This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

# About This Content

Use the Application Security Administration to help Administrators classify users and the data that they are permitted to access.

## Audience

This guide is intended for administrator users who are tasked with creating and classifying users.

## Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

## Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

## Conventions

The following text conventions are used in this document.

Convention	Meaning
<b>boldface</b>	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

# 1

## About Application Security Administration

Application Security Administration helps Administrators classify users and the data that they are permitted to access.

Users are mapped to user groups, which must be mapped to specific security attributes, such as Business Domain, Jurisdiction, and Case Type. Users can then perform activities associated with their user group throughout the functional areas in the application.

Administrators use this menu to perform the following tasks:

1. [Create business domains.](#)
2. [Configuring Jurisdictions.](#)
3. [Map user groups to security attributes.](#)

### 1.1 Security within the Application

Security layers control how users interact with the application. The following table describes the security layers.

**Table 1-1 Security Details within the Application**

Security Layer Type	Controls	Description
Roles	Access to Features and Functions	User roles are used to identify which features and functions the user can access within the application. For example, Case Analysts can access and take action on cases.
Business Domains	Access to Case and Business Information	You can restrict access along operational business lines and practices, such as Retail Banking. Users can only see cases that are assigned to at least one of the business domains their user group is mapped to. For more information about Business Domains, see <a href="#">Create business domains.</a>
Jurisdictions	Access to Case Information	You can restrict access using geographic locations and legal boundaries. Users can only see cases that belong to the jurisdiction their user group is mapped to. For more information about Jurisdictions, see <a href="#">Configuring Jurisdictions.</a>

Table 1-1 (Cont.) Security Details within the Application

Security Layer Type	Controls	Description
Case Type	Access to Cases in Case Manager	<b>Note:</b> Case Types are only applicable if your implementation is using Case Manager. Investigation Hub does not currently support Case Type mapping. You can restrict access to specific types of cases. To view a case, users must be mapped to a user group which has access to view the specific Case Type assigned to the case. For more information about case types, see <a href="#">Configure Case Types</a>

## 1.2 Access Application Security Attributes

To access the Application Security Attributes, follow these steps:

1. In your web browser, enter the application URL to open the **Oracle Cloud Account Sign In** page.
2. On the sign-in page, enter your username and password to log in to the **Oracle Financial Services Crime and Compliance Management Anti Money Laundering Cloud Service** home page.

After you sign in, the **Applications**, **Application Administration**, and **Business Processes** tiles are displayed.

3. Select **Application Administration**. The **Application Administration** page is displayed.
4. Select **Application Security Administration**. The **Application Security Administration** page is displayed.
5. You can perform the following activities using the Application Security UI:
  - [Configure Business Domains](#)
  - [Configure Jurisdictions](#)
  - [Configure Case Types](#)

### Note

Case Types are only applicable if your implementation is using Case Manager. Investigation Hub does not currently support Case Type mapping.

- [Map user groups to security attributes.](#)

# 2

## About Business Domains

Business domains are used to classify records of different business types (such as Retail Banking vs. Private Banking) or to restrict access to data (such as sensitive employee data).

Records (such as accounts, customers, and cases) can be linked to a business domain. Administrators map user groups to one or more business domains. Users can access records with any business domains that their user group has been mapped to.

For example, you have defined a business domain as EMP: Employee Information. You assign this business domain to the account and customer records that belong to employees. Only users who are in user groups mapped to the EMP business domain can view these records.

Cases can be linked to one or more business domains. User groups who are mapped to either business domain can view these cases. For example, when multiple Events are correlated to a case, if Event1 has come from Retail and Event 2 has come from Institutional Broker-Dealer, then the case belongs to both business domains. Users in user groups mapped to either business domain can view these cases. The **General** business domain is provided by default with this application.

### 2.1 Adding Business Domains

You can add Business Domains as needed for your implementation.

1. Expand **Application Security Administration** and then select **Business Domains** page. The **Business Domain List** page is displayed.

2. Click **Add** . The **Add New Business Domain** window is displayed.
3. Enter the details as mentioned in the following table. Mandatory UI elements are marked with an Asterisk \*.

**Table 2-1 Fields to Add a New Business Domain and their Descriptions**

Field	Description
Business Domain Code*	Enter a unique code for the Business Domain. For example, RET for Retail. This field accepts only alphanumeric and hyphen values. Other special characters are not allowed. This field cannot be edited once the business domain is added.
Business Domain Name*	Enter the Business Domain Name. For example, Retail, Institutional Broker-Dealer. This should be a very high-level form of segregation for different areas. This field accepts only alphanumeric, space, underscore and hyphen values. Other special characters are not allowed.

**Table 2-1 (Cont.) Fields to Add a New Business Domain and their Descriptions**

Field	Description
Business Domain Priority*	Enter the Business Domain Priority. This should be equal to or greater than 1. Lower numbers are considered to be higher priority. When events belonging to different business domains with different priorities correlate to a case, then the business domain with highest priority will be assigned to the case. When events belonging to different business domains of the same priority correlate to a case, that case will have multiple business domains.
Business Domain Description	Enter the Business Domain Description. This field accepts only alphanumeric, space, underscore and hyphen value. Other special characters are not allowed.

4. Click **Save**. A confirmation message is displayed. The newly added business domain will be added in the Business Domain List.

## 2.2 Editing Business Domains

You can edit existing business domains as needed for your implementation.

1. Expand **Application Security Administration** and then select **Business Domains** . The **Business Domain List** page is displayed.

2. Select the business domain and click **Edit**  . The Edit New Business Domain window is displayed.
3. Modify the details as shown in [the Fields to Add a New Business Domain table](#). You cannot edit the Business Domain Code.
4. Click **Save**. A confirmation message is displayed. The business domain in the Business Domain List will be updated.

# 3

## About Jurisdictions

Jurisdictions are used to classify and restrict data.

Users can only access records or cases associated with jurisdictions associated with their user groups. Jurisdictions divide data based on the following types of boundaries, as designated by the financial institution:

- Geographical: division of data based on geographical boundaries, such as countries, states, and so on.
- Organizational: division of data based on different legal entities that compose the client's business.
- Other: combination of geographic and organizational definitions.

Scenario thresholds can be fine-tuned to run different threshold values depending on the jurisdiction.

The Asia Middle East Africa (AMEA) jurisdiction is provided by default with this application.

### 3.1 Adding Jurisdictions

You can add new jurisdictions as needed for your implementation.

1. Expand **Application Security Administration** and then select **Jurisdictions** page. The *Jurisdiction List* page is displayed.

2. Click **Add** . The Add New Jurisdiction window is displayed.
3. Enter the details as described in the following table.

**Table 3-1 Fields to Add a New Jurisdiction and their Descriptions**

Field	Description
Jurisdiction Code*	Enter a unique Jurisdiction Code. For example, AMEA. This field accepts alphanumeric values and underscore(_). Other special characters are not allowed. This field cannot be edited once the jurisdiction is added.
Jurisdiction Name*	Enter the Jurisdiction Name. For example, Asia Middle East Africa. This field accepts alphanumeric values and underscore(_). Other special characters are not allowed.

**Table 3-1 (Cont.) Fields to Add a New Jurisdiction and their Descriptions**

Field	Description
Jurisdiction Priority*	Enter the Jurisdiction priority. This should be equal to or greater than 1, and priorities must be unique. Lower numbers are considered to be higher priority. Priority can be used to determine the jurisdiction of a case when multiple events are correlated to a case. Each case can have only one jurisdiction; that is, the jurisdiction with higher priority. For example, if Event1 has come from the EMEA jurisdiction with priority 1 and Event 2 has come from the US jurisdiction with priority 2, then the case belongs to the EMEA jurisdiction.
Jurisdiction Description	Enter the Jurisdiction Description. This field accepts only alphanumeric, space, underscore and hyphen values. Other special characters are not allowed.

- Click **Save**. A confirmation message is displayed. The newly added jurisdiction will be added in the Jurisdiction List.

## 3.2 Editing Jurisdictions

You can edit jurisdictions as needed for your implementation.

- Expand **Application Security Administration** and then select **Jurisdictions** page. The *Jurisdiction List* page is displayed.

- Select the Jurisdiction and click **Edit** . The **Edit Jurisdiction** window is displayed.
- Modify the details as shown in the [Fields to Add a New Jurisdiction](#) table. You cannot edit the Jurisdiction Code.
- Click **Save**. A confirmation message is displayed. The jurisdiction will be updated in the Jurisdiction List.

# 4

## About Case Security Mappings

Use the Security Attributes to map user groups with business domains, jurisdictions, and case types. This determines the access privileges users have and which activities they may perform.

User groups must be mapped with the following attributes:

- Jurisdictions
- Business Domains

### Note

If your firm has enabled the Compliance Regulatory Reporting application, you can optionally map user groups to a Report Type, used to access the CRR Report in Case Investigation. CRR Reports can be generated without mapping the Report Type attribute, but cannot be viewed unless a Report Type has been mapped.

### Note

If your implementation is using Case Manager, you must also map user groups to a Case Type. Investigation Hub does not currently support Case Type mapping.

Before mapping security attributes, you must complete the following:

1. Create users.
2. Map users to user groups.
3. [Create business domains.](#)
4. [Create jurisdictions.](#)

### 4.1 Mapping Security Attributes

You can map user groups to security attributes.

1. Expand **Application Security Administration** and then select **Security Mappings**. The **Security Mappings** page is displayed.
2. Select the User Group that you want to map with the Security Attributes (Jurisdiction, Business Domain, and Case Type) from the **Select User Group** drop-down list.
3. Map one or more Jurisdictions to a User Group by moving the jurisdiction from the **Available Jurisdictions** list to the **Selected Jurisdictions** list. This allows users in this user group to access cases that belong to the mapped jurisdiction.
4. Map one or more Business Domains to a User Group by moving the Business Domain from the **Available Business Domains** list to the **Selected Business Domains** list. This allows users in this user group to access cases that belong to the mapped Business Domain.

- a. **Optional:** Map one or more Case Types to a User Group by moving the Case Type from the **Available Case Types** list to the **Selected Case Types** list. This allows users in this user group to access cases that belong to the mapped Case Type.
- b. **Optional:** Map one or more Report Types to a User Group. For mapping, move the Report Type from the **Available Report Types** list to the **Selected Report Types** list. This allows users in this user group to access cases that belong to the mapped Report Type.
