This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

# My Oracle Support

My Oracle Support (https://support.oracle.com) is your initial point of contact for all product support and training needs. A representative at Customer Access Support can assist you with My Oracle Support registration.

Call the Customer Access Support main number at 1-800-223-1711 (toll-free in the US), or call the Oracle Support hotline for your local country from the list at http://www.oracle.com/us/support/contact/index.html. When calling, make the selections in the sequence shown below on the Support telephone menu:

- For Technical issues such as creating a new Service Request (SR), select **1**.
- For Non-technical issues such as registration or assistance with My Oracle Support, select **2**.
- For Hardware, Networking and Solaris Operating System Support, select **3**.

You are connected to a live agent who can assist you with My Oracle Support registration and opening a support ticket.

My Oracle Support is available 24 hours a day, 7 days a week, 365 days a year.

Copyright © 2022, 2024, Oracle and/or its affiliates.

# Acronyms

The following table provides information about the acronyms and the terminology used in the document.

**Table Acronyms**

| Acronym | Description |
|---|---|
| 3GPP | 3rd Generation Partnership Project |
| 5GC | 5G Core Network |
| 5GS | 5G System |
| AF | Application Function |
| API | Application Programming Interface |
| AMF | Access and Mobility Management Function |
| AnLF | Analytics Logical Function |
| CAP4C | Converged Analytics Platform for Communication |
| CNC | Cloud Native Core |
| CNE | Oracle Communications Cloud Native Core, Cloud Native Environment |
| CSP | Communications Service Provider |
| FE | Front End |
| FQDN | Fully Qualified Domain Name |
| GUI | Graphical User Interface |
| HTTPS | Hypertext Transfer Protocol Secure |
| KPI | Key Performance Indicator |
| HA | High Availability |
| IMSI | International Mobile Subscriber Identity |
| K8s | Kubernetes |
| MDT | Mobile Data Terminal |
| ME | Monitoring Events |
| MICO | Mobile Initiated Connection Only |
| ML | Machine Learning |
| MLOPs | Machine Learning Operations |
| MTLF | Model Training Logical Function |
| Network Slice | A logical network that provides specific network capabilities and network characteristics. |
| NEF | Oracle Communications Cloud Native Core, Network Exposure Function |
| NF | Network Function |
| NRF | Oracle Communications Cloud Native Core, Network Repository Function |
| NSI | Network Slice instance. A set of Network Function instances and the required resources (such as compute, storage and networking resources) which form a deployed Network Slice. |
| NSSF | Oracle Communications Cloud Native Core, Network Slice Selection Function |
| OCNWDAF | Oracle Communications Networks Data Analytics Function |

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Table (Cont.) Acronyms**

| Acronym | Description |
|---|---|
| OAM | Operations, Administration, and Maintenance |
| PLMN | Public Land Mobile Network |
| RAN | Radio Access Network |
| REST | Representational State Transfer |
| SBA | Service Based Architecture |
| SBI | Service Based Interface |
| SMF | Session Management Function |
| SNMP | Simple Network Management Protocol |
| SUPI | Subscription Permanent Identifier |
| UDM | Unified Data Management |
| UE | User Equipment |
| UPF | User Plane Function |
| UDR | Oracle Communications Cloud Native Core, Unified Data Repository |
| UDM | Unified Data Management |
| URI | Uniform Resource Identifier |

Copyright © 2022, 2024, Oracle and/or its affiliates.

# What's New in This Guide

This section introduces the documentation updates for Release 24.1.x in Oracle Communications Networks Data Analytics Function Troubleshooting Guide.

**Release 24.1.0 - F92228-01, April 2024**

The following troubleshooting scenarios are added:

- Pods in IPv4 in IPv6 Deployment
- NRF Client Errors

Copyright © 2022, 2024, Oracle and/or its affiliates.

# 1 Introduction

This document provides information about troubleshooting Oracle Communications Network Data Analytics Function (OCNWDAF).

## 1.1 Overview

Oracle Communications Network Data Analytics Function (OCNWDAF) is a Network Function (NF) in the 5G core network of the 5G Network Architecture.

The OCNWDAF enables the operator to collect and analyze the data in the network through an analytics function. The 5G technology requires prescriptive analytics to drive closed-loop automation and self-healing networks. In a 5G network, the consumers of data are 5G NFs, Application Functions (AFs), and Operations, Administration, and Maintenance (OAM) and the data producers are NFs.

## 1.2 References

For more information about OCNWDAF, refer to the following documents:

- *Oracle Communications Networks Data Analytics Function Installation and Fault Recovery Guide*
- *Oracle Communications Networks Data Analytics Function User Guide*
- *Oracle Communications Networks Data Analytics Function Solution Guide*
- *Oracle Communications Cloud Native Configuration Console Installation, Upgrade, and Fault Recovery Guide*
- *Oracle Communications Cloud Native Environment Installation, Upgrade, and Fault Recovery Guide.*

# 2
# Logs

This chapter explains the process to retrieve the logs and status that can be used for effective troubleshooting.

## 2.1 Log Levels

Logs register system events along with their date and time of occurrence. They also provide important details about a chain of events that could have led to an error or problem.

A log level helps in defining the severity level of a log message. For OCNWDAF, the log level of a microservice can be set to any one of the following valid values:

- **TRACE**: A log level that describes events, as a step by step execution of code. This can be ignored during the standard operation, but may be useful during extended debugging sessions.
- **DEBUG**: A log level used for events during software debugging when more granular information is needed.
- **INFO**: A standard log level indicating that something has happened, an application has entered a certain state, etc.
- **WARN**: A log level indicates that something unexpected has happened in the application, a problem, or a situation that might disturb one of the processes. But this does not mean that the application has failed. The WARN level should be used in situations that are unexpected, but the code can continue to work.
- **ERROR**: A log level that should be used when an application hits an issue preventing one or more functionalities from functioning.

> **Note**
>
> Log levels are defined in the helm chart and as parameters of the Kubernetes pod, they can be updated by changing the Kubernetes pod deployment.

Using this information, the logs can be filtered based on the system requirements. For instance, if you want to filter the critical information about your system from the informational log messages, set a filter to view messages with only WARN log level in Kibana.

The following table provides log level details that may be helpful to handle different NRF Client Service debugging issues:

**Table 2-1 Log Levels**

| Scenarios | Pod | Logs to be searched | Log Level |
|---|---|---|---|
| Registration with NRF Successful | nrf-client-service | Register completed successfully / "nfServiceStatus":"REGISTERED" | INFO |

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Table 2-1 (Cont.) Log Levels**

| Scenarios | Pod | Logs to be searched | Log Level |
|---|---|---|---|
| Heartbeat message log | nrf-client-service | Update completed successfully | INFO |
| NRF configurations reloading | nrf-client-service | NRF client config reloaded | INFO |
| Check for exiting NF Instance Entry | nrf-client-service | No registered NF instance exists | WARN |
| Started Application | nrf-client-service | Successful application start | INFO |
| NRF Client Config Initialized | nrf-client-service | Initialize NRF client configuration | INFO |
| FQDN/BASEURL/ livenessProbeUrl Improper | nrf-client-service | response=<503,java.net. UnknownHostException | WARN |
| nudr-drservice liveness probe failure | nrf-client-service | NFService liveness probe failed | WARN |
| Check if Ports successfully listening | nrf-client-service | Undertow started on port(s) | INFO |
| Registration with NRF failed | nrf-client-service | Register failed | ERROR |
| De registration with NRF successful | nrf-client-service | Deregister completed successfully | INFO |
| De registration with NRF failed | nrf-client-service | Deregister failed | ERROR |
| NF Profile update failed | nrf-client-service | Update failed | ERROR |

# 2.2 Collecting Logs

This section describes the steps to collect logs from PODs and containers. Perform the following steps:

1. Run the following command to get the PODs details:

   ```
   kubectl -n <namespace_name> get pods
   ```

2. Collect the logs from the specific pods or containers:

   ```
   kubectl logs <podname> -n <namespace> -c <containername>
   ```

3. Store the log in a file using the following command:

   ```
   kubectl logs <podname> -n <namespace> > <filename>
   ```

4. (Optional) You can also use the following commands for the log stream with file redirection starting with last 100 lines of log:

   ```
   kubectl logs <podname> -n <namespace> -f --tail <number of lines> >
   <filename>
   ```

Copyright © 2022, 2024, Oracle and/or its affiliates.

For more information on how to collect the logs, see *Oracle Communication Cloud Native Core Data Collector Guide*.

## 2.3 Collect Logs using Deployment Data Collector Tool

Perform this procedure to start the NF Deployment Data Collector module and generate the tarballs. If the user does not specify the output storage path, then this module generates the output in the same directory where the module ran.

**nfDataCapture.sh** is a script which can be used for collecting all the required logs from NF deployment for debugging issues. The script collects logs from all microservice PODs of specified Helm input, Helm deployment details, the status, description of all the Kafka topics, *status.server* properties, and description of all the pods, services and events.

Before running the script, ensure the following requirements are met:

- Ensure that you have appropriate privileges to access the system and run `kubectl` and `helm` commands.
- Perform this procedure on the same machine where the OCNWDAF is deployed using `helm` or `kubectl`.
- Run the **chmod +x nfDataCapture.sh** command on the tool to provide the executable permission.
- Run the following command to start the module:

```
./nfDataCapture.sh -n|--k8Namespace=[K8 Namespace] -k|--
kubectl=[KUBE_SCRIPT_NAME] -h|--helm=[HELM_SCRIPT_NAME]  -s|--
size=[SIZE_OF_EACH_TARBALL] -o|--toolOutputPath -helm3=[true|false]
```

Where:

- `<K8 Namespace>` is the Kubernetes Namespace where OCNWDAF is deployed.
- `<KUBE_SCRIPT_NAME>` is the Kube script name.
- `<HELM_SCRIPT_NAME>` is the Helm script name.
- `<SIZE_OF_EACH_TARBALL>` indicates the size of each tarball.

Example:

```
./nfDataCapture.sh --k8Namespace=ocnwdaf-ns
```

> **Note**
>
> - If the size of the tarball and location are not specified, a default sized tarball will be generated (10M) and the default location of output will be the tool working directory.
> - Kafka Detailed Status is true by default and if we do not want to collect the details we have to specify the argument `false` in the command.
> - By default, Helm2 is used. Use proper argument in command to use Helm3.

Copyright © 2022, 2024, Oracle and/or its affiliates.

> **Note**
>
> If the database is not in same namespace, run the script again for the namespace in which database is deployed to capture the database related logs.

To verify the generated tars, run the commands:

```
cd <generated-tarball-name>
ls
```

- Only if the size of the tar generated is greater than "SIZE_OF_EACH_TARBALL" specified in the command (for example, ocnwdaf.debugData.2023.02.28_09.15.01.tar.gz), the tar is split into multiple tarballs based on the size specified.
- After running the command, tarballs will be created based on size specified in the following format:
  `<namespace>.debugData.<timestamp>`

**Example:**

```
ocnwdaf.debugData.2023.02.28_09.15.01
```

Each tarball can then be combined into one tarball using the following command:

```
cat <splitted files*> <combinedTarBall>.tar.gz
```

```
cat ocnwdaf.debugData.2023.02.28_09.15.01* >
ocnwdaf.debugData.2023.02.28_09.15.01-combined.tar.gz
```

# 2.4 Understanding Logs

This chapter explains the logs you need to look into to handle different OCNWDAF debugging issues.

For more information on how to collect the logs, see *Oracle Communication Cloud Native Core Data Collector Guide*.

### Log Formats

OCNWDAF supports the following log formats:

- **Executor logs**
  Format:

  ```
  <datetime> - <level> - <module>.<line> [<thread>] : <message>
  ```

  Where:
  - `datetime` - The date and time of the event.
  - `level` - Helps in defining the severity level of a log message.
  - `module` - Software component that created the message.
  - `line` - Line of the source code where the message happened.
  - `thread` - Name of the thread that is currently running.

Copyright © 2022, 2024, Oracle and/or its affiliates.

  - `message` - Description of the event.

- **Controller logs**
  Format:

  ```
  <datetime>  <level> <process> --- [<thread>] <loggername> : <message>
  ```

  Where:

  - `datetime` - The date and time of the event.
  - `level` - Helps in defining the severity level of a log message.
  - `process` - Name of the process that is currently running.
  - `thread` - Name of the thread that is currently running.
  - `loggername` - The source class name (often abbreviated).
  - `message` - Description of the event.

Copyright © 2022, 2024, Oracle and/or its affiliates.

# 3 Debug Tool

The Debug Tool provides third-party troubleshooting tools for debugging the runtime issues for the lab environment.

Following are the available tools:

- tcpdump
- ip
- netstat
- curl
- ping
- nmap
- dig

## 3.1 Preconfiguration Steps

This section explains the preconfiguration steps for using the debug tool:

> **Note**
>
> - For CNE 23.2.0 and later versions, follow Step a of Configuration in CNE.
> - For CNE versions prior to 23.2.0, follow Step b of Configuration in CNE.

1. ***Configuration in CNE***
   The following configurations must be performed in the Bastion Host.
   a. When OCNWDAF is installed on CNE version 23.2.0 or above:

> **Note**
>
> - In CNE version 23.2.0 or above, the default CNE 23.2.0 Kyverno policy, disallow-capabilities, do not allow NET_ADMIN and NET_RAW capabilities that are required for debug tool.
> - To run Debug tool on CNE 23.2.0 and above, the user must modify the existing Kyverno policy, disallow-capabilities, as below.

**Adding a Namespace to an Empty Resource**

i. Run the following command to verify if the current disallow-capabilities cluster policy has namespace in it.

Copyright © 2022, 2024, Oracle and/or its affiliates.

Example:

```
$ kubectl get clusterpolicies disallow-capabilities -oyaml
```

Sample output:

```
apiVersion: kyverno.io/v1
kind: ClusterPolicy
...
...
spec:
  rules:
  -exclude:
      any:
      -resources:{}
```

ii. If there are no namespaces, then patch the policy using the following command to add <namespace> under resources:

```
$ kubectl patch clusterpolicy disallow-capabilities --type=json \
  -p='[{"op": "add", "path": "/spec/rules/0/exclude/any/0/
resources", "value": {"namespaces":["<namespace>"]} }]'
```

Example:

```
$ kubectl patch clusterpolicy disallow-capabilities --type=json \
  -p='[{"op": "add", "path": "/spec/rules/0/exclude/any/0/
resources", "value": {"namespaces":["ocnwdaf"]} }]'
```

Sample output:

```
apiVersion: kyverno.io/v1
kind: ClusterPolicy
...
...
spec:
  rules:
  -exclude:
      resources:
        namespaces:
        -ocnwdaf
```

iii. If in case it is needed to remove the namespace added in the above step, use the following command:

```
$ kubectl patch clusterpolicy disallow-capabilities --type=json \
  -p='[{"op": "replace", "path": "/spec/rules/0/exclude/any/0/
resources", "value": {} }]'
```

Sample output:

```
apiVersion: kyverno.io/v1
kind: ClusterPolicy
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

```
...
...
spec:
  rules:
  -exclude:
      any:
      -resources:{}
```

**Adding a Namespace to an Existing Namespace List**

i. Run the following command to verify if the current disallow-capabilities cluster policy has namespaces in it.
*Example:*

```
$ kubectl get clusterpolicies disallow-capabilities -oyaml
```

Sample output:

```
apiVersion: kyverno.io/v1
kind: ClusterPolicy
...
...
spec:
  rules:
  -exclude:
      any:
      -resources:
          namespaces:
          -namespace1
          -namespace2
          -namespace3
```

ii. If there are namespaces already added, then patch the policy using the following command to add <namespace> to the existing list:

```
$ kubectl patch clusterpolicy disallow-capabilities --type=json \
  -p='[{"op": "add", "path": "/spec/rules/0/exclude/any/0/resources/
namespaces/-", "value": "<namespace>" }]'
```

Example:

```
$ kubectl patch clusterpolicy disallow-capabilities --type=json \
  -p='[{"op": "add", "path": "/spec/rules/0/exclude/any/0/resources/
namespaces/-", "value": "ocnwdaf" }]'
```

Sample output:

```
apiVersion: kyverno.io/v1
kind: ClusterPolicy
...
...
spec:
  rules:
  -exclude:
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

```
      resources:
        namespaces:
        -namespace1
        -namespace2
        -namespace3
        -ocnwdaf
```

iii. If in case it is needed to remove the namespace added in the above step, use the following command:

```
$ kubectl patch clusterpolicy disallow-capabilities --type=json \
  -p='[{"op": "remove", "path": "/spec/rules/0/exclude/any/0/
resources/namespaces/<index>"}]'
```

Example:

```
$ kubectl patch clusterpolicy disallow-capabilities --type=json \
  -p='[{"op": "remove", "path": "/spec/rules/0/exclude/any/0/
resources/namespaces/3"}]'
```

Sample output:

```
apiVersion: kyverno.io/v1
kind: ClusterPolicy
...
...
spec:
  rules:
  -exclude:
      resources:
        namespaces:
        -namespace1
        -namespace2
        -namespace3
```

> **Note**
>
> While removing the namespace, provide the index value for namespace within the array. The index starts from '0'.

b. When OCNWDAF is installed on CNE version prior to 23.2.0
**PodSecurityPolicy (PSP) Creation**

Create a PSP by running the following command from the bastion host. The parameters **readOnlyRootFileSystem**, **allowPrivilegeEscalation**, and **allowedCapabilities** are required by debug container.

Copyright © 2022, 2024, Oracle and/or its affiliates.

> **Note**
>
> Other parameters are mandatory for PSP creation and can be customized as per the CNE environment. The default values are recommended.

```
$ kubectl apply -f - <<EOF

apiVersion: policy/v1beta1
kind: PodSecurityPolicy
metadata:
  name: debug-tool-psp
spec:
  readOnlyRootFilesystem: false
  allowPrivilegeEscalation: true
  allowedCapabilities:
  - NET_ADMIN
  - NET_RAW
  fsGroup:
    ranges:
    - max: 65535
      min: 1
    rule: MustRunAs
  runAsUser:
    rule: MustRunAsNonRoot
  seLinux:
    rule: RunAsAny
  supplementalGroups:
    rule: RunAsAny
  volumes:
  - configMap
  - downwardAPI
  - emptyDir
  - persistentVolumeClaim
  - projected
  - secret
EOF
```

**Role Creation**

Run the following command to create a role for the PSP:

```
kubectl apply -f - <<EOF
apiVersion: rbac.authorization.k8s.io/v1
kind: Role
metadata:
  name: debug-tool-role
  namespace: cncc
rules:
- apiGroups:
  - policy
  resources:
  - podsecuritypolicies
  verbs:
  - use
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

```
  resourceNames:
  - debug-tool-psp
EOF
```

**RoleBinding Creation**

Run the following command to associate the service account for the OCNWDAF namespace with the role created for the PSP:

```
$ kubectl apply -f - <<EOF
apiVersion: rbac.authorization.k8s.io/v1
kind: RoleBinding
metadata:
  name: debug-tool-rolebinding
  namespace: ocnwdaf
roleRef:
  apiGroup: rbac.authorization.k8s.io
  kind: Role
  name: debug-tool-role
subjects:
- kind: Group
  apiGroup: rbac.authorization.k8s.io
  name: system:serviceaccounts
EOF
```

2. ***Configuration in NF specific Helm***
   Following updates must be performed in custom_values.yaml file.
   a. Log in to the NF server.
   b. Open the custom_values file:

      ```
      $ vim <custom_values file>
      ```

   c. Under global configuration, add the following:

      ```
      # Allowed Values: DISABLED, ENABLED
      # Preference is to set  "resources" request and limit to same values to
      avoid HPA issues.
      extraContainers: DISABLED
      debugToolContainerMemoryLimit: 4Gi
      extraContainersVolumesTpl: |
        - name: debug-tools-dir
          emptyDir:
            medium: Memory
            sizeLimit: {{ .Values.global.debugToolContainerMemoryLimit |
      quote }}
      extraContainersTpl: |
          - command:
              - /bin/sleep
              - infinity
            image: <image-name>:<image-tag>
            imagePullPolicy: Always
            name: tools
            resources:
              requests:
                ephemeral-storage: "512Mi"
      ```

Copyright © 2022, 2024, Oracle and/or its affiliates.

```
          cpu: "0.5"
          memory: {{ .Values.global.debugToolContainerMemoryLimit |
quote }}
        limits:
          ephemeral-storage: "512Mi"
          cpu: "0.5"
          memory: {{ .Values.global.debugToolContainerMemoryLimit |
quote }}
      securityContext:
        allowPrivilegeEscalation: true
        capabilities:
          drop:
          - ALL
          add:
          - NET_RAW
          - NET_ADMIN
        runAsUser: <user-id>
      volumeMounts:
      - mountPath: /tmp/tools
        name: debug-tools-dir
```

> **Note**
>
> - Debug Tool Container comes up with the default user ID - 7000. If you want to override this default value, use the `runAsUser` field, or else, you can skip the field.
>
>   Default value: uid=7000(debugtool) gid=7000(debugtool) groups=7000(debugtool)
> - In case you want to customize the container name, replace the `name` field in the above values.yaml with the following:
>
>   ```
>   name: {{ printf "%s-tools-%s" (include "getprefix" .)
>   (include "getsuffix" .) | trunc 63 | trimPrefix "-" |
>   trimSuffix "-"  }}
>   ```
>
>   This will ensure that the container name is prefixed and suffixed with the necessary values.

d. Under service specific configurations for which debugging is required, add the following:

```
# Allowed Values: DISABLED, ENABLED, USE_GLOBAL_VALUE
extraContainers: USE_GLOBAL_VALUE
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

> **Note**
>
> - At the global level, `extraContainers` flag can be used to enable or disable injecting extra containers globally. This ensures that all the services that use this global value have extra containers enabled or disabled using a single flag.
> - At the service level, `extraContainers` flag determines whether to use the extra container configuration from the global level or enable or disable injecting extra containers for the specific service.

# 3.2 Deploy Debug Tool

Following is the procedure to run Debug Tool.

1. Run the following command to retrieve the POD details:

   ```
   $ kubectl get pods -n <k8s namespace>
   ```

   Example:

   ```
   $ kubectl get pods -n ocnwdaf
   ```

2. Run the following command to enter Debug Tool Container:

   ```
   $ kubectl exec -it <pod name> -c <debug_container name> -n <namespace> bash
   ```

3. Run the debug tools:

   ```
   bash -4.2$ <debug_tools>
   ```

   Example:

   ```
   bash -4.2$ tcpdump
   ```

4. Copy the output files from container to host:

   ```
   $ kubectl cp -c <debug_container name> <pod name>:<file location in
   container> -n <namespace> <destination location>
   ```

# 3.3 Tools Tested in Debug Container

Following is the list of debugging tools that are tested.

**tcpdump**

The following table describes the options that are testing using `tcpdump` tool.

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Table 3-1 tcpdump**

| Options Tested | Description | Output | Capabilities |
|---|---|---|---|
| -D | Print the list of the network interfaces available on the system and on which *tcpdump* can capture packets. | `tcpdump -D`<br>1. eth02.<br>2. nflog (Linux netfilter log (NFLOG) interface)<br>3. nfqueue (Linux netfilter queue (NFQUEUE) interface)<br>4. any (Pseudo-device that captures on all interfaces)<br>5. lo [Loopback] | NET_ADMIN, NET_RAW |
| -i | Listen on *interface* | `tcpdump -i eth0`<br>tcpdump: verbose output suppressed, use -v or -vv for full protocol decodelistening on eth0, link-type EN10MB (Ethernet), capture size 262144 bytes12:10:37.381199 IP cncc-core-ingress-gateway-7ffc49bb7f-2kkhc.46519 > kubernetes.default.svc.cluster.local.https: Flags [P.], seq 1986927241:1986927276, ack 1334332290, win 626, options [nop,nop,TS val 849591834 ecr 849561833], length 3512:10:37.381952 IP cncc-core-ingress-gateway-7ffc49bb7f-2kkhc.45868 > kube-dns.kube-system.svc.cluster.local.domain: 62870+ PTR? 1.0.96.10.in-addr.arpa. (40) | NET_ADMIN, NET_RAW |
| -w | Write the raw packets to file rather than parsing and printing them out. | `tcpdump -w capture.pcap -i eth0` | NET_ADMIN, NET_RAW |
| -r | Read packets from *file* (which was created with the **-w** option). | `tcpdump -r capture.pcap`<br>reading from file /tmp/capture.pcap, link-type EN10MB (Ethernet)12:13:07.381019 IP cncc-core-ingress-gateway-7ffc49bb7f-2kkhc.46519 > kubernetes.default.svc.cluster.local.https: Flags [P.], seq 1986927416:1986927451, ack 1334332445, win 626, options [nop,nop,TS val 849741834 ecr 849711834], length 3512:13:07.381194 IP kubernetes.default.svc.cluster.local.https > cncc-core-ingress-gateway-7ffc49bb7f-2kkhc.46519: Flags [P.], seq 1:32, ack 35, win 247, options [nop,nop,TS val 849741834 ecr 849741834], length 3112:13:07.381207 IP cncc-core-ingress-gateway-7ffc49bb7f-2kkhc.46519 > kubernetes.default.svc.cluster.local.https: Flags [.], ack 32, win 626, options [nop,nop,TS val 849741834 ecr 849741834], length 0 | NET_ADMIN, NET_RAW |

### ip

The following table describes the options that are testing using `ip` tool.

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Table 3-2 ip**

| Options Tested | Description | Output | Capabilities |
|---|---|---|---|
| addr show | Look at protocol addresses. | `ip addr show`<br>1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN group defaultlink/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00inet 127.0.0.1/8 scope host lovalid_lft forever preferred_lft forever2: tunl0@NONE: <NOARP> mtu 1480 qdisc noop state DOWN group defaultlink/ipip 0.0.0.0 brd 0.0.0.04: eth0@if190: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1440 qdisc noqueue state UP group defaultlink/ether aa:5a:27:8d:74:6f brd ff:ff:ff:ff:ff:ff link-netnsid 0inet 192.168.219.112/32 scope global eth0valid_lft forever preferred_lft forever | -- |

### curl

The following table describes the options that are testing using `curl` tool.

**Table 3-4 curl**

| Options Tested | Description | Output | Capabilities |
|---|---|---|---|
| -o | Write output to <file> instead of stdout. | `curl -o file.txt http://abc.com/file.txt` | -- |
| -x | Use the specified HTTP proxy. | `curl -x proxy.com:8080 -o http://abc.com/file.txt` | -- |

### ping

The following table describes the options that are testing using `ping` tool.

**Table 3-5 ping**

| Options Tested | Description | Output | Capabilities |
|---|---|---|---|
| <ip> | Run a ping test to see whether the target host is reachable or not. | `ping 10.178.254.194` | NET_ADMIN, NET_RAW |
| -c | Stop after sending 'c' number of ECHO_REQUEST packets. | `ping -c 5 10.178.254.194` | NET_ADMIN, NET_RAW |

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Table 3-5 (Cont.) ping**

| Options Tested | Description | Output | Capabilities |
|---|---|---|---|
| -f (with non zero interval) | Flood ping. For every ECHO_REQUEST sent, a period "." is printed, while for every ECHO_REPLY received a backspace is printed. | `ping -f -i 2 10.178.254.194` | NET_ADMIN, NET_RAW |

### nmap

The following table describes the options that are testing using `nmap` tool.

**Table 3-6 nmap**

| Options Tested | Description | Output | Capabilities |
|---|---|---|---|
| <ip> | Scan for Live hosts, Operating systems, packet filters and open ports running on remote hosts. | `nmap 10.178.254.194`<br><br>`Starting Nmap 6.40 ( http://nmap.org ) at 2020-09-29 05:54 UTCNmap scan report for`<br><br>`10-178-254-194.kubernetes.default.svc.cluster .local (10.178.254.194)Host is up (0.00046s latency).Not shown: 995 closed portsPORT STATE SERVICE22/tcp open ssh179/tcp open bgp6666/tcp open irc6667/tcp open irc30000/tcp open unknownNmap done: 1 IP address (1 host up) scanned in 0.04 seconds` | -- |

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Table 3-6 (Cont.) nmap**

| Options Tested | Description | Output | Capabilities |
|---|---|---|---|
| -v | Increase verbosity level | `nmap -v 10.178.254.194`<br><br>`Starting Nmap 6.40 ( http://nmap.org ) at 2020-09-29 05:55 UTC`<br>`Initiating Ping Scan at 05:55`<br>`Scanning 10.178.254.194 [2 ports]`<br>`Completed Ping Scan at 05:55, 0.00s elapsed (1 total hosts)`<br>`Initiating Parallel DNS resolution of 1 host. at 05:55`<br>`Completed Parallel DNS resolution of 1 host. at 05:55, 0.00s elapsed`<br>`Initiating Connect Scan at 05:55`<br>`Scanning 10-178-254-194.kubernetes.default.svc.cluster.local (10.178.254.194) [1000 ports]`<br>`Discovered open port 22/tcp on 10.178.254.194`<br>`Discovered open port 30000/tcp on 10.178.254.194`<br>`Discovered open port 6667/tcp on 10.178.254.194`<br>`Discovered open port 6666/tcp on 10.178.254.194`<br>`Discovered open port 179/tcp on 10.178.254.194`<br>`Completed Connect Scan at 05:55, 0.02s elapsed (1000 total ports)`<br>`Nmap scan report for 10-178-254-194.kubernetes.default.svc.cluster.local (10.178.254.194)`<br>`Host is up (0.00039s latency).`<br>`Not shown: 995 closed ports`<br>`PORT STATE SERVICE`<br>`22/tcp open ssh`<br>`179/tcp open bgp`<br>`6666/tcp open irc`<br>`6667/tcp open irc`<br>`30000/tcp open unknown`<br><br>`Read data files from: /usr/bin/../share/nmap`<br>`Nmap done: 1 IP address (1 host up) scanned in 0.04 seconds` | -- |

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Table 3-6 (Cont.) nmap**

| Options Tested | Description | Output | Capabilities |
|---|---|---|---|
| -iL | Scan all the listed IP addresses in a file. Sample file | `nmap -iL sample.txt`<br><br>`Starting Nmap 6.40 ( http://nmap.org ) at 2020-09-29 05:57 UTC`<br>`Nmap scan report for localhost (127.0.0.1)`<br>`Host is up (0.00036s latency).`<br>`Other addresses for localhost (not scanned): 127.0.0.1`<br>`Not shown: 998 closed ports`<br>`PORT STATE SERVICE`<br>`8081/tcp open blackice-icecap`<br>`9090/tcp open zeus-admin`<br><br>`Nmap scan report for 10-178-254-194.kubernetes.default.svc.cluster.local (10.178.254.194)`<br>`Host is up (0.00040s latency).`<br>`Not shown: 995 closed ports`<br>`PORT STATE SERVICE`<br>`22/tcp open ssh`<br>`179/tcp open bgp`<br>`6666/tcp open irc`<br>`6667/tcp open irc`<br>`30000/tcp open unknown`<br><br>`Nmap done: 2 IP addresses (2 hosts up) scanned in 0.06 seconds` | -- |

**dig**

The following table describes the options that are testing using `dig` tool.

**Table 3-7 dig**

| Options Tested | Description | Output | Capabilities |
|---|---|---|---|
| <ip> | It performs DNS lookups and displays the answers that are returned from the name server(s) that were queried. | `dig 10.178.254.194`<br>**Note**: The IP should be reachable from inside the container. | -- |
| -x | Query DNS Reverse lookup. | `dig -x 10.178.254.194` | -- |

# 3.4 Debug Tool Configuration Parameters

Following are the parameters used to configure debug tool.

Copyright © 2022, 2024, Oracle and/or its affiliates.

### CNE Parameters

**Table 3-8 CNE Parameters**

| Parameter | Description |
|---|---|
| apiVersion | APIVersion defines the version schema of this representation of an object. |
| kind | Kind is a string value representing the REST resource this object represents. |
| metadata | Standard object's metadata. |
| metadata.name | Name must be unique within a namespace. |
| spec | This defines the policy enforced. |
| spec.allowPrivilegeEscalation | Gates whether or not a user is allowed to set the security context of a container to allowPrivilegeEscalation=true. |
| spec.allowedCapabilities | Provides a list of capabilities that are allowed to be added to a container. |
| spec.fsGroup | Controls the supplemental group applied to some volumes. RunAsAny allows any fsGroup ID to be specified. |
| spec.runAsUser | Controls which user ID the containers are run with. RunAsAny allows any runAsUser to be specified. |
| spec.seLinux | RunAsAny allows any seLinuxOptions to be specified. |
| spec.supplementalGroups | Controls which group IDs containers add. RunAsAny allows any supplementalGroups to be specified. |
| spec.volumes | Provides a list of allowed volume types. The allowable values correspond to the volume sources that are defined when creating a volume. |

### Role Creation Parameters

**Table 3-9 Role Creation**

| Parameter | Description |
|---|---|
| apiVersion | APIVersion defines the schema version of this representation of an object. |
| kind | Kind is a string value representing the REST resource this object represents. |
| metadata | Standard object's metadata. |
| metadata.name | Name must be unique within a namespace. |
| metadata.namespace | Namespace defines the space within which each name must be unique. |
| rules | Rules holds all the PolicyRules for this Role |
| apiGroups | APIGroups is the name of the APIGroup that contains the resources. |
| rules.resources | Resources is a list of resources this rule applies to. |
| rules.verbs | Verbs is a list of Verbs that apply to ALL the ResourceKinds and AttributeRestrictions contained in this rule. |
| rules.resourceNames | ResourceNames is an optional allowed list of names that the rule applies to. |

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Table 3-10 Role Binding Creation**

| Parameter | Description |
|---|---|
| apiVersion | APIVersion defines the version of schema of this representation of an object. |
| kind | Kind is a string value representing the REST resource this object represents. |
| metadata | Standard object's metadata. |
| metadata.name | Name must be unique within a namespace. |
| metadata.namespace | Namespace defines the space within which each name must be unique. |
| roleRef | RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. |
| roleRef.apiGroup | APIGroup is the group for the resource being referenced |
| roleRef.kind | Kind is the type of resource being referenced |
| roleRef.name | Name is the name of resource being referenced |
| subjects | Subjects holds references to the objects the role applies to. |
| subjects.kind | Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". |
| subjects.apiGroup | APIGroup holds the API group of the referenced subject. |
| subjects.name | Name of the object being referenced. |

## Debug Tool Configuration Parameters

**Table 3-11 Debug Tool Configuration Parameters**

| Parameter | Description |
|---|---|
| extraContainers | Specifies the spawns debug container along with application container in the pod. |
| debugToolContainerMemoryLimit | Indicates the memory assigned for the debug tool container. |
| extraContainersVolumesTpl | Specifies the extra container template for the debug tool volume. |
| extraContainersVolumesTpl.name | Indicates the name of the volume for debug tool logs storage. |
| extraContainersVolumesTpl.emptyDir.medium | Indicates the location where `emptyDir` volume is stored. |
| extraContainersVolumesTpl.emptyDir.sizeLimit | Indicates the `emptyDir` volume size. |
| command | String array used for container command. |
| image | Docker image name |
| imagePullPolicy | Image Pull Policy |
| name | Name of the container |
| resources | Compute Resources required by this container |
| resources.limits | Limits describes the maximum amount of compute resources allowed |
| resources.requests | Requests describes the minimum amount of compute resources required |
| resources.limits.cpu | CPU limits |
| resources.limits.memory | Memory limits |
| resources.limits.ephemeral-storage | Ephemeral Storage limits |

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Table 3-11 (Cont.) Debug Tool Configuration Parameters**

| Parameter | Description |
|---|---|
| resources.requests.cpu | CPU requests |
| resources.requests.memory | Memory requests |
| resources.requests.ephemeral-storage | Ephemeral Storage requests |
| securityContext | Security options the container should run with. |
| securityContext.allowPrivilegeEscalation | AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This directly controls if the no_new_privs flag will be set on the container process |
| secuirtyContext.readOnlyRootFilesyste m | Whether this container has a read-only root filesystem. Default is false. |
| securityContext.capabilities | The capabilities to add or drop when running containers. Defaults to the default set of capabilities granted by the container runtime. |
| securityContext.capabilities.drop | Removed capabilities |
| secuirtyContext.capabilities.add | Added capabilities |
| securityContext.runAsUser | The UID to run the entry point of the container process. |
| volumeMounts.mountPath | Indicates the path for volume mount. |
| volumeMounts.name | Indicates the name of the directory for debug tool logs storage. |

Copyright © 2022, 2024, Oracle and/or its affiliates.

# 4
# Troubleshooting OCNWDAF

This chapter provides information to troubleshoot the common errors which can be encountered during the preinstallation and installation procedures of OCNWDAF.

## 4.1 Generic Checklist

The following sections provide a generic checklist for troubleshooting tips.

**Deployment related tips**

Perform the following checks after the deployment:

- Are OCNWDAF deployment, pods, and services created?
  Are OCNWDAF deployment, pods, and services running and available?

  Run the following the command:

  ```
  # kubectl -n <namespace> get deployments,pods,svc
  ```

  Inspect the output, check the following columns:

  – AVAILABLE of deployment
  – READY, STATUS, and RESTARTS of a pod
  – PORT(S) of service
- Check if the microservices can access each other through the REST interface.
  Run the following command:

  ```
  # kubectl -n <namespace> exec <pod name> -- curl <uri>
  ```

**Application related tips**

Run the following command to check the application logs and look for exceptions:

```
# kubectl -n <namespace> logs -f <pod name>
```

You can use '-f' to follow the logs or 'grep' for specific pattern in the log output.

## 4.2 Deployment Related Issue

This section describes the most common deployment related issues and their resolution steps. It is recommended to perform the resolution steps provided in this guide. If the issue still persists, then contact My Oracle Support.

### 4.2.1 Installation

This section describes the most common installation related issues and their resolution steps.

Copyright © 2022, 2024, Oracle and/or its affiliates.

## 4.2.1.1 Pod Creation Failure

A pod creation can fail due to various reasons. Some of the possible scenarios are as follows:

**Verifying Pod Image Correctness**

To verify pod image:

- Check whether any of the pods is in the **ImagePullBackOff** state.
- Check if the image name used for all the pods are correct. Verify the image names and versions in the OCNWDAF installation file. For more information about the custom value file, see *Oracle Communications Networks Data Analytics Function Installation and Fault Recovery Guide*.

**Verifying Resource Allocation Failure**

To verify any resource allocation failure:

- Run the following command to verify whether any pod is in the pending state.
  `kubectl describe <nwdaf-drservice pod id> --n <ocnef-namespace>`
- Verify whether any warning on insufficient CPU exists in the describe output of the respective pod. If it exists, it means there are insufficient CPUs for the pods to start. Address this hardware issue.

**Verifying Resource Allocation Issues on Webscale Environment**

Webscale environment has openshift container installed. There can be cases where,

- Pods does not scale after you run the installation command and the installation fails with timeout error. In this case, check for preinstall hooks failure. Run the **oc get job** command to create the jobs. Describe the job for which the pods are not getting scaled and check if there are **quota limit exceeded** errors with CPU or memory.

Copyright © 2022, 2024, Oracle and/or its affiliates.

- Any of the actual microservice pods do not scale post the hooks completion. In this case, run the **oc get rs** command to get the list of replicaset created for the NF deployment. Then, describe the replicaset for which the pods are not getting scaled and check for **resource quota limit exceeded** errors with CPU or memory.
- Installation times-out after all the microservice pods are scaled as expected with the expected number of replicas. In this case, check for post install hooks failure. Run the **oc get job** command to get the post install jobs and do a describe on the job for which the pods are not getting scaled and check if there are **quota limit exceeded** errors with CPU or memory.
- Resource quota exceed beyond limits.

**Verifying Resources Assigned to Previous Installation**

If a previous installations, uninstall procedure was not successful and the uninstall process was forced, it is possible that some resources are still assigned to the previous installation. This can be detected by running the following command:

```
kubectl -n <namepsace> describe pod <podname>
```

While searching for events, if you detect messages similar to the following message, it indicates that there are resources still assigned to the previous installation and should be purged.

```
0/n nodes are available: n pods has unbound immediate PersistenVolumeClaims
```

## 4.2.1.2 Pod Startup Failure

Follow the guidelines shared below to debug the pod startup failure liveness check issues:

- If dr-service, diameter-proxy, and diam-gateway services are stuck in the Init state, then the reason could be that config-server is not yet up. A sample log on these services is as follows:

  ```
  "Config Server is Not yet Up, Wait For config server to be up."
  ```

  To resolve this, you must either check for the reason of config-server not being up or if the config-server is not required, then disable it.
- If the notify and on-demand migration service is stuck in the Init state, then the reason could be the dr-service is not yet up. A sample log on these services is as follows:

  ```
  "DR Service is Not yet Up, Wait For dr service to be up."
  ```

  To resolve this, check for failures on dr-service.

## 4.2.1.3 NRF Registration Failure

The OCNWDAF registration with NRF may fail due to various reasons. Some of the possible scenarios are as follows:

- Confirm whether registration was successful from the nrf-client-service pod.
- Check the ocnwdaf-nrf-client-nfmanagement logs. If the log has **"OCNWDAF is Unregistered"** then:

Copyright © 2022, 2024, Oracle and/or its affiliates.

  - Check if all the services mentioned under allorudr/slf (depending on OCNWDAF mode) in the installation file has same spelling as that of service name and are enabled.
  - Once all services are up, OCNWDAF must register with NRF.
- If you see a log for **SERVICE_UNAVAILABLE(503)**, check if the primary and secondary NRF configurations (primaryNrfApiRoot/secondaryNrfApiRoot) are correct and they are UP and Running.

### 4.2.1.4 NRF Client Errors

**Problem**

During registration, when the OCNWDAF wants to subscribe to the NRF, the following errors appear:

**Scenario 1:**

In the *ocn-nwdaf-subscription pod*, the *con-nwdaf-subscription* log displays the following error message:

```
2024-03-20T00:10:04,426 [nwdaf-subscription] ERROR [main] []
com.oracle.cgbu.nwdaf.subscription.application.nrfregister.listener.NfRegisterOnA
pplicationReady.onApplicationEvent:47 - Error when trying to register the NF:
424 : "{"status":424,"detail":"Failed to resolve 'http' [A(1), AAAA(28)] after 3
queries ","cause":"UnknownHostException occurred in nrfClient"}"
```

In the *nwdaf-ocnf-nrf-client-nfmanagement*, the *nwdaf-ocnf-nrf-client-nfmanagement* log displays the following error message:

```
{"instant":{"epochSecond":1710898639,"nanoOfSecond":579927543},"thread":"pool-8-
thread-2","level":"WARN","loggerName":"com.oracle.cgbu.cnc.nrf.timeout.TracingReq
uestMonitoring","message":"Event call failed(WebClientRequest[method=PUT,

**Solution**

The errors are due to an incorrect configuration in the NRF client section of the main *values.yaml* (*/installer/ocn-nwdaf-helmchart/values.yaml*) file. These values are optional, but if configured, they should be valid as displayed below:

```
rfclient:
   global:
       dockerRegistry: *nrfRegistry
       # Mysql Host
       envMysqlHost: *mySQLHost
       envMysqlSecondaryHost: ''
       # Mysql Port
       envMysqlPort: *mySQLPort
       envMysqlSecondaryPort: ''
       dbEngine: *mySQLEngine
       # NRF ingress gateway (OCNRF) ex:http://ocnrf-ingressgateway.ocnrf ||
NRF simulator service ex:ocn-nrf-simulator-service.ocnwdaf-ns
       egressGatewayHost: <'replace here'>
       deploymentNrfClientService:
           # NRF ingress gateway port (OCNRF) ex:80 || NRF simulator service
port ex:8080
           envEgressGatewayPort: <'replace here'>
           # NRF ingress gateway (OCNRF) ex: 'http://nwdaf-ingress-gateway.oc-
nwdaf.svc.cluster.local:80' || NRF simulator service ex:http://ocn-nrf-
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

```
simulator-service.ocnwdaf-ns:8080
          nfApiRoot: <'replace here'>
```

**Scenario 2:**

In the *ocn-nwdaf-subscription pod*, the *con-nwdaf-subscription* log displays the following error message:

```
2024-03-20T00:10:04,426[nwdaf-subscription] ERROR [main] []
com.oracle.cgbu.nwdaf.subscription.application.nrfregister.listener.NfRegisterOnA
pplicationReady.onApplicationEvent:47- Error when trying to register the NF: 424:
"{"status":424,"detail":"Failed to resolve 'http'[A(1), AAAA(28)] after 3queries
","cause":"UnknownHostException occurred in nrfClient"}"
```

In the *nwdaf-ocnf-nrf-client-nfmanagement*, the *nwdaf-ocnf-nrf-client-nfmanagement* log displays the following error message:

```
{"instant":{"epochSecond":1711067541,"nanoOfSecond":388802001},"thread":"pool-8-
thread-1","level":"WARN","loggerName":"com.oracle.cgbu.cnc.nrf.api.NRFClientApi",

thread-1","level":"ERROR","loggerName":"com.oracle.cgbu.cnc.nrf.api.NRFClientApi"
,"message":" Error Response received from NRF :
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

424","endOfBatch":false,"loggerFqcn":"org.apache.logging.slf4j.Log4jLogger","threadId":92,"threadPriority":5,"messageTimestamp":"2024-03-22T00:32:21.388+0000"}

**Solution**

The errors are due to an incorrect configuration in the NRF client profile in the NRF client *values.yaml (/installer/helmChart/charts/nrf-client/values.yaml)* file. The *primaryNrfApiRoot* value does not exist, or if it exists, ensure to update the value to the valid value displayed below:

> **Note**
>
> If the NRF is having any other name space, add it in the *values.yaml* file. For example: *ocnrf-ingressgateway.ocnrf:80*.
>
> ```
> # Microservice level control if specific microservice need to be
> disabled
> nrf-client:
>   profile: |-
>          [appcfg]
>          primaryNrfApiRoot=ocn-nrf-simulator-service:8080
>          secondaryNrfApiRoot=
> ```

## 4.2.1.5 Incorrect Service Account Creation

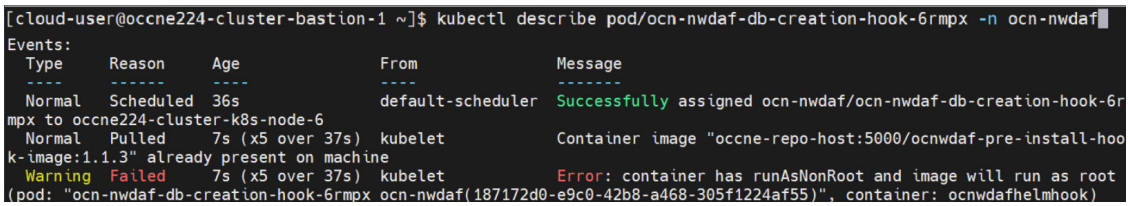
**Problem**

Pods display an error when appropriate service accounts are not created for the pods.

**Error Code or Error Message**

Sample error message:

**Figure 4-1 Sample Error Message**



**Solution**

Ensure the service account creation hook in the parent chart's *values.yaml* file is enabled and runs properly.

## 4.2.1.6 Service Account Creation in Openshift Environment

**Problem**

While deploying OCNWDAF in an Openshift environment, service account creation can result in Helm installation issues.

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Solution**

Add the service account manually in the namespace before deployment, run the following command to add the service account:

```
oc adm policy add-scc-to-user anyuid --serviceaccount=<namespace>-ocnwdaf-sa -
n <namespace>
```

Where,

- `oc`: OpenShift CLI
- `adm`: Admin
- `scc`: Security Context Constraint

## 4.2.1.7 Incorrect Values in Helm Chart

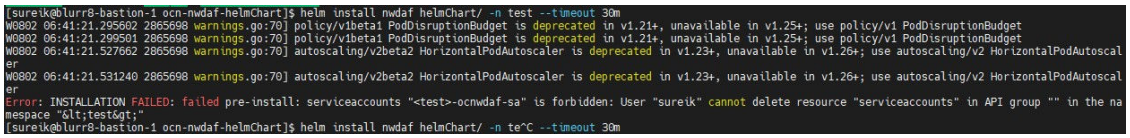
**Problem**

During Helm chart deployment, if instances of the command parameter `<replace here>` are not replaced with values or replaced with incorrect values, services are not deployed.

**Error Code or Error Message**

Sample error message:

**Figure 4-2 Incorrect Values in Helm Chart**



**Solution**

Uninstall the deployment and verify the *values.yaml* file in the Helm chart. Search for `<replace here>` instances and provide correct values.

## 4.2.1.8 Install Timeout Error

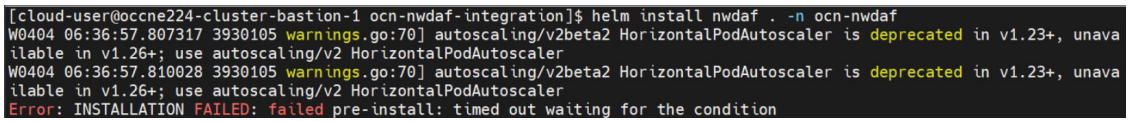
**Problem**

This error occurs when a hook restarts more than five times.

**Error Code or Error Message**

Sample error message:

**Figure 4-3 Sample Error Message**



Copyright © 2022, 2024, Oracle and/or its affiliates.

**Solution**

Check whether the MySQL host or MySQL port is mentioned correctly in the *values.yaml* file of both the parent and the NRF client Helm charts. Verify the pod logs for more information.

Run the following command to verify the logs:

```
kubectl logs <name-of-pod/hook> -n <namespace>
```

## 4.2.1.9 Pods Enter Pending State

**Problem**

Pods enter a pending state due to resource shortage in the setup.

**Error Code or Error Message**

Sample error message:

**Figure 4-4 Sample Error Message**

```
[cloud-user@occne224-cluster-bastion-1 helmChart]$ kubectl describe pod/cap4c-model-controller-deploy-7475d79d7f-xkrsw -
n ocn-nwdaf
Events:
  Type     Reason            Age               From               Message
  ----     ------            ----              ----               -------
  Warning  FailedScheduling  12m               default-scheduler  0/9 nodes are available: 1 node(s) had taint {node.ku
bernetes.io/not-ready: }, that the pod didn't tolerate, 3 node(s) had taint {node-role.kubernetes.io/master: }, that the
 pod didn't tolerate, 5 Insufficient cpu.
  Warning  FailedScheduling  12m (x1 over 12m)  default-scheduler  0/9 nodes are available: 1 node(s) had taint {node.ku
bernetes.io/not-ready: }, that the pod didn't tolerate, 3 node(s) had taint {node-role.kubernetes.io/master: }, that the
 pod didn't tolerate, 5 Insufficient cpu.
```

**Solution**

Free up all unnecessary resources present in the cluster that are consuming a lot of cluster resources.

## 4.2.1.10 Resource Creation Failure

**Problem**

The deployment namespace does not have appropriate permissions to create resources.

**Error Code or Error Message**

Sample error message:

**Figure 4-5 Sample Error Message**

```
[mrlal@blurr7-bastion-1 ocn-nwdaf-integration]$ helm install nwdaf . -n test-del
W0404 06:59:09.349681 3370367 warnings.go:70] autoscaling/v2beta2 HorizontalPodAutoscaler is deprecated in v1.23+, unava
ilable in v1.26+; use autoscaling/v2 HorizontalPodAutoscaler
W0404 06:59:09.352937 3370367 warnings.go:70] autoscaling/v2beta2 HorizontalPodAutoscaler is deprecated in v1.23+, unava
ilable in v1.26+; use autoscaling/v2 HorizontalPodAutoscaler
Error: INSTALLATION FAILED: create: failed to create: secrets is forbidden: User "mrlal" cannot create resource "secrets
" in API group "" in the namespace "test-del"
```

**Solution**

Copyright © 2022, 2024, Oracle and/or its affiliates.

Create a child namespace for the parent namespace that has appropriate permissions, run the following command:

```
kubectl hns create <child-namespace> -n <parent-namespace>
```

## 4.2.1.11 Service Configuration or Parameter Mismatch

**Problem**

Service configuration or parameter mismatch might result in the service entering a *CrashBackLoop* off mode.

**Solution**

Update the properties in the corresponding services *values.yaml* file and perform a Helm install.

## 4.2.1.12 Service Nodeport Error

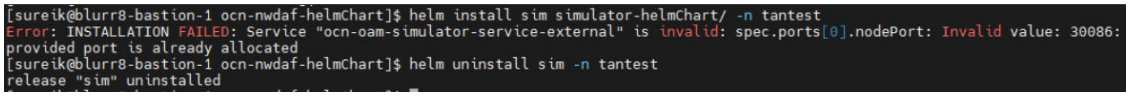
**Problem**

The service nodeport was previously assigned to other services running in the cluster.

**Error Code or Error Message**

Sample error message:

**Figure 4-6 Sample Error Message**



**Solution**

To resolve this error, edit the *values.yaml* file and provide a random port number to the service nodeport.

## 4.2.1.13 Common Services Gateway Service Name Mismatch

**Problem**

Suppose the service name of the common services gateway differs from "nwdaf-ingress-gateway-service" and "nwdaf-egress-gateway-service". This results in errors in the functioning of the gateways and forwarding of external requests to the respective services.

**Solution**

- Run the following command:

  ```
  kubectl edit service <service-name> -n <namespace>
  ```

- Edit the service names of the common services gateways to "nwdaf-ingress-gateway-service" for the Ingress Gateway and "nwdaf-egress-gateway-service" for the Egress Gateway respectively.

Copyright © 2022, 2024, Oracle and/or its affiliates.

### 4.2.1.14 Run Only DB Creation Hook

Set the *dbConfigStatus* flag in *values.yaml* file under */helmchart* directory to *dbonly* to run only the DB creation hook. The Helm installation command will not deploy any other resource or make any other configuration change. Users can use different Helm installation names in the Helm install command to configure the latest database by updating the scripts *ocnwdaf-db-config.yaml* under */helmchart/templates* directory and *prehookconfig.yaml* under */helmchart/charts/ocn-nwdaf-geo-redundancy-agent/templates* directory.

### 4.2.1.15 Helm Chart Upgrade

Helm upgrade is performed for all deployment changes (for example, updating the image used in the microservice) that do not require a reinstallation. Run the following command to perform a Helm upgrade:

```
helm upgrade <installation name> <path to the updated chart directory> -
n $K8_NAMESPACE --timeout <timeout>h
```

**Note**

- Provide the correct installation name on which the installation was performed.
- The `timeout` variable is optional. It is based on the speed of image pull from the nodes of the Bastion. The recommended timeout value is "4 h".
- Helm upgrade must be performed only on the main Helm chart under */helmChart* directory. It must not be performed on the subcharts under */charts* directory. To update any subchart, make changes in the respective subchart and perform Helm upgrade on the main Helm chart under */helmChart* directory.
- To enable DB creation hook or to prepare the dependencies hook, set the *upgradeStatus* flag in *values.yaml* file under */helmChart* directory to true before performing a Helm upgrade. To disable the hooks, set the *upgradeStatus* flag to false.
- Before performing a Helm upgrade on the *ocn-nwdaf-communication*, *nwdaf-cap4c-zookeper-chart*, *nwdaf-cap4c-kafka-chart*, *ocn-nrf-simulator-service*, and *nwdaf-cap4c-spring-cloud-config-server-chart* services, set the *upgradeStatus* flag in *values.yaml* file under */helmChart* directory to true. If there are no changes in the services, set the *upgradeStatus* flag to false.
- Use the prepare dependencies hook for Helm upgrade only when the *upgradeStatus* flag for *nwdaf-cap4c-kafka-chart* and *nwdaf-cap4c-spring-cloud-config-server-chart* microservices is set to false. To upgrade these microservices with the prepare dependencies hook, use the prepare dependencies hook in a separate Helm upgrade procedure, then perform an upgrade of the microservices.

Listed below are some use cases for performing a Helm upgrade:

- To update the fields such as image name, resources allotted, environment variables, and so on, make the required changes in the respective subcharts and run the Helm upgrade command on the updated chart.

Copyright © 2022, 2024, Oracle and/or its affiliates.

- To enable or disable services, set the subcharts enable or disable flag in the centralized *values.yaml* file under the */helmchart* directory to true or false (as required). The services with enable flag set to false are terminated.
- To reinstall the DB, enable the *dbCreationHook upgradeStatus* flag in *values.yaml* file under */helmChart* directory to true. The DB creation hook runs according to the configured *dbConfigStatus* flag in the file. For example, if the *dbConfigStatus* flag is set to *nwdafdb*, only the *nwdafdb* creation hook is run during upgrade.
- To reinstall the simulator's DB, as a prerequisite, refresh the main Helm chart DB to avoid installation failure. The simulation DB hook contains simulation data required by the OCNWDAF. To prevent the duplication of simulation data, set the *dbConfigStatus* flag to *noDb* while redeploying or upgrading the simulator's Helm chart.
- To transfer Spring Cloud config files from *nwdaf-pre-installer.tar.gz* to the *spring-cloud-config-server* microservice, and to create new Kafka topics in the Kafka microservice, use the prepare dependencies hook by updating *prepareDependencyHook upgradeStatus* flag in *values.yaml* file under */helmChart* directory to true. The Kafka pods and Spring Cloud Config server pods must be in *Ready* State before enabling *upgradeStatus* flag in *values.yaml* file under */helmChart* directory to true.

## 4.2.1.16 Stream Transformation or Storage Not Working

**Problem**

Stream transformation or storage is not functioning correctly.

**Solution**

If stream transformation or storage is not functioning as expected, verify the consumer group list and lag for each topic as listed below:

1. To verify if stream storage is not storing data in the database, run the following script to verify the current number of records:

```
K8_NAMESPACE=...
MYSQL_USER=...
MYSQ_PASSWORD=...

kubectl -n ${K8_NAMESPACE} exec -it mysql-pod -- mysql -u ${MYSQL_USER} -p$
{MYSQ_PASSWORD} -e "SELECT COUNT(*) FROM cap4c_kafka_ingestor_db.<replace-
with-db>;"
```

2. Run the following script and verify the output to see if the topics are configured in Kafka:

```
K8_NAMESPACE=...
KAFKA_POD=...

kubectl -n ${K8_NAMESPACE} exec -it ${KAFKA_POD} -- kafka-consumer-
groups.sh  --list --bootstrap-server localhost:9092
```

3. Run the following script and verify the output to see if the consumer group is consuming data from the requested topic:

```
K8_NAMESPACE=...
KAFKA_POD=...
KAFKA_CONSUMER_GROUP=...
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

```
kubectl -n ${K8_NAMESPACE} exec -it ${KAFKA_POD} -- kafka-consumer-
groups.sh --bootstrap-server localhost:9092 --describe --group $
{KAFKA_CONSUMER_GROUP}
```

4. Run the following script and verify the output to see if data is produced in the expected format for the requested topic:

```
K8_NAMESPACE=...
KAFKA_POD=...
KAFKA_TOPIC=...

kubectl -n ${K8_NAMESPACE} exec -it ${KAFKA_POD} -- kafka-console-
consumer.sh --bootstrap-server localhost:9092 --topic ${KAFKA_TOPIC}  --
max-messages 1
```

5. Run the following script and verify the logs of the service which is not consuming the topic:

```
SERVICE_POD=...

kubectl logs ${SERVICE_POD} -f
```

## 4.2.1.17 Slice Load and Geographical Data

Slice load and Geographical data is used for simulation. The *cap4c_configuration_manager* service database tables are populated with slice and cell data for the scripts to run correctly. This information is used as test data. Verify the tables if you face any issues during installation.

## 4.2.1.18 Data Director Integration - Certificates Not Working

**Problem**

The certificates generated by the `gen_certs.sh` script works only if a correct password is used and properties such as state, country, locality, organization, and so on are correctly configured.

> **Note**
>
> The correct configuration of country, state, locality, organization and other fields are provided while generating the CA cert. The common name field can be any name other than the CA's common name.

**Solution**

Use the OCNADD Kafka certificates and manually create the certificate *config* map for OCNWDAF Kafka. Run the following command:

```
kubectl create cm securityfiles --from-file=<truststore file name> --from-
file=<keystore file name> -n <namespace>
```

Update the `truststore` and `keystore` filenames in the *values.yaml* file as below:

```
TRUSTSTORE_LOCATION: /var/security/<truststore file name>
KEYSTORE_LOCATION: /var/security/<keystore file name>
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

## 4.2.1.19 Timeout Errors due to Inadequate Resources

**Problem**

Installation is susceptible timeout errors and potential failure if any of the scenarios listed below occur:

- **Insufficient Nodes to Deploy OCNWDAF**

  Sample command to verify nodes:

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl top node
NAME                    CPU(cores)   CPU%        MEMORY(bytes)   MEMORY%
qa-cluster-k8s-ctrl-1   909m         23%         2859Mi          86%
qa-cluster-k8s-ctrl-2   248m         6%          2740Mi          82%
qa-cluster-k8s-ctrl-3   233m         6%          2463Mi          74%
qa-cluster-k8s-node-1   1605m        5%          18293Mi         14%
qa-cluster-k8s-node-2   1717m        5%          30716Mi         23%
qa-cluster-k8s-node-3   1277m        4%          14117Mi         10%
qa-cluster-k8s-node-4   <unknown>    <unknown>   <unknown>       <unknown>
qa-cluster-k8s-node-5   <unknown>    <unknown>   <unknown>       <unknown>
qa-cluster-k8s-node-6   <unknown>    <unknown>   <unknown>       <unknown>
```

- **Insufficient PVC**

  Sample command to verify PVC:

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl describe pod/nwdaf-mysql-innodb-
cluster-1
Name:         nwdaf-mysql-innodb-cluster-1
Priority:     0
Node:         qa-cluster-k8s-node-6/192.168.200.80
Start Time:   Tue, 12 Dec 2023 00:17:19 +0000
Labels:       app.kubernetes.io/component=database
...
...
...
Events:
  Type     Reason                  Age    From                     Message
  ----     ------                  ----   ----                     -------
  Warning  FailedScheduling        5m40s  default-scheduler        0/9
nodes are available: 9 pod has unbound immediate PersistentVolumeClaims.
```

- **Insufficient Storage**

  Sample command to verify storage:

```
[user-xxxxx@kubernetes-cluster ~]$ df -h
Filesystem                  Size  Used Avail Use% Mounted on
devtmpfs                     32G     0   32G   0% /dev
tmpfs                        32G  168K   32G   1% /dev/shm
tmpfs                        32G  3.1G   29G  10% /run
tmpfs                        32G     0   32G   0% /sys/fs/cgroup
/dev/mapper/vg_main-lv_root   96G   90G    7G  95% /
/dev/vda1                    495M  126M  370M  26% /boot
tmpfs                        6.3G  1.9M  6.3G   1% /run/user/1001
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

Timeout errors or installation failures are observed when there is a shortages of resources.

**Sample Error Message**

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl logs pod/cap4c-db-creation-hook-
XXXXX
E1211 17:17:49.626634       7 memcache.go:238] couldn't get current server
API group list: Get "https://10.233.0.1:443/api?timeout=32s": dial tcp
10.233.0.1:443: i/o timeout

Unable to connect to the server: dial tcp 10.233.0.1:443: i/o timeout
```

When there is no connection between the OCNWDAF services and pods, the following error message is observed:

**Sample Error Message**

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl logs pod/nwdaf-mysql-innodb-
cluster-1 -c initconf
2023-12-11 17:24:59: Info: mysqlsh   Ver 8.1.0-commercial for Linux on x86_64

total 0
2023-12-11T17:27:13 - [WARNING] [urllib3.connectionpool] Retrying
(Retry(total=2, connect=None, read=None, redirect=None, status=None)) after
connection broken by 'NewConnectionError('<urllib3.connection.HTTPSConnection
object at 0x7f1df49260d0>: Failed to establish a new connection: [Errno 110]
Connection timed out')': /api/v1/namespaces/ocnwdaf-qa/pods/nwdaf-mysql-
innodb-cluster-1
```

Errors are also observed when there is no communication between MySQL InnoDB cluster components.

**Solution**

For a successful installation and operation ensure that the minimum and recommended CPU, memory, and storage requirements are met. For information on the resource requirements, see *Oracle Communications Networks Data Analytics Function Installation and Fault Recovery Guide*.

Copyright © 2022, 2024, Oracle and/or its affiliates.

#### 4.2.1.20 Pods in IPv4 in IPv6 Deployment

**Problem**

Pods are incorrectly deployed in IPv4 format in an IPv6 deployment.

**Solution**

In the *values.yaml* file under the */helmchart* directory, verify if the following parameter values are as listed below and update them accordingly:

- Verify the value of the parameter *dbInUse* and ensure the value is *cndb*.
- Verify the value of the parameter *innodbDeploy* and ensure the value is *false*.
- Verify the value of the parameter *ipv6Mode* and ensure the value is *true*.
- Ensure the *ipFamilies* has only "IPv6" value in list for *SingleStack*, and "IPv6" is the first value in the list for *RequireDualStack* or *PreferDualStack*.

## 4.2.2 Postinstallation

### 4.2.2.1 Helm Test Error Scenario

Following are the error scenarios that may be identified using Helm test.

1. Run the following command to get the Helm Test pod name:

   ```
   kubectl get pods -n <deployment-namespace>
   ```

2. When a Helm test is performed, a new Helm test pod is created. Check for the Helm Test pod that is in an error state.
3. Get the logs using the following command:

   ```
   kubectl logs <podname> -n <namespace>
   ```

   Example:

   ```
   kubectl logs <helm_test_pod> -n ocnwdaf
   ```

   For further assistance, collect the logs and contact MOS.

### 4.2.2.2 Uninstall Helm Chart

Perform the following steps to uninstall the Helm chart:

1. Run the following command to delete all jobs running in the cluster:

   ```
   kubectl delete jobs --all -n <namespace>
   ```

2. Run the following command to delete resources like pods, deployments, services, and so on running in the cluster:

   ```
   kubectl delete all --all -n <namespace>
   ```

Copyright © 2022, 2024, Oracle and/or its affiliates.

3. Run the following Helm uninstall command:

   ```
   helm uninstall <release-name> -n <namespace>
   ```

### 4.2.2.3 Purge Kafka Topics for New Installation

If in a previous OCNWDAF installation, Kafka topics contained messages, the topics should be retained in the new installation but not the messages. Follow the procedure below to prevent purge of Kafka topics:

1. Connect to Kafka pod in your Kubernetes environment, run the command:

   ```
   kubectl -n <namespace> exec -it <podname> -- bash
   ```

2. Change directory, move to the directory that contains the binary files:

   ```
   cd kafka_2.13-3.1.0/bin/
   ```

3. Obtain the list of topics, run the command:

   ```
   kafka-topics.sh --list --bootstrap-server localhost:9092
   ```

4. Delete each topic (repeat this step for each topic):

   ```
   kafka-topics.sh --bootstrap-server localhost:9092 --delete --topic
   <topicname>
   ```

On completion of this procedure, the Kafka topics exist, but the messages do not exist.

> **Note**
>
> After every installation is recommended to purge the topics before uninstalling them.

## 4.3 Database Related Issues

This section describes the most common database related issues and their resolution steps. It is recommended to perform the resolution steps provided in this guide. If the issue still persists, then contact My Oracle Support.

### 4.3.1 Debugging MySQL DB Errors

If you are facing issues related to subscription creation, follow the procedure below to login to MySQL DB:

> **Note**
>
> Once the MySQL cluster is created, the *cndbtier_install container* generates the password and stores it in the *occne-mysqlndb-root-secret* secret.

1. Retrieve the MySQL root password from *occne-mysqlndb-root-secret* secret.

Copyright © 2022, 2024, Oracle and/or its affiliates.

Run the command:

```
$ kubectl -n occne-cndbtier get secret occne-mysqlndb-root-secret -o
jsonpath='{.data}'map[mysql_root_password:TmV4dEdlbkNuZQ==]
```

2. Decode the encoded output received as an output of the previous step to get the actual password:

```
$ echo TmV4dEdlbkNuZQ== | base64 --decode
NextGenCne
```

3. Login to MySQL pod, run the command:

```
$ kubectl -n occnepsa exec -it ndbmysqld-0 -- bash
```

> **Note**
>
> Default container name is: `mysqlndbcluster`.
> Run the command `kubectl describe pod/ndbmysqld-0 -n occnepsa` to see all the containers in this pod.

4. Login using MySQL client as the root user, run the command:

```
$ mysql -h 127.0.0.1 -uroot -p
```

5. Enter current root password for MySQL root user obtained from step 2.
6. To debug each microservice, perform the following steps:
   - For the **ocn-nwdaf-subscription** service, run the following SQL commands:

     ```
     use <dbName>;
     use nwdaf_subscription;
     select * from nwdaf_subscription;
     select * from amf_ue_event_subscription
     select * from smf_ue_event_subscription
     ```

   - For the **ocn-nrf-simulator** service, run the following SQL commands:

     ```
     use <dbName>;
     use nrf;
     select * from profile;
     ```

   - For the **ocn-smf-simulator** service, run the following SQL commands:

     ```
     use <dbName>;
     use nrf;
     select * from smf_event_subscription;
     ```

Copyright © 2022, 2024, Oracle and/or its affiliates.

- For the **ocn-amf-simulator** service, run the following SQL commands:

```
use <dbName>;
use nrf;
select * from amf_event_subscription;
```

- For the **ocn-nwdaf-data-collection** service, run the following SQL commands:

```
use <dbName>;
use nwdaf_data_collection;
select * from amf_event_notification_report_list;
select * from amf_ue_event_report;
select * from cap4c_ue_notification;
select * from slice_load_level_notification;
select * from smf_event_notification_report_list;
select * from smf_ue_event_report;
select * from ue_mobility_notification;
```

- For the **ocn-nwdaf-configuration-service** service, run the following SQL commands:

```
use <dbName>;
use nwdaf_configuration_service;
select * from slice;
select * from tracking_are;
select * from slice_tracking_area;
select * from cell;
```

## 4.3.2 Unable to Create Resources

**Problem**

Some errors may be observed during the first deployment of OCNWDAF with the MySQL Innodb cluster. The observed errors are listed below:

```
Error: INSTALLATION FAILED: failed to install CRD crds/crd.yaml:
customresourcedefinitions.apiextensions.k8s.io is forbidden: User "user-xxxxx"
cannot create resource "customresourcedefinitions" in API group
"apiextensions.k8s.io" at the cluster scope
```

```
Error: INSTALLATION FAILED: clusterkopfpeerings.zalando.org is forbidden: User
"user-xxxxx" cannot create resource "clusterkopfpeerings" in API group
"zalando.org" at the cluster scope
```

```
Error: INSTALLATION FAILED: clusterrolebindings.rbac.authorization.k8s.io is
forbidden: User "user-xxxxx" cannot create resource "clusterrolebindings" in API
group "rbac.authorization.k8s.io" at the cluster scope
```

```
Error: INSTALLATION FAILED: clusterroles.rbac.authorization.k8s.io is forbidden:
User "user-xxxxx" cannot create resource "clusterroles" in API group
"rbac.authorization.k8s.io" at the cluster scope
```

**Solution**

Copyright © 2022, 2024, Oracle and/or its affiliates.

Ensure that the user has requisite permissions to create the resources. Run the following command to verify the existing user permissions:

```
kubectl describe clusterrole user-xxxxx-ns-admin-cluster
```

For example:

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl describe clusterrole user-xxxxx-ns-
admin-cluster
Name:         user-xxxxx-admin-cluster
Labels:       <none>
Annotations:  <none>
PolicyRule:
  Resources                          Non-Resource URLs  Resource Names  Verbs
  ---------                          -----------------  --------------  -----
  clusterkopfpeerings.*              []                 []              [*]
  clusterrolebindings.*              []                 []              [*]
  clusterroles.*                     []                 []              [*]
  customresourcedefinitions.*        []                 []              [*]
  kopfpeering.*                      []                 []              [*]
  mutatingwebhookconfigurations.*    []                 []              [*]
  validatingwebhookconfigurations.*  []                 []              [*]
  *.*                                []                 []              [get
list use]
```

If the user does not have sufficient permissions, update the permissions as displayed in the above example.

## 4.3.3 Cluster Pod Forbidden during MySQL Innodb Deployment

**Problem**

Some errors may be observed during the first deployment of OCNWDAF with the MySQL Innodb cluster. The observed errors are listed below:

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl describe statefulset.apps/mysql-
innodb-cluster

Events:
  Type     Reason            Age                From
Message
  ----     ------            ----               ----
-------
  Normal   SuccessfulCreate  40s                statefulset-controller
create Claim datadir-mysql-innodb-cluster-0 Pod mysql-innodb-cluster-0 in
StatefulSet mysql-innodb-cluster success
  Warning  FailedCreate      20s (x13 over 40s)  statefulset-controller
create Pod mysql-innodb-cluster-0 in StatefulSet mysql-innodb-cluster failed
error: pods "mysql-innodb-cluster-0" is forbidden: PodSecurityPolicy: unable
to admit pod: [spec.initContainers[0].securityContext.runAsUser: Invalid
value: 0: running with the root UID is forbidden
spec.initContainers[0].securityContext.capabilities.add: Invalid value:
"CHOWN": capability may not be added
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

```
spec.initContainers[0].securityContext.capabilities.add: Invalid value:
"FOWNER": capability may not be added]
```

**Solution**

The `clusterrolebinding` must use the context at the `system:authenticated` level instead of the Namespace level. For more information, see *Oracle Communications Networks Data Analytics Function Installation and Fault Recovery Guide*.

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl edit clusterrolebinding user-xxxxx-
ns-admin-cluster-role-binding

- apiGroup: rbac.authorization.k8s.io
  kind: Group
  name: user-xxxxx-ns

- apiGroup: rbac.authorization.k8s.io
  kind: Group
  name: system:authenticated
```

## 4.3.4 Cluster Pods in Terminating State

**Problem**

When Helm installation fails and the OCNWDAF is uninstalled, the pods remain in a "Terminating" state.

Run the following command:

```
kubectl get all
```

Sample output:

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl get all
nwdaf-ns   pod/nwdaf-innodb-cluster-0      0/2     Terminating    0
128m
nwdaf-ns   pod/nwdaf-innodb-cluster-1      0/2     Terminating    0
128m
nwdaf-ns   pod/nwdaf-innodb-cluster-2      0/2     Terminating    0
128m
```

**Solution**

Delete and patch the pods in "Terminating" state.

For example:

```
kubectl delete pods nwdaf-mysql-innodb-cluster-0 --grace-period=0 --force
kubectl delete pods nwdaf-mysql-innodb-cluster-1 --grace-period=0 --force
kubectl delete pods nwdaf-mysql-innodb-cluster-2 --grace-period=0 --force
....

kubectl patch pod nwdaf-mysql-innodb-cluster-0  -p '{"metadata":
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

```
{"finalizers":null}}'
kubectl patch pod nwdaf-mysql-innodb-cluster-1  -p '{"metadata":
{"finalizers":null}}'
kubectl patch pod nwdaf-mysql-innodb-cluster-2  -p '{"metadata":
{"finalizers":null}}'
```

## 4.3.5 Manually Delete Custom Resource Definition (CRD) of Innodb Cluster

**Problem**

When the OCNWDAF is deleted using the *no-hooks* option, the following error is observed:

```
helm.go:84: [debug] failed innodbclusters.mysql.oracle.com "nwdaf-mysql-
innodb-cluster" already exists
INSTALLATION FAILED
```

Run the following command to verify if the Innodb cluster still exists:

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl get innodbcluster
NAME                          STATUS    ONLINE   INSTANCES   ROUTERS   AGE
nwdaf-mysql-innodb-cluster    OFFLINE   0        3           1         20h
```

**Solution**

Ensure that the CRD of the Innodb cluster is deleted manually, run the following command:

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl get innodbcluster nwdaf-mysql-
innodb-cluster -o yaml > delete-innodb-cluster.yaml
```

Replace the finalizers with an empty list, edit as displayed below:

```
vi delete-innodb-clusteryaml

apiVersion: mysql.oracle.com/v2
kind: InnoDBCluster
metadata:
  annotations:
    helm.sh/hook: pre-install
    ...
    mysql.oracle.com/mysql-operator-version: 8.1.0-2.1.0
  creationTimestamp: "2023-11-13T15:53:44Z"
  finalizers: []
  generation: 1
  name: nwdaf-mysql-innodb-cluster
  namespace: user-xxxxx
  resourceVersion: "61716523"
  uid: c69778c7-c866-4aa5-a393-c94c5c6b3b25
spec:
  baseServerId: 1000
  imagePullPolicy: IfNotPresent
  ...
  version: 8.1.0
status:
  cluster:
```

Copyright © 2022, 2024, Oracle and/or its affiliates.

```
    lastProbeTime: "2023-11-13T16:10:36Z"
    onlineInstances: 3
    status: ONLINE
  createTime: "2023-11-13T15:54:52Z"
  kopf:
    progress: {}
```

Remove the CRD Innodb cluster and run the following command:

```
[user-xxxxx@kubernetes-cluster ~]$ kubectl apply -f delete-innodb-cluster.yaml
```

Retry the OCNWDAF installation procedure. For the installation procedure, see *Oracle Communications Networks Data Analytics Function Installation and Fault Recovery Guide*.

# 4.4 Apache Kafka Related Issues

To debug issues related to Apache Kafka pipelines (such as, unable to read messages from the pipeline or write messages to the pipeline) perform the following steps:

1. Get the Kafka pods, run the command:

   ```
   kubectl -n <namespace> get pods -o wide | grep "kafka"
   ```

2. Select any pod and access the pod using the command:

   ```
   kubectl -n <namespace> exec -it kafka-sts-0 -- bash
   ```

3. Move to the directory containing the binary files, run the command:

   ```
   cd kafka_2.13-3.1.0/bin/
   ```

4. Obtain the list of topics, run the command:

   ```
   kafka-topics.sh --list --bootstrap-server localhost:9092
   ```

5. For each topic, run the following command:

   ```
   kafka-console-consumer.sh --bootstrap-server 127.0.0.1:9092 --topic
       <topic-name>
   ```

# 4.5 CAP4C Related Issues

CAP4C comprises of the following services:

- cap4c-model-controller
- cap4c-model-executor
- cap4c-kafka-ingestor
- cap4c-api-gateway
- cap4c-configuration-manager
- cap4c-stream-analytics

Copyright © 2022, 2024, Oracle and/or its affiliates.

- cap4c-stream-transformer
- nwdaf-cap4c-reporting-service
- nwdaf-cap4c-scheduler-service

To obtain more information on the service pods, follow the steps listed below:

1. Each of these services is deployed as pod in Kubernetes. To find the status of the pods in Kubernetes run the following command:

   ```
   $ kubectl get pods -n <namespace>
   ```

   Sample output:

   ```
   NAME                                                READY   STATUS
   RESTARTS   AGE

   cap4c-model-controller-deploy-779cbdcf8f-w2pfh      1/1     Running
   0          4d8h

   cap4c-model-executor-deploy-f9c96db54-ttnhd         1/1     Running
   0          4d5h

   cap4c-stream-analytics-deploy-744878569-5xr2w       1/1     Running
   0          4d8h
   ```

2. To verify the pod information, print the detail of each pod to:

   ```
   $ kubectl describe pod cap4c-model-controller-deploy-779cbdcf8f-w2pfh  -n
       <namespace>
   ```

   Sample output:

   ```
   Name:         cap4c-model-controller-deploy-779cbdcf8f-w2pfh

   Namespace:    performance-ns

   Priority:     0

   Node:         sunstreaker-k8s-node-2/192.168.200.197

   Start Time:   Fri, 26 Aug 2022 15:31:39 +0000

   Labels:       app=cap4c-model-controller

                 pod-template-hash=779cbdcf8f

   Annotations:  cni.projectcalico.org/containerID:

```
                kubernetes.io/psp: restricted

                seccomp.security.alpha.kubernetes.io/pod: runtime/default
Status:         Running
```

3. List the service configuration for the pods, run the command:

   ```
   $ kubectl get svc -n <namespace>
   ```

   Sample output:

   ```
   NAME              TYPE        CLUSTER-IP      EXTERNAL-IP
            PORT(S)    AGE cap4c-executor    ClusterIP   10.233.5.218
   <none>

# 4.6 Service Related Issues

This section describes the most common service related issues and their resolution steps. It is recommended to perform the resolution steps provided in this guide. If the issue still persists, then contact My Oracle Support.

## 4.6.1 Errors from Microservices

The OCNWDAF microservices are listed below:

- ocn-nwdaf-analytics
- ocn-nwdaf-mtlf-service
- ocn-nwdaf-subscription-service
- ocn-amf-simulator-service
- ocn-smf-simulator-service
- ocn-nrf-simulator-service
- ocn-oam-simulator-service
- mesa-simulator
- cap4c-model-controller
- cap4c-model-executor
- cap4c-stream-analytics
- cap4c-kafka-ingestor
- nwdaf-cap4c-reporting-service
- nwdaf-cap4c-kafka
- nwdaf-cap4c-scheduler-service
- nwdaf-cap4c-spring-cloud-config-server
- nwdaf-portal
- nwdaf-portal-service

Copyright © 2022, 2024, Oracle and/or its affiliates.

- nwdaf-cap4c-redis
- nwdaf-cap4c-zookeeper
- nwdaf-cap4c-initial-setup-script
- ocats-nwdaf
- ocats-nwdaf-notify
- ocats-nwdaf-notify-nginx
- nf-test
- ocn-nwdaf-geo-redundacy-agent
- ocingress_gateway
- ocegress_gateway
- oc-config-server
- oc-app-info
- oc-perf-info
- nrf-client
- ocn-nwdaf-data-collection-controller
- cap4c-configuration-manager-service
- cap4c-stream-transformer
- nwdaf-cap4c-nginx
- cap4c-api-gateway

To debug microservice related errors, obtain the logs in the pods that are facing issues, run the following commands for each microservice:

1. To obtain the pod information, run the following command:

   ```
   kubectl get pods -n <nameSpace> -o wide
   ```

2. To obtain the log information for the pods, run the following command:

   ```
   kubectl logs <podName> -n <nameSpace>
   ```

Sample commands:

- `kubectl logs ocn-nwdaf-subscription-84f8b74cc7-d7lk9 -n performance-ns`
- `kubectl logs ocn-nwdaf-data-collection-57b948989c-xs7dq -n performance-ns`
- `kubectl logs ocn-amf-simulator-584ccb8fd4-pcdn6 -n performance-ns`

# OCNWDAF Alerts

This chapter includes information about the following alerts:

## 5.1 Application Level Alerts

This section lists the application level alerts.

**OCN_NWDAF_ANALYTICS_NOT_RUNNING**

**Table 5-1 OCN_NWDAF_ANALYTICS_NOT_RUNNING**

| Field | Details |
|---|---|
| Description | The microservice is not available or not reachable. |
| Cause | Microservice ocn-nwdaf-analytics is down. |

**OCN_NWDAF_COMMUNICATION_NOT_RUNNING**

**Table 5-2 OCN_NWDAF_COMMUNICATION_NOT_RUNNING**

| Field | Details |
|---|---|
| Description | The microservice is not available or not reachable. |
| Cause | Microservice ocn-nwdaf-communication is down. |

**OCN_NWDAF_CONFIGURATION_SERVICE_NOT_RUNNING**

**Table 5-3 OCN_NWDAF_CONFIGURATION_SERVICE_NOT_RUNNING**

| Field | Details |
|---|---|
| Description | The microservice is not available or not reachable. |
| Cause | Microservice ocn-nwdaf-configuration-service is down. |

**OCN_NWDAF_DATA_COLLECTION_NOT_RUNNING**

**Table 5-4 OCN_NWDAF_DATA_COLLECTION_NOT_RUNNING**

| Field | Details |
|---|---|
| Description | The microservice is not available or not reachable. |
| Cause | Microservice ocn-nwdaf-data-collection is down. |

Copyright © 2022, 2024, Oracle and/or its affiliates.

### OCN_NWDAF_GATEWAY_NOT_RUNNING

**Table 5-5 OCN_NWDAF_GATEWAY_NOT_RUNNING**

| Field | Details |
|---|---|
| Description | The microservice is not available or not reachable. |
| Cause | Microservice ocn-nwdaf-gateway is down. |

### OCN_NWDAF_MTLF_NOT_RUNNING

**Table 5-6 OCN_NWDAF_MTLF_NOT_RUNNING**

| Field | Details |
|---|---|
| Description | The microservice is not available or not reachable. |
| Cause | Microservice ocn-nwdaf-mtlf is down. |

### OCN_NWDAF_SUBSCRIPTION_NOT_RUNNING

**Table 5-7 OCN_NWDAF_SUBSCRIPTION_NOT_RUNNING**

| Field | Details |
|---|---|
| Description | The microservice is not available or not reachable. |
| Cause | Microservice ocn-nwdaf-subscription is down. |

### HIGH_ABNORMAL_BEHAVIOUR_REQUEST_RATE

**Table 5-8 HIGH_ABNORMAL_BEHAVIOUR_REQUEST_RATE**

| Field | Details |
|---|---|
| Description | The number of requests received per second is high. |
| Cause | Traffic is high, above 1000 requests per second. |
| URI Endpoint | `nnwdaf-analyticsinfo/v1/analytics?event-id=ABNORMAL_BEHAVIOUR` |
| Affected Functions | ABNORMAL_BEHAVIOUR |

### HIGH_UE_MOBILITY_REQUEST_RATE

**Table 5-9 HIGH_UE_MOBILITY_REQUEST_RATE**

| Field | Details |
|---|---|
| Description | The number of requests received per second is high. |
| Cause | Traffic is high, above 1000 requests per second. |
| URI Endpoint | `nnwdaf-analyticsinfo/v1/analytics?event-id=UE_MOBILITY` |
| Affected Functions | UE_MOBILITY |

Copyright © 2022, 2024, Oracle and/or its affiliates.

### HIGH_EVENT_SUBSCRIPTION_REQUEST_RATE

**Table 5-10 HIGH_EVENT_SUBSCRIPTION_REQUEST_RATE**

| Field | Details |
|---|---|
| Description | The number of requests received per second is high. |
| Cause | Traffic is high, above 1000 requests per second. |
| URI Endpoint | `nnwdaf-eventssubscription/v1/subscriptions` |
| Affected Functions | UE_MOBILITY, SLICE_LOAD_LEVEL, ABNORMAL_BEHAVIOUR |

### HIGH_ABNORMAL_BEHAVIOUR_REQUEST_FAILURE_RATE

**Table 5-11 HIGH_ABNORMAL_BEHAVIOUR_REQUEST_FAILURE_RATE**

| Field | Details |
|---|---|
| Description | The number of requests failing per second is high. |
| Cause | The request failing rate is more than the 70%. |
| URI Endpoint | `nnwdaf-analyticsinfo/v1/analytics?event-id=ABNORMAL_BEHAVIOUR` |
| Affected Functions | ABNORMAL_BEHAVIOUR |

### HIGH_UE_MOBILITY_REQUEST_FAILURE_RATE

**Table 5-12 HIGH_ABNORMAL_BEHAVIOUR_REQUEST_FAILURE_RATE**

| Field | Details |
|---|---|
| Description | The number of requests failing per second is high. |
| Cause | The request failing rate is more than the 70%. |
| URI Endpoint | `nnwdaf-analyticsinfo/v1/analytics?event-id=UE_MOBILITY` |
| Affected Functions | UE_MOBILITY |

### HIGH_EVENT_SUBSCRIPTION_REQUEST_FAILURE_RATE

**Table 5-13 HIGH_EVENT_SUBSCRIPTION_REQUEST_FAILURE_RATE**

| Field | Details |
|---|---|
| Description | The number of requests failing per second is high. |
| Cause | The request failing rate is more than the 70%. |
| URI Endpoint | `nnwdaf-eventssubscription/v1/subscriptions` |
| Affected Functions | UE_MOBILITY, SLICE_LOAD_LEVEL, ABNORMAL_BEHAVIOUR |

# 5.2 System Level Alerts

This section lists the system level alerts.

### OCN_NWDAF_ANALYTICS_HIGH_CPU_LOAD

**Table 5-14 OCN_NWDAF_ANALYTICS_HIGH_CPU_LOAD**

| Field | Details |
|---|---|
| Description | CPU load is high at the pod where the microservice is running. |
| Affected Functions | All |
| Cause | CPU load is more than 80% of the allocated resources. |

### OCN_NWDAF_COMMUNICATION_HIGH_CPU_LOAD

**Table 5-15 OCN_NWDAF_COMMUNICATION_HIGH_CPU_LOAD**

| Field | Details |
|---|---|
| Description | CPU load is high at the pod where the microservice is running. |
| Affected Functions | All |
| Cause | CPU load is more than 80% of the allocated resources. |

### OCN_NWDAF_CONFIGURATION_SERVICE_HIGH_CPU_LOAD

**Table 5-16 OCN_NWDAF_CONFIGURATION_SERVICE_HIGH_CPU_LOAD**

| Field | Details |
|---|---|
| Description | CPU load is high at the pod where the microservice is running. |
| Affected Functions | All |
| Cause | CPU load is more than 80% of the allocated resources. |

### OCN_NWDAF_DATA_COLLECTION_HIGH_CPU_LOAD

**Table 5-17 OCN_NWDAF_DATA_COLLECTION_HIGH_CPU_LOAD**

| Field | Details |
|---|---|
| Description | CPU load is high at the pod where the microservice is running. |
| Affected Functions | All |
| Cause | CPU load is more than 80% of the allocated resources. |

Copyright © 2022, 2024, Oracle and/or its affiliates.

### OCN_NWDAF_GATEWAY_HIGH_CPU_LOAD

**Table 5-18 OCN_NWDAF_GATEWAY_HIGH_CPU_LOAD**

| Field | Details |
|---|---|
| Description | CPU load is high at the pod where the microservice is running. |
| Affected Functions | All |
| Cause | CPU load is more than 80% of the allocated resources. |

### OCN_NWDAF_MTLF_HIGH_CPU_LOAD

**Table 5-19 OCN_NWDAF_MTLF_HIGH_CPU_LOAD**

| Field | Details |
|---|---|
| Description | CPU load is high at the pod where the microservice is running. |
| Affected Functions | All |
| Cause | CPU load is more than 80% of the allocated resources. |

### OCN_NWDAF_SUBSCRIPTION_HIGH_CPU_LOAD

**Table 5-20 OCN_NWDAF_SUBSCRIPTION_HIGH_CPU_LOAD**

| Field | Details |
|---|---|
| Description | CPU load is high at the pod where the microservice is running. |
| Affected Functions | All |
| Cause | CPU load is more than 80% of the allocated resources. |

### OCN_NWDAF_ANALYTICS_HIGH_JVM_HEAP_MEMORY_USAGE

**Table 5-21 OCN_NWDAF_ANALYTICS_HIGH_JVM_HEAP_MEMORY_USAGE**

| Field | Details |
|---|---|
| Description | The average of the memory heap usage is high. |
| Affected Functions | All |
| Cause | The heap memory usage is more than the 80%. |

### OCN_NWDAF_COMMUNICATION_HIGH_JVM_HEAP_MEMORY_USAGE

**Table 5-22 OCN_NWDAF_COMMUNICATION_HIGH_JVM_HEAP_MEMORY_USAGE**

| Field | Details |
|---|---|
| Description | The average of the memory heap usage is high. |

Copyright © 2022, 2024, Oracle and/or its affiliates.

**Table 5-22 (Cont.) OCN_NWDAF_COMMUNICATION_HIGH_JVM_HEAP_MEMORY_USAGE**

| Field | Details |
|---|---|
| Affected Functions | All |
| Cause | The heap memory usage is more than the 80%. |

### OCN_NWDAF_CONFIGURATION_SERVICE_HIGH_JVM_HEAP_MEMORY_USAGE

**Table 5-23 OCN_NWDAF_CONFIGURATION_SERVICE_HIGH_JVM_HEAP_MEMORY_USAGE**

| Field | Details |
|---|---|
| Description | The average of the memory heap usage is high. |
| Affected Functions | All |
| Cause | The heap memory usage is more than the 80%. |

### OCN_NWDAF_DATA_COLLECTION_HIGH_JVM_HEAP_MEMORY_USAGE

**Table 5-24 OCN_NWDAF_DATA_COLLECTION_HIGH_JVM_HEAP_MEMORY_USAGE**

| Field | Details |
|---|---|
| Description | The average of the memory heap usage is high. |
| Affected Functions | All |
| Cause | The heap memory usage is more than the 80%. |

### OCN_NWDAF_GATEWAY_HIGH_JVM_HEAP_MEMORY_USAGE

**Table 5-25 OCN_NWDAF_GATEWAY_HIGH_JVM_HEAP_MEMORY_USAGE**

| Field | Details |
|---|---|
| Description | The average of the memory heap usage is high. |
| Affected Functions | All |
| Cause | The heap memory usage is more than the 80%. |

### OCN_NWDAF_MTLF_HIGH_JVM_HEAP_MEMORY_USAGE

**Table 5-26 OCN_NWDAF_MTLF_HIGH_JVM_HEAP_MEMORY_USAGE**

| Field | Details |
|---|---|
| Description | The average of the memory heap usage is high. |
| Affected Functions | All |
| Cause | The heap memory usage is more than the 80%. |

Copyright © 2022, 2024, Oracle and/or its affiliates.

### OCN_NWDAF_SUBSCRIPTION_HIGH_JVM_HEAP_MEMORY_USAGE

**Table 5-27 OCN_NWDAF_SUBSCRIPTION_HIGH_JVM_HEAP_MEMORY_USAGE**

| Field | Details |
|---|---|
| Description | The average of the memory heap usage is high. |
| Affected Functions | All |
| Cause | The heap memory usage is more than the 80%. |
