This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

1 AP CS Batch Task Administration

Administration-Specific Batch Tasks	1-1
Run Batch Measure Load Group	1-2
Run Batch Measure Export Group	1-3
Run Batch Calc Group	1-3
Daily Batch Calc (calc_daily)	1-3
Weekly Batch Calc (calc_weekly)	1-4
Set Export Flags (exp_set)	1-4
Run Batch Task Group	1-4
Daily Batch (batch_daily)	1-5
Weekly Batch (batch_weekly)	1-5
Load Hierarchies (load_hier)	1-6
Load Actuals (load_data)	1-7
Load MFP Data (batch_mfp)	1-7
Import Hierarchies (imp_hier)	1-7
Import Actuals (imp_data)	1-8
Import Forecasts (imp_fcst)	1-8

Import RSE DT Data (batch_rse_dt)	1-8
Import RSE Clusters Data (batch_rse_strc)	1-8
Export Plan Data (exp_plan)	1-9
Export New Placeholder Items (exp_item)	1-9
Export New Product Attributes (exp_patt)	1-9
Export to Allocation (exp_alloc)	1-9
Export Plans to RI (exp_plan_ri)	1-9
Export Assortment to RSE (exp_rse)	1-10
Set RMF CS Dimension Mapping (exp_set)	1-10
Rename Style-Color	1-10
Transform RMS Files (rms_xform_ftp)	1-10
Transform RMS Warehouse Data (batch_rms_wh1)	1-11
Set Dimension Attributes (batch_datr)	1-12
Formalize Hierarchies (form_hier)	1-12
Rebuild Dashboard (batch_dash)	1-12
Post Build Batch (postbuild)	1-12
Scheduling Configured Batch Administration Tasks	1-13
Dashboard	1-18
Retail Home	1-23

2 Build/Patch Application

Self Service - Installing the AP Cloud Service Application from the Bootstrap Domain	2-1
Bootstrap Environment	2-1
Build Application from the Bootstrap Domain	2-1
Self Service - Patching the AP Cloud Service Application	2-5
Template Status	2-8

3 User and Role Maintenance

User Maintenance through OCI IAM	3-2
OCI IAM User Creation	3-2
Adding a User Group	3-4
Managing Users in OCI IAM	3-5
Adding a User to the AP CS Application	3-6
Bulk Loading of User and User Groups	3-9

Send Us Your Comments

Oracle Retail Assortment Planning Cloud Service Administration Guide, Release 22.2.401.0

Oracle welcomes customers' comments and suggestions on the quality and usefulness of this document.

Your feedback is important, and helps us to best meet your needs as a user of our products. For example:

- Are the implementation steps correct and complete?
- Did you understand the context of the procedures?
- Did you find any errors in the information?
- Does the structure of the information help you with your tasks?
- Do you need different information or graphics? If so, where, and in what format?
- Are the examples correct? Do you need more examples?

If you find any errors or have any other suggestions for improvement, then please tell us your name, the name of the company who has licensed our products, the title and part number of the documentation and the chapter, section, and page number (if available).

Note:

Before sending us your comments, you might like to check that you have the latest version of the document and if any concerns are already addressed. To do this, access the Online Documentation available on the Oracle Help Center (docs.oracle.com) web site. It contains the most current Documentation Library plus all documents revised or released recently.

Send your comments to us using the electronic mail address: retail-doc_us@oracle.com

Please give your name, address, electronic mail address, and telephone number (optional).

If you need assistance with Oracle software, then please contact your support representative or Oracle Support Services.

If you require training or instruction in using Oracle software, then please contact your Oracle local office and inquire about our Oracle University offerings. A list of Oracle offices is available on our web site at <http://www.oracle.com>.

Preface

This document describes the administration tasks for Oracle Retail Assortment Planning Cloud Service.

Audience

This document is intended for administrators.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Related Documents

For more information, see the following documents in the Oracle Retail Assortment Planning Cloud Service documentation set:

- *Oracle Retail Assortment Planning Cloud Service Implementation Guide*
- *Oracle Retail Assortment Planning Cloud Service Release Readiness Guide*
- *Oracle Retail Assortment Planning Cloud Service Starter Kit Guide*
- *Oracle Retail Assortment Planning Cloud Service User Guide*

Also, see the Oracle Retail Predictive Application Server Cloud Edition documentation set.

Improved Process for Oracle Retail Documentation Corrections

To more quickly address critical corrections to Oracle Retail documentation content, Oracle Retail documentation may be republished whenever a critical correction is needed. For critical corrections, the republication of an Oracle Retail document may at times **not** be attached to a numbered software release; instead, the Oracle Retail document will simply be replaced on the Oracle Help Center (docs.oracle.com) Web

site, or, in the case of Data Models, to the applicable My Oracle Support Documentation container where they reside.

Oracle Retail documentation is available on the Oracle Help Center (docs.oracle.com) at the following URL:

<https://docs.oracle.com/en/industries/retail/index.html>

An updated version of the applicable Oracle Retail document is indicated by Oracle part number, as well as print date (month and year). An updated version uses the same part number, with a higher-numbered suffix. For example, part number E123456-02 is an updated version of a document with part number E123456-01.

If a more recent version of the document is available, that version supersedes all previous versions.

Oracle Retail Documentation on the Oracle Help Center (docs.oracle.com)

Oracle Retail product documentation is available on the following web site:

<https://docs.oracle.com/en/industries/retail/index.html>

(Data Model documents can be obtained through My Oracle Support.)

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Administration Process

The intent of this document is to guide an Assortment Planning Cloud Service (AP CS) Administrator to perform the recurring administrative activities for the AP CS application. This document outlines all administration activities required to support a live AP CS application. In some cases, the detail will be explained in this document, and in other cases, the process will be covered here and details will be explained in the *Oracle Retail Predictive Application Server Cloud Edition Administration Guide*.

The AP CS Administrative activities can broadly be classified into two categories. This document follows these categories and provide details for the tasks within them.

Regular Activities:

- AP CS Batch Task Administration
- Build/Patch Application

Ad-hoc Activities:

- User and Role Maintenance
- Monitor Domain Performance

Regular Activities

Once a AP CS solution is live, the Administrator is responsible for two key activities that occur on a regular basis. The first of these activities is managing the weekly/daily batch which loads and exports data required for the AP CS users to create, manage, and share their assortment plans. Internally, it also does the calculations for necessary data aggregation.

The AP CS Admin task offers a broad range of options to the Administrator to configure the batch run and maintenance. This document also provides a concise view to the Administrator on troubleshooting when the batch fails or diagnosing rejected records, importing/exporting of data files, reading logs, and modifying the scheduled batch to work around system maintenance or patch periods.

Patch uptake is another recurring task that an Administrator needs to be familiar with. This document walks through the process of taking a monthly patch and the specifics the Administrator needs to take care of.

Ad-hoc Activities

The Administrator generally comes across certain jobs on an as-needed basis. For example, the need occasionally arises to do the following:

- Add a new user who just joined the team/organization and needs to use the AP CS application.
- Remove an existing user who has left the organization and needs to be removed from the AP CS environment.

- Manage a user's access when the role changes within the organization.

This document describes the necessary actions to achieve this kind of request.

The Administrator can leverage the standard Online Administration Tools (OAT) tasks on an ad-hoc basis without scheduling the task daily or weekly. Ad-hoc administrative activities include properly managing the reclassification of product so that planners can continue their work without interruption, monitoring domain related information to maintain system performance, loading a hierarchy from OAT, and so on, are several jobs the Administrator needs to perform intermittently.

For more details about the standard Administrative Tasks applicable to all Planning Solutions, see the *Oracle Retail Predictive Application Server Cloud Edition Administration Guide*.

Oracle Support

It is requested that all retailers submit Oracle Retail Assortment Planning Cloud Service support requests through a single point-of-contact for each environment; the system administrator is usually designated to perform this role. For the maintenance of bulk user and roles, Oracle Support is a smart solution.

The link to use when submitting Service Requests (SR) is:

<https://support.oracle.com>

To learn more about how Oracle Support works, go through the following training at the My Oracle Support website:

- My Oracle Support (MOS) or Cloud Support Portal for New Users - A Getting Started Resource Center (Doc ID 1959163.1)
- How-to use My Oracle Support - Customer User Administrator (CUA) Role and Responsibilities (Doc ID 1544004.2)
- Oracle Support Accreditation - Series Index (Doc ID 1583898.1)

1

AP CS Batch Task Administration

The Assortment Planning Cloud Service (AP CS) batch task is a powerful tool provided to the Administrator to manage periodic load/export of Data/Hierarchy from the front end, eliminating the cumbersome effort of scheduling and running the batch from the back end domain server.

Assortment Planning Cloud Service uses the Oracle Retail Predictive Application Server Cloud Edition (RPAS CE) Online Administration Tools as part of scheduling RPAS utilities and scripts that must be scheduled to run batch on Cloud, as the users do not have access to directly schedule scripts or run utilities on the domain server. Administration users can view the results of the scheduled scripts/utilities log in a dashboard through the RPAS Cloud Edition.

RPAS CE Online Administration Tools support the scheduling of standard RPAS utilities and, in addition, scheduling application-specific services. For a detailed understanding of the Online Administration Tools, see the *Oracle Retail Predictive Application Server Cloud Edition Administration Guide*.

JOS/POM is used to schedule pre-configured jobs from AP CS. Any jobs scheduled using JOS/POM from planning applications, in turn will only schedule the jobs as an OAT task which can also be monitored using OAT dashboards like any other tasks scheduled directly within the application.

The following sections explain the application-specific administration tasks that are pre-configured for AP Cloud Service. These tasks are only applicable for Template implementations.

For non-Template type implementations, the Configured Batch Tasks can be fully configured by making changes to the batch control files. For information about changing the batch control files and how to upload them, see the *Oracle Retail Predictive Application Server Cloud Edition Implementation Guide*.

Customers using Template versions can also customize the tasks by changing the control files as part of the extensibility. For allowed changes, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

Administration-Specific Batch Tasks

The application-specific batch tasks are a set of tasks which help the Administrator to load/export a predefined set of measures and hierarchies. These tasks are found in the Online Administration Tools as Configured Batch Tasks.

Each task in turn calls predefined batch services to do the required tasks. AP CS uses the RPAS CE batch framework to define the batch process.

Some tasks require input data files or hierarchy files as input. These files must be uploaded before the tasks are scheduled. Some tasks export files out of the application. Those files are copied to Object Storage, and Administrators can download these exported files.

For more details about how to upload files to Object Storage and the file name convention used for different type of files, see the *Oracle Retail Predictive Application Server Cloud Edition Implementation Guide*.

Customers using RAP integration to get the integration data should enable the Batch Uses RDX flag in the application in the client UI in Planning Administration -> Batch Setup worksheet. Based on that flag, additional steps will get executed during the batch. This flag can also be enabled as part of Domain build process.

Customers can set up some additional batch specific measures, such as Enable RMF CS Integration, Enable Daily Exports, and Enable Weekly Exports that control the batch process in the client UI in Planning Administration -> Batch Setup.

The following list shows the application-specific administration tasks that are pre-configured for AP Cloud Service under Configured Batch Tasks:

- Run Batch Measure Load Group
- Run Batch Measure Export Group
- Run Batch Calc Group
- Run Batch Task Group

These batch tasks are explained in detail in subsequent sections. There are some additional tasks available under Configured Batch Tasks which are generic RPAS-specific tasks. Details about the RPAS-specific tasks can be found in the Batch Administration section in the *Oracle Retail Predictive Application Server Cloud Edition Administration Guide*.

Run Batch Measure Load Group

This task is used to load a predefined set of measures grouped as a measure set in the batch control file `batch_loadmeas_list.txt`. These set of measures can be loaded together. Actuals Data is a named set of load measures in the batch control file. If the Administrator decides to load the measure set for Actuals Data, the Administrator needs to load data for measures which includes measures such as Ty Sales Clr R and TY Sales Clr U. All required data files must be uploaded to Object Storage. If there is no file present to load a particular measure in that measure set, it will be logged as not found and skipped.

This process will only load the data into those measures and will not run any subsequent calculations after it. The Administrator may need to schedule the necessary Run Batch Calc Group task after scheduling this task in order to process the loaded data.

The Predefined Measure Load Options in AP CS are listed below:

- Actuals Data (`load_act`) - To load all the measures containing actual data as needed such as Sales, Inventory, Receipt, Shrink, and so on.
- On Order Data (`load_oo`) - To load only On Order data files.
- Admin Data (`load_adm`) - To load planning administration level data such as Week Mapping, Clustering Weights, and so on.
- Forecast Data (`load_rms`) - To load Forecast Data.
- Week Mapping (`load_lymap`) - To load the Week Mapping file.
- Image URL Files (`load_img`) - To load all the Image URL files.

For details about the list of measure files that are loaded for different measure sets and file format and source information, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

Run Batch Measure Export Group

This task exports a predefined set of measure data into flat files. The predefined set of measures to be exported are defined in the batch control file `batch_exportmeas_list.txt`. This set of exported data can be used for integration with other applications. Typically, the data exported can be interfaced to an external database that can be used to create reports or queries by users who need Planning data. The Administrator needs to schedule the Set Export Flags under the Run Batch Calc Group task to set the required export flags before scheduling this task. Exported files for this task are put into the Object Storage location; the Administrator can download the files from this location.

The standard exports from AP CS are available to the retailer to use by any downstream applications which need AP CS plan data. Default approved plan standard exports are included as part of the daily and weekly batch.

The predefined options for these tasks are listed below:

- Item Plan - Pre-Season (`ip_ipop`)
- Item Plan - In-Season (`ip_ipcp`)
- Item Plan - OTB (`ip_otb`)
- Item Base Price (`as_sprc`)

For details about the different versions for export, the list of measures exported in each file, and the file name and format details, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

Run Batch Calc Group

This task is used to run a predefined set of all batch rules (as batch calc sets) against the domain to do the necessary data aggregation that is defined in the batch control file `batch_calc_list.txt`.

The following predefined batch calculation sets are available in AP CS:

- Daily Batch Calc (`calc_daily`)
- Weekly Batch Calc (`calc_weekly`)
- Set Export Flags (`exp_set`)

Daily Batch Calc (`calc_daily`)

This batch calc set is used to run batch calculations necessary to initialize date settings and daily calculations that need to run as part of Daily Batch. It internally runs the predefined batch rule groups `AD_Batch_GB` and `AD_Batch_Agg1`.

`AD_Batch_GB` presets the Weekly mappings if it is not loaded or not set by users. `AD_Batch_Agg1` sets all elapsed setting measures. This process runs as part of the daily and weekly batch, so the retailer does not have to run this process unless they change the date settings in the middle of the week.

Weekly Batch Calc (calc_weekly)

It runs all the calculations that run as part of Daily Batch Calc and in addition, it also runs rule group AD_Batch_Agg2 which has the calc set to aggregate all loaded actual measures on a weekly basis to the corresponding AP CS workbook visible measures. This process runs as part of the regular weekly batch. If the retailer has reloaded corrected actuals in the middle of week and wants to reaggregate all loaded measures, then they can schedule this task.

Set Export Flags (exp_set)

This batch calc set is used to set the necessary export flags for all exports used by Item Planning. The user can control the position exported for all versions by setting the administration measure, addvexportb Export Mask, in the Manage Export worksheet. If the Export Elapsed Periods flag is set to false (the default), it will not export elapsed period data. This task sets export flags for each version of exports based on the Export Mask.

By default, daily and weekly batch runs these calculations before running the exports. The user needs to run this task only if they have changed the export settings and wants to create an on-demand plan data export.

Run Batch Task Group

This task is used to schedule a predefined set of batch tasks such as load measure, batch calc, and batch exports in a sequential order. The batch control file batch_exec_list.txt defines the steps in specific order that will be executed during batch task execution. This task is used to schedule a typical daily or weekly AP CS batch. If any task aborts, a log is created and the process terminates. This task has the option to restart from the last failed service rather than running all the completed services again.

Note:

Typically, the user must schedule this task within a time frame after a domain backup and when no users are logged into the domain, because this task runs in domain exclusive mode. The administrator must work with Oracle to find out the time of backups and any other jobs.

The following predefined batch sets are available. A few configured tasks below can call another configured batch task recursively:

- Daily Batch (batch_daily)
- Weekly Batch (batch_weekly)
- Load Hierarchies (load_hier)
- Load Actuals (load_data)
- Load MFP Data (batch_mfp)
- Import Hierarchies (imp_hier)

- Import Actuals (imp_data)
- Import Forecasts (imp_fcst)
- Import RSE DT Data (batch_rse_dt)
- Import RSE Clusters Data (batch_rse_strc)
- Export Plan Data (exp_plan)
- Export New Placeholder Items (exp_item)
- Export New Product Attributes (exp_patt)
- Export to Allocation (exp_alloc)
- Export Plans to RI (exp_plan_ri)
- Export Assortment to RSE (exp_rse)
- Export New Items to RMF CS (exp_rms)
- Set RMS Dimension Mapping (set_rms_sib)
- Transform RMS Files (rms_xform_ftp)
- Transform RMS Warehouse Data (batch_rms_wh1)
- Set Dimension Attributes (batch_datr)
- Formalize Hierarchies (form_hier)
- Rebuild Dashboard (batch_dash)
- Post Build Batch (postbuild)

Daily Batch (batch_daily)

This task is used to schedule a typical daily batch which does the all plan data export and runs any daily batch process. Steps in this process are also part of Weekly Batch, so the retailer does not have to schedule this during the weekly batch.

Also, if the retailer does not need exports on a daily basis, they can skip scheduling this process.

This task runs the following set of activities in this order:

- Run Batch Task: Set Batch Specific Flags
- If Enable Daily Exports is true: Set Export Flags and Export Plan Data
- Run Batch Calc: Daily Batch Calc
- Rebuild Dashboard and Refresh workbooks configured to refresh daily

Weekly Batch (batch_weekly)

This task is used to schedule a typical weekly batch, which includes loading all hierarchy files and actual data and running all batch aggregations tasks needed for inventory roll. This task is the main task that needs to be scheduled to run on a weekly basis so the Administrator can see the most up-to-date location, product structures, and information. Before scheduling this task, all necessary hierarchy and data files need to be uploaded to Object Storage. This task runs the conditional execution of different tasks based on the various batch control flags set in the application.

This task runs the following activities in this order:

- Run Batch Calc: Set Batch Specific Flags
- If Enable Weekly Exports is true: Set Export Flags and Export Plan Data
- If Enable Batch Export to Allocation is true: Export to Allocation
- If Batch Uses RDX is true: Export Plans to RI
- If Batch Uses RDX is true: Export Assortment to RSE
- If Enable RMF CS Integration is true and Batch Uses RDX is false: Transform RMS Files
- If Batch Uses RMS is true: Rename Style/Color
- Import Hierarchies
- Load Hierarchies
- Import Actuals
- Load Actuals, Admin Data
- Run Batch Calc: Set Dimension Attributes
- Run Batch Calc: Transform RMF CS Warehouse
- Run Batch Calc: Weekly Batch Calc
- If Batch Uses AI Foundation Integration (DRDVORASEB) is set to true:
 - If Enable RSE DT Integration (DRDVRSEDTB) is true: Import RSE DT Data
 - If Enable RSE Cluster Integration (DRDVRSESTRCB) is true: Import RSE Clusters
- If Enable MFP CS Integration is set to true: Load MFP Data
- If Batch Uses RDX is set to true: Import Forecasts, other Load Forecasts
- Refresh Workbook Segments: All Plan Admin and Maintenance Templates
- Rebuild Workbook Segments: Assortment Planning, Item Planning

Load Hierarchies (load_hier)

This task is used to load the hierarchy files listed below. Before loading the hierarchy file, the hierarchy file needs to be uploaded into Object Storage. Only if the hierarchy file is available it will load, otherwise, it will skip loading that hierarchy file. It is configured to load all the hierarchy files listed below with the purge age as zero, but it can be configured to change the purge age in the batch_exec_list.txt control file. If RAP integration (Enable RDX) is enabled, it only loads the hierarchies which are interfaced through RAP integration.

This task automatically always runs as part of the weekly batch.

Following is the list of hierarchies that are loaded, if available, to be reloaded:

- Calendar (cld)
- Product (prod)
- Location (loc)
- Cluster (clrh)
- Product Attributes (patr)

- Location Attributes (satr)
- Assortment (asrt)
- Curve (curv)
- Location Space (sspc)
- Performance Group (pos1)
- Clustering Strategy (pos2)
- Cluster Source (csls)
- Cluster Version (cver)
- Customer Segment (csgl)
- Level (lvlh)
- Custom Messages (cmsh)

For details about hierarchies, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

Load Actuals (load_data)

This task is used to load all the input files that are needed for AP CS if those are uploaded to Object Storage. It mainly loads all the Actuals and Admin files.

For details about the list of measure files, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

This task automatically always runs as part of the weekly batch.

Load MFP Data (batch_mfp)

This task is used to load the MFP interface files if the customer is using their own MFP version. They can upload the MFP interface files in the required format into Object Storage and run this task to load the MFP data.

For details about the list of measure files and about integration with MFP, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

This task automatically runs as part of the weekly batch, if Enable MFP CS Integration is set to true in the Planning Admin -> Batch Setup view from show/hide.

Import Hierarchies (imp_hier)

This task is used to import hierarchies that are coming from RI through RAP integration. It runs all the interfaces to pull the hierarchies data from RI. The list of interfaces it runs and dimension mappings details can be found in the Import Foundation and Transactional data from RMF CS using Retail Insights section in Appendix: RAP Integration of the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

This task automatically runs as part of the weekly batch, if Batch Uses RDX is set to true in the Planning Admin -> Batch Setup view from show/hide.

Import Actuals (imp_data)

This task is used to Import Actuals that are coming from RI through RAP integration. It runs all the interfaces to pull the hierarchies data from RI. The list of interfaces it runs and measure mappings details can be found in the Import Foundation and Transactional data from RMF CS using Retail Insights section in the RAP Integration chapter of the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

This task automatically runs as part of the weekly batch, if Batch Uses RDX is set to true in the Planning Admin -> Batch Setup view from show/hide.

Import Forecasts (imp_fcst)

This task is used to import forecasts that are coming from AI Foundation through RAP integration. It runs all the forecast interfaces to pull the forecast data from AI Foundation. The list of interfaces it runs and measure mappings details can be found in the Import Forecasts from AI Foundation section in the RAP Integration chapter of the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

This task automatically runs as part of the weekly batch, if Batch Uses RDX is set to true in the Planning Admin -> Batch Setup view from show/hide.

Import RSE DT Data (batch_rse_dt)

This task is used to import DT parameters data such as Assortment Elasticity, Attribute Weights, and Functional Fit that are coming from AI Foundation through RAP integration. It runs all the DT interfaces to pull the data from AI Foundation. The list of interfaces it runs and measure mappings details can be found in the Import DT Parameters from AI Foundation section in the RAP Integration chapter of the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*. If Enable RDX is not set to true, it will try load to the data from the input files.

This task automatically runs as part of the weekly batch, if Enable RSE DT Integration is set to true in the Planning Admin -> Batch Setup view from show/hide.

Import RSE Clusters Data (batch_rse_strc)

This task is used to import Location Clusters coming from AI Foundation through RAP integration. It runs all the interfaces needed to pull the location clusters data from AI Foundation. The list of interfaces it runs and measure mappings details can be found in the Import Location Clusters from AI Foundation section in the RAP Integration chapter of the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*. If Enable RDX is not set to true, it will try load to the data from the input files.

After loading external clusters, it runs the batch calculations to set it as Loaded Cluster for the department. It also calls the batch calculations to assign the loaded clusters to Assortment Periods. If the defined assortment period is allowed to be overwritten by external loaded cluster definitions and if that date range overlaps with the loaded cluster date range for that department, then those Approved Assortment Periods will be assigned with those loaded location clusters.

This task automatically runs as part of the weekly batch, if Enable RSE Cluster Integration is set to true in the Planning Admin -> Batch Setup view from show/hide.

Export Plan Data (exp_plan)

This task exports all approved plan versions. This task first runs the export set flag task and then exports all the plan versions. This task also runs as part of the daily or weekly batch if enabled, so the user needs to run this task only if they need to export all plan data as needed.

Following is the list of export plan versions that are exported:

- Item Plan - Pre-Season (ip_ipop)
- Item Plan - In-Season (ip_ipcp)
- Item Plan - OTB (ip_otb)

For details on the versions for export, the list of measures exported in each file, and the file name and format details, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

This task automatically runs as part of the weekly batch, if Enable Weekly Exports is set to true in the Planning Admin -> Batch Setup view from show/hide. It runs as part of the daily batch if Enable Daily Exports is set to true.

Export New Placeholder Items (exp_item)

This export set is used to create a standard export for all new placeholder items created in Assortment Planning Cloud Service, if that needs to be interfaced to any other applications.

For details on the list of measures exported and the file name and format details, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

Export New Product Attributes (exp_patt)

This export set is used to create a standard export of new item/product attribute mapping for all new items or new product attributes defined in Item Planning, if that needs to be interfaced to any other applications.

For details on the list of measures exported and the file name and format details, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

Export to Allocation (exp_alloc)

This export set is used to create an export of approved receipts quantities for the Allocation system in its required format. This is an adhoc export and users can schedule it as needed.

For details on the list of measures exported and the file name and format details, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

Export Plans to RI (exp_plan_ri)

This task is used to export approved Assortment Plan data from AP CS to RI through RAP integration. It runs all the export interfaces to export the approved plan data from AP CS into RI staging tables. The list of interfaces it runs and measure mappings details can be found in the Export Assortment Plans to Retail Insights section in the RAP Integration chapter of the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

This task automatically runs as part of the weekly batch, if Batch Uses RDX is set to true in the Planning Admin -> Batch Setup view from show/hide.

Export Assortment to RSE (exp_rse)

This task exports both Active Assortments at the item level and Assortment Periods for Location Clustering defined at the department level to AI Foundation through RAP integration. It runs the batch calculations first to set the flags for the export before running the interfaces. The list of interfaces it runs and measure mappings details can be found in the Export Active Assortments to AI Foundation and Export Assortment Periods for Location Clustering to AI Foundation sections in the RAP Integration chapter of the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

This task automatically runs as part of the weekly batch, if Batch Uses RDX is set to true in the Planning Admin -> Batch Setup view from show/hide.

Set RMF CS Dimension Mapping (exp_set)

AP CS can directly link with RMF CS in real time to directly use the reserved RMF CS items to create new placeholder items in AP CS. It also allows exporting the items to RMF CS in real time using web service calls to the RMF CS Item Induction process staging tables to create new items. In order to initialize that process, this task needs to be run once to set the mapping of dimensions of Item and Style in AP CS with RMF CS Item. Once that linkage is set, any DPM position created against those dimensions will use the reserved numbers from RMF CS. This process runs as part of the postbuild process. Users can use the rmsMgr utility under the Standard Admin Tasks to manage the reserved items.

Rename Style-Color

AP CS uses Item, Style-Color, and Style in the product hierarchy, but RMF CS only uses Item and Style, and only those can be reserved from RMF CS when new DPM positions are defined. Style-Color in the product hierarchy file, is the concatenation of Style position id and the Color Attribute. During new placeholder creation of Style-Color, only one new Item is created using the reserved Item number but Style-Color is defined with standard DPM position names. That Style-Color needs to be renamed in batch with the same position id as Style concatenated with the Color Attribute name.

This process exports the new DPM Style-Colors, Style, and Color Attribute which are not renamed and renames those Style-Colors so that when this new item is approved in RMF CS and becomes part of the Hierarchy Load process, it will get correctly formalized. Color Attribute should be unique for each new Style-Color defined within a Style. If Color Attribute is empty or not unique, then the Rename Style-Color process will not rename those and it will be present in the logs. This process runs as part of the weekly batch process before the hierarchy load to rename any new DPM Style-Color positions.

Transform RMS Files (rms_xform_ftp)

This task is used to transform all hierarchy and data files from RMF CS to the required format. It runs as part of Weekly Batch if Enable RMF CS Integration is set to true and Batch Uses RDX is false. This task, when run as a stand-alone task, transforms the RMF CS hierarchy and data files, also creates rms_hier.zip, and copies the files to Object Storage. This task is mainly for creating the initial set of transformed RMF CS

hierarchy files to build a new application with the RMF CS foundation hierarchy files. The user does not need to use this task if there is no RMF CS integration or if the customer used RAP integration.

The Batch Transform task formats the interface files by filtering the required columns or splitting the input files into multiple files needed for the interface.

This task runs the following activities in this order:

- Transform RMS Calendar Hierarchy File
- Transform RMS Product Hierarchy File
- Transform RMS Location Hierarchy File
- Transform RMS Inventory File
- Transform RMS Tran Data File
- Transform RMS On Order File
- Transform RMS Product Attribute Files
- Transform RMS Location File

Transform RMS Warehouse Data (batch_rms_wh1)

This task is used to transform the loaded RMS warehouse inventory, receipts, and on-order data to the mapped channels as used in the Planning Solutions. It spreads the data to stores within those channels based on the Warehouse to Store Spread Method option selected, which will by default use MFP plan, but the user can change it to use Actuals or Sales metrics in the Batch Setup view in the UI.

This process actually creates an internal export of loaded warehouse inventory, receipts, and on-order data, transforms warehouse to channels and reloads, and then runs the batch aggregates. This task runs as part of the regular Weekly Batch with RMS. The user needs to schedule this only if the user changes the Warehouse-Channel Mapping in the middle of week and would like to reallocate the Warehouse Inventory to the newly mapped Channels for all history in the middle of the week. The user does not need to use this task if there is no RMS integration.

This task runs the following activities in this order:

- Run Batch Calc - Initialize RMS Warehouse Data for Export
- Export RMS Warehouse Inventory Data
- Transform RMS Warehouse Inventory with Channel
- Exports RMS Warehouse On Order Data
- Transform RMS Warehouse On Order with Channel
- Exports RMF CS Warehouse Receipt Data
- Transform RMF CS Warehouse Receipt with Channel
- Load RMS Warehouse data to Channel
- Run Batch Calc - Weekly Batch Calc

Set Dimension Attributes (batch_datr)

AP CS supports the use of product attributes to enable creating new items and assigning product attributes for them from like items from the UI. Whenever a new set of product attributes is loaded, this task needs to be scheduled to set the dimension attributes in order for them to be visible in UI. This task runs as part of the Weekly Batch and needs to be scheduled only if a new set of product attributes is loaded in the middle of the week.

Formalize Hierarchies (form_hier)

This task is available to formalize the DPM-enabled hierarchies. Once formalized, users cannot delete the formalized DPM positions from the client. Only the informal position created in the hierarchies listed below will be formalized if this task is scheduled to run. The user can schedule this task on an as-needed basis; currently, this is not part of the daily or weekly batch schedule.

Following is the list of hierarchies that can be formalized using this task:

- Assortment Group (asrt_bper)
- Cluster Version (cver_vers)
- Location Attributes (satr_satv)
- Performance Group (pos1_clst)
- Product Attributes (patr_patv)
- Product (prod_sku)

For only the Product Hierarchy, it will only formalize the selected items by the measure WP Formalize Placeholder Item; for other hierarchies, it will formalize all informal positions present in the hierarchy.

For details about hierarchies, see the *Oracle Retail Assortment Planning Cloud Service Implementation Guide*.

Rebuild Dashboard (batch_dash)

This task can be scheduled to rebuild the dashboards on demand based on the new Key Items selection criteria. It runs the batch process to select the Key Items to display in the dashboard based on the user selection in the Admin workbooks and rebuilds all the dashboard segments. This task runs by default in the daily batch, but this can be scheduled if the user wants to rebuild dashboards within a day for new selection criteria.

Post Build Batch (postbuild)

This task is available as an option to be called as part of the initial domain build, to load and process all loaded initial data after the initial domain build. If not called during the domain build time, this task can be run after the domain build using this OAT task.

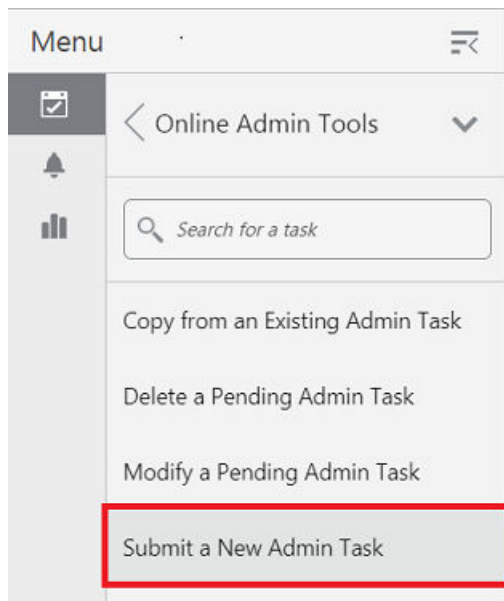

Scheduling Configured Batch Administration Tasks

This section walks through an example of the process for scheduling and monitoring the Configured Batch Administration task named Run Batch Measure Export Group. The steps for scheduling all other tasks are similar, and most of the tasks do not have additional input parameters specific to that task. For more details about scheduling and monitoring Online Administration Tool tasks, see the *Oracle Retail Predictive Application Server Cloud Edition Administration Guide*.

To schedule and monitor a Configured Batch Administration task:

1. Log in to the AP CS application as an Administration user.
2. In the Tasks list, select Admin Tasks for AP CS Customer Domain and then select Online Admin Tools. Click **Submit a New Admin Task**.

Figure 1-1 Administration Tasks

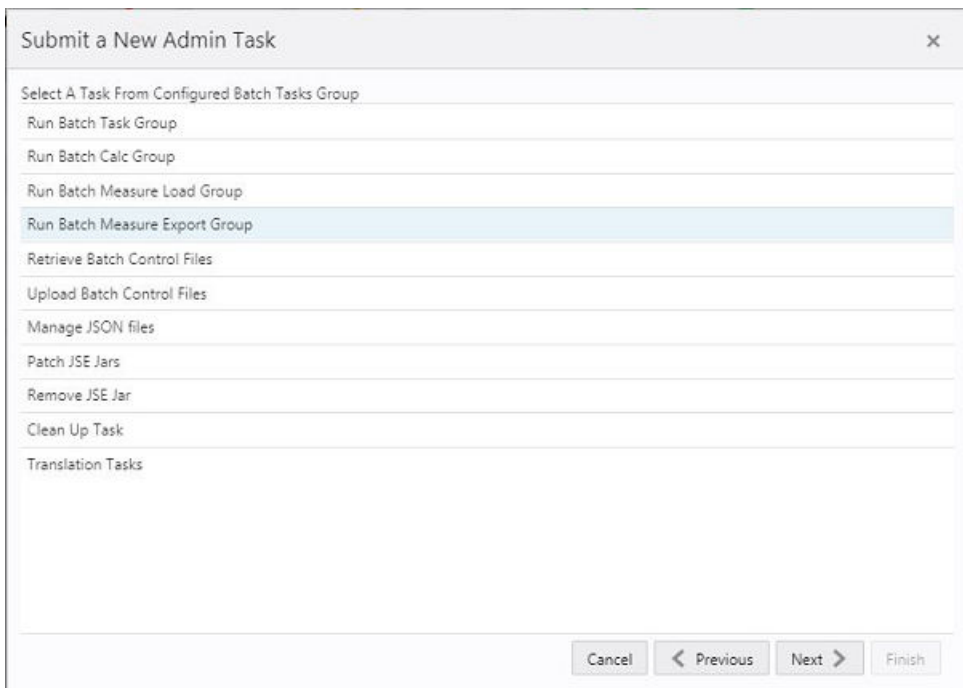

3. Select the Configured Batch Tasks for the Task Group and click **Next**.

Figure 1-2 Select Task Group Window

4. In the task list, select Run Measure Export Group and click **Next**.

Figure 1-3 Select Task Workbook Wizard Window

5. Enter the Task Label. This task has an additional parameter to choose the export measure group. In following figure, as an example, Item Plan - Pre-Season is selected. Click **Next**.

Figure 1-4 Select Export Measure Group

Submit a New Admin Task

Specify the arguments for task:

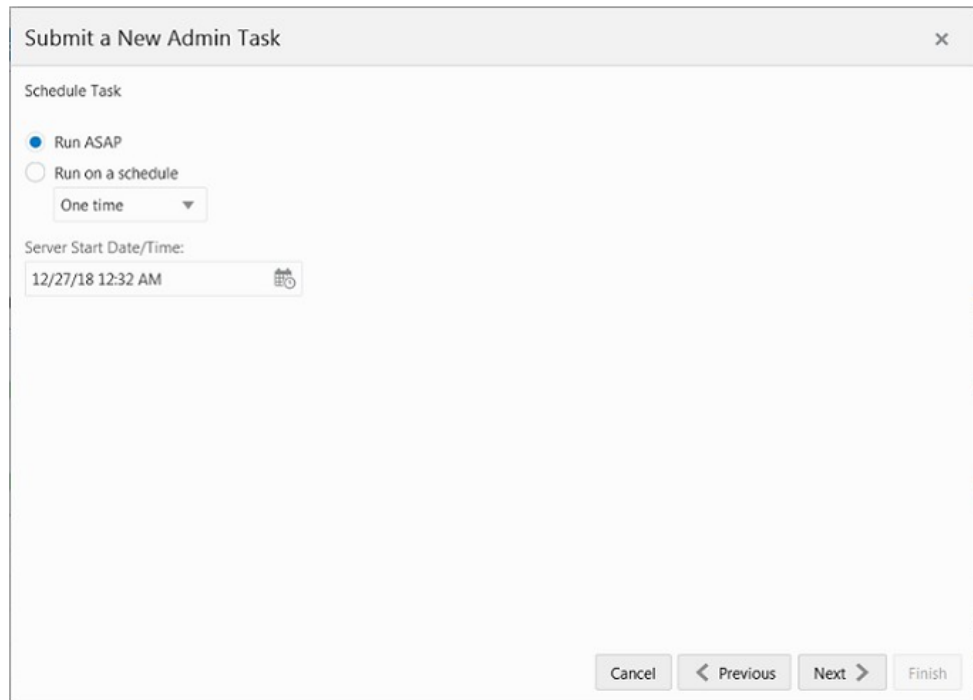

Task Label
Item Plan Pre-Season Export

Batch Export Measure Group
Item Plan - Pre-Season
Build Wedge Plan
Item Base Price
Item Plan - In-Season
Item Plan - Pre-Season
Item Plan - Store Level

Cancel < Previous Next > Finish

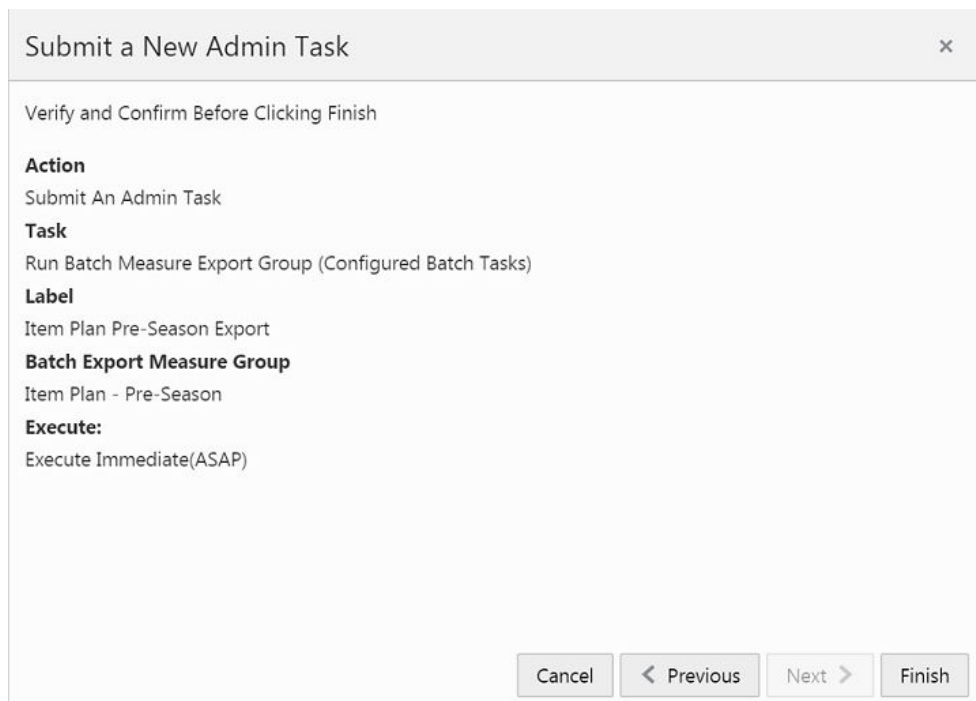

6. To schedule the task to run immediately, select **Run ASAP** and click **Next**. To run on a particular date and time, select Run on a Schedule (One time / Hourly /Daily/ Weekly/ Monthly). Provide the Server Start / Stop Date/Time and click **Next**.

Figure 1-5 Schedule Task Workbook Wizard Window

7. In the Confirm Action window, review the task scheduling details. To confirm the scheduling and submit the task, click **Finish**.

Figure 1-6 Confirm Action Window

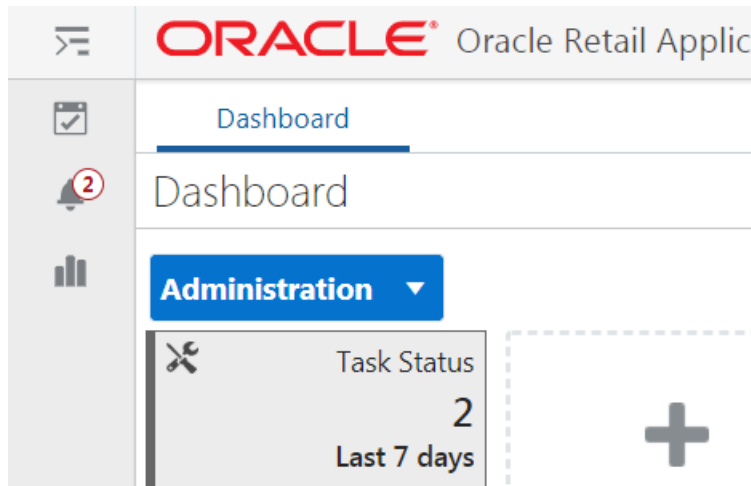

The task submitted confirmation message appears.

Figure 1-7 Task Submitted Confirmation Message

8. To check the status of all submitted tasks in the Dashboard, click **Dashboard** and select **Administration** from the list of Dashboard Profiles in the dropdown.

Figure 1-8 Location of Administration Dashboard Selection

At the bottom of the dashboard, it contains the lists of tasks submitted and their status.

Figure 1-9 List of Submitted Tasks

Description	Status	Task Type	Submitted by	Started/Scheduled	Completed	Record Status
Run Daily Batch	In Progress	Run Batch Task Group	ocladwin	7/14/20 4:22:24 PM		---
Run Batch Task Group	Success	Run Batch Task Group	ocladwin	7/14/20 4:20:47 PM	7/14/20 4:20:47 PM	N/A
Dashboard for ocladwin	Success	Auto dashboard build	ocladwin	7/14/20 10:23:55 AM	7/14/20 10:24:12 AM	N/A

The Status column shows whether a job has completed successfully, failed, or is pending (Scheduled). For any completed (Success/Failed) tasks, click the job name to view the subtask details if any for that job. To view the log, select the task and click Download Log. For failed tasks, the logs show the error details.

Following is an example of a log showing an error:

```
Service 'loadHier' failed with return code 2
03:13:24 : INFORMATION : eebatch_loadhier.ksh[116] - _call of command 'rpsace_run loadHier
-d /u07/projects/mfp/domains/mfprcs -load clnd -checkParents -purgeAge 14 -purgeBackups
-forceInputRollups -forceNAConsistency -maxProcesses 8 -loglevel all' complete
03:13:24 : ERROR : eebatch_loadhier.ksh[122] - Error Result from loadHier call.
03:13:24 : INFORMATION : eebatch_loadhier.ksh[122] - Exiting script with code: 102
03:13:24 : INFORMATION : eebatch_loadhier.ksh[1] - NO_EXIT_STATEMENT
```

Following is an example of a log showing the cause of an error:

```
<E 2018Apr23 03:13:14.426> loadHier (clnd) failed on domain: mfprcs
<E 2018Apr23 03:13:14.426> ReindexDomain must be run first to prepend CLND Dimensions.
<E 2018Apr23 03:13:14.426> Syntax: reindexDomain -d <domainPath> -hier CLND -prepend
<E 2018Apr23 03:13:14.426> LoadHier must be run again after reindexing the domain.
```

Note:

The detailed log file will also be uploaded to Object Storage so the customer can download. The log file names are first appended with `planning/outgoing/logs/` and with the text `success/failure` (with error code) along with the process name and control file entry set names and the time stamp for easy identification. For example:

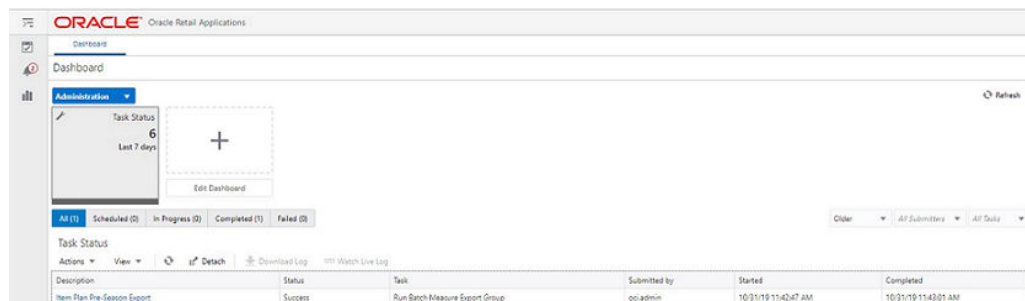

```
/planning/outgoing/logs/
success.eebatch_calc.exp_set.20190614124917.tar.gz
```

```
/planning/outgoing/logs/
failure.13.eebatch_exec.setup.20190614043009.tar.gz
```

Dashboard

The Dashboard provides pre-configured dashboard profiles to the user once logged in to the application. If the user is logged in with administrator access, they will also see the Administration tasks status board as one of the profiles, which shows the scheduled batch job status.

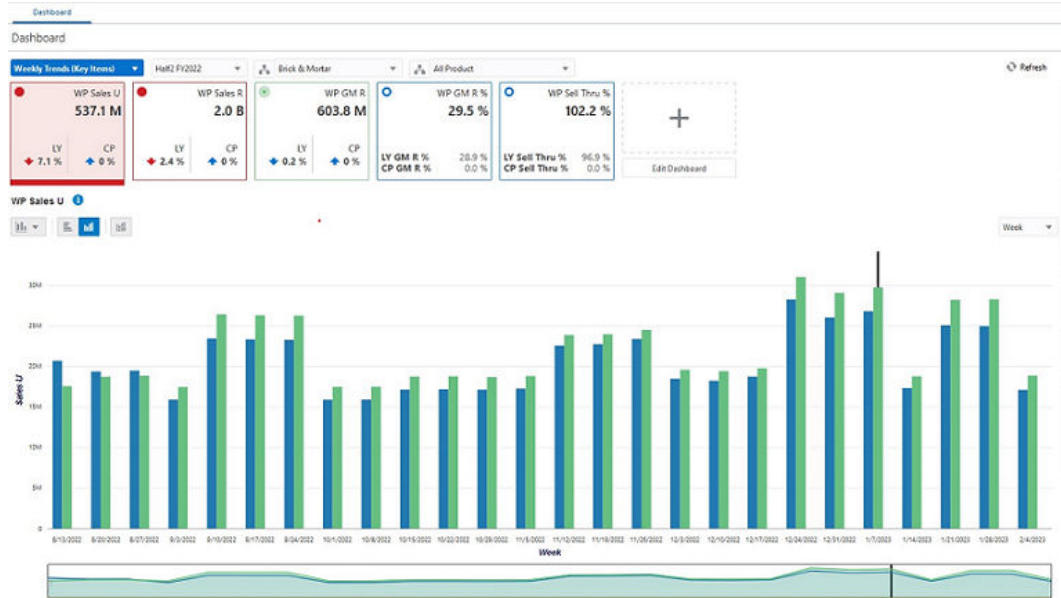

Figure 1-10 Dashboard - Administration Tasks Status

There are four additional dashboard profiles pre-configured for AP CS as specified below. In AP CS, users need to set the Key Item selection criteria for their classes in the Admin setup. The daily batch will rank and select the predefined set of items to be shown in the subsequent dashboard build. For more details about the dashboard, see the *Oracle Retail Assortment Planning Cloud Service User Guide*.

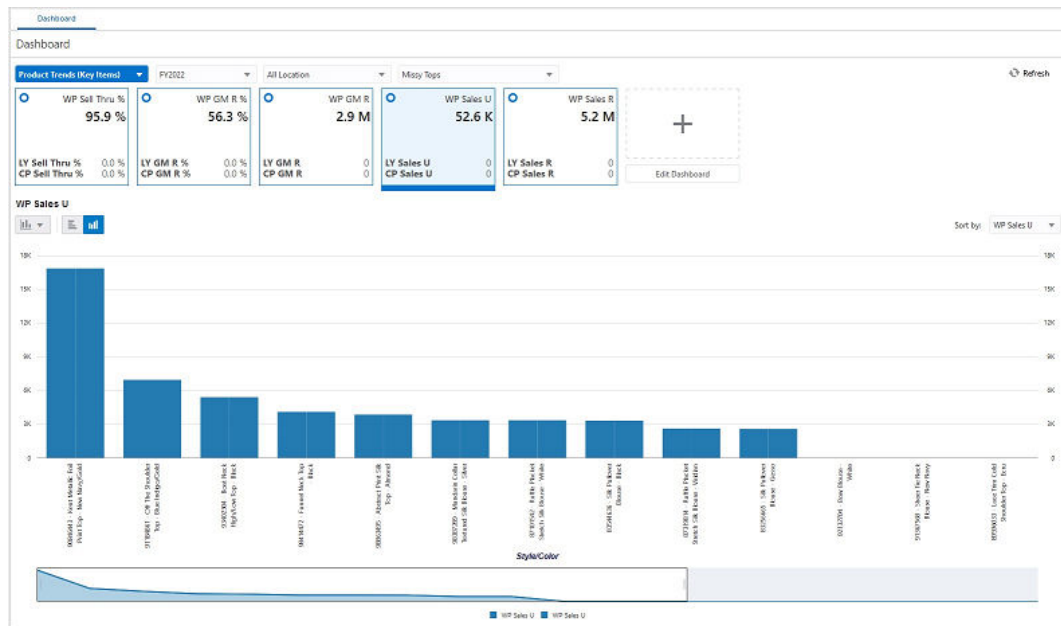

1. Weekly Trends (Key Items): This shows the performance of key items at the week level as different metric tiles.

Figure 1-11 Dashboard - Weekly Trends (Key Items)

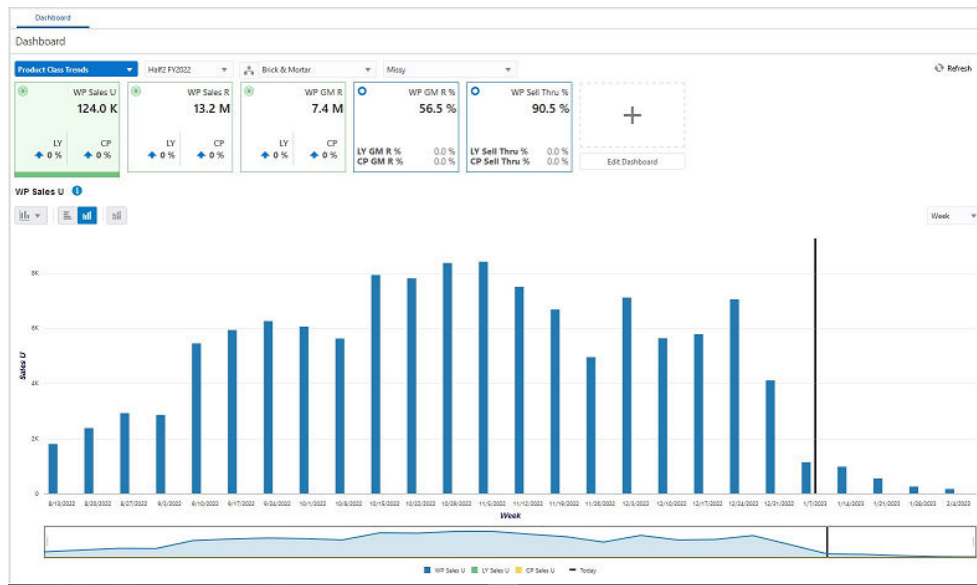

2. Product Trends (Key Items): This shows the same key items to view sorted based on Item Performance.

Figure 1-12 Dashboard - Product Trends (Key Items)

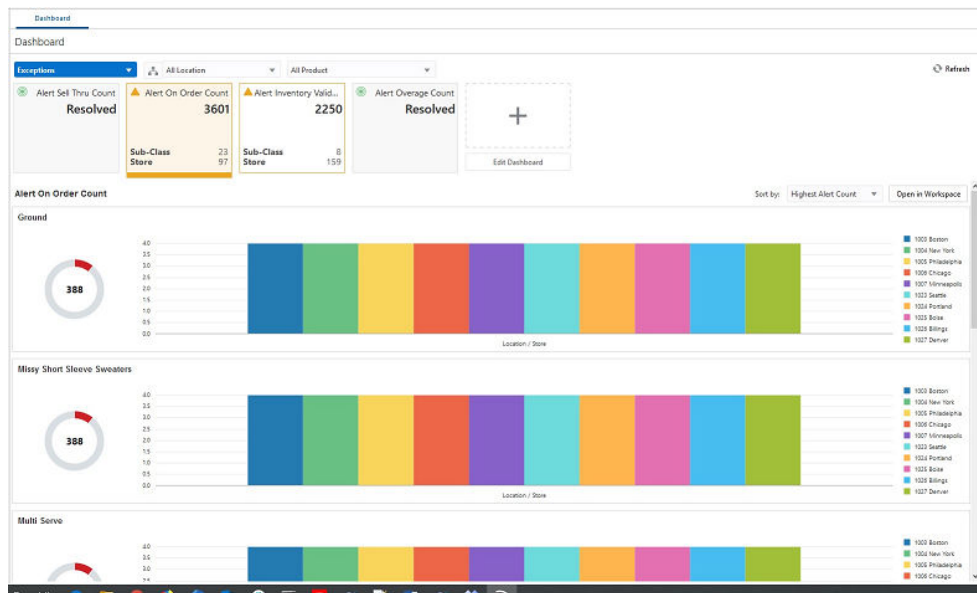

3. Product Class Trends: This shows the class level performance of all items at the week level as different metric tiles.

Figure 1-13 Dashboard - Product Class Trends

- Exceptions: Pre-configured exception alert metric tiles based on the selected key items.

Figure 1-14 Dashboard - Exceptions

The dashboard pulls the data from an admin workbook built from the Online Administration Tool. In order to view the dashboard, an Administrator must schedule the dashboard workbooks from the System Admin Tasks.

Figure 1-15 Schedule Dashboard Build Task

Administrator

Cancel < Previous Next > Finish

- Task Label - Enter the name of the build task to review the status of build.
- Select Override RPAS_TODAY - Check the box and then select a date, if you need to build the dashboard as of a day other than the current date.
- Range dimension - Calendar dimension against which the dashboard will be pre-ranged.
- Pre-Season Range - Number of periods of the Range dimension that need to be included before the Current period Range. Current Period Range will be always included.
- Post-Season Range - Number of periods of the Range dimension that need to be included after RPAS_TODAY.
- Select Delete and Recreate Dashboard Segment check box, only if there are any changes to the dashboard template selection after patching.
- Users - Select All Users, Group, or Users that can access that dashboard.

 **Note:**

For the pre-configured GA dashboard profiles, the preferred selections for Range dimension: Half, Pre-Season Range: 0, and Post-Season Range: 1.

Retail Home

If Retail Home is provisioned, it provides a dashboard view of key configured metrics as tiles across multiple applications in the enterprise. Assortment Planning has the following tile view configured for Retail Home. The metrics are configured in the same dashboard templates, so the regular dashboard segment first should be built first, in order to see the tiles from Retail Home. Retail Home uses a different set of JSON files to get the data from the dashboard segments into these tiles.

Figure 1-17 Assortment Planning Tile View for Retail Home

Metrics shown in the above figure:

- Sales U - Sales U for current Season to Date total for all items containing the current week.
- var to Plan - Variance to Plan.

There are also other tile states for the same metrics for Sales R and Gross Margin.

2

Build/Patch Application

This chapter describes the process to build or patch the application.

Self Service - Installing the AP Cloud Service Application from the Bootstrap Domain

This section describes the process of installing AP Cloud Service from the bootstrap domain with retailer data and generated configuration for the plug-in options. Once RPAS CE and AP Cloud Service are installed in the Oracle Cloud environment, the Administrator will have the option to overwrite and install the domain with GA data or with retailer data. The Administrator also has the option to generate the configuration for different plug-in options.

Bootstrap Environment

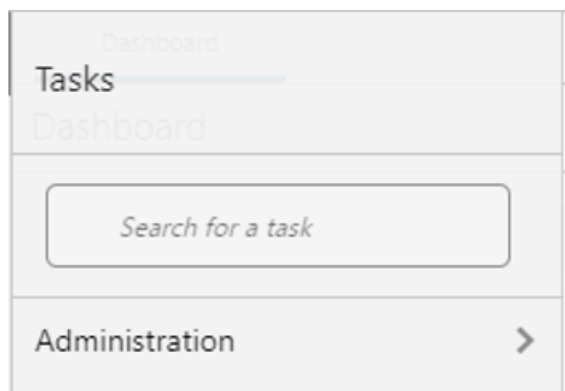

A newly provisioned AP CS environment is set up with a bootstrap configuration that allows the Administrator to log and access the Online Administration Tools (OAT) interface before the domain has been built. The bootstrap OAT configuration allows only tasks required to construct a domain. Once the domain has been constructed, the domain task and the bootstrap activities will both be available. This allows the domain to be rebuilt from scratch multiple times if needed.

Build Application from the Bootstrap Domain

The following steps take you through the process of building a customer domain for AP Cloud Service using the bootstrap domain:

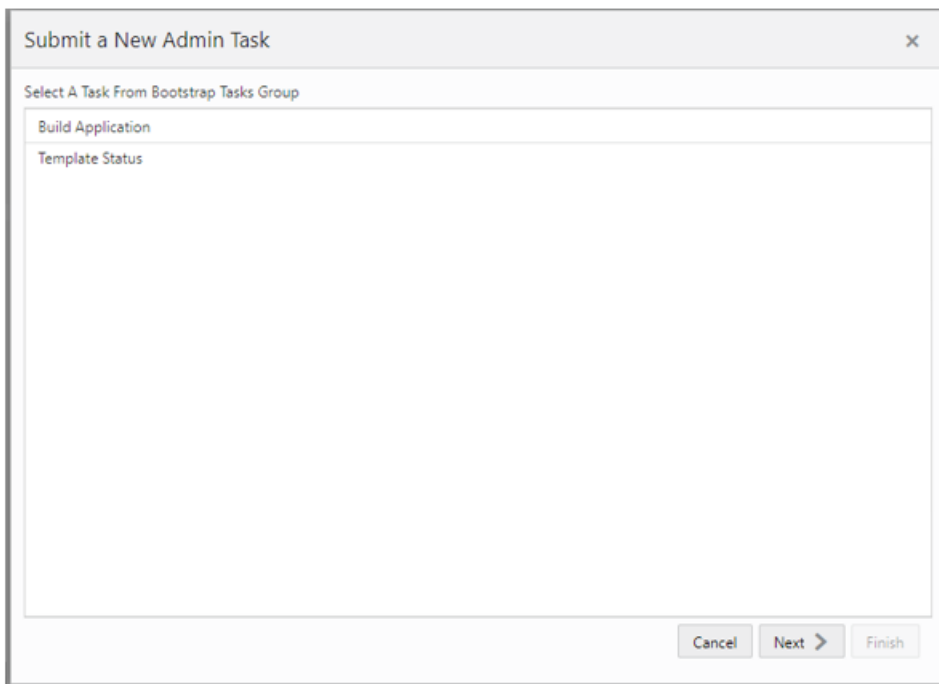

1. After provisioning AP Cloud Service, log in to the bootstrap domain as an Administration user.
2. In the Tasks list, select Admin Tasks for RPASCE Bootstrap and then Online Admin Tools. Click **Submit a New Admin Task**.

Figure 2-1 Admin Tasks for RPASCE Bootstrap Task

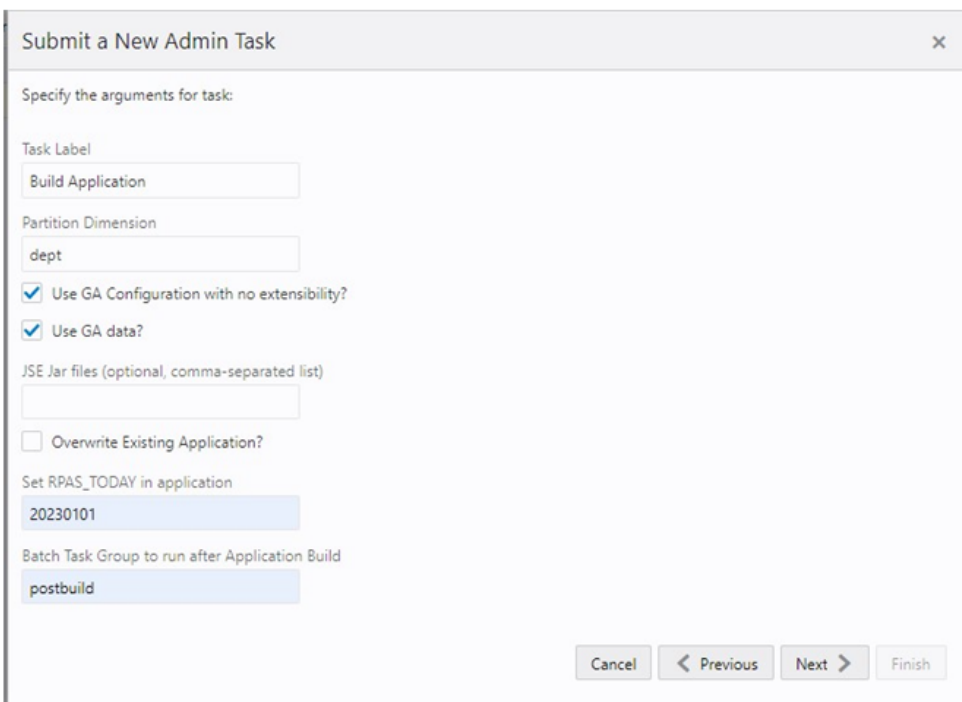

- 3. Select the Build Application task and click **Next**.

Figure 2-2 Select Build Application Task

- 4. Set the arguments for the task:

Figure 2-3 Select Build AP Cloud Service Domain Task Arguments

- a. Enter the Task Label.
 - b. Partition Dimension is defaulted to dept dimension in the AP CS Template version. If the customer is deploying the application as a non-template version, provide the equivalent dimension name from the product hierarchy equivalent to the level of department. The application will be internally partitioned based on this dimension to allow parallel processing of data in the batch.
 - c. Select the Use GA Configuration with no extensibility check box, only if you need to deploy the pure template configuration without any changes, otherwise uncheck this box and upload the new configuration to the Object Storage. If no configuration is found in Object Storage, the deploy job will fail.
 - d. Select the Use GA data option only if the customer wants to deploy the application using the GA data set readily available for the application. If the customer wants to deploy and use their own data set, upload the files to Object Storage.
 - e. Specify the JSE Jar files names if the customer is planning to use new special expressions within the configuration and the JAR file names containing those expressions to be registered. If the customer is providing these file names, they should also upload the JAR files to Object Storage.
 - f. If the application was already created and needs to be overwritten, select the Overwrite Existing Application option; otherwise, do not select this option. Selecting this option will drop the existing application and all associated meta data stored, so it will also lose connection to the environment. The customer will need to log out and log in again to view the status of the deploy.
 - g. RPAS_TODAY is an optional parameter. It is needed only if the customer is planning to use the GA data set. For AP CS GA data, the preferred RPAS_TODAY date is 20230101.
 - h. Select the Batch Task Group to run after Application Build. This is an optional parameter and if the template and GA dataset are used, the batch task to run is postbuild. If its a non-template deploy, the customer can provide the batch task name that they want to run after the application build.

Application Deploy without any batch will not load any hierarchy or data into the application, so the customer may need to run tasks to load hierarchy and data after domain build if they are not providing any task to run during the Application Build.
5. Select the time to schedule the task and click **Next**. Click Run ASAP if the Administrator wants to run the task now or the task can be scheduled by selecting the Run on a Schedule option.

Figure 2-4 Schedule Task

7. After submitting, review the status of that task in the dashboard similar to any other standard administration tasks.

8. After the task is successfully completed, log out and log in to the application to view the additional tasks specific to the newly built domain.

 **Note:**

Users will not be allowed in the application while building and patching the domain.

Self Service - Patching the AP Cloud Service Application

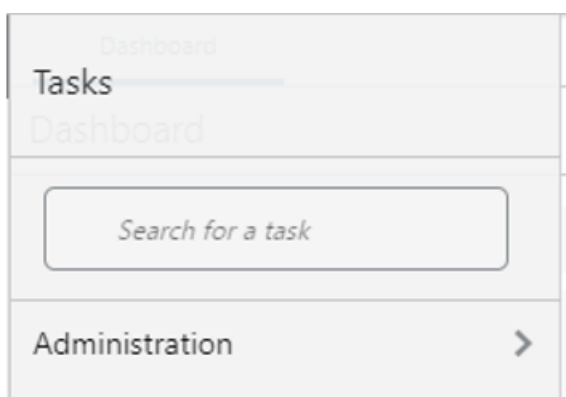

This section describes the process of patching the AP Cloud Service application using the Online Administration Tools. Once the RPAS CE and AP Cloud Service upgrade patches are installed in the Oracle Cloud environment, the AP application will be patched by default with the latest configuration if the application type is template with the last used plug-in options or use the last used extensible configuration, if it was uploaded by the customer. However, if the customer wants to reapply the patch with changes to the plug-in option, use an updated extensible configuration, or if the customer version is non-template, then the customer can use this task to patch the application.

Before scheduling this task, the Administrator should ensure that no users are logged in to the application while patching the solution. The customer also should upload the configuration if the customer is not using the template version or if using the template version but using extensibility. If the customer has not uploaded any configuration, it will try to use the last used configuration during the application build or the one used during the last patching.

The following steps walk you through the process to patch the AP Cloud Service application as an Administration user:

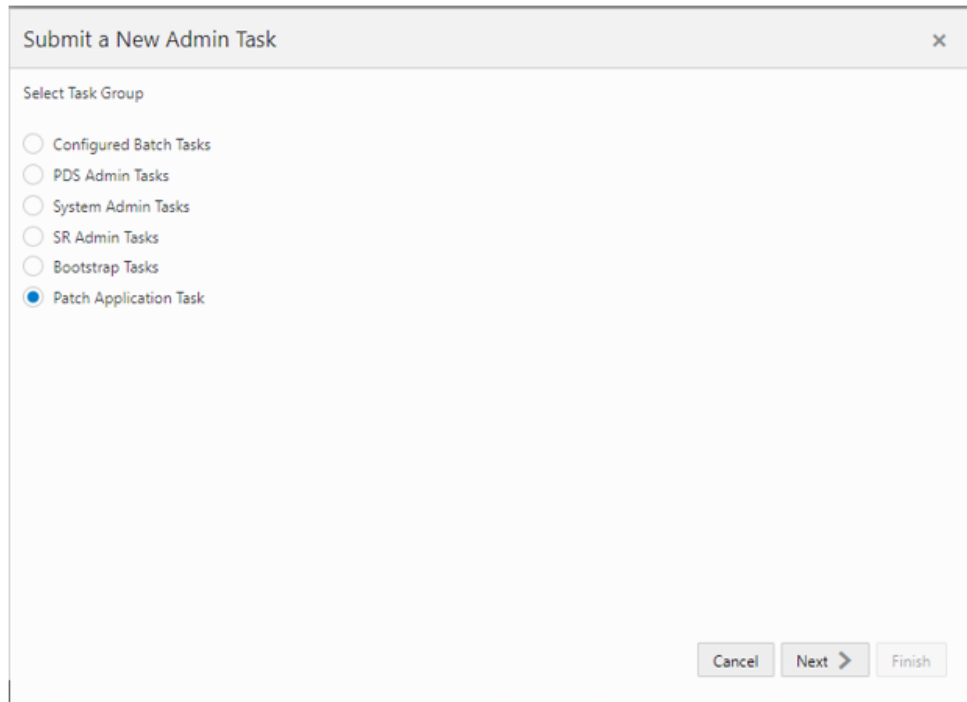

1. After deploying AP Cloud Service, log in to the application as an Administration user.
2. In the Tasks list, select Admin Tasks for Assortment Services and then Online Admin Tools. Click **Submit a New Admin Task**.

Figure 2-6 Admin Tasks for RPAS CE Bootstrap Task

3. Select the Patch Application Task and then click **Next**. Then select Patch Application in the available list of tasks.

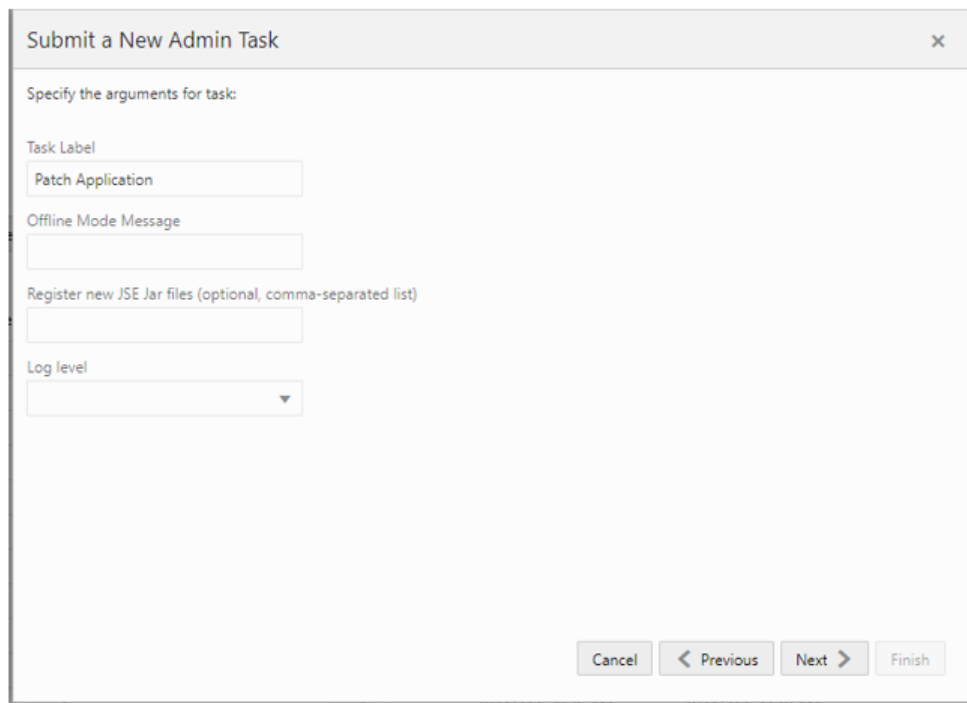

Figure 2-7 Select Patch Application Task

The screenshot shows a dialog box titled "Submit a New Admin Task" with a close button (X) in the top right corner. Below the title bar, the text "Select Task Group" is displayed. There are five radio button options listed vertically: "Configured Batch Tasks", "PDS Admin Tasks", "System Admin Tasks", "SR Admin Tasks", and "Bootstrap Tasks". The "Patch Application Task" option is selected, indicated by a blue dot next to its radio button. At the bottom right of the dialog, there are three buttons: "Cancel", "Next >", and "Finish".

4. Set the arguments for the task:

Figure 2-8 Select Patch Application Task Arguments

The screenshot shows the same "Submit a New Admin Task" dialog box, but now it is in the "Specify the arguments for task:" step. The "Task Label" field contains the text "Patch Application". Below it is an empty "Offline Mode Message" text box. The "Register new JSE Jar files (optional, comma-separated list)" field is also empty. The "Log level" field is a dropdown menu with a downward arrow. At the bottom right, the buttons are "Cancel", "< Previous", "Next >", and "Finish".

- a. Enter the Task Label and Offline Mode Message.
 - b. Specify if any new JAR files that need to be registered for any changes to the application configuration as part of the Patching process. The customer should also upload any new JAR files containing that special expression.
 - c. After choosing all the necessary options and Log level, click **Next**.
5. Select the time to schedule the task and click **Next**. Click Run ASAP if the administrator wants to run the task now or the task can be scheduled by selecting the Run on a Schedule option.

Submit a New Admin Task

Schedule Task

Run ASAP

Run on a schedule

Cancel < Previous Next > Finish

6. Review the selections and click **Finish**.

Figure 2-9 Verify and Confirm Selections

The screenshot shows a dialog box titled "Submit a New Admin Task" with a close button (X) in the top right corner. Below the title bar, the text "Verify and Confirm Before Clicking Finish" is displayed. The configuration details are as follows:

- Action:** Submit An Admin Task
- Task:** Patch Application (Patch Application Task)
- Description:** Patch Application by applying updated Configuration
- Label:** Patch Application
- Offline Mode Message:** Patch Application
- Log level:** All
- Execute:** Execute Immediate(ASAP)

At the bottom right of the dialog, there are three buttons: "Cancel", "< Previous", and "Finish".

7. After submitting, review the status of that task in the dashboard similar to any other standard administration tasks.

Template Status

The AP CS application when provisioned will be deployed as a Template application with the Template status of Activated. The customer has the option to deactivate the template status meaning it is a fully custom configuration. If it is a custom configuration, the customer should upload and completely maintain the configuration. Regular upgrades or patches will not patch the application and only upgrade the server version.

The following task can be used to activate/deactivate the template status of the application. It is advisable for the customer to decide on the template status before the application is built for the first time. Later, it may be easier to convert from the template to the non-template version without any limitations. But it will not be easy to move from a non-template version to template, if the configuration does not follow the extensibility rules for the template version of AP CS Configuration. See the *Oracle Retail Assortment Planning Cloud Service Implementation Guide* for extensibility guidelines for the AP CS template version; only if the non-template application follows those guidelines can it be converted to template.

The Template Status changing task is available as a Bootstrap task together with Build Application. In the Change template status drop down, select the Activate or Deactivate option to toggle the template status option and submit the task to change the template status. Activate means it is a template. Deactivate means it is a custom (non-template).

The customer can also use the same task and choose List template status to view the current template status of the deployed application.

Figure 2-10 Template Status

The screenshot shows a dialog box titled "Submit a New Admin Task" with a close button (X) in the top right corner. The main area contains the following elements:

- Text: "Specify the arguments for task:"
- Section: "Task Label" with a text input field containing "Template Status".
- Section: "List template status" with an unchecked checkbox.
- Section: "Change template status" with a dropdown menu. The dropdown is open, showing two options: "Activate" and "Deactivate".

At the bottom right of the dialog box, there are four buttons: "Cancel", "< Previous", "Next >", and "Finish".

3

User and Role Maintenance

This chapter describes the process for managing users and roles. The Administrator can create users and assign the level of access as needed. This chapter describes how to create/modify/delete a user and assign roles to a user.

Your Assortment Planning Cloud Service is configured with Oracle Cloud Infrastructure Identity and Access Management (OCI IAM) for managing users and access.

In order to provide application access to end users, the Cloud Service Administrator needs to create the user's account from OCI IAM. For OCI IAM user setup, follow the steps in [OCI IAM User Creation](#). The user must also be assigned to a group in OCI IAM.

Note:

The list of groups in [Table 3-1](#) are provided by default. It is not required that additional groups be created by the user.

To complete the user provisioning activity, the same user must be added in the Assortment Planning Cloud Service application and assigned to the same user group. By default, all the roles as user groups in [Table 3-1](#) will be added to the Application Domain. Only if not present will those user groups need to be added.

AP Cloud Service is built with role-based access. Permissions are associated with roles. [Table 3-1](#) lists the available roles. Those roles will be created by default during provision time, but if not present, those can be set up in OCI IAM.

Table 3-1 Assortment Planning Cloud Service Default Enterprise Roles

Application Role	Application Role Description
AP_ADMIN	AP Admin
AP_USERS	AP Users
AP_ADMIN_PROD	AP Admin for Production
AP_ADMIN_STAGE	AP Admin for Stage

Note:

Additional roles for authorization and application administration are also required. See the User Roles section in the *Oracle Retail Predictive Application Server and Applications Cloud Edition Security Guide*.

The Administrator can assign the above role or roles to the user. Follow the steps in [Managing Users in OCI IAM](#).

For detailed information on the tasks related to user and role, see the following sections:

- [User Maintenance through OCI IAM:](#)
 - [OCI IAM User Creation](#)
 - [Managing Users in OCI IAM](#)
- [Bulk Loading of User and User Groups](#)

For AP Cloud Service provisions, the customer needs to define required roles as needed for their configuration using OCI IAM. For more details about Atomic User Management (AUM), additional roles available, and access to security details, see the *Oracle Retail Predictive Application Server and Applications Cloud Edition Security Guide*.

User Maintenance through OCI IAM

This section describes how to maintain users through Oracle Cloud Infrastructure Identity and Access Management (OCI IAM).

OCI IAM User Creation

Before users can access the Oracle Retail Assortment Planning Cloud Service applications, it is necessary to provision access to the system for each user and to assign roles to each user to control what functionality will be available to the user. The access provisioning can be done using OCI IAM. After creation of the user in OCI IAM, the Administrator needs to create the same user with the same user group (that is, the role in OCI IAM) in the Oracle Retail Assortment Planning Cloud Service application.

Note:

The OCI IAM Application URL and login with the required administrator access are needed to perform the following steps. The welcome email sent by Oracle includes the URL.

The following steps explain how to define users and assign roles for a new user:

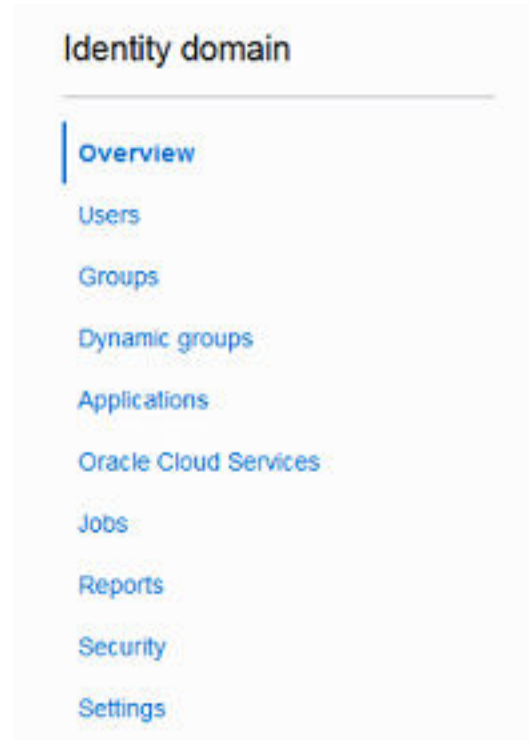

1. Log in to the OCI IAM application. The Domains view is shown by default.

Figure 3-1 OCI IAM Domains

Name	Domain type	Status	Users	Groups
Default	Free	Active	66	132

2. Click the Domain name for which you want to create a user. The Domain Overview page appears.
3. From the Domains Overview page, click Users.

Figure 3-2 Domains Overview Menu

4. From the Domain Users page, click Create User. The Create User page appears.

Figure 3-3 Create User

<input type="checkbox"/>	PRICING_MANAGER_JOB	The Pricing Manager typically works as part of the buying group for one or more departments. Besides all of the typical management duties involved with having direct reports the Pricing Manager has the responsibility of making sure the company objectives are reflected in the pricing policies implemented by the Pricing Analyst.

5. Provide the First Name, Last Name, and unique user name. If the Use the email address as the username option is checked, the system automatically takes the email address as the user name.

 **Note:**
Oracle recommends using the email address as the user name.

6. Assign the user to a group. Typically, this will be the group specific to the provisioned service or application. The user can be assigned to more than one user group, but it is recommended to assign one group to one user.
The available roles are listed in [Table 3-1](#). For example, you could assign the user being created to the AP_USERS role.
7. Click **Create** to complete the user creation in OCI IAM.
8. To complete the user setup, the same user must be created in the Assortment Planning Cloud Service application. To add the user to the Assortment Planning Cloud Service application, follow the steps in [Adding a User to the AP CS Application](#).

Adding a User Group

User groups provide an intermediate level of security to workbooks that were created and saved by specific users. When new users are assigned to the system, they must be assigned to existing user groups. User groups should consist of individuals with similar job functions or responsibilities. In the Oracle Retail Predictive Planning Suite, the user group corresponds to the user's planning role.

To add a user group:

1. Under User Administration, click **Add User Group**. A Workbook Wizard window appears.
2. In the Workbook Wizard window, enter the relevant information into the following fields:
 - In the Group Name field, enter a name for the group.

 **Note:**

Each group name must begin with a letter and contain only alphanumeric characters and underscores. It cannot have spaces. User group names are case sensitive.

- In the Group Label field, enter a descriptive label for the group. This label is displayed when referring to the group throughout RPAS CE.
3. Click **Finish** to add the user group to the database.

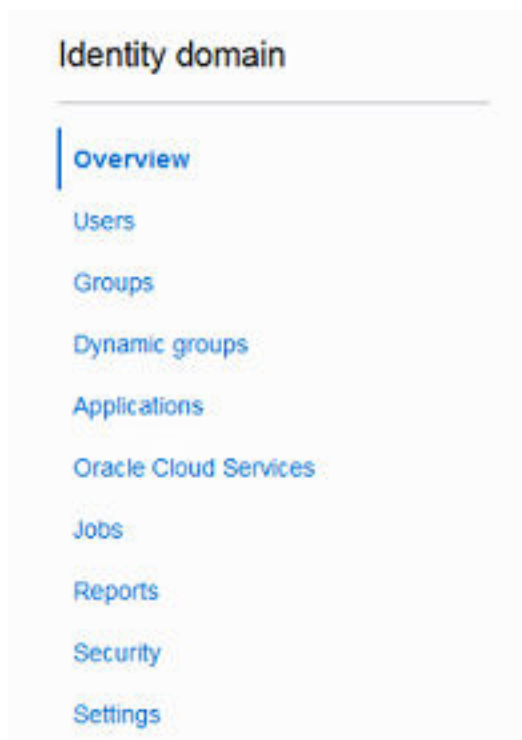

Managing Users in OCI IAM

After users are created in OCI IAM, the Administrator can manage user information, manage user groups assigned to users, delete or revoke user access, and reset a password.

The following steps explain how to manage users in OCI IAM:

1. Log in to the OCI IAM application. The Domains view is shown by default.
2. Click the Domain name for which you want to create a user. The Domain Overview page appears.
3. From the Domains Overview page, click Users.

Figure 3-4 Domains Overview Menu

4. Click the user that you want to edit.
5. You can update the additional information for the selected user. Once updated, click **Update User** to confirm the changes.
6. You can manage the user groups assigned to users in the Groups table.

Assign a New Group

- a. In the Groups table, click **Assign user to groups**.
- b. From the Assign user to group dialog, select the group or groups to add the user.
- c. Click **Assign user**.

Remove a Group

- a. In the Groups table, select the group from which you want to remove the user.
- b. Click **Remove user from group**.

Note:

The same user also needs to be deleted from the Assortment Planning Cloud Service application. This will keep OCI IAM and the application synchronized. Complete the user deletion by following the steps for deleting a user in the User Maintenance chapter of the *Oracle Retail Predictive Application Server Cloud Edition Administration Guide*.

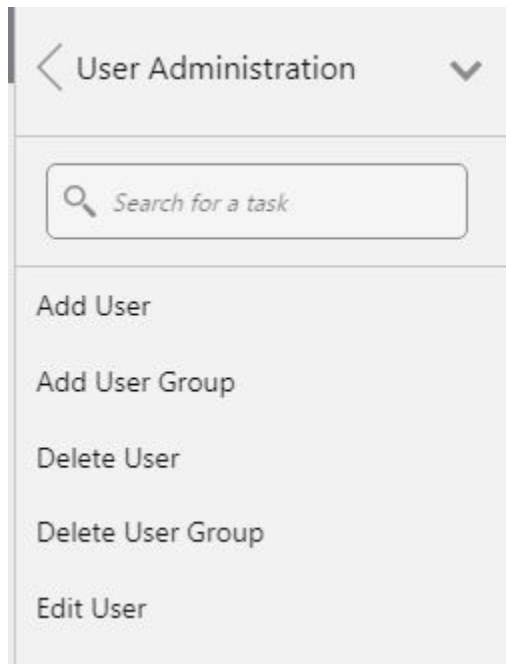

7. A user can be deactivated by selecting **Deactivate** from the More Actions menu and then confirming the selection in the confirmation dialog.
8. A user can be asked to reset their password by selecting **Reset Password** and then confirming the selection in the confirmation dialog. The associated user will get an email with a link to reset the password.

Adding a User to the AP CS Application

To add a user to the AP CS application:

1. Under User Administration, click Add User. A Workbook Wizard window appears.

Figure 3-5 User Administration

2. In the Workbook Wizard window, enter the relevant information in the following fields:

Figure 3-6 Add User Details

A screenshot of a mobile application form titled "Add User". The form contains several input fields and checkboxes. The fields are: "User name:" with an empty text box; "User label:" with an empty text box; "Default group:" with a dropdown menu showing "Admin" and a downward chevron; and "Other groups:" with a text box containing "Admin". Below these fields are three checkboxes: "Administrator:", "Lock user account:", and "Inherit Group Default Rights:", all of which are currently unchecked.

- **User name:** Enter the user name that the user uses for logging in. This user name should be the same as the user name created in OCI IAM.
- **User label:** Enter a label that describes the user (for example, the user's full name). This identifying label appears in various locations throughout the application.
- **Default group:** Select the user group to which the user belongs. The group selected for the user should be same as the role selected for the same user in OCI IAM.

The available roles are listed in [Table 3-1](#). For example, you could assign the user being created to the AP_USERS role.

- **Other groups:** If a user belongs to more than one group, select the additional groups from the list in the Other groups field.

 **Note:**

Passwords are not used by the RPAS CE Client. The password is defined and managed by your external authentication provider.

3. If the user requires Administration status, check the Administrator box. To make the user an Administrator, it is mandatory to check this check box.

 **Note:**

Administrative users have special privileges and the read-only status may not apply to them.

If you are not sure whether a user should be granted this ability, you can modify the Administration status later in the Security Administration workbook.

 **Note:**

Granting users Administration status gives them access to all workbook templates, but it does not automatically give them access to all workbooks.

4. Select the Lock user account check box to temporarily disable the user's account.
5. Select the Inherit group default rights check box so that the user can inherit the default rights set for the user group through the Group Workbook Template Default Rights and Group Measure Default Rights worksheets. If the Inherit group default rights option is not selected and the Administrator check box is not selected, then the user is assigned Denied access rights to all templates and measures. If the Inherit group default rights option is not selected but the Administrator check box is selected, then the user is assigned Full Access rights to all templates and Read/Write rights to all measures.
6. Click **Finish** to add the new user to the database.

Workbook template and measure access rights can now be assigned to the user. To do this, access the Security Administration workbook. For more information, see the Accessing Security Administration section in the *Oracle Retail Predictive Application Server Cloud Edition Administration Guide*.

Bulk Loading of User and User Groups

The Administrator can bulk import user and user groups using comma-separated-values (CSV) files. For information on the bulk import of user and user groups from OCI IAM, see the documentation at the following link: <https://docs.oracle.com/en-us/iaas/Content/Identity/home.htm>.
