## Component Reference

This chapter lists the Oracle Utilities Customer Cloud Service starter components available to create flows in Oracle Utilities Testing Accelerator Workbench for testing the Oracle Utilities Customer Cloud Service applications. It includes the following sections:

- [Overview](#)
- [Components](#)

# Overview

Oracle Utilities Testing Accelerator for Oracle Utilities Customer Cloud Service is a test starter pack built on top of Oracle Utilities Testing Accelerator that generates test automation scripts using Oracle Utilities Testing Accelerator Workbench.

Oracle Utilities Testing Accelerator for Oracle Utilities Customer Cloud Service contains out-of-the-box product-specific components used to build new test flows in Oracle Utilities Testing Accelerator Workbench to test the Oracle Utilities Customer Cloud Service applications. These out-of-the-box components correspond to specific business entities, such as business objects, service scripts, or business services used for interfacing with the application. Users can use these components as available or can extend them. Users can also create new components to be used to create flows. This starter pack also contains a set of function libraries that can be used for creating custom components.

Consider this pack to be a starter kit which can be expanded and built upon. A few sample flows are included as an example.

For more information about creating components and flows, refer to the *Oracle Utilities Testing Accelerator User's Guide* available on the [Oracle Utilities Testing Accelerator for Cloud Services](#) page on [Oracle Help Center](#).

## Components

This section lists the starter components available for Oracle Utilities Customer Cloud Service.

**Pre-requisites:** The Inbound Web Service using the respective business object should be available in the application.

## Inbound Web Services

The Oracle Utilities Customer Cloud Service components are developed using Web services method, and these components require Inbound Web Services to be defined in the application.

This chapter includes the following:

## Identifying Fields For a Web Service Request

The requisite fields need to be filled up with data in order to map the value on a given schema. For example: When a person is added online, only the field description is shown, but the exact field mapping is hidden from the user.

Following are the methods you can use to identify fields for a web service request and add data in those fields:

- [Debug Mode in the Application](#)
- [IE Development Tool Bar](#)
- [SOAP UI](#)

## Debug Mode in the Application

The debug mode enables users to check the field mapping on a given maintenance page. This is actually the easiest among the different possible ways; however some clients may have system restriction (such as access restriction) on using debug mode.

To enter test data in the requisite fields using the debug method:

1. Login to the Oracle Utilities Customer Cloud Service application in the 'debug' mode.
2. Before clicking the Debug mode switch ensure to navigate first to the target page. Example: Person maintenance page

3. Perform the required action. Click **Save**.

Example: The figure below shows adding a person (person name, person phone, person contacts, Person IDs, etc)

The schema window showing the populated values is displayed.

  <listBody action="A">

```

- Navigate to the Business Object or Business Service look up window for the requisite field.

Example: In the figure below, ENTITY\_NAME is named as entityName.

- In the flow, search for the requisite field and enter the component test data.

WS-SETXMLLISTELEMENT			uppercaseEntityName	<input type="text"/>
WS-SETXMLLISTELEMENT			personId	<input type="text"/>
WS-SETXMLLISTELEMENT			sequence	<input type="text"/>
WS-SETXMLLISTELEMENT			entityName	<input type="text" value="Sanity,UserTesting3"/>

WS-SETXMLLISTELEMENT			version	<input type="text"/>
WS-SETXMLLISTELEMENT			isPrimaryName	<input type="text"/>

- Click **Save** to save the test data.

# IE Development Tool Bar

The IE Development tool bar, available in IE11, enables users to inspect the page and its field mapping. It is on a 1:1 basis, meaning one inspect = one field.

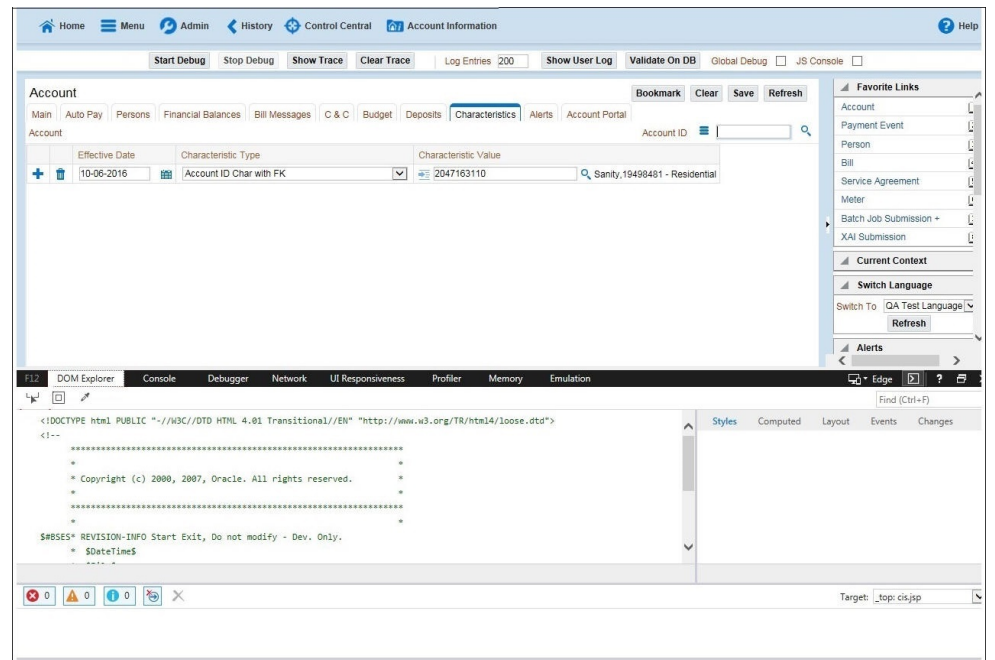

To enter test data in the requisite fields using the IE Development tool bar, follow these steps:

1. Login to Oracle Utilities Customer Cloud Service using Internet Explorer 11.
2. Navigate to the page where the requisite field needs to be updated with data.

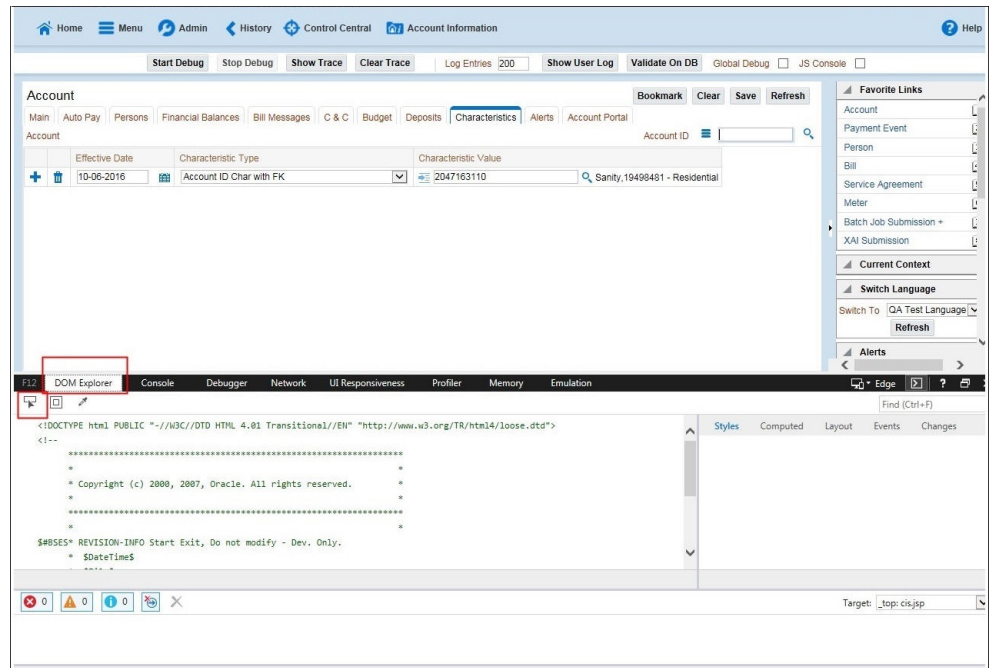

Example: The figure below shows the **Account** page where the **Characteristic Value** field on the **Characteristics** tab needs to be updated.

3. Press **F12**. The browser displays the F12 developer tools that help in building and debugging web pages.

- On the F12 tools menu, select the **DOM Explorer** tab and click the **Select element** icon.

- On the application page, click the field for which you need to enter the data. The DOM Explorer shows the HTML for the selected field.

Example: Click the **Characteristic Value** field on the **Account** page. The DOM Explorer shows the **ID** of that field.

- On the object lookup window, search the requisite field.

Example: Search for CHAR\_VAL\_FK1.

7. In the flow, add the necessary data into the field.

WS-SETXMLELEMENT				characteristicValueFK5	<input type="text"/>

8. Click **Save** to save the data.

# SOAP UI

This method is an alternative to the other methods mentioned above if the user is familiar with SOAP UI.

To identify the requisite fields using SOAP UI:

1. Login to the Oracle Utilities Customer Cloud Service application.
2. Navigate to the page where the test data has to added. Add the data in the respective fields.

Example: The figure below shows the **Case** page where **Characteristics Type** and **Characteristic Value** are added in the **Characteristics** section.
