine (optional)**Range: ayyyyyyyyyy**

Up to 10 alphanumeric characters; the first character must be a letter.

grp (optional)**Range: ayyyyyyyyyy**

Up to 10 alphanumeric characters; the first character must be a letter

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

reset (optional)

This parameter clears the statistics by setting them to zero.

Range:***Rx***

Receive Direction

Tx

Transmit Direction

All

Both in Tx and rx directions

Example

```
rept-stat-lg
```

```
rept-stat-lg:display=all
```

```
rept-stat-lg:reset=tx
```

```
rept-stat-lg:reset=all
```

```
rept-stat-lg:grp=lggroup1
```

```
rept-stat-lg:grp=lggroup1:display=brief
```

```

rept-stat-lg:grp=lggroup1:reset=tx
rept-stat-lg:loc=1101
rept-stat-lg:loc=1101:display=all
rept-stat-lg:loc=1101:reset=all
rept-stat-lg:engine=txengine1
rept-stat-lg:engine=txengine1:display=brief
rept-stat-lg:engine=txengine1:reset=all

```

Dependencies

The `reset` and `display` parameters cannot be specified together.

The `grp`, `loc`, and `engine` parameters cannot be specified together.

The LG group with the specified group name must exist in the system.

The card location must not be 1113-1118, orxy09 andxy10 wherexis the frame andyis the shelf.

The value specified for the `engine` parameter must already exist in the LG Engine table.

The value of `reset` parameter must be `all` when the `engine` parameter is specified.

The card location specified in the `loc` parameter must be of a provisioned LG card.

Output

This example shows the LG System level statistics in brief mode:

```
rept-stat-lg or rept-stat-lg:display=brief
```

```

rept-stat-lnp

Use this command to generate a report of the local number portability (LNP) status information.

When this command is entered with no parameters, a summary of the LNP status of all equipped SCCP cards is provided. This summary includes Global Title Translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information.

When the `loc` parameter is specified, a detailed status of LNP information for the specified SCCP card is provided. These detailed reports include information for each of the following functions: Global Title Translation (GTT), LNP Message Relay (LNPMR), LNP Query Service (LNPQS), Personal Communication Service LNP Query Service (PLNPQS) (if the PLNP feature is turned on), Wireless LNP Query Service (WNPQS) (if the WNP feature is turned on), Triggerless LNP (TLNP) (if the TLNP feature is turned on), LRNQT (if the ITU TCAP LRN Query feature is turned on), and Automatic Call Gap (ACG).

When the `card=sccp-all` parameter is specified, a detailed status of LNP information for all SCCP cards is provided.

Parameters

card (optional)

Specify `card=sccp-all` to display a report of the LNP status of all equipped SCCP cards.

Range:

sccp-all

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

A summary for all cards is displayed.

Example

```
rept-stat-lnp
```

```
rept-stat-lnp:card=sccp-all
```

```
rept-stat-lnp:loc=1106
```

Dependencies

The LNP feature must be turned on before this command can be entered.

The `card` and `loc` parameters cannot be specified together in the command.

The only valid value for the `card` parameter is *sccp-all*.

No other `rept-stat-xxx` command can be in progress when this command is issued.

At least one SCCP card must be configured in the system.

The value specified for the `loc` parameter must identify a Service Module card.

Notes

The error information on this report is based on 30-second intervals. The values for number of errors and total messages are for the last 30-second period. The usage information is also updated once every 30 seconds.

When this command is entered with no parameters, a summary of the LNP subsystem status is reported, followed by a summary of the LNP status of all equipped SCCP cards. This summary includes global title translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information. The GTT status is either ACT (active) or SWDL (software loading). The LNP status is either ACT, OFFLINE, or SWDL. LNPQS system information is then provided in the following fields:

- The ALARM STATUS displays the current alarm on the LNP Subsystem.
- The SSN STATUS and MATE SSN STATUS fields show the state of the LNP subsystems: Prohibited, Restricted, or Allowed.
- The ACG OVERLOAD LEVEL field shows the ACG node overload control level used by the system.
- The system average MIC usage is expressed as a percentage of the number of MICs sent by all cards, divided by the number of responses sent by all cards.

The `rept - stat - lnp` command also provides a summary of the following system-wide LNP statistics.

- The average GTT usage is expressed as the average percentage of GTT usage per card.
- The average LNPMR usage is expressed as the average percentage of LNPMR usage per card.
- The average LNPQS usage is expressed as the average percentage of LNPQS usage per card.
- The average WNPQS usage is expressed as the average percentage of WNPQS usage per card. WNPQS information is displayed only if the WNP feature is turned on.
- The average PLNPQS usage is expressed as the average percentage of PLNPQS usage per card. PLNPQS information is displayed only if the PCS 1900 Number Portability feature (PLNP) is turned on.
- The average LRNQT usage is expressed as the average percentage of LRNQT usage per card. LRNQT information is displayed only if the LRNQT feature is turned on.
- The average CPU usage is expressed as the average percentage of CPU usage per card.
- The total number of GTT, LNPMR, LNPQS, WNPQS (if turned on), TLNP (if turned on), PLNPQS (if turned on), and LRNQT (if turned on) errors for corresponding messages received across all cards.

When the `rept - stat - lnp` command is entered for a specific card (for example, `rept - stat - lnp: loc=xxxx`), status information for the card at the specified location is provided, followed by the alarm status and detailed LNP status information and statistics for each LNP function.

- GTT STATUS, either ACT (active) or SWDL (software loading).
- GTT USAGE, expressed as a percentage of the amount of CPU used to process GTT messages during the last 30 seconds by the specified card.

- GTT ERRORS, the number of GTT errors detected for the total number of GTT messages received by the specified card.
- LNPMR STATUS, either ACT (active), OFFLINE, or SWDL (software loading).
- LNPMR USAGE, expressed as a percentage of the amount of CPU used to process LNP message relay messages during the last 30 seconds by the specified card.
- LNPMR ERRORS, the number of LNP message relay errors detected for the total number of LNP message relay messages received by the specified card.
- LNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- LNPQS USAGE, expressed as a percentage of the amount of CPU used to process LNP query messages during the last 30 seconds by the specified card.
- LNPQS ERRORS, the number of LNP query errors detected for the total number of LNP query messages received by the specified card.
- WNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- WNPQS USAGE, expressed as a percentage of the amount of CPU used to process WNP query messages during the last 30 seconds by the specified card.
- WNPQS ERRORS, the number of WNP query errors detected for the total number of WNP query messages received by the specified card.

Note

IS-41 LNP Queries with a TT associated with the LNPQS service are pegged as IS-41 LNP Queries with a TT associated with the WNP service under the WNPQS counter. The WNPQS STATUS, WNPQS USAGE, and WNPQS ERRORS fields are displayed only if the Wireless Number Portability feature is ON.

- PLNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- PLNPQS USAGE, expressed as the amount of CPU used to process PCS 1900 LNP Query messages over the last 30-second period by the specific card.
- PLNPQS ERRORS, the number of PCS query errors detected for the total number of PCS query messages received by the specified card.

Note

PCS 1900 LNP Queries with a TT associated with the LNPQS service are processed and pegged as IN LNP Queries under the LNPQS counter. The PLNPQS STATUS, PLNPQS USAGE, and PLNPQS ERRORS fields are displayed only if the PCS 1900 Number Portability (PLNP) feature is ON.

- TLNP STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- TLNP USAGE, expressed as a percentage of the amount of CPU used to process Triggerless LNP Encapsulated IAM messages over the last 30-second period by the specific card.
- TLNP ERRORS, the number of TLNP query errors detected for the total number of TLNP query messages received by the specified card.

Note

The TLNP STATUS, TLNP USAGE, and TLNP ERRORS fields are displayed only if the Triggerless LNP (TLNP) feature is ON.

- LRNQT STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- LRNQT USAGE, expressed as a percentage of the amount of CPU used to process LRNQT queries over the last 30-second period by the specific card.
- LRNQT ERRORS, the number of LRNQT query errors detected for the total number of LRNQT messages received by the specified card.

Note

The LRNQT STATUS, LRNQT USAGE, and LRNQT ERRORS fields are displayed only if the LRNQT feature is ON.

- ACG OVERLOAD LEVEL, the ACG node overload control level being used by the system.
- MIC USAGE, expressed as a percentage of the number of MICs sent by the specific card divided by the number of responses sent by the specified card during the last 30 seconds.
- CPU USAGE, expressed as a percentage of the amount of CPU used to process messages by the specified card during the last 30 seconds.

When the card=sccp-all parameter is specified, detailed information is provided about the status of all SCCP cards. The information displayed in the output is the same as that displayed for the loc=xxxx parameter.

Output

This example shows the output when the WNP, PLNP, TLNP, and LRNQT features are off:

rept-stat-ls

Use this command to generate a report of the status of the MTP linksets. When a specific linkset is requested, the output displays a list of the links in the linkset and their secondary status. Output is generated for each of the 16 signaling link codes (SLC). If the Multiple Linksets to Single Adjacent Point Code (MLS) feature is turned on, and an adjacent destination point code is requested, then the output displays a summary status, including the secondary point codes, of the linksets that use that adjacent point code.

Parameters

apc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code 000-000-000 is not a valid point code.

apc/apca/apci/apcn/apcn24/apcn16 (optional)

Adjacent point code.

apci (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

apcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

apcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000-255

apcn16 (optional)

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The *prefix* indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

lsn (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range:

ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

All linksets are displayed

stat (optional)

The primary state filter. The state of the linksets for which a report will be displayed.

Range:

all

All of the primary states

alminh

Alarms inhibited

anr

In-Service-Abnormal (IS-ANR)

dsbld

Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)

mt

Out-of-Service-Maintenance (OOS-MT)

nr

In-Service-Normal (IS-NR)

Default:*all***Example**`rept-stat-ls``rept-stat-ls:lsn=lsnstpa`**Dependencies**

No other `rept-stat-xxx` command can be in progress when this command is entered.

The linkset specified by the `lsn` parameter must be equipped in the database.

The `stat` and `lsn` parameters cannot be specified together in the command.

The Multiple Linksets to a Single Adjacent Point Code (MLS) feature must be turned on before the `apc` parameter can be specified.

The `lsn`, `stat`, and `apc` parameters cannot be specified together in the command.

At least one linkset must be associated with the value of the `apc` parameter.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no link is equipped for the SLC, the output is “____, __ UEQ.”

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

"ASP-STATE" is shown for only IPSP-M3UA linksets.

Output

If the Proxy Point Code feature is enabled, then proxy point code information is displayed.

Legend

- **LSN**—Name of the linkset
- **APCA/APCI/APCN/APCN24/APCN16**—Adjacent point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit, ITU-N 16-bit)
- **SPCA/SPCI/SPCN/SPCN24**—Secondary point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)
- **PST**—Primary state of the linkset. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the linkset. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the linkset. See [Possible Values for PST/SST/AST](#).
- **ALARM STATUS**—List of trouble text alarm messages that have been generated for the specified card
- **SCRN**—Name of the gateway screening screen set associated with the linkset
- **GWSA**—Shows whether gateway screening is used for the specified linkset
- **GWSM**—Shows whether gateway screening messaging is turned on for the specified linkset
- **GWSD**—Shows whether discarding of MSUs that bypass the gateway screening function due to loadshedding is turned on
- **SLC**—Signaling link codes associated with the links in the specified linkset
- **SLK**—Signaling links in the linkset, shown by the card location containing the signaling link and the port on the card containing the signaling link
- **PPCA/PPCI/PPCN/PPCN24/PPCN16**—Proxy point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit, ITU-N 16-bit)
- **ASP STATE**—State of AS associated with each signaling link of the IPSPG-M3UA linkset. The states displayed are: ACTIVE, INACTIVE, or DOWN.

rept-stat-meas

Use this command to report the status of the Measurements Subsystem (Measurements Platform) or MASPs (Integrated Measurements), including card location and state, IP link status, alarm level, and subsystem state.

Note

If the Integrated Measurements collection function is turned on, then the status reflects the state of the E5-OAM card(s). If the Measurements Platform collection function is turned on, then the status reflects the state of the MCPM cards.

Parameters

This command has no parameters.

Example

```
rept-stat-meas
```

Dependencies

At least one MCPM card must be configured in the system if the Measurements Platform feature is turned on.

No other `rept-stat-xxx` commands can be in progress when this command is issued.

The Integrated Measurements or Measurements Platform feature must be turned on before this command can be entered.

The `platformenable=on` or `oamhcmcas=on` parameter must be specified (see the `chg-measopts` command) before this command can be entered.

This command cannot be entered when CAT2 IPSM to OAM syncing is in progress.

Notes

The card status is independent of the IP Network Link status (Port A). The card can be IS-NR even if the network link has failed.

The version of the GPL is shown in the command output if the card is in the IS-NR or IS-ANR state. The `rept-stat-card` command does not show the GPL version if the card is IS-ANR.

Output

Note

The E5-MCPM-B card is an MCPM card. The *Type* field displays MCPM.

Output example with an MCPM card isolated:

rept-stat-meas

```

MEAS SS          PST          SST          AST
IS-ANR          Active      -----
ALARM STATUS =  * 0516 Degraded Mode - 1 card failed

CARD  VERSION      TYPE  PST          SST          AST
1107 P 134-000-000  MCPM  IS-NR      Active      -----
      IP Link A      IS-NR      Active      -----
1109 -----      MCPM  OOS-MT      Isolated    -----
      IP Link A      OOS-MT      Unavail     -----

CARD 1107 ALARM STATUS = No Alarms
CARD 1109 ALARM STATUS = Card is isolated from the system
Command Completed.
;

```

Output example when the Integrated Measurements collection function is turned on:

rept-stat-meas

```

MEAS SS          PST          SST          AST
IS-NR          Active      -----
ALARM STATUS =  No Alarms

CARD  VERSION      TYPE  GPL      PST          SST          AST
1113 P 132-049-000  E5MCAP  OAMHC      IS-NR      Active      -----
      IP Link A      IS-NR      Active      -----
1115  132-049-000  E5MCAP  OAMHC      IS-NR      Active      -----
      IP Link A      OOS-MT      Unavail     -----

CARD 1113 ALARM STATUS = No Alarms
CARD 1115 ALARM STATUS = No Alarms

Command Completed.
;

```

Output example with both MCPM cards IS-NR:

rept-stat-meas

```

tekelec 11-03-15 20:34:15 EST  EAGLE5 44.0.0

MEAS SS          PST          SST          AST
IS-NR          Active      -----
ALARM STATUS =  No Alarms

CARD  VERSION      TYPE  PST          SST          AST
1106  134-000-000  MCPM  IS-NR      Active      -----
      IP Link A      IS-NR      Active      -----
1108  134-000-000  MCPM  IS-NR      Active      -----
      IP Link A      IS-NR      Active      -----

```

```
CARD 1106 ALARM STATUS = No Alarms
CARD 1108 ALARM STATUS = No Alarms
```

```
Command Completed.
```

```
;
```

Legend

- **VERSION**—Version number of the GPL running on the specified card. The version is shown if the card is in the IS-NR or IS-ANR state.
- **TYPE**—Type of card running the Measurements Subsystem application
- **PST**—Primary state of the Measurements Subsystem or card. See [Possible Values for PST/SST/AST](#) for more information.
- **SST**—Secondary state of the Measurements Subsystem or card. See [Possible Values for PST/SST/AST](#) for more information.
- **AST**—Associated state of the Measurements Subsystem or card. See [Possible Values for PST/SST/AST](#) for more information.
- **MEAS SS**—Measurements Subsystem application running on the card
- **ALARM STATUS**—List of trouble text alarm messages that have been generated for the card and the applications running on the card
- **CARD**—Location of the card. The card with the letter “P” to the right of its card location is the primary card. The primary card transfers scheduled measurements report files to the primary FTP server. When the primary state (PST) of the card is IS-NR, the secondary state (SST) indicates whether the card is active or standby, and the value of the associated state (AST) remains "-----".
- **CARD XXXX ALARM STATUS**—List of trouble text alarm messages that have been generated for the card

Related Topics

- [rept-stat-card](#)

rept-stat-mfc

Use this command to obtain the status of the Message Flow Control (MFC) services.

Parameters

mode (optional)

The amount and type of information displayed in the report.

Range:

full

display a full report for the specified MFC service

stats

display detailed statistics for the specified MFC service

act

display information about the status of MFC on individual Service cards

Default:

No change to the current value

reset (optional)

This parameter resets the statistics for all sample periods for the specified service.

Range:

yes

sample (optional)

The data sample to be used.

Range:

avg30s

30-second average value calculated over the previous 5 minutes

tot5m

total value summed over the previous 5 minutes

avg1h

1-hour average value calculated over the previous 24 hours

tot24h

total value summed over the previous 24 hours

service (optional)

The MFC service for which information is reported.

Range:

eroute

EROUTE MFC service

inm

INM MFC service

mtp3

MTP3 MFC service

scpdn

SCCP DN MFC service

scpelap

SCCP ELAP MFC service

scpepap

SCCP EPAP MFC service

scpimsi

SCCP IMSI MFC service

sfapp

SFAPP MFC service

sflog

SFLOG MFC service

sfr
SFAPP response MFC service

snm
SNM MFC service

vsccp
VSCCP MFC service

deirsccp
DEIR SCCP MFC service

Example

```
rept-stat-mfc
rept-stat-mfc:service=vsccp:mode=act
rept-stat-mfc:service=eroute
rept-stat-mfc:service=eroute:reset=yes
rept-stat-mfc:mode=stats:service=vsccp:sample=avg30s
rept-stat-mfc:mode=stats:service=scpimsi:sample=avg30s
rept-stat-mfc:service=scpepap
rept-stat-mfc:service=scpelap
rept-stat-mfc:service=sflog
rept-stat-mfc:service=sfapp
rept-stat-mfc:service=sfr
rept-stat-mfc:service=deirsccp
```

Dependencies

No other command can be in progress when this command is entered.

The mode=stats and sample parameters must be specified together in the command.

If the mode or reset parameter is specified, then the service parameter must be specified.

If a value of *mtp3*, *snm*, or *inm* is specified for the service parameter, then the mode=act parameter cannot be specified.

The EPAP Data Split feature must be enabled before a value of *scpdn* or *scpimsi* can be specified for the service parameter.

The Dual ExAP Config feature must be enabled before a value of *scpepap* or *scpelap* can be specified for the service parameter.

The Dual ExAP Config feature or EPAP Data Split feature must be enabled before a value of *scpepap* can be specified.

Notes

For the SFLOG MFC service, a maximum of two servers can be provisioned in the EAGLE, and only one can be active at a time. This command will provide the basic statistics (i.e., service denied, PDU discard, PDU sent) for the SFLOG MFC service.

Output

Abbreviated output is indicated by 3 vertical dots as shown:

.
.
.

If the card does not support thermal monitoring, and if an MFC service is hosted on that card, then *N/A* is shown in the *THERMAL* column for that card location in `rept-stat-mfc:mode=act` output.

The *UNAVL* state in the output of `rept-stat-mfc:mode=full` indicates the cards that are not in the IS-NR state.

This example shows an MFC report for all the services when EPAP Data Split feature is enabled:

`rept-stat-mfc`

Legend

The MFC Engine provides Server card statistics that are computed every hour (based on a Server card's timer); therefore they are typically posted an hour later. Client card statistics update continuously; current values will be observed at every invocation of the command.

rept-stat-mon

Use this command to display the status of the Fast Copy subsystem on FC-capable cards and the EROUTE subsystem on STC cards and E5-STC cards for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

Parameters

loc (optional)

Card location. The card location as stenciled on the shelf for an STC or E5-STC card or an FC-capable card in the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Status for all STC and FC-capable cards is reported.

mode (optional)

This parameter provides extended performance information, including message flow control (MFC) messaging rates.

If the mode=perf parameter is specified, then only subsystem performance information is displayed.

Range:

perf

type (optional)

Monitoring subsystem type. The type of the subsystem for which the monitoring statistics are displayed.

Range:

fcs

Display the statistics for the Fast Copy subsystem

eroute

Display the statistics for the EROUTE subsystem

Default:

Display the statistics for both the EROUTE and FC subsystems

Example

```
rept-stat-mon
rept-stat-mon:type=eroute
rept-stat-mon:type=fcs
rept-stat-mon:type=eroute:loc=1101
rept-stat-mon:type=fcs:loc=1104
rept-stat-mon:type=eroute:mode=perf
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

At least one STC card must be configured before this command can be entered.

At least one FC-capable card must be provisioned in the system before the `type=fcs` parameter can be specified.

The `loc` and `mode` parameters cannot be specified together in the command.

The `type=eroute` parameter must be specified before the `mode` parameter can be specified.

If the `loc` or `mode` parameter is specified, then the `type` parameter must be specified.

Either an STC card or an FC-capable card must be provisioned in the system.

An FC-capable card must be provisioned in the system before the `type=fcs` parameter can be specified. An STC card must be provisioned in the system before the `type=eroute` parameter can be specified.

Notes

Fast Copy Cards

E5-ENET-B cards running the IPSG or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This restriction does not apply to cards running the IPSG GPL. An *FC-capable* card is considered *FC-enabled* when Fast Copy monitoring is enabled for the respective GPL.

For a card to be FC monitored, the following two conditions must be satisfied:

1. FCMODE = FCOPY for the GPL
2. The card must have at least one (1) link with an EMP session established.

When a card is not being FC-Monitored, no FC alarm will be present on the card/port. The card's FCS state remains OFFLINE and the state of FCS ports on the card is OOS-MA/UEQ irrespective of the Ethernet cable being connected on those ports or not.

Output

This example displays card- and system-level information for the Fast Copy and EROUTE subsystems:

rept-stat-mon

Legend

Information displayed in the EROUTE subsystem report:

- **STC Cards Configured**—Total number of STC cards and E5-STC cards configured in the system
- **Cards IS-NR**—Total number of STC cards and E5-STC cards in IS-NR state
- **EISCOPY BIT**—Indicates whether EIS copy function is turned On or Off
- **System Threshold**—% of system total capacity being used
- **System Peak EROUTE Load**—Current load in Buffers/Sec
- **System Total EROUTE Capacity**—Total capacity in Buffers/Sec

- **SYSTEM ALARM STATUS**—Either "No Alarms" or current alarm number and text
- **CARD**—Card location
- **VERSION**—Version number of the GPL loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:
 - The card does not run a GPL, such as TDM or MDAL cards.
 - The card is configured but is not physically present in the system.
 - The card is IS-ANR or is in the process of being loaded.
- **TYPE**—Card type entered in the database
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#).
- **EROUTE Service Average Messaging Capacity\AVERAGE MESSAGING CAPACITY**—Average MFC Capacity in percent
- **Average CPU Capacity\Average CPU Usage**—Average CPU capacity in percent
- **Message usage**—% of system current MFC rate based on the Max MFC capacity
- **TOTAL MESSAGING RATE**—Total MFC processing rate
- **CPU usage**—% of system current CPU usage
- **STC IP PORT**—Status of the STC IP ports A and B

Information displayed in the Fast Copy subsystem report:

- **FC Cards Configured**—Total number of FC-capable cards configured in the system
- **Cards IS-NR**—Total number of FC-capable cards in IS-NR state
- **FCMODE**—Monitoring mode
- **GPL**—Application loaded on the card
- **SYSTEM ALARM STATUS**—Either "No Alarms" or current alarm number and text
- **CARD**—Card location
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **CPU**—% of system current CPU usage
- **CARD FCS**—Fast Copy status for the card
- **REASON**—Deactivation alarm reason on Card FCS. Possible values are "CPU Thrshld Exceeded" or "Auto-Neg Fails".
- **FCS IP PORT**—status of the FCS IP ports A1 and B1
- **IPADDRESS**—IP addresses of the IMF
- **ASSOC NAME**—Association name
- **PKT CNT**—Snapshot of packets received/sent per association
- **SERVICE MODE**—Type of service granted by the DAS to FC-enabled card

rept-stat-mps

Use this command to display the overall status of the application running on the MPS (multi-purpose server).

- If the LNP ELAP Configuration feature is turned on, the ELAP (EAGLE LNP Application Processor) subsystem status is displayed.
- If the INP/AINPQ feature is turned on, the EPAP (EAGLE Application Processor) subsystem status is displayed.
- If the G-Port (GSM mobile number portability), G-Flex (GSM flexible numbering), or PPSMS (Prepaid SMS Intercept Ph1) feature is turned on, then the GSM (Global System for Mobile Telecommunications) and EPAP status is displayed.
- If the EIR (Equipment Identity Register) feature is turned on, then the status of the EIR component on the card is displayed.
- If the V-Flex (Voice Mail Router) feature is turned on, then the status of the V-Flex component on the card is displayed.
- If the ATINP (ATI Number Portability Query) feature is enabled, then the status of the ATINPQ component on the card is displayed.

Parameters

loc (optional)

The card location of the VSCCP card to be reported on, as stenciled on the shelf of the EAGLE.

Range:

1101 - 1108, 1111 - 1117, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
rept-stat-mps:loc=1106
```

Dependencies

The card location specified in the `loc` parameter must contain a Service Module card.

One of the following features must be turned on, the ATINP feature must be enabled, or at least one ENUM card must be configured before this command can be entered:

- A-Port
- AINPQ
- G-Flex
- G-Port
- INP
- EIR
- LNP ELAP Configuration

- Prepaid SMS Intercept Ph1
- SIP NP
- V-Flex

At least one Service Module card must be configured in the system before this command can be entered.

The card location specified in the loc parameter must be provisioned as an SCCP card but cannot provide only GTT service.

To specify the `rept-stat-mps` command, no other `rept-stat-xxxx` command can be in progress.

The card location specified in the loc parameter must contain either an SCCP card, a SIP card, or an ENUM card.

A Service Module card running the VSCCP/SIPHC/ENUMHC application must be configured before this command can be entered.

Notes

When the MPS does not have an alarm on it, the `rept-stat-mps` report indicates in the SST field of the report which MPS is the active and which is the standby. When the MPS has an alarm on it, the SST field shows "Fault," and the Active/Standby information is displayed in the AST field as long as there is an alarm. After the alarm clears, the Active/Standby information appears in the SST field as before.

Output

Note

The status for a particular feature is shown only if that feature is enabled or turned on.

This example shows the possible system response if the LNP ELAP Configuration feature is turned on:

`rept-stat-mps`

Legend

- **CARD**—Location of the Service Module card. The Service Module card with the designator “P” to the right of its card location is the primary Service Module card as selected by the active ELAP/EPAP. The primary Service Module card provides the ELAP/EPAP status to the OAM. When the primary state (PST) of the ELAP/EPAP is IS-NR, the secondary state (SST) indicates whether the ELAP/EPAP is active or standby.
- **VERSION**—Version number of the GPL that the specified ELAP/EPAP or card is running.
- **PST**—Primary state of the ELAP/EPAP or card. Possible values are described in [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the ELAP/EPAP or card. Possible values are described in [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the ELAP/EPAP or card. Possible values are described in [Possible Values for PST/SST/AST](#).
- **EPAP/ELAP A/B**—Application running on the MPS (multi-purpose server) platform. If the LNP ELAP Configuration feature is turned on, the output shows ELAP A/B. If INP, G-Flex, G-Port, or V-Flex is turned on, the output shows EPAP A/B.
- **ALARM STATUS**—List of trouble text alarm messages that have been generated for the MPS and the applications running on the MPS. Each alarm is listed as a 16-character hexadecimal string where each bit represents a unique platform or application alarm. To decode the string, use the procedure in the *EPAP Administration Guide* or the *ELAP Administration and LNP Feature Activation Guide*. There are 6 categories of MPS alarms:
 - Critical platform alarm data
 - Major platform alarm data
 - Minor platform alarm data
 - Critical application alarm data
 - Major application alarm data
 - Minor application alarm data
- **GSM STAT**—Possible states are ACT (active) or SWDL (the GSM component on that card is inactive until the software download completes). GSM STAT information is not displayed if the G-Port, G-Flex and Prepaid SMS Intercept Ph1 features are turned off.
- **INP STAT**—Possible states include ACT (active), OFFL (offline) and SWDL (the INP component on that card is inactive until the software download completes). INP STAT information is not displayed if the INP feature is turned off.

- **LNP STAT**—Possible states include ACT (active), OFFL (offline) and SWDL (the LNP component on that card is inactive until the software download completes). LNP STAT information is not displayed if the LNP ELAP Configuration feature is turned off.
- **EIR STAT**—Possible states include ACT (active), OFFL (offline), and SWDL (the EIR component on that card is inactive until software download completes). EIR STAT information is not displayed if the EIR feature is not enabled.
- **VFLEX STAT**—Possible states include ACT (active), OFFL (offline), and SWDL (the V-Flex component on that card is inactive until software download completes). V-Flex STAT information is not displayed if the V-Flex feature is not on.
- **ATINPQ STAT**—Possible states include ACT (active), OFFL (offline), and SWDL (the ATINPQ component on that card is inactive until software download completes). ATINPQ STAT information is not displayed if the ATINP feature is not enabled.
- **DSM MEMORY USAGE**—Percentage of Service Module memory used to store the ELAP/EPAP database.
For EPAP, the percentage of the card memory is displayed. For example, 50% of the memory on an E5-SM4G-B card means that 2GB are used.

For ELAP/LNP, the percentage that is displayed depends on the enabled or default feature access key (FAK) quantity for LNP ported TNs, LNP ported LRNs, and LNP ported NPANXXs in the system (see the `rtrv-ctrl-feat` command output). The percentage is the greatest of: 1) TNs provisioned divided by LNP ported TNs FAK quantity, 2) LRNs provisioned divided by LNP ported LRNs FAK quantity, or 3) NPANXXs provisioned divided by LNP ported NPANXXs FAK quantity.
- **CARD XXXX ALARM STATUS**—List of trouble text alarm messages that have been generated for the card
- **DSM Port A/B**—List of trouble text alarm messages that have been generated for the port on the Service Module card.
- **IP Connection Unavailable**—The failed channels on those ports with IP Connection Unavailable alarms. Possible channels reported are:
 - Prov—RTDB Provisioning Channel
 - Dnld—RTDB Download Channel
 - TCP—Transmission Control Protocol Channel
 - UDP—User Datagram Protocol Channel

Legend

- **CARD**—MUX card location
- **TYPE**—Type of card
- **PST**—Primary state of the card. Possible values are described in [Possible Values for PST/SST/AST](#) in Appendix A.
- **SST**—Secondary state of the card. Possible values are described in [Possible Values for PST/SST/AST](#) in Appendix A.
- **AST**—Associated state of the card. Possible values are described in [Possible Values for PST/SST/AST](#) in Appendix A.
- **BITRATE(OPER)**—Maximum operational bit rate that the Fibre-Channel ring is capable of. If the operational bit rate is HIGH, the Fibre-Channel ring can be switched between the HIGH rate and the LOW rate.
- **BITRATE(ACT)**—Bit rate currently used by the Fibre-Channel ring. This rate is determined by various parameters such as the operational bit rate of the other bus, availability of a High Rate Feature Access Key, etc.
- **BERT STATUS**—BERT (Bit Error Rate Test) status of the MUX card. BERT is a diagnostic test that is initiated by the MUX cards on the IMT Bus during Bus alignment. Possible values are:
 - **PASS**—BERT passed for the MUX card
 - **FAIL**—BERT failed for the MUX card

- **UNKNOWN**— This value should not be seen. If it is observed, please contact My Oracle Support (MOS).

rept-stat-rtd

Use this command to report Run Time Diagnostics (RTD) for EAGLE cards, including the status of internal integrity checks and the RTD subsystem alarm. This display can help determine the cause when an RTD subsystem alarm occurs, or when associated issues are reported.

This command is also used to reset MSU validation statistics and clear the RTD subsystem alarm.

Parameters

force (optional)

This parameter is used with the `reset=yes` parameter to clear statistics for a card when the RTD subsystem alarm is present.

Range:

yes

loc (optional)

Location. The card location as stenciled on the shelf of the system.

Note

This parameter can be used to either retrieve or reset statistics for a card location. To reset the statistics, the `loc` and `reset` parameters must be specified together in the command.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

reset (optional)

This parameter clears the statistics by setting them to zero and resets the checksum card indicator error and RTD subsystem alarm.

Range: yes

Clears the statistics.

If this parameter is specified with the `loc` parameter, then statistics are cleared for the specified card. If this parameter is specified, and the `loc` parameter is not specified, then statistics are cleared for all cards in the system.

Example

```
rept-stat-rtd
rept-stat-rtd:loc=1107
rept-stat-rtd:reset=yes:force=yes
rept-stat-rtd:loc=1107:reset=yes
```

Dependencies

If the `reset=yes` parameter is specified, then the `force=yes` parameter must be specified to clear the statistics and checksum failure indicators.

The card specified by the `loc` parameter must be an IPLIMx, IPGWx, IPGS, SCCP, Service Module E5-E1T1-B, E5-ATM-B card.

The card in the location specified by the `loc` parameter must be in service.

The `reset=yes` parameter must be specified to clear the statistics.

The `force=yes` parameter must be specified.

The `loc` parameter cannot have a non-numeric value.

The following card locations are not valid for this command: 1114, 1116, 1117, 1118 (E5-TDM and E5-MDAL cards), and all xy09 and xy10 locations where x is the frame and y is the shelf (MUX cards).

The card slot must be equipped and in service.

Notes**MSU Validation Statistics**

The statistics from internal integrity checks are displayed for all in-service LIM and SCCP cards. The reported statistics are dynamic and are not maintained when a card is re-initialized.

The displayed reports contain message validation totals since the last time the diagnostic information for the cards was reset.

The individual statistics that are reported re-start at zero after the maximum values are reached and are cleared when reset by the `rept-stat-rtd` command.

Summary Report (rept-stat-rtd)

The report displayed shows the summary statistics or overall totals for MSU validation statistics for all LIM and SCCP cards in the system. It also includes the status for the RTD subsystem and the RTD subsystem alarm.

Card Summary Report (rept-stat-rtd:loc=)

When the `loc` parameter is specified in the `rept-stat-rtd` command, the report displayed shows the detailed MSU validation statistics report for the specified card. The report shows statistics from integrity checks performed by the specified card on MSUs transferred to and from LIM/SCCP cards and includes the timestamp when the card last detected an error during integrity checks. The statistics are only displayed for cards with non-zero totals.

The integrity checks are performed on a subset of the MSUs transferred between cards. When card(s) report errors during the integrity checks, the RTD subsystem

alarm is activated. The error statistics reported should be used along with the UIMs or alarms to help identify the source of the problem.

RTD Subsystem Alarm

The RTD subsystem alarm is triggered when a card reports that a checksum error was detected during internal card integrity checks.

The RTD subsystem alarm remains active in the system until the statistics are reset using the `rept-stat-rtd` command, and no further indications of checksum errors are reported during internal card integrity checks.

Output

If the `rept-stat-rtd` command is entered with no parameters, then a summary status for the RTD subsystem and alarm and summary statistics for all of the LIM/SCCP cards in the system are displayed.

If the `loc` parameter is specified in the `rept-stat-rtd` command, then detailed statistics are displayed for the specified card location. Only cards with non-zero totals are reported in the location specific report.

This example displays a summary report on the status of the RTD subsystem and RTD subsystem alarm with MSU validation statistics for all LIM/SCCP cards in the system.

Legend

This section defines the fields of the `rept-stat-rtd` reports.

PST—Possible values are described in [Possible Values for PST/SST/AST](#). For this command, IS-NR specifically means no checksum errors were found during the last reporting period; IS-ANR specifically means that a card or cards reported checksum errors during MSU integrity checks when the RTD status was previously IS-NR, and the RTD System Alarm(s) was raised.

Total Rx Error (for a Summary Report)—Total MSUs received with checksum errors, including MSUs with checksum errors received from all cards in the system.

Total Rx Error (for a Location-Specified Report)—Total MSUs with checksum errors received at the card specified by the LOC parameter from SRC/DEST CARD.

Total Rx Validated (for a Summary Report)—Total MSUs with checksum received and validated from all cards in the system.

Total Rx Validated (for a Location-Specified Report)—Total MSUs with checksum received and validated at the card specified by the LOC parameter from SRC/DEST CARD.

Total Tx (for a Summary Report)—Total MSUs with checksum applied and transmitted to all cards in the system.

Total Tx (for a Location-Specified Report)—Total MSUs with checksums transmitted from the card specified in the LOC parameter to SRC/DEST CARD.

Last Alarm Timestamp—Timestamp for last reported checksum error for the card specified in the LOC parameter.

SRC/DEST CARD—Source card transmitting MSUs with checksums received by the card specified in the LOC parameter. Destination card receiving MSUs with checksums transmitted from card specified in LOC parameter.

RTD Subsystem—Indicates RTD Device Status (IS-NR, etc.).

RTD Alarm Status—Indicates whether an alarm is present for the RTD Device.

rept-stat-rte

Use this command to display the signaling route status for a particular destination.

Parameters

dpc (optional)

Range:

p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p-*

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc=000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni= 006-255*.

The point code 000-000-000 is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

dpcn (optional)**Range:***s-*, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps**nnnnn—0-16383**gc—aa-zz**m1-m2-m3-m4—0-14* for each member; values must sum to 14**dpcn24 (optional)****Range:***p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p**msa—000-255**ssa—000-255**sp—000-255***dpcn16 (optional)****Range:***p--*, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p**un---000---127**sna---000---15**mna---000---31***mode (optional)**

This parameter specifies the type of display to produce.

Range:***full***

Comprehensive display of point code status, including *rtx*. If specified with a point code, then the status for that point code is displayed. If specified without a point code, then the status of all routes is displayed.

rtx

Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

Default:

A summary report is displayed.

stat (optional)

The primary state filter.

Range:***all***

All of the primary states

alminh

Alarms inhibited

anr

In service abnormal (IS-ANR)

dsbld

Out of service maintenance disabled (OOS-MT-DSBLD)

mt

Out of service maintenance (OOS-MT)

nr

In service normal (IS-NR)

Default:

all

Example

```
rept-stat-rte
rept-stat-rte:dpc=5-25-0
rept-stat-rte:dpci=5-5-0:mode=full
rept-stat-rte:dpci=5-5-0:mode=rtx
rept-stat-rte:mode=rtx
rept-stat-rte:mode=full
rept-stat-rte:dpc=5-25-**
rept-stat-rte:dpcn16=1-2-3
```

Dependencies

An x-list DPC cannot be specified in the dpc parameter.

If the mode=full parameter is specified, then the dpc/dpca/dpcn/dpci/dpcn24 parameter must be specified.

If the dpc parameter specifies an *ni-nc-** format, then the mode parameter cannot be specified.

The dpc parameter must specify *anni-nc-** format before the stat parameter can be specified with the dpc parameter.

No other rept-stat-xxx command can be in progress when this command is entered.

If a dpc parameter is specified, then the value must be the true destination point code (not an alias) and the value must be defined in the database.

The Origin-Based MTP Routing feature must be turned on before the mode=rtx parameter can be specified.

The destination address must be a full point code, a network destination, or a cluster point code.

The `pst` and `mode` parameters cannot be specified together in the command.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

This command does not report the x-list point codes. Use the `rept-stat-cluster` command for a report of x-list point codes.

If the `mode=rtx` parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Summary of DPC parameter syntaxes

- `rept-stat-dstn:dpc=ni-nc-ncm` —Requests a report for fully provisioned destination *ni-nc-ncm*.
- `rept-stat-dstn:dpc= ni-*-*` —Requests a report for provisioned network destination with the specified network indicator. If * is specified in the *nc* field, * must be specified in the *ncm* field.
- `rept-stat-dstn:dpc= ni-**-*` —Requests a report for the full network cluster for the specified *ni*.
- `rept-stat-dstn:dpc= ni-***-` — Requests a report for the full network cluster and the network cluster address (if any) for the specified *ni*.
- `rept-stat-dstn:dpc= ni-nc-*` —Requests a report for provisioned cluster destination *ni-nc-**.
- `rept-stat-dstn:dpc= ni-nc-**-*` —Requests a report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. Note, however, that the network cluster address on *ni-nc-** (if it exists) is not reported.
- `rept-stat-dstn:dpc= ni-nc-***` —Requests a report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address (if it exists) is also reported.
- `rept-stat-dstn:dpcn24=msa-ssasp` —Requests a report for fully provisioned 24-bit destination point *main signaling area-sub signaling area signaling point*.

If the `mode=rtx` parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the `mode=full` parameter is specified with a specific destination point code, then additional linkset, route, and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the `mode=full` parameter is specified without a specific destination point code, then status is provided for all regular and exception route sets.

Output

If the `dpc` parameter is not specified:

- If the mode parameter is not specified, then the command output lists the status of all provisioned destination point codes (DPCs) (routesets) in the system.
- If the mode=r t x parameter is specified, then the output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the mode=full parameter is specified, then the command lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the dpc parameter is specified:

- If the mode parameter is not specified, then the output lists the status of all provisioned routes in the route set specified by that DPC.
- If the mode=r t x parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, and the status of all provisioned exception routesets associated with that DPC.
- If the mode=full parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

This example shows how summary information for all provisioned cluster and noncluster DPCs is reported.

This example shows how the circular routing alarm for a cluster destination is displayed. A circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for a full point code destination.

```
rept-stat-rte:dpc=9-3-*
```

```

This example shows how a subsystem information header is displayed without subsystem information, as when an FPC is specified without defining any subsystems. Because aliases cannot be defined for cluster destinations, this report shows only an empty header, as when an FPC is specified without defining aliases. The circular routing information portion of the report displays "-----" for the linkset names when no circular routing condition exists for the DPC.

```

rept-stat-rtkey

Use this command to generate a summary report of the status of the system routing keys.

Parameters

This command has no parameters.

Example

```
rept-stat-rtkey
```

Dependencies

None

Notes

The report generated by this command contains the following information:

- The maximum of static entries (SRKQ) in the routing key table
- The current number of static routing key entries in the routing key table
- The percentage of the static routing key table entries that is provisioned

Output

```
rept-stat-rtkey
```

```
rlghncxa03w 10-10-27 14:59:11 EST EAGLE 43.0.0
SRKQ = 250
```

```
Static Route Key table is (50 of 250) 20% full

Static Route Key Socket Association table is (80 of 4000) 2% full
;
```

rept-stat-rtx

Use this command to display the signaling route status for one or more exception routes to a particular destination.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

cic (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the `ecic` parameter as exception routing criteria for the specified exception route.

Range:

0 - 16383

dpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When `chg-sid:pctype=ansi` is specified, *ni=000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc=000* is not valid if *ni=001-005*.

When `chg-sid:pctype=ansi` is specified, *nc=000* is valid if *ni=006-255*.

When `chg-sid:pctype=ansi` is specified, *ni-*-** is valid if *ni= 006-255*.

The point code 000-000-000 is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

dpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt1` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

dpcn16 (optional)

16-bit ITU national destination point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:*p--*, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p**un---*000---127*sna---*000---15*mna---*000---31**ecic (optional)**

Ending Circuit Identification Code. This parameter, together with the *cic* parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range:

0 - 16383

ilsn (optional)

Incoming Link Set Name. The name of the originating linkset. This value is used as part of the exception routing criteria for the specified exception route.

Range:*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

mode (optional)

The type of display to produce.

Range:*full*

Displays routes from the associated routeset and exception route table for the specified destination point code per criteria.

opc (optional)

Origination point code. ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:*opca***Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni* = 000 is not valid.

When *chg-sid:pctype=ansi* is specified, *nc* = 000 is not valid if *ni* = 001–005.

When *chg-sid:pctype=ansi* is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

opc/opca/opci/opcn/opcn24/opcn16 (optional)

Origination point code.

opci (optional)

Origination Point Code. ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

opcn (optional)

Origination Point Code. ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opcn24 (optional)

Origination Point Code. 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000-255

opcn16 (optional)

Origination Point Code. 16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

si (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range:

0 - 15

Example

```
rept-stat-rtx
```

```
rept-stat-rtx:dpc=1-101-1
```

```
rept-stat-rtx:dpc=1-101-1:opc=1-2-1
```

```
rept-stat-rtx:dpc=100-100-1:opc=1-1-1:mode=full
```

```
rept-stat-rtx:dpcn16=001-1-2
```

Dependencies

If the dpcn parameter is specified, its format must match the format that was assigned with the chg-stpopts:npcfmt parameter.

The dpc parameter and the class criteria parameters (opc/ilsn/cic/si) must be specified before the mode parameter can be specified.

The dpc parameter must be specified before the class criteria parameters (opc/ilsn/cic/si) can be specified.

Notes

Each exception route set can have up to 6 associated routes.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

This command can be cancelled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

MTT 4732 and 4735 deleted by MB

Output

This example provides the status of all exception route sets provisioned in the system, sorted by DPC:

```
rept-stat-rtx
```

```
stdcfg2b 09-05-24 01:54:32 EST EAGLE 41.0.0
```

DPCA 001-101-001	PST IS-NR	SST Allowed	AST ACCESS
OPCA 001-002-001	PST IS-ANR	SST Restrict	AST ACCESS
SI 10	PST OOS-MT	SST Prohibit	AST ACCESS
12	OOS-MT	Prohibit	ACCESS
DPCA 004-101-001	PST IS-NR	SST Allowed	AST ACCESS
SI 10	PST IS-NR	SST Allowed	AST ACCESS
DPCA 007-101-001	PST OOS-MT	SST Prohibit	AST INACCESS
OPCA 003-001-020	PST OOS-MT	SST Prohibit	AST INACCESS

```
Command Completed.
```

This example displays the status of exception route sets provisioned against a particular DPC:

```
rept-stat-rtx:dpc=1-101-1
```

```
stdcfg2b 09-03-24 01:54:32 EST EAGLE 41.0.0
```

DPCA 001-101-001	PST IS-NR	SST Allowed	AST ACCESS

rept-stat-sccp

Use this command to display the following types of reports:

- **rept-stat-sccp** (with no parameters)—displays the status of the Service Module cards and the services executing on those cards:
 - A-Port (IS41 Mobile Number Portability)
 - AIQ (IS41 Analyzed Information Query)
 - ATINPQ (ATI Number Portability Query)
 - EIR (Equipment Identity Register)
 - G-Flex (GSM Flexible Numbering)
 - G-Port (GSM Mobile Number Portability)
 - GTT (Global Title Translation)
 - IAR (Info Analyzed Relay)
 - IDP Relay (Prepaid IDP Query Relay)
 - IGM (IS41 GSM Migration)
 - INP (INAP-based Number Portability)
 - INPMR (INP Message Relay)
 - LNP (Local Number Portability)
 - LNPMR (LNP Message Relay)
 - LRNQT (ITU TCAP LRN Query)
 - MNPSMS (Portability Check for Mobile Originated SMS)
 - MO SMS B-Party Routing
 - MO SMS IS41-to-GSM Migration
 - MO-based GSM SMS NP

- MO-based IS41 SMS NP
- MTPRTD (MTP Routed messages serviced by the SCCP card)
- PPSMS (Prepaid SMS Intercept)
- TLNP (Triggerless LNP)
- TTR (Triggerless TCAP Relay)
- V-Flex (Voice Mail Router)
- CAT2 (Category 2 Validation)

The command also displays any cards that are denied SCCP service.

- `rept-stat-sccp:mode=perf` —targets the general SCCP traffic performance for Service Module cards. The report supplies message rates for message flow control (MFC) performance.
- `rept-stat-sccp:loc=nnnn` —provides a detailed view of the status of SCCP services provided by a specific Service Module card

Note

The `rept-stat-sccp` and `rept-stat-sccp:mode=perf` reports include the status of the Service Module cards (E5-SM8G-B and SLIC cards) but do not differentiate between the card types.

Note

To retrieve traffic statistics for the LNP feature, the `rept-stat-lnp` command can also be used.

Note

Statistics are displayed for the supported features as follows:

- AIQ—AIQ Subsystem Report and Service Statistics
- APORT, GPORT, and IGM—MNP Service Statistics
- ATINPQ—ATINPQ Subsystem Report and Service Statistics
- EIR—EIR Subsystem Report and Service Statistics
- G-Flex—GFLEX Service Statistics
- GTT—GTT Service Statistics
- IAR—IAR Service Statistics
- IDP Relay—IDPR Service Statistics
- INPQ—INP Subsystem Report and Service Statistics (includes INPQ and INPMR - AINPQ is combined with INPQ)
- INPMR-INP Message Relay Service Statistics
- LNP—LNP Subsystem Report and Service Statistics (including LNPMR, LNPQS, WNPQS, TLNP, PLNPQS and LRNQT)
- LNPMR-LNP Message Relay Service Statistics
- LNPQS-LNP Query Service Statistics
- MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, MO-based IS41 SMS NP, PPSMS—SMSMR Service Statistics
- MTPRTD-MTP Routed (MTP routed messages serviced by the SCCP card) Statistics.
- TLNP-Triggerless LNP Service Statistics
- TTR-Triggerless TCAP Relay Service Statistics
- V-Flex—VFLEX Subsystem Report and Service Statistics
- WNPQS-Wireless LNP Query Service Statistics
- CAT2- Category 2 Validation Statistics

Note

If traffic is being generated while Service Module cards are loading, then superfluous counts may be displayed in Daily and Overall Peak SCCP Loads. To correct this occurrence, reset the Peak SCCP Loads using the `rept-stat-sccp:peakreset=yes` command.

Note

It will also include the statistics of GTT-enabled LIM cards. If the system has both SCCP and GTT-enabled LIM cards, then it shows the statistics for both cards.

Parameters

appl (optional)

Used to display the statistics of either SCCP cards or GTT-enabled IPSG cards.

Range:

vsccp

Display the status of the SCCP SM card

ipsg

Display the status of the GTT-enabled IPSG card

Note

Using `data=gtt`, the user is able to see stats of all cards configured with `data=gtt`, as in all SM GTT cards, as well as GTT-enabled IPSG cards. With the `appl` parameter, the user can either see stats of SCCP cards with GTT data or stats of GTT-enabled IPSG cards.

data (optional)

The subsystem data type used in the report.

Range:

dn

report on the SCCP DN subsystem

imsi

report on the SCCP IMSI subsystem

epap

report on SCCP EPAP subsystem

elap

report on SCCP ELAP subsystem

gtt

report on SCCP GTT subsystem (on both SCCP and GTT-enabled IPSG cards)

card (optional)

Used to display statistics of either SCCP cards or GTT-enabled LIM cards.

Range:

sm

Display the status of SCCP SM card

lim

Display the status of GTT-enabled LIM card

all

Display the status of all cards

Note

Using `data=gtt`, the stats of all cards configured with `data=gtt`, (SM GTT cards as well as GTT-enabled LIM cards) are displayed. With the `CARD` parameter, the stats of SCCP cards or stats of GTT-enabled LIM cards are displayed.

loc (optional)

The location of the Service Module card to be reported on.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Report a summary of all cards.

mode (optional)

Use this parameter to provide extended performance information, including output about message flow control (MFC) performance and message rates for direct assignments.

Range:

perf

Default:

No extended performance information is displayed.

peakreset (optional)

Reset all Peak values to zero.

Range:

yes

Example

```
rept-stat-sccp
rept-stat-sccp:mode=perf
rept-stat-sccp:loc=1106
rept-stat-sccp:data=epap
rept-stat-sccp:data=gtt:card=lim
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

A Service Module card running the VSCCP application must be configured before this command can be entered.

Only one optional parameter at a time can be specified in the command. The parameters `DATA`, `LOC` and `CARD` are mutually exclusive.

The value specified for the `loc` parameter must identify a configured Service Module card running the VSCCP application or a GTT-enabled IPSP card running the IPSP32 GPL.

The EPAP Data Split feature must be enabled before the `data` parameter can be specified.

The Dual ExAP Config feature must be enabled before specifying parameter `DATA = ELAP/EPAP`.

The Dual ExAP Config feature or EPAP Data Split feature must be enabled before a value of `DATA=EPAP` can be specified.

Notes

In Release 46.5, with the introduction of GTT on LIM, the output format of the `rept-stat-sccp` command has been changed. The output has been divided into three parts: head, body and tail. The head of the output informs about the status report, primary state, secondary state, alarms, and other information.

The body of the output depends on whether or not an SM/GTT-enabled IPSP card is present in EAGLE. If there are only SM cards in the EAGLE, the body of the output will display only the SCCP Subsystem Report. This report will contain information including daily peak load, total system capacity, number of equipped SM cards, number of in-service SM cards, and other information. It will also contain the card list of SM cards and MSU usage, as well as CPU usage of each individual card. If there are only GTT-enabled IPSP cards in the EAGLE, the body of the output will display only the GTT on LIM Report. This report will contain information including number of equipped and in-service GTT-enabled IPSP cards, total GTT on LIM capacity, and a card list of GTT-enabled IPSP cards and MSU/CPU usage of each individual card. If both SM and GTT-enabled IPSP cards are present, the output will be a combination of an SCCP Subsystem Report and GTT on LIM report.

The tail of the output informs about the Total Service Statistics of enabled services on the EAGLE. The GTT service statistics will be a combination of GTT statistics obtained from SM cards as well as from GTT-enabled IPSP cards.

Output

If the EIR, G-Port, INP, 1100 TPS/DSM for ITU NP, AINPQ, A-Port, IGM, Throughput Capacity, IAR, or V-Flex features are enabled, then the **ansigflex** system option is disabled.

Note

Output for this command displays the status for services associated with features that are enabled and turned on. If a feature is not turned on, then the services for that feature are not displayed. The following examples display output when all possible features are turned on.

This example shows a summary report for all the features corresponding to EPAP-based services and subsystems:

Legend

This section defines the fields of the three rept-stat-sccp reports:

- rept-stat-sccp with no parameters
- rept-stat-sccp:mode=perf

- `rept-stat-sccp:loc=nnnn`

A dash (-) in an output field indicates that the statistic does not apply.

Note

The **ERRORS** and **TOTAL ERRORS** fields indicate that errors have occurred for Service Module cards in the system. Refer to UIMs generated by the system for the specific errors, and refer to the *Maintenance Guide* for error explanations and recovery procedures.

Report Type: `rept-stat-sccp` with no parameters

- **SCCP SUBSYSTEM REPORT, GTT ON LIM REPORT, GFLEX/MNP SERVICE REPORT and LNP/INPQ/EIR/VFLEX/ATINPQ/AIQ SUBSYSTEM REPORT**—Summary of the SCCP subsystem status, GTT on LIM subsystem status, GFLEX and MNP service status, LNP, INPQ (INP Query), EIR, VFLEX, ATINPQ and AIQ subsystem status
- **SCCP CARDS CONFIGURED**—Number of provisioned Service Module cards running the VSCCP application
- **GTT LIM CARDS CONFIGURED**—Number of provisioned GTT-enabled LIM cards running the IPSG32 GPL
- **CARD IS-NR**—Number of Service Module or GTT-enabled LIM cards that can be used by the system (status is In-Service Normal, IS-NR)
- **SYSTEM PEAK SCCP LOAD**—Highest SCCP transactions-per-second (TPS) processed by the EAGLE
- **SYSTEM TOTAL SCCP CAPACITY**—Sum of the maximum capacity of all active SCCP cards
- **SYSTEM TOTAL GTT ON LIM CAPACITY**—Sum of the maximum capacity of all active GTT-enabled LIM cards
- **SYSTEM TPS ALARM THRESHOLD**—Percentage of traffic that triggers an alarm to warn that the EAGLE is approaching the total system SCCP transactions-per-second (TPS) capacity. This value is set by the `chg-th-alarm` command.
- **CARD**—Card location of the cards running the VSCCP/IPSG application
- **P**—When G-Flex, GPORT, INP, APORT, EIR, V-Flex, IAR, or IGM feature is turned on, a P indicates the primary Service Module card. The primary Service Module card provides the MPS status to the EAGLE. This indicator is displayed between the card location and the GPL version.
- **VERSION**—Version number of the GPL running on the Service Module card
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#).
- **MSU USAGE**—Percentage of the maximum number of MSUs received by each card during the last 30 seconds
- **CPU USAGE**—Percentage of the amount of CPU used by each card during the last 30 seconds to process messages and to handle other foreground and background tasks

- **SCCP SERVICE AVERAGE MSU CAPACITY**—Average MSU capacity used over the last 30-second interval. This field includes all services provided by the Service Module or GTT-enabled LIM cards.
- **AVERAGE CPU CAPACITY**—Average CPU capacity used over the last 30-second interval. This field includes all services provided by the Service Module or GTT-enabled LIM cards.
- **AVERAGE CPU USAGE PER SERVICE**—System-wide view of the service traffic composition.
- **TOTAL SERVICE STATISTICS**—System-wide view of per-service statistics for the last 30-second interval. An "A" in the field indicates that the statistic does not apply. The report tracks the following information:
 - **SERVICE**
 - **SUCCESS**—Total number of successful messages processed by the specified card for each service. Applies to all services.
 - **ERRORS**—Total number of messages with errors for each service. Applies to all services.
 - **WARNINGS**—Total number of messages that output UIM warnings and were forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR, INPMR and INPQ services and total number of messages for which CAT2 validation has not been applied in case of CAT2.
 - **FORWARD TO GTT**—Total number of messages that could not find a match in the MPS database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR and INPMR services
 - **FORWARD TO MATE**— Total number of ACK messages on which GTT is performed and send to mate STP.

Report Type: rept-stat-sccp:mode=perf

This report includes the status of E5-SM8G-B and SLIC cards, but does not differentiate between these card types.

- **SCCP SUBSYSTEM REPORT, GTT ON LIM REPORT, LNP SUBSYSTEM REPORT and GFLEX/MNP SERVICE REPORT**—Summary status of the SCCP subsystem, GTT on LIM subsystem status, GFLEX and MNP services, LNP subsystem along with their corresponding Alarm Status
- **SCCP CARDS CONFIGURED**—Number of Service Module cards provisioned
- **GTT LIM CARDS CONFIGURED**—Number of provisioned GTT-enabled LIM cards running the IPSP32 GPL
- **CARD IS-NR**—Number of Service Module or GTT-enabled LIM cards that can be used by the system (status is in-service normal, IS-NR)
- **SYSTEM PEAK SCCP LOAD**—Highest SCCP TPS processed by the EAGLE
- **SYSTEM TOTAL SCCP CAPACITY**—Sum of the maximum capacity of all active Service Module cards
- **SYSTEM TOTAL GTT ON LIM CAPACITY**—Sum of the maximum capacity of all active GTT-enabled LIM cards
- **SYSTEM TPS ALARM THRESHOLD**—Percentage of traffic that triggers an alarm to warn that the EAGLE is approaching the total system SCCP TPS capacity. This value is set by the `chg-th-alm` command.

- **TPS STATISTICS**—Section of the report that provides TPS statistics on each Service Module or GTT-enabled LIM card
 - **CARD**—Card location of the cards running the VSCCP/IPSG application
 - **CPU USAGE**—Percentage of the amount of CPU used to process messages by each card during the last 30 seconds
 - **TOTAL MSU RATE**—Total number of messages processed per second. This and the other message rates are obtained from statistics maintained by the Service Module card for the last 30-second period.
 - **CLASS 0 and CLASS 1 MESSAGING RATE**—Number of messages received per second.

The next section of the `rept-stat-sccp:mode=perf` report provides system-wide SCCP traffic statistics.

AVERAGE MSU USAGE

Total of the MSU usage fields from each Service Module card divided by the number of active Service Module or GTT-enabled LIM cards

AVERAGE CPU USAGE

Total of the CPU usage fields from each Service Module card divided by the number of active Service Module or GTT-enabled LIM cards

TOTAL MSU RATE

Sum of all MSU rates processed by all active Service Module or GTT-enabled LIM cards

STATISTICS FOR PAST 30 SECONDS

Statistics that represent the last 30-second period

TOTAL MSUS

Sum of all transactions on all active Service Module or GTT-enabled LIM cards

TOTAL ERRORS

Sum of all errors on all active Service Module or GTT-enabled LIM cards

TOTAL MSU SEND TO MATE

Sum of all transactions that are sent to the mate STP

Report Type: `rept-stat-sccp:loc=nnnn`

- **CARD**—Card location of the card running the VSCCP/IPSG application
- **VERSION**—Version number of the GPL the card is running
- **TYPE**—Type of the card
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#).
- **CARD ALARM STATUS**—If there are no card alarms present, this field displays No Alarms.

The next section of the `rept-stat-sccp:loc=nnnn` report supplies the status of the individual services provided by the card and the associated CPU usage for the service.

TOTAL

Sum of the CPU usage for the services running over the previous 30-second period

CARD SERVICE STATISTICS

Card service statistics over the previous 30-second period for the specified card. The report tracks the following:

SERVICE

Name of the individual service provided by the card

SUCCESS

Total number of successful messages processed by the specified card for each service. Applies to all services.

ERRORS

Total number of messages with errors for each service. Applies to all services.

WARNINGS

Total number of messages that output UIM warnings and were forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR, INPMR and INPQ services and total number of messages for which CAT2 validation has not been applied in case of CAT2.

FORWARD TO GTT

Total number of messages that could not find a match in the MPS database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for G-Flex, MNP, SMSMR, IDPR, IAR, and INPMR services

FORWARD TO MATE

Total number of successful ACK messages that are send to mate STP by a specific card for GTT service only.

TOTAL

Total number of SUCCESS, ERRORS, WARNINGS, and FORWARD TO GTT messages

IMEI Challenge Legend

This section of the rept - stat - sccp report supplies the stats for the IMEI Challenge. The legends mean the following:

TOTAL REQUEST

All requests for PSI query

VALIDATION SUCCESS

When IMEI is received in the PSI ACK.

VALIDATION FAILURE

IMEI not received in PSI ACK and Purge MS is generated

ERROR1

Decode errors.

ERROR2

Encoding errors.

rept-stat-seas

Use this command to generate a summary report of the status of the SEAS subsystem on the EAGLE. This command reports the status of the CCS MR connections if the SEAS Over IP feature is turned on. See the *Maintenance Guide* for information about the SEAS alarms.

Parameters

This command has no parameters.

Example

```
rept-stat-seas
```

Dependencies

No other rept-stat-xxx command can be in progress when this command is entered.

The SEASCFG Table must be accessible.

Notes

None

Output

This example shows output when the SEAS Over IP feature is turned on.

```
rept-stat-seas
```

```
tekelecstp 07-01-11 16:47:51 EST  EAGLE 37.5.0
```

SEAS SYSTEM			PST	SST	AST
-----			IS-NR	Avail	-----
ALARM STATUS = No Alarms					
TERM	IPADDR	PORT	PST	SST	AST

18	120.30.10.11	15	IS-NR	Active	-----
ALARM STATUS = No Alarms					
40	128.30.15.12	16	IS-NR	Active	-----
ALARM STATUS = No Alarms					

Legend

- **PST**—Primary state of the subsystem. Possible values are described in [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the subsystem. Possible values are described in [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the subsystem. Possible values are described in [Possible Values for PST/SST/AST](#).
- **SEAS SYSTEM**—Overall SEAS component

rept-stat-secu log

Use this command to display the following information about the security log on the active and standby OAMs:

- The active or standby status of each log
- The number of new (that is, not uploaded) entries in each log
- The percentage of log space used by those new entries
- Whether overflow has occurred since the last upload
- Whether a recording failure has occurred since the last upload
- The date and time of the oldest and newest records in the log
- The date and time when the last successful upload of the log occurred

Parameters

This command has no parameters.

Example

```
rept-stat-secu log
```

Dependencies

No other security log command can be in progress when this command is entered.

Notes

The %FULL field displays the amount of space in the log taken up by new (not uploaded) entries. That number is obtained by dividing the number displayed in the ENTRIES field by the overall storage capacity of the log (10,000 entries). Because the log stays full of entries at all times, new entries overwrite existing entries.

The percentage full computed is rounded up to the next integer with one exception: the value of 100 is not displayed until the log is truly 100% full.

The log capacity is 10,000 records. To determine how many more commands can be logged before an overflow condition occurs, subtract the value displayed in the ENTRIES field from 10,000.

The status of the active OAM's log is always reported first in the output report, followed by the status of the standby log; in other words, they are *not necessarily* displayed numerically by the location number.

The report displays dates in the format *yy-mm-dd*, where *yy* is the year, *mm* is the month, and *dd* is the date. The report displays times in the format of *hh:mm:ss*, where *hh* is hours, *mm* is minutes, and *ss* is seconds.

Output

This example shows the output in the normal security log state. All un-uploaded records appear in the log on the active OAM.

rept-stat-seculog

```

rlghncxa03w 05-07-29 16:40:40 EST  EAGLE 28.1.0

1116 Standby ----- --- --- --- -----
;

```

Legend

- **LOC**—Address of the TDM card (with the hard disk on it) that contains the log. It is always the card at location 1114 or 1116.
- **ROLE**—Current role of the security log at that location. This value is always the same as the role of the OAM associated with the TDM card: *active* or *standby*.
- **-- SINCE LAST UPLOAD**—Applies to the four columns directly below the heading on the output. It indicates that the fields below display information obtained since the last upload.
 - **ENTRIES**—Shows how many un-uploaded commands are currently recorded in the log. This value resets to 0 (zero) when the log is uploaded using `copy - secu log`.
 - **%FULL**—Shows, as a percentage, how much space in the log the ENTRIES field value occupies
 - **OFLO**—Overflow indicator. Overflow occurs if the log is not uploaded periodically: new entries start overwriting un-uploaded entries. Displays *No* if no overflow has occurred and *Yes* if overflow has occurred
 - **FAIL**—Failed indicator. Displays *No* if no logging failure has occurred. Displays *Yes* to indicate that a logging failure has occurred that has prevented one or more entries from being recorded in the log successfully.

Note

Whether the system is able to set the logging failure flag in the security log header depends on the nature of the failure. If a `copy - disk` command is processing, the system sets the flag when the `copy - disk` command finishes processing. However, if the active fixed disk fails for some reason, or the security log happens to be in a bad sector that develops, the system is unable to set the logging failure flag.

- **OLDEST RECORD/NEWEST RECORD**—Date and time recorded in the oldest and newest record in the log. Allows the administrator to know the time period that the log covers. The log records all commands that were issued between 6/3/96 at 13:45:03 up to 8/5/96 at 06:58:55. The NEWEST RECORD for the active log is the current date, because the log will have recorded the `rept - stat - secu log` command that was just entered to produce the report.
- **LAST UPLOAD**—Date and time when the log was last uploaded successfully. That is, the `copy - secu log` command successfully copied the log to the FTA.

rept-stat-sfapp

Use this command to display the overall status of the SFAPP Card service in the EAGLE.

Parameters**loc (optional)**

SFAPP card location for which Card status, overall card TPS and total statistics of the card is to be reported.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Report a summary of all cards

peakreset (optional)

Reset peak values to zero.

Range:

yes

Example

```
rept-stat-sfapp
rept-stat-sfapp:peakreset=yes:loc=1101
rept-stat-sfapp:loc=1101
```

Dependencies

Location specified should be of the SFAPP card.

Output

This example shows a summary report for all the SFAPP cards:

rept-stat-sflog

Use this command to display the overall status of the SS7 Firewall Logging subsystem on the EAGLE.

Parameters**loc (optional)**

SFLOG card location for which card status, card TPS usage, and last log file event data is to be reported.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

peakreset (optional)

Reset peak values to the current TPS values and last log event file for primary and secondary SFLOG card.

Range:

yes

Example

```
rept-stat-sflog
```

```
rept-stat-sflog:loc=1101
```

```
rept-stat-sflog:peakreset=yes
```

Dependencies

At least one SCCP/SFAPP and one SFLOG card running the SCCPHC/SFAPP and IPSHC application must be configured before this command can be entered.

The peakreset and loc parameters cannot be specified together.

The location specified with this command should be the location of an SCCP or SFLOG (logging enabled) card running the SCCPHC or IPSHC GPL respectively.

The shelf and card must be equipped.

Notes

The peakreset parameter will reset the statistics on the primary and secondary card.

Legend

This section defines the fields of the three `rept-stat-sflog` reports:

- `rept-stat-sflog` with no parameters
- `rept-stat-sflog:loc=<IPS card location>`
- `rept-stat-sflog:loc=<SCCP card location>`

A dash (-) in an output field indicates that the statistic does not apply.

Report Type: `rept-stat-sflog` with no parameters

- **SFLOG ALARM STATUS**—Displays SFLOG system-related alarms. If there are no system alarms present, this field displays No Alarms.
- **SFLOG Cards Configured**—Number of cards running the IPSHC GPL that are configured for SS7 Firewall Logging.
- **CARDS IS-NR**—Number of SFLOG cards running the IPSHC GPL that can be used by the system (status is In-Service Normal, IS-NR).
- **CARD**—Card location of the SFLOG/SCCP/SFAPP card running the IPSHC/SCCPHC/SFAPP GPL respectively.
- **P**—P indicates the primary Service Module card. The primary Service Module card provides the MPS status to the EAGLE. This indicator is displayed between the card location and the GPL version.
- **VERSION**—Version number of the IPSHC/SCCPHC/SFAPP GPL running on the SFLOG/SCCP/SFAPP card.
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#).
- **TPS**—Transactions Per Second; indicates the number of logging events which are received on the SFLOG card.
- **CPU USAGE**—Percentage of the amount of CPU used to process messages by each card.
- **TOTAL STATISTICS**—System-wide view of per-service statistics. The report tracks the following information:
 - **SERVICE**—SFLOG (**IPSM STATS**), **SCCP STATS** and **SFAPP STATS** statistics are displayed.
 - **SUCCESS**—Total number of messages successfully processed by the SCCP, SFAPP and SFLOG cards.

- **DISCARD**—Total number of messages discarded by the SCCP and SFLOG cards.

Report Type: rept-stat-sflog:loc=<IPS card location>

- **CARD**—Card location of the SFLOG card running the IPSHC GPL.
- **VERSION**—Version number of the IPSHC GPL running on the SFLOG card.
- **TYPE**—Type of the card.
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#).
- **CARD ALARM STATUS**—Displays SFLOG card-specific alarms. If there are no card alarms present, this field displays No Alarms.
- **CPU USAGE**—Percentage of the amount of CPU used to process messages by the card.
- **TPS STATISTICS**—System-wide view of per-service statistics. The report tracks the following information:
 - **TPS**—Transactions Per Second; indicates the number of transactions that are received on the card.
 - **PEAK-TPS**—Indicates the maximum TPS that occurred on the card
 - **PEAKTIMESTAMP**—Indicates the time when the peak TPS occurred on the card.
- **LAST LOG EVENT FILE GENERATED**—Statistics of the last log file transfer to the SFTP server. The report tracks the following information:
 - **FILENAME**—Name of the file.
 - **SIZE**—Size of the file.
 - **SERVER**—IP address of the server to which the file is transferred.

Report Type: rept-stat-sflog:loc=<SCCP card location>

- **CARD**—Card location of the SCCP card running the SCCPHC GPL.
- **VERSION**—Version number of the SCCPHC GPL running on the SCCP card.
- **TYPE**—Type of the card.
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#).
- **CARD ALARM STATUS**—Displays SCCP card-specific alarms. If there are no card alarms present, this field displays No Alarms.
- **CPU USAGE**—Percentage of the amount of CPU used to process messages by the card.
- **SCCP STATISTICS**—Per-card logging statistics on SCCP. The report tracks the following information:
 - **SUCCESS**—Total number of messages successfully processed by the SCCP card.
 - **DISCARD**—Total number of messages discarded by the SCCP card.
 - **SERVER**—IP address of the server to which the file is transferred.

Report Type: rept-stat-sflog:loc=<SFAPP card location>

- **CARD**—Card location of the SFAPP card running the SFAPP GPL.

- **VERSION**—Version number of the SFAPP GPL running on the SFAPP card.
- **TYPE**—Type of the card.
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#).
- **CARD ALARM STATUS**—Displays SFAPP card-specific alarms. If there are no card alarms present, this field displays No Alarms.
- **CPU USAGE**—Percentage of the amount of CPU used to process messages by the card.
- **SFAPP STATISTICS**—Per-card logging statistics on SFAPP. The report tracks the following information:
 - **SUCCESS**—Total number of messages successfully processed by the SFAPP card.
 - **DISCARD**—Total number of messages discarded by the SFAPP card.

rept-stat-sfthrot

Use this command to display the overall status of the provisioned SS7 Firewall Throttling GTT Actions on the EAGLE.

Parameters

This command has no parameters.

Example

```
rept-stat-sfthrot
```

Dependencies

An SCCP card running the SCCPHC application must be configured before this command can be entered.

Output

Following is example output:

```
rept-stat-sfthrot
```

Command Executed

```
tekelecstp 16-02-17 15:45:15 MST EAGLE5 46.3.0.0.0-68.11.1
rept-stat-sfthrot
Command entered at terminal #21.
```

```

-----
```

```
Command Completed.
```

```
;
```

Legend

This section defines the fields of the rept-stat-sfthrot reports:

A dash (-) in an output field indicates that the statistic does not apply.

- **SCCP Cards Configured**—Number of cards running the SCCPHC GPL that are configured for SS7 Firewall Throttling GTT Actions.
- **CARD IS-NR**—Number of SCCP cards running the SCCPHC GPL that can be used by the system (status is In-Service Normal, IS-NR).
- **Average CPU Usage**—Average percentage of the amount of CPU used to process SS7 Firewall Throttling GTT Actions by the cards.
- **CARD**—Card location of the SCCP card running the SCCPHC GPL.
- **P**—P indicates the primary Service Module card. The primary Service Module card provides the MPS status to the EAGLE. This indicator is displayed between the card location and the GPL version.
- **VERSION**—Version number of the SCCPHC GPL running on the SCCP card.
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#) .
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#) .
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#) .
- **TPS**—Transactions per second; indicates the number of SUCCESS MSUs processed by an SCCP card for all Throttling Actions (average cumulative count) for the previous window.
- **PER TA TPS STATISTICS**—System-wide view of per-TA statistics. The report tracks the following information:
 - **TA**—Throttling Actions that are provisioned in the database.
 - **STATUS**—Current state (Allowed or Blocked) of the corresponding Throttling Action for the 30-second window.
 - **CURRENT 30 SECS:**
 - * **SUCCESS**—Number of success messages in the current 30-second window.
 - * **DISCARD**—Number of discarded messages in the current 30-second window.
 - **PREVIOUS 30 SECS:**
 - * **SUCCESS**—Number of success messages in the previous 30-second window.

- * **DISCARD**—Number of discarded messages in the previous 30-second window.

rept-stat-sip

Use this command to display the overall status of the SIP service on the EAGLE.

Parameters

loc (optional)

The SIP card location for which SIP TPS usage data is to be reported.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

peakreset (optional)

Reset peak values to the current TPS values.

Range:

yes

no

Default:

no

mode (optional)

Performance data of SIP cards and their connections.

Range:

perf

Default:

perf

Example

```
rept-stat-sip
```

```
rept-stat-sip:peakreset=yes:loc=1101
```

```
rept-stat-sip:loc=1101
```

```
rept-stat-sip:mode=perf
```

```
rept-stat-sip:mode=perf:loc=1101
```

Dependencies

The location specified with this command should be of a SIP card.

A SIP card running the SIPHC application must be configured before this command can be entered.

Parameter peakreset should be specified with loc parameter.

Notes

If optional parameters are specified, only the entries that match the entered parameters are displayed.

Output

This example displays output when no parameter is specified:

```

rept-stat-slk

Use this command to generate a report of the MTP signaling links status. The secondary state (SST) indicates whether the link is available, unavailable, or manually removed from service.

Use this command to generate a separate report of status of the E1 associated with a signaling link. The status includes the location of the E1 card and the UAM text. If the E1 association is not provisioned, "E1 association unknown" is displayed. If the card is not type LIME1, no E1 output is generated.

Use this command to generate a separate report of status of the T1 associated with a signaling link. The status includes the location of the T1 card and the UAM text. If the card is not type LIMT1, no T1 output is generated.

Parameters

l2stats (optional)

Report L2 status

Range:

align

Display alignment data only

both

Display alignment and service data

brief

Display up to 10 alignment events only

no

Do not display level 2 status information

service

Display service data only

Default:

no

Link (optional)

The signaling link on the card specified in the `Loc` parameter. The links can be specified in any sequence or pattern.

Synonym:

port

Range:

a, b, a1 - a63, b1 - b63

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have assigned signaling link ports.

Default:

Display all

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

All cards containing signaling links are displayed.

stat (optional)

A report on cards whose status is the same as the state indicated by the parameter

Range:***all***

All of the primary states

alminh

Alarms inhibited

anr

In-Service-Abnormal (IS-ANR)

dsbld

Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)

mt

Out-of-Service-Maintenance (OOS-MT)

nr

In-Service-Normal (IS-NR)

Default:

Display all

Example

```
rept-stat-slk
```

```
rept-stat-slk:loc=1201:link=a
rept-stat-slk:stat=alminh
rept-stat-slk:loc=1203:link=b:l2stats=both
rept-stat-slk:loc=1203:link=b:l2stats=brief
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

If the `loc` or `link` parameter is specified, then the `stat` parameter cannot be specified.

When the `loc` parameter is specified, the `link` parameter must be specified.

The card must be equipped and must be one of the following cards:

- E5-E1T1-B card running the SS7ANSI or CCS7ITU application
- E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET-B card running the IPLIMI, or IPSG application
- SLIC card running the IPSG application

The location specified by the `loc` parameter cannot be one of those reserved for non-LIM or non-DCM cards.

The signaling link must be an SS7 signaling link to display level 2 statistics (`l2stats`).

On point-to-multipoint IP links (E5-ENET-B cards equipped as SS7IPGW or IPGWI links), `l2stats` output is not available.

The specified signaling link must be provisioned in the database.

A card location that is valid and defined in the database must be specified.

The card in the location specified by the `loc` parameter must be in service.

The `link=b` parameter cannot be specified for SS7IPGW links.

Neither the `stat` or `loc` and `port` parameters can be specified with this command.

An appropriate value must be specified for the `link` parameter when an ATM card is used:

- `a-a1`, `b`—E5-ATM-B card running the ATMANSI or ATMITU application

This command is not valid for IPSG-M3UA signaling links.

Notes

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

The *Installation Guide* provides an illustration of card locations.

Output

rept-stat-slk

```

```

Legend

- **SLK**—Card location and the signaling link
- **LSN**—Name of the linkset that contains the signaling link
- **CLLI**—CLLI code of the destination STP of the signaling link
- **PST**—Primary state of the signaling link. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the signaling link. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the signaling link. See [Possible Values for PST/SST/AST](#).
- **ALARM STATUS**—Trouble text alarm message generated for the specified signaling link.
- **UNAVAIL REASON**—Reason the signaling link is unavailable. More than one unavailable reason may be listed:
 - **BSNR**—The signaling link received 2 of 3 invalid BSNs.
 - **CNGT**—The signaling link has a remote congestion time-out.
 - **COO**—A changeover order was received.
 - **FC**—The signaling link is unavailable because of false congestion restart.
 - **FE**—The signaling link is in far end loopback mode.
 - **FIBR**—The signaling link received 2 of 3 invalid FIBs.
 - **INTR**—Too many link interrupts were received.
 - **LB**—The signaling link has been blocked locally.
 - **LD**—The signaling link received incomplete data.
 - **LI**—The signaling link has been inhibited locally.

- **NA**—The signaling link is not aligned.
- **PF**—The signaling link failed the proving period.
- **RB**—The signaling link has been blocked remotely.
- **RD(xx.xxx)**—The signaling link is unavailable because of a restart delay to prevent signaling link oscillation. The number in parentheses indicates the amount of time, in seconds, remaining in the restart delay period. The link is restarted automatically after this amount of time has elapsed.
- **RL**—The signaling link is in remote near end loopback mode.
- **RMI**—The signaling link has been inhibited remotely.
- **SIE**—An unexpected SIE was received.
- **SIN**—An unexpected SIN was received.
- **SIO**—An unexpected SIO was received.
- **SIOS**—An unexpected SIOS was received.
- **SLTF**—Link test failed.
- **T1NR**—The level-2 T1 (not ready) timer expired.
- **T1R**—The level-2 T1 (ready) timer expired.
- **T2**—The level-2 T2 timer expired.
- **T3**—The level-2 T3 timer expired.
- **XDA**—The signaling link did not receive an acknowledgment in time.
- **XER**—The SUERM threshold was exceeded.—
- **--**—The card is ISOLATED or the links are available.

The following are reasons that the ATM high-speed signaling link is unavailable:

- **TNC**—Timer No Credit expired - The remote node has held the node in a no-credit state for too long. The far end office should be contacted to determine the cause of the link congestion.
- **TNR**—Timer No Response expired - The far end is taking too long to acknowledge the messages sent to it by the near end. The far end office should be contacted to determine the cause for the excessive delay in acknowledging PDUs.
- **LPO**—Local Processor Outage - Indicates a spontaneous or management-initiated processor outage. The user needs to determine whether the outage was spontaneous or management-initiated on the near end.
- **RPO**—Remote Processor Outage - The far end has sent PDUs causing processor outage. The far end office should be contacted to determine the reason for the processor outage.
- **ROOS**—Remote Out of Service - The far end has sent PDUs causing a link to become out of service. The far end office should be contacted to determine the reason for taking the link out of service.
- **RPE**—Remote Protocol Error - The far end has sent PDUs declaring a protocol error. The far end office should be contacted to determine the details about the protocol error.
- **RMIR**—Remote Management Initiated Release - The far end has sent PDUs releasing the link. The far end office should be contacted to determine the reason for releasing the link.
- **LCD**—Level 1 facility outage: Loss of Cell Delineation
- **LOF**—Level 1 facility outage: Loss of Frame

- **LOS**—Level 1 facility outage: Loss of Signal

EVENT TYPE

The type of event being logged:

RECEIVE

When a signal unit is received.

TRANSMIT

When a signal unit is transmitted.

STATE

When an internal SS7 Level 2 state changes or a special event occurs that would either end alignment or cause the link to fail

EVENT

The specific event being logged: (1) if a signal unit is being received or transmitted, the specific signal unit is displayed; (2) if the event being logged is a state change, the new state is displayed; (3) If neither (1) nor (2) is displayed, the link or alignment failure reason is displayed.

SERVICE EVENT

The service activity of the link; for example, In Service. Anything other than In Service is a description of a link failure.

TIMESTAMP

The time event processed by the system as follows:

- **YY-MM-DD hh:mm:ss.ttt**, where
- **YY**—The last 2 digits of the year (range 00–99)
- **MM**—The month (range 01–12)
- **DD**—The day of month (range 00–31)
- **hh**—The hour of day (range 00–59)
- **mm**—The minute of the hour (range 00–59)
- **ss**—The seconds of the minute (range 00–59)
- **ttt**—Milliseconds of the second (range 000–995 in increments of 5)

E1 STATUS

The status of the E1 interface associated with the link; the status includes the card location and the UAM text. If the E1 association is not provisioned, “E1 association unknown” is displayed. If the card is not type LIME1, no E1 output is displayed.

T1 STATUS

The status of the T1 interface associated with the link; the status includes the card location and the UAM text. If the card is not type LIMT1, no T1 output is displayed.

rept-stat-sys

Use this command to display a summary report of the status of the main system entities. Use this display to determine where the troubles are in the system. The display shows the number of these items that are in service (IS-NR) and how many are in another state (IS-ANR, OOS-MT, OOS-MT-DSBLD).

Parameters

This command has no parameters.

Example

```
rept-stat-sys
```

Dependencies

No other rept-stat-xxx command can be in progress when this command is entered.

Notes

None

Output

The following example shows the output when no features are turned on in the system and only the cards in locations 1109-1110 and 1113-1118 are installed.

```
rept-stat-sys
```

```

The following example shows the output when various features are turned on in the system. (Your output will not show all of these entries; some features are mutually exclusive in the system.)

Some entries appear as follows:

- When the Measurements Platform feature is not turned on and no MCPM cards are in the IS-NR state in the system, the MCPM and MCPM IP LK values are zero and the MEAS SS entry does not appear.
- When one or more MCPM cards have been installed and allowed, the MCPM CARD entry shows the number of MCPM cards that are in each state.
- When the Measurements Platform feature is turned on and the Measurements Platform collection option is enabled, the MEAS SS entry appears.
- When the Measurements Platform collection function is enabled, the MCPM IP LK entry shows the number of links that are functioning for the MCPM cards, and the MEAS SS entry appears.
- When the Origin-Based MTP Routing (MOBR) feature is not turned on, and/or no exception routes have been provisioned, the RTX value is zero.
- When the OA&M IP Security Enhancement feature is turned on, the SECURITY SS entry appears.
- When the Equipment Identity Register (EIR) feature is turned on, the EIR SS entry appears.
- When the INAP Number Portability (INP) feature is turned on, the INP SS entry appears.
- When the ANSI41 Analyzed Information Query (ANSI41 AIQ) feature is enabled, the AIQ SS entry appears.
- When the FCMODE is FCOPY for an *FC-Capable* GPL, the FC IP LK and FCS entries appear. E5-ENET-B cards running the IPSPG or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This requirement does not apply to cards running the IPSPG GPL.

- When the S13/S13' EIR feature is enabled and one or more DEIR cards have been provisioned and allowed, the DEIR CARD entry shows the number of DEIR cards that are in each state.
- When the SIP Number Portability feature is enabled and one or more SIP cards have been installed and allowed, the SIP CARD entry shows the number of SIP cards that are in each state.
- When one or more SFLOG cards have been installed and allowed, the SFLOG CARD entry shows the number of SFLOG cards that are in each state.

Legend

- **INH**—Number of devices within each device type that have their alarms inhibited
- **ALARMS**—Number of critical (**CRIT**), major (**MAJR**), and minor (**MINR**) alarms on the system when the command was executed and the count of alarm inhibited (**INH**) devices for cards, links, linksets, and terminals
- **OAM**—Status of each card that is running the OAM (1113 and 1115)
- **LIMCARD**—Status of the LIM cards
- **SCCP CARD**—Status of the SCCP subsystem cards
- **MUX CARD**—Combined status of the MUX cards
- **MCPM CARD**—Status of the MCPM cards
- **EROUTE CARD**—Status of the EROUTE cards
- **CLOCK**—Status of the system clocks
- **HS CLOCK**—Status of the high-speed clocks
- **IMT**—Status of the IMT system
- **SLK**—Status of the SS7 and IPGWI signaling links in the system
- **DLK**—Status of the TCP/IP data links in the system
- **LINK SET**—Status of the linksets in the system
- **DSM IP LK**—Status of the Service Module IP linksets
- **MCPM IP LK**—Status of the MCPM IP links
- **FC IP LK**—Status of the Fast Copy IP links
- **APPLSOCK**—Status of the application sockets
- **SCTP ASSOC**—Status of the SCTP associations
- **APPL SERVER**—Status of the Application Servers
- **SS7 DPC**—Summary information for provisioned DPCs that are not in clusters
- **CLUST DPC**—Summary information for provisioned cluster DPCs
- **RTX**—Summary information for provisioned exception routes only
- **XLIST DPC**—Summary information for X-LIST DPC entries only
- **DPC SS**—Summary information for the DPC subsystem

- **SCCP SS**—Status of the SCCP subsystem
- **SEAS SS**—Status of the SEAS subsystem
- **MEAS SS**—Status of the Measurements subsystem (for Measurements Platform)
- **MPS**—Summary information on the MPS
- **TERMINAL**—Status of the terminals
- **SECURITY SS**—Status of the EAGLE OA&M IP Security subsystem
- **EIR SS**—Status of the Equipment Identity Register subsystem
- **RTD**—Status of the Run Time Diagnostic subsystem
- **VFLEX SS**—Status of the V-Flex subsystem
- **ATINPQ SS**—Status of the ATI Number Portability Query subsystem
- **INP SS**—Status of the INAP Number Portability subsystem
- **LNP SS**—Status of the Local Number Portability subsystem
- **FCS**—Status of the Fast Copy subsystem
- **AIQ SS**—Status of the ANSI41 Analyzed Information Query subsystem
- **SIP CARD**— Status of the SIP cards
- **DEIR CARD**— Status of the DEIR cards running DEIRHC GPL
- **SFLOG CARD**— Status of the SFLOG cards

rept-stat-t1

Use this command to display the T1 port status and signaling link status for cards with provisioned T1 ports.

Parameters

loc (optional)

Card address. The unique identifier of a specific LIMT1 card located in the STP.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

Information for all LIMT1 cards is reported.

t1port (optional)

T1 port number. This parameter displays information for a T1 port on the card in the specified card location.

Range:

1 - 8 .

Example

```
rept-stat-t1
```

```
rept-stat-t1:loc=1203
```

```
rept-stat-t1:loc=1203:t1port=1
```

Dependencies

No other `rept-stat-xxx` command can be in progress when this command is entered.

The `loc` parameter must be specified when the `t1port` parameter is specified.

The active TDM location cannot be specified in the `loc` parameter.

Card locations 1117 and 1118 and the MUX card locations (xy09 and xy10 where x is the frame and y is the shelf) cannot be specified in the `loc` parameter.

Notes

Specifying the command without any parameters displays T1 port status for all cards with provisioned T1 ports.

If the `loc` parameter is specified, status is displayed for all T1 ports provisioned on the card in the specified location.

If the `loc` and `t1port` parameters are specified, the T1 port status summary is displayed for all T1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified T1 port on the card.

Output

This example shows the output when no parameters are specified:

rept-stat-t1

```

rlghncxa03w 05-01-04 07:01:08 EST EAGLE5 33.0.0

```

Legend

- **LOC**—Card location
- **T1PORT**—Number of the T1 port provisioned on the card in the specified location.
- **PST**—Primary state of the card. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the card. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the card. See [Possible Values for PST/SST/AST](#). The values *PARENT* and *PAIRED* refer to odd and even adjacent ports on the card that are provisioned in channel bridging mode.
- **ALARM STATUS**—Either "No Alarms" or current alarm number and text
- **UNAVAIL REASON**—Reason for the T1 port being unavailable
- **SLK**—Signaling link assigned to the T1 port
- **TS**—Timeslot assigned to the signaling link
- **PST**—Primary state of the signaling link. See [Possible Values for PST/SST/AST](#).
- **SST**—Secondary state of the signaling link. See [Possible Values for PST/SST/AST](#).
- **AST**—Associated state of the signaling link. See [Possible Values for PST/SST/AST](#).

rept-stat-trbl

Use this command to display a summary report of all the device trouble notifications that are logged currently in the OAM's RAM storage area.

Parameters

display (optional)

Display type of alarms to be reported.

Range:

act

Display only active alarms

all

Display all alarms with no timestamps

inhb

Display only inhibited alarms

timestamp

Display all alarms with the date and time when the alarm was logged. Timestamps appear in the output only when the `display=timestamp` parameter is specified.

Default:

all

level (optional)

The alarm level of the alarms to be displayed

Range:*crit**majr**minr***Default:**

All alarms are displayed

Example

rept-stat-trbl

rept-stat-trbl:level=majr

rept-stat-trbl:display=inhb

Dependencies

No other rept-stat-xxx command can be in progress when this command is entered.

Notes

None

Output

This example lists all devices that could appear. This example is to be used as a sample only: all devices and alarms cannot coexist in the system.

rept-stat-trbl

rept-stat-trm

Use this command to display the status of the terminal ports. The device primary, secondary, and associated state information is displayed along with the terminal identification number.

Parameters**trm (optional)**

The ID of the terminal port that is to be reported.

Range:

1 - 40

Default:

Display status of all terminal ports

Example

```
rept-stat-trm
```

```
rept-stat-trm:trm=5
```

```
rept-stat-trm:trm=17
```

Dependencies

No other rept-stat-xxx command can be in progress when this command is entered.

Notes

None

Output

This example shows output when the IP User Interface is not turned on:

```
rept-stat-trm
```

```

rept-stat-tstslk

Use this command to generate a report of the status of the MTP signaling links currently under test.

Parameters

Link (optional)

SS7 signaling links. The SS7 signaling link that is being tested.

Synonym:*port***Range:***a, b, a1 - a3, b1 - b31*

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have assigned signaling links.**loc (optional)**

The card location as stenciled on the shelf of the system.

Range:*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118***loopback (optional)**

Loopback test type.

Range:*sltc**lxvr**oam**line**payload***Example**`rept-stat-tstslk``rept-stat-tstslk:loc=1201``rept-stat-tstslk:loc=1203:link=a``rept-stat-tstslk:loopback=lxvr`**Dependencies**The card location specified in the `loc` parameter must be equipped.The signaling link specified in the `link` parameter must be equipped.If the `link` parameter is specified, the `loc` parameter must be specified.The signaling link specified in the `link` parameter must be an SS7 signaling link.

This command cannot be entered for E5-ENET-B cards that are running the IPGHC or IPSG application, or that have IPGHC or IPSG-M3UA links.

The card location specified in the `loc` parameter cannot be reserved by the system.

This command cannot be entered during upgrade.

Notes

None

Output

If no parameters are specified, all links in test are displayed.

If only the `loc` parameter is specified, all links in test on the specified card are displayed.

If the `loc` and `link` parameters are specified, the specified link on the specified card is displayed.

If the `loopback` parameter is specified, all links in the specified type of loopback test are displayed.

rept-stat-user

Use this command to show which users are logged into the system. The command shows user names, terminal identification numbers, the time that the last valid command was issued, and the current state of the last command entered.

Parameters

This command has no parameters.

Example

```
rept-stat-user
```

Dependencies

None

Notes

None

Output

rept-stat-user

```
e5oam 09-04-03 17:25:57 MST EAGLE 41.0.0
REPT STAT USER COMPLD
USER ID          TERM #  IDLE SINCE          COMMAND              STATE

rept-stat-xlist

Use this command to report statistics related to the storage of x-list entries. X-list entries reside in the routing table and are dynamically created for individual members of clusters whenever one or more routes to that cluster member become more restrictive than the corresponding routes to the cluster.

The following information is reported:

- The number of routing table positions reserved for x-list entries
- The current number of x-list entries
- The percentage of space in the x-list reserved area currently in use
- The percentage of x-list space that must be in use before an alarm is issued

Parameters

This command has no parameters.

Example

```
rept-stat-xlist
```

Dependencies

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before using this command.

Notes

The statistics reported by this command are those gathered during periodic polling by the maintenance subsystem. They might differ slightly from the instantaneous values at the time the command was issued.

The following rules are used to compute the *Current X-LIST occupancy* percentage value that is displayed in the output report:

- The percentage value that is displayed is computed as follows:
$$[(\text{current x-list entries}) / (\text{allocated x-list space})] * 100$$
- Non-integer percentages will be rounded up to the next highest integer (for example, 23.5% becomes 24%), with the exception of the situation described in the next rule.
- 100% is not displayed until the current *X-LIST* entries value exactly equals the allocated *X-LIST* space (for example, 99.1% is not rounded up to 100%).

Output

```
rept-stat-xlist
```

```
rlghncxa03w 04-02-18 03:32:42 EST    EAGLE 31.3.0
Allocated X-LIST space      = 500
Current X-LIST entries      = 156
Current X-LIST occupancy   = 31 %(see "Notes")
X-LIST occupancy threshold = 80 %
;
```

rls-alm

Use this command to silence audible alarms. Entering this command also causes the alarm status on terminals to stop blinking (though they continue showing an alarm condition).

Parameters

lvl (optional)

The alarm level.

Range:

crit

majr

minr

Default:

All alarms are cleared

Example

```
rls-alm
```

```
rls-alm:lvl=crit
```

Dependencies

No other action command can be in progress when this command is entered.

Notes

This command has no effect on visual alarm indicators on the fuse and alarm panel (FAP) or on the cabinet side panel.

Any alarms that occur after the execution of this command activate audible alarms again.

Output

```
rls-alm
```

```
rlghncxa03w 04-01-07 09:27:24 EST EAGLE 31.3.0
rls-alm
Command entered at terminal #8.

rmv-card

Use this command to change the state of the card to Out of Service - Maintenance Disabled (OOS-MT-DSBLD), enabling a technician to test a LIM or E5-TSM card or physically remove it from the shelf.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Refer to *Installation Guide* for card location information.

force (optional)

This parameter is required if the card is the last GLS or SCCP card.

Range:

yes

no

Default:

no

Example

```
rmv-card:loc=1101
```

```
rmv-card:loc=1201:force=yes
```

Dependencies

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (where x is the frame and y is the shelf).

The shelf and card must be equipped.

If the card is a LIM, all signaling links assigned to the card must be placed out of service before the command can be entered.

The force parameter is required to force the last GLS (if the Integrated GLS feature is not turned ON) or SCCP card out of service.

If the card has active TCP/IP links, all TCP/IP data links assigned to it must be placed out of service.

Notes

The function of this command is the same as the `inh-card` command.

When this command is executed, the card boots and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

The command is rejected if you attempt to inhibit a LIM that has active signaling links. The links must be cancelled, using the `dact -s lk` command, before the command is accepted.

Inhibiting a card running the VSCCP application affects GTT service. SCCP messages requiring global title translation are not routed, and an error message is returned to the originator.

Inhibiting an E5-TSM running the GLS application has no immediate affect on the system. These cards are used only when loading gateway screening to the LIMs.

The command is rejected if you attempt to inhibit a card that has active TCP/IP data links. The TCP/IP data links must be cancelled, using the `canc -d lk` command, before the command is accepted.

Output

```
rmv-card:loc=1101
```

```
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0  
Card has been inhibited.  
;
```

rmv-imt

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to remove the IMT bus from service.

Caution

Use this command only when directed by the Customer Care Center.

Parameters

bus (mandatory)

The IMT bus to be inhibited.

Range:

a

b**Example**

```
rmv-imt:bus=a
```

Dependencies

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.

This command cannot be entered during an IMT Fault Isolation Test.

Notes

Cards that are not connected to the other IMT bus will reinitialize.

All traffic is rerouted to the other IMT bus.

The function of this command is the same as the `inh-imt` command.

Output

```
rmv-imt:bus=a
```

rmv-trm

Use this command to set the primary state of a serial port to OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled), and to set the secondary state to MANUAL. The serial port is not available to perform service functions. There is no outgoing traffic from the serial port; all incoming traffic is ignored.

Parameters**trm (mandatory)**

The ID of the serial port to be inhibited.

Range:

1 - 40

force (optional)

This parameter forces the removal of the terminal, even if it is the last in-service SEAS terminal available.

Range:

yes

no

Default:

no

Example

```
rmv-trm:port=5
```

```
rmv-trm:trm=1:force=yes
```

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified as values for the `trm` parameter.

The `force=yes` parameter must be specified to inhibit the last in-service SEAS terminal.

Notes

When removing a terminal that has already been removed, a warning message is echoed to the scroll area but no action is taken.

MTT 2731 was deleted for 42.0, PR 158511.

Output

```

rst-dstn

Use this command to request that the circular routing status for the specified destination be reset (turned OFF). The destination that is specified can be a full point code (FPC), a cluster point code (for example, *ni-nc-**), or an x-list point code. The system clears the circular routing status for the specified destination and then clears any outstanding circular routing alarm for the destination.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

dpc (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

dpca

Range:

p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk value (*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code 000-000-000 is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (mandatory)**dpci (mandatory)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

dpcn (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt1* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps*

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (mandatory)

24-bit ITU national point code with subfields main *signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p**msa—000–255**ssa—000–255**sp—000–255***dpcn16 (mandatory)**16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).**Range:***p--*, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p**un---000---127**sna---000---15**mna---000---31***force (optional)**

This parameter specifies whether to reset all dynamic data for the specified route in the Route table to the initial values.

Range:**yes**

reset the data

no

do not reset the data

Default:*no***Example**`rst-dstn:dpc=1-2-*``rst-dstn:dpc=20-2-5``rst-dstn:dpc=p-20-2-5``rst-dstn:dpc=20-2-5:force=yes``rst-dstn:dpcn16=125-2-10`**Dependencies**

The specified DPC must be either provisioned or an x-list entry.

The destination address must be a full point code or a cluster point code specified as *ni-nc-**. A DPC as *ni-nc-*** or *ni-nc-**** cannot be specified.

Notes

None.

rst-imt

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to change the state of the specified IMT bus from OOS-MT-DSBLD (out of service maintenance disabled) to IS-NR (in service normal), if the command is successful. If the command fails, the status is IS-ANR (in service abnormal).

Parameters

bus (mandatory)

The IMT bus to be returned to service.

Range:

a

b

Example

```
rst-imt:bus=a
```

Dependencies

None

Notes

The function of this command is the same as the `alw-imt` command.

This command returns an inhibited IMT bus to service.

Output

```
rst-imt:bus=a
```

```
rlghncxa03w 04-01-07 11:02:30 EST  EAGLE 31.3.0
Allow IMT Bus A command issued.

rst-trm

Use this command to return the specified serial port to the state IS-NR (in-service-normal) from the state OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) if the command is successful. If the command is not successful, the terminal's state is OOS-MT (Out-of-Service-Maintenance).

Parameters

trm (mandatory)

ID of the serial port to be put into service.

Range:

1 - 40

Example

```
rst-trm:trm=5
```

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the trm parameter.

The terminal specified by the trm parameter must be equipped.

Anyone logged in to the terminal specified by this command is logged off when this command is executed. For the user to continue working on the specified terminal, the user must log on to that terminal again.

An IPSM card must be provisioned for the specified SEAS terminal before this command can be entered.

The SEAS Over IP feature must be turned on before this command can be entered for a SEAS terminal.

If the SEAS terminal is auto-inhibited, then this command cannot be entered.

The terminal specified by the trm parameter cannot be configured as type=none (see the chg-trm command).

Notes

The function of this command is the same as the alw-trm command.

When you attempt to return to service a terminal already in service, a warning message is echoed to the scroll area but no action is taken.

Output

```
rst-trm:trm=12
```

```
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Allow message sent to terminal

rtrv-acg-mic

Use this command to display the values of ACG controls assigned to certain queries. The control can apply to all queries or to specific query services and called party digits.

Parameters

dgts (optional)

Digits

Range:

3 digits, 6 - 10 digits

Valid values are 000-999, 000000-999999999

serv (optional)

Query service

Range:

ain

in

type (optional)

Type of control

Range:

all

sd

Example

Display all MICs:

```
rtrv-acg-mic
```

Display the MIC(s) that apply to particular services and digits:

```
rtrv-acg-mic:type=sd
```

Display the MIC(s) that apply to AIN queries:

```
rtrv-acg-mic:serv=ain
```

Display the MIC(s) that apply to IN queries for 919-460-xxxx:

```
rtrv-acg-mic:serv=in:dgts=919460
```

Dependencies

If the `type=all` parameter is specified, then the `serv` and `dgts` parameters cannot be specified.

The `dgts` parameter value must be specified as 3 digits or 6-10 digits.

The LNP feature must be turned on before this command can be entered.

Notes

None

Output

```
rtrv-acg-mic:type=sd
```

```

rtrv-acg-noc

Use this command to display the definitions of node overload levels. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the Automatic Call Gappings (ACG) to be sent when at the overload level.

Parameters**lvl (optional)**

Overload level

Range:

1 - 10

Example

```
rtrv-acg-noc
```

```
rtrv-acg-noc:lvl=3
```

Dependencies

The ACG NOC table must be accessible.

The LNP feature must be turned on before this command can be entered.

Notes

None

Output

This example displays all defined overload levels:

```
rtrv-acg-noc
```

```
rlghncxa03w 04-01-28 08:50:12 EST  EAGLE 31.3.0
```

```

      LVL  QR          AND  IND  INTVL  DRTN
      3    600000      10   6    3      6
      4    750000      6    6    5      7
      10   2147483647  10   10   15     13
      RTRV-ACG-NOC: MASP A - COMPLTD
;

```

This example displays overload level 3:

```
rtrv-acg-noc:lvl=3
```

```

      rlgncxa03w 04-01-28 08:50:12 EST  EAGLE 31.3.0
      LVL  QR          AND  IND  INTVL  DRTN
      3    600000      10   10   3      6
      RTRV-ACG-NOC: MASP A - COMPLTD
;

```

Legend

- **LVL**—Overload level
- **QR**—Query rate
- **AND**—AIN number of digits
- **IND**—IN number of digits
- **INTVL**—Interval index
- **DRTN**—Duration index

rtrv-ainpopts

Use this command to retrieve AINP-specific options.

Parameters

This command has no parameters.

Example

```
rtrv-ainpopts
```

Dependencies

The AINPOPTS table must be accessible.

None.

Output

If the RNAI or RNAIV option is not provisioned, then the RNAI mnemonic default value is displayed. If the RNAI or RNAIV option is provisioned, then the RNAI mnemonic string for the option is displayed.

If the RNP or RNPV option is not provisioned, then the RNP mnemonic default value is displayed. If the RNP or RNPV option is provisioned, and the RNPV option can be set using RNP, then the RNP mnemonic string for the option is displayed. If the RNPV option cannot be provisioned using RNP, then the RNPV numerical value is displayed.

Each DIALPFX and DIALNAI option is displayed with its associated DLTPFX and SNAI option, respectively.

If the NEC option is not provisioned, then the default is displayed.

If the LNPSNAI, LNPOGLRNNAI, LNPOGDNNAI, LNPSUBDIGLEN, LNPATLDIGLEN, LNPSPORT, or LNPENTPREF option is not provisioned, then the default value is displayed.

This example shows output with default AINP options.

rtrv-appl-rtkey

Use this command to retrieve information from the Routing Key table. A routing key entry associates a routing key with up to 16 socket names with a limit of 2500 routing keys per system (if E5-ENET-B cards exist).

- DPC, SI, SSN routing keys, which are used to route SCCP messages
- DPC, SI routing keys, which are used to route non-SCCP and non-ISUP messages
- DPC, SI, CIC routing keys, which are used to route ISUP messages

Parameters

 Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

asname (optional)

Application Server (AS) name assigned to this routing key.

Range:

aaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

cice (optional)

The end range of circuit identification codes assigned to the routing key.

Range:

0 - 4294967295

See [Table A-4](#) for valid CIC values for specified SI and MSU types.

cics (optional)

The start range of circuit identification codes assigned to the routing key.

Range:

0 - 4294967295

See [Table A-4](#) for valid CIC values for specified SI and MSU types.

display (optional)

The type of output to display.

Note

Output includes the type of card, the data collection being audited, and a message indicating the overall status. This parameter applies only to STP databases.

Range:***all***

The KEY and the ATTRIBUTE sections of the routing key are displayed

brief

Only the KEY section of the routing key is displayed

Default:

brief

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

dpca

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range:*s*-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s**zone*—0-7*area*—000-255*id*—0-7

The point code 0-000-0 is not a valid point code.

dpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-*nnnnn*—0-16383*gc*—*aa-zz**m1-m2-m3-m4*—0-14 for each member; values must sum to 14**dpcn24 (optional)**

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255*ssa*—000-255*sp*—000-255**dpcn16 (optional)**

16-bit ITU national destination point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127*sna*---000---15*mna*---000---31**num (optional)**

The number of entries to display.

Range:

1 - 10000

Default:

50

opc (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:*opca***Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

opc/opca/opci/opcn/opcn24/opcn16 (optional)

Originating point code.

opc i (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range:*s-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

opcn (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc,m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range:*s-, 0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-**nnnnn—0-16383**gc—aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opc24 (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

opc16 (optional)

16-bit ITU national originating point code with subfields *unit number sub number area main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

rcontext (optional)

Routing Context. The routing key with the specified routing context.

Range:

0 - 4294967295

si (optional)

Service indicator.

Range:

0 - 15

The following equivalent text values can be specified:

Number = Text—Description

0=snm

Signaling network management messages

1=regtest

Signaling network testing and maintenance regular

2=spptest

Signaling network testing and maintenance special

3=sccp

SCCP

4=tup

Telephone user part

5=isup

ISDN user part

13=qbicc**ssn (optional)**

Subsystem number.

Range:

0 - 255

type (optional)

The type of routing key.

Range:*all**full**partial**default***Default:***all***Example**

rtrv-appl-rtkey

rtrv-appl-rtkey:dpc=123-234-255:si=3

rtrv-appl-rtkey:dpc=123-234-255

rtrv-appl-rtkey:cics=1:cice=1000:num=3

rtrv-appl-rtkey:cice=19

rtrv-appl-rtkey:opc=122-124-125

rtrv-appl-rtkey:type=partial

rtrv-appl-rtkey:display=all

rtrv-appl-rtkey:rcontext=7

rtrv-appl-rtkey:dpcn16=121-10-15

Dependencies

The ssn parameter must be specified and is valid only when the si=3 (sccp) parameter is specified.

The value specified for the cics parameter must be less than or equal to the value specified for the cice parameter.

A circuit identification code range (cics to cice) that overlaps an existing routing key cannot be specified.

The ssn parameter cannot be specified when opc, cics, and cice parameters are specified. See [Table 4-2](#) for valid parameter combinations.

When the DPC is ANSI and the `si=4` parameter is specified, a DPC/SI routing key must be specified (TUP is used only in an ITU network).

The `opc`, `cics`, and `cice` parameters can be specified with the `si` parameter only if the `si` parameter has a value of 4, 5, or 13 (or *tup*, *isup*, or *qbicc*).

[Table A-4](#) shows valid CIC values for SI types 4, 5, and 13.

The following types of partial routing keys are supported:

- The following types of partial routing keys are supported:
- DPC/SI/OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC/SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

If the `type=default` parameter is specified, then the `dpc`, `si`, `ssn`, `opc`, `cics`, and `cice` parameters cannot be specified.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Static routing keys are stored on disk and a copy of the table is loaded to each SS7IPGW card.

Group codes are required for ITU-N point codes (DPCN/OPCN) when the Duplicate Point Code feature is turned on.

The `display=all` parameter must be specified to display the assigned routing context value for the routing key.

In this command, the point codes support only the spare point code subtype prefix (s-).

Output

rtrv-as

Use this command to retrieve the characteristics of one or all Application Servers from the AS table.

Parameters

aname (optional)

Name of the association.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

Default:

Retrieve all

asname (optional)

Name of the Application Server.

Range:

aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

Example

```
rtrv-as
```

```
rtrv-as:aname=as1
```

Dependencies

None

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

aname (optional)

Name assigned to this association (in IPAPSOCK table).

Range:

aaaaaaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

Default:

Retrieve all

display (optional)

An optional display parameter can be specified in order to display either all or brief reports for associations. The default mode is "brief" if this parameter is not entered at the command line.

Range:

brief

all

lhost (optional)

The local host name as defined in the IP Host table.

Range:

////////////////////////////////////

Any string of characters beginning with a letter and comprising up to 60 characters in length. Valid characters are a–z, A–Z, 0–9, - (dash), . (period).

Default:

Retrieve all

Link (optional)

The signaling link for this association.

Range:

a, b, a1-a63, b1-b63

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have assigned signaling links.

loc (optional)

Card location that is stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

rhost (optional)

Name of Remote Host as defined in the IP Host table.

Range:

////////////////////////////////////

Any string of characters beginning with a letter and comprising up to 60 characters in length. Valid characters are a-z, A-Z, 0-9, - (dash), . (period).

Default:

Retrieve all

rhosttype (optional)

Remote host type. This parameter retrieves associations with a configured primary remote host or with configured primary and alternate remote hosts.

Range:***primary***

retrieve associations with only a primary remote host

alternate

retrieve associations with primary and alternate remote hosts

Default:

retrieve all associations

rhostval (optional)

Remote host validation mode. This parameter retrieves associations with the specified validation mode.

Range:***relaxed******match*****Default:**

retrieve all associations

Example

```
rtrv-assoc
```

```
rtrv-assoc:aname=swbel32
```

```
rtrv-assoc:lhost=gw105.nc.tekelec.com:adapter=sua
```

```
rtrv-assoc:rhosttype=alternate:display=all
```

```
rtrv-assoc:lhost=gw105.nc.tekelec.com:adapter=diam
```

Dependencies

A valid value must be specified for the `lhost` parameter. If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

Notes

This command can be canceled using the **F9** function key or the `canc -cmd` command. See `canc -cmd` for more information.

The IPAPSOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port.

When the command is entered with the `aname`, `lhost`, or `lhost` parameters, the output displays SCTP buffer usage information (used and total buffer space on the card).

Heartbeat timer value is in milliseconds.

Output

AS names are displayed for IPGWx-M3UA and SUA linksets.

LS names are displayed for IPSG linksets.

This example shows buffer usage (used and total buffer space) and card location information:

rtrv-atinpqopts

Use this command to retrieve the data that is used for ATI number conditioning.

Parameters

This command has no parameters.

Example

```
rtrv-atinpqopts
```

Dependencies

The ATINP feature must be enabled before this command can be entered.

The EGLEOPTS table is corrupt or cannot be found.

Output

This example shows output with default ATINPQ options:

```
rtrv-atinpqopts
```

```

tekelecstp 12-01-04 07:53:46 EST  EAGLE 45.0.0

ATINPQ OPTIONS
-----
ATIACKIMSI      = NONE
ATIACKMSISDN    = MSISDN
ATIACKRN        = RN
ATIDFLTRN       = NONE
ATIDLM          = NONE
ATINPTYPE       = ANY
ENTITYLEN       = NONE
SNAI            = INTL
SPORTTYPE       = GSM
ATISUPPLOCINFO  = OFF
VLRNUMLEN       = 40
ATIACKVLRNUM    = RNSPMSISDN

;

```

This example shows output when the Location Information request is supported:

rtrv-atinpopts

```
tekelecstp 12-01-25 12:22:38 EST EAGLE 45.0.0
```

```
ATINPQ OPTIONS
```

```
-----

VLRNUMLEN       = 40
ATIACKVLRNUM    = RNSPMSISDN
```

```
;
```

Legend

- **ATIACKIMSI**—IMSI parameter for ACK response message
- **ATIACKMSISDN**—MSISDN parameter for ACK response message
- **ATIACKRN**—Routing Number format
- **SNAI**—NAI of the incoming MSISDN digits
- **ATIDLM**—Outbound message delimiter
- **ATIDFLTRN**—Default Routing Number
- **ATINPTYPE**—Number Portability Type
- **SPORTTYPE**—Service Portability Type
- **GRN**—Generic Routing Number
- **ATISUPPLOCINFO**—Support ATINP query with LocationInformation request if ATINP feature is activated
- **VLRNUMLEN**—Maximum number of digits that could be encoded as VLR-number in ATI ACK response message
- **ATIACKVLRNUM**— VLR-number format

rtrv-atm-lps

Use this command to display the parameter values for the ATM link parameter sets in the database configured with the `chg-atm-lps` command, along with the non-configurable ATM parameters.

Parameters

lpset (optional)

The ATM link parameter set to be displayed.

Range:
1 - 30

Default:
All ATM link parameter sets are displayed

Example

rtrv-atm-lps:lpset=5
rtrv-atm-lps

Dependencies

None

Notes

None

Output

Note

Dashes (--) in the FC NR and FC BC fields indicate that this implementation is not supported on ATM high-speed signaling links.

rtrv-atm-lps:lpset=5

Legend

- **LPSET**—Link parameter set being changed. The system default value for this parameter is 1 for ANSI and, 21 for ITU.
- **ACTION**—Copy a set of ATM signaling link parameters from one parameter set to another.
- **SCRLPSET**—ATM signaling link parameter set used as a source for the `action=copy` parameter.
- **MAXCC**—Maximum number of transmissions of a BGN, END, ER, or RS PDU
- **MAXPD**—Maximum number of SD PDUs that can be sent before a POLL is sent
- **MAXSTAT**—Maximum number of list elements in a STAT PDU
- **TMRCC**—Timer, in seconds, used during the connection phase to guard against unacknowledged BGN, END, ER or RS PDUs
- **TMRKALIVE**—Timer, in seconds, used during the transient phase when no SD PDUs are being sent to keep connection up
- **TMRNOSP**—Timer, in seconds, used to check that STAT PDUs are arriving often enough
- **TMRPOLL**—Timer, in seconds, used to guarantee that POLL PDUs are sent often enough
- **TMRIDLE**—Timer, in seconds, used during the idle phase when no SD PDUs are being sent to limit time in the idle phase
- **TMRT1**—Time, in seconds, between a link release action and the next link reestablish action during alignment
- **TMRT2**—Total time, in seconds, that SSCF will attempt alignment
- **TMRT3**—Time, in seconds, between proving PDUs
- **N1**—Number of PDUs sent during proving
- **MAXNRP**—Maximum number of retransmitted PDUs during proving
- **TMRSREC**—The timer, in seconds, used to prohibit closely spaced SSCOP recoveries from occurring.

- **TMRNOCRED**—The timer, in seconds, used when the no credit exists and PDUs are available to be sent.
- **TMRERM**—The error rate monitor interval, in seconds.
- **NBLK**—The number of monitoring intervals per block.
- **TMRPROV**—The timer, in seconds, used to monitor the status of a link after it is placed into service.
- **SDU SIZE**—The SSCOP SDU size (set to 272 octets).
- **UU SIZE**—The SCOP UU size (set to 4 octets).
- **N**—The monitoring intervals spanning a 4 second error event (set to 9).
- **FC NR**—The fixed credit increment value.
- **FC BC**—The fixed credit allocation frequency.
- **TSUP**—The superblock timer for layer management, in seconds.
- **TLOSS**—The loss timer for layer management, in seconds.
- **ERMSM**—The error rate monitor smoothing factor.
- **THRES**—The error rate monitor threshold.

rtrv-atm-prm

Use this command to display system-wide non-configurable ATM layer parameters for each ATM high-speed signaling link. The data displayed includes the ATM interface parameters and the ATM traffic descriptor values.

Parameters

This command has no parameters.

Example

```
rtrv-atm-prm
```

Dependencies

None

Notes

None

Output

```
rtrv-atm-prm
```

```
tekelecstp 04-02-05 08:40:18 EST EAGLE 31.3.0
DS1 DS1 E1 E1 MAX MAX VCI VPI
PCR SCR PCR SCR BT CDVT QOS VPCs VCCs BITS BITS
```

```

3622 3622 4528 4528 210 100 3 0 1 16 12
;

```

Legend

The ATM traffic descriptors are displayed in the following fields:

- **BT**—Burst tolerance. The number of consecutive cells on the VCL permitted on the ATM interface by the enforcement process, given the PCR and the line speed.
- **CDVT**—The amount of cell delay variation for the VCL in the network ingress direction.
- **PCR**—The maximum or peak cell rate for the VCL (virtual channel link) T1 is for ANSI and E1 is for ITU.
- **QOS**—Quality of service. The performance objectives that must be met by the ATM VCL when it must discard cells during enforcement of the traffic parameters.
- **SCR**—The average or sustainable cell rate supported on the VCL. T1 is for ANSI and E1 is for ITU.
- The ATM interface parameters are displayed in the following fields:
- **MAX VCCs**—The maximum number of simultaneously active Virtual Circuit Connections (VCCs) supported.
- **MAX VPCs**—The maximum number of simultaneously active Virtual Path Connections (VPCs) supported (by the ATM interface).
- **VCI BITS**—The number of allocated VCI bits to be used in the VPIs in the ATM cells for the VCLs supported on the ATM interface.
- **VPI BITS**—The number of bits to be used in the VPIs in the ATM cells for the VPLs terminated on the ATM interface.

rtrv-bip

Use this command to show the board identification PROM (BIP) data for the main assembly at the specified card location.

The following information is displayed for the main assembly: board part number, board revision, serial number (7, 8, 11, 12, or 14 digits), manufacturing date, and the software match ID.

For main assemblies, the port A Ethernet address (if ENT01 record exists) and port B Ethernet address (if ENT02 record exists) are also displayed.

Parameters

loc (mandatory)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

Example

The following example displays the BIP data for the main assembly.

```
rtrv-bip:loc=1201
```

Dependencies

The card location must be valid for the command.

Notes

The `tst-bip` command verifies that the PROM is good by writing to and reading from the PROM. The `rtrv-bip` command shows the level of the BIP, as well as the board part number, the revision number, and the serial number. If the `rtrv-bip` command fails, this indicates that communication to the card has failed, and you might need to replace the card. Contact My Oracle Support (MOS) to find out if the card can be reprogrammed.

Output

For main assemblies, the Max Power Rating is also displayed. If the Card Power value is not present in BIP data, then the Max Power Rating is displayed as *Undef*.

This example shows the 7-digit serial number of a main assembly card manufactured on the eleventh week of 1993):

```
rtrv-bip:loc=1201
```

```
tekelecstp 10-03-14 23:32:51 IST EAGLE 42.0.0
```

```
-----  
Location: 1201 MBD
```

```
Part Number: 850-0187-03
```

```
Revision: G2
```

```
Serial Number: 3110195
```

```
Week/Year: 11/1993
```

```
Software Match ID: EG - 001
```

```
Max Power Rating : Undef
```

```
-----  
END OF REPORT
```

```
;
```

This example shows the 14-digit serial number with Ethernet port A and B records, manufactured on the eleventh week of 2001:

```
rtrv-bip:loc=1201
```

```
tekelecstp 10-03-14 23:32:51 IST EAGLE 42.0.0

Legend

- **Location**—Card location for the BIP information
- **Part Number**—Part number of the card in the specified card location
- **Revision**—Hardware version of the card
- **Serial Number**—Serial number of the card. Serial number formats are:
 - 7-digit serial number—ywwxxxx
 - 8-digit serial number—yywwxxxx
 - 11-digit serial number—nnnyywwxxxx
 - 12-digit serial number—nnnyyww*xxxx
 - 14-digit serial number—nnnyyyyww*xxxx
 - * y = year digit (0–9)
 - * w = week digit (0–9)
 - * n = product identifier digit (0–9) x = serial number digit (0–F hexadecimal)
 - * * = special character (0–9, a–z, or A–Z, alphanumeric characters)
- **Software Match ID**—Used to check hardware and board type for the BIP information.
- **Max Power Rating**—Maximum power rating of the card.
- **Week/Year**—Week (1–52) and year (4 digits) of the card. The serial number formats are:
 - 7-digit: ywwxxxx
 - 8-digit: yywwxxxx
 - 11-digit: nnnyywwxxxx
 - 12-digit: nnnyyww*xxxx
 - 14-digit: nnnyyyyww*xxxx
 - where y=year, w=week, n=product identifier, x=serial number (0–F, hexadecimal),
*=special character (0–9, a–z, or A–Z)

rtrv-card

Use this command to display the information about a card. The command displays the card type, the application the card is running, the linkset name, the signaling links, and the signaling link codes. If no parameter is specified, the command displays information for all cards defined

by the `ent - card` command. If the `loc` parameter is specified, the command displays information for the specified card only.

Parameters

links (optional)

Links Provision Status. For the card in the location specified by the `loc` parameter, all links, only equipped links, or only unequipped links are displayed. If the parameter is not specified, only the equipped links are displayed.

Range:

all

Display all possible links for the card.

equip

Display links that are equipped on the card.

unequip

Display links that are allowed but not equipped on the card.

ipsg

Display the SLKTPS and total card TPS used for a particular card or for all cards configured with the IPSP GPL.

Default:

equip

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115, 6201 - 6208, 6211 - 6218, 6301 - 6108, 6311 - 6118

Default:

Retrieve all

Example

```
rtrv-card
```

```
rtrv-card:loc=1205
```

```
rtrv-card:links=ipsg
```

```
rtrv-card:loc=1111:links=ipsg
```

```
rtrv-card:loc=6201
```

Dependencies

The card location slot must be between 1 and 18 and not 9 or 10.

The card location cannot be 1114, 1116, 1117, or 1118.

The shelf location must be 11xx, 12xx, 13xx, 21xx, 22xx, 23xx, 31xx, 32xx, 33xx, 41xx, 42xx, 43xx, 51xx, 52xx, 53xx, 61xx, 62xx, or 63xx.

The specified card location must be equipped in the database.

Notes

Rtrv-card for a card slot provisioned for SLIC and a SLIC card inserted will show the card type as SLIC and appl as IPSG. Rtrv-card for a card slot provisioned for SLIC and a SLIC card is not inserted will show the card type as SLIC and appl as IPSG.

Output

rtrv-card

Legend

- **CARD**—Card location as stenciled on the shelf of the system
- **TYPE**—Type of card
- **APPL**—Application associated with each card
- **LSET NAME**—Linkset name associated with the cards
- **LINK**—Signaling link associated with the linkset.
- **SLC**—Signaling link code
- **UNEQUIPPED LINKS**—Signaling links that are unequipped on the provisioned card
- **SLKTPS**—Transactions Per Second configured for signaling links provisioned on the card
- **DATA**—Type of RTDB data loaded on the card. Displayed when the EPAP Data Split feature is turned on. When an SFLOG card is configured, the DATA parameter is used to display its status.
- **SRVNAME**- Server Name of the E5-APP-B Card or Telco Switch.

rtrv-cat2-gta

Use this command to display entries from CAT2 GTA table. CAT2 GTA Table shall store Sender TADIG code from RAEX IR.21 Information, TADIG code and MGT of E.214 from Section ID 4 of Operator IR.21 xml file. It shall store Sender TADIG code from RAEX IR.21 Information, TADIG code and GT Address/Address range for HLR Node type from Section ID 13 of Operator IR.21 xml file. The list can be filtered using an optional parameter. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the CAT2 GTA table without regard to the selector specified. This command obtains the Sender TADIG Code, TADIG Code, Node Type, Start Range, End Range (GT Addresses) for an entry from CAT2 GTA Table.

Parameters**enumber (optional)**

End number. It defines the end number of CAT2 GTA entries to be displayed in the command output. These entries are of the specified stadig.

Range:

1 - 5,00,000

Default:

1000

snumber (optional)

Start number. It defines the start number of CAT2 GTA entries to be displayed in the command output. These entries are of the specified stadiG.

Range:

1 - 5,00,000

Default:

1

stadiG (mandatory)

Sender TADIG Code. It is TADIG code of the operator. The parameter can be used to filter entries on the basis of Sender TADIG Code.

Range:

ayyyy: 1 leading alphabetic and up to 4 following alphanumeric characters

Example

```
rtrv-cat2-gta:stadiG=INDT0
```

```
rtrv-cat2-gta:stadiG=INDT0:snumber=100:enumber=200
```

Dependencies

The stadiG parameter is mandatory and must be specified.

The stadiG parameter must have some string value. It must have maximum length of 5.

enumber and snumber must be specified together. The entries to be displayed are of the specified mandatory stadiG parameter.

End number must be greater than or equal to start number. The entries to be displayed are of the specified mandatory stadiG parameter.

The maximum number of entries to be displayed are 1000. The difference between enumber and snumber must be less than 1000. The entries to be displayed are of the specified mandatory stadiG parameter.

Notes

The percentage full and number of cells used report that is provided with the rtrv-cat2-gta command reflects the total entries in the GTA table without regard to the selector specified.

Total number of entries to be displayed for one Operator/STADIG cannot exceed 1000.

This command can be canceled using the F9 function key or the canc-cmd command. See canc-cmd for more information.

Output

This example retrieves all the entries of CAT2 GTA Table having Sender TADIG code = INDT0. By default 1000 is maximum limit for display.

```
rtrv-cat2-gta:stadiG=INDT0
```

```

      CAT2-GTA table is (152 of 500000) 1% full.

```

```

;

```

This example retrieves entries from CAT2 GTA Table containing specified sender TADigit Code. By default number of entries to be displayed is 1000.

Legend

- **SenTADCode:** It will be used to identify the operator. It consist of two fields, with a total length of five characters consisting of three-character country code and a two-character operator/company identifier.
- **TADCode:** It will be used to identify circle of the operator. It is Operator ID.
- **NodeType:** It will store value 0 for HLR and 1 for MGT.
- **StartRange/EndRange:** It is GT address/Address range.

rtrv-cat2-imsi

Use this command to display entries from CAT2 IMSI Table. CAT2 IMSI table will store MCC-MNC (E.212) along with TADIG code from section ID 4 of Routing Information data. It will also contain Sender TADIG code from RAEX IR.21 Information of IR.21 XMLs. The list can be filtered using an optional parameter. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the CAT2 IMSI table without regard to the selector specified.

This command obtains the Sender TADIG Code, TADIG code and IMSI for an entry from CAT2 IMSI Table.

Parameters

num (optional)

Defines number of CAT2 IMSI entries to be displayed in command output.

Range:

1- 5,000

Default:

1000

stadig (optional)

Sender TADIG Code. It is TADIG code of the operator. Can be used to filter entries on the basis of Sender TADIG Code.

Range:

ayyyy: 1 leading alphabetic and up to 4 following alphanumeric character

Example

```
rtrv-cat2-imsi
```

```
rtrv-cat2-imsi:num=100
```

```
rtrv-cat2-imsi:stadig=INDT0
```

Dependencies

The num parameter if specified, must have some integer value. It must have a value ranging from 1 to 5000.

The stadig parameter if specified, must have some string value. It must have maximum length of 5.

Notes

The percentage full and number of cells used report that is provided with the rtrv-cat2-imsi command reflects the total entries in the IMSI table without regard to the selector specified.

This command can be canceled using the F9 function key or the canc-cmd command. See canc-cmd for more information.

Output

This example retrieves all the entries from CAT2 IMSI Table. By default maximum entry to be displayed is 1000.

```
rtrv-cat2-imsi
```

```
tklc1131001 20-01-23 05:30:39 EST EAGLE 46.9

rtrv-cmd

Use this command to retrieve the list of command classes to which a command is assigned. You can retrieve output for one command, commands in one command class, or all commands.

Parameters

class (optional)

The command class whose attributes are to be retrieved.

Range:

ayyyyyy

One alphabetic character followed by up to 5 additional alphanumeric characters.

cmd (optional)

The command whose attributes are to be retrieved.

Range:

ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ

One alphabetic character followed by up to 19 additional alphanumeric characters, enclosed in double quotes.

Example

```
rtrv-cmd:cmd="ent-rte"
```

```
rtrv-cmd:class=dab
```

rtrv-cmd

Dependencies

The Command Class Management feature must be enabled before a configurable command class name can be specified in the `class` parameter.

The value of the `cmd` parameter must be a valid system command.

The CCCNAMES table is corrupt or cannot be found.

The CCMD table is corrupt or cannot be found.

The value of the `class` parameter must be a valid configurable or non-configurable command class name.

The Command Class Management feature must be enabled before CHG-CMD or CHG-CMDCLASS command can be entered.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Output

This example shows the command classes to which the `rept-stat-slk` command is assigned (non-configurable class `sys` and user-configured classes `u01`, `u02`, `krb`, and `u11`):

```
rtrv-cmd:cmd="rept-stat-slk"
```

rtrv-cmdclass

Use this command to retrieve the name and description of one command class or all command classes.

Parameters

c class (optional)

The command class whose name and description are to be retrieved.

Range:

ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters

Example

```
rtrv-cmdclass:class=krb
```

```
rtrv-cmdclass
```

Dependencies

The Command Class Management feature must be enabled and turned on before a configurable command class name can be specified in the `c class` parameter.

The CCCNAMES table is corrupt or cannot be found.

The value of the `c class` parameter must be a valid configurable or non-configurable command class name.

Notes

The Command Class Management feature must be enabled and turned on before configurable command classes will appear in the command output.

Output

In the following examples, classes *u01*, *u03*, *u05*, and *u32* are default configurable command class names. Classes *krb* and *dab* are user-assigned configurable command class names. Default command class name *u02* was changed to *krb* and command class name *u04* was changed to *dab*. Descriptions of classes *krb* and *dab* were entered with the `descr` parameter when the class names were changed with the `chg-cmdclass` command.

```
rtrv-cmdclass:class=krb
```

```
eagle10404 04-01-22 16:30:56 EST EAGLE 31.3.0

rtrv-csl

Use this command to retrieve all Common Screening List (CSL) entries for a specified feature, a list of screening entries for the specified feature and screening list name, or a specific DS or PC value for a particular feature and screening list name. The Common Screening List commands are used to tailor certain types of general screening information to specific features.

Parameters

ds (optional)

Digit string. A unique string of digits that is used by the specified screening feature.

Note

The ds or pc parameter must be specified. Both parameters cannot be specified in the same command.

Range:

1 - 15 hexadecimal digits. Valid digits are 0-9, a-f, A-F.

- 1-6 digits—Prepaid IDP Query Relay *ccnc* list
- 1-15 digits—Prepaid IDP Query Relay *gt* list
- 1-10 digits—Prepaid IDP Query Relay *skbcsn* list
- 4 digits—IDP Screening for Prepaid *skts* list
- 1-15 digits—IDP Screening for Prepaid *insl* list
- 1-15 digits—VFLEX *vmprfx* list
- 1-6 digits—Info Analyzed Relay Base *ccnc* list
- 1-15 digits—Info Analyzed Relay Base *gt* list
- 2 digits—Info Analyzed Relay Base *trig* list

Prepaid IDP Query Relay

pc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

Synonym:*pca***Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001–005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006–255`.

The point code `000-000-000` is not a valid point code.

pc/pca/pci/pcn/pcn24 (optional)

Point code. The `ds` or a point code parameter must be specified.

pci (optional)

ITU international point code with subfields *zone-area-id*.

Range:

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—0–7

area—000–255

id—0-7

The point code `0-000-0` is not a valid point code.

pcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfnti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

pn (optional)

Part Number. The 9-digit "893xxxxxx" part number of the feature for which the command is entered. The `rtrv-ctrl-feat` command description shows the part number in the command output example.

Note

The `pn` or feature parameter must be specified to identify the feature.

Range:

893000000 - 893999999

The first 3 digits are 893. Do not separate the digits with dashes or spaces. The following part numbers are valid for this command:

893012301

EIR

893015501

IDP Screening for Prepaid

893034201

Info Analyzed Relay Base

893016001

Prepaid IDP Query Relay

893016701

VFLEX

scpgta (optional)

Signaling Control Point (SCP) Global Title Address (GTA).

Note

The scpgta parameter is used only by the Prepaid IDP Query Relay feature.

Range:1 - 21 digits, *none*

1 - 21 hexadecimal digits. Valid digits are 0-9, a-f, A-F

Example

```
rtrv-csl
```

```
rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=456789
```

```
rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc
```

```
rtrv-csl:feature="IDP Screening for  
Prepaid":list=insl:ds=123456789abcdEF
```

```
rtrv-csl:scpgta=12345
```

```
rtrv-csl:feature="EIR":list=imsipfx:ds=401923423
```

```
rtrv-csl:pn=893016001:list=opcdpc
```

Dependencies

The value specified for the feature parameter must be a valid feature name for a feature that uses a Common Screening List. The feature must be specified as it appears in the `rtrv-ctrl-feat` command output. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym. The specified feature name must be valid for a feature that uses a Common Screening List.

The following parameters are allowed with the indicated common screening list type:

- list=ccnc—ds parameter
- list=gt—ds parameter
- list=imsipfx---ds parameter
- list=insl—ds parameter
- list=skbcsn—ds or scpgta parameter
- list=skts—ds parameter
- list=trig—ds parameter
- list=vmpfx—ds parameter

The Common Screening List table is corrupt or cannot be found.

Only one of the ds, pc, and scpgta parameters can be specified in the command.

The pn or feature parameter must be specified before the list parameter can be specified.

Notes

None

Output

This example retrieves the specified screening entry for the specified feature and screening list:

```
rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=456789

rtrv-cspc

Use this command to show one or more lists of concerned signaling point codes that are to be notified when subsystem-prohibited or subsystem-allowed messages are received for an associated mate application.

Parameters

grp (optional)
Group name

Range:
ayyyyyyy
1 alphabetic character followed by up to 7 alphanumeric characters

Default:
Retrieve all.

Example

```
rtrv-cspc
rtrv-cspc:grp=grp01
```

Dependencies

If specified, the group name must exist in the database.

Notes

If no group parameter is specified, a summary list of group names is displayed with an indication of network type and a percent full indication for each group.

Output

This example shows output when the ANSI/ITU SCCP Conversion feature is enabled:

```
rtrv-cspc

rlghncxa03w 04-01-07 11:43:02 EST EAGLE 31.3.0
CSPC GRP    NETWORK          PERCENT FULL
Grp01      ANSI              2%
Grp02      ANSI, ITU, ITU-N24 3%
Grp03      ITU               2%
;
```

This example shows output when the Spare Point Code Support feature is turned on, and the ANSI/ITU SCCP Conversion feature is enabled:

```
rtrv-cspc:grp=grp02

rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP    PC              Type
GRP02      001-012-123      A
           001-012-124      A
           7-089-0          I
           s-2-021-4        I
           s-00789          N
;
```

This example shows output when the Spare Point Code Support feature is turned on, and the ANSI/ITU SCCP Conversion feature is not enabled:

```
rtrv-cspc:grp=groupi

rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP    PCI
groupi      7-089-0
           s-2-021-4
;
```

This example shows output when the Spare Point Code Support feature is turned on, and the ANSI/ITU SCCP Conversion feature is not enabled:

```
rtrv-cspc:grp=grn16
```

```
tekelecstp 13-10-18 12:27:33 EST 45.1.0-64.77.0
CSPC GRP      PCN16
Grn16        001-02-03
;
```

Legend

- **CSPC PC TABLE IS 15% FULL**—Relative size of the CSPC point code tables
- **CSPC GRP**—Name of the CSPC broadcast group
- **NETWORK**—Network type or types associated with the point code or codes in the group. (When no parameters are specified in the command, only the groups are listed. The `grp` parameter must be specified to list the point codes in the specified group.)
- **PERCENT FULL**—Relative size of the CSPC broadcast group
- **PC**—Point codes that make up the CSPC broadcast group
- **Type**—Network type of the point code in the group. (The `grp` parameter is specified in the command to list the point codes in the specified group.)

rtrv-ctrl-feat

Use this command to retrieve the status of feature access key controlled features that are enabled in the system.

Parameters

partnum (optional)

The Part Number to retrieve.

Range:

893000000 - 893999999

Do not include dashes in the 9-digit number.

Default:

Retrieve all controlled features

status (optional)

Retrieve features with the specified status (On or Off).

Range:

on

off

Default:

Retrieve features with On and Off status

Example

```
rtrv-ctrl-feat
```

```
rtrv-ctrl-feat:status=on
```

```
rtrv-ctrl-feat:partnum=893005911
```

Dependencies

None

Notes

None.

Output

The following output examples will differ from the output shown at your terminal and might include features that are not supported in your system. You must be entitled to use a feature before you can enable the feature and turn the feature on. If you are not sure whether you are entitled to use a feature, contact your Oracle Sales Representative or Account Representative.

If a Part Number (partnum parameter) is entered that belongs to a feature associated with quantity, the output will show which quantity is currently enabled on the system, even if the specified Part Number is for a different quantity.

```
rtrv-ctrl-feat
```

```
rlghncxa03w 12-03-13 16:40:40 EST EAGLE 46.4.0
```

Feature Name          Partnum      Status  Quantity
GSM Map Screening (GSM) 893013201   on      ----
```

If the part number specified in the `rtrv-ctrl-feat:partnum=` command is 893400001 for "EAGLE OA&M IP Security," an additional security warning section is displayed if any or all of the following conditions are met (and the output displays all applicable issues in a detailed warning section):

- The 893400001 FAK has Status=OFF, which suppresses non-secure protocol alarms

- The security default SSH option is set to "OFF"
- Any of the FTP servers have a Security setting of "OFF"

```
rtrv-ctrl-feat:partnum=893400001
```

```

rtrv-data-rtdb

This command retrieves data from the RTDB on an active Service Module card. If the **loc** parameter is specified and the target card is an active Service Module card, the RTDB data is retrieved from that card. If the **loc** parameter is not specified, the data is retrieved on the active Service Module card that has the lowest IMT address. The RTDB status on the active Service Module card can be coherent or incoherent.

For LNP database items (TN) all Service Module cards are queried for the existence of the specified item. Either the Service Module card specified by the **loc** parameter or the Service Module card with the lowest IMT address returns full item information. Any remaining Service Module cards return either COHERENT or INCOHERENT if the item is found in the RTDB on the card.

Parameters

dn (optional)

Dialed Number.

Range:

5 - 15 digits

entity (optional)

Network Entity.

Range:

1 - 15 digits

entitytype (optional)

Entity Type.

Range:***sp***

Service Provider: Any 10-digit TN

rn

Routing Number: Any 10-digit TN

vmsid

Voice Mail Server ID: Any 1-15 digit hexadecimal number

grn

Generic Routing Number: Any 1-15 digit hexadecimal number

imei (optional)

International Mobile Equipment Identity.

Range:

14 digits

imsi (optional)

International Mobile Subscriber Identity.

Range:

5 - 15 digits

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1117, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

lrn (optional)

Location Routing Number.

Range:

10 digits

npanxx (optional)

Numbering Plan Area.

Range:

6 digits

tn (optional)

Telephone Number.

Range:

10 digits

Example

```
rtrv-data-rtdb:tn=9194663133
```

```
rtrv-data-rtdb:npanxx=919466
```

```
rtrv-data-lrn=9194460000
```

```
rtrv-data-rtdb:imsi=12345
```

```
rtrv-data-rtdb:dn=12345
```

```
rtrv-data-rtdb:entity=abcdefabcdefabc
```

Retrieve DN information from a specific Service Module card.

```
rtrv-data-rtdb:dn=19195554444:loc=1107
```

Retrieve entity data from a specific Service Module card.

```
rtrv-data-rtdb:entity=12345:loc=1107
```

Dependencies

The specified card location must be equipped in the database.

At least one of the `imsi`, `dn`, `entity`, `imei`, `entitytype`, `npanxx`, `lrn`, or `tn` parameters must be specified.

Only one of the `tn`, `lrn`, or `npanxx` parameters can be specified in the command.

If the `npanxx`, `lrn`, or `tn` parameter is specified, the LNP ELAP Configuration feature must be on.

If the AINPQ, EIR, G-Flex, G-Port, INP, Prepaid IDP Relay Query, Prepaid SMS Intercept Ph1 (PPSMS), or V-Flex feature is turned on, or the ATINP feature is enabled, then the `imsi`, `dn`, `entity`, `imei`, or `entitytype` parameter must be specified.

If the `imsi` parameter is specified, then the G-Flex, EIR, or S13 feature must be turned on.

The G-Flex, G-Port, or V-Flex feature must be turned on, or the ATINP feature must be enabled before the `entity` parameter can be specified.

If the `entitytype` parameter is specified, the `entity` parameter must be specified.

If the `imei` parameter is specified, the EIR or S13 feature must be turned on.

The destination specified by the `loc` parameter must correspond to a Service Module card running the VSCCP application.

The destination specified by the `loc` parameter must correspond to a Service Module card that is IS-NR.

A primary Service Module card must be provisioned.

An EPAP-related feature must be turned on before the `entity`, `entitytype`, or `dn` parameter can be specified.

The value specified by the `loc` parameter must indicate a DN or IMSI card before the `dn` or `imsi` parameter can be specified, respectively.

Notes

For DN and DN Block entries, whichever entity is provisioned in the order of SP/RN, VMSID, GRN, will become Entldx1.

MTT 2376 DELETED. M Buckland

Output

Note

A value of "---" in the TT column indicates that the service does not have a translation type defined in the EAGLE and that call processing will ignore the override data displayed.

Legend

- **Card Loc**—Location of the card that contains the retrieved information
- **Status**—RTDB database status; Coherent or Incoherent
- **IMSI**—International Mobile Subscriber Identity
- **EntIdx, EntIdx1, EntIdx2**—Hexadecimal index where the Network Entity data is stored in the Entity Bucket on the Service Module card
- **IMEI Index**—Hexadecimal index at which the IMEI data is stored in the IMEI Bucket on the Service Module card or S13 card running DEIRHC GPL.
- **Entity Address**—Hexadecimal Network Entity address
- **Type**—Network Entity type; Service Provider (SP), Routing Number (RN), Voice Mail Server ID (VMSID) or Generic Routing Number (GRN)
- **PC (type of PC)**—Point code and type of point code (ANSI; NATL - ITU National with or without group code (-gg))
- **RI**—Routing Indicator
- **SSN**—Subsystem Number
- **TT**—Translation Type
- **NP**—Numbering Plan
- **DA**—Digits action (Prefix, Suffix, or none)
- **SRFIMSI**—Signaling Relay Function IMSI

- **IMSI**—International Mobile Subscriber Identity.
- **NSSN**—New Subsystem Number (yes or no)
- **CCGT**—Cancel GT (yes or no)
- **NTT**—New Translation Type
- **NNP**—New Numbering Plan
- **NNAI**—New Nature of Address Indicator.
- **IMEI**—International Mobile Equipment Identity
- **VERSION**—IMEI data version
- **BLACK, WHITE, GRAY**—Equipment Identity Register search lists
- **DN**—Dialed Number
- **ASD Address**—Additional Subscriber Data address
- **Portability Type** (*number*)—
 - 0—Not known to be ported
 - 1—Own number ported out
 - 2—Foreign number ported to Foreign network
 - 3—Prepaid Short Message Service (PPSMS) subscriber on server #1
 - 4—PPSMS subscriber on server #2

- 36—Not Identified to be ported
- 255—No portability type
- **NS Address**—Address of the associated DN, used for Number Substitution
- **NS Category**—Category of the associated DN, used for Number Substitution
- **NPA**—Number Planning Area (Area Code)
- **NXX**—Exchange Code

rtrv-dconn

Use this command to retrieve Diameter connection entries. The DCONN table supports the provisioning information related to the diameter connections.

Parameters

aname (optional)

Association name configured in the association table and linked with a diameter connection.

Range:

aaaaaaaaaaaaaaaa

A string of alphanumeric characters, beginning with a letter and up to 15 characters in length. Valid values are a..z, A..Z, 0..9.

Default:

No change to the current value

System Default:

null

dcname (optional)

Diameter connection name. This parameter specifies the unique logical name assigned to each diameter connection.

Range:

aaaaaaaaaaaaaaaa

A string of alphanumeric characters, beginning with a letter and up to 15 characters in length. Valid values are a..z, A..Z, 0..9.

Default:

No change to the current value

System Default:

null

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Example

```
rtrv-dconn
rtrv-dconn:dcname=connection1
rtrv-dconn:aname=assoc12d
rtrv-dconn:loc=1103
```

Dependencies

The S13/S13' EIR feature must be enabled before retrieving any diameter connection entry.

The DCONN table should be accessible.

The specified card location must be equipped.

A DEIR card must be present at the specified location.

DCNAME must be present in DCONN table.

The value specified for the ANAME parameter must be present in the IPAPSOCK table and referred by a diameter connection.

Multiple combinations of optional parameters are not allowed.

Notes

Multiple combinations of optional parameters are not allowed.

If optional parameters are specified, only the entries that match the entered parameters are displayed.

Output

This example displays output when no parameter is specified:

```
rtrv-dconn

tekelecstp 14-03-21 02:59:22 EAGLE 46.0.0 65.11.0

Legend

This section defines the fields used in the rtrv-dconn command output:

- **DCNAME** --- Diameter connection name.
- **ANAME** --- Association name configured in IPAPSOCK table which is associated with the diameter connection.
- **LOC** --- Specifies the DEIR card location on which the particular diameter connection is configured.
- **RSVDTPS** --- This (Reserved TPS) is the guaranteed TPS for a diameter connection.
- **MAXTPS** --- This is the maximum TPS for a diameter connection.

- **Tw** --- This (Diameter Watchdog Timer) timer is used to control how long the S13 process will wait for a DWA (Diameter Watchdog Answer) response before sending a DWR (Diameter Watchdog Request).
- **Td** --- This (Diameter Peer Disconnect Timer) is used to control how long the S13 process will wait for a DPA (Disconnect Peer Answer) response before sending a DPR (Disconnect Peer Request).

rtrv-deiropts

Use this command to retrieve S13/S13' diameter EIR configuration options.

Parameters

This command has no input parameters.

Example

```
rtrv-deiropts
```

Dependencies

The S13/S13' EIR Feature must be enabled before retrieving Diameter EIR configuration options.

The DEIROPTS table should be accessible.

Output

This example shows output with default DEIR options.

```
rtrv-deiropts
```

```
tekelecstp 13-03-16 11:43:52 EST EAGLE 45.1
```

```
rtrv-deiropts
```

```
Command entered at terminal #4.
```

DEIRGRSP	= off	DEIRRSPTYPE	= type1
DEIRIMSICHK	= off	CONGERR	= 3004
VENDID	= 0	APPLID	= 16777252
PRODUCT	= none	DPR Cause	= Do not want to talk(2)
DEIRIMSISCRN	= off	DEIRLOGWL	= off
DEIRDFLTIMSISCRN	= off	DEIRDFLTIMSILKUP	= range
DEIRDFLTIMSIRESP	= whitelist		

This example shows output with provisioned DEIR options.

```
rtrv-deiropts
```

```
tekelecstp 13-03-16 11:43:52 EST EAGLE 45.1
```

rtrv-deiropts

Command entered at terminal #4.

DEIRGRSP	= off	DEIRRSPTYPE	= type1
DEIRIMSICHK	= off	CONGERR	= 3004
VENDID	= 4004	APPLID	= 16777252
PRODUCT	= abc	DPR Cause	= Busy(1)
DEIRIMSISCRN	= off	DEIRLOGWL	= off
DEIRDFTIMSISCRN	= off	DEIRDFTIMSILKUP	= both
DEIRDFTIMSIRESP	= blacklist		

Legend

- **DEIRGRSP** -- S13/S13' EIR Global Response Type. The Global Response Type is used to override the response that is sent back to the MME.
- **DEIRRSPTYPE** -- S13/S13' EIR Response Type. The Response Type is used to determine how the lists are to be searched.
- **DEIRIMSICHK** -- Indicates whether IMSI will be used when determining if an IMEI is to be "black" listed or not.
- **CONGERR** -- It displays the diameter response to be sent by DEIRHC card at the time of card congestion.
- **VENDID** -- S13 local Vendor ID. All the outgoing messages that require Vendor ID in Vendor-Specific-Application-ID AVP will use this configured value.
- **APPLID** -- Authentication Application ID. The application ID configured should match with the Auth-Application-Id (AVP Code 258) value in Vendor-Specific-Application-ID AVP. This application ID is fixed and cannot be changed.
- **PRODUCT** -- It contains the vendor-assigned name for the product. All the outgoing messages that require Product name AVP will use this configured value.
- **DPR Cause** -- It is a Disconnect Cause in DPR (Disconnect Peer Request) message sent by the DEIRHC card.
- **DEIRIMSISCRN** -- Indicates whether the IMSI Screening for Diameter Equipment Identity Register (EIR) will be done before the IMEI check.
- **DEIRLOGWL** -- Indicates whether the white list logging for Diameter Equipment Identity Register (EIR) will be on.
- **DEIRDFTIMSISCRN** -- Indicates whether the default IMSI Screening for Diameter Equipment Identity Register (EIR) will be on.
- **DEIRDFTIMSILKUP** -- Indicates the order of IMEI table lookup for default IMSI screening.
- **DEIRDFTIMSIRESP** -- Indicates the default IMEI status for default IMSI screening.

rtrv-dstn

Use this command to show the destination point code entries in the Destination point code table.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

aliasa (optional)

ANSI alias point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Range:

0-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001–005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006–255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni =006–255*.

The point code *000-000-000* is not a valid point code.

aliasa/aliasi/aliasn/aliasn24/aliasn16 (optional)

Alias point code.

aliasi (optional)

ITU international alias point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*). If this parameter is specified with an ITU international destination (*dpci*) point code, the prefix subfields cannot be the same, i.e., both spare or both non-spare.

If an ITU international destination (*dpci*) point code is entered, then the *dpci* and *aliasi prefix* subfields cannot be the same (both spare or both non-spare). Up to 2 comma-delimited entries can be entered in the point code list.

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

aliasn (optional)

ITU national alias point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*). If this parameter is specified with an ITU national destination (*dpcn*) point code, the prefix subfields cannot be the same, i.e., both spare or both non-spare.

If an ITU national destination (*dpcn*) point code is entered, then the *dpcn* and *aliasn prefix* subfields cannot be the same (both spare or both non-spare). Up to 2 comma-delimited entries can be entered in the point code list.

Range:

s—0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

aliasn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

aliasn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

cli (optional)

Common Language Location Identifier. The Common Language Location Identifier assigned to the link.

Range:

ayyyyyyyyyyy

1 alphabetic character followed by 10 alphanumeric characters

Default:

none

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:*dpc***Range:***p-*, 000-255, *, **, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

The asterisk values *, **, and *** are not valid for the *ni* subfield.

If ** or *** is specified for the *nc* subfield, either *, **, or *** must be specified for the *ncm* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc=000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni= 006-255*.

The point code 000-000-000 is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Destination point code.

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:*s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, *p-*, *ps**zone—0-7**area—000-255**id—0-7*

The point code 0-000-0 is not a valid point code.

dpcn (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt1* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s-*, *p-*, *ps*, 0-16383, *aa-zz*, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (*) can be specified either for the node or for the group code, but not both.

prefix—s-, *p-*, *ps-**nnnnn—0-16383*, **gc—aa-zz*, *

m1-m2-m3-m4—0-14 for each member; values must sum to 14; or **-*-** when the point code includes a group code.

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000–255

ssa—000–255

sp—000–255

dpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

homescp (optional)

This parameter displays all destination point codes (DPCs) that have the internal Home SCP flag set to the specified value.

Range:**yes**

the DPC is considered a Home SCP for messages with no Global Title Address Digits

no

the DPC is not considered a Home SCP for messages with no Global Title Address Digits

homesmsc (optional)

This parameter displays all destination point codes (DPCs) that have the internal Home SMSC flag set to the specified value.

Range:**yes**

the DPC is considered a Home SMSC for messages with no Global Title Address Digits

no

the DPC is not considered a Home SMSC for messages with no Global Title Address Digits

msar (optional)

Memory space accounting report. When the NRT feature or the CRMD feature, or both, is turned on, this parameter specifies whether summary or detail destination table memory space accounting information is displayed. The *summary* or *detail* report appears following the destination information that is requested by entering the command with or without other parameters. The only parameter value displays a detail destination table memory space accounting report without any other destination information. If neither feature is on, only the summary report information is displayed; the detail report information cannot be displayed.

Range:

detail

only

summary

Default:

detail

if rtrv-dstn is entered with no parameters

summary

if rtrv-dstn is entered with parameters

ncai (optional)

Nested cluster allowed indicator. This parameter specifies whether the route to the cluster point code can be different for provisioned members of the cluster and whether clusters with nested cluster point codes, or clusters that do not allow nested cluster point codes are displayed.

Range:

yes

Display clusters with NCAI set to yes

no

Display clusters with the NCAI set to *no*

nprst (optional)

NM bits reset. This parameter displays all entries with the specified value of the nprst option.

Range:

off

Display entries with an NPRST value of *off*

on

Display entries with an NPRST value of *on*

pcst (optional)

Point code subtype. This parameter displays point codes with the specified subtype.

Range:***none***

Display only point codes without subtype prefixes

p

Display only private point codes

ps

Display only private and spare point codes

s

Display only spare point codes

pctype (optional)

Point code domain. This parameter displays point codes of the specified domain type.

Range:***ansi***

Display only ANSI point codes

itui

Display only ITU International point codes

itun

Display only ITU National point codes

itun24

Display only 24-bit ITU National point codes

itun16

Display only 16-bit ITU National point codes

ppc (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

The proxy point code must be a full point code.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni* = 000 is not valid.

When `chg-sid:pctype=ansi` is specified, *nc* = 000 is not valid if *ni* = 001–005.

When `chg-sid:pctype=ansi` is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

ppc/ppca/ppci/ppcn/ppcn24/ppcn16 (optional)

Proxy Point Code.

The proxy point code must be a full point code.

ppci (optional)

ITU international proxy point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:*s*-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s**zone*—0-7*area*—000-255*id*—0-7

The point code 0-000-0 is not a valid point code.

ppcn (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:*s*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-*nnnnn*—0-16383*gc*—*aa-zz**m1-m2-m3-m4*—0-14 for each member; values must sum to 14**ppcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255*ssa*—000-255*sp*—000-255**ppcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127*sna*---000---15*mna*---000---31**prx (optional)**

Proxy point code indicator.

Range:**yes**

Will be used as a proxy point code

no

Will not be used as a proxy point code.

sccpmsgcnv (optional)

SCCP UDT(S)/XUDT(S) Message Conversion Indicator. The type of conversion performed on messages for the specified destination.

Range:**none**

conversion is not required on messages for the destination

udt2xudt

convert all UDT(S) messages for the destination to XUDT(S) messages

xudt2udt

convert all non-segmented XUDT(S) messages for the destination to UDT(S) messages

sxudt2udt

convert all segmented and non-segmented XUDT(S) messages for the destination to UDT(S) messages

spc (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

spca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code 000-000-000 is not a valid point code.

spc/spca/spci/spcn/spcn24/spcn16 (optional)

Secondary point code.

spci (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps
zone—0-7
area—000-255
id—0-7

The point code 0-000-0 is not a valid point code.

spcn (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps
nnnnn—0-16383
gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

spcn24 (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p
msa—000-255
ssa—000-255
sp—000-255

spcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---p

un---000---127

sna---000---15

mna---000---31

splitiam (optional)

IAM/SAM split. This parameter displays all entries with the specified splitiam parameter value.

Range:

15 - 31, none

Example

This example displays all encountered destination point codes that are members of network cluster 20-2 as well as the cluster address:

```
rtrv-dstn:dpca=20-2-***
```

This example displays the destination with an ANSI alias of 222-200-200:

```
rtrv-dstn:aliasa=222-200-200
```

This example displays all encountered ANSI alias destination point codes that have a network indicator of 222 and a network cluster of 200:

```
rtrv-dstn:aliasa=222-200-**
```

This example displays the destination with a CLLI of rlghncbb001:

```
rtrv-dstn:clli=rlghncbb001
```

This example displays the secondary point code 6:

```
rtrv-dstn:spc=6-6-6
```

This example displays a single cluster (the NRT feature must be turned on):

```
rtrv-dstn:dpc=010-*-*
```

This example displays a single ITU national destination (the ITUDUPPC feature must be turned on):

```
rtrv-dstn:dpcn=3-15-15-15-fr:spc=1-15-15-15-fr
```

This example displays all ITU national group codes by duplicate point code:

```
rtrv-dstn:dpcn=2050-*
```

This example displays all ITU national point codes within a group code:

```
rtrv-dstn:dpcn=*-fr
```

This example displays 24-bit ITU national point code 15-100-10:

```
rtrv-dstn:dpcn24=15-100-10
```

This example displays 24-bit ITU national alias point code 4:

```
rtrv-dstn:aliasn24=4-4-4
```

This example displays a private point code:

```
rtrv-dstn:dpca=p-12-12-12
```

This example displays a private and spare point code:

```
rtrv-dstn:dpci=ps-1-234-1
```

This example displays all ANSI private point codes:

```
rtrv-dstn:pctype=ansi:pcst=p
```

This example displays all ITU national private and spare point codes:

```
rtrv-dstn:pctype=itun:pcst=ps
```

This example displays all ANSI point codes that do not have point code subtype prefixes:

```
rtrv-dstn:pctype=ansi
```

This example displays all point codes that do not have point code subtype prefixes:

`rtrv-dstn:pcst=none`

This example displays all private point codes:

`rtrv-dstn:pcst=p`

This example displays all spare point codes:

`rtrv-dstn:pcst=s`

This example displays all proxy destinations:

`rtrv-dstn:prx=yes`

This example displays all destinations using a specified proxy point code:

`rtrv-dstn:ppc=1-1-1`

This example displays full DPCs when the `homescp=yes` parameter is specified:

`rtrv-dstn:homescp=yes`

This example displays all point codes where the `sccpmsgcnv=udt2xudt` parameter is specified:

`rtrv-dstn:sccpmsgcnv=udt2xudt`

This example displays 16-bit ITU national point code 125-2-25:

`rtrv-dstn:dpcn16=125-2-25`

This example displays a 16-bit ITU national alias point code:

`rtrv-dstn:aliasn16=2-3-4`

Dependencies

Note

A full point code contains numerical values for all three segments of the point code.

Only one destination point code parameter, or one alias point code parameter, or one CLLI parameter can be specified in the command; these parameters cannot be specified together in the command.

If the `dpcn` or `aliasn` parameter is specified, the format must match the format that was assigned with the `chg-stpopts:npcfmt1` parameter.

If specified (except when `spc=none`), the secondary point code must be a full point code.

Cluster destinations are allowed only if the Cluster Routing Management and Diversity (CRMD) feature is turned on.

Alias point codes must be specified as full point codes.

When the `msar=only` parameter is specified, no other parameters can be specified in the command.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

The `pcst` parameter value `s` or `ps` cannot be specified when the `pctype` value `ansi` or `itun24` or `itun16` is specified.

The `pctype` and `pcst` parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, `clli`, `msar=only`, and `ncai` parameters.

The `cli=none` parameter cannot be specified.

The Route table is corrupt or cannot be found.

The site identification table is corrupt or cannot be found.

The Proxy Point Code feature must be enabled before the `prx` parameter can be specified.

The Proxy Point Code feature must be enabled before the `ppc` parameter can be specified.

The `prx` parameter can be specified with only the `pctype`, `pcst`, or `msar` parameter.

The `ppc` parameter can be specified with only the `msar` parameter.

A valid value must be specified for the `prx` parameter.

The point code specified by the `ppc` parameter must be a full point code.

Proxy point codes, as specified by the `ppc` parameter, cannot be private.

PRX point codes cannot be private.

The XUDT UDT Conversion feature must be turned on before the `sccpmsgcnv` parameter can be specified.

Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (s-). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-). Aliases do not support the private (internal) point code prefix.

Summary description of the reports that are produced by the various DPC parameter syntaxes is shown:

- `rtrv-dstn:dpc=ni-nc-ncm` —Report for fully provisioned destination *ni-nc-ncm*
- `rtrv-dstn:dpc=ni-*-*` —Report for provisioned network destination with the specified network indicator. If * is specified in the *nc* field, * must be specified in the *ncm* field.
- `rtrv-dstn:dpc=ni-**-*` —Report for the full network cluster for the specified *ni*
- `rtrv-dstn:dpc=ni-***-*` —Report for the full network cluster and the network cluster address (if any) for the specified *ni*
- `rtrv-dstn:dpc=ni-nc-*` —Report for provisioned cluster destination *ni-nc-**
- `rtrv-dstn:dpc=ni-nc-**` —Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address *ni-nc-** (if it exists) is not reported.
- `rtrv-dstn:dpc=ni-nc-***` —Report showing all destinations whose network (*ni*) and cluster (*nc*) components match those specified. The network cluster address *ni-nc-** (if it exists) is also reported.
- `rtrv-dstn:dpcn24=msa-ssa-sp` —Report for fully provisioned 24-bit destination *main signaling area-sub signaling area-signaling point*

Asterisks in ANSI Point Codes

Two asterisks in the *ncm* subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, 20-2-**). This does not include the specified cluster point code (for example, 20-2-*).

Three asterisks in the *ncm* subfield of a cluster point code (for example, 20-2-***) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified (*lsn* parameter) and the *dpc/dpca* parameter's *ncm* subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified *dpc/dpca* parameter's subfield values.

Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, 10101-*).
- An asterisk (*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, *-ab).

When the ITUDUPPC feature is on and the STP flexible point code option (*npcfmt.i*) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*)

- An asterisk (*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, 15)
- An asterisk (*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, *, *-15-*, *-*-ab is not valid).

If the Proxy Point Code feature is enabled, then the values specified for the *ppc* and *dpc* parameters must be full point codes. Cluster point codes and private point codes are not supported.

Output

Destination Table Memory Space Accounting Information

Each output example for this command shows the display of destination table memory space accounting information. The *msar* parameter value and the NCR, NRT, CRMD, and Origin-based MTP Routing feature settings determine whether a summary report or a detail report is displayed.

Summary Report

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the summary report is displayed when the command is entered with and without parameters specified and for all of the *msar* parameter values. The detail report cannot be displayed. The summary information appears at the end of the requested destination information, or appears without any other destination information when the *msar=only* parameter is specified.

When one or more of the NCR, NRT, CRMD, and Origin-based MTP Routing features are on, the summary report is displayed:

- When the command is entered with one or more parameters to select the specific destination information to be displayed. The summary information appears at the end of the requested destination information. (The *msar=summary* parameter is the default in this case.)

- When the command is entered with only the `msar=summary` parameter specified. The summary information appears at the end of the destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the `rtrv-feat dstn5000` entry and the `rtrv-ctrl-feat Routesets` entry). The `chg-stpopts` command's `mtpdpcq` parameter must be set to the value of the Routes or Routesets quantity feature to allow the maximum number of destinations to be provisioned.

The number currently provisioned is the value *x*, the allowed maximum is the value *y*, and the table percent full is the value *z* shown in the following first line of the summary report:

Destination table is (x of y) z% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 2000 destinations can be provisioned.
- When the DSTN5000 (5000 Routes) feature bit is on, a maximum of 5000 destinations can be provisioned.
- When the 6000, 7000, 8000, or 10,000 Routesets quantity feature is enabled, a maximum of the corresponding number of destinations can be provisioned.

The maximum number of aliases that can be provisioned depends on the quantity features that are on in the system (see the `rtrv-feat dstn5000` entry and the `rtrv-ctrl-feat Routesets` entry). The number currently provisioned is the *x* value, the allowed maximum is the *y* value, and the table percent full is the *z* value shown in the following second line of the summary report:

Alias table is (x of y) z% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 12000 aliases can be provisioned.
- When the DSTN5000 feature bit is on, a maximum of 12000 aliases can be provisioned.
- When the 6000 Routesets feature quantity is enabled, a maximum of 12000 aliases can be provisioned.
- When the 7000 or 8000 Routesets quantity feature is enabled, a maximum of 8000 aliases can be provisioned.
- When the 10000 Routesets quantity feature is enabled, a maximum of 10000 aliases can be provisioned.

Detail Report

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the detail report cannot be displayed.

When one or more of the NCR, NRT, CRMD, or Origin-based MTP Routing features are on, the detail report is displayed:

- When the command is entered with no parameters. The detail report appears at the end of the destination information. (The `msar=detail` parameter value is the default in this case.)
- When the `msar=detail` parameter is specified with one or more other parameters to select the specific destination information to be displayed. The detail report appears at the end of the requested destination information.

- When the `msar=only` parameter is specified. The detail report appears with no other destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the `rtrv-feat dstn5000` entry and the `rtrv-ctrl-feat Routesets` entry). The `chg-stpopts` command's `mtpdpcq` parameter must be set to the value of the quantity feature to allow the maximum number of destinations to be provisioned. The possible maximum numbers of destinations are described in the *Summary Report* section.

In the example of the detail report, the allowed maximum number of destinations is the `DESTINATION ENTRIES ALLOCATED` value. The list of values under the allocated value includes the `TOTAL DPCs` currently provisioned and the `Destination table CAPACITY (% FULL)`.

The allowed maximum number of aliases is the `ALIASES ALLOCATED` value. The list of values under the allocated value include the current number of `ALIASES USED` and the `Aliases table CAPACITY (% FULL)`. The possible maximum numbers of aliases are described in the *Summary Report* section.

The output for the `rtrv-dstn` command does not change when the Proxy Point Code feature is on.

Abbreviated output is indicated by 3 vertical dots as shown:

```
.
.
.
```

This example shows destination table memory space accounting information contained in a summary report. In the example, the NCR, NRT, CRMD, and Origin-based MTP Routing features are all off. The Summary Report information appears without any other destination information.

rtrv-e1

Use this command to retrieve information for a specified E1 interface or for all E1 interfaces that have been defined by the `ent -e1` command for an E5-E1T1-B or SLIC card used as an E1 or SE-HSL card.

Parameters

e1port (optional)

E1 port number

The value must be an E1 port that has already been configured with an E1 interface on the specified E1 card (loc parameter).

Range:

1 - 8

Default:

If not specified, all E1 ports are listed.

loc (optional)

The card location as stenciled on the shelf of the system.

Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

Default:

If not specified, all E1 card locations are listed.

Example

```
rtrv-e1
```

```
rtrv-e1:loc=1307:e1port=2
```

```
rtrv-e1:loc=1311:e1port=1
```

Dependencies

The loc and e1port parameters must be specified together in the command.

The E1 interface of the E1 card specified by the loc parameter must already be defined (see the ent-e1 command) before this command can be entered.

The card specified by the loc parameter must be a LIME1 card type.

The Card (IMT) table must be accessible.

The E1/T1 table must be accessible.

An E1 interface must already be defined on the port specified by the e1port parameter before this command can be entered.

The following card locations (loc parameter) are not valid for this command: 1113 through 1118 and all xy09 and xy10 locations (where x is the frame and y is the shelf).

Notes

None.

Output

Legend

- **LOC**—E1 card location
- **E1PORT**—E1 port number on an E1 card
- **CRC4**—CRC4 indicator
- **ENCODE**—Indicator for use of HDB3 or AMI encoding/decoding
- **SI**—Value of two Spare International bits of NFAS data
- **SN**—Value of five Spare National bits of NFAS data
- **MINSURATE**—Minimum number of signaling units present on a link uniformly distributed. A value appears in this field only when the LINKCLASS field value is UNCHAN.
- **TSx**—Timeslot

rtrv-enum-acl

Use this command to retrieve an entry from the ENUM Access Control List (ACL) Table. The ENUM ACL Table supports the provisioning information related to the allowed IP addresses for the ENUM application.

Parameters

ipaddr (optional)

This is a TCP/IP address expressed in standard dot notation. It specifies allowed IP addresses for the ENUM application.

Range:

Four numbers separated by dots, with each number in the range of 0-255, *.

Note

It also supports wildcard characters as follows:

xxx.xxx.xxx.*

xxx.xxx.*.*

xxx.*.*.*

where xxx can be any number in range of 0-255.

System Default:

0.0.0.0

Example

```
rtrv-enum-acl
rtrv-enum-acl:ipaddr=10.248.13.9
rtrv-enum-acl:ipaddr=10.248.13.*
rtrv-enum-acl:ipaddr=10.248.*.*
rtrv-enum-acl:ipaddr=10.*.*.*
```

Dependencies

The ENUM ACL Table should be accessible.

The IP address specified by the IPADDR parameter should be provisioned in the ENUM ACL Table.

The IP address specified by the IPADDR parameter must be a valid IP address.

Notes

Wildcard IP addresses are allowed to support the ranges of IP addresses.

Output

This example displays output when the IPADDR parameter is not specified:

```
rtrv-enum-acl
```

```

rtrv-enum-prof

Use this command to retrieve the existing profile entry which has data to generate the ENUM response for three supported resource record formats such as NAPTR, NS and CNAME. The ENUM Profile Table stores the profile entry.

Parameters

prn (optional)

Profile name. This parameter specifies the unique logical name assigned to the profile entry used to generate the ENUM response.

Range:

zzzzzzzzzz

A string of alphanumeric characters, beginning with a letter and up to 10 characters in length. Valid values are a..z, A..Z, 0..9.

rtrtype (optional)

Response type. This parameter specifies the response type for the profile. It identifies the profile used to generate the ENUM response for each resource record type.

Range:

naptr

cname

ns

Default:

No change to the current value

System Default:

naptr

sparm (optional)

Service parameter. This parameter specifies the supported ENUM services. The ENUM application shall only support two ENUM Services.

Range:*pstntel**pstnsip**sip***Default:**

No change to the current value

System Default:*pstntel***prefix (optional)**

This parameter specifies the prefix digits to be appended as routed number (RN) in NAPTR regex response. This parameter is only valid for NAPTR response type.

Range:*0 - ffff*

Upto 5 hexa-decimal digits allowed.

*sip***Default:**

No change to the current value

System Default:*None***Example**`rtrv-enum-prof:prn=pr1``rtrv-enum-prof:sparm=pstntel``rtrv-enum-prof:rtype=ns``rtrv-enum-prof:rtype=naptr:sparm=sip``rtrv-enum-prof:rtype=naptr:sparm=pstnsip``rtrv-enum-prof:prefix=1234`**Dependencies**

The ENUM Profile Table should be accessible.

The Profile name parameter cannot be specified with any other parameter.

The Profile name must be present in the ENUM Profile Table.

Either provide the SPARM parameter alone or with the RTYPE=NAPTR parameter.

Notes

The requirement of using PREFIX in the regular expression is only for PSTN-SIP (NAPTR query). As such, PREFIX will not be applied for PSTN-TEL and SIP (NAPTR queries).

PREFIX can be configured for PSTN-TEL and SIP profiles, but it will not be used.

Output

The example shows the output of a profile having RTYPE = NAPTR.

```
> rtrv-enum-prof:prn=pr1

rtrv-enum-profsel

Use this command to retrieve an entry from the ENUM Profile Selection Table or the ENUM DN Block Table. The ENUM Profile Selection Table supports the provisioning information related to mapping the Entity Id to the Profile Selection Id. The ENUM DN Block table supports the provisioning information related to mapping the DN Block to the Profile Selection Id.

Parameters**edn (optional)**

End Dialed Number

Range:

5-15 digits

entityid (optional)

Network Entity

Range:

1-15 digits

sdn (optional)

Start Dialed Number

Range:

5-15 digits

Example

```
rtrv-enum-profsel:entityid=12345
```

```
rtrv-enum-profsel:sdn=11223344
```

```
rtrv-enum-profsel:edn=1324566
```

```
rtrv-enum-profsel
```

Dependencies

The value specified for the EntityId, SDN, or EDN parameters must already exist in the ENUM Profile Selection Table or the ENUM DN Block Table respectively.

The ENUM Profile Selection Table should be accessible.

The ENUM DN Block Table should be accessible.

Entity Id cannot be specified with SDN or EDN.

Notes

None

Output

This example displays output when entity Id is specified:

```
rtrv-enum-profsel:entityid=1234
```

```
tekelecstp 14-05-28 15:04:28 EST EAGLE 46.1.0
rtrv-enum-profsel:entityid=1234
Command entered at terminal #4.
RTRV-ENUM-PROFSEL: MASP A - COMPLTD
;
```

Entity ID	PRN1	PRN2	PRN3	PRN4
1234	---	cname	---	naptr

This example displays output when SDN is specified:

```
rtrv-enum-profsel:sdn=1234567
```

```
tekelecstp 14-05-28 15:04:28 EST EAGLE 46.1.0
rtrv-enum-profsel:sdn=1234567
Command entered at terminal #4.
RTRV-ENUM-PROFSEL: MASP A - COMPLTD
;
```

SDN	EDN	PRN1	PRN2	PRN3	PRN4
1234567	1235555	prof1	prof2	Prof3	Prof4

This example displays output when EDN is specified:

```
rtrv-enum-profsel:edn=1235555
```

```
tekelecstp 14-05-28 15:04:28 EST EAGLE 46.1.0
rtrv-enum-profsel:edn=1235555
Command entered at terminal #4.
RTRV-ENUM-PROFSEL: MASP A - COMPLTD
;
```

SDN	EDN	PRN1	PRN2	PRN3	PRN4
1234567	1235555	prof1	prof2	Prof3	Prof4

This example displays output of `rtrv-enum-profsel` without any parameters specified:

rtrv-enum-profsel

```

tekelecstp 14-05-28 15:04:28 EST EAGLE 46.1.0
rtrv-enum-profsel
Command entered at terminal #4.
RTRV-ENUM-PROFSEL: MASP A - COMPLTD
;

```

Entity ID	PRN1	PRN2	PRN3	PRN4
1234	---	cname	---	naptr
12345	ns1	---	naptr	---
12346	---	---	---	naptr

SDN	EDN	PRN1	PRN2	PRN3	PRN4
1234567	1235555	prof1	prof2	Prof3	Prof4

ENUMPRID table is (3 of 1024) 1% full.

rtrv-feat

Use this command to show the status of optional features in the system that are controlled with the chg-feat command.

Parameters

This command has no parameters.

Example

```
rtrv-feat
```

Dependencies

The MAS configuration table must be accessible.

The database cannot be accessed. There is a severe database failure.

None

Notes

This command is not allowed in upgrade mode.

Output

 Caution

The following output example may differ from the output shown at your terminal and may include unsupported features. Some optional features must be purchased before you turn the feature on. If you are not sure whether you are entitled to turn a feature on, contact your Oracle Sales Representative or Account Representative. After you turn on a feature with the `chg-feat` command, you cannot turn it off.

rtrv-feat

```

rtrv-frm-pwr

Use this command to retrieve a list of entries for all provisioned frames or the entry for the specified frame from the Frame Power Threshold (FPT) table. The command displays only provisioned entries for provisioned frames.

Parameters

frm (optional)

Frame ID. This parameter displays the FPT table entry for the specified provisioned frame.

Range:

cf00

Control frame

ef00

First extension frame

ef01

Second extension frame

ef02

Third extension frame

ef03

Fourth extension frame

ef04

Fifth extension frame

Example

Retrieve all provisioned Frame Power Threshold table entries.

```
rtrv-frm-pwr
```

Retrieve Frame Power Threshold table entries for the control frame (frm=cf00).

```
rtrv-frm-pwr:frm=cf00
```

Dependencies

The following values are valid for the frm parameter: CF00, EF00, EF01, EF02, EF03, EF04.

The frm parameter value must specify a provisioned frame.

The Frame Power Threshold (FPT) table must be accessible.

The frm parameter value must specify a frame that has a Frame Power Threshold entry provisioned in the FPT table.

Notes

If no parameter is specified in the command, all provisioned FPT table entries are displayed.

If the frm parameter is specified, the FPT entry corresponding to the specified frame is displayed.

Output

This example retrieves all Frame Power Threshold table entries:

```
rtrv-frm-pwr
```

```
tekelecstp 06-04-11 12:38:01 EST  EAGLE 35.0.0
```

Frame	Power Threshold (Amps)
-----	-----
cf00	56
ef00	36
ef01	40

```

FRAME POWER THRESHOLD table is (3 of 10) 30% full;
RTRV-FRM-PWR: MASP A - COMPLTD
;

```

This example Retrieve the Frame Power Threshold table entry for the control shelf:

```
rtrv-frm-pwr:frm=cf00
```

```
tekelecstp 06-04-11 12:38:01 EST  EAGLE 35.0.0
```

Frame	Power Threshold (Amps)
-----	-----
cf00	56

```

FRAME POWER THRESHOLD table is (3 of 10) 30% full;
RTRV-FRM-PWR: MASP A - COMPLTD
;

```

rtrv-ftp-serv

Use this command to retrieve an entry for an FTP server from the FTP Server table or all entries in the FTP Server table.

Parameters

app (optional)

Application. This parameter specifies the FTP Client application that interfaces with the FTP Server.

Range:

db

Database Backup\Restore application

dist

EAGLE Software Release Distribution application

meas

Measurements Platform application

sflog

SS7 Firewall Logging application

user

FTP-based Table Retrieve Application (FTRA)

secu

EAGLE seculog report transfer application

ipaddr (optional)

IP Address of the FTP Server.

Range:

4 numbers separated by dots, with each number in the range of 0-255.

mode (optional)

Full or brief report indicator.

Range:

full

brief

Default:

brief

Example

```
rtrv-ftp-serv
```

```
rtrv-ftp-serv:app=meas:ipaddr=1.255.0.100
```

```

rtrv-ftp-serv:mode=brief
rtrv-ftp-serv:app=meas
rtrv-ftp-serv:ipaddr=1.255.0.100
rtrv-ftp-serv:mode=full
rtrv-ftp-serv:app=sflog
rtrv-ftp-serv:app=secu

```

Dependencies

The app parameter must specify an application that uses the FTP Support feature.

The ipaddr parameter must specify a valid IP address for the FTP server.

The mode parameter allows you to display either the full 100 characters of the path string for each entry (mode=full), or the first 29 characters of the path string for each entry (mode=brief).

Notes

The LOGIN and PATH are displayed in mixed case.

Output

```
rtrv-ftp-serv
```

```

tekelecstp 12-09-19 15:15:04 EST 45.0.0-64.42.0
rtrv-ftp-serv
Command entered at terminal #4.

```

APP	IPADDR	LOGIN	SECU	PRI0	PATH

rtrv-gen-name

Use this command to retrieve the generic name, which is already provisioned into the database.

Parameters**gname (optional)**

Generic name. Each Generic name must be unique in the system. Maximum 15 characters can be provisioned. Valid values are (0-9, A-Z), *, SPACE, all special characters.

Range:

ZZZZZZZZZZZZZZZZ

ZZZZZZ

ZZZ*

***ZZZ**

ZZ*ZZ

ZZ

settype (optional)

Set Type. Set to which generic name belong

Range:

SetA

SetB

Both

None

Example

Retrieve generic name POLICE:

```
rtrv-gen-name:gname="POLICE"
```

Retrieve all generic name, which are configured in the generic name table:

```
rtrv-gen-name
```

Dependencies

Generic name entered is invalid i.e. Generic name in following format is restricted:

- Name with more than two ASTERIK(*) i.e. **ZZ*ZZ*ZZ*ZZ**

- Two consecutive ASTERIK(*) i.e. zzz**zz
- Two ASTERICK(*) if they are not at extremes i.e. zz*zz*

Unable to read generic name table

The generic name and settype combination cannot be specified together.

Notes

The generic name supports wildcarding using ASTERIK (*)

If gname="*" is provisioned as first entry than no more generic name can be configured. Also gname="*" cannot be configured, if atleast one entry is already provisioned.

Output

Retrieve generic name with gname specified

rtrv-gen-name:gname="*ice"

```
tekelecstp 19-10-04 03:39:45 EST  EAGLE 46.9.0.0.0-76.4.0

rtrv-gpl

Use this command to show the version numbers of the GPLs stored on each fixed disk or drive and the system release table stored on each fixed disk.

Parameters

gpl (optional)

Generic program load. The GPL for which to retrieve information.

Range:

xyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

atmhc/atmhc69—Used by E5-ATM-B cards to allow the card to support up to 3 signaling links

bldc32—Flash GPL containing a tar image with all code required on E5-MCAP cards to support VxWorks6.9 32-bit application, as in OAMHC69.

bldc64—Flash GPL containing a tar image with all code required on E5-SM8G-B cards for SCCP64, ENUM64, SIP64 and DEIR64 applications.

blmcap—Flash GPL containing a tar image with all code required on E5-MCAP, E5-E1T1-B, E5-MCPM-B, E5-ATM-B, E5-ENET-B, and E5-SM8G-B cards

bllc32—Flash GPL containing a tar image with all code required on SLIC cards for 32-bit application i.e. MCPHC, IPSHC etc.

bllc64—Flash GPL containing a tar image with all code required on SLIC cards for 64-bit application i.e. SCCP64, ENUM64, SIP64 and DEIR64.

bll932—Flash GPL containing a tar image with all code required on SLIC cards for 32-bit application on VxWorks6.9, as in IPSHC69 and MCPHC69.

blbw32—Flash GPL containing a tar image with all code required on SLICV3 cards for 32-bit application i.e. MCPHC69, SS7HC69, ERTHC69, IPSG69, IPSG932.

blbw64—Flash GPL containing a tar image with all code required on SLICV3 cards for 64-bit application i.e. SCCP64, ENUM64, SIP64 and DEIR64.

deir64—Used by E5-SM8G-B and SLIC cards to support the S13/S13' EIR feature

enum64—Used by E5-SM8G-B and SLIC cards to support the ENUM Mobile Number Portability and Tier One Address Resolution application

erthc/erthc69—Used by E5-ENET-B and SLIC cards for EAGLE 5 Integrated Monitoring Support functions

hipr2—Communication software used on the High Speed IMT Packet Router (HIPR2) card

ipsg/ipsg69—Used by E5-ENET-B and SLIC cards to support the combined functionality of IPSP M2PA and IPSP M3UA

ipsg32/ipsg932—Used by SLIC cards to support IPSP application with 64-bit addressing either with GTT functionality or without it.

ipshc—Used by E5-ENET-B cards to support the IPS application

ipshc69—Used by E5-ENET-B and SLIC cards to support the IPS application when running on VxWorks69.

mcphc—Used by E5-MCPM-B cards for the Measurements Platform feature

mcphc69—Used by E5-MCPM-B and SLIC cards for the Measurements Platform feature when running on VxWorks69.

oamhc—Used by E5-MCAP cards for enhanced OAM functions

oamhc69—Used by E5-MCAP cards for enhanced OAM functions, when running on VxWorks 69.

sccp64—Used by E5-SM8G-B and SLIC cards to support EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and an E5-SM8G-B or SLIC card is present, then the GPL processes normal GTT traffic.

sfapp—Used by SLIC cards to support the Stateful Firewall Application.

sip64—Used by E5-SM8G-B and SLIC Cards to support the SIP application.

ss7hc/ss7hc69—Application GPL used by E5-E1T1-B and SLIC cards to support **E1** and **T1** signaling links.

Default:

Display all

Example

rtrv-gpl

rtrv-gpl:gpl=hipr2

Dependencies

No other activate, change, copy, or retrieve GPL command can be in progress when this command is entered.

The value specified for the `gpl` parameter must be supported.

Notes

To check the version of the EPAP or ELAP application, use the `rept-stat-mps` command.

If no application is specified, the approved and trial versions for all GPLs are shown, as well as the release table and removable GPL.

The approved GPL is the GPL that resides on the fixed disk and was made the approved version by specifying the GPL version number while executing the `act-gpl` command.

The trial GPL is the version of the GPL that was downloaded from the removable drive, but not activated by the `act-gpl` command.

When the `act-gpl` command is executed, the version specified in the command becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If a GPL is not found, a version of "-----" is shown. This should happen only for the OAM GPL trial version on the fixed disk and for all GPLs on the plug-in USB flash drive when the drive is not inserted.

If the approved GPL version does not match the GPL version shown in the ACTIVE MASP RELEASE column, an alarm is activated.

A minor alarm is shown, and ALM is displayed for each APPROVED GPL (`rtrv-gpl`) and for each RUNNING GPL (`rept-stat-gpl`) that does not match the GPL in the RELEASE column of the `rtrv-gpl` output. The minor alarm is not activated, but ALM is displayed for each GPL that does not match the GPL in the RELEASE column.

ALM is always displayed when the approved version does not match the release version. You cannot turn off *fixed disk auditing*. The auditing state shown here is for the `rept-stat-gpl` command. You can turn on and off *running version auditing*.

A GPL audit cannot be in progress when this command is entered.

Output

This example lists all possible GPLs that can be shown in the output when no GPL is specified. All of these GPLs will not appear in the output for your system, because all GPLs are not valid in the same system.

`rtrv-gpl`

```
tekelecstp 18-01-18 21:23:11 EST  EAGLE 46.5.1.5.0-73.10.0
  rtrv-gpl

;

This example shows the output for SFAPP cards. Version information is displayed for three removable drives that are inserted, including the removable drive in the latched USB port of the active OAM, the plug-in flash drive in the flush-mounted USB port of the active OAM, and the removable drive in the latched USB port of the standby OAM:

```
rtrv-gpl:gpl=sfapp
```

```
tekelecstp 17-11-22 06:57:22 EST EAGLE 46.5.1.5.0-73.2.0
```

```
rtrv-gpl:gpl=sfapp
```

```
Command entered at terminal #17.
```

;

Command Executed

Legend

- **GPL**—GPL associated with each card in the display
- **APPROVED**—GPL version that is the approved GPL.
- **CARD**—Card location.
- **RELEASE**—Version number of each GPL that is required to be installed and approved for a specific release of software for the system.
- **REMOVE TRIAL**—GPL version that is on the removable drive.
- **TRIAL**—GPL version that is the trial GPL.
- -----—GPL is not present at the specified location.
- **ALM**—Alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.
- **CORRUPTED**—Data audit has determined that the GPL is corrupted.

rtrv-gserv-data

Use this command to display all values in the GSERV table or to display specific translation type, originating point code, or global title address data. These values are used to determine whether a Send Routing Information (SRI) request should receive G-Port SRI Query for Prepaid service or normal G-Port service.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

display (optional)

Use this parameter to display a specified category of entries in the GSERV table.

Range:***all***

Display all entries in the GSERV table.

gta

Display all calling party (CgPA) global title addresses in the GSERV table.

opc

Display all message transfer part (MTP) originating point codes in the GSERV table.

tt

Display all called party (CdPA) translation types in the GSERV table.

gta (optional)

Global title address. Use this parameter to specify a CgPA global title address.

Range:

1 - 21 digits

opc (optional)

ANSI originating point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

opca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code 000-000-000 is not a valid point code.

opc/opca/opci/opcn/opcn24 (optional)

Originating point code. Use these parameters to specify MTP originating point codes.

opci (optional)

ITU international originating point code with subfields *zone-area-id*.

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

opcn (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opc24 (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p

msa—000-255

ssa—000-255

sp—000-255

tt (optional)

Translation type. Use this parameter to specify a CdPA translation type.

Range: 0 - 255

Example

```
rtrv-gserv-data:display=all
```

```
rtrv-gserv-data:tt=26
```

```
rtrv-gserv-data:display=opc
```

Dependencies

The system is busy, or the GSERV table is corrupted.

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

The G-Port feature must be on before this command can be entered.

The `gta`, `opc/opca/opci/opcn/opcn24`, `tt`, or `display` parameter must be specified.

The `display`, `tt`, `opc`, and `gta` parameters cannot be specified together in the command.

Output

```
rtrv-gserv-data:display=all
```

mystp 06-07-27 20:32:46 EST EAGLE 35.2.0

```

rtrv-gsmmap-scrn

Use this command to retrieve the GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) Screening CgPA and CdPA entries and their attributes from the active system database.

Parameters

opname (mandatory)

User-defined name for the operation code. This value references the operation code defined with the `ent-gsms-opcode` command.

Range:

ayyyyyyy

Up to 8 alphanumeric characters

action (optional)

Screening action to take if a message is forbidden as defined by the *forbid* parameter.

Range:

pass

Route the message as normal to the destination.

discard

Discard the MSU.

atierr

Generate an ATI reject message. This option is only valid for ATI MAP operation codes.

route

Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

forward

Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

duplicate

Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

dupdisc

Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.

Default:

Display all screening actions

cdsr (optional)

CdPA Screening Reference.

Range:

ayyy

1 alphabetic character followed by up to 3 optional alphanumeric characters

cgsr (optional)

CgPA Screening Reference.

Range:

ayyy

1 alphabetic character followed by up to 3 optional alphanumeric characters

eaddr (optional)

Ending origination address, in association with npv and naiv for the CGPA address to be screened.

Range:

1–15 hexadecimal digits. Valid digits are 0–9, a-f, A-F

forbid (optional)

Forbidden parameter value. Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the *action* parameter.

Range:**all**

All parameters are forbidden. Take the specified screening action defined by the *action* parameter for messages arriving at the system.

location

Take the specified screening action defined by the *action* parameter for messages arriving at the system that contain *location* as the forbidden parameter value for the entered address/operation code combination. This value is valid only for GSM ATI messages.

none

None of the parameters are forbidden. Route the message to its destination.

state

Take the specified screening action defined by the *action* parameter for messages arriving at the system that contain *state* as the forbidden parameter value for the entered address/operation code combination. This value is valid only for GSM ATI messages.

Default:

Display all forbidden parameter values

mapset (optional)

MAP set ID.

Range:

1 - 36000, *dflt*

dflt —Default MAP set

naiv (optional)

Nature of Address value for the address or range of CgPA and CdPA addresses.

Range:

0 - 127, *

npv (optional)

Numbering Plan value for the address or range of CgPA and CdPA addresses.

Range:

0 - 15, *

ri (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

Range:

gt

ssn

saddr (optional)

Starting origination address in association with npv and naiv for the single entry or range of entries of the CGPA address to be screened.

Range:

1 - 15 digits, *

1–15 hexadecimal digits. Valid digits are 0–9, a-f, A-F

Default:

*

tt (optional)

Translation type. This parameter specifies the value that the CdPA translation type is set to as the result of Enhanced GSM Map Screening.

Range:

0 - 255, *none*

Default:

Display all translation types

Example

The following example retrieves all CgPA entries for the specified OPNAME:

```
rtrv-gsmmap-scrn:opname=e
```

The following example retrieves the specified CgPA range entry for the specified OPNAME:

```
rtrv-gsmmap-  
scrn:opname=ati:saddr=9194620000000000:eaddr=9194630000000000
```

The following example retrieves all CdPA entries for the specified CGSR:

```
rtrv-gsmmap-scrn:opname=xyz:cgsr=fela
```

The following example retrieves the specified CDSR entry for the specified CGSR:

```
rtrv-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=cal4
```

The following examples retrieves the specified RI for the specified OPNAME:

```
rtrv-gsmmap-scrn:opname=e:ri=ssn
```

```
rtrv-gsmmap-scrn:opname=e:mapset=dflt:ri=gt
```

```
rtrv-gsmmap-scrn:opname=rr:cgsr=au:cdsr=aj
```

```
rtrv-gsmmap-scrn:opname=test4:tt=12
```

Dependencies

The GSM Map Screening feature must be enabled before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be enabled before:

- The `cgsr` parameter can be specified.
- The `cdsr` parameter can be specified.
- The `saddr=*` parameter can be specified.
- The `saddr` and `eaddr` parameters can contain hexadecimal digits.

The specified `opname` parameter value must exist in the GSM Map Op-Code table.

If the `eaddr` parameter is specified, its value must contain the same number of digits as the `saddr` parameter value.

If the `eaddr` parameter is specified, its value must be greater than the `saddr` parameter value.

If the `eaddr` parameter is specified, the `saddr` parameter must be specified.

If the `saddr=*` parameter is specified, then the `eaddr` parameter cannot be specified.

If the `saddr` parameter is specified, the `cgsr` and `cdsr` parameters cannot be specified.

The `saddr`, `npv`, and `naiv` parameters must be specified together in the command.

If any of the `saddr/eaddr/npv/naiv` and `cdsr` parameters are specified, then the `forbid` and `action` parameters cannot be specified.

A value of *state* or *location* cannot be specified for the `forbid` parameter unless the operation code referenced by the `opname` parameter is 71. The `forbid` option is only valid for ATI MAP operation codes, and the `opcode=71` parameter signifies an ATI MAP operation code.

The `action=atierr` parameter cannot be specified unless the operation code referenced by the `opname` parameter is 71. The `atierr` option is only valid for ATI MAP operation codes, and the `opcode=71` parameter signifies an ATI MAP operation code.

The GSM Map Op-Code table must be accessible.

The GSM Map Screening table must be accessible.

- If the cdsr parameter is specified, then the cgsr parameter must be specified.
- The specified cgsr parameter value must exist in the database.
- The specified cdsr parameter value must exist in the database.
- The opname parameter must consist of alphanumeric characters.
- The opname parameter must be entered.
- The cgsr and cdsr parameters must each begin with an alphabetic character.
- The cgsr and cdsr parameters must each consist of 1-4 alphanumeric characters.
- The Flexible GTT Load Sharing feature must be enabled before the mapset parameter can be specified.
- The specified MAP set must exist.

Notes

None

Output

GSM MAP Screening single entries and range entries shown in separate sections of the output. All single entries are shown first in a summary report; all range entries follow.

GSM MAP Screening Table (26 of 4000) is 1% full
;

Legend

- **Single Entries/Range Entries**—GSM MAP screening single entries and range entries are output in separate sections of the retrieval report. All single entries are output first during a summary report and then all range entries follow.
- **CgPA**—Calling Party Address entry
- **CdPA**—Called Party Address entry
- **OPNAME**—User-defined MAP operation code name.
- **SADDR**—Start origination address.
- **EADDR**—End origination address. This column is displayed for range entries only.
- **NPV**—Numbering plan value.
- **NAIV**—Nature of address indicator value.
- **FORBID** or **FORBD**—Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the *action* parameter. (Some values are abbreviated; for example, *locat* means *location* .)
- **ACTION** or **ACT**—Screening action, if forbidden. Possible actions are pass, discard (disc), atterr, route, forward, duplicate (dupl), and dupdisc.
- **PC** or **PCA**—ANSI Point Code
- **PCI**—ITU International Point Code
- **PCN**—ITU National Point Code
- **PCN24**—24-bit ITU National Point Code
- **SSN**—Subsystem Number
- **CGSR**—CgPA Screening Reference
- **CDSR**—CdPA Screening Reference
- **MAPSET**—MAP set
- **RI**—Routing Indicator
- **TT**—Translation Type

rtrv-gsms-opcode

Use this command to retrieve the concerned GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening operation codes and the default screening action for the operation code. This command allows the craftsperson to verify a list of all operation codes or a single operation code that the system uses in performing GSM Map Screening.

Parameters

mapset (optional)

MAP set ID.

Range:

1 - 36000, *dflt*

dflt —Default MAP set

opcode (optional)

MAP operation code.

Range:

0 - 255, *

Default:

Display all MAP operation codes

opname (optional)

User-defined name for the operation code. This value is defined with the ent -gsms -opcode command.

Range:

ayyyyyyy

Up to 8 alphanumeric characters

Default:

Display all operation code names

ri (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

Range:*gt**ssn***tt (optional)**

Translation type. The value the CdPA TT is set to as the result of Enhanced GSM Map Screening.

Range:

0 - 255

Default:

Display all translation types

Example`rtrv-gsms-opcode``rtrv-gsms-opcode:opname=ati``rtrv-gsms-opcode:ri=gt``rtrv-gsms-opcode:tt=11`**Dependencies**

The GSM Map Screening feature must be enabled before this command can be entered.

The EGMS feature must be enabled and turned on before:

- The opcode=* parameter can be specified.
- An opname parameter can be specified that refers to an opcode=* parameter.

The GSM Map Op-Code table must be accessible.

The opcode and opname parameters cannot be specified together in the command.

The value of the opcode parameter must be between 0 - 255 or *.

The specified opname parameter must exist in the GSM MAP Op-Code table.

If the opname parameter is specified, then it must be alphanumeric.

The opname parameter must be no more than 8 characters in length.

The Flexible GTT Load Sharing feature must be enabled before the mapset parameter can be specified.

The specified MAP set must exist.

Notes

None

rtrv-gsmssn-scrn

Use this command to retrieve all or single subsystem numbers in the GSM SSN screening table.

Parameters**ssn (optional)**

Subsystem number.

Range:

000 - 255

Default:

Display all

type (optional)

Subsystem type.

Range:***orig***

Origination SSN

dest

Destination SSN

Default:

Display all

Example

```
rtrv-gsmssn-scrn
```

```
rtrv-gsmssn-scrn:ssn=0:type=dest
```

Dependencies

The GSM Map Screening feature must be enabled before this command can be entered.

The SSN Map Screening table is corrupt or cannot be found.

A valid value must be specified for the ssn parameter.

A valid value must be specified for the type parameter.

Notes

If specified, the **ssn/type** parameter combination must exist in the GSM SSN screening table. If the value does not exist, the following message is displayed:

```
SSN ORIG DEST
```

No matching entries with the specified criteria found.

Output

```
rtrv-gsmssn-scrn:ssn=10:type=orig
```

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
010 Yes Yes
GSMMS SSN table is (256 of 512) 50% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
;
```

```
rtrv-gsmssn-scrn
```

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
002 Yes No
010 Yes Yes
GSMMS SSN table is (2 of 512) 1% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
;
```

Legend

- **SSN**—Subsystem number
- **ORIG**—Specifies whether the subsystem type is origination
- **DEST**—Specifies whether the subsystem type is destination

rtrv-gta

Use this command to display a list of the GTA (global title address) information applicable to the specified GTT set. This list can be filtered using a number of parameters. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the selector specified.

This command obtains the routing object (destination address and subsystem number), relative cost, and routing indicator assigned to that object for specified GTAs (global title addresses) or ranges of GTAs with a given GTT set.

Note

If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrvgttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrvgta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. It is not recommended to run ent/dlt/rtrv-tt & ent/chg/dlt/rtrv-gtt commands as it may cause the advance GTA fields of GTT entry to be reset to the default values.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

gttsn (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters

acn (optional)

Application context name. The ITU TCAP *acn* field in the incoming MSU.

Range:

0 - 255, *, none

The *acn* field supports up to 7 subfields separated by a dash (e.g., 1-202-33-104-54-26-007).

*—any valid value in the ITU TCAP *acn* field in the incoming MSU

none —there is no ITU TCAP *acn* field in the incoming MSU

actsn (optional)

GTT Action Set Name.

Range:

aaaaaaaa, none

1 leading alphabetic character and up to 8 following alphanumeric characters

cdssn (optional)

Starting CdPA subsystem number.

Range:

0 - 255

cggtmod (optional)

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

Range:

yes

no

cgpc (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

cgpca

Range:

*0-255, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni =006-255*.

The point code *000-000-000* is not a valid point code.

cgpci (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

cgpcn (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

cgpcn24 (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

cgpcn16 (optional)

16-bit ITU national CgPA point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

cgpcaction (optional)

This parameter is used to provide the required abilities, indicating what any particular translation needs to do with CgPA PC.

Range:

dflt

protocol will be allowed to perform all the required processing/conversion with CGPC.

ignore

CGPC will be left as it was in incoming MSU.

remove

CGPC will be removed from outgoing MSU.

Default:

dflt

cgssn (optional)

Starting CgPA subsystem number.

Range: 0 - 255

defmapvr (optional)

Default MAP version for MBR opcodes. This parameter is used to provide the default MAP version for supported MBR opcodes if the Application Context Name (ACN) is not present in an incoming MAP message.

Range:

v1

v2

v3

dpc (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

dpca

Range:

0-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001–005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006–255*.

When *chg-sid:pctype=ansi* is specified, *ni-*-** is valid if *ni =006–255*.

The point code *000-000-000* is not a valid point code.

dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)

Point Code.

dpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s

zone—0-7

area—000-255

id—0-7

The point code *0-000-0* is not a valid point code.

dpcn (optional)

ITU destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

dpcn24 (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

dpcn16 (optional)

16-bit ITU national destination point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

eaddr (optional)

End Address (Similar to EGTA). This parameter specifies the end of a range of MAP digits (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA).

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default:

Same as the specified SADDR value.

ecdssn (optional)

Ending CdPA subsystem number.

Range:

0 - 255

ecgssn (optional)

Ending CgPA subsystem number.

Range:

0 - 255

egta (optional)

End global title address. The end of a range of global title digits.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default:

The first gta entry for the given GTT selector

family (optional)

The ANSI TCAP *family* field in the incoming MSU.

Range:

0 - 255, *, none

*

any valid value in the ANSI TCAP *family* field in the incoming MSU

none

there is no value in the ANSI TCAP *family* field in the incoming MSU

force (optional)

Display more than 1000 entries.

Range:

yes

no

Default:

no

gta (optional)

Global title address. The beginning of a range of global title digits.

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default:

The first gta entry for the given GTT selector

gtmodid (optional)

Global title modification identifier.

Range:

ayyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

Default:

displays all GT Modification Indicators for the GTA

loopset (optional)

SCCP loopset name. This parameter retrieves translation entries associated with the specified loopset.

Range:

ayyyyyyy, none

1 alphabetic character followed by up to 7 alphanumeric characters.

none —Translation entries with no association to any loopset.

mapset (optional)

MAP set ID. This parameter retrieves GTA information for a specified Mated Application set.

Range:

1 - 36000, dflt

dflt —Default MAP set

Default:

Retrieves GTA information for the default MAP set.

mrnset (optional)

MRN set ID. This parameter retrieves GTA information for a specified Mated Relay Node set.

Range:

1 - 3000, dflt, none

dflt —Default MRN set

none —The GTA translation does not participate in any loadsharing.

num (optional)

Number of entries to display.

Range:

1 - 1000000

Default:

1 —if *gta* is specified

20 —if *gta* is not specified

opc (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym:

opca

Range:

*0-255, **

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001–005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006–255*.

When `chg-sid:pctype=ansi` is specified, *ni-** is valid if *ni* =006–255.
The point code 000-000-000 is not a valid point code.

opci (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range:

s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

opcn (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

opcn24 (optional)

24-bit ITU originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range:

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

opcn16 (optional)

16-bit ITU originating point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

Range:

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

un---000---127

sna---000---15

mna---000---31

opcode (optional)

The TCAP *opcode* field in the incoming MSU.

Range:

*0 - 255, *, none*

***—any valid value in the TCAP *opcode* field in the incoming MSU

none —there is no value in the TCAP *opcode* field in the incoming MSU

opcodetag (optional)

The ITU TCAP *opcodetag* field in the incoming MSU.

Range:

none, local, global, any

none —there is no value in the ITU TCAP *opcodetag* field in the incoming MSU

local —The *opcodetag* is local in the ITU TCAP *opcodetag* field in the incoming MSU

global —The *opcodetag* is global in the ITU TCAP *opcodetag* field in the incoming MSU

any — any valid value in the ITU TCAP *opcodetag* field in the incoming MSU

Default:

any

pc (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

pca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

pci (optional)

ITU international point code in the form of *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s-*, *p-*, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

pcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

pctype (optional)

Point code type. This parameter retrieves a single type of point code among mixed types of point code provisioned for a Translation Type.

Range:*ansi**itui**itun**itun16**itun24**ituis**ituns***Default:**

Display all point code types

pkgtype (optional)

Package type. The ANSI TCAP and ITU TCAP package type.

Range:*ansiuni*

ANSI unidirectional

qwp

Query with Permission

qwop

Query with out Permission

resp

Response

Per Path Measurement required.

Range:***yes******no*****refgttsn (optional)**Referred GTT set name. The GTT Set Name referred in the GT Translation Entry by the *optsn*, *opcsn*, and *cgcnvs* parameters.**Range:***ayyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters

saddr (optional)

Start Address (Similar to GTA). This parameter specifies the beginning of a range of MAP digits (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA).

Range:

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

ssn (optional)

Subsystem number.

Range:

002 - 255

Default:

Display all

testmode (optional)Test mode. This parameter displays all translation entries that have a specified value of the *testmode* parameter.**Range:*****on***

off**Default:***off***xlat (optional)**

Translate indicator. This parameter specifies translation actions and routing actions.

Range:***dpc******dpcngt******dpcssn******none*****Example**

Dependencies

The EGTT feature must be turned on before this command can be entered.

The ANSI/ITU SCCP Conversion feature must be enabled before the `pctype` parameter can be specified.

The `gttsn` parameter must be specified, cannot have a value of *none*, and must match an existing `gttsn`.

The `pc/pca/pci/pcn/pcn24/pcn16`, `cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16`, `opc/opca/opci/opcn/opcn24/opcn16`, and `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameters must have valid values within the range for each subfield.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated point code that is of a different domain than the GTT set specified by the `gttsn` parameter can be specified.

If the `egta/eaddr` parameter is specified, the `gta/saddr` parameter must be specified. The `gta/saddr` and `egta/eaddr` parameters must be the same length, and the value for the `egta/eaddr` parameter must be greater than the value for the `gta/saddr` parameter.

If the specified `num` parameter value is greater than 1000, the `force=yes` parameter must be specified.

The number of digits in the specified `gta/saddr` parameter must be at least the number of digits provisioned for the GTT set specified by the `gttsn` parameter. If the VGTT feature is turned on, then up to 10 GTA/SADDR lengths can exist per GTT set. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA/SADDR lengths can exist per GTT set.

If the Flexible GTT Load Sharing feature is not enabled, then the `mapset` parameter cannot be specified.

If `ansi pkgtype` is specified in `pkgtype` parameter, then `opcodetag` parameter cannot be specified.

E3703 Cmd Rej: OPCODETAG parameter is allowed with ITU TCAP PKGTYPE

At least one entry must be provisioned in the specified MAP set in the MAP table.

If the `ecgssn/ecdssn` parameter is specified, the `cgssn/cdssn` parameter must be specified.

If the `ecgssn/ecdssn` parameter is specified, the `cgssn/cdssn` parameter must be specified, and the `ecgssn/ecdssn` parameter must be greater than the `cgssn/cdssn` parameter.

The OBSR feature must be enabled before the `cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16`, `opc/opca/opci/opcn/opcn24/opcn16`, `cgssn`, or `ecgssn` parameter can be specified.

The range specified by the `cgssn/ecgssn` or the `cdssn/ecdssn` parameters must exist for the specified GTT set.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the `gta/saddr` and `egta/eaddr` parameters.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The value of the `loopset` parameter must already exist in the database.

The `Loopset` table is corrupt or cannot be found.

At least one entry must be provisioned in the `MRN` table for the `MRN` set that is specified by the `mrnset` parameter.

The Flexible GTT Load Sharing feature must be enabled before the `mrnset` parameter can be specified.

The `AMGTT` feature or the `AMGTT CgPA Upgrade` feature must be turned on before the `cggtmod` parameter can be specified.

The `xlat=none` parameter must be specified before the `mapset` and `mrnset` parameters can be specified together in the command.

A `TOBR` quantity feature must be turned on before the `opcode`, `pkgtype`, `acn`, `family`, `saddr`, `eaddr`, or `defmapvr` parameter can be specified.

The `opcode`, `pkgtype`, and `family` parameters must be specified together for ANSI TCAP translations. The `opcode`, `pkgtype`, and `acn` parameters must be specified together for ITU TCAP translations.

The `acn` and `family` parameters cannot be specified together in the command.

If the `family` parameter is specified, then a value of *ansiuni*, *qwp*, *qwop*, *resp*, *cwp*, *cwop*, *ansiabort*, or *any* must be specified for the `pkgtype` parameter.

If the `acn` parameter is specified, then a value of *bgn*, *ituabort*, *ituuni*, *any*, *end*, or *cnt* must be specified for the `pkgtype` parameter.

If the `pkgtype=ituabort` parameter is specified, then a value of *none* must be specified for the `acn`, `opcode` and `opcodetag` parameters.

If the `pkgtype=ansiabort` parameter is specified, then a value of *none* must be specified for the `family` and `opcode` parameters.

E5144 Cmd Rej: PKGTYPE abort requires ACN/FAMILY/OPCODE/OPTAG value none

The `cgpc`, `cgssn`, `gta`, `opc`, `cdssn`, `opcode/acn`, `pkgtype/family/opcodetag`, and `saddr` parameters cannot be specified together in the command.

If the `cgssn` and `cdssn` parameters are both specified in the same command (in any order), then only the value for the last of the two parameters specified is used during processing.

Failure while reading the GTT Action Set table.

The value specified by the `actsn` parameter must already exist in the database.

The FLOBR feature must be turned on before the `dpc`, `cdssn`, or `ecdssn` parameter can be specified.

The specified point code must be a full point code.

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

The GTMOD table is corrupt or cannot be found.

A value of *none* cannot be specified for the `gttsn` and `refgttsn` parameters.

If the `xlat=none` parameter is specified, then the `pc/pca/pci/pcn/pcn24/pcn16`, `force`, `ssn`, and `ccgt` parameters cannot be specified.

The specified GTT set must have a set type of *opcode* (see the `ent-gttset` command) before the `opcode/acn/pkgtype` or `opcode/family/pkgtype/family` parameters can be specified. The specified GTT set must have a set type of *cdssn*, *cgssn*, *cdgta/cgta*, *opc*, or *cgpc* before the `cdssn`, `cgssn`, `gta`, `opc`, or `cgpc` parameter, respectively, can be specified.

If the `cgssn` parameter is specified, then the `ecdssn` parameter cannot be specified. If the `cdssn` parameter is specified, then the `ecgssn` parameter cannot be specified.

If the `opc` or `dpc` parameter is specified, then the `(e)gta`, `(e)cgssn`, `(e)cdssn`, `acn`, `pkgtype`, `family`, and `opcode` parameters cannot be specified.

The specified GTT set must have a set type of *opcode* (see the `ent-gttset` command) before the `defmapvr` parameter can be specified.

The `SADDR` parameter must be specified if the `EADDR` parameter is specified in the command.

Notes

The percentage full and number of cells used report that is provided with the `rtrv-gta` command reflects the total entries in the GTA table without regard to the selector specified.

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If the `rtrv-gta` command is entered with only the `gta` parameter, a match would be an entry containing the same number of digits, or more digits, for the GTT set. For example, if `gta=8005556666` is specified, the six-digit GTT set `800555` would be a match. If the VGTT feature is turned on and the `egta` parameter is specified, all matching entries regardless of length are displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

The point code domain translation types for EGTT are handled by the EAGLE protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

When the Origin-based SCCP Routing feature is enabled, its parameters are displayed. If no data is provisioned for these parameters, they are displayed as dashes.

Output

Note

The Start GTA (gta) and End GTA (egta) fields are sized according to the ndgt parameter value. Because all GTAs for a GTT Set are the same size, this helps the appearance of the display. If all 21 digits are used, an entry will not fit on a single line. If two lines per entry are used, the size of the report would double, being inefficient for large reports. It is not anticipated that more than 15 digits will be used in the immediate future, but displaying GTAs longer than 19 digits will cause the line to wrap around to the next line.

This example retrieves all GTAs for the specified GTT Set:

Legend

- **GTTSN**—GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.
- **NETDOM**—The network domain.
- **NDGT**—The number of digits required for GTAs associated with this set.
- **START GTA**—The start global title address.
- **END GTA**—The end global title address.
- **XLAT**—The translate indicator.
- **RI**—The routing indicator.
- **PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24, ITUN16 PC**—Translated point code.
- **SSN**—The translated subsystem number.
- **CCGT**—The cancel called global title indicator.
- **MRN**—Mated Relay Node
- **MRNSET**—MRN set ID
- **MAPSET**—MAP set ID
- **CGGTMOD**—Calling Party Global Title Modification Indicator
- **ACTSN**—GTT Action Set Name
- **GTMODID**—Global Title Modification Identifier
- **PPMEASREQD**—Per Path Measurement Required
- **OPCODE**—TCAP opcode field
- **OPCODETAG** – ITU TCAP Operation Code Tag field.
- **ACN**—Application context name. ITU TCAP *acn* field.
- **PKGTYPE**—TCAP package type
- **FAMILY**—ANSI TCAP *family* field
- **TESTMODE**—Invokes a Test Tool to debug the FLOBR/TOBR rules
- **DPC**—Destination point code
- **CGPC**—CgPa point code
- **OPC**—Originating point code
- **NPSN**—Not present set name
- **SADDR**—Start of MAP digits (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA)
- **EADDR**—End of MAP digits (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA)
- **DEFMAPVR**—Default MAP version
- **PRIO**—Priority of each translation of the type OPCODE GTTSET
- **TRANSMEASRQD**—Per GTT Translation Measurement Required

rtrv-gtcnv

Use this command to display entries in the Default Global Title Conversion table.

Parameters

dir (optional)

Direction of conversion.

Range:

atoi

ANSI to ITU conversion

itoa

ITU to ANSI conversion

both

Conversion in both directions

gtixlat (optional)

Global title indicator conversion. This parameter is expressed in the form of the ANSI GTI and the ITU GTI.

Range:

22

Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 2 or an incoming ITU GTI 2 to an outgoing ANSI GTI 2

24

Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2

nai (optional)

Nature of address indicator.

Range:

0 - 63, *

np (optional)

Numbering plan.

Range:

0 - 15, *

tta (optional)

ANSI translation type.

Range:

0 - 255, *

tti (optional)

ITU translation type.

Range:
0 - 255, *

Example

rtrv-gtcnv

Dependencies

The ANSI/ITU SCCP Conversion feature must be enabled before the command can be entered.

Notes

None

Output

This example displays output containing decimal global title digits:

rtrv-gtcnv

```
tekelecstp 06-11-07 13:44:12 EST EAGLE 35.3.0

DIR  GTIXLAT  TTA  TTI  NP  NAI  DEL  POS  ADD
atoi  22      10   5   --- ---  10  pfx  123

GTCNV   table is (1 of 1000) 1% full.
;
```

This example shows output containing hexadecimal global title digits:

rtrv-gtcnv

```
tekelecstp 06-11-07 11:52:58 EST EAGLE 35.3.0

DIR  GTIXLAT  TTA  TTI  NP  NAI  DEL  POS  ADD
atoi  22      1   3   --- ---  ---  pfx  abcdef0123456789abcdf
itoa  24      5   6   2   1   ---  sfx  abcdef0123456789abcef

GTCNV   table is (2 of 1000) 1% full.
;
```

Legend

- **DIR**—Direction of the translation: ANSI to ITU or ITU to ANSI
- **GTIXLAT**—GTI translation
- **TTA**—ANSI translation type
- **TTI**—ITU translation type
- **NP**—Numbering plan
- **NAI**—Nature of address indicator

- **DEL**—Deletion status, listing the number of incoming MSUs that will be deleted prior to translation
- **POS**—Prefix or Suffix
- **ADD**—Global title address

rtrv-gtmod

Use this command to display entries from the GTMOD table. A GTMOD entry consists of a GTMOD ID and GTMOD specific data.

Parameters**Note**

Definitions for the feature options specified by the `on` and `off` parameters are located in the Notes section.

cgpassn (optional)

Calling Party Subsystem number. The calling party subsystem address that receives the message.

Range:

002 - 255

gtmodid (optional)

GT Modification Identifier.

Range:

ayyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

ngti (optional)

New Global Title Indicator. This parameter specifies whether a new GTI translation format is type 2 or type 4.

Range:

2

4

none

nnai (optional)

New nature of address indicator. The value used to replace the received NNAI.

Range:*0 - 127, none***nnp (optional)**

New numbering plan. The value used to replace the received numbering plan.

Range:*0 - 15, none***npdd (optional)**

Number of prefix digits to be deleted. The number of digits to be deleted from the prefix of the received GT address.

Range:*1 - 21, none***npds (optional)**

New prefix digits string. The digits to be prefixed to the received GT address.

Range:*1 - 21 digits, none*

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9 .

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F .

Default:*Display all***nsdd (optional)**

Number of suffix digits to be deleted. The number of digits to be deleted from the suffix of the received GT address.

Range:*1 - 21, none***nsds (optional)**

New suffix digits string. The digits to be suffixed to the received GT address.

Range:*1-21 digits, none*

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9 .

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F .

ntt (optional)

New Translation Type. The value that is used to replace the received Translation Type.

Range:*0 - 255, none***off (optional)**

Disables or turns off the specified feature options. A comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range:*gt0fill***on (optional)**

Enables or turns on the specified feature options. A comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range:*gt0fill**refcnt***precd (optional)**

Precedence. This parameter specifies whether the prefix or suffix takes precedence when modifying the received GT address

Range:*pfx**sfx***Example**

```
rtrv-gtmod:gtmodid=id2
```

```
rtrv-gtmod:npdd=5:on=refcnt
```

```
rtrv-gtmod:nsdd=10:precd=sfx:nnai=2:nnp=5
```

```
rtrv-gtmod:ngti=4:on=gt0fill:cgpasn=12
```

Dependencies

The GTMOD table is corrupt or cannot be found.

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the npds and nsds parameters.

The `gtmodid=none` parameter cannot be specified.

If the `gtmodid` parameter is specified, then the `on=refcnt` parameter is the only other parameter that can be specified.

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

The same value cannot be specified for the `on` and `off` parameters.

Notes**on/off options**

- *gt0fill* —GT zero fill. Specifies whether the last 0 of the GTA is a treated as a valid digit (OFF) or as filler (ON) during GT Modification for the `gti(x)=2` to `gti(x)=4` scenario.
- *refcnt* —Reference count. Specifies the number of entries in the GTT Table that references the GTMOD entry. This option is ON only.

Output

rtrv-gtmod

rtrv-gtt

Use this command to show one or more entries from the GTT Data and the Translation Type tables. The report contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the *type* parameter specified.

Note

If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrvgttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrvgta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. It is not recommended to run ent/dlt/rtrv-tt & ent/chg/dlt/rtrv-gtt commands as it may cause the advance GTA fields of GTT entry to be reset to the default values.

Parameters

Note

See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

cggtmod (optional)

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

Range:

yes

no

egta (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range:

1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default:

If the gta parameter is specified, the egt a parameter default value is the specified gta parameter value.

force (optional)

This parameter allows the user to display more than 1000 entries. This parameter is used to prevent inadvertent displays of extremely large amounts of information, which could take many hours.

Range:

yes

no

Default:

no

gta (optional)

Global title start address. The beginning of a range of global title digits.

Range:

1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default:

The first GTT entry for the given translation type.

gtmodid (optional)

Global Title Modification Identifier.

Range:

ayyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

loopset (optional)

SCCP loopset name. This parameter retrieves translation entries that are associated with the specified loopset.

Range:

ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters.

none —Translation entries with no association to any loopset.

mapset (optional)

MAP set ID.

Range:*1 - 36000, dflt**dflt* —Default MAP set**mrnset (optional)**

MRN set ID. This parameter retrieves GTT information for a specified Mated Relay Node set.

Range:*1 - 3000, dflt, none**dflt* —Default MRN set*none* —The GTA translation does not participate in any loadsharing.**num (optional)**

The number of entries to be shown.

Range:*1 - 1000000**1-1000* —if *force=yes* is not specified*1-1000000* —if *force=yes* is specified**Default:***1* —if *gta* is specified*20* —if *gta* is not specified**pc (optional)**ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).**Synonym:***pca***Range:***p-, 000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.The point code *000-000-000* is not a valid point code.**Default:**

Display all

pc/pca/pci/pcn/pcn24 (optional)

Point code.

pci (optional)ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).**Range:***s-, p-, ps-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*
zone—0-7
area—000-255
id—0-7

The point code 0-000-0 is not a valid point code.

Default:

Display all

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p*-, *ps*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*
nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default:

Display all

pcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*
msa—000-255
ssa—000-255
sp—000-255

Default:

Display all

pctype (optional)

Point code type. This parameter retrieves a single type of point code among mixed types of point code provisioned for a Translation Type.

Range:

ansi

itui

itun

itun24

ituis

ituns

Default:

Display all

ssn (optional)

Subsystem number. The subsystem address that is to receive the message.

Range:

002 - 255

Default:

Display all

ttn (optional)

Translation name.

Range:

ayyyyyyyy

1 alphabetic character followed by up to 8 alphanumeric characters

Default:

None given

type/typea/typei/typen/typen24/typeis/typens (optional)

Translation type identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The type and typea parameters specify an ANSI network.

The typei parameter specifies an ITU-international network.

The typen parameter specifies an ITU-national network.

The typen24 parameter specifies a 24-bit ITU-national network.

The typeis parameter specifies an ITU-international spare network.

The typens parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (type or typea) and as an ITU type (typei/typen/typen24/typeis/typens). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range:

0 - 255

Default:

None given

Example

```
rtrv-gtt:type=5:ttn=lidb1:gta=919555
```

```
rtrv-gtt:type=5:gta=919555
```

```
rtrv-gtt:type=5:gta=919555:num=2500:force=yes
```

```
rtrv-gtt:typen24=0
```

```

rtrv-gtt:typei=7:pctype=ansi
rtrv-gtt:typen=106:pctype=itui

rtrv-gtt:type=9:pctype=itun24
rtrv-gtt:typei=4:pci=s-1-24-1
rtrv-gtt:typen=3:pcn=s-124
rtrv-gtt:ttn=tbla
rtrv-gtt:ttn=tbla:mapset=1
rtrv-gtt:type=4:cggmod=yes
rtrv-gtt:ttn=ituset:gtmodid=set1
rtrv-gtt:typens=5:gta=123456
rtrv-gtt:typeis=5:gta=123456

```

Dependencies

The ANSI/ITU SCCP Conversion feature must be enabled before the pctype parameter can be specified.

If the pcn parameter is specified, its format must match the format that was assigned with the chg-stpopts:npcfmti parameter.

The first character of the translation name must be a letter.

The value of the tt parameter must exist in the Translation Type table.

The value specified for the tt parameter must correspond to a value of the type/typea/typei/typen/typen24/typeis/typens parameter (see the ent/chg-gtt command).

If the value of the num parameter exceeds 1000, then the force=yes parameter must be specified.

The type or ttn parameter must be specified.

The value of the pc/pca/pci/pcn/pcn24 parameter must be a full point code.

If the egta parameter is specified, the gta parameter must be specified.

If the system is defined as an ANSI system, the pc/pca parameter must be specified as a valid ANSI point code.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated point code and a translation type in different network types can be specified.

The number of digits in the specified gta parameter must be at least the number of digits provisioned for the given translation type. If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per translation type. When the ent-gtt command is entered to create entries, the software keeps track of the lengths and allows only ten different lengths.

The value of the tt parameter must not be defined as an alias.

The Flexible GTT Load Sharing feature must be enabled before the mapset parameter can be specified.

The specified MAP set must exist in the database.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the `gta` and `egta` parameters.

The value of the `num` parameter must not exceed the maximum table size.

The length of the `egta` parameter must equal the length of the `gta` parameter.

The value of the `egta` parameter must be greater than the value of the `gta` parameter.

If the `tt` parameter is not specified, then the value of the `ttn` parameter must match the value of a `tt` parameter in the STP database.

The value of the `gta` parameter must exist.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The value of the `loopset` parameter must already exist in the database.

The Loopset table is corrupt or cannot be found.

The Flexible GTT Load Sharing feature must be enabled before the `mrnset` parameter can be specified.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the `mrnset` parameter.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cggmod` parameter can be specified.

The `mapset` and `mrnset` parameters cannot be specified together in the command.

The GTT set associated with the translation type specified by the `ttn` parameter must have a set type of `cdgta` (see the `ent-gttset` command).

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

The GTMOD table is corrupt or cannot be found.

The `ttn=none` parameter cannot be specified.

The network domain of the translation type specified by the `ttn` parameter cannot be CROSS (see the `ent-gttset` command).

Notes

If the `rtrv-gtt` command is entered with only the `gta` parameter, a match would be an entry containing the same number of digits, or more digits, for the translation type. For example, if `gta=8005556666` is specified, the six-digit translation type `800555` would be a match. If the VGTT feature is turned on and the `egta` parameter is specified, all matching entries regardless of length are displayed.

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If you do not know either the translation type or the translation type name, use the `rtrv-tt` command to obtain type and name.

Due to the size of these tables (up to 270,000 possible entries), a limit (65,535) is placed on the number of entries that can be printed at one time.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

The number of entries to be shown (the num parameter) can be specified for any valid combination of parameters.

If the gta parameter is not specified, then the first entry in the global title translation table that corresponds to the translation type is the first entry shown.

If the num and gta parameters are not specified, then up to 20 entries are shown.

If the gta parameter is specified, but the num parameter is not specified, then only one entry is shown.

If the num parameter is specified, then the number of entries shown is the lesser of the number of entries in the table from the defined starting point to the end, or the value of the num parameter.

If the gta and egta parameters are specified, then the entry that matches the gta parameter, or is the nearest entry below the gta parameter, is the first entry shown for the specified range.

The rtrv-gtt command can retrieve only CdGTA entries that were provisioned through GTA commands when the OBSR or FLOBR feature is turned on.

Output

rtrv-gtt:type=10:num=65535:force=yes

rtrv-gttact

Use this command to display entries from the Global Title Translations (GTT) Action table.

Parameters**Note**

Definitions for the feature options specified by the `on` and `off` parameters are located in the Notes section.

act (optional)

Action. The action applied to the message.

Range:***disc***

discard message with no return error

dup

route a copy of the message to a specified duplicate node

fwd

route the original message to a specified forward node instead of the destination indicated by the GTT/ DB data

scpval

perform the SCCP MAP validation on MO/MT-FSM messages

sflog

send a copy of the original message to the SFLOG card

sfthrot

discard message if threshold exceeded

srvc

apply service (GPORT/GFLEX/SMSMR) on the message.

tcaperr

discard message that has a specified TCAP error

udts

discard message and send udts/xudts

sfapp

route message to SFAPP card

actid (optional)

GTT Action Id.

Range:

ayyyyyyy

1 leading alphabetic followed by up to 8 alphanumeric characters

atcaperr (optional)

ANSI TCAP Error Cause. The reason for discarding the message containing the ANSI TCAP portion that is associated with the TCAPERR GTT Action.

Range:

0 - 255

atirescgmodid (optional)

Calling party global title modification identifier for ATI. The GTMOD ID to be associated with the calling party of a SFAPP GTT Action entry.

Range:

ayyyyyyy

1 leading alphabetic character followed by up to 8 alphanumeric characters

Default:

None

cdgtmodid (optional)

Called party global title modification identifier.

Range:

aaaaaaaa

1 leading alphabetic character followed by up to 8 alphanumeric characters

cggmodid (optional)

Calling party global title modification identifier.

Range:

aaaaaaaa

1 leading alphabetic character followed by up to 8 alphanumeric characters

cgpc (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym:

cgpca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code 000-000-000 is not a valid point code.

cgpci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

cgpcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*s*-, *p*-, *ps*

nnnnn—0-16383

gc—*aa-zz*

m1-m2-m3-m4—0-14 for each member; values must sum to 14

cgpcn24 (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—*p*

msa—000-255

ssa—000-255

sp—000-255

cgpcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:

p--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix---*p*

un---000---127

sna---000---15

mna---000---31

cgpcogmsg (optional)

The data that is used as the Calling Party Point Code in the outgoing message.

Range:

cgpcicmsg

CgPA PC data from the incoming MSU

dflt

Default. The standard Global Title Translation process provides the CgPA PC.

opcicmsg

OPC data from the incoming MSU

provcgpc

provisioned CGPC/CGPCA/CGPCI/CGPCN/CGPCN24 data in the GTT Action

remove

CGPC will be removed from the outgoing MSU

defactid (optional)

Default Action ID. The Action ID associated with the Forward/SCPVAL/SFTHROT action.

Range:***disc***

GTT Action ID of type *disc*

udts

GTT Action ID of type *udts*

tcaperr

GTT Action ID of type *tcaperr*

fallback

The MSU is routed using routing data in the incoming MSU when action is *fwd*. When action is set to *scpval/sfthrot*, the MSU is discarded.

failactid (optional)

Fail Action ID. The default action that is performed to route the message when the VLR Validation fails on Stateful App.

Range:

ayyyyyyy

1 leading alphabetic character followed by 8 alphanumeric characters

The failactid parameter can take one of the following values:

- GTT Action ID with a GTT Action of *disc*, *udts* or *tcaperr* (see the act parameter). This value must already be defined in the GTT Action table.
- *fallback* -The MSU is discarded.

Default:

fallback

fwdgtt (optional)

Forward GTT. The forward GTT Action ID that is to be used to route the MSU.

Range:

ayyyyyyy

hlraddr (optional)

It is used to address the HLR for the ATI message.

Range:

USECDPA --- Use the CDPA GTA from the query message

TCAPPARM --- GTT translation shall be performed on MAP Parameter. MAP parameter will be used in SCCP CDPA for GTT translation

FWDACT --- Route the message to a specified forward node indicated in FWD GTT Action ID

Default:

USECDPA

itcaperr (optional)

ITU TCAP Error Cause. The reason for discarding the message containing the ITU TCAP portion that is associated with the TCAPERR GTT Action.

Range:

0 - 255

loopset (optional)

SCCP loopset name. This parameter retrieves action entries that are associated with the specified loopset.

Range:

ayyyyyyy

One alphabetic character followed by up to 7 alphanumeric characters.

none —Action entries with no association to any loopset.

mapset (optional)

MAP Set ID. The Mated Application Set ID.

Range:

1 - 36000, *dflt*

dflt —Default MAP set

mrnset (optional)

MRN Set ID. The Mated Relay Node Set ID.

Range:

1 - 3000, *dflt*

dflt

Default MRN Set ID

none

The GTT Action table entry with no association to any mrnset.

off (optional)

Disables or turns off the specified feature options. A comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range:

uimreqd

useicmsg

handlresp

on (optional)

Enables or turns on the specified feature options. A comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range:

refcnt

uimreqd

useicmsg

handlresp

pc (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The value "none" indicates that the Origin Point Code (OPC) field in the message will be used in place of CGPC.

Synonym:

pca

Range:

p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code 000-000-000 is not a valid point code.

pci (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range:

s-, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

pcn (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range:

s-, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

pcn16 (optional)

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

Range:*p--*, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p**un---*000---127*sna---*000---15*mna---*000---31**pcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range:*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p**msa---*000-255*ssa---*000-255*sp---*000-255**psirescgmodid (optional)**

Calling party global title modification identifier for PSI. The GTMOD ID to be associated with the calling party of a SFAPP GTT Action entry.

Range:

a-z0-9

1 leading alphabetic character followed by up to 8 alphanumeric characters

Default:

None

ri (optional)

Routing indicator.

Range:*gt**ssn***sna i (optional)**

The service nature of address indicator.

Range:*ccr ndn*

Country code, routing number, and national directory number

intl

International number

Natl

National significant number

rnidn

Routing number prefix and international dialed/directory number

rnndn

Routing number prefix and national dialed/directory number

rnsdn

Routing number prefix and subscriber dialed/directory number

Sub

Subscriber number

snp (optional)

The service numbering plan.

Range:**e164**

E.164 numbering plan

e212

E.212 numbering plan

e214

E.214 numbering plan

sprm (optional)

SCCP Parameter. This parameter is used to decide whether the SCCP GTA, NP, and NAI (if GTI=4 and NP/NAI are present) will be picked up from CDPA or CGPA for comparison.

Range:**CDPA**

SCCP CDPA GTA, NP, and NAI (if GTI=4 and NP/NAI are present) will be used for comparison

CGPA

SCCP CGPA GTA, NP, and NAI (if GTI=4 and NP/NAI are present) will be used for comparison

srvcerr (optional)

The action to be taken when the Service triggered by the GTT Action Service fails. The MSU can be processed by either applying the results of the pre-Service GTT, or continuing with the specific Service error processing.

Range:**SRVC**

Continue with specific service error

GTT

Apply the result of pre-GTT service

Default:

SRVC

srvcname (optional)

Service to be applied on the MSU when act is set to srvc.

Range:

GFLEX, GPORT, SMSMR

ssn (optional)

Subsystem number.

Range:

2 - 255, none

tprm (optional)

TCAP Parameter. This parameter is used to decide whether the MAP digits, NP, and NON (if NP and NON are present) will be picked up from SMRPDA or SMRPOA for comparison.

Range:***SMRPDA***

MAP digits, NP, and NON (if NP and NON are present) from SMRPDA will be used for comparison

SMRPOA

MAP digits, NP, and NON (if NP and NON are present) from SMRPOA will be used for comparison

udtserr (optional)

UDTS error cause. This parameter specifies the reason for discarding the message that is associated with UDTS GTT Action.

Range:

0 - 255

valtype (optional)

Validation Type. This parameter is used to decide whether SCCP/TCAP parameter should be used for the validation of the MSU or IR21.xml file data should be used for the validation of the MSU. This parameter can only be set for act=scpval.

Range:

sccptotcap

ir21totcap

```

Dependencies

The GTT Action table is corrupt or cannot be found.

The specified GTT Action entry must already exist in the database.

If the Flexible GTT Load Sharing feature is not enabled, then the mapset parameter cannot be specified.

The value specified for the pc/pca/pci/pcn/pcn24/pcn16 and cgpc/cgpcac/cgpci/cgpcn/cgpcn24/cgpcn16 parameters must be a full point code and must have a valid value within the range for each subfield.

The Flexible GTT Load Sharing feature must be enabled before the mrnset parameter can be specified.

The mapset and mrnset parameters cannot be specified together in the command.

A value of *none* or *fallback* cannot be specified for the actid parameter.

A value of *disc*, *udts*, *tcaperr*, *scpval*, or *sfapp* must be specified for the act parameter before a value of *uimreqd* can be specified for the on or off parameter.

A value of *dup* or *fwd* must be specified for the act parameter before the pc, ssn, ri, mrnset, mapset, loopset, cgpc, cgpcogmsg, cggmodid or cdgtmodid parameters can be specified.

A value of *dup*, *fwd*, *scpval*, or *sfthrot* must be specified for the act parameter before a value of useicmsg can be specified for the on or off parameter.

The act=fwd/scpval/sfthrot parameter must be specified before the defactid parameter can be specified.

The pc, ssn, ri, mrnset, mapset, loopset, cgpc, cgpcogmsg, defactid, tprm, and sprm parameters cannot be specified in the same command as the atcaperr, itcaperr, or udtterr parameters.

Values of *useicmsg* and *uimreqd* cannot be specified for the on or off parameters in the same command.

If the actid parameter is specified, then the ri, pc, ssn, mrnset, mapset, loopset, on, off, atcaperr, itcaperr, udtterr, act, cgpc, cgpcogmsg, defactid, cggmodid, cdgtmodid, snp snai, srvcerr, srvcname, sprm, and tprm parameters cannot be specified.

The act=tcaperr parameter must be specified before the atcaperr or itcaperr parameter can be specified.

The act=udts parameter must be specified before the udtterr parameter can be specified.

The `udtserr` and `svcerr` parameters cannot be specified in the same command.

The `atcaperr` and `itcaperr` parameters cannot be specified in the same command.

The `pc`, `ri`, `ssn`, `mrnset`, `mapset`, `loopset`, `cdgtmodid`, `defactid`, `cgpc`, `cgpcogmsg`, and `cggtmodid` parameters cannot be specified in the same command with the `atcaperr`, `itcaperr`, and `udtserr` parameters.

The `srvcname`, `snp`, `snai` and `svcerr` parameters can only be specified when `act` is set to `svvc`.

The `sprm` and `tprm` parameters can be specified only when `act` is set to `scpval`.

The `scfaddr`, `hlraddr`, `tt`, `failactid` and `fwdgtt` parameters can only be specified if action type is `sfapp`.

The point code specified for the `pc/pci/pcn/pcn24/pcn16` and `cgpc/cgpci/cgpcn/cgpcn24/cgpcn16` parameters must be a full point code.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The value specified for the `loopset` parameter must already exist in the database.

The `Loopset` table is corrupt or cannot be found.

The value specified for the `cdgtmodid` or `cggtmodid` parameter must already exist in the `GTMOD` table.

The `GTMOD` table is corrupt or cannot be found.

The `defactid=none` or `failactid=none` parameter cannot be specified.

The value specified for the `pc/pca/pci/pcn/pcn24/pcn16` and `cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16` parameters must have the same domain.

The same value cannot be specified for the `on` and `off` parameters.

The specified `MAP` set must already exist in the `MAP` table.

The specified `MRN` set must already exist in the `MRN` table.

A value of `fwd`, `dup`, or `scpval` must be specified for the `act` parameter before a value of `useicmsg` can be specified for the `on` or `off` parameter.

The value specified for the `atirescgmodid` and `psirescgmodid` parameters must already exist in the `GTMOD` table.

Notes

on/off options

- *uimreqd* —UIM required. Specifies whether a UIM should be generated.
- *useicmsg* —Use Incoming Message. Specifies whether to apply GTT Action data to the message as the message was received (OFF) or after any EPAP or GTT translation/modification data has been applied (ON).
- *handlresp* —Specifies whether the ATI/PSI response will be sent to the SFAPP card or not.

rtrv-gttapath

Use this command to retrieve a GTT Action path entry. A GTT Action path consists of pairs of "setname + value" for Opcode/CgGTA/CdGTA. Each "setname + value" pair must already be defined in the GTT translation table.

Parameters

acn (optional)

Application context name. The ITU TCAP *acn* field in the incoming MSU.

Range:

0 - 255, *none*

none—there is no ITU TCAP *acn* field in the incoming MSU

cdgta (optional)

Called Party Global Title Address.

Range:

1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, *a-f*, *A-F*.

cdgttsn (optional)

GTT set name (CDPA type).

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters

cggta (optional)

Calling Party Global Title Address.

Range:

1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, *a-f*, *A-F*.

cgttsn (optional)

GTT set name (CGPA type).

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters.

family (optional)

The ANSI TCAP *family* field in the incoming MSU.

Range:

0 - 255, *, *none*

none —there is no value in the ANSI TCAP *family* field in the incoming MSU

gttpn (optional)

GTT Path name.

Range:

ayyyy

1 leading alphabetic character and up to 4 following alphanumeric characters.

opcode (optional)

The TCAP *opcode* field in the incoming MSU.

Range:

0 - 255, *, *none*

none —there is no value in the TCAP *opcode* field in the incoming MSU

opgttsn (optional)

GTT set name (Opcode type).

Range:

ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

pkgtype (optional)

The ANSI and ITU TCAP package type.

Range:

ituuni

ITU unidirectional

qwp

Query with Permission

qwop

Query without Permission

resp

Response

cwp

Conversation with Permission

cwop

Conversation without Permission

any

Wildcard value

bgn

Begin

end

End

cnt

Continue

ituabort

ITU abort

ansiabort

ANSI abort

ansiuni

ANSI unidirectional

ANSI TCAP Package Types—*ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any*
 ITU TCAP Package Types—*bgn, ituabort, ituuni, any, end, cnt*

Example

```
rtrv-
gttapath:opgttsn=opsn2:pkgtype=ansiuni:opcode=124:family=2:cgttsn=cgs
n3: cgtta=987654:cdgttsn=cdsn1:cdgta=123456

rtrv-gttapath:opgttsn=opsn2:pkgtype=ansiuni:opcode=124:family=2

rtrv-gttapath
```

Dependencies

The *acn* and *family* parameters cannot be specified together in the command.

The GTA table is corrupt or cannot be found.

The GTT DBMM table is corrupt or cannot be found.

The GTT Action - DISCARD, GTT Action - FORWARD, or GTT Action - DUPLICATE feature must be enabled before this command can be entered.

The GTT Set table must be accessible.

A value of *none* cannot be specified for the *opgttsn*, *cgttsn*, and *cdgttsn* parameter(s).

The *opcode*, *pkgtype*, and *family* parameters must be specified together for ANSI TCAP translations. The *opcode*, *pkgtype*, and *acn* parameters must be specified together for ITU TCAP translations.

If the *family* parameter is specified, then a value of *ansiuni*, *qwp*, *qwop*, *resp*, *cwp*, *cwop*, *ansiabort*, or *any* must be specified for the *pkgtype* parameter.

If the *acn* parameter is specified, then a value of *bgn*, *ituabort*, *ituuni*, *any*, *end*, or *cnt* must be specified for the *pkgtype* parameter.

If the *pkgtype=ituabort*, then a value of *none* must be specified for the *acn* and *opcode* parameters.

If the *pkgtype=ansiabort* is specified then a value of *none* must be specified for the *family* and *opcode* parameters.

If the *family* and *opcode* parameters are specified in the command, then either both parameters must have a value of *none* or neither parameter can have a value of *none*.

The GTT Action Path table is corrupt or cannot be found.

At least one GTT set-value combination must be specified.

The value specified for the *gttpn* parameter must already exist in the database.

Both Path name and set-value combination(s) cannot be specified together.

The value specified for the gttpn parameter cannot be a reserved word.

rtrv-gttaset

Use this command to display entries from the Global Title Translations (GTT) Action Set table.

Parameters

Note

Definitions for the feature options specified by the on and off parameters are located in the Notes section.

actid1 (optional)

GTT Action ID 1. This parameter specifies the first action ID associated with the GTT action set.

Range:

ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid2 (optional)

GTT Action ID 2. This parameter specifies the second action ID associated with the GTT action set.

Range:

ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

actid3 (optional)

GTT Action ID 3. This parameter specifies the third action ID associated with the GTT action set.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters

actid4 (optional)

GTT Action ID 4. This parameter specifies the fourth action ID associated with the GTT action set.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters

actid5 (optional)

GTT Action ID 5. This parameter specifies the fifth action ID associated with the GTT action set.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters

actid6 (optional)

GTT Action ID 6. This parameter specifies the sixth action ID associated with the GTT action set.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters

actsn (optional)

GTT Action Set Name.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters

off (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range:*testmode***on (optional)**

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range:*testmode**refcnt***Example**

```
rtrv-gttaset:actid1=disc1
```

```
rtrv-gttaset:actsn=asetdisc1:on=refcnt
rtrv-gttaset:on=testmode
```

Dependencies

- The GTT Action Set table is corrupt or cannot be found.
- The specified GTT Action Set must already exist in the database.
- The actsn=none parameter cannot be specified.
- If the actsn parameter is specified, then the on=refcnt parameter is the only other parameter that can be specified.
- A value of *fallback* or *none* cannot be specified for the actid1/actid2/actid3/actid4/actid5/actid6 parameters.
- The EGTT feature must be on before this command can be entered.
- The action ID specified by the actid1/actid2/actid3/actid4/actid5/actid6 parameter(s) must already exist in the GTT Action table.
- The actid1/actid2/actid3/actid4/actid5/actid6 parameters must each specify a unique GTT Action ID in the command.
- Only one Action ID with an action of *disc*, *udts*, *tcaperr* or *svrc* can be specified.
- If an Action ID with an act of *fwd* is specified, then no other Action ID in the Action Set with an act of *disc*, *udts*, *tcaperr*, *fwd* or *svrc* can be specified.
- If an Action ID associated with an action of *svrc* is specified, then no other Action ID in the same Action Set can be associated with an act of *fwd*, *disc*, *udts*, *tcaperr*, or *svrc*.
- If 5 Action IDs with an act of *dup* are specified then the remaining Action ID with an act of *dup* cannot be specified.
- The same value cannot be specified for the on and off parameters.

Notes

When only the actidX (where X=1, 2, 3, 4, 5, 6) parameter is specified, and its value matches any action set, then all such matches will be displayed.

on/off options

- testmode* —Invokes a field-safe Test Tool in order to debug the GTT Action Set rules.
- refcnt* —Reference Count. Displays the number of GTTs that reference the GTT Action Set. This feature option is ON only.

Output

```
rtrv-gttaset
```

rtrv-gttset

Use this command to display a list of administered global title selector combinations required for a global title entry. The list can be filtered by using various parameter combinations.

Note

If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrvgttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrvgta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. It is not recommended to run ent/dlt/rtrv-tt & ent/chg/dlt/rtrv-gtt commands as it may cause the advance GTA fields of GTT entry to be reset to the default values.

Parameters**Note**

The nature of address indicator parameters (naiv or nai) can be specified using a mnemonic or an explicit value. Either value can be specified: however, both values cannot be specified at the same time for the same parameter. [Table 58: NAIV/NAI Mapping](#) shows the mapping between the naiv and the nai parameter values.

Note

The numbering plan parameters (npv or np) can be specified using a mnemonic or an explicit value. Either value can be specified: however, both values cannot be specified at the same time for the same parameter. [Table 59: NPV/NP Mapping](#) shows the mapping between the npv and np parameter values.

cdgtasn (optional)

CdPA GTA GTT set name.

Range:

ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

cdgttsn (optional)

CdPA GTT set.

Range:

ayyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

cggtasn (optional)

CgPA GTA GTT set name.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters.

cggttsn (optional)

CgPA GTT set.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters.

cgpcsn (optional)

CgPA PC GTT set name.

Range:

aaaaaaaa

1 leading alphabetic character and up to 8 following alphanumeric characters.

cgssn (optional)

CgPA subsystem number.

Range:

0 - 255

eaglegen (optional)

This parameter specifies whether the selector is used by EAGLE generated messages.

Range:

yes

The selector is used by EAGLE generated messages

gti/gtia/gtii/gtin/gtin24/gtiis/gtins/gtin16 (optional)

Global title indicator.

For all EGTT selector commands, the domain is defined as GTI and GTIA (ANSI), GTII (ITU international), GTIN (ITU national), GTIN24 (24-bit ITU national), GTIIS (ITU international spare), and GTINS (ITU national spare) and GTIN16 (16-bit ITU National).

For the selector commands, GTI and GTIA are equivalent. GTT selectors can be provisioned for the same translation type (TT) with different ITU domains. For example, if an entry with `gtii=2` and `tt=4` already exists, an entry with `gtin=2` and `tt=4` can be specified.

Range:

0, 2, 4

Supported value for ANSI: `gti=0, 2` and `gtia=0, 2`

Supported values for ITU: `gtii/gtin/gtin24/gtiis/gtins/gtin16=0, 2, 4`

Default:

display all `gti(x)` parameter values

gttsn (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters.

Default:

Display all

lsn (optional)

Linkset name.

Range:

aaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters

msgtype (optional)

SCCP message type.

Allow one or more SCCP message types (UDT/UDTS/XUDT/XUDTS) for every GTT Selector entry. This will help in screening different message types differently.

Range:*sub**u**us**x**xs**all***Default***all***nai (optional)**

Nature of Address indicator.

Range:*sub**rsvd**natl**intl**dflt***Default:**

Display all

naiv (optional)

Nature of Address indicator value.

Range:

0 - 127

Default:

Display all

np (optional)

Numbering Plan.

Range:*e164**generic**x121**f69**e210**e212**e214**private**dflt***Default:**

Display all

npv (optional)

Numbering Plan value.

Range:*0 - 15***Default:**

Display all

ovr lapd (optional)

Overlapped GTT Selectors.

Range:*yes***Default:***no***selid (optional)**

Selector ID.

Range:*0 - 65534, none***tt (optional)**

Translation type.

Range:*0 - 255*

Default:

Display all

Example

```
rtrv-gtttsel
rtrv-gtttsel:gtii=2
rtrv-gtttsel:tt=0:np=e164
rtrv-gtttsel:gti=2:tt=10
rtrv-gtttsel:gttsn=setint000

rtrv-
gttsel:gtia=2:tt=21:cggttsn=setcgpc:cdgttsn=setcdgta:cgssn=20:selid=1:
lsn=ls10

rtrv-gtttsel:gtia=2:tt=2:lsn=ls1010
rtrv-gtttsel:gtia=2:eaglegen=yes
rtrv-gtttsel:cdgttsn=setdpc
rtrv-gtttsel:ovrlapd=yes
rtrv-gtttsel:gtin16=2
rtrv-gtttsel:msgtype=u
rtrv-gtttsel:msgtype=u,us
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

Only entries that exactly match all specified parameters will be displayed. If no match is found, the following message is displayed in the Scroll Area of the terminal: "No GTT Selectors matching the specified criteria were found."

The np and npv parameters cannot be specified together in the same command.

The nai and naiv parameters cannot be specified together in the same command.

The gti/gtia=4, gti(x)=1, and gti(x)=3 parameters cannot be specified.

If the gti/gtia/gtii/gtin/gtin24/gtiis/gtins/gtin16=2 parameter is specified, then the np/npv and nai/naiv parameters cannot be specified.

If a full GTT selector key is specified by the gti(x), tt, np/npv, nai/naiv, cgssn, selid, and lsn parameters, then the GTT set specified by the cgpcsn, cggtasn, or cggttsn parameters cannot be specified.

The OBSR feature must be enabled before the cggtasn, cgpcsn, cgssn, or cdgtasn parameters can be specified.

The GTT set specified by the cggtasn or cgpcsn parameter must exist in the database before it is assigned to a GTT selector.

The set type of the cggtasn or cgpcsn parameter must match the set type of the corresponding entry in the GTT set table. For example, the cggtasn parameter should be have a set type of *cggt*, and the cgpcsn parameter should have a set type of *cgpc*.

The SSNSELID table must be accessible.

The FLOBR feature must be turned on before the `lsn`, `eaglegen`, `cdgttsn`, or `cggttsn` parameter can be specified.

If the `eaglegen=yes` parameter is specified, then the `msgtype`, `lsn`, `selid`, `gttsn`, `cdgtasn`, `cgssn`, `cggttsn`, `cggtasn`, and `cgpcsn` parameters cannot be specified.

The value specified for the `cdgtasn` or `gttsn` parameter must match the name of an existing GTT set.

The GTT set specified by the `cdgtasn` or `gttsn` parameter must have a set type of `cdgta` (see the `ent-gttset` command).

If the OBSR feature is enabled or the FLOBR feature is turned on, then the `gttsn` parameter cannot be specified.

The GTT Set table is corrupt or cannot be found.

The GTT Selector table is corrupt or cannot be found.

The GTTDBMM table is corrupt or cannot be found.

The linkset specified by the `lsn` parameter must already exist in the Linkset table.

The CdPA GTT Set specified by the `gttsn`, `cdgtasn`, or `cdgttsn` parameter must already exist in the GTT Set table.

A value of `dflt` must be specified for the `np` and `nai` parameters, or neither value can be `dflt`.

The Linkset table is corrupt or cannot be found.

If a full GTT selector key is specified by the `gti(x)`, `tt`, `np/npv`, `nai/naiv`, `selid`, and `lsn` parameters, then the GTT set specified by the `gttsn`, `cdgtasn`, or `cdgttsn` parameters cannot be specified.

If the `lsn` parameter is specified, then the `cdgttsn` or `cggttsn` parameter must be specified.

The `cggtasn`, `cgpcsn`, and `cggttsn` parameters cannot be specified together in the command.

The `gttsn`, `cdgtasn`, and `cdgttsn` parameters cannot be specified together in the command.

If the `gttsn`, `cdgttsn`, or `cdgtasn` parameter is specified, then the `cgssn` parameter cannot be specified.

If the `eaglegen=yes` parameter is specified, then the `lsn`, `selid`, `gttsn`, `cdgtasn`, `cgssn`, `cggttsn`, `cggtasn`, or `cgpcsn` parameters cannot be specified.

If the FLOBR feature is turned on, then the `cdgtasn`, `cggtasn`, and `cgpcsn` parameters cannot be specified.

If a value of `dflt` is specified for the `np` and `nai` parameters, then the `cggtasn`, `cgpcsn`, `cgssn`, `selid`, `lsn`, `cggttsn`, and `eaglegen` parameters cannot be specified.

A value of `none` cannot be specified for the `gttsn`, `cdgtasn`, `cdgttsn`, `cggttsn`, `cggtasn`, and `cgpcsn` parameters.

If the `gti(x)=0` parameter is specified, then the `eaglegen`, `tt`, `np/npv`, and `nai/naiv` parameters cannot be specified.

Notes

There is no J7 FAK dependency on the GTIA/GTIN16/GTIN24 parameters. The command can be entered successfully whether the J7 FAK is enabled or not enabled.

GTT Selector entries configured using GTIN24/GTIN16 parameters shall be treated as ITU-N24 entries if the J7 FAK is disabled and shall be treated as ITU-N16 entries if the J7 FAK is enabled.

Also, if the J7 Support feature is enabled, the `rtv-gttset` output displays the GTIN16 header and if the J7 feature is not enabled, the `rtv-gttset` output displays the GTIN24 header.

When `msgtype` is specified in the `rtv-gttset` command, the best match for the specified `msgtype` is shown in the output. For example, say there are two GTT Selector entries provisioned with `msgtype=u`, `us` and `msgtype=us` for different GTI(x), TT, NP and NAI combination. The command `rtv-gttset:msgtype=us` will display both selectors in the output.

Output

This example retrieves all GTT selectors when EGTT is ON:

```
rtv-gttset
```

```
tekelecstp 10-04-15 13:54:13 EST EAGLE 42.0.0

rtrv-gttset

Use this command to display a list of administered GTT sets. This list can be filtered by using the parameters shown.

Note

If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrvgttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrvgta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. It is not recommended to run ent/dlt/rtrv-tt & ent/chg/dlt/rtrv-gtt commands as it may cause the advance GTA fields of GTT entry to be reset to the default values.

Parameters

actsn (optional)

GTT Action Set Name.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters.

gtmodid (optional)

Global title modification identifier.

Range:

aaaaaaaa

Default:

Display all

gttsn (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters.

netdom (optional)

Network domain. This command does not distinguish between ITU National or ITU International because the Enhanced Global Title Translation feature does not discriminate between the ITU-I and ITU-N translations.

Range:

ansi

itu

cross

Default:

Display all

npsn (optional)

GTT set name (Not Present Set Name). This parameter can have the IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA GTT set types.

Range:

aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters.

refcnt (optional)

GTT set reference count. The count of GTT set being referred in GTT Selectors, GTA Translations, BPARTYGTTSN and IS41SMSCGTTSN options in GSMSMSOPTS table and BPARTYGTTSN option in IS41SMSOPTS table.

Range:

yes

setidx (optional)

GTT set index.

Note

A comma-separated setidx list that allow GTT set information to be retrieved based on the GTT index number. Up to 7 setidx can be specified in the list.

Range:

0 - 9999

set type (optional)

GTT set type.

Range:

cdgta

cdssn

cggtta

cgpc

cgssn

dpc

imei

imsi

msisdn

opc

opcode

smrpda

smrpoa

vlrnb

Default:

Display all

sxudt (optional)

Segmented XUDT. This parameter specifies whether TOBR will support the processing of segmented XUDT message.

Range:**yes**

perform decoding of segmented XUDT message

no

do not perform decoding of segmented XUDT message

Default:

no

Example

```
rtrv-gttset
rtrv-gttset:netdom=ansi
rtrv-gttset:gttsn=t800
rtrv-gttset:netdom=ansi:settype=cdssn
rtrv-gttset:settype=opcode
rtrv-gttset:setidx=1
rtrv-gttset:actsn=actdisc1
rtrv-gttset:refcnt=yes
rtrv-gttset:gtmodid=set1
rtrv-gttset:npsn=imsi1
rtrv-gttset:setidx=3,7,65,22
rtrv-gttset:sxudt=yes
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

If the *gttsn* parameter is specified, it cannot have a value of *none*, and must match an existing *gttsn*.

If the *netdom* parameter is specified, at least one entry must exist that exactly matches the specified value. Otherwise, the following error message appears in the scroll area:

No GTT Sets matching the specified criteria were found.

The *netdom=cross* parameter is valid if the *settype=cdgta/imei/imsi/msisdn/vlrnb/smrpoa/smrpda* parameter is specified.

If the *gttsn* parameter is specified then the *settype*, *netdom*, *actsn*, and *gtmodid* parameters cannot be specified.

The Origin-based SCCP Routing feature must be enabled if the value of the *settype* parameter is *cggta*, *cgssn*, *opc*, or *cgpc*.

The ANSI/ITU SCCP Conversion feature must be enabled before the *netdom=cross* parameter can be specified.

The TOBR feature must be turned on before the *opcode=settype* parameter can be specified.

If the `setidx` parameter is specified, then no other parameter can be specified in the command.

The FLOBR feature must be turned on before a value of `cdssn` or `dpc` can be specified for the `settype` parameter.

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

The value specified for the `npsn` parameter must match the name of an existing GTT Set of IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA type.

The `SXUDT` parameter must be specified with the `OPCODE` GTT set type only.

Duplicate values cannot be specified for the `SETIDX` parameter.

Notes

When the Origin-based SCCP Routing feature is turned on, the `settype` parameter is displayed regardless of feature key status. If the feature key is not enabled, the `settype=cdgta` parameter (default value) is displayed.

Only entries that match the `setidx` values specified in the command will be displayed. If no GTTSet is found for a particular `setidx`, the following message is displayed in the Scroll Area of the terminal: "No Entry found." along with the `setidx` for which GTTSet was not found.

Output

rtrv-gtwy-acthresh

Use this command to display the current values for the SS7 message rejection thresholds occurring because of the gateway screening process.

Parameters**lsn (optional)**

Linkset name.

Range:

aaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters

Default:

Display all

Example

```
rtrv-gtwy-acthresh: lsn=wy644368
```

```
rtrv-gtwy-acthresh
```

Dependencies

The Extended Linkset table must be accessible.

The specified linkset must exist in the gateway linkset entity set of the requesting system.

The Linkset table must be accessible.

The linkset specified must exist in the active database.

At least one optional parameter must be specified.

Notes

None

Output

This example shows the thresholds of all linksets:

```
rtrv-gtwy-acthresh
```

```

rtrv-gtwy-prmtrs

Use this command to display the STP values that limit the display of certain notification messages that could become excessive. Only the values set by the `set-scrrej-prmtrs` command are displayed.

Parameters

This command has no parameters.

Example

```
rtrv-gtwy-prmtrs
```

Dependencies

The Extended STP Options table must be accessible.

None

Notes

None

Output

rtrv-gtwy-prmtrs

```

      rlgncxa03w 04-02-18 08:50:12 EST  EAGLE 31.3.0
      LIMIT INTRVL
      1000  15
;

```

Legend

- **LIMIT**—The threshold not to be exceeded.
- **INTRVL**—Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

rtrv-gws-actset

Use this command to display the values defined for gateway screening stop actions.

Parameters

actid (optional)

The identification number of the gateway screening stop action.

Range:

4 - 16

Default:

Display all

actname (optional)

The name of the gateway screening stop action set.

Range:

ayyyyy

One alphabetic character followed by up to five alphanumeric characters.

Default:

Display all

Example

rtrv-gws-actset

rtrv-gws-actset:actname=cr

rtrv-gws-actset:actid=6

Dependencies

Either actname or actid can be specified, but not both.

Notes

If neither actname nor actid are specified, all gateway screening stop actions are displayed.

Output

rtrv-gws-actset

```

tekelecstp 13-10-24 11:56:11 EST 48.0.0.0-80.6.046.0.0-65.3.0

rtrv-gws-redirect

Use this command to display the provisioning data for the redirect function. The parameters and values that are retrieved using this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected.

Parameters

This command has no parameters.

Example

```
rtrv-gws-redirect
```

Dependencies

None

Notes

None

Output

The second column in the output displays the type of point code used:

- ANSI—DPCA
- International—DPCI
- ITU National—DPCN
- ITU National 24—DPCN24
- ITU National 16---DPCN16

```
rtrv-gws-redirect
```

```
rlghncxa03w 09-04-10 11:43:04 EST EAGLE 41.0.0
ENABLED      DPCA          RI  SSN  TT   GTA
off          003-033-003    GT   0    0    1
;
```

This example shows output when the gateway screening redirect function is not enabled:

```
rtrv-gws-redirect
```

```
rlghncxa03w 09-04-10 11:43:04 EST EAGLE 41.0.0
ENABLED      DPCA          RI  SSN  TT   GTA
Redirect function data is not provisioned
;
```

```
rtrv-gws-redirect
```

```
tekelecstp 13-07-02 15:48:55 EST 45.0.0-64.69.0
rtrv-gws-redirect
Command entered at terminal #4.
