This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

- Screenshot Disclaimer

Purpose

Major changes to an application constitute application upgrades. During the upgrade, Oracle Database automatically clones the application root, and the application PDBs point to the clone.

Application upgrade can be performed in the application root only, and application PDBs applies the changes in the upgrade when they synchronize with the application.

Audience

This guide is intended for anyone responsible for installing Oracle Banking Application.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customer access to and use of Oracle support services will be pursuant to the terms and conditions specified in their Oracle order for the applicable services.

Critical Patches

Oracle advises customers to get all their security vulnerability information from the Oracle Critical Patch Update Advisory, which is available at <u>Critical Patches</u>, <u>Security Alerts and Bulletins</u>. All critical patches should be applied in a timely manner to ensure effective security, as strongly recommended by <u>Oracle Software Security Assurance</u>.

Diversity and Inclusion

Oracle is fully committed to diversity and inclusion. Oracle respects and values having a diverse workforce that increases thought leadership and innovation. As part of our initiative to build a more inclusive culture that positively impacts our employees, customers, and partners, we are working to remove insensitive terms from our products and documentation. We are also mindful of the necessity to maintain compatibility with our customers' existing technologies and the need to ensure continuity of service as Oracle's offerings and industry standards evolve. Because of these technical constraints, our effort to remove insensitive terms is ongoing and will take time and external cooperation.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text.
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Related Resources

For more information, see these Oracle Banking Trade Finance resources:

- Oracle Banking Trade Finance Install & Upgrade

Screenshot Disclaimer

Personal information used in the interface or documents is dummy and does not exist in the real world. It is only for reference purposes.

Overview of Applications in an Application Container

Managing Applications in an Application Container

In an application container, an application is the named, versioned set of application common objects stored in the application root. In this context, "application" means "application back-end." Application common objects include user accounts, tables, PL/SQL packages, and so on. An application can be shared with the application PDBs that belong to the application root.

Application Maintenance
 Application maintenance refers to installing, uninstalling, upgrading, or patching an application.

1.1 Managing Applications in an Application Container

In an application container, an application is the named, versioned set of application common objects stored in the application root. In this context, "application" means "application backend." Application common objects include user accounts, tables, PL/SQL packages, and so on. An application can be shared with the application PDBs that belong to the application root.

On performing application changes, application PDBs can synchronize with the application in the application root. The application container also manages the versions of the application and the patches to the application:

- While installing an application, user must specify the application version number.
- While upgrading an application, user must specify the old application version number and the new application version number.

As the application evolves, the application container maintains all of the versions that are applied.

1.2 Application Maintenance

Application maintenance refers to installing, uninstalling, upgrading, or patching an application.

Perform application installation, upgrade, and patching operations using an ALTER PLUGGABLE DATABASE APPLICATION statement.

The basic steps for application maintenance are as follows:

- Log in to the application root.
- 2. Begin the operation with an ALTER PLUGGABLE DATABASE APPLICATION ... BEGIN statement in the application root.
- 3. Execute the application maintenance statements.
- End the operation with an ALTER PLUGGABLE DATABASE APPLICATION ... END statement.

These statements can be issued in the same user session or in different user sessions.

- Application Installation
- Application Upgrade

An application upgrade is a major change to an installed application.

1.2.1 Application Installation

An application installation is the initial creation of a master application definition. A typical installation creates user accounts, tables, and PL/SQL packages.

Refer Multi-Tenant Deployment.pdf for more details on the application installation.

1.2.2 Application Upgrade

An application upgrade is a major change to an installed application.

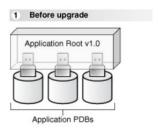

Typically, an upgrade changes the physical architecture of the application. For example, an upgrade might add new tables, and packages, or alter the definitions of existing objects.

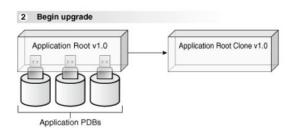

To upgrade the application, specify the following in the ALTER PLUGGABLE DATABASE APPLICATION statement:

- Name of the application
- Old application version number
- New application version number

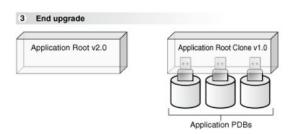

During an application upgrade, the application remains available. To make this availability possible, Oracle Database clones the application root.

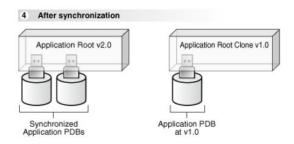

The following figure gives an overview of the application upgrade process.

When an application is upgraded, Oracle Database automatically clones the application root.

During the upgrade, application PDBs point to the clone and applications continue to run during the upgrade. Application PDBs can perform DML on metadata-linked and tables and views and query data-linked tables.

After the upgrade, the application root clone remains and continues to support any application PDB that still uses the pre-upgrade version of the application in the clone.

Application PDBs that re synchronized are pointed to the upgraded application root. Application PDBs that are not synchronized might continue to use the clone.

Patch-set Application Steps

Multi entity application root/PDB based setup has to be available to perform18c database application upgrade for applying the patch-set. Refer Multi-Tenant_Deployment.docx for the deployment and installation steps.

Patch-set can be applied by following below steps in sequential order, and detail of each steps explained as separate sections subsequently.

- Application Upgrade
- Synchronize application PDBs

Patch-set Deployment Pre-requisites:

- Download the required patch-set zip file and unzip it in a local path.
- Verify whether the property files (fcubs.properties and env.properties) have the application root schema details where the application is available, if not update the approot schema details through installer (Refer OBTF_Property_File_Creation.docx for more details) and re-generate the files.
- Make sure to set the flag PATCHSET INSTALLATION to 'Y'.
- Application Upgrade

2.1 Application Upgrade

Purpose

Major changes to an application constitute application upgrades. During the upgrade, Oracle Database automatically clones the application root and the application PDBs point to the clone.

- Steps to be Followed
- Purpose
- Steps to be Followed

2.1.1 Purpose

Major changes to an application constitute application upgrades. During the upgrade, Oracle Database automatically clones the application root and the application PDBs point to the clone.

Application upgrade can be performed in the application root only, and application PDBs applies the changes in the upgrade when they synchronize with the application.

2.1.2 Steps to be Followed

Below steps to be followed to initiate application upgrade:

- Start Application upgrade
- Compiling Incremental Units

- Recompilation of invalids
- End Application upgrade
- Start Application upgrade
- Application Root objects conversion for new objects
- Application Root objects conversion for existing objects
- Recompilation of invalids
- End Application upgrade
- Start Application Upgrade

An ALTER PLUGGABLE DATABASE APPLICATION statement has to be issued to upgrade an application in the application root.

- Compiling Incremental Units
- Recompilation of invalids
- End Application upgrade
- Start Application upgrade
- Application Root Objects Conversion for New Objects
- Application Root Objects Conversion for Existing Objects
- Recompilation of Invalids
- End Application Upgrade

2.1.2.1 Start Application Upgrade

An ALTER PLUGGABLE DATABASE APPLICATION statement has to be issued to upgrade an application in the application root.

Each upgrade must be associated with an application name, starting version number, and ending version number.

- The common user must have the DBA privilege, and the privilege must be commonly granted in the application root.
- The application root must be in open read/write.
- Run the below script for initiating an application upgrade. This will initiate the application from current version to the next version (patch-set version).

Start Upgrade

Input sample for the script:

Spool Path	<< Any local path>>
Application next version	14.4.0.0.0

2.1.2.2 Compiling Incremental Units

Patch-set objects have to be loaded using bat file [E.g.: SMSDBCompileRun.bat, TFDBCompileRun.bat] by silent installer for respective product processer.

Compile the incremental SMS units using /INSTALLER/SOFT/SMSDBCompileRun.sh for UNIX installations or /INSTALLER/SOFT/SMSDBCompileRun.bat for Windows installations.

Compile the incremental OBTF units using /INSTALLER/SOFT/TFDBCompileRun.sh for UNIX installations or /INSTALLER/SOFT/TFDBCompileRun.bat for Windows installations.

2.1.2.3 Recompilation of invalids

As the sharing property of most of the objects are modified other than NONE, recompilation of objects is not allowed outside an application.

Recompilation of objects will be initiated inside the application upgrade for sanity with zero invalids with the below script:

Recompilation of invalids

2.1.2.4 End Application upgrade

Application upgrade can be performed in the application root only and end of the upgrade is performed with an ALTER PLUGGABLE DATABASE APPLICATION END UPGRADE statement.

Run the below script for ending an application upgrade for patch-set.

End Application upgrade

And run the invalid script by connecting to the common user in approot outside the upgrade.

Invalid Recompilation Outside Upgrade.

2.1.2.5 Start Application upgrade

Run the below script for initiating another application upgrade for object conversion. This will initiate the application from current version to the next version (patch-set version).

Start Application upgrade

Input sample for the script:

Spool Path	<< Any local path>>
Application next version	14.4.0.0.0

2.1.2.6 Application Root Objects Conversion for New Objects

As part of patch-set when there are new tables added which has to be converted as DL or when there is a new function id which is identified to be an approot function is provided, otherwise no conversion will happen as part of this step

Below script takes care of converting the new DL objects during patch-set based on the deployment model of the application during installation.

New Object Conversion

Input sample for the script:

Spool Path	<< Any local path>>
Application next version	14.4.0.0.0

2.1.2.7 Application Root Objects Conversion for Existing Objects

Various Sharing types of objects during installation:

- A static table will hold the information of selected table sharing as Data link. Other tables will be treated as Meta Data Link
- Sharing of object types such as INDEX, LOB, TABLE PARTITION, SEQUENCE, and DYNAMIC PACKAGES will remain as NONE.
- All other object types such as Packages, Procedures, Functions, and Synonyms would be converted as Meta Data Link sharing.

Sharing during upgrade:

Sharing of existing database objects will remain the same.

Below script takes care of converting the modified MDL objects when there is a re-creation [objects with Create or Replace command during creation] happens during patch-set.

Application Root Objects Conversion

Input sample for the script:

Spool Path	<< Any local path>>
Application next	14.4.0.0.0
version	

When there are new tables introduced as part of patch-set which has to be converted into DL will be done separately. The recommendation for the same will be provided as part of patch-set instructions for this case.

2.1.2.8 Recompilation of Invalids

As the sharing property of most of the objects are modified other than NONE, recompilation of objects is not allowed outside an application.

Recompilation of objects will be initiated inside the application upgrade for sanity with zero invalids with the below script:

Recompilation of Invalids

2.1.2.9 End Application Upgrade

Application upgrade can be performed in the application root only and end of the upgrade is performed with an ALTER PLUGGABLE DATABASE APPLICATION END UPGRADE statement.

Run the below script for ending an application upgrade for patch-set.

End Application Upgrade

And run the invalid script by connecting to the common user in approof outside the upgrade.

Invalids Recompilation Outside Upgrade

2.1.3 Purpose

Synchronizing an application updates the application in the application PDB to the latest version in the application root. When an application is upgraded in an application root, an application PDB that belongs to the application root is not changed until it is synchronized.

Application PDBs synchronize with an application by running an ALTER PLUGGABLE DATABASE statement with the SYNC clause.

2.1.4 Steps to be Followed

Prerequisites

- The current user must have ALTER PLUGGABLE DATABASE system privilege.
- Ensure that the current container is the application PDB.
- Run an ALTER PLUGGABLE DATABASE APPLICATION statement with the SYNC clause.
- Run the below script to synchronize the PDBs with the latest application changes in the application root.

PDB Sync

Step by Step Execution

Pre-Requisites

This topic provides systematic instructions for pre-requisites.

Patch-set Application Step by Step with Screenshots

This topic provides systematic instructions to patch-set application step by step with screenshots.

3.1 Pre-Requisites

This topic provides systematic instructions for pre-requisites.

1. Before applying the patch-set, we have to make sure the release is updates with the base version of the patch-set.

For Example, If the first patch-set of 14.2 is yet to applied, the release has to be updated as '14.2.0.0.0'. It can be verified with the below gueries.

```
select param_name, param_val from CSTB_PARAM WHERE PARAM_NAME =
'RELEASE';
select module_group_id, release from SMTB_MODULES_GROUP;
```

2. Another significant parameter is the values of application name and deployment type in CSTB_PARAM.

This value will be updated from the installer during Approot Object Conversion utility as part of deployment.

```
select param_name, param_val from cstb_param where PARAM_NAME in
('MULTI_TENANT_APP_NAME','MULTI_TENANT_DEPLOYMENT_MODEL');
```

The Application name of multi-tenant deployment will be stored in CSTB_PARAM as

Param_Name	Param_Val
MULTI_TENANT_APP_NA ME	OBTF

The type of object conversion will be stored in CSTB_PARAM as

Param_Name	Param_Val
MULTI_TENANT_DEPLOY MENT_MODEL	SA (or) SAUA (or) SASDD (or) SASDC

SA

Shared Application

SAUA

Shared Application User Authentication

SASDD

Shared Application Shared Data - Default

SASDC | Shared Application Shared Data – Custom

(Optional) Enter the result of the procedure here.

3.2 Patch-set Application Step by Step with Screenshots

This topic provides systematic instructions to patch-set application step by step with screenshots.

1. Start Application upgrade

- a. Login into the Approot Schema as Common user.
- b. Run 01_Start_Upgrade.sql for initiating the application upgrade.
- c. User input has to be inputted for the below:

Spool Path	<< Any local path>>
Application next version	14.4.0.0.0

d. Script will be executed as in the screen shot below and keep the SQL Plus session open for upcoming steps.

```
SCL SYDOL ON
SCL SET SIGNAMIKINES ON
SQL STATE SIGNAMIKINES ON
SQL STATE SIGNAMIKINES ON
SQL SPORT SIGNAMIKINES ON
SQL STATE SIGNAMIKINES
SQL STATE SIGNAMIKINE
```

```
### Description of the Control of th
```

2. Compiling Incremental Units

- Make sure that the fcubs.properties and env.properties are updated with approot schema details.
- b. Run the <Product Processor>DBCompileRun.bat from <Patchset>\INSTALLER\SOFT directory. DDL Compilation, Object Compilation and Static Data load will be done.

For Example: OBTF INSTALLATION

First load SMS objects first and then OBTF objects. i.e. Run ${\tt SMSDBCompileRun.bat}$ and after SMS object loading is completed, then initiate OBTF compilation Run ${\tt TFDBCompileRun.bat}$

3. Recompilation of invalids

- a. Login into the Approot Schema as Common user
- b. Run 03_Invalids_Recompilation.sql for recompiling the invalids during application upgrade.
- c. No user input is required for this step.
- d. Script will be executed as in the screen shot below and keep the SQL Plus session open for upcoming steps.

```
Bit Chapprident(pathalac)product(18.00.clent, thehiuplus.ce

SOL > promat Netlome to Application Upgrade Invalids Recompilation
Netlome to Application Upgrade Invalids Recompilation
Netlome to Application Upgrade Invalids Recompilation
Sols > SSOL * SSOOL * SSOO
```

4. End Application upgrade

- a. Login into the Approot Schema as Common user.
- b. Run 06_End_Upgrade.sql for recompiling the invalids during application upgrade.
- c. No user input is required for this step.
- d. Script will be executed as in the screen shot below.

5. Start Application upgrade

- a. Login into the Approot Schema as Common user.
- b. Run 05_Start_Upgrade.sql for initiating the application upgrade.
- c. User input has to be inputted for the below:

Spool Path	<< Any local path>>
Application next version	14.4.0.0.0

d. Script will be executed similar to step 1 above and keep the SQL Plus session open for upcoming steps.

6. Application Root objects conversion for new objects

- a. Login into the Approot Schema as Common user.
- Run 06_New_Object_Conversion.sql for converting new approof objects added during patch-set as DL
- c. User input has to be inputted for the below:

Spool Path	<< Any local path>>
Application next version	HUBUSER (common user name)

```
### Composition of the process of th
```

7. Application Root objects conversion for existing objects

- a. Login into the Approot Schema as Common user.
- b. Run 07_Object_Conversion.sql for initiating the application upgrade.
- c. User input has to be inputted for the below:

Spool Path	<< Any local path>>	
Application next version	lication next version HUBUSER (common user name)	

```
SECOND PROBLEM PROBLEM
```

8. Recompilation of invalids

- a. Login into the Approot Schema as Common user.
- b. Run 08_Invalids_Recompilation.sql for recompiling the invalids during application upgrade.
- c. No user input is required for this step.
- d. Script will be executed as in the screen shot below and keep the SQL Plus session open for upcoming steps.

```
Bit Chapprident(pathalac)product(18.00.clent, thehiuplus.ce

SOL > promat Netlome to Application Upgrade Invalids Recompilation
Netlome to Application Upgrade Invalids Recompilation
Netlome to Application Upgrade Invalids Recompilation
Sols > SSOL * SSOOL * SSOO
```

9. End Application upgrade

- a. Login into the Approot Schema as Common user.
- b. Run $06_{End_Upgrade.sql}$ for recompiling the invalids during application upgrade.
- c. No user input is required for this step.
- d. Script will be executed as that of step 4.

10. Synchronize application PDBs

- Login into the PDB Schema as Common user. For each PDB, this steps has to be done individually.
- b. Run 07_PDB_Sync.sql for synching the application upgrade with PDBs.
- c. No user input is required for this step.
- d. Script will be executed as in the screen shot below.

01_Start_Upgrade

This script is used for initiating an application upgrade. This will initiate the application from current version to the next version (patch-set version).
