Copyright © 2023, Oracle and/or its affiliates.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Contents

1 Introduction

1.1	Overview	1
1.2	Deployment Model	2
1.3	References	2

2 ATS Framework Features

2.1	ATS API	1
2.1.1	Creating API User and Granting Access	2
2.1.1.1	Creating an API User	2
2.1.1.2	Granting Access to the API User	2
2.1.1.3	Generating an API Token for a User	2
2.1.2	Use the RESTful Interfaces	4
2.1.2.1	Starting Jobs	4
2.1.2.2	Monitoring Jobs	7
2.1.2.3	Stopping Jobs	8
2.1.2.4	Getting Test Suite Artifacts	10
2.2	ATS Health Check	12
2.3	ATS Jenkins Job Queue	17
2.4	Application Log Collection	18
2.4.1	Application Log Collection and Parallel Test Execution Integration	20
2.5	ATS Maintenance Scripts	21
2.5.1	ATS Scripts	21
2.5.2	Updating ats_install.sh	22
2.5.3	Restarting Jenkins without Restarting Pod	23
2.5.4	Updating Stub Scripts	23
2.5.5	Running ATS and Stub Deployment Scripts	24
2.6	ATS System Name and Version Display on the ATS GUI	25
2.7	ATS Tagging Support	25
2.7.1	Combination of Tags and their Results	27
2.8	Custom Folder Implementation	30
2.9	Single Click Job Creation	31
2.9.1	Configuring Single Click Job	31
2.10	Managing Final Summary Report, Build Color, and Application Log	34

2.11	Lightweight Performance	41
2.11.1	Configure <NF>-Performance Pipeline	41
2.12	Modifying Login Password	42
2.13	Parallel Test Execution	43
2.13.1	ATS GUI Page Changes	45
2.13.2	ATS Console Log Changes	45
2.13.3	Downloading or Viewing Individual Group Logs	46
2.14	Parameterization	49
2.14.1	Running Test Cases	50
2.15	PCAP Log Collection	52
2.15.1	Application Log Collection and Parallel Test Execution Integration	53
2.16	Persistent Volume for 5G ATS	54
2.16.1	Processing Flow	54
2.16.2	Deploying Persistent Volume	55
2.16.3	Backward Porting	57
2.17	Test Results Analyzer	58
2.17.1	Accessing Test Results Analyzer Feature	58
2.18	Support for Test Case Mapping and Count	61
2.18.1	Access Test Case Mapping and Count Feature	61
2.19	Support for Transport Layer Security	62

3 Installing ATS for Different Network Analytics Suite Products

3.1	Installing ATS for NWDAF	1
3.1.1	Software Requirements	1
3.1.2	Environment Setup	2
3.1.3	Resource Requirements	3
3.1.4	Downloading the ATS Package	4
3.1.5	Pushing the Images to Customer Docker Registry	5
3.1.6	Configuring ATS	7
3.1.6.1	Creating and Verifying NWDAF Console Namespaces	7
3.1.6.2	Updating values.yaml File	8
3.1.6.3	Deploying NWDAF ATS in the Kubernetes Cluster	8
3.1.6.4	Verifying ATS Deployment	9
3.2	Installing ATS for OCNADD	10
3.2.1	Resource Requirements	10
3.2.2	Downloading the ATS Package	11
3.2.3	Pushing the Images to Customer Docker Registry	13
3.2.4	Configuring ATS	15
3.2.4.1	Enabling Static Port	15
3.2.5	Deploying ATS and Stub in Kubernetes Cluster	15

4 Running Test Cases Using ATS

4.1	Running NWDAF Test Cases using ATS	1
4.2	Running OCNADD Test Cases using ATS	11
4.2.1	Prerequisites	11
4.2.2	Logging into ATS	13
4.2.3	OCNADD-NewFeatures Pipeline	14
4.2.4	OCNADD-NewFeatures Documentation	20
4.2.5	Troubleshooting ATS	20

My Oracle Support

My Oracle Support (<https://support.oracle.com>) is your initial point of contact for all product support and training needs. A representative at Customer Access Support can assist you with My Oracle Support registration.

Call the Customer Access Support main number at 1-800-223-1711 (toll-free in the US), or call the Oracle Support hotline for your local country from the list at <http://www.oracle.com/us/support/contact/index.html>. When calling, make the selections in the sequence shown below on the Support telephone menu:

- For Technical issues such as creating a new Service Request (SR), select **1**.
- For Non-technical issues such as registration or assistance with My Oracle Support, select **2**.
- For Hardware, Networking and Solaris Operating System Support, select **3**.

You are connected to a live agent who can assist you with My Oracle Support registration and opening a support ticket.

My Oracle Support is available 24 hours a day, 7 days a week, 365 days a year.

Acronyms

The following acronyms are used in the ATS User Guide.

Table Acronyms

Abbreviation	Definition
ATS	Automated Testing Suite
BDD	Behavior Driven Development. It is an agile software development technique that encourages collaboration between developers, QA, and non-technical or business participants in a software project.
CI	Continuous Implementation
CNE	Oracle Communications Cloud Native Core, Cloud Native Environment
OCNADD	Oracle Communications Network Analytics Data Director
OCNWDAF	Oracle Communications Network Data Analytics Function
OL	Oracle Linux is a Linux distribution packaged and freely distributed by Oracle, available partially under the GNU (General Public License) since late 2006. It is compiled from Red Hat Enterprise Linux source code, replacing Red Hat branding with Oracle's.

What's New in This Guide

This section introduces the documentation updates for Release 23.4.x in *Oracle Communications Network Analytics Automated Testing Suite Guide*.

Release 23.4.0 - F88230-01, December 2023

OCNADD Release 23.4.0

- Updated the following sections:
 - OCNADD now supports the ATS Tagging Support feature, updated the [ATS Framework Features](#) section.
 - Total number of resources, pod resource requirements updated in the [Resource Requirements](#) section.
 - OCNADD release versions updated in the [Downloading the ATS Package](#) section.
 - Updated the procedure for [Pushing the Images to Customer Docker Registry](#).
 - Updated the section [Deploying ATS and Stub in Kubernetes Cluster](#) to include information on the different OCNADD deployment modes.
 - OCNADD supports different deployment modes, the [Prerequisites](#) section is updated to support the deployment modes.
 - Script parameters and pipeline screen is updated in the [OCNADD-NewFeatures Pipeline](#) section.

OCNWDAF Release 23.4.0

Updated the following sections:

- Pods resource requirements are updated in the [Resource Requirements](#) section.
- OCNWDAF's directory package and folder structure is updated in the [Downloading the ATS Package](#) section.
- Image tags, release number and installers folder structure are updated in the [Pushing the Images to Customer Docker Registry](#) section.
- Script parameters and pipeline screen is updated in the [Running NWDAF Test Cases using ATS](#) section.

1

Introduction

This document provides information about Automated Testing Suite (ATS) deployment model for the Network Analytics Suite products.

ATS allows you to run software test cases using an automated testing tool and then, compares the actual results with the expected or predicted results.

1.1 Overview

Using ATS, you can deploy and test 5G NFs.

This document provides information to implement ATS for the following 5G products:

- Oracle Communications Networks Data Analytics Function
- Oracle Communications Network Analytics Data Director

ATS for 5G Network Functions

For 5G NFs, ATS is developed using Oracle Linux 8-slim as the base image. Jenkins is a part of the ATS image, and it provides a graphical user interface (GUI) to test either a single NF or multiple NFs independently in the same network environment.

ATS comprises NF docker images, ATS image, simulator images, and test cases of the specific NF. All these images and test cases constitute a fully automated suite to deploy and test NFs. You can combine it with any other Continuous Integration (CI) pipeline with minimal changes because 5G ATS uses Jenkins as GUI.

The ATS package contains the following elements:

- Test scripts and docker images of test container. The docker images have complete framework and libraries installed, which are common for all NFs working with the Behavior Driven Development (BDD) framework.
- Docker image of HTTP Server simulator.
- Helm chart to deploy the ATS (delivered as a tar file).
- Readme text file (.txt file).

ATS provides basic environment, framework, and a GUI (Jenkins) to run all the functional test cases.

ATS Framework Version with Supporting NF Version

Table 1-1 ATS Framework Version with Supporting NF

ATS Framework Version	NWDAF	Data Director
23.4.0	23.4.0	NA
23.4.0	NA	23.4.0

1.2 Deployment Model

According to the In-Cluster deployment model, ATS can coexist in the same cluster where the NFs are deployed. This deployment model is useful for In-Cluster testing.

Figure 1-1 In-Cluster Deployment Model

1.3 References

For more information about NFs and their deployment processes, refer to the following documents:

- *Oracle Communications Network Data Analytics Function User Guide*
- *Oracle Communications Network Data Analytics Function Installation and Fault Recovery Guide*
- *Oracle Communications Network Analytics Data Director User Guide*
- *Oracle Communications Network Analytics Data Director Installation, Upgrade, and Fault Recovery Guide*

2

ATS Framework Features

This chapter describes the ATS Framework features:

Table 2-1 ATS Framework Features Compliance Matrix

Features	NWDAF	OCNADD
Application Log Collection	Yes	No
ATS API	No	No
ATS Health Check	No	No
ATS Jenkins Job Queue	Yes	Yes
ATS Maintenance Scripts	Yes	Yes
ATS System Name and Version Display on Jenkins GUI	Yes	Yes
ATS Tagging Support	No	Yes
Custom Folder Implementation	Yes	No
Single Click Job Creation	Yes	Yes
Final Summary Report, Build Color, and Application Log	Yes	Partially compliant (Application Log is not supported.)
Lightweight Performance	Yes	No
Modifying Login Password	No	Yes
Parallel Test Execution	No	No
Parameterization	Yes	No
PCAP Log Collection	No	No
Persistent Volume	No	Optional
Test Result Analyzer	Yes	Yes
Test Case mapping and Count	Yes	Yes

2.1 ATS API

The Application Programming Interface (API) feature provides APIs to perform routine ATS tasks as follows:

- Start: To initiate one of the three test suites, such as Regression, New Features, or Performance.
- Monitor: To obtain the progress of a test suite's execution.
- Stop: To cancel an active test suite.
- Get Artifacts: To retrieve the JUNIT format XML test result files for a completed test suite.

For more information about configuring the tasks, see [Use the RESTful Interfaces](#).

2.1.1 Creating API User and Granting Access

You require an account as an API user with access authorization and an API token that has to be generated for the user to perform routine ATS tasks using the Restful Interfaces API.

2.1.1.1 Creating an API User

Perform the following procedure to create an API user:

1. Log in to the ATS application using admin credentials.
2. In the left navigation pane of the ATS application, click **Manage ATS**.
3. Scroll down and click **Manage Users**.
4. In the left navigation pane, click **Create User**.
5. Enter the username as `<nf>apiuser`, for example, `policyapiuser`, `udrapiuser`, and a password.
6. The **Full name** field is optional. If left blank, it's automatically assigned a value by Jenkins.
7. Enter your email address as `<nf>apiuser@oracle.com`.
8. Click **Create User**. The API user is created.

2.1.1.2 Granting Access to the API User

Perform the following procedure to grant access to the API user:

1. In the left navigation pane, click **Manage ATS**.
 2. Scroll down and click **Configure Global Security**.
 3. Scroll down to **Authorization** and click **Add User**.
 4. Enter the **username** created in the prompt that appears.
 5. Check all the boxes in the Authorization matrix for `apiuser` that are also checked for `<nf>user`.
 6. Click **Save**.
 7. Go to the ATS main page and choose each of your NFs' pipeline.
 8. In the left navigation pane, click **Configure**.
 9. Scroll down to **Enable project-based security** and click **Add user**.
 10. Enter the **user name** created in the prompt that appears.
 11. Check all the boxes in the Authorization matrix for API user that are also checked for `<nf>user`.
 12. Click **Save**.
- Now, API user can be used in API calls.

2.1.1.3 Generating an API Token for a User

Any API call requires the use of an API token for authentication. You can generate the API token, and it works until it is revoked or deleted.

Perform the following procedure to generate an API token for a user:

1. Log in to Jenkins as an NF API user to generate an API token.

Figure 2-1 ATS Login Page

Oracle Communications Cloud Native Core - Automated Test Suite

Welcome to ATS!

☐ Keep me signed in

2. Click user name from the drop-down list at the top right of the Jenkins GUI, and then click **Configure**.

3. In the **API Token** section, click **Add New Token**.

Figure 2-3 Add New Token

API Token

Current token(s)

There are no registered tokens for this user.

Add new Token

4. Enter a suitable name for the token, such as policy, and then click **Generate**.

Figure 2-4 Generate Token

API Token

Current token(s) ?

There are no registered tokens for this user.

policy Generate Cancel

Add new Token

5. Copy and save the generated token.
You cannot retrieve the token after closing the prompt.

Figure 2-5 Save Generated Token

API Token

Current token(s) ?

policy 1171eda238dc75119765021d448a15d36e 📄 📄

⚠️ Copy this token now, because it cannot be recovered in the future.

Add new Token

6. Click **Save**.
An API token is generated and can be used for starting, monitoring, and stopping a job using the REST API.

2.1.2 Use the RESTful Interfaces

This section provides an overview of each RESTful interface.

2.1.2.1 Starting Jobs

To start a job, use the following RESTful interfaces:

- Default Jenkins API: The default Jenkins API to start a pipeline job
- Custom API: To start a job forcibly

Starting a Job using Default Jenkins API

If any other job is already running, the job started with this API goes to Jenkins' job queue.

- Run the following command to start a job (Default Jenkins method):

```
curl --request POST <Jenkins_host_port>/job/<Pipeline_name>/
buildWithParameters -user
<username>:<API_token> --verbose
```

The details of the parameters for the API are as follows:

Table 2-2 API Parameters

Parameters	Mandatory	Default Value	Description
userName	YES	NA	This parameter indicates the name of API user.
token	YES	NA	This parameter indicates the API token for API user.
Startjob_host_port	YES	NA	This parameter's format is <host>:<port> – <host> will be same as Jenkins host – <port> will be different(5001 or its nodeport)
pipelineName	YES	NA	This parameter indicates the name of the pipeline for which build is to be triggered.
pageAndQuery	YES	NA	This parameter can have two values: – buildWithParameters: for parametrized pipelines – build: for non-parametrized pipelines
jenkins_wait_time	NO	5	This parameter indicates the wait time for Jenkins in seconds. – If Jenkins is very slow in responding and the API response is not as expected, this wait time can be increased. – It is required when multiple running builds must be aborted before starting a new API build.
jenkins_host_port	YES	NA	This parameter's format is <Jenkins host>:<Jenkins port>.

For example,

```
curl --request POST http://10.123.154.163:30427/job/Policy-NewFeatures/
buildWithParameters
--user policyapiuser:111ad02d7471cec9ca689696e9c7a55c62 --verbose
```

Starting a Job Forcibly using Custom API

If another job is already running and has not been started by an API user, the running job is aborted, along with all other jobs in the queue that have not been started by an API user, and a new job is started.

If the running job is started by the API user, the new job does not start, and the start job request fails, returning a message in response: Build <job_id> of pipeline <pipeline_name> is already running, triggered by an API user.

Builds are aborted gracefully by a forceful API, such as when a running scenario completes its execution and cleanup before the corresponding build is aborted.

The forceful API now returns an aborted-builds parameter in response, which contains job IDs for all the aborted builds. It also returns a parameter called cancelled_builds_in_queue, which contains queue IDs for all the builds aborted in queue.

If a job ID is assigned to a build in queue, it contains a list of two values: [queueid, jobid] rather than just the queue ID.

Run the following command to start a job forcibly:

```
curl -s --request POST <Startjob_host_port>/build -H "Content-Type: application/json" -d '{"jenkins_host_port": "<Jenkins_host_port>", "pipelineName": "<Pipeline_name>", "pageAndQuery": "<pageAndQuery>", "userName": "<username>", "token": "<API_token>"}' --verbose
```

For example,

```
curl --request POST 10.123.154.163:31423/build -H "Content-Type: application/json" -d '{"jenkins_host_port": "10.123.154.163:30427", "pipelineName": "Policy-NewFeatures", "pageAndQuery": "buildWithParameters", "userName": "policyapiuser", "token": "111ad02d7471cec9ca689696e9c7a55c62"}' --verbose
```

Note

Startjob_host_port has the same IP as jenkins_host_port, but its port is different (the StartAPI port). ATS has two pairs of ports:

- Jenkins port (8080) with its nodeport
- StartAPI port (5001) with its nodeport

Customizing Job Parameters

Both of the Start APIs start the pipeline job with default parameter values. You can provide a different value for a parameter in an API call, such as paramx=valuex.

1. Append paramx=value to buildWithParameters?.

Example 1,

```
curl --request POST 10.75.217.40:31378/job/Policy-NewFeatures/buildWithParameters?paramx=valuex --user policyapiuser:110ed65222b9e63445689314998ff8c3bk -- verbose
```

Example 2,

```
curl --request POST 10.75.217.4:32476/build -H "Content-Type: application/json" -d '{"jenkins_host_port": "10.75.217.40:31378", "pipelineName": "Policy-NewFeatures", "pageAndQuery": "buildWithParameters?paramx=valuex", "userName": "policyapiuser", "token": "110ed65222b9e63445689314998ff8c3bk"}' --verbose
```

2. To add more than 1 parameter, such as paramx=valuex and paramy=valuey, append the other parameters to the API call using &.

Example 1,

```
curl --request POST 10.75.217.40:31378/job/Policy-NewFeatures/
buildWithParameters?paramx=valuex&paramy=valuey
--user policyapiuser:110ed65222b9e63445689314998ff8c3bk -- verbose
```

Example 2,

```
curl --request POST 10.75.217.4:32476/build -H "Content-Type: application/
json" -d '{"jenkins_host_port": "10.75.217.40:31378", "pipelineName":
"Policy-NewFeatures", "pageAndQuery": "buildWithParameters?
paramx=valuex&paramy=valuey", "userName": "policyapiuser", "token":
"110ed65222b9e63445689314998ff8c3bk"}' --verbose
```

3. Replace buildWithParameters? with build for non-parametrized pipeline jobs.
4. Start the pipeline by using the default Jenkins API or by changing the pageAndQuery parameter's value to build in the following way:

```
curl --request POST <Jenkins_host_port>/job/<Pipeline_name>/build --user
<username>:<API_token> --verbose
```

Example 1,

```
curl --request POST 10.75.217.40:31378/job/Policy-NewFeatures/build --user
policyapiuser:110ed65222b9e63445689314998ff8c3bk --
verbose
```

Example 2,

```
curl --request POST 10.75.217.4:32476/build -H "Content-Type: application/
json" -d '{"jenkins_host_port": "10.75.217.40:31378",
"pipelineName": "Policy-NewFeatures", "pageAndQuery": "build",
"userName": "policyapiuser", "token":
"110ed65222b9e63445689314998ff8c3bk"}' -verbose
```

2.1.2.2 Monitoring Jobs

This Default Jenkins API is used to monitor the progress of the job that was started.

For monitoring, the following APIs are used:

- A qid is obtained from the Location header in the response for starting a job. The first API uses this qid to get queue status about the corresponding job, including its job_id.
- The second API uses the job_id to obtain further information about the job status.

Monitoring a Job

To monitor jobs, run the following commands in a sequence:

1. `curl --request POST <Jenkins_host_port>/queue/item/<qid>/api/json --user <username>:<API_token> --verbose`

For example,

```
curl --request POST http://10.123.154.163:30427/queue/item/5/api/json --
user policyapiuser:111ad02d7471cec9ca689696e9c7a55c62
--verbose
```

2. `curl --request POST <Jenkins_host_port>/job/<Pipeline_name>/<job_id>/api/json --user <username>:<API_token> --verbose`

For example,

```
curl --request POST http://10.123.154.163:30427/job/Policy-
NewFeatures/3/api/json --user
policyapiuser:111ad02d7471cec9ca689696e9c7a55c62
--verbose
```

The following screenshot shows an example of monitoring the progress of the job:

Figure 2-6 Monitoring a Job

```
odin@blurr5-bastion-1 ~$ curl --request POST http://10.123.154.163:30427/job/Policy-NewFeatures/3/api/json --user policyapiuser:111ad02d7471cec9ca689696e9c7a55c62 --verbose

              "inProgress": true,
              "nextBuild": null,
              "previousBuild": null
            }
          }
        }
      ]
    }
  ]
}
```

2.1.2.3 Stopping Jobs

Stop API is used to stop the currently running job using its job_id. It is also a default Jenkins API.

Stopping a Job

For ATS without Parallel Test Execution framework integrated:

```
curl --request POST
  <Jenkins_host_port>/job/<Pipeline_name>/<job_id>/stop --user
<username>:<API_token>
--verbose
```

For example,

```
curl --request POST http://10.75.217.4:31881/job/UDR-Regression/21/stop --user
udrapiuser:1139a72213e0a686972cbff4a2f9333a9f --verbose
```

Note

- If the rerun count is greater than zero, the job must be stopped twice.
- This Stop API call does not abort the build gracefully.

For ATS with Parallel Test Execution framework integrated:

```
curl --request POST
    <Stopjob_host_port>/job/<Pipeline_name>/<job_id>/stop --user
<username>:<API_token>
--verbose
```

For example.

```
curl --request POST http://10.75.217.4:32476/job/UDR-Regression/21/stop --user
udrapiuser:1139a72213e0a686972cbff4a2f9333a9f --verbose
```

The following table lists the parameter details for Stop API:

Table 2-3 Stop API Details

Parameter	Mandatory	Default Value	Description
userName	Yes	NA	Name of API user
token	Yes	NA	The API token for the API user
Stopjob_host_port	Yes	NA	Format is <host>:<port> • <host> is same as Jenkins host • <port> is different such as 5001 or its nodeport
pipelineName	Yes	NA	Name of the pipeline for which build is to be stopped

Table 2-3 (Cont.) Stop API Details

Parameter	Mandatory	Default Value	Description
immediate	No	False	To stop the build immediately, send a query parameter ("immediate=true") with API call. For example, <pre>curl --request POST <Stopjob_host_port>/j ob/<Pipeline_name>/ <job_id>/stop? immediate=true --user <username>:<API_token > --verbose</pre> immediate can also have values such as yes or 1. These values work similar to the true value.

2.1.2.4 Getting Test Suite Artifacts

Default Jenkins API is used to get the JUNIT-formatted XML test result files for a completed test suite.

For getting artifacts for any completed test suite, the following APIs are used:

- For getting an overall build summary
- For getting a JUNIT XML test result file for every feature file that ran

For getting an overall build summary:

```
curl --request POST <Jenkins_host_port>/job/<Pipeline_name>/<job_id>/
testReport/api/xml?exclude=testResult/suite --user <username>:<API_token> --
verbose
```

For example,

```
curl --request POST http://10.123.154.163:30427/job/Policy-NewFeatures/4/
testReport/api/xml?exclude=testResult/suite--user
policyapiuser:111ad02d7471cec9ca689696e9c7a55c62 --verbose
```

For getting Feature-wise XML, Select_Option = All:

```
curl --request POST
<Jenkins_host_port>/job/<Pipeline_name>/<job_id>/artifact/test-results/
reports/*zip*/test-results.zip
--user <username>:<API_token> --verbose --output test-results.zip
```

For example,

```
curl --request POST http://
    10.75.217.4:31881/job/Policy-NewFeatures/21/artifact/test-results/
reports/*zip*/test-results.zip --user
policyapiuser:11c3344996c4fda01ded2124bec4f9aa17
--verbose --output test-results.zip
```

For getting Feature-wise XML, Select_Option = Single/MultipleFeatures:

```
curl --request POST
    <Jenkins_host_port>/job/<Pipeline_name>/<job_id>/artifact/test-results/
reports/
    *.<Feature1_name>.xml, *.<Feature2_name>.xml/*zip*/test-results.zip --
user <username>:<API_token>
--verbose --output test-results.zip
```

For example,

```
curl --request POST http://
    10.75.217.4:31881/job/Policy-NewFeatures/21/artifact/test-results/
reports/*.goldenfeature.xml, *.AMPolicy.xml/*zip*/test-results.zip
    -user policyapiuser:11c3344996c4fda01ded2124bec4f9aa17 --verbose --
output test-results.zip
```

API calls for Select_Option = All and Select_Option = Single/MultipleFeatures return a zip file with JUNIT XMLs, one XML for each feature.

Figure 2-7 Sample XML Output for AMPolicy.feature

```
<testsuite name="features.regression.templ.AMPolicy.AMPolicy.This feature is to refactor and/or redesign the Access and Mobility Management Service of PCF and to test Policy Establishment/Termination for AMF" tests="3" errors="0" failures="3" skipped="0" time="61.84246" timestamp="2022-03-24T07:11:12.693986" host
name="ocsa-ocsa-policy-5566d4e-d1042"><properties><property name="vendor.name" value="Oracle" /><property name="vendor.product" value="Automated Test Su
ite" /></properties><testcase classname="features.regression.templ.AMPolicy.AMPolicy.This feature is to refactor and/or redesign the Access and Mobility Mana
gement Service of PCF and to test Policy Establishment/Termination for AMF" name="AM_Policy_Create_Query_User_Subscribe_True" status="failed" time="17.291319"
><failure type="AssertionError" message="Maximum number of retries exhausted!!!">
<![CDATA[
Failing step: Then Cleanup before test run ... failed in 12.130s
location: features/regression/templ/AMPolicy/AMPolicy.feature:23
Assertion Failed: Maximum number of retries exhausted!!
]]>
</failure>
</testcase>
</testsuite>
```

In the API call, specify other selected features in comma-separated form as /
*<Feature1_name>.xml, *<Feature2_name>.xml, *<Feature3_name>.xml, *<Feature4_name>.x
ml/ for Select_Option = Single/MultipleFeatures.

The API call for getting the overall build summary returns an XML with values for duration, failCount, passCount, and skipCount for the current build.

Figure 2-8 Sample Output

```
▼<testResult _class="hudson.tasks.junit.TestResult">
  <duration>61.424786</duration>
  <empty>false</empty>
  <failCount>12</failCount>
  <passCount>0</passCount>
  <skipCount>294</skipCount>
</testResult>
```

It is recommended to maintain a gap of at least a few seconds between two API calls. This gap depends on the time Jenkins takes to complete the API request.

2.2 ATS Health Check

ATS Health Check functionality is to check the health of the System Under Test (SUT)

Earlier, ATS used Helm test functionality to check the health of the System Under Test (SUT). With the implementation of the ATS Health Check pipeline, the SUT health check process has been automated. ATS health checks can be performed on webscale and non-webscale environments.

Deploying ATS Health Check in a Webscale Environment

- Set the Webscale to 'true' and the following parameters by encoding them with base64 in the ATS values.yaml file:
- Set the following parameter to encrypted data:

```
webscalejumpserverip: encrypted-data
webscalejumpserverusername: encrypted-data
webscalejumpserverpassword: encrypted-data
webscaleprojectname: encrypted-data
webscalelabserverFQDN: encrypted-data
webscalelabserverport: encrypted-data
webscalelabserverusername: encrypted-data
webscalelabserverpassword: encrypted-data
```

Encrypted data is the value of parameters encrypted in base64. Fundamentally, Base64 is used to encode the parameters.

For example:

```
webscalejumpserverip=$(echo -n '10.75.217.42' | base64), Where Webscale Jump
server ip needs to be provided
webscalejumpserverusername=$(echo -n 'cloud-user' | base64), Where Webscale
Jump server Username needs to be provided
webscalejumpserverpassword=$(echo -n '*****' | base64), Where Webscale Jump
server Password needs to be provided
webscaleprojectname=$(echo -n '*****' | base64), Where Webscale Project Name
```

needs to be provided
 webscalelabserverFQDN=\$(echo -n '*****' | base64), Where Webscale Lab Server FQDN needs to be provided
 webscalelabserverport=\$(echo -n '*****' | base64), Where Webscale Lab Server Portneeds to be provided
 webscalelabserverusername=\$(echo -n '*****' | base64), Where Webscale Lab Server Username needs to be provided
 webscalelabserverpassword=\$(echo -n '*****' | base64), Where Webscale Lab Server Password needs to be provided

Running ATS Health Check Pipeline in a Webscale Environment

To run ATS Health Check pipeline:

1. Log in to ATS using respective <NF> login credentials.
2. Click <NF>HealthCheck pipeline and then click **Configure**.

Note

<NF> denotes the network function. For example, in Policy, it is called as Policy-HealthCheck pipeline.

Figure 2-9 Configure Healthcheck

3. Provide parameter a with Helm release name deployed. If there are multiple releases, use comma to provide all Helm release names.

//a = helm releases [Provide Release Name with Comma Separated if more than 1]

Provide parameter c with the appropriate Helm command, such as helm, helm3, or helm2.

//c = helm command name [helm or helm2 or helm3]

Figure 2-10 Save the Changes

Pipeline script

Script ?

```
1 node{

Save

Apply

4. Save the changes and click **Build Now**. ATS runs the health check on respective network function.

Figure 2-11 Build Now

Deploying ATS Health Check in a Non-Webscale Environment

Perform the following procedure to deploy ATS Health Check in a non-webscale environment such as OCCNE:

Set the Webscale parameter set to 'false' and following parameters by encoding it with base64 in the ATS values.yaml file:

```
occnehostip: encrypted-data
occnehostusername: encrypted-data
occnehostpassword: encrypted-data
```

Example:

```
occnehostip=$(echo -n '10.75.217.42' | base64) , Where occne host ip needs to
be provided
occnehostusername=$(echo -n 'cloud-user' | base64), Where occne host username
needs to be provided
occnehostpassword=$(echo -n '*****' | base64), Where password of host needs to
be provided
```

Running ATS Health Check Pipeline in a Non-Webscale Environment

Perform the following procedure to run the ATS Health Check pipeline in a non-webscale environment such as OCCNE:

1. Log in to ATS using respective <NF> login credentials.
2. Click <NF>HealthCheck pipeline and then click **Configure**.
3. Provide parameter a with Helm release name deployed. If there are multiple releases, use comma to provide all Helm release names.

Provide parameter b with SUT deployed namespace name.

Provide parameter c with the appropriate Helm command, such as helm, helm3, or helm2.

```
//a = helm releases [Provide Release Name with Comma Separated if more
than 1 ]
//b = Namespace, If not applicable to WEBSCALE environment then remove the
argument
//c = helm command name [helm or helm2 or helm3]
```

9       )
10    ]
11  )
12  stage('Helm-Test-Init') {
13    catchError(buildResult: 'SUCCESS', stageResult: 'UNSTABLE') {
14      //a = helm releases [Provide Release Name with Comma Separated if more than 1 ]
15      //b= Namespace, If not applicable then remove the argument
16      //c= helm command name [helm or helm2 or helm3]

```

☒ Use Groovy Sandbox ?

[Pipeline Syntax](#)

Save

Apply

4. Save the changes and click **Build Now**. ATS runs the health check on respective network function.

Figure 2-13 Build Now

By clicking **Build Now**, you can run the health check on ATS and store the result in the console logs.

2.3 ATS Jenkins Job Queue

The ATS Jenkins Job Queue feature places the second job in a queue if the current job is already running from the same or different pipelines to prevent jobs from running in parallel to one another.

Job/build queue status can be viewed in the left navigation pane on the ATS home page. The following image shows the build queue status when a user has tried to run the NewFeatures pipeline when the Regression pipeline is already running.

Figure 2-14 Build Executor Status

2.4 Application Log Collection

Using Application Log Collection, you can debug a failed test case by collecting the application logs for NF System Under Test (SUT). Application logs are collected for the duration that the failed test case was run.

Application Log Collection can be implemented by using ElasticSearch or Kubernetes Logs. In both these implementations, logs are collected per scenario for the failed scenarios.

Application Log Collection Using ElasticSearch

To access the option to collect logs using ElasticSearch:

1. Log in to ATS using respective <NF> login credentials.
2. On the NF home page, click any new feature or regression pipeline, from where you want to collect the logs.
3. In the left navigation pane, click **Build with Parameters**.
4. Select YES or NO from the drop-down menu of **Fetch_Log_Upon_Failure** to select whether the log collection is required for a particular run.
5. If option **Log_Type** is also available, select value **AppLog** for it.

Figure 2-15 Log Levels

6. Select the Log Level from the drop-down menu of Log_Level to set the log level for all the microservices. The possible values for Log_Level are as follows:
 - WARN: Designates potentially harmful situations.
 - INFO: Designates informational messages that highlight the progress of the application at coarse-grained level.
 - DEBUG: Designates fine-grained informational events that are most useful to debug an application.
 - ERROR: Designates error events that might still allow the application to continue running.
 - TRACE: The TRACE log level captures all the details about the behavior of the application. It is mostly diagnostic and is more granular and finer than DEBUG log level.

Note

Log_Level values are NF dependent.

7. After the build execution is complete, go into the ATS pod, then navigate to following path to find the applogs: `.jenkins/jobs/<Pipeline Name>/builds/<build number>/` For example, `.jenkins/jobs/SCP-Regression/builds/5/`

Applogs is present in zip form. Unzip it to get the log files.

The following tasks are carried out in the background to collect logs:

- ElasticSearch API is used to access and fetch logs.
- Logs are fetched from ElasticSearch for the failed scenarios
- Hooks (after scenario) within the cleanup file initiate an API call to Elasticsearch to fetch Application logs.
- Duration of the failed scenario is calculated based on the time stamp and passed as a parameter to fetch the logs from ElasticSearch.
- Filtered query is used to fetch the records based on Pod name, Service name, and timestamp (Failed Scenario Duration).
- For ElasticSearch, there is no rollover or rotation of logs over time.

- The maximum records that the ElasticSearch API can fetch per microservice in a failed scenario is limited to 10K.
- The following configuration parameters are used for collecting logs using Elastic Search:
 - ELK_WAIT_TIME: Wait time to connect to Elastic Search
 - ELK_HOST: Elastic Search HostName
 - ELK_PORT: Elastic Search Port

Application Log Collection Using Kubernetes Logs

To access the option to collect logs using Kubernetes Logs:

1. On the NF home page, click any new feature or regression pipeline, from where you want to collect the logs.
2. In the left navigation pane, click **Build with Parameters**.
3. Select YES or NO from the drop-down menu of **Fetch_Log_Upon_Failure** to select whether the log collection is required for a particular run.
4. Select the Log Level from the drop-down menu of Log_Level to set the log level for all the microservices. The possible values for Log_Level are as follows:
 - WARN: Designates potentially harmful situations.
 - INFO: Designates informational messages that highlight the progress of the application at coarse-grained level.
 - DEBUG: Designates fine-grained informational events that are most useful to debug an application.
 - ERROR: Designates error events that might still allow the application to continue running.

Note

Log_Level values are NF dependent.

The following tasks are carried out in the background to collect logs:

- Kube API is used to access and fetch logs.
- For failed scenarios, logs are directly fetched from microservices.
- Hooks (after scenario) within the cleanup file initiate an API call to Elasticsearch to fetch Application logs.
- The duration of the failed scenario is calculated based on the time stamp and passed as a parameter to fetch the logs from microservices.
- Logs roll can occur while fetching the logs for a failed scenario. The maximum loss of logs is confined to a single scenario.

2.4.1 Application Log Collection and Parallel Test Execution Integration

A new stage, "Logging/Rerun", has been added at the end of the Execute-Tests stage to collect rerun logs, such as applog and PCAP logs, by running the failed test cases in a sequence.

Figure 2-16 Logging/Rerun new stage

Stage View

If the `Fetch_Log_Upon_Failure` parameter is set to YES and if any test case fails in the initial run, then:

- The failed test case reruns and log collection start in the Logging/Rerun stage after the initial run is completed for all the test cases.
- The logs from the initial execution are collected, but they might be incorrect.
- Even if the rerun parameter is set to 0, the failed test case reruns in the Logging/Rerun stage and the log is collected.
- If the `Fetch_Log_Upon_Failure` parameter is set to NO and if any test case fails in the initial run, then the failed test case rerun starts in the same stage after the initial execution is over for all the test cases in its group.

2.5 ATS Maintenance Scripts

ATS maintenance scripts are used to perform the following operations:

- Taking a backup of the ATS custom folders and Jenkins pipeline.
- Viewing the configuration and restoring the Jenkins pipeline.
- Viewing the configuration and installing or uninstalling ATS and stubs.

ATS maintenance scripts are present in the ATS image at the following path: `/var/lib/jenkins/ocats_maint_scripts`

Run the following command to copy the scripts to a local system (bastion):

```
kubectl cp <NAMESPACE>/<POD_NAME>:/var/lib/jenkins/ocats_maint_scripts
<DESTINATION_PATH_ON_BASTION> pod
```

For example,

```
kubectl cp ocpcf/ocats-ocats-policy-694c589664-js267:/var/lib/Jenkins/
ocats_maint_scripts /home/meta-user/ocats_maint_scripts pod
```

2.5.1 ATS Scripts

ATS maintenance scripts are used to perform various task related to ATS and Jenkin pipeline.

The following are the types of scripts:

- **ats_backup.sh:** This script requires the user's input and takes a backup of the ATS custom folders, Jenkins jobs, and user's folders on the user's system. The backup can be of the Jenkins jobs and user's folder, the custom folders, or both. The custom folders

include `cust_regression`, `cust_newfeatures`, `cust_performance`, `cust_data`, and `custom_config`. For a Jenkins job or a user's folder, the script only takes a backup of the `config.xml` file. Also, the script requires the user to store a backup on the user's system (the default path is the location from where the script is being run) and to create a backup folder on the system and take the backup of the chosen folder from the corresponding ATS into the backup folder. The backup folder name can be of the following notation: `ats_<version>_backup_<date>_<time>`.

- **ats_uninstall.sh**: This script requires the user's input and uninstalls the corresponding ATS.
- **ats_install.sh**: This script requires the user's input and installs a new ATS. If `PVEnabled` is set to `true`, the script also reads the PVC name from `values.yaml` and creates `values.yaml` before installation. Also, if needed, the script performs the postinstallation steps, such as copying tests and Jenkins jobs' folders from the `ats_data` tar file to the ATS pod when PV is deployed, and then restarts the pod.
- **ats_restore.sh**: This script requires the user's inputs, restores the new release ATS pipeline, and views the configuration by referring to the last release ATS Jenkins jobs and the user's configuration. It depends on the user whether to use the backup folders from the user's system to restore the ATS configuration. If the user instructs the script to use the backup from the system, the script requires the path of the backup and uses the backup to restore. Otherwise, the script requires the last ATS Helm release name to refer to its Jenkins jobs and the user's configuration to restore.
The script refers to the last release of ATS Jenkins pipelines and sets the `Discard old builds` property if this property is set in the last release of ATS for a pipeline but not in the current release. If this property is set in both releases, the script just updates the values according to the last release. Also, the script restores the `pipeline_environment` variables values as per the last release of ATS. If any custom pipeline (created by the user) was present in the last release of ATS, the script restores that as well. It also restores the extra views created by NF users, for example, policy users, SCP users, and NRF users. Moreover, the script displays messages about the pending configuration that the user needs to perform manually. For example, a new pipeline or a new environment variable (for a pipeline) is introduced in the new release.

While deploying ATS without PV, Jenkins needs to be restarted for the restore process to complete. If the last release ATS contains the `Configuration_Type` parameter, the `Configuration_Type` script needs to be approved with the **In Process Script Approval** setting under **Manage ATS** in Jenkins for the restore process to complete.

2.5.2 Updating `ats_install.sh`

Currently, the `ats_install.sh` script copies the tests folder and Jenkins jobs folder into the ATS pod and then restarts the pod when deployed with PV.

How to Update `ats_install.sh`

Other NFs can also use the `ats_install.sh` scripts. However, additional post installation steps may have to be performed manually for a few NFs.

For the additional post installation commands, perform the following steps:

1. In the `ats_install.sh` script, there is a post install section between `#####POST_INSTALL_START#####` and `##### POST_INSTALL_END #####`.
 - a. Add the required post install commands.

Note

These commands are NF-specific.

- b. Use the following commands:
 - \$namespace for the namespace value
 - \$pod_name for the pod name
 - \$ats_data_path for the ats_data folder path (it has tests folder and Jenkins jobs folder provided as tar file in ATS package)
- c. In the if-else block related to whether PV is enabled or not, add the following:
 - Add a command specific to PVEabled=true in the if block.
 - Add a command specific to PVEabled=false in the else block.
2. For additional inputs, enter the required code between ##### INPUT_START ##### and ##### INPUT_END #####.

2.5.3 Restarting Jenkins without Restarting Pod

Perform the following procedure to restart Jenkins without restarting pods:

1. Log in as the Jenkins admin.
2. Go to the <Jenkins_IP>:<port>/safeRestart, for example, 10.87.73.32:32156/safeRestart.

Figure 2-17 Safe Restart

3. Click **Yes**.

Figure 2-18 Restart Jenkins

2.5.4 Updating Stub Scripts

The following stubs can be updated:

- **stub_uninstall.sh**: This script requires the user's inputs and uninstalls all the stubs.
- **stub_install.sh**: This script requires the user's inputs and installs all the stubs.

Note

Currently, `stub_uninstall.sh` and `stub_install.sh` work.

Perform the following procedure to update the stub scripts for other NFs (NRF in this case):

1. Go to the stub folder.
2. From each script:
 - a. Remove the CNC Policy-specific stubs inputs (dns, amf, and ldap), and add the input code blocks for NRF-specific stubs.
 - b. For the stubs to uninstall, change the value of the `stubUninstallList` variable, and delete the variables for the CNC Policy-specific stubs below it.

Note

`stubUninstallList` contains the Helm release names of the common stubs that are deployed generally.

- c. Declare the variables for the NRF-specific stubs below the `stubUninstallList` line.
- d. Remove the Helm uninstallation commands of the policy-specific stubs, and add the Helm uninstallation commands of the NRF-specific stubs.
- e. For the stubs to install, change the value of the `stubInstallList` variable, and delete the variables for the CNC Policy-specific stubs below it.

Note

`stubInstallList` contains the Helm release names of the common stubs that are deployed generally.

- f. Declare the variables for the NRF-specific stubs below the `stubInstallList` line.
- g. Remove the Helm installation commands of the CNC Policy-specific stubs, and add the Helm installation commands of the NRF-specific stubs.

2.5.5 Running ATS and Stub Deployment Scripts

Perform the following procedure to run ATS and stub deployment scripts:

Note

If you want to take a backup of the custom folders or Jenkins jobs and user's configuration or both, run the `ats_backup.sh` script.

1. Run the `ats_install.sh` script to install the new release ATS (values.yaml of the ATS Helm chart must be updated before this step).
2. Run the `ats_restore.sh` script to restore the new ATS pipeline and view configuration.

Note

- You might perform the manual steps required for the restore script.
- You must copy all the necessary changes to the new release ATS from the last release ATS. To get the changes in the last release, you must refer to the custom folders in the last release ATS backup on the system with an existing backup using `ats_backup.sh` before this step.
- You can remove the last release ATS pod using the `ats_uninstall.sh` script while continuing to retain the last release PVC. You can use the last release PVC to port backward. Delete the last release PVC when you do not require the backward porting.

3. Run the `stub_install.sh` script to install all the new release stubs values.yaml of the stub Helm charts must be updated before this step.
4. Run the `stub_uninstall.sh` script to uninstall all the last release stubs.

2.6 ATS System Name and Version Display on the ATS GUI

This feature displays the ATS system name and version on the ATS GUI.

You can log in to the ATS application using the login credentials to view the following:

- ATS system name: Abbreviated product name followed by NF name.
- ATS Version: Release version of ATS.

Figure 2-19 ATS System Name and Version

The screenshot shows the Oracle Communications Cloud Native Core ATS GUI. The header includes the Oracle logo, a search bar, and user information (scpuser). The main content area displays the system name "CNCATS SCP : 23.2.1" and the version "Automated Test Suite". Below this, there is a table with columns: S, W, Name, Last Success, Last Failure, Last Duration, and Fav. The table lists three items: SCP-NewFeatures, SCP-Performance, and SCP-Regression, all with "N/A" for Last Success and Last Failure, and "N/A" for Last Duration. The left sidebar contains navigation links: New Item, People, Build History, My Views, and Open Blue Ocean. The bottom section shows the Build Queue and Build Executor Status.

S	W	Name	Last Success	Last Failure	Last Duration	Fav
...	...	SCP-NewFeatures	N/A	N/A	N/A	▶ ☆
...	...	SCP-Performance	N/A	N/A	N/A	▶ ☆
...	...	SCP-Regression	N/A	N/A	N/A	▶ ☆

2.7 ATS Tagging Support

The ATS Tagging Support feature assists in running the feature files after filtering features and scenarios based on tags. Instead of manually navigating through several feature files, the user can save time by using this feature.

The GUI offers the following four options for selecting tag types:

- **Feature_Include_Tags:** The features that contain either of the tags available in the **Feature_Include_Tags** field are considered for tagging.
 - For example, "cne-common", "config-server". All the features that have either "cne-common" or "config-server" tags are taken into consideration.
- **Feature_Exclude_Tags:** The features that contain neither of the tags available in the **Feature_Exclude_Tags** field are considered for tagging.
 - For example, "cne-common", "config-server". All the features that have neither "cne-common" nor "config-server" as tags are taken into consideration.
- **Scenario_Include_Tags:** The scenarios that contain either of the tags available in the **Scenario_Include_Tags** field are considered.
 - For example, "sanity", "cleanup". The scenarios that have either "sanity" or "cleanup" tags are taken into consideration.
- **Scenario_Exclude_Tags:** The features that contain neither of the tags available in the **Scenario_Exclude_Tags** field are considered.
 - For example, "sanity", "cleanup". The scenarios that have neither "sanity" nor "cleanup" as tags are taken into consideration.

Filter with Tags

The procedure to filter feature files and scenarios based on tags are as follows:

1. On the NF home page, click any new feature or regression pipeline, where you want to use this feature.
2. In the left navigation pane, click **Build with Parameters**. The following image appears.

Figure 2-20 Filter with Tags

Select_Option

☒ All

☐ Single/MultipleFeatures

FilterWithTags

No ▾

3. Select **Yes** under **FilterWithTags**. The result shows four input fields.

Figure 2-21 Types of Tags

FilterWithTags

Yes ▾

Feature_Include_Tags

Feature_Exclude_Tags

Scenario_Include_Tags

Scenario_Exclude_Tags

The default value of **FilterWithTags** field is "No".

4. The input fields serve as a search or filter, displaying all tags that match the prefix entered. You can select one or multiple tags.

Figure 2-22 Tags Matching with Entered Prefix

5. Select the required tags from the different tags list and click **Submit**.

The specified feature-level tags are used to filter out features that contain any one of the include tags and none of the exclude tags. Here, any or both the fields may be left empty. All features are automatically taken into consideration when both fields are empty.

The scenario level tags are used to filter out the scenarios from the features filtered above. Only scenarios with any of the include tags and none of the exclude tags are considered. Any or both fields can be empty. When both fields are empty, all the scenarios from the above filtered feature files are considered.

Note

- If you select the Select_Option as 'All', all the displayed features and scenarios will run.
- If you select the Select_Option as 'Single/MultipleFeatures', it enables you to select some features, and only those features and respective scenarios are going to run.

2.7.1 Combination of Tags and their Results

The combination of tags and expected results are as follows.

Table 2-4 Result of Filtered Tags

Feature_Include	Feature_Exclude	Scenario_Include	Scenario_Exclude	Results
-	-	-	-	All the features and scenarios are taken into consideration.

Table 2-4 (Cont.) Result of Filtered Tags

Feature_Include	Feature_Exclude	Scenario_Include	Scenario_Exclude	Results
"abc","def"	-	-	-	Features with either "abc" or "def" tags and all scenarios from the filtered features are taken into consideration.
-	"abc","def"	-	-	All the features with neither "abc" nor "def" tags and all scenarios from the filtered features are taken into consideration.
-	-	"sanity","cne"	-	Scenarios with either "sanity" or "cne" tags and features having these scenarios are taken into consideration.
-	-	-	"sanity","cne"	Scenarios with neither "sanity" nor "cne" tags and features having these filtered scenarios are taken into consideration.
"abc","def"	"ghi"	-	-	Features with either "abc" or "def" tags but without the "ghi" tag and all scenarios from filtered features are taken into consideration.
"abc","def"	-	"sanity","cne"	-	Scenarios only with either "sanity" or "cne" tags and only features that contain these scenarios and have either "abc" or "def" as feature tags are taken into consideration.
"abc","def"	-	-	"sanity","cne"	Scenarios with neither "sanity" nor "cne" tags and only features that contain the filtered scenarios and have either "abc" or "def" feature tags are taken into consideration.
-	"ghi"	"sanity","cne"	-	Features without the "ghi" tag and scenarios with either "sanity" or "cne" tags from the filtered features are taken into consideration.

Table 2-4 (Cont.) Result of Filtered Tags

Feature_Include	Feature_Exclude	Scenario_Include	Scenario_Exclude	Results
-	"ghi"	-	"sanity","cne"	Features without the "ghi" tag and scenarios without the "sanity" and "cne" tags from filtered features are taken into consideration.
-	-	"sanity","cne"	"cleanup"	Scenarios with either the "sanity" or "cne" tags and without the "cleanup" tag and features with filtered scenarios are taken into consideration.
"abc","def"	"ghi"	"sanity","cne"	-	Scenarios with either the "sanity" or "cne" tags and features that have these scenarios and have either the "abc" or "def" tags but not the "ghi" tag are taken into consideration.
"abc","def"	-	"sanity","cne"	"cleanup"	Scenarios with either the "sanity" or "cne" tags and without the "cleanup" tag, and features having the filtered scenarios and having the feature tags either "abc" or "def" are taken into consideration.
"abc","def"	"ghi"	-	"cleanup"	Scenarios without the tag "cleanup", and features with filtered scenarios and having either "abc" or "def" as feature tags but not the "ghi" tag are taken into consideration.
-	"ghi"	"sanity","cne"	"cleanup"	Scenarios with either the "sanity" or "cne" tags and without the "cleanup" tag, and features with filtered scenarios and not the tag "ghi," are taken into consideration.

Table 2-4 (Cont.) Result of Filtered Tags

Feature_Include	Feature_Exclude	Scenario_Include	Scenario_Exclude	Results
"abc","def"	"ghi"	"sanity","cne"	"cleanup"	Scenarios with either "sanity" or "cne" tags and without the "cleanup" tag, and features with filtered scenarios and feature tags either "abc" or "def" but without the tag "ghi" are taken into consideration.

Note

The tags mentioned in the table are just examples; they may or may not be actually used.

2.8 Custom Folder Implementation

The Custom Folder Implementation feature allows the user to update, add, or delete test cases without affecting the original product test cases in the new features, regression, and performance folders. The implemented custom folders are cust_newfeatures, cust_regression, and cust_performance. The custom folders contain the newly created, customised test cases.

Initially, the product test case folders and custom test case folders will have the same set of test cases. The user can perform customization in the custom test case folders, and ATS always runs the test cases from the custom test case folders. If the option "Configuration_Type" is present on the GUI, the user needs to set its value to "Custom_Config" to populate test cases from the custom test case folders.

Figure 2-23 Custom Config Folder

Summary of Custom Folder Implementation

- Separate folders such as cust_newfeatures, cust_regression, and cust_performance are created to hold the custom cases.
- The prepackaged test cases are available in the newfeature and regression Folder.
- The user copies the required test cases to the cust_newfeatures and cust_regression folders, respectively.

- Jenkins always points to the cust_newfeatures and cust_regression folders to populate them in the menu.
If someone initially launches ATS, they will not see any test cases in the menu if the cust folders are not populated. To avoid this, it is recommended to prepopulate both the folders, cust and original, and ask the user to modify only the cust folder if needed.

Figure 2-24 Summary of Custom Folder Implementation

2.9 Single Click Job Creation

With the help of Single Click Job Creation feature, ATS users can easily create a job to run TestSuite with a single click.

2.9.1 Configuring Single Click Job

Prerequisite: The network function specific user should have 'Create Job' access.

Perform the following procedure to configure the single-click feature:

- Log in to ATS using network function specific log-in credentials..
- Click **New Item** in the left navigation pane of the ATS application. The following page appears:

Figure 2-25 New Item Window

3. In the **Enter an item name** text box, enter the job name. Example: <NF-Specific-name>-NewFeatures.
4. In the **Copy from** text box, enter the actual job name for which you need single-click execution functionality. Example: <NF-Specific-name>-NewFeatures.
5. Click **OK**. You are automatically redirected to edit the newly created job's configuration.
6. Under the **General** group, deselect the **This Project is Parameterised** option.
7. Under the **Pipeline** group, make the corresponding changes to remove the 'Active Choice Parameters' dependency.
8. Provide the default values for the **TestSuite, SUT, Select_Option, Configuration_Type**, and other parameters, as required, on the **BuildWithParameters** page.
Example: Pipeline without Active Choice Parameter Dependency

```
node ('built-in'){
    //a = SELECTED_NF      b = PCF_NAMESPACE      c = PROMSVC_NAME      d
= GOSTUB_NAMESPACE
    //e = SECURITY        f = PCF_NFINSTANCE_ID    g = POD_RESTART_TIME    h
= POLICY_TIME
    //i = NF_NOTIF_TIME   j = RERUN_COUNT        k = INITIALIZE_TEST_SUITE
l = STUB_RESPONSE_TO_BE_SET
    //m = POLICY_CONFIGURATION_ADDITION          n = POLICY_ADDITION
o = NEXT_MESSAGE
    //p = PROMSVCIP      q = PROMSVCPORT          r = TIME_INT_POD_DOWN    s
= POD_DOWN_RETRIES
    //t = TIME_INT_POD_UP    u = POD_UP_RETRIES    v = ELK_WAIT_TIME    w =
ELK_HOST
    //x = ELK_PORT    y = STUB_LOG_COLLECTION    z = LOG_METHOD    A =
enable_snapshot    B = svc_cfg_to_be_read    C = PCF_API_ROOT
```

//Description of Variables:

```
//SELECTED_NF : PCF
//PCF_NAMESPACE : PCF Namespace
//PROMSVC_NAME : Prometheus Server Service name
//GOSTUB_NAMESPACE : Gostub namespace
//SECURITY : secure or unsecure
//PCF_NFINSTANCE_ID : nfInstanceId in PCF application-config config map
//POD_RESTART_TIME : Greater or equal to 60
//POLICY_TIME : Greater or equal to 120
//NF_NOTIF_TIME : Greater or equal to 140
//RERUN_COUNT : Rerun failing scenario count
//TIME_INT_POD_DOWN : The interval after which we check the POD status
if its down
    //TIME_INT_POD_UP : The interval after which we check the POD status
if its UP
    //POD_DOWN_RETRIES : Number of retry attempt in which will check the
pod down status
    //POD_UP_RETRIES : Number of retry attempt in which will check the
pod up status
    //ELK_WAIT_TIME : Wait time to connect to Elastic Search
    //ELK_HOST : Elastic Search HostName
    //ELK_PORT : Elastic Search Port

    //LOG_METHOD : To select Log collection method either elasticsearch or
```

```

kubernetes
    //enable_snapshot: Enable or disable snapshots that are created at the
start and restored at the end of each test run
    //svc_cfg_to_be_read: Timer to wait for importing service
configurations
    //PCF_API_ROOT: PCF_API_ROOT information to set Ingress gateway
service name and port
    withEnv([
        'TestSuite=NewFeatures',
        'SUT=PCF',
        'Select_Option=All',
        'Configuration_Type=Custom_Config'
    ]){
    sh '''
        sh /var/lib/jenkins/ocpcf_tests/preTestConfig-NewFeatures-PCF.sh \
        -a PCF \
        -b ocpcf \
        -c occne-prometheus-server \
        -d ocpcf \
        -e unsecure \
        -f fe7d992b-0541-4c7d-ab84-c6d70b1b0123 \
        -g 60 \
        -h 120 \
        -i 140 \
        -j 2 \
            -k 0 \
            -l 1 \
            -m 1 \
            -n 15 \
            -o 1 \
            -p occne-prometheus-server.occne-infra\
            -q 80\
            -r 30\
            -s 5\
            -t 30\
            -u 5\
            -v 0\
            -w occne-elastic-elasticsearch-master.occne-infra\
            -x 9200\
            -y yes\
            -z kubernetes\
            -A no\
            -B 15\
            -C ocpcf-occpn-ingress-gateway:80\

        '''
        load "/var/lib/jenkins/ocpcf_tests/jenkinsData/Jenkinsfile-Policy-
NewFeatures"
    }
}

```

9. Click **Save**. The ATS application is ready to run TestSuite with 'SingleClick' using the newly created job.

2.10 Managing Final Summary Report, Build Color, and Application Log

This feature displays an overall execution summary, such as the total run count, pass count, and fail count.

Supports Implementation of Total-Features

ATS supports implementation of **Total-Features** in the final summary report. Based on the rerun value set, the **Final Result** section in the final summary report displays the Total-Features output.

- If rerun is set to 0, the test result report shows the following result:

Figure 2-26 Total-Features = 1, and Rerun = 0

```
+ rerun=0
+ sh report.sh 0
Final Result:-
Total-Features RUN 1, PASS 1, FAIL 0
```

- If rerun is set to non-zero, the test result report shows the following result:

Figure 2-27 Total-Features = 1, and Rerun = 2

```
+ rerun=2
+ sh report.sh 2
Initial Run :-
Features RUN 1, PASS 0, FAIL 1

1st Rerun:-
Features RUN 1, PASS 0, FAIL 1

2nd Rerun:-
Features RUN 1, PASS 0, FAIL 1

Final Result:-
Total-Features RUN 1, PASS 0, FAIL 1
```

Changes After Parallel Test Execution Framework Feature Integration

After incorporating the Parallel Test Execution feature, the following results were obtained:

Final Summary Report Implementations

Figure 2-28 Group Wise Results

```

*****Stage: stage1 Group: group3 Result*****
Initial Run :-

Features RUN 1, PASS 0, FAIL 1

2nd Rerun:-
Features RUN 1, PASS 0, FAIL 1

Final Result:-
Total-Features RUN 1, PASS 0, FAIL 1

```

Implementing Build Colors

ATS supports implementation of build color. The details are as follows:

Table 2-5 Build Color Details

Rerun Values	Rerun set to zero		Rerun set to non-zero		
Status of Run	All Passed in Initial Run	Some Failed in Initial Run	All Passed in Initial Run	Some Passed in Initial Run, Rest Passed in Rerun	Some Passed in Initial Run, Some Failed Even After Rerun
Build Status	SUCCESS	FAILURE	SUCCESS	SUCCESS	FAILURE
Pipeline Color	GREEN	Execution Stage where test cases failed shows YELLOW color, rest of the successful stages are GREEN.	GREEN	GREEN	Execution Stage where test cases failed shows YELLOW color, rest of the successful stages are GREEN
Status Color	BLUE	RED	BLUE	BLUE	RED

Changes After Integrating Parallel Test Execution Framework Feature

In sequential execution, the build color or overall pipeline status of any run was mainly dependent on the following parameters:

- the rerun count and the pass or fail status of test cases in the initial run
- the rerun count and the pass or fail status of test cases in the final run

For the parallel test case execution, the pipeline status also depends on another parameter, "Fetch_Log_Upon_Failure," which is given in the **build with parameters** page. If the parameter Fetch_Log_Upon_Failure is not there, its default value is considered "NO".

Table 2-6 Pipeline Status When Fetch_Log_Upon_Failure = NO

Rerun Values	Rerun set to zero		Rerun set to non-zero		
Passed/Failed	All Passed in Initial Run	Some Failed in Initial Run	All Passed in Initial Run	Some Passed in Initial Run, Rest Passed in Rerun	Some Passed in Initial Run, Some Failed Even After Rerun
Status	SUCCESS	FAILURE	SUCCESS	SUCCESS	FAILURE

Table 2-7 Pipeline Status When Fetch_Log_Upon_Failure = YES

Rerun Values	Rerun set to zero			Rerun set to non-zero		
Passed/Failed	All Passed in Initial Run	Some Failed in Initial Run and Failed in Rerun	Some Failed in Initial Run and Passed in Rerun	All Passed in Initial Run	Some Passed in Initial Run, Rest Passed in Rerun	Some Passed in Initial Run, Some Failed Even After Rerun
Status	SUCCESS	FAILURE	SUCCESS	SUCCESS	SUCCESS	FAILURE

Some common combinations of these parameters, such as `rerun_count`, `Fetch_Log_Upon_Failure`, and pass/fail status of test cases in initial and final run and the corresponding build colors are as follows:

- When `Fetch_Log_Upon_Failure` is set to YES and `rerun_count` is set to 0, test cases pass in the initial run. The pipeline will be green, and its status will show as blue.

Figure 2-31 `Fetch_Log_Upon_Failure` is set to YES and `rerun_count` is set to 0, test cases pass

- When `Fetch_Log_Upon_Failure` is set to YES and `rerun_count` is set to 0, test cases fail on the initial run but pass during the rerun. The initial execution stage is yellow and all subsequent successful stages will be green, and the status will be blue.

Figure 2-32 Test Cases Fail on the Initial Run but Pass in the Rerun

- When `Fetch_Log_Upon_Failure` is set to YES and `rerun_count` is set to 0, test cases fail in both the initial and the rerun. Execution stages will show as yellow, all other successful stages will be shown as green, and the overall pipeline status will be red.

Figure 2-33 Test Cases Fail in Both the initial and the Rerun

- When Fetch_Log_Upon_Failure is set to YES and the rerun count is set to non-zero. If all of the test cases pass in the first run, no rerun will be initiated because the cases have already been passed. The pipeline will be green, and the status will be indicated in blue.

Figure 2-34 All of the Test cases Pass in the Initial Run

- When Fetch_Log_Upon_Failure is set to YES and the rerun count is set to non-zero. If some of the test cases fail in the initial run and the remaining ones pass in one of the remaining reruns, then the initial test case execution stages will show as yellow, the remaining stages as green, and the overall pipeline status as blue.

Figure 2-35 Test Cases Fail in the Initial Run and the Remaining Ones Pass

- When Fetch_Log_Upon_Failure is set to YES and the rerun count is set to non-zero. If some of the test cases fail in the initial run and the remaining ones fail in all the remaining reruns, the stages of test case execution will be shown in yellow, the remaining stages in green, and the overall pipeline status in red.

Figure 2-36 Test Cases Fail in the Initial and Remaining Reruns

- Whenever any of the multiple Behave processes that are running in the ATS are exited without completion, the stage in which the process exited and the consolidated output stage are shown as yellow, and the overall pipeline status will be yellow. Also in the consolidated output stage, near the respective stage result, the exact run in which the Behave processes exited without completion will be printed.

Figure 2-37 Stage View When Behave Process is Incomplete

Figure 2-38 Consolidated Report for a Group When a Behave Process was Incomplete

Implementing Application Log

ATS automatically fetches the SUT Debug logs during the rerun cycle if it encounters any failures and saves them in the same location as the build console logs. The logs are fetched for the rerun time duration only using the timestamps. If, for some microservices, there are no log entries in that time duration, it does not capture them. Therefore, the logs are fetched only for the microservices that have an impact or are associated with the failed test cases.

Location of SUT Logs: /var/lib/jenkins/.jenkins/jobs/PARTICULAR-JOB-NAME/builds/BUILD-NUMBER/date-timestamp-BUILD-N.txt

Note

The file name of the SUT log is added as a suffix with the date, timestamp, and build number (for which the logs are fetched). These logs share the same retention period as build console logs, set in the ATS configuration. It is recommended to set the retention period to optimal owing to the Persistent Volume Claim (PVC) storage space availability.

2.11 Lightweight Performance

The Lightweight Performance feature allows you to run performance test cases. In ATS, a new pipeline known as "<NF>-Performance", where NF stands for Network Function, is introduced, for example, SLF-Performance.

Figure 2-39 Sample Screen: UDR Home Page

S	W	Name	Last Success	Last Failure	Last Duration
...	...	SLF-HealthCheck	N/A	N/A	N/A
...	...	SLF-NewFeatures	N/A	N/A	N/A
...	...	SLF-Performance	N/A	N/A	N/A
...	...	SLF-Regression	N/A	N/A	N/A
...	...	UDR-HealthCheck	N/A	N/A	N/A
...	...	UDR-NewFeatures	N/A	N/A	N/A
...	...	UDR-Regression	N/A	N/A	N/A

The <NF>-Performance pipeline verifies from 500 to 1k TPS (Transactions per Second) of traffic using the http-go tool, a tool used to run the traffic on the backend. It also helps to monitor the CPU and memory of microservices while running lightweight traffic.

The duration of the traffic run can be configured on the pipeline.

2.11.1 Configure <NF>-Performance Pipeline

Perform the following to configure the performance pipeline:

1. On the NF home page, click **<NF>-Performance** pipeline, and then click **Configure**. The **General** tab appears. The user must wait for the page to load completely.
2. Click the **Advanced Project Options** tab. Scroll down to reach the **Pipeline** configuration section.

Figure 2-40 Advanced Project Options

15   //PROVSVC_NAME : Prometheus Server Service name
16   //GOSTUB_NAMESPACE : Gostub namespace

```

Save Apply

- Update the configurations as per your NF requirements and click **Save**. The **Pipeline <NF>-Performance** page appears.
- Click **Build Now**. This triggers lightweight traffic for the respective network function. For more information, see [#unique_65](#).

2.12 Modifying Login Password

You can log in to the ATS application using the default login credentials. The default login credentials are shared for each NF in the respective chapter of this guide.

Perform the following procedure to modify the default password:

- Log in to the ATS application using the default login credentials. The home page of the respective NF appears with its preconfigured pipelines as follows:

Figure 2-41 Sample Screen: NRF Home Page

Oracle Communications Cloud Native Core
Automated Test Suite

S	W	Name	Last Success	Last Failure	Last Duration
...	...	NRF-NewFeatures	N/A	N/A	N/A
...	...	NRF-Performance	N/A	N/A	N/A
...	...	NRF-Regression	N/A	N/A	N/A

The following page appears:

Figure 2-43 Logged-in User Details

The screenshot shows the 'Logged-in User Details' page. The left sidebar contains links for People, Status, Routes, Configure, My Views, and Credentials. The main content area contains fields for Full Name, Description, API Token, Credentials, E-mail, My Views, Notification URL, Password, SSH Public Keys, Session Termination, and Settings for search. The 'Password' section is highlighted with a red box.

4. In the Password section, enter the new password in the **Password** and **Confirm Password** fields.
5. Click **Save**.
A new password is set for you.

2.13 Parallel Test Execution

Parallel test execution allows you to perform multiple logically grouped tests simultaneously on the same System Under Test (SUT) to reduce the overall execution time of ATS.

ATS currently runs all its tests in a sequential manner, which is time-consuming. With parallel test execution, tests can be run concurrently rather than sequentially or one at a time. Test cases or feature files are now separated into different folders, such as stages and groups, for concurrent test execution. Different stages, such as stage 1, stage 2, and stage 3, run the test

cases in a sequential order, and each stage has its own set of groups. Test cases or feature files available in different groups operate in parallel. When all the groups within one stage have completed their execution, only then the next stage will start the execution.

Pipeline Stage View

The pipeline stage view appears as follows:

Figure 2-44 Pipeline Stage View

Stage View

Pipeline Blue Ocean View

Blue Ocean is a Jenkins plugin that provides a better representation of concurrent execution with stages and groups. The pipeline blue ocean view appears as follows:

Figure 2-45 Pipeline Blue Ocean View

Impact on Other Framework Features

The integration of the parallel test framework feature has an impact on the following framework features. See the following sections for more details:

- [Application Log Collection](#)
- [ATS API](#)
- [Managing Final Summary Report, Build Color, and Application Log](#)
- [PCAP Log Collection](#)

2.13.1 ATS GUI Page Changes

This section describes the changes to the ATS GUI page to trigger a build.

Changes in ATS GUI Page to Trigger a Build

The feature name, file name, and test case name are displayed under their stage and group names.

Figure 2-46 To Trigger a Build

2.13.2 ATS Console Log Changes

This section describes the changes to the ATS console log. The ATS console log contains logs of all the stages and groups. For more details, see [Downloading or Viewing Individual Group Logs](#).

- A test case's stage and group names are listed in the logger statements for that test case.

Figure 2-47 Logger Statement

```
2022-12-06 09:34:53,762[32m INFO LOG: stage2.group1 STEP:5453 [0m] [32m10.233.109.13[0m
2022-12-06 09:34:53,762[32m INFO LOG: stage2.group1 STEP:5454 [0m] [32mudm1svc.scpsvc.svc.galaxy[0m
2022-12-06 09:34:53,893[32m INFO LOG: stage2.group1 STEP:5459 [0m] [32m{"url":"/USEast/nudm-uecm/v1/imsi
```

- When a test case fails, a list of test cases running in parallel gets printed to make the debugging easier. The name of the test case and the absolute path to the feature file it belongs to are listed in this list.

Figure 2-48 Absolute Path of Feature File

```

2022-12-06 11:27:19,253[32m      INFO LOG.stage1.group3.CleanUP:2317 [0m] [32mBelow feature(s)/scenario(s) were found
to be running in parallel at the time of failure:
{
  "feature_path": "/var/lib/jenkins/ocscp_tests/features/regression/release16features/allfeatures/stage1/group3
/SCP_Registration_With_PLMNList.feature",
  "scenario_name": "Static configuration to NRF for all nfType"
}
{
  "feature_path": "/var/lib/jenkins/ocscp_tests/features/regression/release16features/allfeatures/stage1/group1
/Version_support.feature",
  "scenario_name": "Scenario-1_To test Forward route for notification request UECM AMF Registration messages with
3gpp-Sbi-Target-apiRoot and 3gpp-sbi-routing-binding header bl=nfset, when the apiVersionInUri is set to v2 and the
message is also sent to v2"
}

```

- The test result summary contains a summary for each group and an overall summary, along with the details of failing scenarios (stage-groupwise) and the total time taken by any pipeline execution. For further information, see the [Final Summary Report, Build Colour Changes](#).

2.13.3 Downloading or Viewing Individual Group Logs

To download individual group logs:

- On the Jenkins pipeline page, click **Open Blue Ocean** in the left navigation pane.

Figure 2-49 Jenkins Pipeline Page

- Click the desired build row on the Blue Ocean page.

Figure 2-50 Run the Build

STATUS	RUN	COMMIT	MESSAGE	DURATION	COMPLETED
✖	7	—	Started by user scpuser	52m 59s	19 hours ago
✖	6	—	Started by user scpuser	1h 27m 1s	20 hours ago
✖	5	—	Started by user scpuser	41m 24s	a day ago
✔	4	—	Started by user scpuser	41s	a day ago
✖	3	—	Replayed #2	4m 24s	a day ago
✔	2	—	Started by user scpuser	3m 29s	a day ago
✔	1	—	Started by user scpuser	6m 8s	a day ago

- The selected build appears. The diagram displays the order in which the different stages, or groups, are executed.

Figure 2-51 Stage Execution

- Click the desired group to download the logs.

Figure 2-52 Executed Groups

- Click the **Download** icon on the bottom right of the pipeline. The log for the selected group is downloaded to the local system.

Figure 2-53 Download Logs

- To view the log, click the **Display Log** icon. The logs are displayed in a new window.

Figure 2-54 Display Logs

Viewing Individual Group Logs without using Blue Ocean

There are two alternate ways to view individual group logs:

- Using Stage View
 - On the Jenkins pipeline page, hover the cursor over the group in stage view to view the logs.
 - A pop-up with the label "Logs" will appear. Click on it.
 - There will be a new pop-up window. It contains many rows, where each row corresponds to the execution of one Jenkins step.
 - Click on the row labelled **Stage: stage_name>."Group: <group_name> Run test cases** to view the log for this group's execution.

- Click on the row labelled **Stage: stage_name>." "group_name> Rerun** to display the re-run logs.
- Using Pipeline Steps Page
 - On the Jenkins pipeline page, under the **Build History** dropdown, click on the desired build number.
 - Click the **Pipeline Steps** button on the left pane.
 - A table with columns for step, arguments, and status appears.
 - Under the Arguments column, find the label for the desired stage and group.
 - Click on the step with the label **Stage: <stage_name> Group: <group_name> Run test** cases under it or click the **Console output** icon near the status to view the log for this group execution.
 - To see rerun logs, find the step with the label **Stage: <stage_name> Group: <group_name> Rerun** under it.

2.14 Parameterization

This feature allows you to provide or adjust values for the input and output parameters needed for the test cases to be compatible with the SUT configuration. You can update or adjust the key-value pair values in the `global.yaml` and `feature.yaml` files for each of the feature files so that they are compatible with SUT configuration. In addition to the existing custom test case folders (Cust New Features, Cust Regression, and Cust Performance), this feature enables folders to accommodate custom data, default product configuration, and custom configuration. You can maintain multiple versions or copies of the custom data folder to suit varied or custom SUT configurations. With this feature, the ATS GUI has the option to either execute test cases with the default product configuration or with a custom configuration.

This feature enables you to perform the following tasks:

- Define parameters and assign or adjust values to make them compatible with SUT configuration.
- Execute test cases either with default product configurations or custom configurations and multiple custom configurations to match varied SUT configurations.
- Assign or adjust values for input or output parameters through custom or default configuration yaml files (key-value pair files).
- Define or adjust the input or output parameters for each feature file with its corresponding configuration.
- Create and maintain multiple configuration files to match multiple SUT configurations.

Figure 2-55 SUT Design Summary

In the folder structure:

- The Product Config folder contains default product configuration files (feature-wise yaml per key-value pair), which are compatible with default product configuration.
- New features, Regression and Performance, Data folder, and Product Config folders are replicated or copied into custom folders and delivered as part of the ATS package in every release.
- You can customize custom folders by:
 - Removing test cases not needed or as appropriate for your use.
 - Adding new test cases as needed or as appropriate for your use.
 - Removing or adding data files in the cust_data folder or as appropriate for your use.
 - Adjusting the parameters or values in the key-value pair per yaml file in the custom config folder for test cases to run or pass with a custom configured SUT.
- The product folders are always intact (unchanged) and you can update the Custom folders
- You can maintain multiple copies of Custom Configurations and bring them to use as needed or as appropriate for the SUT configuration.

Figure 2-56 Folder Structure

2.14.1 Running Test Cases

Enable

Rename or copy the Cust Config [1/2/3/N] folder to the Cust Config folder in order for ATS to run the test cases with a specific custom configuration. When the option to run test cases with custom configuration is chosen, it always points to the Cust Config folder.

To Run ATS Test Cases

ATS has the option to run test cases with default or custom configuration.

- If custom configuration is selected, then test cases from custom folders are populated on the ATS UI, and custom configuration is applied to them through the key-value pair per yaml file defined or present in the "Cust Config" folder.
- If product configuration is selected, then the test cases from product folders are populated on the ATS UI, and product configuration is applied to them through key-value pairs per yaml file defined or present in the Product Config folder.

2.15 PCAP Log Collection

PCAP Log Collection allows collecting the NF, SUT, or PCAP logs from the debug tool sidecar container. This feature can be integrated and delivered as a standalone or along with the Application Log Collection feature. For information, see [Application Log Collection](#).

PCAP Log Integration

1. The Debug tool should be enabled on SUT Pods while deploying the NF. The name of the Debug container must be "tools".
For example, in SCP, the debug tool should be enabled for all the SCP microservice pods.
2. Update the following parameters in the values.yaml file, under the resource section, with ATS minimum resource requirements:
 - a. CPU: 3
 - b. memory: 3Gi
3. On the home page, click any new feature or regression pipeline.
4. In the left navigation pane, click **Build with Parameters**.
5. Select YES from the drop-down menu of **Fetch_Log_Upon_Failure**.
6. If option **Log_Type** is available, select value **PcapLog [Debug Container Should be Running]** for it.
7. Select **PcapLog [Debug Container Should be Running]** to activate PCAP Log Collection in ATS-NF.
The following Build with Parameters page appears when only the PCAP logs feature has been integrated.

Figure 2-59 PCAP Logs Selection Option

Oracle Communication Automated Test Suite - UDR

Fetch_Log_Upon_Failure	YES ▾
Build	

8. After the build execution is complete, go into the ATS pod, then navigate to below path to find the pcaplogs: `.jenkins/jobs/<Pipeline Name>/builds/<build number>/`
For example, `.jenkins/jobs/SCP-Regression/builds/5/`

Pcaplogs is present in zip form. Unzip it to get the log files.

The following Build with Parameters page appears when both application and PCAP logs have been integrated.

Log_Level	Not Applicable ▾
Build	

2.15.1 Application Log Collection and Parallel Test Execution Integration

A new stage, "Logging/Rerun", has been added at the end of the Execute-Tests stage to collect rerun logs, such as applog and PCAP logs, by running the failed test cases in a sequence.

Figure 2-61 Logging/Rerun new stage**Stage View**

	Preparation	Execute-Tests	1st Stage	1st Stage 1st Group	1st Stage 2nd Group	1st Stage 3rd Group	2nd Stage	2nd Stage 1st Group	2nd Stage 2nd Group	3rd Stage	3rd Stage 1st Group	Logging / Rerun	Archive logs	Consolidated Output	Declarative: Post Actions
Average stage times: (Average full run time: ~54s)	5s	59ms	1s	31s	2s	26s	1s	999ms	1s	1s	997ms	33s	487ms	2s	6s
992 Feb 07 14:10 No Changes	5s	46ms	1s	1s	1s	27s	1s	1s	1s	1s	887ms	2s	580ms	2s	5s

If the `Fetch_Log_Upon_Failure` parameter is set to YES and if any test case fails in the initial run, then:

- The failed test case reruns and log collection start in the Logging/Rerun stage after the initial run is completed for all the test cases.
- The logs from the initial execution are collected, but they might be incorrect.
- Even if the rerun parameter is set to 0, the failed test case reruns in the Logging/Rerun stage and the log is collected.
- If the `Fetch_Log_Upon_Failure` parameter is set to NO and if any test case fails in the initial run, then the failed test case rerun starts in the same stage after the initial execution is over for all the test cases in its group.

2.16 Persistent Volume for 5G ATS

The Persistent Volume (PV) feature allows ATS to retain historical build execution data, test cases, and ATS environment configurations.

ATS Packaging When Using Persistent Volume

- **Without the Persistent Volume option:** ATS package includes an ATS image with test cases.
- **With Persistent Volume option:** ATS package includes the ATS image and test cases separately. The new test cases are provided between the releases.
To support both with and without Persistent Volume options, test cases and execution job data are packaged in the ATS image as well as a tar file.

2.16.1 Processing Flow

First Time Deployment

Initially, when you deploy ATS, for example, the PI-A ATS pod, you use PVC-A, which is provisioned and mounted to the PI-A ATS pod. By default, PVC-A is empty. So, you have to copy the data (`ocslf_tests` and `jobs` folders) from the PI-A tar file to the pod after the pod is up and running. Then restart the PI-A pod. At this point, you can change the number of build logs to maintain in the ATS GUI.

Subsequent Deployments

When you deploy ATS for the subsequent time, for example, in a PI-B ATS pod, you use PVC-B, which is provisioned and mounted to the PI-B ATS pod. By default, the PVC-B is empty, and you have to copy the data (`ocslf_tests` and `jobs` folders) from the PI-B tar file to the pod after the pod is up and running. At this point, copy all the necessary changes to the PI-B pod from the PI-A pod and restart the PI-B pod. You can change the number of build logs to maintain in

the ATS GUI. After updating the number of builds, you can delete the PI-A pod and continue to retain the PVC-A. If you do not want backward porting, you can delete PVC-A.

2.16.2 Deploying Persistent Volume

Preinstallation Steps

1. Before deploying Persistent Volume, create a PVC in the same namespace where you have deployed ATS. You have to provide values for the following parameters to create a PVC:
 - PVC Name
 - Namespace
 - Storage Class Name
 - Size of the PV
2. Run the following command to create a PVC:

```
kubectl apply -f - <<EOF

apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  name: <Please Provide the PVC Name>
  namespace: <Please Provide the namespace>
  annotations:
spec:
  storageClassName: <Please Provide the Storage Class Name>
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: <Please Provide the size of the PV>
EOF
```

Note

It is recommended to suffix the PVC name with the release version to avoid confusion during subsequent releases. For example: ocats-slf-pvc-1.9.0

3. The output of the above command with parameters is as follows:

```
[cloud-user@atscne-bastion-1 templates]$ kubectl apply -f - <<EOF
>
> apiVersion: v1
> kind: PersistentVolumeClaim
> metadata:
>   name: ocats-slf-1.9.0-pvc
>   namespace: ocslf
>   annotations:
> spec:
>   storageClassName: standard
>   accessModes:
```

```
>         - ReadWriteOnce
>     resources:
>         requests:
>             storage: 1Gi
> EOF
```

The persistentvolumeclaim/ocats-slf-1.9.0-pvc is created.

4. To verify whether PVC is bound to PV and is available for use, run the following command:

```
kubectl get pvc -n <namespace used for pvc creation>
```

The output of the above command is as follows:

Figure 2-62 Verifying PVC

```
[cloud-user@atscne-bastion-1 templates]$ kubectl get pvc -n ocslf
NAME                STATUS    VOLUME                                     CAPACITY   ACCESS MODES   STORAGECLASS   AGE
ocats-slf-1.9.0-pvc Bound     pvc-1ee50daf-2eb7-4289-b541-51c111270513 1Gi         RWO            standard       8s
policy-pvc-test     Bound     pvc-d346d5c4-129e-4f13-8bd0-a7b7555e0e2f 1Gi         RWO            standard       31d
slf-pvc             Bound     pvc-0b0bce8c-b856-4e0e-b4d8-0f981250adbd 1Gi         RWO            standard       12d
```

Check that the STATUS is **Bound** and that the rest of the parameters, such as NAME, CAPACITY, ACCESS MODES, STORAGECLASS, and so on, are the same as specified in the PVC creation command.

Note

Do not proceed further if there is any issue with PVC creation. Contact your administrator to create a PV.

5. After creating persistent volume, change the following parameters in the values.yaml file to deploy persistent volume.
 - Set the **PVEnabled** parameter to "true".
 - Provide the value for the **PVClaimName** parameter. The PVClaimName value should be the same as the value used to create a PVC.

Postinstallation Steps

1. After deploying ATS, copy the <nf_main_folder> and <jenkins jobs> folders from the tar file to their ATS pod, and then restart the pod as a one-time activity.
 - a. Run the following command to extract the tar file:

```
ocats-<nf_name>-data-<release-number>.tgz
```

Note

The ats_data.tar file is the name of the tar file containing <nf_main_folder> and jobs folders. It can be different for different NFs.

- b. Run the following set of commands to copy the required folders:

```
kubectl cp ats_data/jobs <namespace>/<pod-name>:/var/lib/
jenkins/.jenkins/
```

```
kubectl cp ats_data/<nf_main_folder> <namespace>/<pod-name>:/var/lib/
jenkins/
```

- c. Run the following command to restart the pods as one-time activity:

```
kubectl delete po <pod-name> -n <namespace>
```

Note

Before running the following command, copy the changes done on the new release pod from the old release pod using the `kubectl cp` command.
[Applicable in the case of subsequent deployment only]

2. When the pod is up and running, log in to the ATS GUI and go to your NF specific pipeline. Click **Configure** in the left navigation pane. The **General** tab appears. Configure the **Discard old Builds** option. This option allows you to configure the number of builds you want to retain in the persistent volume.

Figure 2-63 Discard Old Builds

☒ Discard old builds

Strategy: Log Rotation

Days to keep builds:

if not empty, build records are only kept up to this number of days

Max # of builds to keep: 4

if not empty, only up to this number of build records are kept

Advanced...

Note

It is recommended to configure this option. If you do not input a value for this option, the application will take into account all builds, which could be a large number, and will completely consume the Persistent Volume.

2.16.3 Backward Porting

The following deployment steps apply to the old release of PVC-supported ATS Pod.

Prerequisite: You should have the old PVC that contains the old release of POD data.

Note

This procedure is for backward porting purposes only and should not be considered a subsequent release of the POD deployment procedure.

The deployment procedure for the old release PVC-supported ATS pod is the same; however, while deploying the ATS pod, you have to update the values.yaml file with the following:

- Change the **PVEnabled** parameter to "true".
- Provide the name of the old PVC as the value for parameter **PVClaimName**.

2.17 Test Results Analyzer

The Test Results Analyzer is a plugin available in ATS to view pipeline test results based on XML reports. It provides the test results report in a graphical format, which includes consolidated and detailed stack trace results in case of any failures. It allows you to navigate to each and every test.

The test result report shows any one of the following statuses for each test case:

- **PASSED:** If the test case passes.
- **FAILED:** If the test case fails.
- **SKIPPED:** If the test case is skipped.
- **N/A:** If the test cases are not executed in the current build.

2.17.1 Accessing Test Results Analyzer Feature

To access the test results analyzer feature:

1. From the NF home page, click any new feature pipeline or regression pipeline where you want to run this plugin.
2. In the left navigation pane, click **Test Results Analyzer**.

Figure 2-64 Test Results Analyzer Option

When the build completes, the test result report appears. A sample test result report is shown below:

Figure 2-65 Sample Test Result Report

Chart	Package/Class/Testmethod	Passed	Transitions	5	4	3	2	1
☐	features.cust_newfeatures.temp1.Binding_Service.Binding_Service	0% (0%)	0	FAILED	N/A	N/A	N/A	N/A

```

2.18 Support for Test Case Mapping and Count

The Test Case Mapping and Count feature displays the total number of features, test cases, or scenarios and their mapping to each feature in the ATS GUI.

2.18.1 Access Test Case Mapping and Count Feature

1. On the NF home page, click any new feature or regression pipeline where you want to use this feature.
2. In the left navigation pane, click **Build with Parameters**.
3. Select **All** from the Select_Option to view the TestCases details mapped to each feature.

Figure 2-70 Test Case Mapping

4. Select **Single/MultipleFeatures** from the Select_Option to view the the test cases details.

Figure 2-71 Test Cases Details When Select_Option is Single/MultipleFeatures

Pipeline Policy-Regression

This build requires parameters:

TestSuite
Regression
SUT
CL-POLICY

Select_Option
All
Single/MultipleFeatures

Features
☒ Binding_Service
☐ Diameter_GW_Error_Handling
☐ IMS_Emergency_Call
☐ Port_core_audit
☐ Request_AVP
☐ Time_Of_Day
☐ Charging_Servers
☐ Gx_Ldap_Lookup
☐ Operators
☐ Policy_Conditions_And_Actions
☐ Sanity
☐ VoLTE_Call_Flows

TestCases
Total Test Cases are : 6
Binding_Service
 • Binding_Service_Rx_IPv6_Binding
 • Binding_Service_Rx_IPv4_Binding
 • Binding_Service_Rx_Dual_Stack_Binding
 • Binding_Service_Multiple_Rx_Sess_IPv4_Binding
 • Binding_Service_Multiple_Rx_Sess_IPv6_Binding
 • Binding_Service_Multiple_Rx_Sess_Binding

Fetch_Log_Upon_Failure
YES

Build

2.19 Support for Transport Layer Security

Currently, ATS is accessible through HTTP, which can raise security risks.

With the support of the TLS feature, Jenkins servers have been upgraded to support HTTPS, ensuring a secure and encrypted connection when accessing the ATS dashboard.

To provide encryption, HTTPS uses an encryption protocol known as Transport Layer Security (TLS), which is a widely accepted standard protocol that provides authentication, privacy, and data integrity between two communicating computer applications.

Now, users can access the ATS GUI with the HTTPS protocol instead of the previously used HTTP protocol.

Figure 2-72 Access with TLS

Note

If this feature is not enabled before installation, HTTP will continue to operate.

3

Installing ATS for Different Network Analytics Suite Products

This section describes how to install ATS for different Network Analytics Suite products. It includes:

- [Installing ATS for NWDAF](#)
- [Installing ATS for OCNADD](#)

3.1 Installing ATS for NWDAF

This section describes the resource requirements and ATS installation procedures for NWDAF:

- [Software Requirements](#)
- [Environment Setup](#)
- [Resource Requirements](#)
- [Downloading the ATS Package](#)
- [Pushing the Images to Customer Docker Registry](#)
- [Configuring ATS](#)
- [Deploying NWDAF ATS in the Kubernetes Cluster](#)
- [Verifying ATS Deployment](#)
- [Creating and Verifying NWDAF Console Namespaces](#)

3.1.1 Software Requirements

This section describes the software requirements to install ATS for NWDAF. Install the following software bearing the versions mentioned in the table below:

Table 3-1 Software Requirements

Software	Version
Kubernetes	1.20.7, 1.21.7, 1.22.5
Helm	3.1.2, 3.5.0, 3.6.3, 3.8.0
Podman	2.2.1, 3.2.3, 3.3.1

Supported CNE versions are: Release 1.9.x ,1.10.x, and 22.1.x.

To verify the CNE version, run the following command:

```
echo $OCNE_VERSION
```

To verify the Helm and Kubernetes versions installed in the CNE, run the following commands:

- Verify Kubernetes version:

```
kubectl version
```

- Verify Helm version:

```
helm3 version
```

3.1.2 Environment Setup

This section describes steps to ensure the environment setup facilitates the correct installation of ATS for NWDAF.

Network Access

The Kubernetes cluster hosts must have network access to the following:

- Local docker image repository, where the OCATS NWDAF images are available.
To verify if the Kubernetes cluster hosts have network access to the local docker image repository, retrieve any image with tag name to check connectivity by running the following command:

```
docker pull <docker-repo>/<image-name>:<image-tag>
```

Where, `docker-repo` is the IP address or host name of the repository, `image-name` is the docker image name and `image-tag` is the tag the image used for the NWDAF pod.

- Local helm repository, where the OCATS NWDAF helm charts are available.
To verify if the Kubernetes cluster hosts have network access to the local helm repository, run the following command:

```
helm repo update
```

Client Machine Requirement

Listed below are the Client Machine requirements for a successful ATS installation for NWDAF:

- Network access to the Helm repository and Docker image repository.
- Helm repository must be configured on the client.
- Network access to the Kubernetes cluster.
- The environment settings to run the `kubectl` and `docker` commands. The environment should have privileges to create a namespace in the Kubernetes cluster.
- The Helm client must be installed. The environment should be configured such that the Helm install command deploys the software in the Kubernetes cluster.

cnDBTier Requirement

NWDAF supports cnDBTier in a vCNE environment. cnDBTier must be up and active in case of containerized CNE. For more information, see *Oracle Communications cnDBTier Installation, Upgrade, and Fault Recovery Guide*.

Note

If the environment has cnDBTier 23.2.0 installation, follow the instruction below:

- If cnDBTier 23.2.0 release is installed, set the `ndb_allow_copying_alter_table` parameter to 'ON' in the cnDBTier custom values `dbtier_23.2.0_custom_values_23.2.0.yaml` file and perform cnDBTier upgrade before install, upgrade, or any fault recovery procedure is performed for OCNWDAF. Set the parameter to its default value, 'OFF' once the activity is completed and perform the cnDBTier upgrade to apply the parameter changes.
- To perform cnDBTier upgrade, see *Oracle Communications Cloud Native Core, cnDBTier Installation, Upgrade, and Fault Recovery Guide*.

Oracle Communications Network Analytics Data Director (OCNADD) Requirements

Oracle Communications Network Analytics Data Director (OCNADD) serves as one of the data sources for the OCNWDAF. If OCNADD is configured as a data source, ensure the following prerequisites are met before OCNWDAF installation:

- OCNADD is setup and running.
- ACL feed is enabled on OCNADD as the required data source.
- Run OCNWDAF `gen_certs` script under `/scripts/gen_certs.sh`.

Note

Configure the ACL topic certificate from the OCNADD Kafka Cluster in the OCNWDAF Kafka Cluster to enable secure data flow between OCNADD and OCNWDAF.

For more information, see *Oracle Communications Network Analytics Data Director Installation, Upgrade, and Fault Recovery Guide*.

Analytics Database

This database is based on MySQL cluster and stores relational and time-series data. The relational data represents all the objects within the telecommunication network, such as UEs, slices, cells, NFs, and so on and their relationships with each other. The time-series data represents all the KPIs, measurements, and event data collected over time and used in streaming analytics and training ML models.

Note

The deployment of the Mysql Innodb cluster is based on the variable `dbConfigStatus` present in the `values.yaml` file under `/helmchart`.

For more information, see *Oracle Communications Network Analytics Data Director Installation, Upgrade, and Fault Recovery Guide*.

3.1.3 Resource Requirements

This section describes the ATS resource requirements for NWDAF.

NWDAF Pods Resource Requirements Details

This section describes the resource requirements, which are needed to deploy NWDAF ATS successfully. The following table describes the total resource usage for:

- NWDAF Suite
- NWDAF Notification Consumer Simulator

Table 3-2 NWDAF Pods Resource Requirements Details

Microservice	vCPUs Required per Pod	Memory Required per Pod (GB)	Storage PVC Required per Pod (GB)	Replicas (regular deployment)	Replicas (ATS deployment)	CPUs Required - Total	Memory Required - Total (GB)	Storage PVC Required - Total (GB)
ocn-ats-nwdaf-service	4	8	0	1	1	4	8	0
ocn-ats-nwdaf-notify-service	2	2	0	1	1	2	2	0

3.1.4 Downloading the ATS Package

Locating and Downloading ATS Images

To locate and download the ATS image from MOS:

1. Log in to [My Oracle Support](#) using the appropriate credentials.
2. Select the **Patches & Updates** tab.
3. In the **Patch Search Window**, click **Product or Family (Advanced)**.
4. Enter Oracle Communications Cloud Native Core Network Data Analytics Function in the **Product** field.
5. From the **Release** drop-down, select "**Oracle Communications Cloud Native Core Network Data Analytics Function <release_number>**" Where, <release_number> indicates the required release number of OCNWDAF.
6. Click **Search**. The **Patch Advanced Search Results** list appears.
7. Select the required ATS patch from the list. The Patch Details window appears.
8. Click **Download**. The File Download window appears.
9. Click the **<p*****>_<release_number>_Tekelec.zip** file to download the NWDAF ATS package file.
10. Extract the release package ZIP file. The package is named as *nwdaf-pkg-<marketing-release-number>.tgz*. For example, *nwdaf-pkg-23.4.0.0.tgz*.
11. Untar the NWDAF package file to the specific directory, *tar -xvf nwdaf-pkg-<marketing-release-number>.tgz*. The NWDAF directory has the following package structure:

```
# Root
- images
  - tar of images
```

- sha 256 of images
- troubleshooting/
 - nfDataCapture.sh
- ocn-nwdaf-helmChart/
 - helmChart
 - templates
 - charts
 - values.yaml
 - charts.yaml
 - nwdaf-pre-installer.tar.gz
 - simulator-helmChart
 - templates
 - charts
 - values.yaml
 - charts.yaml
- nwdaf-ats/
 - ocn-ats-nwdaf-tool
 - templates
 - ocnwdaftests
 - data
 - kafka_topic_template
 - perfgo_data
 - features
 - perfgo
 - regression
 - quality of service
 - steps

Figure 3-1 OCNWDAF Folder Structure

3.1.5 Pushing the Images to Customer Docker Registry

Follow the procedure described below to push the NWDAF ATS docker images to the docker repository:

Prerequisites

- Oracle Linux 8 environment
- NWDAF 23.4.0.0.0 package

Note

The NWDAF deployment package includes:

- Ready-to-use docker images in the images tar or zip file.
- Helm charts to help orchestrate Containers in Kubernetes.

The communication between NWDAF service pods is preconfigured in the Helm charts. The NWDAF ATS uses the following services:

Table 3-3 NWDAF ATS Services

Service Name	Docker Image Name	Image Tag
ocats-nwdaf	ocats-nwdaf	23.4.0.0.0
ocats-nwdaf-notify	ocats-nwdaf-notify	23.4.0.0.0

1. Verify the checksums of tarballs mentioned in file `Readme.txt`.
2. Run the following command to extract the contents of the tar file:

```
tar -xvf nwdaf-pkg-<marketing-release-number>.tgz
```

Or

To extract the files, run the command:

```
unzip nwdaf-pkg-<marketing-release-number>.zip
```

The `nwdaf-pkg-<marketing-release-number>.tar` file contains the following NWDAF ATS images:

- `ocats-nwdaf-notify`
 - `ocats-nwdaf`
3. Navigate to the folder path `./installer`, and extract the zip file. Run the following command:

```
unzip nwdaf-ats.zip
```

The zip folder contains the following files:

```
ocn-ats-nwdaf-tool
  nginx
  templates
ocnwdaf_tests
  data
  kafka_topic_template
  perfgo_data
  features
```

```
perfgo
regression
quality_of_service
steps
```

4. Run the following command to push the Docker images to the Docker Repository:

```
docker load --input <image_file_name.tar>
```

Example:

```
docker load --input images
```

5. Run the following command to push the NWDAF ATS Docker files to the Docker Registry:

```
docker tag <image-name>:<image-tag> <docker-repo>/<image-name>:<image-tag>
docker push <docker_repo>/<image_name>:<image-tag>
```

Where, <docker - repo> indicates the repository where the downloaded images can be pushed.

6. Run the following command to verify if the images are loaded:

```
docker images
```

7. Run the following command to push the Helm charts to the Helm repository:

```
helm cm-push --force <chart name>.tgz <helm repo>
```

3.1.6 Configuring ATS

This section describes how to configure ATS for NWDAF.

3.1.6.1 Creating and Verifying NWDAF Console Namespaces

This section explains how to create a new namespace or verify an existing namespace in the system.

Run the following command to verify if the required namespace exists in the system:

```
$ kubectl get namespaces
```

If the namespace exists, continue with the NWDAF ATS installation. If the required namespace is not available, create a namespace using the following command:

```
$ kubectl create namespace <required namespace>
```

For example:

```
$ kubectl create namespace ocats-nwdaf
```

Naming Convention for Namespaces:

The naming convention for namespaces must:

- start and end with an alphanumeric character

- contain a maximum of "63" characters
- contain only alphanumeric characters or '-'

3.1.6.2 Updating values.yaml File

Update the values.yaml file before you deploy NWDAF ATS. To update the values.yaml file:

1. In the installation package, navigate to `*root/installer/nwdaf-ats/ocn-ats-nwdaf-tool`
2. Edit the values.yaml file.
For example:

```
vim values.yaml
```

Update the following parameters in the values.yaml file:

- `imageRegistry`: Provide the registry where the images are located.
- `imageVersion`: Verify the value is 23.4.0.0.0.

Note

Ensure that the image registry path is correct, and is pointing to the docker registry where the ATS docker images are located.

3.1.6.3 Deploying NWDAF ATS in the Kubernetes Cluster

To deploy ATS, perform the following steps:

1. The values.yaml file is located inside `ocn-ats-nwdaf-tool` directory. The namespace, docker image or tag can be updated in the values.yaml file.
2. Run the following command to deploy the NWDAF ATS and its consumers in the same namespace where NWDAF suite is installed:

```
helm install <installation name> <path to the chart directory> -  
n $K8_NAMESPACE
```

For example:

```
helm install ocnwda-ats ocn-ats-nwdaf-tool/
```

Note

Ensure NWDAF ATS is installed in the same namespace where the NWDAF suite is installed.

3. Perform Helm installation with proxy command, run the following command:

```
helm install <installation name> <path to the chart directory> -  
n $K8_NAMESPACE  
--set ocatsNwdaf.config.env.JAVA_OPTS="\-Dhttps\$.proxyHost\  
\$=<proxy_domain>\$ \-Dhttps\$.proxyPort\$=<proxy_port>\$ \-Dhttp\
```

```
\.nonProxyHosts\\=localhost\\,127.0.0.1\\,\\<no_proxy_host>"
```

For example:

```
helm install ocnwdaf-ats ocn-ats-nwdaf-tool/ --set  
ocatsNwdaf.config.env.JAVA_OPTS="\\-Dhttps\\.proxyHost\\=www-  
proxy.us.oracle.com\\ \\-Dhttps\\.proxyPort\\=80\\ \\-Dhttp\\.nonProxyHosts\\  
\\=localhost\\,127.0.0.1\\,\\.oracle.com\\,\\.oraclecorp\\.com"
```

Note

Provide the **ocatsNwdaf.config.env.JAVA_OPTS** field in the proxy configuration. This allows access to the internet to download the required plugins and components required for a successful ATS installation.

4. Run the following command to verify the ATS deployment status:

```
kubectl get deployments -n <namespace_name>
```

3.1.6.4 Verifying ATS Deployment

Run the following command to verify ATS deployment:

```
helm status <release_name>
```

Once ATS is deployed, run the following commands to check the pod and service deployment:

To check pod deployment, run the command:

```
kubectl get pod -n <namespace_name>
```

To check service deployment, run the command:

```
kubectl get service -n <namespace_name>
```

Once the installation (service and pod deployment) is successfully running, track the progress of the ATS Jenkins preconfiguration process, run the following command:

```
kubectl exec -it <ats_pod_name> -- tail -f /var/lib/jenkins/.jenkins/jenkins-  
configure.log
```

For example:

```
kubectl exec -it ocats-nwdaf-deploy-787d4f5f84-5vmv5 -- tail -f /var/lib/  
jenkins/.jenkins/jenkins-configure.log
```

Wait for the preconfiguration process to complete, the following message is displayed:

Jenkins configuration finish successfully

3.2 Installing ATS for OCNADD

Following are the ATS installation procedures for Oracle Communications Network Analytics Data Director (OCNADD):

1. [Downloading the ATS Package](#)
2. [Pushing the Images to Customer Docker Registry](#)
3. [Configuring ATS](#)
4. [Deploying ATS and Stub in Kubernetes Cluster](#)
5. [Verifying ATS Deployment](#)

3.2.1 Resource Requirements

This section describes the ATS resource requirements for OCNADD.

Overview - Total Number of Resources

The following table describes the overall resource usage in terms of CPUs and memory for the following:

- OCNADD SUT
- ATS

Table 3-4 OCNADD - Total Number of Resources

Resource Name	CPU	Memory (GB)
OCNADD SUT Totals	47	309
ATS Totals	10	14
Grand Total OCNADD ATS	47	323

OCNADD Pods Resource Requirement Details

This section describes the resource requirements, which are needed to deploy OCNADD ATS successfully.

Table 3-5 OCNADD Pods Resource Requirement Details

OCNADD Service	CPUs Required per Pod	Memory Required per Pod (GB)	# Replicas (regular deployment)	# Replicas (ATS deployment)	CPUs Required - Total	Memory Required - Total (GB)
ocnaddconfiguration	1	1	1	1	1	1
ocnaddalarm	1	1	1	1	1	1
ocnaddadmin	1	1	1	1	1	1
ocnaddhealthmonitoring	1	1	1	1	1	1
ocnadduirouter	1	1	1	1	1	1
ocnaddscppaggregation	2	2	1	1	2	2
ocnaddnrfaggregation	2	2	1	1	2	2

Table 3-5 (Cont.) OCNADD Pods Resource Requirement Details

OCNADD Service	CPUs Required per Pod	Memory Required per Pod (GB)	# Replicas (regular deployment)	# Replicas (ATS deployment)	CPUs Required - Total	Memory Required - Total (GB)
ocnaddseppaggregation	2	2	1	1	2	2
ocnaddadapter	3	4	8	1	3	4
ocnaddkafka	5	48	4	4	20	192
zookeeper	1	2	3	3	3	6
ocnaddgui	2	1	1	1	2	1
ocnaddfilter	3	3	3	1	3	3
ocnaddcorrelation	3	48	3	1	3	48
OCNADD SUT Totals					47 CPU	309 GB

For more information about OCNADD Pods Resource Requirements, see the "Resource Requirements" section in *Oracle Communications Network Analytics Data Director Installation, Upgrade, and Fault Recovery Guide*.

ATS Resource Requirement details for OCNADD

This section describes the ATS resource requirements, which are needed to deploy OCNADD ATS successfully.

Table 3-6 ATS Resource Requirement Details

Microservice	CPUs Required per Pod	Memory Required per Pod (GB)	# Replicas (regular deployment)	# Replicas (ATS deployment)	CPUs Required - Total	Memory Required - Total (GB)
ATS Behave	2	1	1	1	2	1
OCNADD Producer Stub (SCP,NRF,SEPP)	6	12	1	1	6	12
OCNADD Consumer Stub	2	1	1	1	2	1
ATS Totals					10	14

3.2.2 Downloading the ATS Package

Locating and Downloading ATS Images

To locate and download the ATS Image from MOS:

1. Log in to [My Oracle Support](#) using the appropriate credentials.
2. Select the **Patches & Updates** tab.
3. In the **Patch Search** window, click **Product or Family (Advanced)**.
4. Enter *Oracle Communications Network Analytics Data Director* in the **Product** field.

5. Select *Oracle Communications Network Analytics Data Director <release_number>* from the **Release** drop-down.
6. Click **Search**. The **Patch Advanced Search Results** list appears.
7. Select the required ATS patch from the list. The Patch Details window appears.
8. Click **Download**. The File Download window appears.
9. Click the **<p*****_<release_number>_Tekelec>.zip** file to download the OCNADD ATS package file.
10. Untar the zip file to access all the ATS Images. The **<p*****_<release_number>_Tekelec>.zip** directory has following files:

```
ocats-ocnadd-tools-pkg-23.4.0.tgz
ocats-ocnadd-tools-pkg-23.4.0-README.txt
ocats-ocnadd-tools-pkg-23.4.0.tgz.sha256
ocats-ocnadd-custom-configtemplates-23.4.0.zip
ocats-ocnadd-custom-configtemplates-23.4.0-README.txt
```

The `ocats-ocnadd-tools-pkg-23.4.0-README.txt` file has all the information required for the package. The `ocats-ocnadd-tools-pkg-23.4.0.tgz` file has the following images and charts packaged as tar files:

```
ocats-ocnadd-tools-pkg-23.4.0.tgz
|
|_ _ _ _ _ ocats-ocnadd-pkg-23.4.0.tgz
|
|      |_ _ _ _ _ ocats-ocnadd-23.4.0.tgz (Helm Charts)
|
|      |_ _ _ _ _ ocats-ocnadd-image-23.4.0.tar (Docker Images)
|
|      |_ _ _ _ _ OCATS-ocnadd-Readme.txt
|
|      |_ _ _ _ _ ocats-ocnadd-23.4.0.tgz.sha256
|
|      |_ _ _ _ _ ocats-ocnadd-image-23.4.0.tar.sha256
|
|      |_ _ _ _ _ ocats-ocnadd-data-23.4.0.tgz (ATS test scripts and
Jenkins data)
|
|      |_ _ _ _ _ ocats-ocnadd-data-23.4.0.tgz.sha256
|
|
|
|_ _ _ _ _ ocstub-ocnadd-pkg-23.4.0.tgz
|
|      |_ _ _ _ _ ocstub-ocnadd-23.4.0.tgz (Helm Charts)
|
|      |_ _ _ _ _ ocstub-ocnadd-image-23.4.0.tar (Docker Images)
|
|      |_ _ _ _ _ OCSTUB-ocnadd-Readme.txt
```

```
|_ _ _ _ _ ocstub-ocnadd-23.4.0.tgz.sha256
```

```
|_ _ _ _ _ ocstub-ocnadd-image-23.4.0.tar.sha256
```

In addition to the above images and charts, there is an ocats-ocnadd-custom-configtemplates-23.4.0.zip file in the package file.

```
ocats-ocnadd-custom-configtemplates-23.4.0.zip
```

```
|
```

```
|_ _ _ _ _ ocats-ocnadd-custom-values_23.4.0.yaml (Custom values file for
installation)
```

```
|
```

```
|_ _ _ _ _ ocats-ocnadd-custom-serviceaccount_23.4.0.yaml (Template to
create custom service account)
```

11. Copy the tar file to the CNE, OCI, or Kubernetes cluster where you want to deploy ATS.

3.2.3 Pushing the Images to Customer Docker Registry

Preparing to deploy ATS and Stub Pod in Kubernetes Cluster

To deploy ATS and Stub Pod in Kubernetes Cluster:

1. Run the following command to extract tar file content.

```
tar -xvf ocats-ocnadd-tools-pkg-23.4.0.tgz
```

The output of this command is:

```
ocats-ocnadd-pkg-23.4.0.tgz
ocstub-ocnadd-pkg-23.4.0.tgz
ocats-ocnadd-custom-configtemplates-23.4.0.zip
```

2. Run the following command to extract the helm charts and docker images of ATS.

```
tar -xvf ocats-ocnadd-pkg-23.4.0.tgz
```

The output of this command is:

```
ocats-ocnadd-23.4.0.tgz
ocats-ocnadd-23.4.0.tgz.sha256
ocats-ocnadd-data-23.4.0.tgz
ocats-ocnadd-data-23.4.0.tgz.sha256
ocats-ocnadd-image-23.4.0.tar
ocats-ocnadd-image-23.4.0.tar.sha256
OCATS-ocnadd-Readme.txt
```

Note

The `ocats-ocnadd-Readme.txt` file has all the information required for the package.

3. Run the following command to untar the ocstub package.

```
tar -xvf ocstub-ocnadd-pkg-23.4.0.tgz
```

The output of this command is:

```
ocstub-ocnadd-image-23.4.0.tar
ocstub-ocnadd-23.3.4.tgz.sha256
ocstub-ocnadd-image-23.4.0.tar.sha256
ocstub-ocnadd-23.4.0.tgz
OCSTUB-ocnadd-Readme.txt
OCSTUB_OCNADD_Installation_Readme.txt
```

4. Run the following command to extract the content of the custom configuration templates:

```
unzip ocats-ocnadd-custom-configtemplates-23.4.0.zip
```

The output of this command is:

```
ocats-ocnadd-custom-values_23.4.0.yaml (Custom yaml file for deployment of
OCATS-OCNADD)
ocats_ocnadd_custom_serviceaccount_23.4.0.yaml (Custom yaml file for
service account creation to help the customer if required)
```

5. Run the following commands in your cluster to load the ATS docker image, 'ocats-ocnadd-image-23.4.0.tar':

```
$ podman load -i ocats-ocnadd-image-23.4.0.tar
```

6. Run the following commands to tag the imported image and push it to the local registry:

```
$ podman tag docker.io/<image-tag> <local_registry>/<image-name>:<image-
tag>
$ podman push <local_registry>/<image-name>:<image-tag>
```

7. Run the following commands in your cluster to load the Stub docker images ocstub-ocnadd-image-23.4.0.tar:

```
$ podman load -i ocstub-ocnadd-image-23.4.0.tar
```

8. Run the following commands to tag each imported image and push it to the local registry:

```
$ podman tag docker.io/<image-tag> <local_registry>/<image-name>:<image-
tag>
$ podman push <local_registry>/<image-name>:<image-tag>
```

9. Update the image name and tag in the `ocats-ocnadd-custom-values.yaml` and `ocnaddsimulator/values.yaml` files of simulator Helm as required. For `ocats-ocnadd-custom-values.yaml` update the 'image.repository' with respective `local_registry`. For `ocnaddsimulator/values.yaml` update the 'repo.REPO_HOST_PORT' and 'initContainers.repo.REPO_HOST_PORT' with respective `local_registry`.

3.2.4 Configuring ATS

3.2.4.1 Enabling Static Port

1. To enable static port:
 - In the **`ocats-ocnadd-custom-values.yaml`** file under service section, set the **`staticNodePortEnabled`** parameter value to 'true' and **`staticNodePort`** parameter value with valid nodePort.

```
service:
  customExtension:
    labels: {}
    annotations: {}
  type: LoadBalancer
  port: "8080"
  staticNodePortEnabled: true
  staticNodePort: "32385"
  staticLoadBalancerIPEnabled: false
  staticLoadBalancerIP: ""
```

Note

ATS supports static port. By default, this feature is not available.

Note

To enable `staticLoadBalancerIP`, set the `staticLoadBalancerIPEnabled` parameter value to 'true' and `staticLoadBalancerIP` parameter value with valid LoadBalancer IP value. By default, this is set to false.

3.2.5 Deploying ATS and Stub in Kubernetes Cluster

Note

It is important to ensure that the ATS and Stub are deployed as follows:

- In **Centralized Deployment** mode (fresh deployments) the ATS and Stub must be deployed in the **Worker Group** namespace.
- In **Non-Centralized Deployment** mode (when the OCNADD is upgraded from any older release) the ATS and Stub should be deployed in the **default** OCNADD namespace.

For the test cases to run successfully, ensure the *intraTLSEnabled* parameter value in the Jenkins pipeline script is identical to the value in the OCNADD deployment. The Alert Manager does not support HTTPS connections. When *intraTLSEnabled* is set to *true*, the following Alert Manager test cases may fail:

- Verify the OCNADD_CONSUMER_ADAPTER_SVC_DOWN alert, this alert is raised when deployments of OCNADD are broken.
- Verify the OCNADD_ADMIN_SVC_DOWN alert, this alert is raised when deployments of OCNADD are broken.
- Verify the OCNADD_NRF_AGGREGATION_SVC_DOWN alert, this alert is raised when deployments of OCNADD are broken.
- Verify the OCNADD_SCP_AGGREGATION_SVC_DOWN alert, this alert is raised when deployments of OCNADD are broken.
- Verify the OCNADD_ALARM_SVC_DOWN alert, this alert is raised when deployments of OCNADD are broken.
- Verify the OCNADD_HEALTH_MONITORING_SVC_DOWN alert, this alert is raised when deployments of OCNADD are broken.

ATS and Stub Support Helm Deployment

Choose the namespace to deploy the ATS and Stub based on the OCNADD deployment mode, see [Note](#).

If the namespace does not exist, run the following command to create a namespace:

```
kubectl create namespace <namespace_name>
```

Note

- It is recommended to use the <release_name> as ocnadd-sim while installing stubs.
- The ATS deployment with OCNADD does not support the Persistent Volume (PV) feature. Therefore, the default value of the deployment .PVEnabled parameter in ocats-ocnadd-custom-values.yaml must not be changed. By default, the parameter value is set to **false**.

Deploying ATS:

Run the following command:

```
helm install -name <release_name> ocats-ocnadd-23.4.0.tgz --namespace  
<namespace_name> -f <values-yaml-file>
```

Example:

```
helm install -name ocats ocats-ocnadd-23.4.0.tgz --namespace ocnadd-deploy -f  
ocats-ocnadd-custom-values.yaml
```

Deploying Stubs:

Note

Before you deploy stubs, update the parameter `oraclenproducer.REST_BASED_TRAFFIC` to `true` in the `ocnaddsimulator/values.yaml` file. The default value of the parameter is `false`.

```
helm install -name <release_name> <ocstub-ocnadd-chart> --namespace  
<namespace_name>
```

Note

For more details about installing the stub, refer to the `OCSTUB_OCNADD_Installation_Readme.txt` file.

Example:

```
helm install -name ocnadd-sim ocnaddsimulator --namespace ocnadd-deploy
```

3.2.6 Verifying ATS Deployment

Run the following command to verify ATS deployment.

```
helm status <release_name> -n <namespace>
```

Once ATS and Stub are deployed, run the following commands to check the pod and service deployment:

To check pod deployment:

```
kubectl get pod -n ocnadd-deploy
```

To check service deployment:

```
kubectl get service -n ocnadd-deploy
```

4

Running Test Cases Using ATS

This section describes how to run test cases using ATS. It includes:

- [Running NWDAF Test Cases using ATS](#)
- [Running OCNADD Test Cases using ATS](#)

4.1 Running NWDAF Test Cases using ATS

This section describes how to run Networks Data Analytics Function (NWDAF) test cases using ATS.

Prerequisites

To run NWDAF test cases, ensure that the following prerequisites are met:

- The ATS version must be compatible with the NWDAF release.
- The NWDAF and ATS must be deployed in the same namespace.
- The NWDAF must be deployed using the appropriate `values.yaml` file as per the configuration to be tested.
- Ensure a nodePort or LoadBalancer port is available for "ocats-nwdaf-deploy".

Logging into ATS

Running ATS

Before logging into ATS, you need to ensure that ATS is deployed successfully using HELM charts.

For more information on verifying ATS deployment, see [Verifying ATS Deployment](#).

Note

To modify default log in password, refer to [Modifying Login Password](#).

Build the Jenkins host IP and load the Jenkins tool, run the following command to obtain the ocats-nwdaf-deploy service port:

```
kubectl get svc -n <namespace> | grep ocats-nwdaf-deploy
```

To obtain ocn-ats-nwdaf-tool pod IP:

- Obtain the node and pod name, run the following command:

```
kubectl get pod -o=custom-columns=NODE:.spec.nodeName,NAME:.metadata.name -n <namespace> | grep ocats-nwdaf-deploy
```

- If an external IP is used, obtain the external Kubernetes node IP. Run the following command:

```
kubectl get no -o wide
```

- Build the IP host as <External Node IP> : <Host IP>

ATS Login

1. To log in to ATS, open a browser and provide the IP Address and port details as <Worker-Node-IP>:<Node-Port-of-ATS>.

Figure 4-1 ATS Login

Welcome to Jenkins!

Username

Password

☐ Keep me signed in

Sign in

To run ATS, enter the login credentials. Click **Sign in**.

2. **Customize Jenkins** page appears. Close this page.
3. **Jenkins is ready!** page appears, click **Start Using Jenkins**.
4. Dashboard screen displaying the NWDAF preconfigured pipelines appears.

Figure 4-2 Pipelines

S	W	Name	Last Success	Last Failure	Last Duration
🔄	🌟	NWDAF-NewFeatures	N/A	N/A	N/A
🔄	🌟	NWDAF-Performance	N/A	N/A	N/A
🔄	🌟	NWDAF-Regression	N/A	N/A	N/A

The NWDAF ATS has three configured pipelines:

- NWDAF-NewFeatures
- NWDAF-Performance
- NWDAF-Regression

Configure NWDAF Pipelines

To run configure a pipeline perform the following steps:

Prerequisites

- The user database access includes permission to retrieve, update, and delete information.
 - The user has logged in to the Jenkins page with admin credentials.
1. Select the pipeline you want to run the test cases on, click **NWDAF-NewFeatures** in the **Name** column. The following screen appears:

Figure 4-3 Pipeline Configuration

In the above screen:

- Click **Configure** to configure the NWDAF pipeline.
 - Click **Build History** box to view all the previous pipeline executions, and the Console Output of each execution.
 - The **Full Stage View** represents the previously run pipelines for reference.
 - The **Test Results Analyzer** is the plugin integrated into the OCNWDAF-ATS. This option can be used to display the build-wise history of all the executions. It will provide a graphical representation of the past execution together.
2. Click **Configure** to configure the environment parameters of the pipeline. User must wait for the page to load completely. Once the page loads completely, move to the **Pipeline** section:

Note

Make sure that the following page loads completely before you perform any action on it. Also, do not modify any configuration other than shown below.

Figure 4-4 Configure Pipeline

**Note**

Remove the existing default content of the pipeline script.

3. Depending on the pipeline you want to configure, use the respective script. The following scripts are available at: `/var/lib/jenkins/ocnwdaftests/pipeline_scripts`:
 - NewFeatures_Pipeline_script.txt
 - Regression_Pipeline_script.txt
 - Performance_Pipeline_script.txt
4. Update the script of the pipeline you want to configure, and update the parameters according to the ATS and NWDAF environment you want to test.
 - a. - **b** : Use this option to update the namespace according to the current namespace being used.
 - b. - **c** : Use this option to update the service name of the Ingress gateway according to the current service name of the Ingress gateway being used.

`kubectl get svc -n <namespace_name> | grep ingress`

For example:

`kubectl get svc -n mdc-nwdaf-qa | grep ingress`

Figure 4-5 Ingress Gateway

```
nwdaf-ingress-gateway      $ kubectl get svc -n mdc-nwdaf-qa | grep ingress
                           NodePort    10.233.12.1    <none>         80:30277/TCP,81:31960/TCP
```

- c. Verify if the same name is assigned to "**-c = NWDAF api gateway**" host field, if not update to match the current name. Use the option "**-c ingress-gateway-service**".

- d. **-g** : Use this option to update the service name of the MESA simulator according to the current service name of the MESA simulator being used.
Run the following command in the NWDAF console to verify the current service name of the Mesa simulator:

```
kubectl get svc -n <namespace_name> | grep mesa
```

For example:

```
kubectl get svc -n mdc-nwdaf-qa | grep mesa
```

Figure 4-6 Mesa Simulator

```
$ kubectl get svc -n mdc-nwdaf-qa | grep mesa
mesa-simulator ClusterIP 10.233.15.130 <none> 8080/TCP,9000/TCP
```

- e. Verify if the same name is assigned to "**-g = MESA simulator API**" host field, if not update to match the current name. Use the option "**-g mesa-simulator-service **".
- f. **-i** : Use this option to update the service name of the NWDAF Configuration API Host Service according to the current service name of the NWDAF Configuration API Host Service being used.
Run the following command in the NWDAF console to verify the current service name of the NWDAF Configuration API Host Service:

```
kubectl get svc -n <namespace_name> | grep configuration
```

For example:

```
kubectl get svc -n mdc-nwdaf-qa | grep configuration
```

Figure 4-7 Configuration API Host Service

```
$ kubectl get svc -n mdc-nwdaf-qa | grep configuration
ocn-nwdaf-configuration-service ClusterIP 10.233.46.145 <none> 8080/TCP,9000/TCP
```

- g. Verify if the same name is assigned to "**-i = NWDAF CONFIGURATION API**" host field, if not update to match the current name. Use the option "**-i ocn-nwdaf-configuration-service **".
5. Update the following parameters according to the database setup:
- **-q** : Use this option to update the NWDAF database host name, it can be FQDN or IP address.
For example:
**-q 10.75.245.174 **
 - **-r** : Use this option to update the NWDAF database port, it can be Cluster IP or Node Port.
For example:
**-r 32648 **
 - **-F** : Use this option to update the InnoDB database host name, it can be FQDN or the IP address.
For example:

**-F 10.75.245.189 **

- **-G** : Use this option to update the InnoDB database port, it can be Cluster IP or Node Port.
For example:

**-G 3306 **

6. Update the `-s db_user_id`, `-t db_user_psw`, `inno_db_user_id`, and `inno_db_user_psw` variables with the current data base user credentials, follow the steps listed below:
 - a. Provide the userid and password of the database to be encrypted. Navigate to `ocats-nwdaf-deploy` pod and run the command:

```
kubectl exec -it <pod_name> -n <namespace_name> bash
```

For example:

```
kubectl exec -it ocats-nwdaf-deploy-54f98c447c-l6vxq -n ocnwdaf-ns bash
```

- b. From the console, run the following command:

```
cd /env/lib/python3.9/site-packages/ocnwdaf_lib/db_mgt
```

- c. To update the user id run the following command from the console:

```
python -c "from db_connection_mgt import *;
print(encode_values_data('<user>'))"
```

- d. To update the password run the following command from the console:

```
python -c "from db_connection_mgt import *;
print(encode_values_data('<password>'))"
```

- e. Copy and paste the encrypted user id and password into the pipeline script located in the bottom of the page.
For example:

Figure 4-8 Sample Output

```
kubectl exec [POD] [COMMAND] is DEPRECATED and will be removed in a future version. Use kubectl exec [POD] -- [COMMAND] instead.
(env) [jenkins-nwdaf@ocats-nwdaf-deploy-77ffd579d6-6qbbt jenkins]$ cd /env/lib/python3.9/site-packages/ocnwdaf_lib/db_mgt

4.2 Running OCNADD Test Cases using ATS

This section describes how to run Oracle Communications Network Analytics Data Director (OCNADD) test cases using ATS. It includes:

- [Prerequisites](#)
- [Logging into ATS](#)
- [OCNADD-NewFeatures Pipeline](#)
- [OCNADD-NewFeatures Documentation](#)
- [Troubleshooting ATS](#)

4.2.1 Prerequisites

To run OCNADD test cases, ensure that the following prerequisites are met:

- The ATS version must be compatible with the OCNADD release.
- The ATS and Stub must be deployed in the namespace based on the OCNADD deployment mode, see [Note](#).
- For OCNADD deployments in which ACL is enabled, perform the following steps:

Note

Skip these steps if ACL is not enabled in the OCNADD deployment.

1. Set the Jenkins pipeline variables *INTRA_TLS_ENABLED* and *ACL_ENABLED* to *true*.
2. Update the *ssl.truststore.password*, *ssl.keystore.password*, and *ssl.key.password* in *ocnadd_tests/data/admin.properties* file inside the ATS pod as follows:
 - a. Access the Kafka pod from the OCNADD worker group or the default group deployment in which the SCRAM user configuration was added while enabling the

ACL. Run the following command, in this example kafka-broker-0 is the Kafka pod:

```
kubectl exec -it kafka-broker-0 -n <namespace> -- bash
```

- b. Extract the *ssl* parameters from the Kafka broker environments, run the following command:

```
env | grep -i pass
```

- c. Use the *truststore* and *keystore* passwords retrieved from the above command output to update the *ocnadd_tests/data/admin.properties* file of the ATS pod, run the following commands:

```
kubectl exec -it ocats-ocats-ocnadd-xxxx-xxxx -n <namespace> -- bash
```

```
$ vi ocnadd_tests/data/admin.properties
```

Sample output:

```
security.protocol=SASL_SSL
sasl.mechanism=PLAIN
```

```
sasl.jaas.config=org.apache.kafka.common.security.plain.PlainLoginModule
required username="ocnadd" password="ocnadd";
ssl.truststore.location=/var/securityfiles/keystore/
trustStore.p12
ssl.truststore.password=<truststore pass>
ssl.keystore.location=/var/securityfiles/keystore/
keyStore.p12
ssl.keystore.password=<keystore pass>
ssl.key.password=<keystore pass>
```

Note

- Before triggering a new pipeline from Jenkins, delete all existing Data Feed and Filter configurations from the previous execution.
- If ATS and Stub are in OCNADD centralized deployment mode, exclude the scenario tag *NotSupportedForCentralizedDD* follow the step below:
 - In the Jenkins UI, navigate from **FilterWithTags(Yes)** to **Scenario_Exclude_Tags**, enter **NotSupportedForCentralizedDD** and click **Submit**.
This step avoids failures from the various scenarios that are not supported by the OCNADD in the centralized deployment mode.

4.2.2 Logging into ATS

Before logging into ATS, you need to ensure that ATS is deployed successfully using HELM charts as shown below:

```
[ocnadd@k8s-bastion ~]$ helm status ocats -n ocnadd-deploy
NAME: ocats
LAST DEPLOYED: Sat Nov  3 03:48:27 2022
NAMESPACE: ocnadd-deploy
STATUS: deployed
REVISION: 1
TEST SUITE: None
NOTES:
# Copyright 2018 (C), Oracle and/or its affiliates. All rights reserved.
```

Thank you for installing ocats-ocnadd.

Your release is named ocats , Release Revision: 1.
To learn more about the release, try:

```
$ helm status ocats
$ helm get ocats
```

```
[ocnadd@k8s-bastion ~]$ kubectl get pod -n ocnadd-deploy | grep ocats
ocats-ocats-ocnadd-54ffddb548-4j8cx          1/1      Running    0           9h

[ocnadd@k8s-bastion ~]$ kubectl get svc -n ocnadd-deploy | grep ocats
ocats-ocats-ocnadd          LoadBalancer    10.20.30.40    <pending>
8080:12345/TCP              9h
```

For more information on verifying ATS deployment, see [Verifying ATS Deployment](#).

To log in to ATS, open a browser and provide the IP Address and port details as <Worker-Node-IP>:<Node-Port-of-ATS>.

Note

If LoadBalancer IP is provided, then give <LoadBalancer IP>:8080

OCNADD ATS has three pre-configured pipelines.

- **OCNADD-NewFeatures:** This pipeline has all the test cases delivered as part of OCNADD ATS - 23.4.0.
- **OCNADD-Performance:** This pipeline is not operational as of now. It is reserved for future releases of ATS.
- **OCNADD-Regression:** This pipeline is not operational as of now. It is reserved for future releases of ATS.

4.2.3 OCNADD-NewFeatures Pipeline

OCNADD-NewFeatures Pipeline

This is a pre-configured pipeline where users can run all the OCNADD new test cases. To configure its parameters, which is a one time activity, perform the following steps:

1. Click **OCNADD-NewFeatures** in the **Name** column. The following screen appears:

Figure 4-17 Configuring OCNADD-New Features

In the above screen:

- Click **Configure** to configure OCNADD-New Features.
 - Click **Build History** box to view all the previous pipeline executions, and the Console Output of each execution.
 - The **Stage View** represents the previously run pipelines for reference.
 - The **Test Results Analyzer** is the plugin integrated into the OCNADD-ATS. This option can be used to display the build-wise history of all the tests. It provides a consolidated graphical representation of all past tests.
2. Click **Configure**. Once the page loads completely, click the **Pipeline** tab:

Note

Make sure that the **Configure** page loads completely before you perform any action on it. Also, do not modify any configuration other than shown below.

The **Pipeline** section of the configuration page appears as follows:

Figure 4-18 Pipeline Section

You can modify pipeline script parameters from **"-b"** to **"-q"** on the basis of your deployment environment, click on 'Save' after making the necessary changes.

The description of all the script parameters is as follows:

- **a:** Name of the NF to be tested in the capital (NADD).
- **b:** Namespace in which the NADD is deployed (ocnadd-deploy).
- **c:** DB Host IP provided NADD deployment (10.XX.XX.XX).
- **d:** DB username provided during NADD deployment.
- **e:** DB password provided during NADD deployment.
- **f:** DB Schema Name of ocnaddalarm microservice provided during NADD deployment (alarm_schema).
- **g:** DB Schema Name of ocnaddhealthmonitoring microservice provided during NADD deployment (healthdb_schema).
- **h:** DB Schema Name of ocnaddconfiguration microservice provided during NADD deployment (configuration_schema).
- **i:** API root endpoint to reach NADD's ocnaddalarm microservice. (<Worker-Node-IP>:<Node-Port-of-ocnaddalarm>) or default value
- **j:** API root endpoint to reach NADD's ocnaddhealthmonitoring microservice. (<Worker-Node-IP>:<Node-Port-of-ocnaddhealthmonitoring>) or default value
- **k:** API root endpoint to reach NADD's ocnaddconfiguration microservice. (<Worker-Node-IP>:<Node-Port-of-ocnaddconfiguration>) or default value
- **l:** API root endpoint to reach NADD's ocnaddbackendrouter microservice. (Not used in the current release, use the default value)
- **m:** API root endpoint to reach NADD's ocnaddadminservice microservice. (Not used in the current release, use the default value)
- **n:** API root endpoint to reach NADD's ocnaddthirdpartyconsumer microservice. (<Worker-Node-IP>:<Node-Port-of-ocnaddthirdpartyconsumer>) or default value
- **o:** Repository path for ocnaddbackuprestore image.
- **p:** API root endpoint to reach alert manager microservice.
- **q:** Prometheus URI
- **r:** Set the IntraTLS value to either "true" or "false" based on user requirement and OCNADD deployment (either with intraTIS enabled or disabled).
- **s:** Rerun count for failed test cases. The default value is set to '2'. It can be set to '0', '1', or any other value based on user requirements.
- **t:** Set the ACL_ENABLED value to either "true" or "false" based on the OCNADD deployment (ACL enabled or disabled).
- **u:** Worker group namespace name along with cluster name.
- **v:** Management group namespace name.

Note

If ATS and Stub are on a OCNADD in non-centralized deployment mode, then u: <worker-group-namespace:clusterName> and v: <management-group-namespace> will be in the same namespace.

Running OCNADD Test Cases

To run OCNADD test cases, perform the following steps:

1. Click the **Build with Parameters** link available in the left navigation pane of the **NADD-NewFeatures** Pipeline screen. The following page appears:

Figure 4-19 Pipeline NADD_NewFeatures

2. Select **Configuration_Type** as **Product_Config**.
3. Set **Include_Regression** to 'NO' from the drop-down list.
4. In **Select_Option**:
 - Select **All** to run all the feature test cases and click the **Build** button to run the pipeline.
 - Choose **Single/MultipleFeatures** to run the specific feature test cases and click the **Build** button to run the pipeline.
 - Choose **MultipleFeature/MultipleTestCases** to select multiple features and multiple test cases within the selected features and click the **Build** button to run the pipeline.

4.2.4 OCNADD-NewFeatures Documentation

The NADD-NewFeatures pipeline has a HTML report of all the feature files that can be tested as part of the OCNADD ATS release. Follow the procedure listed below to view all the OCNADD functionalities:

1. On the **Pipeline NADD-NewFeatures** page click **Documentation** in the left navigation pane. All test cases provided as part of the OCNADD ATS release are displayed on the screen.

Note

- The **Documentation** option appears on the screen only if NADD-NewFeatures pipeline test cases are executed at least once.
- Use the Firefox browser to open the **Documentation**, other browsers are not supported.

Figure 4-20 Documentation

2. Click any functionality to view its test cases and scenarios for each test case.
3. To exit, click **Back to NADD-NewFeatures** on the top-left corner of the screen.

4.2.5 Troubleshooting ATS

This section provides troubleshooting procedures for some common ATS test case failures.

Offset Count Mismatch Results in Test Case Failure

Problem

Test cases fail due to the offset count mismatch. Delay in third-party consumers receiving messages results in this failure.

Sample Error Message

Example: The test case failed due to offset count of the MAIN topic(which is 186) does not match with off set count of the third-party Consumer(which is 155)

Then Compare the offset change in MAIN topic and consumer ... failed in 0.000s

```

Assertion Failed: The increase in offset counts is not matching, increase in
offset of MAIN : 186 , increase in offset of Consumer : 155
Captured stdout:
{'Location': 'http://ocnaddconfiguration:12590/ocnadd-configuration/
configure/v3/app-oracle-cipher', 'content-length': '0'}
['OCL', '2023-08-13T19:49:49.944Z', 'INFO', '1', '---', '[', 'scheduling-1]',
'c', '.o', '.c', '.c', '.o', '.c', '.c', '.ConsumerController', ':', '|',
'*TOTAL*', '|', '0', '(0', ')', '|']
['OCL', '2023-08-13T19:49:49.944Z', 'INFO', '1', '---', '[', 'scheduling-1]',
'c', '.o', '.c', '.c', '.o', '.c', '.c', '.ConsumerController', ':',
'+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
['OCL', '2023-08-13T19:50:14.952Z', 'INFO', '1', '---', '[', 'scheduling-1]',
'c', '.o', '.c', '.c', '.o', '.c', '.c', '.ConsumerController', ':', '|',
'*TOTAL*', '|', '155', '(0', ')', '|']
['OCL', '2023-08-13T19:50:14.952Z', 'INFO', '1', '---', '[', 'scheduling-1]',
'c', '.o', '.c', '.c', '.o', '.c', '.c', '.ConsumerController', ':',
'+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

```

Solution

The test cases which failed due to offset count mismatch, pass when a test case rerun is performed.

Assertion Failed: Status code:404 did not match with 204

Problem

The test cases fail due to 'Assertion Failed: Status code:404 did not match with 204'. This error occurs when any previous scenario abruptly fails without executing all the steps of the scenario.

Sample Error Message

```

Example:
Given delete already existing data feeds ... failed in 0.346s
Assertion Failed: FAILED SUB-STEP: Given delete already existing
configurations
Substep info: Assertion Failed: Status code:404 did not match with 204
Traceback (of failed substep):
  File "/env/lib64/python3.9/site-packages/behave/model.py", line 1329, in run
    match.run(runner.context)
  File "/env/lib64/python3.9/site-packages/behave/matchers.py", line 98, in
run
    self.func(context, *args, **kwargs)
  File "/var/lib/jenkins/cncats/ocnfctest/ocnadd_steps.py", line 1906, in
step_impl
    assert False , 'Status code:{} did not match with
204'.format(context.response.status_code)

```

Solution

The test cases which failed due to previous scenario failures, pass when a test case rerun is performed.

OCNADD Pods Enter a 'Image Pull' Error State

Problem

The OCNADD pods enter a 'Image Pull' error state after a few test cases are executed. This occurs when a test case appends a suffix to the image name and its execution is incomplete.

Solution

Correct the image name by editing the pods deployment and rerun the test suite.
