Preface

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Customer Support

To contact Oracle Customer Support, access My Oracle Support at the following URL:

https://support.oracle.com

When contacting Customer Support, please provide the following:

- Product version and program/module name
- Functional and technical description of the problem (include business impact)
- Detailed step-by-step instructions to re-create
- Exact error message received
- Screen shots of each step you take

Oracle Help Center (docs.oracle.com)

Oracle Retail Product documentation is available on the following website https://docs.oracle.com/en/industries/retail/html

Comments and Suggestions

Please give us feedback about Oracle Retail Help and Guides. You can send an e-mail to: retail-doc_us@oracle.com

Oracle Retail Cloud Services and Business Agility

Oracle Retail Order Administration is hosted in the Oracle Cloud with the security features inherent to Oracle technology and a robust data center classification, providing significant uptime. The Oracle Cloud team is responsible for installing, monitoring, patching, and upgrading retail software.

Included in the service is continuous technical support, access to software feature enhancements, hardware upgrades, and disaster recovery. The Cloud Service model helps to free customer IT resources from the need to perform these tasks, giving retailers greater business agility to respond to changing technologies and to perform more value-added tasks focused on business processes and innovation.

Oracle Retail Software Cloud Service is acquired exclusively through a subscription service (SaaS) model. This shifts funding from a capital investment in software to an operational expense. Subscription-based pricing for retail applications offers flexibility and cost effectiveness.

1

Getting Started

About Oracle Retail Order Administration

Oracle Retail Order Administration Cloud Service (OA) manages direct-to-consumer orders, whether they are taken on the website, contact center, or in the retail store.

About this Online Help

The **Classic View Online Help** describes how to perform the functions available within the entire order process from creation to shipment, and allows customer service representatives (CSR) to manage the exceptions. The online help is available from the help button in each fast path such as from Customer Service OIOM. The help in the application is context sensitive meaning that if you click on the  icon whilst further into the application and not the home screen, the opening page opens to that section of help and not the Contents page. For example, clicking the  icon from Order Inquiry window opens the section of help for OIOM.

To complement the online help there are four guides associated. Direct hyperlinks to these guides are linked from within the online help.

- The Reports Guide describes the contents of each report and includes links to sample reports.
- The Technical Guide provides more detailed information to supplement the content in the online help.
- The Implementation Guide includes information on configuration options, such as defining properties. The system control values (SCV) are documented in this guide.
- The Integration and Import/Export Guide provides the details of Oracle internal integrations, imports and exports, such as Oracle Retail Customer Engagement (ORCE) and Order Orchestration (OO) integration, and external integrations such as Avalara AvaTax, and Experian EDQ address API.

Contents of the Online Help

The online help consists of the following chapters. Click on a link to go directly to the topic for more information.

- Configuration and Administration: includes troubleshooting and FAQ's.
- Accounting Setup: includes general accounting setup.
- Customer Service: includes customer maintenance, order inquiry, order maintenance, returns, backorder and soldout process, refunds, and memberships.
- Fulfillment: includes pick slip generation, drop ship processing, Order Orchestration Drop Ship Manager integration, and shipment confirmation.

- Installation Setup: includes system control values, number assignment, and secured features.
- Marketing: includes promotions, source code and offer setup, and list management.
- Merchandising: includes item maintenance and purchase order maintenance.
- Order Entry: includes the generic order API.
- System Operations: includes utilities, periodic processing, authorizations and depositions, the e-commerce interface, stored value cards, the point-of-sale integration, and Order Orchestration integration.
- Warehousing: includes purchase order receiving and warehouse management.

Navigating within the Online Help

There are several ways to get about within the online help. You can:

- select the **Table of Contents**

  
  icon on the top right of the page. Drill down or expand the chapters. Right clicking allows you to open the link in a new window or tab.
- use the **Previous Page** and **Next Page** buttons at the bottom of each page to move through the help one page at a time.
- enter text to search in the **Search**

  

  field at the top of the screen.
- use **CTRL F** and start typing to find matching text.

  
  Find looks for text on the current page only. The filter allows you to select to match the case and/or word. The arrows allow you to rotate between the results.
- click on an external link to go direct to another associated guide.

Options available at this home screen such as Quick Find Options: Fast Path, Menu selection, meaning of icons, and so on.	Menu Driver Screen

Where to Look for Additional Help

A variety of guides provide you with complete information about Oracle Retail Order Administration. If you navigated to the help from the application, you can access the main Order Management Suite Cloud Service documentation page from here. Additional guides provide supplemental information.

- Omnichannel Web Service Authentication Configuration: MOS ID 2728265.1
- Web Services Guide and Order Maintenance Web Services Guide: MOS ID 2953017.1
- Security Guides: MOS ID 2953017.1
- Technical References (includes Reporting Guide): MOS ID 2953017.1
- Data Models: MOS ID 2910995.1
- Documentation for other retail products: https://docs.oracle.com/en/industries/retail/index.html

2 Glossary

Accompanying items are added to the order automatically at no charge or for a set price when the customer orders the originating item, or “trigger item”, in a specific quantity and for a specific offer. This activity is automated, so that the order entry operator does not have to remember to add this item to the order. No pop-up window opens to notify the operator that the system is adding an accompanying item to the order. In addition, certain updates to the originating item in order entry also update the accompanying item. When you ship the order, the system ensures that the originating item and accompanying item ship together.

Additional charges are user-defined types of charges that you can add to an order for any reason. You might establish standard additional charge codes for freight fees, special handling charges or rush shipment fees. You might also establish standard credit types of additional charge codes to reimburse the customer for long-distance telephone calls or postage fees.

Address verification services help to reduce the fraudulent use of credit cards by verifying that the billing address on the credit card is legitimate.

Advanced queuing allows you to send messages between Order Administration and other applications using database-integrated message queuing.

Application areas categorize related functions, such as all functions that relate to the Purchase Order application area, Inventory application area, Order Entry application area, etc.

Application groups further define the functions within an application area. An example of an application area may be O/E (Order Entry); an example of an application group within the O/E application area may be FRE (freight).

Arrival date is the date when the customer wants to receive the order. This date controls whether the system reserves inventory and prints pre-generated picks immediately.

ASYNC (background) jobs are used to process the non-time sensitive table updates, such as analysis and reporting updates, associated with transactions that are processed throughout the day in the following modules: Order Entry, Order Maintenance, Purchase Order Maintenance, Purchase Order Receiving, and Billing.

Automated inventory transactions allow you to process inventory transactions across companies. This is useful if you use Inventory Sharing (A69) and you wish to move inventory from the sharing company (which uses inventory located in another company) to the shared company (where you actually maintain the inventory). However, you can still process automated inventory transactions without using inventory sharing.

Best way shipping in order entry can either display a window enabling the order entry operator to offer a choice of shipment options to the customer, or have the system automatically select the ship via with the lowest overall shipping charges.

Billing addresses are addresses where you send the invoice for an order.

Bill-to customers are people or businesses that are billed for the order. This type of customer exists when a business order is placed that will be paid “on-account.”

Brokered backorder: Use the brokered backorder integration with Order Orchestration to automatically send backordered lines to the Order Orchestration module in Order Orchestration for fulfillment.

Buyers are eligible to create purchase orders and may be assigned to purchase specific items. A record must be established on the system for every buyer. The Buyer table is required in order to use the Purchase Order function.

Cache: A store of information that will be required in the future, and can be retrieved quickly. Order Administration uses caching to store recently used information from the Order Administration database in a place where it can be accessed quickly, rather than accessing the database, in order to improve performance. Caching occurs across all Order Administration companies; if you use multiple application servers, you can specify which servers share the same cache. For example, you should have all of your test servers share the same cache and all of your production servers share a cache that is different from the cache assigned to your test servers.

Cancel date is the date when the customer wants to cancel an order if it has not been shipped.

Companies are single, isolated set of tables and data: an organization of financial information, inventory, and customers. Essentially a company has a completely separate database from other companies.

Contact Center is a module of Order Administration where you can review and maintain orders. Contact Center is available in OACS Modern View.

Contact Center: A component of Modern View that provides the ability to create, work with, or review orders.

Credit card authentication services help to reduce fraud and chargeback volume on card not present transactions by requiring the cardholder to enter a card authentication password on the web storefront. The authentication password is sent to an authentication service, such as Visa's Verified by Visa program or MasterCard's SecureCode program, to verify the cardholder's identify and ownership of the credit card during the online purchase.

Credit card net exchange billing allows the system to hold the credit invoice for a return to net it against the debit invoice for the associated exchange in order to reduce the number of transactions that occur for an exchange. The system uses the system-delivered EXC Net Billing for Exchanges deferred payment option to determine how long to delay billing the customer's credit card, based on the invoice date and the # of days for deferral defined for the EXC payment option.

Credit card number formats allow you to specify which digits of a credit card number are masked on Order Administration screens and reports using a special character, such as an asterisk (*). For example, you may wish to mask all but the last 4 digits of a 16-digit credit card number: ************1111.

Credit card security services (CID, CVV2, CVC2) help to reduce the fraudulent use of credit cards by verifying that the credit card is present at the point of sale and to ensure that the credit card security value from the transaction matches the security value stored by the service bureau for that card.

Customer action notes are messages about a customer issue or problem that you need to resolve. You use customer action reason codes to identify and group the issues or problems in customer action notes or track when and how often customers report certain issues or problems.

Customer Engagement Loyalty Integration allows you to register customers in the Oracle Retail Customer Engagement loyalty program. Once a customer is registered in the loyalty program, you can retrieve the customer's loyalty points and awards balances, accrue points from completed purchases, and redeem awards as a pro-rated merchandise discount on an order.

Customer Engagement Stored Value Card integration allows you to process stored value cards between Order Administration and Oracle Retail Customer Engagement using point-to-point communication. Processing of stored value cards remains the same in Order Administration; however, in this integration, Order Administration uses Oracle Retail Customer Engagement APIs to send the stored value card transactions directly to the Oracle Retail Customer Engagement system for processing.

Customer ownership allows you to capture and confirm information about the products a customer currently owns or previously owned. You can use this information to determine trends in the products a customer purchases and recommend related products for purchase.

Customer Price Group Best Price Comparison determines if the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value provides a better price than the customer price group assigned to the sold to customer on the order.

Customer profiles let you define the demographics you want to capture for your customer base and define the valid responses for these categories. You can also establish default codes that represent the most common profile characteristics of your customer base. For example, assume that a profile for marital status includes married, single, divorced, etc., as valid options, and that the majority of people who place orders are single. If you set a profile default for the single option, this value appears on new customer orders. You would then need to perform data entry in the marital status field for new customers only if the customer were not single.

Default messages are standard order or gift messages that you enter on orders on a regular basis. Instead of requiring users to retype a standard message on each eligible order, you can have the user select the message from a list of standard messages to default to the order, allowing you to avoid typographical errors that can occur when the message is manually added to the order. You can create default messages for order level messages and line level messages. When a user selects a default message to add to an order, the message text defined for the default message defaults to the Message field and the print code defined for the default message defaults to the Print field; however, the user can still override the default message text and the print code or add to the default message text. For example, if a user selects to default Happy Birthday, the user may wish to modify the message line to read Happy Birthday, Mom! Love, Alex and Beth.

Deferred payment plans are payment plans that allow a customer to pay at a later date, for example, Payment due on January 1st or can be a rolling date, for example, Payment due in 30 days.

Drop points represent locations to which merchandise will be shipped from your warehouse. Typically, a drop point represents the address of a UPS facility. This drop point prints as the return address on the pick slip and is the destination to which undeliverable packages are returned.

Drop ship items are items that you do not stock in inventory. When a customer places an order for a drop ship item, you order the item from your supplier (vendor). The vendor ships the item directly to your customer.

Dunnage weight is the weight of packing materials. Use the Work with Dunnage Weight menu option to define the weight of dunnage based on the cube of the items on a pick slip.

Experian Data Quality (EDQ) Address Validate API, formerly known as the QAS Pro On Demand Service, allows you to retrieve address information from Experian's Address Validate API to update an Order Administration address during interactive quote or order entry/maintenance, the order API, catalog requests, the customer API, and customer maintenance. The Address Validate API captures, cleans, maintains, and enhances address records and validates the address data against national postal authorities, such as the U.S. Postal Service. This is an on-demand, SaaS solution hosted by Experian Data Quality.

External payment service is a RESTful web service that provides an interface from Order Administration for sending credit card and stored value card transactions and receiving responses. Using this service, you can build a custom payment processor that maps to your payment provider.

Finished goods are items that require assembly prior to picking and packing. A finished good is made up of one or more components. These components are assembled to build the finished good. The finished good is picked and packed, not the individual components. The system tracks the usage of each component and will recommend re-order quantities. The system also determines demand for the finished good item and recommends the number of finished goods to be made up to meet demand.

FOB (freight on board) address is the location where title to merchandise being shipped passes from the seller to the buyer. If the FOB address is an Origin type, ownership of the merchandise passes from seller to buyer at the origin of the shipping route, and the buyer is responsible for transportation costs and risk of loss or damage from that point. If the FOB address is a Destination type, ownership of the merchandise passes from seller to buyer at the receiving point for the merchandise, and the seller is responsible for transportation costs and risk of loss or damage until the merchandise reaches its destination.

Freight by order weight involves calculating the freight charges for an order by evaluating the number of cartons you expect the order will require to ship, and the weight of each carton. The tables you create with this function define the freight charges to add to an order based on the weight of each carton.

Generic retail integration from an external system into Order Administration allows you to keep merchandise information in Order Administration in sync with merchandise information in your external merchandising system. Using this integration, you can provide your customers with a consistent shopping experience across your retail store, catalog, and online channels. You can carry the same merchandise and offer your customers the same merchandise pricing in your retail store, catalog, and online channels. This allows you to maintain the image and service levels customers have come to expect.

Ghost customers are customers whose records have been merged with the records of matching customers when you performed a merge/purge.

Gross profit margin is used to determine the profit of an item on an order based on the item's selling price, or to determine the profit of an entire order. This calculation is helpful if your operators are allowed to negotiate prices and work on a commission basis.

Hazard codes identify hazardous items and indicate if special storage and/or handling is required. You assign a Hazard code to an item in Work with Item/SKUs.

Indicia messages are messages you enter to print on the pick slip, such as shipping instructions or notes to the carrier. The indicia message that displays is determined by the drop point associated with the ship via for an order. The drop point associated with the ship via for an order depends on whether or not you are using the Zone skipping feature in Pick Slip Generation.

Installment payment plans are payment plans that allow a customer to pay a specific amount of the payment each month. The date of the payment is due can be a fixed day of the month, for example, Installments due on the 25th of each month, or based on a specific interval, for example, Installments due in 30-day intervals.

Item category codes classify and group similar items on a level below Item Class. For example, you can assign a group of items within the same item class an Item category of “printers only” to differentiate printers from the other items under that item class.

Item ship via overrides are the shippers that can be used to deliver a particular item to its destination, even if the other items on the order are delivered by another ship via.

Items are units of inventory that are defined to the system by item codes. The item code consists of the code itself and, optionally, a SKU, which allows you to define the item further by characteristics such as color, size, etc.

Line of business assignments represent the entity, division, or offer, or combination of these three values assigned to a line of business. The assignment determines which line of business the system assigns to an order in order entry. The system uses a line of business assignment to group all orders associated with a specific line of business together.

Lines of business represent clients, or business units, in Order Administration. Each line of business contains assignments that represent a specific entity, division, or offer, or a combination of these three values.

List sources are codes used to identify segments of a list of names rented from a list broker.

Long Running Jobs Monitor watches the batch jobs running on the Job Management Screen and sends a Long Running Job Email to a specified email address if a job runs without ending longer than a specified time.

Match codes are unique customer identification codes that consist of selected portions of a customer name, company name, and address information. The system generates a match code for each customer based on positional field contents you include in a match code schematic or algorithm. You can create up to four match codes per customer, including a standard match code and three fraud identification match codes.

Merchandise locator searching: This integration with Order Orchestration provides a way to search for a location across the enterprise where the customer can pick up an item. This option is available in item availability, order entry, and order maintenance. The results are informational only.

Misships are items that were inadvertently shipped to your customer. When you process a misship through return authorizations, you add a record of the item to the order and process other updates, such as receipt into inventory, as required. Misships differ from regular returns, in which you process a return against an item that was already on the order. Misship returns cannot be credited, since they were not billed. However, the system updates the Date credited field in the RA Header table to indicate a pending credit does not exist.

Modern View: OACS Modern View is a separate component of Order Administration and includes the Contact Center. Your user configuration controls whether you advance automatically to Order Administration or Modern View when you first log in.

OAuth is a standard for web service authentication through the use of temporary access tokens rather than passwords. With OAuth authentication:

The requesting system first passes a client ID and a client secret to an authenticating service, such as IDCS (Oracle Identity Cloud Service) or OCI IAM (Oracle Cloud Infrastructure Identity and Access Management).

The authenticating service, such as IDCS or OCI IAM, generates a temporary token.

The requesting system submits the token, along with the client ID, to the destination system, rather than a password and user ID as with basic authentication.

The destination system validates the token and client ID with the authenticating service.

Oracle Retail Customer Engagement Batch Customer and Sales Integration allows you to send merchandise hierarchy, item, customer, sales and return information from Order Administration to Customer Engagement. Sending this information to Customer Engagement provides a centralized view of the customer's value across your enterprise. You can use this information to perform data analysis, or segmentation, in Customer Engagement.

Oracle Retail Order Orchestration's Supplier Direct Fulfillment is a module of Order Orchestration that provides a collaborative, browser-based environment for retailers and vendors to share order, customer, and shipping information related to drop ship processing, and to automatically process drop ship orders. Order Orchestration is an Oracle application that also provides distributed order fulfillment through its Order Orchestration module.

Order batching allows you to review, correct, and accept orders received from an external system that are in error.

Order Orchestration: Integration with the Order Orchestration module in Order Orchestration supports fulfilling orders across the enterprise.

Order line activity codes define the type of activity, such as a shipment or return, performed against an item on an order line. You can review the activity performed against an item on an order line on the Display Order Line History Screen. You can use the Work with Order Line Activity Codes (WOLA) menu option to review system-delivered order line activity codes and to also create user-defined order line activity codes.

Order ship-to addresses are addresses that are attached to orders you are entering, but which are not saved as permanent mailing addresses for customers.

Order/Call Disposition Activity allows you to track the calls that come into Order Administration from an external order call center. In addition, you can track the reason why a call was terminated or an order was rejected. You can use the order/call disposition activity in Order Administration to match the calls taken in Order Administration against the call history in the external order call center.

Outbound interface trigger rules are the criteria a transaction must meet in order for the system to create an IL outbound trigger. For each outbound process, you can create trigger rules for certain tables. For example, you can create trigger rules for the Item table and SKU table to control the Item Outbound job. If you enter more than one criterion, the record must meet all of the criteria in order to generate a trigger.

Pay plans are deferred payment or installment billing options you can offer to your customers. Under a pay plan, you delay billing the customer's credit card for a prearranged interval.

Pending warehouse locations are locations that were created by the Location Generator in a deferred status. These records are created in a deferred status when you want to review and modify location information before updating the permanent Location Table.

Periodic functions are jobs that you need to run periodically, usually on a daily, monthly, or yearly basis. Periodic functions include reports listing or summarizing activity in a particular area of your business, reports providing current status information on your business, periodic resets, and aging operations.

Periodic processes are jobs consisting of one or more periodic functions that run on a daily, weekly, monthly, or yearly basis.

Permanent shipping addresses are address that are kept on file for the sold-to customer. An example of a ship-to address would be the customer's work address. The system adds a separate record to the Ship-to Customer table for this shipping address under the customer number. You can define up to 999 permanent shipping addresses for one customer.

Physical stored value cards are physical cards that you can stock in a warehouse or retail location. Physical stored value cards are reserved on an order based on available inventory and printed on a separate pick slip from the other items on the order. You must assign a number to the physical card before the card can be billed. Once the card receives an approved activation from the service bureau, the system delivers the physical card to the recipient card holder on the order. In addition, an email may be sent to the recipient card holder, notifying the customer that the physical card is in the process of being delivered.

Pick processing days are the number of days it takes your company, on average, to pick, pack, and ship an order. This is your internal lead time. The system uses this number to determine when to generate a pick slip.

Pick Slip Allocation determines the locations where the system pulls stock in order to fulfill the pick slips in the pick slip generation run.

Pick slip preparation prepares an order for fulfillment when you create or change an order, such as creating pre-generated picks in the Pick Control Header and Pick Control Detail tables and defining whether the pre-generated picks require authorization. Preparing the order for pick slip generation in advance reduces the time it takes to run Streamlined Pick Slip Generation (WSPS) to fulfill and print the picking documents.

Pre-generated picks are picks created prior to running pick slip generation for an order. The status of a pre-generated pick is either G Generated No Authorization, indicating the pick requires authorization during pick slip generation, or H Generated Has Authorization, indicating the pick can bypass authorization during pick slip generation. Pick slip generation selects pre-generated picks to fulfill and print based on the pick slip selection criteria specified.

Price codes allow you to define a price discount for items/SKUs in a specified offer or source code when you order a specified quantity. The price code can offer a dollar or percentage off the price of the item, a special price for the item, or a group price for a defined group of items. The system applies price code pricing to an order during repricing and end-of-order pricing.

Price tickets are labels you attach to items that you wish to transfer to a retail store. The ticket contains information such as the item number and SKU, retail price and outlet price. A barcode prints on each label so you can scan the label information automatically into your system.

Pricing Upload Interface allows you to upload Special Pricing by Source records and Quantity Price Matrix Detail records from an external system.

Primary email address: The primary address is the one displayed on most screens, such as in customer inquiry and in catalog requests.

Primary primary: The primary location stored in the Primary location field in the SKU table.

Promotional pricing allows you to specify an item, a group of items, or a dollar amount that a customer must order to receive an incentive item at no charge or at a special price. Promotional pricing is defined for a source code or offer. When the customer meets the eligibility requirements established in the promotional pricing record, a pop-up window appears in Order Entry allowing the customer to select from an incentive group or select an incentive item. The system automatically adds the item to the order.

Properties define system-wide configuration settings for Order Administration.

Protected: the quantity of the item that can be reserved only through Interactive Reservation.

Purchase order layering updates the expected delivery dates for items on backorder, based on records in the PO Layering table. The oldest orders on the system receive stock before new orders.

Quoting allows you to create a pre-order for a customer listing the items the customer wishes to order and the estimated order totals should the customer agree to place the order. The system does not reserve inventory or perform background async updates for the quote until it is converted to an order. Optionally, the system assigns an expiration date to a quote, indicating how long the estimated quote is valid before it expires.

Recipient orders are secondary orders that you add to an order to ship to a different address. For example, you can place an order for yourself and a friend in a single phone call, on a single order. The system assigns the first order an order number, you enter name, address, item, and payment information for this order, and then select Accept/Add Rcpt to accept the current order and add a recipient order.

Recipient orders are secondary orders that you add to an order to ship to different customers or addresses. For example, you can place an order for yourself and a friend in a single phone call, on a single order.

Regionalization is the process of creating software that is able to be translated more easily. Changes to the code are not specific to any particular market. Order Administration supports multiple decimal and thousand separators as well as multiple date formats.

Reserved: the quantity of the item that is already set aside for other orders.

Retail pickup or ship-for-pickup order: Order Orchestration sends a retail pickup order or ship-for-pickup order to Order Administration for fulfillment when the customer would like to pick up the order at a retail location. The ship-to address on the order sent to Order Administration for fulfilment is the name and address of the pickup store location. If Order Orchestration sends a ship-for-pickup order to Order Administration for fulfillment, the system treats the ship-for-pickup order the same as a retail pickup order.

Sectional Center Facility (SCF) codes represent the first 3 digits of the destination postal (zip) code. The Work with SCF function allows you to enter information specific to the SCF, including the valid states, the preferred method of shipping to this area, and a warehouse list which defines a hierarchy for reserving merchandise in warehouses.

Secured features are procedures or functions that occur within a function, such as the ability to maintain batch totals within Order Entry.

Sets are a group of items which are assembled when the set is picked and packed. Sets can be made up of items which are sold individually. Each of these component items appear on the pick slip and are packed together. Component items might not appear on the same pick slip, but the picks are created at the same time.

Ship via lead days, as defined in the Working with SCF/Ship Via Values (WSHV) menu option, represents the number of days it takes a shipper to deliver the order to its destination. The SCF represents the first 3 positions of the destination postal code. To retrieve the correct ship via lead days, the system uses the ship via on the order line (or order ship it not defined at the line level) and the SCF (first 3 digits of the postal code) and country code defined for the order ship to delivery address.

Ship-for-pickup order: Use the ship-for-pickup integration with Order Orchestration to send the merchandise for an order to a designated store, where the customer can pick it up. Order Orchestration integration facilitates communication between Order Administration and the designated store location, so the store receives notification that the order is in transit, and sends notification back to Order Administration after the merchandise is received and when the customer picks up the order.

Ship-to customers are people receiving the merchandise. This may be the sold-to customer, the recipient of a gift, the address of a business or an address used for this order only.

SKU Sort Sequence Numbers are sequence numbers assigned to SKUs to determine the order in which the SKUs sort. You can use the sort sequence to display SKUs in a different order, such as by size, rather than alphanumerically by SKU code.

SKUs are codes that further define items by virtue of color, size, width, or any other type of user-defined attribute. Usually, you define SKUs when the majority of your items have 2 or more identifying characteristics.

Sold to customers are people placing orders. The system tables the customer's name and address and other basic information so that a customer main record is available for future use.

Soldout control codes define which calculation the system uses to determine when to sell out an item. When a customer orders a soldout item in order entry or order maintenance, the order line is automatically closed with a status of Soldout. The soldout units and dollars are updated in the Item table, Item/Offer table, Source Code table and order history tables. You can define a soldout control code for an item in the S/O control field on the second item screen in item maintenance, or on the SKU screen if the item has SKUs. If you do not define a soldout control code for an item or SKU, it will never sell out automatically in order entry/ maintenance.

Source codes are unique codes used to identify segments of your customer base or a rented list. Each source code is assigned to one offer and one division. Source codes control the freight and pricing method used on an order.

Standard special handling is a set of free-form instructions or notes about how to work on an item, including the charge for the special handling work. Standard special handling is entered on a free-format screen where you can enter any information necessary to explain what needs to be done to the item.

Store pickup order: Use the store pickup integration with Order Orchestration to send orders to an external retail location where the merchandise is already available for pickup.

Unlike a ship-for-pickup order, a store pickup order does not require Order Administration to transfer the inventory to the store. The ship-to address on a store pickup order sent from Order Administration to Order Orchestration is the name and address of the originating store location.

Stored value card refunds allow you to generate a credit card credit against the original stored value card on the order or generate a new stored value card for the amount of the refund to send to the customer when you process a refund.

Sub-offers for an offer allow you to analyze how certain pages in an offer perform from the rest of the offer. For example, you may want to create a sub-offer if the main offer contains insert pages, such as a section of items sold at a discounted price.

Tax Jurisdictions define postal code ranges for an area where a special tax structure exists. For example, tax jurisdictions exist for some counties in New York and New Jersey. Standard tax reporting does not identify taxes collected at the jurisdiction level.

Threshold values indicate the numbers and/or dollar values that trigger the system to generate an email when these values are breached.

Tickler event rules are the criteria that must be met by the system action for the system to create a tickler for a user to resolve.

Tickler events are the system actions for which the system may create a workflow task (tickler).

Tickler procedures are the instructions a user follows to complete the tickler task.

Ticklers are tasks automatically created by the system and assigned to a user when a system action meets the criteria defined for a tickler event rule. For each tickler, you can define the procedures, or instructions, the user should follow to complete the task. A tickler can also be created manually.

User classes are logical groupings of users, for example all Order Entry operators. Like the individual user record, a default menu and default company can be assigned so that all users in this user class will sign on to the same menu and work within the same company. Authority to companies, menu options, secured features and user defined functions can also be assigned at the user class level.

User edit points allow the system to pass a hash map of pre-defined values to an external program for validation whenever a certain activity occurs in the Order Administration application and have the external program return a string response so that Order Administration can display any data returned in the string as an error message on the Order Administration screen from where the user edit point was called.

User exit points allow the system to pass parameters to an external program to obtain additional information whenever a certain activity occurs within Order Administration. You might also set up a user exit point as a means of feeding information to an external accounting package, or a service bureau that maintains customer information.

User records allow an individual to sign on and access all or some of the features of the system. A user can be a customer service representative, an order entry operator, or a system administrator. Each user on the system must have both a user profile and a user control record.

Variable sets are lists of items that customers can choose from to make up the set they want to purchase. Like sets, variable sets are assembled when the set variable is picked and packed. The items which make up the variable set might not appear on the same pick slip, but the picks are created at the same time.

VAT is a taxing method that applies in only certain states in countries. When an order is subject to VAT, the customer is charged a tax-inclusive price, and the tax amount is “hidden” on the order detail line for the item, not included in the Tax bucket for the order.

Vendor response codes identify the reasons that the service bureau approves (authorizes) or declines a credit card charge or deposit. The codes are assigned to each transaction by the service bureau when approving or declining the request.

Vendors are companies who supply you with merchandise or services. A record must be established on the system for every vendor from whom you purchase merchandise.

Virtual stored value cards are virtual (non-physical) cards that you do not stock. Virtual stored value cards are automatically reserved on an order and express-billed during pick slip generation. During pick slip generation, the system also assigns a number to the virtual card. Once the card receives an approved activation from the service bureau, an email is sent to the recipient card holder on the order, notifying the customer that a stored value card has been purchased and providing the stored value card number and dollar amount to use as a form of payment.

Warehouse lists are used to more efficiently allocate an order when you ship from more than one warehouse.

Warehouse management systems control inventory movement, such as receiving merchandise, inventory transactions, picking and packing, and shipping merchandise to a customer.

Warranty items are items you can add to an order at no charge. For example, if a customer previously ordered a grill that came with a 2-year warranty and the burner on the grill was defective, you could add the replacement burner to the customer's order free of charge.

Web service authentication allows you to define a valid web service authentication user or client ID for each web service used by Order Administration.

Workflow management allows you to automate system actions, during which tasks (ticklers) are assigned to a user for action, according to a defined set of procedures, until the issues associated with the ticklers are resolved.

XML inclusion defines which elements to include in a download message.

Zone skipping is a method of reducing freight charges by shipping inventory via one carrier to a central drop point, where it is picked up by another carrier and delivered to its final destination. For example, if you are shipping from a Massachusetts warehouse to destinations in California, you might use one carrier to deliver all packages to a UPS center in California, from which they will be shipped to their California destinations. Whether or not you are using zone skipping determines which table the system uses to identify the drop point.

Working with Customer Properties (PROP)

Purpose: Use this menu option to define system-wide configuration settings for Order Administration that an administrator type user would update.

When you update a property setting, unless otherwise noted, your update takes effect immediately.

In this topic:

- Work with Properties Screen
- Summary of Customer Properties
- Forms Property Settings
- Integration Property Settings
- System Property Settings

Work with Properties Screen

How to display this screen: Enter PROP in the Fast path field or select Refresh System Properties from a menu.

Authority: Users with ALLOW or DISPLAY authority to this menu option can update the settings in the properties files with the new values.

When you first advance to this screen, property settings display in ascending property name sequence.

Field	Description
Group	The type of property setting. Valid values are: • Forms: The property setting is related to forms processing. • Integration: The property setting is related to an integration with an external system. • System: The property setting is related to a system-wide function. Enter a full or partial group name to display property settings that contain your entry. Alphanumeric, 25 positions; optional.
Property	The name of a property. Enter a full or partial property name to display property settings that contain your entry. You can expand the Property column to review the full name of the property setting. Alphanumeric, 75 positions; optional.

Field	Description
Value	The current setting of the property. If this field is blank, it means a property setting has not been defined. Enter a full or partial property value to display property settings that contain your entry. You can expand the Current Value column if its full value does not display. Alphanumeric, 150 positions; optional.
Type	The type of property setting. This setting is always set to CUSTOMER indicating the property setting is a setting available to the customer. Enter a full or partial property type to display property settings that contain your entry. Alphanumeric, 10 positions; optional.

Screen Option	Procedure
Change the current value defined for a property	Select Change for a property to advance to the Change Property screen.

Summary of Customer Properties

The property settings that display on the Work with Properties Screen are listed below.

- Forms Property Settings
- Integration Property Settings
- System Property Settings

Forms Property Settings

Property Name	Description
BOCARDS	Controls whether certain information prints on the Backorder Card. Currently, there is no information to define.
CAMPAIGNPERF CAMPAIGN_PERFORMANCE	Controls whether certain information prints on the Campaign Performance Report (PCPR). Currently, there is no information to define.
CPGSKUEXUPLOAD CPG_SKU_EXCLUSION_UPLOAD_ERROR	Controls whether certain information prints on the CPG Item/SKU Exclusions Upload Error Records Report. Currently, there is no information to define.
CSHLDORD HELD_ORDER_BY_REASON_REPORT	Controls whether certain information prints on the Held Order by Reason Code Report. Currently, there is no information to define.
CSHLDORDCSV HELD_ORDER_BY_REASON_REPORT_CSV	Controls whether certain information prints on the Held Order by Reason Code Report in spreadsheet format. Currently, there is no information to define

Property Name	Description
EMSTSRPT CUSTOMER_EMAIL_STATUS_REPORT	Controls whether certain information prints on the Unmatched Email Status Report. Currently, there is no information to define.
EXCARSNNOITM EXCHANGE_ALL_REASON_NO_ITEM	Controls whether certain information prints on the Exchange Reason Report when the exchange reason code and item are not defined. Currently, there is no information to define.
EXCARSNNOITMCSV EXCHANGE_ALL_REASON_NO_ITEM_CSV	Controls whether certain information prints on the Exchange Reason Report in spreadsheet format when the exchange reason code and item are not defined. Currently, there is no information to define.
EXCARSNWITM EXCHANGE_ALL_REASON_WITH_ITEM	Controls whether certain information prints on the Exchange Reason Report when an item is defined. Currently, there is no information to define.
EXCARSNWITMCSV EXCHANGE_ALL_REASON_WITH_ITEM_CSV	Controls whether certain information prints on the Exchange Reason Report in spreadsheet format when an item is defined. Currently, there is no information to define.
EXCRSNNOITM EXCHANGE_SPECIFIC_REASON_NO_ITEM	Controls whether certain information prints on the Exchange Reason Report when an exchange reason code is defined. Currently, there is no information to define.
EXCRSNNOITMCSV EXCHANGE_SPECIFIC_REASON_NO_ITEM_CSV	Controls whether certain information prints on the Exchange Reason Report in spreadsheet format when an exchange reason code is defined. Currently, there is no information to define.
EXCRSNWITM EXCHANGE_SPECIFIC_REASON_WITH_ITEM	Controls whether certain information prints on the Exchange Reason Report when an exchange reason code and item are defined. Currently, there is no information to define.
EXCRSNWITMCSV EXCHANGE_SPECIFIC_REASON_WITH_ITEM_CSV	Controls whether certain information prints on the Exchange Reason Report in spreadsheet format when an exchange reason code and item are defined. Currently, there is no information to define.
FLASHPIECHARTS FLASHPIECHARTSFULL	Defines the order statistics that display on the Menu Driver Screen. • FLASHPIECHARTS = The order statistics section of the menu screen displays total numbers and dollars of orders created by the current date, current week, current month, year to date, and previous year. Use this setting if the Delay Billing Updates (K85) system control value is selected. • FLASHPIECHARTSFULL = The order statistics section of the menu screen displays total numbers and dollars of orders created and shipped by the current date, current week, current month, year to date, and previous year. Use this setting if the Delay Billing Updates (K85) system control value is unselected.
FLASHREPORT FLASHREPORT	Controls whether certain information displays in Reviewing Operations Control Summary (FLSH). Currently, there is no information to define.

Property Name	Description
GIFTACKG=GIFTACKDB,SUPPRESS_IMAGES=N,INPUT_TYPE=DB **Note:** These settings also apply to your graphical custom gift acknowledgement. Each option is available only if your gift acknowledgement print program supports it.	Defines whether images print on the graphical Gift Acknowledgement. SUPPRESS_IMAGES Controls whether the system prints images on the graphical gift acknowledgement. • N (default) = Print images on the graphical gift acknowledgement. • Y = Suppress images on the graphical gift acknowledgement. **Note:** The SUPPRESS_IMAGES value should be N for the graphical gift acknowledgement. INPUT_TYPE Controls the means by which your gift acknowledgement printing program obtains the data to print on the gift acknowledgement. Valid values are: • XML = The program uses the *Pick Message from Order Administration (CWPickOut)* to generate the gift acknowledgment. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). • DB = The program queries the database to generate the gift acknowledgement. The INPUT_TYPE setting for the standard printing program GIFTACKG is DB.
JFLR0393 PICKING_PULLSHEET_CARTBIN	Controls whether certain information prints on the Cart/Bin Batch Picking Pullsheet. Currently, there is no information to define.
JFLR0393CSV PICKING_PULLSHEET_CARTBIN_CSV	Controls whether certain information prints on the Cart/Bin Batch Picking Pullsheet in spreadsheet format. Currently, there is no information to define.
JFLR0397 PICKING_PULLSHEET	Controls whether certain information prints on the Cart/Bin Batch Picking Pullsheet. Currently, there is no information to define.
JFLR0397CSV PICKING_PULLSHEET_CSV	Controls whether certain information prints on the Cart/Bin Batch Picking Pullsheet in spreadsheet format. Currently, there is no information to define.
ORDERRECG ORDERREC,SUPPRESS_IMAGES=N **Note:** These settings also apply to your graphical custom order receipt. This option is available only if your order receipt print program supports it.	Defines whether images print on the graphical Order Receipt. SUPPRESS_IMAGES Controls whether the system prints images on the graphical order receipt. • N (default) = Print images on the graphical order receipt. • Y = Suppress images on the graphical order receipt. **Note:** The SUPPRESS_IMAGES value should be N for the graphical order receipt.

Property Name	Description
ORDERSUM ORDERSUM,SUPPRESS_IMAGES=Y	Not currently implemented.
ORDERSUMG ORDERSUM,SUPPRESS_IMAGES=N	Not currently implemented.

Property Name	Description
PICKG =PICKDB,SUPPRESS_IMAGES=N,BARCODE_IMAGE=Code39,ORDER_BARCODE_IMAGE=Code39;INPUT_TYPE=XML **Note:** These settings also apply to your graphical custom pick slip. Each option is available only if your pick slip print program supports it	Defines whether images and barcodes print on the graphical Pick Slip. SUPPRESS_IMAGES Controls whether the system prints images on the graphical pick slip. • N (default) = Print images on the graphical pick slip. • Y = Suppress images on the graphical pick slip. **Note:** The `SUPPRESS_IMAGES` value should be N for the graphical pick slip. BARCODE_IMAGE Controls whether the system prints a barcode on the graphical pick slip. • Code39 (default) = Print this type of barcode on the graphical pick slip. • Code128 = Print this type of barcode on the graphical pick slip. **Note:** **Code 39** is a low-density format that encodes upper case letters (A to Z), digits (0 to 9), and some special characters. **Code 128** is a high-density format that accepts alphanumeric or numeric-only codes, or all 128 ASCII characters. • NOT DISPLAYED = Do not print barcodes on the graphical pick slip. **Note:** This value is case-sensitive. ORDER_BARCODE_IMAGE Controls whether the system prints the order barcode on the graphical pick slip. The barcode is comprised of the company code, order number, and ship to number. • Code39 (default) = Print this type of order barcode on the graphical pick slip. • Code128 = Print this type of order barcode on the graphical pick slip. • **NOT DISPLAYED** = Do not print the order barcode on the graphical pick slip. **Note:** This value is case-sensitive. INPUT_TYPE Controls the means by which your pick slip printing program obtains the data to print on the pick slip. Valid values are: • XML = The program uses the Pick Message from Order Administration (CWPickOut) to generate the pick slip. • DB = The program queries the database to generate the pick slip. The `INPUT_TYPE` setting for the standard printing program PICKG is DB.
PICKAUTH PICK_AUTH_REPORT	Controls whether certain information prints on the Pick Authorization Error Report. Currently, there is no information to define.

Property Name	Description
PICKLBL PICKLBL,SUPPRESS_IMAGES=Y,BARCODE_IMAGE=Code39 **Note:** These settings also apply to your non-graphical custom pick label. Each option is available only if your pick label print program supports it.	SUPPRESS_IMAGES Controls whether the system prints images on the non-graphical pick label. • N = Print images on the non-graphical pick label. • Y (default) = Suppress images on the non-graphical pick label. **Note:** The`SUPPRESS_IMAGES` value should be Y for the non-graphical pick label. `BARCODE_IMAGE` Controls whether the system prints a barcode on the non-graphical pick label. • Code39 (default) = Print this type of barcode on the non-graphical pick label. • Code128 = Print this type of barcode on the non-graphical pick label. **Note:** **Code 39** is a low-density format that encodes upper case letters (A to Z), digits (0 to 9), and some special characters. **Code 128** is a high-density format that accepts alphanumeric or numeric-only codes, or all 128 ASCII characters. • NOT DISPLAYED = Do not print barcodes on the non-graphical pick label. **Note:** This value is case-sensitive.
PICKPACK PICKPACK,SUPPRESS_IMAGES=Y	Not currently implemented.
PICKPACKG PICKPACK,SUPPRESS_IMAGES=N	Not currently implemented.
PICKUNIT PICK_UNIT_REPORT	Controls whether certain information prints on the Pick Unit Report. Currently, there is no information to define.
PPRORDERED PRODUCT_PERFORMANCE_ORDERED	Controls whether certain information prints on the Product Performance Report (Ordered Totals). Currently, there is no information to define.
PPRORDEREDF PRODUCT_PERFORMANCE_ORDERED_FAST	Controls whether certain information prints on the Product Performance Report (Ordered Totals). Currently, there is no information to define.
PPRORDEREDFCSV PRODUCT_PERFORMANCE_ORDERED_FAST_CSV	Controls whether certain information prints on the Product Performance Report (Ordered Totals) in spreadsheet format. Currently, there is no information to define.
PPRORDEREDOT PRODUCT_PERFORMANCE_ORDERED_BY_ORDER_TYPE	Controls whether certain information prints on the Product Performance Report (Ordered Totals). Currently, there is no information to define.
PPRSHIPPED PRODUCT_PERFORMANCE_SHIPPED	Controls whether certain information prints on the Product Performance Report (Ordered Totals). Currently, there is no information to define.
PPRSHIPPEDF PRODUCT_PERFORMANCE_SHIPPED_FAST	Controls whether certain information prints on the *Product Performance Report (Shipped Totals)*. Currently, there is no information to define.

Property Name	Description
PPRSHIPPEDFCSV PRODUCT_PERFORMANCE_SHIPPED_FAST_CSV	Controls whether certain information prints on the *Product Performance Report (Shipped Totals)* in spreadsheet format. Currently, there is no information to define.
PPRSHIPPEDOT PRODUCT_PERFORMANCE_SHIPPED_BY_ORDER_TYPE	Controls whether certain information prints on the *Product Performance Report (Shipped Totals)*. Currently, there is no information to define.
PRCCDUPLDERR PRICE_CODE_UPLOAD_ERROR_REPORT	Controls whether certain information prints on the Price Code Upload Errors Report. Currently, there is no information to define.
PROMOUPLDERR PROMOTION_UPLOAD_ERROR_REPORT	Controls whether certain information prints on the Promotion Upload Error Records Report. Currently, there is no information to define.
PROVRCIRPT PRICE_OVERRIDE_REASON_BY_CODE_AND_ITEM	Controls whether certain information prints on the Price Override Reason Report by reason code and item. Currently, there is no information to define.
PROVRCIRPTCSV PRICE_OVERRIDE_REASON_BY_CODE_AND_ITEM_CSV	Controls whether certain information prints on the Price Override Reason Report by reason code and item in spreadsheet format. Currently, there is no information to define.
PROVRCRPT PRICE_OVERRIDE_REASON_BY_CODE	Controls whether certain information prints on the Price Override Reason Report by reason code. Currently, there is no information to define.
PROVRCRPTCSV PRICE_OVERRIDE_REASON_BY_CODE_CSV	Controls whether certain information prints on the Price Override Reason Report by reason code in spreadsheet format. Currently, there is no information to define.
PROVRIRPT PRICE_OVERRIDE_REASON_BY_ITEM	Controls whether certain information prints on the Price Override Reason Report by item. Currently, there is no information to define.
PROVRIRPTCSV PRICE_OVERRIDE_REASON_BY_ITEM_CSV	Controls whether certain information prints on the Price Override Reason Report by item in spreadsheet format. Currently, there is no information to define.
PROVRRPT PRICE_OVERRIDE_REASON	Controls whether certain information prints on the Price Override Reason Report. Currently, there is no information to define.
PROVRRPTCSV PRICE_OVERRIDE_REASON_CSV	Controls whether certain information prints on the Price Override Reason Report in spreadsheet format. Currently, there is no information to define.
PROVRUCIRPT PRICE_OVERRIDE_REASON_BY_USER_CODE_AND_ITEM	Controls whether certain information prints on the Price Override Reason Report by user code and item. Currently, there is no information to define.
PROVRUCIRPTCSV PRICE_OVERRIDE_REASON_BY_USER_CODE_AND_ITEM_CSV	Controls whether certain information prints on the Price Override Reason Report by user code and item in spreadsheet format. Currently, there is no information to define.

Property Name	Description
PROVRUCRPT PRICE_OVERRIDE_REASON_BY_USER_AND_CODE	Controls whether certain information prints on the Price Override Reason Report by user code and reason code. Currently, there is no information to define.
PROVRUCRPTCSV PRICE_OVERRIDE_REASON_BY_USER_AND_CODE_CSV	Controls whether certain information prints on the Price Override Reason Report by user code and reason code in spreadsheet format. Currently, there is no information to define.
PROVRUIRPT PRICE_OVERRIDE_REASON_BY_USER_AND_ITEM	Controls whether certain information prints on the Price Override Reason Report by user code and item. Currently, there is no information to define.
PROVRUIRPTCSV PRICE_OVERRIDE_REASON_BY_USER_AND_ITEM_CSV	Controls whether certain information prints on the Price Override Reason Report by user code and item in spreadsheet format. Currently, there is no information to define.
PROVRURPT PRICE_OVERRIDE_REASON_BY_USER	Controls whether certain information prints on the Price Override Reason Report by user. Currently, there is no information to define.
PROVRURPTCSV PRICE_OVERRIDE_REASON_BY_USER_CSV	Controls whether certain information prints on the Price Override Reason Report by user in spreadsheet format. Currently, there is no information to define.
PURCHORDG PURCHORD,SUPPRESS_IMAGES=N **Note:** These settings also apply to your graphical custom purchase order. This option is available only if your purchase order print program supports it.	Defines whether images print on the graphical *Purchase Order* SUPPRESS_IMAGES Controls whether the system prints images on the graphical purchase order. • N (default) = Print images on the graphical purchase order. • Y = Suppress images on the graphical purchase order. **Note:** The `SUPPRESS_IMAGES` value should be N for the graphical purchase order.
QUOTE QUOTE,SUPPRESS_IMAGES=Y **Note:** These settings also apply to your non-graphical custom quote form. This option is available only if your quote print program supports it.	Defines whether images print on the non-graphical Quote Form. SUPPRESS_IMAGES Controls whether the system prints images on the non-graphical quote form. • N = Print images on the non-graphical quote form. • Y (default) = Suppress images on the non-graphical quote form. **Note:** The `SUPPRESS_IMAGES` value should be Y for the non-graphical quote form.

Property Name	Description
QUOTEG QUOTE,SUPPRESS_IMAGES=N **Note:** These settings also apply to your graphical custom quote form. This option is available only if your quote print program supports it.	Defines whether images print on the graphical Quote Form. SUPPRESS_IMAGES Controls whether the system prints images on the graphical quote form. • N (default) = Print images on the graphical quote form. • Y = Suppress images on the graphical quote form. **Note:** The `SUPPRESS_IMAGES` value should be N for the graphical quote form.
REFCHECK REFCHECK,SUPPRESS_IMAGES=Y,TEXT_AMOUNT_UPPERCASE=N,INCLUDE_DOLLAR_SIGN=Y **Note:** These settings also apply to your non-graphical custom refund check. This option is available only if your refund check print program supports it.	Defines whether images and a dollar sign print on the non-graphical Refund Check. SUPPRESS_IMAGES Controls whether the system prints images on the non-graphical refund check. • N = Print images on the non-graphical refund check. • Y (default) = Suppress images on the non-graphical refund check. **Note:** The `SUPPRESS_IMAGES` value should be Y for the non-graphical refund check. `TEXT_AMOUNT_UPPERCASE` Defines whether the system prints text on the non-graphical refund check in all uppercase. • N = Print text on the non-graphical refund check in upper and lower case. • Y = Print text on the non-graphical refund check in all uppercase. `INCLUDE_DOLLAR_SIGN` Defines whether the system prints the dollar sign on the non-graphical refund check. • N = Do not print the dollar sign on the non-graphical refund check. • Y = Print the dollar sign on the non-graphical refund check.

Property Name	Description
REFCHECKG REFCHECK,SUPPRESS_IMAGES=N,TEXT_AMOUNT_UPPERCASE=N,INCLUDE_DOLLAR_SIGN=Y **Note:** These settings also apply to your graphical custom refund check. This option is available only if your refund check print program supports it.	Defines whether images and a dollar sign print on the graphical Refund Check. SUPPRESS_IMAGES Controls whether the system prints images on the graphical refund check. • N (default) = Print images on the graphical refund check. • Y = Suppress images on the graphical refund check. **Note:** The `SUPPRESS_IMAGES` value should be N for the graphical refund check. `TEXT_AMOUNT_UPPERCASE` Defines whether the system prints text on the graphical refund check in all uppercase. • N = Print text on the graphical refund check in upper and lower case. • Y = Print text on the graphical refund check in all uppercase. `INCLUDE_DOLLAR_SIGN` Defines whether the system prints the dollar sign on the graphical refund check. • N = Do not print the dollar sign on the graphical refund check. • Y = Print the dollar sign on the graphical refund check.
REPLENDTLSHC REPLENDTLSHC,BARCODE_IMAGE=Code 128	
RESAUDITLOG RESET_AUDIT_LOG	Controls whether certain information prints on the Print Reset Audit Log. Currently, there is no information to define.
RESETBO RESET_AUDIT_LOG_QTY_BACKORDERED	Controls whether certain information prints on the Reset Audit Log for Quantity on Backorder. Currently, there is no information to define.
RESETONHAND RESET_AUDIT_LOG_QTY_ON_HAND	Controls whether certain information prints on the Reset Audit Log for Quantity On Hand. Currently, there is no information to define.
RESETPRT RESET_AUDIT_LOG_QTY_PRINTED_ITEM_LOC	Controls whether certain information prints on the Reset Audit Log for Quantity Printed. Currently, there is no information to define.
RESETRSV RESET_AUDIT_LOG_QTY_RESERVED	Controls whether certain information prints on the Reset Audit Log for Quantity Reserved. Currently, there is no information to define.
RESETSKU RESET_AUDIT_LOG_SKU_QTYS	Controls whether certain information prints on the Reset Audit Log for SKU Quantities. Currently, there is no information to define.
RETARSNNOITM RETURN_ALL_REASON_NO_ITEM	Controls whether certain information prints on the Return Reason Report. Currently, there is no information to define.

Property Name	Description
RETARSNNOITMCSV RETURN_ALL_REASON_NO_ITEM_CSV	Controls whether certain information prints on the Return Reason Report in spreadsheet format. Currently, there is no information to define.
RETARSNWITM RETURN_ALL_REASON_WITH_ITEM	Controls whether certain information prints on the Return Reason Report by item. Currently, there is no information to define.
RETARSNWITMCSV RETURN_ALL_REASON_WITH_ITEM_CSV	Controls whether certain information prints on the Return Reason Report by item in spreadsheet format. Currently, there is no information to define.
RETRSNNOITM RETURN_SPECIFIC_REASON_NO_ITEM	Controls whether certain information prints on the Return Reason Report by reason code. Currently, there is no information to define.
RETRSNNOITMCSV RETURN_SPECIFIC_REASON_NO_ITEM_CSV	Controls whether certain information prints on the Return Reason Report by reason code in spreadsheet format. Currently, there is no information to define.
RETRSNWITM RETURN_SPECIFIC_REASON_WITH_ITEM	Controls whether certain information prints on the Return Reason Report by reason code and item. Currently, there is no information to define.
RETRSNWITMCSV RETURN_SPECIFIC_REASON_WITH_ITEM_CSV	Controls whether certain information prints on the Return Reason Report by reason code and item in spreadsheet format. Currently, there is no information to define.
SLSJRN SALES_JOURNAL	Controls whether certain information prints on the Standard Sales Journal. Currently, there is no information to define.
SLSJRNCSV SALES_JOURNAL_CSV	Controls whether certain information prints on the Standard Sales Journal in spreadsheet format. Currently, there is no information to define.
SLSJRNDIV SALES_JOURNAL_BY_DIV	Controls whether certain information prints on the Sales Journal by Division. Currently, there is no information to define.
SLSJRNDIVCSV SALES_JOURNAL_BY_DIV_CSV	Controls whether certain information prints on the Sales Journal by Division in spreadsheet format. Currently, there is no information to define.
SLSUPERR SALES_REP_UPDATE_ERROR	Controls whether certain information prints on the Sales Rep Update Errors Report. Currently, there is no information to define.
SOLDOUT SOLDOUT	Controls whether certain information prints on the Soldout Notification Card. Currently, there is no information to define.
STRUPERR STORE_UPDATE_ERROR	Controls whether certain information prints on the Store Update Errors Report. Currently, there is no information to define.
TAXJUR TAX_JURISDICTION_REPORT	Controls whether certain information prints on the Tax Jurisdiction Report. Currently, there is no information to define.

Property Name	Description
UTJOBMRPT JOB_MONITOR_STS_TXT	Controls whether certain information prints on the job monitor alert email; see Monitoring Jobs. Currently, there is no information to define.
UTSTSRPT SERENADE_STATUS_REPORT	Controls whether certain information prints on the Order Administration Status report. Currently, there is no information to define.

Integration Property Settings

Property Name	Description
ADDRESS_SERVICE_ENDPOINT_URL	Verify the URL used to connect to EDQ. This setting is delivered with the application and should not be changed.
ADDRESS_SERVICE_RETURN_LAYOUT	The name of the custom layout used for data mapping. This layout resides with Experian and should be set to Serenade. Do not change this setting.
API_SERVER_URL	Information will be provided at a later date.
API_TENANT_ACCESS_KEY	Information will be provided at a later date.
API_TENANT_SECRET_KEY	Information will be provided at a later date.
AVATAX_ACCOUNT	The account ID used for communication with the AvaTax tax interface when a company-specific account ID has not been provided in the AvaTax Account (M37) system control value. See Avalara AvaTax Setup for more information.
AVATAX_LICENSE	The license ID used for communication with the AvaTax tax interface when a company-specific license ID has not been provided in the AvaTax License (M38) system control value. The system encrypts this entry. See Avalara AvaTax Setup for more information.
CA_INVENTORY_FILE_NAME	The file name for the CAINV periodic function to use when creating a file of current inventory levels for items. See Sending Current Inventory Information to ChannelAdvisor for background.

Property Name	Description
CA_PRODUCT_SERVICE_SUFFIX	The suffix to include in the URL used for the ChannelAdvisor price and inventory integration. The CAINV and CAPRICE periodic functions use a web service request to pass the generated price and inventory files to ChannelAdvisor. The URL is composed of the CA_SERVICES_URL_PREFIX concatenated with the CA_PRODUCT_SERVICE_SUFFIX, for example: `https://api.channeladvisor.com/v1/ProductUpload`. Defaults to vi/ProductUpload and should not ordinarily be changed. See Sending Current Inventory Information to ChannelAdvisor and Sending Current Prices to ChannelAdvisor for background.
CA_SERVICES_URL_PREFIX	The prefix to include in the URL used for the ChannelAdvisor price and inventory integration, as described above under the CA_PRODUCT_SERVICE_SUFFIX. Defaults to `https://api.channeladvisor.com` and should not ordinarily be changed. **Note:** It is not necessary for this prefix to include a trailing slash in order to create the full URL of `https://api.channeladvisor.com/v1/ProductUpload`. The CAINV and CAPRICE functions insert the slash. See Sending Current Inventory Information to ChannelAdvisor and Sending Current Prices to ChannelAdvisor for background.
CHANNELADVISOR_ORDER_URL	The URL for: • the CAORDUP periodic function to use when requesting new orders from ChannelAdvisor; see Importing Orders from ChannelAdvisor for background. • Processing Refunds (MREF) to use when sending refund information to ChannelAdvisor; see Submitting Refunds for ChannelAdvisor Orders for background.
CHANNELADVISOR_SHIPPING_URL	The URL for the CASHIP periodic function to use when sending shipment confirmations to ChannelAdvisor; see Sending Shipment Confirmations to ChannelAdvisor for background.

Property Name	Description
CHANNELADVISOR_ PULL_ORDERS_MAX	The maximum number of orders that the GetOrderList function processes at once before sending the notification to ChannelAdvisor that the orders were successfully received and created. Each batch can include up to 50 orders. For example, if you set this property to 100, the function imports two batches of 50 orders. If no maximum is specified, a default of 50 orders applies.
CW_MANIFST_ENVIRONMENT_ID	The environment ID that identifies the Order Administration database environment associated with the Manifest Web Service. The environment ID associated with a database environment is defined in the dbconfig.properties file. You can locate the environment ID in this file by locating the database; the number in the first column for the database represents the environment ID. The default environment ID is 1. Required.
CW_MANIFST_USER_ID	The user ID that the Manifest Web Service uses to connect to the Order Administration database environment specified in the `CW_MANIFEST_ENVIRONMENT_ID` property. **Note:** You must also create this user ID in Order Administration: • as a valid user ID with administrator authority in Work with Users (WUSR), and See User Configuration in the Administration Guide for more information on creating a user ID. Required.
CW_POS_LOG_FILE_NAME	Specifies the name of the POSLog file, with the pound sign (#) indicating where to insert the three-position I53Default Location for ORCE Integration (K69). For example, if you set this property to Store #.POL, the file is named Store #123.POL, where 123 is the Default Location for ORCE Integration (K69).
CWDIRECTCP_ USPS_UPLOAD_ FILE	The folder where the system places files that have been uploaded prior to additional processing. This setting is defined by Oracle and cannot be changed. **Note:** If you are using multiple application servers, you need to update this setting on each server where you plan to use the Load USPS Zip Code File (LZPS) to update postal code data.

Property Name	Description
DELETE_DUPLICATE_INVOICE_OUT_TRIGGERS	Defines whether to delete duplicate invoice trigger records. This new property applies only when the Consolidate Invoice (B49) system control value is selected: • If you consolidate invoices and do not run the INVOICE_OUT job all day, you should set this property to Y to remove duplicate trigger records. • If you consolidate invoices and run the INVOICE_OUT job all day, you should leave this property set to N to prevent sending incomplete invoice data. Otherwise, if you do not consolidate invoices, this property is not used. **Note:** If you change the setting of this property, the new setting is effective immediately.
FILE_STORAGE_MAX_SIZE	The maximum size, in bytes, of a file that can be uploaded to the FILE_STORAGE table. If a file's size exceeds this maximum, the API returns a 403 error and the upload fails. Uploaded files should be less than 1G in size, so this property should be set to 1073741824 or less.
IMAGE_URL_PREFIX	Specifies the prefix to use for the URL of a company logo, entity logo, at the Home page in Modern view, and the menu driver image to display on menu screens or print on forms, including the pick slip, purchase order, quote form, gift acknowledgment, and order receipt. Must point to a publicly available server. For example, set this property to `https://SERVER:7500/images` where `SERVER` is the name of the server, `7500` is the port, and images is the folder where company and entity logo images are stored. The URL for image.png might then be `https://SERVER:7500/images/image.png`. See Setting Up Company Logos for Menu Screens and the Modern View Home Page, Setting Up Menu Driver Images for Companies, and Setting Up Company Logos for Forms for more information. **Note:** This URL is not used for item images. You need to specify the complete URL. See Setting Up Item Images for background.

Property Name	Description
JOB_NOTIFICATION_ENDPOINT_URL	Defines the URL to receive the Job Notification Outbound Message. When you set this URL, the change takes effect immediately. Required to generate the Job Notification message. See *Using the Job Notification Outbound REST Message* for more information. If the endpoint is not valid or cannot be reached for any reason, an error is written to the CWDirect.log. However, if the property is blank, a message such as the following is written to the APP log: DEBUG APP - message: Job Notification Outbound Webservice URL not mentioned in Property. For more information see the Web Services Guide on My Oracle Support (ID 2953017.1)
LOYALTY_REWARDS_ACCOUNT_INQUIRY_PROCESSING	Not implemented.
LOYALTY_REWARDS_REDEEM_CERTIFICATE_PROCESSING	Not implemented.
LOYALTY_REWARDS_VOID_CERTIFICATE_PROCESSING	Not implemented.
MASS_CUSTDWNLD_CUSTOMER_CLASSES	Not currently implemented.
MASS_CUSTDWNLD_FILE_NAME	Not currently implemented.
MASS_CUSTDWNLD_MESSAGE_WRAPPER	Not currently implemented.
oms.car.service.url	The prefix URL for Oracle Retail Collect and Receive Cloud Service (CaR). Provided by your Oracle representative. Defaults to http://hostname:port/.
oms.car.service.version	The message version for the CaR services. A value of ‘2’ is required. Any other value will cause a communication failure.
oms.car.status.enabled	Not currently implemented. Default value of false (blank).
oms.promotion.engine.service.url	The URL entered to store the full URL for the Oracle Retail Promotion Engine (ORPE) Cloud Service with a value of https://[SERVER]/promote/services/dealServices/v2/applyDeals where [SERVER] is replaced with actual server details. **Note:** Only v2 applyDeals is supported.
oms.tax.generic.oauth.client.id	The client ID to use, together with the client secret, to generate the token to use for OAuth 2.0 authentication.

Property Name	Description
oms.tax.generic.oauth.client.secret	The client secret to use, together with the client ID, to generate the token to use for OAuth 2.0 authentication.
oms.tax.generic.oauth.scope	The scope to use when generating the token for authentication.
oms.tax.generic.oauth.url	The URL of the OAuth service to use when generating the token for authentication. Must conform to the OpenId OAuth 2.0 specification to get an authorization token. It also must support the "Client Credentials" Grant Type and accept the client ID and client secret as a Basic Authentication header.
oms.tax.generic.timeout	The number of milliseconds to wait before timing out the tax call. If this property is not set to a number, a default of 30 seconds applies. Optional.
oms.tax.generic.url	*oms.tax.generic.url*: The URL to use when generating the generic tax request. Must: • host a service called /calculateTax. • accept a JSON object conforming to the tax interface request. • return a JSON object conforming to the tax interface response.
oocs.return.locations.service	The prefix URL for the OOCS Eligible Return Location service. Provided by your Oracle representative. Defaults to https://server:port/Locate/rest.
orce.coupon.service.url.suffix	

Property Name	Description
ORCE_ALT_ID_OROMS	Indicates the Alt Key Type of the alternate key in Oracle Retail Customer Engagement that maps to the Order Administration customer number. Defaults to OROMS_ID, but you can override it. If the alternate key record of this type does not already exist in Customer Engagement for a customer, it is created when Customer Engagement receives an add or update customer message. Also, Customer Engagement adds a row to the **CST_ALT_KEY_TYPCODE** table in the Customer Engagement database if it does not already exist. An example of this setting in the Customer Engagement database is: **ORCE_ALT_ID_OROMS=OROMS_ID** An entry here is required to identify the customers for POSlog transactions. This alternate key type is passed in the POSlog transaction message as the TypeCode for the AlternateKey, in order to assign POSlog data with existing customers in Customer Engagement. **Important:** Consult your Oracle representative before you change the setting of this property if you have already enabled the customer integration between Order Administration and Customer Engagement, as previously assigned alternate keys in Customer Engagement will not match up when searching for customers.
ORCE_ALT_ID_WEB	Indicates the Alt Key Type of the alternate key in Oracle Retail Customer Engagement that maps to the e-commerce site's customer number. How to define in Oracle Retail Customer Engagement? You can create a alternate key type such as EONE_USER_ID in Oracle Retail Customer Engagement by: • sending the Customer Engagement Add or Update Customer Message from your e-commerce system with an `AlternateKey` whose `TypeCode is EONE_USER_ID` • adding a row to the **CST_ALT_KEY_TYPCODE** table in the Oracle Retail Customer Engagement database **Note:** See the Customer Engagement Customer Integration for information on how the e-commerce customer ID is used to identify the customer in the order API. An example of this setting is: **ORCE_ALT_ID_WEB=OCP_CUST_ID**

Property Name	Description
ORCE_CARD_SERVICE_SUFFIX	The system uses this property, along with the `ORCE_CUSTOMER_SERVICE_PREFIX` and the value in the ORCE Organization Descriptor (L50) to build the URL for communication with Oracle Retail Customer Engagement using the Oracle Retail Customer Engagement Card Services API. Set this to `/OrceWebServices/v3_2/CardServicesApiService?wsdl` where **3_2** is the version of the Card Services API. The highest supported version is 3_2.
ORCE_CUSTOMER_SERVICE_PREFIX	The system uses this property to build the URL for communication with Oracle Retail Customer Engagement. Set this to **https://server:8447**/ where: • **server** = the name of your Oracle Retail Customer Engagement server • **8447** = the port to use on the Oracle Retail Customer Engagement server
ORCE_CUSTOMER_SERVICE_SUFFIX	The system uses this property, along with the ORCE_CUSTOMER_SERVICE_PREFIX and the value in the ORCE Organization Descriptor (L50) to build the URL for communication with Oracle Retail Customer Engagement using the Customer Services API. Both version 2.3 and version 3.1 are supported. Set this to **/OrceWebServices/v2_3/CustomerServicesApiService?wsdl** where **2_3** is the version of the Customer Services API or /**OrceWebServices/v3_1/CustomerServicesApiService?wsdl** where **3_1** is the version of the Customer Services API. **Note**: This property is not updated automatically, and there is no additional functionality provided by changing the version number to version 3.1.
ORCE_DAY_PHONE_LABEL	Indicates the Telephone Type in Oracle Retail Customer Engagement that maps to the daytime phone number in Order Administration. Should be set to BUSINESS. How to define in Oracle Retail Customer Engagement? You can create a telephone type of BUSINESS in Oracle Retail Customer Engagement by: • sending the Customer Engagement Add or Update Customer Message with a `ContactType` of `Phone` and a `SubTypeCode BUSINESS` • adding a row to the **CST_PHONE_TYPCODE** table in the Oracle Retail Customer Engagement database An example of this setting is: **ORCE_DAY_PHONE_LABEL=BUSINESS**

Property Name	Description
ORCE_EVE_PHONE_LABEL	Indicates the Telephone Type in Oracle Retail Customer Engagement that maps to the evening phone number in Order Administration. Should be set to HOME. How to define in Oracle Retail Customer Engagement? You can create a telephone type of HOME in Oracle Retail Customer Engagement by: • sending the Customer Engagement Add or Update Customer Message with a `ContactType` of `Phone` and a `SubTypeCode HOME` • adding a row to the **CST_PHONE_TYPCODE** table in the Oracle Retail Customer Engagement database An example of this setting is: **ORCE_EVE_PHONE_LABEL=HOME**
ORCE_FAX_PHONE_LABEL	Indicates the Telephone Type in Oracle Retail Customer Engagement that maps to the third phone number in Order Administration. Should be set to MOBILE. The Third Phone Number Type (L53) system control value controls whether the third phone number is labeled as the mobile or fax number in Order Administration. **Note:** The name entered in the Third Phone Number Type (L53) system control value should match the value defined for the `ORCE_FAX_PHONE_LABEL`. How to define in Oracle Retail Customer Engagement? You can create a telephone type of FAX or MOBILE in Oracle Retail Customer Engagement by: • sending the Customer Engagement Add or Update Customer Message with a `ContactType` of `Phone` and a `SubTypeCode FAX or MOBILE` • adding a row to the **CST_PHONE_TYPCODE** table in the Oracle Retail Customer Engagement database An example of this setting is: **ORCE_FAX_PHONE_LABEL=MOBILE**
ORCE_LOYALTY_AWARD_SERVICE_SUFFIX	The system uses this property, along with the ORCE_CUSTOMER_SERVICE_PREFIX and the value in the ORCE Organization Descriptor (L50) to build the URL for communication with Oracle Retail Customer Engagement using the Oracle Retail Customer Engagement Award Account Services API. Set this to /**OrceWebServices/v3_1/AwardAccountServicesApiService?wsdl** where **3_1** is the version of the Award Account Services API. The highest supported version is 3_1.

Property Name	Description
ORCE_LOYALTY_PROMPT_ATTRIBUTE	The text to display on the in Modern View when prompting for loyalty enrollment. Defaults to Does the customer want to join the loyalty program? Up to 55 positions.
ORCE_LOYALTY_REG_MESSAGE	The text to display on the Customer Loyalty Registration Window, up to 55 positions.
ORCE_LOYALTY_SERVICE_SUFFIX	The system uses this property, along with the ORCE_CUSTOMER_SERVICE_PREFIX and the value in the ORCE Organization Descriptor (L50) to build the URL for communication with Oracle Retail Customer Engagement using the Oracle Retail Customer Engagement Loyalty Account Services API. Set this to **/OrceWebServices/v3_4/LoyaltyAccountServicesApiService?wsdl** where **3_4** is the version of the Loyalty Account Services API. The highest supported version is 3_4.
ORCE_REGISTRY_SERVICE_SUFFIX	The system uses this property, along with the ORCE_CUSTOMER_SERVICE_PREFIX and the value in the ORCE Organization Descriptor (L50)ORCE Organization Descriptor (L50) to build the URL for communication with Oracle Retail Customer Engagement using the Oracle Retail Customer Engagement Registry Service API. Set this to **/v3_1/RegistryServices?wsdl** where **3.1** is the version of the Registry Service API. The highest supported version is 3_1.
ORCE_SECURITY_USER_ID	The Oracle Retail Customer Engagement user ID with Security Group permission included in the Oracle Retail Customer Engagement API messages. This setting must be a valid user ID in Oracle Retail Customer Engagement that has Security Group permission.
ORCE_SVC_SERVICE_SUFFIX	The system uses this property, along with the ORCE_CUSTOMER_SERVICE_PREFIX and the value in the ORCE Organization Descriptor (L50) to build the URL for communication with Oracle Retail Customer Engagement using the Oracle Retail Customer Engagement Stored Value Card Transaction Services API. Set this to **/OrceWebServices/v3_1/SvcTransactionServicesApiService?wsdl** where **3_1** is the version of the Stored Value Card Transaction Services API. The highest supported version is 3_1.
ORCE.COUPON.SERVICE.URL.SUFFIX	The system uses this property, along with the ORCE_CUSTOMER_SERVICE_PREFIX, and the value in the ORCE Organization Descriptor (L50) to build the URL for communication with Oracle Retail Promotion Engine for the ORCE Serialized Coupon Service.

Property Name	Description
OROB_DISCOVERY_SERVICES_WSDL_LOCATION	The endpoint for the Discovery Services web service. This entry should be set to `https://SERVER:8443/Locate/DiscoveryServices`, where `SERVER` is the name of your Oracle Retail Order Orchestration server. See Importing Store Cross Reference Locations through Order Orchestration's Discovery Web Service.
OROB_INVENTORY_AVAILABILITY_SKU_LIMIT	The maximum number of items/SKUs flagged as Active PO to include in each inventory availability request to Order Orchestration. The ACTPO periodic function generates this request message as part of future receipts and pre-order processing. The maximum number of records that Order Orchestration will process per request is 500. When this property is blank or is set to a number higher than 500, the request can include up to 500 records if there are that many Active PO items/SKUs evaluated by the periodic function. If there are more than 500 records, the next group of records is included in the next request message. Defaults to 500.
OROB_INVENTORY_AVAILABILITY_URL	The URL to use when submitting the inventory availability request to Order Orchestration through the ACTPO periodic function. Should be set to `https://<SERVER>:<PORT>/Locate/adws/ProductService/1.0/getInventoryAvailability`, where `<SERVER>` is the name of the Order Orchestration server, `<PORT>` is the port, and 1.0 is the version.

Property Name	Description
OROB_LIMITED_STATUS_BEG_TIME OROB_LIMITED_STATUS_END_TIME	Defines settings for the Daily Status Inquiry Time Window (all versions). These settings apply to retail pickup and ship-for-pickup orders. **Overview:** For certain Order Orchestration statuses, it is not necessary to send a status inquiry as frequently as the Order Broker Status Update Interval (K10), because no immediate action is required in Order Administration. These statuses apply to retail pickup and ship-for-pickup orders: • In transit: the order has been shipped to the store location. • received: the order has been received at the store location, but the customer has not yet picked it up. • partially fulfilled: the customer has picked up some of the items, or quantity of items on the order, but has not yet received the entire order. In order to avoid including orders in these statuses in the status list request more often than necessary, if the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to NEVER or blank, the BROKER process checks their status once daily during a specified time window. It uses the following two additional properties to determine the start and end of the window: • OROB_LIMITED_STATUS_BEG_TIME=123456 • OROB_LIMITED_STATUS_END_TIME=123456 Each time is indicated in HHMMSS format, military time. For example, if you set these properties to: OROB_LIMITED_STATUS_BEG_TIME=180000 OROB_LIMITED_STATUS_END_TIME=210000 Then the BROKER process can send status inquiry list requests for these orders between 6:00 p.m. and 9:00 p.m. daily. Orders are eligible for status inquiry if an inquiry has not taken place in the previous 12 hours. You should set the time window long enough to process status inquiries for all orders in the related statuses; also, the time window should not cross midnight.

Property Name	Description
OROB_MAXIMUM_STATUS_LIST_REQUEST_ORDERS	Defines the maximum number of request IDs to include in a single Status List request message to Order Orchestration. Defaults to 500, and should not exceed 1000. If you do not set this property to a number of 1 or higher, the maximum number of request IDs to use is set to 1, indicating to send requests for one request ID at a time. You need to stop and restart the BROKER job to apply a change to this property. Pick slip generation also uses this property to determine the maximum number of request IDs to include in a single status list request. **For more information:** See Order Orchestration Configuration.
OROB_MESSAGE_VERSION	Defines the message version to include in Order Orchestration and merchandise locator request messages that Order Administration sends to Order Orchestration. Version requirements: • A message version of 5.0 or higher is required to use the status list request message and streamlined allocation at pick slip generation. See Use OROB Status Inquiry List Web Service (M05) and Use Streamlined Allocation (L63) for background. • A message version of Order Broker 16.0 or higher, or Order Orchestration is required to use the Ship-for-Pickup Orders integration with Order Broker, or Order Orchestration. • A message version of Order Broker 19.0 or higher, or Order Orchestration is required to include the shipment_date tag in the status inquiry response message from Order Orchestration. This date indicates the actual date when the order line was shipped by the fulfilling location, provided the fulfilling system passed this date when it submitted the status update to Order Orchestration when reporting the fulfillment. The shipment date is available to include in shipment notifications to the customer; see *Outbound Email API* for more information. This property cannot be set higher than 19.9 for integration with Order Broker 19.x, or higher than 21.1 for integration with Order Orchestration 22.2.301.0 or higher. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) **Note:** To avoid unpredictable results, do not leave this property blank.

Property Name	Description
OROB_PURCHASING_SERVICES_MAX_UPDATES	Indicates the maximum number of drop ship updates for Oracle Retail Order Orchestration to include in drop ship status inquiry responses. For example, you might set this number to 100 to prevent a large number of status updates from impeding system performance. If this property is blank, Oracle Retail Order Orchestration does not limit the number of updates included in the response message.
OROB_PURCHASING_SERVICES_MESSAGE_VERSION	Specifies the outbound message version to send to Oracle Retail Order Orchestration for integration with the Supplier Direct Fulfillment module. Should be set to 4.5 or higher.
OROB_PURCHASING_SERVICES_WSDL_LOCATION	The endpoint for the Purchasing Services web service. This entry should be set to `https://SERVER:8443/Locate/PurchasingServices`, where `SERVER` is the name of your Oracle Retail Order Orchestration server.
OROB_SERVICES_WSDL_LOCATION	The endpoint for the Services web service. This entry should be set to `https://SERVER:8443/Locate/LocateServices`, where `SERVER` is the name of your Oracle Retail Order Orchestration server.
PMD_PAY_LINK_SERVICE	The name of the external system. **Note:** This field is not currently implemented.
PMD_PAY_LINK_SERVICE_BATCH_DEPOSIT_PORT	The port number used to connect to Paymentech to process batch deposit transactions. **Note:** Defining a separate port number to process batch deposit transactions allows you to run pick slip generation (batch authorizations) and deposits at the same time. Leave this setting blank if you wish to use the port number defined for the PMD_PAY_LINK_SERVICE_BATCH_PORT property to process both batch authorization and deposit transactions; if you use the same port number to process batch authorization and deposit transactions, you cannot run pick slip generation and deposits at the same time. **Note:** This setting is not currently implemented.
PMD_PAY_LINK_SERVICE_BATCH_IP_ADDRESS	The IP address used to connect to Paymentech to process batch transactions. **Note:** This setting is not currently implemented.
PMD_PAY_LINK_SERVICE_BATCH_PORT	The port number used to connect to Paymentech to process batch transactions. **Note:** This setting is not currently implemented.
PMD_PAY_LINK_SERVICE_ONLINE_IP_ADDRESS	The IP address used to connect to Paymentech to process online transactions. **Note:** This setting is not currently implemented.

Property Name	Description
PMD_PAY_LINK_SERVICE_ONLINE_PORT	The port number used to connect to Paymentech to process online transactions. **Note:** This setting is not currently implemented.
QAS ADDRESS SERVICE TOKEN	Enter the address service token used by EDQ to identify a customer; this is a token you created in the EDQ self service portal.
UPDATE_ON_ORDER_FROM_PO_LAYERING	Select this property to have the warehouse on-order quantity updated through the purchase order layering process. Default = false. • You should set this property to TRUE if you upgrade to 19.0 or higher from a release prior to 18.0, in order to have PO layering update the on-order quantity consistently with prior functionality. • You should leave this property set to FALSE if you use the enterprise order integration for future receipts and pre-order processing. See Purchase Order Layering for background on the purchase order layering process.
VERTEX_PASSWORD, VERTEX_USER	The user ID and password used to connect to Vertex. The password is encrypted. See Vertex Setup.
VERTEX_SERVICE_ENDPOINT_URL	The URL used to communicate with Vertex, such as http://example.com/vertex-ws/services/CalculateTax90, where 90 indicates the version of Vertex, such as 9.0. See Vertex Setup.
XLINK_POSLOG_FILE_DATETIME XLINK_POSLOG_FILE_EXTENSION XLINK_POSLOG_FILE_FORMAT XLINK_POSLOG_FILE_PREFIX XLINK_POSLOG_FILE_TRIGGER_EXTENSION	Used to create the name of a custom POSLog: • the date and time format. • the file extension. • the file format. • the file prefix. • the file trigger extension.

System Property Settings

The settings below define configuration settings for the Order Administration application server.

Property Name	Description
DECIMAL_SEPARATOR	The character format used to indicate the decimal place in a number on screens. Valid value are: . (period); default , (comma) For example, if you enter . (period) as the decimal separator, a number with decimals displays as 123.45. If you enter , (comma) as the decimal separator, a number with decimals displays as 123,45. During installation, the system prompts for the default decimal separator of Order Administration. The system stores the default decimal separator in this property. **Important:** If you change the default decimal separator from the decimal separator selected during installation, the new default decimal separator applies only to new data; seed data provided during installation will not be translated to the new decimal separator format. The decimal separator used on reports generated through Oracle Analytics Cloud is based on the BI Date and Separator Format defined for the company. See Regional Settings for an overview, and see Where are Number Format Applied? for more information on the decimal separator that defaults to different areas of the application.

<table>
<tr><th>Property Name</th><th>Description</th></tr>
<tr><td>DEFAULT_DATE_FORMAT</td><td>The default date format used in the application.
Valid values are:
MY (DDMMYY) = If the date is December 25 2018, the date displays as 251218.
MDY (MMDDYY) = If the date is December 25 2018, the date displays as 122518.
YMD (YYMMDD) = If the date is December 25 2018, the date displays as 161228.
During installation, the system prompts for the default date format of Order Administration. The system:
Stores the default date format in this property. Important: If you change the default date format from the date format selected during installation, the new default date format applies only to new users and companies; seed data provided during installation will not be translated to the new default date format.
Defaults this date format to the admin user that is created during installation.
Defaults this date format to the Date format field in the Company table for the companies delivered with Order Administration. However, you can change the date format for a company in the Work with Company (WCMP) menu option.
When you create a new user or company, the system assigns the default date format to the user or company. However, you can change the date format defined for a user in the Work with Users (WUSR) menu option and you can change the date format for a company in the Work with Company (WCMP) menu option.
Note: Regardless of the date format that displays on screens, dates are stored in the database in CYYMMDD format.
The date format to use on reports generated through Oracle Analytics Cloud is based on the BI Date and Separator Format defined for the company.
Note: In order to have a consistent date format on all reports, this property and the Date Format defined for the company should be the same.
See Regional Settings for an overview and see Where are Number Format Applied? for more information on the date format used for different areas of the application.</td></tr>
</table>

Property Name	Description
DEFAULT_LOCALE	The default locale used in the application, indicating the default language for the application. During installation, the system: • Stores the default locale in this property. • Defaults this locale to the admin user that is created during installation. • Defaults this locale to the Locale field in the Company table for the companies delivered with Order Administration. • When you create a new user or company, this default locale defaults, but you can override it. See: • Regional Settings for an overview. • Where are Date Formats Applied? for more information on which date format the system uses in different areas of the application. • Where are Number Format Applied? for more information on the decimal and thousand separators the system uses in different areas of the application.
ECOMMERCE_AVAILABILITY_XML_VERSION	The XML version of the Availability Web XML message received from an external system; see *E-Commerce Availability Web API*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)
ECOMMERCE_PRODUCT_XML_VERSION	The XML version of the ProductWeb XML message generated through Downloading E-Commerce Offer Files (EOFR) when the Generate E-Commerce Offer Tables (M29) system control value is unselected.
oms.ui.session.timeout	The number of minutes before an inactive user session times out in either Classic View or Modern View. Your entry can be a whole number from 15 to 1440. Defaults to 30 minutes, and an inactivity timeout interval of 30 minutes applies if this property is blank.

Property Name	Description
THOUSAND_SEPARATOR	The character format used to separate groups of thousands. Valid value are: , (comma); default . (period) For example, if you enter . (decimal) as the thousand separator, a number with thousand displays as 1.000. If you enter , (comma) as the thousand separator, a number with thousand displays as 1,000. During installation, the system prompts for the default thousand separator of Order Administration. The system stores the default thousand separator in this property. **Important:** If you change the default thousand separator from the thousand separator selected during installation, the new default thousand separator applies only to new data; seed data provided during installation will not be translated to the new thousand separator format. The thousand separator used on reports generated through Oracle Analytics Cloud is based on the BI Date and Separator Format defined for the company. See Regional Settings for an overview and see Where are Number Format Applied? for more information on the thousand separator that defaults to different areas of the application.

Working with Admin Properties (CPRP)

Purpose: Use this menu option to define system-wide configuration settings for Order Administration that an administrator would update.

When you update a property setting, your update takes effect immediately.

In this topic:

- Work with Admin Properties Screen
- Change Property Screen
- Summary of Admin Properties
  - Email Property Settings
  - Forms Property Settings
  - Integration Property Settings
  - Logging Property Settings
  - Monitor Property Settings
  - System Property Settings

Work with Admin Properties Screen

Use this screen to define property settings that are available to an administrator user in the application.

How to display this screen: Enter CPRP in the Fast path field or select Work with Admin Properties from a menu.

When you first advance to this screen, property settings display on this screen in ascending property name sequence.

Column sort: You can sort on any column on this screen by clicking the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Field	Description
Group	The type of property setting. Valid values are: • Email: The property setting is related to email processing. • Logging: The property setting is related to logging. • Integration: The property setting is related to an integration with an external system. • Monitor: The property setting is related to job monitoring. • Printing: The property setting is related to printing. • System: The property setting is related to a system-wide function. Enter a full or partial group name to display property settings that contain your entry. Alphanumeric, 25 positions; optional.
Property	The name of the property. Enter a full or partial property name to display property settings that contain your entry. Alphanumeric, 75 positions; optional.
Value	The current setting of the property. If this field is blank, it means a property setting has not been defined. Enter a full or partial property value to display property settings that contain your entry. Alphanumeric, 150 positions; optional.
Type	The type of property setting. Valid values are: • Admin = The property setting is a setting available to an administrator user in the application. • Customer = The property setting is a setting available to a user in the application. Enter a full or partial property type to display property settings that contain your entry. Alphanumeric, 10 positions; optional.

Screen Option	Procedure
Change the current value defined for a property	Select Change for a property to advance to the Change Property screen.
Switch between viewing admin property settings and customer property settings	Select Admin/Customer. • If you are currently on the Work with Admin Properties screen, the system advances you to the Work with Properties Screen. • If you are currently on the Work with Properties screen, the system advances you to the Work with Admin Properties Screen.

Change Property Screen

Purpose: Use this screen to change a property setting.

How to display this screen: Select Change for a property on the Work with Admin Properties Screen.

Field	Description
Property	The name of the property whose value you wish to update. Alphanumeric, 75 positions; display-only.
Group	The group assigned to the property. Alphanumeric, 25 positions; display-only.
Type	The type of property setting. Valid values are: • Admin = The property setting is a setting available to the administrator user. • Customer = The property setting is a setting available to customer. Alphanumeric, 10 positions; display-only.
Display	Defines whether you can update the property setting. Valid values are: • C = You can change the value defined for the property. • D = The value defined for the property is display-only. Alphanumeric, 1 position; display-only.
Value	The current setting of the property. If this field is blank, it means a property setting has not been defined. **Note:** The system does not validate your entry. Alphanumeric, 150 positions; optional.

Summary of Admin Properties

The property settings that display on the Work with Admin Properties Screen are listed below.

- Email Property Settings
- Forms Property Settings
- Integration Property Settings
- Logging Property Settings
- Monitor Property Settings
- System Property Settings

Email Property Settings

See Email Generation Setup for more information on the required and optional setup for generating email notifications through Order Administration.

Property Name	Description
CWEMAIL_TEMPLATE_PATH	The location of the folder containing the template files used to generate HTML-based emails. Not used for shipment emails generated through the Narvar integration.
oms.email.job.queue.output.name	The output queue to use for emails. Output queues are displayed when you select the My Jobs option in Order Administration, where you can use them for filtering purposes. The default output queue is EMAIL. Not used for shipment emails generated through the Narvar integration.
oms.email.support.to	The list of email addresses to receive the Support Notification email when a job is placed in MSG status because an error has occurred, or System Alert email for other errors such as inconsistent system control value setup across companies. Separate each email address with a semi-colon (;), such as: email1@add.com;email2@add.com. **Note:** You cannot enter an email distribution list in this field. However, you can use an email program, such as Microsoft Outlook®, to create rules to send emails to a distribution list. See Order Administration Support Notification for more information on error email processing.

Forms Property Settings

Property Name	Description
BI_BYPASS_CACHE_ENABLE	Defines whether the system bypasses caching for reports generated using Oracle Business Intelligence Publisher. true = Bypass caching for reports generated using Oracle Business Intelligence Publisher. false = Cache reports generated using Oracle Business Intelligence Publisher.
BI_REST_REPORTS_FOLDER	The location in Oracle Analytics Cloud where Order Administration reports are stored. Needs to be set to OMSCS/Reports/.
BI_REST_URL	The name of the host where Oracle Business Intelligence Publisher is running. The system uses this property to build the URL for communication with Oracle Business Intelligence Publisher. For example: https://<host>:<port>/xmlpserver/services/rest/reports where: • host is the setting in the BI_REST_URL. • port is the setting in the BI_REST_PORT. • xmlpserver/service/rest/reports is the setting in the BI_REST_SERVER_PATH.

Property Name	Description
BI_REST_PORT	The IP port number where Oracle Business Intelligence Publisher is running. The system uses this property to build the URL for communication with Oracle Business Intelligence Publisher. For example: https://<host>:<port>/xmlpserver/services/rest/reports where: • host is the setting in the BI_REST_URL. • port is the setting in the BI_REST_PORT. • xmlpserver/service/rest/reports is the setting in the BI_REST_SERVER_PATH.
BI_REST_SERVER_PATH	The fixed prefix for Oracle Business Intelligence Publisher REST report resource. The system uses this property to build the URL for communication with Oracle Business Intelligence Publisher. For example: https://<host>:<port>/xmlpserver/services/rest/v1/reports where: • host is the setting in the BI_REST_URL. • port is the setting in the BI_REST_PORT. • xmlpserver/service/rest/v1/reports is the setting in the BI_REST_SERVER_PATH.
BI_REST_USER	The user ID used to connect to Oracle Business Intelligence Publisher.
BI_REST_PASSWORD	The password for the user ID used to connect to Oracle Business Intelligence Publisher. For security, the system encrypts the password.

Integration Property Settings

See *Integrations* for more information on the set up required for integrations with Order Administration.

Property Name	Description
ASSOCIATE_FILE_PATH	The directory the Salesman Associate Upload Process monitors for new Salesman Associate files to place files that have been uploaded prior to additional processing. This setting is defined by Oracle and cannot be changed. **Note:** The name of the file must start with SR and have a .TXT file extension; for example: SR00001.txt and SR00002.txt. If there are multiple eligible files, they are processed sequentially based on file name; SR00001 processes before SR00002. You can use the file storage API to upload a zip file that contains a single text file with the same name, for example: SR00001.ZIP containing a text file named SR00001.TXT.
CA_INVENTORY_FILE_LOCAL_FOLDER	The folder on the Order Administration server where the CAINV periodic function writes the inventory file. See Sending Current Inventory Information to ChannelAdvisor for background. This property is set by Oracle and cannot be changed.
CWDIRECTCP_UPLOAD_ BATCH_SIZE	Defines the number of records to process in an upload file at a time. The default setting is 2500, indicating the system inserts records from the upload file into the Order Administration database in batches of 2500. If a record in a batch contains an error, the system does not insert any of the records in the batch into the Order Administration database and places the upload file in an error status. For troubleshooting purposes, you can decrease the UPLOAD_BATCH_SIZE and reprocess the file upload to help you determine which record contains the error. Example: In this example, the CWDIRECTCP_UPLOAD_BATCH_SIZE is 10. You process an upload file containing 30 records. In this situation, the system processes the upload file in 3 batches: the first batch contains records 1-10; the second batch contains records 11-20; and the third batch contains records 21-30. If a record in the second batch fails, the system does not process any of the records in the second batch, but does process all of the records in the first batch and third batch. See Work with File Uploads (WUPL) for more information.

Property Name	Description
	Setting for pick slip forms generated through the database: If you use a pick slip form that is generated directly through the database, set this value to 999999. The INPUT_TYPE setting for your pick slip form in the Forms Properties indicates the means by which your pick slip printing program obtains the data to print on the pick slip. Valid values are: • XML (default) = The program uses the *Pick Message from Order Administration (CWPickOut)* to generate the pick slip. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). • DB = The program queries the database to generate the pick slip. This option is available only if your pick slip printing program supports it. **Note:** If no INPUT_TYPE is specified, the program uses the CWPickOut message.
ELO_CONFIG_URL	Defines the URL to use to establish a connection with Oracle Retail EFTConnect when you open the Payment Configurations page in Modern View. Contact your Oracle representative if this property is not defined, or if the Payment Configurations page in Modern View displays an error.
ELO_IDCS_ENDPOINT_URL	Defines the URL to use when requesting the token for OAuth authentication for the integration with EFTConnect. Setup of the EFTConnect outbound web service authentication is required in Work with Web Service Authentication (WWSA). Contact your Oracle representative if this property is not defined.
ELO_PAYMENT_URL	Defines the URL to use for any transactional communication with EFTConnect, such as obtaining a form token, authorization, or deposit. Required for use of the Payment Configurations page in Modern View. Contact your Oracle representative if this property is not defined.
ELO_POLL_COUNT_THRESHOLD	Indicates how many times a Capture, Refund, or Auth+Capture call to EFTConnect can be made to check to see if it has the status of the transaction from the payment provider before its status changes to Unconfirmed. The current poll count is tracked on the Credit Card Deposit record. If the poll count is equal to or greater than the setting of this property, the Credit Card Deposit record is deleted and the deposit is unconfirmed. You can then use Resubmit Rejected Deposits in Modern View to attempt to resubmit the deposit. Defaults to 3. Must be at least 1 and cannot be higher than 99. A change to this setting takes effect immediately.
ELO_THRESHOLD_TIME	Used for logging purposes. Compares the elapsed time of the web service with the this setting. If the elapsed time exceeds the threshold, a message is logged.

Property Name	Description
ELO_TIMEOUT	Defines the number of milliseconds to wait before requests from Order Administration to EFTConnect time out. Defaults to 12000 milliseconds (12 seconds). Depending on the type of request and the payment provider, the record might stay in SENT status or RDY status; or, in the case of a new payment method, the payment information might not be saved and an error displayed.
IDCS_ENABLED	Defines whether the IDCS (Oracle Identity Cloud Service) or OCI IAM (Oracle Cloud Infrastructure Identity and Access Management) integration is enabled. false = The system uses internal password authentication. true (default) = The system uses IDCS or OCI IAM for password authentication. Note: • Once you change this property to true, the setting can no longer be changed. If you need to change this setting back to false, you must contact your support representative to disable IDCS or OCI IAM. • New cloud installations of Order Management System version 17.1 and later, or Order Administration, will have this setting delivered as true. • When you enable the IDCS or OCI IAM integration, the system no longer creates records in the Password Audit table to track when a user's password is updated. • Before you change this value to true, make sure your admin user and other users in Order Administration are set up in IDCS or OCI IAM and match the exact format of the user name. • When this property is set to true, multi-factor authentication is disabled. See Multi-Factor Authentication in the Administration Guide for background. • When defining a user ID in IDCS or OCI IAM, the user ID is NOT case-sensitive. • If this property is set to true, when users sign out of Order Administration or OACS Modern View, they return to the IDCS or OCI IAM login page. • When this property is set to true, working with User Control records is not available through the Advanced Commands option. See Oracle Authentication (IDCS or OCI IAM) in the Administration Guide for more information.
IDCS_ACCESS_ APPLICATION_ID	Not currently implemented.

Property Name	Description
INVOIC_OUT_MAX_THREADS	Controls the maximum number of threads that the INVOIC_OUT job spawns to process invoice trigger records. Defaults to 10. Optionally, set it to a higher number to enhance performance. If this property is not set to a whole number larger than 0, a setting of 1 applies. See the Generic Invoice Download API for more information on the INVOIC_OUT process in the Web Services Guide on My Oracle Support (ID 2953017.1)
OCDS_RESPONSE_BATCH_SIZE	The number of records to request at a time for different types of data imported through the integration with Omnichannel Cloud Data Service (OCDS). Background: The OCDSITM periodic function requests merchandise hierarchy information, item information, item image information, item location attribute information, and pricing information, if the related system control value for each type of data is configured. Limiting the number of records in the response: For each of these types of data (with the exception of merchandise hierarchy information), the function requests the number of records specified in this property; for example, it requests up to 15,000 pricing information records when this property is set to 15,000. Oracle recommends that you set this property no higher than 100,000. The default setting is 10,000. If property not set: if this property is blank, the import requests the number of records defined in the INT_OCDS_CONFIG table for the import type. For example, if this property is blank and the quantity defined in the table for the item image import is 10,000, then the item image request specifies a quantity of 10,000. INT_OCDS_CONFIG defaults: The default settings in this table are 10,000 for each type of imported information. **Note:** This setting does not control the number of records requested for the merchandise hierarchy import; instead, it always uses the setting from the INT_OCDS_CONFIG table. For more information: See Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS).
oms.car.scope	The scope used for Oracle Retail Collect and Receive Cloud Service (CaR). Provided by your Oracle representative. Defaults to domain:scope.
oms.cloud.file.transfer.bucket	This auto populated property displays the bucket value for file transfers that is specific to each environment.
oms.cloud.file.transfer.timeout	The timeout for the file transfer service. Default 15000.
oms.cloud.file.transfer.url	This auto populated property holds the file transfer service (FTS) base URL value.
oms.cloud.file.transfer.version	The version of the file transfer service (FTS) such as /fts/v1.

Property Name	Description
oms.promotion.engine.token.url	Defines the URL to use when requesting the token for OAuth authentication for the integration with ORPE. Setup of the ORPE outbound web service authentication is required in Work with Web Service Authentication (WWSA). Contact your Oracle representative if this property is not defined.
ORCE_CUSTOMER_ID_DIRECTORY_PATH	Defines the location on the Order Administration application server where the Update Customer with Relate ID periodic function (program name PFRCIU) looks for the Oracle Retail Customer Engagement query results comma separated value file (CSV) to process. See Customer Engagement Update Customer with Relate ID Process. This setting must be a valid location on the Order Administration application server. An example directory setting is `/domain/conf/OACSFiles/RelateData/customerID/`, where `domain` is the installed location of Order Administration.
ORCE_DIRECTORY_PATH	Defines the location where Order Administration places the batch files to send to Oracle Retail Customer Engagement. **Note:** • This setting is defined by Oracle and cannot be changed. • Not related to the Customer Engagement Customer Integration. • Because Order Administration uses this directory to stage files before executing a transfer through the file transfer service, this setting still needs to specify a valid path if you use Customer Engagement File Transfer Service (FTS).
QAS SERVICES WSDL LOCATION	The location of the ProOnDemandService.wsdl file. The recommended location is file:///domain/conf/cwdirectcpproperties/ProOnDemandService.wsdl, where domain is the WebLogic domain directory for Order Administration. The ProOnDemandService.wsdl is delivered with Order Administration and should not be changed.
STORE_FILE_PATH	The directory the Store Upload Process monitors for new Store files to process. **Note:** The name of the file must start with ST and have a .TXT file extension; for example: ST00001.txt and ST00002.txt. See Store Upload. This property is set by Oracle and cannot be changed. **Note:** You need to use Work with File Uploads (WUPL) to upload stores.
XLINK_DIRECTORY_PATH	The directory where the POSLOGX periodic function places a custom POSlog to send to Xlink when you are not using the file storage API. This property is set by Oracle and cannot be changed.

Logging Property Settings

See Logs for more information on the logs that are available to help troubleshoot Order Administration processing.

Property Name	Description
CUST_FILE_NAME	The name of the log that stores Customer API transaction information. The delivered setting is CUST.log. If you Use Multiple Application Servers If you use multiple application servers, rename the log so that it identifies the server where the log is located. For example, if you use two application servers named SERVER1 and SERVER2, rename the CUST log on each server to CUSTSERVER1.log and CUSTSERVER2.log.
OCDS_JOB_HISTORY_RETENTION_DAYS	Defines the number of days to retain records in the INT_OCDS_STATUS table. This table tracks activity of the and the OCDSFA periodic function (see Importing Future Available Information (OCDSFA Periodic Function) for background). You can review these records at the **Enterprise Data Import History** page in Modern View. The OCDSITM periodic function purges records older than the number of days specified here. Default = 30 days. If this property is blank, the periodic function does not purge records.
oms.promotion.engine.service.timeout	Defines the number of seconds to wait before requests from Order Administration to the ORPE Promotion / dealServices/applyDeals method time out. Defaults to 500 seconds.
oms.db.query.log.threshold	Oracle staff can use this property to control when to log longer-running queries for troubleshooting purposes. Queries that run for longer than the number of milliseconds defined here create log entries that include terms such as `Query Timer` and `took longer than logging threshold`. Defaults to 4000 milliseconds.

Monitor Property Settings

The settings below are used by Oracle staff to manage system processing.

For more information: See:

- Monitoring Jobs for more information on how the system monitor jobs to ensure that they are running correctly.
- Long Running Jobs Monitor for more information on how the system watches the batch jobs running on the Job Management Screen and sends a Long Running Job Email to a specified email address if a job runs without ending longer than a specified time.
- Working with Required Responses (WREQ) and Required Response Processing for more information on how to respond to Order Administration jobs that require user intervention in order to proceed.

- Running a Periodic Process on Server Startup for more information on how to run a periodic process when the Order Administration application server is restarted.

Property Name	Description
oms.reports.service.active.procedures	Used to filter data on the Managed Services report.
oms.reports.service.email.to	The email addresses that receive Managed Services reports. Separate email addresses with a semi-colon.
ALLOW_JOB_MONITOR	Indicates whether the job monitor runs on this application server. Valid values: Y = The job monitor runs on this server. N (default) or blank = The job monitor does not run on this server. In this situation, the only option on the Work with Job Monitor Rules Screen is to display a rule's settings. **Note:** Set this value to Y for all application servers that you wish to collect data on the Work with Job Monitor Screen (WJMO).
oms.reports.service.processes	Used to filter data on the Managed Services report.
oms.job.history.purge.retain.days	Defines how long to retain a batch job in the Job History table before the system purges it automatically based on the job's End date. The default setting is 30 days. The system submits the Job History purge process each time you start the application server. Job History records that do not have an End Date (indicating the job did not end) are not purged. **Note:** This setting does not apply to the history records in the job_run_history table. These records are not currently purged. The job_run_history table contains records for the BILLUPD and SCHDDEP periodic functions. See Display Job History (DJHY) for more information.
JOB_MONITOR_QUERY_ DIRECTORY	The directory on the application server where you store queries used by the job monitor. An example directory is domain/conf/OACSFiles/JobMonitorQueries/, where domain is the installed location of Order Administration.
REPORT_TYPE	Indicates the format of the Managed Services report. • pdf = Generate the Managed Services report in .pdf portable document format. • rtf = Generate the Managed Services report in .rtf rich text format. • txt = Generate the Managed Services report in .txt text format.
RESPONSE_EMAILS	The list of email addresses that receive the Response Required Email when a job requires user intervention. Each email address entered must be separated by a semi-colon (;). For example: email1@add.com;email2@add.com.

Property Name	Description
RESPONSE_RETRIES	The number of times Order Administration looks for a response to a job that requires user intervention before using the default response in order to proceed with the job. For example, if this setting is 5, Order Administration will look for a user response five times, waiting 60 seconds between each timeSee Working with Required Responses (WREQ).
oms.reports.service.email.subject	The text that displays in a Managed Services email.
oms.reports.service.email.disabled	Defines whether a Managed Services email is generated. • Y = Do no generate Managed Services emails. • N = Generate Managed Services emails.
TRACK_ALERTS_IN_LOG	Indicates whether you log all alerts generated by the job monitor. Valid values: • Y = Log all alerts generated by the job monitor in the Alert Log. • N or blank = Do not log alerts generated by the job monitor.

System Property Settings

The settings below define configuration settings for the Order Administration application server.

Property Name	Description
CC_TOKENIZATION_DEFAULT_LOG_LEVEL	Information will be provided at a later date.
CC_TOKENIZATION_LOG_NAME	Information will be provided at a later date.

Property Name	Description
CHECK_AUTHS_IN_PICKS	Defines whether you can process Streamlined Pick Slip Generation (WSPS) when records exist for your company in the CC Authorization Transaction table. Valid values are: • Y or this setting does not exist = Before processing Streamlined Pick Slip Generation (WSPS), the system first looks for records in the CC Authorization Transaction table for the company for which you are generating pick slips. If records exist in the CC Authorization Transaction table, the system does not continue with pick slip generation and instead generates a Pick Authorization Error Report and a Order Administration Support Notification. Review the records in the CC Authorization Transaction table to determine if you need to use the Reprocess Authorizations Screen (RPAA) to reprocess authorizations and clear the records from the CC Authorization Transaction table. • N = The system allows you to run Streamlined Pick Slip Generation (WSPS) when records exist for your company in the CC Authorization Transaction table. Any records in the CC Authorization Transaction table will be resent for authorization. See Pick Slip Generation Overview.
COMMIT_RATE	The number of records that the Batch Inventory Overlay Upload should process at a time. Normally set to 1000.
CWDIRECTCP_FTP_FOLDER	The location of the FTP script for the POSLog integration (poslog_ftp_commands.script file). This property is set by Oracle and cannot be changed. This folder is also used for the following integrations: • Integration with the Sales Audit Module of the Oracle Retail Merchandising Foundation Cloud Service • Working with the Marketing Download Extract See these integrations for more information.
The CWDIRECTCP_LINK_TEXT and CWDIRECTCP_LINK_URL settings below allow you to add a link to all screens in Order Administration (with the exception of the menu screens, the DITH and MMCM menu options, and the administrative screens such as Job Management and Document Management).	Example: If you enter Go To Google in the CWDIRECTCP_LINK_TEXT setting and http://www.google.com in the CWDIRECTCP_LINK_URL setting, then each screen will have a link that reads Go To Google that will open a new browser window and launch the URL to the Google web site.

Property Name	Description
CWDIRECTCP_LINK_TEXT	Defines the text to display on the Order Administration screens for the link. Example: If you enter Go To CNN, then each screen will have a link that reads Go To CNN. If you are Using Multiple Application Servers If you are using multiple application servers, you will need to update this setting on each server.
CWDIRECTCP_LINK_URL	Defines the URL to launch when a user clicks the link on a Order Administration screen. Example: If you enter http://www.cnn.com, the system opens a new browser window and launches the URL to advance to the CNN web site. If you are Using Multiple Application Servers If you are using multiple application servers, you will need to update this setting on each server.
Password Rules	The following settings identify the requirements for user passwords, including the minimum and maximum length and any required numeric, uppercase, or special characters. **Note:** These settings are not currently used. **When you change password rules:** Your new password rules take effect for new users the next time you reboot Order Administration or the server itself. However, your password rules do not prevent existing users from logging in using passwords created under the previous rules. The new rules apply only when you attempt to change user control record settings or change the password itself. To make sure a user will change the password to conform to the new rules upon the next login, set the user's Password Expired field to a date that is earlier than the current date. See User Configuration in the Administration Guide for more information.
CWDIRECTCP_UPLOAD_DIRECTORY	The location where an import process initially uploads files. This property is set by Oracle and cannot be changed. See Work with File Uploads (WUPL) for more information.
CWDIRECTCP_USPS_UPLOAD_FILE	The temporary location on the Order Administration application server where the system should look for the City State data file when you use the Load USPS Zip Code File (LZPS) to update postal code data. This property is set by Oracle and cannot be changed. **Note:** If you are using multiple application servers, you need to update this setting on each server where you plan to use the Load USPS Zip Code File (LZPS) to update postal code data.

Property Name	Description
CWMQ_TARGET_CLIENT	The default setting is 1.
CWMQ_WAIT_TIME	The default setting is -1.
DEPOSIT_MAX_THREADS	Controls the number of threads available to process deposits. The default setting is 1. Optionally, set it to a higher number to enhance performance. You can enter any positive integer. If the property is empty, missing, or not set to an integer, a setting of 1 defaults. **For more information:** See Processing Auto Deposits (SDEP).
ECOMMERCE_DIRECTORY_PATH	Defines the location on the application server where the system downloads product offer and customer merge information. • The system downloads product offer information to this directory when you download e-commerce offer files (EOFR) and the Generate E-Commerce Offer Tables (M29) system control value is unselected. See Downloading E-Commerce Offer Files (EOFR) for processing details. • The system downloads customer merge information to this directory when Performing a Merge using the Working with Merge/Purge Sold-to Names (MMCS) menu option if the Generate E-Commerce Customer Merge Staging Files (H86) system control value is selected. • The system downloads the AvailabilityWeb XML file to this directory when it receives the E-Commerce Availability Web Request XML Message (AvailabilityWebRequest). This property is set by Oracle and cannot be changed. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)
END_ORDERIN_IJCT_ON_CONNECTION_ERROR	Indicates the action to take when the order API generates an Invalid XML error response, since this error can indicate a database connection problem. If this property is set to Y, when the order API generates an Invalid XML error response, it attempts to verify the database connection. If the attempt is unsuccessful, the system ends the ORDER_IN job and sends a support notification. Otherwise, if this property is set to N or blank or does not exist, the order API continues trying to process order messages in the event of an Invalid XML error response.

<table>
<tr><th>Property Name</th><th>Description</th></tr>
<tr><td>oms.job.purge.retain.days</td><td>The number of days to store jobs and generated reports and forms before they are eligible for deletion. Each time you restart Order Administration, the start up process deletes the following if they are older than the number of days specified here:
• archived reports, including PDF files, XML files, and text files.
• job logs.
• entries in the dbo.Jenasysjob table. This table is used to track submitted jobs.
If you do not define the retention days, Order Administration does not delete outdated documents.
Note:
• The deletion uses both the date and the time in determining whether to purge a document. For example, the current time is 7:00 a.m. and the oms.job.purge.retain.days is set to 30. If the report was created earlier than 7:00 30 days ago, it is eligible for deletion; otherwise, if it was created later than 7:00 30 days ago, it is not currently eligible.
• Certain text files might have a later date than the related PDF files, and so might not be eligible to purge at the same time as the related PDF. For example, if you view a PDF file for a form a day after creating it, Order Administration creates a text file logging that activity for the date when you viewed the PDF.</td></tr>
<tr><td>OROB_DIRECTORY_PATH</td><td>The location on the application server where the system creates Order Orchestration product, product location, and incremental inventory files to import into Order Orchestration.
This property is set by Oracle and cannot be changed.
See Order Orchestration’s Product, Product Location, and Incremental Inventory Import Process.</td></tr>
<tr><td>OROB_IMPORTS_URL</td><td>The URL used to call the Order Orchestration RESTful web service when sending product, product location, and incremental inventory data to Order Orchestration.
For example: https://order_broker_url:port, where order_broker_url is the URL used to connect to Order Orchestration and port if the port number used to connect to Order Orchestration.
See Order Orchestration’s Product, Product Location, and Incremental Inventory Import Process.</td></tr>
</table>

Property Name	Description
OVERLAY_DEBUG	If this property is set to Y, the Batch Inventory Overlay Upload writes entries in the Job.log file, for example: File: INV_OVERLAY_005.TXT Rows: 4 Success: 1 Errors: 3 Start Time: Mon Mar 04 16:03:11 EST 2019 End Time: Mon Mar 04 16:03:11 EST 2019 Time In Seconds: 0.041420431 Time In Minutes: 6.903405166666667E-4
PICKS_IN_SPOOL_FILE	The maximum number of pick slips in a single PDF document. The system continues to break pick slips into separate PDF documents using the criteria outlined under Sorting Pick Slips into Separate PDF Documents; however, if the number of pick slips in a PDF document reaches the number defined in the PICKS_IN_SPOOL_FILE setting, the system creates a new PDF document. **Note:** The system uses the PICKS_IN_SPOOL_FILE setting when printing pick slips through Streamlined Pick Slip Generation (WSPS) and Reprinting and Voiding Pick Slips (WVRP or WSVP). Also, the system uses this setting when printing Gift Acknowledgements. **Working with the pick slip form:** Once the system finishes processing one pick slip PDF document, you can open and print the pick slips in the document using the Forms Management Screen; you do not have to wait until all of the PDF documents for the pick slip generation run have generated. When printing pick slips, the system includes a PDF document sort number in the name of the document generated for the pick slip. For example, if the system generates two pick slip documents for warehouse 1, ship via priority 5, the system names the documents **PICKG.KBROWN.20090804.103001456_001.PDF** and **PICKG.KBROWN.20090804.103001456_002.PDF**, where **PICKG** is the name of the print program, **KBROWN** is the user ID of the person who generated the pick slips, **20090804.103001456** is the date and time stamp, and **001** and **002** is the PDF document sort number. See Form Naming Conventions for more information. **Recommended setting:** The recommended setting is 250 picks. The system also uses 250 as the default value if this setting is blank or missing.

Property Name	Description
	Example: When the PICKS_IN_SPOOL_FILE setting is 600, the system creates the following spool files for a pick slip generation run: • 50 pick slips for warehouse 1, ship via priority 1 (**PICKG.KBROWN.20090804.103000123_001.PDF**) • 300 pick slips for warehouse 1, ship via priority 5 (**PICKG.KBROWN.20090804.103001456_001.PDF**) • 510 pick slips for warehouse 1, ship via priority 9 (**PICKG.KBROWN.20090804.103003789_001.PDF**) • 75 pick slips for warehouse 2, ship via priority 1 (**PICKG.KBROWN.20090804.103006912_001.PDF**) • 225 pick slips for warehouse 2, ship via priority 5 (**PICKG.KBROWN.20090804.103007134_001.PDF**) • 25 pick slips for warehouse 2, ship via priority 9 (**PICKG.KBROWN.20090804.103008112_001.PDF**)

Property Name	Description
	When the PICKS_IN_SPOOL_FILE setting is 250, the system creates the following spool files for the same pick slip generation run: • 50 pick slips for warehouse 1, ship via priority 1 (**PICKG.KBROWN.20090804.103000123_001.PDF**) • 250 pick slips for warehouse 1, ship via priority 5 (**PICKG.KBROWN.20090804.103001456_001.PDF**) • 50 pick slips for warehouse 1, ship via priority 5 (**PICKG.KBROWN.20090804.103001456_002.PDF**) • 250 pick slips for warehouse 1, ship via priority 9 (**PICKG.KBROWN.20090804.103003789_001.PDF**) • 250 pick slips for warehouse 1, ship via priority 9 (**PICKG.KBROWN.20090804.103003789_002.PDF**) • 10 pick slips for warehouse 1, ship via priority 9 (**PICKG.KBROWN.20090804.103003789_003.PDF**) • 75 pick slips for warehouse 2, ship via priority 1 (**PICKG.KBROWN.20090804.103006912_001.PDF**) • 225 pick slips for warehouse 2, ship via priority 5 (**PICKG.KBROWN.20090804.103007134_001.PDF**) • 25 pick slips for warehouse 2, ship via priority 9 (**PICKG.KBROWN.20090804.103008112_001.PDF**) Notice that the system creates multiple spool files for pick slips in warehouse 1, ship via priority 5 and for pick slips in warehouse 1, ship via priority 9, based on 250 in the PICKS_IN_SPOOL_FILE setting.

Clearing the Cache for HTML Email Templates (CEML)

Purpose: To improve performance, Order Administration saves HTML email templates to a cache, and does not refresh the cache until you restart Order Administration. On occasions when you edit an HTML email template and would like to clear the cache without restarting Order Administration, you can use the Clear Email Template Cache option.

Does not apply to shipment emails generated through the Narvar Integration.

How to display this screen: Enter CEML in the Fast path field at the top of any screen, or select Clear Email Template Cache from a menu.

Completing this screen:

1. Select All templates from the Template cache name field.

2. Select Clear cache.

Working with Web Service Authentication (WWSA)

Web service authentication allows you to define a valid web service authentication user for each web service used by Order Administration.

Which web services are eligible? You can define web service authentication for the following:

- Inbound: Web services used to process inbound messages to Order Administration. See Inbound Web Service Authentication Process for Order Administration.
- To Order Orchestration: Web services used to process messages from Order Administration to Order Orchestration. See Web Service Authentication Process for Order Orchestration.
- To Customer Engagement: Web services used to process messages from Order Administration to Customer Engagement. See Web Service Authentication Process for Customer Engagement.
- To OCDS: Web services used for authentication for RESTful web service requests sent to the Omnichannel Cloud Data Service (OCDS). See Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS) for background.
- To RICS: Web services used for authentication for the pre-order (backorder quantity update) notification message (RICS). See Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing) for background.
- Job notifications: A web service to send a job notification to an external system. See *Using the Job Notification Outbound REST Message* in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for more information.

Authentication types: Order Administration supports both basic and OAuth 2 authentication for inbound and outbound messages, although not all integrating systems support OAuth. See Basic or OAuth Authentication for a discussion.

For more information: See Setting Up Web Service Authentication for an overview and a discussion of the different types of authentication, and see the Oracle Retail Omnichannel Web Service Authentication Configuration Guide on My Oracle Support (2728265.1) for web service authentication configuration instructions.

In this topic:

- Basic or OAuth Authentication
- Inbound Web Service Authentication Process for Order Administration
  - Order Administration Web Services Eligible for Authentication
- Work with Inbound Web Service Authentication Screen
- Work with Inbound Web Service Authentication Users Screen
- Add User Window
- Work with Outbound Web Service Authentication Screen
- Change Outbound Web Service Authentication Screen

Basic or OAuth Authentication

Basic authentication requires the requesting system to pass a user ID and a password to authenticate a web service request. The destination system validates the user ID and password.

OAuth requires the requesting system to provide an access token with the web service request. Oracle Cloud Services use IDCS (Oracle Identity Cloud Service) or OCI IAM (Oracle Cloud Infrastructure Identity and Access Management) as the authenticating service. The requesting system will use its configured client ID and secret to request an OAuth token from IDCS or OCI IAM and then include that token in service requests.

If the xx Client ID and Client Secret are not defined in Work with Web Service Authentication (WWSA), Order Administration will use the application client and secret for authentication.

In addition to being more secure, OAuth provides better performance than basic authentication.

> **Note:**
>
> Only OAuth authentication is supported for inbound messages. You can use basic authentication for outbound messages if the external system requires it.

How Requests are Validated with OAuth

OAuth enables web service communication between applications using a token provided by IDCS or OCI IAM rather than a password, providing greater security. The requesting application first passes its:

- Client ID: Similar to a user ID in that it identifies a client application to the authentication service, in this case IDCS or OCI IAM. You can create client IDs through the Manage External Application Access page, in IDCS or OCI IAM, or through other applications, such as Customer Engagement.
- Client secret: A secure code that IDCS or OCI IAM creates for a client application, and that the client application passes to IDCS or OCI IAM for authentication. The client secret should be known only to the requesting application and to IDCS or OCI IAM.

When IDCS or OCI IAM receives the valid client ID and client secret, it then provides the token to the requesting application. The requesting application can then include the token in the web service request to the destination system, which validates the token with IDCS or OCI IAM.

For example, if your ecommerce system will communicate with Order Administration using OAuth, you can use this page to:

- Create a client ID and secret, which you can then provide to the ecommerce system.
- Create the associated web service authentication records for the ecommerce system.

With OAuth authentication:

The requesting system first passes a client ID and a client secret to an authenticating service, such as IDCS or OCI IAM.

- The authenticating service, such as IDCS or OCI IAM, generates a short-lived token.

- The requesting system submits the token to the destination system, rather than a password and user ID as with basic authentication.
- The destination system validates the token and client ID.

The following is required in order to support OAuth with Omnichannel products:

- The IDCS or OCI IAM client ID and client secret for the integrating system must be created through an Omnichannel cloud service, if it does not already exist.
- The system receiving the web service request needs to have a record of the client ID with assigned access for the web service API.
- A system sending the web service request needs to be able to request the token from IDCS or OCI IAM.
- The system sending the web service request needs to include the token so the system receiving the web service request can validate the request.

Configuration for outbound web service authentication: You need to specify an authentication type of either BASIC or OAUTH for each outbound web service from Order Administration. OAuth is supported for the following outbound web services:

- Order Broker 18.2 or higher, or Order Orchestration
- Customer Engagement 18.0 or higher
- Job Notification

OAuth is not currently supported for the RICS Service.

OAuth summary by product:

Product	Supports Receiving OAuth	Supports Sending OAuth
Order Broker	19.0 or higher	19.1.1 or higher
Order Broker Cloud Service	18.2 or higher	19.1 or higher
Order Orchestration	23.2.401.0	23.2.401.0
Order Management System	18.3 or higher; 19.0 or higher supports XOffice OnPrem validation of stores with parent ID. 19.0 or higher. See the **Manage External Application** page in Modern View for background.	19.1 or higher
Order Administration	23.2.401.0	23.2.401.0
Customer Engagement	18.0 or higher; 18.3or higher supports XOffice OnPrem validation of stores with parent ID.	not currently supported

For more information: See the Oracle Retail Omnichannel Web Service Authentication Configuration Guide on My Oracle Support (2728265.1) for web service authentication configuration instructions.

Inbound Web Service Authentication Process for Order Administration

When an external system calls an Order Administration web service, the external system sending the message to Order Administration must send authentication information in the HTTP header of the message.

Oracle Identity Cloud Service: When you use IDCS (Oracle Identity Cloud Service) or OCI IAM (Oracle Cloud Infrastructure Identity and Access Management) for password authentication, you do not define passwords in Work with Web Service Authentication (WWSA) for inbound web services; instead, you can use the Manage External Application Access page in Modern View to create web service authentication records for client applications created in IDCS or OCI IAM that use OAuth authentication. See Basic or OAuth Authentication for a discussion, and see Oracle Identity Authentication (IDCS or OCI IAM) in the Administration Guide.

When Order Administration receives an inbound web service request:

- If the web service passes authentication, the web service continues with regular processing.
- If the web service fails basic authentication, the web service returns a 401 error.

Order Administration Web Services Eligible for Authentication

You must define web service authentication, either through this menu option or through the Manage External Application Access page in Modern View, for the following Order Administration web services.

- CWCustomer: This web service is used to process an *Inbound Customer Message (CWCustomerIn)* received from an external system. See *Generic Customer API* for more information.

  For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
- CWEmailRequest: this web service is used to process an Email Request Message (CWEmailRequest) received from an external system. See Store Pickup Confirmation Email Program (L48) for more information.
- CWMessageIn: This web service works with any of the integration layer processes set up through Working with Integration Layer Processes (IJCT). See XML Messages Processed By the *CWMessageIn Web Service* for a list of the messages processed by the CWMessageIn web service and see *CWMessageIn Web Service* for an overview.
- CWOrderIn: This web service is used to process an *Inbound Order XML Message (CWORDERIN)* from an external system. See *Generic Order Interface (Order API)* for more information.
- CWPickIn: This web service is used to process a *CWPickIn XML Message* from an external system. See *Generic Pick In API (Shipments, Voids, and Backorders)* for more information.
- CWReceiptIn: This web service is used to process a *PO Receipt In XML Message (CWReceiptIn)* from an external system. See *Purchase Order Receipt In API* for more information.
- CWServiceIn: This web service is used to process the following messages received from an external system:

  For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)

  – *Order Transaction History Message (CWOrderTransactionHistory)* if its type attribute is CWOrderTransactionHistory. See *Generic Order Transaction History API* for more information.

  - *Order Line History In Message (CWOrdLnHstIn)* if its type attribute is CWOrdLnHstIn. See *Order Line History In API* for more information in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
  - *Item Availability Request XML Message (CWItemAvailabilityWeb)* if its type attribute is CWItemAvailabilityWeb. See *Item Availability API* for more information.
  - E-Commerce Cancel Request Message (CWCancel) –) if its type attribute is CWCancel. and see E-Commerce Cancel Process for more information.
  - *E-Commerce Catalog Request Message (CWCatRequest)* if its type is CWCatRequest. See *E-Commerce Catalog Requests* for more information.
  - CWProcessIn Message if its type attribute is CWProcessIn. See *Using the CWProcessIn Message to Start a Periodic Process* for more information.

  See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)

- JMSQueue. This web service is used during Advanced Queuing to read from a queue in the queuing database.
- OrderMaintenance. These web services are available to lock or unlock orders, add an order detail line, or cancel an order detail line or an order ship-to. See the Order Administration Order Maintenance Web Service Guide on My Oracle Support (ID 2953017.1) for more information.
- PaymentToken. This web service facilitates refund processing against the original payment in an external system, such as Xstore, for orders that billed through Order Administration, without requiring the customer to submit a credit card for the refund. This option is available for EFTConnect pay types. Oauth is required. See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for details.
- PrivateDataRequest RESTful web service. This web service is used to process a Get Personal Data Request and Forget Personal Data Request from an external system. See the Personal Data API in the Data Security Guide on My Oracle Support (ID 2953017.1) for more information.
- ProcessIn. This RESTful web service is used to start a periodic process. See *Using the ProcessIn REST Message to Start a Periodic Process* for more information.
- Storage. This RESTful web service is used to upload, download, delete, or inquire on files imported or exported through the File Storage API.

Job Notification Outbound Message. This web service is used to notify an external system of a periodic process or job completion. See U*sing the Job Notification Outbound REST Message* for more information.

See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Work with Inbound Web Service Authentication Screen

Purpose: You can use this screen to review inbound web services, and advance to the Work with Inbound Web Service Authentication Users screen, where you can review the client IDs that have been configured for inbound web service authentication.

> **Note:**
>
> Only OAuth authentication is supported for inbound web services. You should use the Manage External Application Access option in Modern View to generate a client ID, obtain the client secret, and define web service access, rather than the Work with Inbound Web Service Authentication screen.

How to display this screen: Enter WWSA in the Fast path field at the top of any menu or select Work with Web Service Authentication from a menu.

Field	Description
Web Service	An Order Administration web service that requires web service authentication. Valid web services are: • CWCustomer • CWEmailRequest • CWMessageIn • CWOrderIn • CWPickIn • CWReceiptIn • CWServiceIn • JMSQueue • JobRun • OrderMaintenance • PaymentToken • PrivateDataRequest • ProcessIn • Storage Enter a full or partial web service name to display web services that contain your entry. See Order Administration Web Services Eligible for Authentication for a summary of each web service. Alphanumeric, 50 positions; optional.

Screen Option	Procedure
Review existing client IDs that are configured for web service authentication for each inbound web service.	Optionally, select Authentication for a web service to advance to the Work with Inbound Web Service Authentication Users Screen, described below, to review existing client IDs. **Note:** Instead of configuring web service authentication here, you should use the Manage External Application Access option in Modern View to generate a client ID, obtain the client secret, and define web service access, rather than the Work with Inbound Web Service Authentication screen.
Configure web service authentication for an external web service	Select Outbound Svcs to advance to the Work with Outbound Web Service Authentication Screen.

Work with Inbound Web Service Authentication Users Screen

Purpose: Optionally, use this screen to review the existing client IDs that have been configured for authentication for inbound web services.

> **Note:**
>
> Only OAuth authentication is supported for inbound web services. You should use the Manage External Application Access option in Modern View to generate a client ID, obtain the client secret, and define web service access. However, you can use this screen to review the existing client IDs that have been configured for web service authentication of inbound web services.

How to display this screen: Select Authentication for a web service on the Work with Inbound Web Service Authentication Screen.

Field	Description
Web Service	The web service requiring authentication. Alphanumeric, 50 positions; display-only.
User	The IDCS or OCI IAM Client ID of the client that requests the OAuth token. **About OAuth:** OAuth is a standard for web service authentication through the use of access tokens rather than passwords. When OAuth is used, the inbound web service request specifies a client ID and a temporary token for authentication, rather than a user ID and a password. You can use the Manage External Application Access page in Modern View to create web service authentication records for applications created in IDCS or OCI IAM that use OAuth authentication. Enter a full or partial user ID to display users that contain your entry. Alphanumeric, 100 positions; optional.

Screen Option	Procedure
Create a web service authentication user	You should not use this option to create a web service user. Instead, use the Manage External Application Access page in Modern View to create web service authentication records for client applications created in IDCS or OCI IAM and using OAuth authentication.
Delete a web service authentication user	Select Delete for a user. At the Are you sure you want to delete the web service user? window, select Yes to delete the user; otherwise, select No to cancel. You can also use the Manage External Application Access page in Modern View to delete web service authentication records for client applications created in IDCS or OCI IAM, if necessary,

Add User Window

Purpose: You should not use this window

How to display this screen: Select Create on the Work with Inbound Web Service Authentication Users Screen.

Field	Description
User	The web service authentication user ID. When you use IDCS (Oracle Identity Cloud Service) or OCI IAM (Oracle Cloud Infrastructure Identity and Access Management) for password authentication, this is the user ID or client ID defined in IDCS or OCI IAM. **About OAuth:** OAuth is a standard for web service authentication through the use of access tokens rather than passwords. When OAuth is used, the inbound web service request specifies a client ID and a temporary token for authentication, rather than a user ID and a password. Use the Manage External Application Access page in Modern View to create web service authentication records for client applications created in IDCS or OCI IAM that use OAuth, such as XOffice on premises. **When OAuth not used:** OAuth is not currently supported for web service requests to Order Administration from older versions of Order Broker. When OAuth is not supported, you should use the Work with Inbound Web Service Authentication screen (WWSA) rather than the Manage External Application Access page in Modern View. Alphanumeric, 100 positions. Add window: required.

Work with Outbound Web Service Authentication Screen

Purpose: Use this screen to define a valid web service authentication user and password for an external web service that requires web service authentication.

You must define web service authentication for each of your Order Administration companies that communicates with the external system. Unlike inbound web service authentication, outbound web service authentication is defined at the company level.

Web service authentication for messages to Order Orchestration or Customer Engagement occurs when the message is received in that application. The web service user for web service authentication on inbound messages to Order Orchestration or Customer Engagement must be defined in that application.

How to display this screen: Select Outbound Svcs at the Work with Inbound Web Service Authentication Screen.

Field	Description
Web Service	An external web service for which you can define a valid web service authentication user and password. **EFTConnect:** The web service used for payment definition and processing, including defining merchant accounts with payment processors and supported payment types. See the Payment Configurations screen in Modern View for more information. **Job Notification:** The Job Notification web service is used to notify an external system about the completion of a periodic process or a job. See *Using the Job Notification Outbound REST Message* in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for more information. **Narvar Service:** Used for authentication of RESTful web service requests to generate shipment notification emails through the Narvar Integration. **Note:** Narvar currently supports only Basic authentication. **OCDS Service:** Used for authentication for RESTful web service requests sent to the Omnichannel Cloud Data Service. See Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS) for background. **Customer Engagement:** Web services listed for Oracle Retail Customer Engagement are: • ORCE Customer • ORCE File Service • ORCE Loyalty • ORCE Purchase History • ORCE Stored Value Card • ORCE Registry See Oracle Retail Customer Engagement Web Services Eligible for Authentication for a summary of each web service.

Field	Description
	Order Orchestration: Web services listed for Order Orchestration are: • OROB Discovery • OROB Locate • OROB Purchasing See Order Orchestration Web Services Eligible for Authentication for a summary of each web service. **Oracle Retail Promotion Engine (ORPE) Web Service Authentication:** Used to create a new Outbound web service authentication record in Outbound Web Service Authentication (WWSA) screen in OACS. **Note:** Only OAuth Authentication is supported for this service and it will not work if Basic is selected. **RICS Service:** Used for authentication for the pre-order (backorder quantity update) notification message that is part of the Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing). **Note:** RICS Service does not support OAuth authentication. See Basic or OAuth Authentication for more information on using OAuth. **Sales Audit File Service:** Used for OAuth authentication for submission of the RTLOG file to object storage for the Sales Audit module of the Oracle Retail Merchandising Foundation Cloud Service. Note that object storage is supported for version 21.0 or higher of the Sales Audit module. See Transmitting the RTLOG File to Object Storage for more information. Alphanumeric, 50 positions; optional.
User/Client ID	The web service authentication user defined for the web service, or the client ID to use for the web service for OAuth authentication. Enter a full or partial user name or client ID to display web service users that contain your entry. See Basic or OAuth Authentication for background. Alphanumeric, 100 positions; optional.
Authentication Type	Indicates the type of authentication to use for the outbound web service: • BASIC: Requests pass a user ID and a password for authentication of the web service. • OAUTH: Requests pass a client ID and a client secret for authentication of the web service. See Basic or OAuth Authentication for background.

Screen Option	Procedure
Define a valid web service authentication user and password or client ID and client secret	Select Change for a web service to advance to the Change Outbound Web Service Authentication Screen.
Configure web service authentication for an Order Administration web service	Select Inbound Svcs to advance to the Work with Inbound Web Service Authentication Screen.

Change Outbound Web Service Authentication Screen

Purpose: Use this screen to define whether the service uses basic or OAuth authentication, and to define a valid:

- User and password if using basic authentication for the web service.
- Client ID and client secret if using OAuth for the web service.

See Basic or OAuth Authentication for background.

How to display this screen: Select Change for a web service on the Work with Outbound Web Service Authentication Screen.

Field	Description
Web Service	The web service for which you wish to define web service authentication. Alphanumeric, 50 positions; display-only.
Authentication Type	Indicates the type of authentication to use for the outbound web service: • BASIC: Requests pass a user ID and a password for authentication of the web service. • OAUTH: Requests pass a client ID and a client secret for authentication of the web service. See Basic or OAuth Authentication for background. Also, see the Work with Outbound Web Service Authentication Screen for information on which outbound web services support basic or OAuth authentication. If you have difficulty seeing both authentication types: Both options for this field may be difficult to see in Internet Explorer if the Enable syncing Internet Explorer settings and data option is not selected at the Advanced tab of the **Internet Options** window for Internet Explorer.
User/Client ID	Depending on the setting of the Authentication Type, this field is: • User (basic authentication): A valid web service authentication user that can authenticate the web service using basic authentication. You must enter the user ID in the correct case. • This user must be defined in the destination system, such as Order Orchestration or Customer Engagement. • Client ID (OAuth authentication): A valid client ID that you can use, along with the client secret, to generate a temporary token for OAuth authentication. In IDCS or OCI IAM, this field is labeled as the Display Name for the client, for example, RGBU_OBCS_<RANDOM>_APPID, where OBCS identifies the application, and <RANDOM> is a series of 8 random characters. The client ID must be defined in the authentication service, such as IDCS or OCI IAM, as well as the destination system. If you use IDCS or OCI IAM, you create the user in IDCS or OCI IAM and import the user into the destination system. Alphanumeric, 10 positions; required.

Field	Description
Password/Client Secret	Depending on the setting of the Authentication Type, this field is: • Password (basic authentication): A valid web service authentication user that can authenticate the web service using basic authentication. You must enter the user ID in the correct case. The password assigned to the web service authentication user. Must match the password in the destination system. You can define both upper and lower case letters for the password. • Client secret (OAuth authentication): The client secret defined for the client ID in the authentication service, such as IDCS or OCI IAM, to generate a temporary token for OAuth authentication. You can regenerate the client secret For security reasons, the system masks the password or client secret on the screen and encrypts it in the database. Alphanumeric, 50 positions; required.

Working with Contact Center (WWCC)

Contact Center is the component of Modern View that allows a customer service representative to perform order entry as well as order inquiry and order maintenance functions.

Use this menu option to configure which fields display in Contact Center and the order in which fields display on the Order Search page in Contact Center.

In this topic:

- Contact Center Field Display Screen
- Contact Center Order Search Field Sequence Screen

Contact Center Field Display Screen

Purpose: Use this screen to configure which fields display in Contact Center. In addition, you can use this screen to define whether the Phone Number and Email fields in Contact Center display as a hyperlink to directly call or email the customer.

How to display this screen:

- Enter WWCC in the Fast path field at the top of any menu or select Work with Contact Center from a menu.
- Select Configure Field Display on the Contact Center Order Search Field Sequence Screen.

Available Fields to Display

The Available Fields to Display section of the screen lists the fields that are available to display in Contact Center that currently will not display in Contact Center.

To select fields for display: Highlight one or more fields that you wish to select and drag the fields over to the Selected Fields to Display section of the screen.

Selected Fields to Display

The Selected Fields to Display section of the screen lists the fields that will display in Contact Center.

To remove fields from display: Highlight one or more fields that you wish to select and drag the fields over to the Available Fields to Display section of the screen.

Select to set as a hyperlink

The Select to set as a hyperlink section of the screen allows you to define whether the Phone Number and Email fields in Contact Center display as a hyperlink to directly call or email the customer.

Phone set as a hyperlink:

- Selected = The Phone Number field in Contact Center displays as a hyperlink. When you select the Phone Number field in Contact Center, the system advances you to the default application used to initiate phone calls. If a default application is not defined, a window displays where you can select the application to use to call the customer.
- Unselected (default) = The Phone Number field in Contact Center displays as text only.

Email set as a hyperlink:

- Selected (default) = The Email field in Contact Center displays as a hyperlink. When you select the Email field in Contact Center, the system advances you to the default application used for email. If a default application is not defined, a window displays where you can select the application to use to email the customer.
- Unselected = The Email field in Contact Center displays as text only.

Fields Available for Configuration

The following fields are available to display or hide in Contact Center.

Field	Description
Affect Inventory	Defines whether the system reserves an item and reduces inventory for the item after shipment. Valid values are: • Selected = Reserve the item and reduce inventory. • Unselected = Do not affect inventory.
Arrival Date	The date an item is scheduled to be shipped to the customer. Alphanumeric, 6 positions, in user date format.
Backorder Priority	The backorder priority defined for a source code. The system defaults the backorder priority to orders assigned to the source code. • 9 = highest priority • 0 = lowest priority The Evaluate Backorders program runs in the background and matches available inventory to backorders. Numeric, 1 position.
Batch Number	Allows users to search orders based on the error order batch number value. Numeric, 5 positions.

Field	Description
Broker Delivery Type	Defines whether the order is fulfilled through the Order Orchestration Integration. Possible settings are: • Retail Pickup = The order originated in an external system and Order Administration ships the order to the originating retail store location, where the customer picks it up • Delivery = The order originated in an external system, and Order Administration ships the order directly to the customer • Ship for Pickup = The order originated in Order Administration, and Order Administration ships the order ships the order to a designated retail store location, where the customer picks it up • Store Pickup = The order originated in Order Administration, and the customer picks up the order in a designated retail store location where the inventory is currently available **Note:** This setting does not indicate whether the order includes any brokered backorder lines (in which Order Administration assigns backordered items to the Order Orchestration for fulfillment).
Calculate Shipping	Defines whether the system calculates and adds shipping charges to the order. • Selected = The system calculates shipping charges for the order. • Unselected = The system does not calculate shipping charges for the order; the freight method for the source code is ignored.
Cancel Backorder	Defines whether to automatically cancel items that are unavailable (backordered) with the first shipment on the order. Valid values are: • Selected = Cancel backordered items with first shipment. • Unselected = Do not cancel backordered items. If this field is selected, any unshipped line on an order is canceled during billing using the Auto Soldout Cancel Reason (C20), provided this system control value specifies a valid cancel reason code.
Cancel Date	The date the customer wants the order canceled if it has not been shipped. The order is not canceled automatically, but is listed on the Order Cancellation List. You can cancel the order manually or contact the customer to extend the deadline. Numeric, 6 positions (in user date format).
Coordinate Group	A number assigned to two or more items to ensure that they ship together. Numeric, 2 positions; display-only.
Coupon	A code that identifies the coupon applied to an order or order detail line. Alphanumeric, 6 positions; optional.

Field	Description
Coupon Amount	Indicates the amount of the discount. • If the coupon's Discount type is D, this is the dollar discount for the coupon; if this is an order-level coupon, the total dollar discount applies to the eligible order detail line with the highest unit price; if this is a detail-level coupon, the total dollar discount applies to this order line. The total discount amount is prorated against the quantity of the order line. • If the coupon's Discount type is %, this is the percentage discount for the coupon to apply to the eligible items on the order (order-level coupons) or the order detail line (detail-level coupons). Numeric, 13 positions with a 2-place decimal.
Customer Class	A code that categorizes customers at a high level for reporting purposes. You can use customer class codes to: • send offers to a limited group of customers. • restrict item sales to a group of customers. • bypass normal item reservation (If the customer is assigned to a class flagged to bypass reservation, then the bypass setting applies even if the Bypass reservation setting for the customer is unselected). • determine whether to prompt for user-defined fields in order entry. Alphanumeric, 2 positions.
Discount Percent	The percentage discount to apply to an order in Contact Center order entry. Controls whether this field is available at the Select Shipping Option and Enter Other Details step in Contact Center order entry. Does not control whether a discount percentage field is available anywhere else in Contact Center, such as through the Order Summary page. Regardless of this setting, entry of value in this field is restricted if integration to Oracle Retail Promotion Engine (ORPE) is enabled (SCV M77). **Note:** The Discount Percent option is available after the Weight field at the Contact Center Field Display Screen; it is not listed alphabetically. Numeric, 5 positions with a 2-place decimal.
Gift Wrap	A flag that identifies whether an item is gift wrapped. Valid values are: • Selected = Gift wrap the item. • Unselected = Do not gift wrap the item.

Field	Description
Offer Code	A code for the catalog, space, or television advertisement from which you accept quotes and orders. The offer defined for the quote or order controls how to calculate shipping and price items. However, if you override the offer for an item (if the customer is ordering from more than one catalog, for example), demand for the item is attributed to the offer associated with the item rather than the order. Demand represents the number and dollar value of orders placed against an offer. Offers are defined in and validated against the Offer table. You can create and work with offers using the Work with Offers (WOFR) menu option. Alphanumeric, 3 positions.
Phone	The customer’s telephone number. Alphanumeric, 14 positions.
Priority	Used by the Evaluate Backorders program to match items to backorders. Immediate Reservation If you use Immediate Reservation, this value determines the sequence in which orders with backordered items receive inventory. The Evaluate Backorders program uses the priority to determine which backorders receive stock first. Numeric, 1 position.
Purchase Order Number	The customer's purchase order number. Alphanumeric, 15 positions.
Quote Origin	Defines whether the order originated from a pre-order quote. • Selected = The order originated from a pre-order quote. • Unselected = The order did not originate from a pre-order quote.
Recalculate Shipping	Defines whether to recalculate shipping charges. • Selected = Recalculate shipping charges. • Unselected = Do not recalculate shipping charges.
Sales Representative	The person who is credited for making the sale. This is the person who is responsible for obtaining the customer's order; this may not be the same person who enters the order on the system. Sales representatives are defined in and validated against the Salesman table. You can create and work with sales representatives in the Work with Sales Representatives (WSLS) menu option. Numeric, 7 positions.
Sales Representative Store	The store associated with the sales representative.

Field	Description
Shipping	The total charge for shipping the quote or order, not including additional shipping charges. You can define additional shipping charges for a carrier to include standard freight; in this case, this field is blank. See the Add'l freight (Additional freight charges) field. This field also includes service charges by ship via, if any. This field also includes order weight charges based on the ship via defined for each ship to customer on the order. See Working with Ship Via Codes (WVIA). The system calculates shipping charges based on the freight method defined for the source code. If the system calculates freight as a percentage of the merchandise charges, there might be a penny variation in total freight amount due to rounding differences. Numeric, 13 positions with a 2-place decimal.
Source Code	The source code from the order header. Source codes are unique codes used to identify segments of your customer base or a rented list. Each source code is assigned to one offer and one division. Source codes control the freight and pricing method used on an order. Alphanumeric, 7 positions.
Warehouse	A code that identifies the warehouse from which merchandise on the order ships. A value appears in this field only if it was entered during order entry or order maintenance or was passed through the Order Orchestration Integration for a retail pickup or delivery order. Warehouse code: numeric, 3 positions.
Weight	The total shipping weight of the items on the order, excluding soldout, cancelled, and returned items. Numeric, 13 positions with a 3-place decimal.

Contact Center Order Search Field Sequence Screen

Purpose: Use this screen to define the order in which fields display on the **Search for Orders and Customers** page in Contact Center, as well as on the **Home** page.

How to display this screen: Select Configure Search Field Sequence on the Contact Center Field Display Screen.

When you advance to this screen, the system displays the configuration that is currently defined.

Delivered Order Information Settings: The delivered sort order for the Search for Orders panel in Contact Center is:

- Order Number
- Order Date
- Invoice Number
- Alternate Order Number
- Last 4 Digits of Payment Card
- Item ID and SKU

- Order Status
- Origin
- Pick Control Number
- User ID
- Sales Rep Number
- Batch Number

The delivered number of Order Quick Search fields is 1.

The delivered setting of the *Use Oracle Retail Customer Engagement Customer Number on Search* is unselected.

Delivered Customer Information Settings: The delivered sort order for the Search for Customers panel on the **Search for Orders and Customers** page, **Home** page, and search page of **Contact Center Order Entry** is:

- Email Address
- Phone Number
- First Name
- Last Name
- Company Name
- Postal Code
- Customer Number
- Match Code

The delivered number of Customer Quick Search fields is 6.

Field	Description
Search by Order Information Fields	The order in which to display the fields in the Search for Orders panel of the Search for Orders and Customers page, as well as the Home page in Contact Center. You can define the sort order of the following fields: • Order Number • Order Date • Invoice Number • Alternate Order Number • Last 4 Digits of Payment Card • Item ID and SKU • Order Status • Origin • Pick Control Number • User ID • Sales Representative Number Note: The Sales Representative Number field displays only if it has been selected for display on the Contact Center Field Display Screen. • Batch Number

Field	Description
Use Oracle Retail Customer Engagement Customer Number on Search	Indicates whether to search for customers at the Home page or the Search for Orders or Customers page in Contact Center, as well as in Contact Center Order Entry, based on the Order Administration customer number or the Customer Engagement customer number. **Note:** This setting applies only when the ORCE Customer Integration (L37) system control value is set to INTERACT. With this setting, Customer Engagement is the system of record for customers, so Order Administration searches for customers in Customer Engagement, and then uses the information returned from Customer Engagement to update the customer record in Order Administration. **About customer mapping between Order Administration and Customer Engagement:** The mapping of customer records between Order Administration and Customer Engagement uses the following fields: • The customer ID in Customer Engagement is stored as the customer's ORCE Customer ID (RELATE_ID) in Order Administration. • The Order Administration customer number is stored as an alternate key for the customer in Customer Engagement. Because a customer record in Customer Engagement can have multiple alternate keys, the ORCE_ALT_ID_OROMS in Working with Customer Properties (PROP)defines the alternate key used for the Order Administration customer number. **How this flag affects searching for a customer record at the Home page or the Search for Orders or Customers page in Contact Center and requesting a match from Customer Engagement:** If this flag is: • Selected, when the user enters a customer number while searching, Order Administration sends a request to Customer Engagement for a customer who is assigned that Customer Engagement customer ID. • Unselected, when the customer enters a customer number while searching, Order Administration sends a request to Customer Engagement for a customer who is assigned that number as an alternate key, based on the ORCE_ALT_ID_OROMS property setting. **Which customer number displayed in Modern View?** When the ORCE Customer Integration (L37) system control value is set to INTERACT and this flag is: • selected, the customer number displayed in Modern View is the Customer Engagement customer ID. • unselected, the customer number displayed in Modern View is the Order Administration customer number. **Things to note:** • Before selecting this setting, it is important to evaluate any potential confusion that might be caused by displaying the different number for the customer. • This setting does not affect how to update customers in Order Administration based on the information received from Customer Engagement. If Customer Engagement returns information on the customer, the

Field	Description
	customer record is still created or updated regardless of whether the flag is selected. • When this flag is not selected but the ORCE Customer Integration (L37) system control value is set to INTERACT, Customer Engagement returns any customer found that is assigned the entered customer number as an Order Administration alternate key, even if that customer did not previously exist in your Order Administration company. In this case, the customer record is created in Order Administration; or if a customer record already existed in your company with that customer number, the customer's name and address are updated with the information from Customer Engagement. • This flag is also used to determine the customer to retrieve through the Direct Link to Modern View option described in the Modern View online help.
Number of Order Quick Search Fields	The number of fields in the Search for Orders panel of the Search for Orders and Customers page, as well as the Home page in Contact Center in Contact Center. Based on this number, the system displays fields in the sort order sequence that you have defined, and once the maximum number is reached, you must select the Additional Order Search Fields link to display the remaining fields in the defined sort order. Example: If you have defined the following sort order: • Order Number • Order Date • Invoice Number • Alternate Order Number • Last 4 Digits of Payment Card • Item ID and SKU • Order Status • Origin • Pick Control Number • User ID • Sales Representative Number • Batch Number And you have entered 4 in the Number of Order Quick Search Fields, the system initially displays the Order Number, Order Date, Invoice Number, and Alternate Order Number fields in the Search for Orders panel. You must select the Additional Order Search Fields link to display the Last 4 Digits of Payment Card, Item ID and SKU, Order Status, Origin, Pick Control Number, User ID, Sales Representative Number, and Batch Number fields. **Note:** You must enter a number greater than 0 and equal to or less than the number of available fields (12) that display in the Search for Orders panel. Numeric, 2 positions; required.

Field	Description
Search by Customer Information Fields	The order in which to display the fields in Contact Center in the Search for Customers panel of the: • Search for Orders and Customer page • Home page • Contact Center Order Entry You can define the sort order of the following fields: • Email Address • Phone Number Note: The Phone Number field displays only if it has been selected for display on the Contact Center Field Display Screen. • First Name • Last Name • Company Name • Postal Code • Customer Number • Match Code
Number of Customer Quick Search Fields	The number of fields to display in Contact Center in the Search for Customers panel. Based on this number, the system displays fields in the sort order sequence that you have defined, and once the maximum number is reached, you must select the Additional Customer Search Fields link to display the remaining fields in the defined sort order. Example: If you have defined the following sort order: • Email Address • Phone Number • Last Name • Company Name • Postal Code • Customer Number • Match Code And you have entered 4 in the Number of Customer Quick Search Fields, the system initially displays the Email Address, Phone Number, Last Name, and Company Name fields when you are searching for a customer in Contact Center. You must select the Additional Customer Search Fields link to display the Postal Code, Customer Number, and Match Code fields. **Note:** You must enter a number greater than 0 and equal to or less than the number of fields that display in Contact Center for searching. Numeric, 2 positions; required.

Screen Option	Procedure
Change the sort order of the Search by Order Information Fields	Highlight one or more fields that you wish to move and drag the fields up or down to the preferred sort order.
Change the number of fields to initially display in the Search for Orders panel in Contact Center	Enter a number in the Number of Order Quick Search Fields field and select OK.

Screen Option	Procedure
Change the sort order of the Search by Customer Information Fields	Highlight one or more fields that you wish to move and drag the fields up or down to the preferred sort order.
Change the number of fields to initially display in the Search for Customers panel in Contact Center	Enter a number in the Number of Customer Quick Search Fields field and select OK.

Display Active Batch Jobs (DABJ)

Purpose: Use the Display Active Batch Jobs Screen to determine which batch jobs on the Job Management Screen are running successfully.

- Which Jobs are Active Batch Jobs?
- If a Batch Job is not on the Display Active Batch Jobs Screen
- Display Active Batch Jobs Screen

Display Active Batch Jobs

Which Jobs are Active Batch Jobs?

The Display Active Jobs screen displays the batch jobs that are running in the Order Administration application server across all servers, including jobs submitted through the ProcessIn message; see Using the ProcessIn REST Message to Start a Periodic Process in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

If a job is listed but is not actually running, use the JOBCLN periodic function to correct. See Using the JOBCLN Function to Resolve Job Status Across Servers.

If a Batch Job is not on the Display Active Batch Jobs Screen

If the batch job is not displayed on the Display Active Batch Jobs Screen for any of the Order Administration application servers, the batch job is not really running, regardless of the status of the job on the Job Management Screen or the status of the process that submitted the job.

Display Active Batch Jobs Screen

How to display this screen: Enter DABJ in the Fast path field at the top of any menu or select Display Active Batch Jobs from a menu.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Active batch jobs are listed on this screen in job number sequence.

Field	Description
Job	A code identifying the batch job. See Periodic Functions Available to Schedule in the Implementation Guide for information on submitted job names. **Note:** Interactive jobs, such as the job started for each user session (for example, QPADEV0B9A), are not listed on this screen.

Field	Description
User	The user ID of the person who submitted the batch job.
Job Nbr	A system-assigned identification number to track the job. **Note:** The job_number returned to the ProcessIn Message identifies the job that starts the process; this number may not match the one displayed here, which identifies the job that was generated. Also, note that the job number changes when the job switches to a different host. See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Start Time	The date and time when the job went into RUN status on the currently displayed Hostname, even if the job first started on a different host. In Thu Nov 19 15:03:58 EDT 2013 format, where: • Thu = the day of the week • Nov = the month • 18 = the day of the month • 15:03:58 = the time when the job started, in hour, minute, and second format • UTC = the time zone • 2020 = the year
Status	The status of the batch job on the Job Management Screen. Valid values are: • RUN = The batch job is running and the status of the job on the Job Management Screen is accurate. • MSG = The batch job is running, but the status of the job on the Job Management Screen is not accurate. • END = The batch job is running, but a user has manually ended the job on the Job Management Screen. • ERR = The batch job is running, but a user has manually ended the job on the Job Management Screen while its status was MSG. • RMV* = The batch job is running, but a user has removed the job from the Job Management Screen.
Hostname	Indicates where the job is currently running. This information is available to Oracle staff for troubleshooting purposes. Alphanumeric, 50 positions.
Last Program	The last program called by the job. Included for troubleshooting information. Not included for the billing update job (for example, BILL_UPD123, where 123 is the company number) or the deposit job (for example, AUTO_DEP123, where 123 is the company number). Alphanumeric, 50 positions.

Screen Option	Procedure
Refresh data listed on the screen	Select Refresh: • Newly running batch jobs are added to the screen. • Batch jobs that are no longer running are removed from the screen. • The status of batch jobs are updated. • The last program used by batch jobs are updated. **Note:** You receive the error Function key not allowed if you press F5 to refresh the screen; you must select Refresh in order to refresh the data on the screen.

Display Job History (DJHY)

Purpose: Use the Display Job History Screen to research the history of completed batch jobs. Job history displays in descending chronological order (newest to oldest).

Combining search criteria: When searching on this screen, you can combine search criteria to restrict the display to jobs that match all of your entries. For example, you can enter a Job name of PICK_GEN, a Start date of the previous Sunday, and a Start time of 2:00 p.m. (14:00:00) to display pick slip generation jobs started on the previous Sunday at 2:00 p.m. or later.

Tracking the total records evaluated and processed: The DEP_UPDATE (deposits) job and the PICK_GEN (pick slip generation) job also track the Total number of records evaluated and the Total number of records processed. If either of these numbers is equal to or greater than 1, the totals display when you place your cursor over the Job name for these jobs.

> **Note:**
>
> The system does not track total records evaluated and processed when you use the Reprocess Authorizations Screen (RPAA).

Display Job History Screen

How to display this screen: Enter DJHY in the Fast path field or select Display Job History from a menu.

Default sort: The job history records are sorted by default in descending chronological order (newest to oldest) based on start date and time. If multiple jobs have the same start date and time, they are sorted in ascending alphanumeric order.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Field	Description
Hostname	Indicates where the job is currently running. This information is available to Oracle staff for troubleshooting purposes. Optionally, enter a complete, valid host name to display jobs run on that server. Enter a full or partial server name to display job history records that start with your entry. Alphanumeric, 50 positions.
Job No	The system-assigned identification number to track the job. Optionally, enter a job number to display job history records that match your entry exactly. Numeric, 19 positions.
Job Name	The name of the job, such as PICK_GEN or CNTL_ASYNC. The BILL_UPD and AUTO_DEP jobs include the company number as a suffix, for example: BILL_UPD123 or AUTO_DEP123. For the DEP_UPDATE, and PICK_GEN jobs, place your cursor over the job name to display the Total number of records evaluated and the Total number of records processed. These totals display for a job only if at least one of the totals is equal to or greater than 1. Optionally, enter a full or partial job name to display job history records that contain your entry. Alphanumeric, 50 positions.
Job Queue	The job queue where the job runs, such as QSYSNOMAX or QBATCH. Not included for the BILL_UPD or AUTO_DEP jobs. Optionally, enter a full or partial job queue name to display job history records that match your entry. Alphanumeric, 10 positions.
Submitted By	The user ID of the person who submitted the job. Optionally, enter a full or partial user name to display job history records that contain your entry. Alphanumeric, 10 positions.
Start date	The date the job first started, even if it started originally on a different host than the displayed Hostname. Optionally, select a date and press Enter to display job history records from this date or later. Numeric, 6 positions (in user date format).
Start time	The time the job first started, even if it started originally on a different host than the displayed Hostname. Optionally, enter a full or partial time to see job history records with this start time or later. Numeric, 6 positions (HH:MM:SS, 24-hour format).
End date	The date when the job ended, if any. No date is displayed if the job is currently running, or if the BILL_UPD or AUTO_DEP job was submitted while another instance of the job for the same company was running. Numeric, 6 positions (in user date format).
End time	The time when the job ended, if any. No time is displayed if the job is currently running, or if the BILL_UPD or AUTO_DEP job was submitted while another instance of the job for the same company was running. Numeric, 6 positions (HH:MM:SS, 24-hour format).

Monitoring Jobs (WJMO)

The system collects the monitoring information in the Job Monitor Status table. You can review the monitoring information on the Work with Job Monitor Screen (WJMO)

Overview: Job Monitoring provides the ability to monitor jobs to ensure that they are running correctly.

The Job Monitor:

Collects monitoring information, such as:

- Last heartbeat date/time: the last date and time when the system verified the job was running.
- ast transaction date/time: the last date and time when a transaction was processed by the job.

The system collects the monitoring information in the Job Monitor Status table. You can review the monitoring information on the Work with Job Monitor Screen (WJMO).

> **Note:**
>
> If you use multiple application servers, the system collects monitoring information in the Job Monitor Status table across all application servers.

Performs an action when job monitor rules you set up for a job are met, such as:

- receiving an email so that you can react to the condition.
- running a periodic function. For example, you can define a job monitor rule that if the Controlling Async goes down, to run the periodic function that starts the Controlling Async. If you define a periodic function, you can also have the system notify you by email if the condition for the job monitor rule still exists after running the periodic function.

The monitor rules defined for a job can be based on the last update date and time, the last transaction date and time, or query results.

You can define monitor rules for a job on the Work with Job Monitor Rules Screen. When you schedule a job monitor rule, the rule becomes a scheduled job that you can review on the Scheduled Jobs screen.

Additional Job Monitoring

- The Long Running Jobs Monitor watches the batch jobs running on the Job Management Screen and sends a Long Running Jobs Monitor to a specified email address if a job runs without ending longer than a specified time. See Long Running Jobs Monitor for more information on this process and the setup requirements.
- Running a Periodic Process on Server Startup provides the ability when you restart Order Administration (see Restarting Order Administration) for the system to look at the settings in the Monitor Property Settings to determine the periodic process and its assigned periodic functions to run on server startup. See Running a Periodic Process on Server Startup for more information about this process and the setup requirements.

In this topic:

- Job Monitor Setup
- Which Jobs are Monitored?
- Job Monitor Examples
- Work with Job Monitor Screen (WJMO)
- Work with Job Monitor Rules Screen
- Create Job Monitor Rule Screen

Job Monitor Setup

Before you can use the Job Monitor, you must complete the required setup.

- Monitor Properties
- Job Monitor Rules
- Job Monitor Queries

Monitor Properties

The Monitor Properties in Working with Admin Properties (CPRP) contain the settings required to enable the Job Monitor.

Property Name	Description
ALLOW_JOB_ MONITOR	Indicates whether you wish to run the job monitor. Valid values: Y = Run the job monitor. N (default) or blank = Do not run the job monitor. In this situation, the only option on the Work with Job Monitor Rules Screen is to display a rule's settings. **Note:** Set this value to Y for all application servers.
JOB_MONITOR_QUERY_ DIRECTORY	The directory on the application server where you store queries used by the job monitor. An example directory is /domain/conf/ OACSFiles/JobMonitorQueries/, where domain is the installed location of Order Administration.
TRACK_ALERTS_IN_LOG	Indicates whether you log all alerts generated by the job monitor. Valid values: Y = Log all alerts generated by the job monitor in the Alert Log. N or blank = Do not log alerts generated by the job monitor.

Job Monitor Rules

Use the Work with Job Monitor Rules Screen to define monitor rules for a job. For each rule, you can define:

- how often the system evaluates the rule to determine if its condition is met.

- whether the system uses the last update date and time, the last transaction date and time, or query results to determine whether to act on the rule.
- the type of action to perform if the rule's conditions are met, such as:
  - receiving an email so that you can react to the condition.
  - running a periodic function. For example, you can define a job monitor rule that if the Controlling Async goes down, to run the periodic function that starts the Controlling Async. If you define a periodic function, you can also have the system notify you by email if the condition for the job monitor rule still exists after running the periodic function.

Job Monitor Queries

Create any queries for which you wish to receive an alert if the query results come back true. Once you create the query:

- Store these queries in the directory defined for the JOB_MONITOR_QUERY_DIRECTORY property.
- Create a job monitor rule for the **Query** job monitor on the Work with Job Monitor Rules Screen. For this job monitor rule:
- Select to Alert On Query and enter the name of the query that you created.
- Define a schedule when the system determines if the query results come back true.
- Define the action to take if the query results come back true.

Job Monitor Query Examples

Job Monitor Rule	Query Example
receive an alert when the number of records in the billing data queue is equal to or greater than 100	select 'Y' from dual where (Select COUNT(*) from Billing_Header_Data_Queue)>=100
receive an alert if the number of running jobs for the INVTRAN_IN integration layer job is not equal to 3	select 'Y' from dual where (Select COUNT(*) from JenasysJob where jobName in (select ilq_job_name from Integration_Process_Queue where ILP_Process='INVTRAN_IN' and ILQ_Enabled='Y') and status='RUN')=3
receive an alert if no orders were created for the current date	select 'Y' from dual where (select COUNT(*) from Order_Header where CMP_Company=555 and OHD_Order_date=FNSYNONDATE)>0

Which Jobs are Monitored?

The table below lists the jobs you can monitor on the Work with Job Monitor Screen (WJMO). For each job, this table lists:

- The name of the job.
- The type of information collected for each job.
- Heartbeat Only = the job is associated with a heartbeat that the system uses to verify that the job is still active. Currently, there are no jobs associated with a heartbeat only.
- Transactions Only = the job processes transactions.
- Heartbeat and Transactions = the job is associated with a heartbeat and processes transactions.

- Query = the job runs queries not related to the other jobs listed on the Work with Job Monitor screen.
- When the system collects the type of information.
- The purpose of the job.
- The menu option where you can work with the job.

> **Note:**
>
> - If you have the same job running more than once; for example, you have multiple Billing Async jobs running at the same time, the job displays on the Work with Job Monitor Screen (WJMO) only once.
> - If you have the same integration layer job running more than once; for example, you have multiple stored value card activation jobs, each job displays on the Work with Job Monitor Screen (WJMO).

Job	Information Collected	Updated When
MBJC Use Background Job Control (MBJC) to review and work with these jobs.		
BILL_ASYNC background job Processes updates related to shipments and returns.See Working with the BILL_ASYNC Job.	Heartbeat and Transaction date/time	Heartbeat date/time The job reads the billing async data queue every 30 seconds. Transaction date/time The system reads a record from the billing async data queue. **Note:** The system also updates the heartbeat date/time and transaction date/time when you end the asyncs.
CNTL_ASYNC background job Starts and ends each of the background ASYNC jobs. When you start the CNTL_ASYNC job, all of the background ASYNC jobs start; when you end the CNTL_ASYNC job, all of the background ASYNC jobs end. You cannot start or end an individual background ASYNC job.See Working with the CNTL_ASYNC Job.	Heartbeat and Transaction date/time	Heartbeat date/time The job reads the controlling async data queue every 30 seconds. Transaction date/time The system reads a record from the controlling async data queue. **Note:** The system also updates the heartbeat date/time and transaction date/time when you end the asyncs.

Job	Information Collected	Updated When
EBO_ASYNC background job Updates the system tables with reservation and backorder information whenever the inventory level for a backordered item increases. Inventory levels for an item increase when you process inventory transactions, receive purchase orders, or transfer merchandise from suspense.See Working with the EBO_ASYNC Job.	Heartbeat and Transaction date/ time	Heartbeat date/time The job reads the EBO async data queue every 30 seconds. Transaction date/time The system reads a record from the EBO async data queue. **Note:** The system also updates the heartbeat date/time and transaction date/time when you end the asyncs.
ORDR_ASYNC background job Updates the system tables with order and demand information as orders are entered and maintained. See Working with the ORDR_ASYNC Job.	Heartbeat and Transaction date/ time	Heartbeat date/time The job reads the order async data queue every 30 seconds. Transaction date/time The system reads a record from the order async data queue. **Note:** The system also updates the heartbeat date/time and transaction date/time when you end the asyncs.
OTHR_ASYNC background job Updates the system tables with purchase order information when purchase orders are entered, maintained, or received. See Working with the OTHR_ASYNC Job.	Heartbeat and Transaction date/ time	Heartbeat date/time The job reads the other async data queue every 30 seconds. Transaction date/time The system reads a record from the other async data queue. **Note:** The system also updates the heartbeat date/time and transaction date/time when you end the asyncs.
APIs		

Job	Information Collected	Updated When
CUSTIN CWCustomer web service Processes an Inbound Customer Message (CWCustomerIn received from an external system, such as a point-of-sale system. For more information, see the Order Administration Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time The CWCustomer web service processes a CWCustomerIn message.
EMAILREQ CWEmailRequest web service Processes an Email Request Message (CWEmailRequest) received from an integrated point-of-sale system.	Transactions Only date/time	Transaction date/time The CWEmailRequest web service processes a CWEmailRequest message.
ORDERINAPI CWOrderIn web service Processes an Inbound Order XML Message (CWORDERIN) received from an external system, such as a web storefront. For more information, see the Order Administration Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time The CWOrderIn web service processes a CWOrderIn message.
PICKINAPI CWPickIn web service Processes a CWPickIn XML Message received from a warehouse management system. For more information, see the Order Administration Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time The CWPickIn web service processes a CWPickIn message.
RECEIPTIN CWReceiptIn web service Processes a PO Receipt In XML Message (CWReceiptIn) received from a warehouse management system. For more information, see the Order Administration Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time The CWReceiptIn web service processes a CWReceiptIn message.
WPBJ Use Working with Drop Ship Background Jobs (WPBJ) to review and work with this job.		
COLLAB Processes transactions between Order Orchestration's Drop Ship Manager and Order Administration in the Order Orchestration Drop Ship Integration.	Heartbeat and Transaction date/time	Heartbeat date/time The job looks for transactions to process, based on the Delay Time defined for the job. Transaction date/time The job processes a transaction.

Job	Information Collected	Updated When
IJCT This list includes: • any outbound integration layer job that has program ILR0022 defined as its Outbound program, including any jobs that you create. • specific inbound integration layer jobs: – CUSTHIST – CUSTSRCH – INV_INQUIRY – INVTRANIN – ORDLINHIST – ORDTRNHIST – PROCESSIN – RETURNIN Use Working with Integration Layer Processes (IJCT) to review and work with these jobs.		
BILL_UPD At periodic intervals, processes deferred billing updates for records in the Invoice Header table whose Process Date field is 0. The Parameter defined for the BILLUPD periodic function how often the job processes the deferred billing updates. Example: If the Parameter is 60, the system looks for deferred billing updates to process every 60 seconds.See Delay Billing Updates (K85) for processing details.	Heartbeat and Transaction date/time	Heartbeat date/time The BILL_UPD job reads the IL Outbound Trigger table, based on the Parameter defined for the periodic function. Transaction date/time The BILL_UPD job processes a billing transaction. **Note:** This job is no longer associated with the IJCT process in Order Management System 21.2 or higher, or Order Administration.
BROKER Sends and receives order information and updates using Order Orchestration's message formats; see Sample Order Orchestration Messages for examples.	Heartbeat and Transaction date/time	Heartbeat date/time The BROKER job reads the IL Outbound Trigger table, based on the Outbound delay time defined for the job. Transaction date/time The BROKER job processes a broker transaction.
BROKER_ORD Sends and receives new order, pending cancellation requests, and other status updates using Order Orchestration's message formats; see Sample Order Orchestration Messages for examples.	Heartbeat and Transaction date/time	Heartbeat date/time The BROKER_ORD job reads the IL Outbound Trigger table, based on the Outbound delay time defined for the job. Transaction date/time The BROKER_ORD job processes a broker transaction.

Job	Information Collected	Updated When
CUST_OUT Generates an outbound CWCustomerDownload XML message when you create, change, or delete a customer. See Generic Customer Download API for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Heartbeat and Transaction date/ time	Heartbeat date/time The CUST_OUT job reads the IL Outbound Trigger table for CST customer download triggers, based on the Outbound delay time defined for the job. Transaction date/time The CUST_OUT job reads and processes a customer download trigger record in the IL Outbound Trigger table.
CUSTHIST Receives a CustHistRequest for customer order history or information on a specific order, and generates a response (CWCUSTHISTOUT or CWORDEROUT). See Generic Customer History API for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time updated when the job receives and processes a transaction.
CUSTSRCH Receives a CWCustomerInqRequest for information on one or more customers matching specific search criteria, and generates a CWCustomerInqResponse. See Generic Customer Inquiry (Search) API for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time updated when the job receives and processes a transaction.
INV_DOWNLOAD Sends inventory availability information to another system in the CWInventoryDownload message. See Generic Inventory Download API for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Heartbeat and Transaction date/ time	Heartbeat date/time updated by reading the IL Outbound Trigger table. If the table is empty, the system sleeps for the Outbound delay time and then reads the table again. Transaction date/time updated every time the system reads and processes a record in the IL Outbound Trigger table.

Job	Information Collected	Updated When
INV_INQUIRY Receives a CWInventoryInquiryRequest for inventory availability on a specific item/SKU and generates a CWInventoryInquiryResponse. See Generic Customer Inquiry (Search) API for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time updated when the job receives and processes a transaction.
INVOIC_OUT Sends invoice information in the CWInvoiceOut message to another system, such as a retail store, financial system, or warehouse management system. See Generic Invoice Download API for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Heartbeat and Transaction date/time	Heartbeat date/time updated by reading the IL Outbound Trigger table. If the table is empty, the system sleeps for the Outbound delay time and then reads the table again. Transaction date/time updated every time the system reads and processes a record in the IL Outbound Trigger table.
INVTRANIN Receives inventory transactions in the inCreateInvXaction message and updates inventory information, such as in the Item Location and Item Warehouse tables. Any errors create Item Transaction Error records. See Generic Inventory Transaction Upload for an overview.	Transactions Only date/time	Transaction date/time updated when the job receives and processes a transaction.
ITEM_OUT Sends item and SKU information in the CWItemOut message to another system, such as a retail store or warehouse management system. See Generic Item Download API.	Heartbeat and Transaction date/time	Heartbeat date/time updated by reading the IL Outbound Trigger table. If the table is empty, the system sleeps for the Outbound delay time and then reads the table again. Transaction date/time updated every time the system reads and processes a record in the IL Outbound Trigger table.

Job	Information Collected	Updated When
ORDCLNUP Order Cleanup job Rejects any orders that have been “abandoned” on the web storefront if, for example, the customer closes the browser window. This process uses the Time Limit for Suspended E-Commerce Orders (G43) system control value to determine the number of minutes to wait before rejecting an order. Only orders of the type specified in the E-Commerce Order Type (G42) system control value are eligible for cleanup. The system generates the E-Commerce Order Cleanup Log each time it deletes a suspended order. Each time the job rejects an order, it writes a record in the Deleted Order Table.	Heartbeat and Transaction date/time	Heartbeat date/time The job looks for orders to clean up every minute. The system also updates the heartbeat date/time when the job deletes an order. Transaction date/time The job deletes an order.
ORDLINHIST Receives order line history activity for a specified order line on an order, based on XML messages from an external system, such as a warehouse management system. See Order Line History In API. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time updated when the job receives and processes a transaction.
ORDTRNHIST Receives order transaction records for a specified order, based on XML messages from an external system, such as a warehouse management system. You can review the order transaction history records created on the Display Order History Screen. See Generic Order Transaction History API. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time updated when the job receives and processes a transaction.
PICK_OUT Sends a Pick Message from Order Administration (CWPickOut) for each pick slip generated. See Generic Pick Out API for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Heartbeat and Transaction date/time	Heartbeat date/time updated by reading the IL Outbound Trigger table. If the table is empty, the system sleeps for the Outbound delay time and then reads the table again. Transaction date/time updated every time the system reads and processes a record in the IL Outbound Trigger table.

Job	Information Collected	Updated When
PO_OUT Sends a CWPurchaseOrderOut message to a warehouse management system or an EDI vendor. See Generic Outbound Purchase Order API. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Heartbeat and Transaction date/ time	Heartbeat date/time updated by reading the IL Outbound Trigger table. If the table is empty, the system sleeps for the Outbound delay time and then reads the table again. Transaction date/time updated every time the system reads and processes a record in the IL Outbound Trigger table.
PROCESSIN Uses the CWServiceIn Web Service to receive the CWProcessIn message and submit the specified periodic process received from an external system. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time updated when the CWServiceIn web service receives and processes a CWProcessIn message.
RETURN_OUT Sends a Return Authorization Outbound XML Message (CWReturnRAOut) when a return authorization is created, changed, or deleted. See Outbound Return API for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Heartbeat and Transaction date/ time	Heartbeat date/time updated by reading the IL Outbound Trigger table. If the table is empty, the system sleeps for the Outbound delay time and then reads the table again. Transaction date/time updated every time the system reads and processes a record in the IL Outbound Trigger table.
RETURNIN Receives an Return Request Message (CWReturnIn) to create and process a return against a specified order line. Optionally, the process sends an Return Response Message (CWReturnOut) to the external system, indicating if the return processed successfully or if an error occurred. See Inbound Return API for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Transactions Only date/time	Transaction date/time updated when the job receives and processes a transaction.

Job	Information Collected	Updated When
SVC_OUT Sends a Stored Value Card Activation Request to a service bureau. The service bureau returns a Stored Value Card Activation Response to Order Administration. See Stored Value Card Purchase and Activation.	Heartbeat and Transaction date/time	Heartbeat date/time updated by completing a stored value card activation transaction then then sleeping for 2 seconds. Transaction date/time updated every time the SVC_OUT job processes an activation transaction.
SVC_REVRSL Sends a Stored Value Card Authorization Reversal to the service bureau. The service bureau sends a Stored Value Card Authorization Reversal Response to Order Administration. See Stored Value Card Authorization Reversal.	Heartbeat and Transaction date/time	Heartbeat date/time updated by completing a stored value card authorization reversal transaction then sleeping for 2 seconds. Transaction date/time updated every time the SVC_REVRSL job processes an authorization reversal transaction.
VENDOR_OUT Sends a CWVendorOut message to another system, such as a retail store or warehouse management system. See Generic Vendor Download API. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Heartbeat and Transaction date/time	Heartbeat date/time updated by reading the IL Outbound Trigger table. If the table is empty, the system sleeps for the Outbound delay time and then reads the table again. Transaction date/time updated every time the system reads and processes a record in the IL Outbound Trigger table.
Query		
QUERY Runs queries not related to the jobs listed on the Work with Job Monitor screen.	Query Only	The system does not update the heartbeat date/time or transaction date/time for this job. See Job Monitor Queries for more information on how to set up the **Query** job monitor.

Job Monitor Examples

- Job Monitor Example: PICK_OUT
- Job Monitor Example: ORDER_IN

- Job Monitor Example: Query

Job Monitor Example: PICK_OUT

You want to be notified by email every day between 9AM and 5PM when the system does not update the Update Date and Update Time for the PICK_OUT integration layer job, indicating the job is no longer active. The system should send an email 2 minutes after the conditions for the job monitor rule are met (the update date and update time are NOT updated), and then check every 5 minutes to see if the rule's conditions are still met. After 10 minutes, the system should send another email.

You create a job monitor rule with the following rule settings:

- Frequency: Daily
- Start Time: 090000
- End Time: 170000
- Alert On: Update Time
- Alert After: 5 minutes
- Sleep Time: 5 minutes
- Re-alert After: every 10 minutes
- Action Type: Email

The system uses the following calculation to determine if the job monitor rule's conditions are met: current time - alert after minutes > last update time.

At 9:05 the system checks to see if the job monitor rule's conditions are met (the update date and time are not updated, indicating the job is not active). In this example, the PICK_OUT job is not active. The system sends a job monitor rule email to the specified To Email address and updates the Check date and Check time for the rule.

The job monitor rule sleeps for 5 minutes.

At 9:10 (9:05 + 5 minutes sleep), the system checks to see if the job monitor rule's conditions are met (the update date and time are not updated, indicating the job is not active). In this example, the PICK_OUT job is not active. Because the 10 minute re-alert time has been reached, the system sends a job monitor rule email to the specified To Email address and updates the Check date and Check time for the rule.

At 9:15 (9:10 + 5 minute sleep), the system checks to see if the job monitor rule's conditions are met (the update date and time are not updated, indicating the job is not active). In this example, the PICK_OUT job is not active; however, the Re-alert After interval has not been reached.

At 9:20 (9:15 + 5 minutes sleep), the system checks again. If the job monitor rule's conditions are met again, the system generates the job monitor rule email, based on the Re-alert After interval.

Job Monitor Example: ORDER_IN

You want to be notified by email every day between 9AM and 5PM when the system does not update the Transaction Date and Transaction Time for the ORDER_IN integration layer job, indicating web orders are no longer being received. The system should send an email 15 minutes after the conditions for the job monitor rule are met (the transaction date and time are NOT updated, indicating a web order was not received in the last 15 minutes), and then check every 30 minutes to see if the rule's conditions are still met. After 15 minutes, the system should send another email.

You create a job monitor rule with the following rule settings:

- Frequency: Daily
- Start Time: 090000
- End Time: 170000
- Alert On: Transaction Time
- Alert After: 15 minutes
- Sleep Time: 15 minutes
- Re-alert After: every 30 minutes
- Action Type: Email

The system uses the following calculation to determine if the job monitor rule's conditions are met: current time - alert after minutes > last transaction time.

At 9:15 the system checks to see if the job monitor rule's conditions are met (the transaction date and time are not updated, indicating web orders are no longer being received). In this example, the conditions are met. The system sends a job monitor rule email to the specified To Email address and updates the Check date and Check time for the rule.

At 9:30 (9:15 + 15 minutes sleep) the system checks again, but the Re-alert After interval of 30 minutes has not yet been met.

At 9:45 (9:15 + 30 minutes total sleep), the system checks to see if the job monitor rule's conditions are met (the transaction date and time are not updated, indicating web orders are no longer being received). In this example, the conditions are met and the 30 minute re-alert time has been reached. The system sends a job monitor rule email to the specified To Email address and updates the Check date and Check time for the rule.

Job Monitor Example: Query

You want to be notified by email every day between 9AM and 5PM when the number of unprocessed billing async records is equal to or greater than 500 records. The system should send an email 5 minutes after the query results are true, and then check every 10 minutes to see if the rule's conditions are still met. After 30 minutes, the system should send another email.

You create the following query and place the query in the JOB_MONITOR_QUERY_DIRECTORY:

select 'Y' from dual where (Select COUNT(*) from Billing_Header_Data_Queue)>=500

You create a job monitor rule with the following rule settings:

- Frequency: Daily
- Start Time: 090000
- End Time: 170000
- Alert On: Query
- Query: BILLINGRECORDS.TXT
- Alert After: 10 minutes
- Sleep Time: 10 minutes

- Re-alert After: every 20 minutes
- Action Type: Email

At 9:10, the system checks to see if the job monitor rule's conditions are met (the results for the BILLINGRECORDS.TXT query in the JOB_MONITOR_QUERY_ DIRECTORY are Y, indicating there are 500 or more unprocessed billing async records). In this example, the query results are met. The system sends a job monitor rule email to the specified To Email address and updates the Check date and Check time for the rule.

The job monitor rule sleeps for 10 minutes.

At 9:20 (9:10 + 10 minutes sleep), the system checks to see if the job monitor rule's conditions are met (the results for the BILLINGRECORDS.TXT query in the JOB_MONITOR_QUERY_ DIRECTORY are Y, indicating there are 500 or more unprocessed billing async records). However, the Re-alert After of 30 minutes has not yet elapsed.

At 9:30 (9:20 + 10 minutes sleep), the system checks In this example, the conditions are met and the 20 minute re-alert time has been reached. The system sends a job monitor rule email to the specified To Email address and updates the Check date and Check time for the rule.

Work with Job Monitor Screen (WJMO)

Purpose: Use this screen to review and work with the job monitor rules defined for a batch job.

How to display this screen: Enter WJMO in the Fast Path field at the top of any menu or select Job Monitor Status from a menu.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Jobs first display on this screen in alphanumeric job name sequence.

- To review the job with the most recent update, click on the Update Date field until an arrow pointing down displays next to it to display jobs in descending update date sequence.
- To review the job with the most recent transaction, click on the Transaction Date field until an arrow pointing down displays next to it to display jobs in descending transaction date sequence.

Field	Description
Job Name	The name of the job. Place your cursor over the job name to determine if the job is associated with a heartbeat and/or transactions. • Heartbeat Only = the job is associated with a heartbeat that the system uses to verify that the job is still active. Currently, there are no jobs associated with a heartbeat only. • Transactions Only = the job processes transactions. • Heartbeat and Transactions = the job is associated with a heartbeat and processes transactions. • Query = this job runs queries not related to the other jobs listed on the Work with Job Monitor screen. See Which Jobs are Monitored? for a list of jobs that display on this screen and whether the job is associated with a heartbeat and/or transactions. Alphanumeric, 10 positions; display-only.
Update Date	The date when a heartbeat was last processed for the job to verify that the job is still active. If the job also processes transactions, the system also updates this field when a transaction is processed. **Note:** If a job uses a heartbeat and processes transactions, the update date and time may be different from the transaction date and time. Numeric, 8 positions (in user date format); display-only.
Update Time	The time when a heartbeat was last processed for the job to verify that the job is still active. If the job also processes transactions, the system also updates this field when a transaction is processed. **Note:** If a job uses a heartbeat and processes transactions, the update date and time may be different from the transaction date and time. Numeric, 6 positions (HH:MM:SS format); display-only.
Transaction Date	The date when a transaction was last processed by the job. **Note:** If a job uses a heartbeat and processes transactions, the update date and time may be different from the transaction date and time. Numeric, 8 positions (in user date format); display-only.

Field	Description
Transaction Time	The time when a transaction was last processed by the job. **Note:** If a job uses a heartbeat and processes transactions, the update date and time may be different from the transaction date and time. Numeric, 6 positions (HH:MM:SS format); display-only.
Process	The menu option where you can work with the job. Click on this value to advance to the specified menu option.
Rules	Indicates whether any condition rules are defined for the job. Once rules are defined for a job, the color of the Rules icon changes to blue ().

Screen Option	Procedure
Work with the condition rules defined for a job	In the Action drop down list, select Rules for a job to advance to the Work with Job Monitor Rules Screen. **Note:** Once rules are defined for a job, the color of the Rules icon changes to blue ().
Refresh the screen with the most recent Update Date, Update Time, Transaction Date, and Transaction Time	Select Refresh.
Display all jobs in the Job Monitor Status, including jobs that were previously hidden	Select Show All. **Note:** You can use the Hide Job option on the Work with Job Monitor Rules Screen to hide a job so that it does not display on the Work with Job Monitor Screen (WJMO).

Work with Job Monitor Rules Screen

Purpose: Use this screen to define monitoring rules for a job. When these rules are met, you can have the system:

- Notify you by email.
- Run a periodic function, and if the conditions for the rule are still met after the defined sleep time, send an email when the re-alert time is reached.

The condition rules can be based on the last update date and time, the last transaction date and time, or query results.

> **Note:**
>
> If job monitoring does not run on the application server (the ALLOW_JOB_MONITOR property for the application server is set to N), the only option on this screen is to display a rule's settings.

How to display this screen: In the Action drop down list, select Rules for a job on the Work with Job Monitor Screen (WJMO).

Column sort: You can sort on the Rule and Status columns on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Field	Description
Job Name	The name of the job associated with the monitoring rules. This is the job you selected on the Work with Job Monitor Screen (WJMO). Alphanumeric, 10 positions; display-only.
Rule	The name of the job monitor rule. **Note:** When you schedule a job monitor rule, the system uses the first 10 positions of the rule name as the job name that displays on the Scheduled Jobs Screen. Alphanumeric, 25 positions; display-only.
When	Indicates how often the system monitors the job to see if it meets the rule's conditions, based on the Frequency, Start Time, and End Time defined for the rule on the Create Job Monitor Rule Screen. Alphanumeric, 40 positions; display-only.
Status	The status of the job monitor rule. Valid statuses are: • Unscheduled = The rule has been created, but it not in use. • Scheduled = The rule has been created and scheduled, but is not currently running. • Running = The rule is actively running. • Ending = The rule is in the process of ending. Alphanumeric, display-only.
Check Date	The date when the system last compared this rule to the monitoring information for the job to determine if the rule's conditions are met. Numeric, 8 positions (in user date format); display-only.
Check Time	The time when the system last compared this rule to the monitoring information for the job to determine if the rule's conditions are met. Numeric, 6 positions (HH:MM:SS format); display-only.

If you are reviewing the Work with Job Monitor Rules screen from an application server

Screen Option	Procedure
Create a job monitor rule	Select Create to advance to the Create Job Monitor Rule Screen.

Screen Option	Procedure
Hide this job from the Work with Job Monitor Screen (WJMO)	Select Hide Job. **Note:** To redisplay this job, including all other jobs that are hidden, select Show All on the Work with Job Monitor Screen (WJMO).
Review a job monitor rule	Select Display in the Action column for a job monitor rule to advance to the Display Job Monitor Rule screen. All fields on this window are display-only. See the Create Job Monitor Rule Screen for field descriptions. **Note:** This option is available if the status of the job is Unscheduled, Scheduled, Running, or Ending.
Change a job monitor rule **Note:** This option is available only if the Status of the job monitor rule is Unscheduled.	Select Change in the Action column for a job monitor rule to advance to the Change Job Monitor Rule screen. See the Create Job Monitor Rule Screen for field descriptions. **Note:** This option is available if the status of the job is Unscheduled.
Run a job monitor rule **Note:** This option is available only if the Status of the job monitor rule is Unscheduled or Scheduled.	Select Start in the Action column for a job monitor rule to change its status to Running. At the Confirm window, select OK to start running the rule; otherwise, select Cancel. **Note:** This option is available if the status of the job is Unscheduled or Scheduled and the start time is met. When you start a job monitor rule, the system changes the status of the job to Running.
Stop a job monitor rule **Note:** This option is available only if the Status of the job monitor rule is Running.	Select Stop in the Action column for a job monitor rule. At the Confirm window, select OK to stop running the rule; otherwise, select Cancel. **Note:** This option is available if the status of the job is Running. When you stop a rule, the system changes its status from Running to Ending, and then to Unscheduled or Scheduled.
Schedule a job monitor rule **Note:** This option is available only if the Status of the job monitor rule is Unscheduled.	Select Schedule in the Action column for a job monitor rule to change its status to Scheduled. At the Confirm window, select OK to schedule the rule; otherwise, select Cancel. **Note:** This option is available if the status of the job is Unscheduled. When you schedule a job monitor rule, the system displays the job on the Scheduled Jobs Screen. The first 10 positions of the job monitor rule name displays as the job name on the screen. If the job monitor rule runs a periodic process, the system also displays the periodic process on the Scheduled Jobs screen and schedules the periodic process to run 1 minute after the associated job monitor rule. Once the periodic process runs, the system removes it from the Scheduled Jobs screen.

Screen Option	Procedure
Unschedule a job monitor rule	Select Unschedule in the Action column for a job monitor rule to change its status to Unscheduled. At the Confirm window, select OK to schedule the rule; otherwise, select Cancel. **Note:** This option is available if the status of the job is Scheduled.
Delete a job monitor rule	Select Delete in the Action column for a job monitor rule. At the Confirm window, select OK to delete the rule; otherwise, select Cancel. **Note:** This option is available if the status of the job is Unscheduled.

Create Job Monitor Rule Screen

Purpose: Use this window to define settings for a job monitor rule.

How to display this screen: Select Create on the Work with Job Monitor Rules Screen.

Field	Description
Job Name	The name of the job associated with the monitoring rule. This is the job you selected on the Work with Job Monitor Screen (WJMO). Alphanumeric, 10 positions; display-only.
Rule	The name of the job monitor rule. **Note:** When you schedule a job monitor rule, the system uses the first 10 positions of the rule name as the job name that displays on the Scheduled Jobs Screen. Alphanumeric, 25 positions; required.
Frequency	How often the system monitors the job to see if it meets the rule's conditions. Valid values: • Daily: the system monitors the job for this rule every day. • Weekdays: the system monitors the job for this rule every Monday, Tuesday, Wednesday, Thursday, and Friday. • Weekends: the system monitors the job for this rule every Saturday and Sunday. • Monday: the system monitors the job for this rule every Monday. • Tuesday: the system monitors the job for this rule every Tuesday. • Wednesday: the system monitors the job for this rule every Wednesday. • Thursday: the system monitors the job for this rule every Thursday. • Friday: the system monitors the job for this rule every Friday. • Saturday: the system monitors the job for this rule every Saturday. • Sunday: the system monitors the job for this rule every Sunday. Alphanumeric; required.

Field	Description
Start Time	Defines the start time when the system monitors the job to see if it meets the rule's conditions. You must enter the start time in HHMMSS military format; for example, enter 07:00:00 to indicate a start time of 7 AM. **Note:** Valid entries are 00:00:00 - 23:59:59. The start time must be earlier than the end time. Numeric, 6 positions; required.
End Time	Defines the end time when the system monitors the job to see if it meets the rule's conditions. You must enter the end time in HHMMSS military format; for example, enter 17:00:00 to indicate an end time of 5 PM. **Note:** Valid entries are 00:00:00 - 23:59:59. The end time must be later than the start time. Numeric, 6 positions; required.
User	The user ID associated with the job monitor rule. The user ID defaults to the user that is creating or updating the rule, but you can override it. User IDs are defined in and validated against the User table. Alphanumeric, 10 positions; required.
Alert On	Defines the factor the system evaluates to determine if the job meets the rule's conditions. Valid values: • Update Time: The system evaluates the job's last update date and time to determine if the job meets the rule's conditions. • Transaction Time: The system evaluates the job's last transaction date and time to determine if the job meets the rule's conditions. • Query: The system evaluates the results of the query specified for the rule to determine if the job meets the rule's conditions. Alphanumeric, required.
Query	The name of the query whose results the system evaluates to determine if the job meets the rule's conditions. The query must be located in the directory defined in the JOB_MONITOR_QUERY_ DIRECTORY property. Alphanumeric, 25 positions; required if Alert On is set to Query.

Field	Description
Alert After	The number of minutes to wait before the system can initially generate an alert. Typically equal to or a multiple of the Sleep Time. Example: • Alert After is set to 10 minutes • Sleep Time is set to 5 minutes • Start Time is set to 08:00. Result: • Based on the Sleep Time, the system first evaluates the job's status at 8:05 (5 minutes after the start time). The number of minutes specified as the Alert After has not passed. • Based on the Sleep Time, the system then evaluates again at 8:10, and at that point the Alert After has been met. The system generates the alert. **Note:** If the Sleep Time is greater than the Alert After time, the initial alert is not generated until the Sleep Time elapses. For example, if the Alert After is set to 5 minutes, but the Sleep Time is set to 10 minutes, the system does not check the job's status until 10 minutes after the start time. For more information: See Job Monitor Examples for more examples. Numeric, 3 positions; required.
Sleep Time	The number of minutes to wait before checking or re-checking the condition to determine whether it is time to generate an alert. Used in combination with: • Alert After: How long to wait before generating the initial alert. • Re-alert After: How long to wait between checking whether to generate additional alerts. The Alert Time and Re-alert After Time would typically be multiples of the Sleep Time. For example, if the Sleep Time is 5 minutes, the Alert Time and Re-alert After Time might be 10 minutes or 15 minutes. See Alert After, above, and Re-alert After, below, for examples. Also, see Job Monitor Examples for more examples. Numeric, 3 positions; required.

Field	Description
Re-alert After	The number of minutes to wait before generating an alert after the initial alert is generated. Typically equal to or a multiple of the Sleep Time. Example: • Sleep Time is set to 5 minutes • Alert After is set to 5 minutes • Start Time is set to 8:00 • Re-alert After is set to 10 minutes. Result: • The system first evaluates the job's status at 8:05 (based on the Sleep Time) and generates the first alert (based on the Alert After time of 5 minutes). • The system checks again at 8:10 (based on the Sleep Time) and finds that the Re-alert After time has not elapsed. • The system then checks again at 8:15 (based on the Sleep Time) and finds that the Re-alert After time has elapsed, so it generates another alert. • The next time that another alert will be generated is 8:25. • The system continues to check every 5 minutes, and generates the re-alert each time an additional 10 minutes has passed. For more information: See Job Monitor Examples for more examples. Numeric, 3 positions; optional.
Action Type	Defines the type of action to take when the job meets the rule's conditions. Valid values: • Email: Send an email to the specified To Email. • Periodic Process: Run the specified periodic process. **Note:** When the Action Type is Periodic Process, define a From Email Alias, Subject, To Email, and Email Text to have the system send an email alert if the condition for the job monitor rule still exists after running the periodic function. The system will continue to send an email alert until the condition is no longer met or the end time is met. Alphanumeric, required.
Periodic Process	The code for the periodic process to run. Periodic processes are defined in and validated against the Periodic Process table. Alphanumeric, 10 positions; required if Action Type is Periodic Process.
Process Company	The code for the company to run the periodic process. Company codes are defined in and validated against the Company table. Numeric, 3 positions; optional.
From Email Alias	The "from" email alias to display with the "from" address for emails, for example, My Email Alias <no-reply@omni.retail.oraclecloud.com>. The actual "from" address is set by Oracle and cannot be changed. Alphanumeric, 50 positions; required if Action Type is Email.

Field	Description
Subject	The subject of the job monitor rule email. Alphanumeric, 50 positions; required if Action Type is Email.
To Email	The list of email addresses that receive the job monitor rule email. Each email address entered must be separated by a semi-colon (;). For example: email1@add.com;email2@add.com. See WJMOEmail Address Validation. Alphanumeric, 200 positions; required if Action Type is Email.
Email Text	The text to display in the body of the job monitor rule email. Alphanumeric, 255 positions; required if Action Type is Email.

5 Accounting Setup

Setting Up the Accounting Tables

This part describes how to access the accounting tables, how to create and maintain records within the tables, and how to change, delete or display the records within the tables.

- Working with Entities (WENT) describes creating, changing, deleting, and displaying entity codes.
- Working with Divisions (WDIV) tells you how to create, change, delete, and display divisions, how to assign a division to an entity, and how to display divisional history (summary statistics of a division's sales performance).
- Working with Pay Types (WPAY) explains how to create, change, delete, and display pay types. This topic includes information about specifying the financial conditions under which an order will go on hold and describing the characteristics of the credit cards you honor (for example, length of card number, leading digits, authorization and deposit services).
- Working with Banks (WBNK) discusses how to create, change, delete, and display bank information including bank codes and their descriptions and the transit number associated with a bank.
- Working with Accounting Periods (WACP) explains how to create, change, delete, display and close accounting period information including specifying year, start date, and end date for the period.
- Working with Currency (WCUR) includes how to create, change, delete, and display currency information.
- Working with Sales Representatives (WSLS) describes how to create, change, delete, and display sales representative information. This topic includes information about your sales representatives, the center to which they are assigned, and their commission and bonus structure.
- Salesman Associate Upload describes how to upload salesman information from an external system to create or update records the Salesman table.

Working with Entities (WENT)

Purpose: Use the Entities function to add or maintain entities, their descriptions, and override settings such as email options. Entities are an important component of the Order Administration sales reporting hierarchy, and can represent the business units within your company (for example, mail order, retail, wholesale). Every sale, return, exchange, discount, and write-off is attributed to an entity. Entities should represent any organization within your company that is held accountable for sales performance.

You must create at least one entity.

Email options: You can set entity-level or order type/entity-level overrides for email notifications generated by the system, including the text of the email template, the "from" email address, and whether to generate the *Outbound Email XML Message (CWEmailOut)* or an actual email directly to the customer.

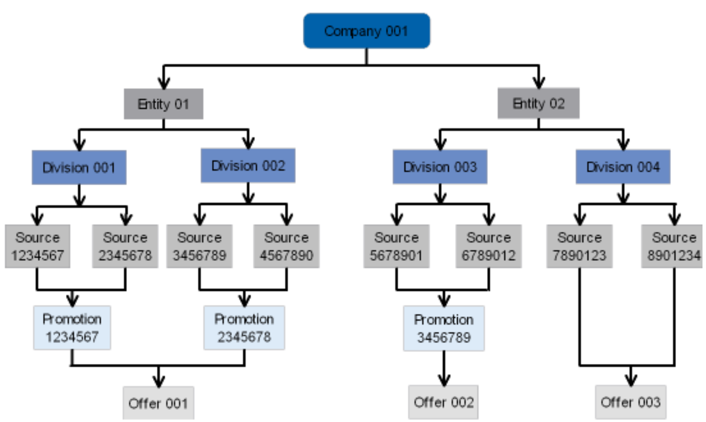
For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

You can also set up system control value overrides at the entity level.

In this topic:

- Order Administration Sales Reporting Hierarchy
- Related System Control Values and Settings
- Work with Entities Screen
- Create Entity Screen
- Work with Entity SCV Overrides Screen
- Edit Pricing Values Screen
- Work with Entity Return Address Screen
- Work with Entity Email Overrides Screen
- Change Email Override Screen
- Entity Email Override by Order Type Screen
- Create Entity Order Type Template Screen
- Change Entity Order Type Template Screen
- Display Entity Email Override Template Screen

Order Administration Sales Reporting Hierarchy



Related System Control Values and Settings

Purpose: These system control values allow you to define additional settings related to the use of entity in your company.

- Display Entity Description (F84): If this system control value is selected, the entity related to an order displays in order inquiry and at the Customer Selection

Screen in order entry. An entity is related to an order through the source code on the order header; when you create a source code, you must associate it with a division, and each division points to an entity. See the Order Administration Sales Reporting Hierarchy chart for an illustration.

> **Note:**
>
> Only the first five characters of the entity description display on the CTI Customer Selection screen.

- Track Customer History at Entity Level (F89): If this system control value is selected, the system tracks each customer's order history separately based on the entity associated with the source code on the order header. You might choose to break out customer history by entity if you have multiple catalogs with distinct identities, yet sharing the same customer list and inventory.

Work with Entities Screen

Purpose: Use this screen to review the entities in your company, or to create, change, delete, or display an entity.

How to display this screen: Enter WENT in the *Fast Path* field at the top of any menu or select Work with Entities from a menu.

Field	Description
Entity	A code that represents the entity. *Numeric, 3 positions; optional.*
Description	The description of the entity code. *Alphanumeric, 25 positions; optional.*

Screen Option	Procedure
Create a new entity code	Select Create to advance to the Create Entity Screen.
Change entity information	Select Change for an entity to advance to the Change Entity screen. At this screen you can change anything but the entity code. See Create Entity Screen for field descriptions.
Delete entity information	Select Delete for an entity to delete it. The system does not display an additional warning if you have taken orders for this entity; use care in deleting.
Display entity information	Select Display for an entity to advance to the Display Entity screen. You cannot change any information on this screen. See Create Entity Screen for field descriptions.
Work with system control value overrides by entity	Select Control Value Overrides for an entity to advance to the Work with Entity SCV Overrides Screen.
Enter or change the return address for printing on customer return labels from the web storefront	Select Return address for an entity to advance to the Work with Entity Return Address Screen.

Screen Option	Procedure
Work with entity-level or entity/order type-level overrides for email notifications	Select Email overrides for an entity to advance to the Work with Entity Email Overrides Screen.
Work with user defined fields	Select User Field for an entity to advance to the Work with User Fields Screen.

Create Entity Screen

Purpose: Use this screen to create an entity code.

How to display this screen: Select Create at the Work with Entities Screen.

Field	Description
Entity	A code that represents an entity. Entities are an important component of the Order Administration sales reporting hierarchy. Entities can represent the business units within your company (for example, mail order, retail, wholesale). Every sale, return, exchange, discount, and write-off is attributed to an entity. Entities should represent any organization within your company that is held accountable for sales performance. You must create at least one entity. *Numeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Description	The description of the entity. *Alphanumeric, 25 positions; required.*
The following address fields may appear on printed forms if your unique printing programs support it.	N/A
Name	The name of the entity. *Alphanumeric, 30 positions; optional.*
Address	Two lines of address information. You must enter at least one line of address information if you complete any of the remaining address fields. *Alphanumeric, 32 positions each; required if you complete any of the address fields.*
City	The city where the entity is located. *Alphanumeric, 25 positions; required if you complete any of the address fields.*
State	The state where the entity is located. The system validates that this is a valid state associated with the Country you enter. See Setting Up the Country Table (WCTY). *Alphanumeric, 2 positions; required if you complete any of the address fields.*

Field	Description
Zip	The zip or postal code where the entity is located. Your entry is not validated against the Postal Code table, and no formatting is applied. *Alphanumeric, 10 positions; required if you complete any of the address fields.*
Country	The country where the entity is located. Your entry is validated against the Country table; see Setting Up the Country Table (WCTY). *Alphanumeric, 3 positions; required if you complete any of the address fields.*
Phone #/Extension	The phone number and extension. You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a phone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and is saved as it was entered by the operator. **Telephone Number Format Examples** An operator enters a phone number containing 10 numbers: 5085550100 The telephone number format used in the United States to represent an area code, local exchange and local phone number is: (508) 555-0100 When an operator enters a phone number containing 10 numbers (as in the example), the phone number displays so that the first 3 positions are in parenthesis and a hyphen is between the sixth and seventh numbers, regardless of how the operator entered it into the system. If an operator enters a phone number containing 6 numbers, for example 5550100 and no format exists for 6 numbers, the phone number would display as it was entered (4293197). See Setting Up the Zip/City/State (Postal Code) Table (WZIP). *Alphanumeric, 14 positions (phone number) and 4 positions (phone extension); optional.*
Retail Brand	The retail brand associated with the entity. Retail brands are used for integration with Order Orchestration's Drop Ship Manager to identify the retail brand for a drop shipment. A retail brand may be associated with one or more entities. Retail brands are defined in and validated against the Retail Brand table. See Working with Retail Brands (WRBD). This field is enterable only if the Use OROB Drop Shipping (H13) system control value is selected. *Alphanumeric, 3 positions; required.*

Work with Entity SCV Overrides Screen

Purpose: Use this screen to work with overrides to System Control table settings based on entity.

Available SCV overrides: Pricing values are available for override at the entity level; see Edit Pricing Values Screen.

How to display this screen: Select Control Value Overrides for an entity at the Work with Entities Screen.

Field	Description
Entity	The entity you selected at the Work with Entities screen. *Numeric, 3 positions; display-only.*
Description	The description of the selected entity. *Alphanumeric, 25 positions; display-only.*
SCV	A number that identifies the system control value to the system. This is an internal code that programs reference when checking a specific system control value. *Alphanumeric, 3 positions; optional.*
App (Application area)	The application area (for example, Order Entry or O/E) to which this system control value belongs. Application areas are used to categorize similar control values, secured features, and menu options by functional area. Once an application area has been assigned to a control value, it cannot be changed. *Alphanumeric, 3 positions; optional.*
Grp (Application group)	The application group to which this system value relates. Application groups further define functions within an application area and are used to categorize similar control values, secured features, and menu options. Examples of application groups with the Order Entry application area are pricing (PRI) and tax. *Alphanumeric, 3 positions; optional.*
Description-value	The description of the system control value. *Alphanumeric, 60 positions; display-only.*
Active	This field indicates whether the *Active override* flag for the entity-level system control value has been selected. If you select this flag, the system updates the Entity System Control Value table. Also, the entity-level settings will override your company-wide entries in the System Control table for any activity within this entity. Valid values are: • Y = Entity-level settings override company-wide system control value settings. • N =Entity-level settings are not in effect.

Screen Option	Procedure
Change an entity-level system control value setting	Select Change for system control value to advance to the Edit Pricing Values Screen.

Screen Option	Procedure
Display an entity-level system control value setting	Select Display for a system control value to advance to the Edit Pricing Values Screen.
View the history of changes to system control value overrides for this entity	Select View History to advance to the Display All System Control Value History Screen. See Display System Control Value History Screen for a discussion of the System Control Value History table.

Edit Pricing Values Screen

Purpose: Use this screen to work with entity-level overrides to your company-wide pricing values in the System Control table. Pricing values control how the system determines item price in order entry and order maintenance.

How to display this screen: Select Change for the Pricing Values system control value at the Work with Entity SCV Overrides Screen.

> **Note:**
>
> Each of the pricing values are described under Pricing Values (B31).

Field	Description
Entity	The entity you selected at the Work with Entities screen. *Numeric, 3 positions; display-only.*
Application code	The application area (for example, Order Entry or O/E) to which this system control value belongs. Application areas are used to categorize similar control values, secured features, and menu options by functional area. Once an application area has been assigned to a control value, it cannot be changed. *Alphanumeric, 3 positions; display-only.*
Active override	If you select this flag, the system updates the Entity System Control Value table. Also, the entity-level settings will override your company-wide entries in the System Control table for any activity within this entity. Valid values are: • Select = Entity-level settings override company-wide system control value settings. • Unselected (default) = Entity-level settings are not in effect.
Application group	The application group to which this system value relates. Application groups further define functions within an application area and are used to categorize similar control values, secured features, and menu options. Examples of application groups with the Order Entry application area are pricing (PRI) and tax. *Alphanumeric, 3 positions; display-only.*

Instructions:

1. Select the Active override flag to have the entity-level pricing values override the company-wide settings.

2. Optionally, complete each of the pricing values. See Pricing Values (B31).

How the system determines how to price orders: When you enter an order, the system determines how to select prices at the time you complete the order header information, including the source code. The system checks the Active override setting for the entity associated with the division specified for this source code. If the Active override flag is selected, the system uses the entity-level pricing values to determine the price of each item on the order. If the Active override flag is unselected, the system uses the company-wide pricing levels from the System Control table.

Work with Entity Return Address Screen

Purpose: Use this screen to create or edit the entity address to print on return labels. The system uses this address only if your web storefront supports printing these labels for return authorizations when customers enter returns on the storefront. See the E-Commerce Interface for more information.

If there is no entity return address: The system uses the address you specify for the company at the Work with Company Return Address Screen if you do not define a return address for the entity associated with an order. An order is associated with an entity through the division assigned to the source code on the order header.

If there is no entity or company return address: If a return address is not specified for the entity associated with the order or for the company, the system uses the address for the Default Warehouse (A04).

How to display this screen: Select Return address for an entity at the Work with Entities Screen.

Completing this screen: Enter the address to appear on return labels for use when customers enter returns through your web storefront. See the Work with Company Return Address Screen for field descriptions. To delete the return address, select Delete.

Work with Entity Email Overrides Screen

Purpose: Use this screen to review and work with email notification overrides for an entity. You can override the "from" email alias, the boilerplate text to print above and below the items, or the *XML only?* checkbox. You can also set up order type/entity overrides for certain notification types.

> **Note:**
>
> An entity-level override is not available for the purchase order email, as the purchase order is not related to a specific entity.

For more information: See Email Setup within Order Administration and Working with E-Mail Notification Templates (WEMT).

How to display this screen: Select Email overrides for an entity at the Work with Entities Screen.

Field	Description
Entity	The entity you selected at the Work with Entities Screen. The description of the entity is to the right. *Entity: numeric, 3 positions; display-only.* *Description: alphanumeric, 30 positions; display-only.*
Type	The email notification type to use the "from" email alias specified for the Directory address and the template text. Email notification types are: • Backorder 1st Notice • Backorder 2nd Notice • Backorder Continue Notice • C/C Credit Acknowledgment • Contact Us • Credit Card Decline • Loyalty Activate Notice • Loyalty Deactivate Notice • Maintenance Failure • Membership Cancel Confirmation • Order Cancellation • Order Confirmation • Order Line Cancellation • Quote Confirmation • Return Confirmation • Shipment Confirmation • Soldout Notification • Store Pickup Confirmation • Stored Value Card Notification **Note:** All notification types available at the entity level are listed, regardless of whether you use the notification in this entity or in your company. The purchase order email template is available only at the company level, since the purchase order is not related to a specific entity. *Alphanumeric, 27 positions; display-only.*
From email alias	The alias to display with the "from" address for emails, for example, My Email Alias <no-reply-omni@oraclecloud.com>. The actual "from" address is set by Oracle and cannot be changed. *Alphanumeric, 50 positions; optional.*

Option	Procedure
Create or change the entity-level override of the “from” email alias and/or template and *XML only?* setting for an email notification type	Select Change for an email notification type to advance to the Change Email Override Screen. **Note:** There is no Create option at this screen; use the Change option to create a new template.
Display the entity-level override of the “from” email alias and/or template and *XML only?* setting for an email notification type	Select Display for an email notification type to advance to the Display Email Override screen. See the Change Email Override Screen for field descriptions.
Delete an email template at the entity level	Select Change for a template to advance to the Change Email Override Screen, where you can delete the contents of the template.
Work with order type/ entity email overrides for the order, shipment, order cancel, or order line cancel notifications	Select Order Type to advance to the Entity Email Override by Order Type Screen.

Change Email Override Screen

Purpose: Use this screen to enter, change, or delete entity-level email override information. See Email Text Templates and “From” Email Alias for a discussion.

How to display this screen: Select Change for an email notification type at the Work with Entity Email Overrides Screen.

Field	Description
Entity	The entity you selected at the Work with Entities Screen. The description of the entity is to the right. *Entity: numeric, 3 positions; display-only.* *Description: alphanumeric, 30 positions; display-only.*

Field	Description
Notice type	The email notification type to use the “from” email alias specified for the *Directory address* and the template text. Email notification types are: • Backorder 1st Notice • Backorder 2nd Notice • Backorder Continue Notice • C/C Credit Acknowledgment • Contact Us • Credit Card Decline • Loyalty Activate Notice • Loyalty Deactivate Notice • Maintenance Failure • Membership Cancel Confirmation • Order Cancellation • Order Confirmation • Order Line Cancellation • Quote Confirmation • Return Confirmation • Shipment Confirmation • Soldout Notification • Store Pickup Confirmation • Stored Value Card Notification **Note:** All notification types available at the entity level are listed, regardless of whether you use the notification in this entity or in your company. However, the purchase order email template is available only at the company level, since the purchase order is not related to a specific entity. *Alphanumeric, 27 positions; display-only.*

Field	Description
XML only	Indicates whether to generate the *Outbound Email XML Message (CWEmailOut)* rather than an actual email notification for notices generated for this entity. This XML message includes additional information that is not included in the standard email notice. You might choose to generate the XML message so that you can use the additional information to produce a reformatted HTML email that includes promotional material. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Valid values are: • Selected = Generate the *Outbound Email XML Message (CWEmailOut)* rather than an actual email • Unselected = Generate the email notification rather than the outbound XML message For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** • This setting applies only if this is the email text template used to generate the notification, as described under HTML Email or Outbound Email XML Message? for a discussion. • This option is not available for the loyalty activation/deactivation email templates. See *Outbound Email API* for an overview, and see HTML Email or Outbound Email XML Message? for a discussion of when the system uses this setting as an override at the entity level. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
From email alias	The alias to display with the “from” address for emails, for example, My Email Alias <no-reply@omni.retail.oraclecloud.com>. The actual “from” address is set by Oracle and cannot be changed. The system uses the following hierarchy in selecting the “from” email alias: 1. Order Type/Entity: If a *From email alias* is specified at the Create Entity Order Type Template Screen or Change Entity Order Type Template Screen, use this alias; otherwise, 2. Entity: If a *From email alias* is specified here for the email notification type, use this alias; otherwise, 3. Company: If a *From email alias* is specified at the Change Company Screen or the Change Company screen, use this alias; otherwise, 4. Display just the actual email address of no-reply@omni.retail.oraclecloud.com without including an alias *Alphanumeric, 50 positions; optional.*
Text to print above items	The standard text to include in each email above the information specific to the order. See the HTML Format Notification Samples and Contents and the Simple Format Notification Sample. See Email Text Templates for information on the hierarchy that determines which text template to use. Setting a “from” email alias override works independently from the email template override. For example, you can override the “from” email alias and not the template, or vice versa. *Alphanumeric, ten 60-position lines; optional.*
Text to print below items	The standard text to include in each email below the information specific to the order. See the HTML Format Notification Samples and Contents and the Simple Format Notification Sample. *Alphanumeric, three 60-position lines; optional.*

Completing this screen:

- **Create a new template:**
  - Optionally, select the *XML only?* flag to *Outbound Email XML Message (CWEmailOut)* rather than an actual email notification.

    For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
  - Optionally, enter a *From email alias* to use an override email alias at the entity level.
  - Enter the *Text to print above items*.
  - Optionally, enter the *Text to print below items*.
  - Click OK when you are done to save your changes, or click Exit to exit without saving.

- **Change an existing template:**
  - Optionally, change the setting of the *XML only?* flag indicating whether to generate the actual email or the *Outbound Email XML Message (CWEmailOut).*

    For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
  - Optionally, enter a *From email alias* to use an override email alias at the entity level.
  - Optionally, change the *Text to print above items* or the *Text to print below items*, or enter additional text.
  - Click OK when you are done to save your changes, or click Exit to exit without saving.
- **Delete an existing template:**
  - Delete each line of text in the *Text to print above items* and *Text to print below items*.
  - Click OK when you are done to delete the template, or click Exit to exit without deleting.

Entity Email Override by Order Type Screen

Purpose: Use this screen to work with entity/order type email text templates, including the “from” email alias and the *XML only?* settings, for the order, shipment, order cancellation, and order line cancellation notifications.

Overrides other templates: If you set up an email override here, it overrides all other email setup at the entity, order type, or order level. See Email Setup within Order Administration for background on the hierarchies that apply to generating email or the *Outbound Email XML Message (CWEmailOut)*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

How to display this screen: Select Order Type at the Work with Entity Email Overrides Screen.

> **Note:**
>
> When you first advance to this screen, it does not display any entity/order type email overrides; you need to use the Create option to create each record.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Field	Description
Order type	An order type to generate the email override. Order types are defined in and validated against the Order Type file. See Establishing Order Types (WOTY) for more information. *Alphanumeric, 1 position; display-only.* **Note:** The order type description is not displayed.
Notification type	The type of notification for the override. Possible notification types are: • Order Cancel Confirmation • Order Line Cancel Confirmation • Order Confirmation • Shipment Confirmation You cannot set up overrides for any other notification types at the entity/order type level.

Option	Procedure
Create an entity/order type email override	Select Create to advance to the Create Entity Order Type Template Screen.
Change an entity/order type email override	Select Change for an existing override to advance to the Change Entity Order Type Template Screen.
Display an entity/order type email override	Select Display for an existing override to advance to the Display Entity Email Override Template Screen.
Delete an entity/order type email override.	Select Delete for an existing override to delete it. At the Confirm Delete window, select Yes to delete the record; otherwise, select No.

Create Entity Order Type Template Screen

Purpose: Use this screen to create a new entity/order type email override by entering the template text to use for the order, shipment, order cancellation, or order line cancellation notification. You can also specify the “from” email alias and the *XML only?* settings.

Overrides other templates: If you set up an email override here, it overrides all other email setup at the entity, order type, or order level. See Email Setup within Order Administration for background on the hierarchies that apply to generating email or XML notifications.

How to display this screen: Select Create at the Entity Email Override by Order Type Screen.

Field	Description
Entity	The code for the entity you selected at the Work with Entities Screen. *Number: numeric, 3 positions; display-only.*

Field	Description
Description	A description of the entity. *Description: alphanumeric, 25 positions; display-only.*
Order Type	Select the type of order to receive the notification for orders in the selected entity. Only order types whose *Email notification* flag is selected are available for selection. **Note:** The order type code is not displayed. *Description: alphanumeric, 30 positions; required.*
Notification Type	Select the type of notification you are creating for the entity/order type override. Available notice types are: • Order Cancel Confirmation • Order Line Cancel Confirmation • Order Confirmation • Shipment Confirmation *Required.*
XML Only?	Indicates whether to generate the *Outbound Email XML Message (CWEmailOut)* rather than an actual email notification for notices generated for this order type and entity. This XML message includes additional information that is not included in the standard email notice. You might choose to generate the XML message so that you can use the additional information to produce a reformatted HTML email that includes promotional material. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Valid values are: • Selected = Generate the *Outbound Email XML Message (CWEmailOut)* rather than an actual email • Unselected = Generate the email notification rather than the outbound XML message For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** This setting applies only if this is the email text template used to generate the notification, as described under HTML Email or Outbound Email XML Message? See *Outbound Email API* for an overview, and see HTML Email or Outbound Email XML Message? for a discussion of when the system uses this setting as an override at the entity level. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
From Email Alias	The alias to display with the "from" address for emails, for example, My Email Alias <no-reply@omni.retail.oraclecloud.com>. The actual "from" address is set by Oracle and cannot be changed. The system uses the following hierarchy in selecting the "from" email alias: uses the following hierarchy in selecting the "from" email alias: 1. Order Type/Entity: If a From email alias is specified at the Create Entity Order Type Template Screen or Change Entity Order Type Template Screen, use this alias; otherwise, 2. Entity: If a From email alias is specified here for the email notification type, use this address; otherwise, 3. Company: If a From email alias is specified at the Change Company Screen, use this address; otherwise, 4. Do not use an email alias You can enter an email alias in upper and lower case. See Email Address Validation for information on how the system verifies that your entry is formatted correctly. Default: • Select Dflt Frm Comp to default the email alias defined at the company level. • Select Dflt Frm Ent to default the email alias defined at the entity level. *Alphanumeric, 50 positions; optional.*
Text To Print Above Items	The standard text to include in each email above the information specific to the order; the system allows your entry in upper and lower case. See the HTML Format Notification Samples and Contents and the Simple Format Notification Sample. See Email Text Templates for information on the hierarchy that determines which text template to use. Setting a "from" email alias override works independently from the email template override. For example, you can override the "from" email alias and not the template, or vice versa. *Alphanumeric, ten 60-position lines; optional.*
Text To Print Below Items	The standard text to include in each email below the information specific to the order; the system allows your entry in upper and lower case. See the HTML Format Notification Samples and Contents and the Simple Format Notification Sample. *Alphanumeric, three 60-position lines; optional.*

Completing this screen: To create an email override at the entity/order type level:

1. Select an Order Type.
2. Select a Notification Type.
3. Optionally, select the XML Only? flag to generate the *Outbound Email XML Message (CWEmailOut)* rather than an actual email notification.

   For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)
4. Optionally, enter a From Email Alias.

5. Optionally, enter the Text To Print Above Items and the Text To Print Below Items.

> **Note:**
>
> When you copy the text from the company-level or entity-level template, it overrides any text currently entered at the entity/order type level. If you then click OK, the system overwrites the previous entity/order type-level text. To restore the text, you need to enter it again.

See the field descriptions above for more information.

Screen Option	Procedure
Default the email alias defined at the company level to the From Email Alias	Select Dflt Frm Comp.
Default the email alias defined at the entity level to the From Email Alias	Select Dflt Frm Ent.

Change Entity Order Type Template Screen

Purpose: Use this screen to change an existing entity/order type notification override that you set up through the Create Entity Order Type Template Screen.

Available options are:

- change the setting of the XML Only? flag
- enter, change, or delete the From Email Alias
- change or delete the Text To Print Above Items or Text To Print Below Items. You can also edit the copied text as needed.

> **Note:**
>
> When you copy the text from the company-level or entity-level template, it overrides any text currently entered at the entity/order type level. If you then click OK, the system overwrites the previous entity/order type-level text. To restore the text, you need to enter it again.

For more information: See the Create Entity Order Type Template Screen for field descriptions.

How to display this screen: Select Change for an existing notification override at the Entity Email Override by Order Type Screen.

Display Entity Email Override Template Screen

Purpose: Use this screen to review an existing entity/order type notification override that you set up through the Create Entity Order Type Template Screen.

You cannot change any information on this screen. See the Create Entity Order Type Template Screen for field descriptions.

How to display this screen: Select Display for an existing template at the Entity Email Override by Order Type Screen.

Working with Divisions (WDIV)

Purpose: You can use the Divisions function to:

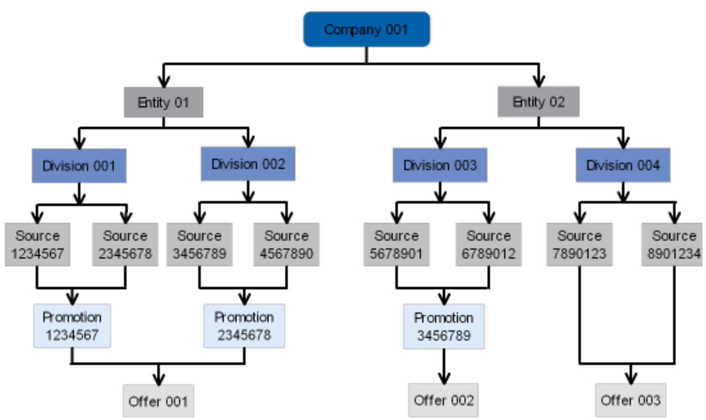
- add or maintain divisions and their descriptions
- assign a division to an entity

Divisions are an important component of the Order Administration sales reporting hierarchy. Divisions can represent groups within business units (for example, winter, spring, summer, fall, and holiday within a business unit called Mail Order). If you are interested in grouping sales within an entity, create divisions. You must create at least one division per entity.

In this topic:

- Work with Divisions Screen
- Create Division Screen
- Display Division History Screen

Example: Within a business unit called Mail Order, you want to keep sales information separate for employees and each of your 5 seasons. Set up 6 divisions: 1 division for employees and 5 divisions to represent each of your seasons.



Work with Divisions Screen

How to display this screen: Enter WDIV in the *Fast Path* field or select Work with Divisions from a menu.

Field	Description
Div (Division)	A code that represents a division. *Alphanumeric, 2 positions; optional.*

Field	Description
Description	The description of the division code. *Alphanumeric, 30 positions; optional.*

Screen Option	Procedure
Create a new division code	Select Create to advance to the Create Division Screen.
Change division information	Select Change for a division to advance to the Change Division screen. At this screen you can change any information except the division code. See Create Division Screen for field descriptions.
Delete a division	Select Delete for a division to delete it.
Display a division	Select Display for a division to advance to the Display Division screen. You cannot change any information on this screen. See Create Division Screen for field descriptions. Select Dsp Div History to advance to the Display Division History Screen.
Review division history	Select History for a division to advance to the Display Division History Screen.
Work with user defined fields	Select User Field for a division to advance to the Work with User Fields Screen

Create Division Screen

Purpose: Use this screen to create a division for an entity in your company.

How to display this screen: At the Work with Divisions Screen, select Create.

Field	Description
Division	A code that represents a division. *Alphanumeric, 2 positions.* *Create screen: required.* *Change screen: display-only.*
Description	The description of the division. *Alphanumeric, 30 positions; required.*
Entity	The entity code to which this division is assigned. Validated against the Entity table; see Working with Entities (WENT). *Numeric, 3 positions; required.*

Field	Description
Bank code	The bank code used by this division. The system uses this bank code when it creates refund records. If you process orders in multiple currencies, each currency is associated with a unique bank; as a result, you must be sure to associate each division with a bank of the correct currency. See Working with Currency (WCUR), for a discussion on how to use the bank code when setting up your company for multi-currency orders. *Alphanumeric, 3 positions; required.*

Display Division History Screen

Purpose: Use this screen to review performance statistics for a division. You cannot change or update any information on this screen.

How to display this screen:

- select History for a division code at the Work with Divisions Screen
- select Display Division History at the Change Division screen or the Display Division screen

Field	Description
Division	A code that represents a division. *Numeric, 2 positions; display-only.*

Field	Description
Sales to date	Number of sales (invoices) for this division. This is a life-to-date figure. If the Consolidated Invoice (B49) system control value is selected, the system creates 1 invoice record for all items on an order that ship on a single day regardless of the number of picks associated with that order. **Note:** An order with multiple recipients (several ship-to addresses) has 1 order number. For an order with multiple recipients, 1 invoice record is created for all packages shipped in a single day. If the *Consolidated Invoice* system control value is unselected, then Order Administration creates an invoice record for every pick on an order that shipped on a single day. **Note:** In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date. *Numeric, 7 positions; display-only.*
Value sales to date	Dollars in sales for this division. This is a life-to-date figure. *Numeric, 20 positions with a 2-place decimal; display-only.*
Returns to date	Number of returns and/or exchanges for this division. This is a life-to-date figure. *Numeric, 7 positions; display-only.*
Value retrns to date (Value returns to date)	Dollars in returns and/or exchanges for this division. This is a life-to-date figure. *Numeric, 20 positions with a 2-place decimal; display-only.*
Sales today	Number of sales (invoices) for this division since the last time you ran Daily Periodic Processing. *Numeric, 7 positions; display-only.*

Field	Description
Value sales today	Dollars in sales for this division since the last time you ran Daily Periodic Processing. *Numeric, 20 positions with a 2-place decimal; display-only.*
Returns today	Number of returns and/or exchanges for this division since the last time you ran Daily Periodic Processing. *Numeric, 7 positions; display-only.*
Value retrns today (Value returns today)	Dollars in returns and/or exchanges for this division since the last time you ran Daily Periodic Processing. *Numeric, 20 positions with a 2-place decimal; display-only*.
Year	Year in which the sales period occurs. *Numeric, 2 positions, optional.*
Period	The sales period within a specified year. *Numeric, 2 positions, optional.*
Sales	Number of sales (invoices) for this division for the year and period displayed. *Numeric, 7 positions; display-only.*
Value sales	Monetary value in sales for this division for the year and period displayed. *Numeric, 20 positions with a 2-place decimal; display-only.*
Returns	Number of returns and/or exchanges for this division for the year and period displayed. *Numeric, 7 positions; display-only.*
Value retrns (Value returns)	Monetary value in returns and/or exchanges for this division for the year and period displayed. *Numeric, 20 positions with a 2-place decimal; display-only.*

Working with Pay Types (WPAY)

Working with Pay Types (WPAY)

Purpose: Use this option to perform the following for stored value card (gift card) or cash/check payment methods:

- add or maintain these payment methods and their descriptions
- specify an alternate refund pay type if your company allows you to change the method by which you refund the customer
- indicate the minimum dollar value and the maximum dollar amounts for which your company will produce a refund
- specify the characteristics of credit cards that your company accepts as a method of payment including the limits, if any, for reauthorizing a credit card order and the authorization and deposit services
- specify the financial conditions under which an order will go on hold (for example, dollar amount limits, balance due)
- specify the cross-reference for a ChannelAdvisor marketplace, so that orders originating in that marketplace are assigned the matching payment method, and specify whether to calculate tax and shipping at the item level or the order level.

Card number layout: You can also use this option define the format for displaying card numbers on screens and reports in Order Administration.

> **Note:**
>
> You cannot use the Work with Pay Types option for creating or changing credit card or wallet pay types; instead, you need to use the Payment Configurations options in Modern View. See the Modern View online help for more information. However, you can display existing credit card or wallet types.

Pay type versus pay category: A pay type defines a specific method of payment such as check, cash, Visa, Mastercard, American Express, etc. Each pay type is assigned to a pay category.

Valid pay categories are:

- Cash/Check
- Credit Card (used for stored value cards)

Charging against pay types: When billing each pay type on a multi-paytype order, the system automatically assigns charge sequences to different payment categories as follows:

Payment Method	Pay Category	Default Charge Sequence
Cash or check	Cash/Check	**1**
Stored value card	Credit Card	**2**
Credit card (any Card type besides a stored value card)	Credit Card	**3**

In addition, the system assigns the charge sequence for the “catch-all” payment method the highest charge sequence. For example, if the charge sequence for a check is 10, the system updates the charge sequence for the credit card on the order to 11 (provided the credit card is the “catch-all”).

Work with Pay Types Screen

How to display this screen: Enter WPAY in the *Fast path* field at the top of any menu or select Work with Pay Types from a menu.

Field	Description
Type	A code that represents the pay type. *Numeric, 2 positions; optional.*
Description	The description of the pay type. *Alphanumeric, 30 positions; optional.*
Category	A code for a category of pay type. Valid values: • **Cash/Check** • **Credit Card** (including stored value card and debit card) *Optional.*

Screen Option	Procedure
Create a pay type code	Select Create to advance to the Create Pay Type Screen. You can create only cash/check or stored value card pay types through this screen. Use the Payment Configurations option in Modern View to create credit card, debit card, or wallet pay types.
Change pay type information	Select Change for a pay type to advance to the Change Pay Type screen. At this screen you can change any information except the pay type code. See the Create Pay Type Screen for field descriptions. You can change only cash/check or stored value card pay types through this screen. Use the Payment Configurations option in Modern View to change credit card, debit card, or wallet pay types.
Delete pay type information	Select Delete for a pay type to delete it. You can delete only cash/check or stored value card pay types through this screen. Use the Payment Configurations option in Modern View to delete credit card, debit card, or wallet pay types.
Display pay type information	Select Display for a pay type to advance to the Display Pay Type screen. You can display any pay type; however, you cannot update any information on this screen. See Create Pay Type Screen for field descriptions.
Work with credit card number format	Select Card Number Format for a Credit Card pay category pay type to advance to the Credit Card Number Format. An error message indicates if the pay type is not a Credit Card pay category pay type: `Not available for this pay type.`
Work with user defined fields	Select User Field for a pay type to advance to the Work with User Fields Screen.

Create Pay Type Screen

Purpose: Use this screen to create a cash/check or stored value card (gift card) pay type code.

How to display this screen: At the Work with Pay Types Screen, select Create.

Field	Description
Pay type	A code that represents a pay type, such as a check, credit card, or stored value card. *Numeric, 2 positions.* *Create screen: required.* *Change screen: display-only.*
Desc (Description)	The description of the pay type. *Alphanumeric, 30 positions; required.*
Category	The category of the pay type. Valid values are: • **Cash/Check** • **Credit Card** (stored value card) *Required.*
Alt refund type (Alternate refund type)	The pay type to use for refunds to this pay type. Complete this field only if the pay type for refunds is different from the pay type used on the order. The system checks the appropriate values defined for the alternate refund pay type, not the original pay type, when generating refunds. The alternate refund type must be a pay category of Cash/ Check or Stored Value Card for *Card type* Stored Value. The system displays an error message if you enter an invalid alternate refund type: `Only SVC pay type OR alt pay category of Cash/Check allowed.` *Numeric, 2 positions; optional.*
Alt refund category (Alternate refund category)	The pay category to which the system-generated refund can be charged during refund maintenance. Valid values are: • **Cash/Check** • **Credit Card** (stored value card) When you define an alternate refund category for a pay type, you give yourself the option of changing the refund to the type that corresponds to this category. The alternate refund category must be a pay category of Cash/Check. *Optional.*
Authorization service	A code for the service bureau that authorizes or declines credit card charges. *Alphanumeric, 3 positions; optional.*

Field	Description
Credit card length	The required length of the stored value card number. You can require any length up to 20 positions. **Note:** The system does not validate the credit card length if you enter a 0 in this field. *Numeric, 2 positions; optional.*
Deposit service	A code for the service bureau that performs stored value card deposits for this pay type. *Alphanumeric, 3 positions; optional.*
Leading digits	The first digits numbers of a valid stored value card number. You can enter up to 4 leading digits. *Numeric, 4 positions; optional.*
Reauthorization days	The number of days before a stored value card authorization expires. **Note:** If online authorization is enabled, you should specify this number of days for a payment method in order to prevent repeated, unnecessary authorization requests. If this field is blank for a stored value card pay type, the authorization expires immediately. Also, if the order is submitted to Order Orchestration for fulfillment, there will be unsuccessful authorization attempts. The REAUTH periodic function uses this date to determine when to attempt to reauthorize an expired authorization. Only pay types that have this field set to a number greater than 0 are eligible for reauthorization attempts. *Numeric, 3 positions; optional.*

Field	Description
Modulus check	This setting indicates if the system performs a calculation against the digits of the stored card number to ensure that the card is valid. Valid values are: • Modulus 10 = for a modulus 10 check • Modulus 11 = for a modulus 11 check • Modulus User Defined = for a user-defined modulus check • blank = no modulus check is performed If you enter MU in this field, the system uses the program name from the User Defined Modulus Check Program (E94) system control value. An error message indicates if a program name has not been defined: `Modulus check program has not been specified for SCV E94.` **Note:** The system cannot perform a modulus check against the number if the number includes spaces; for example: 4111 1111 1111 1111. To perform a modulus check, you must enter the number without any spaces between the numbers; for example: 4111111111111111. *Optional.*

Field	Description
Require start date	Indicates whether to require a start date when the customer uses this stored value card pay type. For example, you might use a start date for a stored value card to indicate the first date when the card is effective. If a start date is required but not entered, the system displays an error message in order entry or maintenance: `Credit card start date (0) is not valid.` The start date is a four-position date in MMYY format, similar to the expiration date. Select this flag if you want to require a start date for this pay type. This is a valid selection only if the pay type is a stored value card. Do not select this field if you do not want to require a start date for the pay type. **Note:** • Even if you require a start date for a pay type, the system does not validate the card based on whether the start date is before or after the current date. Typically, if your authorization service requires a start date for this pay type, the service would validate the start date provided against the current date. • If you require the start date for a stored value card, you will not be able to enter the start date at the recap screen in order entry. Instead, you should advance to the Enter Payment Method screen, where all pay type fields are available for entry.
Card type	Indicates the type of card — Credit Card, Debit Card, Stored Value or Wallet. See Stored Value Card Overview and Setup). You cannot enter a card type for a cash/check pay type. You can define a card number format to specify how the credit card number should display on Order Administration screens and reports for all card types; see Credit Card Number Format for instructions. *Required for stored value card pay types.*

Field	Description
Require expiration date	Indicates whether to require an expiration date when the customer uses this stored value card pay type. If an expiration date is required but not entered, the system displays an error message in order entry or maintenance: `Credit card expiration date (0) is not valid.` The expiration date is a four-position date in MMYY format. • Select this flag if you want to require an expiration date for this stored value card pay type. • Leave this field blank if you do not want to require an expiration date for the pay type.
Send reversal	Defines whether the REVERSE Send Reversals for Expired Authorizations (program name PFR0133) periodic function processes all open Authorization History records for this pay type that are eligible for authorization reversal. • Selected = The REVERSE periodic function processes all open Authorization History records for this pay type that are eligible for authorization reversal. • Unselected = The REVERSE periodic function does not process open Authorization History records for this pay type. See the REVERSE Send Reversals for Expired Authorizations periodic function for processing information. **Note:** This setting does not affect Stored Value Card Reversal with the External Payment Service.

Field	Description
Require issue #	Indicates whether to require an issue number when the customer uses this credit card pay type. Some banks assign an incremental issue number when they replace a card because it is lost or stolen. Select this flag if you want to require an issue number for this pay type. This is a valid selection only if the pay type is a credit card. Do not select this flag if you do not want to require an issue number for the pay type. If an issue number is required but not entered in order entry or order maintenance, the system displays an error message: `Credit card issue# () is not valid.` **Note:** • Debit cards might require a start date, an issue number, both, or neither. Even if a start date or an issue date are not required, you can still enter this information in order entry if it is available. • If you require the issue number for any credit card type besides a debit card, you will not be able to enter the issue number at the recap screen in order entry. Instead, you should advance to the Enter Payment Method screen, where all pay type fields are available for entry. However, if the pay type is a debit card, the system displays a pop-up window from the order recap screen for you to enter additional information such as the issue number and start date, regardless of whether the issue number or start date are required.

Field	Description
Notify of installments	CyberSource: Indicates whether to send a `commerceIndicator` set to `install` in the subsequent authorization and deposit request to CyberSource for an order using a deferred or installment pay plan, or to have the information passed in the `ccAuthService` element similar to other subsequent authorizations, such as a split shipment. **Important:** To determine how to set this flag if you offer deferred or installment billing and use CyberSource, you need to confirm the information that the end processor requires for deferred or installment payment plans for each payment type. Possible settings are: • Selected = The `commerceIndicator` is set to `install` in the authorization and deposit request, and no `subsequentAuthReason`, `subsequentAuthStoredCredential`, or `subsequentAuthOriginalAmount` is passed. • Unselected (default) = The authorization and deposit request includes the `commerceIndicator` set to either `moto` or `internet`, based on where the order originated, and also includes the `subsequentAuthReason`, `subsequentAuthStoredCredential`, and `subsequentAuthOriginalAmount`, similar to the request for a split shipment. External Payment Service: Indicates whether to send a `subsequentAuthReason` of INSTALLMENT in the subsequent authorization request for an order using a deferred or installment pay plan. For External Payment Service: • Selected = The `subsequentAuthReason` is set to `INSTALLMENT` in the authorization request. • Unselected (default) = The `subsequentAuthReason` is set to either `REAUTH`, similar to the request for a split shipment. **For more information:** See: • Subsequent Authorization Requests to CyberSource • Subsequent Authorization Requests through the External Payment Service • Deferred/Installment Billing Overview **Note:** You need to verify that the end processor supports the selected option.

Field	Description
Bal due $ limit (Balance due dollar limit)	If a customer short pays an order by an amount equal to or greater than this amount, the system places the order automatically on BD (Balance Due) hold. **Note:** Orders are evaluated for Bal due $ limit (Balance due dollar limit) and Bal due % limit (Balance due percentage limit). *Balance due % limit* takes precedence over *balance due $ limit*, so the system puts the order on hold when it is underpaid by the percentage even if it not underpaid by the dollar amount. When you apply a cash/check payment method: • If there is a *Bal due % limit* specified, and the order is underpaid by this percentage, put the order on hold; otherwise, • If there is a *Bal due $ limit* specified, and the order is underpaid by this amount, put the order on hold; otherwise, • Do not put the order on hold for an underpayment. Example: A customer underpays a $1,250.00 order by $25.00. The *Balance due $ limit* is $5.00; however, the *Balance due % limit* is 5%. Five percent of this order is $62.50. This order will not go on hold. The customer has underpaid by more than the *Balance due $ limit* but less than the *Balance due % limit*. **Note:** If the underpaid amount is less than the amount specified here (and there is no *Bal due % limit* specified), the order does not go on hold. The system creates a balance due record (negative refund record) and puts this record into a write-off pending status. These refund write-off amounts accumulate for the sold-to customer, and can be applied to a subsequent order as an additional charge. The Default

Field	Description
	Additional Charge Code (C45) to be used in these instances is specified in the System Control table. *Numeric, 13 positions with a 2-place decimal; optional.*
Order $ limit (Order dollar limit)	If the order total meets or exceeds this dollar amount, the system places the order on dollar hold, regardless of the pay category (cash/check or credit card). **Multi-pay orders:** If there is more than one payment method on the order, the system places the order on hold if the order total meets or exceeds the *Order $ limit* for any pay type. Example: The order total is $200.00, and the customer sends a $50.00 check and puts the balance on a credit card. The *Order $ limit* for the check pay type is $150.00, and the *Order $ limit* for the credit card is $250.00. The system places the order on hold, because the order total of $200.00 meets or exceeds the *Order $ limit* of $150.00 for the check pay type (even though the check payment amount is less than the *Order $ limit*). **Cash/check orders:** The system evaluates both *Order $ limit* and Hold days. *Order $ limit* takes priority over *Hold days*. Example: The order total is $350.00 and the customer pays by check. *Order $ limit* is $225.00; *Hold days* is 5. Six days pass; this order will still be on hold. This customer order meets the value specified in *Hold days* but still exceeds the *Order $ limit* specified in this table. The system does not check this setting if: • the order is already on *any type* of system hold • an authorization service has been defined for this payment type; instead, the system places the order payment method automatically on CW (credit wait) hold *Numeric, 13 positions with a 2-place decimal; optional.*
Bal due % limit (Balance due percentage limit)	If a customer underpays on an order by a percentage equal to or greater than this amount, the system places the order on hold. **Note:** Orders are evaluated for both Bal due $ limit (Balance due dollar limit) and *Balance due % limit*. *Balance due % limit* takes priority over *balance due $ limit*. See the Bal due $ limit (Balance due dollar limit) for a discussion. *Numeric, 13 positions with a 2-place decimal; optional.*

Field	Description
Hold days	The number of days to hold an order while waiting for a check to clear the bank. The system releases the order from hold automatically through Daily Periodic Processing once the number specified here has passed. **Note:** Cash/check orders are evaluated for both Order $ limit (Order dollar limit) and Hold days. *Order $ limit* takes priority over *Hold days*. *Numeric, 3 positions; optional.*
Ref chk min (Refund check minimum)	The minimum dollar amount for which you issue a refund. Refunds less than this amount are put in a write-off pending status. These write-off amounts accumulate in the Customer Sold-to table and can be used as an order credit on a subsequent order. The Default Cash Pay Type (C07) to be used in these instances is indicated in the System Control table. If a pay type has an alternate refund type, the system checks the refund check minimum for the alternate refund type. *Numeric, 13 positions with a 2-place decimal; optional.*
Ref chk max (Refund check maximum)	The maximum dollar amount for automatic refund creation. Any refund exceeding this dollar amount is put on hold. For example, if you leave this field blank for a credit card alternate refund type, all refunds will go on hold because they exceed the blank (zero) amount. If a pay type has an alternate refund type, the system checks the refund check minimum for the alternate refund type. *Numeric, 13 positions with a 2-place decimal; optional.*
Release days	The number of days to hold a refund from processing. The system changes the status of the refund to “open” when you process the refund if the release days have passed. This feature ensures that the customer's check for the order clears before you print a refund check for the overpayment. If a pay type has an alternate refund type, the system checks the refund check minimum for the alternate refund type. *Numeric, 3 positions; optional.*
Store tender	A cross-reference to the corresponding tender code in a point-of-sale system. This field is available only if you specify a Default Location for ORCE Integration (K69). This code is passed in the POSLog integration to Customer Engagement as the tender ID, which can be used as a loyalty qualifier. *Alphanumeric, 4 positions; optional.*

Field	Description
CA cross reference #	A cross-reference to a ChannelAdvisor marketplace, set up through Work with ChannelAdvisor Offers Screen, from which you receive orders: • If the CAORDUP periodic function creates an order from ChannelAdvisor, and the `ItemSaleSource` passed for the order matches this cross-reference, the periodic function assigns this payment method to the order. Your marketplace needs to match a ChannelAdvisor Site Token value. • If an order has a payment method whose cross-reference matches a ChannelAdvisor marketplace and also matches the ChannelAdvisor Order Type (L90), the Processing Refunds (MREF) option submits any pending refunds for the order to ChannelAdvisor, and does not actually generate the refund. If more than one pay type has the same matching cross-reference, the periodic function selects the pay type with the highest pay type code. **Cash/check category:** If a *CA cross reference #* is specified, the pay type Category must be Cash/Check. See ChannelAdvisor Integration Overview and ChannelAdvisor Setup. This field is available only if the ChannelAdvisor Order Type (L90) system control value specifies an order type. If you enter a value in this field, then the CA type field is required. *Alphanumeric, 40 positions; optional.*
CA type	Controls how the CAORDUP periodic function calculates shipping and tax, and how refund amounts are passed when Submitting Refunds for ChannelAdvisor Orders. If this field is set to: • Item Level or blank = Consistent with the Amazon and eBay with premium tax marketplaces: – the CAORDUP periodic function calculates shipping and tax based on the amounts in the OrderLineItemItem element – refund processing calculates tax and shipping at the item level and passes these amounts in the RefundItem level in the SubmitOrderRefund message • Order Level = Consistent with the eBay marketplace (without premium tax): – the CAORDUP periodic function uses the tax and shipping amounts from the OrderLineItemInvoice element and prorates them across the lines on the order – the SubmitOrderRefund message specifies amounts at the order level This field is available only if the ChannelAdvisor Order Type (L90) system control value specifies an order type. If a CA cross reference # is specified for the pay type, then this field is required.

Credit Card Number Format

Card number formats allow you to specify which digits of a credit card number are masked on Order Administration screens and reports using a special character, such as an asterisk (*). For example, you may wish to mask all but the last 4 digits of a 16-digit credit card number: ************1111.

Data security: You should set up a masking format for all credit cards. See *Guidelines for Data Security* in the Security document for a checklist of recommended data security settings.

Tokenization: If you use credit card tokenization, the number that is masked is a token, rather than the actual credit card number.

Defining a format: You can use the Card Number Layout Screen to define which digits of the credit card number on Order Administration screens and reports are masked. You can define a separate credit card number format for each Credit Card pay category pay type and also define a default format to use for those Credit Card pay category pay types that do not have a card number format defined.

When a card number displays on a screen or report, the system looks at the pay type associated with the card number to determine which digits of the card number are masked. If the system cannot determine the pay type associated with the card number, the card number displays in the default card number format.

Which Cards are Eligible for Card Number Formatting?

Eligible cards: You can define a card number format for the following types of Credit Card pay category pay types:

- Credit card (*Card type* Credit)
- Debit (Switch) card (*Card type* Debit)
- Stored value card (*Card type* Stored Value)

Ineligible cards: You receive the error message `Not available for this pay type` if you try to define a card number format for any non-pay category Credit Card pay type.

Card number scan screens: You can scan on credit card number at the following Order Administration screens:

- Order Maintenance Selection Screen
- Order Inquiry Scan Screen
- Select Orders For Return Authorization Screen

However, if you have defined a card number format, the credit card numbers that display on the bottom half of the scan screen will be masked by the associated card number format.

In addition, if you have credit card encryption enabled, the system will not find a credit card number match unless you enter the full credit card number in the scan field. The credit card number you entered in the scan field is display-only at the top of the screen and the credit cards that display at the bottom of the screen are masked by the associated card number format.

> **Note:**
>
> If you use credit card tokenization, you will not be able to scan on the full credit card number on these screens since the credit card number has been replaced with a token. Instead, you can scan on the last four digits of the credit card number on these screens; the system advances you to the Scan By CC Last 4 screen, where you can review orders that contain a credit card payment whose *CC Last 4* field in the Order Payment Method table matches the last four digits of the credit card number that you entered in the scan field.

Setting Up a Credit Card Number Format

Use the Unformatted card number positions field on the Card Number Layout Screen as a layout of the number of positions in the *Credit card number* field. There are 20 positions available in a credit card number that you can select to display or mask with a special character.

> **Note:**
>
> Even if a credit card number only includes 16 digits, you will still be required to enter a value in positions 17-20 of the card number format. Enter `17, 18, 19`, and `20` in the respective fields if you do not want a special character to display.

To create or change:

1. At the Work with Pay Types Screen, select Card Number Format for a Credit Card pay category pay type to advance to the Card Number Layout Screen.
2. In the Formatted card number positions fields, decide which digits of the credit card number you wish to display and enter the digit number in the appropriate field. For example, if you wish to display the last 4 digits of a 16-digit card number, enter 13 in field 13, 14 in field 14, 15 in field 15, and 16 in field 16.
3. In the Formatted card number positions fields, decide which digits of the credit card number you wish to mask and enter a special character in the appropriate field. You can enter any special character, such as an asterisk (*) or a number sign (#) as well as any letter, such as C. However, you cannot use a number to mask a credit card number. For example, if you wish to mask all but the last 4 digits of a 16 digit credit card number using an asterisk, enter * in fields 1-12 and enter 13, 14, 15, and 16 in the respective fields.

> **Note:**
>
> You cannot mask the digits of a credit card number using a number. If you enter a number between 1 - 20 in any of the Formatted card number positions fields, the system will display that digit of the credit card number in the position specified. For example, if you enter 9 in field 1, the system will display the 9th digit of the credit card number in position 1 and not the number 9. You will receive an error if you enter a number greater than 20: `Only one character or number 1-20 allowed per position.`

4. Select OK to validate your entries. You must enter a number between 1 and 20 or a special character in each of the *Formatted card number positions* fields.

To delete: To delete a card number format, clear the data in all of the *Formatted card number positions* fields and select OK.

If you delete a card number format, but still have a default credit card number format defined, the card number will display in the default format on Order Administration screens and reports.

Creating a Default Card Number Format

If you wish to assign most of your Credit Card pay category pay types to the same card number format, you can create the format and select the Set as default format field. Any Credit Card pay category pay type that does not have a card number format defined, will use the default card number format.

You can create only 1 default card number format. If you flag a card number format as the default and then create a new card number format and flag it also as the default, the system advances you to the Override Default window, where you must confirm that you wish to change the default card number format.

Select Accept to change the default card number format; otherwise, select Exit to keep the current default card number format.

If you wish to create a default card number format, but still display the entire card number for one of your Credit Card pay category pay types, create a card number format for that pay type and enter all of the card digits in the Formatted card number positions fields: `1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20`. The system will display the entire card number on Order Administration screens and reports.

If you do not define a default card number format, and a format has not been defined for a Credit Card pay category pay type, the system displays the full card number for that pay type on Order Administration screens and reports.

Card Number Format Examples

The table below displays examples of card number formats.

Card Format	Formatted card number positions fields	Card Display
Mask the card number using the number sign.	# # # # # # # # # # # # # # # # # # # #	If the number is 4111111111111111, it displays as: ####################

Card Format	Formatted card number positions fields	Card Display
Display the full card number.	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 **Note:** You may wish to define this format if you have also defined a default card number format and you w	If the number is 4111111111111111, it displays as: 4111111111111111.

Display all but the last 4 digits of a 16-digit card number. For all other digits, display an asterisk.	1 2 3 4 5 6 7 8 9 10 11 12 * * * * 17 18 19 20	If the number is 4111111111111111, it displays as: 411111111111****
Only display the first 4 digits and the last 4 digits of a 16-digit card number. For all other digits, display an asterisk.	1 2 3 4 * * * * * * * * 13 14 15 16 17 18 19 20	If the number is 4111111111111111, it displays as: 4111********1111
Display all of the digits in a 16-digit card number, but display the first 4 digits in the last 4 positions and the last 4 digits in the first 4 positions.	13 14 15 16 5 6 7 8 9 10 11 12 1 2 3 4 17 18 19 20	If the number is 4788250000121443, it displays as: 1111111111114111

Card Number Layout Screen

Use this screen to create a card number format; see Card Number Format for an overview and setup instructions.

How to display this screen: Select Card Number Format for a Credit Card pay category pay type at the Work with Pay Types Screen.

Field	Description
Pay type	The code and description of the credit card pay type assigned to the card number layout. *Pay type code: Numeric, 2 positions; display-only.* *Description: Alphanumeric, 30 positions; display-only.*

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Set as default format</td><td>Indicates if you wish to set this card number format as the default format. Any Credit Card pay category pay type that does not have a card number format defined, will use this format.
Selected = This card number format is the default format to use if a format has not been defined for a Credit Card pay category pay type.
Unselected (default) = This card number format is not the default format and is only used to display card numbers for this pay type.
If you select this flag and a default card number format already exists, the system advances you to the Override Default Window, where you can confirm that you wish to change the default card number format.

Note:
If you do not define a default card number format, and a format has not been defined for a Credit Card pay category pay type, the system displays the full card number for that pay type on Order Administration screens and reports.

See Creating a Default Card Number Format.</td></tr>
<tr><td>Unformatted credit card number positions</td><td>Displays the number of positions available to format in a card number. Use this field as a reference when creating the card number format in the Formatted credit card number positions field.
Alphanumeric, 20 positions; display-only.</td></tr>
</table>

Field	Description
Formatted card number positions	The position and format of each of the card digits to display on Order Administration screens and reports. For example, to display only the last 4 digits of a 16 digit card number, enter a special character, such as an asterisk (*) in fields 1 - 12. Enter the digit number in fields 13 - 20. `* * * * * * * * * * * * 13 14 15 16 17 18 19 20` If the card number is 4111111111111111, the system displays `************1111` as the card number on `Order Administration` screens and reports. **Note:** You must enter either a digit number (1-20) or a single position special character in each field or an error message displays: `Only one character or number 1-20 allowed per position.` See Setting Up a Card Number Format for setup instructions and examples. *Numeric, 20 positions; required.*

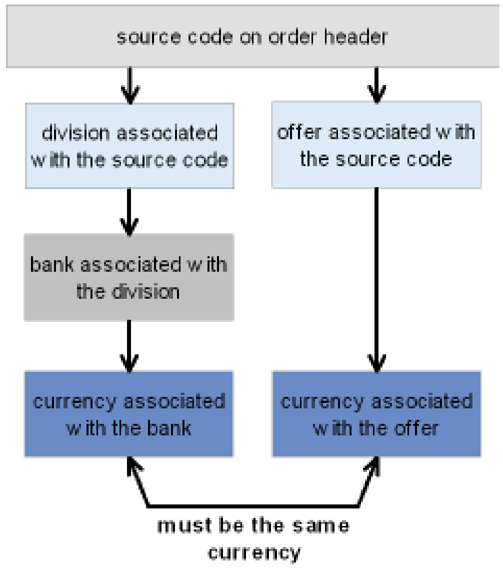
Working with Banks (WBNK)

Purpose: Use the Banks function to:

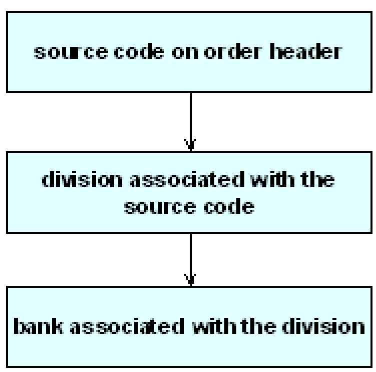
- add or maintain bank codes and their descriptions
- indicate the transit number associated with the bank
- define the currency for the bank, if you process orders in multiple currencies
- define the inbound and outbound reconciliation programs, if you send and receive refund check information to and from a bank

If using multiple currencies by offer: The bank code is key to your setup if you process orders in multiple currencies. The system determines that you intend to process orders in multiple currencies if the Multi Currency by Offer (E03) system control value is selected.

When processing orders in multiple currencies, you must create a separate bank for each currency you intend to use, including your local currency.



Processing refunds: Each time you create a refund record, the system associates the refund with the appropriate bank.



For more information:

- working with currency codes: Working with Currency (WCUR)
- working with refunds: Working with Refunds, Writeoffs and Balances Due (WREF)
- Multi Currency by Offer (E03) system control value

In this topic:

- Work with Banks Screen
- Create Bank Screen

Work with Banks Screen

How to display this screen: Enter WBNK in the *Fast Path* field at the top of any menu or select Work with Banks from a menu.

Field	Description
Bank	A code that represents the bank. *Alphanumeric, 3 positions; optional.*
Description	The description of the bank code. *Alphanumeric, 30 positions; optional.*
Transit#	The transit number, provided by the bank. *Numeric, 25 positions; optional.*

Screen Option	Procedure
Create bank codes	Select Create to advance to the Create Bank Screen.
Change bank information	Select Change for a bank to advance to the Change Bank screen. At this screen you can change any information except the bank code. See Create Bank Screen for field descriptions.
Delete a bank	Select Delete for a bank to delete it.
Display bank information	Select Display for a bank to advance to the Display Bank screen. You cannot update any information on this screen. See Create Bank Screen for field descriptions.

Create Bank Screen

Purpose: Use this screen to create a bank.

How to display this screen: At the Work with Banks Screen, select Create.

Field	Description
Bank #	A code that represents the bank. *Numeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Description	The description of the bank code. This is commonly the name of the bank. *Alphanumeric, 30 positions; required.*
Transit #	The transit number, provided by the bank. *Numeric, 25 positions; required.*
Account #	Your account number with the bank. *Numeric, 12 positions; optional.*
Last check #	The last refund check number printed. When you process refund checks for this bank, the system suggests the next sequential number after the value here. When refund check generation is complete, the system updates this field with the last number used. *Numeric, 9 positions; required.*
Phone number	The phone number for the bank. *Numeric, 14 positions; optional.*

Field	Description
Currency code	The code representing the currency to be processed by this bank. This field displays only if the Multi Currency by Offer (E03) system control value is selected. See Working with Currency (WCUR). *Alphanumeric, 3 positions; required if using multiple currencies.*
Country	The code representing the country where the bank is located. The bank code from the Default Country for Customer Address (B17) system control value defaults. *Alphanumeric, 3 positions; optional.*

Working with Accounting Periods (WACP)

Purpose: Use the Accounting Periods function to define your fiscal calendar. Specifically, use this function to:

- add or maintain accounting periods and their descriptions
- assign accounting periods to a year
- indicate the start date and end date of the period

Transactions post to the accounting period in which they occur, even if your accounting department has not closed the previous accounting period.

In this topic:

- Work with Accounting Periods Screen
- Create/Change/Display Accounting Period Screen
  - Changing Accounting Periods
  - Displaying Accounting Periods

Work with Accounting Periods Screen

How to display this screen: Select Work with Accounting Periods from a menu or enter WACP in the *Fast Path* field at the top of any menu.

Field	Description
Year	Year when the accounting period occurs. *Numeric, 2 positions (YY); optional.*
Period	A 2-position code that represents the accounting period. *Alphanumeric, 30 positions; optional.*
Desc (Description)	The description of the accounting period. *Alphanumeric, 3 positions; optional.*
Start	The date when the accounting period begins. *Numeric, 6 positions (in user date format); optional.*
End	The date when the accounting period ends. *Numeric, 6 positions (in user date format); optional.*

> **Note:**
>
> The options on this screen function somewhat differently from other screens. See the table below for details.

Screen Option	Procedure
Create an accounting period	Select Create to advance to the Create/Change/Display Accounting Period Screen in create mode.
Change accounting period information	Select Change from the *Action* column on the left to advance to the Create/Change/Display Accounting Period Screen in change mode.
Delete an accounting period	Select Delete from the *Action* column on the left to delete an accounting period.
Display an accounting period	Select Display from the *Action* column on the left to advance to the Create/Change/Display Accounting Period Screen in display mode.

Create/Change/Display Accounting Period Screen

Purpose: Use this screen to create, change, or display an accounting period.

How to display this screen: Select Create at the Work with Accounting Periods Screen, or select Change or Display from the *Action* column on the left. See Changing Accounting Periods and Displaying Accounting Periods for information on available options in change and display modes.

Field	Description
Year	The year when the accounting period occurs. *Numeric, 2 positions (YY).* *Create mode: required.* *Change mode: display-only.*
Period	A 2-position code that represents the accounting period. *Numeric, 2 positions.* *Create mode: required.* *Change mode: display-only.*
Description	The description of the accounting period (e.g., JAN, FEB, Q1, Q2). *Alphanumeric, 3 positions; required.*
Start date	The date the accounting period begins. *Numeric, 6 positions (in user date format); required.*
End date	The date the accounting period ends. *Numeric, 6 positions (in user date format); required.*

Changing Accounting Periods

To change: Select Change for an accounting period from the *Action* column on the left at the Work with Accounting Periods Screen to advance to the Create/Change/Display Accounting Period screen in change mode. You cannot change the year or period fields.

Displaying Accounting Periods

To display: Select Display for an accounting period from the *Action* column on the left at the Work with Accounting Periods Screen to advance to the Create/Change/Display Accounting Period screen in display mode. You cannot update any information.

Working with Currency (WCUR)

Purpose: Use the Currency table to define currencies and their conversion rates.

The system uses this information when:

- you create purchase orders, to convert your currency rate to your vendor's currency rate
- you receive against a purchase order, to convert your vendor's currency rate to your currency rate
- you bill orders, if the Customer Sold To on the order is from a foreign country
- you enter orders, bill orders, or process refunds, if you track multi-currency by offer

> **Note:**
>
> If you track currency conversion rates at the time of order billing in the Invoice Currency table, you must use the same code to identify a country and its currency. You must also have the Track Invoice Currency (D68) field in the System Control table selected. See Setting Up the Country Table (WCTY) for more information on country codes.

Multiple Currencies by Offer: You can accept orders in various currencies by defining the currency to be used for each offer. You must set the Multi Currency by Offer (E03) system control value to Y. Setting up multiple currencies by offer enables you to take orders in a foreign currency, but track demand in your local currency.

Default decimal separator and thousand separator for currency: The system uses the following values to determine the default decimal separator and thousand separator of Order Management System.

- The DECIMAL_SEPARATOR property defines the character used to indicate the decimal place in a number.
- The THOUSAND_SEPARATOR property defines the character used to separate groups of thousands.

The supported thousand and decimal separators are displayed below.

Default Thousand Separator	Default Decimal Separator	Results
, (comma)	. (period)	4,294,967,295.00
. (period)	, (comma)	4.294.967.295,00

See Regional Settings for an overview and see Setting the Default Decimal and Thousand Separator Formats for more information on how numbers display in different areas of the application.

In this topic:

- Work with Currency Screen
- Create Currency Screen

Work with Currency Screen

How to display this screen: Enter WCUR in the *Fast path* field at the top of any menu or select Work with Currency from a menu.

Field	Description
Code	A code that represents the currency. *Alphanumeric, 3 positions; optional.*
Description	The description of the currency code. *Alphanumeric, 30 positions; optional.*
Last update	The date that a conversion rate was most recently updated. *Numeric, 6 positions; optional.*
Conversion rate	The rate at which this currency is converted to the local currency. Should be set to 1.00 for the Local Currency Code (A55). *Numeric, 13 positions with a 7-place decimal; display-only.*

Screen Option	Procedure
Create currency codes	Select Create to advance to the Create Currency Screen.
Change currency information	Select Change for a currency code to advance to the Change Currency screen. At this screen you can change any information except the currency code. See Create Currency Screen for field descriptions.
Delete currency information	Select Delete for a currency code to delete it.
Display currency information	Select Display for a currency code to advance to the Display Currency screen. You cannot update any information on this screen. See Create Currency Screen for field descriptions.

Create Currency Screen

Purpose: Use this screen to create a currency code.

How to display this screen: At the Work with Currency Screen, select Create.

Field	Description
Currency code	A code that represents a type of currency. *Alphanumeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Description	The description of the currency code. *Alphanumeric, 30 positions; required.*

Field	Description
Date of last update	The most recent date on which the conversion rate was updated. **Note:** The system does not update this field. *Numeric, 6 positions (in user date format); required.*
Conversion rate	The rate at which this currency is converted to the local currency in purchase order maintenance and receipts. The system divides the amount in the foreign currency by the conversion rate to determine the amount in your local currency; for example, if you set the conversion rate for Canadian dollars at 1.3, the system would convert $10.00 to $7.69 in your local currency, dividing 10 by 1.3. Should be set to 1.00 for the Local Currency Code (A55). Currency conversion settings for purchase order maintenance and receiving are defined in the Vendor table. See Working with Vendors (WVEN) for more information. **Note:** This field does not support a number with more than four positions in front of the decimal point; otherwise, your entry will be truncated. For example, if you enter 12345.1234567, it will be truncated to 2345.1234567. *Numeric, 13 positions with a 7-place decimal; required.*
Shadow entity	This field displays only if the Multi Currency by Offer (E03) system control value is selected; it is required for all currencies except your local currency, as defined in the Local Currency Code (A55) field in the System Control table. Entity codes are defined in and validated against the Entity table; see Working with Entities (WENT). *Numeric, 3 positions; required.*

Working with Sales Representatives (WSLS)

Purpose: Use the Sales Representatives function to create or maintain sales representative information:

- the name and email address of your sales representatives
- the sales representative numbers that you assign to them

- the centers to which your sales representatives are assigned (for example, regional centers or product line groups)
- the commission and bonus structure for your sales representatives.

Uploading sales representatives: You can also create or update records in the Salesman table by uploading them from an external system; see Salesman Associate Upload for instructions.

In this topic:

- Work with Salesrep Screen
- Create Salesrep Screen

Work with Salesrep Screen

How to display this screen: Enter WSLS in the *Fast path* field at the top of any menu or select Work with Salesreps from a menu.

Field	Description
SLS# (Sales representative number)	A code that represents the sales representative. *Numeric, 7 positions; optional.*
Name	The name of the sales representative. *Alphanumeric, 30 positions; optional.*
Center	A code that represents the center to which this sales representative is assigned. Center codes can be used to group sales representatives (for example, region or product line). *Alphanumeric, 4 positions; required.*

Screen Option	Procedure
Create sales representative codes	Select Create to advance to the Create Salesrep Screen.
Change sales representative information	Select Change for a salesrep to advance to the Change Salesrep screen. At this screen you can change any information except the sales representative code. See Create Salesrep Screen for field descriptions
Delete sales representative information	Select Delete for a salesrep to delete it.
Display sales representative information	Select Display for a salesrep to advance to the Display Salesrep screen. You cannot change any information on this screen. See Create Salesrep Screen for field descriptions.

Create Salesrep Screen

Purpose: Use this screen to create a new sales representative.

How to display this screen: Select Create on the Work with Salesrep Screen.

Field	Description
Salesrep #	A code that represents a sales representative. The system performs a modulus 10 check against the salesrep number on the Create or Change Salesrep screen when the Modulus 10 Check on Salesrep Number (E88) system control value is selected. An error message indicates if the salesrep number fails the modulus 10 check: **Salesman# is invalid or missing.** *Numeric, 7 positions.* *Create screen: required.* *Change screen: display-only.*
Name	The description of the sales representative code. This is commonly the name of the sales representative. *Alphanumeric, 30 positions; required.*
Email Address	The salesrep's email address. The system verifies that: • there is an @ sign and a period (.) • there is some text: – before the @ sign – between the @ sign and the period – after the period If the email address does not meet these criteria, the system does not let you create it. For example, the system would not let you create an email address such as: • @example.com • firstlast@example • firstlast@.org • www.example.com The system does not confirm that your entry represents a valid email address, that the domain name (such as "example" in example.com) exists, or that the extension (such as "com" in example.com) exists. *Alphanumeric, 50 positions; optional.*
Active	Defines whether the salesrep is active. • Selected (default) = The salesrep is active. • Unselected = The salesrep is not active. The system validates that the salesrep is active when you define the salesrep on the Work with Order Screen in Order Entry or receive an order through the *Generic Order Interface (Order API)* that contains a salesrep. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** Searching for an order based on salesrep in Contact Center is available only if the salesrep is currently flagged as active.

Field	Description
Home Store	The code identifying the default store location for the salesrep. Validated against the Store Cross Reference table; see Work with Store Cross Reference (WSCR). If the Store Cross Reference record is flagged as Active and the order is not fulfilled through the Order Orchestration integration, the store's code, description, address, and phone number are included in the *OriginatingStore* element in the *Outbound Email XML Message (CWEmailOut)*. See the *OriginatingStore* element for more information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Numeric, 10 positions; optional.*
Center code	A code that represents the center to which this sales representative is assigned. Center codes can be used to group sales representatives (for example, region or product line). *Alphanumeric, 4 positions; required.*
Additional bonus	The additional bonus that the sales representative receives if the value from Over quota break is met or exceeded. *Additional bonus* works in conjunction with *Over quota break*. *Numeric, 5 positions; required.*
Over quota break	The quota, in dollars, that the sales representative must meet or exceed to receive an additional bonus. *Over quota break* works in conjunction with Additional bonus. *Over quota break* and *Additional bonus* are in addition to Quota and Commission % as incentives to your sales representatives. *Numeric, 5 positions; required.*
Quota	A sales goal, in dollars, that the sales representative must meet or exceed to receive a commission. *Quota* works in conjunction with Commission %. *Numeric, 7 positions; required.*
Commission %	The percentage of sales earned by the sales representative if the value from Quota is met or exceeded. *Commission %* works in conjunction with Quota. *Numeric, 5 positions with a 2-place decimal; required.*
Phone	The phone number where the salesrep can be reached. You can define a telephone number format for each country to map to the phone numbers operators enter into the system. See Setting Up the Country Table (WCTY). *Alphanumeric, one 14-position field (phone number) and one 4-position field (phone extension); optional.*
User field 1	This field is informational only. *Alphanumeric, 2 positions; optional.*
User field 2	This field is informational only. *Alphanumeric, 2 positions; optional.*
User field 3	This field is informational only. *Alphanumeric, 2 positions; optional.*
User field 4	This field is informational only. *Alphanumeric, 2 positions; optional.*

Field	Description
Number of sales life-to-date	The number of sales for this sales representative. This figure is cumulative across years. This field is a count of orders shipped. If back orders result in multiple shipments, Order Administration updates this field with each shipment. *Numeric, 5 positions; display-only.*
Number of returns life-to-date	The number of return transactions for this sales representative. This figure is cumulative across years. This field is neither a count of units nor a count of orders. Each time items from an existing order are returned -- regardless of the quantity returned or the number of lines affected by the return -- Order Administration considers this 1 return transactions and this field is updated. Order Administration updates this field if you use a return reason code in Order Maintenance or Return Authorization. If an order has multiple returns, Order Administration updates this field for each return transaction. *Numeric, 5 positions; display-only.*
Number of exchanges life-to-date	The number of exchange transactions for this sales representative. This figure is cumulative across years. This field is neither a count of units nor a count of orders. Each time items from an existing order are exchanged -- regardless of the quantity exchanged or the number of lines affected by the exchange -- Order Administration considers this 1 exchange transaction and this field is updated. Order Administration updates this field if you use an exchange reason code in Order Maintenance or Return Authorization. If an order has multiple exchanges, Order Administration updates this field for each exchange transaction. *Numeric, 5 positions; display-only.*
Sales $ life-to-date	The dollars associated with all sales for this sales representative. This figure is cumulative across years. *Numeric, 20 positions with a 2-place decimal; display-only.*
Returns $ life-to-date	The dollars associated with all return transactions for this sales representative. This figure is cumulative across years. *Numeric, 20 positions with a 2-place decimal; display-only.*
Exchanges $ life-to-date	The dollars associated with all exchange transactions for this sales representative. This figure is cumulative across years. *Numeric, 20 positions with a 2-place decimal; display-only.*

6 Customer Service

Establishing Customer Service Tables

Topics in this part: The following topics describe how to create and maintain customer support tables that work in conjunction with Order Entry, Order Maintenance, and other Customer Service functions.

- Establishing Order Types (WOTY) presents the screens you work with to create and maintain order types required for Order Entry.
- Establishing Price Override Reason Codes (WPOR) presents the screens you work with to create and maintain price override reason codes needed for entering item prices at no charge and for overriding prices in Order Entry and Order Maintenance.
- Establishing Additional Charge Codes (WADC) describes how to create and maintain codes that let you add additional charges or credits to an order.
- Establishing Order Hold Reason Codes (WOHR) describes how to create and maintain user-defined reason codes that you apply when you want to place an order on hold.
- Establishing Cancel Reason Codes (WCNR) describes the screens you work with to create and maintain reason codes for canceling items from an order.
- Establishing Return Reason Codes (WRTR) describes the screens you work with to create and maintain reason codes for returning items.

- Establishing Exchange Reason Codes (WEXR) describes the screens you work with to create and maintain reason codes for exchanging items.
- Establishing Return Disposition Values (WRDV) describes the screens you work with to establish codes that you use to direct returned merchandise to the warehouses and warehouse locations that you have designated to receive returns.
- Establishing Custom Special Handling Formats (WSHF) describes the screens you work with to design the format of the special handling screen that you use in Order Entry.
- Establishing Add Reason Codes (WADR) describes the screens you work with to establish codes for tracking the reasons for adding items to orders in Order Maintenance.
- Working with Order Inquiry Reason Codes (WORC) describes the screens you use to create and maintain reason codes for advancing to order inquiry or order maintenance from the CTI Customer Selection screen.
- Working with Order/Call Disposition Reject Reason Codes (WWRR) describes the screens you work with to create or maintain order and call disposition reject reason codes.
- Working with Default Messages (WMSG) describes the screens you use to create and maintain default messages, used to default message text to an order message or order line message on an order.
- Working with Order Line Activity Codes (WOLA) describes the screens you use to create and maintain order line activity codes.

Establishing Order Types (WOTY)

Purpose: Order type codes identify how you received the order, such as by phone, mail or fax. You can use order type codes for analysis purposes, to control the format of the Order Entry Detail screen, or to indicate whether to:

- display promotional pricing windows.
- display zone date windows for zone reservation (weather-sensitive) items.
- generate soldout notifications for items you sell out through order entry or order maintenance.
- generate immediate backorder notifications.
- perform online credit card authorization and display an authorization response window in order entry.
- generate various types of an email notifications or the *Outbound Email XML Message (CWEmailOut)*, and whether to include soldout items on the order confirmation email message.
  For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
- use the *Experian Data Quality (EDQ) Address Validate API* to standardize addresses.
- treat orders as pre-order quotes instead of regular orders; see *Entering Pre-Order Quotes*.
- indicate that the order originated from an external system and was assigned to Order Administration for fulfillment via the *Order Orchestration Integration*.

- identify a ship-for-pickup order to the Order Orchestration primarily by its Order Administration order number or its e-commerce order number.
- indicate that the order originated in Order Administration but the customer prefers to pick up the order at a store location that has the inventory available; see *Store Pickup Orders*.
- use override template text for certain email notification types.
- indicate that the order originated through the ChannelAdvisor integration; see the *ChannelAdvisor Order Type (L90)* and the *ChannelAdvisor Integration Overview*.

The order API uses the *E-Commerce Order Type (G42)* if no order type is specified in the message. If that system control value is also blank, the order is created in error status.

Each order must have an order type.

In this topic:

- *Work with Order Types Screen*
- *Create Order Type Screen*
- *Order Type Email Selection Screen*
- *Order Type Email Template Screen*
- *Change Order Type Email Template Screen*

Work with Order Types Screen

How to display this screen: Type *WOTY* in the Fast path field at the top of any menu, or select Work with Order Types from a menu.

Field	Description
Type	Identifies how you receive an order. Alphanumeric, 1 position; optional.
Description	The description associated with the order type. Alphanumeric, 30 positions; optional.
Promo	Determines whether to display promotional pricing windows for orders with this order type. Promotional pricing windows open if the customer orders a specific item or quantity of items, and also display items that the customer can order for a special price. Valid values are: • *None* = Do not display promotional pricing pop-up windows. Also, do not open the *Display Coordinate Items Window* in Classic View order entry or the **Select Coordinate Items** window in Contact Center entry. • *P*romo Price = Display the Promotional Pricing window. Also, open the *Display Coordinate Items Window* in Classic View order entry, or the **Select Coordinate Items** window in Contact Center order entry. **For more information:** See *Upselling the Customer in Order Entry* for information on promotional pricing, and see *Automatically Display Coordinate Items in Order Entry (I53)* for more information on adding coordinate items to an order. Optional.

Field	Description
S/O (soldout)	Controls whether to generate soldout notifications when an item sells out in order entry or order maintenance. Valid values are: • *Yes* = Generate a soldout notification for an item that sells out in order entry or maintenance • *No* = Do not generate soldout notifications unless you sell out items through *Processing Auto Soldout Cancellations (MASO)*. You might choose this setting for phone orders, because normally you can notify the customer immediately if an item is sold out. Optional.
Mail/Rtl	Indicates whether this is a mail order or retail order type. Informational only. Valid values are: • *Mailorder* = Mail orders. • *Retail* = Retail sales. Optional.
Whs	The warehouse defined for the order type. Used for: • *Retail order defaults:* If the Retail Order Defaults (F59) system control value is *selected*, the system defaults the warehouse defined here to the Warehouse field on the Enter Location pop-up window when you enter an express bill order. • *Non-allocatable warehouse:* If the *Reserve from Non-Allocatable Warehouse (J25)* system control value is *selected*, the system allows you to enter a non-allocatable warehouse code in this field, regardless of the setting of the Mail order/retail flag. Orders entered for this order type reserve against the non-allocatable warehouse specified. Numeric, 3 positions; optional.

Screen Option	Procedure
Create an order type	Select *Create* to advance to the *Create Order Type Screen*.
Change an order type	Select *Change* for an order type to advance to the Change Order Type screen. You can change any information on this screen except the order type code. See *Create Order Type Screen* for field descriptions.
Delete an order type	Select *Delete* for an order type to delete it. **Note:** When you delete an order type code you lose: • History associated with the order type • Visibility to the description on orders containing the code

Screen Option	Procedure
Display an order type	Select *Display* for an order type to advance to the Display Order Type screen. You cannot change any information on this screen. See *Create Order Type Screen* for field descriptions.
Work with user defined fields	Select *User Field* for an order type to advance to the *Work with User Fields Screen*.
Suppress generation of individual email notifications for the order type	Select *Email Selection* for an order type to advance to the *Order Type Email Selection Screen*. **Note:** This option is available only if the order type's *Email notification* flag is *selected*.
Work with email notification templates for the order type	Select *Email Template* for an order type to advance to the *Order Type Email Template Screen*. **Note:** This option is available only if the order type's *Email notification* flag is *selected*.

Create Order Type Screen

Purpose: Use this screen to create an order type.

How to display this screen: Select *Create* at the *Work with Order Types Screen*

Field	Description
Type	Indicates how the order was received, such as from the web storefront, a retail integration, or other methods. Alphanumeric, 1 position Create screen: required. Change screen: display-only.
Description	The description of the order type. Alphanumeric, 30 positions; required.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Promo windows</td><td>Controls whether to display promotional pricing windows for orders with this order type.
Valid values are:
• None = Do not display promotional pricing pop-up windows
• Promo = Display promotional pricing windows
You can define promotional pricing to take place at the dollar, group, or item level, including:
• Order dollar discount or a free gift when the order reaches a set dollar level
• Order dollar discount or a free gift when the customer orders from a specific item group defined in the Item table
• Item discount or a free gift when the customer orders a specific item defined in the Item table
If you set this field to Promo, a pop-up window opens in Order Entry when the operator enters an item associated with a promotional pricing promotion.
See Upselling the Customer in Order Entry.
Required.</td></tr>
<tr><td>Zone date windows</td><td>Controls whether to display an informational zone reservation date window in order entry when the customer orders a zone reservation-coded item. Zone reservation codes identify weather-sensitive inventory, such as plant stock, which require restricted shipping dates.
Valid values are:
• selected = Display an informational pop-up window in order entry when an order includes a zone reservation-coded item whose shipping date window has not yet opened.
• unselected = Do not display the pop-up window in order entry.
Generally, you would select for phone orders, since you can notify the customer of the date the item will ship and deselect for mail orders. See Shipping Zone Reservation Overview for more information.</td></tr>
<tr><td>Soldout notifications</td><td>Controls whether to generate soldout notifications for items that you sell out through order entry or order maintenance.
Valid values are:
• Selected = Generate a soldout notification for items that you sell out in order entry or order maintenance. You can sell out an item by selecting it in order entry or maintenance; also, if the item is currently flagged with the appropriate soldout control code, it sells out automatically when you add it to an order.
• Unselected = Do not generate soldout notification cards for this order type except for items sold out through Processing Auto Soldout Cancellations (MASO). Generally, you would deselect for phone orders, since you can notify the customer immediately that the item is sold out.

Note:
This flag does not apply to quote orders. The system does not generate soldout notifications for items sold out in order entry or maintenance for quotes.</td></tr>
</table>

Field	Description
Exclude S/O on order confirmation	Indicates whether to exclude soldout items on the order confirmation email or the *Outbound Email XML Message (CWEmailOut)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** The system excludes soldout items from the order confirmation email only if the program in the *Order Acknowledgement Program (G50)* system control value is based on the *ECR0318* or *ECR0405* base program. For example, you might wish to exclude soldout items on order confirmations for phone orders, but include soldout items for orders you receive through the order API. • *Selected* = Exclude soldout items on the order confirmation email or the *Outbound Email XML Message (CWEmailOut)*. **Note:** If the soldout item is the only item on the order and you exclude soldout items from the order confirmation, the system does not generate the email. 1. *Unselected* = Include soldout items on the order confirmation email or the *Outbound Email XML Message (CWEmailOut)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Mail order/ Retail	Indicates whether to treat the order as a mail order or a retail sale. Informational only. Valid values are: • *Mailorder* = Mail or e-commerce orders. • *Retail* = Retail sales, such as in a retail outlet. Required.

Field	Description
Retail warehouse	The warehouse defined for the order type. Used for: • *Retail order defaults:* If the Retail Order Defaults (F59) system control value is *selected*, the system defaults the warehouse defined here to the Warehouse field on the Enter Location pop-up window when you enter an express bill order. • *Non-allocatable warehouse:* If the *Reserve from Non-Allocatable Warehouse (J25)* system control value is *selected*, the system allows you to enter a non-allocatable warehouse code in this field, regardless of the setting of the Mail order/retail flag. Orders entered for this order type will reserve against the non-allocatable warehouse specified. In order to enter a warehouse code in this field: • The Mail order/retail field must be set to *R*, or • The *Reserve from Non-Allocatable Warehouse (J25)* system control value must be *selected*. Numeric, 3 positions; optional.
Immediate B/O notice	Indicates whether to generate an initial (first) backorder notification card the next time you run *Generate Backorder Notices (GBOC)*. Valid values are: • *Selected* = Generate backorder cards immediately • *Unselected* = (Default): Do not generate backorder cards immediately Typically, you *select* this setting for mail orders because you do not have an opportunity to inform the customer of the expected delivery date when you enter the order. If you have defined a *Number of Days to Delay Initial Backorder Notice (D89)*, the system does not generate a notice for a backordered item unless the expected ship date is after this number of days. • Once an expected delivery date for a backordered item is expired or changed, the system automatically generates a backorder notice, regardless of the setting of this field. • This flag does not apply to quotes. The system does not generate backorder notices for quotes.

Field	Description
Email notification	Indicates whether to generate order-related email notifications to the customer. Valid values are: • *Selected* = Generate email notifications or the *Outbound Email XML Message (CWEmailOut)*. If you use the *Narvar Integration*, shipment notifications to customers are generated through Narvar, so this flag must be selected to have the order request generated to Narvar. • *Unselected* = Do not generate email notifications or the *Outbound Email XML Message (CWEmailOut)*; create a document for printing instead if available. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Even if this setting is selected, the system generates email notifications only if all the required information is available and if you have not flagged the notification type at the *Order Type Email Selection Screen* to prevent generation. See *Working with E-Mail Notification Templates (WEMT)* for an overview of the logic the system uses to determine whether to generate an email notification, and for information on setting up your company to generate email notifications. • This flag does not control automatic email generation for quote order types (with the exception of the soldout notification and the Quote confirmation for orders received through the order API), or for stored value card notices, “contact us” emails, maintenance failure notices, or credit card decline notices. • If this flag is *unselected*, you cannot advance to the *Order Type Email Selection Screen* or *Order Type Email Template Screen*. • This flag *must* be *selected* for the *Store Pickup Order Type (L33)* so the system can generate the email notifying the customer that the order is ready for pickup. See *Store Pickup Confirmation Email Program (L48)* for background.
On-line authorization	Indicates whether to perform online credit card authorization during order entry and order maintenance. Valid values are: • *Window* = Perform online credit card authorization for credit card payment methods during order entry/maintenance and display the *Select Authorization Response Option Window* when an authorization response is received. • *Without Window* = Perform online credit card authorization for credit card payment methods during order entry/maintenance and do not display the window. • *Not Eligible* = Do not perform online credit card authorization for this order type. The system performs credit card authorization during pick slip generation. See *Performing Online Credit Card Authorizations* for an overview of the online credit card authorization process. This field displays only if the *On-line Authorizations (B89)* system control value is *selected*. Required.

Field	Description
Address standardization	Controls whether to use the Experian Data Quality (EDQ) Address Validate API for address standardization. • *Selected* = Use EDQ for address standardization. • *Unselected* = Do not use EDQ for address standardization. See *Experian Data Quality (EDQ) Address Validate API* for an overview and required setup. Required.
Quote	Indicates whether an order of this order type is a pre-order quote and not a regular order. Valid values are: • *Selected* = An order for this order type is a pre-order quote. See *Entering Pre-Order Quotes* for an overview and the required setup. • *Unselected* = An order for this order type is a regular order. See *Entering Orders*. Optional.
Expiration days	Indicates the number of days a pre-order quote is valid before it expires. When you accept a pre-order quote in order entry, the system updates the Cancel date for the quote based on the quote's arrival date and the expiration days specified here. The system removes the cancel date when you convert the quote to an order. *Example:* If the arrival date for a quote is 10/29/11 and the expiration days defined for the quote order type is 30, the system updates the Cancel date for the quote to 11/28/11. **Note:** If you change the order type for a quote to another order type whose Quote field is also *selected*, the system recalculates the cancel date for the quote based on the Expiration days field for the new order type. If an Expiration days has not been defined for the new order type, the system removes the cancellation date from the quote. **Note:** You can enter a value in this field only if the Quote field is *selected*. Numeric, 3 positions; optional.

Field	Description
Pay method required	Indicates whether a pay method is required on a pre-order quote. Valid values are: • *Selected* = A pay method is required on a pre-order quote. You cannot add a pre-paid pay method to a quote. • *Unselected* = A pay method is not required on a pre-order quote. The system does not require a pay method until the quote is converted to an order. If you change the order type for a quote to another order type whose Quote field is also *selected*, the setting of the Pay method required field for the new order type determines whether to require a payment method. **Note:** You can select this field only if the Quote field is *selected*. Optional.

Order Type Email Selection Screen

Purpose: Use this screen to prevent the system from generating emails or the *Outbound Email XML Message (CWEmailOut)* for certain types of notifications for an order type.

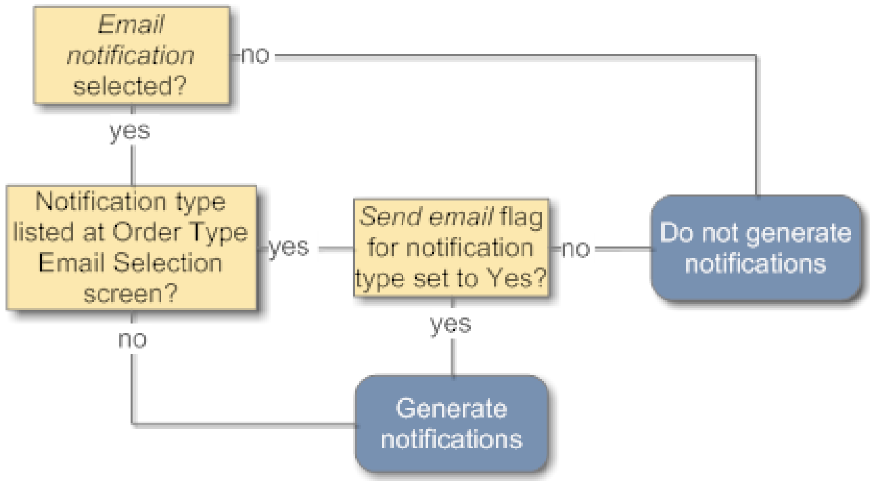
For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

You might want to prevent generating certain notices for order types that Order Administration fulfills as part of an integration with an external system. For example, if you create store pickup orders as part of the integration with Order Orchestration, you might want to suppress generation of shipment confirmation emails, because the customer picks up the order in a store location rather than receiving a shipment, so the shipment confirmation might confuse the customer; however, you might want to continue generating order confirmation emails for that order type, and you require the *Email notification* flag to be *selected* so that store pickup notifications are generated.

To suppress all notifications for an order type, *deselect* the *Email notification* flag.

Determining whether to generate an notice:

1. If the *Email notification* flag for the order type is *unselected*, do not generate any notices. Otherwise,
2. If the *Email notification* flag for the order type is *selected*, is the notification type included in the Order Type Email Selection screen? If not, generate the notice. Otherwise,
3. If the *Email notification* flag for the order type is *selected* and the notification type is included at the Order Type Email Selection screen, is the notification type *set to Yes*? If it is, generate the notice. Otherwise,
4. If the notification type is *set to No* at the Order Type Email Selection screen, do not generate the notice.



Things to note:

- *Default setting:* If the *Email notification* flag for the order type is *selected*, each Order Type Email Selection setting is *set to Yes* by default.
- *Screen access:* If the *Email notification* flag for the order type is *unselected*, you cannot advance to the Order Type Email Selection screen.
- *Additional rules:* Each notice type is still subject to the additional generation rules described in *Working with E-Mail Notification Templates (WEMT)*. For example, the system checks the customer's opt-in/out setting and whether there is an email program defined in the related system control value.
- *Quotes:* The Order Type Email Selection settings (with the exception of the Soldout Notification setting) do not apply to quote order types, regardless of the setting of the *Email notification* flag for the quote order type. The system does not automatically generate any emails except the soldout notification for quotes you create through interactive order entry until you accept them and change them to non-quote orders, although you can generate the Quote Confirmation or "Contact Us" emails for a quote on demand. See *HTML Format Notification Samples and Contents* for examples and more information.
- *Template selection is separate:* The email selection rules you set at this screen operate independently of the rules that govern which template to use for a notification. See the *Order Type Email Template Screen* for more information on setting up templates.

Narvar: The Send Email setting for the Shipment Confirmation here does not prevent generating shipment notifications through the *Narvar Integration*.

How to display this screen: Select *Email Selection* for an order type at the *Work with Order Types Screen*. This option is available only if the *Email notification* flag for the order type is *selected*.

Field	Description
Order type	The code and description of the order type you selected at the *Work with Order Types Screen*. Code: alphanumeric, 1 position; display-only. Description: alphanumeric, 30 positions; display-only.

Field	Description
Notification type	The type of notification that you would like to generate or suppress for this order type. Only certain notification types are available for selection; the system automatically generates the additional notification types that are not listed at this screen if the *Email notification* flag for the order type is *selected*. **Available types:** • Backorder 1st Notice • Backorder 2nd Notice • Backorder Continue Notice • C/C Credit Acknowledgment • Order Cancel Confirmation • Order Confirmation • Order Line Cancel Confirmation • Return Confirmation • Soldout Confirmation • Shipment Confirmation **Note:** The Shipment Confirmation setting also controls generation of a request with the customer's actual email address through the *Narvar Integration*. **Automatic generation of other notification types that are not listed:** Any additional notification types that are not listed at this screen are generated automatically for the order type if the *Email notification* flag for the order type is *selected* and the customer and order are otherwise eligible. These additional notification types are: • Credit Card Decline • Loyalty Activate Notice • Loyalty Deactivate Notice • Maintenance Failure • Membership Cancel Confirmation • Stored Value Card Notification See *Working with E-Mail Notification Templates (WEMT)* for more information on how the system determines whether to generate various types of notifications.
Send email	Controls whether to generate this type of notification for the selected order type: **Narvar:** The Send Email setting for the Shipment Confirmation here does not prevent generating shipment notifications through the *Narvar Integration*. *Yes* (default) = Generate the notification type if the customer and order are eligible. *No* = Do not generate this notification type for the selected order type.

Completing this screen: When you first advance to this screen, the Send email flags for each notification type are set to *Yes* by default. Change the setting of the Send email flag for each notification type you would like to update and select *OK*. Your changes take effect immediately.

Other updates to notification types: See *Email Generation Setup* for an overview of setup requirements and options, including the hierarchy for notification template text and the “from” email address.

Order Type Email Template Screen

Purpose: Use this screen to work with the template text for the order, shipment, order cancellation, and order line cancellation confirmation notices for a specific order type. You can also change the setting of the XML only? flag if you would like to specify whether to generate an actual email or the *Outbound Email XML Message (CWEmailOut)*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> The system does not automatically create an order type template. To create a template for one of the notifications types, you need to select the *Change* option and complete the *Change Order Type Email Template Screen*.

When does the system use this template? The system uses the text and XML only? setting from the order type if there is no template set up at the order type/entity or entity level. The hierarchy for template selection is:

1. Order type/entity level (set up through the *Entity Email Override by Order Type Screen*)
2. Entity (set up through the *Work with Entity Email Overrides Screen*)
3. Order type (set up through this screen, the Order Type Email template screen)
4. Company (set up through *Work with E-Mail Template Screen*)

> **Note:**
>
> Although the screen does not prevent you from setting up templates for a quote order type, the system never generates any of the notifications available at this screen until you accept the quote and change it to a new order type; and, at that time, the templates for the new order type apply.

These settings are not used for the generation of shipment notifications through the *Narvar Integration*.

What about other notification types? You cannot set up email templates at the order type or order type/entity level for any other notification types besides the order, shipment, order cancellation, and order line cancellation notices. For the remaining notification types, the hierarchy is:

1. Entity (set up through the *Work with Entity Email Overrides Screen*)

2. Company (set up through *Work with E-Mail Template Screen*)

Notification type selected for order type? The system does not prevent you from creating or changing an email template whose Send email flag is set to *No* at the *Order Type Email Selection Screen*, although in this situation the system does not generate the notification.

Narvar integration: The template settings do not apply to shipment notifications generated through the *Narvar Integration*.

How to display this screen: Select *Email Template* for an order type at the *Work with Order Types Screen*. This option is available only if the *Email notification* flag for the order type is *selected*.

Field	Description
Order type	The code and description of the order type you selected at the *Work with Order Types Screen*. Code: alphanumeric, 1 position; display-only. Description: alphanumeric, 30 positions; display-only.
Notification type	A notification type whose template you can create, change, display, or delete at this screen. Notification types you can set up for an order type: • Order Cancel Confirmation • Order Confirmation • Order Line Cancel Confirmation • Shipment Confirmation See *Working with E-Mail Notification Templates (WEMT)* for more information on when the system generates each notification type and the contents of each.

Option	Procedure
Create a new email template at the order type level	In the Action drop down list, select *Change* for a template to advance to the *Change Order Type Email Template Screen*, where you can enter template text and optionally select the XML only? flag if you would like to generate the *Outbound Email XML Message (CWEmailOut)* rather than an actual email. **Note:** There is no *Create* option at this screen; use the *Change* option to create a new template. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Option	Procedure
Change an existing email template at the order type level	In the Action drop down list, select *Change* for a template to advance to the *Change Order Type Email Template Screen*, where you can change the template text and optionally change the setting of the XML only? flag if you would like to specify whether to generate an actual email or the *Outbound Email XML Message (CWEmailOut)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Display an email template at the order type level	In the Action drop down list, select *Display* for a template to advance to the Display Order Type Email Template screen, where you can review an existing template or verify whether the template has been set up. See the *Change Order Type Email Template Screen* for field descriptions.
Delete an email template at the order type level	In the Action drop down list, select *Change* for a template to advance to the *Change Order Type Email Template Screen*, where you can delete the contents of the template.

Change Order Type Email Template Screen

Purpose: Use this screen to:

- create a new order type-level template
- change an existing order type-level template
- delete an existing order type-level template

These settings are not used for the generation of shipment-related emails through the *Narvar Integration*.

How to display this screen: Select *Change* for a notification type at the *Order Type Email Template Screen*.

Field	Description
Notice Type	The notice type you selected at the *Order Type Email Template Screen*. Display-only.
Order Type	The code and description of the order type you selected at the *Work with Order Types Screen*. Code: alphanumeric, 1 position; display-only. Description: alphanumeric, 30 positions; display-only.

Field	Description
XML only?	Indicates whether to generate the *Outbound Email XML Message (CWEmailOut)* rather than an actual email notification. This XML message includes additional information that is not included in the standard email notice. You might choose to generate the XML message so that you can use the information to produce a reformatted HTML email that includes promotional material. See *Outbound Email XML Message (CWEmailOut)* for an overview. Valid values are: 1. *Selected* = Generate the *Outbound Email XML Message (CWEmailOut)* rather than an actual email 2. *Unselected* = Generate the email notification *Used only if there is text:* The system uses the setting of this flag at this level only if there is also text set up for the template at this level. For example, if you select this flag for the order confirmation template for an order type, but do not enter any text, the system continues up the hierarchy and checks the setting for the order confirmation template at the company level (set up through *Working with E-Mail Notification Templates (WEMT)*). For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Text to print above items	The standard text to include in each email above the information specific to the order. This text is also included in the *Outbound Email XML Message (CWEmailOut)*. Select *Dflt Frm Comp* to copy the Text to print above items and Text to print below items to the screen from the company-level template, and then edit as needed. Alphanumeric, ten 60-position lines; at least one line required. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Text to print below items	The standard text to include in each email below the information specific to the order. This text is also included in the *Outbound Email XML Message (CWEmailOut)*. Select *Dflt Frm Comp* to copy the Text to print above items and Text to print below items to the screen from the company-level template, and then edit as needed. Alphanumeric, three 60-position lines; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Completing this screen:

- **Create a new template:**
  - Optionally, *select* the XML only? flag to *Outbound Email XML Message (CWEmailOut)* rather than an actual email notification

    For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

- Optionally, select *Dflt Frm Comp* to copy the Text to print above items and Text to print below items to the screen from the company-level template, and then edit as needed.
- If you did not default text from the company-level template, enter the Text to print above items. You must define at least one line of text.
- Optionally, enter the Text to print below items
- Click *OK* when you are done to save your changes, or click *Exit* to exit without saving.

- **Change an existing template:**
  - Optionally, change the setting of the XML only? flag indicating whether to generate the actual email or the *Outbound Email XML Message (CWEmailOut)*

    For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
  - Optionally, change the Text to print above items or the Text to print below items, or enter additional text.
  - Click *OK* when you are done to save your changes, or click *Exit* to exit without saving.
- **Delete an existing template:**
  - Delete each line of text in the Text to print above items and Text to print below items.
  - Click *OK* when you are done to delete the template, or click *Exit* to exit without deleting.

Establishing Price Override Reason Codes (WPOR)

Purpose: Price override reason codes let an authorized operator change an item price or enter an item at no charge in Order Entry or Order Maintenance. You need to designate one or more price override reason codes for promotional or upsell items that may be added to an order automatically. When an item is added to the order from a promotion, the system updates the Override field on the order detail line with the default override reason code designated for the type of promotion or upsell so that you can track the discounts by override reason. Price overrides apply only at the line item level.

The Price Override Reason table stores the number of price overrides and the net discount associated with each reason code.

Default Price Override Reasons

You can set up the following default price override reason codes in the System Control table:

- *Default Price Override Reason (B35)*
- *Price Override Code for Promotional Priced Lines (B61)* **Note:** This system control value is not currently implemented. The system applies the *Default Price Override Reason (B35)* to promotional priced lines.
- *Price Override Reason for Same Price Exchanges (D92)*
- *Price Table Level Override Code (E05)*

- *Default Price Override Reason for Warranty Items (G01)*
- *Price Override Reason for E-Commerce (G73)*
- *Price Override Reason for SVC Refund Item (I74)*
- *Price Override Reason for Price Matrix Customer Specials (K42)*
- *Price Override Reason for Promotions (K45)*
- *Price Override Reason for Quotes (K75)*
- *Order Broker Price Override (K95)*
- *Price Override Reason Code for CPG Pricing (L59)*
- Price Override Reason for ORPE Discounts (M78)

> **Note:**
>
> You cannot apply the *Price Override Reason for Price Matrix Customer Specials (K42)*, *Price Override Reason for Promotions (K45)*, or *Price Table Level Override Code (E05)* to an order line in order entry; these price override reason codes are reserved for system use.

See the description of each system control value for more information.

ChannelAdvisor default: The ChannelAdvisor integration uses a price override reason code of *W*. You cannot change this default. See *ChannelAdvisor Integration Overview* and *ChannelAdvisor Setup* for background.

Secured features: The *Price Overrides (A23)* secured feature controls the ability to override a price in order entry, and the *Override Price Override Limit (A64)* controls the ability to exceed the *Price Override Limit Percent (E55)*.

Report: You can use the *Printing the Price Override Reason Report (PROR)* option to generate a report indicating the number of units, discount amount, and discount percentage applied through price override reason codes. The report does not include price override reason codes whose Exclude from price override report field is selected.

In this topic:

- *Overriding the Item/SKU Offer Price*
- *Work with Price Override Reason Screen*
- *Create Price Override Reason Screen*

Overriding the Item/SKU Offer Price

The *Override item offer price* field for a price override reason code indicates whether to use the price override amount entered in order entry as the item/SKU offer price for the order. The item offer price is stored in the Order Detail table for each order line. The following table describes how the system handles various functions depending upon how this flag is set for a price override reason code:

Function	Flag is Selected	Flag is Unselected	For Example, see:
calculating the discount amount on an order or order detail line	The discount amount equals the difference between the override price entered and the final selling price; in other words, it equals any additional discounts applied after the price override. When an item is added to the order at no charge (for example, an accompanying item) then the regular offer price is not included in the discount total on the order	• If an item/SKU offer price exists, the discount amount equals the difference between the offer price and the selling price. When an item is added to the order at no charge (for example, an accompanying item) then the regular offer price is included in the discount total on the order. • If an item/SKU offer price does not exist, the discount amount equals the selling price of the item, presented as a negative number.	The *Discount* field at the *Display Invoice Header Screen*
evaluating the order or order detail line for a minimum coupon dollar amount	The system uses the price override amount entered to evaluate the order or line for a dollar minimum	The system uses the regular, single-unit offer price of the item or SKU to evaluate the order or line for a dollar minimum. If there is no offer price, the item cannot qualify for a coupon with a dollar minimum.	*How an Order or Item Qualifies for a Coupon*
highlighting discounted prices if the Display Order Line Discount Messages (F01) system control value is *selected*	The system does not highlight the overridden price.	The system highlights the overridden price and displays the discount calculation message if an item/SKU offer price exists.	The *Display Order Line Discount Messages (F01)* system control value and *Discount Calculation Messages*
calculating freight using the By Offer Price freight method for a source code (see for an overview)	The system uses the actual price to calculate freight charges for the order	The system uses the original offer price to calculate freight charges for the order	

Work with Price Override Reason Screen

How to display this screen: Enter *WPOR* in the Fast path field at the top of any menu or select Work with Price Override Reasons from a menu.

Field	Description
Reason	Represents a reason for overriding a price during order entry or order maintenance. Alphanumeric, 1 position; optional.
Description	The description associated with the price override reason code. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a price override reason code	Select *Create* to advance to the *Create Price Override Reason Screen*.
Change a price override reason code description	Select *Change* for a code to advance to the Change Price Override Reason screen. At this screen, you can change only the description. See *Create Price Override Reason Screen* for field descriptions.
Delete a price override reason code	Select *Delete* for the code. **Note:** You can delete a price override reason code at any time. However, you will lose any data associated with the reason code that is stored in the Price Override table. Additionally, if the reason code is defined as a default in the System Control table, deleting the code causes the system to display error messages in order entry.
Display a price override reason code	Select *Display* for a code to advance to the Display Price Override Reason screen. You cannot change any information on this screen. See *Create Price Override Reason Screen* for field descriptions.

Create Price Override Reason Screen

Purpose: Use this screen to create price override reason codes for use in Order Entry and Order Maintenance.

How to display this screen: Select *Create* at the *Work with Price Override Reason Screen*.

Field	Description
Price override code	Identifies the reason to override a price during order entry or order maintenance. Alphanumeric, 1 position. Create screen: required. Change screen: display-only.
Description	The description associated with the price override reason code. Alphanumeric, 30 positions; required.
Override item offer price	This flag indicates whether to use the price override amount entered in order entry as the item/SKU offer price for the order. The item offer price for each order line is stored in the Order Detail table. Valid values are: • *Selected* = Override the price, if any, specified for the item/SKU offer on the Order Detail line, and store the price override amount in the Original price and Offer price fields in the Order Detail table. • *Unselected* = Do not override the price specified for the item/SKU offer. See *Overriding the Item/SKU Offer Price* for an overview of how each setting works.
Exclude from price override report	This flag indicates whether to exclude the price override code from the *Price Override Reason Report*, which you can use to review the price override reason codes used to discount items for a range of dates, and the total discount amounts and percentages applied. Valid values are: • *Selected* = Exclude the price override code from the Price Override Reason Report. For example, you may wish to exclude system-assigned price override reason codes, such as *Default Price Override Reason (B35)*, from the report; see *Default Price Override Reasons* for a list of system-assigned codes specified in system control values. • *Unselected* = Include the price override code on the Price Override Reason Report.
Exclude from promotion engine discounts	Indicates whether order lines with the reason code assigned, should include/exclude promotion engine discounts. When the ORPE Integration is enabled, OMS will evaluate an order line's price override reason code. Valid values are: • *Selected* = The nonDiscountable and nonQualifying fields are set to true within the applyDeals request message, for that cart line. • *Unselected* = Default. The nonDiscountable and nonQualifying fields are set to false within the applyDeals request message, for that cart line.
Nbr of overrides (Number of overrides)	This field, displayed only on the Display Price Override Reason Code screen, is no longer implemented as of update 21.0. If a number of overrides was tracked for a price override reason code prior to update 21.0, the total is set to zero when the override reason is first used after applying the 21.0 update. To track the usage of a price override reason, generate the *Price Override Reason Report*. Numeric, 5 positions; display-only, updated by the system.

Field	Description
Total discount	The total discount amount represented by usage of this price override reason code. This number is calculated by subtracting the override price from the offer price, and is not updated for price override reason codes whose Override item offer price field is *selected*. **Note:** This field appears on the Display Price Override Reason Code screen only. Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.

Establishing Additional Charge Codes (WADC)

Purpose: Use additional charge codes to add miscellaneous charges or credits to an order.

You can add an additional charge or credit to an order in order entry or order maintenance by selecting *Charges*. You can display the same pop-up window in Work with Return Authorizations if you use the streamlined version; see *Working with Return Authorizations: Streamlined Process*.

You can establish additional charge codes for:

- special handling charges, such as monogramming, engraving, alterations or personalization.
- dollar discounts for an offer or source
- service charges
- shipper additional charges
- credits to offset additional charge codes when processing refunds
- freight credits to apply to Amazon orders

Additionally, use this table to identify whether the additional charge code displays the standard special handling screen, a customized special handling screen, or no special handling screen.

> **Note:**
>
> You can limit the total amount of negative additional charges applied to an order by entering a dollar value in the Negative Additional Charge Limit (E49) system control value.

In this topic:

- *Examples of Additional Charge Codes*
- *Special Handling Overview*

  - *Bypassing or Suppressing the Special Handling Screens*
  - *Overriding the Special Handling Charge or Price*
  - *Putting a Line on Hold through a Special Handling Format*
- *Work with Additional Charges Screen*
- *Create Additional Charges Screen*

Related system control values:

- *Default Additional Charge Code (C45)*: The system uses this code to apply a balance due write-off in order entry.
- Negative Additional Charge Limit (E49): You cannot enter negative additional charges on an order whose *total* will exceed this limit unless you have proper authority, as controlled by the *Override Negative Additional Chrge Limit (A60)* secured feature, described below.
- *Restrict Additional Charge Amount if Default Charge (F43)*: If you set this system control value to *Y*, you will not be able to enter an additional charge amount at the Enter Additional Charges window in order entry, order maintenance, or Work with Return Authorizations for any additional charge code set up with a default charge amount. This system control value works together with the *Enter Amount for Order Additional Charge Code (A80)* secured feature, described below.

See *Special Handling Overview* for additional system control values related specifically to special handling.

Related secured features:

- *Additional Charges Access (A24)*: Controls access to the Enter Additional Charges pop-up window in order entry, order maintenance, or Work with Return Authorizations, accessible by selecting *Charges*. If a user is prohibited from working with additional charges through this secured feature, this setting overrides the settings of any other secured features.
- *Override Negative Additional Charge Limit (A60)*: Controls the ability to override the negative additional charge limit set with the system control value described above.
- Enter Amount for Order Additional Charge Code (A80): Controls the ability to enter an additional charge amount at the Enter Additional Charges pop-up window in order entry, order maintenance, and Work with Return Authorizations (streamlined version only), accessible by selecting *Charges*. Works together with the *Restrict Additional Charge Amount if Default Charge (F43)* system control value described above; see *Adding Miscellaneous Charges or Credits in Order Entry* for a complete description.

See *Special Handling Overview* for additional secured features related specifically to special handling.

Examples of Additional Charge Codes

Type of Charge	Example	Defined Where?
service charge	flat charge applied to an order	Offer or Source Code; see *Setting Up Offer Information*

Type of Charge	Example	Defined Where?
dollar discount	discount (credit) applied to an order based on merchandise total	Offer or Source Code; see *Setting Up Offer Information*
shipper/ item	additional charge for delivery of oversized or heavy items	Shipper/Item (using the additional charge code for this purpose is not currently implemented)
special handling	charge for monogramming or other personalization, hemming, or dyeing	Item SKU/Offer; see *Special Handling Overview* below
restocking fee	charge for processing returns	Ad hoc; Additional Charges pop-up window in Order Entry (*Charges*)
long distance phone credit	credit to customer for phone calls to customer service	Ad hoc; Additional Charges pop-up window in Order Entry (*Charges*)
miscellaneous credits	credit you apply when processing a return to offset an additional charge added in Order Entry	Ad hoc; Additional Charges pop-up window in Order Entry (*Charges*)

Special Handling Overview

What is special handling? Special handling is any type of item personalization, such as monogramming, alterations, engraving, etc. You can also use a special handling code to automatically add a handling charge to an order when the customer orders a specific item, even if there are no actual handling instructions.

What are the two main types of special handling?

- *Standard* special handling (the *S/H type (Special handling type)* is *Standard*) supports entry of free-form text instructions.
- *Custom* special handling (the *S/H type (Special handling type)* is *Custom*) supports entry of specific fields, with default entries and validation. You use the *Establishing Custom Special Handling Formats (WSHF)* menu option for format setup.

What makes an item eligible for special handling? The *Special handling* flag for the item offer or SKU offer controls whether the item is eligible for personalization. If the *Special handling* flag is *selected*:

- *Default special handling:* If there is a *S/H code (Special handling code)* specified for the item offer or SKU offer, and that code's *Bypass S/H* flag is *unselected*, then this type of special handling defaults for the item. See *Bypassing or Suppressing the Special Handling Screens* for a discussion of screen flow based on different special handling options.

- *Optional special handling:* Otherwise, the item receives special handling only if you enter a code in the S/H code field for the item when you are entering the order, select the special handling option for an existing order detail line, or specify a special handling code in order maintenance.

If the *Special handling* flag for the item offer or SKU offer is *unselected*, the item is not eligible for special handling.

How much does the special handling cost? The system determines the special handling charge by:

- If a *S/H price (Special handling price)* is specified for the item offer or SKU offer, use this price; otherwise,
- If a *Default price* or *Default price %* is specified for the special handing format, use this price (this option is available for custom special handling only).

See *Overriding the Special Handling Charge or Price* for a discussion.

Putting the order line on hold: You can flag a custom special handling format to automatically put an order line on hold. See *Putting a Line on Hold through a Special Handling Format* for a discussion.

Contact Center: You can also review, add, update, or delete special handling for an order line in Contact Center. However, Contact Center does not currently support:

1. putting an order line on hold or releasing the line from hold through a special handling format
2. bypassing or suppressing special handling screens

System control values: System control values related to special handling include:

- *FTC -- # of Days to Add for Special Handling (C67)*
- *Enter Custom Special Handling in Upper and Lower Case (D65)*
- *Generate Custom Special Handling File (D66)*
- *Evaluate Special Handling Charges by Order Line (D67)*
- *Tax on Handling (B15)*
- *Display Special Format Response Descriptions in Order Entry (E90)*
- *Include Spaces in Special Handling Edit for Maximum Characters (F80)*

Bypassing or Suppressing the Special Handling Screens

You can set up special handling for an item offer or SKU offer so that you advance automatically to a special handling screen when entering an item; or, you can specify to advance to the screen on demand only; or you can prohibit display of the screen in order entry, but still add the handling charges to the order.

When do you advance to a special handling screen?

- **Automatically when you enter an item:** When you enter an item in order entry or order maintenance that has a *S/H code (Special handling code)* specified for the item offer or SKU offer, you automatically advance to the *Work with Special Handling Screen* or *Work with Custom Special Handling Screen* (depending on the special handling type) unless:
- if the *Suppress S/H window* flag for the additional charge code is set to *Suppress*: The special handling code and any appropriate charges are added to the order

without advancement to a special handling screen. In this situation, you cannot advance to a special handling screen in order entry or order maintenance, although you can display the related screen in standard or streamlined order inquiry.

> **Note:**
>
> The Suppress S/H window flag causes the special handling charge to be added to the order automatically when you use interactive order entry. For example, the charge is not added automatically through the generic order message (order API).

> **Note:**
>
> You should not select the Suppress S/H window flag for a custom special handling format. Adding an item with this setting to an order causes an error in Contact Center order entry.

1. if the *Bypass S/H* flag for the additional charge code is set to *Bypass*: You do not advance automatically to the *Work with Special Handling Screen* or *Work with Custom Special Handling Screen*, although you can display it on demand as described below.

> **Note:**
>
> It is not appropriate to select both the *Suppress S/H window* flag and the *Bypass S/H* flag.

- **By specifying a special handling code when you enter an item:**
- *If no special handling code assigned:* When you enter an item in order entry or order maintenance that does not have a *S/H code (Special handling code)* specified for the item offer or SKU offer, but does have the *Special handling* flag *selected*, you can advance automatically to a special handling screen by specifying the S/H code while entering the item. However, if the *Suppress S/H window* flag is set to *Suppress*, you cannot actually display the special handling screen, as described above.
- *If special handling code is flagged to bypass the screen:* If the *Bypass S/H* flag for the additional charge code is set to *Bypass*, you can still display the screen when you enter the item in order entry or order maintenance by specifying the S/H code while you enter the item.
- **Adding special handling to an existing order detail line:** You can also advance to a special handling screen by:
- Selecting *Handling* for an existing item at the *Work with Order Lines Screen (Adding Items to the Order)*, unless the *Suppress S/H window* flag is set to *Suppress*, as described above.
- Selecting *Change* for an existing item at the *Work with Order Lines Screen (Adding Items to the Order)* to advance to the *Work with Order Line Screen (Changing/Adding an Item)*, then entering the S/H code and, optionally, S/H charge. Again, you cannot display the special handling screen if the *Suppress S/H window* is set to *Suppress*, as described above.

- Selecting *Change* for an existing item at the *Work with Order Lines Screen (Adding Items to the Order)* to advance to the *Work with Order Line Screen (Changing/Adding an Item)*, then selecting *Special Handling*, you have the opportunity to select a special handling code and apply it to the order line, provided the *Special handling* flag *selected*.

Removing special handling information for an order line: If special handling is assigned to an item on an order, you can remove it by:

- If the special handling format is not suppressed, you can select *Handling* for an existing item at the *Work with Order Lines Screen (Adding Items to the Order)* and then select *Delete special handling* or *Delete all* at the special handling screen.
- Otherwise, unless the *Suppress S/H window* is *selected* and the additional charge code specifies a custom special handling format, you can delete the special handling instructions and charge by selecting *Change* for an existing item at the *Work with Order Lines Screen (Adding Items to the Order)* to advance to the *Work with Order Line Screen (Changing/Adding an Item)*, then clearing the S/H code and the S/H charge.
- If the additional charge code is flagged to suppress special handling and uses a custom special handling format, you cannot delete the special handling from the order line. You will need to delete the order line and re-add it.

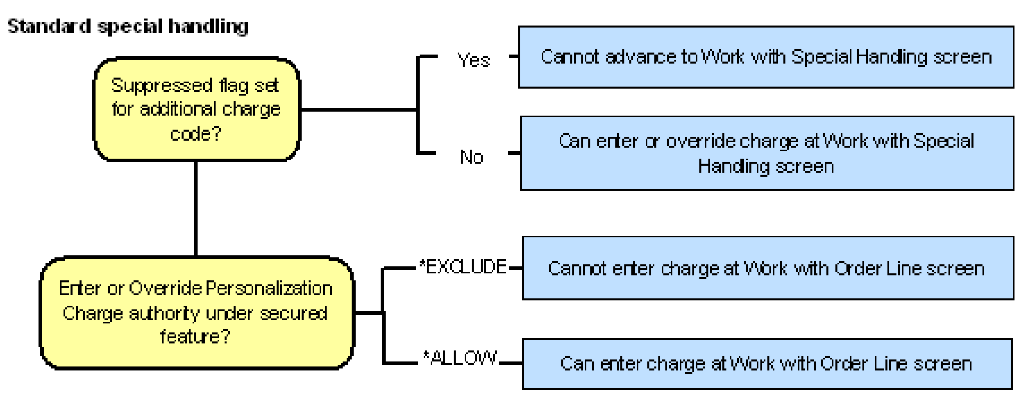
Bypassing or suppressing special handling screens is not supported in Contact Center.

Overriding the Special Handling Charge or Price

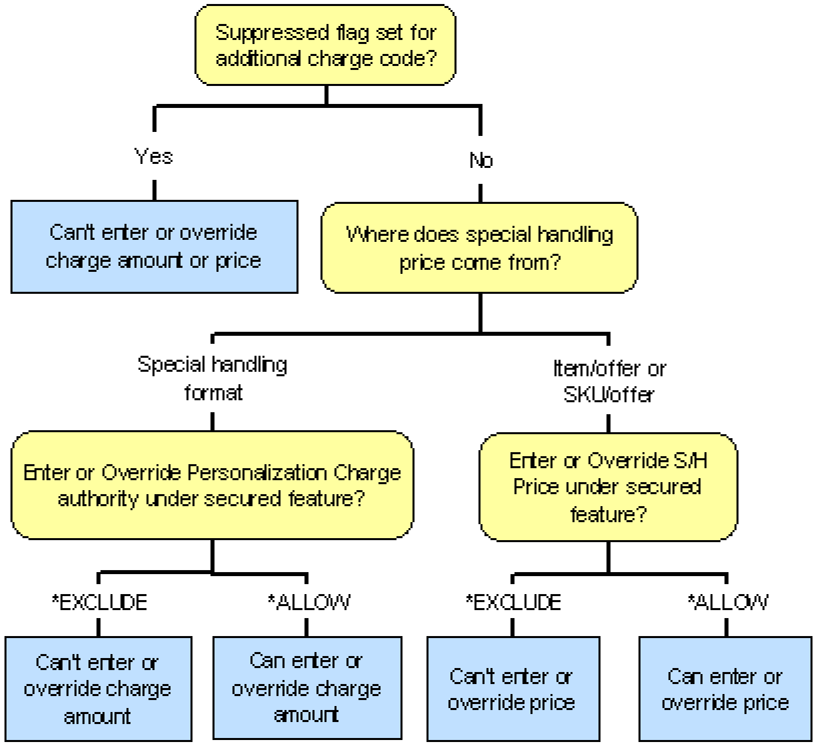
You can enter a special handling price at the special handling screen or the *Work with Order Line Screen* if you have the required authority. Two secured features control access:

- *Enter or Override Personalization Charge (A40)*: Controls access to the Charge field when you are working with custom special handling formats in order entry (when the charge is established at the special handling format)
- *Enter or Override S/H Price (B12)*: Controls access to the S/H price field when you are working with custom special handling formats in order entry (when the special handling price is defined for the item/offer or SKU/offer)

Standard special handling: The following chart summarizes how the system controls access for standard special handling formats:



Custom special handling: The following chart summarizes how the system controls access for custom special handling formats:



Summary: The following table summarizes the situations in which you can enter or override the special handling charge or price:

Screen	You can enter or override special handling charge/price if:
Work with Order Line Screen	Special handling type = standard Authority under the Enter or Override S/H Price secured feature is *ALLOW
Work with Special Handling Screen	Special handling type = standard Display of the special handling screen is not suppressed
Work with Custom Special Handling Screen	Special handling type = custom Display of the special handling screen is not suppressed And: • If the special handling price is derived from the special handling format: authority under the Enter or Override Personalization Charge = *ALLOW; or, • If the special handling price is derived from the item/offer or SKU/offer: authority under the Enter or Override S/H Price secured feature = *ALLOW

Putting a Line on Hold through a Special Handling Format

You can use the *S/H hold* flag for a custom special handling format to automatically put an order line on hold. When you create an order line that uses the special handling format, or apply the special handling format to an existing line, the system puts the order line in hold status.

You can release the order line from hold by:

- removing the special handling from the order line by selecting *Special Handling* at the *Work with Order Line Screen* (**NOTE:** Removing the special handling by selecting *Special Handling* at the *Work with Order Line Screen* will *NOT* release the order line from hold); or,
- changing the special handling format to a format that is not flagged for hold; or,
- using the *Release* option for the order line.

What if the special handling is suppressed? If you select the Suppress flag for the additional charge code associated with the special handling format, you cannot remove the special handling format from an existing order line. You can release the line to remove the hold, or you can delete the line and re-enter it.

Order API: When you create an order through the generic order API rather than interactive order entry, the system also puts the order line in hold status if it uses a special handling format flagged for hold.

> **Note:**
>
> Lines in hold status due to their special handling format are not displayed through the *Working with Held Detail Lines (WOHD)* menu option.

Automatically applying the hold without special handling: You can set up a "dummy" special handling format to automatically place certain items in hold status, even though they do not require any actual special handling. To do so, create a custom special handling format with the *S/H hold* flag selected, but with no details. When you assign the special handling format to an additional charge code, select the Bypass option so that you do not advance automatically to a special handling screen; also, when you assign the additional charge code to the item offer or SKU offer, do not specify a S/H price.

When you add the item to an order through the order API, use the personalization_id in the inbound order message to specify the additional charge code, but do not include any personalization lines in the message.

> **Note:**
>
> To prevent pick slip preparation from sorting the order line with items that require actual special handling, remove the special handling format from the order line; do not use the *Release* option in order maintenance.

Putting a line on hold or releasing the line from hold through a special handling format is not supported in Contact Center.

Work with Additional Charges Screen

Purpose: Use this screen to work with or review additional charge codes, including charges that you use for special handling. See *Establishing Additional Charge Codes (WADC)* for an overview.

How to display this screen: Enter *WADC* in the Fast path field at the top of any menu or select Work with Additional Charges from a menu.

Field	Description
Code	Represents a type of additional charge or credit. Alphanumeric, 2 positions; optional.
Description	The description associated with the additional charge code. Alphanumeric, 30 positions; optional.
Group	Groups similar charge types for reporting purposes. Alphanumeric, 3 positions; optional.
S/H type (Special handling type)	Defines the type of special handling screen the additional charge code calls in order entry. Valid values are: • *Custom* = Custom special handling screen • *Standard* = Standard special handling screen (which includes free-form entry fields) • blank = This additional charge code is not used for special handling. Required.
S/H format (Special handling format)	This code indicates the format of the custom special handling screen for the additional charge code. Special handling format codes are defined in and validated against the Special Handling Format table. See *Establishing Add Reason Codes (WADR)*. Alphanumeric, 2 positions; optional.
U/F	User field; this field is informational only. Alphanumeric, 1 position; optional.

Screen Option	Procedure
Create an additional charge code	Select *Create* to advance to the *Create Additional Charges Screen*.
Change additional charge code information	Select *Change* for a code to advance to the Change Additional Charges screen. You can change any information on this screen except the additional charge code. See *Create Additional Charges Screen* for field descriptions. **Note:** Changing the values in the *S/H type (Special handling type)* and *S/H format (Special handling format)* fields will not affect existing orders.

Screen Option	Procedure
Delete an additional charge code	Select *Delete* for a code. **Note:** You can delete an additional charge code at any time. However, existing orders will retain the code, but not the description.
Display an additional charge code	Select *Display* for a code to advance to the Display Additional Charges screen. You cannot change any information on this screen. See *Create Additional Charges Screen* for field descriptions.

Create Additional Charges Screen

Purpose: Use this screen to create and define the characteristics of an additional charge code.

How to display this screen: Select *Create* at the *Work with Additional Charges Screen*.

Field	Description
Code	Represents the type of additional charges or credits. You may apply additional charges to the source code, to the offer, to special handling of an item, to the item at the ship via level, or you can add them in order entry. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Description	The description associated with the additional charge code. Alphanumeric, 30 positions; required.
Group	Groups similar charge types for reporting purposes. Alphanumeric, 3 positions; optional.

Field	Description
S/H type (Special handling type)	Defines the type of special handling screen that appears in Order Entry or Order Maintenance for the additional charge code. Only additional charge codes with a type of *C* or *S* appear when you scan on the Special Handling field in Order Entry or Order Maintenance. Valid values are: • *Custom* = Custom special handling (entry fields that you can customize). If you enter *Custom*, then you must also enter a value in the *S/H format (Special handling format)* field. • *Standard* = Standard special handling (free-form entry fields) • blank = the additional charge code is not for special handling. **Note:** If you specify a special handling type, you cannot enter a default charge amount, below. This is because the system never uses the default charge amount as part of special handling. Optional.
S/H format (Special handling format)	This code indicates the format of the custom special handling screen. Special handling format codes are defined in and validated against the Special Handling Format table. See *Establishing Custom Special Handling Formats (WSHF)*. You must enter a a format if you entered *Custom* in the *S/H type (Special handling type)* field; otherwise, the system ignores the format entered here if the S/H type field is set to *Standard* or is blank. Alphanumeric, 2 positions; required if S/H type = *Custom*.
S/H exclude tax?	This flag indicates whether special handling charges are subject to normal tax evaluation. Valid values are: • blank = Leave this field blank if the S/H type field is blank, indicating the additional charge code is not for special handling. • *Exclude* = Special handling charges are excluded from any tax, including line handling (*LH*) charges passed from an external tax system. • *Do Not Exclude* = Special handling charges are evaluated for tax, based on the regular tax logic; see *About Tax Rates* for an overview. Selecting this flag is valid only if the additional charge code represents special handling (the S/H type is *Custom* or *Standard*). You cannot select this flag if the additional charge does not represent special handling. Alphanumeric, required if S/H type = *Custom* or *Standard*.
User field	This field is informational only. Alphanumeric, 1 position; optional.

Field	Description
Default charge	The charge (positive amount) or credit (negative amount) to apply to an order when you enter this additional charge code at the Enter Additional Charges pop-up window. The system does not use the default charge in any other situation except through this pop-up window, which is available by selecting *Additional Charges* in order entry, order maintenance, or Work with Return Authorizations. **Note:** You cannot enter both a default charge amount and a special handling type. The *Restrict Additional Charge Amount if Default Charge (F43)* system control value and the Enter Amount for Order Additional Charge Code (A80) secured feature control how this field works. Numeric, 13 positions with a 2-place decimal; optional.
Suppress S/H window	Indicates whether to suppress the display of the *Work with Special Handling Screen* or the *Work with Custom Special Handling Screen* when you add an item with special handling in order entry. You might want to suppress display in order to automatically add a charge to the Handling bucket on an order without requiring the order entry operator to complete or accept the information on the special handling screen. Valid values are: • blank = Leave this field blank if the S/H type field is blank, indicating the additional charge code is not for special handling. • *Suppress* = Suppress the display of the related special handling screen in order entry when you add an item with this additional charge code; however, any related handling charge is still added to the order. • *Do not suppress* = The related special handling screen is available for entry. Not a valid entry for an additional charge code that does not have a Special handling format.

Field	Description
	Additional considerations when suppressing the special handling screens: *Displaying special handling screens on demand:* If the automatic advancement to the special handling screen is suppressed, you cannot display the screen on-demand. For example, a special handling screen is not available by selecting *Special Handling* for an item in order entry or order maintenance. However, you can still advance to the Display Special Handling or the Display Custom Special Handling screens in standard order inquiry, or display special handling information in streamlined order inquiry, regardless of the setting of this field. If you would like to prevent the special handling screen automatically but retain the ability to display it on demand, use the Bypass S/H flag instead of the Suppress S/H window flag. *Entering returns through order entry:* If a special handling format is set to suppress display and applies to the order detail line, then the handling charge will be automatically added to the order as a credit when you create a return by entering a negative quantity in order entry. However, if the special handling format is not set to suppress display, you advance to the special handling screen and have the option of accepting or rejecting the charge. **Note:** This flag causes the special handling charge to be added to the order automatically when you use interactive order entry. For example, the charge is not added automatically through the generic order message (order API). Does not control screen flow in Contact Center. Optional.

Field	Description
Bypass S/H	Indicates whether to bypass the automatic display of the *Work with Special Handling Screen* or the *Work with Custom Special Handling Screen* when you add an item with special handling in order entry; however, you can still display the special handling screen by: • selecting *Special Handling* next to an existing order detail line • entering the code in the S/H field when adding an item to an order • entering the S/H code at the *Work with Order Line Screen (Changing/Adding an Item)* Valid values are: • blank = Leave this field blank if the S/H type field is blank, indicating the additional charge code is not for special handling. • *Bypass* = Bypass automatic display of the special handling screen in order entry or maintenance, but leave the screen available on demand • *Do Not Bypass* = Do not bypass automatic display of the special handling screen in order entry or maintenance Does not control screen flow in Contact Center. **Note:** You should not have both this flag set to *Bypass* and the Suppress S/H window flag set to *Suppress* for an additional charge code in order to have the special handling option work correctly in order entry and order maintenance. Alphanumeric, optional.

Establishing Order Hold Reason Codes (WOHR)

Purpose: Use the Order Hold Reason Code screens to create and maintain reason codes used to place orders on hold, and to set authority to release orders from hold for specific hold reason codes for a user or user class.

The Order Hold Reason table includes:

- system hold reason codes that are delivered with the system and cannot be changed
- reason codes that you can use to place orders on "user hold" in order entry or order maintenance
- reason codes that identify why a credit card order was declined
- reason codes for the system to apply automatically to orders you send to or receive from Order Orchestration (see the *Order Orchestration Integration Overview*)

Reason codes in this table are assigned in Order Entry and Order Maintenance, and are also entered in the Vendor Response table to translate the service bureau decline response code into a user defined reason code. See *Defining Vendor Response Codes*.

You can also assign a hold reason code to an order through the *Generic Pick In API (Shipments, Voids, and Backorders)*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

In this topic:

- *Work with Order Hold Reason Screen*
- *Create Order Hold Reason Screen*
- *Authority Hierarchy*
- *Work with User Field Authority Screen (Setting Hold Reason Authority for Users)*
  - *Resetting User Authority*
- *Work with User Class Field Authority Screen (Setting Order Hold Reason Authority for User Classes)*
  - *Resetting User Class Authority*

For more information: See *Introducing Order Hold Reason Codes* for a discussion of system-assigned order hold reason codes.

Work with Order Hold Reason Screen

How to display this screen: Enter *WOHR* in the Fast path field at the top of any menu or select Work with Order Hold Reasons from a menu.

Field	Description
Reason	Represents: • a user-defined reason for placing an order on hold in Order Entry or Order Maintenance • a system-defined code used in the credit checking process, • a reason for credit card decline holds Alphanumeric, 2 positions; optional.
Description	The description associated with the hold reason code. Hold reason codes created through the *Generic Pick In API (Shipments, Voids, and Backorders)* have a description of `AB - AUTO CREATED` where the `hold_reason` passed is `AB`. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** When you scan, your entry must match a full description exactly. Alphanumeric, 50 positions; optional.

Screen Option	Procedure
Create an order hold reason code	Select *Create* to advance to the *Create Order Hold Reason Screen*.
Change an order hold reason code description	Select *Change* for a hold reason code to advance to the Change Order Hold Reason screen. At this screen, you can change only the description. See *Create Order Hold Reason Screen* for field descriptions. To change the actual reason code, you must delete the existing record, then create a new one.
Delete an order hold reason code	Select *Delete* for a code. **Note:** You can delete an order hold reason code that you created at any time. When you delete a code, the code will still appear on customer order records, but no description will display. You will not be able to remove the order from hold through the Release Held Orders menu option; however, you will be able to release the order from hold in order maintenance by deleting the hold reason code. See *Performing the Release* and *Work with Order Screen in Order Maintenance*.
Display order hold reason code detail	Select *Display* for a hold reason code to advance to the Display Order Hold Reason screen. You cannot change any information on this screen. See *Create Order Hold Reason Screen* for field descriptions.
Work with hold release authority for users	Select *User Release Auth* for a hold reason code to advance to the *Work with User Field Authority Screen (Setting Hold Reason Authority for Users)*.
Work with hold release authority for user classes	Select *User Class Release Auth* for a hold reason code to advance to the *Work with User Class Field Authority Screen (Setting Order Hold Reason Authority for User Classes)*.

Create Order Hold Reason Screen

To create: Use this screen to add an order hold reason code.

How to display this screen: Select *Create* at the *Work with Order Hold Reason Screen*.

Field	Description
Reason	Represents the reason you are placing an order on hold. A reason code may also identify reasons for credit card decline or be a code delivered with the system for use during the credit checking process. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Description	The description associated with the hold reason code. Alphanumeric, 50 positions; required.

Authority Hierarchy

You can use the Work with Order Hold Reason menu option to set user or user class authorities to specific hold reason codes. The settings you enter through this menu option are overrides to defaults set at a higher level.

General guidelines: The order in which the system checks for a user's authority to release an order from hold is described in the table below:

Authority setting	Set up through:
1. user's authority to the specific order hold reason	*Work with User Field Authority Screen (Setting Hold Reason Authority for Users)*
2. user's user class authority to the specific order hold reason	*Work with User Class Field Authority Screen (Setting Order Hold Reason Authority for User Classes)*
3. user's authority to the *Order Hold Reason Release Authority (A77)* secured feature	Work with Secure Feature Authority screen in *Working with User Records (WUSR)*
4. user's user class authority to the *Order Hold Reason Release Authority (A77)* secured feature	Work with User Class Feature Authority screen in *Setting Up User Classes (WUCL)* (also available by selecting *W/W User Classes* in Work with Users)
5. default setting of the *Order Hold Reason Release Authority (A77)* secured feature	Work with Secure Features screen in Work with System Values/Features (fast path = *WSYS*)

The system checks each setting in the above order, skipping over any blank settings until it finds a **ALLOW* or **EXCLUDE* setting.

Example One: User SBROWN is assigned to the user class WAREHOUSE. The *Order Hold Reason Release Authority (A77)* secured feature is set to **ALLOW*. The WAREHOUSE user class authority for order hold reason UH is set to **EXCLUDE*. SBROWN's user authority for order hold reason UH is set to **ALLOW*. The result is that SBROWN can release orders from UH hold, because her user authority overrides the other settings. However, the other users in the WAREHOUSE user class cannot release orders from UH hold, unless they also have an override at the user level.

Example Two: User HBROWN has a *Order Hold Reason Release Authority (A77)* secured feature setting of **EXCLUDE*. However, the user settings for the AA and BB hold reason codes only are set to **ALLOW*. This user is not assigned to a user class. The result is that HBROWN can release orders from AA and BB hold only, but is excluded from releasing an order with any other hold reason code.

Releasing a hold in Contact Center: In the case of the *Order Holds* window in Contact Center, authority to the *Selecting Held Orders (ERHO)* menu option is also required, except for releasing user holds.

For more information:

- releasing an order through order maintenance: *Work with Order Screen in Order Maintenance*
- releasing an order through Release Held Orders: *Performing the Release*

> **Note:**
>
> Order hold reason release authority settings do not prevent a user from releasing an order from recipient hold (available by selecting *Display* for an order through Release Held Orders) or from a pay type hold (available by selecting *User Class Release Auth* for an order in Release Held Orders). The authority settings are effective only for header-level holds.

Work with User Field Authority Screen (Setting Hold Reason Authority for Users)

Purpose: Use this screen to review or change a user's authority to release an order from hold for a specific hold reason code.

> **Note:**
>
> The authority settings are effective only for header-level holds, not for pay type or recipient holds.

How to display this screen: Select *User Release Auth* for a hold reason code at the *Work with Order Hold Reason Screen*.

Field	Description
Hold reason	The hold reason code you selected at the *Work with Order Hold Reason Screen*. The description displays to the right. Code: alphanumeric, 2 positions; display-only. Description: alphanumeric, 50 positions; display-only.
User	The user ID of a person within your company. Alphanumeric, 10 positions; optional.
Name	The user's name. Alphanumeric, 30 positions; optional.

Field	Description
Authority	The user's authority to release an order from the hold reason code specified. Valid values are: • *Allow* = User can release orders with this hold reason code. • *Display* = User can review orders with this hold reason code. • *Exclude* = User cannot release orders with this hold reason code. • blank = User's ability to release orders with this hold reason code depends on the user class setting; if there is no user class setting for this hold reason code, the system checks the setting of the *Order Hold Reason Release Authority (A77)* secured feature at the user, user class, and default levels in order. See *Authority Hierarchy*. Optional.
User class authority	The authority of the user's class to release an order from the hold reason code specified. Valid values are: • *Allow* = User can release orders with this hold reason code, unless the user-level authority is set to *Exclude*. • *Display* = User can review orders with this hold reason code. • *Exclude* = User cannot release orders with this hold reason code, unless the user-level authority is set to *Allow*. • blank = User's ability to release orders with this hold reason code does not depend on the user class setting; if there is no user setting for this hold reason code, the system checks the setting of the *Order Hold Reason Release Authority (A77)* secured feature at the user, user class, and default levels in order. See *Authority Hierarchy*. Alphanumeric, 8 positions; optional.

Resetting User Authority

To delete: Select *Delete* for a user ID.

If you delete a user's user-level authority, the user class-level authority setting for this order hold reason, if any, will be in effect; if there is no user class setting, the system checks the setting of the *Order Hold Reason Release Authority (A77)* secured feature at the user, user class, and default levels in order. See *Authority Hierarchy*.

If the user did not have a user-level authority setting for this order hold reason, the screen does not display an error message; however, no changes take place.

To set to ALLOW: Select *Allow* for a user ID. The user will be able to release orders with this header-level order hold reason.

If the user already had authority to this order hold reason, the screen does not display an error message; however, no changes take place.

To set to EXCLUDE: Select *Exclude* for a user ID. The user will not be able to release orders with this header-level order hold reason.

If the user already is excluded from this order hold reason, the screen does not display an error message; however, no changes take place.

Work with User Class Field Authority Screen (Setting Order Hold Reason Authority for User Classes)

Purpose: Use this screen to review or work with the authority settings to a selected order hold reason by user class.

> **Important:**
>
> The authority settings are effective only for header-level holds, not for pay type or recipient holds.

How to display this screen: Select *User Class Release Auth* for an order hold reason code at the *Work with Order Hold Reason Screen*.

Field	Description
Hold reason	The hold reason code you selected at the *Work with Order Hold Reason Screen*. The description displays to the right. Code: alphanumeric, 2 positions; display-only. Description: alphanumeric, 50 positions; display-only.
Class	A user class within your company. Alphanumeric, 10 positions; optional.
Description	The description of a user class. Alphanumeric, 30 positions; optional.
Authority	The user class's authority to release an order from the hold reason code specified. Valid values are: • *Allow* = User in this class can release orders with this hold reason code, unless the user-level setting is *Exclude*. • *Display* = User in this class can review orders with this hold reason code. • *Exclude* = User in this class cannot release orders with this hold reason code, unless the user-level setting is *Allow*. • blank = User's ability to release orders with this hold reason code depends on the order hold reason setting at the user level, if defined; otherwise, the system checks the secured feature setting at the user, user class, and default levels in order. See *Authority Hierarchy*. Alphanumeric, 8 positions; optional.

Resetting User Class Authority

To delete: Select *Delete* for a user class.

If you delete a user class's authority, and if there is no user-level setting for the order hold reason, the system checks the setting of the *Order Hold Reason Release Authority (A77)* secured feature at the user, user class, and default levels in order. See *Authority Hierarchy*.

If the user class did not have an authority setting for this order hold reason, the screen does not display an error message; however, no changes take place.

To set to ALLOW: Select *Allow* for a user class. The users in this class can release orders with this header-level order hold reason unless the authority setting for an individual user is set to *Exclude*.

If the user class already had authority to this order hold reason, the screen does not display an error message; however, no changes take place.

To set to EXCLUDE: Select *Exclude* for a user class. The users in this class will not be able to release orders with this header-level order hold reason unless the authority setting for an individual user is set to *Allow.*

If the user class already is excluded from this order hold reason, the screen does not display an error message; however, no changes take place.

Establishing Cancel Reason Codes (WCNR)

Purpose: Use the Cancel Reason Code screens to create and maintain reason codes for item, order, or quote cancellations. You must establish at least one cancel reason code, because order maintenance requires that you enter a cancel reason code when you cancel an order or quote or reduce the quantity ordered. Additionally, the system uses cancel reason codes for automatic backorder cancellations, such as the cancellation of:

- the balance of an order after its first shipment
- backordered items after a specified number of days
- an item from all orders that contain the item (for example, soldout items)

Updates: When you cancel an entire order and enter a cancel reason code, the system assigns the reason code to each open (unshipped) item on the order.

The Cancel Reason table stores history on cancellations by offer, and the system writes transactions to the Order History table whenever you perform a cancellation.

The system also writes cancel reason information to the Refund table for prepaid orders. Prepaid orders include orders paid by check or cash.

Prevent refund? You might designate whether to generate refunds for a cancel reason code, such as when you cancel fraudulent orders. When you use a cancel reason code flagged to prevent a refund, the refund record is still generated, but in a *Cancel Pending* status. The next time you use *Processing Refunds (MREF)*, the refund is canceled.

Reduce demand? If the cancel reason code is not flagged to reduce demand, and you cancel all items on the order, the order status is set to *Canceled*; otherwise, if the cancel reason code is flagged to reduce demand, or any items have shipped, the order status is set to *Closed*.

In this topic:

- *Work with Cancel Reason Codes Screen*
- *Create Cancel Reason Screen*
- *Display Reason/Offer Screen (Cancel Reason History)*

Work with Cancel Reason Codes Screen

How to display this screen: Enter *WCNR* in the Fast path field or select Work with Cancel Reasons from a menu.

Field	Description
Rsn (Cancel reason)	Represents a reason for canceling an order or item. Numeric, 2 positions; optional.
Description	The description associated with the cancel reason code. Alphanumeric, 30 positions; optional.
Refund	Controls whether a refund will be generated for orders or quantities canceled with the cancel reason code. Valid values are: • *Generate Refund with Release Status* = Generate a refund. • *Generate Refund with Hold Status* (default*) or blank* = Generate a refund, but place it on hold. • *Do Not Generate a Refund* = The refund record is still generated, but in a *Cancel Pending* status. The next time you use *Processing Refunds (MREF)*, the refund is canceled. Optional.
Reduce	Indicates whether the system decreases demand figures for cancellations using this cancel reason code. Demand represents the quantity ordered (but not necessarily shipped). Valid values are: • *Yes* = Reduce demand by the quantity canceled. The line status and order status is set to *Closed*. • *No* or blank = Do not reduce demand. The line status is set to *Canceled*. If you cancel all the items on the order with a cancel reason flagged not to reduce demand, the order status is set to *Canceled*; otherwise, it is set to *Closed*. Optional.

Screen Option	Procedure
Create a cancel reason code	Select *Create* to advance to the *Create Cancel Reason Screen*.
Change a cancel reason code	Select *Change* for a cancel reason to advance to the Change Cancel Reason screen. See *Create Cancel Reason Screen* for field descriptions. You can change any information on this screen except the cancel reason code.
Delete a cancel reason code	Select *Delete* for a cancel reason code. If the cancel reason code has been used to cancel one or more orders, a pop-up window indicates that history information exists and requires confirmation. The Cancel Reason History record includes information about the number and dollar value of cancellations for that cancel reason by offer. See *Display Reason/Offer Screen (Cancel Reason History)*. You will lose this history if you delete the cancel reason code.

Screen Option	Procedure
Display a cancel reason code	Select *Display* for a cancel reason code to advance to the Display Cancel Reason screen. You cannot change any information on this screen. See *Create Cancel Reason Screen* for field descriptions.
Display cancel reason history by offer	Select *Display Offer* for a cancel reason code to advance to the Display Cancel Reason/Offer screen. See *Display Reason/Offer Screen (Cancel Reason History)*.

Create Cancel Reason Screen

To create: Use this screen below to create a cancel reason code.

How to display this screen: Select *Create* at the *Work with Cancel Reason Codes Screen*.

Field	Description
Cancel reason code	Represents a reason for canceling an order or a quantity on the order. Numeric, 2 positions. Create screen: required. Change screen: display-only.
Description	The description associated with the cancel reason code. Alphanumeric, 30 positions; required.
Generate refund?	Controls whether a refund will be generated for orders or quantities canceled with the cancel reason code. Valid values are: • *Generate Refund with Release Status* = Generate a refund. • *Generate Refund with Hold Status* (default*) or blank* = Generate a refund, but place it on hold. • *Do Not Generate a Refund* = The refund record is still generated, but in a *Cancel Pending* status. The next time you use *Processing Refunds (MREF)*, the refund is canceled. Optional.
Reduce demand	This flag indicates whether the system decreases demand figures (quantity ordered) for dollar value of orders when you cancel a line using the cancel reason code. Demand figures are tracked in the Source table (*MSSRC*) as well as the other tables listed under *Demand Updates: Affected Tables*. Valid values are: • *Selected* = Reduce demand by the quantity canceled. One reason to reduce demand is if the operator made a keying error when entering the quantity. Using a cancel reason code with this setting *selected* changes the status of lines or orders to closed and reduces the quantity ordered on the order line to zero. When you use a cancel reason code with this setting *selected*, and system control value *Update Demand for Order Maintenance Transactions (C72)* is also *selected*, the system decreases the dollar value of orders, but does not change the dollar value or number of cancellations in the Source table (*MSSRC*).

Field	Description
	1. *Unselected* (default) = Do not reduce demand. Using a cancel reason code with this setting *unselected* changes the status of lines to canceled but does not change the quantity ordered. If you cancel the entire order with a reason code that is not set to reduce demand, the order status is also set to canceled. When you use a cancel reason code with this field *unselected*, and system control value *Update Demand for Order Maintenance Transactions (C72)* is *selected*, the system increases the dollar value and the number of cancellations but does not change the dollar value of orders in the Source table (*MSSRC*) and other tables listed under *Demand Updates: Affected Tables*.

Display Reason/Offer Screen (Cancel Reason History)

Purpose: Use this screen to display history by offer for a cancel reason code.

How to display this screen: At the *Work with Cancel Reason Codes Screen*, select *Display Offer* for a cancel reason code.

How to interpret this screen: This screen displays cancellation history associated with the reason code. Behind each reason code is the Cancel Reason/Offer table, which includes the number of orders and dollars canceled for the reason code.

Updates when? The system updates the History table when you accept a cancellation through Order Maintenance, provided the cancel reason code is not flagged to Reduce Demand.

This screen displays summary data by offer, with cancel counts and dollars for each date when items were canceled. Summaries are listed by offer, then by date. You cannot change any information on this screen.

Field	Description
Cancel reason code	Represents a reason for canceling an order or a quantity on an order. This is the code you selected at the *Work with Cancel Reason Codes Screen*. Numeric, 2 positions; display-only.
Offer	A code representing a catalog, space or television advertisement from which you accept orders. Offer codes are defined in and validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; optional.
Date	The date when the cancellation(s) occurred. Numeric, 6 positions (in user date format); optional.
# cancels	The number of cancellations performed manually or automatically. Numeric, 3 positions; display-only, updated by the system.
# units	The total number of units canceled. Numeric, 3 positions; display-only, updated by the system.
$ cancels (Dollars canceled)	The total merchandise dollars canceled. Numeric, 13 positions with a 2-place decimal; display-only, updated by the system.

Establishing Return Reason Codes (WRTR)

Purpose: Use the Return Reason Code screens to create and maintain reason codes for merchandise returns. You must establish at least one return reason code for receipt and credit of returned merchandise. When you enter returns through return authorizations, order entry, or order maintenance, or when the customer creates a return authorization at the web storefront, a return reason code is required.

The Return Reason table stores history on returns by offer, and the system writes transactions to the Order History table whenever you perform a return. The system also writes return reason history to the Refund table for customer credit.

Download to web storefront: You can download return reason codes to the web storefront if you enable customers to create return authorizations on the storefront.

Uploading: You can use the *Submit Supporting Data Upload Screen (SDUP)* to upload new return reason codes. See *Importing Item-Related Supporting Data (SDUP)* for an overview.

Report: You can use the *Return Reason Report* to review the total number of units and dollars returned for a selected time period. See *Printing the Return Reason Report (PRRR)* for more information.

For more information: See *Introducing Return Authorizations (WRTA)* for an overview on returns.

In this topic:

- *Work with Return Reason Screen*
- *Create Return Reason Screen*
- *Display Return Reason/Offer Screen (Reviewing History)*

Work with Return Reason Screen

How to display this screen: Enter *WRTR* in the Fast path field or select Work with Return Reason from a menu.

Field	Description
Rsn (Return reason)	Represents a reason for returning an item. Numeric, 3 positions; optional.
Description	The description associated with the return reason code. Alphanumeric, 30 positions; optional.
Def (Defective)	Indicates whether the return is defective. This field is informational only. Valid values: • *Yes* = The item is defective. • *No* (default) = The item is not defective.
Rtv (Return to vendor)	Indicates whether you send the returned merchandise back to the vendor. Valid values: 1. *Yes* = Send the returned merchandise to the vendor. 2. *No* (default) = Do not send the returned merchandise back to the vendor.

Field	Description
Whs (Warehouse)	Represents a warehouse to receive the returned merchandise. Warehouse codes are defined in and validated against the Warehouse table. Numeric, 3 positions; optional.

Screen Option	Procedure
Create a return reason code	Select *Create* to advance to the *Create Return Reason Screen*.
Change a return reason code	Select *Change* for a code to advance to the Change Return Reason screen. You can change any information except the return reason code. See *Create Return Reason Screen* for field descriptions. To change the actual code, delete the record and create a new one.
Delete a return reason code	Select *Delete* for a code to delete it. If the return reason code has been used to return one or more items, a pop-up window indicates that history exists and requires confirmation. You will lose this history if you delete the return reason code.
Display return reason code detail	Select *Display* for a code to advance to the Display Return Reason screen. You cannot change any information on this screen. See *Create Return Reason Screen* for field descriptions.
Display return reason history by offer	Select *Display Offers* for a code to advance to the *Display Return Reason/Offer Screen (Reviewing History)*.

Create Return Reason Screen

To create: At the *Work with Return Reason Screen*, select *Create*.

Field	Description
Return reason code	Represents a reason for returning merchandise. Numeric, 3 positions. Create screen: required. Change screen: display-only.
Description	The description associated with the reason code. Alphanumeric, 30 positions; required.
Defective?	This flag indicates whether the item is defective. This setting is informational only. Valid values: • *Selected* = The item is defective. • *Unselected* (default) = The item is not defective.

Field	Description
Return to vendor	This flag indicates whether you send the returned merchandise back to the vendor. Valid values: • *Selected* = Send the returned merchandise to the vendor. • *Unselected* (default) = Do not send the returned merchandise back to the vendor.
Warehouse	Represents the warehouse to receive the returned merchandise. This field is not currently implemented; the warehouse is determined by the return disposition value used on the return. See *Establishing Return Disposition Values (WRDV)*. Numeric, 3 positions; optional.

Display Return Reason/Offer Screen (Reviewing History)

Purpose: Use this screen to display return history by offer for a reason code.

How to display this screen: At the *Work with Return Reason Screen*, select *Display Offers* for a return reason.

How to interpret this screen: This screen displays return history associated with a reason code. Behind each reason code is a history table that indicates the number of items and dollars returned for the reason code. The History table matches each return with an offer (for example, a catalog) and the date of the return transaction.

About returns: The system updates this history each time you complete the return processing (that is, credit the return). Processing a return involves creating the return authorization, receiving the return into inventory, and processing the credit so that you can refund the customer, if necessary. When you process a return in order entry or order maintenance, these three steps occur at once “behind the scenes.” You can also break this process out into the three separate steps when you process returns through the e-commerce interface or the return authorizations options. See *Introducing Return Authorizations (WRTA)*.

The information on this screen changes whenever the history table is updated. This screen displays summary data with return counts and dollars for each date on which item returns were processed. Summaries are listed by offer, then by date. You cannot change any of the information on this screen.

Field	Description
Return reason code	Represents a reason for returning merchandise. Numeric, 3 positions; display-only.
Offer	Represents a catalog, space or television advertisement from which you accept orders. Offer codes are defined in and validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; optional.
Date	The date when the return processing was completed. Numeric, 6 positions (in user date format); optional.
Number	The number of units returned and credited. Numeric, 3 positions; display-only.
Dollars	The total value of returned merchandise. Alphanumeric, 13 positions with a 2-place decimal; display-only.

Establishing Exchange Reason Codes (WEXR)

Purpose: Use the Exchange Reason Code screens to create and maintain reason codes for merchandise exchanges. The Return Authorization and Order Maintenance functions require an exchange reason code when you exchange merchandise.

The Exchange Reason table stores history by offer, and the system writes transactions to the Order History table whenever you perform an exchange.

Uploading: You can use the *Submit Supporting Data Upload Screen (SDUP)* to upload new exchange reason codes. See *Importing Item-Related Supporting Data (SDUP)* for an overview.

Report: You can use the *Exchange Reason Report* to review the total number of units and dollars returned for exchange in a selected time period. See *Printing the Exchange Reason Report (PERR)* for more information.

In this topic:

- *Work with Exchange Reason Screen*
- *Create Exchange Reason Screen*
- *Display Exchange Reason/Offer Screen (Reviewing History)*

Work with Exchange Reason Screen

How to display this screen: Enter *WEXR* in the Fast path field or select Work with Exchange Reasons from a menu.

Field	Description
Rsn (Exchange reason code)	Represents a reason for exchanging merchandise. Numeric, 3 positions; optional.
Description	The description associated with the exchange reason code. Alphanumeric, 30 positions; optional.
Def (Defective)	Indicates whether the merchandise returned for exchange is defective or damaged. Valid values: • *Yes* = The merchandise is defective. • *No* = The merchandise is not defective. Optional.
Rtv (Return to vendor)	Indicates whether you send the returned merchandise back to the vendor. Valid values: • *Yes* = Return the merchandise to the vendor. • *No* = Do not return the merchandise to the vendor. Optional.
Whs (Warehouse)	Represents a warehouse. Numeric, 3 positions; optional.

Screen Option	Procedure
Create an exchange reason code	Select *Create* to advance to the *Create Exchange Reason Screen*.
Change an exchange reason code	Select *Change* for a code to advance to the Change Exchange Reason screen. See *Create Exchange Reason Screen* for field descriptions. To change the reason code, delete the record and create a new one.
Delete an exchange reason code	Select *Delete* for a code. If the exchange reason code has been used to exchange one or more items, a pop-up window indicates that there is history for the exchange reason code, containing information on number and dollar value of returns for that return reason by offer. See *Display Exchange Reason/Offer Screen (Reviewing History)*. You will lose this history if you delete the exchange reason code.
Display an exchange reason code	Select *Display* for a code to advance to the Display Exchange Reason screen. You cannot change any information on this screen. See *Create Exchange Reason Screen* for field descriptions.
Display exchange reason code history by offer	Select *Display Offers* for a code to advance to the *Display Exchange Reason/Offer Screen (Reviewing History)*.

Create Exchange Reason Screen

To create: At the *Work with Exchange Reason Screen*, select *Create*.

Field	Description
Exchange reason code	Represents a reason for exchanging merchandise. Numeric, 3 positions. Create screen: required. Change screen: display-only.
Description	The description associated with the exchange reason code. Alphanumeric, 30 positions; required.
Defective	Indicates whether the returned item is defective or damaged. Valid values: • *Selected* = The merchandise is defective. • *Unselected* (default) = The merchandise is not defective.
Return to vendor?	Indicates whether to return the merchandise back to the vendor. Valid values: • *Selected* = Return the merchandise to the vendor. • *Unselected* (default) = Do not return the merchandise to the vendor.

Field	Description
Warehouse	Represents the warehouse to receive the returned merchandise. Warehouse codes are defined in and validated against the Warehouse table. This field is not currently implemented; the warehouse is determined by the return disposition value used on the return. See Establishing Return Disposition Values (WRDV). Numeric, 3 positions; optional.

Display Exchange Reason/Offer Screen (Reviewing History)

Purpose: Use this screen below to display exchange reason/offer records.

How to display this screen: At the *Work with Exchange Reason Screen*, select *Display Offers* for an exchange reason code.

How to interpret this screen: This screen displays exchange history associated with a reason code.

Behind each reason code is a History table that indicates the number of units and dollar total in exchanges for the code. The system updates this History table whenever you accept an exchange through Order Maintenance or Return Authorization. The History table matches each exchange with an offer (for example, a catalog) and the date of the exchange transaction.

The information on this screen changes whenever the History table is updated. This screen displays summary data with exchange counts and dollars for each date on which exchanges were processed. Summaries are listed by offer, then by date. You cannot change any information on this screen.

Field	Description
Exchange reason code	Represents a reason for exchanging merchandise. Numeric, 3 positions; display-only.
Offer	Represents a catalog, space or television advertisement from which you accept orders. Offer codes are defined in and validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; optional.
Date	The date when the exchange transaction occurred. Numeric, 6 positions (in user date format); display-only.
Number	The number of units exchanged. Numeric, 3 positions; optional.
Dollars	The value of exchanged merchandise. Numeric, 13 positions with a 2-place decimal; display-only.

Establishing Return Disposition Values (WRDV)

Purpose: Use return disposition values to identify how a returned item will be handled by the system when you process a return through Return Authorizations, Order Entry or Order Maintenance.

- *Does the return affect inventory?* If the return disposition code affects inventory, the merchandise will be returned into active inventory and the system updates the on hand quantity for the specified location.
- *Is the merchandise returned to its primary location?* The system checks for a primary location and warehouse in the Item table. If a location and warehouse is defined in the Item table, the system returns the item automatically to this warehouse location. If a location has not been defined in the Item table or if the return disposition value is not set up to receive returns to the primary location, the system receives the return in the warehouse and location defined for the return disposition value.
- *Does the user have authority to this return disposition value?* You can set up authority to a specific return disposition value for a user or user class. If the user has authority to the return disposition code, the system processes the return. If the user does not have authority to the return disposition value, an error message indicates when you try to process the return.

In this topic:

Work with Return Disposition Values Screen

How to display this screen: Enter *WRDV* in the Fast path field at the top of a menu or select Work with Return Disposition Values from a menu.

Field	Description
Return code	A code that identifies how the returned merchandise will be handled by the system, in terms of whether the return updates inventory and the warehouse and location to which the merchandise will be returned. Alphanumeric, 2 positions; optional.
Description	The description of the return disposition value. Alphanumeric, 30 positions; optional.
Affect inv (Affect inventory)	Determines whether the return affects the on-hand quantity. Valid values: • *Yes* = Affect inventory. When set to *Yes*, you must enter a valid warehouse and location even if the **Use primary location** = Y. • *No* = Do not affect inventory. Optional.

Field	Description
Use primary location	Indicates whether the item should be returned to its primary location. Valid values: • *Yes* = Use primary. • *No* = Do not use primary. Optional.
W/H (Warehouse)	A code that identifies the warehouse where the item will be returned. Warehouse codes are defined in and validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; optional.
Location	A code that identifies the location within the warehouse where you place the item. Location codes are defined in and validated against the Location table. See *Creating and Maintaining Locations (WLOC)*. Alphanumeric, 7 positions; optional.

Screen Option	Procedure
Create a return disposition code	Select *Create* to advance to the *Create Return Disposition Screen*.
Change return disposition information	Select *Change* for a return disposition value to advance to the Change Return Disposition screen. You can change any information on the Change Return Disposition screen except the disposition code itself. See *Create Return Disposition Screen* for field descriptions. To change the actual disposition code, you must delete the existing record and create a new one.
Delete a return disposition code	Select *Delete* for a return disposition value.
Display a return disposition code	Select *Display* for a return disposition value to advance to the Display Return Disposition screen. You cannot change any information on this screen. See *Create Return Disposition Screen* for field descriptions.
Work with return disposition authority for users	Select *User Authority* for a return disposition value to advance to the *Work with User Field Authority Screen (Return Disposition Authority for Users)*.
Work with return disposition authority for user classes	Select *User Class Authority* for a return disposition value to advance to the *Work with User Class Field Authority Screen (Return Disposition Authority for User Classes)*.

Create Return Disposition Screen

Purpose: Use this screen to create a return disposition value.

How to display this screen: At the *Work with Return Disposition Values Screen*, select *Create*.

Field	Description
Code	Represents the return disposition value. Return disposition values identify how returned merchandise will be handled by the system, in terms of whether the return updates inventory and the warehouse and location to which the merchandise will be returned. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Description	The description of the return disposition value. Alphanumeric, 30 positions; required.
Affect inventory	This flag identifies whether the returned merchandise will be returned into active inventory and update the on hand quantity in the specified location. Valid values are: • *Selected* = Returned merchandise increases the on-hand quantity. • *Unselected* = Returned merchandise does not increase the on-hand quantity. **Note:** If you *deselect* this setting, you must *deselect* the *Use primary location* setting. Also, you cannot enter values in the *Warehouse* or *Location* fields or the system displays the following message: `Warehouse & location not required for Disp. code .`
Use primary location	This flag indicates whether to return items to their primary locations. Valid values are: • *Selected* = Return the item to the primary location. If the disposition code is set up to affect inventory and return to the primary location, the system checks for a primary location in the Item table. If one is available, the system returns the item automatically to this warehouse location. If one is not available, the system receives the return in the warehouse and location defined for the return disposition code. • *Unselected* = Do not return the item to the primary location; instead, return the item to the warehouse and location defined for the Return Disposition code.

Field	Description
Warehouse	The default warehouse used for returns with this Return Disposition code. You must define a default warehouse if you *selected* the *Affect inventory* field. **Note:** The system uses this warehouse automatically if the *Use primary location* field is *selected*, but no primary warehouse is defined for the item/SKU. Warehouse codes are defined in and validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; required when Affect inventory field is *selected*.
Location	The default location used for returns with this Return Disposition code. You must define a default location if you *selected* the *Affect inventory* flag. **Note:** The system uses this location automatically if the *Use primary location* field is *selected*, but no primary location is defined for the item/SKU. Location codes are defined in and validated against the Location table. See *Creating and Maintaining Locations (WLOC)*. Alphanumeric, 7 positions; required when Affect inventory field is *selected*.

Authority Hierarchy

Purpose: You can use the Work with Return Disposition Values menu option to set user or user class authorities to specific return disposition values. The settings you enter through this menu option are overrides to defaults set at a higher level.

General guidelines:

Authority Setting	Set Up Through:
1. user's authority to the specific return disposition value	*Work with User Field Authority Screen (Return Disposition Authority for Users)*
2. user's user class authority to the specific return disposition value	*Work with User Class Field Authority Screen (Return Disposition Authority for User Classes)*

Authority Setting	Set Up Through:
3. user's authority to the Return Disposition Code Authority (A83) secured feature	*Work with User Class Field Authority Screen (Return Disposition Authority for User Classes)* in Work with User Classes (fast path = *WUCL*); also available by selecting *W/W User Classes* in Work with Users
4. user's user class authority to the Return Disposition Code Authority (A83) secured feature	*Work with User Class Field Authority Screen (Return Disposition Authority for User Classes)* in Work with User Classes (fast path = *WUCL*); also available by selecting *W/W User Classes* in Work with Users
5. default setting of the Return Disposition Code Authority (A83) secured feature	Work with System Features screen in Work with System Values/Features (fast path = *WSYS*)

The system checks each setting in the above order, skipping over any blank settings until it finds a *Allow* or *Exclude* setting.

Example One: User BMIRANDA is assigned to the user class WAREHOUSE. The Return Disposition Code Authority (A83) secured feature is set to *Allow*. The WAREHOUSE user class authority for return disposition value 4A is set to *Exclude*. BMIRANDA's user authority for return disposition value 4A is set to *Allow*. The result is that BMIRANDA can process a return using the 4A return disposition value, because her user authority overrides the other settings. However, the other users in the WAREHOUSE user class cannot process a return user the 4A return disposition value, unless they also have an override at the user level.

Example Two: User TBROWN has a Return Disposition Code Authority (A83) secured feature setting of *Exclude*. However, the user settings for the 4A and 4B return disposition values only are set to *Allow*. This user is not assigned to a user class. The result is that TBROWN can process a return using return disposition values 4A and 4B only, but is excluded from processing a return using any other return disposition values.

Work with User Field Authority Screen (Return Disposition Authority for Users)

Purpose: Use this screen to review or change a user's authority to a specific return disposition value.

How to display this screen: Select *User Authority* for a return disposition value at the *Work with Return Disposition Values Screen*.

Field	Description
Return disposition	The return disposition value you selected at the *Work with Return Disposition Values Screen*. The description displays to the right. Value: alphanumeric, 2 positions; display-only. Description: alphanumeric, 30 positions; display-only.
User	The user ID of a person within your company. Alphanumeric, 10 positions; optional.
Name	The user's name. Alphanumeric, 30 positions; optional.

Field	Description
Authority	The user's authority to process a return using the return disposition value specified. Valid values are: • *Allow* = The user can process a return using this return disposition value. • *Display* = The user can review a return with this return disposition value. • *Exclude* = The user cannot process a return using this return disposition value. • Blank = The user's ability to process a return using this return disposition value depends on the user class setting; if there is not user class setting for this return disposition value, the system checks the setting of the Return Disposition Code Authority (A83) secured feature at the user, user class, and default levels in order. See *Authority Hierarchy*. Optional.
User class authority	The authority of the user's class to process a return using the return disposition value specified. Value values are: • *Allow* = The user can process a return using the return disposition value specified, unless the user-level authority is set to *Exclude*. • *Display* = The user can review a return with the return disposition value specified. • *Exclude* = The user cannot process a return using the return disposition value specified, unless the user-level authority is set to *Allow*. • Blank = The user's ability to process a return using the return disposition value specified does not depend on the user class setting; if there is not user setting for this return disposition value, the system checks the setting of the Return Disposition Code Authority (A83) secured feature at the user, user class, and default levels in order. See *Authority Hierarchy*. Optional.

Resetting User Authority

To delete: Select *Delete* for a user ID.

If you delete a user's user-level authority, the user class-level authority setting for this return disposition value, if any, will be in effect; if there is no user class setting, the system checks the setting of the Return Disposition Code Authority (A83) secured feature at the user, user class, and default levels in order. See *Authority Hierarchy*.

If the user did not have a user-level authority setting for this return disposition value, the screen does not display an error message; however, no changes take place.

Set to ALLOW: Select *Allow* for a user ID. The user will be able to process a return using the specified return disposition value.

If the user already had authority to this return disposition value, the screen does not display an error message; however, no changes take place.

Set to EXCLUDE: Select *Exclude* for a user ID. The user will not be able to process a return using this return disposition value.

If the user already is excluded from this return disposition value, the screen does not display an error message; however, no changes take place.

Work with User Class Field Authority Screen (Return Disposition Authority for User Classes)

Purpose: Use this screen to review or work with the authority settings to a selected return disposition value by user class.

How to display this screen: Select *User Class Authority* for a return disposition value at the *Work with Return Disposition Values Screen*.

Field	Description
Return disposition	The return disposition value you selected at the *Work with Return Disposition Values Screen*. The description displays to the right. Value: alphanumeric, 2 positions; display-only. Description: alphanumeric, 30 positions; display-only.
Class	A user class within your company. Alphanumeric, 10 positions; optional.
Description	The description of a user class. Alphanumeric, 30 positions; optional.
Authority	The user class's authority to process a return using the return disposition code specified. Valid values are: • *Allow* = User in this class can process a return using this return disposition value, unless the user-level setting is *Allow*. • *Display* = User in this class can review a return using this return disposition value. • *Exclude* = User in this class cannot process a return using this return disposition value, unless the user-level setting is *Exclude*. • blank = User's ability to process a return using this return disposition value depends on the return disposition value setting at the user level, if defined; otherwise, the system checks the secured feature setting at the user, user class, and default levels in order. See *Authority Hierarchy*. Optional.

Resetting User Class Authority

To delete: Select *Delete* for a user class.

If you delete a user class's authority, and if there is no user-level setting for the return disposition value, the system checks the setting of the Return Disposition Code Authority (A83) secured feature at the user, user class, and default levels in order. See *Authority Hierarchy*.

If the user class did not have an authority setting for this return disposition value, the screen does not display an error message; however, no changes take place.

To set to ALLOW: Select *Allow* for a user class. The user in this user class will be able to process a return using this return disposition value, unless the authority setting for an individual user is set to *Exclude*.

If the user class already had authority to this return disposition value, the screen does not display an error message; however, no changes take place.

Set to EXCLUDE: Select *Exclude* for a user class. The users in this class will not be able to process a return using this return disposition value, unless the authority setting for an individual user is set to *Allow*.

If the user class already is excluded from this return disposition value, the screen does not display an error message; however, no changes take place.

Establishing Custom Special Handling Formats (WSHF)

Purpose: Use the Special Handling Format table to define the contents of the custom special handling screen that displays in Order Entry. Custom special handling differs from standard special handling in that you can define required fields, offer additional features with a special charge, and specify valid values for input fields that the system will validate in Order Entry.

Overview: To display the custom special handling screen in Order Entry, you must first define the format. You then associate the format with an additional charge code. You can then define that additional charge code for the Item/Offer or Item/SKU/Offer.

See *Special Handling Overview* for more information on how special handling works.

Setup: There are three basic steps to setting up a custom special handling format:

1. Select *Create* on the *Work with Special Handling Format Screen* to define the new format.
2. Select *Work with details* for the new format to define the fields to display in Order Entry, then select *Create* to create each field.
3. Enter valid responses for each field that you want the system to validate in Order Entry. Later, you can designate a default response by using the Change option on the *Work with Special Handling Format Detail Screen*.

Suppressing screen display in order entry: You can use the *Suppress S/H window* for the additional charge code to prevent the *Work with Custom Special Handling Screen* from opening automatically in order entry. You might want to suppress display in order to automatically add a charge to the Handling bucket on an order without requiring the order entry operator to complete or accept the information on the special handling screen.

Sending custom special handling instructions in the order API: See the *personalization_line* element in the CWOrderIn message for information on how to pass custom special handling instructions through the order API in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

  - *Enter or Override S/H Price (B12)*
- entering an item with custom special handling on an order: *Work with Special Handling Screen*

Work with Special Handling Format Screen

How to display this screen: Enter *WSHF* in the Fast path field at the top of any menu, or select Work with Special Handling Format from a menu.

Field	Description
Code	This code identifies the special format. Alphanumeric, 2 positions; optional.
Description	The description of the special format. Alphanumeric, 30 positions; optional.
Status	A code used to indicate whether the special format is active. Valid codes are: • *Active* • *Inactive* The system issues a message in Order Entry when you enter an item that uses an inactive special handling format and it will not accept the item on the order. Required.

Field	Description
Extract	Controls whether the system will include items to receive this type of special handling in extract files. If an outside service performs special handling for you, you might want to use these tables to transmit the information to them. The system generates these tables when you generate pick slips. In order to generate the tables for custom special handling items, both this field and the *Generate Custom Special Handling File (D66)* system control value must be *selected*. Valid values: • *Yes* = Include items to receive this type of special handling in the custom special handling extract. • *No* = Do not include items to receive this type of special handling in the custom special handling extract. Optional.
Hold	Indicates whether to automatically put an order line on hold when it uses this special handling format. *YES* = When you create an order line using this format, or apply this format to an existing order line, the system puts the order line on hold. *NO* = The system does not automatically put an order line on hold when it uses this special handling format. See *Putting a Line on Hold through a Special Handling Format*.

Screen Option	Procedure
Create a special handling format	Select *Create* to advance to the *Create Special Handling Format Screen*.
Change a special handling format	Select *Change* for a special handling format to advance to the Change Special Handling Format screen. You can change any information on this screen except the format code. See *Create Special Handling Format Screen* for field descriptions. You can change or delete a special handling format at any time without affecting existing orders.
Delete a special handling format	Select *Delete* for a special handling format.
Display a special handling format	Select *Display* for a special handling format to advance to the Display Special Handling Format screen. You cannot change any information on this screen. See *Create Special Handling Format Screen* for field descriptions.
Change, delete, display or create the actual screen format, or define appropriate responses for fields on the custom special handling screen	Select *Work with details* for a special handling format to advance to the *Work with Special Handling Format Detail Screen*.

Create Special Handling Format Screen

Purpose: At this screen, you can create and define the characteristics of a custom special handling screen.

How to display this screen: Select *Create* at the *Work with Special Handling Format Screen*.

Field	Description
S/H format code (Special handling format code)	A code to identify the special format. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Description	The description of the special format. Alphanumeric, 30 positions; required.
Status	This code indicates if the special format is active. Valid values: • *Active* • *Inactive* The system issues a message in Order Entry when you enter an item that uses an inactive special handling format and it will not accept the item on the order. Required.
S/H extract	This flag controls whether the system will include items to receive this type of special handling in extract files. If an outside service performs special handling for you, you might want to use these tables to transmit information to them. The system generates these tables when you generate pick slips. In order to generate the tables for custom special handling items, both this field and the *Generate Custom Special Handling File (D66)* system control value must be *selected*. • *Selected* = Include items to receive this type of special handling in the custom special handling extract. • *Unselected* = Do not include items to receive this type of special handling in the custom special handling extract.
S/H hold	Indicates whether to automatically put an order line on hold when it uses this special handling format. *Selected* = When you create an order line using this format, or apply this format to an existing order line, the system puts the order line on hold. *Unselected* = The system does not automatically put an order line on hold when it uses this special handling format. See *Putting a Line on Hold through a Special Handling Format*.

Work with Special Handling Format Detail Screen

Purpose: Use this screen to create, change, display, or delete the actual format of a custom special handling screen or to define appropriate responses for fields on the screen.

How to display this screen: Select *Work with details* for a special handling format at the *Work with Special Handling Format Screen*.

Field	Description
Special format code	A code used to identify the special format, carried over from the *Work with Special Handling Format Detail Screen*. You enter this code in the S/H format field in the Additional Charge Code table to link a custom special handling format screen to a type of special handling. The description associated with the special handling format appears to the right of the code. Alphanumeric, 2 positions; display-only.
Field label	The name of the input field as it appears on the *Work with Custom Special Handling Screen* in Order Entry. Alphanumeric, 15 positions; display-only.
Valid responses	The valid values you have defined for the input field. If the field will accept any response in Order Entry without validation, this field will be blank on the *Work with Special Handling Format Screen*. Responses appear on this screen separated by commas. The Work with Special Handling Format screen may not display all responses if there is not sufficient room. Alphanumeric, 45 positions; display-only.
Default response	The value to appear automatically in the input field on the special handling screen in Order Entry. Enter the same response in the Valid responses field, above. You can override the default value in order entry. Alphanumeric, 25 positions; display-only.
F/O (Feature option)	Indicates whether the input field is a feature option. A feature option is an extra feature that can be added to the item, possibly for an additional charge. Define the price and cost for the custom special handling in a required feature option field to add the base price of the special handling to the order and the base cost to the drop ship purchase order. You can also define additional feature options, with or without additional costs; the price and/or cost will be added to the order as long as you enter a valid value in the input field in order entry. • *Y* = Feature option • *N* = Not a feature option Display-only.
Req (Required)	Indicates whether entry in the input field is required in Order Entry. • *Y* = Required • *N* = Not required. Display-only.

Field	Description
Default text	This code allows you to select text from the Customer Sold-to table to default onto a Custom Special Handling Detail Line in Order Entry/Order Maintenance. Each code is associated with specific text. For example, selecting code 4 will default the first name, middle initial and last name of the sold-to customer onto a special handling detail line. The first 14 characters of the description appear to the right of the default text code. Any default text overrides valid responses. You cannot use default responses. Valid values are: • First Name: 15 positions • Middle Initial: 1 position • Last Name: 25 positions • First Name, Middle Initial, Last Name: 41 positions • Company Name: 30 positions • Street Address: 32 positions • Apartment Number: 10 positions • Address Line 2: 32 positions • Address Line 3: 32 positions • Address Line 4: 32 positions • City: 25 positions • State Code: 2 positions • Zip Code: 10 positions • City, State, Zip Code: 37 positions • Country Code: 3 positions • Prefix: 3 positions • Suffix: 3 positions • Daytime Phone Number: 14 positions • Evening Phone Number: 14 positions • Mobile\Fax Phone Number: 14 positions **Note:** The *Third Phone Number Type (L53)* system control value determines whether the third phone number is labeled the Fax or Mobile number on screens and reports. Display-only.

Screen Option	Procedure
Add a field to the custom special handling format screen	Select *Create* to advance to the *Create Special Handling Format Detail Screen*.

Screen Option	Procedure
Change a field on the custom special handling format screen	Select *Change* for a field to advance to the Change Special Handling Format Detail screen. You can change any information on this screen except the format code. See *Create Special Handling Format Detail Screen* for field descriptions.
Delete a field on the custom special handling format screen	Select *Delete* for a field.
Display a field on the custom special handling format screen	Select *Display* for a field to advance to the Display Special Handling Format Detail screen. You cannot change any information on this screen. See *Create Special Handling Format Detail Screen* for field descriptions.
Change, delete, display or create the appropriate responses for a field on the custom special handling screen	Select *Responses* for a field to advance to the *Work with Special Format Response Screen*.
Change, delete, display, or create rules that control the application of special handling details for an item on an order	Select Rules for a field to advance to the Work with Special Format Rules Screen.
Adjust the sequence of the fields on the custom special handling screen	Select *Resequence* to update the structure of the custom special handling screen based on the specified sequence.

Create Special Handling Format Detail Screen

Purpose: At this screen, you can define the characteristics of a field that appears on the custom special handling screen.

How to display this screen: At the *Work with Special Handling Format Detail Screen*, select *Create*.

Field	Description
Special format code	A code used to identify the special format, carried over from the *Work with Special Handling Format Detail Screen*. You enter this code in the S/H format field in the Additional Charge Code table to link a custom special handling format screen to a type of special handling. The description associated with the special handling format appears to the right of the code. Alphanumeric, 2 positions; display-only.
Display sequence	This code controls the order in which the input fields display on the *Work with Custom Special Handling Screen* in order entry. The fields display in ascending numeric sequence. Numeric, 3 positions; required.
Field label	The name of the input field as it appears on the *Work with Custom Special Handling Screen* in order entry. Alphanumeric, 15 positions; required.
Required field	This flag indicates whether entry in the input field is required in order entry. • *Selected* = Required • *Unselected* = Not required

Field	Description
Feature option	This flag indicates whether the input field is a feature option. A feature option is an extra feature that can be added to the item, possibly for an additional charge. Define the price and cost for the custom special handling in a required feature option field to add the base price of the special handling to the order and the base cost to the drop ship purchase order. You can also define additional feature options, with or without additional costs; the price and/or cost will be added to the order as long as you enter a valid value in the input field in order entry. • *Selected* = Feature option • *Unselected* = Not a feature option
Default price	Use this field to define the unit price to charge the customer for the feature option. This amount defaults to the *Work with Custom Special Handling Screen* in order entry if the Feature option flag is *selected*. Except in the case of an override as listed below, the system adds this price to the total handling charge on the order if the customer purchases the feature option. You can override the default price: • in the S/H price field for the item offer or SKU offer: see Performing Initial Item Entry (MITM) for information on creating item offers and SKU offers • in order entry if you have authority to do so, based on the Enter or Override Personalization Charge (A40) secured feature. **Note:** The *Evaluate Special Handling Charges by Order Line (D67)* system control value controls whether the handling charge added to the order is based on the number of order lines with special handling or on the total unit quantity. You can enter a price only if the Feature option flag is *selected* and the Default price % field is blank. This is not a required field, even for feature options. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Default price %	Use this field to define the percentage used to calculate the price of the feature option. Except in the case of an override as listed below, the system adds this price to the total handling charge on the order if the customer purchases the feature option. The percentage is calculated based on the selling price of the item. You can override the default price: • in the S/H price field for the item offer or SKU offer: see *Performing Initial Item Entry (MITM)* for information on creating item offers and SKU offers • in order entry if you have authority to do so, based on the *Enter or Override Personalization Charge (A40)* secured feature. **Note:** The *Evaluate Special Handling Charges by Order Line (D67)* system control value controls whether the handling charge added to the order is based on the number of order lines with special handling or on the total unit quantity. You can enter a price percentage only if the *Feature option* flag is *selected* and the *Default price* field is blank. Numeric, 13 positions with a 2-place decimal; optional.
Default cost	The unit cost of the feature option for drop ship purchase orders. This cost does not display in order entry or on pick slips; it is the amount that you pay the vendor for the special handling. **Note:** When a special handling format is set to suppress display in order entry, the system creates a purchase order detail line for the special handling only if there is a default response specified for the special handling detail line. You can complete this field only if the *Feature option* flag is *selected* and the *Default cost %* field is blank. Numeric, 13 positions with a 4-place decimal; optional.

Field	Description
Default cost %	A percentage used to compute the cost of the item for drop ship purchase orders, determined as follows: `Cost percentage * Item cost = Unit cost` This cost does not display in order entry or on pick slips; it is the amount that you pay the vendor for the special handling. **Note:** When a special handling format is set to suppress display in order entry, the system creates a purchase order detail line for the special handling only if there is a default response specified for the special handling detail line. You can complete this field only if the *Feature option* flag is *selected* and the *Default cost* field is blank. Numeric, 5 positions with a 2-place decimal; optional.
Default text	Allows you to select text from the customer record to default onto a custom special handling detail line in order entry. Each code is associated with specific text. For a list of the codes and the default text associated with each code, see *Work with Special Handling Format Detail Screen*. Optional.
Max # characters	Indicates the maximum number of characters allowed for this special handling detail line. You can define any number from 0 to 45. If you define 0 as the maximum number, it is treated as a blank field and allows the maximum 45 characters to be used. The value you select will display to the right of this field. Text cannot exceed the maximum number of characters allowed in the special format detail table. A message similar to the following displays if your entry exceeds the maximum number of characters allowed in the special format detail table: `Exceeds Maximum Characters Allowed` If the *Include Spaces in Special Handling Edit for Maximum Characters (F80)* system control value is *selected*, the system includes spaces in the edit to determine the maximum number of characters allowed for a custom special handling input field. *Example:* When this system control value is *selected*, the Exceeds Maximum Characters Allowed error message indicates if a user enters Paws and Claws Limited Supplies in an input field that is set up with a maximum character length of 30 positions. If this system control value is *unselected*, the system would not display the error message since the number of characters not including spaces is 27. Numeric, 2 positions; optional.

Field	Description
Cross reference	A code used to cross reference between the special handling format detail in Order Administration and the element's code on the manufacturing system. The manufacturing system records this cross reference code in the Order Special Format table when a special format defined with this code is used in order entry. Alphanumeric, 3 positions; optional.

Work with Special Format Response Screen

Purpose: Use this screen to create, change or delete valid responses of fields that appear on the custom special handling screen.

You need to enter responses only if you want the system to validate responses for this field in order entry. Any default text used overrides valid responses in Order Entry/ Order Maintenance. Otherwise, this screen displays only free-form entry fields for valid responses. Enter one response per line.

How to display this screen: This screen appears automatically after you create a Special Handling Format Detail record. You can also display this screen by selecting *Responses* for an existing Detail record at the *Work with Special Handling Format Detail Screen*.

Defining responses: To create valid responses for a field on the custom special handling screen, enter one desired response(s) per line. A second line, labeled desc, is available under the first line for entry of the description of the valid response. This description is displayed in order entry if the *Display Special Format Response Descriptions in Order Entry (E90)* system control value is *selected*.

Entering response descriptions is helpful if you use codes to represent valid responses. For example, if you identify the color black with the code 8859, order entry operators can identify code 8859 as black by referring to the valid response description field.

> **Note:**
>
> If the *Enter Custom Special Handling in Upper and Lower Case (D65)* system control value is *selected*, you can enter case-sensitive responses in this field in Order Entry.

You can define an unlimited number of responses for a field by selecting *Next* to display additional input fields on the Work with Special Format Response screen (not all responses may appear, however, on the Work with Special Format Detail screen).

If you enter any valid responses on this screen, the system validates responses in Order Entry against your entries here.

Responses for feature options: When defining responses for a feature option, remember that the system adds the price defined for the feature option to the order if you enter any valid response in Order Entry.

You can use a required feature option to add the price of the basic special handling to the order. You can then add additional feature options if desired, with or without associated prices.

Identifying a default response: You can define a default response for the field by selecting *Change* for the detail record. Enter the desired default in the *Default response* field on the Change Special Format screen. The system validates your entry against the responses you have previously defined for the field.

Displaying responses: Select *Responses* for a Detail record at the *Work with Special Handling Format Detail Screen* to review the valid responses for a field on the custom special handling screen.

Changing or deleting: Select *Resequence* at the *Work with Special Format Response Screen* to update or delete a response.

Type over the existing value to update the response or *Tab* through the response to delete it.

Work with Special Format Rules Screen

Purpose: Use this screen to work with rules to validate the custom special handling instructions for order lines that use a particular custom special handling format.

Why set up rules? Setting up rules for a complex special handling format helps you prevent the customer or CSR from entering special handling instructions that are inconsistent, impractical, or otherwise invalid. For example, for if monogramming is optional, but there are additional requirements when monogramming is selected, setting up rules can help prevent problems in creating the special handling instructions.

What do rules consist of? Each rule includes:

- *an IF statement* that identifies whether the rule applies, for example: If the pocket style for a shirt is equal to “no pocket”
- *a THEN statement* that specifies the rule to apply, for example: then the monogram location cannot be “pocket”

More rule examples:

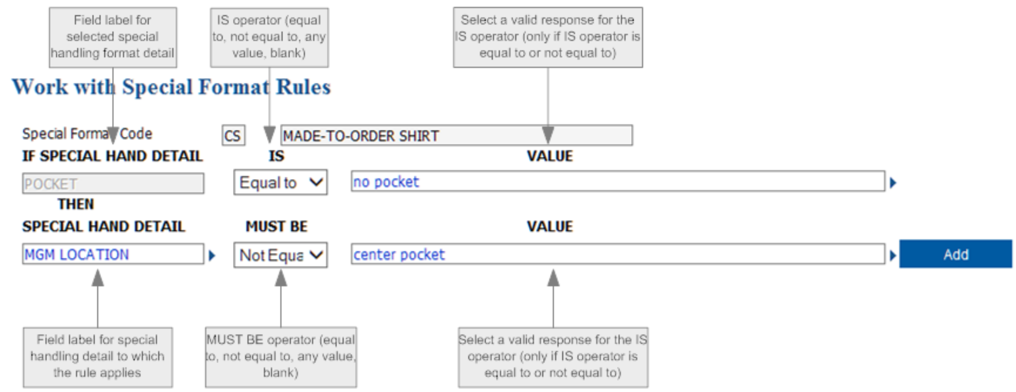
- If the cuff type for a shirt is any value (not blank), then the sleeve length must not be 0 (short sleeve)
- If the cuff type for a shirt is blank (no cuff style specified), then the sleeve length must be 0 (short sleeve)
- If the monogram for a shirt is any value (not blank), then the monogram style must also be any value (not blank)

What if the special handling format violates a rule?

- *Order entry:* When you select *Accept* at the *Work with Custom Special Handling Screen*, the screen displays an error message such as `MGM LOCATION - center pocket response is not valid for POCKET - no pocket`. You need to fix the error before accepting the special handling for the item. If there are multiple errors, the screen displays each error individually, and you need to fix each error before accepting.
- *Order API:* If the special handling instructions do not conform to a rule, the order line is put in error status with an error code of `GA: SH Resp fail defined rule`.

> **Note:**
>
> All existing validation, such as maximum number of characters, still occurs when you use special handling format rules.

Setting up rules is optional.



Field	Description
Special format code	The code and description of the special handling format that you selected from the *Work with Special Handling Format Screen*. Code: alphanumeric, 2 positions; display-only. Description: alphanumeric, 30 positions; display-only.
IF statement	The *IF* statement determines whether to apply the rule.
If special handling detail	The Field label for the special handling detail you selected at the *Work with Special Handling Format Detail Screen*. The *IF* statement must be based on the selected detail. Alphanumeric, 15 positions; display-only.
IS	The test you are using to evaluate whether the special handling rule applies. Possible tests are: *Any Value* = Apply the rule if the entry for the special handling detail for the order line is not blank *Blank* = Apply the rule if there is no entry for the special handling detail on the order line *Not Equal To* = Apply the rule unless the entry for the order line matches the value for the IS statement *Equal To* = Apply the rule if the entry for the order line matches the value for the IS statement

Field	Description
Value	The response you are using to qualify the special handling rule based on whether the special handling entry matches or does not match a particular value. You can specify a response value only if the *IS* operator is set to *Not Equal To* or *Equal To*. Typically, you use this field to select one of the responses you set up at the *Work with Special Format Response Screen*. *Example:* Apply the rule if the pocket style is equal to "no pocket," where: • *pocket style* is the Field label for the special handling detail you selected at the *Work with Special Handling Format Detail Screen* • *Equal To* is the operator you selected at the *IS* field • *no pocket* is a valid response for the special handling detail You cannot enter a value here if the *IS* operator is set to *Any Value* or *Blank*. • Determining whether a response is a match occurs regardless of case; a value of `BLACK` is the same as a value of `black`. • You can enter a value, rather than selecting it from the valid responses, only if you have not set up any responses with the *Work with Special Format Response Screen*.
THEN statement	The *THEN* statement defines the rule to apply.
Then special handling detail	Select the Field label for the special handling detail that is affected by the rule. *Example:* If the font is blank, then the monogram must be blank, where: • *font* is the special handling detail from the IF statement (the IF special handling detail) • *BLANK* is the operator for the IF statement • *monogram* is the Field label for the special handling detail selected here • *Blank* is the operator selected at the MUST BE field, below. You can select the Field label for any of the special handling details set up for the custom special handling format you are working with except for the IF special handling detail.
MUST BE	The operator that applies to the entry for the Then special handling detail. Possible operators are: *Any Value* = The entry for the Then special handling detail cannot blank *Blank* = The entry for the Then special handling detail must be blank *Not Equal To* = The entry for the Then special handling detail must not match the value for the THEN statement *Equal To* = The entry for the Then special handling detail must match the value for the THEN statement

Field	Description
Value	The response that either must match (*Equal To*) or cannot match (*Not Equal To*) the response on the order. If the *MUST BE* operator is set to *Not Equal To* or *Equal To*, use this field to select one of the responses you set up at the *Work with Special Format Response Screen*. *Example:* The cuff style must be equal to "no cuff" where: • *cuff style* is the Field label for the special handling detail you selected at the *Work with Special Handling Format Detail Screen* • *Equal To* is the operator you selected at the *MUST BE* field • *no cuff* is a valid response for the special handling detail You cannot select a value here if the *IS* operator is set to *Any Value* or *Blank*. • Determining whether a response is a match occurs regardless of case; a value of `BLACK` is the same as a value of `black`. • You can enter a value, rather than selecting it from the valid responses, only if you have not set up any responses with the *Work with Special Format Response Screen*.

Establishing Add Reason Codes (WADR)

Overview: Use the Add Reason Code table to establish codes for tracking the reasons you add items to orders in Order Entry or Order Maintenance. Examples of reasons for adding items to an order include:

- mis-shipments
- exchanges
- allowing the customer to select a different item or SKU for a backordered item
- the item is a warranty part

You might want to track this information to identify problem areas, and focus your training or quality control efforts.

Required when? The system requires an add reason code if the:

- Require Reason for Lines Added in Order Maintenance (D75) system control value is *selected*, or
- *Required reason code* flag for the item offer or SKU offer is *selected*.

Pop-up window: When an operator adds an item by selecting *Create*, entering an exchange, or adding a mis-ship to an order in order maintenance, the *Enter Add Reason Window* pop-up window opens.

> **Note:**
>
> When the item is added automatically to an order through the order API, the add reason code is not required. For example, an item might be added to an order automatically if it is set up as a free gift by source code.

Report: You can review add reason codes assigned to new order lines with the *Order Addition Audit Report*.

In this topic:

- *Work with Add Reason Screen*
- *Create Add Reason Screen*

For more information:

- reviewing the add reason code for an order line: *Display Order Line History Screen*
- adding an item to an order: *Adding an Item in Order Maintenance*

Work with Add Reason Screen

How to display this screen: Enter *WADR* in the Fast path field at the top of any menu or select Work with Add Reason Codes from a menu.

Field	Description
Reason	This code represents the reason for adding an item to an order in order entry or order maintenance. Alphanumeric, 5 positions; optional.
Description	The description of the add reason. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create an add reason code	Select *Create* to advance to the *Create Add Reason Screen*.
Change an add reason code	Select *Change* for an add reason code to advance to the Change Add Reason screen. You can change only the reason description. See *Create Add Reason Screen* for field descriptions.
Delete an add reason code	Select *Delete* for an add reason code.
Display an add reason code	Select *Display* for an add reason code to advance to the Display Add Reason screen. You cannot change any information on this screen. See *Create Add Reason Screen* for field descriptions.

Create Add Reason Screen

Purpose: Use this screen to create an add reason code.

How to display this screen: Select *Create* at the *Work with Add Reason Screen*.

Field	Description
Order addition reason code	A code to identify the reason for adding an item reason code to an order in order entry or order maintenance, such as a mis-ship or exchange. Alphanumeric, 5 positions. Create screen: required. Change screen: display-only.

Field	Description
Description	The description of the add reason. Alphanumeric, 30 positions; required.

Working with Order Inquiry Reason Codes (WORC)

Purpose: Order inquiry reason codes allow you to define the reason why a CTI operator advanced to standard order inquiry or order maintenance from the *Customer Selection Screen*.

You can use order inquiry reason codes to determine why customers are inquiring about their orders or requesting maintenance on their orders. For example, if customers are inquiring about when they can expect to receive the merchandise on their orders, you can train your order entry operators to inform the customers of the expected delivery date.

> **Note:**
>
> You can enter an order inquiry reason code only if you advance to standard (not streamlined) order inquiry or order maintenance from the *Customer Selection Screen*, and system control value *Require Reason in CTI (G98)* is *selected.* In this case a window displays requiring an order inquiry reason code when you return to the CTI Customer Selection screen after using order inquiry or order maintenance. If you advance to order inquiry from the *Order Inquiry Scan Screen* or you advance to order maintenance from the *Select Customer Sold To For Order Screen*, the system will not allow you to enter an order inquiry reason code.

You must set up Order Inquiry Reason codes before advancing to the Order Inquiry Reason code window. If you advance to this window and have no valid Order Inquiry Reason codes to enter, you will not be able to exit the window.

About CTI Customer Selection screen: This screen allows you to review a customer’s address information and order history before entering, maintaining, or reviewing an order. In order to advance to this screen:

- the *Use Computer Telephony Integration (F26)* system control value must be *selected*
- the CTI user flag in *Working with User Records (WUSR)* is *selected*
- the CTI default screen field in Work with User Records (WUSR) is set to *Always display CTI screen* or *Display CTI scrn w/call*.

How do order inquiry reasons relate to the order? When you define an order inquiry reason code after maintaining or reviewing an order, the system does not assign the order inquiry reason code to the order. Instead, the system tracks the number of times a specific user maintained or reviewed an order or orders associated with a specific line of business for a specific date and a specific order inquiry reason. You can review order inquiry reason history at the *Order Inquiry Reason History Screen*.

In this topic:

- *Order Inquiry Reason Codes Window*
- *Work with Order Inquiry Reason Screen*
- *Create Order Inquiry Reason Screen*
- *Order Inquiry Reason History Screen*

Order Inquiry Reason Codes Window

Purpose: Use this window to enter the reasons why the order was maintained or reviewed. You can enter up to five order inquiry reason codes.

How to display this window: If the *Require Reason in CTI (G98)* system control value is *selected* and you do not have authority to the *Bypass CTI Reason Code (B24)* secured feature, the system displays the Order Inquiry Reason Codes window when you return to the *Customer Selection Screen* from order inquiry or order maintenance.

> **Note:**
>
> You can prompt on a reason code field by clicking the Prompt arrow to display valid reason codes, but you cannot create a reason code at the selection screen. To create reason codes, you must use the *Create Order Inquiry Reason Screen*.

Field	Description
Order inquiry reason codes	A code to define the reason why a CTI operator advanced to order inquiry or order maintenance from the CTI Customer Selection screen. A message displays if you do not enter at least one order inquiry reason code: `At least one field must be entered to continue.` Order inquiry reason codes are defined in and validated against the Order Inquiry Reason Code table. Alphanumeric, five 3-position fields; required.

Work with Order Inquiry Reason Screen

Purpose: Use this screen to work with order inquiry reason codes.

How to display this screen: Enter *WORC* in the Fast path field at the top of a menu or select Work with Order Inquiry Reason from a menu.

Field	Description
Reason code	A code to define the reason why a CTI operator advanced to order inquiry or order maintenance from the CTI Customer Selection screen. Order inquiry reason codes are defined in and validated against the Order Inquiry Reason Code table. Alphanumeric, 3 positions; optional.
Description	A description of the order inquiry reason. Alphanumeric, 30 positions; optional.

Field	Description
Cost	The cost to your company for the CTI operator to review or maintain the order. This field is informational only. Numeric, 13 positions with a 4-place decimal; display-only.

Screen Option	Procedure
Change an order inquiry reason code	Select *Change* for a code to advance to the Change Order Inquiry Reason screen. At this screen, you can change every field except the Order inquiry reason code field. See *Create Order Inquiry Reason Screen* for field descriptions.
Delete an order inquiry reason code	Select *Delete* for a code to delete it. **Note:** The system allows you to delete an order inquiry reason code even if order inquiry reason history exists. If you delete the code, you will lose the history related to this order inquiry reason.
Display an order inquiry reason code	Select *Display* for a code to advance to the Display Order Inquiry Reason screen. You cannot change any fields on this screen. See *Create Order Inquiry Reason Screen* for field descriptions.
Review order inquiry reason history	Select *History* for a code to advance to the *Order Inquiry Reason History Screen*.
Create an order inquiry reason code	Select *Create* to advance to the *Create Order Inquiry Reason Screen*.

Create Order Inquiry Reason Screen

Purpose: Use this screen to create an order inquiry reason code.

How to display this screen: Select *Create* at the *Work with Order Inquiry Reason Screen*.

Field	Description
Order inquiry reason code	A code to define the reason why a CTI operator advanced to order inquiry or order maintenance from the CTI Customer Selection screen. Order inquiry reason codes are defined in and validated against the Order Inquiry Reason Code table. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Description	A description of the order inquiry reason. Alphanumeric, 30 positions; required.
Cost	The cost to your company for the CTI operator to review or maintain the order. This field is informational only. Numeric, 13 positions with a 4-place decimal; display-only.
User field	An informational field where you can enter additional order inquiry reason information. Alphanumeric, 3 positions; optional.

Order Inquiry Reason History Screen

Purpose: Use this screen to review history for a specific order inquiry reason code.

You can review:

- each day this reason code was used for an order or orders
- the CTI operator who entered the reason
- the number of times this operator reviewed or maintained an order or orders for a specific date and line of business
- the line of business associated with the order or orders for a specific date and CTI operator

How to display this screen: Select *History* for an order inquiry reason code at the *Work with Order Inquiry Reason Screen*.

Field	Description
Order inquiry reason code	The code and description for the reason why a CTI operator advanced to order inquiry or order maintenance from the CTI Customer Selection screen. Order inquiry reason codes are defined in and validated against the Order Inquiry Reason Code table. Code: Alphanumeric, 3 positions; display-only. Description: Alphanumeric, 30 positions; display-only.
Date	The date when this code was used as the reason for maintaining or reviewing an order(s). Numeric, 6 positions (in user date format); optional.
User	The user ID of the person who maintained or reviewed the order(s) and used this order inquiry reason code. Alphanumeric, 10 positions; display-only.

Field	Description
Number	The number of times an order(s) was maintained or reviewed on a specific date by a specific user for this order inquiry reason code. Numeric, 5 positions; display-only.
LOB (line of business code)	The line of business code associated with the order(s) maintained or reviewed on a specific date by a specific user for this order inquiry reason code. A line of business represents a client or business unit in Order Administration. These codes contain assignments that represent a specific entity, division, or offer, or a combination of these values. Each order is assigned a specific line of business, based on the entity, division, and offer associated with the order. See *Working with Lines of Business (WLOB)*. Alphanumeric, 3 positions; optional.

Working with Order/Call Disposition Reject Reason Codes (WWRR)

Purpose: Order/call disposition reject reason codes allow you to define the reason why an order entry operator rejected an order an ended a call received from an external order call center before an order was placed.

You can use the order/call disposition reject reason codes to determine why the order or call was rejected.

To assign an order/call disposition reject reason code to an order or call: The setting of the *Capture Order/Call Disposition (K03)* system control value controls when the system requires an order/call disposition reject reason code.

- If set to *ORDER*, the system requires you to enter an order/call disposition reject reason code at the *Confirm Order/Call Disposition Window* when you reject from an order in interactive Order Entry. **Note:** Interactive order entry in this situation does not include batch order entry, web orders, or membership orders.
- If set to *ALL*, the system requires you to enter an order/call disposition reject reason code at the *Confirm Order/Call Disposition Window* when you:
- reject from an order in interactive Order Entry.
- end a call received from an external order call center or select *Exit* at the *Select Customer Sold To For Order Screen* if a Universal call ID has been captured for the call in the Order Disposition table.
- If set to *NONE* or blank, you cannot assign an order/call disposition reject reason code to an order.

To view the reject reason assigned to an order or call: When you assign an order/call disposition reject reason code to an order or call, the system creates a record in the Order Disposition table. **Note:** You cannot view the information in the Order Disposition table from any Order Administration screen; see *Order Disposition Table* for a description of the fields in this table.

Work with Reject Reason Screen

Use this screen to work with order/call disposition reject reason codes.

How to display this screen: Enter *WWRR* in the Fast path field at the top of a menu or select Work with Reject Reasons from a menu.

Field	Description
Reason	A code to define the reason why an order entry operator rejected an order an ended a call from an external order call center before an order was placed. Order/call disposition reject reason codes are defined in and validated against the Reject Reason table. Enter a reason code and select *OK* to display reason codes in alphanumeric sequence, beginning with your entry. Alphanumeric, 2 positions; optional.
Description	A description of the order/call disposition reject reason. Enter a full or partial description and select *OK* to display reject reasons that contain your entry. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create an order/call disposition reject reason	Select *Create* to advance to the *Create Reject Reason Screen*.
Change an order/call disposition reject reason	Select *Change* for an order/call disposition reject reason to advance to the Change Reject Reason screen. At this screen, you can change the Description. See *Create Reject Reason Screen* for field descriptions.
Display an order/call disposition reject reason	Select *Display* for an order/call disposition reject reason to advance to the Display Reject Reason screen. You cannot change any fields on this screen. See *Create Reject Reason Screen* for field descriptions.
Delete an order/call disposition reject reason	Select *Delete* for an order/call disposition reject reason to delete it. The system allows you to delete an order/call disposition reject reason even if it has been assigned to an order or call.

Create Reject Reason Screen

Purpose: Use this screen to create an order/call disposition reject reason code.

How to display this screen: Select *Create* at the *Work with Reject Reason Screen*.

Field	Description
Order reject reason code	A code to define the reason why an order entry operator rejected an order an ended a call from an external order call center before an order was placed. Order/call disposition reject reason codes are defined in and validated against the Reject Reason table. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.

Field	Description
Description	A description of the order/call disposition reject reason. Alphanumeric, 30 positions; required.

Working with Default Messages (WMSG)

Default messages are standard order or gift messages that you enter on orders on a regular basis. Instead of requiring users to retype a standard message on each eligible order, you can have the user select the message from a list of standard messages to default to the order, allowing you to avoid typographical errors that can occur when the message is manually added to the order. You can create default messages for order level messages and line level messages. When a user selects a default message to add to an order, the message text defined for the default message defaults to the Message field and the print code defined for the default message defaults to the Print field; however, the user can still override the default message text and the print code or add to the default message text. For example, if a user selects to default `Happy Birthday`, the user may wish to modify the message line to read .

Default message examples: An example of the type of messages you may wish to default are listed below.

- Happy Birthday
- Happy Anniversary
- Congratulations
- Merry Christmas
- Happy Holidays
- Season’s Greetings
- Best Wishes
- Thinking of You,
- With Deepest Sympathy,
- Use discount code PR5 to receive 5% off your next order.

Selecting Default Messages in Contact Center

The Print Code setting for default messages controls whether they are available for selection in Contact Center:

- *Order Messages:* Default order messages are available for selection in Contact Center based on the Print Code setting:
- *Nowhere*: Can apply to an order message in Contact Center. Only these default messages are available for selection as message templates in Contact Center order entry.
- *Picks*: Can apply to a pick message (under Customer Messages) in Contact Center, including Contact Center order entry.
- *Gift*: Can apply to a gift message (under Customer Messages) in Contact Center, including Contact Center order entry.

- *Quote*: Can apply to a quote message (under Customer Messages) in Contact Center.
- *Ref Chk Cust*: Can apply to a refund check message (under Customer Messages) in Contact Center.
- *Order Line Messages:* Default order line messages are available for selection in Contact Center, including Contact Center order entry, regardless of the Print Code setting.

Order and order line default messages with any other print code settings are not available in Contact Center.

In this topic:

- *Work with Default Messages Screen*
- *Create Default Message Screen*
- *Change Default Message Screen*
- *Select Default Message Screen*

For more information:

- *Adding Order Messages*
- *Work with Order Line Messages Screen* (in Order Entry/Maintenance)
- *Item Availability Screen* (in Order Inquiry)

Work with Default Messages Screen

Use the Work with Default Messages screen to review default messages. From this screen, you can also create, change, or delete a default message.

Default messages display on this screen in message type, message code sequence.

How to display this screen: Enter *WMSG* in the Fast path field at the top of a menu or select Work with Default Messages from a menu.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field to indicate the values for the field display in ascending sequence; an arrow pointing down displays next to the field to indicate the values for the field display in descending sequence.

Default messages initially display on this screen alphanumerically by message type, message code sequence.

Field	Description
Message Type	A code that indicates whether the default message text is used for order level messages or order line level messages. Valid values: • *Order Message* = The default message text is used for order messages. • *Order Line Message* = The default message text is used for order line messages. *Search:* Select a message type to display default messages that match your entry. Alphanumeric; Optional.

Field	Description
Message Code	A unique code used to identify the default message. **Note:** The message code must be unique within the message type; however, you can use the same message code for an *Order Message* and an *Order Line Message* message type. For example, you may wish to define a default message of `Happy Birthday` at the order message level and at the order line message level. *Search:* Select a *Message Type* and enter a full or partial message code to display default messages in alphanumeric sequence within message type, starting with your entry. Alphanumeric, 2 positions; Optional.
Default Message	The text you wish to automatically default to the message line when a user selects this default message. The system defaults the message text to the message line; however, the user can override the default message text or add to the default message text. For example, if a user selects to default `Happy Birthday`, the user may wish to modify the message line to read `Happy Birthday, Mom!` *Search:* Enter text in this field to display default messages that contain the text you entered. Alphanumeric, 60 positions; Optional.

Field	Description
Print Code	A code that indicates where, if at all, the message displays. The print code you define defaults to the Print field on the Work with Order Messages Screen or Work with Order Line Messages Screen. Valid values for *Order Message*: • *Both* = Print on both the pick slip and invoice. • *Ref Chk Cust* = Print on refund check only. • *Gift Message* = Gift message on pick slip. • *Invoices* = Print on invoice only. • *Nowhere* = Do not print. • *Picks* = Print on pick slip only. • *Quotes* = Print on the Quote Form. • *Ref Chk Int* = Print in detachable area of refund check not visible to the customer. • *User Defined* = Print on a document defined by the user, such as a custom pick slip. Valid values for *Order Line Message*: • *Nowhere* = Do not print. • *Both* = Print on both the pick slip and invoice. • *Invoices* = Print on invoice only. • *Picks* = Print on pick slip only. *Search:* Select a Message Type and enter a valid print code to display default messages that match your entry. **Contact Center:** See Selecting Default Messages in Contact Center for information on default messages available for selection in Contact Center, based on Print Code setting. Alphanumeric; Optional.

Screen Option	Procedure
Create a default message.	Select *Create* to advance to the Create Default Message Screen.
Change a default message.	In the Action field, select *Change* for a default message to advance to the Change Default Message Screen.
Delete a default message.	In the Action field, select *Delete* for a default message to advance to the Confirm Delete window. Select *Yes* to confirm the delete or select *No* to cancel the delete.

Create Default Message Screen

Purpose: Use this screen to create a new default message record.

How to display this screen: Select *Create* at the Work with Default Messages Screen.

Field	Description
Message Type	A code that indicates whether the default message text is used for order level messages or order line level messages. Valid values: • *Order Message* = The default message text is used for order messages. • *Order Line Message* = The default message text is used for order line messages. Alphanumeric; Required.
Message Code	A unique code used to identify the default message. **Note:** The message code must be unique within the message type; however, you can use the same message code for an *Order Message* and an *Order Line Message* message type. For example, you may wish to define a default message of `Happy Birthday` at the order message level and at the order line message level. Alphanumeric, 2 positions; Required.
Default Message	The text you wish to automatically default to the message line when a user selects this default message. The system defaults the message text to the message line; however, the user can override the default message text or add to the default message text. For example, if a user selects to default `Happy Birthday`, the user may wish to modify the message line to read `Happy Birthday, Mom!` Alphanumeric, 60 positions; Required.

Field	Description
Print Code	A code that indicates where, if at all, the message displays. The print code you define defaults to the Print field on the *Work with Order Messages Screen* or *Work with Order Line Messages Screen*. Valid values for *Order Message*: • *Both* = Print on both the pick slip and invoice. • *Ref Chk Cust* = Print on refund check only. • *Gift Message* = Gift message on pick slip. • *Invoices* = Print on invoice only. • *Nowhere* = Do not print. • *Picks* = Print on pick slip only. • *Quotes* = Print on the *Quote Form*. • *Ref Chk Int* = Print in detachable area of refund check not visible to the customer. • *User Defined* = Print on a document defined by the user, such as a custom pick slip. Valid values for *Order Line Message*: • *Nowhere* = Do not print. • *Both* = Print on both the pick slip and invoice. • *Invoices* = Print on invoice only. • *Picks* = Print on pick slip only. **Contact Center:** See *Selecting Default Messages in Contact Center* for information on default messages available for selection in Contact Center, based on Print Code setting. Alphanumeric; Required.

Change Default Message Screen

Purpose: Use this screen to change a default message record.

How to display this screen: Select *Change* for a default message at the *Work with Default Messages Screen*.

Field	Description
Message Type	A code that indicates whether the default message text is used for order level messages or order line level messages. Alphanumeric; Display-only.
Message Code	A unique code used to identify the default message. Alphanumeric, 2 positions; Display-only.
Default Message	The text you wish to automatically default to the message line when a user selects this default message. The system defaults the message text to the message line; however, the user can override the default message text or add to the default message text. For example, if a user selects to default `Happy Birthday`, the user may wish to modify the message line to read `Happy Birthday, Mom!` Alphanumeric, 60 positions; Required.

Field	Description
Print Code	A code that indicates where, if at all, the message displays. Valid values for *Order Message*: • *Both* = Print on both the pick slip and invoice. • *Ref Chk Cust* = Print on refund check only. • *Gift Message* = Gift message on pick slip. • *Invoices* = Print on invoice only. • *Nowhere* = Do not print. • *Picks* = Print on pick slip only. • *Quotes* = Print on the *Quote Form*. • *Ref Chk Int* = Print in detachable area of refund check not visible to the customer. • *User Defined* = Print on a document defined by the user, such as a custom pick slip. Valid values for *Order Line Message*: • *Nowhere* = Do not print. • *Both* = Print on both the pick slip and invoice. • *Invoices* = Print on invoice only. • *Picks* = Print on pick slip only. **Contact Center:** See *Selecting Default Messages in Contact Center* for information on default messages available for selection in Contact Center, based on Print Code setting. Alphanumeric, Required.

Select Default Message Screen

Purpose: Use this screen to review and select a standard message that you wish to default to an order. When you select a default message to add to an order, the message text defined for the default message defaults to the Message field and the print code defined for the default message defaults to the Print field; however, you can still override the default message text and the print code or add to the default message text. For example, if a user selects to default `Happy Birthday`, the user may wish to modify the message line to read `Happy Birthday, Mom! Love, Alex and Beth`.

How to display this screen: Select the prompt arrow for the Messages field on one of the following screens:

- *Item Availability Screen* (Order Inquiry) *Note:* Only default messages identified as Message type *Order Line Message* display on this screen.
- *Work with Order Line Messages Screen* (Order Entry/Maintenance) *Note:* Only default messages identified as Message type *Order Line Message* display on this screen.
- *Work with Order Messages Screen* *Note:* Only default messages identified as Message type *Order Message* display on this screen.

Contact Center: Default messages are also available for selection in Contact Center, depending on the Print Code setting. See *Print Code*, above, for background.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Code (Message code)</td><td>A code used to identify a default message.
Default message codes are defined in and validated against the Default Message table.
Enter a full or partial message code to display default messages in alphanumeric sequence, starting with your entry.
Alphanumeric, 2 positions; optional.</td></tr>

• Work with Order Messages Screen</td></tr>
</table>

Working with Order Line Activity Codes (WOLA)

Order line activity codes define the type of activity, such as a shipment or return, performed against an item on an order line. You can review the activity performed against an item on an order line on the *Display Order Line History Screen*. You can use the Work with Order Line Activity Codes (WOLA) menu option to review system-delivered order line activity codes and to also create user-defined order line activity codes.

In this topic:

- *System Delivered Order Line Activity Codes*
- *Work with Order Line Activity Codes Screen*
- *Create Order Line Activity Code Screen*

System Delivered Order Line Activity Codes

The system automatically creates the system delivered order line activity codes in the Order Line Activity table and displays them on the *Work with Order Line Activity Codes Screen*.

Activity Code	Description
A	Add; the order line is added to the order during order maintenance or exchange, or through a system process, such as Process Item Substitutions (PSUB).
B	Express Bill; the order line is express billed.
C	Cancel; a quantity of the item on the order line is cancelled during order maintenance or through a system process, such as Process Item Substitutions (PSUB). This includes canceling or reducing quantity using a cancel reason code flagged not to reduce demand.
D	Discount; a discount is applied to the order line after shipment.
E	Exchange; the order line is added to the order as an exchange item during return processing.
G	Change; the order line is changed during order maintenance. This includes changes that don’t affect quantity, in addition to canceling or reducing quantity using a cancel reason code flagged to reduce demand.
J	Item Hold; the order line was put on hold.
O	Sold Out; a quantity of the item on the order line has been sold out. • If the item was soldout using the *Sell Out* option in order maintenance, the order line history will be negative and the name of the user who soldout the item displays. • If the order line was sold out automatically in order entry because there was a soldout control code assigned to the item, order line history quantity will be a positive quantity, and the name of the user who entered the order displays. • If the order line was sold out through Process Auto Soldouts, the order line history quantity will be negative and the user ID is the user who processed auto soldouts.
P	Item Partially Shipped; a partial quantity of the item was shipped.
R	Return; a quantity of the item on the order line has been returned.

Activity Code	Description
S	Shipment; a quantity of the order line has been shipped.
X	This code is not currently implemented.
8	Order Line Message Added; an order line message was added.
9	Item Unreserved: the item was unreserved through Work with Void/ Reprint Picks, Interactive Reservation, or the Picking message. This record is not created through the Void Pick Batch option.
#	Item Partially Cancelled; a partial quantity of the order line was canceled through the Cancel option.
+	Item Released from Hold; the line was released from held status.

Work with Order Line Activity Codes Screen

Use this screen to work with system delivered and user defined order line activity codes.

When you first advance to this screen, order line activity codes display on the screen in activity code sequence.

How to display this screen: Enter *WOLA* in the Fast path field at the top of any menu or select Work with Order Line Activity Codes from a menu.

Field	Description
Activity Order line activity code	A code for the type of update against the item on an order line. See *System Delivered Order Line Activity Codes* to review a list of the system delivered order line activity codes and a description of each. *Search:* Enter an activity code to display the order line activity code that matches your entry. *Column sort:* Click the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence. Alphanumeric, 1 position; optional.
System Option	Defines whether the order line activity code is a system delivered code or a user defined code. Valid values: • *Y* = The order line activity code is a system delivered code. You cannot delete a system delivered code. • *N* = The order line activity code is a user defined code. *Search:* Enter a valid system option to display order line activity codes whose System Option setting matches your entry. Alphanumeric, 1 position; optional.
Description	A description of the order line activity. *Search:* Enter a full or partial description to display order line activity codes whose description contains your entry. Alphanumeric, 25 positions; optional.

Screen Option	Procedure
Create a user defined order line activity code	Select *Create* to advance to the *Create Order Line Activity Code Screen*.

Screen Option	Procedure
Delete a user defined order line activity code	In the Action column, select *Delete* for an order line activity code to advance to the Confirm Delete window. Select *Yes* to confirm the delete; otherwise, select *No* to cancel the delete. **Note:** You cannot delete a system delivered order line activity code (the System Option field for the order line activity code is *Y*).

Create Order Line Activity Code Screen

Purpose: Use this screen to create a user defined order line activity code.

How to display this screen: Select Create at the *Work with Order Line Activity Codes Screen*.

Field	Description
Activity Order line activity code	A code for the type of update against the item on an order line. See *System Delivered Order Line Activity Codes* to review a list of the system delivered order line activity codes and a description of each. Alphanumeric, 1 position; required.
Description	A description of the order line activity. Alphanumeric, 25 positions; required.
System Option	*N* defaults, indicating the order line activity code is a user defined code. Alphanumeric, 1 position; display-only.

Setting Up Customer Support Tables

The following topics describe how to create and maintain tables that support Order Entry and Customer Service activities:

- Setting Up the Country Table (WCTY) describes the screens you use to create, change, delete, and display country codes.
- Setting Up the Zip/City/State (Postal Code) Table (WZIP) describes the screens you work with to create tables that support address and tax information associated with postal and zip codes.
- Setting Up Customer Profiles (WPFL) describes the screens you use to define demographics categories and their data options for profiling your customer base.

- Setting Up the Customer Class Table (WCCL) describes the Work with Customer Class screens you use to establish codes to group customers for reporting and other purposes.
- Setting Up Match Codes (MMCH) describes how to view or change the match code structure.
- Setting Up User-Defined Fields (WUDF) describes how you can “design” a screen with user-defined numeric, text or date fields, which you can link to another table (such as the Customer table).
- Working with Postal Code Formats (WPCF) describes how to define the formats of zip and postal codes, so that they will print correctly on pick slips and gift acknowledgments.
- Working with Mail/Call Codes (WMCC) describes how to create codes that define when and under what circumstances you call or send mail to your customers.
- Working with Customer Action Reason Codes (WCAR) describes how to create codes that allow you to define and track the types of issues your customers raise.
- Working with Customer Note Types (WNTY) describes how to create codes that allow you to flag certain types of customer notes to appear automatically in order entry, or define text to default into the note field.
- Working with Language Codes (WLAN) describes the screens you use to create, change and delete language codes.

Setting Up the Country Table (WCTY)

Purpose: Setting up the country table consists of creating identifying codes for each country where your customers or vendors reside. You can also create information related to a country, such as:

- any duty rates that apply to shipments to the country
- the telephone number formats for each country
- valid states for each country, and whether they are subject to VAT
- whether a state or a postal code is required for a customer address
- whether a valid SCF/ship via is required for the ship via and shipping address on an order
- a default VAT or tax rate for the country

Default country: Use the *Default Country for Customer Address (B17)* system control value to specify this default.

In this topic:

– *Create State Screen*

Work with Countries Screen

How to display this screen: Enter *WCTY* in the Fast path field at the top of any menu or select Work with Countries from a menu.

Field	Description
Country	A code representing a country. Alphanumeric, 3 positions; optional.
Description	The name of the country. Alphanumeric, 30 positions; optional.
Require state	Controls whether a state is required in Order Entry, Customer Maintenance, and when setting up item restrictions by country/state. See Entering Additional Item Information, for more information on item country/state restrictions. Valid values are: • *Yes* = A state code is required. • *No* = A state code is not required. Optional.
Country prefix	The country's international telephone prefix. Numeric, 3 positions; optional.
ISO code	A code representing the international standard code used to identify a country. If you use the *Experian Data Quality (EDQ) Address Validate API*, the system sends the ISO country code instead of the country code as part of the address sent to EDQ for standardization. See *Country ISO Codes* for a list of country ISO codes supplied by EDQ. If you are using the ChannelAdvisor integration, you need to specify a 2-position ISO code for each country where you ship orders. See *ChannelAdvisor Integration Overview* and *ChannelAdvisor Setup* for more information. Alphanumeric, 3 positions; optional.

Screen Option	Procedure
Create a country code	Select *Create* to display the *Create Country Screen*.
Change a country code	Select *Change* for a country code to display the Change Country screen. See *Create Country Screen* for field descriptions. You can change any information except the country code.
Delete a country code	Select *Delete* for a country.
Display a country code	Select *Display* for a country code to advance to Display Country screen. You cannot change any information on this screen. See *Create Country Screen* for field descriptions.
Work with duty rates for a country	Select *Duty Rates* for a country code to display the *Work with Duty Rates Screen*.

Screen Option	Procedure
Work with telephone number formats for a country	Select *Phone Format* for a country code to display the *Work with Telephone Number Format Screen*.
Work with state codes for a country	Select *States* for a country code to display the *Work with States Screen*.
Work with user defined fields	Select *User Options* for a country code to advance to the *Work with User Fields Screen*.

Create Country Screen

Purpose: Use this screen to create a country code.

How to display this screen: Select *Create* at the *Work with Countries Screen*.

Field	Description
Country	A code to identify a country. *Invoice currency:* If you want the system to record the currency rate in effect for orders at the time they are billed in the Invoice Currency table, the country code must match a code from the Currency table. You must also have the *Track Invoice Currency (D68)* system control value *selected*. **Note:** This is a separate type of tracking than that related to multi-currency by offer. See *Setting Up Order Entry Values* for more information on defining Order Entry values. Alphanumeric, 3 position. Create screen: required. Change screen: display-only.
Description	A description of the country. This is the description that prints on pick slips, for example. Alphanumeric, 30 positions; required.
Require state?	This flag controls whether a state code is required for customer addresses, or for item country/state restrictions that you set up through the Work with Items menu option. Valid values are: • *Selected* (default) = The state code is required. • *Unselected* = The state code is not required; however, if you do specify a state code for a customer address, it needs to be a valid state for the country as set up through the *Create State Screen*. You can define state codes for a country by selecting *States* for a country at the *Work with Countries Screen*. *Item restrictions:* If a country does not require state codes, you can set up item country/state restrictions for the entire country. Item country restrictions prevent you from entering an order for items which cannot be shipped to this country. See Entering Additional Item Information.

Field	Description
Require postal code?	Indicates whether a postal code is required for customer addresses for the country. Valid values are: • *Selected* (default) = The postal code is required. • *Unselected* = The postal code is optional for customer addresses, and: • You do not need to set up postal code records for the country using the *Setting Up the Zip/City/State (Postal Code) Table (WZIP)* option. • If you enter a postal code for a customer address, the system does not validate it against the Postal Code table or the SCF table. See the Perform ship via edit? flag below for more information. *Brokered backorders:* When the system submits a brokered backorder for fulfillment, Order Orchestration rejects it if the shipping address does not include a postal code. In this situation, the backorder returns to standard backorder processing in the warehouse. See *Brokered Backorders* for more information on brokered backorders.
Perform ship via edit?	Indicates whether to validate the SCF and ship via on an order or order line against the SCF Ship Via table. Valid values are: • *Selected* (default) = The SCF/ship via combination on an order or order line must exist in the SCF Ship Via table. • *Unselected* = The SCF/ship via combination on an order or order line does not need to exist in the SCF Ship Via table. **Note:** The *Require postal code?* flag must be selected for a country if Perform ship via edit? flag is selected. Use *Working with SCF Codes (WSCF)* to create the SCF record of # for the country, and then use *Working with SCF/Ship Via Values (WSHV)* to create the SCF/ship via record for each valid ship via for the country.
Phone country code	A valid international telephone prefix for the country. You can define a telephone number format for a country by selecting *Phone Format* for next to a country at the *Work with Countries Screen*. See *Telephone Number Layout Screen (Create Mode)*. Numeric, 3 positions; optional.

Field	Description
VAT percent (Value added tax percentage)	The default VAT or tax percentage for the country. The system uses this value in two different ways, depending on how the *Tax Included in Price (E70)* system control value is set: *If this system control value is selected* this means that you charge the tax-inclusive price for items you ship to certain states or provinces; instead of including an amount in the Tax bucket on the order, the tax is “hidden” in the item price. To determine the hidden tax amount, the system first checks the SKU record to determine if there is a unique hidden tax amount or percentage defined for the item; if there is no hidden tax information for the item, the system uses the VAT percentage defined for the country where you are shipping the order. If there is no VAT percentage for the customer's country, and if there is no hidden tax information for the SKU, no hidden tax will be charged. Only shipments to states flagged as subject to VAT (the VAT exempt flag is *unselected*) use tax-inclusive pricing and hidden tax. See *Work with States Screen*. The system never checks the VAT percentage for orders subject to regular taxing rather than VAT; instead, the system first checks the customer's postal code record, then the customer's SCF, for the tax rate on the order. *If this system control value is unselected,* this means that any tax on the order is included in the Tax bucket and you never charge a tax-inclusive price or hidden tax. If an item on an order is subject to tax, the system multiplies the item price by the VAT percentage for the customer's country and adds this amount to the Tax bucket on the order. If there is no VAT percentage defined for the customer's country, the system next checks the customer's postal code, then the customer's SCF, to find an applicable tax percentage. See *How Hidden Tax is Calculated by Percentage* for more information. Numeric, 6 positions; optional.
ISO code	A code representing the international standard code used to identify a country. If you use the *Experian Data Quality (EDQ) Address Validate API*, the system sends the ISO country code instead of the country code as part of the address sent to EDQ for standardization. See *Country ISO Codes* for a list of country ISO codes supplied by EDQ. Alphanumeric, 3 positions; optional.

Work with Duty Rates Screen

Purpose: Use this screen to create, change, delete or display duty rates for international orders. The system consults these rates to determine whether to add duty to orders you are shipping to this country.

Overview: Duty is a tax you can add to orders you are shipping to customers in certain countries. The system performs the following checks to determine whether to charge duty for an item in Order Entry:

- *Is the shipper exempt from duty?* If the field for the shipper on the order header is *selected*, the system will not add any duty to the order. This flag must be *unselected* for the system to evaluate the order for duty charges.
- *Does the item's harmonize code match a duty rate defined for the country?* The system compares the harmonize code defined for the item or SKU with the harmonize codes associated with the duty rates. If it finds a match in harmonize code, the system

computes duty for the item and adds this charge to the order. Two blank records are a match; that is, if both the item's and the duty rate's harmonize codes are blank, the system will add the duty to the order. You can define harmonize codes for items through *Performing Initial Item Entry (MITM)* or *Updating Harmonize Codes (UPHC)*.

If you use an external tax system and want to pass the duty information, you must create a product table record for duty.

Reviewing duty charges: Duty appears on the order totals in the Handling bucket, but appears separately on the *Display Order Detail Screen (Reviewing Order Line Detail)* in standard Order Inquiry and the *Work with Order Line Screen (Changing/ Adding an Item)* in Order Entry and Order Maintenance. The system writes an order line message when an item has a duty charge. You can also review duty charges on an invoice at the Invoice Detail Charges screen, available by selecting *Invoices* in standard Order Inquiry and advancing to the invoice detail level.

> **Note:**
>
> Duty does not appear on your pick slip without customization. Contact your Order Management System representative for more information.

How to display this screen: Select *Duty Rates* for a country at the *Work with Countries Screen*.

Field	Description
Country	The code representing the country where the duty rates apply. Alphanumeric, 3 positions; display-only.
Description	The description associated with the country code. Alphanumeric, 25 positions; display-only.
Harmonize code	The code that associates an item with a duty rate. The system applies duty to an order if the ship-to address is in this country, and if the harmonize code defined for the item or SKU matches a harmonize code defined for a duty rate. If both the item's and the duty rate's harmonize codes are blank, the system considers this a match, and applies the duty rate. You can define harmonize codes for items through *Performing Initial Item Entry (MITM)* or *Updating Harmonize Codes (UPHC)*. Alphanumeric, 16 positions; optional.
Duty amount	The amount of duty to add to the order for the item. The system multiplies this amount by the unit quantity. You can define either a duty amount or a percentage. Numeric, 13 positions with a 2-place decimal; display-only.
Duty percent	The percentage of duty to add to the order for the item. The system adds the percentage of the extended price for the item line. Numeric, 5 positions with a 2-place decimal; display-only.

Screen Option	Procedure
Change a duty rate	Select *Change* for a duty rate to advance to the Change Duty Rates screen. You can change only the Duty percent or Duty amount fields on this screen. See Create Duty Rates Screen for field descriptions.
Delete a duty rate	Select *Delete* for a duty rate.
Display a duty rate	Select *Display* for a duty rate to advance to the Display Duty Rates screen. You cannot change any information on this screen. See Create Duty Rates Screen for field descriptions.
Create a duty rate	Select *Create* to create a new duty rate. See Create Duty Rates Screen.

Create Duty Rates Screen

Purpose: Use this screen to create a duty rate.

How to display this screen: Select *Create* at the Work with Duty Rates Screen.

Field	Description
Country	The code representing the country where the duty rates apply. Alphanumeric, 3 positions; display-only.
Harmonize code	The code that associates an item with a duty rate. The system applies duty to an order if the ship-to address is in this country, and if the harmonize code defined for the item or SKU matches a harmonize code defined for a duty rate. If both the item's and the duty rate's harmonize codes are blank, the system considers this a match, and applies the duty rate; for this reason, a blank harmonize code is a valid value. You can define harmonize codes for items through Performing Initial Item Entry (MITM) or Updating Harmonize Codes (UPHC). Alphanumeric, 16 positions. Create screen: required. Change screen: display-only.
Duty percentage	The percentage of duty to add to the order for the item. The system adds the percentage of the extended price for the item line. You can define either a duty amount or a percentage. Numeric, 5 positions with a 2-place decimal; required if no duty amount is defined.
Duty amount	The amount of duty to add to the order for the item. The system multiplies this amount by the unit quantity. You can define either a duty amount or a percentage. Numeric, 13 positions with a 2-place decimal; required if no duty percentage is defined.

Work with Telephone Number Format Screen

Purpose: Use this screen to define the format for phone numbers. Telephone number formats are defined by country, but each country can have more than one telephone number format.

When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and displays as it was entered by the operator. For this reason, it is useful to consider the different telephone number formats your operators typically use and define a format to cover each.

Telephone Number Format Examples

Example: Telephone number format with a numeric length of 7: 1 2 3 - 4 5 6 7

- 7 position phone number: 5550100
- 5550100 formats to 555 - 0100

Example: Telephone number format with a numeric length of 10: (1 2 3) 4 5 6 - 7 8 9 10

- 10 position phone number: 5085550100
- 5085550100 formats to (508) 555 - 0100

Example: Telephone number format with a numeric length of 11: 1 (2 3 4) 5 6 7 - 11 10 9 8

- 11 position phone number: 15085550100
- 15085550100 formats to 1 (508) 555 - 0100

How to display this screen: Select *Phone Format* for a country.

Field	Description
Country	The country code and description associated with the phone format. Country code: Alphanumeric, 3 positions; display-only. Country description: Alphanumeric, 30 positions; display-only.
Code length	The number of numeric characters in the phone number. Numeric, 3 positions; optional.
Format (Telephone number format)	The telephone number format, illustrated by arranging numbers from 1 to 14 in the same order and position as the numbers in a phone number would display. Enter special characters, such as hyphens or parenthesis, where you would like them to display. *Example:* The telephone number format used in the United States to represent an area code and a local phone number is: (508) 555-0100 When an operator enters a phone number containing 10 numbers (as in the example), the phone number changes to the format defined for 10 numbers, regardless of how the operator entered it into the system. Alphanumeric, fourteen 2-position fields; display-only.

Screen Option	Description
Change a telephone number format	Select *Change* for a telephone number format to advance to the Telephone Number Layout screen in Change mode. You can change the *Formatted telephone number positions* fields on this screen only. See *Telephone Number Layout Screen (Create Mode)* for field descriptions.
Delete a telephone number format	Select *Delete* for a telephone number format.
Display a telephone number format	Select *Display* for the telephone number format to advance to the Telephone Number Layout screen in Display mode. You cannot change any information on this screen. See *Telephone Number Layout Screen (Create Mode)* for field descriptions.
Create a telephone number format	Select *Create*. See *Telephone Number Layout Screen (Create Mode)*.
Map existing phone numbers to the telephone number formats defined.	Select *Submit Reformat*. See *Revising Telephone Number Formats*.

Telephone Number Layout Screen (Create Mode)

Purpose: Use this screen to create a telephone number format for a country.

How to display this screen: Select *Create* at the *Work with Telephone Number Format Screen*.

Field	Description
Country	The country associated with the telephone number format you are creating. Alphanumeric, 3 positions; display-only.
Length	The number of numeric characters in the phone number. The maximum number is 14. Numeric, 3 positions. Create screen: required. Change screen: display-only.

Field	Description
Formatted telephone number positions	The order and positions of each of the numbers for a phone number format, including any special characters such as hyphens or parentheses. The first number of the phone number will display where you enter a *1*, the second number will display where you enter a *2*, etc. *Example:* Create a United States phone number containing an area code and local phone number as: (1 2 3) 4 5 6 - 7 8 9 10 A message similar to the following indicates if you enter a telephone number format that includes a numeric length already defined for that country: `Telephone Number Format already exists.` **Note:** If an operator enters a phone number containing a length that has not been defined in a telephone number format, the system will not format the phone number and it will display as it was entered by the operator. Alphanumeric, fourteen 2-position fields; optional.

Instructions:

1. Enter the numeric length of the telephone number format in the *Length* field.
2. Enter the telephone number format in the *Formatted telephone number positions* fields, indicating where each number of the phone number should display. Include any special characters, such as hyphens or parentheses in the format. Use the Unformatted Telephone Number Positions fields as a guideline. See the field descriptions for examples.

Revising Telephone Number Formats

Submitting reformat: Select *Submit Reformat* at the *Work with Telephone Number Format Screen* to submit a batch program. This program revises existing phone numbers to the telephone number formats defined on the screen. You must confirm the submission at the Confirm Accept pop-up window.

Only phone numbers containing the same length as a telephone number format will be revises. For example, if a telephone number format with a length of 10 is defined as: (1 2 3) 4 5 6 - 7 8 9 10, any telephone number with a length of 10 will be revised so that the first 3 positions are in parentheses and a hyphen is between the sixth and seventh numbers.

Work with States Screen

Purpose: Use this screen to define the state codes for a country. The system prevents you from entering a customer address if the state and country do not match, based on your entries here.

How to display this screen: Select *States* for a country at the *Work with Countries Screen*.

Field	Description
Country	The country code associated with the states. Alphanumeric, 3 positions; display-only.
State	A code that defines a state within a country. Alphanumeric, 2 positions; optional.
Description	The name of the state. Alphanumeric, 25 positions; display-only.
VAT exempt flag	This flag controls whether shipments to this state are exempt to VAT *only* if the *Tax Included in Price (E70)* system control value is *selected*; in this case, the system uses the tax-inclusive price for an item and adds a Hidden tax, if applicable, to the order line. If this system control value is *unselected*, or if the state is exempt from VAT, the system adds tax to the order in the Tax bucket, and does not check this field when determining whether to charge tax on an order. Valid values are: • *Y* = Shipments to this state are exempt from VAT if the *Tax Included in Price (E70)* system control value is *selected*; the regular item price will be used, rather than the tax-inclusive price, and any tax on the order will be added to the Tax bucket. The system will check the postal code first, and then the SCF, to find the appropriate tax rate for the order. • *N* (default) = Shipments to this state are subject to VAT if the *Tax Included in Price (E70)* system control value is *selected*; the tax-inclusive price will be used, and any applicable tax for an item will appear in the Hidden tax field on the order line. This setting defaults to *unselected* if there is a *VAT percent (Value added tax percentage)* defined for the country; otherwise, it defaults to *selected*. Display-only.

Screen Option	Description
Change the description or VAT exempt flag for a state	Select *Change* for a state to display the Change State screen. You can change only the *Description* and *VAT exempt flag* fields on this screen. See *Create State Screen* for field descriptions.
Delete a state	Select *Delete* for a state.
Create a state	Select *Create* to display the *Create State Screen*.

Create State Screen

Purpose: Use this screen to create a state code for a country.

How to display this screen: Select *Create* at the *Work with States Screen*.

Field	Description
Country	The country associated with the state. Alphanumeric, 3 positions; display-only.

Field	Description
State code	A code that defines a state within the country. For countries that do not require states, you should create one state record with a state code of **. Then, when you create SCF and postal codes for the country, you assign each to this state code. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Description	The description of the state you are creating. Alphanumeric, 25 positions; required.
VAT exempt flag	Controls whether shipments to this state are exempt from VAT. The system checks this flag *only* if the *Tax Included in Price (E70)* system control value is *selected*; in this case, the system uses the tax-inclusive price for an item subject to VAT and adds a Hidden tax, if applicable, to the order line. If this system control value is *unselected*, or if the state is VAT-exempt, the system adds any applicable tax to the order in the Tax bucket, and does not check this field when determining whether to charge tax on an order. Valid values are: 1. *Selected* = Shipments to this state are exempt from VAT if the *Tax Included in Price (E70)* system control value is *selected*; the regular item price will be used, rather than the tax-inclusive price, and any tax on the order will be added to the Tax bucket. The system will check the postal code first, and then the SCF, to find the appropriate tax rate for the order. 2. *Unselected* = Shipments to this state are subject to VAT if the *Tax Included in Price (E70)* system control value is *selected*; the tax-inclusive price will be used, and any applicable tax for an item will appear in the Hidden tax field on the order line. This field defaults to *unselected* if there is a *VAT percent (Value added tax percentage)* defined for the country; otherwise, it defaults to *selected*.

Note:

When you create a state, you must also define an SCF code and postal code for the state or Order Entry, Maintenance and Catalog Requests display an error message similar to the following:

Invalid state (FL) for zip. Valid states are: (MA)

See *Working with SCF Codes (WSCF)* for more information on SCF's, and *Setting Up the Zip/City/State (Postal Code) Table (WZIP)* for more information on postal codes.

Setting Up the Zip/City/State (Postal Code) Table (WZIP)

Purpose: The Zip/City/State (postal code) table includes the city, state or province, country, tax rates, and geographic zone for postal areas. The city and state or province you enter for a customer in Order Entry or Order Maintenance are validated against this table.

Creating postal code records: You can use the Work with Postal Codes function to enter the information yourself, or purchase it from the U.S. Postal Service to build the table in your database. If you purchase the information from the U.S. Postal Service, use the *Load USPS Zip Code File (LZPS)* option to upload the data to the Zip/City/State table.

> **Note:**
>
> The *Load USPS Zip Code File (LZPS)* option does not create Zip/City/State Tax Rate records; it only creates Zip/City/State (postal code) records.

Tax rates: You need to set up this table to set up tax rates and, for Canadian addresses, tax calculation methods, if you do not use an external tax system. Even if you use an external tax system, you might still want to establish the Zip/City/State table to help reduce other application errors or to provide an alternative means of calculating tax when there is a communication problem. See About Tax Rates.

> **Note:**
>
> The *City* name must be all upper case in order for the tax rate to apply.

Geographic zones: The Zip/City/State table can be used to identify the geographic zone of a shipping address. Geographic zones are used to divide the country into shipping regions for the purpose of restricting the shipment of weather-sensitive inventory such as plant stock. See Shipping Zone Reservation Overview.

Delivery codes: Some shippers, such as UPS, charge different rates based on the type of delivery address on an order. For example, shipping to a business address is cheaper than shipping to a residential address. You can define the delivery code for a postal area to insure that the best possible rate is charged for shipping an order.

The information you enter through this menu option is not unique to a particular company; it applies to all companies on your system.

Postal code required? The Require postal code? flag in the Country table controls whether a postal code is required for customer addresses. See *Setting Up the Country Table (WCTY)* for background.

In this topic:

- *Work with Postal Codes Screen*
- *Create Postal Code Screen*
- *About Tax Rates*
- *Work with Zip Tax Rates Screen*
- *Update Postal Codes by Range Screen*

Not in this topic:

- *Automatic fill-in of city and state in order entry:* If you set the *Use Zip/City/State Defaulting? (B13)* system control value to *Y*, the system fills in a customer's city and state in Order Entry or Order Maintenance based on the postal code you enter.

- *Tax jurisdictions:* You can track tax activity for tax jurisdictions within states. You define a tax jurisdiction as a range of postal codes. See *Working with Tax Jurisdiction (WTXJ)*.
- *Postal code formats for pick slips:* In order for a postal code to print on pick slips or gift acknowledgments, you must first define the postal code format. See *Working with Postal Code Formats (WPCF)*.

Work with Postal Codes Screen

How to display this screen: Enter *WZIP* in the Fast path field at the top of any menu or select Work with Postal Codes from a menu.

Field	Description
Postal code	The postal code or zip code representing a delivery area. Alphanumeric, 10 positions; optional.
City	The city where the customer receives mail or shipments. Alphanumeric, 25 positions; optional.
State	The state or province where the customer receives mail or shipments. States are defined in and validated against the State table, which is accessible through the Work with Country Table menu option; see *Work with States Screen*. Alphanumeric, 2 positions; optional.
Description	The description of the state, as set up through the *Work with States Screen*. Alphanumeric, 25 positions; display-only.
Delivery code	A code representing the type of delivery address for a postal code. Valid values are: • *B* = Business address. • *R* = Residence. • *N* = No distinction. • ' ' = Blank. Some shippers, such as UPS, charge different rates based on the type of delivery address on an order. For example, shipping to a business address is cheaper than shipping to a residential address. You can define the delivery code for a postal area to insure that the best possible rate is charged for shipping an order. The system uses the following logic to default a delivery code to a customer address on an order: • The system defaults the delivery code defined for the postal code on the address. • If a delivery code has not been defined for the postal code on the address, the system defaults the delivery code from the Customer table. • If a delivery code has not been defined in the Customer table, the *Default Delivery Code for New Order Entry Customers (D13)* defaults. Alphanumeric, 1 position; display-only.

Screen Option	Procedure
Change postal code information	Select *Change* for a postal code to advance to the Change Postal Codes screen. See the *Create Postal Code Screen* for field descriptions.
Delete a postal code	Select *Delete* for a postal code.
Display a postal code	Select *Display* for a postal code to advance to the Display Postal Code screen. You cannot change any information on this screen. See the *Create Postal Code Screen* for field descriptions.
Work with tax rates	Select *Work with tax rates* for a postal code to advance to the *Work with Zip Tax Rates Screen*.
Create a postal code	Select *Create* to advance to the *Create Postal Code Screen*.
Update a postal code range	Select *Updt Pst Cd Range* to advance to the *Update Postal Codes by Range Screen*.

Create Postal Code Screen

Purpose: Use this screen to create a postal code.

How to display this screen: Select *Create* at the *Work with Postal Codes Screen*.

Field	Description
Postal code	The postal code or zip code representing a delivery area. The first three positions of your entry must match a valid SCF for the state and country. See *Working with SCF Codes (WSCF)* for background. Alphanumeric, 10 positions. Create screen: required. Change screen: display-only.
City	The city where a customer receives mail or shipments. The *City* name must be all upper case in order for the tax rate from the *Work with Zip Tax Rates Screen* to apply. Alphanumeric, 25 positions. Create screen: required. Change screen: display-only.
State	The code representing the state where the customer receives mail or shipments. State codes are defined in and validated against the State table, accessible at the *Work with States Screen* through the Work with Countries menu option. This code is required if the Require state? flag for the country is *selected*. The system validates that your entry is a state assigned to the SCF derived from the first three positions of the postal code. See *Working with SCF Codes (WSCF)*. Alphanumeric, 2 positions. Create screen: may be required. Change screen: display-only.

Field	Description
Country	A code representing a country. Country codes are defined in and validated against the Country table; see *Setting Up the Country Table (WCTY)*. The system defaults the *Default Country for Customer Address (B17)*. Alphanumeric, 3 positions; required.
Delivery code	A code representing the type of delivery address for a postal code. Valid values are: • *Business* • *Residential* • *No Distinction* • *Blank* Some shippers, such as UPS, charge different rates based on the type of delivery address on an order. For example, shipping to a business address is cheaper than shipping to a residential address. You can define the delivery code for a postal area to insure that the best possible rate is charged for shipping an order. When the system defaults a delivery code to a customer address on an order, it uses: 1. The delivery code for the postal code on the address if any; otherwise, 2. The delivery code from the Customer table, if any; otherwise; 3. The *Default Delivery Code for New Order Entry Customers (D13)*. Optional.
Geographic zone	A code representing a geographic region. Geographic zones are used to divide the country into shipping regions for the purpose of restricting the shipment of weather-sensitive inventory such as plant stock. Geographic zones are used in conjunction with zone reservation codes, assigned to items or SKUs, to control item reservation in order entry. Zone reservation coded items/SKUs are not reserved during order entry; instead they are reserved during pick generation, at an optimal time for shipping. Zone reservation logic requires: • The item/SKU must be assigned a zone reservation code. • The offer associated with the order must be assigned a season code. • The shipping address for the order must be assigned to a geographic zone, using either the postal zip code of the ship to address, or the SCF (Sectional Center Facility) code of the ship to address. The SCF code consists of the first three digits of the zip code. See Working with SCF/Ship Via Values (WSHV). • For each zone reservation code, you must define zone date windows for all geographic zones in the country. See Shipping Zone Reservation Overview for a discussion. Alphanumeric, 3 positions; optional.
Store tax code	The cross-reference to the corresponding tax code in a point-of-sale system. This field is available only if you have defined a *Default Location for ORCE Integration (K69)*. Alphanumeric, 8 positions; optional.

About Tax Rates

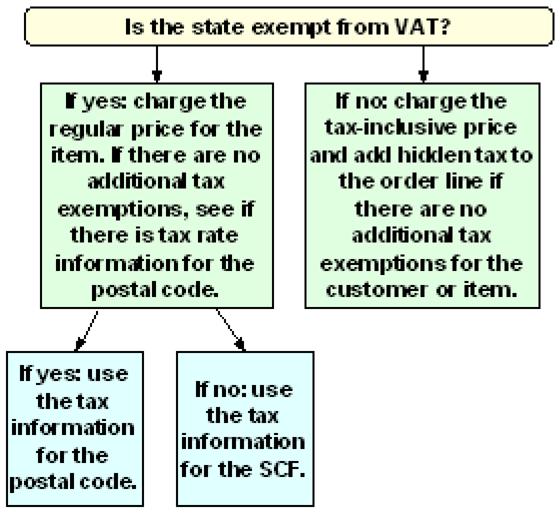
Purpose: The basic steps that the system takes in calculating tax are outlined below. Also presented below are a summary of the places where you can define tax rates, methods, and exemptions.

The system follows two basic paths in evaluating each order for tax depending on whether you process orders that are subject to VAT.

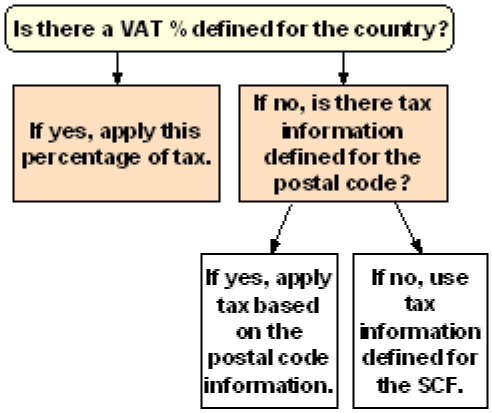
VAT is a taxing method that applies in only certain states in countries. When an order is subject to VAT, the customer is charged a tax-inclusive price, and the tax amount is “hidden” on the order detail line for the item, not included in the Tax bucket for the order.

> **Note:**
>
> You cannot use both an external tax system and tax-inclusive pricing (VAT) in the same company.

Tax-inclusive pricing? If the *Tax Included in Price (E70)* system control value is *selected*, the system follows the steps presented below in determining how to calculate tax on an order.



If the *Tax Included in Price (E70)* system control value is *unselected*, the system follows the steps presented below in determining how to calculate tax:



The system follows the steps above only if you are not using an external tax system.

Tax exemptions: Any of the following tax exemptions might prevent an order or an item from being taxed:

- customer tax exemptions or overrides (see *Working with Customer Tax Status*)
- the VAT exempt flag for the item/SKU (see *Working with Existing Items (MITM)*)
- item tax exemptions and exceptions for U.S. states (see *Working with Item Tax Exemptions (WITX)*)
- GST and PST item exemptions and exceptions for Canadian provinces (see *Working with GST Tax Exemption Status (MGTX)*)
- the *S/H exclude tax?* field for a special handling format (see *Establishing Additional Charge Codes (WADC)*)

> **Note:**
>
> VAT does not apply to an order unless a tax rate is specified for the SCF for the shipping address.

Upper and lower case? The *City* name must be all upper case in order for the tax rate to apply.

Work with Zip Tax Rates Screen

Purpose: Use this screen to work with tax information for shipments to a postal code.

How to display this screen: Select *Work with tax rates* for a postal code at the *Work with Postal Codes Screen*.

Note:

- The system does not consider the settings at this screen if you use an external tax system unless the *Use Standard Tax Calc if Tax Interface Communication Fails (J13)* system control value is selected and the integration with the external tax system fails.
- The system automatically creates a zip tax rate record if you update postal codes by range (*Updt Pst Cd Range* at the *Work with Postal Codes Screen*). The zip tax rate's effective date is the date when you process this update. See *Update Postal Codes by Range Screen*.
- Uploading postal code information through the *Load USPS Zip Code File (LZPS)* option does not automatically create zip tax rate records.
- The *City* name must be all upper case in order for the tax rate to apply.

Field	Description
Effect date (Effective date)	The date when this tax information became effective for orders in this postal code. Whenever you perform pick slip preparation, bill, or maintain the order, the system calculates tax based on the tax rates in effect when the order was first entered. Numeric, 6 positions; optional.

Field	Description
Tax rate	The tax rate for the postal code. Numeric, 5 positions with a 2-place decimal; optional.
GST rate	The rate of Canadian Goods and Services tax for this province. If there is not a GST rate defined for the postal code, but a GST/PST tax method is defined, the system uses the default GST Rate (A90). Numeric, 5 positions with a 2-place decimal; optional.
PST rate	The rate of the Canadian Provincial Services tax for this province. Numeric, 5 positions with a 2-place decimal; optional.
GST/PST method	A code that determines the method of calculating total tax on goods shipped to Canadian provinces. This calculation method varies depending on the province where you are shipping the order. Valid codes for this field are: • *Calculate GST First* (Goods and Services Tax) = Calculate the GST on the order, including freight and handling, if applicable. Add this amount to the order total, then calculate the PST on the result. Calculation (where O = the order total subject to tax): `O * GST rate = GST amount` `GST amount + ((GST amount + O) * PST rate) = order tax` *Example:* The order total subject to tax = $10.00 GST rate = 10% PST rate = 5% $10 * 10% = $1.00 GST amount $1 GST amount + (($1 + $10) * 5%) = $1 + ($11 * 5%) = $1.60 • *Calculate PST First* (Provincial Services Tax) = Calculate the PST on the order, including freight and handling, if applicable. Add this amount to the order total, then calculate the GST on the result. Calculation (where O = the order total): `O * PST rate = PST amount` `PST amount + ((PST amount + O) * GST rate) = order tax` *Example:* The order total subject to tax = $10.00 GST rate = 10% PST rate = 5% $10 * 5% = $.50 PST amount $.50 PST amount + (($.50 + $10) * 10%) = $.50 + ($10.50 * 10%) = $1.55

Field	Description
	• *Calculate PST/GST Separately* = Calculate GST and PST separately; neither tax is subject to the other. Calculation (where O = the order total) `S = (O * GST) + (O * PST)` *Example:* The order total subject to tax = $10.00 GST rate = 10% PST rate = 5% ($10 * 10%) + ($10 * 5%) = $1 + $.50) = $1.50 Optional.
Tax freight	Indicates whether the shipping charges on the order are taxed (Frt and Frt+ amounts). Valid values are: • *Yes* = The customer pays tax on freight. • *No* = The customer does not pay tax on freight. **Note:** This flag acts as an override to the *Tax on Freight (B14)* system control value if the system control value is *selected*. If the order uses the tax rate for the postal code, but the *Tax on Freight (B14)* field is unselected, the system uses the value from the System Control table. If the system control value is *unselected*, you cannot override this value by selecting it here.
Tax handling	Indicates whether handling charges on the order are taxed (special handling, guaranteed service charges, and other handling charges). • *Yes* = The customer pays tax on the handling charges. • *No* = The customer does not pay tax on the handling charges. This flag acts as an override to the same setting for the SCF; see *Working with SCF Codes (WSCF)*, and the Tax on Handling (B15) system control value if the system control value is *selected*. If the order uses the tax rate for the postal code, but the Tax on Handling (B15) field is unselected, the system uses the value from the System Control table. If the system control value is *unselected*, you cannot override this value by selecting it here. • If the *S/H exclude tax?* field for the special handling code is *selected*, the handling charge is not evaluated for tax.

Screen Option	Procedure
Change existing tax rate information	Type over the information you want to change, or just delete existing information. You can change any field but the *Effect date (Effective date)*.
Delete tax rate information	Select *Delete* for a tax rate record.
Switch to ADD Mode	Select *Add*.

Update Postal Codes by Range Screen

Purpose: Use this screen to update postal code information, such as delivery code and tax information, for a range of postal codes.

How to display this screen: Select *Updt Pst Cd Range* at the *Work with Postal Codes Screen*.

Field	Description
Country	A code representing a country. Country codes are defined in and validated against the Country table. The system defaults the *Default Country for Customer Address (B17)*. Alphanumeric, 3 positions; required.
Postal code range	The range of postal codes you wish to update. Enter the beginning postal code in the From range field and ending postal code in the To range field. An error message similar to the following indicates if you enter a postal code in the To field that is greater than the postal code in the From field: `From zip (01601) is greater than to zip (01600).` Numeric, 5 positions; required.
	The system requires entry in one of the following fields:
Delivery code	A code representing the type of delivery address for the range of postal codes. Valid values are: • *Business* • *Residential* • *No Distinction* • *Blank* Some shippers, such as UPS, charge different rates based on the type of delivery address on an order. For example, shipping to a business address is cheaper than shipping to a residential address. You can define the delivery code for a postal area to insure that the best possible rate is charged for shipping an order. The system uses the following logic to default a delivery code to a customer address on an order: • The system defaults the delivery code defined for the postal code on the address. • If a delivery code has not been defined for the postal code on the address, the system defaults the delivery code from the Customer table. • If a delivery code has not been defined in the Customer table, the *Default Delivery Code for New Order Entry Customers (D13)* defaults. Optional.
Tax rate	The tax rate for the postal code. Numeric, 5 positions with a 2-place decimal; optional.

Field	Description
GST rate	The rate of Canadian Goods and Services tax for this province. If there is not a GST rate defined for the postal code, but a GST/PST tax method is defined, the system uses the default GST Rate (A90). Numeric, 5 positions with a 2-place decimal; optional.
PST rate	The rate of the Canadian Provincial Services tax for this province. Numeric, 5 positions with a 2-place decimal; optional.
GST/PST method	A code that determines the method of calculating total tax on goods shipped to Canadian provinces. This calculation method varies depending on the province where you are shipping the order. Valid codes for this field are: • *Calculate GST First* (Goods and Services Tax) = Calculate the GST on the order, including freight and handling, if applicable. Add this amount to the order total, then calculate the PST on the result. • *Calculate PST First* (Provincial Services Tax) = Calculate the PST on the order, including freight and handling, if applicable. Add this amount to the order total, then calculate the GST on the result. • *Calculate GST/PST Separately* = Calculate GST and PST separately; neither tax is subject to the other. See *GST/PST method* for an example of each GST/PST method. Optional.
Tax freight?	Indicates whether the shipping charges on the order are taxed (Frt and Frt+ amounts). Valid values are: 1. *Selected* = The customer pays tax on freight. 2. *Unselected* = The customer does not pay tax on freight. **Note:** This flag acts as an override to the *Tax on Freight (B14)* system control value if the system control value is *selected*. If the order uses the tax rate for the postal code, but the *Tax on Freight (B14)* field is unselected, the system uses the value from the System Control table. If the system control value is *unselected*, you cannot override this value by *selecting* it here.
Tax handling?	Indicates whether special handling charges on the order are taxed (special handling, guaranteed service charges, and other handling charges). • *Selected* = The customer pays tax on the handling charges. • *Unselected* = The customer does not pay tax on the handling charges. • This flag acts as an override to the Tax on Handling (B15) system control value if the system control value is *selected*. If the order uses the tax rate for the postal code, but the Tax on Handling (B15) field is unselected, the system uses the value from the System Control table. If the system control value is *unselected*, you cannot override this value by *selecting* it here. • If the *S/H exclude tax?* field for the special handling code is *selected*, the handling charge is not evaluated for tax.

Field	Description
Geographic zone	A code representing a region of the country. Geographic zones are used to divide the country into shipping regions for the purpose of restricting the shipment of weather-sensitive inventory such as plant stock. Geographic zones are used in conjunction with zone reservation codes, assigned to items or SKUs, to control item reservation in order entry. Zone reservation coded items/SKUs are not reserved during order entry; instead they are reserved during pick generation, at an optimal time for shipping. Zone reservation logic requires: • The item/SKU must be assigned a zone reservation code • The offer associated with the order must be assigned a season code • The shipping address for the order must be assigned to a geographic zone, using either the postal zip code of the ship to address, or the SCF (Sectional Center Facility) code of the ship to address. The SCF code consists of the first three digits of the zip code. See Working with SCF/ Ship Via Values (WSHV). • For each zone reservation code, you must define zone date windows for all geographic zones in the country. See Shipping Zone Reservation Overview. Alphanumeric, 3 positions; optional.

Setting Up Customer Profiles (WPFL)

Customer profiles let you define the demographics you want to capture for your customer base and define the valid responses for these categories. You can also establish default codes that represent the most common profile characteristics of your customer base. For example, assume that a profile for marital status includes married, single, divorced, etc., as valid options, and that the majority of people who place orders are single. If you set a profile default for the single option, this value appears on new customer orders. You would then need to perform data entry in the marital status field for new customers only if the customer were not single.

Mandatory categories: If there is a profile category that you want to capture for each new customer, you can define that category as mandatory. When you enter an order for a customer who has not provided you with this information, the *Work with Customer Profile Screen* appears automatically when you select *Accept* or *Accept/Add Rcp* to accept the order.

> **Note:**
>
> If the *Alternate ID Required for Displaying Customer Profile (K87)* system control value is *selected*, you automatically advance to the Work with Customer Profile screen in order entry and maintenance only if an Alternate customer number is defined for the sold to customer on the order.

Sending profile data to Oracle Retail Customer Engagement:

- *Customer Engagement Customer Integration*: The customer's profile data is included in the information synchronized between Order Administration and Oracle Retail Customer Engagement, provided the *Send Profile Data to ORCE (L51)* system control value is selected and you have completed the setup described under *Order Management System Customer Profile > Customer Engagement Attribute Definition*.

- *Customer Engagement Batch Customer and Sales Integration*. The customer's profile data is included in the information sent to Oracle Retail Customer Engagement provided you have completed the setup described under *Order Management System Customer Profile > Customer Engagement Attribute Definition*. The *Send Profile Data to ORCE (L51)* system control value does not apply to the sales integration.

In this topic:

- *Work with Profile Categories Screen*
- *Create Profile Screen (Creating a Category)*
- *Work with Profile Data Screen (Category Responses)*
- *Create Profile Data Screen (Category Responses)*

Work with Profile Categories Screen

How to display this screen: Enter *WPFL* in the Fast Path field at the top of a menu, or select Work with Demographic Profiles from a menu.

Field	Description
Code	A number you assign to a demographic profile category. Numeric, 3 positions; optional.
Description	The description of the demographic profile category. Alphanumeric, 20 positions; optional.
Mandatory	This flag indicates whether to prompt the operator to complete this field in Order Entry if the customer has not yet provided you with this information. Valid values are: • *Yes* = Prompt for this information in Order Entry by displaying the Work with Customer Profile screen automatically. **Note:** If the *Alternate ID Required for Displaying Customer Profile (K87)* system control value is *selected*, you automatically advance to the Work with Customer Profile screen in order entry and maintenance only if an Alternate customer number is defined for the sold to customer on the order. • *No* = Do not prompt for this information in Order Entry. The system also prompts you in Order Maintenance if the *Prompt for Mandatory Demographics in Order Maintenance (E60)* system control value is *selected*. Optional.

Screen Option	Procedure
Create a profile category	Select *Create* to advance to the *Create Profile Screen (Creating a Category)*.

Screen Option	Procedure
Change a profile category	Select *Change* for a profile category to advance to the Change Profile screen. You can change only the description and the mandatory flag. See *Create Profile Screen (Creating a Category)* for field descriptions.
Delete a profile category	Select *Delete* for a profile category.
Work with valid profile responses	Select *Profile Options* for a profile category to advance to the *Work with Profile Data Screen (Category Responses)*.

Create Profile Screen (Creating a Category)

How to display this screen: At the *Work with Profile Categories Screen*, Select *Create*.

Field	Description
Profile code	A number that represents a demographic profile category. Numeric, 3 positions. Create screen: required. Change screen: display-only.
Description	The description of the demographic profile category. The system does not prevent you from creating more than one profile code with the same description. Alphanumeric, 20 positions; required.
Mandatory	This flag indicates whether to prompt Order Entry operators to collect this information if the customer has not already provided it. Valid values are: • *Selected* = Prompt for this information in Order Entry by advancing to the Work with Customer Profile screen automatically if the customer has not provided you with a response. **Note:** If the *Alternate ID Required for Displaying Customer Profile (K87)* system control value is *selected*, you automatically advance to the Work with Customer Profile screen in order entry and maintenance only if an Alternate customer number is defined for the sold to customer on the order. • *Unselected* = Do not prompt for this information in Order Entry. The system will also advance to the *Work with Customer Profile Screen* automatically in Order Maintenance if the *Prompt for Mandatory Demographics in Order Maintenance (E60)* system control value is *selected*. **Note:** The system does not prompt you for a mandatory profile category if you define a default response for the category; instead, the system will update the customer record with the default value automatically, behind the scenes.

Work with Profile Data Screen (Category Responses)

Purpose: Use this screen to create, change, or delete valid responses for a profile category.

How to display this screen: Select *Profile Options* for a profile category at the Work with Profile Categories Screen.

Field	Description
Code	A number from 1 through 9 that you assign to a profile response. Alphanumeric, 1 position; optional.
Description	The description of the profile response. Alphanumeric, 20 positions; optional.
Default?	A flag that determines whether the system defaults this response automatically when you create or change demographic information for a customer. You can override this default value. • *Yes* = Defaults when you advance to the Work with Customer Profile Screen in Order Entry, Order Maintenance or Customer Maintenance. • *No* = Does not default.

Screen Option	Procedure
Create a response code	Select *Create* to advance to the Create Profile Data Screen (Category Responses).
Delete a response code	Select *Delete* for a code.
Change a response code	Select *Change* for a code to advance to the Change Data Option screen. You can change the description or the default flag for a profile data option. See Create Profile Data Screen (Category Responses) for field descriptions.

Create Profile Data Screen (Category Responses)

Purpose: Select *Create* at the Work with Profile Categories Screen.

Field	Description
Profile code	A number that represents a demographic profile category for which you are creating a valid response code. Numeric, 3 positions; display-only.
Profile data code	A user-defined code that represents a valid response for the profile category. For example, if the profile code were income, the profile data code might be 1, representing income less than $20,000. Alphanumeric, 1 position. Create screen: required. Change screen: display-only.

Field	Description
Description	Text that describes the profile data response. *Example:* For the profile category of Income level, you might create profile data codes such as the following: 1 = less than $30,000 2 = $20,000-$69,000 3 = $30,000-$89,000 4 = $40,000-$109,000 5 = more than $149,000 Alphanumeric, 30 positions; required.
Default?	This flag identifies whether to default this code for the profile category. When you establish a default code by *selecting* this setting, the default code appears when you advance to the *Work with Customer Profile Screen* in Order Entry, Order Maintenance, and Customer Maintenance. You can designate only one default response code for each profile category. If you designate a default response for a mandatory category, the system will default this value for customers automatically behind the scenes in Order Entry if the customers have not already supplied you with the correct information; the Work with Customer Profile screen will not display (unless there is an additional mandatory category without a default value designated). The same condition is true for Order Maintenance if the *Prompt for Mandatory Demographics in Order Maintenance (E60)* field in the System Control file is *selected*. • *Selected* = This is the default response code. • *Unselected* = This is not the default response code.

Setting Up the Customer Class Table (WCCL)

Purpose: Use customer classes to create high level groupings of customers. You can use customer class codes to:

- direct offerings to a limited customer group
- restrict item sales to a group of customers (for example, restricting the sale of guns to minors)
- exclude a group of customers from a particular pay type
- set a default for bypassing item reservation for a group of customers
- generate a list of customers for reporting purposes, or segment reports by class code
- trigger a prompt in order entry to complete a user-defined field for customers based on their class

Related system control values: You can define a *Default Customer Class in Order Entry (D63)* in the System Control table for the system to assign automatically to all new customers created through Order Entry. Also, you can use the *Require Customer Class in OE, WCAT, and WCST (H85)* system control value to require the customer class in order entry, order maintenance, catalog requests, and customer maintenance.

Secured feature: The *Maintenance of Customer Class Field (B07)* controls the authority to enter or change the customer class in order entry, order maintenance, catalog requests, and order maintenance.

> **Important:**
>
> If you set the *Require Customer Class in OE, WCAT, and WCST (H85)* system control value to *Y*, a user who does not have authority to the customer class field will not be able to enter or maintain an order or a catalog request, or perform customer maintenance for any customer that does not already have a customer class assigned.

- *customer maintenance:*
  - *First Create Sold To Customer Screen*

Work with Customer Classes Screen

How to display this screen: Enter *WCCL* in the Fast path field at the top of any menu, or select Work with Customer Classes from a menu.

Field	Description
Class	A code you can use to group customers. Alphanumeric, 2 positions; optional.
Description	The description of the code. Alphanumeric, 30 positions; optional.

Field	Description
Bypass reservation	This code indicates whether customers in this class are restricted to interactive reservation. Valid values are: • *Yes* = Restrict the customers to interactive reservation; they are prohibited from immediate or batch reservation. If a customer is assigned to a class with this setting, then the customer bypasses reservation regardless of the setting of the Bypass res flag set through *Creating and Updating Sold-to Customers (WCST)*. • *No* = No reservation restrictions apply. If a customer is assigned to a class with this setting, then the customer does not bypass reservation unless the Bypass res flag set through *Creating and Updating Sold-to Customers (WCST)* is *selected*. **Note:** Use this flag only if the *Use OROB for Fulfillment Assignment (M31)* system control value is unselected. This system control value uses the Bypass reservation flag to send orders to Order Orchestration for fulfillment assignment. Optional.

Screen Option	Procedure
Create a customer class	Select *Create* to advance to the *Create Customer Class Screen*.
Change customer class information	Select *Change* for a class to advance to the Change Customer Class screen. At this screen you can change the description or the bypass reservation code. See *Create Customer Class Screen* for field descriptions.
Delete a customer class	Select *Delete* for a class.
Establish a pay type exclusion	Select *Pay Type Exclusions* for a class to advance to the *Exclude Pay Types by Customer Class Screen*.

Create Customer Class Screen

To create: Select *Create* at the *Work with Customer Classes Screen*.

Field	Description
Class	The code you use to categorize customers at a high level for reporting purposes. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Description	The description of the class. Alphanumeric, 30 positions; required.
Bypass reservation	This flag indicates whether customers in the class are restricted to interactive reservation, in which you manually assign inventory to orders. Valid values are: • *Selected* = Restrict the customers to interactive reservation; they are prohibited from immediate or batch reservation. If a customer is assigned to a class with this setting, then the customer bypasses reservation regardless of the setting of the Bypass res flag set through *Creating and Updating Sold-to Customers (WCST)*. • *Unselected* = No reservation restrictions apply. If a customer is assigned to a class with this setting, then the customer does not bypass reservation unless the Bypass res flag set through *Creating and Updating Sold-to Customers (WCST)* is *selected*. **Note:** Use this flag only if the *Use OROB for Fulfillment Assignment (M31)* system control value is unselected. This system control value uses the Bypass reservation flag to send orders to Order Orchestration for fulfillment assignment.
Exclude from Rewards	Not implemented.

Exclude Pay Types by Customer Class Screen

Purpose: Use this screen to work with any pay type(s) the customer class is prohibited from using. If you attempt to enter an excluded pay type on an order for a customer in this class, the system displays a message such as the following:

Customer class (99) has been excluded from using pay type (4).

How to display this screen: Select *Pay Type Exclusions* for a class at the Work with Customer Classes Screen.

Field	Description
Pay Type	Represents the method of payment on an order. See *Working with Pay Types (WPAY)*. Numeric, 2 positions; optional.

Screen Option	Procedure
Create a new pay type exclusion for this customer class	Select *Create* to advance to the *Create Pay Type Exclusions/Customer Class Screen*.
Delete a pay type exclusion for a customer class	Select *Delete* for a pay type exclusion.

Create Pay Type Exclusions/Customer Class Screen

To create: Use this screen to create a new pay type exclusion for a customer class.

How to display this screen: Select *Create* at the *Exclude Pay Types by Customer Class Screen*.

To complete this screen: Enter the code representing the pay type from which the class should be excluded. See *Working with Pay Types (WPAY)*.

Setting Up Match Codes (MMCH)

Match codes are unique customer identification codes that consist of selected portions of a customer name, company name, and address information. The system generates a match code for each customer based on positional field contents you include in a match code schematic or algorithm. You can create up to four match codes per customer, including a standard match code and three fraud identification match codes.

The standard match code identifies duplicate customers any time you create a customer through Order Entry, Customer Maintenance, Order Maintenance, or the Catalog Request table. The three fraud match codes identify customers you have included in *Working with Customer Fraud Tables (WCFD)*.

> **Note:**
>
> To avoid duplicate addresses in the system, you must define the standard match code. To identify a customer as a fraud customer, define the three fraud match codes; the system checks for matches in the Fraud table based on three different algorithms.

The system includes an industry standard match code schematic. You can rearrange the fields and modify the field portions that the match code logic draws from to generate a match code. You can also limit the length of the resulting match code display by leaving match code positions blank. However, you cannot exceed the length of the match code algorithm itself, which is 15 positions.

In this topic:

- *Change Match Codes Screen (Maintaining Match Codes)*

- *Display Match Code Summary Screen*
- *Change Match Code Screens*
- *Test Match Code Screen*

Change Match Codes Screen (Maintaining Match Codes)

How to display this screen: Enter *MMCH* in the Fast Path field at the top of a menu or select Change Customer Match Codes from a menu.

Field	Description
Match code	An algorithm that generates a unique customer identifier comprised of selected portions of the customer name, company name, and address. You can generate up to four match code types: • *Standard Match Code* = This match code checks for, and flags, duplicate customer entries. • *Fraud Code 1, Fraud Code 2, or Fraud Code 3* = Fraud match codes identify a customer as a fraud customer when the system finds a matching record in the Fraud table. The three fraud match code types enable the system to check for matches in the Fraud table based on three different algorithms. Required.

Screen Option	Procedure
Select a match code for review	Select a code in the *Match code* field. You advance to the *Display Match Code Summary Screen*. If no match code has been defined, this screen displays only the title and field headings.

Display Match Code Summary Screen

Purpose: Use this screen to review the pattern and structure of a match code. This screen presents the current algorithm, including the field names and field positions that comprise the match code.

How to display this screen: Select a match code value at the *Change Match Codes Screen (Maintaining Match Codes)*.

Field	Description
Match code position	Identifies the position in the match code that each field element occupies. *Example:* In the sample screen above, match code positions 1-3 consist of elements from the customer's first name. Positions 4-6 in the match code consist of elements from the customer's last name. Positions 7-9 in the match code consist of elements from the street address. Positions 10-14 consists of elements from the postal code. Position 15 consists of an element from the customer' s prefix.

Field	Description
Name/address	The name of the field from which the system extracts the match code element. See *Change Match Code Screens* for complete field descriptions, including attributes. You can use: • *Name*, including: • Prefix • First name • Middle initial • Last Name • Suffix • Company • Street Address • Address Line 2 The second line is available for entering an extended address, for use when street address alone is insufficient. • *Apt./Suite* = The Apartment number or Suite number of the delivery address. • *Postal code* = The postal or zip code for this customer. **Note:** This format differs from the zip code format you use in other situations. In most other tables, you include the hyphen when entering an extended zip code (format = xxxxx-xxxx). However, when creating a match code, you disregard the hyphen (format = xxxxxxxxx). • *City* = The city in which the customer lives, or receives mail or shipments. • *St* = The state or province in which the customer lives, or receives mail or shipments.
Field position used	This graphic illustrates the field length and identifies which field positions the match code includes. The ruler at the top of the screen lets you identify the length of any field and the positional values from that field that the match code includes. The words “Position not used” indicate that you did not define positional values for the related match code positions.

Field	Description
	Example: • The first 3 positional values from the customer's first name (identified by an *X* in each field position) are the first 3 positions of the match code • The first 3 positional values from the last name make up positions 4-6 of the match code • The first 3 positional values from the street address are match code positions 7-9 • The first 5 positional values from the postal code make up positions 10-14 • The first positional value from the prefix makes up position 15 Using this algorithm, the system assembles the match code shown below for a customer named John Brown whose street address is 10 Sample Street, and whose zip or postal code is 01609 `JOHBRO10S01609M` See *Change Match Code Screens* for complete field descriptions, including atttributes.

Screen Option	Procedure
Change the match code contents	Select *Change* to change the match code. You advance to the first of the *Change Match Code Screens*.
Test the match code	Select *Test* to advance to the *Test Match Code Screen*.

Change Match Code Screens

Purpose: You use four Change Match Code screens to define or modify a match code.

> **Important:**
>
> Changing a Match Code algorithm results in a complete regeneration of every Sold-to, Ship-to, and Bill-to customer's match code in the Customer Maintenance Table. This process is *extremely time consuming* and prevents your access to tables until it is complete.

How to display this screen: Select *Change* at the *Display Match Code Summary Screen*.

How to interpret this screen: There are 4 screens that display the fields you can select when changing a match code. The subsequent screens are identical to the first, except that the field names and positions change from screen to screen.

One screen provides two rows per field to accommodate the maximum number of field positions available in any given field. However, you identify the positions available within the field by the number of spaces shown.

Field	Description
Match code	The type of match code you are defining. You can define the standard match code, or one of three fraud match codes. Alphanumeric, 30 positions; display-only.
Prefix	A title (such as "Ms." or "Dr.") that belongs before the customer's name. Alphanumeric, 3 positions; optional.
First Name	The customer's first name. Alphanumeric, 15 positions; optional.
Initial	The customer's middle initial. Alphanumeric, 1 position; optional.
Last Name	The customer's last name. Alphanumeric, 25 positions; optional.
Suffix	An addition to the customer's full name (such as "M.D.", "Fr.", or "III"). Alphanumeric, 3 positions, optional.
Company name	The name of the company placing the order Alphanumeric, 30 positions; optional.
Street Address	The name and number of the customer's street address. Alphanumeric, 32 positions; optional.
Address Line 2	The second line available for entering an address, used when street address alone is insufficient. Alphanumeric, 30 positions; optional.
Apartment	The Apartment number or Suite number of the delivery address. The format of this field should always include the abbreviation for apartment (Apt.) or Suite (Ste.) followed by the number. Alphanumeric, 10 positions; optional.
Postal code	The postal or zip code for this customer. The postal code field allows for entry of a maximum 9-digit code. When using a zip code, you may select up to 9 digits of the extended zip code, excluding hyphen. **Note:** This format differs from the zip code format you may use in other areas. In most other tables, you include the hyphen when entering an extended zip code (format = xxxxx-xxxx). However, when creating a match code, you disregard such formatting (format = xxxxxxxxx). Alphanumeric, 9 positions; optional.
City	The name of the city where the customer lives, or receives mail or shipments. Alphanumeric, 25 positions; optional.

Field	Description
St	The state or province where the customer lives, or receives mail or shipments (See *Setting Up the Zip/City/State (Postal Code) Table (WZIP)*). Alphanumeric, 2 positions; optional.

Instructions:

#	Step
1.	Select a field from those available. Select *Next* or *Prev* to move forward or backward between the four screens.
2.	Determine which match code positions you want the field positions to hold. Enter the number of the match code position in the blank provided for the field position. For example, if you want the first three match code positions to consist of the first, third, and fourth positions of the Postal code field, then advance to the screen that displays this field, and enter *1* in the first blank, *2* in the third blank, and *3* in the fourth blank of this field.
3.	When you complete the field selection and position numbering process, select *OK*. The screen displays a warning: `The match code algorithm has changed.` `Are you sure you want to proceed?` If you confirm the change, you return to the *Display Match Code Summary Screen*. When you exit this screen, another pop-up window prompts you to confirm the change again. **Important:** When you select *OK* to confirm the change at the second pop-up window, the system will proceed to modify every match code on file.
4.	If you select *Exit* at this second pop-up window, the system displays a warning: `The match code algorithm has changed.` `To avoid a discrepency, regenerate all` `customer match codes, or return the` `algorithm to its original values.`

Note:

Whether you select *OK* or *Exit*, you return to the Change Match Codes Screen (Maintaining Match Codes) and must repeat the process to correct changes made to the algorithm or to regenerate the match codes.

Test Match Code Screen

Purpose: Use this screen to test a new match code pattern.

How to display this screen: Select *Test* at the *Display Match Code Summary Screen*.

Field	Description
Match code type	The standard match code the system uses to flag duplicate customers. There are four match code types: • Standard Match Code (*M*) • Fraud code 1 (*F1*) • Fraud code 2 (*F2*) • Fraud code 3 (*F3*) Display-only.
Name	The following 5 fields are available for you to enter the customer's full name: **Prefix** A title that belongs before the customer's name, such as "Mrs." or "Dr. The prefix value will print on labels, reports, etc. Alphanumeric, 3 positions; optional. **First Name** The customer's first name. Alphanumeric, 15 positions; optional. **Initial** The initial of the customer's middle name. Alphanumeric, 1 position; optional. **Last Name** The customer's last name. Alphanumeric, 25 positions; required if Company name is not present **Suffix** An addition to the customer's full name (such as "M.D.", "Fr.", or "III"). Alphanumeric, 3 positions; optional.
Company name	The name of the company placing the order. Alphanumeric, 30 positions; required if Last name is not present
Address	The customer's full street address. Alphanumeric, 32 positions; optional.
Apartment	The Apartment number or Suite number of the delivery address. To enter an apartment or suite address: • Type *APT* to indicate an apartment or *STE* to indicate a suite. • Insert a space and type the number of the apartment or suite, for example: *APT 4* or *STE 116*. Alphanumeric, 10 positions; optional.

Field	Description
Postal code/city/st	Three fields are available for you to enter the customer's postal code, city, and state. **Postal code** The postal code or zip code for this customer. Alphanumeric, 9 positions; optional. **City** The city where the customer lives. Alphanumeric, 25 positions; optional. **State** The state or province where the customer lives, or receives mail or shipments. Alphanumeric, 2 positions; optional.
Match code	When you select *OK*, the system generates the match code for the address you entered above. Alphanumeric, 25 positions; display-only.

Setting Up User-Defined Fields (WUDF)

Purpose: Use Work with User Defined Fields to design a screen containing the information you want to collect for a variety of types of records in Order Administration. For example, you can specify information to capture from customers during order entry or through customer maintenance. User-defined fields are available for:

- different customer types
- items, offers, and related tables
- users, companies, and countries
- divisions and entities
- pay types, ship vias, and warehouses

A complete listing is provided in this topic.

Process overview: Before defining the individual user-defined fields, you must first use Work with User Defined fields to create a link to the related table. You can then enter the detailed information that specifies the type of information you want to collect. Then, you can enter information for individual records in the table.

Example: You want to track the language of each country to which you ship orders. To do so:

1. Select *Create* at the Work with User Defined Fields Screen to create the link to the Country table.
2. When you advance to the *Create User Defined Field Screen*, select a table code of *CST* (Customer Sold To) and enter a description.
3. Select *Work with details* for the record at the Work with User Defined Fields screen to advance to the Work with User Defined Field Detail Screen (Defining the Fields).
4. Select *Create* to advance to the Create User Defined Field Detail Screen, where you create a record for “language.”

Prompting in order entry: In the case of sold-to customers, you can have this screen open automatically when you enter an order for new or existing customers. See *Prompting in Order Entry*. For most other types of user-defined fields, you can display this screen by selecting *Work with user fields* for a record at a "Work with" screen. For example, to work with however, the Order Header User Field table is not available through any screen.

In this topic:

- *Prompting in Order Entry*
- *Work with User Defined Fields Screen*
  - *Create User Defined Field Screen*
- *Work with User Defined Field Detail Screen (Defining the Fields)*
  - *Create User Defined Field Detail Screen*

Prompting in Order Entry

The system uses the following two system control values to determine when to prompt for user-defined information for a sold-to customer in order entry:

- User-defined Field Prompting for Existing Customers (D33)
- *Customer Class for User Defined Field Prompting (G04)*

These two system control values work together as follows:

User Defined Field Prompting in Order Entry set to:	Customer Class for User Defined Field Prompting set to:	Result
	a valid customer class	prompts for any new or existing customer in the class who has not yet provided the user-defined information
	blank	prompts for any new or existing customer, regardless of class, who has not yet provided the user-defined information
N	a valid customer class	prompts for a new customer in the class only if you assign the class before completing the header information and selecting *OK* **Note:** If the *Default Customer Class in Order Entry (D63)* system control value is set to this same customer class, each new customer you create will be assigned to the class automatically, and you will always advance to the prompt screen
N	blank	prompts for any new customer

For more information: See:

- Entering user-defined field information: *Work with User Fields Screen*
- Completing user-defined fields in order entry: *Entering User Fields*

Work with User Defined Fields Screen

How to display this screen: Enter *WUDF* in the Fast path field at the top of any menu, or select Work with User Defined Fields from a menu.

Field	Description
Cde(Code)	A code that identifies the table linked to the user-defined fields. Valid values are: • *CST* = Customer Sold To Table (see *Work with Customers Screens (Selecting a Customer)*) • *CMP* = Company (see *Work with Companies Screen*) • *CNT* = Country (see *Work with Countries Screen*) • *CBT* = Customer Bill To (see *Work with Bill To Customers Screen*) • *DIV* = Division (see *Work with Divisions Screen*) • *ENT* = Entity (see *Work with Entities Screen*) • *ITM* = Item (see *Work with Items Screen*) • *IOF* = Item Offer (see *Work with Item Offers Screen*) • *ITW* = Item Warehouse (see *Work with Item Warehouse Screen*) • *OFR* = Offer (see *Work with Offers Screen*) • *OHD* = Order Header (the Order Header User Field table is not available at any screen) • *OTY* = Order Type (see *Work with Order Types Screen*) • *PAY* = Pay Type (see *Work with Pay Types Screen*) • *VIA* = Ship Via (see *Work with Ship Via Screen*) • *SKU* = SKU (see *Work with SKUs Screen*) • *SKO* = SKU Offer (see *Work with SKU Offers Screen*) • *SRC* = Source (see *Work with Source Codes Screen*) • *USR* = User (see *Work with Users Screen*) • *VND* = Vendor (see *Work with Vendors Screen*) • *VIT* = Vendor Item (see *Work with Vendor Item Screen*) • *WHS* = Warehouse (see *Work with Warehouses Screen*) Optional.
Description	The description associated with the table code. Alphanumeric, 25 positions; optional.

Screen Option	Procedure
Create a user defined field	Select *Create*. See Create User Defined Field Screen.

Screen Option	Procedure
Change the description of the link to the Customer Sold To table	Select *Change* for a code to advance to the Change User Defined Field screen. At this screen, you can change only the description. See *Create User Defined Field Screen* for field descriptions. See for information on changing the type of information stored in user defined fields.
Review the code and description of the link	Select *Display* for a code to advance to the Display User Defined Field screen. You cannot change any information at this screen. See *Create User Defined Field Screen* for field descriptions. See *Work with User Defined Field Detail Screen (Defining the Fields)* for information on reviewing the type of information stored in user defined fields.
Create, change, delete or display individual user-defined fields	Select *Work with details* for a code to advance to the *Work with User Defined Field Detail Screen (Defining the Fields)*.

Create User Defined Field Screen

To create: Use this screen to link a user-defined field to appear on the *Work with User Fields Screen*.

How to display this screen: Select *Create* at the *Work with User Defined Fields Screen*.

Field	Description
File code	Identifies the table linked to the user-defined fields. Valid values are: • Add Reason • Bank • Buyer • Cancel Reason • Catalog Request • Company (see *Work with Companies Screen*) • Correspondence History • Country (see *Work with Countries Screen*) • Customer Bill To (see *Work with Bill To Customers Screen*) • Customer Class • Customer Membership • Customer Profile • Customer Ship To • Customer Ship To Entity • Customer Sold To (see *Work with Customers Screens (Selecting a Customer)*) • Customer Sold To Email • Customer Sold To Entity • Customer Warranty Track • Dispute Reason • Division (see *Work with Divisions Screen*) • Entity (see *Work with Entities Screen*) • Exchange Reason • Geographic Zone

Field	Description
	• Hazard • Item (see *Work with Items Screen*) • Item Category • Item Class • Item Offer (see *Work with Item Offers Screen*) • Item Status • Item Transaction Code • Item Transaction History • Item Transaction Reason • Item (SKU) UPC • Item Warehouse (see *Work with Item Warehouse Screen*) • Language • Line of Business • List Source • Location Class • Long SKU Class • Long SKU Department • Long SKU Division • Mail/Call Code • Manifest Upload Audit • Offer (see *Work with Offers Screen*) • Order Detail • Order Header (the Order Header User Field table is not available through any screen) • Order Payment Method • Order Ship To • Order Type (see *Work with Order Types Screen*) • Pay Type (see *Work with Pay Types Screen*)

Field	Description
	• Prep Code • Price Override Reason • Profile Data • Promotion • PO Detail • PO Header • Recency • Retail Class • Return Reason • RI Price Change Hist Detl • RI Price Change Hist Summ • Salesman • Season • Ship Via (see *Work with Ship Via Screen*) • SKU (see *Work with SKUs Screen*) • SKU Element 1 • SKU Element 2 • SKU Element 3 • SKU Offer (see *Work with SKU Offers Screen*) • Soldout Control • Source (see *Work with Source Codes Screen*) • Source Category • Tickler • User (see *Work with Users Screen*) • Vendor (see *Work with Vendors Screen*) • Vendor Item (see *Work with Vendor Item Screen*) • Warehouse (see *Work with Warehouses Screen*) Create screen: required. Change screen: display-only.
File description	The description associated with the table code. Alphanumeric, 25 positions; required.

Note:

You cannot delete the user-defined field link once you create it.

See *Work with User Defined Field Detail Screen (Defining the Fields)* for more information on setting up the individual fields.

Work with User Defined Field Detail Screen (Defining the Fields)

Purpose: Once you create the link to a table, you need to define and sequence the fields available on the new screen. Use this screen to work with the individual fields.

How to display this screen: Select *Work with details* for the link at the *Work with User Defined Fields Screen*.

Field	Description
File code	The code representing the table to which the user-defined fields are linked. Alphanumeric, 3 positions; display-only.
File description (Unlabeled field to the right of the File code field)	The description associated with the table code. Alphanumeric, 25 positions; display-only.
Seq (Sequence)	A value you assign to a field to control its placement on the screen. Typically, you would assign a sequence number of *10* to the field that should appear first, a sequence number of *20* to the field that should appear second, and so on. **Note:** This display sequence number differs from the other sequence number field in the User Defined Field Detail table; this other sequence number is not displayed on any screen, although the system can use it to identify user defined field record types. Numeric, 3 positions; optional.
Field label	The field label to appear on the user-defined field screen in order entry or customer maintenance. **Note:** To support passing user-defined fields through the order API, the field label should be in upper case, and should be passed in the *Inbound Order XML Message (CWORDERIN)* in upper case as well. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Alphanumeric, 15 positions; optional.
Typ (Type)	A code that identifies the type of field. Valid codes are: • *Date* • *Number* • *Text* On the *Enter User Fields Screen* (displayed during Order Entry or from the Sold To Customer table), numeric fields appear on the left side of the screen, text fields appear in the center of the screen, and date fields appear on the right side of the screen. Optional.

Field	Description
Usage	A code that identifies whether you are collecting the field information on the user-defined field screen for sold-to customers in order entry. Valid values are: • *Input* = the system prompts you to enter information in this field in order entry; or, you can use customer maintenance • *Output* = you can enter information in this field in customer maintenance only; it is not available in order entry Optional.

Screen Option	Procedure
Create a new user defined detail field to use when collecting customer information	Select *Create* to advance to the *Create User Defined Field Detail Screen*.
Change the sequence, description or characteristics of a field	Select *Change* for a field to advance to the Change User Defined Field Detail. See *Create User Defined Field Detail Screen* for field descriptions.
Delete a field	Select *Delete* for a field. The Confirm Delete window indicates that customer fields have been created, and that you will lose this information if you continue. Select *Enter* to continue, or select *Exit* to cancel.
Review a field	Select *Display* for a field to advance to the Display User Defined Field Detail screen. You cannot change any information on this screen. See *Create User Defined Field Detail Screen* for field descriptions.

Create User Defined Field Detail Screen

Purpose: Use this screen to specify a new field you will use to collect information.

How to display this screen: Select *Create* at the *Work with User Defined Field Detail Screen (Defining the Fields)*.

Field	Description
File code	The code representing the table to which the user-defined fields are linked. Alphanumeric, 3 positions; display-only.

Field	Description
Seq (Sequence)	A value you assign to a field to control its placement on the screen. Typically, you would assign a sequence number of *10* to the field that should appear first, a sequence number of *20* to the field that should appear second, and so on. **Note:** This display sequence number differs from the other sequence number field in the User Defined Field Detail table; this other sequence number is not displayed on any screen, although the system can use it to identify user defined field record types. Numeric, 3 positions; required.
Field label	The field label to appear on the user-defined field screen. Alphanumeric, 15 positions; required.
Typ (Type)	A code that identifies the type of field. Valid codes are: • *Date* • *Number* • *Text* **Note:** On the *Enter User Fields Screen* (displayed during Order Entry or from the Sold To Customer table), numeric fields appear on the left side of the screen, text fields appear in the center of the screen, and date fields appear on the right side of the screen. Create screen: required. Change screen: display-only.
Usage	A code that identifies whether you are collecting the field information on the user-defined field screen for sold-to customers in order entry. Valid values are: • *Input* = the system prompts you to enter information in this field in order entry; or, you can use a maintenance screen if appropriate • *Output* = you can enter information in this field in maintenance only; it is not available in order entry Required.

Working with Postal Code Formats (WPCF)

Purpose: Use the Work with Postal Code Format function to define the format for printing postal codes on pick slips or gift acknowledgments. Postal codes are defined by country, but each country can have more than one postal code format.

When you print pick slips, the system compares each customer's postal code with the postal code formats you have defined through this function. In order to match a format, the postal code should have the same number of positions and conform in the placement of filler characters, such as hyphens. If the system cannot find a match, no postal code prints on the pick slip. For this reason, it is useful to consider the different postal code formats your operators typically use in Order Entry and define a format to cover each.

In this topic:

- *Work with Postal Code Format Screen*
- *Postal Code Layout Screen*

Work with Postal Code Format Screen

Purpose: Use this screen to work with the formats you have defined for printing postal codes on pick slips or gift acknowledgments.

How to display this screen: Enter *WPCF* in the Fast path field or select *Working with Postal Code Formats (WPCF)* from a menu.

Field	Description
Country	A code to represent the country for the postal code format. Country codes are defined in and validated against the Country table. See *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; optional.
Country description (Unlabeled field to the right of the country)	The description of the country. Alphanumeric, 30 positions; display-only.
Code length	The number of characters in the postal code. Numeric, 3 positions; optional.
Format postal code	The postal code format, illustrated by arranging the ten letters of the word "postalcode" in the same order and position as the characters of the postal code will print on the pick slip. *Example:* The "zip plus 4" postal code used in the United States is represented on this screen as: `POSTA-LCOD` When printed on the pick slip or gift acknowledgment, this postal code would appear in the following format: `01609-1039` Alphanumeric, 10 positions; display-only.

Screen Option	Procedure
Change a postal code format	Select *Change* for a postal code format to advance to the Postal Code Layout screen in Change mode. You can change only the *Formatted postal code positions* fields. See *Postal Code Layout Screen* for field descriptions.
Delete a postal code format	Select *Delete* for a postal code format.
Display a postal code format	Select *Display* for a postal code format to advance to the Postal Code Layout screen in Display mode. You cannot change any information on this screen. See *Postal Code Layout Screen* for field descriptions.
Add a new postal code format for a country	Select *Create*. See *Postal Code Layout Screen*.

Postal Code Layout Screen

To create: Select *Create* at the *Work with Postal Code Format Screen*.

Field	Description
Country	A code to represent the country for the postal code format. Country codes are defined in and validated against the Country table. See *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; required.
Code length	The number of characters in the postal code. The maximum number is ten. Numeric, 3 positions; required.
Formatted postal code positions	The order and position of each of the postal code digits for pick slips or gift acknowledgments, including any hyphens or other "filler" characters. The first digit of the postal code will print where you enter a 1, the second digit will print where you enter a 2, and so on, up to the tenth digit, which will print where you enter a 0. *Example:* Create a United States five-digit postal code format as: 1 2 3 4 5 Create a United States "zip plus 4" postal code format as: 1 2 3 4 5 - 7 8 9 0 Create a Canadian postal code format as: 1 2 3 4 5 6 Alphanumeric, 10 positions; required.
Zip spaces	This field is not currently implemented. Numeric, 1 position; optional.
Zip position	This field is not currently implemented. Valid values: • *After* • *Before* • *Separate* Optional.

Instructions:

1. Complete the *Country* field and the *Code length* field.

2. Enter the postal code format in the *Formatted postal code positions* fields, indicating where each digit of the postal code should print. Include any hyphens or other “filler” characters in your count. See the *Formatted postal code positions* fields for an example.

Working with Mail/Call Codes (WMCC)

Purpose: Use the Mail/Call Code table to define codes that specify how often, and under what conditions, you will call or send mail to customers.

You can define mail and call codes for sold-to and ship-to customers. See *Creating and Updating Customers* for more information on working with different customer types.

> **Note:**
>
> The system defaults the value in the Mail flag field (either Y or N) to the Mail code field when you create or change a sold-to customer. (The Mail flag setting itself defaults from the *Default Mail Name (D10)* system control value.) For this reason, you should define *Y* and *N* as valid mail codes in the Mail/Call Code table, so that the system will accept the default as a valid value in the Mail code field.

In this topic:

- *Work with Mail/Call Code Screen*
- *Create Mail/Call Code Screen*

Work with Mail/Call Code Screen

How to display this screen: Enter *WMCC* in the Fast path or select Work with Mail/ Call Codes from a menu.

Field	Description
Mail/call code	This code defines when, and under what circumstances, you should send mail to or call the customer. The system distinguishes mail codes from call codes by the value in the *Type* field. Alphanumeric, 3 positions; optional.
Description	The description associated with the mail or call code. Alphanumeric, 40 positions; display-only.
Type	Indicates whether this is a mail or call code. Valid values are: • *Call Code* • *Mail Code* Optional.

Screen Option	Procedure
Change a mail or call code	Select *Change* for a mail or call code you want to change to advance to the Change Mail/Call Code screen. You can change only the *Description* and the *Type* fields. See *Create Mail/Call Code Screen* for field descriptions.
Delete a mail or call code	Select *Delete* for a mail or call code.
Display a mail or call code	Select *Display* for a mail or call code to advance to the Display Mail/Call Code screen. You cannot change any information on this screen. See *Create Mail/Call Code Screen* for field descriptions.
Add a new mail or call code	Select *Create*. See *Create Mail/Call Code Screen*.

Create Mail/Call Code Screen

Purpose: Use this screen to create a new mail code or call code.

To create: Select *Create* at the *Work with Mail/Call Code Screen*.

Field	Name
Mail/call code	This code indicates when and under what circumstances to call or send mail to the customer. You cannot use the same code for both a mail code and a call code. The system distinguishes mail codes from call codes based on the value in the *Type* field. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Description	The description associated with the mail or call code. Alphanumeric, 40 positions; required.
Type	Indicates whether this is a mail code or a call code. Valid values are: • *Mail Code* • *Call Code* Required.

Working with Customer Action Reason Codes (WCAR)

Customer action notes are messages about a customer issue or problem that you need to resolve. You use customer action reason codes to identify and group the issues or problems in customer action notes or track when and how often customers report certain issues or problems.

In this topic:

- *Work with Customer Action Reasons Screen*
- *Create Customer Action Reason Screen*

For more information: See *About Customer Action Notes*.

Work with Customer Action Reasons Screen

How to display this screen: Enter *WCAR* in the Fast path field at the top of any menu or select Work with Customer Action Reasons from a menu.

Field	Description
Reason code	This code represents the reason behind the customer issue or problem. Alphanumeric, 2 positions; optional.
Description	A description of the reason code. Alphanumeric, 40 positions; display-only.

Screen Option	Procedure
Change a reason code	Select *Change* for a reason code to advance to the Change Customer Action Reason screen. At this screen, you can change only the customer action reason description. See *Create Customer Action Reason Screen* for field descriptions.
Delete a reason code	Select *Delete* for the reason code to delete it.
Display a reason code	Select *Display* for a reason code to advance to the Display Customer Action Reason Code screen. You cannot change any information on this screen. See *Create Customer Action Reason Screen* for field descriptions.
Create a reason code	Select *Create* to advance to the *Create Customer Action Reason Screen*.

Create Customer Action Reason Screen

Purpose: Use this screen to create a reason code.

How to display this screen: Select *Create* at the *Work with Customer Action Reasons Screen*.

Field	Description
Customer action (Customer action reason code)	This code reason represents the reason behind the customer issue or problem. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Description	A description of the reason code. Alphanumeric, 40 positions; required.

Working with Customer Note Types (WNTY)

Purpose: Use this menu option to set up types of customer notes and the special actions or defaults associated with each. You can review or enter customer notes at the *Edit Customer Notes Screen*, available through Work with Customers or through order entry, order maintenance or standard order inquiry.

The features you can assign to a note type include:

- *Automatic display in order entry:* a pop-up window displays when you select the customer in order entry, or when you maintain the customer's order in order maintenance.
- *Default text:* this text will default into the Note field when you select the note type for a customer. You can override the default if desired.

> **Note:**
>
> The pop-up window displays only when you select the customer as the Sold-to customer on an order, not when the customer is a shipment recipient only (by selecting *Sold To/Rcp.* or *Accept/Add Rcp.*).

How might you use note types? You might use a note type to alert operators to a customer whose payment history may be fraudulent, or any other information about the customer that warrants special attention, such as purchase habits. You can also use the default text feature to save keystrokes when entering "boilerplate" notes for a customer, or to group customers for reporting purposes.

In this topic:

- *Work with Customer Note Type Screen*
- *Create Customer Note Type Screen*

For more information:

- customer notes: *Displaying More Options in OIOM*
- how customer note information displays in a pop-up window in order maintenance: *Selecting an Order for Maintenance*
- how customer note information displays in a pop-up window when you select a customer in order entry: *Selecting Customers in Order Entry*

Work with Customer Note Type Screen

How to display this screen: Enter *WNTY* in the Fast path field at the top of any menu or select Work with Customer Note Types from a menu.

Field	Description
Typ (Type)	The code representing the type of customer note. Alphanumeric, 1 position; optional.
Description	A description of the type code. Alphanumeric, 30 positions; display-only.

Screen Option	Procedure
Create a note type	Select *Create* to advance to the *Create Customer Note Type Screen*.

Screen Option	Procedure
Change a note type	Select *Change* for a note type to advance to the Change Customer Note Type screen. At this screen, you can change any field but the note type code. For a description of the fields on this screen, see *Create Customer Note Type Screen*.
Delete a note type	Select *Delete* for a note type to delete it.
Display a note type	Select *Display* for a note type to advance to the Display Customer Note Type screen. You cannot change any information on this screen. For a description of the fields on this screen, see *Create Customer Note Type Screen*.

Create Customer Note Type Screen

Purpose: Use this screen to create a note type.

How to display this screen: Select *Create* at the *Work with Customer Note Type Screen*.

Field	Description
Type	A code representing the type of customer note. Alphanumeric, 1 positions. Create screen: required. Change screen: display-only.
Description	A description of the type code. Alphanumeric, 30 positions; required.
Default message	The text that should default into the customer note field when you add a note of this type at the *Edit Customer Notes Screen*. This text defaults only if you do not enter any other text into the note field, and you can override or delete defaulted text. You can use the default message text to save keystrokes when entering notes. Alphanumeric, 50 positions; optional.
O/E message	This flag indicates whether the note should display automatically when you select the customer in order entry. The note will also display when you select one of the customer's order for order maintenance. Possible settings are: • *Selected* = Display the note in order entry and order maintenance. • *Unselected* (default) = Do not display the note in order entry and order maintenance.

Working with Language Codes (WLAN)

Purpose: Use this menu option to create, change, or delete a language code. You can assign a language to a customer in *Creating and Updating Sold-to Customers (WCST)*.

> **Note:**
>
> The Work with Language Codes menu option is informational only and is not supported by any functionality in Order Administration.

In this topic:

- *Work with Language Codes Screen*
- *Create Language Code Screen*
- *Change Language Code Screen*

Work with Language Codes Screen

Use this screen to review language codes.

How to display this screen: Enter *WLAN* in the Fast path field or select Work with Language Codes from a menu.

Field	Description
Language	A code that represents a language. Enter a full or partial language code and select *OK* to display language codes in alphanumeric order starting with your entry. Alphanumeric, 3 positions; optional.
Description	A description of the language. Alphanumeric, 30 positions; display-only.

Screen Option	Procedure
Create a language code	Select *Create* to advance to the *Create Language Code Screen*.
Change a language code	Select *Change* for a language code to advance to the *Change Language Code Screen*.
Delete a language code	Select *Delete* for a language code to advance to the Confirm Delete window. Select *Delete* to delete it; otherwise, select *Exit* to cancel.

Create Language Code Screen

Purpose: Use this screen to create a language code.

How to display this screen: Select *Create* at the *Work with Language Codes Screen*.

Field	Description
Language	A code that represents a language. Alphanumeric, 3 positions; required.
Description	A description of the language. Alphanumeric, 30 positions; required.

Change Language Code Screen

To change: Select *Change* at the *Work with Language Codes Screen* to advance to the Change Language Code screen. At this screen, you can change the language description. See the *Create Language Code Screen* for field descriptions.

Creating and Updating Customers

Topics in this part: The following topics describe how to create and maintain customer information on the system through the Customer Maintenance module:

- *Understanding Customer Types* describes the three types of customers you work with throughout the Customer Maintenance module.
- *Selecting Customers* explains how to use the Customer Maintenance Selection Screen to search for existing customer records.
- *Creating and Updating Sold-to Customers (WCST)* describes the Work with Customers screens you use when creating and updating sold-to customers.
- *Creating and Updating Ship-to Customers (WCST)* describes the screens you use when creating and updating ship-to customers.
- *Creating and Updating Bill-to Customers (WCBT)* describes the screens you work with when creating and updating bill-to customers.
- *Work with Contract Price Screen* describes how to establish special contract pricing opportunities for a customer.
- *Working with Customer Tax Status* describes the tax status that you can apply to customers, including standard taxes and exemptions.
- *Working with Pay Type Exclusions* describes how to apply payment method exclusion codes to a customer.
- *Reviewing Customer History* describes how to view a customer's mail history, item history, and order summary and detail history.
- *Work with User Fields Screen* describes how to change, delete, or display information for user-defined fields.
- *Reviewing Customer Address Changes* describes how to display address changes that you enter for your customers.
- *Printing the Customer Exposure Report (PCER)* describes how to print a report listing customer action notes entered and customer action reason codes used on each.
- *Printing the Customer Detail Exposure Report (PCAR)* describes how to print a report listing customer action notes, including details on the customer.
- *Working with Customer Warranty Information (WCST)* describes the screens you use to review and work with items you shipped to customers at no charge, in fulfillment of a warranty.
- *Working with Customer Email Addresses* describes how the system stores and validates email addresses for sold-to customers, and presents the screens you use to work with email addresses.
- *Working with Customer Ownership* describes how to create and update information about the products a customer owns.

- *Working with Alternate Customer Number Cross-References* describes the screens you use to work with additional alternate customer numbers assigned to a customer.
- *Generic Customer API* describes how to create or update customers through a generic XML message.
  For more information see the Order Administration Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).
- *Customer Engagement Customer Integration* describes how to keep customer information in sync with Oracle Retail Customer Engagement when Oracle Retail Customer Engagement is the system of record for customer data.

Work with Customers (WCST)

Reviewing and working with **alternate customer numbers** used to cross-reference a customer record in Order Administration with records from external systems	*Working with Alternate Customer Number Cross-References*

Creating and Updating Bill-to Customers (WCBT)

Purpose: A bill-to customer represents the person or company that is billed for an order. The system creates a bill-to customer record automatically only when the person being billed for the order is different from the customer who placed the order.

The system stores information on the bill-to customer related to payment arrangements and history; unlike the sold-to customer record, the bill-to customer table does not contain order history information.

Bill-to/sold-to association: Each customer who places orders (the customer sold-to) can be associated with no more than one bill-to customer, but each bill-to customer can be associated with more than one sold-to customer. If a bill-to customer is specified in the *Bill to* field for a sold-to customer, that bill-to will be added to each order that the sold-to customer places, regardless of payment method. See the system control values listed below for more information on the situations when the system automatically updates the *Bill to* field for the sold-to customer.

Related system control values:

- *Create/Assign Bill To Customers in Order Entry (A76)*: determines whether you can assign existing bill-to customers to sold-to customers through Order Entry as well as through Customer Maintenance.
- *Update Bill-to Address with Sold-to Address Changes (E13)*: controls whether to prompt the operator whenever you change a sold-to address to see if the bill-to address should receive the same updates.

In this topic:

- *Work with Bill To Customers Screen*
- *Create Bill-to Customer Screen*
- *Display Duplicate Bill To Window*
- *Change Bill-to Customer Screen*
- *Work with Bill To Phone Numbers Screen*
- *Create Bill To Phone Number Screen*
- *Work with Bill To Notes Screen*
- *Work with Ticklers Screen (bill-to customer view)*

Related system control values: The following system control values control how the system creates new bill-to customers:

- *Create/Assign Bill To Customers in Order Entry (A76)* controls whether the system allows you to assign a bill-to customer to a sold-to customer in Order Entry. In this case, the system uses the sold-to customer information for the new bill-to customer.

- *Allow Order for New Bill-to Without Order Hold (D84)* controls whether orders associated with a new bill-to customer, created automatically by the system in Order Entry, go on *UB* (unreferenced bill-to) hold.

For more information: On order hold reason codes: see *Introducing Order Hold Reason Codes*.

Work with Bill To Customers Screen

How to display this screen: Enter *WCBT* in the Fast path field at the top of any menu or select Work with Bill To Customers from a menu.

Field	Description
Acct #	A unique number assigned by the system to identify the bill-to customer. Numeric, 7 positions; optional.
Name (Last/Company)	**Last Name** The customer's last name. Enter a full or partial last name to list customers who match your entry alphanumerically. Alphanumeric, 25 positions; optional. **Company** The name of the company placing the order. Alphanumeric, 30 positions; optional.
First name	The customer’s first name. Enter a full or partial last name to list customers whose names follow your entry alphanumerically. Enter a full or partial last name and first name to list customers with last names and first names that follow your entry alphanumerically. Alphanumeric, 15 positions; optional.
St (State)	The state or province in which the customer lives or receives mail or shipments. See *Setting Up the Country Table (WCTY)* for more information on state codes. Alphanumeric, 2 positions; optional.
Postal code	The postal or zip code for this customer. Alphanumeric, 10 positions; optional.

Screen Option	Procedure
Create a bill-to customer	Select *Create* to advance to the *Create Bill-to Customer Screen*.
Change bill-to customer information	Select *Change* for a customer to advance to the *Change Bill-to Customer Screen*.

Screen Option	Procedure
Delete a bill-to customer	Select *Delete* for a customer to delete it. When you delete a bill-to customer, you lose the customer's billing account history. **Note:** You cannot delete a bill-to customer that is associated with any unpurged orders or assigned to any sold-to customers.
Display a bill-to customer	Select *Display* for a customer to advance to the First Display Customer Bill To screen. See *Create Bill-to Customer Screen* for descriptions of the fields on this screen.
Work with bill-to phone numbers	Select *Phone #'s* for a customer to advance to the *Work with Bill To Phone Numbers Screen*.
Review customer notes	Select *Notes* for a customer to advance to the *Work with Bill To Notes Screen*.
Work with ticklers associated with the bill-to customer	Select *Ticklers* for a customer to advance to the *Work with Ticklers Screen (bill-to customer view)*.
Review email correspondence history	Select *Email history* for a customer to advance to the *Work with Email by Customer Bill To Number Screen*.
Work with user defined fields	Select *User Field* for a customer to advance to the *Work with User Fields Screen*.

Create Bill-to Customer Screen

Purpose: At the *Work with Bill To Customers Screen*, select *Create* to advance to this screen.

Duplicate bill to customer: The *Display Duplicate Bill To Window* displays if you try to create a bill to customer whose name and address matches an existing bill to customer.

Field	Description
Account #	A unique number to identify a customer billing account. Numeric, 7 positions; display-only, assigned by the system.

Field	Description
Hold/bypass/fraud	Determines the type of credit checking to apply to this customer. Valid values are: • *Hold* = The system places all orders for this customer on hold automatically. You must review each order, then release good orders. • *Bypass* = The system does not credit check orders for this customer. • *Fraud* = This code identifies the customer as a “fraud.” The system adds a record to the Fraud table for the customer and places all orders for the customer on “fraud” hold automatically. You must review each order for this customer, then release good orders. Entering the customer's name in the Fraud table does not by itself add *Fraud* to this field, although the system still holds all of the customer's orders for fraud. See *Working with Customer Fraud Tables (WCFD)*. Optional.
Match code	A code used to identify duplicate customers based on a match on the customer's address. The system assembles a match code for each new customer, and updates the match code when you change any of the related components. Match codes are defined in the Match Code table, and may consist of components of the bill-to customer's name, company name, address and postal code. See *Setting Up Match Codes (MMCH)*. Alphanumeric, 15 positions; display-only.
Name	The following 5 fields are available for you to enter the Bill-To customer's full name: **Prefix** A title (such as "Mrs." or "Dr.") that belongs before the customer's name. The prefix prints on labels, reports, etc. Alphanumeric, 3 positions; optional. **First Name** The bill-to customer's first name. Alphanumeric, 15 positions; optional. **Initial** The customer's middle initial. Alphanumeric, 1 position; optional. **Last Name** The customer's last name. Alphanumeric, 25 positions; required if company name is not present. **Suffix** An addition to the customer's full name (such as "M.D.", "Fr.", or "III"). Alphanumeric, 3 positions, optional.
Company	The name of the customer's company. Alphanumeric, 30 positions; required if last name is not present.

Field	Description
Street	The customer's street address or the number of the customer's post office box (entered as *P.O. Box ###*). This is the primary delivery address. Alphanumeric, 32 positions; required.
Apt/suite (Apartment/ suite)	The apartment or suite number of the delivery address. To enter an apartment or suite address: Type *APT* to indicate an apartment or *STE* to indicate a suite. Insert a space and type the number of the apartment or suite, for example: *APT 4* or *STE 116*. Alphanumeric, 10 positions; optional.
Address	The customer's expanded address. Alphanumeric, three 30-position fields; optional.
Postal code	The postal or zip code for the customer. Required only if the Require postal code? flag is selected for the country. See Setting Up the Country Table (WCTY) for background. Validated against the Zip/City/State (Postal Code) table only if postal code is required. Alphanumeric, 10 positions; required or optional based on country.
City	The city where the customer lives or receives mail or shipments. Alphanumeric, 25 positions; required.
St (State)	The state or province where the customer lives or receives mail or shipments. Required only if the Require state? flag is selected for the country. If you enter a state, it is validated against the State table (accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY)) even if state is not required for the country. If state is required for the country, the system validates that the state you enter is assigned to the SCF for the postal code. Alphanumeric, 2 positions; required or optional based on country.
Country	The code for the customer's country. Country codes are defined in and validated against the Country table. Alphanumeric, 3 positions; required.
Delivery code	Identifies a business (commercial) or residential address and is used to calculate shipping charges by carriers who use different rate tables when shipping to homes and businesses, such as UPS. Valid values: • *Business* = Business rate table determines shipping charges. • *Residential* = Residential rate table determines shipping charges. • *No Distinction* = No distinction between business and residence. Only *Business* and *Residential* are valid values for U.P.S. The system defines the shipper on an order as U.P.S. if the Type field in the Ship Via table = *U*; see Working with Ship Via Codes (WVIA). Optional.

Field	Description
PO box	Identifies the address as a post office box. If the address is a post office box, you must use Parcel Post to ship the orders. Valid values are: • *selected* = this is a post office box address • *unselected* = this is not a post office box address
Language code	The language code, if any, specified for the bill-to customer. Defined in and validated against the Language table; see *Working with Language Codes (WLAN)*, Informational only.
Fax	Indicates whether you can fax this customer. Valid values are: • *unselected* = Do not fax this customer. • *selected* = Fax this customer. This field is not currently implemented.
EDI	This field is not currently implemented.
Currency code	The currency code, if any, specified for the bill-to customer. Defined in and validated against the Currency Code table; see *Working with Currency (WCUR)*. Informational only. Alphanumeric, 3 positions; optional.
Email address	The email address where the system sends purchase orders. See *Purchase Order Emails* for more information. See *Email Address Validation* for information on how the system verifies that your entry is formatted correctly. **Fraud checking:** An order associated with this bill-to customer (or whose sold-to customer is assigned to this bill-to customer) goes on *EB* hold if this email address matches an email address in the Miscellaneous Fraud table; see Working with Miscellaneous Frauds (WMFF). Alphanumeric, 50 positions; optional.

Field	Description
OptIn	Indicates the preferred method of correspondence for the bill-to email address. Not currently implemented for bill-to customers' email addresses. Valid values are: • *All Emails* = Email is the preferred method of correspondence. • *Order Emails Only* = Use email for order-related correspondence only; generate a document for other correspondence. • *No Emails* = Do not use email for any correspondence; generate a document instead. • *Do Not Ask* = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. Defaults from the *Default Opt In/Opt Out Flag (G97)* system control value, but you can override it. **Note:** The above value uses the letter O, not the number 0 (zero). Required.
Phone # (Day, Eve, Fax or Mobile)	The bill-to customer's day, evening and fax numbers. • You can also work with the bill-to customer's phone numbers at the *Work with Bill To Phone Numbers Screen*. • The *Third Phone Number Type (L53)* system control value determines whether the third phone number is labeled the Fax or Mobile number. • You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a phone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and displays as it was entered by the operator.

Field	Description
	Telephone Number Format Examples An operator enters a phone number containing 10 numbers: 5085550100 The telephone number format used in the United States to represent an area code, local exchange and local phone number is: (508) 555-0100 When an operator enters a phone number containing 10 numbers (as in the example), the phone number displays so that the first 3 positions are in parenthesis and a hyphen is between the sixth and seventh numbers, regardless of how the operator entered it into the system. If an operator enters a phone number containing 6 numbers, for example 5550100 and no format exists for 6 numbers, the phone number would display as it was entered (5550100). See *Work with Telephone Number Format Screen*. Alphanumeric, one 14-position field (phone number) and one 4-position field (phone extension); optional.

Display Duplicate Bill To Window

This window displays if you try to create a bill to customer whose name and address matches an existing bill to customer on the system. The system determines this by assembling a match code for each bill to customer address on the system. A match code is made up of parts of the customer's name, address, and postal code. The match is a user-defined code defined in the Match Code table.

This window displays the new bill to customer's name and address and the matching bill to customer(s) on the system. You can:

- Select *Display* for the matching bill to customer to review additional name and address information to determine whether you should use the exiting bill to customer or create a new bill to customer.
- Select an existing bill to customer and select *Select Exist* to select an existing bill to customer instead of creating a new bill to customer.
- Select *Accept Dup* to create the new bill to customer.

Change Bill-to Customer Screen

To change: At the Work with Bill To Customers Screen, select *Change* for a bill-to customer to advance to this screen. If you change any of the information that the system extracts for the match code, the system updates the match code also. See Create Bill-to Customer Screen for remaining field descriptions.

Customer Workflow Management window: The *Customer Workflow Management Window* automatically displays when you select *Change* for a customer if open or in use ticklers exist for the bill to customer. Select *Ticklers* at this window to advance to the *Work with Ticklers Screen (bill-to customer view)* where you can review and work with ticklers associated with the bill to customer.

Work with Bill To Phone Numbers Screen

Purpose: Use this screen to review or work with phone numbers for a bill-to account.

How to display this screen: Select *Phone #s* for a customer at the Work with Bill To Customers Screen.

For more information: See *Work with Ship To Phone Numbers Screen* and *Work with Bill To Customers Screen* for field descriptions.

Screen Option	Procedure
Create a new phone number	Select *Create* to advance to the *Create Bill To Phone Number Screen*.
Change a phone number	Select *Change* for a phone number to advance to the Change Bill To Phone Numbers screen. See *Work with Bill To Customers Screen* and *Work with Ship To Phone Numbers Screen* for field descriptions.
Delete a phone number	Select *Delete* for a phone number to delete it.

Create Bill To Phone Number Screen

Purpose: Use this screen to create a phone number for a bill-to account. **How to display this screen:** Select *Create* at the Work with Bill To Phone Numbers Screen.

About this screen: See *Work with Bill To Customers Screen* and *Work with Ship To Phone Numbers Screen* for field descriptions.

Work with Bill To Notes Screen

Purpose: Use this screen to enter or review notes about the customer's billing account.

How to display this screen:

- Select *Notes* for a customer billing account at the *Work with Bill To Customers Screen*.
- Select *Notes* at the *Change Bill-to Customer Screen* or *Work with Bill To Phone Numbers Screen*.

If you *Use Workflow Management (H96)*:

- select *Notes* for a tickler whose Note type is *B* (bill to notes) at the *Work with Tickler Screen (user/group view)* or *Workflow Management Screen*.
- select *OK* at the *Create Tickler Screen*.
- select *Notes* at the *Change Tickler Screen* or Display Tickler Screen.

Field	Description
Notes	Fields where you can view, enter, or delete customer messages. If you need more space, select *Next* to display additional entry fields. Alphanumeric, 60 positions per line.
Date	The date when the note was entered. Numeric, 6 positions (in user date format); display-only, updated by the system.

Screen Option	Procedure
Enter a new note	Enter your message in the first Note field and continue until you are done, pressing *Tab* to advance to the next line if necessary.
Change an existing note	Select *Add/Change* to switch to CHANGE mode. The previously entered note fields will be enterable; you can type over them as necessary.
Switch back to ADD mode	Select *Add/Change*.

Work with Ticklers Screen (bill-to customer view)

Purpose: Use this screen to review, work with, and resolve ticklers associated with the bill-to customer.

Secured feature: If you do not have authority to the *Update All Ticklers (B09)* secured feature, you cannot update a tickler that is not assigned to you or your tickler groups or an error message indicates: `Not authorized to change`.

This secured feature controls updating a tickler by:

- selecting *Change* for a tickler to change it.
- selecting *Delete* for a tickler to delete it.
- selecting *In process* for a tickler to assign the tickler to yourself.
- selecting *Resolve* for a tickler to resolve it.

If you do not have access to this feature, you can update only ticklers assigned to you or your tickler groups. However, you can still release an order associated with the tickler from hold.

See *Workflow Management Overview and Setup* for an overview and required setup for workflow management processing.

How to display this screen:

- select *Tickers* for a bill to customer at the *Work with Bill To Customers Screen*.
- select *Ticklers* at the *Customer Workflow Management Window* (which displays when you advance to the *Change Bill-to Customer Screen* screen).

Field	Description
Bill to	The number and description of the bill to customer associated with the ticklers on the screen. Bill to number: Numeric, 9 positions; display-only. Bill to description: Alphanumeric, 40 positions; display-only.
S (tickler status)	The status of the tickler. Valid values: • *Open* = Open; the tickler is open and is available to work on in the assigned tickler work queue. • *In Process* = In process; the tickler is currently being worked on by the assigned user. • *Resolved* = Resolved; the tickler has been resolved. Optional.

Field	Description
P (tickler priority)	The priority of the tickler, indicating how important the issue associated with the tickler is to resolve (1 is the lowest priority and 9 is the highest priority). Numeric, 1 position; optional.
Assigned (assign date)	The date the tickler was assigned to the user or tickler user group. Numeric, 7 positions (in user date format); optional.
Ev (tickler event code)	The code for the tickler event that created the tickler. Valid values: • *BO* = Backorders • *CO* = Cancelled orders • *HO* = Held orders • *MN* = Manually created • *NO* = New orders • *OO* = Aged open orders • *SO* = Sold out orders • *UP* = Unconfirmed pick tickets • *VP* = Voided pick tickets • *WF* = Remote workflow See *System Delivered Tickler Events*. Alphanumeric, 2 positions; optional.
Cat (tickler category)	The tickler category assigned to the tickler. Tickler categories are defined in and validated against the Tickler Category table; see *Working with Tickler Category (WTCT)*. Alphanumeric, 3 positions; optional.
Tickler#	The tickler number assigned to the tickler, from the *Tickler Number* number assignment record. Numeric, 9 positions; optional.
User group	The group ID code of the tickler user group assigned to the tickler. Tickler user groups are defined in and validated against the Tickler User Group table; see *Working with Tickler User Groups (WTUG)*. Tickler group ID: Alphanumeric, 10 positions; display-only.
User	The user ID of the user assigned to the tickler. Users are defined in and validated against the User table; see *Working with User Records (WUSR)*. Alphanumeric, 10 positions; display-only.

Field	Description
Sts (Status)	The status of the order associated with the tickler. Valid values: • blank = Open. • *A* = Archived to optical disk. This option is not currently implemented. • *C* = Cancelled. • *H* = Held. **Note:** The system highlights the held status in a different color (for example fuchsia) if the sold to customer is a new customer, based on purchase history. A new customer has placed an order, but no orders have shipped (# orders LTD is equal to or greater than 1 and # sales LTD is equal to 0 in the Customer Sold To Order History table). • *P* = Purged. • *S* = Suspended. • *X* = Closed. Alphanumeric, 1 position; display-only.
Order#	The order associated with the tickler. Numeric, 9 positions; display-only.
Sold to	The sold to customer associated with the tickler. Numeric, 9 positions; display-only.

Screen Option	Procedure
Change a tickler	Select *Change* for a tickler to advance to the *Change Tickler Screen*.
Delete a tickler	Select *Delete* for a tickler to delete it. You can only delete *MN* (manually created) ticklers.
Display a tickler	Select *Display* for a tickler to advance to the Display Tickler Screen. See the *Change Tickler Screen* for field descriptions.
Release the order associated with the tickler from hold	Select *Release* for a tickler to advance to the *Release Reason Prompt Pop-Up Window* (order header hold), *Release Recipient Hold Reason Pop-Up Window* (recipient hold), and/or *Release Order Payment Method Window* (pay type hold). If you release an order from hold for an *HO* (held order) tickler, the system automatically resolves the tickler. Also, the system evaluates any other ticklers associated with the order to determine if they can be resolved.

Screen Option	Procedure
	If you select *Release* for a tickler not associated with a held order, an error message indicates: `Order not on hold`. If you select *Release* for a tickler not associated with an order, an error message indicates: `Tickler not eligible for this option`. **Note:** You must have authority to the Release Held Orders (ERHO) menu option to release the order from hold.
Select a tickler to work on	Select *In process* for a tickler to change the status of the tickler from open to in process. You can only select to work with a tickler that is in an open status; if you select *In process* for a tickler that is in an in process or resolved status, an error message indicates: `Tickler status cannot be changed - resolved or already in process`. Selecting this option automatically assigns the tickler to the user and creates a tickler history record.
Enter or review tickler work notes	Select *Notes* for a tickler to advance to the work notes screen, based on the note type defined for the tickler. Note type *A* advances you to the *Edit Customer Actions Window*. Note type *B* advances you to the *Work with Bill To Notes Screen*. Note type *O* advances you to the *Work with Order Messages Screen*. Note type *S* advances you to the *Edit Customer Notes Screen*. Note type *T* advances you to the *Work with Tickler Notes Screen*.
Review the tickler source	Select *Detail* for a tickler to advance to the source screen, based on the tickler event associated with the tickler. *BO*, *CO*, *HO*, *NO*, *OO*, *SO*, *UP*, *VP*, and *WF* ticklers advance you to the *Order Inquiry Header Screen*. You cannot view the source for *MN* ticklers: `Requested tickler has no source reference`.
Review tickler history	Select *History* for a tickler to advance to the *Work with Tickler History Screen*.
Resolve a tickler	Select *Resolve* for a tickler to advance to the *Resolve Tickler Window*.

Screen Option	Procedure
Review procedures for a tickler	Select *Procedure* for a tickler to advance to the *Work with Tickler Event Rule Procedure Screen*. You cannot add or change tickler procedures when you advance from the Work with Tickler screen. You cannot review procedures for *MN* ticklers.
Create a tickler for the *MN* (manually created) tickler event	Select *Create* to advance to the *Create Tickler Screen*. **Note:** To create a *MN* tickler, you must have authority to the *Create Manual Tickler (B13)* secured feature.
Review the number of ticklers in the work queue, based on the selection criteria you have defined	Select *Count* to advance to the *Current Tickler Count Window* window.
Toggle between displaying open and in use ticklers or resolved ticklers	Select *Open/Resolved*. The system toggles between displaying: • ticklers in an open or in process status. • tickler in a resolved status.

Printing the Customer Exposure Report (PCER)

Purpose: The Customer Exposure Report tells you the numbers of customer action notes entered in your company within a given date range, sorted by the reason for the note or the person who entered it. The report includes totals for each reason code, including the quantity of notes entered, in process, resolved, and remaining.

A customer action note is a message about a customer issue or problem that you need to resolve. You can enter or resolve customer action notes in:

- order entry, standard order inquiry, or order maintenance by selecting *Options* to advance to the *Display More Options Screen* and selecting Customer Action Notes (you can also use this option in quote entry, inquiry, or maintenance)
- Work with Customers by selecting *Customer Actions* or selecting *Customer Actions* for a customer at a selection screen; see *Selecting Customers* or *Creating and Updating Sold-to Customers (WCST)*

Pop-up window: Until the note is resolved, a window will pop up in quote entry/maintenance or order entry/maintenance when you select a quote or order to remind you of the open issue. The window will also pop up in Work with Return Authorizations if the Display Customer Action Notes/Messages in RA (F64) system control value is *selected*.

You can assign customer action reason codes to action notes to help you track common issues your customers raise.

Menu option: You can also work with customer action issues through *Work with Email by Order Number Screen*.

In this topic:

- *Customer Exposure Report Selection Screen*
- *Customer Exposure Report by Reason Code*
- *Customer Exposure Report by User*

For more information: See *Working with Customer Action Reason Codes (WCAR)*.

Customer Exposure Report Selection Screen

How to display this screen: Enter *PCER* in the Fast path field at the top of any menu or select Customer Exposure Report from a menu.

Field	Description
Date from	The beginning date for including notes on the report. The current date defaults. Numeric, 6 positions (in user date format); required.
Date to	The ending date for including notes on the report. The current date defaults. Numeric, 6 positions (in user date format);required.
Sort by fields:	
Customer exposure by reason code	*Select* this field to print the *Customer Exposure Report by Reason Code*.
Customer exposure by user	*Select* this field to print the *Customer Exposure Report by User*.

Instructions:

1. Optionally, enter a different beginning or end date in the Date from or Date to fields.
2. *Select* the Customer exposure by reason code field to produce the *Customer Exposure Report by Reason Code*. *Select* the Customer exposure by user field to produce the *Customer Exposure Report by User*.
3. Select *OK*. The system validates your entries and highlights any fields you need to correct. Correct any fields and select *OK* again.
4. Select *Accept*. The system submits the job *CUSTEXRPT1* to print the *Customer Exposure Report by Reason Code* or the *CUSTEXRPT2* job to print the *Customer Exposure Report by User*.

Printing the Customer Detail Exposure Report (PCAR)

Purpose: The *Customer Detail Exposure Report by Reason Code* gives you a description of the customer for whom the action note was entered within a given date range, sorted by the reason code and status of the action note. The report includes information about the customer, including the customer's address and phone numbers.

A customer action note is a message about a customer issue or problem that you need to resolve. You can enter or resolve customer action notes in order entry, inquiry, or maintenance, quote entry, inquiry, or maintenance, or through Work with Customers. Until the note is resolved, a window will pop up in order entry and quote entry to remind you of the open issue.

You can assign customer action reason codes to action notes to help you track common issues your customers raise.

> **Note:**
>
> If there are multiple customer action notes for a customer, the report lists just the first note.

For more information: See *Working with Customer Action Reason Codes (WCAR)*, and *Work with Email by Order Number Screen*.

Print Customer Detail Exposure Report Screen

How to display this screen: Enter *PCAR* in the Fast path field at the top of any menu or select Customer Detail Exposure Report from a menu.

Field	Description
Date from	The beginning date for including notes on the *Customer Detail Exposure Report by Reason Code*. The current date defaults. Numeric, 6 positions (in user date format); required.
To (Date to)	The ending date for including notes on the report. The current date defaults. Numeric, 6 positions (in user date format); required.
Reason code	The reason behind the customer action note. You can type in a specific code for this report or leave the field blank in order to view all the reason codes that have been entered for notes with the date range you have selected. Alphanumeric, 2 positions; optional.
Status to include	The status of the customer action issue. Valid status codes are: • *Open* • *Resolved* • *Work in Process* • blank = select all issues regardless of status Required.

Instructions:

1. Optionally, enter a different beginning or end date in the Date from or Date to fields.
2. Enter a valid reason code in the Reason code field or leave this field blank to print all valid reason codes.
3. Enter a valid status code in the Status to include field or leave this field blank to include all action notes.
4. Select *OK*. The system validates your entries and highlights any fields you need to correct. Correct any fields and select *OK* again.
5. Select *Accept*. The submitted job generates the *Customer Detail Exposure Report by Reason Code*.

Working with Customer API (WCAI)

Purpose: Use this menu option to review, work with, delete, or resubmit customer API requests that are in error.

The *CWCustomer or CWMessageIn Web Service* receives and processes the *Inbound Customer Message (CWCustomerIn)* and creates or updates a customer, based on the information in the inbound message. If the request is in error for any reason, the system saves the information from the request in the Customer API Work table. If the request also includes email or user-defined field information, this additional information is stored in the Customer API E-mail Work table and the Customer API UDF Work table.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Error reasons: See *Error Checking for Add Requests*.

For more information: See *Generic Customer API*, including *Adding a Customer using the Customer API*, *Changing a Customer using the Customer API*, and the *Inbound Customer Message (CWCustomerIn)*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

- *Work with Customer API Email Screen*
- *Change Customer API Email Screen*

Work with Customer API Screen

How to display this screen: Enter *WCAI* in the Fast path field at the top of any menu, or select Work with Customer API from a menu.

Field	Description
Date	The date when the Customer API Work table record was created. Numeric, 6 positions (in user date format); optional.
Time	The time when the Customer API Work table record was created. Numeric, 6 positions (HHMMSS format); optional.
Act (Action)	The requested action from the *cst_action_type* in the *Inbound Customer Message (CWCustomerIn)*. If the cst_action_type is *D*, the system places the message in error with the error reason `Invalid Action Type`. The system ignores any other value; see *Determining Whether to Add or Change a Customer* for more information on the logic the system uses to determine whether to create a new customer or change an existing one. Display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
Status	The status of the request. *E* (error) = The Customer request is in error. blank = The Customer request is ready to reprocess. Alphanumeric, 1 position; display-only.
Customer#	The customer number affected by the request. • If an Add request is in error, the customer number displayed here does not yet exist in the Customer Sold To table. • If a Change request is in error because the customer could not be identified, the customer number displayed here is zero. Numeric, 9 positions; display-only.
Alternate#	The *cst_interface_cust_nbr*, if any, specified in the *Inbound Customer Message (CWCustomerIn)*. No alternate customer number is displayed if the *Assign Alternate Customer # (I88)* system control value is *selected*; in this situation, the system assigns the alternate customer number when it actually creates the customer. Alphanumeric, 15 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Rsn	Not currently implemented. Select *Change* for the customer API record to advance to the *Change Customer API Screen*; when you select *OK* on this screen, the system displays a message indicating the reason why the Customer API record is in error. Alphanumeric, 1 position; display-only.

Option	Procedure
Change a customer API request record	Select *Change* for a customer API request record to advance to the *Change Customer API Screen*.
Delete a customer API request record.	Select *Delete* for a customer API request record to delete it.
Work with user-defined fields for a customer API request record	Select *User defined fields* for a customer API request record to advance to the *Work with Customer API User Field Screen*.
Work with email information for a customer API request record	Select *Email* for a customer API request record to advance to the *Work with Customer API Email Screen*.
Reprocess a customer API request record	Select *Reprocess* for a customer API request record to submit it for processing. The system reprocesses the record only if it is error-free. See *Adding a Customer using the Customer API* for more information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Reprocess all customer API requests	Select *Reprocess* to submit all eligible request records for processing. See *Adding a Customer using the Customer API* for more information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Change Customer API Screen

Purpose: Use this screen to work with customer API requests that are in error based on the information passed in the *CustSoldTo* element of the *Inbound Customer Message (CWCustomerIn)*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

How to display this screen: Select *Change* for a customer API record in error.

Field	Description
Date	The date when the Customer API Work table record was created. Numeric, 6 positions (in user date format); display-only.
Action	The requested action from the *cst_action_type* in the *Inbound Customer Message (CWCustomerIn)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Possible actions are: • *Add* = Add a customer • *Change* = Change an existing customer • *Delete* = Delete an existing customer **Note:** You can only create or update a customer; the system does not allow you to delete a customer through the *Generic Customer API*. See *Determining Whether to Add or Change a Customer* or the logic the system uses to determine whether to create a new customer or change an existing one. Display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Entered on	The *cst_entry_date* from the *Inbound Customer Message (CWCustomerIn)*. Numeric, 6 positions (in user date format); optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Lng (Language)	The *cst_language* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 3 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
Class	The *cst_cust_class* from the *Inbound Customer Message (CWCustomerIn)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Alphanumeric, 2 positions; optional (required if the *Require Customer Class in OE, WCAT, and WCST (H85)* system control value is *selected*).
Time	The time when the Customer API Work table record was created. Numeric, 6 positions (HHMMSS format); display-only.
Status	The status of the customer API request. Possible statuses are: • *Error* = The Customer request is in error. • *No Error* = The Customer request is ready to reprocess. Display-only.
Created by	The *cst_create_user* from the *Inbound Customer Message (CWCustomerIn)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** Regardless of the user you select for this field, the system defaults the user ID of the user updating the Customer API record. Alphanumeric, 10 positions; optional.
Cur (Currency)	The *cst_currency* from the *Inbound Customer Message (CWCustomerIn)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Alphanumeric, 3 positions; optional.
Comp Cd (Company code)	The *cst_cust_company* from the *Inbound Customer Message (CWCustomerIn)*. Numeric, 3 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Customer#	The *cst_cust_nbr* from the *Inbound Customer Message (CWCustomerIn)*, or assigned by the system if this is an Add request. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). • If an Add request is in error, the customer number displayed here does not yet exist in the Customer Sold To table. • If a Change request is in error because the customer could not be identified, the customer number displayed here is zero. Numeric, 9 positions; display-only.

Field	Description
Changed by	The *cst_change_user* from the *Inbound Customer Message (CWCustomerIn)*. **Note:** Regardless of the user you select for this field, the system defaults the user ID of the user updating the Customer API record. Alphanumeric, 10 positions; required. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Typ (Type)	The *cst_cust_type* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 3 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Mail Cd (Mail code)	The *cst_mail_code* from the *Inbound Customer Message (CWCustomerIn)* Not to be confused with the Mail flag. Alphanumeric, 3 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Account#	The *cst_account_nbr* from the *Inbound Customer Message (CWCustomerIn)*. Numeric, 7 positions; optional.
Commer (Commercial)	The *Inbound Customer Message (CWCustomerIn)* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Alt# (Alternate customer #)	The *cst_interface_cust_nbr cst_interface_cust_nbr* from the *Inbound Customer Message (CWCustomerIn)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** No alternate customer number is displayed if the *Assign Alternate Customer # (I88)* system control value is *selected*; in this situation, the system assigns the alternate customer number when it actually creates the customer. Alphanumeric, 15 positions; optional.

Field	Description
Call Cd (Call code)	The *cst_call_code* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 3 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Name	The customer's name from the *Inbound Customer Message (CWCustomerIn)*, consisting of: • *cst_prefix* • *cst_fname* • *cst_minitial* • *cst_lname* • *cst_suffix* Alphanumeric, 47 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Inact (Inactive)	The *cst_inactive* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Company	The *cst_company_name* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 30 positions; required if no last name is specified. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Apt	The *cst_apt* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 7 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
PO Box	The *cust_po_box* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Suppr Sls Email (Suppress salesman email)	The *cst_suppress_sales_rep_email* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Street	The *cst_street_addr* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 32 positions; required. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
Delivery code	The *cst_delivery_type* from the *Inbound Customer Message (CWCustomerIn)*. Valid values: • *Business* • *Residential* • *No Distinction* Required. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Mail	The *cst_mail_name* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Address	The *cst_addr_line_2*, *cst_addr_line_3*, and *cst_addr_line_4* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 32 positions each; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Deliverable cde (Deliverable code)	The *cst_deliverable* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Rent	The *cst_rent_name* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Orig mail type (Original mail type)	The *cst_orig_mail_type* from the *Inbound Customer Message (CWCustomerIn)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Valid values: • *Buyer* • *Catalog Request* • *Recipient* • *Rental* • *Suspect/Prospect* Optional.
Seed	The *cst_seed_name* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional.

Field	Description
Curr mail type (Current mail type)	The *cst_curr_mail_type* from the *Inbound Customer Message (CWCustomerIn)*. Valid values: • *Buyer* • *Catalog Request* • *Recipient* • *Rental* • *Suspect/Prospect* Optional.
H/B/F	The *cst_hold_bypass_ fraud* flag from the *Inbound Customer Message (CWCustomerIn)*. Valid values: • *Hold* • *Bypass* • *Fraud* Optional.
Postal code	The *cst_orig_mail_type* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 10 positions; required. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
City	The *cst_city* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 25 positions; required. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
State	The *cst_state* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 10 positions; required if specified for country. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Country	The *cst_country* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 3 positions; required. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Job title	The *cst_job_title* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 10 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Exempt status	The *cst_tax_exempt* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 positions optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
Cert# (Certificate number)	The *cst_exempt_ certificate* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 30 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Day phone	The *cst_day_phone* and *cst_day_ext* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 14 positions (phone number) and 4 positions (extension); optional.
Expiry date	The *cst_exempt_expiry* from the *Inbound Customer Message (CWCustomerIn)*. Labeled the *Second Create Customer Sold To Screen*. Numeric, 8 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
VAT	The *cst_vat_nbr* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 20 positions; optional.
Eve phone (Evening phone)	The *cst_eve_phone* and *cst_eve_ext* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 14 positions (phone number) and 4 positions (extension); optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Orig source (Original source)	The *cst_original_source* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 9 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Email sts (Email status)	The *cst_email_status* from the *Inbound Customer Message (CWCustomerIn)*. The value specified in the *Default Opt In/Opt Out Flag (G97)* system control value defaults here if no status was specified in the inbound message. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** The system displays an error message at this screen if the email status is missing or invalid for the email address specified for the Add or Change request. See *Work with Customer API Email Screen*. Alphanumeric, 2 positions; optional.
Assoc (Associate)	The *cst_associate* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional.

Field	Description
Fax	The *cst_fax_phone* and *cst_fax_ext* from the *Inbound Customer Message (CWCustomerIn)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** The *Third Phone Number Type (L53)* system control value determines whether the third phone number is labeled the Fax or Mobile number here, and on reports and other screens. Alphanumeric, 14 positions (phone number) and 4 positions (extension); optional.
Curr source (Current source)	The *cst_current_source* from the *Inbound Customer Message (CWCustomerIn)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Alphanumeric, 9 positions; optional.
Rent email	The *cst_rent_email* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Can BO (Cancel backorder)	The *cst_cancel_bo* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Byp rsv (Bypass reservation)	The *cst_bypass_reservation* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Discount%	The *cst_discount_pct* from the *Inbound Customer Message (CWCustomerIn)*. Numeric, 5 positions with a 2-place decimal; optional.
Sls # (Salesrep #)	The *cst_salesman_nbr* from the *Inbound Customer Message (CWCustomerIn)*. Numeric, 7 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Do not fax	The *cst_do_not_fax* flag from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional.

Field	Description
Col (Column)	The *cst_price_column* from the *Inbound Customer Message (CWCustomerIn)*. Numeric, 2 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Item track	The *cst_item_hist_ tracking* flag from the *Inbound Customer Message (CWCustomerIn)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Valid values: • *No Item Tracking* • *Sold To Tracking Only* • *Sold To + Ship To Tracking* Optional.
User 1-4	The *cst_user_field_1*, *cst_user_field_2*, *cst_user_field_3*, and *cst_user_field_4* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 10 positions each; optional.
Relate Id	The *cst_relate_id* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 32 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Pop up 1-2	The *cst_pop_window_1* and *cst_pop_window_2* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 20 positions each; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Reserve Warehouse	The *cst_reserve_warehouse* from the *Inbound Customer Message (CWCustomerIn)*.The warehouse must be an allocatable warehouse (the Allocatable flag for the warehouse is *selected*). Warehouse codes are defined in and validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Pop up 3-4	The *cst_pop_window_3* and *cst_pop_window_4* from the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 20 positions each; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Completing this screen: Complete or correct each required field. See *Inbound Customer Message (CWCustomerIn)* for more information on how each field is derived and validated.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Note:

- The system displays an error message at this screen if there is an error with the Customer API UDF Work table or the Customer API E-mail Work table. See below for more information on how to advance to the correct screens to correct these errors.
- The system displays the Display Duplicate Sold To window if the customer information in an Add request matches an existing customer. See *Adding a Customer using the Customer API* for more information.
- For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Option	Procedure
Work with user-defined fields for the customer API request	Select *User fields* to advance to the *Work with Customer API User Field Screen*.
Work with email addresses for the customer API request	Select *Email* to advance to the *Work with Customer API Email Screen*.

Work with Customer API User Field Screen

Purpose: Use this screen to review or work with customer user-defined field information passed in the *CustUserDefinedField* element of the *Inbound Customer Message (CWCustomerIn)*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

How to display this screen: Select *User defined fields* for a record at the *Work with Customer API Screen*, or select *User fields* at the *Change Customer API Screen*.

Field	Description
Customer	The *cst_cust_nbr* from the *Inbound Customer Message (CWCustomerIn)*, or assigned by the system if this is an Add request. The name of the customer is displayed to the right. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Number: numeric, 9 positions; display-only. Name: alphanumeric, 41 positions; display-only.
Seq	The *cst_udf_seq* from the *CustUserDefinedField* element of the *Inbound Customer Message (CWCustomerIn)*. This sequence number identifies the type of user-defined field required. See *Work with User Fields Screen* for more information. Numeric, 9 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Text	The *cst_udf_text* from the *CustUserDefinedField* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 30 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
Number	The *cst_udf_nbr* from the *CustUserDefinedField* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 30 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Date	The *cst_udf_date* from the *CustUserDefinedField* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 30 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Option	Procedure
Change user-defined field information	Select *Change* for a user-defined field to advance to the *Change Customer API User Field Screen*.
Delete user-defined field information	Select *Delete* for a user-defined field to delete it.

Change Customer API User Field Screen

Purpose: Use this screen to review or change the user-defined field information in a customer API Add or Change request.

Correcting user-defined field information: The user-defined field information passed in the *Inbound Customer Message (CWCustomerIn)* must match the type (text, number, or date) based on the sequence number for the user-defined field detail, or the customer API Add or Change request will be in error. Each customer API user field record must include one of these types of data. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).*Work with User Fields Screen* for more information.

How to display this screen: Select *Change* for a record at the *Work with Customer API User Field Screen*.

Field	Description
Customer	The *cst_cust_nbr* from the *Inbound Customer Message (CWCustomerIn)*, or assigned by the system if this is an Add request. The name of the customer is displayed to the right. Number: numeric, 9 positions; display-only. Name: alphanumeric, 41 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
	Just one of the following fields must be completed. The type of field must match the sequence number for the user-defined field detail. See *Work with User Fields Screen* for more information.

Field	Description
Text	The *cst_udf_text* from the *CustUserDefinedField* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 30 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Number	The *cst_udf_nbr* from the *CustUserDefinedField* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 30 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Date	The *cst_udf_date* from the *CustUserDefinedField* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 30 positions; optional. v

Work with Customer API Email Screen

Purpose: Use this screen to review the email addresses included in the *CustEmail* element of the *Inbound Customer Message (CWCustomerIn)*, or to select an email address for review or update.

How to display this screen: Select *Email* for an Add or Change request at the *Work with Customer API Screen* or select *Email* at the *Change Customer API Screen*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
Customer	The *cst_cust_nbr* from the v, or assigned by the system if this is an Add request. The name of the customer is displayed to the right. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Number: numeric, 9 positions; display-only. Name: alphanumeric, 41 positions; display-only.
Email address	The *cst_email_address* from the *CustEmail* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 50 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Status	The *cst_email_status* from the *CustEmail* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 2 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Fmt (Format)	The *cst_email_format* from the *CustEmail* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
Prm (Primary)	The *cst_email_primary* flag from the *CustEmail* element of the *Inbound Customer Message (CWCustomerIn)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Alphanumeric, 1 position; display-only.

Option	Procedure
Change an email address in an Add or Change request	Select *Change* for an email address to advance to the *Change Customer API Email Screen*.
Delete an email address in an Add or Change request	Select *Delete* for an email address to delete the email address from the Add or Change request.

Change Customer API Email Screen

Purpose: Use this screen to review or change the email address information included in a customer API Add or Change request.

How to display this screen: Select *Change* for an email address at the *Work with Customer API Email Screen*.

Field	Description
Customer	The *cst_cust_nbr* from the *Inbound Customer Message (CWCustomerIn)*, or assigned by the system if this is an Add request. The name of the customer is displayed to the right. Number: numeric, 9 positions; display-only. Name: alphanumeric, 41 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Email address	The *cst_email_address* from the *CustEmail* element of the *Inbound Customer Message (CWCustomerIn)*. Subject to the email address format edits described under *Email Address Validation*. Alphanumeric, 50 positions; required. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Email status	The *cst_email_status* from the *CustEmail* element of the *Inbound Customer Message (CWCustomerIn)*. If no status is specified here, the *cst_email_status* from the *CustSoldTo* element defaults; and if no status is specified there, then the value from the *Default Opt In/Opt Out Flag (G97)* system control value defaults to both. Alphanumeric, 2 positions; required. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Email format	The *cst_email_format* from the *CustEmail* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
Display name	The *cst_display_name* from the *CustEmail* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 50 positions; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Primary	The *cst_email_primary* flag from the *CustEmail* element of the *Inbound Customer Message (CWCustomerIn)*. Alphanumeric, 1 position; optional. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Order Inquiry

In this part: Order inquiry spans the breadth of the system's functions, giving you access to customer, order, line, and item summary and detail information. This part presents the screens you use to review this information.

- *Using the Order Inquiry Scan Screens (OIOM)* shows you how to find an order based on the information available to you.
- *Reviewing the Order Inquiry Header Screen* presents the Order Inquiry screen, which contains information about the customer, such as name, address, phone number and source code.
- *Reviewing Order Inquiry Detail Information* presents the Order Inquiry screen containing information on the items the customer has ordered.
- *Reviewing Order Details* presents the screens you use to review detail related to a specific item on an order.
- *Options Available in Order Inquiry* presents a table of the functions available from the Order Inquiry Header or Detail screens, and refers you to topics containing more information on the use of these functions.
- *Reviewing Financial Information on an Order* presents screens that display information pertaining to charges and credits, such as invoices, refunds, and order totals. The topic also includes a discussion of order payment methods.
- *Reviewing Order-Level Properties* explains how to review order properties.
- *Display Order Line History Screen* explains how to review all activity performed on a particular item on an order.
- *Display Order History Screen* explains how to review all activity performed on an entire order.
- *Display Package Information Screen* describes the screen that lists all tracking numbers associated with shipments for the order and provides live links to shipment tracking pages when available.
- *Streamlined Order Inquiry (DORI)* describes a consolidated order inquiry option with simplified search options.
- *Customer Engagement Purchase History Integration* presents the Display Purchase History screen, which contains a customer’s completed sales and return transactions

across multiple channels, such as retail, call center, and e-commerce. This purchase history information is from Oracle Retail Customer Engagement.

Order Inquiry/Maintenance (OIOM)

> **Note:**
>
> You can also review and work with orders in Modern View.

Streamlined Order Inquiry (DORI)

Purpose: Streamlined order inquiry provides a one-screen snapshot of an order for efficient order inquiry. This option includes a subset of the information available through standard order inquiry, so that you can quickly answer the most frequently asked questions about an order.

When would you use standard order inquiry? You might use standard rather than streamlined order inquiry if you need:

- additional search options (for example, search by customer number, order type, or purchase order number)
- more extensive information related to the customer, order, invoices, payment methods, and items (for example, order detail pricing methods, additional charge codes applied, customer warranty information, pick slips, customer action notes, subscriptions, price override reasons, or deferred billing information)
- the ability to advance to order maintenance and maintain or cancel the order

Standard order inquiry is the default: When you select *Order Inquiry* within another menu option, you advance to standard order inquiry.

Modern View option: You can also review and work with orders through Modern View.

In this topic:

- *First Streamlined Order Inquiry Screen (Find Order or Customer)*
- *Second Streamlined Order Inquiry Screen (Search Results)*
  - *Customer Results Fields (Select Customer from List Below)*
  - *Order Results Fields*
  - *Sort and Expand Column Options*
- *Third Streamlined Order Inquiry Screen (Order Summary)*
  - *Screen Header*
  - *Products*
  - *Customers*
  - *Properties*
  - *Payment*
  - *Invoices*
  - *Carton Contents*
  - *Refunds*

- *Pop-Up Windows*
  - *History Window*
  - *Order Messages Window*
  - *Order Detail Window*
  - *Order Detail Messages Window*
  - *Invoice Detail Window*

First Streamlined Order Inquiry Screen (Find Order or Customer)

Purpose: Use this screen to select an order for inquiry, or to search for an order based on information you know about the customer or the order.

How to display this screen: Enter *DORI* in the Fast path field at the top of any menu, or select Streamlined Order Inquiry from a menu.

Field	Description
Enter Order	
Order #	Enter a valid order number (without including the ship-to number) to advance directly to the *Third Streamlined Order Inquiry Screen (Order Summary)*, displaying information on that order. **No ship-to number:** You cannot search on the ship-to number, just the order number. For example, enter 1234 rather than 1234-1. **Multiple ship-tos?** If the order number you enter has multiple recipients, you cannot advance directly to one of these ship-tos. For example, if order 1234 has three ship-tos (1234-1, 1234-2, and 1234-3), to review the third ship-to: • Enter 1234 in the Order # field and click *Search* • Click 1234-3 in the *Order Results Fields* to advance to the *Third Streamlined Order Inquiry Screen (Order Summary)* If the order number you enter is invalid, you need to enter other search criteria in order to review the order. **Cannot combine:** You cannot use the order number together with other criteria to search. Order number: numeric, 8 positions.

Field	Description
or Find Customer	Enter information about the sold-to customer to display the *Customer Results Fields (Select Customer from List Below)* so you can identify the customer who placed the order. After you use the *Customer Results Fields (Select Customer from List Below)* to select the customer, you can then use the *Order Results Fields* to select a particular order for inquiry. *More than 100 matches?* If there are more than 100 customers that match your search criteria, the *Customer Results Fields (Select Customer from List Below)* display just the first 100. In this situation, you need to further refine your search criteria to make sure that the correct customer is included in the search results. **Note:** Ghost customers are omitted from the search results.
Postal code	Enter a full or partial postal or zip code to display customers whose postal codes begin with your entry. **Can combine:** You can use the Postal code in combination with the Last name or Company name to search for customers. **Sort order for search results:** When you search based on Postal code, the *Customer Results Fields (Select Customer from List Below)* are initially sorted in ascending order by postal code (lowest postal code first). Within a postal code, results are sorted in ascending order by customer number. Alphanumeric, 10 positions.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Last name</td><td>Enter a full or partial last name to display customers whose last names begin with your entry.

Note:
If a customer record that matches your entry also has a company name specified, the company name is listed before the last name in the search results.

Can combine: You can use the Last name in combination with the Postal code or Company name to search for customers.
Sort order for search results: When you search based on Last name, the Customer Results Fields (Select Customer from List Below) lists customers as follows:
• alphanumerically by last name
• if more than one customer has the same last name, alphanumerically by first name
• if more than one customer has the same last and first name, numerically by customer number
The screen does not use any other fields, such as middle initial or company name, when sorting customers by name.
Alphanumeric, 25 positions.</td></tr>
<tr><td>Company name</td><td>Enter a full or partial company name to display customers whose company names begin with your entry.
Can combine: You can use the Company name in combination with the Last name or Postal code to search for customers.
Sort order for search results: When you search based on Company name, the Customer Results Fields (Select Customer from List Below) are initially sorted in ascending alphabetical order by company name. If more than one customer has the same company name, results are sorted in ascending order by customer number.
Alphanumeric, 30 positions.</td></tr>
<tr><td>Phone number</td><td>Enter a full phone number to display customers with that day, evening, or third (fax or mobile) phone number.
• It is not necessary to enter the number in the country’s telephone number format.
• Searching by partial phone number is not supported.
Cannot combine: You cannot use phone number together with other criteria to search.
Sort order for search results: If more than one customer has a matching phone number, the Customer Results Fields (Select Customer from List Below) are sorted in ascending order by customer number.
Alphanumeric, 14 positions.</td></tr>
</table>

Field	Description
Email address	Enter a full or partial email address to display customers with a matching record in the Customer Sold To Email table. • The email address does not need to be the customer's primary email address. • The email address can be upper and lower case; however, searching is case-insensitive (matches regardless of case). • If a customer has multiple email addresses that match your entry, the customer is displayed only once. The *Customer Results Fields (Select Customer from List Below)* list customers matching your entry in numeric order by customer number. **Cannot combine:** You cannot use the email address together with other criteria to search. **Sort order for search results:** If more than one customer has a matching email address, the *Customer Results Fields (Select Customer from List Below)* are initially sorted in numeric order by customer number. Alphanumeric, 50 positions.
or Find Order	**Cannot combine:** You cannot combine any of the following criteria to search. **More than 100 matches?** If there are more than 100 orders that match your search criteria, the *Order Results Fields* display just the first 100. In this situation, you need to further refine your search criteria to make sure that the correct order is included in the search results.
Customer #	Enter a valid sold-to customer number to display orders placed by that customer. **Sort order for search results:** The *Order Results Fields* list orders placed by the customer in ascending order by order number (most recent first). Numeric, 9 positions.

Field	Description
Web order #	Enter a valid web order number to display orders whose E-Commerce order number in the Order Header Extended table matches your entry. In the case of a retail pickup or delivery order assigned through the Order Orchestration Integration, the web order number is the order number in the system originating the order. If the originating system is Order Administration, the system prefaces this number with the text `ORIG#:`. For example: `ORIG#: 9999-001`, where `ORIG#:` indicates the order originated in Order Administration, `9999` is the original order number in Order Administration, and `001` is the ship to number. **Important:** Searching by a partial web order number is not supported. If you wish to review a retail pickup or delivery order whose originating system is Order Administration, you must enter `ORIG#: 9999-001`, where `9999` is the order number and `001` is the ship to number. **Sort order for search results:** If there is more than one order with the specified alternate order number, the *Order Results Fields*list matching orders in reverse chronological sequence (most recent orders first). Alphanumeric, 35 positions.
Order date	Enter or select an order date to display orders matching your entry. The order date might differ from the entered date for an order if, for example, you did not create the order on the system the same day it was received, and wanted to back-date the order so it would receive appropriate priority for reservation and backorder purposes. **Sort order for search results:** The *Order Results Fields*list orders for the specified date in reverse chronological sequence (most recent orders first). Numeric, 6 positions (in user date format).
User	Select the user ID of the person or process that entered or created the order. **Sort order for search results:** The *Order Results Fields* list matching orders in reverse chronological sequence (most recent orders first).

Option	Procedure
Search for customers or orders	Use the fields described above to search for a sold-to customer or for a particular order, and click *Search* to display the *Customer Results Fields (Select Customer from List Below)* or the *Order Results Fields*.

Option	Procedure
Clear data from the screen	Select *Clear* to clear your search criteria and previous search results from the screen. **Note:** If you have removed any columns from the results as described under *Sort and Expand Column Options*, the deleted columns remain hidden when you search based on new results.

Second Streamlined Order Inquiry Screen (Search Results)

Purpose: Use this screen to review the results of your search from the *First Streamlined Order Inquiry Screen (Find Order or Customer)*. From the:

- *Customer Results Fields (Select Customer from List Below)*: Select a customer to display the *Order Results Fields*.
- *Order Results Fields*: Select an order to advance to the *Third Streamlined Order Inquiry Screen (Order Summary)*.

Field and sort options are described below:

- *Customer Results Fields (Select Customer from List Below)*
- *Order Results Fields*
- *Sort and Expand Column Options*

Maximum 100 results: Search results are limited to the first 100 matching customers or orders, based on your search criteria. For example, if your search results display orders in descending sequence by order number, only the 100 most recent orders are displayed. To see additional customers or orders, you must use different search criteria.

How to display this screen: Complete any of the fields under *or Find Customer* or *or Find Order* and click *Search*.

Customer Results Fields (Select Customer from List Below)

Customer-related search results are described below. The screen displays these results when your search was based on the criteria available under *or Find Customer*.

Select a customer: You can click a customer number to display the *Order Results Fields* for that customer, and then select an order.

Field	Description
Customer #	The number identifying a sold-to customer who matches the search criteria you entered under *or Find Customer*. Click the customer number to display the *Order Results Fields* for that customer. Numeric, 9 positions.
Name	The customer's: • company name, if any • last name • first name • middle initial, if any Company name: alphanumeric, 30 positions. Last name: alphanumeric, 25 positions. First name: alphanumeric, 15 positions. Middle initial: alphanumeric, 1 position.
Address	The first line of the customer's street address. Alphanumeric, 32 positions.
City	The customer's city. Alphanumeric, 25 positions.
State	The customer's state. Alphanumeric, 2 positions.
Postal code	The customer's postal or zip code. Alphanumeric, 10 positions.

Order Results Fields

Order-related search results are described below. The screen displays these results when your search was based on the criteria available under *or Find Order*, or when you select a customer from the *Customer Results Fields (Select Customer from List Below)*.

> **Note:**
>
> The order results fields do not display orders if the selected customer was the order recipient.

Select order: You can click an order number to advance to the *Third Streamlined Order Inquiry Screen (Order Summary)*.

If no orders displayed: You can click *Search* again without clearing your search criteria in order to re-display the same list of customers from your previous search and select a different customer.

Group option: The group option is available for the following fields. See *Sort and Expand Column Options* for more information.

Field	Description
Order #	The number identifying an order that matches the search criteria you entered under *or Find Order*. Click the order number to display the *Third Streamlined Order Inquiry Screen (Order Summary)* for that order. Numeric, 8 positions.
Status	The order status. Possible statuses are: • *Billing* = The order is currently being processed by the BILL_ASYNC job. If an order remains in this status, it could indicate an error in billing processing. See *Working with the BILL_ASYNC Job* for background. • *Canceled* = You have canceled all items on the order, either individually or collectively, using a cancel reason code that is not flagged to reduce demand. See *Establishing Cancel Reason Codes (WCNR)* for background on cancel reason codes. • *Error* = The order is currently flagged with an error and suspended in an order batch. See *Order Creation Errors* for background. • *Held* = The order is currently held. See *Introducing Order Hold Reason Codes* for background. • *Open* = There is at least one open, unshipped item on the order. • *Quote* = This is a pre-order quote. See *Entering Pre-Order Quotes* for background. • *Suspended* = The order is currently suspended in an order batch. See *Introducing Order Batches* for background. • *Closed* = The order is shipped, canceled with a cancel reason flagged to reduce demand, or partially shipped and the remainder of the lines canceled. This is also the status displayed if the Order Header status is *Purged*. **Header and Ship To status different?** If the status for the Order Header is different from the status for the Order Ship To, the Order Ship To status is displayed, unless: • If the Order Ship To is open and the Order Header is held, the held status is displayed. • If the Order Ship To is suspended and the Order Header is in error, the error status is displayed.
Date	The order date. This date might differ from the entered date if, for example, you did not create the order on the system the same day it was received, and wanted to back-date the order so it would receive appropriate priority for reservation and backorder purposes. Numeric, 6 positions; in user date format.
Customer	The sold to customer's: • company name, if any • last name • first name • middle initial Company name: alphanumeric, 30 positions. Last name: alphanumeric, 25 positions. First name: alphanumeric, 15 positions. Middle initial: alphanumeric, 1 position.

Field	Description
Recipient	The order recipient's: • company name, if any • last name • first name • middle initial The recipient can be a one-time shipping address; a permanent shipping address; a different sold-to customer; or the sold-to customer's own address. Company name: alphanumeric, 30 positions. Last name: alphanumeric, 25 positions. First name: alphanumeric, 15 positions. Middle initial: alphanumeric, 1 position.

Sort and Expand Column Options

Default sort: The initial sort of the search results is based on the search criteria you entered at the *First Streamlined Order Inquiry Screen (Find Order or Customer)*. See the field descriptions (under *or Find Customer* and *or Find Order*) for more information.

Displaying more than the first 100 results: Regardless of how you sort or group the information in the search results, the screen does not display any records that are not among the first 100 results based on your search criteria. For example, if your search criteria display orders in descending sequence by order number, only the 100 most recent orders are displayed. To see additional customers or orders, you must use different search criteria.

Options:

- *Sorting by a Column*
- *Expanding a Column*

Sorting by a Column

Click the column name to sort the displayed search results by the information in that column in either ascending or descending order.

For example, click the Order # column to sort the search results by order number.

If the search results are currently sorted in ascending order (for example, by date), the arrow points up:

If the search results are currently sorted in descending order (for example, by date), the arrow points down:

Expanding a Column

To expand a column so that you can see more information, position your cursor on the border between the column you want to expand and the column to its right until you see a double-pointed arrow; then drag the arrow to the right.

Third Streamlined Order Inquiry Screen (Order Summary)

Purpose:

- *Screen Header*
- *Products*
- *Customers*
- *Properties*
- *Payment*
- *Invoices*
- *Carton Contents*
- *Refunds*

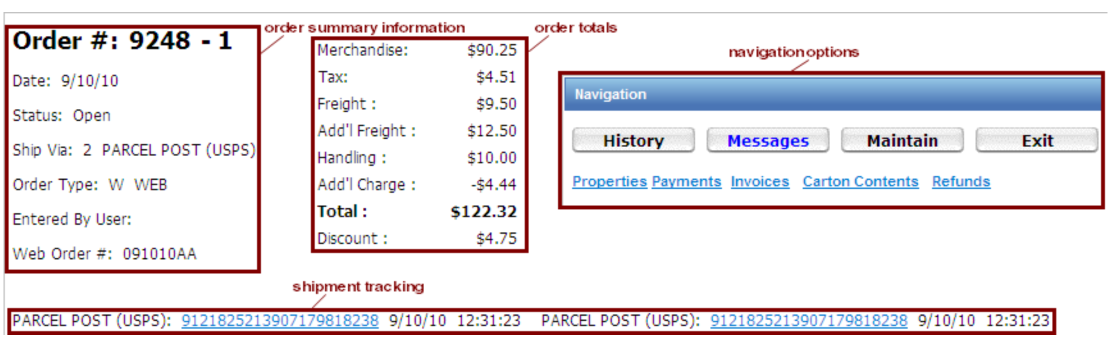
> **Note:**
>
> Depending on the user's authority to credit card information, the system may write a record to the Credit Card Audit table when this screen is displayed. See Logging Credit Card Data Access in the *Data Security Guide* on My Oracle Support (2953017.1) for more information.

How to display this screen: Select an order from the *Order Results Fields*.

Screen Header

This area of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen includes:

- *Order summary information*
- *Order totals*
- *Navigation options*
- *Shipment tracking*



Field	Description
Order summary information	Key information to briefly identify the order is in the upper left corner of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen.

Field	Description
Order #	A unique number the system assigns to identify a quote or order. The ship-to number follows the order number, separated by a hyphen; this number identifies each separate shipping address for the order. Order: numeric, 8 positions. Ship-to: numeric, 3 positions.
Date	The order date. This date might differ from the entered date if, for example, you did not create the order on the system the same day it was received, and wanted to back-date the order so it would receive appropriate priority for reservation and backorder purposes. Numeric, 6 positions; in user date format.
Status	The order ship-to status. Possible statuses are: • *Billing* = The order is currently being processed by the BILL_ASYNC job. If an order remains in this status, it could indicate an error in billing processing. See *Working with the BILL_ASYNC Job* for background. • *Canceled* = You have canceled all items on the order, either individually or collectively, using a cancel reason code that is not flagged to reduce demand. See *Establishing Cancel Reason Codes (WCNR)* for background on cancel reason codes. • *Error* = The order is currently flagged with an error and suspended in an order batch. See *Order Creation Errors* for background. • *Held* = The order is currently held. See *Introducing Order Hold Reason Codes* for background. • *Open* = There is at least one open, unshipped item on the order. • *Quote* = This is a pre-order quote. See *Entering Pre-Order Quotes* for background. • *Suspended* = The order is currently suspended in an order batch. See *Introducing Order Batches* for background. • *Closed* = The order is shipped, canceled with a cancel reason flagged to reduce demand, or partially shipped and the remainder of the lines canceled. This is also the status displayed if the Order Header status is *Purged*. **Header and Ship To status different?** If the status for the Order Header is different from the status for the Order Ship To, the Order Ship To status is displayed, unless: • If the Order Ship To is open and the Order Header is held, the held status is displayed. • If the Order Ship To is suspended and the Order Header is in error, the error status is displayed.
Ship via	The code for the shipper who delivers the merchandise to your customer. The description of the ship via is to the right. Ship via codes are defined in and validated against the Ship Via table. See *Working with Ship Via Codes (WVIA)*. Ship via: numeric, 2 positions. Description: alphanumeric, 30 positions.
Order type	A code that identifies how the quote or order was received, such as by phone or through the order API. You can also use the order type to identify special kinds of orders, such as those you generate as part of a membership program. Order types are defined in and validated against the Order Type table. See *Establishing Order Types (WOTY)*. Alphanumeric, 1 position.

Field	Description
Entered by user	The user ID of the person or process who entered the order. Alphanumeric, 10 positions; display-only.
Web order #	The order number, if any, defined in the E-Commerce order number field in the Order Header Extended table. This is the web order that was passed through the *Generic Order Interface (Order API)* and used to identify the order in an external system. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). In the case of a retail pickup or delivery order assigned through the *Order Orchestration Integration*, this is the order number in the system originating the order. • If the originating system is Order Administration, the system prefaces the originating order number with the text `ORIG#:`. For example: `ORIG#:9999-001`, where `ORIG#:` indicates the order originated in Order Administration, `9999` is the original order number in Order Administration, and `001` is the ship to number. • In addition, if the originating order number begins with `ORIG#:`, the system also displays the following message below the web order number: `This order is fulfilling the originating order shown above`. See *Retail Pickup (including Ship-for-Pickup) or Delivery Orders* for more information. Alphanumeric, 30 positions.
Order totals	The totals for the Order Ship To are in the center top of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen, to the left of the *Navigation options* and to the right of the *Order summary information*.
Merchandise	The total value of the items on the quote or order, excluding freight, additional charges, service charges, tax (but including hidden tax if the order is subject to VAT), handling, and duty. The merchandise total does not include items that are canceled, sold out, or returned. **Note:** If you create a return by entering an order for a negative quantity, the merchandise total and the other totals are negative amounts. Numeric, 20 positions with a 2-place decimal.
Tax	The total sales tax for the quote or order, based on the value of the merchandise and, optionally, freight and special handling charges. If the order is subject to VAT, tax is generally included in the item price rather than in the Tax field. Use standard order inquiry to review the hidden tax for order lines. Numeric, 20 positions with a 2-place decimal.

Field	Description
Freight	The total charge for shipping the quote or order, not including additional freight charges. You can define additional freight charges for a carrier to include standard freight; in this case, the freight charges are 0.00. This field also includes service charges by ship via, if any, or order weight charges based on the ship via defined for each ship to customer on the order. See *Working with Ship Via Codes (WVIA)*. The system calculates freight charges based on the freight method defined for the source code. If the system calculates freight as a percentage of the merchandise charges, there might be a penny variation in total freight amount due to rounding differences. Numeric, 20 positions with a 2-place decimal.
Add’l freight	The total dollar amount for freight charges, in addition to the base freight charge for the quote or order. Additional freight charges are defined in the Ship Via table. Examples of additional freight charges are overnight shipping or second day delivery. The Add'l freight field here corresponds to the Frt+ field in Order Entry. Numeric, 20 positions with a 2-place decimal.
Handling	The cost of any special handling on the quote or order, such as personalizing, monogramming, or engraving, and any gift wrapping charges. If there are any duty charges on the order, they are included in the Handling total. See *Work with Duty Rates Screen*. You can review the special handling instructions and charges for items at the *Order Detail Window*. Numeric, 20 positions with a 2-place decimal.
Add’l charge	This field can include charges or credits. Additional charges might include: **Additional source code charge** An additional charge for services that apply to the source code or offer. The system applies the additional charge to the quote or order based on the total dollar value of the merchandise. **Credits** A credit you apply to the customer's order, such as reimbursement for long distance telephone charges or a promotion discount that is not applied to the merchandise, freight charges, or additional freight charges. **Additional shipper/item charge** An additional charge that applies to the item based on the shipper. Such charges might apply when the item exceeds established shipping rates, such as for oversized items. **Dollar discounts** A credit applied based on the total dollar value of the merchandise. You can define dollar discounts by source code or offer. If the *Prorate Dollar Discounts and Coupons (D90)* system control value is selected, the dollar discounts are applied to the detail lines on the quote or order rather than appearing as a negative additional charge. The Add'l charges field displayed here corresponds to the Chg field in Order Entry. Numeric, 13 positions with a 2-place decimal.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Total</td><td>The total amount the customer owes for the quote or order, including:
• Merchandise
• Freight
• Additional freight charges
• Taxes (excluding any hidden tax (VAT))
• Handling
• Duty
• Additional charges
The total does not include charges for canceled, returned or sold out items.
Numeric, 20 positions with a 2-place decimal.</td></tr>
</table>

Field	Description
Discount	The total discount applied to the order shipping address. The total discount is calculated by comparing the selling price of merchandise with the item/SKU offer price. If you use a price override on any of the detail lines: • If the price override reason code's *Override item offer price* field is selected, the Ord discount includes any discounts that reduce the selling price from the price override amount you entered for the detail line. • If the price override reason code's *Override item offer price* field is unselected, and: • you override an existing item/SKU offer price for the item: the Ord discount includes the difference between the original item/SKU offer price and the final selling price, including the price override and any other discounts. When the system adds an item to the order at no charge (for example, an accompanying item) and the price override reason code defaults from the *Default Price Override Reason (B35)* system control value, then the regular offer price of the item is not included in the discount amount. • there is no item/SKU offer price for the item: the detail line does not affect the Ord discount total. **Note:** The setting of the *Override item offer price* field has no effect on orders you receive through the e-commerce interface. If there is a price override reason code in the new order message, the system always processes these orders as if the field is unselected. See *Overriding the Item/SKU Offer Price* for an overview of the *Override item offer price* field. **Note:** This field is not included if the *Display Discount on Order Recap Screen (D38)* system control value is unselected or if no discount applies to the order. Any dollar discounts by source code or offer appear as a negative additional charge if the *Prorate Dollar Discounts and Coupons (D90)* system control value is selected. Numeric, 20 positions with a 2-place decimal.
Shipment tracking	Information on each order shipment is below the *Order summary information*. This information is from the Manifest Upload Audit table, and is not available if the order was shipped as a brokered backorder through integration with Order Orchestration. The screen displays a maximum of 20 shipments.
Ship via	The description of the ship via used for the shipment. Ship via: numeric, 2 positions. Description: alphanumeric, 30 positions.

Field	Description
Tracking number	The shipping tracking number, as reported through the *Generic Pick In API (Shipments, Voids, and Backorders)*, or through *Manually Confirming Shipments (MCON)*. For more information see the Web Services Guide on My Oracle Support (ID 2953017.1). **Live link?** The tracking number is a live link: • If not using the *Narvar Integration*: The ship via type is UPS, Federal Express, or Parcel Post (*not* Parcel Post Class 1, 2, 3, or 4). If the link is live, you can click it to advance to the shipper's web site and review shipment history. • If using the *Narvar Integration*: This is a live link enabling you to track the shipment, provided: • You have completed setup of the related system control values, including the *Narvar Track URL Prefix (M60)*. • You have specified the *Narvar Carrier Name* and *Narvar Carrier Service Code* for the ship via. • You specified a tracking number when confirming the shipment. • All other configuration was completed for Narvar, as described under *Narvar Integration Setup*. • After you enable Narvar, tracking number links that were created previously do not work automatically when you click on them at this screen. • The tracking number link can still be available if all the above requirements are met, even if the customer did not receive a shipment confirmation when, for example, the customer has opted out of email communication. • The tracking link is not supported for drop ship purchase orders or shipments made through the Order Orchestration integration. The tracking link is supported for drop ship picks. • The *Narvar Track URL Prefix (M60)* is required for a valid tracking number link to be enabled in emails or on screens. If you are using the Narvar integration and submit an order request to Narvar while the tracking URL prefix is not defined, the Narvar.log file contains errors such as: `Shipment tracking is disable for company 123` `Unable to construct shipment tracking URL for order 456` Where `123` is the company number and `456` is the order number. **Error displayed:** Also, if the tracking URL is not defined, when you click on the tracking number link at the screens mentioned above, an error window indicates: `Tracking information not available. Check Narvar Order Error Export screen for failures.` However, a Narvar Order Error Export record is not created because the tracking number link could not be created correctly if there are no other issues with the order request to Narvar. Alphanumeric, 30 positions.
Date and time shipped	The date and time when the package was scanned for shipment, as reported through the *Generic Pick In API (Shipments, Voids, and Backorders)*, or through *Manually Confirming Shipments (MCON)*. For more information see the Web Services Guide on My Oracle Support (ID 2953017.1). Date: numeric, 6 positions; in user date format. Time: numeric, 6 positions (HH:MM:SS format).

Navigation options

Option	Procedure
Review order history	Select *History* to open the History Window. **Note:** This option is available only if there is at least one Order Transaction History message on the order.
Review or enter order messages	Select *Messages* to open the Order Messages Window. The word *Messages* is blue if there are already any messages on the order.

Option	Procedure
Advance to order maintenance	Select *Maintain* to advance to the Work with Order Screen in Order Maintenance. **Authority:** • This option displays only if you have authority to the Order Maintenance Access (A22) secured feature and the order is not in an error or suspended status. Also, if the order includes one or more printed order lines, this option displays only if you have authority to the Maintain Order with Printed Quantity (J05) secured feature. • You cannot advance to order maintenance if the order is locked by a user. • You must have authority to the Maintain Brokered Fulfillment Orders (B20) secured feature to maintain an order whose Broker delivery type is *Retail pickup* or *Delivery*. **Note:** When you return to *Streamlined Order Inquiry (DORI)* from Order Maintenance, the system displays the First Streamlined Order Inquiry Screen (Find Order or Customer) before displaying the information for the order you just maintained. Do not select any options until the system displays the order you maintained; any updates you made in Order Maintenance will be reflected on the Third Streamlined Order Inquiry Screen (Order Summary).

Option	Procedure
Review loyalty account information for a customer that is registered in the Oracle Retail Customer Engagement Loyalty program	Select *Loyalty*. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement. • If Oracle Retail Customer Engagement finds a loyalty card assigned to the customer, the system advances you to the *Display Loyalty Account Screen*. If more than one loyalty card is assigned to the customer in Oracle Retail Customer Engagement, the system displays loyalty account information for the first card assigned to the customer. • If Oracle Retail Customer Engagement does not find a loyalty card for the customer, the system advances you to the *Customer Loyalty Registration Window*, where you can select to enroll the customer in the Oracle Retail Customer Engagement Loyalty program. • If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: `Unable to connect to ORCE`. **Note:** This option displays only if the Use ORCE Loyalty (M06) system control value is selected and a Relate ID is defined for the sold to customer in the Customer Sold To table; see *Customer Engagement Loyalty Integration*.

Option	Procedure
Review the customer's purchase history from Oracle Retail Customer Engagement	Select *Purch Hist*. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement and advances you to the *Display Purchase History Screen* where you can review the completed sales and returns transactions from Oracle Retail Customer Engagement. If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: `Unable to connect to ORCE`. **Note:** This option displays only if the *ORCE Customer Integration (L37)* system control value is set to *INTERACT*; see *Customer Engagement Purchase History Integration*.
Return to your search results	Select *Exit* to return to the *Second Streamlined Order Inquiry Screen (Search Results)*.
Review order properties	Select *Properties* or scroll down to display the *Properties* area.
Review payment information	Select *Payment* or scroll down to display the *Payment* area. **Note:** This option is displayed even if there are no payment methods on the order.
Review invoices	Select *Invoices* or scroll down to display the *Invoices* area. **Note:** This option is available only if there is at least one Invoice for the order.

Option	Procedure
Review carton contents	Select *Carton Contents* or scroll down to display the *Carton Contents* area. **Note:** This option is available only if there is at least one Carton Contents record for the order.
Review refunds	Select *Refunds* or scroll down to display the *Refunds* area. **Note:** This option is available only if there is at least one refund record for the order.

Products

Purpose: This area of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen provides information on each item on the order.

Field	Description
Line #	A number the system assigns to each item as it is added to the order. A quote or order can have up to 999 lines. Numeric, 3 positions.
Item	A code that identifies a unit of inventory. Item codes are defined in and validated against the Item table. **Note:** The code displayed is the item alias if the customer ordered using an alias and the *Display Item Alias (D56)* system control value is selected. Alphanumeric, 12 positions.

Field	Description
SKU	An item's unique characteristics, such as its size and color. **Note:** The first 14 positions of the SKU description is displayed instead of the SKU elements if the *Display SKU Description in place of SKU Element (F25)* system control value is selected. Alphanumeric, three 4-position fields or one 14-position field.
Name	The first 30 positions of the description of the item. This is the base item description if the item has SKU's. Alphanumeric, 30 positions.
S (Status)	A one-position code indicating the current status of the item on the order. Possible statuses are: • blank = The order line is currently open. • *Express Bill* = You have entered the order using an express-bill ship via, but the BILL_ASYNC process has not yet processed the invoice. See *Working with the BILL_ASYNC Job* for background. • *Cancelled* = You have canceled the item using a cancel reason code that is not flagged to reduce demand. See *Establishing Cancel Reason Codes (WCNR)* for background on cancel reason codes. • *Error* = The order line is currently flagged with an error, and the order is suspended in an order batch. See *Order Creation Errors* for background. • *Held* = The order line is currently held. You can hold a line on an open order to prevent it from printing on a pick slip, even if it is available. • *Soldout* = The item has been sold out. An order line can be sold out: • manually in order entry or maintenance through the *Sell Out* option • automatically in order entry or maintenance, based on the soldout control code assigned to the item • through the Process Auto Soldouts option See *Managing Soldouts and Backorders* for background. • *Closed* = The item has been shipped, canceled with a cancel reason flagged to reduce demand, or partially shipped and the remainder of the ordered quantity canceled.
B (Order Orchestration)	This field is set to *B* if the order is fulfilled through integration with Order Orchestration, regardless of whether this is a ship-for-pickup, store pickup, delivery, or retail pickup order, if the order line is a brokered backorder, or the order status. See the *Order Orchestration Integration* for more information.

Field	Description
Price	The actual unit price of the item after applying any discounts, breaks, or overrides. Discounted or overridden item prices are highlighted if the *Display Order Line Discount Messages (F01)* system control value is selected. Numeric, 13 positions with a 2-place decimal.
Qty ordered	The number of units of the item that the customer ordered. Numeric, 5 positions.
Qty reserved	The number of units of the item that are currently reserved from stock. The system does not reserve stock on quotes until they are converted to standard orders; see *Converting Quotes to Orders*. The reserved quantity is reduced when an item is canceled, confirmed for shipment, or unreserved using Interactive Reservation. The system updates this quantity at billing. Numeric, 5 positions.
Qty printed	The number of units included on a printed pick slip. *Pre-generated picks:* The system does not update this field when you create a pre-generated pick for the order line during pick slip preparation; the system updates this quantity when you generate a pick slip . See *Applying Pick Slip Preparation to an Order* and *Performing Pick Slip Generation*. *Voiding a pick slip:* The system reduces the printed quantity if you void the pick slip and don't reprint, or when shipment of the item is confirmed. *Order Orchestration?* If the order line has been assigned to Order Orchestration for fulfillment (brokered backorder) or if the customer is picking up the order at a store (store pickup), the print quantity here is equal to the ordered quantity. In the case, the Drop ship flag at the *Order Detail Window* is set to *D*, although for a brokered backorder, the BO warehouse indicates your distribution center. See *Brokered Backorders* or *Store Pickup Orders* for background. Numeric, 5 positions.
Qty shipped	The number of units that have shipped. The system updates this quantity at billing. This quantity is negative for a return processed by entering a negative quantity in order entry. Place your cursor over the shipped quantity to display the most recent shipment date for the item on the order. The text `No Ship Date Found` displays if the system could not find a shipment date for the item on the order. Numeric, 5 positions.
Qty returned	The number of units that the customer has returned. This quantity is zero for a return processed by entering a negative quantity in order entry. Numeric, 5 positions.

Field	Description
Expected date	*Backordered item:* The date a purchase order for this backordered item is expected. **Note:** This field is not displayed for a reserved item, a brokered backorder item, or if there are no open purchase orders for the item. *Drop ship item:* This date is displayed for drop ship items if the *Assign Drop Ship Expected Ship Date (I59)* system control value is selected. See that system control value for more information. Numeric, 6 positions; in user date format.
Total	The extended price of the line, calculated as: `Unit price * Order quantity = Extended price` Numeric, 20 positions with a 2-place decimal.

Option	Procedure
Review more information about the order detail line	Click the icon ( ) in the *Detail* column to open the *Order Detail Window*.
Review or enter order detail messages	Click the icon ( ) in the *Msg* column to open the *Order Detail Messages Window*. The icon is blue ( ) if any messages already exist for the order line.

Customers

This area of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen provides the name, address, phone number(s), and email address of:

- the sold-to customer who placed the order
- the shipping address for the order
- the bill-to customer, if any, associated with the order

Note:

If the name and address for the bill-to customer and sold-to customer are identical, the bill-to customer is not displayed.

Field	Description
Sold To Information	The sold-to information identifies the customer who placed the order.

Field	Description
Name	Last name, first name, and middle initial of the customer placing the order. Last name: alphanumeric, 25 positions. First name: alphanumeric, 15 positions. Middle initial: alphanumeric, 1 position.
Company	The name of the company associated with the customer placing the order. Alphanumeric, 30 positions.
Address	Up to four lines indicating the street address and apartment or suite number. First address line: alphanumeric, 32 positions. Apartment or suite: alphanumeric, 10 positions (to the right of the first address line). Address lines 2-4: alphanumeric, 30 positions each.
City	The city where the customer lives or receives mail and shipments. Alphanumeric, 25 positions.
State	The state where the customer lives or receives mail and shipments. State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). Alphanumeric, 2 positions.
Postal code	The postal or zip code for the customer's address. Alphanumeric, 10 positions.
Country	The three-position code identifying the customer's country. Included only if the country does not match the *Default Country for Customer Address (B17)*. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY). Alphanumeric, 3 positions.
Phone numbers	The customer's daytime and evening phone numbers, including any formatting set up through the *Work with Telephone Number Format Screen*. The mobile phone number is also displayed if the *Phone Numbers (D15)* system control value is set to *MOBILE*; however, if this system control value is set to *FAX*, the fax number is not displayed. Also, any extensions are not displayed. Alphanumeric, 14 positions each.
Email address	The order-level email address, if any. See *Working with an Order-Level Email Address* for information on how the system determines the email address to assign to an order. Alphanumeric, 50 positions.

Field	Description
OptIn	The opt-in/opt-out setting for the email address. Possible settings are: • *All* = Email is the preferred method of correspondence. • *Order* = Use email for order-related correspondence only; generate a document for other correspondence. • *None* = Do not use email for any correspondence; generate a document instead. • *Don't Ask* = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified.
Ship to information	The ship-to information identifies the shipping address of the order, which can be an order ship-to, a permanent ship-to address for the sold-to customer, or a recipient who is another sold-to customer.
Name	The last name, first name, and middle initial of the ship-to. Last name: alphanumeric, 25 positions. First name: alphanumeric, 15 positions. Middle initial: alphanumeric, 1 position.
Company	The name of the company associated with the ship-to. Alphanumeric, 30 positions.
Address	Up to four lines indicating the street address and apartment or suite number. First address line: alphanumeric, 32 positions. Apartment or suite: alphanumeric, 10 positions (to the right of the first address line). Address lines 2-4: alphanumeric, 30 positions each.
City	The city where you ship the order. Alphanumeric, 25 positions.
State	The state where you ship the order. State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). Alphanumeric, 2 positions.
Postal code	The postal or zip code for the shipping address. Alphanumeric, 10 positions.
Country	The three-position code identifying the country for the shipping address. Included only if the country does not match the *Default Country for Customer Address (B17)*. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY). Alphanumeric, 3 positions.

Field	Description
Phone numbers	The customer's daytime and evening phone numbers, including any formatting set up through the *Work with Telephone Number Format Screen*. The mobile phone number is also displayed if the *Phone Numbers (D15)* system control value is set to *MOBILE*; however, if this system control value is set to *FAX*, the fax number is not displayed. Also, any extensions are not displayed. **Note:** The system stores a single phone number for an order ship-to. Alphanumeric, 14 positions each.
Email address	The email address associated with the shipping address. If there is not a separate shipping address, this is the sold-to customer's primary email address. Alphanumeric, 50 positions.
Bill to information	Bill-to information is included if the sold-to customer is associated with a bill-to account and the names and addresses for the two records are not identical.
Name	The last name, first name, and middle initial of the bill-to account. Last name: alphanumeric, 25 positions. First name: alphanumeric, 15 positions. Middle initial: alphanumeric, 1 position.
Company	The company name for the bill-to. Alphanumeric, 30 positions.
Address	Up to four lines indicating the street address and apartment or suite number. First address line: alphanumeric, 32 positions. Apartment or suite: alphanumeric, 10 positions (to the right of the first address line). Address lines 2-4: alphanumeric, 30 positions each.
City	The city where the bill-to is located. Alphanumeric, 25 positions.
State	The state where the bill-to is located. State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). Alphanumeric, 2 positions.
Postal code	The postal or zip code for the bill-to address. Alphanumeric, 10 positions.
Country	The three-position code identifying the country for the bill-to address. Included only if the country does not match the *Default Country for Customer Address (B17)*. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY). Alphanumeric, 3 positions.

Field	Description
Phone numbers	The bill-to customer's daytime and evening phone numbers, including any formatting set up through the *Work with Telephone Number Format Screen*. The mobile phone number is also displayed if the *Phone Numbers (D15)* system control value is set to *MOBILE*; however, if this system control value is set to *FAX*, the fax number is not displayed. Also, any extensions are not displayed. Alphanumeric, 14 positions each.
Email address	The bill-to customer's email address. Alphanumeric, 50 positions.

Properties

This area of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen provides additional information about the order as a whole.

Field	Description
Source	The source code from the order header. Source codes are unique codes used to identify segments of your customer base or a rented list. Each source code is assigned to one offer and one division. Source codes control the freight and pricing method used on an order. Alphanumeric, 7 positions.
Entered date	The date when the order was created. Numeric, 6 positions; in user date format.
Entered time	The time of day the order was originally created. Numeric, 6 positions (HH:MM:SS format).
Ship complete	Determines whether all the items on an order must ship together. Valid values are: • *Selected* = Ship all items on the order in one shipment; delay printing pick slips until all items are available in the requested quantities. • *Unselected* = (default): Ship the items on the order as soon as they are reserved.
Arrival date	The date the customer requests to receive the order. The arrival date defaults to the order date, but you can override this default. Numeric, 6 positions; in user date format.
Purchase order #	The purchase order number under which the order was placed. From the `ref_transaction_no` if the order is a retail pickup or delivery order received from Order Orchestration. See *Building the Retail Pickup (including Ship-for-Pickup) or Delivery Order* for more information. Alphanumeric, 15 positions.

Field	Description
Cancel BO	Identifies whether to automatically cancel items that are unavailable (backordered) with the first shipment on the order. Valid values are: • *Selected* = Cancel backordered items with first shipment. • *Unselected* = (default): Do not cancel backordered items. If this field is selected, any unshipped line on an order is canceled during billing using the *Auto Soldout Cancel Reason (C20)*, provided this system control value specifies a valid cancel reason code.
Cancel date	The date, if any, the customer wants the order canceled if it has not been shipped. The order is not canceled automatically, but is listed on the *Order Cancellation List*. You can cancel the order manually or contact the customer to extend the deadline. Numeric, 6 positions; in user date format.
BO priority	A code that determines the priority for order fulfillment on a backordered item. Defaults from the *B/O priority (Backorder priority)*, if any, specified for the source code; in this case, the header-level value defaults to the *Priority* field on the order detail line. Priority codes range from 0-9, where: *0* = Low priority. *9* = High priority.
Calculate freight	Determines whether the system calculates and adds freight charges and any service charges by ship via to the order: • selected (default) = the system calculates freight based on the freight method defined for the source code on the order header • unselected = the system does not calculate freight
Weight	The total shipping weight of the items on the order. Numeric, 20 positions with a 3-place decimal.
Freight override	Indicates the freight charges for the Order Ship To if they were applied as an override. Numeric, 13 positions with a 2-place decimal.
Gift	If this field is selected, this is a gift order, which means: • item prices do not print on the pick slip • the system generates a gift acknowledgment to notify the sold-to customer who placed the order that the order has shipped

Field	Description
Tax code	The code and description of the tax status on the order. Valid values are: • *T* = *Standard tax*. The customer is subject to all applicable state sales tax on merchandise. • *N* = *Non taxable*. The customer is not taxed on purchases. • *R* = *Resale*: The customer purchases goods for resale, so is exempt from tax. A valid tax identification number must be specified for the customer or entered during Order Entry. • *E* = *Exempt*. The customer is a school or charity, so is exempt from tax. A valid tax identification number must be specified for the customer or entered during Order Entry. • *G* = *GST only*. The customer is subject to the Canadian Goods and Services Tax (GST) because the order is shipping to a Canadian province. • *P* = *PST only*. The customer is subject to the Canadian Provincial Services Tax (PST), but exempt from the GST. See *Working with Customer Tax Status* for more information.
Tax identification	The customer’s tax identification number, typically the certificate that identifies the customer as a reseller or tax exempt; otherwise, the tax identification number does not control taxability. This number is required when the customer's tax code is *R* (Reseller) or *E* (Exempt). Alphanumeric, 30 positions.
Warehouse	A code that identifies the warehouse from which merchandise on the order ships. A value appears in this field only if it was entered during order entry or order maintenance or was passed through the *Order Orchestration Integration* for a retail pickup or delivery order. The warehouse description is to the right. Warehouse code: numeric, 3 positions; display-only. Warehouse description: alphanumeric, 30 positions; display-only.
Quote origin	If this field is selected, the order originated from a pre-order quote. See *Entering Pre-Order Quotes* for an overview and the required setup.
Broker delivery type	Indicates whether the order is being fulfilled through the *Order Orchestration Integration*. Possible settings are: • *Retail pickup* = The order originated in an external system and Order Administration ships the order to the originating retail store location, where the customer picks it up • *Delivery* = The order originated in an external system, and Order Administration ships the order directly to the customer • *Ship for Pickup* = The order originated in Order Administration, and Order Administration ships the order to a designated retail store location, where the customer picks it up • *Store Pickup* = The order originated in Order Administration, and the customer is picking the order up in a designated retail store location, where the inventory is already available • blank = This is not an order being fulfilled through Order Orchestration, or it is a brokered backorder (in which Order Administration assigns backordered items to Order Orchestration for fulfillment).

Field	Description
Batch #	The system-assigned number for a group of orders. Orders you receive through the order API are assigned to the *Default Batch for E-Commerce Orders in Error (G41)* if they are in error; similarly, retail pickup or delivery orders that are in error are assigned to the *Order Broker Error Batch Number (K90)*. The system removes the batch number when you accept the batch if the order is error-free. Numeric, 5 positions; display-only.

Payment

This area of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen provides summary information about the payment methods used on the order.

> **Note:**
>
> This screen does not include complete payment method details, such as information on deferred or installment billing.

Additional options for credit card payment methods: A plus sign next to a credit card payment method indicates that there is additional information available.

Click the plus sign to display any authorization and deposit history. See *Credit Card Authorization and Deposit History* for field descriptions.

> **Note:**
>
> If you move your cursor over a payment method, it changes color; however, this color change does not indicate that the payment method is an active link.

Field	Description
Payment category	Indicates the category that defines the basic rules for processing a payment. Each payment type is assigned to a payment category. Possible categories are: • Cash/Check • Credit Card (including stored value cards and debit card) See *Working with Pay Types (WPAY)* for background.
Pay type description	The description of the pay type is to the right of the description of the payment category. Alphanumeric, 30 positions.
Credit card number	**Credit card pay types only:** The credit card number the customer used on the order. Alphanumeric, 20 positions; display-only.

Field	Description
Expiration	**Credit card pay types only:** The date the credit card is no longer active. The expiration date might be zero if the *Require expiration date* flag for the pay type is not selected. For example, a stored value card credit card type typically does not require an expiration date. Numeric, 4 positions (MMYY format); display-only.
CC last 4	The last four positions of the credit card number. From the CC Last 4 field in the Order Payment Method table. Alphanumeric, 4 positions; display-only.
Amount to charge	The amount to charge this payment method. Always 0.00 for the “catch-all” payment method on an order, meaning any dollar amount not assigned to another payment method applies to this one. **Note:** If this is a prepay amount, and part of the prepayment total was applied to a membership program, only the remaining amount appears as the amount to charge or amount billed. For example, if the customer sent a check for 100.00 and 80.00 was applied to the membership program, 20.00 appears here. See *Membership Overview*. Numeric, 20 positions with a 2-place decimal.

Credit Card Authorization and Deposit History

The information described below is available in the *Payment* area of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen by clicking the arrow next to a credit card payment method.

Field	Description
Authorization history	The authorization history is flagged with a letter *H*. See *Display Authorization History Screen* for background.
Auth history status	A description of the status of the authorization as updated by the system. Possible statuses are: • *Sent for authorization* • *Authorized* • *Not yet sent* • *Declined* • *Authorized but not used* • *Mismatch Auth/Deposit* (created for authorizations during deposits) • *Voided*

Field	Description
Amount authorized	The amount submitted for authorization and approved by the credit card authorization service. Numeric, 20 positions with a 2-place decimal.
Auth number	A number assigned by the authorization service for the authorization transaction. Alphanumeric, 16 positions.
Auth date	The date the authorization service approved the amount to be charged. Numeric, 6 positions; in user date format.
Sent date	The date you transmitted the authorization to the authorization service. Numeric, 6 positions; in user date format.
Amount deposited	The amount deposited to the bank for the charge. Numeric, 20 positions with a 2-place decimal.
Vendor response 1	A code indicating the response, if any, from the authorization service. Although the response can be up to 10 positions, only the first four positions are displayed. Alphanumeric, 4 positions.
Vendor response 2	A code indicating the credit card security response, if any, from the authorization service. Although the response can be up to 10 positions, only the first four positions are displayed. Alphanumeric, 4 positions.
AVS response	A code indicating the address verification response, if any, from the authorization service. Although the response can be up to 10 positions, only the first four positions are displayed. Alphanumeric, 4 positions.
Deposit history	See *Display Deposit History Screen* for background.
Deposit history status	The status of this deposit: • *Confirmed* = The service bureau confirmed the deposit. • *Deleted* = The user deleted a rejected deposit. • *Forced* = The deposit was rejected, but was forced through deposit (the Forced deposit field for the authorization service is selected). • *Manual confirmation* = The user manually confirmed the deposit through Submit Rejected Deposits. • *Prepaid* = The user entered a prepaid adjustment amount. • *Resubmitted* = The deposit was resubmitted for deposit. • *Sent* = The deposit is in the process of being sent to the service bureau. • *Unconfirmed* = The deposit is unconfirmed by the service bureau. • *Written off* = The user wrote off a rejected deposit. • *Not yet sent* = The deposit has not yet been sent to the service bureau.
Invoice #	The number the system assigns to a customer's bill or credit. The system generates an invoice during billing. Numeric, 7 positions.

Field	Description
Type	Indicates the type of deposit: • **PURCH* = Purchase (debit) • **RETURN* = Return deposit (credit) Alphanumeric, 10 positions.
Deposit date	The date when this deposit history record was created. This is the date when the invoice pay method was deposited. Numeric, 6 positions; in user date format.
Deposit amount	The amount deposited. The amount is negative for a return. For a flexible payment option, calculated as follows: • For deferred payment plans: `prepaid amount - adjustment amount - total amount deposited to date = deposit amount` • For installment payment plans: `prepaid amount - adjustment amount - total amount deposited to date / intervals remaining = deposit amount` Numeric, 20 positions with a 2-place decimal.
Response	The response code from the Credit Card Deposit History table. Alphanumeric, 10 positions.

Invoices

This area of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen provides summary information about the shipment or credit invoices billed against the order.

Field	Description
Invoice #	The number the system assigns to a customer's bill. *Assigned when?* If the *Generate Invoice Number at Pick Gen (H80)* or *Generate Invoice # at Pick Gen without Address Match (K81)* system control value is selected, the system assigns the invoice number at pick slip generation if the order is eligible; otherwise, it assigns the invoice number at billing. Numeric, 7 positions.
Date	The date the invoice record was created by billing. Numeric, 6 positions; in user date format.
Type	Indicates the type of invoice: • *C* = Credit memo. Typically generated when you process a return or apply a negative additional charge after billing the order. Credit and return amounts appear as negative numbers when you review invoice information. • *I* = Invoice. Generated when you bill a shipment. The system does not consolidate credit invoices with other credits or with debit invoices. Alphanumeric, 1 position.
Merch	The total dollar value of the merchandise. Merchandise amount does not include tax (with the exception of hidden tax, or VAT), handling, additional charges, or freight. Numeric, 20 positions with a 2-place decimal.

Field	Description
Freight	The freight charges for the invoice. This amount may not be equal to the total of all the line-level freight charges. Numeric, 20 positions with a 2-place decimal.
Tax	The sales tax for the invoice. This field includes GST and PST, if any. This field does not include hidden tax. Numeric, 20 positions with a 2-place decimal.
Handling	The cost of any special handling billed or credited on the invoice. Examples include personalizing, monogramming, or engraving, and any gift wrapping charges. Any duty charges on the invoice are also included in this total. Numeric, 20 positions with a 2-place decimal.
Add’l charge	The total additional charges billed or credited on the current invoice. See *Add’l charge* for examples. Numeric, 20 positions with a 2-place decimal.
Add’l freight	The total dollar amount for freight charges exceeding the order's base freight charge. This is a shipper-level charge directly associated with the order, as opposed to the line item. Additional freight is defined for the shipper in the Ship Via table. Examples of additional freight charges that might apply include charges for overnight shipping, second day delivery, or padded van. Additional freight charges may include the standard freight charges, depending on how you have set up the ship via. If you set up a ship via this way, the Freight field is blank. Numeric, 20 positions with a 2-place decimal.
Total	The total amount billed or credited, including all related merchandise charges, freight, tax, handling, additional charges, and additional freight. Numeric, 20 positions with a 2-place decimal.

Option	Procedure
Print order receipts for each ship-to on the order	Click the order receipt icon to generate the order receipt:  • This icon is available only if the *Order Receipt Print Program (L46)* system control value specifies a program and if there are any invoices on the order ship-to that you are currently reviewing. • If this is a multi-recipient order, the system generates an order receipt for all ship-tos. • The screen displays an error message when you click this icon if the only invoices on the order are credits: `No eligible invoices found to print on Order Receipt`.

Option	Procedure
Review the invoice detail records related to the items shipped or returned on the order.	Click the icon ( ) in the *Detail* column to open the *Invoice Detail Window*. This icon is not included for a credit invoice created by applying a negative additional charge to the order, since in this case there are no invoice details.

Carton Contents

This information can come from*Generic Pick In API (Shipments, Voids, and Backorders)* .

For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
Pick #	A unique number assigned by the system to identify the pick slip. Numeric, 7 positions.
Carton #	Identifies the carton number containing the items shipped on the pick slip. Set to *1* unless you used multiple cartons to ship the pick slip. Numeric, 3 positions.
Item	The code identifying the item shipped. Alphanumeric, 12 positions.
SKU	The item's unique characteristics, such as its color or size. Included only if the item has SKUs. Alphanumeric, three 4-positions fields.
Qty	The quantity of the item shipped in this carton. Numeric, 3 positions.
Pack date	The date when the carton was packed or shipped. From the shipment date passed through the pick in API. Numeric, 6 positions; in user date format.
Pack time	The time when the carton was packed or shipped. From the shipment time passed through the pick in API. Numeric, 6 positions (HH:MM:SS format).
Packer	The packer passed through the pick in API. Alphanumeric, 10 positions.

Refunds

This area of the screen provides information on any refunds that have been generated for the order. See *Issuing Refunds* for background.

Field	Description
Pay type	The code identifying the pay type to be refunded. This pay type might be different from the payment method used to pay for the order if the pay type has an alternate refund type or alternate refund category; see *Working with Pay Types (WPAY)* for background. Numeric, 2 positions.

Field	Description
Pay type desc	The description of the pay type to be refunded. Alphanumeric, 30 positions.
Status	The status of the refund. Possible statuses are: • Cancel Pending (the refund will be canceled the next time you process refunds) • Cancelled • Held • Open • Processed • Write-off pending (the refund will be written off the next time you process refunds) • Written off
Deposit	Indicates whether the refund has been deposited. A deferred or installment payment plan can prevent the system from depositing a refund in order to offset the deferred or installment amount. For example, if the order payment amount of 60.00 is deferred for 30 days and the customer receives a refund for 20.00, instead of refunding the customer 20.00, the system subtracts the refund amount from the order payment amount. The customer will then pay 40.00 at the end of the 30 days. Valid values are: • *Y* = The refund has been deposited (there is a Deposit created date for the Invoice Payment Method). • *N* = The refund has not been deposited.
Current category	The description of the payment category for the pay type to be refunded. Possible categories are: • Cash/Check • Credit Card (including stored value cards and debit card)
Original category	The payment category of the original payment method used on the order. Possible categories are: • Cash/Check • Credit Card (including stored value cards and debit card)
Amt collected	The amount that you are refunding to the customer. Numeric, 20 positions with a 2-place decimal.
Date created	The date the refund was generated through order activity such as a return. Numeric, 6 positions; in user date format.
Date processed	The date, if any, when the refund was processed, written off, or canceled. Numeric, 6 positions; in user date format.
Manual hold	Indicates whether you applied a manual hold against the refund through *Working with Refunds, Writeoffs and Balances Due (WREF)*: *Y* = Manual hold applies *N* = No manual hold applies
Hold until	The date when the refund is eligible for processing. Numeric, 6 positions; in user date format.

Pop-Up Windows

Purpose: The pop-up windows available at the *Third Streamlined Order Inquiry Screen (Order Summary)* are:

- *History Window*
- *Order Messages Window*
- *Order Detail Window*
- *Order Detail Messages Window*
- *Invoice Detail Window*

History Window

Purpose: Use this window to review the activity that has taken place related to the order since it was created. This is the same information available at the *Display Order History Screen*.

How to display this window: Click *History* in the Navigation area at the top of the *Third Streamlined Order Inquiry Screen (Order Summary)*.

Field	Description
Date	The date when the order activity occurred. Numeric, 6 positions; in user date format; display-only, updated by the system.
Time	The time when the order activity occurred. Numeric, 6 positions (HH:MM:SS format); display-only, updated by the system.
Type	A code for a type of update against the order. Valid values are: • *Auth* = Authorization received for credit card order • *Subscription* = Issue sent for subscription item • *Cancel* = Cancel through Order Maintenance • *D/S PO* = Drop ship purchase order • *Upsell Promo* = Promotion discount applied • *Refund* = Refund processed • *Hold* = Hold through Order Maintenance or as a result of credit checking • *Retail Order* = Retail transaction. Used only if you use the *Retail Integration (External System to Order Administration)*. • *BO Cards* = Backorder card evaluation and update to the Order Detail record. See *Purchase Order Layering and Backorder Notifications* for an overview. The actual generation of the backorder notice is listed under *Letter*.

Field	Description
	• *Letter* (L) = Notification (card, email, *Narvar Integration*, or *Outbound Email XML Message (CWEmailOut)*) generated for the customer or vendor related to the order. The Transaction Note provides information on the notification type and customer address, for example: Ord Conf to first.last@example.com. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Narvar notices:** When you use the *Narvar Integration*, the *Letter* notification type for a shipment email can be: • Order sent to Narvar: The *Narvar Order Request Message* was generated, even if the email address specified was the *Narvar Non-Deliverable Email Address for Shipment Confirmations (M59)*. See that system control value for more information. • Failure sending order to Narvar: The *Narvar Order Request Message* could not be generated. For example, this message could mean that the *Narvar Integration Setup* was not correct. • Order not eligible to be sent to Narvar: This message can indicate: – This is a store pickup order. – This is a fulfilling order for an order assigned back from Order Orchestration if the *Use OROB for Fulfillment Assignment (M31)* system control value is selected. – This is a retail pickup order that is a fulfilling order for a ship-for-pickup order, and the merchandise was shipped to the store location for customer pickup. – The user ID and password specified for Narvar Service are not valid. See *Work with Outbound Web Service Authentication Screen* for more information. **For more information:** See *Narvar Troubleshooting*. • *Maint* = Maintenance through Order Maintenance. The system also uses this code when it applies a prorated discount or when activity takes place related to the *Order Orchestration Integration*. • *Rtn Auth* = Return authorization processed • *Sold Out* = Order sold out automatically during Billing, based on the value in the S/O field for the Item, and a soldout notification generated. • *Pick Gen* = Pick slip generated. The system also uses this code when an item stock allocation error occurs, or when the ship via on the order is overridden through the best way shipping option at pick slip generation.

Field	Description
	• *Release* = Release through Order Maintenance, Release Held Orders program or by the system (from time hold for prepaid orders). • *Shipment* = Shipment logged when pick slips generated for all order lines. • *Sale* = Shipment billed. • *System Update* = – CSV removed for security, or – a promotion was not applied to the order because the Allow Manual Entry of Promotion Code (I63) system control value was selected • *Call Tag* = Call tag printed. This option is not currently implemented. • *Unreserved* = Interactive reservation. Indicates that an item was reserved or unreserved manually, such as through Working with Interactive Reservation (MIRV) or Reprinting and Voiding Pick Slips (WVRP or WSVP). • *Void/Reprint* = Pick ticket voided through Reprinting and Voiding Pick Slips (WVRP or WSVP) or Void Pick Batch (WSVP). • *Price Override* = Price override. Indicates that the user entered a price override. • *User Defined* = Reserved for user-defined order transaction history entries. • *ROL Error* = The system did not print a pick slip for the specified order line because the Qty remaining or Qty printed in the Reserved Order Line table does not match the Qty reserved or Qty printed in the Order Detail table. The system also prints the order line on the Unmatched Reserved/Remaining Qty Report.
Transaction note	The description of the activity related to the transaction, such as: • Authorization • Flag for cancellation due to declined authorization • Backorder notification evaluation and Order Detail update • Backorder notice generated (for example. BO 1st Ntf for a first backorder notification) • Cancel • Cancel request for a drop ship item • Cancel confirm or reject for a drop ship item • CSV removed for security • Drop ship • Hold • Ln#: 2 Submitted To Broker (or other activity related to Order Orchestration; see Order Orchestration Integration for more information) • Ord Conf to ssmith@example.com (Order confirmation email or *Outbound Email XML Message (CWEmailOut)*) For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). • Pk 1236612 Whs 1 Ct/Bn 1234734/411/1 if the Use Cart/Bin Picking? (B38) system control value is selected and: – you use standard pick slip generation, or, – you use streamlined pick slip generation and the *Bypass Creation of Pick Forms during WSPS Pick Generation (K55)* system control value is unselected • Pk 1236609 Whs 1 Batch # 1234731 if: – the *Use Cart/Bin Picking? (B38)* system control value is unselected, or – you use streamlined pick slip generation and the *Bypass Creation of Pick Forms during WSPS Pick Generation (K55)* system control value is selected • Promotion (PROMO1) not applied • Maintenance

Field	Description
	• Release • Retrn conf (Return confirmation email or *Outbound Email XML Message (CWEmailOut)*) For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). • Sale • Ship conf (Shipment confirmation email or *Outbound Email XML Message (CWEmailOut)*) For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). • , • Shipment Confirmed for drop ship PO # XXXX. For confirmed shipment of a drop ship item, the transaction notes also include item code, meter charge, weight, ship via and description, and tracking number. • Sold out • Subscription generation • Pick not printed Ln # 001 qty mismatch *Special character?* If there are any special characters in an Order Transaction History message, the system replaces the special character, excluding any underscores, with a space when you display the message at the *Display Order History Screen*; however, the *History Window* might display the special character as a series of alphanumeric characters, such as `\u000F`. Alphanumeric, 40 positions; display-only.
Amount	The total order amount following the order activity, including merchandise, freight, tax, handling, etc. No amount is associated with issuing a subscription, as the system bills the customer for the entire amount of the subscription when billing the order. Numeric, 20 positions with a 2-place decimal; display-only.
User	The user ID of the person who performed this activity against the order. If the system performs the activity automatically, such as releasing prepaid orders on time hold, the user ID is the name of the person who started the ASYNC processing program (background jobs). If the activity took place through a system process or an API, the user ID indicates the process or API; otherwise, the system uses your default user. Alphanumeric, 10 positions; display-only.

Order Messages Window

Purpose: Use this window to review or work with free-formatted order-level messages. These are the same messages you can work with at the *Work with Order Messages Screen*.

See *Adding Order Messages* for background on working with order messages, including the print requirements and limitations of including messages on different forms; however, important differences between the Work with Order Messages screen and the Order Messages window are:

- *Default messages:* At the *Work with Order Messages Screen*, you can apply a message set up through *Working with Default Messages (WMSG)*; however, this option is not available through *Streamlined Order Inquiry (DORI)*.

- *Message sequence:* At the Work with Order Messages Screen, you can select whether to display the messages in LIFO or FIFO sequence; however, in *Streamlined Order Inquiry (DORI)*, messages are always listed in FIFO sequence.

Change or delete existing messages? The *Modify Existing Messages (A30)* secured feature controls the ability to change or delete an existing order message. If you have authority to this secured feature, double click on a line to change or delete it; see *Working with existing message lines* for instructions.

How to display this window: Click *Messages* in the Navigation area at the top of the *Third Streamlined Order Inquiry Screen (Order Summary)*. The word *Messages* is in blue rather than black if there are any existing order messages.

Field	Description
Entering new message lines	Optionally, use the upper part of the window to enter new order messages.
New message	Use this field to enter new free-form text messages. If your entry exceeds 60 positions and you do not press *Enter* to start a new line, the system splits the text into separate lines of up to 60 positions each, using the last occurring blank space before position 60 as a line break.
Print	Highlight the print option to the right of the New message field. Available options are: • *Both* = Print on both invoice and pick slip • *Check Cust* = Print on refund check only • *Gift Msg* = Gift message • *Invoices* = Print on invoice only • *Nowhere* or blank (default) = Do not print • *Picks* = Print on pick slip only • *Quote* = Print on the Quote Form • *Check Int* = Print on detachable area of refund check not visible to the customer • *User* = Print on the document defined by the user, such as a custom pick slip. If there is no user-defined document, the message does not print anywhere in Order Administration.
Click *Add* when you are done to save your changes.	
Working with existing message lines The lower part of the window displays existing order messages. You can review, change, or delete these messages.	**To change:** • Position your cursor in the message line and double-click. • Edit the text as needed and press *Exit*. You can also change the Print option next to a message line. **To delete:** • Double-click in the message line to highlight it. • Clear the Message and Print fields. • Press *Exit*. The message line is deleted, and the remaining message lines move up on the screen if the deletion left a blank line. • The *Modify Existing Messages (A30)* secured feature controls the ability to change or delete an existing order message. • See the discussion under More Print Flag Information for background before changing existing message lines.
Message	A message related to the order. Alphanumeric, 60 positions.

Field	Description
Print	Available options are: • *Both* = Print on both invoice and pick slip • *Check Cust* = Print on refund check only • *Gift Msg* = Gift message • *Invoices* = Print on invoice only • *Nowhere* or blank = Do not print • *Picks* = Print on pick slip only • *Quote* = Print on the *Quote Form* • *Check Int* = Print on detachable area of refund check not visible to the customer • *User* = Print on the document defined by the user, such as a custom pick slip. If there is no user-defined document, the message does not print anywhere in Order Administration.
Date	The date when the message was written. Numeric, 6 positions; in user date format.
Time	The time when the message was written. Numeric, 6 positions (HH:MM:SS format).
User	The user ID identifying the person who wrote the message. Alphanumeric, 10 positions.

> **Note:**
>
> Depending on your screen resolution, if there are multiple message lines the *Exit* button might not be visible. In this case, press *F12* to exit the window and return to the *Third Streamlined Order Inquiry Screen (Order Summary)*.

Order Detail Window

Purpose: Use this window to display additional information about an item on the order.

How to display this window: Click the icon ( ) in the *Detail* column next to an item in the *Products* area of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen.

Field	Description
Item	The item you selected in the *Products* area of the *Third Streamlined Order Inquiry Screen (Order Summary)*. **Note:** The code displayed is the item alias if the customer ordered using an alias and the *Display Item Alias (D56)* system control value is selected. Alphanumeric, 12 positions.

Field	Description
SKU	The item's unique characteristics, such as its size and color. **Note:** The first 14 positions of the SKU description is displayed instead of the SKU elements if the *Display SKU Description in place of SKU Element (F25)* system control value is selected. Alphanumeric, three 4-position fields or one 14-position field.
Desc	The first 30 positions of the description of the item. This is the base item description if the item has SKU's. Alphanumeric, 30 positions.
Qty ordered	The number of units of the item that the customer ordered. Numeric, 5 positions.
Price	The actual unit price of the line after applying any discounts, breaks, or overrides. Discounted or overridden item prices are highlighted if the *Display Order Line Discount Messages (F01)* system control value is selected. Numeric, 13 positions with a 2-place decimal.
Source	The source code assigned to the detail line, if any. There might not be a source code on the order detail line if the *Use Source Code from Order Header When Creating Order Lines (D73)* is not selected. The source code at the line level controls demand and sales information/ posting for that item, while the source code on the order controls how to price items and calculate freight. Alphanumeric, 9 positions.
Offer	A code for the catalog, space or television advertisement from which you accept quotes and orders. The offer defined for the quote or order controls how to calculate shipping and price items. However, if you override the offer for an item (if the customer is ordering from more than one catalog, for example), demand for the item is attributed to the offer associated with the item rather than the order. Demand represents the number and dollar value of orders placed against an offer. **Note:** The system automatically overrides the offer for an item if *Override Offer on Order Detail Line (D49)* system control value is selected and the item is not sold in the offer used on the order. Offers are defined in and validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions.

Field	Description
Offer price	The item price as defined for the offer. If the order was subject to VAT and tax-inclusive pricing, in which any tax is included in the Hidden tax field rather than the Tax bucket on the order, the offer price presented here is the tax-inclusive offer price. **Note:** When a price override reason applies to the order line (whether you enter an override reason manually, or if the system applies the override automatically), the override reason's *Override item offer price* setting controls whether to use the regular offer price. See *Overriding the Item/SKU Offer Price* for a discussion. Numeric, 13 positions with a 2-place decimal.
G/W	If this flag is selected, it indicates that the item is gift wrapped.
Freight	The charge for shipping the item. This total does not include additional freight charges, and is blank if the freight is calculated for the entire order instead of item-by-item. Numeric, 13 positions with a 2-place decimal.
Add'l freight	The dollar amount of shipper/item charges, as defined for the shipper and item at the *Work with Ship Via/Item Screen*. Numeric, 13 positions with a 2-place decimal.
Quantities	
Qty reserved	The number of units of the item that are currently reserved from stock. The system does not reserve stock on quotes until they are converted to standard orders; see *Converting Quotes to Orders*. The reserved quantity is reduced when an item is canceled, confirmed for shipment, or unreserved using Interactive Reservation. The system updates this quantity at billing. Numeric, 5 positions.
Qty printed	The number of units included on a printed pick slip. *Pre-generated picks:* The system does not update this field when you create a pre-generated pick for the order line during pick slip preparation; the system updates this quantity when you generate a pick slip. See *Applying Pick Slip Preparation to an Order* and *Performing Pick Slip Generation*. *Voiding a pick slip:* The system reduces the printed quantity if you void the pick slip and don't reprint, or when shipment of the item is confirmed. *Order Orchestration?* If the order line has been assigned to the Order Orchestration for fulfillment (brokered backorder) or if the customer is picking up the order at a store (store pickup), the print quantity here is equal to the ordered quantity. In the case, the Drop ship flag at the *Order Detail Window* is set to *D*, although for a brokered backorder, the BO warehouse indicates your distribution center. See *Brokered Backorders* or *Store Pickup Orders* for background. Numeric, 5 positions.

Field	Description
Qty shipped	The number of units that have shipped. The system updates this quantity at billing. This quantity is negative for returns processed by entering a negative quantity in order entry. Numeric, 5 positions.
Qty returned	The number of units that the customer has returned. This quantity is zero for a return created by entering a negative quantity in order entry. Numeric, 5 positions.
Qty canceled	The number of units that have been canceled. Numeric, 5 positions.
Qty sold out	The number of units that have been sold out, either automatically or manually. Numeric, 5 positions.
Expected ship date	*Backordered item:* the date a purchase order for this backordered item is expected. **Note:** This field is not displayed for a reserved item, a brokered backorder, or if there are no open purchase orders for the item. *Drop ship item, including brokered item:* This date is displayed for drop ship items if the *Assign Drop Ship Expected Ship Date (I59)* system control value is selected. See that system control value for more information. Numeric, 6 positions; in user date format.
Next BO date	The next date when the order line is eligible to generate a backorder notice. See *Generate Backorder Notices (GBOC)* for more information. Numeric, 6 positions; in user date format.
Entered date	The date when the order was created, or when the item was added to the order. Numeric, 6 positions; in user date format.
Arrival date	The date when the customer wants to receive this item. The arrival date entered here overrides the arrival date defined for the order. The arrival date for each item is initially set to the current date; however, you can enter some future date in order entry or maintenance to delay shipment of the item. The system defaults a future arrival date to an item with a future ship status if the item's status code matches the *Future Orders Item Status (E52)*. The future arrival date that defaults for this item comes from the *Default Future Orders Arrival Date (E53)*. The arrival date controls: • Whether the item is reserved • Whether to create a pre-generated pick for the item **Influence on Reservation** The arrival date for the item controls whether to reserve inventory as follows: `Arrival date` - *Reservation Lead Days (B27)* = `Date`

Field	Description
	The system does not reserve inventory if the result is a future date. In this case, the item is flagged as a future order and assigned a backorder status. When you run the Evaluate Future Orders process (typically, every evening) it evaluates each item flagged as a future order and reruns the arrival date calculation. When the result is no longer in the future, the process reserves the inventory. See *Scheduling Jobs* for more information. **Influence on Pre-Generated Picks** The item's arrival date also controls whether the system creates pre-generated pick. The system uses this calculation: `Arrival Date from Order Line (or Order Ship To) - (Pick Processing Days (B37) + Ship Via Lead Days in WSHV) < or = Today's Date` The system creates a pre-generated pick for the order line if this system-calculated date is less than or equal to today's date; otherwise, the system does not create a pre-generated pick for the order line until the date is within the allotted time frame. See *Selecting Order Lines for Pick Slip Preparation*. *Zone reservation rules:* For items subject to zone reservation, this date is: • the zone start date if the item was ordered before the zone season start date. • the order date if the item was ordered between the zone season start date and zone end date, provided that: • if you use *Standard Zone Reservation Rules*, the item was available or you took the order before the zone's deferred cutoff date • if you use *Alternate Zone Reservation Rules*, the item was available or had an open PO quantity • otherwise, this date is the next season's zone start date from the zone reservation dates. See *Shipping Zone Reservation Overview* for a complete discussion. You can use an order line's Arrival date as a selection criterion in pick slip generation. For zone reservation coded inventory such as plant stock, this selection insures that the item will ship at a date suitable for planting at its destination. Numeric, 6 positions; in user date format.
Cancel date	The date when the customer wants to cancel the item if it has not shipped. Numeric, 6 positions; in user date format.
Inventory	
Drop ship	Set to *D* for a drop ship item, or for a brokered backorder or store pickup order. In the case of a brokered backorder or store pickup, there is a printed quantity; for a brokered backorder, the BO warehouse indicates your distribution center. Alphanumeric, 1 position.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Warehouse</td><td>The warehouse shipping the item. Typically set to 0. Some reasons why an order line might be assigned to a specific warehouse:
this is a retail pickup or delivery order assigned to a warehouse by Order Orchestration
the order line is a return created by entering a negative quantity in order entry
the order line was express-billed
you specified a warehouse override for the order or line when creating the order, either in interactive order entry or through the order API
Warehouse code: numeric, 2 positions.
Warehouse description: alphanumeric, 30 positions.</td></tr>
<tr><td>BO warehouse</td><td>A code that identifies the warehouse assigned to ship a backordered item.
Note:
This field appears only if there is a backordered quantity of the item.
Warehouse code: numeric, 2 positions.
Warehouse description: alphanumeric, 30 positions.</td></tr>
<tr><td>Future order</td><td>This flag indicates that the arrival date for the item is too far in the future to reserve stock. The item is reserved when the current date reaches the requested arrival date minus lead days for picking and shipping.
Valid values are:
Selected = This is a future order; do not reserve inventory.
Unselected = This is not a future order and is eligible for inventory reservation.
See the Arrival date for a discussion.</td></tr>
<tr><td>Affect inventory</td><td>Indicates whether the quantity available to sell (on-hand quantity) of the item is reduced during order entry.
Valid values are:
Selected (default for a regular item) = Inventory levels are affected during order entry and when you ship the order. During order entry, reserved and open inventory increase and available inventory is decreases; when you ship the order, on-hand inventory, pickable inventory, open inventory, reserved inventory and total inventory across all warehouses decreases.
Unselected (default for a Non/inv (Non inventory) item) = Inventory is not tracked. The system does not generate a pick slip for the item if all other items on the order are backordered; when one or more backordered items are available, the system generates a pick slip for the non-inventory item as well as for the available item(s).</td></tr>
</table>

Field	Description
Bypass reservation	Indicates whether to reserve this item during order entry if inventory is available. • If the Use OROB for Fulfillment Assignment (M31) system control value is selected, the system selects this flag for each order line sent to Order Orchestration for fulfillment assignment. See Brokered Backorders. • If the *Use OROB for Fulfillment Assignment (M31)* system control value is unselected, items that bypass immediate reservation must be reserved using Interactive Reservation. See Working with Interactive Reservation (MIRV). You can define an item to bypass reservation in the Item table. Valid values are: • *Unselected* (default) = Do not bypass reservation. • *Selected* = Bypass reservation. This setting defaults from the Item table if the item is set up to bypass reservation, because it is available in a limited quantity or it is a limited edition.
Special Handling	This area of the window provides information on custom or standard special handling for the item. See Special Handling Overview for background.
Special handling	The special handling code and description identifying the type of work to be performed on the item. Special handling codes are defined in and validated against the Additional Charges table. Code: alphanumeric, 2 positions. Description: alphanumeric, 30 positions.
Special handling charge	The charge for special handling of an item. See Special Handling Overview for background. Numeric, 13 positions with a 2-place decimal.
Handling information	One or more lines of free-form text describing the handling for the item. Alphanumeric, 30 positions each line.
The following lines provide information custom special handling.	For more information on custom special handling information, see: • Special Handling Overview • Establishing Custom Special Handling Formats (WSHF) on how to set up special format detail • Working with Items on the Order on how to enter custom special handling information on an order
Label	A special handling option defined for this custom special handling format. Alphanumeric, 15 positions.
Input	The response selected for each special handling option available in the custom special handling format. These fields might be blank if, for example, you use the special handling format only to add a charge to the Handling bucket on the order. The Suppress S/H window field for the additional charge code allows you to suppress the automatic display of the special handling screen in order entry if you use a special handling code for this purpose. Alphanumeric, 45 positions.

Field	Description
Description	The description of the response, as specified at the *Work with Special Format Response Screen* when you set up the valid responses for the format. Alphanumeric, 45 positions.
Charge	The charge associated with an option in the custom special handling format. This charge is added to the Handling bucket of the order totals. Numeric, 13 positions with a 2-place decimal.
Activity	This area of the window displays order line history. See *Display Order Line History Screen* for background.
Activity	A code for a type of update against this item detail line. Valid values are: • *A = Add:* The line was added in order maintenance. • *B = Express Bill* • *C = Cancel:* includes canceling or reducing quantity using a cancel reason code flagged not to reduce demand. • *D = Discount:* You used the *Discount* option in order maintenance against a shipped order line. • *E = Exchange* • *G = Change:* Includes changes that don't affect quantity, in addition to canceling or reducing quantity using a cancel reason code flagged to reduce demand. • *O = Sold Out* • *R = Return* • *S = Shipment*
Description	The description of the activity. See above.
Date	The date when the activity occurred. Numeric, 6 positions; in user date format.
Qty	The quantity of the item affected by this activity. For example, *3-* indicates that three units of the item were canceled. Activities that do not affect the order quantity, such as changing the pricing of the order line, do not display a quantity here. This quantity is displayed differently depending on how the item was sold out; see *Processing Auto Soldout Cancellations (MASO)* for details. Numeric, 5 positions.
Exc reason	Represents a reason for the customer to exchange one item for another. Exchange reasons are defined in and validated against the Exchange Reasons table; see *Establishing Exchange Reason Codes (WEXR)*. Numeric, 3 positions.
Can reason	The reason for canceling the units or reducing the quantity. A cancel reason code is not displayed for soldout cancellations, whether you sell out the item by selecting *Sold-out* in order entry or order maintenance, or through *Processing Auto Soldout Cancellations (MASO)*. Cancel reason codes are defined in and validated against the Cancel Reason table; see *Establishing Cancel Reason Codes (WCNR)*. Numeric, 2 positions.

Field	Description
Rtn reason	Represents a reason for the customer to return an item. Return reasons are defined in and validated against the Return Reason table; see *Establishing Return Reason Codes (WRTR)*. Numeric, 2 positions.
Add reason	Represents a reason for adding an item to the order. The system requires an add reason code if: • the *Require Reason for Lines Added in Order Maintenance (D75)* system control value is selected, or • the *Required reason code* field for the item offer or SKU offer is selected. Add reason codes are defined in and validated against the Add Reason table; see *Establishing Add Reason Codes (WADR)*. Alphanumeric, 5 positions.
User	The user ID of the person who performed the activity. No user is listed if you sold out a line through *Processing Auto Soldout Cancellations (MASO)*. Alphanumeric, 10 positions.

> **Note:**
>
> Depending on your screen resolution and the contents of this window, the complete contents and the *Exit* button might not be visible. In this case, press *F12* to exit the window and return to the *Third Streamlined Order Inquiry Screen (Order Summary)*. You can review the order line information in standard order inquiry, or increase your screen resolution; see *How do I display the Order Administration screens correctly on a laptop?*

Order Detail Messages Window

Purpose: Use this window to review or work with free-formatted order-detail-level messages. These are the same messages you can work with at the *Work with Order Line Messages Screen*.

> **Note:**
>
> You cannot apply a message set up through *Working with Default Messages (WMSG)* through this window; to do so, you can use the *Work with Order Line Messages Screen*.

Change or delete existing messages? The *Modify Existing Messages (A30)* secured feature controls the ability to change or delete an existing order line message.

How to display this window: Click the icon ( ) in the *Msg* column next to an item in the *Products* area of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen.The icon is blue ( )if there are any existing order line messages.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Item</td><td>The item and SKU you selected at the Third Streamlined Order Inquiry Screen (Order Summary).
Item: alphanumeric, 12 positions.
SKU: alphanumeric, three 4-position fields.</td></tr>
<tr><td>Entering new message lines</td><td>Optionally, use the upper part of the window to enter new order line messages.</td></tr>
<tr><td>New messages</td><td>Use this field to enter new free-form text messages. If your entry exceeds 60 positions and you do not press Enter to start a new line, the system splits the text into separate lines of up to 60 positions each, using the last occurring blank space before position 60 as a line break.</td></tr>
<tr><td>Print</td><td>Highlight the print option to the right of the New message field. Available options are:
• Both = Print on both invoice and pick slip
• Invoices = Print on invoice only
• Nowhere or blank (default) = Do not print
• Picks = Print on pick slip only</td></tr>
<tr><td>Click Add when you are done.</td><td></td></tr>
<tr><td>Working with existing message lines</td><td>The lower part of the window displays existing order detail messages. You can review, change, or delete these messages.
To change:
• Position your cursor in the message line and double-click.
• Edit the text as needed and press Exit.
You can also change the Print option next to a message line.
To delete:
• Double-click in the message line to highlight it.
• Clear the Message field.
• Press Exit. The message line is deleted, and the remaining message lines move up on the screen if the deletion left a blank line.
Secured feature: The Modify Existing Messages (A30) secured feature controls the ability to change or delete an existing order line message.</td></tr>
<tr><td>Message</td><td>A message related to the order line.
Alphanumeric, 60 positions.</td></tr>
<tr><td>Print</td><td>Available options are:
• Both = Print on both invoice and pick slip
• Invoices = Print on invoice only
• Nowhere or blank = Do not print
• Picks = Print on pick slip only</td></tr>
<tr><td>Date</td><td>The date when the message was written.
Numeric, 6 positions; in user date format.</td></tr>
<tr><td>User</td><td>The user ID identifying the person who wrote the message.
Alphanumeric, 10 positions.</td></tr>
</table>

Invoice Detail Window

Purpose: Use this window to review the invoice details for each item on the order that has been billed or credited.

How to display this window: Click the icon ( ) in the *Detail* column next to an item in the *Invoices* area of the *Third Streamlined Order Inquiry Screen (Order Summary)* screen.

> **Note:**
>
> This icon is available only if Invoice Details exist; it is not available for a credit invoice created by applying a negative additional charge to an order.

Field	Description
Line #	The number of the invoice line for the item. Numeric, 3 positions.
Item	The code identifying the item that shipped or was returned. Alphanumeric, 12 positions.
SKU	The item's unique characteristics, such as its color or size. Included only if the item has SKUs. Alphanumeric, three 4-position fields.
Ship qty	The shipped quantity of the invoiced item. The quantity is negative in the case of a credit invoice created for a return. Numeric, 5 positions.
Price	The actual unit price of the shipped or returned item. Numeric, 13 positions with a 2-place decimal.
Ship date	The date the invoice line shipped or the return was processed. Numeric, 6 positions; in user date format.
Return qty	The quantity of the item returned on this invoice. Numeric, 5 positions.
Return date	The most recent date when the customer returned any quantity of the item billed on this invoice. Numeric, 6 positions; in user date format.

Performing Order Maintenance

In this part: These topics describe how to update an existing order on the system:

- *Introducing Order Maintenance* describes how to access Order Maintenance to update an existing order and lists the features and restrictions of this program.
- *Selecting an Order for Maintenance* describes how to identify the order you wish to update or how to locate a particular order from a scan of orders.
- *Work with Order Screen in Order Maintenance* lists the fields you can update on the Work With Order screen, describes the results of your updates, and identifies any conditions or restrictions for updating each field.

- *Changing Item Detail Line Information in Order Maintenance* lists the fields you can update on the Work With Order Line screen, describes the results of your updates, and identifies any conditions or restrictions for updating each field for a specific item on the order.
- *Adding an Item in Order Maintenance* describes how to add an item to an existing order or how to reopen a closed or canceled order when you add an item.
- *Increasing the Quantity Ordered in Order Maintenance* describes how to increase or decrease the number of units ordered of an item and describes how to account for the item cancellation when you reduce the quantity ordered.
- *Canceling an Item in Order Maintenance* describes how to cancel a single, unshipped order detail line on an existing order and describes how to account for the item cancellation from the order.
- *Canceling an Order through Order Maintenance* describes how to cancel an entire order and describes how to account for the item cancellations resulting from the order cancellation.
- *Returning and Exchanging Items in Order Maintenance* describes how to perform an item return or exchange by first creating a return authorization, receiving the merchandise return, and crediting the customer.
- *Enter Payment Methods Screen in Order Maintenance* describes how to add a payment method to the order to release it from hold or how to change or delete payment information already defined for the order.
- *Adding a Recipient Order in Order Maintenance* describes how to enter an additional order to an existing order that will ship to a different address.
- *Maintaining Quotes in Order Maintenance* describes the updates you can apply to a pre-order quote before converting it to a regular order.
- *Converting Quotes to Orders* describes how to convert a pre-order quote to a regular order and the updates that the system performs.
- *Order Line History In API* allows you to receive order line history from an external system. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
- *Order Maintenance API* allows you to remove a user hold or update the arrival date for an order line. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Order Status Reports and On-line Inquiries

In this part: This part presents the reports and on-line inquiries you use to monitor order activity for your company according to a variety of criteria.

- *Order Status and Activity Reports* provides examples of the reports related to researching an order through Order Inquiry, including order cancellation reports, backorder reports, sales journals, shipment analyses, and prepaid orders lists.
- *Displaying Open Orders by Item (DOOI)* describes several on-line inquiry functions that can help you evaluate your order activity.
- *Ship Via/Item Inquiry (SVII)* describes how to review the shippable orders for different shippers, broken out by item.
- *Printing Backorder Reports by Descending Dollars (PBOD)* describes how to generate the Backorder Report by Descending Dollars and provides a sample report

- *Reviewing Operations Control Summary (FLSH)* allows you to review operations and merchandising summary information.
- *Reviewing Pending Orders (DOSS)* describes how to review orders requiring further processing or action.
- *Sales Summary (DSSS)* describes a screen you can use to review sales numbers and amounts for the current date, week, and month, as well as sales for the current date broken out by order type and entity.
- *Printing the Order Type Summary by Delivery Type Report (PDTS)* describes how to generate the Order Type Summary by Delivery Type Report and provides a sample report.

Submit Order Cancellation List Screen (POCL)

Purpose: Use this screen to print the *Order Cancellation List*, a list of orders that have impending cancellation dates due to soldout items, automatic backorder cancellation, and other cancel conditions. This information gives you the option to contact customers before canceling their orders.

Quotes: The Order Cancellation List also includes quotes that contain items whose Cancel date in the Order Detail table are older than the date you generate the report. See *Cancelling a Quote through Order Maintenance* for more information on how to cancel a quote.

How to display this screen: Enter POCL in the Fast path field at the top of any menu or by selecting this option from a menu.

Printing Backorder Reports (PBOR)

Purpose: Use this function to obtain various types of backorder reports, which give you visibility into your backorder situation, based on an item, warehouse or vendor. You may run these report for the base items only (at the model level) or for each backordered SKU.

Quotes: Items that are on backorder on quotes do not print on the backorder reports; the system includes the items on the backorder reports when the quote is converted to an order. See replace for an overview and *Converting Quotes to Orders*.

Print Backorder Report Selection Prompt Screen

The system submits a series of backorder reports if you make multiple selections on this screen.

How to display this screen: Enter PBOR in the Fast path field at the top of any menu or select this option from a menu.

Field	Description
By item	Determines whether the system will generate a backorder report that is sorted by item number. Valid values are: • *Yes* = Generate the Backorder Report by Item • *No* (default) = Do not generate the Backorder Report by Item If both this field and the Print SKU detail field are *Yes*, the system also generates the Backorder Report by Item with SKU Details.
By whse/item (By warehouse/item)	Determines whether the system will generate a backorder report that is sorted by warehouse. Valid values are: • *Yes* = Generate the Backorder Report by Warehouse • *No* (default) = Do not generate the Backorder Report by Warehouse Optionally, you may enter a valid warehouse code in the next field to run the report for a particular warehouse; if you set this field to *No*, the system runs the report for all warehouses. If both this field and the Print SKU detail field are *Yes*, the system also generates the Backorder Report by Warehouse with SKU Details.
Warehouse (Unlabeled field to the right of the By whse/item field)	The warehouse for which you want to run this report. Leave this field blank if you want to run the report for all warehouses; otherwise, enter a valid warehouse code to run the report for the specified warehouse. Warehouse codes are defined in and validated against the Warehouse table. See replace. Numeric, 3 positions; optional
By vendor	Determines whether the system will generate a backorder report that is sorted by vendor number. Valid values are: • *Yes* = Generate the Backorder Report by Vendor • *No* (default) = Do not generate the Backorder Report by Vendor. Optionally, you may type a vendor code in the next field to run the report for a particular vendor; otherwise, the system runs the report for all vendors. If both this field and the Print SKU detail field are *Yes*, the system also generates the Backorder Report by Vendor with SKU Details.
Vendor number (Unlabeled field to the right of the By vendor field)	Represents the supplier of an item you sell. Leave this field blank if you want to run the report for all vendors; otherwise, enter a valid vendor code to run the report for the specified vendor. Vendor codes are defined in and validated against the Vendor table. See replace. Numeric, 7 positions; optional.

Field	Description
By vendor w/PO	Determines whether the system will generate a backorder report that is sorted by vendors with open (unreceived or partially received) purchase orders. Valid values are: • *Yes* = Generate the *Backorder Report by Vendor w/PO* • *No* (default) = Do not generate the Backorder Report by Vendor w/PO Optionally, you may type a vendor code in the next field to run the report for a particular vendor; otherwise, the system runs the report for all vendors. No backordered items will be listed on this report if there are no open POs for these items. If both this field and the Print SKU detail field are *Yes*, the system also generates the *Backorder Report by Vendor/SKU/PO*.
Vendor number (Unlabeled field to the right of the By vendor w/PO field)	Represents the supplier of an item you sell. Leave this field blank if you want to run the report for all vendors; otherwise, enter a valid vendor code to run the report for the specified vendor. Vendor codes are defined in and validated against the Vendor table. See replace. Numeric, 7 positions; optional.
Print SKU detail	Determines whether the backorder report(s) will list the backordered items at the base item (model) level or at the SKU level. Valid values are: • *Yes* = List the backordered level for each SKU • *No* (default) = List the backorders at the base item level only An example of a base item is SILK DRESS. SKUs may exist for this item to identify the various styles in which the item is sold, such as PETITE/RED; PETITE/BLUE; PETITE/WHITE, etc. If you do not print the SKU detail, the system will identify the backorder level at the top level (SILK DRESS); otherwise, if you print the SKU detail, the system will list the backorder level only for each backordered SKU of the item.

Printing the Sales Journal (PDSJ)

Purpose: Use this option to specify the date range, and optionally, the division for which you want to print a Sales Journal. This report provides a detailed audit trail of all sales transactions for the specified date range (and division, if specified), including all shipments, returns, credits and no charge sales transactions. The system registers a sales transaction when a shipment occurs.

This report provides a detailed listing of sales activity for the specified invoice date range.

Understanding this report: This report is divided into two halves; the left half provides sales information relating to each invoice and the right half provides information about how each sale was posted. The invoice totals on the report are from the Invoice Ship To record.

Out-of-Balance Invoices

If an invoice is out of balance: An invoice is flagged as out of balance on the Sales Journal and Sales Journal by Division if the total Merchandise, Freight, Additional freight, Tax, Handling, and Additional charge for all Invoice Pay Method records do not equal the corresponding totals for the Invoice Ship To record. If the Invoice Pay Method total is higher than the Invoice Ship To total, the out-of-balance amount is negative; otherwise, if the Invoice Pay Method total is lower than the Invoice Ship To total, the out-of-balance amount is positive.

How can an invoice be out of balance? Invoices should ordinarily never be out of balance, but sometimes it is possible for this situation to occur if, for example, there is a rounding difference in the tax calculation on an order with multiple payment types.

Error report: Use the *Printing Sales Journal Errors (PSJE)* menu option to print a report listing just the out-of-balance invoices for a time period.

Fixing an out-of-balance invoice: Contact your Order Administration representative for assistance in fixing an out-of-balance invoice.

Reporting by Division

When you run the report, you can choose to run it by division. If so, the report lists all sales transactions for the division and starts a new page for each division. The division code is determined by the source code used on the order header.

If you do not print the report by division, the report lists sales transactions in invoice number/ date sequence.

How to display this screen: Enter PDSJ in the Fast path field at the top of any menu or select Print Daily Sales Journal from a menu.

Field	Description
Invoice date from	The beginning date to include on the report. The invoice date represents the date when the shipment or return credit occurred. This field defaults to the current date. Numeric, 6 positions (in user date format); required.
Invoice date to	The ending date to include on the report. The invoice date represents the date when the shipment occurred. This field defaults to the current date. Numeric, 6 positions (in user date format); required.
Print by division	Indicates whether you want to sort, subtotal, and page break the report by sales division. If not, the report lists all sales transactions sorted by invoice date/number. Valid values are: • *Selected* = Sort the Sales Journal by sales division; see *Sales Journal by Division*. • *Unselected* (default) = Sort the Sales Journal by invoice date and invoice number; see *Standard Sales Journal*.

Instructions:

1. Enter or verify the date range you want to include on the Sales Journal. The system defaults the current date in the Invoice date from and Invoice date to fields.
2. *Select* the Division field if you want to print sales transactions grouped by sales division (the *Sales Journal by Division*); otherwise, the report lists sales transactions by invoice number/date (the *Standard Sales Journal*).
3. Select *OK* to accept your entries.

4. Select *Accept* to print or reprint the Sales Journal for the specified invoice date.

Printing the Sales Journal by Pay Type (PSJP)

Purpose: Use this option to print the *Sales Journal by Pay Type*, a detailed audit trail of all sales transactions for the specified date range, including all shipments, returns, credits and no charge sales transactions, grouped by payment method and payment plan type. The system registers a sales transaction when a shipment occurs.

This report provides:

- a detailed listing of sales activity for the specified invoice date range
- totals for each pay type
- a grand total for all paytypes

Understanding this report: This report provides information about the individual charges on each invoice, grouped by pay type. The totals on this report are from the Invoice Pay Method records.

The individual order charges in the Merchandise, Freight, Add'l frt, Tax, Handling, and Add'l charge columns on the left side of the report are totaled in the Total invoice field on the right side of the report.

This report provides totals for the number of credits (refunds) and invoices (shipments) for each payment plan type, each pay type and page breaks between each pay type. A grand total is provided at the end of this report.

How to display this screen: Enter PSJP in the Fast path field at the top of any menu or select Print Sales Journal by Pay Type from a menu.

Field	Description
Invoice date range	The date range for which you want to run this report. The invoice date range represents the dates on which shipments occurred. Both fields default to the current date. Numeric, 6 positions (in user date format); required.

To print the report:

Enter or verify the date range for which you want to print the *Sales Journal by Pay Type*. The current date defaults to the Invoice from and Invoice to fields.

Printing the Sales Journal Summary (PSJM)

Purpose: Use this report as an audit trail of consolidated sales information for an entity, offer, period, or invoice date. This report summarizes all invoice records by offer or invoice date for a month and shows how these invoices were posted.

This report shows your cost for the items sold, the price at which you sold these items, and the corresponding gross profit dollars and gross profit percentage you realized from these sales. The totals on this report are from the Invoice Ship To records.

This report is typically used by the Accounting department to reconcile the month's sales figures.

How to display this screen: Enter **PSJM** in the Fast path field at the top of any menu or select Print Sales Journal Summary from a menu.

Field	Description
Start date	The earliest date for which you want to print sales figures on this report. Only invoices printed on this date, and up to the date in the End date field will be included. This field defaults to the current date. Numeric, 6 positions (in user date format); required.
End date	The last date for which you want to print sales figures on this report. Only invoices printed up to this date, starting from the date in the Start date field will be included. This field defaults to the current date. Numeric, 6 positions (in user date format); required.
By period	Controls whether to print the Sales Journal Summary by Period. This report sorts in offer code sequence within period, and provides consolidated sales information for each offer, in relation to accounting period. Totals are provided for each period, and a grand total of sales for all periods is provided at the bottom of the report. Valid values are: • Selected= Run the Sales Journal Summary by Period, which summarizes sales information by period. • unselected (default) = Do not run this report.
By offer	Controls whether to print the Sales Journal Summary by Offer. This report provides consolidated sales information for each offer. A grand total of sales for all offers is provided at the bottom of the report. This report is sorted in alphanumeric offer code sequence. Valid values are: • Selected = Run the Sales Journal Summary by Offer, which summarizes sales information by offer. • Unselected (default) = Do not run this report.
By merch$ (By merchandise dollars, descending)	Controls whether to print the Sales Journal Summary by Descending Dollars. This report sorts in descending (highest-to-lowest) dollar order for each offer within each period, and provides consolidated sales information for each offer, within each accounting period. A grand total of sales for all periods is provided at the bottom of the report. Valid values are: • Selected= Run the Sales Journal Summary by Descending Dollars, which summarizes sales information by descending dollar value. • Unselected (default) = Do not run this report.
By invoice date	Controls whether to print the Sales Journal Summary by Invoice Date. This report sorts by invoice date and division, and provides consolidated sales information for each offer. A grand total of sales for all periods is provided at the bottom of the report. Valid values are: • Selected = Run the Sales Journal Summary by Invoice Date, which summarizes sales information by invoice date and division • Unselected (default) = Do not run this report.

Field	Description
By entity/offer	Controls whether to print the Sales Journal Summary by Entity/Offer. This report sorts in offer code sequence within entity, and provides consolidated sales information for each offer, in relation to entity. Totals are provided for each entity, and a grand total of sales for all entities is provided at the bottom of the report. Valid values include: • Selected = Run the Sales Journal Summary by Entity/Offer, which summarizes sales information by entity. • Unselected (default) = Do not run this report.

Note:

You must select at least one of the sort selection fields described above (By period; By offer; By merch$ descending; By invoice date; By entity/offer). A report prints for each sort selected.

Instructions

1. Verify or enter the range of dates for which you want to report sales information.
2. Select the desired report by selecting the By period, By offer, By merch$ descending, By invoice date and/or By entity/offer field(s).
3. Select OK to submit the report(s) for printing.

- Sales Journal Summary by Period
- Sales Journal Summary by Offer
- Sales Journal Summary by Descending Dollars
- Sales Journal Summary by Invoice Date
- Sales Journal Summary by Entity/Offer

Printing Sales Journal Errors (PSJE)

Purpose: Use the *Sales Journal Errors Report* to identify invoice records that are out of balance. Invoices that are out of balance are also flagged on the *Standard Sales Journal* and *Sales Journal by Division*.

How can an invoice be of balance? Invoices should ordinarily never be out of balance, but sometimes it is possible for this situation to occur if, for example, there is a rounding difference in the tax calculation on an order with multiple payment types.

If an invoice is out-of-balance: An invoice is flagged as out-of-balance if the total Merchandise, Freight, Additional freight, Tax, Handling, and Additional charge for all Invoice Pay Method records do not equal the corresponding totals for the Invoice Ship To record. If the Invoice Pay Method total is higher than the Invoice Ship To total, the out-of-balance amount is negative; otherwise, if the Invoice Pay Method total is lower than the Invoice Ship To total, the out-of-balance amount is negative.

Fixing out of balance invoices: Contact your Order Management System representative for assistance if any invoices are out of balance.

Print Sales Journal Errors Screen

How to display this screen: Enter *PSJE* in the Fast path field at the top of any menu, or select Print Sales Journal Errors from a menu.

Completing this screen: Confirm that the Start date and the End date are correct, or override the dates if needed, then select *Submit*. Both fields default to the current date.

Printing the Order Shipment Analysis (POSA)

Purpose: Use this screen to obtain the *Order Shipment Analysis Report*, a list of the shipments for the specified date.

How to display this screen: Enter POSA in the Fast path field or select this option from a menu.

> **Note:**
>
> The system uses program CSR0604 to print this report.

Field	Description
Date	The date for which you want to review shipment activity. Numeric, 6 positions (in user date format); required.

Printing the Open Prepaid Order List (POPP)

Purpose: Use the *Open Prepaid Order List* to see relevant balance and payment information on all open prepaid orders. This report also shows refund or balance due figures where applicable. The report sorts in ascending customer number order.

To print the report, enter *POPP* in the Fast path field at the top of any menu, or select this option from a menu. There is no prompt screen to complete.

Print the Order Addition Report (PAAR)

Purpose: Use the *Order Addition Audit Report* to review the add reason codes used to add items to orders in order entry or order maintenance.

If the replace system control value is *selected*, the system requires an add reason code each time you add an item to an order in order maintenance.

If the Require reason code field for an item offer or SKU offer is *selected*, the system requires an add reason code each time an operator adds an item to an order in order entry or order maintenance.

You can use add reason codes to track the reasons for adding items to orders; for example, mis-shipments, exchanges, or to replace an item or SKU that is backordered.

You specify the period you want to include in the report; also, you can include a specific add reason code or all codes.

> **Note:**
>
> You can also define this report as a periodic function to include in your periodic processing. To do so, you should first use replace to create the function, using the program name CSR0646. You then use replace to add the function to your daily process.

When the report runs as part of your daily process, it includes all add reason codes for that day.

How to display this screen: Select Print Order Addition Audit Report from a menu or enter PAAR in the Fast path field at the top of any menu.

Field	Description
Add reason	The reason for adding an item to an order in order entry or order maintenance. Add reasons are defined in and validated against the Add Reason table; see *Establishing Add Reason Codes (WADR)*. Numeric, 5 positions; optional.
To	The last date of the period you want to include in the report Numeric, 6 positions; required
From	The first date of the period you want to include in the report. Numeric, 6 positions (in user date format); required.

Instructions:

1. Enter an add reason code if you want to print a report for this reason alone.
2. Enter beginning and ending dates for the report in the From and To fields.
3. Select *OK*. The system validates your entries and highlights any fields you need to correct. Correct the entries again.
4. The system submits the job PRT_OAAR, which produces the *Order Addition Audit Report*, and returns you to the previous screen.

Printing the Sales Tax Report by State (PSTX)

Purpose: Use the *State Tax Report* to review tax, GST, and PST totals by state for all debit invoices and credit invoices within a given date range.

Determining the shipping address:

- If there is a shipping address recorded in the Invoice Address table, the system uses this address to calculate the tax for the invoice. The system saves the shipping address in this table if the replace system control value is *selected*.
- If there is no shipping address in the Invoice Address table, the system determines the shipping address as follows:
  - If there is an order-level (temporary) shipping address, use this address.
  - If the order shipped to a Customer Sold To or to a permanent Customer Ship To, use the address that was in effect at the time of the shipment, based on any address changes recorded in the Customer Address Change table. See

Reviewing Customer Address Changes for more information on address change history. If there is no record of an address change since the date of the shipment, the current address provides the information for tax calculation.

How to display this screen: Enter *PSTX* in the Fast path field at the top of a menu or select Print Sales Tax Report by State from a menu.

Field	Description
Starting date	The first date to include on the report. Invoices and credits processed on this date or later will be included. The starting date cannot be later than the ending date. Numeric, 6 positions (in user date format); required.
Ending date	The last date to include on the report. Invoices and credits processed on this date or earlier will be included. The ending date cannot be later than the current date. Numeric, 6 positions (in user date format); required.

Printing the State Tax Detail Report (PSTD)

Purpose: Use the *State Tax Detail Report* to review invoices and credits by state for a given period, including details such as shipping and handling as well as state taxes and customer tax status.

Determining the shipping address:

- If there is a shipping address recorded in the Invoice Address table, the system uses this address to calculate the tax for the invoice. The system saves the shipping address in this table if the replace system control value is *selected*.
- If there is no shipping address in the Invoice Address table, the system determines the shipping address as follows:
  - If there is an order-level (temporary) shipping address, use this address.
  - If the order shipped to a Customer Sold To or to a permanent Customer Ship To, use the address that was in effect at the time of the shipment, based on any address changes recorded in the Customer Address Change table. See *Reviewing Customer Address Changes* for more information on address change history. If there is no record of an address change since the date of the shipment, the current address provides the information for tax calculation.

How to display this screen: Enter PSTD in the Fast path field at the top of any menu or select Print State Tax Detail Report from a menu.

Field	Description
Country	The country for which you want to run the report. Country codes are defined in and validated against the Country table; see *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; required.

Field	Description
State	The state or province for which you want to run the report. The report will include invoices for customers whose shipping address matches the state you enter. The state you enter must be valid for the country you selected, above. Alphanumeric, 2 positions; required.
Currency	The currency associated with the source code specified on the order header. Currency codes are defined in and validated against the Currency table; see *Working with Currency (WCUR)*. The default local currency specified in the System Control table appears here. The description of the currency appears to the right. This field appears only if the replace system control value is *selected*. Alphanumeric, 3 positions; required
Starting date	The first date to include on the report. Invoices and credits processed on this date or later will be included. The starting date cannot be later than the ending date. Numeric, 6 positions (in user date format); required.
Ending date	The last date to include on the report. Invoices and credits processed on this date or earlier will be included. The ending date cannot be later than the current date. Numeric, 6 positions (in user date format); required.

Printing the Order Demand/Sales Reports (PSSR)

Purpose: Use these reports to review order and demand information such as order number, merchandise total and gross margin for orders within a given date range. Available reports are:

- *Salesman Demand Report* by Date: open, held and shipped orders within the given date range and is sorted by salesman number.
- Salesman Shipped Report by Date: shipped and partially shipped orders within the given date range and is sorted by salesman number.
- Source Demand Report by Date: open, held and shipped orders within the given date range and is sorted by source code.
- *Source Shipped Report* by Date: shipped and partially shipped orders within the given date range and is sorted by source code.

Quotes: The system includes quotes in these reports. *Q* displays in the Order Status field for orders flagged as quotes. The Quantity Returned, Quantity Reserved, and Quantity Shipped totals are always *0* for quotes. See replace for more information.

How to display this screen: Enter PSSR in the Fast path field at the top of any menu or select Print Demand/Shipped Report from a menu.

Field	Description
Date from	The starting date from which you want to run this report. Orders entered on or after this date display on the report. You must enter a valid date that is not later than the ending date. Numeric, 6 positions (in user date format); required.

Field	Description
Date to	The ending date from which you want to run this report. Orders entered on or before this date display on the report. You must enter a valid date that is not earlier than the start date. Numeric, 6 positions (in user date format); required
Report option	The type of Order Demand/Sales report you wish to generate. Valid values are: • *Salesman Demand Report by Date* = This report displays order and demand information for open, held and shipped orders within the given date range and is sorted by salesman number. • *Salesman Shipped Report by Date* = This report displays order and demand information for shipped and partially shipped orders within the given date range and is sorted by salesman number. • *Source Demand Report by Date* = This report displays order and demand information for open, held and shipped orders within the given date range and is sorted by source code. • *Source Shipped Report by Date* = This report displays order and demand information for shipped and partially shipped orders within a given date range and is sorted by source code. Required

Item Purchase and Sales Aging Report (LIPS)

Purpose: Use the *Item Purchase and Sales Aging Report* to review purchase and sales history, such as open purchase order quantity and on hand quantity for items in a selected warehouse. This report places sales and receipt quantities into weekly aging buckets.

How to display this screen: Enter LIPS in the Fast path field at the top of any menu or select Item Purchase and Sales Aging Report from a menu.

Field	Description
Selected warehouse	The warehouse containing the items whose purchase and sales history you wish to review. Warehouse *1* defaults in this field. If you leave this field blank, the system displays purchase and sales information for items located in warehouse *0*. Numeric, 3 positions; optional.
Select vendor	The vendor whose purchase and sales history you wish to review. Leave this field blank if you wish to review purchase and sales information for all vendors. Numeric, 7 positions; optional.
On hand only	Identifies whether you want to review purchase and sales information for items containing an on hand quantity only. Valid values are: • *Unselected* = Display purchase and sales history for all items. • *Selected* = Display purchase and sales history for items containing an on hand quantity only.

Print Order Control Report (POCT)

Purpose: Use the *Operations Control Report* to review the flow of order activity and merchandising activity for a period of time. This report provides a high-level overview of the fulfillment process, identifies potential bottlenecks or problem areas, and delivers an audit trail of order activity.

The system uses the Order Control Summary table to track the total figures used to build this report; see *Reviewing Operations Control Summary (FLSH)*.

Periodic function to update backorder totals: You must include the *PFR0062* periodic function as part of your periodic processing to have correct and up-to-date ending order balance totals on the report. This periodic function must be run at the end of the day, when the background jobs have ended. In addition to performing this update to the table, the periodic function also submits the *ORDSUM* job, which generates the Order Control Report using the current date.

Order Control Report Screen

How to display this screen: Enter *POCT* in the Fast path field at the top of any menu, or select Print Order Control Report from a menu.

Field	Description
Start date	The first date to include on the report. Numeric, 6 positions (in user date format); required.
End date	The last date to include on the report. Numeric, 6 positions (in user date format); required.

Note:

Both dates must be earlier than the current date. The information on the report would be incomplete if you did not run the periodic process to update backorder totals. See above.

Completing this screen: Complete the start and end date fields and select *Submit*. The system submits the job *ORD_CONTRL*, which generates the *Operations Control Report*.

Printing the Held Order Report (PHOR)

Purpose: Use this option to print the *Held Order by Reason Code Report*, which lists held orders in your company. You can restrict the report to a particular hold reason code, pay type, or ship via priority.

Quotes: This report does not include held quotes.

Option in Modern View: You can also generate this report by selecting *Print Held Orders* at the **Manage Held Orders** page in Modern View.

Print Held Orders Report Screen

How to display this screen: Enter *PHOR* in the Fast path field at the top of any menu, or select Print Held Orders Report from a menu.

Field	Description
Reason code	Optionally, enter the code identifying the reason why an order is on hold, or leave this field blank to include held orders regardless of reason. Hold reason codes are defined in and validated against the Order Hold Reason Code table; see *Establishing Order Hold Reason Codes (WOHR)*. **Note:** The Awaiting Credit Card Auth (CW) hold reason is not included on the report. Alphanumeric, 2 positions; optional.
Pay type	Optionally, enter the code identifying the payment type used on the order, or leave this field blank to include held orders regardless of payment type. Pay types codes are defined in and validated against the Pay Type table; see *Working with Pay Types (WPAY)*. Numeric, 2 positions; optional.
Ship via priority	Optionally, enter the code identifying the *Priority (Ship via priority)* assigned to the ship via on the order, or leave this field blank to include held orders regardless of ship via priority. Numeric, 1 position; optional.

Completing this screen: Select *Submit* after completing any of the optional fields to submit the *HELD_ORDS* and *HO_RPT* jobs, which generate the *Held Order by Reason Code Report*.

Printing the Daily Business Status Report (DBST)

Purpose: Use this report to review a high-level summary of sales, cash, inventory, order activity, and shipments.

Daily Business Status Screen

To print: Enter a processing date in the Enter processing date field and select *Submit* to generate the *Daily Business Status Report*. The current date defaults in the Enter processing date field, but you can override it to a prior date.

Periodic function: You can also run the *Daily Business Status Report* periodic function (program name *ACR0178*) to generate this report; in this case, the report date is the current date.

How to display this screen: Enter *DBST* in the Fast path field at the top of a menu or select Daily Business Status Report from a menu to advance to the Daily Business Status screen.

Printing the Order Reconciliation Report (PORS)

Purpose: Use this menu option to print the *Order Reconciliation Report*, which summarizes the total number of orders, units, and merchandise dollars by status in your company.

Order Reconciliation Report Screen

How to display this screen: Enter *PORS* in the Fast path field at the top of any menu, or select Order Reconciliation Report from a menu.

Field	Description
Start date	The first date to include on the report. Numeric, 6 positions (in user date format); required.
End date	The last date to include on the report. Numeric, 6 positions (in user date format); required.

Completing this screen: Select *Submit* after completing the date fields to submit the *ORD_SUMMRY* job, which generates the *Order Reconciliation Report*.

Printing the Sales Journal by Currency Report (PSJC)

Purpose: Use this menu option to print the *Sales Journal by Currency Report* based on a selected invoice date range and optionally currency code. This report provides a detailed audit trail of all sales transactions for a specified invoice date range, including all shipments, returns, credits, and no charge sales transactions, grouped by currency, invoice date, pay plan type, and pay type. The system registers a sales transaction when a shipment occurs.

This report provides:

- a detailed listing of sales activity for a specified invoice date range and currency.
- totals for each currency, pay type, pay plan type, and invoice date in the local currency and the alternate (foreign) currency.
- a grand total across all pay types and currencies in the local currency.

Understanding this report: This report provides information about the individual charges on each invoice, grouped by currency, invoice date, payment plan, and pay type.

The individual order charges in the Merchandise, Freight, Additional freight, Tax, Handling, and Additional charge columns on the left side of the report are totaled in the Total invoice field on the right side of the report.

This report provides totals for the number of credits (refunds) and invoices (shipments) for each currency, invoice date, payment plan type, pay type combination. A page break occurs between each currency, invoice date, payment plan type, pay type combination. A grand total displays at the end of the report.

Print Sales Journal by Currency Screen

Use this screen to select the invoice date range and currency code(s) to print on the Sales Journal by Currency report. If you do not select a currency code, the system prints the report for all currencies based on the invoice date range you define.

How to display this screen: Enter *PSJC* in the Fast path field at the top of a menu or select Print Sales Journal by Currency from a menu.

Field	Description
Invoice date range	The date range for which you wish to run this report. The invoice date range represents the dates on which shipments occurred. Both fields default to the current date. Numeric, 6 positions (in user date format); required.
Currency code	The currency associated with the invoices you wish to print on the report. Only invoices and invoice credits associated with the currency you select, print on the report. Leave this field blank if you wish to print the report for all currencies, based on the invoice date range you define. The currency associated with the invoice is defined in the Order Header Extended table. The conversion rate is also stored in this table. If the currency code and conversion rate in the Order Header Extended table are blank, the invoice is for the local currency. Currency codes are defined in and validated against the Currency table. Alphanumeric, 3 positions; optional.

Enter or verify the date range for which you wish to print the *Sales Journal by Currency Report*. The current date defaults. Select *Submit* to generate the report. A message indicates that the job has been submitted.

Printing the Held Orders by Pay Type Report (PHOP)

Purpose: Use the *Held Order by Pay Type Report* to obtain a list of the orders that are on hold for the specified payment type.

Print Held Orders by Pay Type Prompt Screen

How to display this screen: Enter *PHOP* in the Fast Path field at the top of any menu or select the Print Held Orders by Pay Type option from a menu.

Field	Description
Pay type	A code that represents the method by which the customer paid for the order. Pay type codes are defined in and validated against the Pay Types table. Enter the appropriate pay type code to submit the *Held Order by Pay Type Report*. The system checks the status of each open order that uses this pay type and includes only those orders in a *DH* (dollar hold) status in this report. Numeric, 2 positions; required.

Printing the Exchange Reason Report (PERR)

Purpose: Use this screen to generate the *Exchange Reason Report*, which you can use to review exchanges processed using various reason codes for a range of dates, including total units exchanged and dollar value. Your options in generating the report include:

- restricting the report to one exchange reason code, or including all codes
- listing the items that were exchanged

The report lists the total dollars exchanged based on the actual selling prices of the items returned for exchange. It does not indicate the prices of the replacement items.

Report based on order line history: When you generate the report, you need to specify a date range for selection. The report includes exchanges processed within the date range you enter, regardless of when the order was first created or when you ship the replacement item. The exchange date is determined by the Order Line History record for the exchange. You can review order line history at the *Display Order Line History Screen*.

> **Note:**
>
> If you use *Working with Return Authorizations (WRTA)*, it is possible to create, receive, and credit an exchange on different dates. In this case, the date range is based on the date you receive the return, because that is when the Order Line History record is created.

Print Exchange Reason Report Screen

How to display this screen: You can display this screen by entering *PERR* in the Fast path field at the top of a menu, or by selecting Print Exchange Reason Report from a menu.

Field	Description
Start date	Enter the first order date to include on the report. Must be on or before the End date, below. The report includes exchanges processed on that date or later, regardless of when the order was originally created. Based on the Date from the Order Line History table; see the *Display Order Line History Screen* for more information. **Note:** If you use *Working with Return Authorizations (WRTA)*, this is the date you receive the exchange, which might differ from the date you create or credit the return authorization for the exchange, or ship the replacement item. Numeric, in user date format; required.
End date	Enter the last order date to include on the report. Must be on or after the Start date. See the discussion of the Start date, above, for more information. Numeric, in user date format; required.
Exchange reason	Optionally, enter an exchange reason code to limit the report to that code. If you leave this field blank, all exchange reason codes are eligible for inclusion on the report. Exchange reason codes are defined in and validated against the Exchange Reason table; see *Establishing Exchange Reason Codes (WEXR)* for more information. Alphanumeric, 1 position; optional.
Include item	Optionally, select this flag to have the report list the items exchanged. • *Selected* = The report lists the items exchanged. • *Unselected* = The report does not list items.

Completing this screen: To generate the *Exchange Reason Report*:

- Complete the Start date and End date to specify the range of dates to include on the report.
- Optionally, select an Exchange reason or the Include item flag.
- Select *Print Report* to submit the EXCH_RSN job, which generates the report.

> **Note:**
>
> If there are no order lines that meet the selection criteria you enter, the job does not produce a report. No empty report is generated.

See the field descriptions above for more information.

Printing the Price Override Reason Report (PROR)

Purpose: Use this screen to generate the *Price Override Reason Report*, which you can use to review the price override reason codes used to discount items for a range of dates, and the total discount amounts and percentages applied. Your options in generating the report include:

- restricting the report to one price override reason code, or including all codes whose *Exclude from price override report* field is unselected
- listing the ID's of the users who applied the price overrides, listing the items whose prices were overridden, or listing both user ID's and items

Report based on order date, not price override date: When you generate the report, you need to select a date range for selection. The report includes orders that originated within the date range you enter, although the price override might not have been applied within that date range (for example, if you changed, added, or returned an order line at a later date).

Excluding price override reason codes: The system excludes any price override reason codes whose *Exclude from price override report* field is selected; for example, you may wish to exclude system-assigned price override reason codes, such as *Default Price Override Reason (B35)*, from the report; see *Default Price Override Reasons* for a list of system-assigned codes specified in system control values. You can also limit the report to a single code by completing the Price override reason field at the *Print Price Override Reason Report Screen*.

Discount amount and percentage based on item offer: The discount amounts and percentages listed on the report are determined by comparing the Item offer price from the Order Detail table with the actual price after applying the price override. If the *Override item offer price* flag for a price override reason code is selected, the system changes the Item offer price in the Order Detail table to be the same as the actual selling price; as a result, the discount amount and percentage in this case are both zero.

The report does not list any discounts that were not applied using a price override reason code.

In this topic:

1. *Identifying the User who Applied the Price Override*
2. *Print Price Override Reason Report Screen*

Identifying the User who Applied the Price Override

To identify the user who applied the price override, the system checks:

1. Order Line History? If there is no Order Line History record for the order line, this indicates that the price override was applied at initial order creation, so use the User ID on the Order Header. Otherwise, if there are any Order Line History records:

2. D (Discount) Order Line History? If there is an Order Line History record indicating that a discount was applied after shipment, use the User ID for that record; otherwise,

3. W (Price override) Order Transaction History message? If there is one or more Order Transaction History messages indicating a price override for the order line (for example, `User price override - Order line 2)`, use the User ID associated with the *first* Order Transaction History message.

Example: User EJOHNSON changes the price of an order line using price override reason code Z. Later that day, user HBROWN changes the price again, using price override reason W. The report lists the current reason code of W and the first user ID of EJOHNSON.

> **Note:**
>
> - The system writes a price override Order Transaction History message whenever a user makes any change to an order in order maintenance if there is already a price override reason applied to an order line.
> - The line number specified in the Order Transaction History message indicates the order line sequence number, and this is the number used to identify the order line for the price override. This sequence number is typically the same as the order line number, but might differ depending on updates made to the order.

Otherwise, if there is no Order Transaction History message for a price override,

4. A (Add) Order Line History but no subsequent changes? If there is an Order Line History record indicating that the order line was added after initial order creation, use that User ID; otherwise,

5. G (Change) Order Line History? If there are any *Change* Order Line History records indicating that the order line was changed after creation, use that User ID.

Print Price Override Reason Report Screen

How to display this screen: Enter *PROR* in the Fast path field at the top of any menu, or select Print Price Override Reason Report from a menu.

Field	Description
Start date	Enter the first order date to include on the report. Must be on or before the End date, below. The report includes orders that were originally created on that date or later, regardless of when the price override was applied. Based on the Order date from the Order Header. Numeric, in user date format; required.
End date	Enter the last order date to include on the report. The report includes orders that were originally created on that date or earlier, regardless of when the price override was applied. Based on the Order date from the Order Header. Numeric, in user date format; required.

Field	Description
Price override reason	Optionally, enter a price override reason code to limit the report to that code. An error message displays if you enter a price override reason code whose *Exclude from price override report* field is selected: `Reason is currently flagged to be excluded from reports - select another.` If you leave this field blank, all price override reason codes whose *Exclude from price override report* field is unselected are eligible for inclusion on the report. Price override reason codes are defined in and validated against the Price Override Reason table; see *Establishing Price Override Reason Codes (WPOR)* for more information. Alphanumeric, 1 position; optional.
Include users	Optionally, select this flag to have the report list the users who applied price overrides. • *Selected* = The report lists users who applied price overrides if the report includes all price overrides, there is a summary for each user. • *Unselected* = The report does not list users.
Include items	Optionally, select this flag to have the report list the item that received the price override. • *Selected* = The report lists the items that received price overrides. • *Unselected* = The report does not list items.

Completing this screen: To generate the *Price Override Reason Report*:

- Complete the Start date and End date to specify the range of original order dates to include on the report.
- Optionally, select a Price override reason, or the Include users or Include items flags.
- Select *Print Report* to submit the PRC_OVR job, which generates the report.

> **Note:**
>
> If there are no order lines that meet the selection criteria you enter, the job does not produce a report. No empty report is generated.

See the field descriptions above for more information.

Printing the Return Reason Report (PRRR)

Purpose: Use this screen to generate the *Return Reason Report*, which you can use to review returns processed using various reason codes for a range of dates, including total units returned and dollar value. Your options in generating the report include:

- restricting the report to one return reason code, or including all codes
- listing the items that were returned

Report based on order line history: When you generate the report, you need to specify a date range for selection. The report includes returns processed within the date range you enter, regardless of when the order was first created. The return date is determined by the Order Line History record for the return. You can review order line history at the *Display Order Line History Screen*.

> **Note:**
>
> If you use *Working with Return Authorizations (WRTA)*, it is possible to create, receive, and credit a return on different dates. In this case, the date range is based on the date you receive the return, because that is when the Order Line History record is created.

Print Return Reason Report Screen

How to display this screen: You can display this screen by entering *PRRR* in the Fast path field at the top of a menu, or by selecting Print Return Reason Report from a menu.

Field	Description
Start date	Enter the first order date to include on the report. Must be on or before the End date, below. The report includes returns processed on that date or later, regardless of when the order was originally created. Based on the Date from the Order Line History table; see the *Display Order Line History Screen* for more information. **Note:** If you use *Working with Return Authorizations (WRTA)*, this is the date you receive the return, which might differ from the date you create or credit the return authorization. Numeric, in user date format; required.
End date	Enter the last order date to include on the report. Must be on or after the Start date. See the discussion of the Start date, above, for more information. Numeric, in user date format; required.
Return reason	Optionally, enter a return reason code to limit the report to that code. If you leave this field blank, all return reason codes are eligible for inclusion on the report. Return reason codes are defined in and validated against the Return Reason table; see *Establishing Return Reason Codes (WRTR)* for more information. Alphanumeric, 1 position; optional.
Include item	Optionally, select this flag to have the report list the items that were returned. • *Selected* = The report lists the items returned. • *Unselected* = The report does not list items.

Completing this screen: To generate the *Return Reason Report*:

- Complete the Start date and End date to specify the range of dates to include on the report.
- Optionally, select a Return reason or the Include item flag.
- Select *Print Report* to submit the RET_RSN job, which generates the report.

> **Note:**
>
> If there are no order lines that meet the selection criteria you enter, the job does not produce a report. No empty report is generated.

See the field descriptions above for more information.

Displaying Open Orders by Item (DOOI)

Purpose: Use this on-line inquiry to identify orders that contain a specific item and to evaluate item statistics such as quantities ordered and reserved for that item.

You can also use this option to advance to standard Order Inquiry for a specific order, or to find out about pending purchase orders for a backordered item.

Quotes: This menu option also allows you to review item statistics on quotes; see *Entering Pre-Order Quotes*.

In this topic:

- *Open Orders by Item Screen (Selecting an Item for Review)*
- *Display Open Orders by Item Screen*
- *Display Open Purchase Orders Screen*

Open Orders by Item Screen (Selecting an Item for Review)

Use this screen to select the item you would like to research for open orders or purchase order information.

How to display this screen: Enter *DOOI* in the Fast path field or select this option from a menu.

> **Note:**
>
> You must enter complete and accurate information in both the Item and the SKU fields if applicable.

Field	Description
Item	Represents a unit of inventory. Alphanumeric, 12 positions; required.
SKU (Stock keeping unit; an unlabeled field to the right of the item number)	The style of the item, such as its color and size. Alphanumeric, three 4-position fields; required for any item with a SKU.

Display Open Orders by Item Screen

Use this screen to evaluate open orders for a specific item by quantity, age, and reason for backorder. You can also advance from this screen to standard Order Inquiry for a specific order or display open purchase orders for the item. **How to display this screen:** Enter a complete item code and SKU, if any, at the *Display Open Orders by Item Screen*.

Field	Description
Description (Unlabeled field to the right of the SKU field)	Text that describes the item. Alphanumeric, 120 positions; display-only
Order #	A unique number that the system assigns each order. Numeric, 7 positions; display-only.
St # (Ship To Number)	The number of the shipping address for the order. The system assigns a ship to suffix for each shipping address on an order. Numeric, 3 positions; display-only.
Ln # (Line number)	The item's order detail line number. Numeric, 3 positions; display-only.
Days old	The age of the order in days. Numeric, 5 positions; display-only
Quantity	Three status fields for the order detail line. These fields are: **Ordered** The quantity of the item on the order line. Numeric, 7 positions; display-only. **Reserved** The total reserved quantity of the item on the order line. Numeric, 7 positions; display-only. **Shipped** The total quantity of the item on the order line that has shipped to date. Numeric, 7 positions; display-only.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Rsn cde (Reason code)</td><td>Represents the reason the item is on backorder.
Valid values are:
blank = Order detail line is not backordered.
D = Item is a drop ship item that is not kept in your inventory, and will be sent to the customer directly from your vendor.
F = Item is a future order, as determined by the order's arrival date.
The system will not “tie-up” inventory that can be matched to current orders if the order will not ship for a period of time. The system uses the following calculation to identify future orders:
<code>Arrival date - Reservation lead days = Date</code>
The system will not reserve inventory if the system-calculated date is greater than today's date.
Normally, the Evaluate Future Orders program runs each evening during a periodic process to evaluate each order detail line identified as a “future” order. The system reruns the arrival date calculation and reserves inventory if the system-calculated date is less than or equal to today's date.
I = No Item/Warehouse record or no allocate; you have not defined a warehouse for this item or the warehouse you have assigned to this item is a non-allocatable warehouse.
W = No warehouse specified; you have not identified the warehouse from which you want to reserve the inventory.
N = Non-allocatable warehouse; inventory cannot be shipped from this warehouse.
O = Not enough inventory available in the warehouse to fulfill the entire order quantity.
S = Not selected batch reservation; you are using Batch Reservation (as opposed to Immediate Reservation, which reserves inventory during Order Entry) and you have not run the Batch Reservation program.</td></tr>
</table>

Field	Description
	• *B* = Reservation bypassed; the customer is excluded from normal reservations (Immediate or Batch Reservation) based on the setting of the Hold/Bypass/Fraud field. You must reserve inventory on a selective basis, using the Interactive Reservation program to reserve or unreserve inventory. Typically, customers who buy in large quantities are set up to bypass reservation so that they do not deplete your available stock when they place their orders. *Note:* If the *Use OROB for Fulfillment Assignment (M31)* system control value is selected, the system uses the Bypass reservation flag to send items to Order Orchestration for fulfillment assignment. • *L* = SKU Reserve limit exceeded. The customer has ordered a quantity equal to or greater than the item's Reserve quantity. Any order quantity above this value will not be reserved by the Immediate or Batch Reservation program and must be reserved selectively through the Interactive Reservation program. You may define a Reserve quantity limit for items that you carry in limited quantities or for items that are in great demand. • *U* = Interactive unreserve; an order detail line can be unreserved when you upload an inventory transaction through the *Generic Inventory Transaction Upload*, or through *Reprinting and Voiding Pick Slips (WVRP or WSVP)*. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Alphanumeric, 1 position; display-only.
Description	Text that explains the meaning of the backorder reason code. Alphanumeric, 25 positions; display-only

Screen Option	Procedure
Display an order	Select *Display* for an order to advance to *Order Inquiry Header Screen* or the *Order Inquiry Detail Screen*, depending on the setting of the *Default Version for Order Inquiry (C34)* system control value.
Display open purchase orders for an item	Select *Display Open POs* to advance to the *Display Open Purchase Orders Screen*.

Display Open Purchase Orders Screen

Use this screen to obtain information about the unreceived or partially received purchase orders for an item. This screen includes the purchase order numbers, vendors, quantities and expected delivery dates for the item.

How to display this screen: Select *Display Open POs* at the *Display Open Orders by Item Screen*.

Field	Description
Whs (Warehouse)	The warehouse to which the item will be delivered. Numeric, 3 positions; display-only.

Field	Description
PO#	The number of the purchase order on which the item was ordered from the vendor. Numeric, 7 positions; display-only
Ln# (Line number)	The line number of item on the purchase order. Numeric, 3 positions; display-only
Vendor #	A code to identify the supplier of the item. Vendor codes are defined in and validated against the Vendor table. See Working with Vendors (WVEN). Numeric, 7 positions; display-only.
Name	The name of the vendor associated with the vendor number. **Note:** This field is blank if the *Vendor Name Display (D41)* system control value is *unselected*. Alphanumeric, 30 positions; display-only.
Qty due (Quantity due)	The number of units of the item expected in the shipment. Numeric, 7 positions; display-only.
Date	The date when the shipment of the item is expected. Numeric, 6 positions (in user date format); display-only.

Display Held Order Summary (DHOS)

Purpose: Use this function to review the total held number of orders and unbilled dollar totals for each order hold reason code.

Update summary table: The Held Order Summary table stores held order totals. You must submit a batch program to update this table with current totals. The totals that display on the Held Order Summary screen are only as current as the last time you ran this batch update.

Quotes: The # Orders and Dollars totals in this menu option does not include quotes that are on hold.

Modern View option: See the Modern View online help for information on the **Held Order Summary** page available in Modern View. Authority to the Held Order Summary page in Modern View is also controlled by the DHOS fast path.

Held Order Summary Screen

How to display this screen: Enter *DHOS* in the Fast path field at the top of any menu, or select Display Held Order Summary from a menu.

> **Note:**
>
> Each field on this screen is blank if you have not yet submitted the batch update to the Held Order Summary table.

Field	Description
Date last updated	The date and time when you most recently updated the Held Order Summary table. The totals provided for each hold reason code are current as of this date and time. Date: numeric, 6 positions (in user date format); display-only. Time: numeric, 6 positions (HH:MM:SS format); display-only.
Hold reason	The reason code that identifies why the order is held. Hold reason codes are defined in and validated against the Order Hold Reason table; see *Establishing Order Hold Reason Codes (WOHR)*. Alphanumeric, 2 positions; optional.
System hold	Indicates whether the orders were held automatically by the system, or a user put the orders on hold. Valid values are: • *selected* = The system put these orders on hold automatically. • *unselected* = Operators put these orders on hold. If your operators use a code that the system also uses automatically, there will be two totals for the hold reason: one for all system-assigned holds, and one for non-system-assigned (that is, user) holds. See *Introducing Order Hold Reason Codes*.
Description	The description of the order hold reason code. This field is blank for an order hold reason code if the system has assigned it to orders automatically, but you have not built the reason code in the Order Hold Reason Code table. Alphanumeric, 50 positions; display-only.
# orders	The total number of orders on hold with this hold reason code. Each held order increases this total by one, regardless of the number of recipients. Numeric, 8 positions; display-only.
Dollars	The total value of orders on hold with this hold reason code. This total includes merchandise, freight, tax, handling, additional charges, and any other charges (such as additional freight and duty) that make up the order total). **Note:** If you process orders in multiple currencies (the *Multi Currency by Offer (E03)* system control value is *selected*), the order total will be converted into your local currency. Numeric, 20 positions with a 2-place decimal; display-only.

Screen Option	Procedure
Review orders held for a particular hold reason code	Select *Disp Orders* for a hold reason code to advance to the Release Held Orders by User Hold Screen (if you select a user hold) or the Release Held Orders by System Hold Screen (if you select a system hold). See Selecting Held Orders (ERHO).
Submit the batch update to the Held Order Summary table	Select *Submit Update* to submit the *HLDORD_SUM* job, which updates the table with current held order totals.

Ship Via/Item Inquiry (SVII)

Purpose: The Ship Via/Item Inquiry menu option allows you to review how many shippable orders you currently have for a shipper, broken out by item. You might use this information to determine whether a bulk mailing may be appropriate for certain items.

Batch job: You must run a batch job to collect information on the current number of available order lines for each item/ship via combination in your company before you can review or print the information. You can run this batch job through the Ship Via/ Item Inquiry menu option, or by adding the periodic function SUMVIA to your periodic processing, using the program name OER1024.

Summary tables: The batch job populates the Ship Via/Item Summary Header (OESVIH) and Ship Via/Item Summary Detail (OESVID) tables. For a brief period during this process, you will be locked out of the Ship Via/Item Inquiry menu option while the system updates the summary information. If someone is already using the inquiry menu option when the system is ready to complete the batch job and update the summary tables, the batch job will go into a “delay” status, checking every 15 seconds to see if the user has exited the inquiry screens so that the update can be processed.

Review summary information: Use the Ship Via/Item Inquiry menu option to review the total open orders, shippable units, and oldest arrival dates for each item with a particular ship via assigned. An additional screen, where you can review the number of orders and units for each arrival date, is also available.

Reporting: You can print a report listing all shippable items by ship via code, or the items assigned to a particular ship via code only.

Which order lines are included? Ship Via/Item Inquiry and the related reports include any order line quantity that is reserved and unprinted. Both open and held order lines are included. The system uses the ship via code on the order header, unless there is a ship via override for the order line.

In this topic:

- *First Inquiry by Ship Via/Item Screen*
- *Second Inquiry by Ship Via/Item Screen*
- *Third Inquiry by Ship Via/Item Screen*
  - *Ship Via/Item Header Report*
  - *Ship Via/Item Detail Report*

First Inquiry by Ship Via/Item Screen

Purpose: Use this screen to:

- populate the Ship Via/Item Summary tables with up-to-date information
- advance to the *Second Inquiry by Ship Via/Item Screen* so you can review shippable items for a particular ship via
- generate the *Ship Via/Item Header Report* for all ship via codes in your company.

See *Ship Via/Item Inquiry (SVII)*.

How to display this screen: Enter SVII in the Fast path field at the top of any menu or select Ship Via/Item Inquiry from a menu.

Field	Description
Ship via	A code to identify a shipper who delivers merchandise for you to your customers. Enter a valid ship via code to advance to the *Second Inquiry by Ship Via/Item Screen*. Ship via codes are defined in and validated against the Ship Via table; see *Working with Ship Via Codes (WVIA)*. Numeric, 2 positions; required to advance to the second Inquiry by Ship Via/Item screen.
Last update (Last update information)	The date and time when the Ship Via/Item Summary tables were last updated, and the user ID of the person who generated the batch update. If these fields are blank, the batch job to populate the summary tables has never been run in your company. Date: numeric, 6 positions (in user date format); display-only. Time: numeric, 6 positions (HH:MM:SS format); display-only.

Summary table update: If the UPDSVITM batch job to update the summary tables is running, you will not be unable to advance to the *Second Inquiry by Ship Via/Item Screen* or print the *Ship Via/Item Header Report* during the time it takes to copy the updated information into the summary tables. Instead, an error message indicates:

The summary files are being updated and cannot be viewed or printed. When the file update is complete, you will be able to advance to the second screen or print a summary report.

Screen Option	Procedure
Update the Ship Via/Item Summary tables	Select *Update Summary File* to generate the UPDSVITM batch job, which populates the Ship Via/Item Summary Header and Detail tables with up-to-date information.
Print a list	Select *Print List (all ship via)* to print the *Ship Via/Item Header Report*.

Second Inquiry by Ship Via/Item Screen

Purpose: Use this screen to review the total number of shippable orders and units, and the oldest order arrival date, for all items assigned to a particular ship via.

How to display this screen: Complete the Ship via field at the *First Inquiry by Ship Via/Item Screen*.

Field	Description
Ship via	The ship via code you entered at the *First Inquiry by Ship Via/Item Screen*. The ship via description appears to the right. Ship via: numeric, 2 positions; display-only. Ship via description: alphanumeric, 30 positions; display-only.
Item	A code representing the unit of inventory that you sell. The items that display are either on orders with the selected ship via assigned at the header level, or have a ship via override for this particular item on the order. Alphanumeric, 12 positions; optional.
SKU	The item's unique characteristics, such as color or size. The labels that appear above the SKU field(s) are defined in the *Split SKU Values (B32)* system control values. Alphanumeric, three 4-position fields; optional.
Total orders	The total number of orders containing reserved, unprinted units of this item or SKU that are assigned to the ship via code you selected at the *First Inquiry by Ship Via/Item Screen*. Numeric, 5 positions; optional.
Total units	The total number of reserved, unprinted units of this item or SKU that are assigned to the ship via code you selected at the *First Inquiry by Ship Via/Item Screen*. Numeric, 7 positions; optional.
Oldest arrival (Oldest arrival date)	The earliest arrival date for all shippable orders of the item or SKU. The arrival date is when the customer wants to receive this item. The current date defaults in order entry; however, you can override the default and enter a future date. The system performs a calculation that projects the total processing and shipping time to determine when it will need to reserve the items and make them available for pick slip preparation. See *Working with Items on the Order*. Numeric, 6 positions (in user date format); optional.
Description (Unlabeled field below the item code field)	The description of the item. Alphanumeric, 120 positions; optional.

Screen Option	Procedures
Display order totals	Select *Display Totals* for an item or SKU to advance to the *Third Inquiry by Ship Via/Item Screen*.
Print a report	Select *Print List* to print the *Ship Via/Item Header Report*.

Third Inquiry by Ship Via/Item Screen

Purpose: Use this screen to review the total shippable orders and units for an item or SKU/ship via combination, broken out by arrival date.

How to display this screen: Select *Display Totals* for an item or SKU at the *Second Inquiry by Ship Via/Item Screen*.

Field	Description
Ship via	The ship via code you entered at the first Inquiry by Ship Via/Item screen. The ship via description appears to the right. Ship via: numeric, 2 positions; display-only. Ship via description: alphanumeric, 30 positions; display-only.
Item	The item you selected at the *Second Inquiry by Ship Via/Item Screen*. Alphanumeric, 12 positions; display-only.
SKU	The item's unique characteristics, such as color or size. Alphanumeric, three 4-position fields; display-only.
Item description	The description of the item. Alphanumeric, 120 positions; display-only.
Arrival date	The date when the customer wants to receive this item. The current date defaults in order entry; however, you can override the default and enter a future date. The system performs a calculation that projects the total processing and shipping time to determine when it will need to reserve the items and make them available for pick slip preparation. See *Working with Items on the Order*. Numeric, 6 positions (in user date format); optional.
Total orders	The total number of orders with the arrival date indicated. An order may be counted more than once if there is an override arrival date for one or more of the same order lines for the selected item. Numeric, 5 positions; optional.
Total units	The total number of units with the arrival date indicated. Numeric, 7 positions; optional.

Screen Option	Procedure
Print a report	Select *Print List* to print the *Ship Via/Item Detail Report*.

Printing Backorder Reports by Descending Dollars (PBOD)

Purpose: Use this screen to define the selection criteria you wish to use to print one of the Backorder Reports by Descending Dollars. These reports print the total number of orders with at least one order detail line on backorder, based on the selection criteria you defined. You can use these reports to determine the total value of backorders in each entity, division, offer, or warehouse.

Quotes: These reports do not include backorders on quotes; see *Entering Pre-Order Quotes*.

Backorder Reports by Descending Dollars:

- *Backorder Report by Descending Dollars by Entity/Warehouse* (sorts in entity/warehouse/ item/descending dollar sequence and displays backordered order detail lines for each entity).
- *Backorder Report by Descending Dollars by Division/Warehouse* (sorts in division/ warehouse/item/descending dollar sequence and displays backordered order detail lines for each division).

- *Backorder Report by Descending Dollars by Offer/Warehouse* (sorts in offer/warehouse/item/descending dollar sequence and displays backordered order detail lines for each offer).
- *Backorder Report by Descending Dollars by Warehouse* (sorts in warehouse/item/descending dollar sequence and displays backordered order detail lines for each warehouse).

Backorder Report by Descending Dollars Screen

How to display this screen: Enter *PBOD* in the Fast path field at the top of any menu or select Print B/O Reports by Descending Dollars from a menu.

Field	Description
Select offer for pricing	The code for the offer you wish to use to determine the selling price of an item on this report. The last offer entered defaults. Offer codes are validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required.
By entity/whse	Indicates if you wish to print the Backorder Report by Descending Dollars By Entity/Warehouse. Valid values are: • *YES* = Print the *Backorder Report by Descending Dollars by Entity/Warehouse*. • *NO* = Do not print the Backorder Report by Descending Dollars by Entity/Warehouse. The last value entered defaults.
Entity (unlabeled field to the right of the	A code for the entity for which you wish to generate the Backorder Report by Descending Dollars By Entity/Warehouse. Enter an entity code in this field if you wish to only include backorder information associated with this entity. Leave this field blank if you wish to include backorder information for all entities. The last entity entered, if any, defaults. Entity codes are validated against the Entity table. Numeric, 3 positions; optional.
By division/whse	Indicates if you wish to print the Backorder Report by Descending Dollars by Division/Warehouse. Valid values are: • *YES* = Print the *Backorder Report by Descending Dollars by Division/Warehouse*. • *NO* = Do not print the Backorder Report by Descending Dollars by Division/Warehouse. The last selected setting defaults.

Field	Description
Division (unlabeled field to the right of the	A code for the division for which you wish to generate the Backorder Report by Descending Dollars by Division/ Warehouse. Enter a division code in this field if you wish to only include backorder information associated with this division. Leave this field blank if you wish to include backorder information for all divisions. The last division entered, if any, defaults. Division codes are validated against the Division table. Alphanumeric, 2 positions; optional.
By offer/whse	Indicates if you wish to print the Backorder Report by Descending Dollars by Offer/Warehouse. Valid values are: • *YES* = Print the *Backorder Report by Descending Dollars by Offer/Warehouse*. • *NO* = Do not print the Backorder Report by Descending Dollars by Offer/Warehouse. The last value entered defaults.
Offer (unlabeled field to the right of the	A code for the offer for which you wish to generate the Backorder Report by Descending Dollars by Offer/Warehouse. Enter an offer code in this field if you wish to only include backorder information associated with this offer. Leave this field blank if you wish to include backorder information for all offers. The last offer entered, if any, defaults. Offer codes are validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; optional.
By warehouse	Indicates if you wish to print the Backorder Report by Descending Dollars by Warehouse. Valid values are: • *YES* = Print the *Backorder Report by Descending Dollars by Warehouse*. • *NO* = Do not print the Backorder Report by Descending Dollars by Warehouse. The last value entered defaults.
Warehouse (unlabeled field to the right of the	A code for the warehouse for which you wish to generate the Backorder Report by Descending Dollars by Warehouse. Enter a warehouse code in this field if you wish to only include backorder information associated with this warehouse. Leave this field blank if you wish to include backorder information for all warehouses. The last warehouse entered, if any, defaults. Warehouse codes are validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Alphanumeric, 3 positions; optional.

Screen Option	Procedure
Generate the Backorder Report by Descending Dollars, based on the selection criteria you defined.	Select *Accept*.

Reviewing Operations Control Summary (FLSH)

Purpose: Use the Operations Control Summary screens to review order and merchandising summary information for a selected date; you can review the flow of orders from entry through shipment to determine the health of your business. This menu option provides a high-level overview of the fulfillment process, identifies potential bottlenecks or problem areas, and delivers an audit trail of order activity.

Quotes: This menu option does not include information on quotes; see *Entering Pre-Order Quotes*.

Modern View page: The **Operations Summary** page in Modern View displays much of the same totals as the *First Operations Control Summary Screen*, as well as average values for each type of activity and bar charts illustrating the percentages of units, orders, and merchandise value represented for each activity.

This Modern View page is also controlled by access to the FLSH menu option, and is available from the Modern View **Home** page.

See the Modern View online help for more information.

In this topic:

- *Defining Thresholds*
- *Updating Operations and Merchandising Summary Totals*
- *Display Operations Control Summary Screen*
- *First Operations Control Summary Screen*
- *Second Operations Control Summary Screen*

You can review the number, units, and amount totals for the following information:

- orders:
  - entered
  - cancelled
  - soldout
  - shipped
  - returned
  - exchanged
  - held
  - suspended; also the number of suspended batches
  - open backordered
  - held backordered
  - open printed

  - held printed
  - open reserved
  - held reserved
- pending pick slips
- pending RA:
  - receipts
  - credits
- pending refunds
- backordered items
- purchase orders:
  - open
  - held
  - docked
  - open past due
  - held past due
  - docked past due
- inventory in:
  - suspense receipt
  - pending putaway
  - staging warehouse

Screen flow: The screen that opens when you first enter the Operations Control Summary menu option varies, depending on whether the Batch Order Control job was submitted for the day. See *Updating Operations and Merchandising Summary Totals* for more information on the Batch Order Control job.

- If the Batch Order Control job has not yet been submitted for the day, the *Display Operations Control Summary Screen* opens when you first enter the Operations Control Summary menu option.
- If the Batch Order Control job has already been submitted for the day, the *First Operations Control Summary Screen* opens when you first enter the Operations Control Summary menu option.

Defining Thresholds

You can define thresholds to monitor the numbers and/or amounts of operational and merchandising summary totals. The system compares the actual number and/or amount for the threshold against the threshold number and/or amount you defined; if the threshold you have defined is breached, the system generates the *Threshold Monitor Breach Email*.

Example: One of the system delivered thresholds is Backorders (*BO*). This threshold monitors the number of open orders and held orders that contain at least one unit on backorder and/or the merchandise amounts of backordered units on open or held orders. You can set this threshold to send an email to the warehouse supervisor when the number of open and held orders that contain at least one unit on backorder is greater than 100. Once the actual number of open and held orders containing a backordered item is 101, the system sends an email to the warehouse supervisor.

For more information: See *Working with Threshold Values (WTHR)* for more information on system delivered thresholds and how to define your own thresholds.

Updating Operations and Merchandising Summary Totals

Updating order activity totals for the selected date and accounting period: The system updates the information on the top part of the *First Operations Control Summary Screen* (order activity by date and accounting period) as changes occur in order activity and are processed through the Order Async and Billing Async. You can select *Refresh screen* to update the order activity totals displayed on the screen with any changes that may have occurred since you first entered the screen.

The system interactively updates the number, units, and amounts totals of the following order activity information:

orders:

- entered
- cancelled
- soldout
- shipped
- returned
- exchanged

Totals display for the selected date and accounting period.

- *Drop ship items* update the order activity totals as well as items that you ship from your warehouse.
- *Non-inventory items:* The setting of the *Demand Update for Non-Inventoried Items (E59)*system control value does not affect how the system calculates the order activity totals; non-inventory items update each total regardless of this setting.
- *Update demand for order maintenance:* The setting of the Update Demand for Order Maintenance Transactions (C72) system control value does not affect how the system calculates the order activity totals.
- *Excluded from totals:* Retail pickup and delivery orders that fulfill orders originating in Order Administration and submitted to Order Orchestration for assignment are excluded from these totals. These are orders whose *Alt ord* indicates an originating order number, and whose *Broker delivery type* is Delivery or Retail Pickup.
- *Currency:* Totals are displayed in the *Local Currency Code (A55)*.

Updating operations control summary totals: The Batch Order Control job (*ORD_CONTRL*) updates the operations and merchandising summary totals. You can review operations totals on the bottom part of the *First Operations Control Summary Screen* and the *Second Operations Control Summary Screen*.

The Batch Order Control job updates the number, units, and amounts totals of the following operations and merchandising information:

- orders:
  - open
  - held

  - suspended (also the number of suspended batches)
  - open backordered
  - held backordered
  - open printed
  - held printed
  - open reserved
  - held reserved
- pending pick slips
- pending RA:
  - receipts
  - credits
- pending refunds
- backordered items
- purchase orders:
  - open
  - held
  - docked
  - open past due
  - held past due
  - docked past due
- inventory in:
  - suspense receipt
  - pending putaway
  - staging warehouse

Submitting the Batch Order Control job: The system submits the Batch Order Control job when:

- you select *Update current totals* on the *First Operations Control Summary Screen*, *Second Operations Control Summary Screen*, or *Display Operations Control Summary Screen* in the Operations Control Summary (*FLSH*) menu option.
- you submit a periodic process that:
  - includes the Order Summary (*ORDSUM*) periodic function (program name *PFR0062*), OR
  - includes the Threshold (*THRESHD*) periodic function (program name *PFTHRESHMO*).

> **Note:**
>
> You can schedule a periodic process to run at a specified time; see *Executing Periodic Processes (EPRO)* for more information on defining a job schedule for a periodic process.

Batch Order Control processing: The Batch Order Control job:

- updates all of the fields in the Order Control Summary table for the current transaction date.
- generates the *Operations Control Report*, which displays the most recent operations and merchandising summary totals; the system generates the report only if you submit the Batch Order Control job from the Operations Control Summary menu option.
- updates the actual value fields and Last updated fields in the Threshold Values table; see *Updating Threshold Actual Values* for more information on the updates the batch order control job performs for threshold values.

> **Note:**
>
> The system does not update or use the Flash Report table to capture operations and merchandising summary information; instead, the system updates and uses the Order Control Summary table.

Display Operations Control Summary Screen

Updates to this screen: This screen displays operations control summary information for the dates when:

- you have executed order, cancellation, sold out, shipping, return or exchange transactions, or
- you have run the Batch Order Control job; see *Updating Operations and Merchandising Summary Totals*.

Order Control Report: When you update current totals by selecting *Update current totals*, or execute the periodic function *ORDSUM* (program name *PFR0062*), the system prints the *Operations Control Report* for the current (today's) date.

How to display this screen:

- select *Display All Days* at the *First Operations Control Summary Screen*, or
- If you have not yet run the Batch Order Control job or processed information through the Order Async or Billing Async for the current day:
- enter *FLSH* in the Fast path field or select this option from a menu.
- Select *Dsp Flash Rpt* at the *Streamlined Pick Slip Generation Screen*.

Field	Description
Date	The date when the displayed order activity took place. Numeric, 6 positions, in user date format; display-only.

Field	Description
The totals listed on the Display Operations Control Summary screen are accurate as of the time you refreshed the screen for the current date.	
Ordered	The number of orders and merchandise amounts for orders entered for the selected date and accounting period. **Note:** The order totals include order lines added to an existing order through order maintenance, regardless of the setting of the Update Demand for Order Maintenance Transactions (C72) system control value. **Orders** The number of orders entered, including: • the total number of ship-to addresses for orders with multiple ship-to's. For example, an order with two ship-to addresses updates the number of orders total by 2. • orders which include only sold out items or non-inventory items. This does not include batch orders that have not yet been accepted. This is the Orders entered number in the Order Control Summary table. The system adds the Orders entered number value for each transaction date in the accounting period to determine the number of orders entered for the accounting period. **Amount** The merchandise amount total of orders entered, including merchandise amount total of sold out items or non-inventory items. This does not include: • merchandise amounts for items returned during order entry. • merchandise amounts for batch orders that have not yet been accepted. This is the Orders entered dollars in the Order Control Summary table. The system totals the Orders entered dollars value for each transaction date in the accounting period to determine the merchandise amount total of orders entered for the accounting period. Number fields: numeric, 9 positions; display-only. **Amount fields: numeric, 20 positions with a 2-place decimal; display-only.**

Field	Description
Cancelled	The number of orders and merchandise amounts for orders cancelled for the selected date and accounting period. **Note:** These totals include orders, items, or merchandise amount only if the Reduce demand? flag for the cancel reason is unselected. **Orders** The number of orders cancelled (orders in *Cancelled* status; all order lines have been cancelled). This is the Orders cancelled number in the Order Control Summary table. The system totals the Orders cancelled number value for each transaction date in the accounting period to determine the total number of orders cancelled for the accounting period. **Amount** The merchandise amount total of cancelled items. This total updates when you cancel an entire order or one or more lines on an order. This is the Orders cancelled dollars in the Order Control Summary table. The system totals the Orders cancelled dollars value for each transaction date in the accounting period to determine the merchandise amount total of cancelled items for the accounting period. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Soldout</td><td>The number of orders and merchandise amounts for orders soldout for the selected date and accounting period.
The system considers an order line sold out if:
• you process soldout order lines in order entry, order maintenance, or the Processing Auto Soldout Cancellations (MASO) menu option.
• you cancel order lines with a cancel reason whose Reduce demand? flag is selected. However, the system updates only soldout orders and does not update soldout units, soldout amounts, cancelled orders, cancelled units, or cancelled amounts for these order lines.
Orders
The total number of soldout orders, including orders for which all order lines are sold out, or at least one order line is sold out and all other order lines have been cancelled using any cancel reason code.
This does not include order lines that are sold out if other order lines exist on the order that are not sold out or cancelled.
• This is the Orders soldout/closed number in the Order Control Summary table. The system totals the Orders soldout/closed number value for each transaction date in the accounting period to determine the total number of soldout orders for the accounting period.
Amount
The merchandise amount total of soldout items.
This is the Orders soldout dollars in the Order Control Summary table. The system totals the Orders soldout dollars value for each transaction date in the accounting period to determine the merchandise amount total of soldout items for the accounting period.
Number fields: numeric, 9 positions; display-only.
Amount fields: numeric, 20 positions with a 2-place decimal; display-only.</td></tr>
<tr><td>Shipped</td><td>The number of orders and merchandise amounts for orders shipped for the selected date and accounting period.
These totals are not decreased by returns or exchanges.
Orders
The total number of shipped orders.
This is the Orders shipped number in the Order Control Summary table. The setting of the Order Control Summary Shipment Update Method (I55) system control value determines how the system updates the shipped totals in the Order Control Summary table.
The system totals the # Orders shipped value for each transaction date in the accounting period to determine the total number of shipped orders for the accounting period.</td></tr>
</table>

Field	Description
	Amount The merchandise amount total of shipped items. This is the Orders shipped dollars in the Order Control Summary table. The system adds the Orders shipped dollars value for each transaction date in the accounting period to determine the merchandise amount total of shipped items for the accounting period. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
Returned	The number of orders and merchandise amounts for orders returned for the selected date and accounting period. You can enter a return in: • order entry (via negative quantity ordered) • order maintenance, or • Work with Return Authorizations (these totals increase only when you process the credit) These totals include simple returns only, as opposed to exchanges. See *Returning and Exchanging Items in Order Maintenance*. **Orders** The total number of return transactions processed and credited, regardless of whether the returns are on the same order. For example, an order with 2 returned order lines processed separately updates this total by 2; however, if the same 2 returned order lines on a single order are processed in the same transaction, the total updates by 1. This is the Invoices credited number in the Order Control Summary table. The system totals the Invoices credited number value for each transaction date in the accounting period to determine the total number of return transactions processed and credited for the accounting period. **Amount** The merchandise amount total of returned items. This is the Invoices credited dollars in the Order Control Summary table. The system totals the Invoices credited dollars value for each transaction date in the accounting period to determine the merchandise amount total of returned items for the accounting period. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.

Screen Option	Procedure
Display operations control summary information for a selected date.	Select *Display* for a date to advance to the *First Operations Control Summary Screen*, which displays information for the selected date.

Screen Option	Procedure
Update totals for order recap information on the Operations Control Summary screen and print the Order Control Report for the current date.	Select *Update current totals* to submit the ORD_CONTRL job, which updates the information in the lower part of the *First Operations Control Summary Screen*. After the batch job is completed, you must exit the screen and re-display it to view the changes. This batch job also prints the *Operations Control Report* for the current date.

First Operations Control Summary Screen

Purpose: Use this screen to review:

- order activity information for the selected date and accounting period, such as the number, quantity, and amount totals of orders entered, cancelled, soldout, shipped, returned, and exchanged. The top half of the screen displays order activity information.
- order summary information as of the selected date, such as the number, quantity, and amount totals of orders open, held, suspended, open backordered, held backordered, open printed, held printed, open reserved, and held reserved. Operations summary information is on the lower half of the screen.

Updating totals: See *Updating Operations and Merchandising Summary Totals* for more information on how the system updates the totals on this screen.

> **Note:**
>
> If you advance to this screen for a date when you did not update the totals, the bottom half of the screen does not display any information.

Additional operations summary information: Select *OK* to advance to the *Second Operations Control Summary Screen*.

How to display this screen:

- Select a date at the *Display Operations Control Summary Screen* to display information for a selected date, or
- If the batch order control job has already run for today's date, or the Order Async is active and you have processed order information for the current day:
- enter *FLSH* in the Fast path field or select Display Operations Control Summary from a menu.
- select *Dsp Flash Rpt* at the *Streamlined Pick Slip Generation Screen*.

Field	Description
Information for selected date and accounting period:	

Field	Description
Date(Unlabeled field at top left of screen)	The current date, or the date you have selected at the *Display Operations Control Summary Screen*. The order activity information displayed below this date reflects total ongoing activity for the date. Numeric, 6 positions, in user date format; display-only.
Accounting period and year(Unlabeled field at top right of screen)	The accounting period which includes the date displayed in the Date field. The order activity information displayed below the month and year reflects total activity for the accounting period up to the selected date. Alphanumeric, 7 positions; display-only.
Ord (Orders)	The number of orders, number of units, and merchandise amounts for orders entered for the selected date and accounting period as of the time you refreshed the screen. **Note:** The order totals reflect initial order entry only. These totals do not include order lines added to an existing order through order maintenance, regardless of the setting of the Update Demand for Order Maintenance Transactions (C72) system control value. **Orders** The number of orders entered, including: • the total number of ship-to addresses for orders with multiple ship-to's. For example, an order with two ship-to addresses updates the number of orders total by 2. • orders which include only sold out items or non-inventory items. This total does not include: • Batch orders that have not yet been accepted. • An order that includes only order lines with negative quantities in order to process a return. This is the Orders entered number in the Order Control Summary table. The system adds the Orders entered number value for each transaction date in the accounting period to determine the number of orders entered for the accounting period. **Units** The number of units ordered, including: • the main set item as well as each component item. • units of sold out items or non-inventory items. This total does not include: • units returned by entering negative quantities in order entry. • units on batch orders that have not yet been accepted. This is the Quantity ordered in the Order Control Summary table. The system totals the Quantity ordered value for each transaction date in the accounting period to determine the number of units ordered for the accounting period.

Field	Description
	Amount The merchandise amount total of orders entered, including merchandise amount total of sold out items or non-inventory items. This total does not include: • merchandise amounts for items returned during order entry. • merchandise amounts for batch orders that have not yet been accepted. This is the Orders entered dollars in the Order Control Summary table. The system totals the Orders entered dollars value for each transaction date in the accounting period to determine the merchandise amount total of orders entered for the accounting period. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
The following fields display totals for transactions processed on the selected date, or in the selected accounting period, regardless of whether the original order was processed on the selected date or in the selected accounting period.	

Field	Description
Can (Cancelled)	The number of orders, number of units, and merchandise amounts for orders cancelled for the selected date and accounting period as of the time you refreshed the screen. **Note:** These totals include orders, items, or merchandise amount only if the Reduce demand? flag for the cancel reason is unselected. **Orders** The number of orders cancelled (orders in *Cancelled* status; all order lines have been cancelled). This is the Orders cancelled number in the Order Control Summary table. The system adds the Orders cancelled number value for each transaction date in the accounting period to determine the total number of orders cancelled for the accounting period. **Units** The total number of units cancelled. This total updates when you cancel an entire order or one or more lines on an order. This is the Quantity cancelled in the Order Control Summary table. The system adds the Quantity cancelled value for each transaction date in the accounting period to determine the total number of units cancelled for the accounting period. **Amount** The merchandise amount total of cancelled items. This total updates when you cancel an entire order or one or more lines on an order. This is the Orders cancelled dollars in the Order Control Summary table. The system adds the Orders cancelled dollars value for each transaction date in the accounting period to determine the merchandise amount total of cancelled items for the accounting period. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>S/O (Sold out)</td><td>
The number of orders, number of units, and merchandise amounts for orders soldout for the selected date and accounting period as of the time you refreshed the screen.
The system considers an order line sold out if you:

Process soldout order lines in order entry, order maintenance, or the Processing Auto Soldout Cancellations (MASO) menu option.
Cancel all lines on the order with a cancel reason whose Reduce demand? flag is selected. However, the system updates only soldout orders and does not update soldout units, soldout amounts, canceled orders, canceled units, or canceled amounts for these order lines.

Orders
The total number of soldout orders, including orders for which all order lines are sold out, or at least one order line is sold out and all other order lines have been cancelled using any cancel reason code.
This does not include order lines that are sold out if other order lines exist on the order that are not sold out or cancelled.
This is the Orders soldout/closed number in the Order Control Summary table. The system adds the Orders soldout/closed number value for each transaction date in the accounting period to determine the total number of soldout orders for the accounting period.
Units
The total number of soldout units.
This is the Quantity soldout in the Order Control Summary table. The system adds the Quantity soldout value for each transaction date in the accounting period to determine the total number of soldout units for the accounting period.
Amount
The merchandise amount total of soldout items.
This is the Orders soldout dollars adds in the Order Control Summary table. The system adds the Orders soldout dollars value for each transaction date in the accounting period to determine the merchandise amount total of soldout items for the accounting period.
Number fields: numeric, 9 positions; display-only.
Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
</td></tr>
</table>

Field	Description
Shp (Shipped)	The number of orders, number of units, and merchandise amounts for orders shipped for the selected date and accounting period as of the time you refreshed the screen. These totals are not decreased by returns or exchanges. **Orders** The total number of shipped orders. This is the # Orders shipped in the Order Control Summary table. The setting of the *Order Control Summary Shipment Update Method (I55)* system control value determines how the system updates the # Orders shipped field in the Order Control Summary table: • *ORDERS* = The system updates the # Orders shipped field when the Billing Async updates the status of an order to closed; see *ORDERS Order Control Summary Shipment Update Method* for more information on how the system updates by ORDERS. • *INVOICES* = The system updates the # Orders shipped field when the Billing Async creates an invoice for an order, excluding credit invoices; see *INVOICES Order Control Summary Shipment Update Method* for more information on how the system updates by INVOICES. • *PICKS* = The system updates the # Orders shipped field when the Billing Async processes a pick control number for an order; see *PICKS Order Control Summary Shipment Update Method* for more information on how the system updates by PICKS. The system totals the # Orders shipped value for each transaction date in the accounting period to determine the total number of shipped orders for the accounting period. **Units** The total number of shipped units, including: • shipped units confirmed; the system updates the units total as each unit is confirmed. • non-inventory items confirmed during billing. • For set items, the system updates the Quantity shipped by the number of components, plus the main set item. For example, if shipped main set set item A101 includes 2 components, the system updates the Quantity shipped by 3. This total does not include: • units for returns processed in order entry. • units on orders that are express billed if the *Order Control Summary Shipment Update Method (I55)* system control value is set to PICKS. • memberships or virtual stored value cards processed at pick slip generation if the *Order Control Summary Shipment Update Method (I55)*system control value is set to PICKS. This is the Quantity shipped in the Order Control Summary table. The system adds the Quantity shipped value for each transaction date in the accounting period to determine the total number of shipped units for the accounting period.

Field	Description
	Amount The merchandise amount total of shipped items, including: • shipments confirmed; the system updates the amount total as each unit is confirmed. • non-inventory items confirmed during billing. This total does not include: • amounts for returns processed in order entry. • amounts on orders that are expressed billed if the *Order Control Summary Shipment Update Method (I55)* system control value is set to PICKS. • amounts for memberships or virtual stored value cards processed at pick slip generation if the *Order Control Summary Shipment Update Method (I55)* system control value is set to PICKS. This is the Orders shipped dollars in the Order Control Summary table. The system totals the Orders shipped dollars value for each transaction date in the accounting period to determine the merchandise amount total of shipped items for the accounting period. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only. **Units** The total number of returned units. This is the Quantity credited in the Order Control Summary table. The system totals the Quantity credited value for each transaction date in the accounting period to determine the total number of returned units for the accounting period. **Amount** The merchandise amount total of returned items. This is the Invoices credited dollars in the Order Control Summary table. The system totals the Invoices credited dollars value for each transaction date in the accounting period to determine the merchandise amount total of returned items for the accounting period. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
Rtn (Returns)	The number of orders, number of units, and merchandise amounts for orders returned for the selected date and accounting period as of the time you refreshed the screen. You can enter a return in: • order entry (via negative quantity ordered) • order maintenance, or • Work with Return Authorizations (these totals increase only when you process the credit) These totals include simple returns only, as opposed to exchanges. See *Returning and Exchanging Items in Order Maintenance*. **Orders** The total number of return transactions processed and credited, regardless of whether the returns are on the same order. For example, an order with 2 returned order lines processed separately updates this total by 2; however, if the same 2 returned order lines on a single order are processed in the same transaction, the total updates by 1. This is the Invoices credited number in the Order Control Summary table. The system totals the Invoices credited number value for each transaction date in the accounting period to determine the total number of return transactions processed and credited for the accounting period.

Field	Description
Exc (Exchanges)	The number of orders, number of units, and merchandise amounts for items returned in exchange transactions for the selected date and accounting period as of the time you refreshed the screen. These totals include quantities and merchandise amount of the items returned in exchange transactions, *not* units and merchandise amount of items ordered in exchange. See *Returning and Exchanging Items in Order Maintenance*. You can enter an exchange in: • order maintenance • Work with Return Authorizations (these totals increase only when you process the credit) **Orders** The total number of exchange transactions processed, regardless of whether the exchanges are on the same order. For example, an order with 2 exchanged order lines processed separately updates this total by 2; however, if the same 2 exchanged order lines on a single order are processed in the same transaction, the total updates by 1. This is the Exchanges number in the Order Control Summary table. The system totals the Exchange number value for each transaction date in the accounting period to determine the total number of exchange transactions processed for the accounting period. **Units** The total number of units returned in exchange transactions. This is the Quantity exchanged in the Order Control Summary table. The system totals the Quantity exchanged value for each transaction date in the accounting period to determine the total number of units returned in exchange transactions for the accounting period. **Amount** The merchandise amount total of returned items in exchange transactions. This is the Exchanged dollars in the Order Control Summary table. The system totals the Exchanged dollars value for each transaction date in the accounting period to determine the merchandise amount total of returned items in exchanged transactions for the accounting period. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
Information for order recap totals: Totals display only if you have run the Batch Order Control job; these totals are cumulative up to the date and time of the last update.	

Field	Description
Opn (Open)	Total number of open orders, open units, and total amount of open order lines. **Orders** The total number of open orders; this is the number of orders in an open status. This is the Open orders number in the Order Control Summary table for the most recent transaction date. **Units** The total number of open units; this is the total number of units on open order lines, including units on backorder and regardless if the units are printed or unprinted. This also includes units on order lines that are in a held status. This is the total of the Open backordered quantity, Open printed quantity, and Open unprinted quantity in the Order Control Summary table for the most recent transaction date. **Amount** The merchandise amount total of open order lines, including open order lines containing backordered units and regardless if the units are printed or unprinted. This also includes the merchandise amount for order lines that are in a held status. This is the total of the Open backordered dollars, Open printed dollars, and Open unprinted dollars in the Order Control Summary table for the most recent transaction date. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
Hld (Held)	Total number of held orders, held units, and total amount of order lines on held orders. **Orders** The total number of held orders; this is the number of orders in a held status. This is the Held orders number in the Order Control Summary table for the most recent transaction date. **Units** The total number of held units; this is the total number of units on held orders, including units on backorder and regardless if the units are printed or unprinted. This does not include units on held order lines if the order is not held. This is the total of the Held backordered quantity, Held printed quantity, and Held Unprinted quantity in the Order Control Summary table for the most recent transaction date. **Amount** The merchandise amount total of held orders, including order lines containing backordered units and regardless if the units are printed or unprinted. This does not include merchandise amounts for held order lines if the order is not held. This is the total of the Held backordered dollars, Held printed dollars, and Held unprinted dollars in the Order Control Summary table for the most recent transaction date. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
Sus (Suspended)	Total number of suspended orders, suspended units, and total amount of suspended orders, regardless if the order is batched. **Orders** The total number of suspended orders; this is the number of orders in a suspended status or error status as defined in the Order Header table. This is the Orders suspended number in the Order Control Summary table for the most recent transaction date. **Units** The total number of units on suspended orders, including orders in a suspended status and error status. The system uses this calculation over the Order Detail table to determine the suspended units: `quantity ordered - quantity cancelled - quantity shipped - quantity soldout = suspended units`. This is the Orders suspended quantity in the Order Control Summary table for the most recent transaction date. **Amount** The merchandise amount total of suspended orders, including orders in a suspended status and error status. This is the sum of the merchandise amounts for suspended and orders in error in the Order Ship To table. This is the Orders suspended dollars in the Order Control Summary table for the most recent transaction date. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
OBO (Open/ backordered)	Total number of open backordered orders, open backordered units, and total merchandise amount of open backordered units. The system determines if an item is on backorder using this calculation: `open quantity on order line - reserved quantity on order line = backorder quantity`. The system uses this calculation to determine the open quantity: `order quantity - shipped quantity - cancelled quantity - soldout quantity = open quantity`. **Orders** The total number of open orders that contain at least one unit on backorder, including the total number of ship-to addresses for orders with multiple ship-to's. For example, an order with two ship-to addresses updates the number of orders total by 2. This is the Future use 1 number in the Order Control Summary table for the most recent transaction date. **Units** The total number of backordered units on open orders. This is the Quantity backordered in the Order Control Summary table for the most recent transaction date. **Amount** The total merchandise amounts of backordered units on open orders. This is the Open backordered dollars in the Order Control Summary table for the most recent transaction date. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
HBO (Held/ backordered)	Total number of held backordered orders, held backordered units, and total merchandise amount of held backordered units. The system determines if an item is on backorder using this calculation: `open quantity on order line - reserved quantity on order line = backorder quantity`. The system uses this calculation to determine the open quantity: `order quantity - shipped quantity - cancelled quantity - soldout quantity = open quantity`. **Orders** The total number of held orders that contain at least one unit on backorder, including the total number of ship-to addresses for orders with multiple ship-to's. For example, an order with two ship-to addresses updates the number of orders total by 2. This is the Future use 2 number in the Order Control Summary table for the most recent transaction date. **Units** The total number of backordered units on held orders. This is the Quantity held backordered in the Order Control Summary table for the most recent transaction date. **Amount** The total merchandise amount of backordered units on held orders. This is the Held backordered dollars in the Order Control Summary table for the most recent transaction date. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
Opn/Prt (Open/ Printed)	Total number of units on open orders for which pick slips have been printed and total merchandise amount of units on open orders for which pick slips have been printed. **Units** The total number of printed units on open orders. The total number of open printed units is the Open printed quantity in the Order Control Summary table for the most recent transaction date. **Amount** The total merchandise amount of printed units on open orders. This is the Open printed dollars in the Order Control Summary table for the most recent transaction date. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
Hld/Prt (Held/ printed)	Total number of units on held orders for which pick slips have been printed and total merchandise amount of units on held orders for which pick slips have been printed. **Units** The total number of printed units on held orders. This is the Held printed quantity in the Order Control Summary table for the most recent transaction date. **Amount** The total merchandise amount of printed units on held orders. This is the Held printed dollars in the Order Control Summary table for the most recent transaction date. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
Opn/Rsv (Open/ reserved)	Total number of units on open orders which are reserved and total merchandise amount of units on open orders which are reserved. **Units** The total number of reserved units on open orders. This is the Open unprinted quantity in the Order Control Summary table for the most recent transaction date. **Amount** The total merchandise amount of reserved units on open orders. This is the Open unprinted dollars in the Order Control Summary table for the most recent transaction date. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
Hld/Rsv (Held/ reserved)	Total number of units on held orders which are reserved and total merchandise amount of units on held orders which are reserved. **Units** The total number of reserved units on held orders. This is the Held unprinted quantity in the Order Control Summary table. **Amount** The total merchandise amount of reserved units on held orders. This is the Held unprinted dollars in the Order Control Summary table. Number fields: numeric, 9 positions; display-only. Amount fields: numeric, 20 positions with a 2-place decimal; display-only.
General information	
Last updated on/at	The date and time when the Batch Order Control job was last run, updating the operations and merchandising totals. Date: numeric, 6 positions, in user date format; display-only. Time: numeric, 6 positions, HH:MM:SS format; display-only.
Suspended batches	The total number of order batches that are in a suspended status. The system determines the number of order batches in a suspended status by totaling the number of orders in the Order Batch table whose Batch suspended field is *selected*. This is the Batches suspended number in the Order Control Summary table. Numeric, 9 positions; display-only.

Screen Option	Procedure
Review operations summary information on the second Operations Control Summary screen.	Select *OK* to advance to the *Second Operations Control Summary Screen*.
Update the operation totals on the screen	Select *Refresh screen* to update the operations totals.
Review order summary information by date or select a date for which you want to view detailed order summary information	Select *Display all days* to advance to the *Display Operations Control Summary Screen*.

Screen Option	Procedure
Update current totals for open/ held order recap information and print the Order Control Report for the current date.	Select *Update current totals* to submit the batch job ORD_CONTRL, which will update the information in the lower part of the screen (Order Recap information). After the batch job is completed, you must select *Refresh screen* to view the changes. This batch job will also print the *Operations Control Report* for the current date. **Note:** This option is not available when you display this screen for dates other than the current date. If you try to use this option for past dates, the screen displays the following error message: `Update cannot be submitted for a prior date.`
Review merchandising summary information for the date you are currently reviewing	Select *Merchandising* to advance to the Merchandising Control Summary screen.

Second Operations Control Summary Screen

Purpose: Use this screen to review operations control summary information, such as the number, quantity, and amount total of pending pick slips, pending RA receipts, pending RA credits, and pending refunds.

Updating totals: See *Updating Operations and Merchandising Summary Totals* for more information on how the system updates the totals on this screen.

If you display this screen for a date when you did not update the totals, there is no information on this screen.

How to display this screen: Select *OK* at the *First Operations Control Summary Screen*.

Field	Description
Date (unlabeled field at the center top of the screen)	The current date, or the date you have selected at the *Display Operations Control Summary Screen*. The operations summary information displayed below this date reflects total ongoing activity for the date. Numeric, 6 positions, in user date format; display-only.

Field	Description
Totals display only if you have run the Batch Order Control job; these totals are cumulative up to the date and time of the last update.	
Pick slips	The number of pending pick slips, number of units on pending pick slips, and merchandise amounts for pending pick slips. Pending pick slips are pick slips that have been printed but not yet billed, not including pick slips voided, waiting for authorizations, or suspended. The system increases the pending pick slip number, units, and amounts for drop ship orders if the drop ship output defined for the vendor is drop ship pick slip; if the drop ship output defined for the vendor is drop ship purchase order or collaborative shipping, the system only increases the total units and total amounts pending and does not increase the total number pending. **Number** The total number of pick slips pending. This is the Pending picks number in the Order Control Summary table. **Units** The total number of units on pending pick slips. This is the total of the Open printed quantity and Held printed quantity in the Order Control Summary table for the most recent transaction date. **Amount** The merchandise amount total of items on pending pick slips. This is the total of the Open printed dollars and Held printed dollars in the Order Control Summary table. Number fields: numeric, 9 positions; display-only. Amount field: numeric, 20 positions with a 2-place decimal; display-only.
RA receipts	The number of pending return authorization receipts, number of units on pending return authorization receipts, and merchandise amounts for pending return authorization receipts. Pending return authorization receipts are return authorizations that have been entered, but not yet received. You can only enter a pending RA receipt using non-streamlined return authorizations (the *Use Streamlined Return Authorizations (F44)* system control value is *selected*. These totals include quantities and merchandise amount of the items returned in return transactions and items returned in exchange transactions, *not* units and merchandise amount of items ordered in exchange. See *Returning and Exchanging Items in Order Maintenance*.

Field	Description
	Number The total number of pending return authorization receipts, regardless of whether the returns are on the same order. For example, an order with 2 pending RA receipt order lines processed separately updates this total by 2; however, if the same 2 pending RA receipt order lines on a single order are processed in the same transaction, the total updates by 1. The system determines the number of pending RA receipts by totaling the number of RA header records whose date received is 0. This is the Pending RA receipt number in the Order Control Summary table. **Units** The total number of units on pending return authorization receipts. The system determines the number of units on pending RA receipts by looking at the RA detail records whose quantity returned is less than the quantity to return and totaling the unreceived quantity. This is the Pending RA receipt quantity in the Order Control Summary table. **Amount** The merchandise amount total of items on pending return authorization receipts. The system determines the merchandise amounts of items on pending RA receipts by multiplying the unreceived quantity by the order detail price. This is the Pending RA receipt dollars in the Order Control Summary table. Number fields: numeric, 9 positions; display-only. **Amount field: numeric, 20 positions with a 2-place decimal; display-only.**
RA credits	The number of pending return authorization credits, number of units on pending return authorization credits, and merchandise amounts for pending return authorization credits. Pending return authorization credits are return authorizations that have been received, but not yet credited. You can only enter a pending RA credit using non-streamlined return authorizations (the *Use Streamlined Return Authorizations (F44)* system control value is *selected*). These totals include quantities and merchandise amount of the items returned in return transactions and items returned in exchange transactions, *not* units and merchandise amount of items ordered in exchange. See Returning and Exchanging Items in Order Maintenance.

Field	Description
	Number The total number of pending return authorization credits, regardless of whether the returns are on the same order. For example, an order with 2 pending RA credit order lines processed separately updates this total by 2; however, if the same 2 pending RA credit order lines on a single order are processed in the same transaction, the total updates by 1. The system determines the number of pending RA credits by totaling the number of RA header records whose date received is greater than 0 and date credited is 0. This is the Pending RA credit number in the Order Control Summary table. **Units** The total number of units on pending return authorization credits. The system determines the number of units on pending RA credits by looking at the RA detail records whose quantity credited is less than the quantity to credit and totaling the uncredited quantity. This is the Pending RA credit quantity in the Order Control Summary table. **Amount** The merchandise amount total of items on pending return authorization credits. The system determines the merchandise amounts of items on pending RA credits by multiplying the uncredited quantity by the order detail price. This is the Pending RA credit dollars in the Order Control Summary table. Number fields: numeric, 9 positions; display-only. **Amount field: numeric, 20 positions with a 2-place decimal; display-only.**
Refunds	The number of pending refunds, number of units on pending refunds, and merchandise amounts for pending refunds. Pending refunds are refunds in an open or held status that have not yet been processed; these totals do not include refunds that are in a pending canceled, canceled, pending write off, write off, or processed status. **Number** The total number of unprocessed refunds. This is the Refunds pending number in the Order Control Summary table. **Amount** The merchandise amount total of items on unprocessed refunds. This is the Refunds pending dollars in the Order Control Summary table. Number field: numeric, 9 positions; display-only. Amount field: numeric, 20 positions with a 2-place decimal; display-only.
Last updated on/at	The date and time when the Batch Order Control job was last run, updating the operations and merchandising totals. Date: numeric, 6 positions, in user date format; display-only. Time: numeric, 6 positions, HH:MM:SS format; display-only.

Screen Option	Procedure
Review operations summary information on the first Operations Control Summary screen.	Press *Page Up* to advance to the First Operations Control Summary Screen.
Update the operation totals on the screen	Select *Update current totals*.
Review order summary information by date or select a date for which you want to view detailed order summary information	Select *Display all days* to advance to the Display Operations Control Summary Screen.
Update current totals for open/held order recap information and print the Order Control Report for the current date.	Select *Update current totals* to submit the batch job ORD_CONTRL, which will update the information in the lower part of the screen (Order Recap information). After the batch job is completed, you must select *Refresh screen* to view the changes. This batch job will also print the Operations Control Report for the current date. **Note:** This option is not available when you display this screen for dates other than the current date. If you try to use this option for past dates, the screen displays the following error message: `Update cannot be submitted for a prior date`.

Reviewing Pending Orders (DOSS)

Purpose: Use this option to review current totals of orders that require shipment or other processing or action, broken out by the type of action or processing required. The information displayed includes:

- order queue classification: quote, error, suspended, held, backordered, printed, pickup, or reserved
- for each queue:
  - total number of orders and total dollar value
  - oldest and newest order date

You can select an order queue to advance to a subsequent screen listing the individual orders in that queue and providing information about each order, such as merchandise total, source code, hold reason, and sold-to customer. At this screen, you can select an order for inquiry.

In this topic:

- *Assignment Hierarchy for Pending Order Queues*
- *Pending Order Summary Screen*
- *Pending Order Details Screen*

Assignment Hierarchy for Pending Order Queues

The system uses the following hierarchy to assign each order to a pending order queue:

1. If the Quote field for the order type on the order is *selected* and the order is not in error, assign to the Quote queue; otherwise,
2. If the order header status is Error, assign to the Error queue; otherwise,
3. If the order header status is Suspended, assign to the Suspended queue; otherwise,
4. If the order is a store pickup order, assign to the Pickup queue; otherwise,
5. If the order ship-to status is Held, or if any of the ship-tos on a multi-recipient order is Held, assign to the Held queue; otherwise,
6. If any of the order lines on any of the ship-tos is backordered, assign to the Backordered queue; otherwise,
7. If any of the order lines on any of the ship-tos is printed on a pick slip, assign to the Printed queue; otherwise,
8. Assign to the Reserved queue.

Considerations when determining queue assignment:

- Orders whose status is Canceled or Closed are not included in the pending orders screens.
- For non-quote orders, order lines are considered backordered if the reserved quantity is less than the quantity ordered - the quantity canceled - the quantity sold out - the quantity shipped.
- Brokered backorders are included in the Backordered queue.
- For non-quote orders, order lines for drop-ship items, non-inventory items, membership items, gift cards, and main set items are considered reserved, not backordered.
- Orders that include held order lines are not automatically assigned to the Held order queue. The system evaluates this status at the order ship-to level, not at the order line level.
- Order lines are considered printed if they are included on a regular pick slip, a drop ship pick slip, or a drop ship purchase order.
- For non-quote orders, the status of order lines controls the queue assignment even if the order line is “no charge.” For example, if all the items on an order are reserved except for a “no charge” item that is backordered, the order is assigned to the Backordered queue rather than the Reserved queue.
- Quote orders that are suspended are included in the Quote queue rather than the Suspended queue; however, quote orders that are in error are included in the Error queue. A quote order received through the order API might be in error if the Pay method required field is selected for the quote order type and there was no

payment method on the order, or if any other information in the CWOrderIn message was invalid.

Determining the order count: The Order count at the *Pending Order Summary Screen* is based on the order header for multi-recipient orders, not the individual order ship-tos. For example, an order with 3 recipients increases the Order count by 1, not 3.

Determining the order amount:

- The $ on orders total at the *Pending Order Summary Screen* and the Order amount at the *Pending Order Details Screen* include total merchandise value based on actual selling price only. The totals do not include tax, freight, additional freight, or additional charges, and do not reflect offer prices before applying discounts or price overrides.
- Only order lines whose status is open, held, error, or closed are included in the $ on orders total at the *Pending Order Summary Screen* or the Order amount at the *Pending Order Details Screen*. Canceled and soldout lines are not included in the total.
- The extended value of all eligible order lines (open, held, error, or closed) is included in the displayed total, even if the order line status does not correspond to the queue status. For example, if any lines on the order are backordered, the entire merchandise total for the order is included, even though some of the lines might be reserved or closed.
- Negative order line values (which can occur when you process a return by entering a negative quantity) are subtracted from the total order value.

Pending Order Summary Screen

Purpose: Use this screen to review the total pending orders broken out by queue assignment. See *Reviewing Pending Orders (DOSS)* for a discussion.

Reviewing Pending Orders (DOSS)
How to display this screen: Enter *DOSS* in the Fast path field at the top of any menu, or select Pending Orders from a menu.

Field	Description
Queue	The queue assignment, indicating the type of action you need to take to process the order. Each order is assigned to a queue as follows: • *Suspended* = the order header status is Suspended, and the order is not a quote (the Quote field for the order type is not selected) • *Error* = the order header status is Error • *Held* = the order ship-to status is Held; or, any of the ship-tos on a multi-recipient order is Held, and the order header is not in Error • *Backordered* = one or more of the order lines on any of the ship-tos is backordered, and the order is not eligible for the Error or Held queue • *Printed* = one or more of the order lines on any of the ship-tos is printed on a pick slip, and the order is not eligible for the Error, Held, or Backordered queue • *Reserved* = the order is not eligible for any of the other queues • *Quote* = the Quote field for the order type on the order is *selected* and the order header status is not Error • *Pickup* = the customer is picking up the order in a store location where the merchandise is currently available. See Store Pickup Orders for background. See Assignment Hierarchy for Pending Order Queues for an overview. **Note:** If there are no orders meeting the criteria for a particular queue, the screen does not display that queue. See Assignment Hierarchy for Pending Order Queues for a discussion. Click on a queue name to advance to the Pending Order Details Screen.
Oldest date	The oldest Order date of all orders in the queue. This is the Date displayed on the order header screen in standard order inquiry. Numeric, 6 positions (in user date format); display-only.
Newest date	The newest Order date of all orders in the queue. This is the Date displayed on the order header screen in standard order inquiry. Numeric, 6 positions (in user date format); display-only.
Order count	The total number of orders in the queue. Increased by *1* for a multi-recipient order. See Assignment Hierarchy for Pending Order Queues for a discussion of how orders are assigned to a particular queue. Numeric, no pre-defined maximum length; display-only.

Field	Description
$ on orders	The total merchandise dollar value of orders assigned to the queue. This total includes merchandise value based on actual selling price only, and does not include tax, freight, additional freight, or additional charges, and does not reflect offer prices before applying discounts or price overrides. Also, only order lines whose status is open, held, error, or closed are included in the total; canceled and soldout lines are not included. • The extended value of all eligible order lines (open, held, error, or closed) is included in the displayed total, even if the order line status does not correspond to the queue status. For example, if any lines on the order are backordered, the entire merchandise total for the order is included, even though some of the lines might be reserved or closed. • Negative order line values (which can occur when you process a return by entering a negative quantity) are subtracted from the total order value. Numeric, no pre-defined maximum length, with a 2-position decimal; display-only.

Options at this screen:

Option	Procedure
Review orders within a queue	Click the queue name to advance to the *Pending Order Details Screen*, where you can review the orders in that queue.
Change the order in which queues are sorted on the screen	Click a column heading to sort the queues by that column. For example, click Order count to sort the queues in ascending sequence by total order count. Once you have sorted by a column, you can click the column heading again to reverse the sort. For example, click Order count again to reverse the sort from ascending to descending sequence.

Pending Order Details Screen

Purpose: Use this screen to review the individual orders within a pending order queue.

How to display this screen: Select a queue at the *Pending Order Summary Screen*.

When you first advance to this screen, orders display in ascending order number sequence.

Maximum number of records to display: The system displays the first 500 records in the queue that meet your search criteria. The following message displays if there are more than 500 records to display:

The maximum number of records was exceeded. Please refine search criteria. Showing records 1-500.

You can use the Order # and Date fields on this screen to refine the pending order details you wish to review. In order to refine the records that display you must select *OK* after you enter your search criteria.

Field	Description
Queue	The queue selected at the *Pending Order Summary Screen*.
Order #	An order number assigned to the queue. See *Assignment Hierarchy for Pending Order Queues* for background. You can click the order number to advance to standard order inquiry for that order. Numeric, 8 positions; optional.
Date	The order date. This is the Date displayed on the order header screen in standard order inquiry. Numeric, 6 positions (in user date format); optional.
Customer #	The sold-to customer who placed the order. Numeric, 9 positions; display-only.
Rcp (recipient)	The number of shipping addresses on the order. Numeric, 3 positions; display-only.
Order type	The description of the order type, as set up through *Establishing Order Types (WOTY)*. Alphanumeric, 30 positions; display-only.
Order amount	The total merchandise dollar value of the order. This total includes merchandise value based on actual selling price only, and does not include tax, freight, additional freight, or additional charges, and does not reflect offer prices before applying discounts or price overrides. Also, only order lines whose status is open, held, error, or closed are included in the total; canceled and soldout lines are not included. • The extended value of all eligible order lines (open, held, error, or closed) is included in the displayed total, even if the order line status does not correspond to the queue status. For example, if any lines on the order are backordered, the entire merchandise total for the order is included, even though some of the lines might be reserved or closed. • Negative order line values (which can occur when you process a return by entering a negative quantity) are subtracted from the total order value. Numeric, no pre-defined maximum length, with a 2-position decimal; display-only.
Source code	The source code from the order header. Alphanumeric, 9 positions; display-only.
Hold reason	The hold reason code, if any, assigned to the order header. Hold reasons assigned to an order ship-to might differ from the reason code at the header. This field is used only when you are reviewing orders in the Held order queue. See *Introducing Order Hold Reason Codes* for an overview. Alphanumeric, 2 positions; display-only.
Ship via	The ship via code assigned to the order. If the order has more than one ship to, this is the ship via code for the order from the Order Ship To table with the lowest numeric number, regardless of the status of the ship to order. Numeric, 2 positions; display-only.

Scanning and display sequence options: Click a column name to sort the displayed orders in ascending or descending sequence by that field. For example, click the Hold reason column name once to display orders in alphanumeric sequence by hold reason code; click the Hold reason column name again to display orders in reverse alphanumeric sequence.

Current display sequence indicated: An arrow next to a column heading indicates that the orders are currently displayed in sequence based on that column.

For example, the upward-pointing arrow indicates that orders are displayed in ascending sequence by order value:

The downward-pointing arrow indicates that orders are displayed in descending sequence:

Combining display sequence with scan fields: You can also scan on the Date field to restrict the displayed orders by date. For example, if you enter a date and then click the Customer # column heading, the screen displays orders for that date or later in customer number sequence.

Retaining display sequence: When you change the display sequence for an order queue, then return to the *Pending Order Summary Screen* and select a different queue for review, the screen retains the display sequence. For example, you review held orders and click the Order amount field to display orders in ascending sequence by dollar value. If you then exit the screen and select reserved orders for review, the screen displays reserved orders in ascending sequence by dollar value.

> **Note:**
>
> Sorting by order number is not supported.

Options at this screen:

Option	Procedure
Select an order for inquiry	Click an order number to advance to standard order inquiry for that order. See *Order Inquiry* for a discussion.
Change the display sequence on the screen	See above for a discussion.
Refresh the list of orders	Select *Reset* to refresh the order information displayed on the screen and to clear the information in the Order # and Date scan fields.

Sales Summary (DSSS)

Purpose: Use the Sales Summary screen to view the number and dollar value of shipments processed:

- for the current day, week, and month
- broken out by order type and entity

Updated continuously: The totals displayed are based on the Invoice Ship To records created when you ship orders. When the BILL_ASYNC job is running, it creates these records as part of initially billing an order. These updates are not deferred based on the setting of the *Delay Billing Updates (K85)* system control value.

Modern View option: A **Sales Summary** page is also available in Modern View, including tiles at the top of the page, with totals are broken out by order type below, and bar charts illustrating the percentages of merchandise value billed for each order type. If your company supports fulfilling orders through integration with Order Orchestration, totals are broken out by delivery type as well, including store pickup, delivery, retail pickup, and ship-for-pickup. Orders that were not fulfilled through the Order Orchestration integration are listed as direct delivery. See the **Sales Summary** page in the Modern View online help for more information.

In this topic:

- *Calculations*
- *Sales Summary Screen*

Calculations

Which invoices are included? The totals displayed on this screen include Invoice Ship To records for regular (debit) invoices and their merchandise totals only. This screen does *not* include:

- Returns, credits, or discounts applied after shipment
- Freight, tax, handling, or other charges
- Any invoice with a merchandise total of $0.00

How is the invoice date determined? This screen organizes shipments based on the Invoice date from the Invoice Ship To record. This date is from the Start date from the BILL_ASYNC job. If the background jobs are running using a previous date because they are not stopped and restarted daily, then the invoices billed today are included under that previous date, not under *Today*.

How is the number of sales calculated? The total number of sales for a period, order type, or entity is from the total number of Invoice Ship To records billed. This total:

- Excludes (is not net of) credit invoices, such as an invoice created by processing a return. For example, if you process 1000 shipments, 50 returns, and 10 discount credits after shipment, the total displayed here is still 1000.
- Does not include any invoice with a merchandise total of $0.00.:

For more information: See *Consolidated Invoice (B49)* for a discussion on the factors that control how many invoices are generated for orders that include multiple shipments on the same day.

> **Important:**
>
> In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

How is the sales amount calculated? The total sales amount for a period, order type, or entity is from the total dollar value of merchandise billed for the period, based on actual selling price. This total:

- Excludes (is not net of) returns, credits, or discounts applied after shipment.
- Does not include freight, tax, handling, or other charges.
- Includes a two-position decimal.

Sales Summary Screen

How to display this screen: Enter *DSSS* in the Fast path field at the top of any menu, or select the Sales Summary option from a menu.

Field	Description
Current day, week, and month totals	The top portion of the screen displays totals for the current day, week, and month.
Period	Periods are: *Today* = The current date. *This week* = The current week runs from Monday through Sunday, and the totals displayed include all days so far for this period. **Note:** The calculation of totals for This week occurs regardless of whether a new month starts during the week. *Example:* Today is Sunday June 3. The totals displayed under This week include Monday May 28 through the current date. *This month* = The totals for the current month to date. **Note:** See the note above on how invoice date is determined.
Number	See the *Calculations* above for a discussion.
Amount	See the *Calculations* above for a discussion.
Order Type totals for today	The *Order Type* tab lists the current day’s total number of Invoice Ship To records and dollar amounts for each order type in your company, except for quote order types. **Note:** See the note above about how invoice date is determined.

Field	Description
Order type	The code identifying the order type. The description of the order type follows, separated by a hyphen. Order types are defined in and validated against the Order Type table. See *Establishing Order Types (WOTY)* for more information. Quote order types are not listed here, since it is not possible to bill merchandise for a quote. See *Entering Pre-Order Quotes* for background.
Number	See the *Calculations* above for a discussion.
Amount	See the *Calculations* above for a discussion.
Entity totals for today	The *Entity* tab lists the current day's total number of Invoice Ship To records and dollar amounts for each entity in your company. **Note:** See the note above on how invoice date is determined.
Entity	The code identifying a business entity within your company. The description of the entity follows, separated by a hyphen. Entities are defined in and validated against the Entity table. See *Working with Entities (WENT)* for more information.
Number	See the *Calculations* above for a discussion.
Amount	See the *Calculations* above for a discussion.

Printing the Order Type Summary by Delivery Type Report (PDTS)

Purpose: Use this menu option to print the Order Type Summary Report by Delivery Type, which provides a summary of order information by order type and delivery type for a specified date range. This is useful if you want to review a snapshot of orders for today.

Order Delivery Type Summary Screen

Use this screen to define the selection criteria you wish to use to print the Order Type Summary by Delivery Type Report.

How to display this screen: Enter *PDTS* in the Fast path field at the top of any menu or select Order Type Summary by Delivery Type Report from a menu.

Field	Description
Start date	The first order date to include on the report. The system includes orders whose Order date in the Order Header table is equal to or greater than this date. The From date cannot be greater than the To date. The date cannot be greater than the current date. If you enter a From date, you must also enter a To date. Numeric, 6 positions (in user date format); required.

Field	Description
End date	The last order date to include on the report. The system includes orders whose Order date in the Order Header table is equal to or earlier than this date. The From date cannot be greater than the To date. The date cannot be greater than the current date. If you enter a From date, you must also enter a To date. Numeric, 6 positions (in user date format); required.

Screen Option	Procedure
Generate the *Order Type Summary by Delivery Type Report*	Enter a date range and select *Submit*. The system submits the MSR1174RPT job to generate the report and returns you to the main menu.

Managing Declined Authorizations

In this part: This part presents the functions available to cancel orders that are declined by an authorization service, and includes the following topic:

- *Working with Credit Card Cancellations (WCCC)* shows you how to cancel orders flagged for cancellation due to credit card decline.

Working with Credit Card Cancellations (WCCC)

Purpose: Use the Work with Credit Card Cancellations function to cancel orders whose credit cards have been declined by the authorization service.

In this topic:

- *Overview*
- *Cancel Credit Card Order Cancellation Screen*
- *Credit Card Order Cancellation List*

Overview

You can define different actions to take for each vendor response code you receive from an authorization service. For example, if the service declines an authorization because the card is over its credit limit, you could set up the system to put the order on hold for five days and reattempt authorization after that time. You have the option of setting up a vendor response so that the system will flag the order for cancellation, either when the credit card is first declined or after a given number of attempts.

Determining when to flag for cancellation: The system determines that an order should be flagged for cancellation based on the number of declines received from the authorization service. You can set up the maximum number of declines in two ways:

- *vendor response code:* Specify the maximum number of attempts for an individual vendor response code. For example, a vendor response code that indicates credit card fraud might trigger cancellation after one authorization attempt; a vendor response code that indicates insufficient credit limit might trigger order cancellation after four or more attempts. Some response codes might be set up to attempt authorization an unlimited number of times, and never trigger a cancellation.

- *system control value:* The *Maximum Number of Retries on Credit Card Orders (E74)* system control value specifies the number of times to attempt reauthorization across all vendor responses. Overrides the limits you set up for individual response codes; in other words, if you specify you will attempt authorization 15 times for a vendor response code, but the system control value is set to 10, the system will not exceed 10 attempts.

The counter for authorization attempts is reset when you receive an authorization.

Example: An order:

- fails authorization three times
- is authorized
- you make a partial shipment
- the order fails authorization again

This last decline counts as response number one.

What happens when an order is flagged for cancellation? The system creates a record in the Backorder Cancellation Pending table (*BOCANP*). These records are assigned a type of *C*, to distinguish them from orders flagged for cancellation due to a backorder. In addition, the system writes:

- an Order History message, which you can review in standard or streamlined order inquiry by selecting *Messages*; see *Display Order History Screen*
- a cancel date on the order detail line, which you can review in standard order inquiry by selecting *Display* for an item or in streamlined order inquiry by selecting the *Detail* option; see *Reviewing Order Details*.

If an order is flagged for cancellation but is not on hold, it will still be submitted for authorization.

Once an order is flagged for cancellation, you cannot exclude it when you cancel credit cards. Deleting the cancel date on the order detail line will not prevent the order from being canceled by this function. The system cancels every order flagged with a *C* in the Backorder Cancellation Pending table, and there is no visibility into this table through a Order Administration menu option.

What happens when you cancel orders? You can use the Work with Credit Card Cancellations menu option to cancel all orders flagged for cancellation due to credit card decline, or you can select all orders within a given range of cancel dates. The system:

- Cancels each flagged order, using the cancel reason specified for the vendor response code that triggered the cancellation. If the order is cancelled because it exceeded the maximum number of declines defined in the System Control table, the system uses the cancel reason code for the most recent vendor response that has a cancel reason code assigned. If none of the responses in the order's authorization history is assigned a cancel reason code, the system uses the default cancel reason defined in the *Auto Soldout Cancel Reason (C20)* system control value.
- Produces the *Credit Card Order Cancellation List*.

- Writes an order line history message for all canceled items (available by selecting *Message* for the item in standard or streamlined order inquiry) specifying the quantity canceled and the cancel reason code.
- Removes any pick slip preparation that has been applied to the order; see *Preparing Orders for Pick Slip Generation*.

> **Note:**
>
> If the cancel reason code set up to reduce demand, the order status after cancellation will be *X*; otherwise, the order status after cancellation will be *C*.

Cancellation email: The system generates an order cancellation email or to the customer if:

- you have specified an *Order Cancellation Email Program (K78)*, and
- there have not been any shipments on the order, and
- the cancel reason code you use does not match the *Cancel Reason Code to Suppress Email (L08)*, and
- the customer is eligible to receive email notifications; see *When Does the System Generate an Email Notification?*

For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

If there have been any shipments on the order, the system generates the order line cancellation email even if all the remaining order lines are now canceled.

See the *Order Cancellation Confirmation Email Sample and Contents* and the *Order Line Cancellation Confirmation Email Sample and Contents* for more information.

Stored value card authorization reversal: If a stored value card payment with an open, unused authorization amount exists on the order, the system also generates a stored value card authorization reversal; see *Stored Value Card Authorization Reversal*.

Periodic function: You can also set up credit card cancellations to run as part of your periodic processing, using function *BOR0029*. In this case, you would not be able to specify a range of dates; all flagged orders would be canceled.

Cancellation email: The system generates an order or order line cancellation email to the customer if:

- you have specified an *Order Cancellation Email Program (K78)* or *Order Line Cancellation Email Program (K79)*, and
- the cancel reason code you use does not match the *Cancel Reason Code to Suppress Email (L08)*, and
- the customer is eligible to receive email notifications; see *When Does the System Generate an Email Notification?*

See the *Order Cancellation Confirmation Email Sample and Contents* and the *Order Line Cancellation Confirmation Email Sample and Contents* for more information.

What happens if the order includes a membership item? If you use this menu option to cancel an order that includes a membership item, the order cancellation process does not automatically cancel the customer membership created by the membership item. You need to use *Working with Customer Memberships (WWCM)* in order to cancel the customer membership. See *Membership Overview* for background on customer memberships.

For more information:

- vendor response codes and an overview of the authorization process: *Defining Vendor Response Codes*
- *Establishing Cancel Reason Codes (WCNR)*
- *Establishing Order Hold Reason Codes (WOHR)*
- *Maximum Number of Retries on Credit Card Orders (E74)* system control value
- reviewing authorization history for an order: *Reviewing Financial Information on an Order*
- setting up periodic processing: *Working with Periodic Functions (WPER)*

Cancel Credit Card Order Cancellation Screen

How to display this screen: Enter *WCCC* in the Fast path field at the top of any menu or by selecting Work with Credit Card Cancellations from a menu.

Field	Description
Beginning date	The earliest cancel date to include when selecting credit card orders for cancellation. You cannot enter a beginning date without also entering an ending date. Numeric, 6 positions (in user date format); optional.
Ending date	The latest cancel date to include when selecting credit card orders for cancellation. You cannot enter an ending date without also entering a beginning date. Numeric, 6 positions (in user date format); optional.

Instructions:

- Optionally, complete the beginning and ending dates.
- Select *OK*. The system validates your entries and highlights any field you need to correct. Correct any fields and select *OK* again.
- Select *Accept*.
- If you have entered a range of dates, the system submits the job *CC_CANCELS*.
- If you have not entered a range of dates, the system displays the Confirm Cancellation of Orders window. At this window, select *OK* to confirm that you want to cancel all credit card orders flagged for cancellation; otherwise, select *Exit* to cancel.

The *CC_CANCELS* job cancels each order flagged for cancellation using the cancel reason code associated with the vendor response code received from the vendor. This job also generates the *Credit Card Order Cancellation List*.

Releasing Held Orders

Topics in this part: The following sections describe how to review and release held orders:

- *Introducing Order Hold Reason Codes* describes system-assigned hold reason codes and their application to orders, and presents the screens you work with to create user-assignable hold reason codes.
- *Working with Customer Fraud Tables (WCFD)* discusses the process of creating, changing, and deleting fraudulent customers based on customer name and address.
- *Working with Miscellaneous Frauds (WMFF)* discusses the process of creating, changing, and deleting fraudulent customers based on postal or zip code, credit card, and check.
- *Selecting Held Orders (ERHO)* describes the screens that provide your initial point of access to held orders display and release tables.
- *Displaying Order Hold Information* presents the customer screens you can use to investigate customer detail on a held order, and the Order Inquiry function you can use to review order status.
- *Performing the Release* presents a pictorial map of screen relationships between the Release Held Order scan screen and the Release Recipients screens, and discusses release functions you use to release orders by recipient, payment method, and order number.

Working with Customer Fraud Tables (WCFD)

Purpose: You can build several fraud tables on the system to evaluate customers to see if they are frauds, based on their:

- Names
- Addresses
- Postal codes
- Credit cards
- Checks

The system checks for fraudulent customers whenever you process a new order during order entry, or when you create a new customer through the Customer Maintenance table. When the system detects a fraud customer, based on the criteria you enter into the Customer Fraud table, the system places the customer's orders on hold and assigns a fraud reason code to the order.

Quotes: The system does not check for fraudulent customers until you convert a quote to an order; see *Entering Pre-Order Quotes* and *Converting Quotes to Orders*.

To create a customer fraud record: There are several ways you can create a customer fraud record:

- create a record using the *Create Fraudulent Customer Screen*.

> **Note:**
>
> Adding a customer to the Customer Fraud table does not by itself add a “fraud” flag to the customer's Hold/bypass/fraud field. You can add a flag to this field through order entry, order maintenance, or by working with the Customer Sold To or Customer Bill To table (See *Creating and Updating Sold-to Customers (WCST)* and *Creating and Updating Bill-to Customers (WCBT)*).

- enter *F* in the Hold/bypass/fraud field for a sold to customer. If you flag a sold to customer as fraud, the system creates a customer fraud record for the sold to customer and a separate customer fraud record for each ship to customer associated with the sold to customer.
- enter *F* in the Hold/bypass/fraud field for a bill to customer. If you flag a bill to customer as fraud, the system creates a customer fraud record for the bill to customer only.

In this topic:

- *Work with Fraudulent Customers Screen*
- *Create Fraudulent Customer Screen*

Work with Fraudulent Customers Screen

How to display this screen: Enter *WCFD* in the Fast path field at the top of any menu or select Work with Fraudulent Customers from a menu.

Field	Description
Match code	A user-defined code that includes parts of the customer's name, company name, and address, which is used to identify duplicate (and fraud) customers. The structure of the match code is defined in the Match Code table; see *Setting Up Match Codes (MMCH)*. Enter a full or partial match code and select *OK* to display customer fraud records in ascending match code order, beginning with your entry. Alphanumeric, 15 positions; optional.
First name	The customer's first name. Alphanumeric, 15 position; display-only.
Last name	The customer's last name. Enter a full or partial last name and select *OK* to display customer fraud records in ascending last name order, beginning with your entry. Alphanumeric, 25 positions, optional.

Screen Option	Procedure
Create a fraudulent customer	Select *Create* to advance to the *Create Fraudulent Customer Screen*.

<table>
<tr><th>Screen Option</th><th>Procedure</th></tr>
<tr><td>Change fraudulent customer information</td><td>Select Change for a fraudulent customer to advance to the:

Change Fraudulent Customers Screen if the fraudulent customer was created using the Create Fraudulent Customer Screen. At this screen you can change any field except Sequence number, Match code, and the three Fraud codes. See Create Fraudulent Customer Screen for field descriptions.

Note:
If you change the address of a fraudulent customer here, the system updates the corresponding Sold To Customer record automatically.
Change Customer Screen if the fraudulent customer was created by placing Fraud in the Hold/bypass/fraud field in the Customer Sold to table.
Change Ship To Screen if the ship to is associated with a sold to that has Fraud in the Hold/bypass/fraud field in the Customer Sold To table
Change Bill To Customer Screen if the fraudulent customer was created by placing Fraud in the Hold/bypass/fraud field in the Customer Bill To table.
</td></tr>
</table>

Screen Option	Procedure
Delete fraudulent customer information	Select *Delete* for a fraudulent customer to delete it. **Note:** If you delete a customer from the Sold To Customer table, the system also deletes the corresponding record from the Customer Fraud table; however, if you delete a customer from the Customer Fraud table, the Sold To Customer record remains in the Customer table, but without the fraud status.
Display fraudulent customers	Select *Display* for a fraudulent customer to advance to the Display Fraudulent Customers Screen.You cannot change any information on this screen. See *Create Fraudulent Customer Screen* for field descriptions.

Create Fraudulent Customer Screen

Purpose: Use this screen to add a customer to the Customer Fraud table.

How to display this screen: At the *Work with Fraudulent Customers Screen*, select *Create*.

Field	Description
Seq # (Sequence number)	A number the system assigns to each fraudulent customer you create. Numeric, 7 positions; display-only.
Match code	A code that includes elements of the customer's name and address, which is used to identify duplicate or fraud customers. The system generates a match code when you finish creating a new customer fraud record. Alphanumeric, 15 positions; display-only.

Field	Description
Fraud code 1	The first of three match codes, defined in the Customer Fraud table, that identifies the customer as fraudulent. A fraud match code exists for every customer in the Customer Fraud table. The system checks this table during order entry for the sold-to and bill-to addresses, and when you create a customer through customer maintenance. Alphanumeric, 15 positions; display-only.
Fraud code 2	The second of three user-defined match codes that identifies the customer as fraudulent. A fraud match code exists for every customer in the customer Fraud table. The system checks this table during Order Entry for the sold-to and bill-to addresses. Alphanumeric, 15 positions; display-only.
Fraud code 3	The third of three user-defined match codes that identifies the customer as fraudulent. A fraud match code exists for every customer in the customer Fraud table. The system checks this table during Order Entry for the sold-to and bill-to addresses. Alphanumeric, 15 positions; display-only.
Name	The following 5 fields are available for you to enter the customer's full name: **Prefix** A title that belongs before the customer's name (such as "Mrs." or "Dr."). Alphanumeric, 3 positions; optional. **First Name** The customer's first name. Alphanumeric, 15 positions; optional. **Initial** The initial of the customer's middle name. Alphanumeric, 1 position; optional. **Last Name** The customer's last name. Alphanumeric, 25 positions; optional. **Suffix** An addition to the customer's full name (such as "M.D.", "Fr.", or "III"). Alphanumeric, 3 positions; optional.
Company name	The name of the company associated with the order. Alphanumeric, 30 positions; optional.
Address	The customer's full street address. Alphanumeric, 4 lines of 32 positions; optional.
Apartment	The apartment number or suite number of the delivery address. To enter an apartment or suite address: 1.Type *APT* to indicate an apartment or type *STE* to indicate a suite. 2.Insert a space and type the number of the apartment or suite; for example *APT 4* or *STE 116*. Alphanumeric, 10 positions; optional.

Field	Description
Zip/city/state	Three fields are available for you to enter the customer's postal code, city, and state. **Zip** The postal code or zip code for this customer. Alphanumeric, 10 positions; optional. **City** The city in which the customer lives, or receives mail or shipments. Alphanumeric, 25 positions; optional. **State** The state or province in which the customer lives, or receives mail or shipments. **Note:** The system does not validate this address in the same way it validates a customer's address, as in order entry. For example, it does not validate that the state is associated with the SCF for the postal code. Alphanumeric, 2 positions; optional.
Country	The country where the customer lives. Alphanumeric, 3 positions; optional.
Notes	Three fields are available for you to enter additional notes about this fraudulent customer, such as why the customer is a fraud. If the fraudulent customer record was created by placing *F* in the Hold/bypass/fraud field in the Customer Sold to table or Customer Bill To table, you do not advance to the Change Fraudulent Customers screen when you wish to change fraudulent customer information; instead the system advances you to the Change Customer Screen (sold to fraud), Change Ship To Screen (ship to fraud) or Change Customer Bill To Screen (bill to fraud). If you wish to enter notes about a fraudulent customer created by placing *F* in the Hold/bypass/fraud field, you must enter the notes using the *Edit Customer Notes Screen* or *Work with Bill To Notes Screen*. Alphanumeric, three 60-position fields; optional.

Working with Miscellaneous Frauds (WMFF)

Purpose: You can establish miscellaneous frauds based on postal code, check, email address, or IP address.

The system checks the Miscellaneous Fraud table only if the *Fraud Checking (A68)* system control value is *selected*. **Quotes:** The system does not check the

Miscellaneous Fraud table until you convert a quote to an order; see *Entering Pre-Order Quotes* and *Converting Quotes to Orders*.

Defining miscellaneous frauds: The Type field indicates the type of information that is evaluated for fraud. Once you define the Type, enter the information that is fraudulent in the Code field.

Fraud Type	Results
E Email Address	The system compares the email addresses related to the order against the email addresses in the Miscellaneous Fraud table. Depending on which email address related to the order matched an email in the Miscellaneous Fraud table, the system puts the order on hold as follows: • order-level email address: *EO* hold • recipient, permanent ship-to customer or order-level shipping address: *ES* hold (**Note:** The system puts the order on hold for a recipient customer only if the matching email is the recipient's primary email address) • sold-to customer: *EC* hold (**Note:** The system puts the order on hold only if the customer's primary email address matches) • bill-to customer: *EB* hold (**Note:** The system puts the order on hold if the bill-to is on the order or just assigned to the sold-to customer) **Setting up a fraud email address:** When setting up a fraud email address, you can define a specific email address or you can use the asterisk (*) as a wildcard match. Options are: • *text@domain.com:* the email is flagged as fraud if it matches the specific email address. **Example:** If the fraud email is `johnsmith@kab.com`, then this specific email will be flagged as fraud, but `johnsmithers@kab.com` will not be flagged as fraud. • **@domain.com:* the email is flagged as fraud if its domain matches the specified domain. **Example:** If the fraud email is `*@kab.com`, then any email whose domain is `kab.com` will be flagged as fraud. `js@kab.com` will be flagged as fraud, but `js@twb.com` will not be flagged as fraud. • **text@domain.com:* the email is flagged as fraud if the text before the @ sign ends with the specified characters and is at the specified domain. **Example:** If the fraud email is `*smith@kab.com`, then any email whose text before the @ sign ends with `smith` and whose domain is `kab.com` will be flagged as fraud. `johnsmith@kab.com` will be flagged as fraud, but `johnsmitty@kab.com` will not be flagged as fraud. • *text*@domain.com:* the email is flagged as fraud if the text before the @ sign starts with the specified characters and is at the specified domain. **Example:** If the fraud email is `john*@kab.com`, then any email whose text before the @ sign starts with `john` and whose domain is `kab.com` will be flagged as fraud. `johnsmith@kab.com` and `johnsmitty@kab.com` will be flagged as fraud, but `jsmith@kab.com` will not be flagged as fraud.

Fraud Type	Results
I IP Address	When creating an order through the generic order API, the system updates the *IP address* in the Order Header Extended table if an ip_addr is provided in the *Inbound Order XML Message (CWORDERIN)*. The system then compares the IP address for the order with the IP addresses in the Miscellaneous Fraud table. IP address matching is based on a full or partial IP address specified in the Miscellaneous Fraud table, which permits asterisks to be used as "wild cards." For more information see the Web Services Guide on My Oracle Support (ID 2953017.1). *Example:* If the Miscellaneous Fraud record is `1.2.*.*`, then any IP addresses that begin with `1.2` will cause orders to go on hold (`1.2.3.4`, `1.2.99.7`, etc.). **About IP address:** The IP (internet protocol) address identifies where an order originates. The IP address is expressed as a series of four numbers separated by three periods (for example, `192.168.255.255`). Each number in the series must be from 1 to 255. Depending on the type of network where the customer is logged in, the first one, two, or three numbers between the periods typically represent the hosting network itself. The remainder of the IP address can be permanently assigned to the user's location (static IP address), or can be temporarily assigned each time the user logs in (dynamic IP address). In the case of a dynamically assigned IP address, creating a Miscellaneous Fraud record for the entire address would not be helpful, because the last portion of the address will be different every time. In this case, you can create a Miscellaneous Fraud record for the beginning portion(s) of the IP address, because this portion of the IP address identifies the hosting network. If the ip_addr matches the Miscellaneous Fraud record, the system puts the order on *IP* (IP address) hold and writes a message such as `SYS HLD---IP ADDRESS HOLD` (where `IP ADDRESS HOLD` is the description of the hold reason code) to the Order Transaction History table.
K Check	The system compares the micra number (routing number) on a check pay type against the micra numbers in the Miscellaneous Fraud table. If the micra number on the check pay type matches a micra number in the Miscellaneous Fraud table, the system places the order pay type on *KF* (check fraud) hold.

Fraud Type	Results
Z Zip Code	The system compares the postal code defined for a customer address against the postal codes in the Miscellaneous Fraud table. **Setting up a fraud zip code:** If you enter a 5-digit postal code in the Miscellaneous Fraud table, the system considers a postal code a match if the first 5 positions of the postal code defined for a customer address match the postal code in the Miscellaneous Fraud table. **Example:** if you enter `96624` in the Miscellaneous Fraud table, the system considers a customer address with postal code `96624` or postal code `96624-1620` as fraud. If the postal code for a customer matches a postal code in the Miscellaneous Fraud table, the system: • places the order bill to customer on *ZB* (bill to zip fraud) hold (the postal code for the bill to is fraudulent). • places the order sold to customer on *ZS* (sold to zip fraud) hold (the postal code for the sold to is fraudulent). • places the order ship to customer on *ZH* (ship to zip fraud) hold (the postal code for the ship to is fraudulent).

For more information: See *Introducing Order Hold Reason Codes* for more information on defining fraudulent hold reason codes.

In this topic:

- *Work With Miscellaneous Frauds Screen*
- *Create Miscellaneous Fraud Screen*

Work With Miscellaneous Frauds Screen

How to display this screen: Enter *WMFF* in the Fast Path field at the top of any menu or select this option from a menu.

Field	Description
Type	Indicates the type of information that is evaluated for fraud. Valid values are: • *Check* = the system compares the micra number (routing number) on a check pay type against the micra numbers in the Miscellaneous Fraud table. • *Email* = the system compares the email address against the email addresses in the Miscellaneous Fraud table. • *IP Address* = the system compares the ip_addr in the *Inbound Order XML Message (CWORDERIN)* when creating an order through the generic order API. • *Zip* = the system compares the postal code defined for a customer address against the postal codes in the Miscellaneous Fraud table. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Define a Type and select *OK* to display miscellaneous fraud records that match your entry. Optional.

Field	Description
Code	The information that is considered fraudulent, based on the code defined in the Type field. **Check code** The micra number located on the check. The micra number is also referred to as a routing number. Alphanumeric, 15 positions, optional. **Email address** The email address defined for an order or customer (sold to, bill to, or ship to). Alphanumeric, 50 positions; optional. **IP address** The full or partial IP address received for an order API (e-commerce) order. The IP address specified here can include asterisks (*) for “wild card” matching. For example, if the Miscellaneous Fraud record is `1.2.*.*`, then any IP addresses that begin with `1.2` will cause orders to go on hold (`1.2.3.4`, `1.2.99.7`, etc.). **Zip code** The postal code defined for the customer’s address. You can enter an extended, non-hyphenated code, or the initial 5 digits of the postal code. Define a Type and Code and select *OK* to display miscellaneous fraud records that match your entry. Alphanumeric, 9 positions, optional.

Screen Option	Procedure
Create a miscellaneous fraud customer	Select *Create* to advance to the *Create Miscellaneous Fraud Screen*.
Change miscellaneous fraud information	Select *Change* for a fraudulent customer to advance to the Change Miscellaneous Fraud Screen. At this screen you can only change fraud information. See *Create Miscellaneous Fraud Screen* for field descriptions.
Delete a miscellaneous fraud record	Select *Delete* for a fraudulent customer to delete it.
Display a miscellaneous fraud	Select *Display* for a fraudulent customer to advance to the Display Miscellaneous Fraud Screen. You cannot change any information on this screen. See *Create Miscellaneous Fraud Screen* for field descriptions.

Create Miscellaneous Fraud Screen

To create: Use this screen to add a fraudulent postal code, check, or email address to the Miscellaneous Fraud table.

How to display this screen: At the *Work With Miscellaneous Frauds Screen*, select *Create*.

Field	Description
Fraud type	Indicates the type of information that is evaluated for fraud. Valid values are: • *Check* = the system compares the micra number (routing number) on a check pay type against the micra numbers in the Miscellaneous Fraud table. • *Email* = the system compares the email address against the email addresses in the Miscellaneous Fraud table. • *IP Address* = the system compares the ip_addr in the *Inbound Order XML Message (CWORDERIN)* when creating an order through the generic order API. • *Zip* = the system compares the postal code defined for a customer address against the postal codes in the Miscellaneous Fraud table. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Required.
Fraud information	The information that is considered fraudulent, based on the code defined in the Type field. **Check code** The micra number located on the check. The micra number is also referred to as a routing number. Alphanumeric, 15 positions, optional.

Field	Description
	Email address The email address defined for an order or customer (sold to, bill to, or ship to).When setting up a fraud email address, you can define a specific email address or you can use the asterisk (*) as a wildcard match. Options are: • *text@domain.com:* the email is flagged as fraud if it matches the specific email address. **Example:** If the fraud email is `johnsmith@example.com`, then this specific email will be flagged as fraud, but `johnsmithers@example.com` will not be flagged as fraud. • **@domain.com:* the email is flagged as fraud if its domain matches the specified domain. **Example:** If the fraud email is `*@kab.com`, then any email whose domain is `kab.com` will be flagged as fraud. `js@kab.com` will be flagged as fraud, but `js@twb.com` will not be flagged as fraud. • **text@domain.com:* the email is flagged as fraud if the text before the @ sign ends with the specified characters and is at the specified domain. **Example:** If the fraud email is `*smith@kab.com`, then any email whose text before the @ sign ends with `smith` and whose domain is `kab.com` will be flagged as fraud. `johnsmith@kab.com` will be flagged as fraud, but `johnsmitty@kab.com` will not be flagged as fraud. • *text*@domain.com:* the email is flagged as fraud if the text before the @ sign starts with the specified characters and is at the specified domain. **Example:** If the fraud email is `john*@kab.com`, then any email whose text before the @ sign starts with `john` and whose domain is `kab.com` will be flagged as fraud. `johnsmith@kab.com` and `johnsmitty@kab.com` will be flagged as fraud, but `jsmith@kab.com` will not be flagged as fraud. Alphanumeric, 50 positions; required for an email address type.

Field	Description
	IP address The full or partial IP address received for an order API order. The IP address specified here can substitute asterisks (*) as "wild cards" for one or more of the four numbers that make up the IP address. For example, if the Miscellaneous Fraud record is `1.2.*.*`, then any IP addresses that begin with `1.2` will cause orders to go on hold (`1.2.3.4`, `1.2.99.7`, etc.). The system validates that your entry includes four numbers between 1 and 255, separated by three periods. Matching begins at the first number of the series and works back, which means that one or more numbers in the series can consist of a "wild card" asterisk; however, once the IP address includes an asterisk, the remainder of the IP address cannot include any more numbers. The system displays an error message if your entry: • includes any non-numeric characters • begins with a wild card (for example, `*.22.33.44`) • includes a wild card but does not end with one (for example, `12.*.33.4` or `11.2.*.4`) • includes both a wild card and a number between periods (for example, `123.45.67*.*` or `1.2.3.4*`) • includes a number greater than 255 • includes any blank spaces Alphanumeric, 15 positions; required for an IP address type.
	Zip code The postal code defined for the customer's address. You can enter an extended, non-hyphenated code, or the initial 5 digits of the postal code. When setting up a fraud zip code, if you enter a 5-digit postal code in the Miscellaneous Fraud table, the system considers a postal code a match if the first 5 positions of the postal code defined for a customer address match the postal code in the Miscellaneous Fraud table. **Example:** if you enter `96624` in the Miscellaneous Fraud table, the system considers a customer address with postal code `96624` or postal code `96624-1620` as fraud. Alphanumeric, 9 positions; required for a postal code type.

Selecting Held Orders (ERHO)

Purpose: You gain access to a list of held and suspended orders from the Release Held Orders scan screen. You can then use the subsequent screens to continue your scan for held orders, or to select individual orders for review or release.

Quotes: Held quotes are not included in the Release Held Orders (ERHO) menu option; you can use quote maintenance to remove the hold reason on the Work with Order screen from the quote; see *Maintaining Quotes in Order Maintenance*.

In this topic:

- *Release Held Order Scan Screen*
- *Release Held Orders Screen (Working with Releases)*

Release Held Order Scan Screen

Purpose: You can find held orders in two ways: by entering a specific customer number in the Customer number field, or by reviewing a list of orders by scanning on any other field on this screen. Optionally, you can display the *Held Order Summary Screen*, and select a hold reason for working with held orders.

How to display this screen: Enter *ERHO* in the Fast path field or select Release Held Orders from a menu.

Field	Description
Order #	A number the system assigns to identify an order. Enter a valid order number in this field to advance to the *Release Held Orders Screen (Working with Releases)*. Numeric, 8 positions; optional.
Customer #	A number to identify a customer who places an order. Enter a valid customer number to advance to the *Release Held Orders Screen (Working with Releases)*. Numeric, 9 positions; optional.
System hold reason	A code that identifies the reason the system put an order on hold. See *Introducing Order Hold Reason Codes*. Enter a system hold code in this field to advance to the *Release Held Orders Screen (Working with Releases)*. **Note:** You cannot search based on the Awaiting Credit Card Auth (CW) hold reason. Alphanumeric, 2 positions; optional.
User hold reason	A hold reason code assigned by an operator in Order Entry or Order Maintenance, or through the *Generic Pick In API (Shipments, Voids, and Backorders)*. See *Establishing Order Hold Reason Codes (WOHR)*. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Enter a user hold code in this field to advance to the *Release Held Orders Screen (Working with Releases)*. Alphanumeric, 2 positions; optional.
Order date	The date an order was entered. Enter a date in this field ato advance to the *Release Held Orders Screen (Working with Releases)*. Numeric, 6 positions (in user date format); optional.
Ship via	Represents a carrier who delivers merchandise to your customers. Enter a valid code in this field to display the *Release Held Orders Screen (Working with Releases)*. Numeric, 2 positions; optional.

Release Held Orders Screen (Working with Releases)

Purpose: This screen is your point of access to held orders.

How to display this screen: Enter valid criteria in one of the fields at the *Release Held Order Scan Screen*, or select a hold reason at the *Held Order Summary Screen*.

Using this screen: Use this screen to:

- Gain access to specific held order and customer information
- Perform releases at the bill-to record level
- Perform a global release on all orders listed
- Display hold reason codes

The appearance of this screen will vary depending on your selection criteria at the *Release Held Order Scan Screen*.

Additional fields: The fields not described under *Release Held Order Scan Screen* are:

Field	Description
New cust (New customer)	Indicates if the customer associated with the held order is a new customer, based on purchase history. • *selected* = The customer has placed an order, but no orders have shipped. The # orders LTD is equal to or greater than 1 and the # sales LTD is equal to 0 for the customer in the Customer Sold To Order History table. • *unselected* = The customer has placed an order and at least one order has shipped. The # orders LTD and # sales LTD is equal to or greater than 1 for the customer in the Customer Sold To Order History table.
Pay	This code indicates whether an order is on hold because of pay type. Valid values are: • *Yes* = order is on hold due to pay type • *No* = order is not on hold due to pay type
Rcp (Recipient)	This code indicates whether an order is on hold for reasons related to the recipient customer. Valid values are: • *Yes* = order is on hold due to recipient • *No* = order is not on hold due to recipient

Screen Option	Procedure
Release held orders by recipient	Select *Recipients* for an order to advance to the *Release Order Recipients Screen*.
Release an order from all holds	Select *Release* for an order to release holds without advancing to another screen. See *Performing the Release*.
Release held order payment method	Select *Payments* for an order to advance to the *Release Held Order Payment Methods Screen*.
Display customer information	Select *Cust Info* for an order to advance to the *First Display Customer Screen*.

Screen Option	Procedure
Display order hold reason codes	Select *Hold reasons* for an order to display a *Held Order Reasons Pop-Up Window (Displaying Hold Reason Codes)*.
Advance to standard Order Inquiry	Select *Order Inquiry* for an order to advance to the *Order Inquiry Header Screen* or the *Order Inquiry Detail Screen*, depending on the setting of the *Default Version for Order Inquiry (C34)* system control value. See *Using the Order Inquiry Header Screen to Review Held Orders* for a discussion on relevant information on the header screen in standard order inquiry.
Display order messages	Select *Messages* to advance to the Work with Order Messages Screen.

Managing Returns

In this part:

- *Introducing Return Authorizations (WRTA)* discusses the three stages of creating, receiving, and issuing credit for merchandise returns.
- *Selecting Orders for Return (WRTA)* shows you how to use the Select Order for Return Authorization screen to select an order for return authorization through the Work with Return Authorizations menu option.
- *Working with Return Authorizations: Standard Process* describes how to create or work with a return authorizations using the standard process, which involves creating, receiving, and crediting returns in separate steps.
- *Working with Return Authorizations: Streamlined Process* describes how to create or work with return authorizations using the streamlined process, which involves automatically processing the return authorization as far as your authority extends.
- *Receiving Returns (WRAR)* shows you how to receive returns into your warehouse using a separate menu option.
- *Crediting Returns (WRAC)* shows you how to credit returns using a separate menu option.
- *Processing Credits by Line of Business (MCLB)* describes how to process credits for a specific line of business and dollar amount.
- *Work with Return Interface Errors (WRIE)* describes the screens you use to review or delete return records which went into error status when received from an outside return system.
- *Inbound Return API* describes using the generic returns API (RETURNS_IN process) to create and process a return against an order detail line, based on XML messages from an external system.
  For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Working with Return Authorizations (WRTA)

For information on:	See:
The stages of creating, receiving, and issuing credit for merchandise returns; background	*Introducing Return Authorizations (WRTA)*
Selecting orders for return authorization and different scanning and selection options	*Selecting Orders for Return (WRTA)*
Standard return authorization processing through Work with Return Authorizations	*Working with Return Authorizations: Standard Process*
Streamlined return authorization processing through Work with Return Authorizations	*Working with Return Authorizations: Streamlined Process*

Receiving Returns (WRAR)

Purpose: Use the Work with Return Authorization Receiving menu option to perform the receipt phase of processing a return authorization. This phase consists of updating the order and posting the receipt into inventory. If the return includes an exchange, the exchange item is added to the order at this time.

Additional uses: You can also use this menu option to review information, or to change settings on the return authorization before processing the receipt. Additionally, you can advance to the *Work with Return Authorization Detail Screen*.

> **Note:**
>
> This screen is available regardless of whether you use the standard or streamlined process in Work with Return Authorizations.

Authority: You must have authority to *Enter Return Authorization (A28)* and *Receive Return Authorization (A29)* to use this menu option.

Other options: You can also use the Work with Return Authorizations menu option to perform each step of a return authorization, or you can use order maintenance to perform all steps of the return “behind the scenes.” You might choose to use the Work with Return Authorization Receiving menu option instead of these other options because it allows staff to process a series of receipts efficiently.

Pick slip preparation: When you select a return authorization to receive, the system removes any pick slip preparation from the order. When you accept or reject the return authorization receipt, the system determines if the order qualifies for pick slip preparation and reapplies it to the order. If you add an exchange item to the order, the system performs pick slip preparation for the exchange item when you receive the return authorization. See *Preparing Orders for Pick Slip Generation*.

In this topic:

For more information: See *Introducing Return Authorizations (WRTA)* for an overview of return authorizations.

Receive Returns Screen

This screen displays all return authorizations with pending merchandise returns.

How to display this screen: Enter *WRAR* in the Fast path field of any menu or select this option from a menu.

Field	Description
RA # (Return authorization number)	A number that identifies the return authorization, order, and shipping address. On this screen, this number is made up of three segments separated by hyphens: **Order number** A number to identify an order. Numeric, 7 positions; optional. **Ship-to number** The number of the shipping address on the order. Numeric, 3 positions; optional. **Return authorization number** The number of the return authorization against this order number and shipping address. Returns for the same order number and shipping address will appear as separate return authorizations if they were created separately. See *Working with Return Authorizations: Standard Process* for more information on return authorization header and detail structure. Numeric, 3 positions; optional.
Qty entered	The total quantity of the item(s) being returned on this return authorization. Numeric, 5 positions; display-only.
Date entered	The date the return authorization was created. Return authorizations can have multiple lines, each entered on separate dates; if so, the most recent date displays. The date entered appears beneath the quantity entered. Numeric, 6 positions (in user date format); display-only.
Qty received (Quantity received)	The total number of units received against the return authorization. Numeric, 5 positions; display-only.

Field	Description
Date received	The date that the return authorization line was received. Return authorizations can have multiple lines, each received on separate dates; if so, the most recent date displays. The date received appears beneath the quantity received. Numeric, 6 positions (in user date format); display-only.
Qty credited (Quantity credited)	The number of received units for which a credit was issued. Numeric, 5 positions; display-only.
Date credited	The date that a credit was issued. Return authorizations can have multiple lines, each credited on separate dates; if so, the most recent date displays. The date credited appears beneath the quantity credited. Numeric, 6 positions (in user date format); display-only.
Customer number	This number identifies the customer who placed the order. Scanning on this field is not currently implemented. Numeric, 9 positions; optional.
Customer name	The name of the customer. Alphanumeric, 30 positions; display-only.

Screen Option	Procedure
Receive one or more items	Select *Receive detail* for a return authorization to advance to the Work with Return Authorization Detail Screen.
Receive all returns	Select *Receive all* for a return authorization. See Receiving Returned Items.

Receiving Returned Items

Overview: You can receive returned items through the Receive Returns Screen in the following ways:

- Receive All from First Screen, select *Receive all* for a return authorization
- Receive Item, select *Receive detail* for a return authorization to advance to the Work with Return Authorization Detail Screen, where you can select one or more items for receipt
- Receive All from Second Screen, select *Receive detail* for a return authorization to advance to the Work with Return Authorization Detail Screen, where you can select *Receive All* to receive all items on the return authorization

Exchange item: You will need to enter an exchange item when processing a receipt if the return has an exchange reason code, and the Require Exchange Item at Time of Receipt (F42) system control value is *selected*. See Entering an Exchange Item.

Receive All from First Screen

Use this option if you do not need to review the items on the return authorization before processing the receipt.

Select *Receive all* for a return authorization at the Receive Returns Screen to display the Confirm Accept pop-up window.

If you select *OK*, all items on the return authorization will be received, and the return authorization will be removed from the Receive Returns screen.

> **Important:**
>
> You cannot undo the receipt once you select *OK*.

Receive Item

Use this option if you would like to review the items on the return authorization before receiving them, to receive one or more individual items, or to change settings on the return before processing the receipt.

1. Select *Receive detail* for a return authorization at the *Receive Returns Screen* to advance to the *Work with Return Authorization Detail Screen*.
2. *Review:* Optionally, select *Receive detail* for any item you would like to review to advance to the *RA Exchange Item Window (Review Exchange)* and the *RA Exchange Item Window (Review Exchange)* for an exchange.
3. *Change:* Optionally, select *Change* for any item you would like to change to advance to the *Change RA Detail Screen*.
4. select *Receive all* for each item that you want to receive to advance to the *Receive RA Items Screen (Receiving Detail)*.

You can also display this screen by selecting *Receive all* for an item at the *Work with Return Authorization Detail Screen* through *Working with Return Authorizations: Standard Process*.

To complete the Receive RA Items screen: You can change the Quantity returned, Disposition code, Warehouse, or Location fields.

Pop-up windows: If the item does not have a primary location, the system displays an informational pop-up window when you select *OK* if the *Display "No Primary Location" Message in Returns (G46)* system control value is *selected*.

Field descriptions: See *Working with Return Authorizations: Standard Process*.

Receive All from Second Screen

Use this option if you want to review the items on the return authorization before processing the entire receipt.

1. Select *Receive detail* for a return authorization at the *Receive Returns Screen* to advance to the *Work with Return Authorization Detail Screen*.
2. *Review:* Optionally, select *Receive detail* for any item you would like to review to advance to the *RA Exchange Item Window (Review Exchange)* and the *RA Exchange Item Window (Review Exchange)* for an exchange.
3. *Change:* Optionally, select *Change* for any item you would like to change to advance *Change RA Detail Screen*.
4. Select *Receive All* to receive all unreceived items on the return authorization. All items are removed from the screen.
5. Select *Accept* to accept your entries; otherwise, Select *Reject* to cancel.

When you select *Accept*, you return to the *Receive Returns Screen*. The receipt for each item is processed, and the return authorization is removed from the screen.

Error message: You cannot process two returns against the same Item Location in a warehouse at the same time. However, if you use the standard process, it is possible to have two returns created that point to the same Item Location, because no updates take place at the time you create the return authorization, only at the time of receipt. For this reason, the screen might display an error message at the time you attempt to receive all the items on a return authorization at once:

```
Multiple returns not allowed for same Item/Whse/Loc.
```

To correct, you can change the location to receive one or more of the returns, or process one of the returns completely before processing the other.

Entering an Exchange Item

If the *Require Exchange Item at Time of Receipt (F42)* system control value is *selected*, you will need to enter exchange item information for all exchanges when you process the receipt. The *Enter Exchange Item Screen* or window displays, depending on the steps you took to process the receipt; the fields on both the screen and the window are the same.

If the exchange item you enter is associated with any item comments, you advance to the *Work with Item/SKU Comments Window*.

Create a Return Authorization/Misship

You can select *Create* at the *Work with Return Authorization Detail Screen* in the Work with Return Authorization Receiving menu option to advance to the *R/A Select Order Detail Pop-Up Window*. At this window, you can:

Standard processing:

- *Create new return authorization:* If there are additional unreturned items on the order, you can select it and create a new return authorization.
- *Enter misship:* select *Exit* at this window to create and receive a misship return.

Streamlined processing: Advance directly to the *Create RA Detail Screen*. At this screen, you can add a misship item to the return authorization. You cannot create a new return authorization for a shipped item from the order.

About misships: The misship will be created and received when you accept.

Crediting Returns (WRAC)

Purpose: Use the credit return authorization function to process credits for return authorizations that have already been created and received. You can use this menu option regardless of whether you use the standard or streamlined process.

> **Note:**
>
> Misship returns do not display in this menu option, and are not available for crediting.

Additional uses: You can also use this menu option to review information on the return authorization before processing the credit.

Authority: You must have authority to create, receive, and credit a return authorization to use this menu option. The *Credit Return Authorization (A34)* secured feature controls this authority.

Other options: You can also use the Work with Return Authorizations menu option to perform each step of a return authorization. Also, you can use order maintenance to perform all steps of the return "behind the scenes." You might choose to use the Work with Return Authorization Credits menu option instead of these other options because it allows staff to process a series of credits efficiently.

See *Introducing Return Authorizations (WRTA)* for an overview of return authorizations.

> **Important:**
>
> You cannot change any of the settings on the return authorization through the Work with Return Authorization Credits menu option; instead, you should use Work with Return Authorizations if you wish to make any changes before processing the credit.

In this topic:

- *First Process RA Credits Screen*
- *Second Process RA Credits Screen*
- *Processing Credits*
  - *Credit All from First Screen*
  - *Credit Item*
  - *Credit All from Second Screen*

For more information:

- *Working with Return Authorizations: Standard Process*
- *Working with Return Authorizations: Streamlined Process*

First Process RA Credits Screen

This screen displays return authorizations that contain one or more RA detail lines with an uncredited quantity (the quantity returned - the quantity credited is greater than zero).

Use this screen to:

- select a return authorization to credit, either in full or for selected items only
- review additional information about return authorizations that have been received into your warehouse but not yet credited

Each return authorization that has been received but not yet fully credited is listed.

How to display this screen: Enter *WRAC* in the Fast path field at the top of any menu or select Process Return Authorization Credits from a menu.

Field	Description
RA # (Return authorization number)	A number that identifies the return authorization, order, and shipping address. On this screen, this number is made up of three segments separated by hyphens: **Order number** A number to identify an order. Numeric, 7 positions; optional. **Ship-to number** The number of the shipping address on the order. Numeric, 3 positions; optional. **Return authorization number** The number of the return authorization against this order number and shipping address. Returns for the same order number and shipping address will appear as separate return authorizations if they were processed separately. Numeric, 3 positions; optional.
Qty entered (Quantity entered)	The quantity of the item(s) being returned on this return authorization. Numeric, 5 positions; display-only.
Date entered	The date the return authorization was created. Return authorizations can have multiple lines, each entered on separate dates; if so, the most recent date displays. The date entered appears beneath the quantity entered. Numeric, 6 positions (in user date format); display-only.
Qty received (Quantity received)	The total number of units received against the return authorization. Numeric, 5 positions; display-only.
Date received	The date that the return authorization line was received. Return authorizations can have multiple lines, each received on separate dates; if so, the most recent date displays. The date received appears beneath the quantity received. Numeric, 6 positions (in user date format); display-only.
Qty credited (Quantity credited)	The number of received units for which a credit was issued. Numeric, 5 positions; display-only.
Date credited	The date that a credit was issued. Return authorizations can have multiple lines, each credited on separate dates; if so, the most recent date displays. The date credited appears beneath the quantity credited. Numeric, 6 positions (in user date format); display-only.
Customer number	This number identifies the customer who placed the order. Scanning on this field is not currently implemented. Numeric, 9 positions; optional.
Customer name	The name of the customer. The customer's name, or company name and contact, appear beneath the customer number. Alphanumeric, 30 positions; display-only.

Screen Option	Procedure
Credit return authorization detail lines separately	Select *Credit Detail* for a return authorization to advance to the *Second Process RA Credits Screen*.
Credit the entire return authorization	Select *Credit All* for a return authorization to credit all lines on the return authorization. See *Processing Credits*.

Second Process RA Credits Screen

Purpose: Use this screen to issue credit for one or more lines returned against an order. This screen displays items that you have received into your warehouse for the return authorization shown. Items on the return authorization but not yet received do not display.

Issuing credit to return authorizations line-by-line enables you to review item detail on the return authorization before selecting which lines to credit.

How to display this screen: Select *Credit Detail* for a return authorization at the *First Process RA Credits Screen*. You can also display this screen by selecting a return authorization to credit using *Working with Return Authorizations: Standard Process*.

Field	Description
RA # (Return authorization number)	A number that identifies the return authorization, order, and shipping address. On this screen, this number is made up of three segments separated by hyphens: Order number A number to identify an order. Numeric, 7 positions; display-only. Ship-to number The number of the shipping address on the order. Numeric, 3 positions; display-only. Return authorization number The number of the return authorization against this order number and shipping address. Returns for the same order number and shipping address will appear as separate return authorizations if they were processed separately. Numeric, 3 positions; display-only.
Customer number	This number identifies the customer who placed the order. Numeric, 9 positions; optional.
Customer name	The name of the customer. The customer's name, or company name and contact, appear to the right of the customer number. Alphanumeric, 30 positions; display-only.
Ln # (Line number)	The line number on the return authorization. Numeric, 3 positions; optional.
Item	A code representing a unit of inventory. Alphanumeric, 12 positions; optional.

Field	Description
SKU (Stock keeping unit)	The unique characteristics of an item, such as its size or color. **Note:** This field appears as one 14-position field; to scan, enter the complete SKU information, separating each SKU element with a space. Alphanumeric, 14 positions; optional.
Qty rtn'd (Quantity returned)	The number of units that have been returned to date. Numeric, 5 positions; optional.
Rtn rsn (Return reason)	Represents the reason for returning the item. Return reason codes are defined in and validated against the Return Reason table. See *Establishing Return Reason Codes (WRTR)*. Numeric, 3 positions; optional.
Xch rsn (Exchange reason)	Represents the reason for exchanging the item. Exchange reason codes are defined in and validated against the Exchange Reason table. See *Establishing Exchange Reason Codes (WEXR)*. Numeric, 3 positions; optional.
Merchandise value	The dollar value of the items returned, excluding freight, handling, tax, or additional charges. Numeric, 20 positions with a 2-place decimal; display-only.

Screen Option	Procedure
Display return authorization detail	Select *Display* for a return authorization to advance to the *Display RA Detail Screen*.
Credit the return authorization line	Select *Credit Line* for a returned item to credit it. See *Processing Credits*.
Credit all items on the return	Select *Credit All* to credit all displayed items. See *Processing Credits*.
Accept your entries	Select *Accept* to accept your entries and exit the screen. See *Processing Credits*.
Reject your entries	Select *Reject* to reject your entries and exit the screen. See *Processing Credits*.

Screen Option	Procedure
Exit the screen and return to the *First Process RA Credits Screen*	Select *Exit*. **Note:** This option is available only if you have not selected any items on the screen to process; otherwise, you must select *Accept* or *Reject* to exit.

Processing Credits

Overview: You can process credits though the *Crediting Returns (WRAC)* menu option in the following ways:

- *Credit All from First Screen:* select *Credit Line* for a return authorization at the *First Process RA Credits Screen*
- *Credit Item* select *Credit Line* for an item at the *Second Process RA Credits Screen*
- *Credit All from Second Screen:* select *Credit All* at the *Second Process RA Credits Screen*

Credit All from First Screen

Use this option if you do not need to review the return authorization before crediting.

Select *Credit Line* for a return authorization at the *First Process RA Credits Screen* to display the Confirm Accept pop-up window:.

Select *OK* at this window to process the credit. All received items on the return authorization will be credited, and the return authorization will be removed from the first Process RA Credits screen.

> **Important:**
>
> You cannot undo the credit once you select *OK*.

Credit Item

Use this option if you want to select an individual item (or items) from the return authorization to credit.

1. Select *Display* for a return authorization at the *First Process RA Credits Screen* to advance to the *Second Process RA Credits Screen*.
2. Optionally, select *Display* for any item you would like to review to advance to the *RA Exchange Item Window (Review Exchange)* and the *RA Exchange Item Window (Review Exchange)* for an exchange.

3. Select *Credit Line* for each item that you want to credit. The item is removed from the screen.
4. Select *Accept* to accept your entries; otherwise, select *Reject* to cancel.

When you select *Accept*, you return to the *First Process RA Credits Screen*. The credit for each selected item is processed, and the return authorization is removed from this screen if all items on the return authorization have been credited.

Credit All from Second Screen

Use this option if you want to review the items on the return authorization before crediting the entire return.

1. Select *Display* for a return authorization at the *First Process RA Credits Screen* to advance to the *Second Process RA Credits Screen*.
2. Optionally, select *Display* for any item you would like to review to advance to the *RA Exchange Item Window (Review Exchange)* and the *RA Exchange Item Window (Review Exchange)* for an exchange.
3. Select *Credit All* to credit all received items on the return authorization. All items are removed from the screen.
4. Select *Accept* to accept your entries; otherwise, select *Reject* to cancel.

When you select *Accept*, you return to the *First Process RA Credits Screen*. The credit for each item is processed, and the return authorization is removed from the screen.

Processing Credits by Line of Business (MCLB)

Purpose: Use Process Credits by Line of Business to release a batch of credits for a certain line of business and dollar amount.

> **Note:**
>
> In order to process credits by line of business, you must have authority to the *Enter Return Authorization (A28)*, *Receive Return Authorization (A29)*, and *Credit Return Authorization (A34)* secured features. If you do not have authority to one or all of these secured features, the system displays an error message.

When you process credits by line of business and dollar amount, the system selects the oldest credit associated with the line of business first, using the return entered date.

Maximum dollar amount: The system does not know the amount of the credit until the credit is created. Because of this, the system may release a dollar amount that exceeds the maximum dollar amount you specified. Once the system creates a credit that meets or exceeds the dollar amount specified, the system stops crediting, but includes the last credit that caused the dollar amount to go over.

Once the system stops crediting, the system generates the *Batch Release Summary Report*, which lists the orders associated with the credits released and the dollar amount of each credit.

Process Credits by Line of Business Screen

Purpose: Use this screen to release a batch of credits for a certain line of business and dollar amount.

How to display this screen: Enter *MCLB* in the Fast path field at the top of any menu or select Process Credits by Line of Business from a menu.

Field	Description
Line of business to credit	The code for the line of business you wish to credit. The system selects the oldest credit associated with the line of business first, using the return entered date. Line of business codes are defined in and validated against the Line of Business table. See *Working with Lines of Business (WLOB)*. Alphanumeric, 3 positions; required.
Amount to credit	The maximum amount you wish to credit for the line of business you selected. The system does not know the amount of the credit until the credit is created. Because of this, the system may release a dollar amount that exceeds the maximum dollar amount you specified. Once the system creates a credit that meets or exceeds the dollar amount specified, the system stops crediting, but includes the last credit that caused the dollar amount to go over. If you leave this field blank, the system processes all available credits for the line of business you selected. Numeric, 10 positions; optional.

Completing this screen: Select *Process* Once the *CREDITLOB* job completes, the system generates the *Batch Release Summary Report*.

Work with Return Interface Errors (WRIE)

Purpose: Use this menu option to review errors that occurred when processing a return from an external system.

Order Administration can receive returns from an external system through:

- the RETURNS_IN process in *Working with Integration Layer Processes (IJCT)*. See *Inbound Return API* for an overview.
- the ORDER_IN process in *Working with Integration Layer Processes (IJCT)*. However, the system does not post errors to this menu option. See *Generic Order Interface (Order API)* for an overview.
- For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

In this topic:

- *Return Interface Errors*
- *Work with Return Errors Screen*

Return Interface Errors

A list of errors that may occur when processing a return from an external system is presented below.

Error description	Reason
`Invalid Company`	The company code specified for the return was not a valid Order Administration company code.
`Invalid item/SKU for Order Detail Line`	The item information specified for the return is not located on the specified order line.
`Invalid Loc for Return`	The location for the return or the location associated with the *Default Return Disposition Code for Inbound Returns (H65)* is not a valid location for the warehouse specified.
`Invalid Order Detail Line`	The system: • Could not locate an order line to return against. • Could not return against the order line because there wasn't an available quantity to return, for example, the item had not shipped yet.
`Invalid Order Header`	The system could not locate an order to return against.
`Invalid Order Ship To`	The system could not locate a ship to order to return against.
`Invalid RA Detail`	The return authorization number for the return does not match the Line # field in the RA Detail table for the specified Order Administration order number, ship to number, and item.
`Invalid RA Header`	The return authorization number for the return does not match a return authorization number for the specified ship to order line.
`Invalid Return Quantity`	The return quantity does not match the quantity available to return for the order line. If you are returning against an RA, the quantity passed must match the quantity to return that was created on the RA.
`Invalid Return Reason`	The return reason specified is not a valid return reason code. Return reason codes are defined in and validated against the Return Reason table.
`Invalid Rtn Disposition`	The return disposition code is blank and a disposition code is not defined in the *Default Return Disposition Code for Inbound Returns (H65)* system control value.
`Invalid Sales Order Line Number`	The order line number specified does not exist on the specified order.
`Invalid Sales Order Number`	The system could not locate the order to return against.
`Invalid Whs for Return`	The warehouse for the return is not a valid warehouse.
`Line not eligible to be returned - quantity shipped is equal to 0`	The specified order line has not been shipped.
`Missing Company`	The return did not specify a Order Administration company code.

Error description	Reason
`Missing Default Charge Code (H64) for misc credit`	A credit amount was specified for the return and an additional charge code was not defined in the *Default Additional Charge Code for Inbound Returns (H64)* system control value to assign to the charge.
`Missing Return Reason`	The return reason is blank and a return reason code is not defined in the *Default Return Reason Code for Inbound Returns (H63)* system control value.
`No Active Paytypes`	This message could indicate that the payment method was deactivated for some reason, such as that it is a retail pickup or delivery order. See *Retail Pickup (including Ship-for-Pickup) or Delivery Orders* for background on retail pickup and delivery orders.
`No primary location defined for item`	The return disposition code specifies to return the item to its primary location and a primary location has not been defined for the item.
`Order Detail line already returned`	The item passed has already been returned for the available quantity.
`Quantity returned exceeds quantity remaining`	The quantity that is available to return on the specified order line is less than the requested quantity to return.
`Quantity returned exceeds quantity shipped`	The quantity shipped on the specified order line is less than the requested quantity to return.
`Return Already Processed`	The quantity available to return against the order line has already been returned and processed.
`Return not allowed for Retail Pickup/ Delivery Orders.`	The order specified is a retail pickup or delivery order, and the *Suppress Returns for Retail Pickup/Delivery (L88)* system control value is selected. See that system control value for background.
`Return not allowed for Ship for Pickup Orders.`	The order specified is a ship-for-pickup order, and the *Payment at POS for Ship for Pickup Orders (L60)* system control value is selected. See that system control value for background.

Work with Return Errors Screen

This screen displays all records in the Return Error table (CSRTER*)*. This table is not company-specific; return errors for all companies in an environment display.

How to display this screen: Enter *WRIE* in the Fast path field at the top of any menu or select Work with Return Errors from a menu.

Field	Description
Co# (company)	Order Administration company code. Enter the code for any company in the current environment to display return errors in that company. Numeric, 3 positions, optional.

Field	Description
Item	A code for item associated with the return. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions, display-only.
SKU	The SKU code for the item associated with the return. Alphanumeric, three 4-position fields; required if the item has SKUs.
Qty (quantity)	The number of units of the item being returned. Numeric, 5 positions, display-only.
Whs (warehouse)	A code for the warehouse to which the item will be returned, specified on the return authorization, or defaulted from the return disposition code on the return authorization. For returns received from an outside system without a return authorization, the return disposition code may default from system control value *Default Return Disposition Code for Inbound Returns (H65)*. For items with a return disposition code which specifies that the item not be returned to inventory, the warehouse code is *0*. Numeric, 3 positions, display-only.
Location	The warehouse location to which the item will be returned. Alphanumeric, 7 positions, display-only.
Order #/Line #	The order number, ship-to number, and line number of the Order Administration order associated with the return. Order number: numeric, 8 positions, display-only. Ship to number: numeric, 3 positions; display-only. Line number: numeric, 5 positions, display-only.
Error message (unlabeled field)	A brief description of the reason for the error. See *Return Interface Errors* for a list of possible errors. Alphanumeric, 25 positions, display-only.

Screen option	Procedure
Delete an error record from the Return Error table (CSRTER)	Select *Delete* for an error record to delete it. The record will be deleted from the Return Error table and will no longer display on the screen.
Display return error details	Select *Display* for an error record to advance to the *Display Return Error Screen*.

Display Return Error Screen

Purpose: Use this screen to review details of a return error record.

How to display this screen: Select *Display* for an error record at the *Work with Return Errors Screen*.

Field	Description
Sequence #	A number assigned by the system to the error record. Sequence numbers are assigned sequentially as errors are received, and are not reassigned when you delete a record. Numeric, 8 positions, display-only.
Company #	The code for the company. Numeric, 3 positions, optional.
Item/SKU	Item: a code for an existing unit of inventory. Item codes are defined in and validated against the Item table. SKU: a code that further defines an item's color, size, width, or any other type of user-defined attribute. Item: alphanumeric, 12 positions, display-only. SKU: three 4-position fields; display-only if the item has SKUs.
Return quantity	The number of units of the item which are being returned. Numeric, 5 positions, display-only.
Warehouse/Location	The warehouse and location to which the item will be returned, specified on the return authorization, or defaulted from the return disposition code on the return authorization. For returns received from an outside system without a return authorization, the return disposition code may default from system control value *Default Return Disposition Code for Inbound Returns (H65)*. For items with return disposition code which specifies that the item not be returned to inventory, the warehouse code is *0*. Warehouse: numeric, 3 positions, display-only. Location: alphanumeric, 7 positions, display-only.
Return reason	The return reason and description for the item, specified on the return authorization. For returns received from an outside system without a return authorization, the return reason code may default from system control value *Default Return Reason Code for Inbound Returns (H63)*. Reason: alphanumeric, 3 positions, display-only. Description: alphanumeric, 30 positions, display-only.
Return disposition	The return disposition code and description for the item, specified on the return authorization. The return disposition code determines whether the item being returned will affect inventory, and can specify the warehouse and location where the item will be returned, or that the item will be returned to its primary location. For returns received from an outside system without a return authorization, the return disposition code may default from system control value *Default Return Disposition Code for Inbound Returns (H65)*. Code: alphanumeric, 2 positions, display-only. Description: alphanumeric, 30 positions, display-only.
Order #/Line #	The order number, ship-to number, and line number of the sales order. Order number: numeric, 8 positions, display-only. Line number: numeric, 5 positions, display-only.

Field	Description
RA #/Line #	A number representing the return authorization, used as a suffix with the order number/ship to number of the order to identify a return authorization. Return authorization number: numeric, 3 positions; display-only. Line number: numeric, 3 positions; display-only.
Refund freight	A value indicating whether freight charges on the order will be refunded for a return. Specified on the return authorization. For returns received from an outside system without a return authorization, the Refund freight value may default from system control value *Refund Freight Default for Inbound Returns (H59)*. Alphanumeric, 1 position; display-only.
Refund handling	A value indicating whether handling charges on the order will be refunded for a return. Specified on the return authorization. For returns received from an outside system without a return authorization, the Refund handling value may default from system control value *Refund Handling Default for Inbound Returns (H61)*. Alphanumeric, 1 position; display-only.
Refund charges	A value indicating whether additional charges on the order will be refunded for a return. Specified on the return authorization. For returns received from an outside system without a return authorization, the Refund charges value may default from system control value *Refund Additional Charge Default for Inbound Returns (H60)*. Alphanumeric, 1 position; display-only.
Refund duty	A value indicating whether duty charges on the order will be refunded for a return. Specified on the return authorization. For returns received from an outside system without a return authorization, the Refund duty value may default from system control value *Refund Duty Default for Inbound Returns (H62)*. Alphanumeric, 1 position; display-only.
Misc credit amount	A credit amount passed from the outside system. Numeric, 13 positions with a 2-place decimal.
Called from	The outside system from which the return was received.
Error date/time	The date and time the record in error was received into Order Administration. Date: numeric, 6 positions, in user date format; display-only. Time: numeric, 6 positions, military time HH:MM:SS format; display-only.
Error message	A brief description of the reason for the error. See *Return Interface Errors* for a list of possible errors. Alphanumeric, 25 positions, display-only.

Issuing Refunds

Topics in this part:

- *Introducing the Refund Process* presents an overview of the refund process, including a discussion of situations that can cause a refund, refund types and reason codes.
- *Printing and Interpreting Refund Due Lists (MRDU)* explains how to print the Refund Due List and use this report to verify and document the changes you make to refunds prior to processing.
- *Working with Refunds, Writeoffs and Balances Due (WREF)* shows you how to research refunds, change a refund's type, place a refund on hold indefinitely or until a specific date, release a refund from hold, or change the refund's status so it will be canceled or written off when you next process refunds.
- *Processing Refunds (MREF)* shows you how to print and reprint refund checks and process credits and write-offs.
- *Printing the Processed Refund Register (PPRR)* explains how to generate the Processed Refund Register.
- *Processing Refunds by Order Number (MRFO)* explains how to generate refunds for selected orders only.

Printing and Interpreting Refund Due Lists (MRDU)

Purpose: The *Refund Due List* provides information about refunds and the orders associated with these refunds.

Use this report:

- as a guide for contacting customers to resolve outstanding balances due.
- to review refunds before processing refund checks and credits.
- to monitor writeoffs and refund aging.

You can print this report sorted by refund type or by order number:

- *Refund Due List by Type*. This report sorts refunds by refund type.
- *Refund Due List by Order #*. This report sorts refunds by order number.

The *Selection criteria* you define on the *Print Refund Due List Screen* controls the type of refunds that display on the report.

- *All* = The report includes all refunds, including balance dues and writeoffs.
- *Refunds Only* = The report includes refunds, excluding balance dues and writeoffs.
- *Balance Dues Only* = The report includes balance dues only.
- *Writeoffs Only* = The report includes writeoffs only.

Identifying a refund as a balance due: The system considers a refund a balance due if the Refund reason field for the refund is set to *B* (Balance due).

Identifying a refund as a write off: The system considers a refund a write off if the Refund status field for the refund is set to *W* (Write off pending).

Note:

If a refund is flagged as both a balance due and a write off, the write off setting will take precedence over the balance due setting. In this situation, if you select to generate the report for *Balance Dues Only*, the system will not include the refund on the report. If you select to generate the report for *Writeoffs Only*, the system will include the refund on the report.

Important:

If you generate the *Refund Due List* during a time when refunds are being processed, the totals and amounts on the report may not tie out correctly because the refunds that were being processed at the time the report was generated may not be reflected accurately on the report. You should generate the *Refund Due List* during a time when refunds are not being processed.

In this topic:

- *Print Refund Due List Screen*
- *Refund Due List*

Print Refund Due List Screen

How to display this screen: Enter *MRDU* in the Fast path field or select Print Refund Due List from a menu.

Field	Description
By refund type	Controls whether the system prints the *Refund Due List* sorted by refund type. Valid values are: • *Selected* = Print the *Refund Due List by Type*. • *Unselected* (default) = Do not print the *Refund Due List by Type*.
By order #	Controls whether the system prints the *Refund Due List* sorted by order number. Valid values are: • *Selected* = Print the *Refund Due List by Order #*. • *Unselected* (default) = Do not the *Refund Due List by Order #*.

Field	Description
Selection criteria	Controls the type of refunds included on the *Refund Due List*. Valid values are: • *All* = The report includes all refunds, including balance dues and writeoffs. • *Refunds Only* = The report includes refunds, excluding balance dues and writeoffs. • *Balance Dues Only* = The report includes balance dues only. • *Writeoffs Only* = The report includes writeoffs only. *Identifying a refund as a balance due:* The system considers a refund a balance due if the Refund reason field for the refund is set to *B* (Balance due). *Identifying a refund as a write off*: The system considers a refund a write off if the Refund status field for the refund is set to *W* (Write off pending). **Note:** If a refund is flagged as both a balance due and a write off, the write off setting will take precedence over the balance due setting. In this situation, if you select to generate the report for *Balance Dues Only*, the system will not include the refund on the report. If you select to generate the report for *Writeoffs Only*, the system will include the refund on the report.

Instructions:

1. Select the *By refund type* check box if you wish to generate the *Refund Due List by Type*, which sorts refunds by refund type.
2. Select the *By order #* check box to generate the *Refund Due List by Order #*, which sorts refunds by order number.
3. You can select both check boxes to generate both versions of the *Refund Due List*. If you do not select one of the check boxes, the system does not generate the *Refund Due List*.
4. Use the *Selection criteria* drop down box to select the type of refunds you wish to include on the *Refund Due List*.
5. Select *OK* to generate the report.
6. If you select to generate the *Refund Due List by Type* or both versions of the *Refund Due List*, a message similar to the following displays: `Job (REFDUE_TYP) has been submitted to batch`.
7. If you select to generate the *Refund Due List by Order #*, a message similar to the following displays: `Job (REFDUE_ORD) has been submitted to batch`.

Working with Refunds, Writeoffs and Balances Due (WREF)

Purpose: Use Work with Refunds to review refunds and change their status or type. For example, you could use this function to:

- place a refund on hold
- cancel a refund to a fraudulent customer
- review a refund record to find out its original payment type
- change a refund from a check to a stored value card refund
- release a held refund for processing
- writeoff an uncollectible balance due from a customer
- advance to Order Inquiry to research an order with a balance due

Order transaction history: The system creates an order transaction history message with a Type of *Refund* when you change a refund. The table below indicates the order transaction history message the system creates, based on the change made to the refund.

Refund Change	Order Transaction History Note
Place a refund on hold by selecting *Hold* for a refund	`Refund has been held`
Cancel a refund by selecting *Cancel* for a refund	`Refund changed to cancel pending`
Release a refund from hold by selecting *Release* for a refund	`Refund has been released`
Change a writeoff to a refund by selecting *Refund* for a refund in a pending writeoff status	`Refund chg from writeoff pend to open`
Change a refund to a writeoff by selecting *Write off* next to a refund	`Refund changed to writeoff pending`
Release all held refunds by selecting *Release All Held*	`Refund has been released` (the system writes this message for each refund that was released from hold)
Place a refund on manual hold by selecting the Manual hold field on the *Change Refund Screen* Release a refund from manual hold by deselecting the Manual hold field on the *Change Refund Screen*	`Refund Manual Hold has been changed`
Enter or update the date in the Hold until date field on the *Change Refund Screen* Remove the date in the Hold until date field on the *Change Refund Screen*	`Refund Hold Until Date has been changed`
Change the Pay type field on the *Change Refund Screen*	`Refund paytype has been changed`

The system also creates an order transaction history message when you process refunds; see *Processing Refunds (MREF)*.

> **Note:**
>
> The system does not create an order transaction history message when the system changes a refund during processing or when you access a refund without making any changes.

Sample order transaction history: You can review order transaction history messages on the Display Order History Screen.

Date	Type	Transaction Note	Amount	User
7/31/14	REFUND	Refund has been released		TBROWN

Work with Refunds Screen

Purpose: After reviewing the *Refund Due List*, you may need to review or change some refunds before processing. Use the Work with Refunds screen to hold, release, cancel, writeoff, review, or change the type of refund a customer will receive.

> **Note:**
>
> A processed refund remains on this screen until you purge the order containing the refund.

How to display this screen: Enter *WREF* in the Fast path field or select Work with Refunds from a menu.

Refunds display on this screen in ascending refund status sequence; select *Display By Order* to display refunds in ascending order number sequence; see *Work with Refunds By Order# Screen*.

Field	Description
Ref Sts (Refund status)	The current status of the refund. Valid values are: • *C* = Cancelled • *H* = Held • *I* = ChannelAdvisor pending • *N* = Cancel pending • *O* = Open • *P* = Processed • *T* = Written off • *W* = Writeoff pending A second refund status in parentheses indicates that the system will evaluate the first status field when you process refunds and, if appropriate, process the refund based on the second status field. For example, a refund will be released from hold, if appropriate, and written off when you process refunds if it has a status of *H (W)*. Enter a refund status and select *OK* to display refunds is ascending refund status sequence, beginning with your entry. Alphanumeric, 1 position; optional.
Order #	A unique number to identify an order. Enter a valid order number and select *OK* to display refunds that match your entry. Numeric, 7 positions; optional.
Ord sts (Order status)	The current status of the order containing the refund. Valid values are: • *C* = Canceled • *H* = Held • *' '* = Open • *X* = Closed **Note:** As long as a refund's Ord sts = *H* (that is, the order is held), the refund will not be processed. Alphanumeric, 1 position; display-only.
Net	An asterisk indicates whether the refund is eligible for *Credit Card Net Exchange Billing*.

Field	Description
Type (Refund type)	Represents a type of refund. Valid values are: • *CC Credit* = A credit adjustment is sent to the credit card authorization service • *Check Credit* = The customer receives a refund check • *SVC* = Customer receives a new stored value card for the refund amount that can be used a payment towards a new purchase Select a refund type and select *OK* to display refunds that match your entry. See *How Pay Type Determines Refund Type*. Optional.
Ref date (Refund date)	The date the transaction that resulted in a refund occurred. Enter a date and select *OK* to display refunds that match your entry. Numeric, 6 positions (in user date format); optional.
Trn dt (Refund transaction date)	The date of the most recent transaction associated with the refund. Enter a date and select *OK* to display refunds that match your entry. Numeric, 6 positions (in user date format); optional.
Hold	Indicates whether the refund is on hold. A refund may be on hold because: • the amount of the refund exceeds the maximum amount specified in *Working with Pay Types (WPAY)*. • you placed the refund on hold through Work with Refunds. Valid values are: • *Yes* = The refund is on manual hold. • *No* = The refund is not on manual hold. Select *Yes* or *No* and select *OK* to display refunds that match your entry.
Hold date (Hold until date)	The date when the system will release a refund from hold. Enter a date and select *OK* to display refunds that match your entry. Numeric, 6 positions (in user date format); optional.
Reason (Refund reason)	The reason for the refund. Valid values are: • *B* = Balance due • *O* = Overpayment (initial overpayment or cancellation, including soldouts on prepaid orders) • *R* = Return Enter a reason code and select *OK* to display refunds that match your entry. Alphanumeric, 1 position; optional; assigned by the system.
Amount	The dollar amount to be refunded. The tax amount included in the refund amount is based on the tax rate that was effective when the item was shipped. A negative sign indicates a balance due from the customer. If you accept orders in foreign currencies, the system displays the amount in the foreign currency indicated by the Bank code. Enter an amount and select *OK* to display refunds whose amount is equal to or greater than your entry. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Bank	The bank associated with the source code on the order. You associate a source code with a bank by specifying a division when you create the source code, because each division is associated with a bank. When you generate refund checks, the system uses the next check number indicated for the bank in the Bank table. See *Working with Banks (WBNK)*. If the *Multi Currency by Offer (E03)* system control value is *selected*, you must define the currency to be used for each offer. Each currency you define on the system must be associated with a unique bank, so the bank code that appears on this screen indicates the currency of the order. If you use multi currency, the prices and other amounts on an order appear in the currency of the offer, but the system converts the figures into your local currency for order billing history. Similarly, the refund amount indicated is in the currency used on the order, indicated by the bank code. When you process the refund, the system uses the currency conversion rate that was in effect when the order was billed. Enter a bank code and select *OK* to display refunds that match your entry. Alphanumeric, 3 positions; optional.

Screen Option	Procedure
Change a refund record	Select *Change* for a refund to advance to the *Change Refund Screen*.
Place a refund on hold	Select *Hold* for the refund. See *Changing the Refund Status*.
Cancel a refund	Select *Cancel* for the refund. See *Changing the Refund Status*.
Display a refund	Select *Display* for a refund to advance to the Display Refund Screen. You cannot change any information on this screen. See Change Refund Screen for field descriptions.
Release a refund from hold	Select *Release* for the refund. See *Changing the Refund Status*.
Change a writeoff to a refund	Select *Write Off* for the refund in pending writeoff status. See *Changing the Refund Status*.
Change a refund to a writeoff	Select *Refund* for the refund. See *Changing the Refund Status*.
Advance to Order Inquiry for the order containing the refund	Select *Ord Inq* for a refund.

Screen Option	Procedure
Display refunds in ascending order number sequence	Select *Display By Order* to advance to the *Work with Refunds By Order# Screen*. **Note:** If you advance to this screen and select *Exit*, the system returns you to the main window and not the *Work with Refunds Screen*.
Release all held refunds	Select *Release all held*. See *Changing the Refund Status*.
Print the *Refund Due List*	Select *Print list*.

How Pay Type Determines Refund Type

Overview: The pay type that a customer uses on an order determines the type of refund received, depending on how you have defined the pay type.

Payment category: When you create a pay type, you must assign it to one of five payment categories. Each payment category automatically produces a certain refund type, as follows.

Payment Category	Produces Refund Type
Cash/check (1)	Check
Credit card (2)	Credit card credit

See the field descriptions at the *Change Refund Screen* for more information on each of the refund types.

Alternate refund type: When you define an alternate refund type for a pay type, the system automatically generates refunds of the alternate refund type.

The system accepts only stored value card or cash/check alternate refund types.

Alternate refund category: When you define an alternate refund category for a pay type, you give yourself the option of changing the refund to the type that corresponds to this category.

The system accepts only cash/check alternate refund categories. However, you can change any type of refund to a stored value card credit at the *Change Refund Screen*.

See *Working with Pay Types (WPAY)*.

Stored Value Card Refunds

The system generates a stored value card refund when:

- The alternate refund type defined for a pay type is a stored value card.

- You process a return outside the *Return Grace Period (B52)* and the *Alternate Pay Type (B51)* is a stored value card pay type.
- You change a refund to a stored value card refund in Work with Refunds (WREF).

> **Note:**
>
> If you process a return against a stored value card pay type that does not have an alternate pay type or alternate refund category defined, the system generates a credit card credit refund against the original stored value card pay type, allowing you to reimburse the original stored value card instead of sending the customer a new card. However if the customer no longer has the original stored value card, you can change the credit card credit refund to a stored value card refund by changing the Type field on the *Change Refund Screen* to *V* (stored value card refund); by doing this, the system sends a new stored value card to the customer for the refund amount.

For more information: See *Generating Stored Value Card Refunds* for an overview and required setup.

Changing a Refund

You can change a refund at the *Change Refund Screen* by entering a new pay type in the Pay type field. If you do this, the system updates the refund type based on the pay category of the new pay type. For example, if you change the pay type to a check pay type, the system updates the refund type to *Check Credit*.

The system allows you to change the original pay type defined for the refund to another pay type, if:

- The new pay type is the same pay category as the original pay type associated with the refund. For example, if the original pay type is a credit card pay type, the system allows you to change the pay type to another credit card pay type. In this example, the refund type does not change.
- The new pay type is the same pay category as the alternate refund type defined for the original pay type associated with the refund. For example, if the original pay type is a credit card with an alternate pay type of cash/check, the system allows you to enter a cash/check pay type in the Pay type field. In this example, the refund type changes based on the pay category of the pay type.
- The new pay type is the same pay category as the alternate refund category defined for the original pay type associated with the refund. For example, if the original pay type is a credit card with an alternate pay category of cash/check, the system allows you to enter a cash/check pay type in the Pay type field.
- The new pay type is a stored value card pay type. In this scenario, the system updates the refund type to *V* (stored value card).

Eligible refund changes: The table below indicates the type of pay type you can enter in the Pay type field, based on the original pay type (and its alternate refund type/category) associated with refund.

> **Note:**
>
> You can always change the pay type defined for the refund to a stored value card pay type; this updates the refund type to V (stored value card credit)

If original pay type is:	And alternate refund type or category is:	You can change the pay type defined for the refund to:
cash check	blank or cash/check	cash/check pay type (refund type *Check Credit*)
credit card	blank	original pay type for the refund (refund type *CC Credit*)
	cash/check	original pay type for the refund (refund type *CC Credit*) cash/check pay type (refund type *Check Credit*)

> **Note:**
>
> The system does not allow you to change a credit card credit to another credit card pay type.

Stored value card pay types: If the original pay category and current pay category associated with the refund is a stored value card pay type (pay category Credit Card) and Card type Stored Value), the system allows you to change the refund by entering a different refund type in the Type field. You can only change the refund type to a *credit card credit* or *stored value card credit*.

- If the refund is a credit card credit, the system adds the refund amount to the original stored value card on the order.
- If the refund is a stored value card credit, the system generates a new stored value card for the refund amount.

Change Refund Screen

Purpose: Use this screen to review a refund, change the type of refund, place a refund on hold, release a refund from hold, or enter a date on which to release the refund from hold.

To change a refund: See *Changing a Refund* for an explanation of the options available when changing a refund.

To place a refund on hold: Select the Hold field and optionally, enter a date in the Hold until date field. If you enter a hold until date, the system automatically releases the refund from hold on that date.

To release a refund from manual hold: Deselect the Hold field.

How to display this screen: Select *Change* for a refund at the *Work with Refunds Screen*.

> **Note:**
>
> You cannot change a refund once it has been processed.

Field	Description
Order #	A unique number the system assigns to identify an order. Numeric, 7 positions; display-only.
Sold to (Sold to customer number)	The number of the customer or company that placed the order. The customer's or company's name appears as an unlabeled field to the right of the customer number. Numeric, 9 positions; display-only.
Bill to (Bill-to customer number)	The number of the customer or company responsible for paying for the order. The bill-to customer number appears only if there is a bill-to customer associated with the order producing the refund; in this situation, the refund check will be generated for the bill-to customer rather than the sold-to customer. The bill-to customer's and/or company's name appears as an unlabeled field to the right of the bill-to customer number. Numeric, 7 positions; display-only.
Amount	The dollar amount to be refunded. The tax amount included in the refund amount is based on the tax rate that was effective when the item was shipped. A negative sign indicates a balance due. Numeric, 20 positions with a 2-place decimal; display-only.
***NET BILLING**	The text `*NET BILLING` displays to the right of the Amount if the refund is associated with *Credit Card Net Exchange Billing*. In this situation, the Pay type field is display-only on this screen.
Status (Refund status)	The current status of the refund. Valid values are: • *Canceled* • ChannelAdvisor pending • *Held* • *Cancel pending* • *Open* • *Processed* • *Written off* • *Writeoff pending* The description associated with the status appears as an unlabeled field to the right. Display-only.

Field	Description
Type (Refund type)	Represents the kind of refund the customer will receive. The description associated with the type appears as an unlabeled field to the right. Valid values are: • *CC Credit* = A credit adjustment is sent to the credit card authorization service • *Check Credit* = The customer receives a refund check. • *SVC Credit* = The customer receives a new stored value card for the refund amount that can be used towards a new purchase; see *Stored Value Card Refunds*. The system allows you to change the refund by entering a pay type in the Pay type field; see *Changing a Refund*. See *How Pay Type Determines Refund Type*. Display-only.
Manual hold	Indicates whether the refund is on hold because: • you placed it on hold though Work with Refunds, or • the system placed the refund on hold because the refund amount exceeds the maximum amount defined for the pay type. Valid values are: • *Selected* = The refund is on hold. Changing this value to *selected* does not affect the Refund status field, but the refund will not be processed when you process refunds. • *Unselected* = The refund is not on hold. Changing this value to *unselected* when the refund is currently in a held status changes the Refund status field to *H (O)*, and the refund will be processed when you process refunds.
Hold until date	The date when the system will release a refund from hold. **Note:** Entering a date in this field does not by itself hold the refund; the refund status must be *Held* or the value in the Manual hold field must be *selected* to hold the refund until this date. Numeric, 6 positions (in user date format); optional.
Current category	The current payment category of the refund. The current category may change if you change the pay type of the refund. See the description of the Pay type field. Valid values are: • *Cash/check* • *Credit card* Display-only.

Field	Description
Original category	The category of the payment type used on the order. May differ from the current category if there is an alternate refund type or alternate refund category. Valid values are: • *Cash/check* • *Credit card* Display-only.
Refund date	The date when the transaction that resulted in a refund occurred. Numeric, 6 positions (in user date format); display-only.
Trans date (Transaction date)	The date of the most recent transaction associated with the refund. Numeric, 6 positions (in user date format); display-only.
Refund reason	Identifies the reason for the refund. Valid values are: • *Balance due* • *Overpayment* = initial overpayment or item/order cancellation, including soldouts on prepaid orders • *Return* Display-only.
Pay type	A code for the payment method of the refund. Pay types are defined in and validated against the Pay Type table. See *Working with Pay Types (WPAY)*. The system creates the refund in the same pay type used on the order. However, if an Alternate refund type is defined for that pay type, the system creates the refund in the alternate type. The system allows you to change the pay type of the refund to another pay type; see *Changing a Refund* for the available options. The description associated with the pay type appears as an unlabeled field to the right. **Note:** This field is display-only if the refund is associated with *Credit Card Net Exchange Billing* (the text `*NET BILLING` displays to the right of the Amount field). Numeric, 2 positions; optional.
RA# (Return authorization number)	The number the system assigns to a return authorization on an order. You can create a return authorization in Order Maintenance when you are expecting a customer to return an item. Using return authorizations help you control of the process of receiving and crediting returns. A value other than zero appears here if a return authorization caused the refund. Numeric, 3 positions; display-only.

Changing the Refund Status

How to change the status of a refund: To change the status of a refund, enter the appropriate option number next to the refund at the *Work with Refunds Screen*. Each option number works with only certain refund statuses. The table below outlines valid combinations. If you attempt an invalid status change, the system displays an error message.

Process	Option	Works on current status of	Result
Hold refund	*Hold*	*O* (open) *N* (cancel pending)	The Ref sts (refund status) field changes to *H* to indicate that the refund is held; it now appears in order number sequence among held refunds. The Manual hold field changes to *selected*. The refund will not be affected the next time you process refunds.
Cancel refund	*Cancel*	*H* (held*)* *O* (open) *W* (writeoff pending)	The Ref sts (refund status) field changes to *unselected* to indicate that a cancel is pending; the refund now appears in order number sequence among refunds pending cancellation. The refund will be canceled the next time you process refunds.
Release refund	*Release*	*H* (held) *N* (cancel pending)	The Ref sts (refund status) field changes to *O* to indicate that the refund is open for processing; it now appears in order number sequence among open refunds The refund will be processed the next time you process refunds.3
Change writeoff to refund	*Writeoff*	*W* (writeoff pending)1	The Ref sts (refund status) field changes to *O* to indicate that the refund is open for processing; it now appears in order number sequence among open refunds The refund will be processed the next time you process refunds.
Writeoff a refund	*Refund*	*H* (held *N* (cancel pending) *O* (open)2	The Ref sts (refund status) field changes to *W* to indicate that a writeoff is pending on the refund; the record now appears in order number sequence among pending writeoffs The refund will be written off the next time you process refunds

1 Writeoffs must have a positive refund amount to be changed to refunds.

2 Refunds must be prepaid payment types to be written off.

3 A refund will remain on hold as long as the order containing the refund is on hold (Ord sts = *H*)

Release all held refunds: You can also release all held refunds at once by selecting *Release all held*. The system displays a pop-up window indicating that held refunds are about to be released.

Work with Refunds By Order# Screen

Purpose: Use this screen to review and work with refunds in ascending order number sequence.

> **Note:**
>
> To review and work with refunds in ascending refund status sequence, use the *Work with Refunds Screen*.

> **Note:**
>
> A processed refund remains on this screen until you purge the order containing the refund.

How to display this screen: Select *Display By Order* on the *Work with Refunds Screen*.

Field	Description
Ref Sts (Refund status)	The current status of the refund. Valid values are: • *C* = Cancelled • *H* = Held • *I* = ChannelAdvisor pending • *N* = Cancel pending • *O* = Open • *P* = Processed • *T* = Written off • *W* = Writeoff pending A second refund status in parentheses indicates that the system will evaluate the first status field when you process refunds and, if appropriate, process the refund based on the second status field. For example, a refund will be released from hold, if appropriate, and written off when you process refunds if it has a status of *H (W)*. Alphanumeric, 1 position; display-only.
Order #	A unique number to identify an order. Enter a valid order number and select *OK* to display refunds in ascending order number sequence, beginning with your entry. Numeric, 7 positions; optional.

Field	Description
Ord sts (Order status)	The current status of the order containing the refund. Valid values are: • *C* = Canceled • *H* = Held • *' '* = Open • *X* = Closed **Note:** As long as a refund's Ord sts = *H* (that is, the order is held), the refund will not be processed. Alphanumeric, 1 position; display-only.
Net	An asterisk indicates whether the refund is eligible for *Credit Card Net Exchange Billing*.
Type (Refund type)	Represents a type of refund. Valid values are: • *CC Credit* = A credit adjustment is sent to the credit card authorization service • *Check Credit* = The customer receives a refund check • *SVC* = Customer receives a new stored value card for the refund amount that can be used a payment towards a new purchase Select a refund type and select *OK* to display refunds that match your entry. See *How Pay Type Determines Refund Type*. Optional.
Ref date (Refund date)	The date the transaction that resulted in a refund occurred. Enter a date and select *OK* to display refunds that match your entry. Numeric, 6 positions (in user date format); optional.
Trn dt (Refund transaction date)	The date of the most recent transaction associated with the refund. Enter a date and select *OK* to display refunds that match your entry. Numeric, 6 positions (in user date format); optional.
Hold	Indicates whether the refund is on hold. A refund may be on hold because: • the amount of the refund exceeds the maximum amount specified in *Working with Pay Types (WPAY)*. • you placed the refund on hold through Work with Refunds. Valid values are: • *Yes* = The refund is on manual hold. • *No* = The refund is not on manual hold. Select *Yes* or *No* and select *OK* to display refunds that match your entry.
Hold date (Hold until date)	The date when the system will release a refund from hold. Enter a date and select *OK* to display refunds that match your entry. Numeric, 6 positions (in user date format); optional.

Field	Description
Reason (Refund reason)	The reason for the refund. Valid values are: • *B* = Balance due • *O* = Overpayment (initial overpayment or cancellation, including soldouts on prepaid orders) • *R* = Return Enter a reason code and select *OK* to display refunds that match your entry. Alphanumeric, 1 position; optional; assigned by the system.
Amount	The dollar amount to be refunded. The tax amount included in the refund amount is based on the tax rate that was effective when the item was shipped. A negative sign indicates a balance due from the customer. If you accept orders in foreign currencies, the system displays the amount in the foreign currency indicated by the Bank code. Enter an amount and select *OK* to display refunds whose amount is equal to or greater than your entry. Numeric, 13 positions with a 2-place decimal; optional.
Bank	The bank associated with the source code on the order. You associate a source code with a bank by specifying a division when you create the source code, because each division is associated with a bank. When you generate refund checks, the system uses the next check number indicated for the bank in the Bank table. See *Working with Banks (WBNK)*. If the *Multi Currency by Offer (E03)* system control value is *selected*, you must define the currency to be used for each offer. Each currency you define on the system must be associated with a unique bank, so the bank code that appears on this screen indicates the currency of the order. If you use multi currency, the prices and other amounts on an order appear in the currency of the offer, but the system converts the figures into your local currency for order billing history. Similarly, the refund amount indicated is in the currency used on the order, indicated by the bank code. When you process the refund, the system uses the currency conversion rate that was in effect when the order was billed. Enter a bank code and select *OK* to display refunds that match your entry. Alphanumeric, 3 positions; optional.

Screen Option	Procedure
Change a refund record	Select *Change* for a refund to advance to the *Change Refund Screen*.
Place a refund on hold	Select *Hold* for the refund. See *Changing the Refund Status*.
Cancel a refund	Select *Cancel* for the refund. See *Changing the Refund Status*.

Screen Option	Procedure
Display a refund	Select *Display* for a refund to advance to the Display Refund Screen. You cannot change any information on this screen. See Change Refund Screen for field descriptions.
Release a refund from hold	Select *Release* for the refund. See *Changing the Refund Status*.
Change a writeoff to a refund	Select *Write Off* for the refund in pending writeoff status. See *Changing the Refund Status*.
Change a refund to a writeoff	Select *Refund* for the refund. See *Changing the Refund Status*.
Advance to Order Inquiry for the order containing the refund	Select *Ord Inq* for a refund.
Print the *Refund Due List*	Select *Print list*.

Processing Refunds (MREF)

Purpose: Use the Process Refunds function to:

- print refund checks
- generate credit card credits, including credits to a stored value card
- process writeoffs
- process refund cancellations
- print credit card credit acknowledgements and/or generate email notices
- generate stored value card credits (issue a new stored value card for the credit amount)

You can process any one refund type or a combination of refund types. You can also process all open refunds of a selected type, or you can specify a dollar limit to process for each. The function generates a register for each refund type and for writeoffs, including amounts, customer names, and order numbers. At this time, any refunds in *unselected* (cancel pending) status will be canceled, but no report is produced.

Which orders and refunds are eligible for processing? To determine whether to process a refund for an order, or to cancel or writeoff the refund if appropriate, the system checks:

- *order status:* The *Ord sts (Order status)* must be open, closed (*X*), or canceled (*C*). The system will not generate a refund if the order is held (*H*), or suspended (*S*).
- *refund status:* The *Ref Sts (Refund status)* must be open (*O*), cancel pending (*N*), or writeoff pending (*W*). The refund status cannot be held (*H*), processed (*P*), canceled (*C*) or written off (*T*). If the refund has a separate status in parentheses (for example, *O (H)*), then the status in parentheses applies.
- *manual hold:* If the *Manual hold* flag for the refund is *selected*, the refund will not be processed.
- *bank:* The order must have the same *Bank* as the one you specify at the *Process Refunds Screen*.

If there is more than one refund eligible for processing on a single order, all eligible refunds will be processed.

Generating refunds for selected orders: You can use the *Process Refunds by Order Screen* to generate refunds for selected orders only. See *Processing Refunds by Order Number (MRFO)*.

Multiple currency by offer: If you use *Multiple Currencies by Offer*, each refund you generate will be in the currency used on the order.

Suppressing refunds: You can suppress refund processing:

- For orders you receive through the *Generic Order Interface (Order API)*. In this situation, the refund is generated in a *N* (cancel pending) status. See *Suppressing Deposits and Refunds* for an overview.
- For orders associated with a return you receive through the *Inbound Return API*. In this situation, the refund is generated in a *N* (cancel pending) status. See *Suppressing Refunds* for an overview.

For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

ChannelAdvisor refunds: If any of the refunds eligible for processing are for orders whose order type matches the *ChannelAdvisor Order Type (L90)*, the refund generation program submits a refund request to ChannelAdvisor and does not actually generate the refund. See *ChannelAdvisor Integration Overview* for more information, especially *Submitting Refunds for ChannelAdvisor Orders*.

- *Refund Check Register*
- *Refund Writeoff Register*
- *Credit Card Credit Acknowledgment*
- *Credit Card Credit Register*

For more information: See *Reprint Refunds Screen (MREP)*.

Not in this topic: This topic does not explain how different types of refunds are generated or how you evaluate and change refunds before processing them. See *Printing and Interpreting Refund Due Lists (MRDU)*, and *Working with Refunds, Writeoffs and Balances Due (WREF)*.

Multiple Currencies by Offer

If you take orders in multiple currencies, then you will need to process refunds in these currencies as well. When you process refunds, you must indicate the bank code; since each currency is associated with a unique bank, this tells the system the currency of the refunds to generate. You can process refunds for only one currency at a time. (To take orders in multiple currencies, you must have the *Multi Currency by Offer (E03)* system control value selected.)

The dollar limit for foreign currencies: You can specify a dollar limit for each refund type if you are generating refunds in a foreign currency. The system interprets the limit in your local currency, but generates refunds in the foreign currency. For example, your local currency is U.S. dollars, and you are generating refund checks to your Canadian customers. You specify a dollar limit of $1,000. The system uses the currency conversion rate in effect for each order at the time it was billed to calculate each refund amount in U.S. dollars. The first refund, for $50 in Canadian currency, was on an order billed at a currency conversion rate of 1.29. The system calculates the value of the refund in your local currency as $38.76 (50/1.29). This leaves a maximum of $961.24, converted into your local currency, left to generate.

The system continues to process refunds in chronological order by refund date, stopping before it exceeds the dollar limit you defined in your local currency. The refund checks, however, will always be in the currency used on the order.

Refund Check Messages

You can enter up to three message lines to print on a refund check if your refund check print program supports them. You specify the print program in the *Refund Check Print Program (D23)* system control value. The base print program is *REFCHECK*.

To enter messages, you use the Work with Order Messages Screen, available by selecting *Messages* in order entry, order maintenance, or standard or streamlined order inquiry.

Process Refunds Screen

Purpose: Use this screen to process:

- refund checks
- credit card credits
- stored value card credits
- writeoffs

How to display this screen: Enter *MREF* in the Fast path field or select Process Refunds from a menu.

Field	Description
Generate refund checks	Determines whether to generate refund checks; see *Refund Check* for a sample and a description of its contents. Valid values are: • *Selected* = Generate checks. • *Unselected* (default) = Do not generate checks. The system produces the *Refund Check Register*. The system also prints checks for refunds that are eligible for processing and have a check refund type. Refund checks are written to the Refund Reconciliation table.

Field	Description
Amount to generate (Refund check amount to generate)	The maximum total dollar amount that you want to disburse in refund checks. The system prints checks for all eligible refunds in ascending chronological order based on refund date, and stops before exceeding this amount. If you are processing refunds in a foreign currency, the system evaluates the amount to generate in your local currency by converting the refund amount, using the conversion rate in effect when you billed the order. The refund check, however, will be in the foreign currency. If you leave this field blank, the system processes all eligible refund checks. Numeric, 10 positions; optional.
Bank	The bank associated with the source code on the order. You associate a bank with a source code by selecting a division for the source code; each division is associated with a bank. The system determines the next sequential check number to use by adding *1* to the Last check number defined in the Bank table. If you process orders in multiple currencies, the bank also indicates the currency of the refunds, since each currency on your system is associated with a unique bank. The bank you specify at this screen indicates the currency of all refund checks, credits, or writeoffs that you process at this screen. Bank codes are defined in and validated against the Bank table. See *Working with Banks (WBNK)*. Alphanumeric, 3 positions; required.

Field	Description
Generate credit card credits	Determines whether to generate refunds in the form of credit card credits. This setting includes refunds to a stored value card where the credit amount is applied back to the original stored value card; to issue a new stored value card for the credit amount you must use the *Generate SVC credits* option. Valid values are: • *Selected* = Generate credit card credits. • *Unselected* (default) = Do not generate credit card credits. Select this field to process credit card credits. The system generates a *Credit Card Credit Register* that identifies the amount, customer name, and order number of each credit processed. The system also produces either a *Credit Card Credit Acknowledgment* (if the *Print Credit Card Credit Acknowledgments (C35)* system control value is *selected*) or an email notification when the *Credit Card Credit Acknowledgement E-Mail Program (H08)* is set to *CCCNOTF*, (regardless of the setting of the *Print Credit Card Credit Acknowledgments (C35)* value) for each credit as appropriate; see *When Does the System Generate an Email Notification?* **Email template:** You can use the *Working with Entities (WENT)* menu option to create an entity-level email template, and the *Working with E-Mail Notification Templates (WEMT)* menu option to create a default company-level credit card credit template. The template specifies the text to print above and below the standard credit card credit information. **Note:** If the *XML Only* checkbox is selected, the *Sample Credit Card Credit Acknowledgement XML Message* is generated and the system does not create an email. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). The system does not process a credit card credit against an installment or deferred billing order before the deposit has been processed. This ensures that you do not credit the customer's credit card before the card has been charged. **Note:** Sales Journal and deposit summary records may differ depending on how often you process credit card credits. **Scheduling:** You can schedule the generation of credit card credits using the *REFCCCR Process Credit Card Credit Refunds* periodic function.

Field	Description
Amount to generate (Credit card credit amount to generate)	The maximum total dollar amount that you want to process in credit card credits. The system issues credits for all eligible refunds in ascending chronological order based on refund date, and stops before exceeding this amount. If you are processing refunds in a foreign currency, the system evaluates the amount to generate in your local currency by converting the refund amount, using the conversion rate in effect when you billed the order. The credit, however, will be in the foreign currency. If you leave this field blank, the system processes all eligible credit card credits. Numeric, 10 positions; optional.
Generate SVC credits	Determines whether to generate stored value card credits. Valid values are: • *Selected* = Generate stored value card credits. • *Unselected* (default) = Do not generate stored value card credits. When you generate stored value card credits, the system issues a new stored value card to the sold to customer for the refund amount. The system: • Produces the *Stored Value Card Credit Register*. • Writes an order transaction history message: `F Stored Value Card refund created`. • Adds the stored value card item defined in the *Default SVC Refund Item Number (I73)* system control value to the order at no charge and performs pick slip preparation. **Note:** The system will not generate a stored value card refund unless the stored value card refund item has available inventory. If the item does not have available inventory, the stored value card refund remains unprocessed. • Generates a pick slip for the stored value card item if the *Default Pick Generation Template for SVC Refund Processing (I75)* system control value indicates a pick slip generation template. You can then follow the normal process of activating, billing, and shipping the stored value card to the customer. See *Generating Stored Value Card Refunds* for an overview. **Scheduling:** You can schedule the generation of stored value card credits using the *REFSVCR Process SVC Credit Refunds* periodic function.

Field	Description
	Note: The system can process stored value cards in the US currency only. If the order is for a currency other than US, you should generate a refund type other than stored value card for the order. The *Process Refunds Screen* displays an error message if you select to generate stored value card credits and the *Default SVC Refund Item Number (I73)* and/or *Price Override Reason for SVC Refund Item (I74)* system control values are unselected: `Sys Con Values I73 & I74 must be populated first`.
Amount to generate (Stored value card credit amount to generate)	The maximum total dollar amount that you want to process in stored value card refunds. The system issues credits for all eligible refunds in ascending chronological order based on refund date, and stops before exceeding this amount. **Note:** Stored value cards are only allowed in US currency. If you leave this field blank, the system processes all eligible stored value card credits. Numeric, 10 positions; optional.
Process writeoffs	Determines whether the system processes refunds to be written off. Valid values are: • *Selected* = Process writeoffs. • *Unselected* (default) = Do not process writeoffs. The system produces the *Refund Writeoff Register*. The system updates the writeoff amount for the customer. You can apply positive writeoff balances as credits and negative writeoff balances as charges against a new order placed by the customer.
Prior to date	Enter a date to specify that only writeoffs with a Refund created date earlier than the date you enter will be processed. If you leave this field blank, the system will process all refunds to be written off.

Instructions:

1. Select the Generate refund field for each type of refund you want to process.
2. Enter maximum amounts for each type of refund, if needed.
3. Specify the bank code associated with the refunds you wish to generate.

4. If you are processing refund checks, a pop-up window appears displaying the next available check number. You can accept the check number displayed, change the check number, or select *Exit* to close the window and cancel the action.
5. If you are generating unlimited credit card credits, a pop-up window displays confirming that you are not restricting these credits to a specific dollar amount. Again, you can accept or select *Exit* to close the window and cancel the action.
6. The system submits the batch job *REF_PROC,* which processes the refunds up to the specified dollar limits.

> **Note:**
>
> The system displays an error message if you select to generate stored value card credits and the *Default SVC Refund Item Number (I73)* and/or *Price Override Reason for SVC Refund Item (I74)* system control values are unselected: `Sys Con Values I73 & I74` must be populated first; see *Generating Stored Value Card Refunds*.

Summary of Refund Processing Updates and Reports

Update refunds: The status of each refund is updated, as well as the *Trn dt (Refund transaction date)*.

Update order history: The system writes a message to the Order History table for each order being refunded such as the following:

- *refund check:* `7/20/06 F Refund check# 212 created 49.50 EJOHNSON`
- *writeoff:* `7/20/06 F Refund type K has been cancelled 17.48- EJOHNSON`
- *credit card credit:* `7/20/06 F CC Crd for inv# 3918 processed 52.50 EJOHNSON`. If the credit card credit generates an email notification, the system also writes: `7/20/06 L C/C Ack to ejohnson@example.com.`
- *stored value card credit:* `5/27/06 F Stored Value Card refund created 12.99 KBROWN`

You can review Order History at the *Display Order History Screen*, available in standard order inquiry. This information is also available in streamlined order inquiry by selecting *History*.

Checks, registers, and acknowledgements: Depending on your selections, this job produces the:

- *Refund Check*
- *Refund Check Register*
- *Refund Writeoff Register*
- *Credit Card Credit Acknowledgment* (*Note:* The acknowledgment can also be sent by email; see *When Does the System Generate an Email Notification?*)
- *Credit Card Credit Register*
- *Stored Value Card Credit Register*

The system does not generate a register of canceled refunds.

ChannelAdvisor: See *Submitting Refunds for ChannelAdvisor Orders* for an overview of the refund process for ChannelAdvisor orders.

For more information: See *Refund Reports and Standard Programs*.

Refund Reports and Standard Programs

Purpose: The reports and print programs related to refunds, the standard program values, and the system control values you use to define them, are:

Report	Standard Program	System Control Value Name (Value)
Checks		
Refund Check	REFCHECK	*Refund Check Print Program (D23)* (program name)
Refund Check Register	CSR0385	
Writeoffs		
Refund Writeoff Register	CSR0390	
Credit Cards		
Credit Card Credit Acknowledgment	CSR0559	*Credit Card Credit Acknowledgment Print Program (D22)* (program name) *Print Credit Card Credit Acknowledgments (C35)* (Selected/Unselected)
Credit Card Credit Acknowledgement Email	CSR0258	*Credit Card Credit Acknowledgement E-Mail Program (H08)* (program name) **Note:** The *Print Credit Card Credit Acknowledgments (C35)* system control value does not control email acknowledgments.
Credit Card Credit Register	CSR0397	
Stored Value Card Register	CSR1405	

Reprint Refunds Screen (MREP)

Purpose: Use this screen when you encounter a problem printing refund checks or credits and you need to reprint them.

> **Note:**
>
> Because the reprint program uses information from the Check Reconciliation table, the reprint process picks up only unreconciled, unvoided checks within the check range you specify.

How to display this screen: Enter *MREP* in the Fast path field at the top of any menu or select this option from a menu.

Field	Description
Check # (Check number)	The check numbers of the first and last checks to reprint. *From* The check number of the first check to reprint. Numeric, 7 positions; optional. *To* The check number of the last check to reprint. Numeric, 7 positions; optional. *New #* Indicates whether to assign new check numbers to the reprinted checks/credits or use the same check numbers again. Valid values are: • *Selected* = Assign new check numbers. • *Unselected* (default) = Use the same check numbers again. The system does not reprint voided check numbers.
New # (New check number)	Indicates whether to assign a new check number to the reprinted check. Valid values are: • *Selected* = Assign a new check number • *Unselected* (default) = Use the same check number for the reprint.
Bank # (Bank)	The bank associated with the source code used on the orders. Bank codes are defined in and validated against the Bank table. See *Working with Banks (WBNK)*. Alphanumeric, 3 positions; required.

Completing this screen: If you select checks, a pop-up window appears displaying the next available check number. You can accept the check number, change the number, or select *Exit* to close the window and cancel the action. The system submits a batch job called *REF_RPRT*. This program reprints all the refunds you have specified. See *Refund Reports and Standard Programs*.

The system also writes a message to the Order History table that identifies the original check number, a reprint message, and the new check number, if applicable. You can view Order History through standard or streamlined order inquiry.

Reconciling Checks (MREC)

Purpose: Each refund check you print produces a record in the Refund Reconciliation table. You can use the Work with Check Reconciliation function to:

- reconcile refund checks that you receive back from the bank
- void refund checks in order to write them off
- void refund checks so that you can issue new refund checks
- unreconcile refund checks that were reconciled in error

In this topic:

- *Work with Check Reconciliation Screen*
- *Display Check Screen*
- *Reconciling and Unreconciling Checks*
- *Correcting Refund Check Errors*
- *Print Reconcile List Prompt Screen*
- *Check Reconciliation List*
- *Check Reconciliation List by Bank*

For more information: See *Purge Refund Checks Screen (MPRF)*.

Work with Check Reconciliation Screen

Purpose: Use this screen to display, reconcile, unreconcile, writeoff, void or reinstate refund checks. This screen lists all refund checks. Reconciled, voided and written off refunds remain on this screen until you use the Purge Refund Checks Screen (MPRF).

How to display this screen: Enter *MREC* in the Fast path field at the top of any menu or select Work with Check Reconciliation from a menu.

Field	Description
Bank	The bank associated with the source code on the order. You associate a source code with a bank through its division. If you process orders in multiple currencies, the bank indicates the currency of the refund check, since each currency on your system is associated with a unique bank. Bank codes are defined in and validated against the Bank table. See *Working with Banks (WBNK)*. Alphanumeric, 3 positions; optional.
Check number	The number of the refund check. Numeric, 7 positions; optional.
Chk Dt (Check date)	The date the system generated the refund check. Numeric, 6 positions (in user date format); optional.
Amount	The amount of the refund check. If you process orders in multiple currencies, this amount is in the currency used on the order. Numeric, 13 positions with a 2-place decimal; optional.
Recon (Date reconciled)	The date you reconciled the check. Reconciliation does not necessarily occur the same day you receive the check from the bank. Numeric, 6 positions (in user date format); optional.
Voided	The date you voided the refund check. Numeric, 6 positions (in user date format); optional.

Field	Description
Customer name	The name of the customer to receive the refund. Alphanumeric, 25 positions; display-only.

Screen Option	Procedure
Display a refund	Select *Display* for a refund to advance to the Display Check Screen.
Reconcile a refund check	Select *Reconcile* for the refund to reconcile the check. See Reconciling and Unreconciling Checks.
Unreconcile a refund	Select *Unreconcile* for the refund to unreconcile the check. See *Reconciling and Unreconciling Checks*.
Void/writeoff a refund	Select *Void/Write-off* for a refund to void/writeoff the refund. See Correcting Refund Check Errors.
Void/reinstate a refund	Select *Void/Reinstate* for a voided refund to reinstate the refund. See *Correcting Refund Check Errors*.
Display refunds by check date or by check number	Select *By Check Date* to display the refunds in ascending order by check date. Select *By Check Date* again to display refunds in ascending order by check number.
Reconcile by check or date range	Select *Batch Reconcile* to reconcile refunds by check or date range. See Reconciling and Unreconciling Checks.
Print a list of refunds	Select *Print List* to advance to the *Print Reconcile List Prompt Screen*.

Display Check Screen

Purpose: Use this screen to review the details of a refund check.

How to display this screen: At the *Work with Check Reconciliation Screen*, select *Display* for the check you want to review.

Field	Description
Check number	The number of the refund check. Numeric, 7 positions; display-only, assigned by the system.
Amount	The total dollar amount of the refund. If you take orders in multiple currencies, the amount is in the currency used on the order. Numeric, 20 positions with a 2-place decimal; display-only.
Date printed	The date you printed the refund check. Numeric, 6 positions (in user date format); display-only.
Date voided	The date you voided the refund check. Numeric, 6 positions (in user date format); display-only.
Date reconciled	The date you reconciled the refund check. Numeric, 6 positions (in user date format); display-only.

Field	Description
Received from bank	Indicates whether you have received the canceled refund check from the bank. Valid values are: 1. *selected* = You have received the check from the bank. 2. *unselected* = You have not received the check from the bank. The system updates this field to *selected* when you reconcile the check. See Reconciling and Unreconciling Checks.
Order number	The order that produced the refund. Numeric, 8 positions; display-only, assigned by the system.
Customer number	The number of the customer receiving the refund. Numeric, 9 positions; display-only, assigned by the system.
Customer name (Unlabeled field to the right of the customer number)	The name of the customer receiving the refund. Alphanumeric, 41 positions; display-only.
Bill to (Bill-to customer number)	The number of the bill-to customer associated with the order. Bill-to customer information appears only if there is a bill-to customer associated with the order. Numeric, 7 positions; display-only.
Bill-to customer name (Unlabeled field to the right of the bill-to customer number)	The name of the bill-to customer and company associated with the order. Alphanumeric, 42 positions; display-only.
Bank	The bank associated with the source code on the order. You associate a source code with a bank through its division. Bank codes are defined in and validated against the Bank table . See *Working with Banks (WBNK)*. If you process orders in multiple currencies, each currency on your system is associated with a unique bank. Alphanumeric, 3 positions; display-only.
Bank name (Unlabeled field to the right of the bank code)	The description associated with the bank. Alphanumeric, 30 positions; display-only.

Reconciling and Unreconciling Checks

Purpose: From the *Work with Check Reconciliation Screen*, you can reconcile individual canceled refund checks or you can reconcile a group (batch) of canceled checks by check number or by date range.

> **Note:**
>
> You cannot reconcile or unreconcile a voided check.

Reconcile a single check: Select *Reconcile* for the refund check. The current date appears in the Recon field to indicate that the check has been reconciled.

Unreconcile a single check: Select *Unreconcile* for a reconciled refund check that you want to unreconcile. The reconciled date disappears from the screen to indicate that the check is still unreconciled.

You cannot unreconcile a voided check.

Reconcile a batch of checks: Select *Batch Reconcile* to display the Batch Reconciliation pop-up window.

To reconcile a batch of canceled refund checks, enter the necessary information. You can:

- *Reconcile canceled checks by check number* by entering the first and last check numbers in the Starting check # and the Ending check # fields, or
- *Reconcile canceled checks by batch* by entering the first date and the final date of the checks in the Starting check date and Ending check date fields

Correcting Refund Check Errors

Void and writeoff a refund check: Select *Void/Write-off* for the refund at the *Work with Check Reconciliation Screen*.

When you accept the void/writeoff, the system:

- displays the void date
- voids the check record
- puts the refund in writeoff pending status so it can be written off the next time you process refunds
- writes a transaction message at the *Display Order History Screen*.

Void and reinstate: Select *Void/Reinstate* for the refund.

Using the void/reinstate option:

- places the refund on hold so that it won't be processed the next time you process refunds
- writes a transaction message at the *Display Order History Screen*, which you can view through standard Order Inquiry. This information is also available through streamlined Order Inquiry by selecting *History*.

Print Reconcile List Prompt Screen

Purpose: Use the *Check Reconciliation List* when reconciling refund checks against your account. You can include checks within a specific range of dates and also a specific bank; this may be useful if you are preparing a report for a specific accounting period.

How to display this screen: At the *Work with Check Reconciliation Screen*, select *Print List*.

Field	Description
Print unreconciled checks with a check date from and to	The first and last dates of the period for which you want to review unreconciled refund checks. Numeric, 6 positions (in user date format) each field; required if reconciled date range is not specified.
Print reconciled checks with a reconciled date from and to	The first and last dates of the period for which you want to review reconciled refund checks. Numeric, 6 positions (in user date format) each field; required if unreconciled date range is not specified.

To print the *Check Reconciliation List*, enter dates in each field for unreconciled, reconciled or both.

Purge Refund Checks Screen (MPRF)

Purpose: Use this screen to purge refund check records once you have reconciled or voided the checks.

How to display this screen: Enter *MPRF* in the Fast path field at the top of any menu or select Purge Refund Checks from a menu.

To purge checks, select *OK*. *Select* the confirmation prompt that appears at the bottom right corner of the screen to purge refund checks; otherwise, select *Exit* to return to a menu.

The system submits the *PURG_REFCHK* batch job, which purges all reconciled and voided refund checks. .

The system also produces the Check Reconciliation List. Although identical in layout to the *Check Reconciliation List*, this version of the list includes all voided and reconciled refund checks that have been purged by the Purge Refund Check program.

Printing the Processed Refund Register (PPRR)

Purpose: Use the Processed Refund Register to view a detailed listing of refunds processed, written off, or canceled within a selected date range. You can flag a refund for writeoff or cancellation in *Working with Refunds, Writeoffs and Balances Due (WREF)*. Once the refunds are flagged they can be processed in Process Refunds, provided they match the bank at the Process Refund screen.

This report includes detail information such as refund status, refund type, amount, customer name, and totals.

For more information:

- *Processing Refunds (MREF)*
- *Working with Refunds, Writeoffs and Balances Due (WREF)*

In this topic:

- *Processed Refund Register Screen*
- *Processed Refund Register*

Processed Refund Register Screen

Purpose: Use this screen to select the dates to include on the *Processed Refund Register* and to print the report.

How to display this screen: Enter *PPRR* in the Fast path field at the top of any menu or select Print Processed Refund Register from a menu.

Field	Description
Start date	The first date to include on the report. The system determines the information to include on the report based on the refund process date, not the create date of the refund. Numeric, 6 positions (in user date format); required.
End date	The last date to include on the report. Numeric, 6 positions (in user date format); required.

Instructions: Enter the date range in the start date and end date fields. Select *Accept* to submit your entries and generate the *Processed Refund Register*.

Processing Refunds by Order Number (MRFO)

Purpose: Use Process Refunds by Order Number to generate refunds for selected orders only. This option differs from *Processing Refunds (MREF)*; this option allows you to generate all available refunds by selected refund type for a specified bank, limiting the total dollar value of refunds if desired.

Which refunds are eligible? See *Processing Refunds (MREF)* for an overview of how the system determines which refunds to process, cancel, or write off.

ChannelAdvisor integration: You cannot generate refund notifications to ChannelAdvisor using Process Refunds by Order Number, and must use *Processing Refunds (MREF)* instead for these orders. See the *ChannelAdvisor Integration Overview*, including *Submitting Refunds for ChannelAdvisor Orders*, for background.

Process Refunds by Order Screen

Purpose: Use this screen to generate refunds for selected orders.

How to display this screen: Enter *MRFO* in the Fast path field at the top of any menu, or select Process Refunds by Order from a menu.

Field	Description
Bank	The bank associated with the source code on the order. You associate a bank with a source code by selecting a division for the source code; each division is associated with a bank. The system determines the next sequential check number to use by adding *1* to the Last check number defined in the Bank table. If you process orders in multiple currencies, the bank also indicates the currency of the refunds, since each currency on your system is associated with a unique bank. The bank you specify at this screen indicates the currency of all refund checks, credits, or writeoffs that you process at this screen. Bank codes are defined in and validated against the Bank table. See *Working with Banks (WBNK)*. Alphanumeric, 3 positions; required.
Orders	Enter each order number that should have a refund processed, canceled, or written off. The system verifies that there is a refund for each order that is eligible for processing; see below for details. Numeric, fifteen 8-position fields; required.

Completing this screen:

#	Step
1.	Enter the bank associated with the refund(s).
2.	Enter each order number to have a refund processed, canceled, or written off. Optionally, select *Work with Refunds* to advance to the Work with Refunds Screen to review refunds eligible for generation. **Note:** If you Select *OK* before entering any order numbers, you can enter any order number and Select *OK* again in order to exit the screen.
3.	Select *OK*. The system validates your entries and highlights any order numbers in error. Possible errors are:

Sample error message	Explanation
All refund records on hold for order 2464 1 of 3 refunds for order 2192 are on hold	The *Ref Sts (Refund status)* is held (*H*) or the *Manual hold* flag for the refund is *selected*.
Bank not valid for order 2465	The bank for the order is not the same as the *Bank* you entered.
Order 2605 not valid for processing	The *Ref Sts (Refund status)* is processed (*P*), canceled (*C*), or written off (*T*).
Order 3865 is not eligible for refund processing	The *Ord sts (Order status)* is held (*H*) or suspended (*S*).
No refunds exist for order 5845	There are no refunds for the order.

#	Step
4.	After correcting any errors, select *Submit*. If there are any refund checks to generate, a pop-up window appears displaying the next available check number. You can accept the check number displayed, change the check number, or select *Exit* to close the window and cancel the action.
5.	The system submits the job *REFORD_PRC*. This job processes the same updates and reports as the Processing Refunds (MREF) menu option; see Summary of Refund Processing Updates and Reports.

Working with Catalog Requests

In this part:

- *Entering Catalog Requests (WCAT)* shows you how to use the Catalog Request screens to create catalog requests for new and existing customers, and to change, delete, or display catalog request records.
- *Processing Catalog Requests (PCAT)* shows you how to use the Process Catalog Requests screen, discusses printing options, and shows you how to reset printed requests so that you can reprint labels, if needed.

- *Deleting All Printed Catalog Requests (DCAT)* discusses the screen you use to delete all printed catalog requests at one time.
- *Working with the Catalog Request Interface (WCRU)* discusses processing catalog requests you receive through an interface with Order Administration.

Entering Catalog Requests (WCAT)

Purpose: Use catalog requests to capture inquiries and manage requests for catalogs from new or existing customers. Creating catalog requests lets you track inquiry information, report on trends with respect to requests for specific catalogs, and quickly print labels in response to those requests.

You use the *Work with Catalog Requests Screen* when you want to create, change, delete, or display specific catalog requests or when you want to display or print a list of catalog customers whose names are still in the Catalog Request table.

> **Note:**
>
> You can also receive catalog requests through the catalog request interface. See *Working with the Catalog Request Interface (WCRU)*.

Catalog request history: The system tracks the total number of catalog requests by source code and date in the Catalog Request History table. This information is available for reporting purposes, such as on the Campaign Performance Report; see *Print Campaign Performance Reports (PCPR)* for more information. See *Catalog Request History Options* for additional menu options related to the Catalog Request History table.

Oracle Retail Customer Engagement customer integration: When you use the Oracle Retail Customer Engagement customer integration, if you create a customer through a catalog request, Order Administration sends the customer information to Oracle Retail Customer Engagement so that the customer records in the two systems are synchronized. See the *Customer Engagement Customer Integration* for more information.

E-Commerce Catalog Requests

The CWServiceIn web service allows an external system to post the E-Commerce Catalog Request Message (CWCatRequest) directly to Order Administration and receive responses without the need of any queues. My Oracle Support

- If the E-Commerce Catalog Request Message (CWCatRequest) passes validation, a catalog request record is created. See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). You can review and change the catalog request at the *Work with Catalog Requests Screen*.
- If the *E-Commerce Catalog Request Message (CWCatRequest)* does not pass validation, a catalog request interface record is created. See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). You can review and correct the catalog request through *Working with the Catalog Request Interface (WCRU)*.

Catalog request response: You can also send an E-Commerce Catalog Request Response Message (CWCatreqResponse) to the web storefront. See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). The catalog request response message indicates the customer number used to create the catalog request. If the customer number in the catalog request response message is blank, the catalog request did not process correctly and needs to be corrected through *Working with the Catalog Request Interface (WCRU)*. **Note:** The e-commerce customer updates response message is available for XML messages only, not name/value pair messages.

The response_required field in the catalog request message indicates if a catalog request response message is sent to the web storefront.

- A value other than *Y* indicates a catalog request response message is not sent to the web storefront.
- *Y* indicates a catalog request response message is sent to the web storefront.

Customer updates: Additionally, if the customer associated with the catalog request does not exist, the system will create a new customer; see Customer Creation/Update Logic in E-Commerce Catalog Requests. In this case, it is useful to send a catalog request response message to the web storefront indicating the newly assigned customer number.

Oracle Retail Customer Engagement customer integration: When you use the Oracle Retail Customer Engagement customer integration, if you create a customer through an e-commerce catalog request, Order Administration sends the customer information to Oracle Retail Customer Engagement so that the customer records in the two systems are synchronized. See the *Customer Engagement Customer Integration* for more information.

See E-Commerce Catalog Requests in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).for additional processing information.

In this topic:

- *Work with Catalog Requests Screen*
- *Catalog Request Creation Options*
- *Create Catalog Request Screen*
- *Select Customer for Catalog Request Screen*
- *Change Catalog Request Screen*
- *Ghost Customer Warning Window*

Work with Catalog Requests Screen

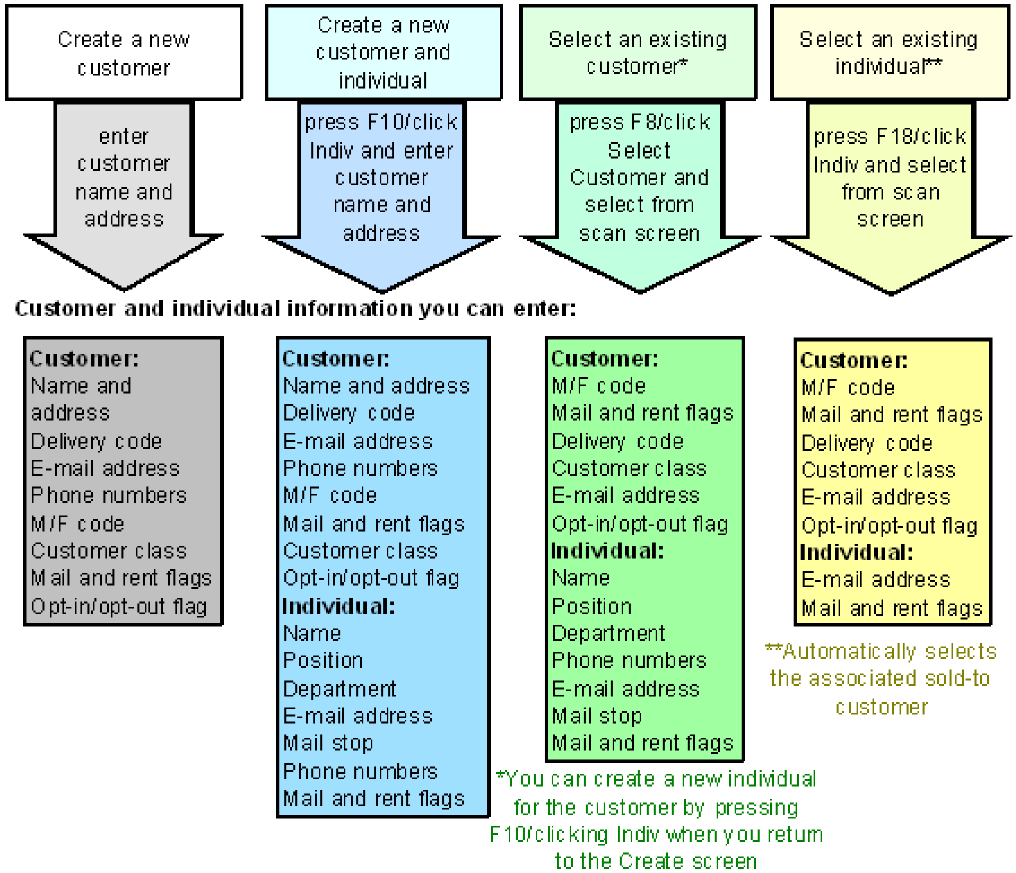
How to display this screen: Enter *WCAT* in the Fast path field at the top of any menu or select Work with Catalog Request from a menu.

Field	Description
Customer	A unique number the system assigns to each Sold-to customer on creation of the customer through Order Entry, Customer Maintenance, or catalog requests. **Ghost customers:** If you enter the customer number of a ghost customer, the scan screen does not display any catalog requests; this is because a merge/purge has assigned any catalog requests using that customer number to the “target” customer. You can identify a ghost customer by the setting of the *Ghost* flag. Numeric, 9 positions; optional.

Field	Description
Ofr (Offer)	Represents the advertising medium that you use to present merchandise to your customers. Your entry is validated against the Offer table. Alphanumeric, 3 positions; optional.
Source	A code that identifies a list of customers. The source code drives marketing, pricing, and freight information on an order. A source code will appear here only if a source code was entered when the catalog request was created. Alphanumeric, 9 positions; optional.
Request date	The date the catalog request was created. Numeric, 6 positions (in user date format); display-only.
Printed	A flag that indicates whether you have printed a catalog for the customer. *No* displays in this field next to a request until the catalog label is printed. Once the catalog label is printed, this value changes to *Yes*. Records remain on this list, regardless of their printed status, until you delete them selectively, or in batch mode. Values are: • *Yes* = A catalog label has been printed. • *No* = A catalog label has not been printed. Optional.

Screen Option	Procedure
Create a catalog request	Select *Create* to advance to the Create Catalog Request Screen.
Change a catalog request	Select *Change* for a catalog request to advance to the Change Catalog Request Screen.
Delete one or more catalog request records	Select *Delete* for a catalog request to display a pop-up window containing deletion options. You can delete a request using this method regardless of whether the label has been printed.
Display catalog request records	Select *Display* for a catalog request to advance to the Display Catalog Request Screen. You cannot change any information on this screen. See Change Catalog Request Screen for a sample screen and field descriptions.

Catalog Request Creation Options



E-commerce catalog requests: If the customer associated with an e-commerce catalog request does not exist, the system will create a new customer; see Customer Creation/Update Logic in E-Commerce Catalog Requests in the Order Administration Web Services Guide on My Oracle Support (ID 214914.1)

Ghost customers: If you enter the customer number of a ghost customer, the system displays the *Ghost Customer Warning Window*.

Create Catalog Request Screen

Purpose: Use this screen to create a catalog request for a new or existing customer.

How to display this screen: At the *Work with Catalog Requests Screen*, select *Create*.

> **Note:**
>
> You can also display this screen by selecting *Catalog Request* from the *Select Customer Sold To For Order Screen* or at the *Customer Selection Screen* in Order Entry.

> **Note:**
>
> If you are creating a catalog request for an existing customer, do not complete the following fields; instead, select *Select Customer* to select an existing customer, then complete the Offer, Item, Source, and # of copies fields. See *Catalog Request Creation Options* for an overview.

Ghost customers: If you enter the customer number of a ghost customer, the system displays the *Ghost Customer Warning Window*.

Field	Description
Name	The following five fields can hold the sold-to customer's full name: **Prefix** A title that belongs before the customer's name (such as "Mrs." or "Dr."). The prefix will print on labels. Alphanumeric, 3 positions; optional if you are creating a new customer, or display-only if you select an existing customer. **First Name** The customer's first name. Alphanumeric, 15 positions; optional if you are creating a new customer, or display-only if you select an existing customer. **Initial** The initial of the customer's middle name. Alphanumeric, 1 position; optional if you are creating a new customer, or display-only if you select an existing customer. **Last Name** The customer's last name. Alphanumeric, 25 positions; required if company name is not present and you are creating a new customer, or display-only if you select an existing customer. **Suffix** An addition to the customer's full name (such as "M.D.," "Fr.," or "III"). Alphanumeric, 3 positions, optional if you are creating a new customer, or display-only if you select an existing customer.
Company	The name of the company to which the catalog should be mailed, if applicable. Alphanumeric, 30 positions; required if last name is not present and you are creating a new customer, or display-only if you select an existing customer.
M/F (Male/ Female code)	A code that identifies the customer's gender. Alphanumeric, 1 position; optional.
Mail	This flag indicates whether the customer wants to receive future catalog mailings from your company. Not to be confused with the Mail code, a three-position, alphanumeric field. Valid values are: • *selected* = You can mail catalogs to this customer. • *unselected* = You can not mail catalogs to this customer. May default from the *Default Mail Name (D10)* system control value, but you can override it.

Field	Description
Rent	Indicates whether you can sell this customer's name to another company for their catalog mailings. Valid values are: • *selected* = You can sell this customer's name. • *unselected* = You can not sell this customer's name. May default from the *Default Rent Name (D11)* system control value, but you can override it.
Address	The customer's street address. This is the primary delivery address. **Shipping to a Post Office Box** To ship to a Post Office Box, enter `POST OFFICE BOX`, `POST BOX`, or any variation of `PO BOX` (with or without spaces or non-alphabet characters, such as `P.O. BOX`), and the box number in the customer's street address. During order processing, the system validates that the carrier can ship to a post office box (as defined in the Ship Via table). *Example:* Enter `P.O. Box 9999` in the Street field to indicate delivery to a post office box instead of a home or company address. **Note:** If you type `POST OFFICE BOX`, `POST BOX`, or any variation of `PO BOX` in the customer's street address during order entry or through the Order API, the system automatically selects the PO box field for the customer. However, if you remove this text from the customer's street address, the system does not automatically deselect the PO box flag. **Note:** When you create a customer outside of order processing, you need to select the PO box field manually. Alphanumeric, 32 positions; required if you are creating a new customer, or display-only if you select an existing customer.
Apt./suite	The apartment number or suite number of the delivery address. To enter an apartment or suite address: 1.Enter *APT* to indicate an apartment or *STE* to indicate a suite. 2.Insert a space and enter the number of the apartment or suite (for example, *APT 4* or *STE 116*). Field contents must conform to United States Parcel Service (USPS) address formatting Field Description standards. Always precede the apartment or suite number with the applicable abbreviation (such as APT or STE), to meet USPS regulations and correctly identify this information on labels or reports. Alphanumeric, 10 positions; optional if you are creating a new customer, or display-only if you select an existing customer.

Field	Description
Address lines 2-4 (Unlabeled fields directly beneath the street address)	Additional entry fields for the customer's address. The contents of address line 2 of the address must conform to United States Postal Service (USPS) formatting standards. For example, if the address represents a post office box, you must enter *P.O. Box* on this line to meet USPS regulations and correctly identify this information on labels. Alphanumeric, 30 positions; optional if you are creating a new customer, or display-only if you select an existing customer.
Postal code	The postal or zip code for this customer. Required only if the Require postal code? flag is selected for the country. See *Setting Up the Country Table (WCTY)* for background. If a postal code is required for the country, it is validated against the Zip/City/State (Postal Code) table; see *Setting Up the Zip/City/State (Postal Code) Table (WZIP)*. *Scan length:* The *Postal Code Scan Length (F61)* system control value controls how many characters of the postal code to use when searching for a customer. See that system control value for a discussion. **Note:** If postal codes have been entered into the Postal Code/City/State table, the postal code indicates the City and State to default. If you enter a valid postal code that does not correspond to the city or state you entered, the system changes the city or state information to correspond with the zip code you entered. Numeric, 10 positions; required or optional based on country if you are creating a new customer, or display-only if you select an existing customer.
City	The city where the customer lives, or receives mail or shipments. The system will complete this field for you when you enter a valid postal code if the postal code exists in the Postal Code/City/State table. Alphanumeric, 25 positions; required if you are creating a new customer, or display-only if you select an existing customer.
St (State)	The state or province where the customer lives, or receives mail or shipments. The system validates that the state you enter is assigned to the SCF in the first three positions of the postal code. State codes are defined in and validated against the State table, which is accessible through the Work with Countries menu option; see *Setting Up the Country Table (WCTY)*. Required only if the Require state? flag is selected for the country. The system completes the state field automatically when you enter a valid postal code if the postal code exists in the Postal Code/City/State table. Alphanumeric, 2 positions; required or optional based on country if you are creating a new customer, or display-only if you select an existing customer.
Country	The code for the customer's country. May default from the *Default Country for Customer Address (B17)* system control value; however, you can override it. Country codes are defined in and validated against the Country table. See *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; required if you are creating a new customer, or display-only if you select an existing customer.

Field	Description
Delivery code	This code identifies the address as a business or residential address. This code is used by shippers who charge different rates when shipping to a business or home. Valid values are: • *Business* • *No distinction* = Not valid for a UPS shipper • *Residential* This field may default based on the *Default Delivery Code for New Order Entry Customers (D13)* system control value, but you can override it. Required.
Customer class	A code that categorizes the consumer environment at a high level for reporting purposes. You can use a customer class code to: • direct offerings to a limited customer group • restrict item sales to a group of customers, for example, restricting the sale of guns to minors • set a default for bypassing item reservation for a group of customers • generate a list of customers for reporting purposes, or segment reports by class code *If you enter a new customer class code* in this field, the system updates the Customer Sold To table with the code you entered. *Required?* The *Require Customer Class in OE, WCAT, and WCST (H85)* system control value defines whether this field is required. *Secured?* The Maintenance of Customer Class Field (B07) secured feature defines whether you can enter or maintain the customer class field at this screen. **Note:** If the *Require Customer Class in OE, WCAT, and WCST (H85)* is *selected* and the customer does not have a customer class code assigned, a user who does not have authority based on the Maintenance of Customer Class Field (B07) secured feature will not be able to enter a catalog request. See *Setting Up the Customer Class Table (WCCL)* for information on working with customer classes. Numeric, 2 positions; optional.

Field	Description
Phone	The customer's daytime, evening, and fax or mobile telephone numbers. **Note:** The *Third Phone Number Type (L53)* system control value determines whether the third phone number is labeled the Fax or Mobile number. Alphanumeric, one 14-position field (phone number) and one 4-position field (phone extension); optional if you are creating a new customer, or display-only if you select an existing customer.
Email address	The customer's primary email address. This address, along with any other email addresses for the customer, is stored in the Customer Sold To Email table. A plus sign (+) indicates that there are additional email addresses on record for the customer. See *Email Address Validation* for information on how the system verifies that your entry is formatted correctly. **Entering a new email address:** If you overwrite the existing email address in this field, the system flags your entry as the primary email address for the customer, but retains the previous email address in the Customer Sold To Email table. In order to delete the previous email address, you need to prompt to display the *Select Customer Email Address Screen* and delete the previous email address there. See *Working with Customer Email Addresses* for an overview. **Deleting the email address:** Similar to entering a new email address, if you delete the email address from this field, the system removes the primary email flag for the address but retains the address in the Customer Sold To Email table. **Email notifications:** See *When Does the System Generate an Email Notification?* for an overview. Alphanumeric, 50 positions; optional.

Field	Description
Opt in	Determines the preferred method of correspondence for the sold-to customer email address. Valid values are: • *O1* (Email) = Email is the preferred method of correspondence. • *O2* (Order-only email) = Use email for order-related correspondence only; generate a document for other correspondence. • *O3* (No email) = Do not use email for any correspondence; generate a document instead. • *O4* (Do not ask the customer) = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. Defaults from the *Default Opt In/Opt Out Flag (G97)* system control value, but you can override it. **Note:** The above values use the letter O, not the number 0 (zero). The system updates this field when you change the setting of the Opt in/Opt out value at any other screen, such as order entry, order maintenance, or customer maintenance. **Email notifications:** See *When Does the System Generate an Email Notification?* for an overview. Alphanumeric, 2 positions; required.
# of copies	The number of catalogs the customer wants to receive; controls the number of labels printed when you use *Processing Catalog Requests (PCAT)*. For example, if you enter 5 here, the system prints 5 labels for the customer. If you do not have authority to the *Allow Number of Copies to Maintain in Catalog Request (A75)* secured feature, this field is display-only. **Tracking catalog request history:** When you print the catalog request label, the system uses the total number of requests rather than the total number of copies when tracking catalog request history in the Source Code table and in the Catalog Request History table. For example, if a customer requests 3 copies of a catalog, the system increases the total by 1, not by 3. You can review the total number of catalog requests for a source code at the *Source Code History Screen* and on the *Campaign Performance Report (PCPR)*. Numeric, 2 positions; required.

Field	Description
Source	A code that identifies a list of names for this catalog mailing. The source code drives marketing, pricing, and freight information on an order. **Note:** You can prompt to view a list of the source codes you can use. Only those source codes set to display in Order Entry and catalog requests appear in the Select Source pop-up window. The first source code you enter on this screen will default for any other catalog requests you create so you can enter them quickly. Once you exit this screen, the Source field will clear. The source code will default in the Source field for alternate address and standard address format. Source codes are defined in and validated against the Source Code table. See *Working with Source Codes (WSRC)*. Alphanumeric, 7 positions; required.
Offer	The code for the catalog that the customer is requesting. Offer codes are defined in and validated against the Offer table. See *Working with Offers (WOFR)*. The first offer code you enter on this screen will default for any other catalog requests you create so you can enter them quickly. This field clears when you exit the screen. The offer code will default in the Offer field for alternate address and standard address format. **Note:** You must enter an offer code or an item/SKU. Numeric, 3 positions; required unless you complete the Item field.
Item (Item number)	The code for the item you are sending to the customer with the catalog. Examples would be swatches of material or promotional items printed with your company name. Item numbers are defined in and validated against the Item table. See *Performing Initial Item Entry (MITM)*. Alphanumeric, 12 positions; optional.
SKUs	A code for the style of the item, such as its color or size. Alphanumeric, three 4-position fields; required if entering an item that has SKUs.

Catalog Request Customer Updates

When you create a new customer here, the system creates the new customer in the Customer Sold To table. The current and original mail type fields are set to *C* (catalog request). If the *Track Customer History at Entity Level (F89)* system control value is *selected*, the system also creates a Customer Entity record for the entity associated with the source code.

Oracle Retail Customer Engagement customer integration: If the *ORCE Customer Integration (L37)* system control value is set to *INTERACT*, when you create a new customer at this screen, the customer is also created in Oracle Retail Customer Engagement, and the two customer records are synchronized. See the *Customer Engagement Customer Integration* for more information.

If you select an existing customer and change the value of an existing field, such as the Opt in/opt out field or the Customer class, the system updates the customer table. See *Creating and Updating Sold-to Customers (WCST)*.

When the catalog request label is printed, the Customer Mail History table is updated through the catalog request. The Original source field is updated if you added a new customer. See *First Create Sold To Customer Screen*.

If the customer you enter already exists: The system displays the Duplicate Customer window if the customer information you enter matches an existing customer in the Sold To Customer table. The system displays this window based on match code.

You can use the existing customer information and cancel the creation of the new customer, or you can override this message and create the additional customer. You might use the duplicate customer information, for example, if two different people with the same name, such as John Smith, live at addresses that are so similar that the system thinks they are the same person.

If the customer's catalog request already exists: The system displays the Display Duplicate Sold To pop-up window if the customer and offer/item information you enter at the *Create Catalog Request Screen* matches an existing customer sold to, based on match code. A match code is made up of parts of the customers name, address, and postal code. The match code is a user-defined code defined in the Match Code table; See *Setting Up Match Codes (MMCH)*.

> **Note:**
>
> If you do not set up a match code in the Match Code table, the system displays the first sold to customer, based on sold to customer number, as a duplicate each time you enter a new address.

Duplicate catalog requests: The system uses the *Edit for Duplicate Catalog Requests (E46)* system control value to update duplicate catalog requests. If this value is *selected*, the system checks for a duplicate when you create a new catalog request; if there is a match, the system replaces the existing request with the new one. If this value is *unselected*, the system creates a new catalog request without checking the existing records.

When you print the catalog request label, the system uses the total number of requests rather than the total number of copies when tracking catalog request history in the Source Code table and in the Catalog Request History table. For example, if a customer requests 3 copies of a catalog, the system increases the total by 1, not by 3. You can review the total number of catalog requests for a source code at the *Source Code History Screen* and on the *Campaign Performance Report (PCPR)*.

Screen Option	Procedure
Enter a catalog request for a new customer	Complete the fields as described under *Create Catalog Request Screen*. See *Catalog Request Creation Options* for an overview.

Screen Option	Procedure
Select an existing customer	Select *Customer* to advance to the *Select Customer for Catalog Request Screen*. See *Catalog Request Creation Options* for an overview. **Note:** If the *ORCE Customer Integration (L37)* system control value is set to *INTERACT*, you advance instead to the *Customer Scan Screen*. See that screen for more information.
Work with products a customer owns	Select *Cust Ownership*. • If the customer is currently associated with customer ownership records, you advance to the *Work with Customer Ownership Screen*. • If the customer is currently not associated with customer ownership records, you advance to the *Create Customer Ownership Screen*.
Add notes for the customer	Select *Notes* to advance to the *Edit Customer Notes Screen*.

Select Customer for Catalog Request Screen

Purpose: In addition to creating catalog requests for people who are not yet customers, you can also create catalog requests for existing customers from the *Create Catalog Request Screen*.

When creating a catalog request for an existing customer, the system copies customer information from the Sold To Customer directly into the catalog request. See *Catalog Request Creation Options* for an overview.

How to display this screen: At the *Create Catalog Request Screen*, select *Select Customer*.

> **Note:**
>
> If the *ORCE Customer Integration (L37)* system control value is set to *INTERACT*, you advance instead to the v. See that screen for more information.

How to use this screen: Use this screen to advance to scan screens that let you locate existing customer records. If the customer exists, you can select the customer and the system will copy information from the customer into the customer fields on the *Create Catalog Request Screen*.

Field	Description
Customer	A unique number the system assigns to each customer on creation of the customer through Order Entry, Customer Maintenance, or catalog requests. **Ghost customers:** If you enter the customer number of a ghost customer, the system displays the *Ghost Customer Warning Window*. Numeric, 9 positions; optional.
Postal code	The postal or zip code that identifies the customer's geographic location. Enter a full or partial code to advance to the Scan Sold To by Postal Code/Company screen. This screen lists all customers by postal code in ascending (lowest to highest) numeric sequence, beginning with the code you entered. If you enter a postal code, last name, and first name, you advance to the Scan Customer Sold To by Postal Code screen, which lists all customers alphabetically beginning with the postal code you entered. Alphanumeric, 10 positions; optional.
Last name	The sold-to customer's last name. Enter a last name, first name, and postal code to advance to the Scan Customer by Postal Code/Last Name screen, positioned to the customer with the last name, first name, and postal code you entered. Enter a full or partial name to advance to a Scan Cust Sold To By Last Name screen, which lists all customers alphabetically beginning with the name you entered. You can also include a full or partial first name along with a full (not partial) last name to restrict the scan further. Alphanumeric, 25 positions; optional.
First name	The sold-to customer's first name. Enter the last name, first name, and postal code to advance to the Scan Customer Sold To by Postal Code screen, which lists all customers alphabetically beginning with the postal code you entered. You can also enter just the full (not partial) last name and full or partial first name to advance to the Scan Cust Sold To By Last Name screen. **Note:** First name must be used in conjunction with Postal code, Last name for scanning. You cannot scan on first name alone, or on first name, last name. Alphanumeric, 15 positions; optional.
Company	The name of the company placing the catalog request. Alphanumeric, 30 positions; optional.

Field	Description
Telephone #	The customer's daytime, evening, or third (fax or mobile) telephone number. **Note:** The *Third Phone Number Type (L53)* system control value determines whether the third phone number is labeled the Fax or Mobile number. **Note:** Your entry should include any formatting specified by the telephone number format for the country; for example, if the telephone number format for the United States is `(111) 111-111`, your entry should include the parentheses and hyphen. See Setting Up the Country Table (WCTY), for more information on telephone number formats by country. Alphanumeric, 14 positions; optional.
Alternate customer number	A number to identify the customer, such as an old customer number from a system conversion. Enter an alternate customer number to advance to a subsequent scan screen that lists customers by alternate customer number. *Display Alternate Customer Cross Reference Window (I84)* for more information. **Alternate Customer Number Label Description** The field label on this screen is based on the name you enter in the *Alternate Customer Number Label Description (H95)* system control value; if you do not enter a name in this system control value, the field label is Alt cust. *Example:* If you enter the field label name *MEMBER#* in the system control value, the field label on this screen is MEMBER#. **Note:** Scanning by the alternate customer number of a ghost customer is not currently implemented if the *Display Alternate Customer Cross Reference Window (I84)* system control value is *selected*. Alphanumeric, 15 positions; optional.

Field	Description
Email Address	An email address for the customer. When you enter a full or partial email address, you advance to the Scan Customer by Email Address screen, where you can scan by any email address on file for a customer. This field is not case sensitive; an email address of *abc@example.com* matches an entry of *ABC@EXAMPLE.COM*, and vice versa. Alphanumeric, 30 positions; optional.

Option	Procedure
Select a customer for a catalog request	Click a customer name to return to the *Create Catalog Request Screen* with that customer's name and address defaulted.
Change a customer's name and address information	Select *Change* for a customer to advance to the *Change Cust Sold to Name & Address Screen*.
Display a customer's name and address information	Select *Display* for a customer to advance to the Display Customer Sold To screen. See the See the *First Create Sold To Customer Screen* for field descriptions.
Create a catalog request for a new customer	Select *Create* to return to the *Create Catalog Request Screen* without selecting a customer.

Ghost Customer Warning Window

A ghost customer is a customer whose records have been merged with the records of a matching customer through a merge/purge. The ghost customer was the source customer in the merge; records for this customer were merged with the records for a matching target customer. When performing the merge you can elect to flag a source customer as a *Ghost*. Ghost customer records are retained in the Customer Sold To table for informational purposes, but they do not represent the most recent customer order information from the merged (target customer) records.

When you enter the number of a ghost customer, the pop-up Warning Window presents the information on the ghost customer and target.

Select *Continue* to advance to the *Create Catalog Request Screen* with the target customer number entered on the screen. For example, if you enter *202*, a ghost customer, the system will display this window informing you that customer *202* has been merged into customer *137*. When you continue with the catalog request process, customer *137* will default on the Create Catalog Request screen.

> **Note:**
>
> The Ghost Customer Warning pop-up window does not display when you use the *Customer Selection Screen*.

See *Working with Merge/Purge Sold-to Names (MMCS)* for more information on the merge/purge function.

Canceling the creation: Once you select a customer from the *Select Customer for Catalog Request Screen*, you return to the *Create Catalog Request Screen*, which displays the information from the request you selected. If, on review, you learn that the customer information is incorrect, you can remove it from the screen without creating a catalog request.

Select *Create* to erase the selected customer information from the *Create Catalog Request Screen*. The system clears your entries and you can begin again.

Change Catalog Request Screen

Purpose: Use this screen to change the offer number, item number, SKU, source code, or the number of copies for a catalog request.

How to display this screen: At the *Work with Catalog Requests Screen*, select *Change* for a catalog request.

Additional fields at this screen:

Field	Description
Printed	A code that identifies whether the catalog mailing label has been printed for a catalog request. The system updates this value when you process the catalog requests; see *Processing Catalog Requests (PCAT)*. If you deselect this flag after the catalog request label is printed, the system decreases the Requests mailed total for the source code. Once you print the label again, the system increases the total again. You can review this total at the *Source Code History Screen* and on the *Campaign Performance Report (PCPR)* Values are: *selected* = The catalog label has been printed. *unselected* = The catalog label has not been printed.
Date printed	The date the catalog label was printed. Numeric, 6 positions (in user date format); display-only.
Catalog requested on	The date and time of the catalog request. Date: numeric, 6 positions (in user date format); updated by the system. Time: numeric, 6 positions; HHMMSS (hour/hour, minute/minute, second/second) format, updated by the system.
Catalog requested by	The name of the system user who entered or processed the catalog request. Alphanumeric, 10 positions; display-only.

See *Create Catalog Request Screen* for a description of the other fields on this screen.

> **Note:**
>
> Changing a catalog request from one source code to another does not affect the total quantity for each source code tracked in the Catalog Request History file, or tracked on reports such as the Campaign Performance Report (see *Print Campaign Performance Reports (PCPR)* for more information).

Processing Catalog Requests (PCAT)

Purpose: Once you have created catalog requests, you process them by printing the catalog mailing labels. You can format the labels in rows of two or three addresses each.

Reprint: You can reprint catalog requests if the labels become jammed in the printer by using the *Reset Printed Catalog Request Screen (RCAT)* and then the *Process Catalog Requests Screen (PCAT)*.

Related system control values: Use the *Label 2-Up Printing Program (C83)* and *Label 3-Up Printing Program (C84)* system control values to specify which program to use when printing catalog request labels.

History updates: When you print catalog request mailing labels, the system updates:

- Customer mail history: see *Display Customer Mail History Screen*
- Last source and Last mail date in customer order history: see *Display Customer Order History Screen*
- Source code: see the *Source Code History Screen*
- Catalog request history: see the *Campaign Performance Report (PCPR)*

> **Note:**
>
> You cannot print catalog requests if another person has submitted the job and it is currently running.

In this topic:

- *Process Catalog Requests Screen (PCAT)*
- *Catalog Mailing Labels (MSR0613 or MSR0614)*
- *Labels Printed by Item Report*
- *Labels Printed by Source Report*
- *Labels Printed by Zip Report*

For more information: See *Reset Printed Catalog Request Screen (RCAT)*.

Process Catalog Requests Screen (PCAT)

Purpose: At this screen you can print labels for the catalogs you want to mail. You can:

- print directly to a printer
- specify the number of labels to print
- print labels for selected source codes and/or items

> **Note:**
>
> For best results, do not select the Shrink to Fit option when printing labels.

How to display this screen: Enter *PCAT* in the Fast path field on any menu screen or select Process Catalog Requests from a menu.

Field	Description
Number of labels ready to print	The number of catalog mailing labels eligible to be printed for catalog requests. The number of unprinted catalog requests appears here. Represents the total number of copies requested for the catalogs if a customer requested multiple copies. Numeric, 5 positions; display-only.
Nbr of labels to print (Number of labels to print)	The number of labels that you want to print. This field defaults to the same number as in the Nbr of labels ready to print field, but you can override it. Numeric, 5 positions; required.
Select source codes	Use this field if you want to print catalog mailing labels only for one or more specific source codes. Selecting multiple source codes: *Click* on the arrow in this field to advance to the Select Multiple Sources screen. At this screen, you can select a source by *Selecting* it. You can deselect a source by selecting *Deselect* for it. Select *Exit* to return to the Process Catalog Requests screen. If you have selected more than one source code, (MULTIPLE SELECTED) appears to the right of this field. Leave this field blank to select all eligible catalog requests regardless of source code. Alphanumeric, 9 positions; optional.
Select items	Use this field if you want to print catalog mailing labels only for one or more specific items. You can identify an item, such as a promotional item with your company's logo or a swatch of material that should be sent along with the catalog. If an item is specified with a catalog request, the item code prints on the catalog mailing label. Selecting multiple items: *click* on the arrow in this field to advance to the Select Multiple Items screen. At this screen, you can select an item by *Selecting* it. You can deselect an item by *Deselecting* it. Select *Exit* to return to the Process Catalog Requests screen. If you have selected more than one source code, (MULTIPLE SELECTED) appears to the right of this field. Leave this field blank to select all eligible catalog requests regardless of item. Alphanumeric, 12 positions; optional.
Print option	The code to print the catalog mailing labels. *Printer* indicates the mailing labels will be printed on a printer. Required.

Field	Description
Label type	Controls how many labels to print in a row. Valid values are: • *2 up* = print 2 labels per line. • *3 up* = print 3 labels per line. The *Label 2-Up Printing Program (C83)* and *Label 3-Up Printing Program (C84)* system control values specify which formats to use when printing labels. Required if Print option field is set to Printer.
Sort labels	Identifies how to sorts the catalog mailing labels. Valid values are: • *Zip* = Sort labels alphanumerically by postal code (zip code). Labels print in ascending (lowest-to-highest) customer number sequence. Catalog requests that do not contain item information print first. See *Labels Printed by Zip Report*. • *Source* = Sort labels alphanumerically by source code. Labels print in ascending (lowest-to-highest) customer number sequence. See *Labels Printed by Source Report* • *Item* = Sort labels alphanumerically by item. Labels print in ascending (lowest-to-highest) zip code (postal code) sequence. See *Labels Printed by Item Report* Required if Print option field is set to Printer.
Delete request	Controls whether to delete all catalog requests whose Printed fields are *selected*, regardless of whether these records were included in the current print job. *Example:* If you entered *20* in the Nbr of labels to print field, but there are additional printed catalog requests in the Catalog Request table, the system will delete the requests you included in your current print number plus every catalog request whose Printed field is *selected*. Valid values are: • *Selected* = Delete all printed catalog requests. • *Unselected* (default) = Do not delete printed catalog requests.

Screen Option	Procedure
Display the *Work with Catalog Requests Screen*	Select *W/W Requests*.

Reset Printed Catalog Request Screen (RCAT)

Purpose: Use the Reset Printed Catalog Requests function to change the status of all printed request records to "unprinted." This reset might be useful if there is a problem with the catalog mailing labels you just printed, such as if the labels jammed when printing.

This screen displays the number of printed catalog requests that will be reset.

How to display this screen: Enter *RCAT* in the Fast path field at the top of any menu, or select Reset Printed Catalog Requests from a menu.

Reset all printed catalog requests: Select *OK* without entering a date range to reset the status of all printed catalog requests from *selected* to *unselected* to make them eligible for reprinting. Optionally, you can also select a company (by number) to reset catalog requests in a different company; your current company defaults.

Reset specific catalog requests:

- Enter a date range to reset the status of all catalog requests printed within the dates you specify. Optionally, you can select a company (by number) to reset catalog requests in a different company; your current company defaults.
- Select *Work with Requests* to advance to the *Work with Catalog Requests Screen*, where you can review printed requests before you reset the print status of all printed catalog requests. From this screen, you can also select *Change* for a catalog request to advance to the *Change Catalog Request Screen*, where you can reset the Printed field for a specific request.

Screen Option	Procedure
Advance to the *Work with Catalog Requests Screen*	Select *Work with Requests*.

Deleting All Printed Catalog Requests (DCAT)

Purpose: Once you have created and printed catalog requests, you can delete them individually or as a group.

Delete Printed Catalog Requests Screen

How to display this screen: Enter *DCAT* in the Fast path field on any menu or select Delete Printed Catalog Requests from a menu.

To delete printed catalog requests: Enter a date range to delete catalog request records printed within the dates you specify. Optionally, you can also enter a company (by number) to delete catalog requests in a different company; your current company defaults.

To delete all printed catalog requests: Select *OK* at this screen without entering a date range to delete all printed Catalog Request records.

> **Note:**
>
> You cannot reprint deleted catalog request records.

Review printed catalog requests: Select *Work with Requests* to advance to the *Work with Catalog Requests Screen*, where you can view printed requests to verify the global deletion.

For more information: *Entering Catalog Requests (WCAT)* and *Processing Catalog Requests (PCAT)*.

Working with the Catalog Request Interface (WCRU)

Purpose: Use the Work with Catalog Request menu option to review the records that have been uploaded to the Catalog Request Interface table (IXCRIN), to correct any errors, and to generate catalog requests from the interface records. You might use the Catalog Request Interface table as a means to collect catalog requests you receive from various sources, and make sure that you have complete information for each of them before you attempt to create the catalog requests in Order Administration.

The catalog request interface also creates new customer sold to records, and you can use the interface to create a customer record without actually processing a catalog request.

Use the following steps to create a catalog request from an external system.

#	Step
1	Create a text file that contains the records to upload to the Catalog Request Interface table. You can use the sample data below to create records in the upload text file. `34 SAMPLE STREET|APT123|ADDRESS LINE 2|ADDRESS LINE 3|ADDRESS LINE 4|WESTBOROUGH|01581||MA|US|5085550100||thomasbrown@example.com|O1|R|COMPANY NAME|SOURCE7|7|1150417|207|5085550101||5085550102||MS.|MARY|M|JOHNSON||MARYJOHNSON@EXAMPLE.COM||5085550104|5085550105|5085550106|1|1|O1` **Note:** If you wish to leave any field in the upload file blank, pass a space in an alphanumeric field and a 0 in a numeric field so that the file can be processed without errors. Leaving a field with no space or 0 is interpreted as null in the database and causes errors.
2	Populate the Catalog Request Interface table by: • Using the *File Storage API* to upload the contents of the file in the FILE_STORAGE table, and then run the *UPCATRQ Upload Catalog Request File* (Program name *PFR0134*, Parameter *IXCRIN*) periodic function, or • Use the *Work with File Uploads (WUPL)* menu option to upload the file and populate the table.
3	Select *Submit* at the *Work with Catalog Request Interface Screen* to process the requests. When you process: • Each valid record is deleted from the interface table, and a customer sold to and/or catalog request is created as appropriate. Also, the Catalog Request History table is updated. • Each invalid record is flagged with an error *(E)* status. You can use the *Change Catalog Request Screen* to correct errors. • The *Print Request Interface Report* and the *Print Catalog Request Interface Errors Report* are generated.
4	Once the catalog requests are generated, you can process and print them like any other requests. See *Entering Catalog Requests (WCAT)*.

E-Commerce catalog requests: You can use this menu option to review and correct catalog requests received through the e-commerce catalog request process that are in error. If a catalog request received through the e-commerce catalog request process does not contain errors, you can review and process the catalog request using the Work with Catalog Requests menu option; see *Entering Catalog Requests (WCAT)*.

> **Note:**
>
> If you receive a catalog request from e-commerce that has errors, and customer ownership information has been defined for the sold to customer on the catalog request, the system does not retain the customer ownership information when you correct the errors and reprocess the catalog request.

Oracle Retail Customer Engagement customer integration: When you use the Oracle Retail Customer Engagement customer integration, if you create a customer through the catalog request interface, Order Administration sends the customer's name, address, email address, phone numbers, and contact permissions to Oracle Retail Customer Engagement so that the customer records in the two systems are synchronized. See the *Customer Engagement Customer Integration* for more information.

In this topic:

Work with Catalog Request Interface Screen

How to display this screen: Enter *WCRU* in the Fast path field on any menu or select Work with Catalog Request Interface from a menu.

Field	Description
Type	Indicates the source of the catalog request. **Note:** If this field is blank, the catalog request is in error status and you cannot change it through this menu option. You need to delete the record and recreate it, either by populating the Catalog Request Interface table directly or by entering the catalog request through *Entering Catalog Requests (WCAT)*. *E-Commerce catalog requests:* Catalog requests received through the e-commerce catalog request process have a type of *PHR0062*. Alphanumeric, 10 positions; optional.
Source	The source code assigned to the catalog request, indicating how the customer came to contact you. If the source code is not specified in the Catalog Request Interface table, the system assigns the *Default Source Code for Batch Catalog Requests (D37)* system control value when you select *Submit* to submit the interface records for processing. Alphanumeric, 9 positions; optional.
Name	The customer's last and first names, separated by a column. Last name: alphanumeric, 25 positions; display-only. First name: alphanumeric, 15 positions; display-only.
Date	The date specified in the Catalog Request Interface table indicating when the request was received. Numeric, 6 positions (in user date format); optional.
St (Status)	Indicates the current status of the catalog request. Valid values are: • *E* = One or more errors are preventing the interface record from being processed. You must correct the record before you resubmit the records for processing. However, if the Type field is not populated, you cannot correct the record; you need to delete it and recreate it. • *P* = The *CATALOGREQ* job is currently running; you cannot work with the record until this job is complete. • blank = The record is currently open. When you select *Submit* to submit the interface records for processing, the *CATALOGREQ* job evaluates the record for errors and, if it is error-free, the job performs the processing described Processing Requests Alphanumeric, 1 position; optional.

Screen Option	Procedure
Change a catalog request interface record	Select *Change* for a record to advance to the *Change Catalog Request Screen*.
Delete a catalog request interface record	Select *Delete* for a record to delete it.
Display a catalog request interface record	Select *Display* for a record to advance to the *Display Catalog Request Screen*.
Submit the catalog request records for processing	Select *Submit*. See *Processing Requests*.

Change Catalog Request Screen

Purpose: Use this screen to change a record in the Catalog Request Interface table and to correct errors. When you select *OK*, the system validates the entries on the screen and highlights the field that contains an error.

Once you correct the errors on this screen, the record's status changes from *E* to blank, and it is eligible for processing.

How to display this screen: Select *Change* for a catalog request record at the *Work with Catalog Request Interface Screen*.

> **Note:**
>
> If the Type field for the catalog request record is blank, you advance first to a key screen and you cannot correct any other errors for the record. You need to delete the record and recreate it (for example, using *Entering Catalog Requests (WCAT)*).

Field	Description
Name	The following fields are available for the customer's full name: *Prefix* A title (such as “Mrs.” or “Dr.”) that precedes the customer's name. The prefix prints on labels, reports, etc. Alphanumeric, 3 positions; optional. *First Name* The Sold-to customer's first name Alphanumeric, 15 positions; optional. *Initial* The initial of the customer's middle name. Alphanumeric, 1 position; optional. *Last Name* The customer's last name. Alphanumeric, 25 positions; required if company name is not specified. *Suffix* An addition to the customer's full name (such as “M.D.,” “Fr.,” or “III”). The suffix prints on labels, reports, etc., but is not accessible to scans. *Errors:* The record is in error status if both the last name and the company field are blank. Alphanumeric, 3 positions, optional.
Company	The name of the company associated with the customer placing the order. *Errors:* The record is in error status if both the last name and the company field are blank. Alphanumeric, 30 positions; required if last name is not specified.
Street	The customer's street address. This is the primary delivery address. *Errors:* The record is in error status if this field is blank. Alphanumeric, 32 positions; required.
Apt./suite (Apartment/suite)	The apartment number or suite number associated with the customer's delivery address. Follow these steps to enter an apartment or suite address: • Enter *APT* to indicate an apartment or *STE* to indicate a suite. • Insert a space and enter the number of the apartment or suite, for example: *APT 4* or *STE 116*. Addresses must conform to United States Parcel Service (USPS) address formatting field description standards. For example, always precede the apartment or suite number with the appropriate abbreviation (for example, APT or STE). Alphanumeric, 10 positions; optional.
Address	Three additional lines of the customer's delivery address. If the address represents a post office box, you must enter *P.O. Box* on the first line to meet USPS delivery regulations. Alphanumeric, three 30-position lines; optional.

Field	Description
Postal code	The postal or zip code for this customer. This code represents a delivery area. *Required?* A postal code is required only if the Require postal code? flag for the country is selected; see *Setting Up the Country Table (WCTY)*. *Postal code validation:* If a postal code is required, it is validated against the Zip/City/State (Postal Code) table; see *Setting Up the Zip/City/State (Postal Code) Table (WZIP)*. *Errors:* The record is in error status if the Require postal code? flag for the country is selected and the SCF of the postal code is blank or invalid, or if the postal code does not match the state. See *Catalog Request Interface Errors*. Alphanumeric, 10 positions; required or optional based on country.
City	The city where the customer lives or receives mail or shipments. Alphanumeric, 25 positions; required.
St (State)	The state or province where the customer lives or receives mail or shipments. *Defined where?* State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see *Setting Up the Country Table (WCTY)*. *Required?* A state is required only if the Require state? flag for country is selected. See *Setting Up the Country Table (WCTY)*. *SCF validation:* If the Require postal? flag for the country is selected, the system validates that the state you enter is assigned to the SCF associated with the postal code. See *Working with SCF Codes (WSCF)* for background. *Errors:* The record is in error status if the Require state? flag for country is selected and there is not a valid state code. State codes must be in uppercase. Alphanumeric, 2 positions; required or optional based on country.
Country	The code for the customer's country. Country codes are defined in and validated against the Country table. The *Default Country for Customer Address (B17)* system control value defaults here when you submit the catalog request for processing if the country code was not already specified for the record. *Errors:* The record is in error status if there is not a valid country code. Country codes must be in uppercase. See *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; required.

Field	Description
Delivery code	Identifies a business (commercial) or residential address. Used to calculate shipping charges for shippers that use rate tables (such as U.P.S.). • *Business* = Business rate table determines shipping charges. • *Residential* = Residential rate table determines shipping charges. • *No distinction* = No distinction between business and residence. *Errors:* The record is in error if the delivery code is blank or invalid. Delivery codes must be in uppercase. Required.
Phone numbers	The customer's day, evening, and third (fax or mobile) phone numbers. **Note:** The *Third Phone Number Type (L53)* system control value determines whether the third phone number is labeled the Fax or Mobile number. Alphanumeric, 14 positions each; optional.
Ext (Extension)	The extension of the customer's day, evening, and third (fax or mobile) phone number. **Note:** The extension for the third phone number is not updated through the catalog request upload process. Numeric, 4 positions; optional.
Email address	The customer's email address. Alphanumeric, 30 positions; optional.

Field	Description
OptIn (Opt in/opt out)	Indicates the preferred method of correspondence for the customer email address. Valid values are: • *All Emails* = Email is the preferred method of correspondence. • *Order Emails Only* = Use email for order-related correspondence only; generate a document for other correspondence. • *No Emails* = Do not use email for any correspondence; generate a document instead. • *Do Not Ask* = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. Defaults from the Opt in/opt out field for the sold-to customer, and if blank, defaults from the *Default Opt In/Opt Out Flag (G97)* system control value, but you can override it. **Note:** The above value uses the letter O, not the number 0 (zero). Required.
Create catalog request?	Indicates whether to create a catalog request. Valid values are: • *selected* = Create a catalog request. • *unselected* = Do not create a catalog request. Regardless of the setting in this field, the system may still create a new customer sold to; see the Perform duplicate check field. *Errors:* The record is in error status if this field is not set to a valid value.
Perform duplicate check?	Indicates whether to perform a match code check to determine whether the catalog request represents a new customer. Valid values are: • *selected* = Perform a duplicate check based on match code. If the catalog request matches an existing customer based on match code, do not create a new customer; use the existing customer record without updating it. If more than one existing customer has the same match code, use the first match. • *unselected* = Do not perform a duplicate check based on match code; create a new customer record using the information in the catalog request. *Errors:* The record is in error status if this field is not set to a valid value. See *Setting Up Match Codes (MMCH)* for more information on match codes and duplicate checking.

Field	Description
File type	Indicates the source of the catalog request. This information is not validated against any tables in Order Administration. *Errors:* The record is in error status if this field is blank. In this case, you cannot correct the record at this screen; instead, you can delete the record and recreate it, or update the table directly. Alphanumeric, 10 positions; display-only.
Request date	The date when you received the request. The system does not update this field. If a date was indicated in the catalog request interface record, it appears here; however, you can change it. Numeric, 6 positions (in user date format); optional.
Source	A code that identifies a list of names for this catalog mailing. The source code drives marketing, pricing, and freight information on an order. *Overrides:* When you submit the requests for processing, the system assigns the *Default Source Code for Batch Catalog Requests (D37)*system control value if a valid source is not specified for the catalog request. In this situation, the offer for the record is reset, if necessary, to match the default source code. Source codes are defined in and validated against the Source Code table. See Working with Source Codes (WSRC). Alphanumeric, 9 positions; required.
Offer	The code for the catalog that the customer is requesting. *Overrides:* The system defaults or overrides the offer in the catalog request record when you submit the requests for processing so that it matches the source code. If the offer is not specified, the job defaults the offer associated with the source code. If the offer does not match the source code, the job replaces this offer with the offer associated with the source code. *Errors:* The record is in error status if both source code and offer are blank when you submit the records for processing. However, the record is corrected the next time you submit records for processing. The reason this correction occurs is that, the first time you submit the records, the job sets the source code field to the *Default Source Code for Batch Catalog Requests (D37)* The second time you submit the records, the job updates the Offer field to match the assigned source code. Offer codes are defined in and validated against the Offer table. See Working with Offers (WOFR) for more information. Alphanumeric, 3 positions; required.

Field	Description
Entity	The business unit in your company associated with the catalog request. If the *Track Customer History at Entity Level (F89)* system control value is *selected*: When you submit the requests for processing, the system creates a Customer Sold To Entity record for the entity specified for the catalog request, if any. If no entity is specified for the catalog request, the system creates a Customer Entity record for the entity associated with the *Default Source Code for Batch Catalog Requests (D37)* system control value. (An entity is associated with a source code through the division assigned to the source code.). *Errors:* The record is in error status if this field is not set to a valid entity. If the entity is not specified for the record, the system resets the entity to match the source code. Entity codes are defined in and validated against the Entity table. See *Working with Entities (WENT)*. Numeric, 3 positions; required.

Display Catalog Request Screen

To display: Select *Display* for a record at the Work with Catalog Request Interface Screen to advance to the Display Catalog Request screen. You cannot change any information on this screen. See *Change Catalog Request Screen* for field descriptions.

Processing Requests

Purpose: Select *Submit* at the *Work with Catalog Request Interface Screen* to submit requests for processing. The system submits the job *CATALOGREQ*, which:

- Checks each open record in the Catalog Request Interface table for errors. Each record that has an error is flagged with an error status (*E*).
- Checks for duplicates:
  - If the record's Perform duplicate check? flag is *selected*, the job checks the catalog request against existing customer sold to records based on match code. If the catalog request's match code is the same as an existing customer's, the job does not create a new customer; instead, it uses the existing customer. (If more than one customer record has the same match code, the job uses the first matching customer it finds.) See *Setting Up Match Codes (MMCH)*.
  - If the record's Perform duplicate check? flag is *unselected*, or if no customer records match the catalog request, the job creates a new sold to customer. See *Creating a New Customer*.
- Creates the catalog request. The job creates a catalog request only if the record's Create catalog request? flag is *selected*. You can review or process these catalog requests through the Work with Catalog Request menu option; see *Entering Catalog Requests (WCAT)*.
- Creates the *Print Request Interface Report* and the *Print Catalog Request Interface Errors Report*.
- Deletes each processed record from the Catalog Request Interface table.

Catalog Request Interface Errors

The following conditions put a catalog request in an error (*E*) status:

- Type field is blank
- Invalid postal code or SCF, or postal code does not match state
- State is not valid, or does not match country
- Country code is invalid
- Both last name and company name are blank
- No street address
- Entity is invalid
- Delivery code is invalid or blank
- Create catalog request? flag is invalid or blank
- Perform duplicate check? flag is invalid or blank
- Both offer and source code are blank (but this error is corrected when you next submit the records for processing if the *Default Source Code for Batch Catalog Requests (D37)* is assigned to the record)
- Offer is invalid
- Source is invalid

Certain errors, such as a missing source code, country, or entity, are corrected by the batch job during processing based on system control value defaults. See *Change Catalog Request Screen*.

Catalog Request Related System Control Values

System Control Value	Description
Default Country for Customer Address (B17)	If a country code is missing from the catalog request, Order Administration defaults the country code defined in this system control value to the catalog request.
Default Delivery Code for New Order Entry Customers (D13)	If a delivery code is missing from the catalog request, Order Administration defaults the delivery code defined in this system control value to the catalog request.
Default Source Code for Batch Catalog Requests (D37)	If both a source code and offer code have not been defined for the catalog request, Order Administration defaults the source code defined in this system control value to the catalog request. The source code indicates the offer (catalog) to mail to the customer.
Edit for Duplicate Catalog Requests (E46)	Defines whether Order Administration checks for duplicate records when you create a new catalog request. If a duplicate is found, Order Administration does not create a new catalog request and instead uses the existing request, resetting the Printed flag to *No* if necessary.
Duplicate Checking for Customers (F71-F77, H88 and I11)	Defines whether a catalog request received through the e-commerce qualifies as a match to an existing record based on match code, even if the first name is not exactly the same.

System Control Value	Description
Default Opt In/Opt Out Flag (G97)	Defines the value that defaults to the Opt-in/Opt-out field for the catalog request and customer sold to record. The opt-in flag indicates whether e-mail is the preferred method of correspondence for a customer. If the catalog request includes a value in the bill_to_opt_in flag, the system defaults this value to the catalog request and the customer sold to record. If the customer sold to record already has an opt-in value, the system overrides this value with the opt-in value passed in the catalog request. If the catalog request does not contain a value in the sold_to_opt_in flag, the system defaults the value defined in the *Default Opt In/Opt Out Flag (G97)* system control value.
Default Customer Class in Order Entry (D63)	If the *Require Customer Class in OE, WCAT, and WCST (H85)* system control value is *selected*, this customer class is assigned to new customers you create through the catalog request interface.

Creating a New Customer

If the catalog request does not match an existing customer based on match code, or if match code duplicate checking was not selected for the catalog request, the system creates a new sold to customer based on the information in the catalog request. The system uses the following information to create the new customer:

From the catalog request:

- Name and address information
- Delivery code
- Daytime, evening, and third (fax or mobile) phone numbers, and the extensions for the daytime and evening numbers
- Mail code and mail flag: from the allow_mail setting
- Rent flag: from the allow_rent setting
- Opt in/opt out: from the bill_to_opt_in setting

The country and source code may have defaulted from the *Default Country for Customer Address (B17)* and *Default Source Code for Batch Catalog Requests (D37)* settings in the System Control table.

Additional defaults from the System Control table:

- Associate flag: uses the setting from the *Default Associate Code (D09)* system control value
- Mail flag: uses the setting from the *Default Mail Name (D10)* system control value if it was not specified in the catalog request
- Rent flag: uses the setting from the *Default Rent Name (D11)* system control value if it was not specified in the catalog request
- Mail code: uses the setting from the *Default Mail Name (D10)* system control value if the allow_mail setting was not specified in the catalog request

- Opt-in/opt-out flag: uses the setting from the *Default Opt In/Opt Out Flag (G97)* system control value if it was not specified in the catalog request
- Customer class: uses the setting from the *Default Customer Class in Order Entry (D63)* system control value if the *Require Customer Class in OE, WCAT, and WCST (H85)* is *selected*

The Current mail type and Original mail type fields are set to *C* (catalog request).

Oracle Retail Customer Engagement customer integration: When you use the Oracle Retail Customer Engagement customer integration, if you create a customer through the catalog request interface, Order Administration sends the customer's name, address, email address, phone numbers, and contact permissions to Oracle Retail Customer Engagement so that the customer records in the two systems are synchronized. See the *Customer Engagement Customer Integration* for more information.

Purge Catalog Request History (PCRH)

Purpose: Use this option to delete outdated records from the Catalog Request History table. This table provides an historical record of catalog requests within your company, even after you have purged outdated catalog requests. You can include this information in reports, such as the Campaign Performance Report; see *Print Campaign Performance Reports (PCPR)* for more information.

How to display this screen: Enter *PCRH* in the Fast path field at the top of any menu, or select Purge Catalog Request History from a menu.

Completing this screen:

- Complete the Purge date field to indicate the earliest date for which you want to retain Catalog Request History records. Any records for catalog requests created earlier than this date will be purged.
- Select *Accept* to submit the *PRG_CATHST* job, which purges the records.

Managing Soldouts and Backorders

In this part:

- *Working with Soldout Controls (WSLD)* shows you how to create, change, delete, and display soldout controls in the Soldout Control table.
- *Processing Auto Soldout Cancellations (MASO)* presents the screen you use to cancel soldout items from those orders that contain them.
- *Generating Soldout Notifications (MSON)* shows you how to use the Print Soldout Notifications screen to produce soldout notifications that you send to your customers.
- *Purchase Order Layering and Backorder Notifications* shows you how to use the Generate Backorder Cards function to print backorder notification cards and the Backorder Cancellation Register.
- *Working with Held Detail Lines (WOHD)* shows you how to use the Work with Order Hold Detail screen. You use this screen to work with items that were held because they were coordinate grouped with items canceled through Process Auto Soldouts.

- *Working with Backorders Pending Cancellation (WBPC)* shows you how to use this menu option to continue to work with backorders once you have generated a second notice if the FTC--second notice output system control value is set to *FILE* or *FILE/PRINT*.
- *Processing Item Substitutions (PSUB)* shows you how to cancel all open, unreserved order lines for a particular item and add a substitute item to each order.

Working with Soldout Controls (WSLD)

Soldout control codes define which calculation the system uses to determine when to sell out an item. When a customer orders a soldout item in order entry or order maintenance, the order line is automatically closed with a status of *Soldout*. The soldout units and dollars are updated in the Item table, Item/Offer table, Source Code table and order history tables. You can define a soldout control code for an item in the S/O control field on the second item screen in item maintenance, or on the SKU screen if the item has SKUs. If you do not define a soldout control code for an item or SKU, it will never sell out automatically in order entry/ maintenance.

Brokered backorders? If you use Order Orchestration to fulfill backordered items, then unavailable items are otherwise eligible for brokering are submitted to Order Orchestration rather than selling out. See *Brokered Backorders* for a general overview, and see *Brokering Items with Soldout Control Codes* for details.

Pre-orders: Pre-order processing sells out brokered backorders automatically if the pre-order calculation indicates that there will not be a sufficient quantity of the item received on purchase orders for Order Orchestration to fulfill the orders. See *Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing)* for more information.

In this topic:

- *Soldout Calculation*
- *Soldout Calculation for Eligible Warehouses*
- *What Happens when you Sell Out an Item in Order Entry?*
- *Process Auto Soldouts*
- *Disregarding Soldout Controls for Non-Allocatable Warehouses*
- *Projected Returns*
- *Work with Soldout Control Screen*
- *Create Soldout Control Screen*

Soldout Calculation

The Status field for the soldout control code defines the calculation the system uses to determine when to sell out the item if it is not eligible for fulfillment through the *Order Orchestration Integration*; see *Brokered Backorders* for an overview.

Status	Description
Sell Out Immediately	Sell out immediately, regardless of available on-hand stock. You would use this status code if you have open orders for an item that you now determine is sold out. Only items with this status are eligible for cancellation through *Processing Auto Soldout Cancellations (MASO)*.

Status	Description
Include On Order Quantity in Soldout Calculation	Sell out when the available quantity is less than or equal to zero, including the on order quantity and projected returns in the soldout calculation: `(On-order + on-hand + projected returns) - reserved < 0` The system includes projected returns if you specify a quantity in the Projected return field for an item or SKU; see *Projected Returns*. The system includes the on-order quantity for pending putaway detail records that are associated with a pending putaway warehouse whose “final destination” warehouse is allocatable in this calculation; see *Pending Putaway Overview*.
Exclude On Order Quantity in Soldout Calculation	Sell out when the available quantity is less than or equal to zero, excluding the on order quantity and projected returns in the soldout calculation: `On-hand - reserved < 0`

Soldout Calculation for Eligible Warehouses

When the system sells out an item with a soldout control code of *2* or *3*, the system limits the soldout calculation to the eligible warehouses instead of all allocatable warehouses.

- If you define a warehouse override for the order or order line, the system limits the soldout calculation to that warehouse.
- If a warehouse list is associated with the SCF for the order ship to, the system limits the soldout calculation to the warehouses for the selected warehouse list and the item’s primary warehouse.
- If a warehouse override has not been defined, or the SCF for the order ship to is not associated with a warehouse list, the soldout calculation includes all allocatable warehouses.

> **Note:**
>
> When the system sells out an item with a soldout control code of *1*, the soldout calculation includes all allocatable warehouses.

Example 1: Item SO10 exists in the following warehouses.

Warehouse	Open PO Qty	PO#	On Hand	Reserved	Available
206	20	112	10	5	5
207	0	201	20	20	-5

You add item SO10 to an order for 10 units. A warehouse override has been defined for the order for warehouse 207. The soldout code assigned to item SO10 is 2, which means the system uses this calculation to determine when to sell out the item:

```
(On-order + on-hand + projected returns) - reserved < 0
```

Because a warehouse override has been defined, the system only includes warehouse 207 in the soldout calculation:

```
(0 + 20 + 0) - 20 = 0
```

Because the quantity is not greater than 0, the system sells out the item.

If a warehouse override had not been defined, the system would have reserved the item because the soldout calculation would have included warehouses 206 and 207:

```
(20 + 30 + 0) - 25 = 25
```

Example 2: Item SO20 exists in the following warehouses.

Warehouse	Open PO Qty	PO#	On Hand	Reserved	Available
206	20	112	10	5	5
207	0	201	20	20	-5
601	25	356	30	20	10
602	40	475	40	25	15

You add item SO20 to an order for 1 unit. The SCF for the order ship to on the order is associated with a warehouse list containing warehouses 601 and 602. The soldout code assigned to item SO10 is 3, which means the system uses this calculation to determine when to sell out the item:

On-hand - reserved < 0

Because a warehouse list has been defined, the system only includes warehouses 601 and 602 and the item's primary warehouse 206 in the soldout calculation:

80 - 50 = 30

Because the quantity is greater than 0, the system does not sell out the item.

Example 3: Item SO30 exists in the following warehouses.

Warehouse	Open PO Qty	PO#	On Hand	Reserved	Available
206	20	112	10	5	5
207	0	201	20	20	-5
601	25	356	30	20	10
602	40	475	40	25	15

You add item SO30 to an order for 1 unit. A warehouse override is not defined and the SCF for the order ship to is not associated with a warehouse list. The soldout code assigned to item SO30 is 3, which means the system uses this calculation to determine when to sell out the item:

```
On-hand - reserved < 0
```

Because a warehouse override and a warehouse list has not been defined, the system includes all allocatable warehouses in the soldout calculation:

```
100 - 70 = 30
```

Because the quantity is greater than 0, the system does not sell out the item.

What Happens when you Sell Out an Item in Order Entry?

When you enter an item in order entry that is sold out, the system:

- adds the item with a status of *Soldout*
- does not increase the order totals
- does not display an ordered quantity or extended price (although the unit price does appear)

The soldout units and dollars are updated in the Item table, Item/Offer table, Source Code table and Order History tables.

If a partial quantity of the item is sold out on the order line, the appropriate quantities and prices display. For example, if the customer orders 10, 8 units reserve or go on backorder, and 2 units sell out, the totals for the order line reflect 8 units. The order line status will be open.

See *Working with Items on the Order*.

Accompanying items: If an accompanying item is associated with a soldout item, the system also sells out the accompanying item.

Promotional pricing incentives: If a soldout item has promotional pricing incentives associated with it, the incentives will still be offered to the customer during Order Entry.

Set items: See *Reserving Inventory for Set Orders* for a discussion of how the system handles soldout control codes assigned to set items and their components.

Process Auto Soldouts

Use the Process Auto Soldouts menu option to cancel orders for items that have become sold out since the time you entered them.

When you process auto soldouts, you have the option of updating the soldout control code in the SKU table automatically for each backordered item. See *Processing Auto Soldout Cancellations (MASO)*.

> **Note:**
>
> You can define a soldout control code in the *Default Soldout Control Code (D72)* system control value. This code will default when you create items and SKUs, although you can override it.

Disregarding Soldout Controls for Non-Allocatable Warehouses

If the *Disregard Soldout Controls for Non-Allocatable Warehouses (J27)* system control value is *selected*, the system disregards soldout control rules for inventory reserved against a non-allocatable warehouse.

- When you enter an item in order entry, the system reserves the item against the non-allocatable warehouse, regardless of the soldout control code defined for the item. If the item cannot be reserved, the system backorders the item in the non-allocatable warehouse.

- When you process auto soldouts, the system bypasses any order associated with a non-allocatable warehouse. The system considers an order associated with a non-allocatable warehouse if:
- A non-allocatable warehouse is defined for one or more lines on the order, or
- A non-allocatable warehouse is defined as the backorder warehouse for one or more lines on the order, or
- A non-allocatable warehouse is defined on the order header.

You can reserve items against a non-allocatable warehouse if the *Reserve from Non-Allocatable Warehouse (J25)* system control value is *selected*.

Brokered backorders: Even when the item's OROB eligible field is selected, the item reserves against the non-allocatable (retail) warehouse if the order type is associated with that warehouse.

Projected Returns

If you expect to be able to fulfill a certain number of backorders for an item using returns from your customers, you can prevent that number of orders from selling out automatically. For example, if you currently did not have any of item AA100 on hand, but you project at least 10 units will be returned, you can put the next 10 units ordered on backorder instead of having them sell out; then, when you receive the returned units from the customers, you can fulfill these backorders.

How to set the projected return total: Use the Projected returns field to specify the number of units you expect to receive in customer returns toward the fulfillment of backorders. This field appears on the *Create SKU 1 of 2 (With Overrides) Screen*, the *Create SKU 2 of 2 (With Overrides) Screen*, or the *Create Item (Base Information) Screen* for non-SKU'ed items.

When a return is processed, the system automatically subtracts the number of units returned from the number you initially entered in the Projected returns field. The number will never be less than *0*, however. For example, if you initially enter a value of *10* in this field, and 11 units of this item are returned, the Projected returns field will show a value of *0* when the returns are processed. Updating this field does not affect any orders already entered.

> **Note:**
>
> The system checks this field only if the item has a soldout control value of *Include On Order Qty in Sold Out Calculation*. If the item has a soldout control value of *Sell Out Immediately* or *Exclude On Order Qty in Sold Out Calculation*, the system does not retain any units from selling out based on projected returns. The system does not consider this field when determining whether a backordered line is eligible for fulfillment through Order Orchestration; see *Brokered Backorders* for background.

Projected return calculation: If you specify a number of units in the Projected returns field, this number is included in the total number of units that the system will backorder before selling out the item. When an item has a soldout control value of *2*, this total includes:

- on-order quantity (on unreceived purchase orders)
- projected return quantity

For example, item AA100 has

- {on-hand quantity 5}

- on-order quantity = 20
- projected return quantity = 10
- {total quantity to reserve = 5}
- total quantity to backorder =30

If you enter an order for 35 units or fewer, the item will be backordered and not sold out. However, if there were already a backordered quantity of 20, only orders for 15 units or fewer would be backordered and not sold out.

Brokered backorders: The system does not consider the projected returns quantity when determining whether to assign the item to Order Orchestration for fulfillment. See *Brokered Backorders* for an overview, and *Brokering Items with Soldout Control Codes* for details.

Work with Soldout Control Screen

Purpose: Use this screen to create, change, delete, and display these codes.

How to display this screen: Enter *WSLD* in the Fast Path field at the top of a menu or select Work with Soldout Controls from a menu.

Field	Description
Code	Represents the item soldout control. Alphanumeric, 2 positions; optional.
Description	The description of the soldout code. Alphanumeric, 30 positions; optional.
Status	Represents the soldout status. Valid Values: • Sell Out Immediately • Include On Order Qty in Sold Out Calculation • Exclude On Order Qty in Sold Out Calculation Optional.

Screen Option	Procedure
Create a soldout control	Select *Create* to advance to the *Create Soldout Control Screen*.
Change a soldout control	Select *Change* for a soldout control to advance to the Change Soldout Control Screen. At this screen you can change any information except the soldout control code. See Create Soldout Control Screen for field descriptions.

Screen Option	Procedure
Delete a soldout control	Select *Delete* for a soldout control to delete it. Delete soldout control records with caution. The soldout control code is assigned at the item level. When the control applies to a item on an order, the status of the item remains open if you delete the control code before notifying the customer. You may wish to generate a report identifying the orders that might be affected before deleting the code. See *Processing Auto Soldout Cancellations (MASO)*. **Note:** You can delete this code even if it is assigned to an item. The next time you maintain the item you will receive a message indicating that the code assigned to the item is not found.
Display a soldout control	Select *Display* for a soldout control to advance to the Display Soldout Control Screen. You cannot change any information on this screen. See *Create Soldout Control Screen* for field descriptions.

Create Soldout Control Screen

Purpose: Use this screen to create soldout control codes.

How to display this screen: At the *Work with Soldout Control Screen*, select *Create*.

Field	Description
Code	A code that defines the type of soldout handling that applies to an item. You enter this code in the S/O control field on the second item screen in item maintenance, or on the SKU screen if the item has SKUs. If you do not enter a soldout control code for an item or SKU, it will never sell out automatically in Order Entry or Order Maintenance. You can define a soldout control code for: • Items that must be sold out immediately, regardless of available quantity • Items whose available quantity is less than or equal to zero (not including open purchase orders) • Items whose available quantity is less than or equal to zero (including open purchase orders) See the *Sts (Status)* field. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Description	Text that describes the code. Alphanumeric, 30 positions; required.
Sts (Status)	A number that directs the system whether to close a soldout line item during Order Entry or Order Maintenance. Valid values are: • *Sell Out Immediately* = Sell out immediately, regardless of available on-hand stock. You would use this status code if you have open orders for an item that you now determine is sold out. *Only* items with this status are eligible for cancellation through the Auto Soldout Cancellation program. • *Include On Order Qty in Sold Out Calculation* = An item is sold out when this condition is met: `(On-order + on-hand) - reserved < 0` If you specify a quantity in the Projected return field for an item or SKU, this quantity is also included in the calculation above. See *Projected Returns*. The system includes the on-order quantity for pending putaway detail records that are associated with a pending putaway warehouse whose “final destination” warehouse is allocatable in this calculation; see *Pending Putaway Overview*. 1. *Exclude On Order Qty in Sold Out Calculation* = An item is sold out when the following condition is met: `On-hand - reserved < 0` Required.

Processing Auto Soldout Cancellations (MASO)

Purpose: Process auto soldout cancellations when you want to automatically cancel soldout items that were ordered before the item sold out, or to print a list of all such items.

Overview: When you process auto soldout cancellations, the system:

1. Reads every item or SKU that has a soldout control status of 1 (sell out immediately).
2. Checks the setting of the *Auto Soldout Cancel Reason (C20)* system control value.
3. Locates every matching open, fully backordered, unreserved line item on open or held orders. Also, locates every matching open, unreserved line item on quotes.
4. Looks at the setting of the *Disregard Soldout Controls for Non-Allocatable Warehouses (J27)* system control value. If this system control value is *selected*, the system bypasses any order that is associated with a non-allocatable warehouse.
5. Cancels each of the selected items.
6. Automatically recalculates freight and tax.
7. Removes any duty charge from the Handling field that is associated with the soldout item.
8. Optionally, closes any positive or negative additional charges on orders where processing auto soldouts has the effect of closing the order (if you *select* the Open charges if order closes field when you process auto soldouts).
9. Writes a record, displayed at the *Display Order Line History Screen* or *Order Line Activity* window in Modern View, indicating that the item has been sold out.
10. Generates notification records that you can use to generate soldout cards, emails, or XML messages using the Print Soldout Notifications function (See *Generating Soldout Notifications (MSON)*).
11. Generates the *Auto Soldout Register*.

Note:

- Orders that are suspended at the time you process auto soldout cancellations do not sell out. You can sell out the items on these orders at a later time, either by processing auto soldouts again or through Order Maintenance.
- Order lines that are partially reserved are not automatically cancelled by this process.

Stored value card authorization reversal: If a stored value card payment is associated with a cancelled item and has an open, unused authorization amount, the system generates a stored value card authorization reversal; see *Stored Value Card Authorization Reversal*.

Retail pickup or delivery order: If you sell out an order line on a retail pickup or delivery order received from Order Orchestration, the system sends a status update to Order Orchestration indicating the order was *Rejected*. Order Orchestration then attempts to reassign the order to another location for fulfillment. The Order Orchestration record's status in Order Administration changes to *Rejected*. See *Retail Pickup (including Ship-for-Pickup) or Delivery Orders* for an overview.

Pick slip preparation: When you process auto soldout cancellations, the system performs pick slip preparation:

1. The system REMOVES any pick slip preparation from the order.
2. Once the system processes auto soldout cancellations, the system EVALUATES the order to determine if it is eligible for pick slip preparation.
3. If the order is eligible for pick slip preparation after the changes to the order have been made, the system RE-APPLIES pick slip preparation to the order.

See *Preparing Orders for Pick Slip Generation* for processing details.

Reviewing order history: When you review a soldout line in Order Inquiry, you can determine how the item was sold out through the *Display Order Line History Screen* (select *Order History*) as follows:

- If the item was sold out through *Sell Out*, the quantity is negative and the name of the user who sold out the item is listed
- If the line sold out automatically in Order Entry because there was a soldout control code assigned to the item, the line history has a positive quantity, and the name of the user who entered the order is listed
- If the line was sold out through Process Auto Soldouts, the quantity is negative and no user name is listed

> **Note:**
>
> When you sell out an item, the system also writes a message, visible on the *Display Order History Screen*, indicating that the order was maintained.

Holding coordinate grouped items: You have the option of placing any items coordinate grouped with sold out items on hold at the time you process auto soldouts, if you *select* the Hold related coordinate group lines field. In this case, the system also generates the *Order Hold Detail Report*. You can use this report to contact the customers and see if they still want the coordinate grouped items.

Retaining items from sellout: You have the option of retaining a quantity of an item from selling out if you expect to receive some units in the near future that you can use to fulfill these orders. For example, if you expect a certain number of returns on an item, you might choose to keep an appropriate number of order lines open when you process auto soldouts. In this case, the system uses the Sold out retention method system control value to determine whether to retain your oldest or newest orders containing the backordered item. The system also produces the *Auto Sold Out Retained Order Register*. See *Retaining Item Quantities* for an overview of this process and more information.

Unfulfillable through Order Orchestration?If a backordered item is brokered to Order Orchestration's Order Orchestration, but Order Orchestration cannot fulfill the item, the item might sell out automatically.

Example: An item is unavailable in the warehouse, so the system assigns it to Order Orchestration for fulfillment; however, Order Orchestration cannot find a location to fulfill the item, and rejects the item as unfulfillable. In Order Administration, the item is assigned a soldout control value indicating to include the on-order quantity of any open purchase orders before selling out the item, but there are no open purchase orders. As a result, the unfulfillable item sells out automatically after it is rejected by Order Orchestration.

When you use the Process Auto Soldouts option, any unfulfillable items that have sold out automatically after rejection by Order Orchestration are listed on the *Auto Soldout Register*, regardless of whether the items are assigned a soldout control value to sell out immediately.

After you have used the Process Auto Soldouts option, the item is then eligible to have a soldout notification generated through the *Generating Soldout Notifications (MSON)* option, even if you did not select the Update orders option at the *Process Auto Sold Outs Screen*.

The same process applies if Order Orchestration returns an error for a brokered backorder.

See *Brokered Backorders* for background on fulfilling backorders through integration with Order Orchestration's Routing Engine module.

In this topic:

Process Auto Sold Outs Screen

Purpose: Use this screen to cancel all lines for sold out items on quotes and orders. The order must be open or held and the item must be backordered (unreserved).

Notifications: You must generate soldout notifications as a separate step after you run Auto Soldouts. See *Generating Soldout Notifications (MSON)*.

How to display this screen: Enter *MASO* in the Fast path field at the top of any menu or select Process Auto Soldouts from a menu.

Field	Description
Update orders	Controls whether the system cancels order lines for sold out items. Valid values are: • *Selected* = Cancel sold out order lines. • *Unselected* = (default) Do not cancel sold out order lines; run the Auto Soldout Register only.
Hold related coordinate group lines	Controls whether the system places items on hold if they are on the same order with a sold out item and share a coordinate group code. The system does not create pre-generated picks for held items; see *Selecting Order Lines for Pick Slip Preparation*. You assign a coordinate group code to items or SKUs if they are related, such as a blouse and skirt, or a plate, cup and bowl. Your customers can order each item individually, but if coordinate grouped items are on the same order, the system forces these items to ship together. The system lists any held coordinate grouped items on the *Order Hold Detail Report*, produced when you process auto soldouts. You can then work with the held lines either through Order Maintenance or the Work with Order Hold Detail Function; see *Working with Held Detail Lines (WOHD)*. Valid values are: • *Selected* = Place coordinate grouped items on the same orders on hold. Valid only if you *selected* the Update orders field. • *Unselected* = (default) Do not place coordinate grouped items on the same orders on hold.

Field	Description
Delete open charges if order closes	Controls whether the system deletes any additional charges, either positive or negative, if processing auto soldouts closes the order completely. The system does not write order history to indicate if additional charges were deleted in this way and simply removes the charges from the order. Valid values are: • *Selected* = Delete open additional charges. • *Unselected* (default) = Do not delete open additional charges.
Soldout control code to update SKUs	Use this field to specify a soldout control code to assign to each item or SKU with a backorder quantity when you process auto soldouts. Assigning a soldout control code through this field might be useful to you if you use the *Enter Quantity to Retain Screen* to keep orders open for certain items. See *Retaining Item Quantities* for more information on how you might use this field. The soldout control code most recently entered in this field when you processed auto soldouts defaults, but you can override it. Soldout control codes are defined in and validated against the Soldout Control Code table. See *Working with Soldout Controls (WSLD)*. Alphanumeric, 2 positions; optional.

Instructions: Use the following steps to process auto soldouts:

1. Complete each field on this screen and select *OK*.
2. If you want to retain any item quantities, select *Review Items* to advance to the *Enter Quantity to Retain Screen*. You cannot advance to this screen unless the Update orders field is *selected* and you have selected a *Sold Out Retention Method (E63)*. See Retaining Item Quantities.
3. If you are not retaining item quantities, select *Accept*. If you *selected* the Update orders field, the system submits a batch job called *AUTO_SO*, which cancels the items on quotes and orders and generates the *Auto Soldout Register*. Each sold out order line has a status code of *S*. If you also *selected* the Hold related coordinate group lines field, the system also submits a batch job called *ORD_HOLD*, which places items coordinate grouped with the sold out items on hold and generates the *Order Hold Detail Report*. Each held order line has a status code of *H*. If you *selected* both fields, the system generates the *Auto Soldout Register* only.

Note:

If an order has more than one item that needs to be canceled because it is sold out, the system produces one soldout card per item, and writes one message line per item to the Order Line History table. Each message line indicates that the item was canceled because it was sold out.

Screen Option	Procedure
Review items and specify quantities to retain from selling out	select *Review Items*. See *Retaining Item Quantities*.
Process auto soldouts	Select *Accept*.

Retaining Item Quantities

Process overview: When you process auto soldouts, you can prevent certain items or SKUs from selling out completely. For example, you might have sold all of your remaining stock of item AB100 and don't plan to order any more. However, based on this item's history you can expect to receive about 15 units as returns. In this case, you can use the *Enter Quantity to Retain Screen* to keep orders for 15 units of AB100 open when you process auto soldouts.

When you process auto soldouts, you have the option of resetting the soldout control code for each backordered item or SKU to the value you specify at the *Process Auto Sold Outs Screen*. Typically, you would reset the soldout control code to one with a status of *Include On Order Qty in Sold Out Calculation* or *Exclude On Order Qty in Sold Out Calculation*, since only items assigned a soldout control code with a status of *Sell Out Immediately* are eligible to be sold out by Process Auto Soldouts. Resetting the soldout control codes for the items and SKUs prevents them from appearing on the *Enter Quantity to Retain Screen* or being inadvertently sold out while you attempt to fulfill the retained orders.

When you no longer expect to receive any additional units of an item, you may still have retained orders on your system that you are not able to fulfill. In this case, you could change the soldout control code for the item or SKU back to a code with a status of *Sell Out Immediately*. You can then sell out the item completely the next time you process auto soldouts.

Which orders to retain? The sequence in which the system selects orders to retain is controlled by the Sold out retention method system control value. Valid settings for this field are:

- *FIFO*: oldest orders are selected for retention first
- *LIFO*: newest orders are selected for retention first.

The system selects an order line for retention only if it can retain the entire backordered quantity of the item on the line. For example, if you set a retention quantity of 3, and the first order line the system evaluates has a backordered quantity of 5, the system skips this order line and evaluates the next. The order line with the quantity of 5 is sold out.

Another example:

Item AB100 has a quantity to retain of 5 units and the soldout retention method being used is *LIFO*. The orders on the system, from newest to oldest, are:

Order Number	Units
2000	1
1999	5
1998	3
1997	3
1996	1
1995	1

The system evaluates the orders as follows:

1. Order 2000 with 1 unit is evaluated first, and the order is retained.
2. Order 1999 with 5 units is evaluated next, but there are just 4 units available for retention. The order is sold out.

3. Order 1998 with 3 units is evaluated next, and the order is retained.
4. Order 1997 with 3 units is evaluated next, but there is just one unit available for retention. The order is sold out.
5. Order 1996 with 1 unit is evaluated next, and the order is retained.
6. Order 1995 is sold out.

If there are no open order lines that meet the evaluation criteria (that is, the backorder quantity is less than or equal to the retention quantity), no orders are retained.

Enter Quantity to Retain Screen

Purpose: Use this screen to review the quantities of items eligible to be sold out when you submit the Process Auto Soldouts job, and to specify any item quantities you want to retain from selling out. The selected number of order lines remain open so that if, for instance, you expect to receive that quantity of returns, you can fulfill the orders using the returned items.

How to display this screen: Select *Review Items* at the *Process Auto Sold Outs Screen*. You can display this screen only if:

- you have selected a valid retention method in the *Sold Out Retention Method (E63)* system control value, and
- you have *selected* the Update orders field on the *Process Auto Sold Outs Screen*.

> **Note:**
>
> This screen displays each item or SKU assigned a soldout control code with a value of *1*, which may include discontinued items for which you are not taking any more orders. To prevent such an item from appearing on this screen, you can change its soldout control code to one with a value of *2* or *3*.

Field	Description
Item	The unit of inventory currently eligible for selling out. Each item or SKU assigned a soldout control code with a value of *1* appears on this screen. Alphanumeric, 12 positions; optional.
SKU	The item's unique characteristics, such as its color and size. Alphanumeric, three 4-position fields; optional.
Qty to retain (Quantity to retain)	The quantity of the item or SKU to prevent from selling out. You cannot enter a number greater than the backorder quantity. Numeric, 8 positions; optional.
Qty/BO (Quantity on backorder)	The total number of units of the item that is currently backordered. Numeric, 8 positions; display-only.
Status	The status of the item specified in the item or SKU table. The item status appears for SKU'd items if no status code is specified at the SKU level. Alphanumeric, 1 position; display-only.

Instructions: Follow the steps below to complete this screen:

1. Optionally, enter a quantity to retain for any selected items or SKUs. The system does not allow you to retain a quantity of an item that is greater than the backordered quantity.
2. Select *Accept* to process auto soldouts. If you cancel from this screen, the system clears your entries in the retained quantities fields.

When you process auto soldouts from this screen, the system produces the *Auto Sold Out Retained Order Register* in addition to the *Auto Soldout Register* and the *Order Hold Detail Report*.

Generating Soldout Notifications (MSON)

Purpose: Use the Print Soldout Notifications function when you want to notify customers about soldout items being canceled from their orders.

Order type and sellouts in order entry and order maintenance: The order type and the way in which you sell out the item determines whether a customer receives a soldout notification. For example, you might set up phone orders so that the customer does not receive a notification when you sell out an item in order entry, because you can advise the customer during the phone call. However, you might choose to print a soldout notification for orders you receive through the mail or from the web storefront. The *Soldout notifications* field in the Order Type table determines whether to generate a notification for items that are sold out in order entry and order maintenance.

Processing auto soldouts: The *Processing Auto Soldout Cancellations (MASO)* menu option generates a notification for each item it sells out, regardless of order type.

Periodic function: You can use the *PFSDOUT* periodic function (program name: *CSSDOUT*) to generate soldout notifications. See *Scheduling Jobs*.

Email or XML notifications: The system sends an email notice to the customer rather than generating a document for printing if the order is eligible. See *When Does the System Generate an Email Notification?* for an overview. If the order is eligible for an email notification but the XML only? flag on the soldout notification email template is selected, the system generates the *Outbound Email XML Message (CWEmailOut)* instead of sending an email. See the *Credit Card Credit Acknowledgement Email Sample and Contents* and the *Sample Soldout Notification XML Message* for examples.

For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Email template: You can use the *Working with Entities (WENT)* menu option to create an entity-level soldout notification email template, and the *Working with E-Mail Notification Templates (WEMT)* menu option to create a default company-level soldout notification template. The template specifies the text to print above and below the standard soldout notification information. Also, the *Soldout Notification E-Mail Program (G96)* system control value defines the format of the notification email.

Save in email repository? The *Write Outbound Email to Email Repository (H99)* system control value controls whether email notifications are stored in correspondence history. See this system control value for more information on identifying and reviewing outbound emails for a customer.

Unfulfillable through Order Broker? If a backordered item is brokered to Order Broker's Order Broker, but the Order Broker cannot fulfill the item, the item might sell out automatically.

Example: An item is unavailable in the warehouse, so the system assigns it to the Order Broker for fulfillment; however, the Order Broker cannot find a location to fulfill the item, and rejects the item as unfulfillable. In Order Administration, the item is assigned a soldout control value indicating to include the on-order quantity of any open purchase orders before selling out the item, but there are no open purchase orders. As a result, the unfulfillable item sells out automatically after it is rejected by the Order Broker.

When you use the Process Auto Soldouts option, any unfulfillable items that have sold out automatically after rejection by the Order Broker are listed on the *Auto Soldout Register*, regardless of whether the items are assigned a soldout control value to sell out immediately.

After you have used the Process Auto Soldouts option, the item is then eligible to have a soldout notification generated through the *Generating Soldout Notifications (MSON)* option, even if you did not select the Update orders option at the *Process Auto Sold Outs Screen*.

This same process applies if the Order Broker returns an error for a brokered backorder.

See the *Brokered Backorders* for background on fulfilling backorders through integration with Order Orchestration's Routing Engine module.

In this topic:

- *Print Soldout Notification Screen*
- *Soldout Notification Card*

Print Soldout Notification Screen

How to display this screen: Enter *MSON* in the Fast path field at the top of any menu or select the Print Soldout Notifications option from a menu.

Instructions: Follow these steps to print soldout notification cards, or to generate notification emails or the XML message (see *When Does the System Generate an Email Notification?*):

1. Select *OK* to submit the print job; otherwise, select *Exit* to cancel.
2. This submits the batch job *SLDOUT_PRT*. This job generates the *Soldout Notification Card*, soldout notification email (see *Credit Card Credit Acknowledgement Email Sample and Contents*), or the outbound XML message (see *Sample Soldout Notification XML Message*).

For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> In order to generate soldout notifications, you need to specify a program in the *Soldout Notification Print Program (E75)* system control value. If no program is specified, the screen displays an error message:

```
No soldout print program has been defined in SCV E75.
```

Order history message: The system also writes a message such as the following, which is visible on the Display Order History Screen:

```
S/O card generated-line 1
```

If the system sent an email notification or XML message to the customer rather than generating a PDF soldout notification, it also writes a message such as the following:

```
S/O Notice to ejohnson@example.com
```

Generate Backorder Notices (GBOC)

Use the Generate Backorder Notifications function to generate notices (cards, emails, or the *Outbound Email XML Message (CWEmailOut)*) informing customers when backordered items are expected to ship. The function automatically generates an initial (first) backorder notice if you select the *Immediate B/O notice* field at the *Create Order Type Screen*.

For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

If you have defined a *Number of Days to Delay Initial Backorder Notice (D89)* in the System Control table, the system does not generate a notice for a backordered item unless you do not expect to ship the item until after the defined delay period.

> **Note:**
>
> Once an expected delivery date for a backordered item is expired or changed, the system automatically generates a backorder notice, regardless of the value in the *Immediate B/O notice* field.

Typically, you would want to notify customers immediately about backordered items if they place an order through the mail or fax; you can inform customers who order by phone at the time you take their orders if an item they want is currently backordered.

Order Orchestration: If an order line is assigned to Order Orchestration for fulfillment, this option does not generate backorder notices for the order line while the Order Orchestration request is in process; however, if Order Orchestration cannot fulfill the order, the order line returns to standard backorder processing and is eligible for backorder notice generation.

See the *Order Orchestration Integration* for background.

Generate notice if purchase order changes? The *FTC - Suppress Backorder Notice for Due Date Changes (L65)* system control value controls whether to generate a backorder notice if you change the due date for the next expected purchase order to a later date, or cancel the purchase order.

Quotes? The system does not generate backorder notification emails for quotes; see *Entering Pre-Order Quotes* for an overview.

Instructions:

1. Enter *GBOC* in the Fast path field at the top of any menu, or select Generate Backorder Cards from a menu.
2. The system submits the *BO_CARDS* job and displays a confirmation message at the bottom of the screen.
3. The job generates:
   - first, second, and continuing backorder cards (depending on the settings in the System Control table) using the *Backorder Card Print Program (D04)*; see *Backorder Card*

- first, second, and continuing email backorder notifications or the *Outbound Email XML Message (CWEmailOut)* rather than generating document notices for printing for certain customers; see *When Does the System Generate an Email Notification?*
- For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
- the *Backorder Cancellation Register*

4. The job writes a message to the Order History table, such as:

```
1st B/O--line 2, ship date 11/15/06
```

Also, in the case of an email notification, the system writes an Order History message such as:

```
BO 1st Ntf to ejohnson@example.com.
```

This message indicates the user ID of the person who submitted the *BO_CARDS* job.

If using backorders pending cancellation: If the *FTC--Second Notice Output (E68)* system control value is set to *FILE/PRINT* or *FILE*, and the *FTC -- Action after Second Notification (C70)* value is set to *CANCEL*, the job creates records in the Backorder Cancellation Pending table (*BOCANP*) for each second notice. You can use *Working with Backorders Pending Cancellation (WBPC)* to continue to work with these orders. Your options include:

- advancing to order maintenance or standard order inquiry
- accepting a backorder delay
- canceling a group of backorders
- generating backorder notices

You can generate backorder notices through the Work with Backorders Pending Cancellation menu option only if the *FTC--Second Notice Output (E68)* system control value is set to *FILE*. The system submits the job *SEC_NOTICE* when you generate notices through this menu option. In this situation, the system writes two order history messages: one when you write the record to the Backorder Cancellation Pending table, and one when you actually generate the notice. Both messages are identical.

For more information:

- *Purchase Order Layering and Backorder Notifications*
- *Purchase Order Layering*
- *Working with Backorders Pending Cancellation (WBPC)*

Working with Held Detail Lines (WOHD)

Purpose: Use the Work with Order Hold Detail function to review or release coordinate grouped items that were held by *Processing Auto Soldout Cancellations (MASO)*.

The Process Auto Soldouts function cancels all open, unreserved lines for any item with a soldout control code of “sellout immediately” defined in the Item table. If the item is coordinate grouped with other items, you have the option of placing the related items on hold at the time you process auto soldouts. Coordinate groups, identified by a code in the Item table, include items that you can sell separately, but should be shipped together when they appear on the same order. An example would be a matching skirt and blouse, or a cup, plate and bowl set.

You can use the Work with Order Hold Detail function to release held coordinate group items, or to advance to Order Maintenance. In Order Maintenance, you have the option of releasing the items, canceling them, selling them out or maintaining the order in any other way. When you release, cancel, or sell out the held item, you remove it from the Order Hold Detail table.

Note:

1. The system places coordinate grouped items on hold only when related items are soldout through *Processing Auto Soldout Cancellations (MASO)*, *not* when you sell out an item through Order Entry by selecting *Sell Out*, and *not* when an item sells out in Order Entry automatically because of a soldout control code in the Item table.
2. This menu option does not display order lines put in hold status manually, or through a special handling format; see *Putting a Line on Hold through a Special Handling Format*.

In this topic:

- *Work with Order Hold Detail Screen*
- *Releasing Items*

For more information:

- *Processing Auto Soldout Cancellations (MASO)*
- *Changing Item Detail Line Information in Order Maintenance*
- *Working with Existing Items (MITM)* for more information on assigning coordinate groups or soldout controls to items.

Work with Order Hold Detail Screen

Purpose: Use this screen to review held coordinate group items, release the items, or advance to Order Maintenance.

How to display this screen: Enter *WOHD* in the Fast path field at the top of any menu or select Work with Order Hold Detail from a menu.

Field	Description
Batch	The batch number assigned by the system when you processed auto soldouts. The system may reuse a batch number if all the items in the batch have been released or canceled. Numeric, 7 positions; optional.
Order	The number of the order that includes the soldout and held items. Numeric, 8 positions; optional.
Seq	The line number of the item on the order. Numeric, 5 positions; display-only.
CG (Coordinate group)	The coordinate group code assigned to the item in the Item table. Numeric, 3 positions; optional.
Item no.	This code represents a unit of inventory that you sell. Item codes are defined in and validated against the Item table. See *Performing Initial Item Entry (MITM)*. Alphanumeric, 12 positions; optional.

Field	Description
Clr size wdth (SKU codes)	The item's unique characteristics, such as its color and size. The SKU column headings defined in the System Control table display here. Alphanumeric, three 4-position fields; display-only.
Description	The description associated with the Item. Alphanumeric, 25 positions; display-only.
Customer first name (Unlabeled field below the coordinate group code)	The first name of the customer who placed the order. Alphanumeric, 15 positions; display-only.
Customer last name (Unlabeled field below the SKU fields)	The last name of the customer who placed the order. Alphanumeric, 25 positions; display-only.
Phone number (Unlabeled field below the item description)	The daytime phone number of the customer who placed the order. Alphanumeric, 14 positions; display-only.

Screen Option	Procedure
Release an item	Select *Release* for an item to release it. See *Releasing Items*.
Advance to Order Maintenance	Select *Order Maintenance* for an item to advance to Order Maintenance, where you can release the item, cancel it, sell it out, or maintain the order in other ways. When you cancel, release, or sell out the item, you remove it from the Order Hold Detail table. See *Changing Item Detail Line Information in Order Maintenance*.
Batch release	Select *Batch Release*. See *Releasing Items*.
Print a list	Select *Print List* to print the *Order Hold Detail Report*, listing all held coordinate group items.

Releasing Items

Release an item: Select *Release* for an item at the *Work with Order Hold Detail Screen* to release it. The item disappears from the screen, and the status of the order line changes to open. The item is now eligible to print on a pick slip.

Release a batch: Select *Batch Release* at the *Work with Order Hold Detail Screen* to release an entire batch. You might need to release an entire batch at once if you processed an auto soldout inadvertently, or if you determine that the held items in the batch can be shipped alone without notifying customers.

Enter the number of the batch you want to release in this pop-up window. The system releases the batch, and all the held items within the batch disappear from the *Work with Order Hold Detail Screen*.

Pick slip preparation: When you release an item or batch from hold, the system determines whether the order is eligible for pick slip preparation; see *Preparing Orders for Pick Slip Generation*.

Working with Backorders Pending Cancellation (WBPC)

Purpose: Use the Work with Backorders Pending Cancellation menu option to work with orders and order lines that have been flagged for cancellation due to backordered items.

Options: The options available through this function are:

- order maintenance or standard order inquiry
- *Inquiring into Item Availability (DIAV)*
- changing the backorder dates for orders where the customer has accepted the delay
- canceling orders or order lines
- flagging an order to suppress or unsuppress generation of backorder notices
- generating backorder notices
- printing the *Order Cancellation List by Item*. You can also print this report through the *Printing the Order Cancellation List (PBRI)* menu option.

When available? The system creates records in the B/O Cancellation Pending table for order lines flagged for cancellation when you generate backorder notices through *Generate Backorder Notices (GBOC)* if:

- the *FTC--Second Notice Output (E68)* system control value is set to *FILE* or *FILE/PRINT* (If this system control value is set to *PRINT*, the system generates the backorder notices and does not save records in this file); and
- the *FTC -- Action after Second Notification (C70)* system control value is set to *CANCEL*.

> **Important:**
>
> Orders that are flagged for cancellation due to credit card decline but also would be eligible for cancellation due to backordered items are not visible or accessible through *Working with Credit Card Cancellations (WCCC)*.

Drop ship items: Drop ship items are not included in the B/O Cancellation Pending table.

Quotes: Orders flagged as pre-order quotes are not included in the B/O Cancellation Pending table; the system includes quotes once they are converted to an order; see *Entering Pre-Order Quotes* for an overview and required setup.

Cancellation email: The system generates an order or order line cancellation email or *Outbound Email XML Message (CWEmailOut)* to the customer if:

For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

- you have specified an:
  - *Order Line Cancellation Email Program (K79)*, if there is still at least one open line on the order and no order lines have shipped, or
  - *Order Cancellation Email Program (K78)*, if you are canceling the last open line on the order, and

- the cancel reason code you use does not match the *Cancel Reason Code to Suppress Email (L08)*, and
- the customer is eligible to receive email notifications; see *When Does the System Generate an Email Notification?*

See the *Order Cancellation Confirmation Email Sample and Contents* and the *Order Line Cancellation Confirmation Email Sample and Contents* for more information.

Retail pickup and delivery orders: If you cancel a retail pickup or delivery order received from Order Orchestration, the system sends Order Orchestration a status update indicating that the order has been canceled. This status indicates to Order Orchestration that it should not attempt to find another location to fulfill the order. See *Retail Pickup (including Ship-for-Pickup) or Delivery Orders* for an overview.

Pick slip preparation: When you cancel an order, the system removes any pick slip preparation that has been applied to the order. When you cancel order lines, the system removes any pick slip preparation that has been applied to the order and then reevaluates the order for pick slip preparation; see *Preparing Orders for Pick Slip Generation*.

In this topic:

- *Work with Backorders Pending Cancellation Screen*
- *Display Backorder Notice Screen*
- *Suppressing and Unsuppressing Notices*
- *Accepting the Delay*
- *Cancel Backordered Lines Window*
  - *Orders Canceled After Second Notice Report*

For more information: See *Printing the Order Cancellation List (PBRI)*.

Work with Backorders Pending Cancellation Screen

How to display this screen: Enter *WBPC* in the Fast path field at the top of any menu or select Work with Backorders Pending Cancellation from a menu.

Field	Description
Order #	The number of the order flagged for cancellation due to the backordered item. Numeric, 8 positions; optional.
Date	The date you entered the order. Numeric, 6 positions (in user date format); display-only.
SKU	The item's unique characteristics, such as its color and size. Enter a valid SKU code to display orders that match your entry. **Note:** You can scan on SKU code with or without entering an item code. Alphanumeric, three 4-position fields; optional.

Field	Description
Item	The code representing the unit of inventory that is backordered. Alphanumeric, 12 positions; optional.
B/O (Next backorder date)	The next date when the order is eligible for a backorder notice. Numeric, 6 positions (in user date format); display-only.
Cancel (Cancel date)	The date when the order line is eligible for cancellation due to backorder. This date also appears on the order detail line (available by selecting *Display* for the item in standard order inquiry, or *Change* for the item in order maintenance, or by selecting the *Detail* option in streamlined order inquiry). See Cancel Backordered Lines Window. Numeric, 6 positions (in user date format); optional.
Prt (Printed?)	Indicates whether you have already generated a backorder notice (printed, emailed, or in the *Outbound Email XML Message (CWEmailOut)*) for this item. For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Valid values are: • *selected* = A backorder notice was generated. • *unselected* = A backorder notice was not generated. If the *FTC--Second Notice Output (E68)* system control value is set to *FILE/PRINT*, this field will be *selected*. If the system control value is set to *FILE*, this field will be *unselected*. (If the system control value were set to *PRINT*, you would not be able to use the Work with Backorders Pending Cancellation menu option to review orders.)
Sup (Suppress printing?)	Indicates whether to generate a backorder notice when you select *Print Notices*. Valid values are: • *selected* (default) = Suppress generation (do not generate notices). • *unselected* = Do not suppress notice generation. You can switch this flag from suppressed to unsuppressed, or vice versa, by selecting *Suppress/Unsuppress Notice* for the item. You select *Print Notices* to generate each unsuppressed notice. However, the *FTC--Second Notice Output (E68)* system control value must be set to *FILE* in order for you to generate notices this way; if not, a message indicates: `E68 must be set to file.`

Screen Option	Procedure
Display complete backorder notice details	Select *Display* for an item to advance to *Display Backorder Notice Screen*.
Advance to standard order inquiry	Select *Order Inquiry* for an item. See *Order Inquiry*.
Advance to order maintenance	Select *Order Maintenance* for an item. See *Changing Item Detail Line Information in Order Maintenance*.

Screen Option	Procedure
Advance to item inquiry	Select *Item Inquiry* for an item. See *Using Inventory Inquiry (DINI)*.
Change the Suppress notice flag for an item	Select *Suppress/Unsuppress Notice* for an item to unsuppress notice generation if it is currently suppressed, or to suppress notice generation if it is currently unsuppressed. The backorder notice will be eligible for generation when you select *Print Notices*. See *Suppressing and Unsuppressing Notices*.
Remove the cancel date from an item because the customer accepts the delay	Select *Customer Accepts Delay* for an item. See *Accepting the Delay*.
Cancel a group of order lines based on cancellation date or item	Select *Cancel Group* to display the *Cancel Backordered Lines Window*.
Accept the delay for all order lines with the same item	Select *Accept Delay* to display the *Accept Delay for All Customers Pop-Up Window*.
Generate backorder notices and the Backorder Cancellation Register	Select *Print Notices*. This option is available only if the *FTC--Second Notice Output (E68)* system control value is set to *FILE*. See *Purchase Order Layering and Backorder Notifications*, for report and notice samples and more information on generated emails.
Print the Order Cancellation List	Select *Print Report* to print the *Order Cancellation List by Item*.
Unsuppress a group of notices by date range or item	Select *Unsuppress Group* to display the *Unsuppress Notices Window*.

Display Backorder Notice Screen

Purpose: Use this screen to review details about a backorder notice.

How to display this screen: Select *Display* for an item at the *Work with Backorders Pending Cancellation Screen*.

Field	Description
Order number	The number of the order containing the backordered item. The ship-to number is separated from the order number by a hyphen. If there is only one ship-to address, the ship-to number will be *1*. Order number: numeric, 8 positions. Ship-to number: numeric, 3 positions.
Order line	The line on the order where the backordered item appears. Numeric, 3 positions.
Generation date	The date when the backorder notice was generated; or, if the *FTC--Second Notice Output (E68)* system control value is set to *FILE*, the date when the record was written to the file. Numeric, 6 positions (in user date format).

Field	Description
Cancellation date	The date when the order is flagged for cancellation. The system writes this date to the Backorder Cancellation Pending table when you generate backorders. **Note:** This date does not update automatically based on changes to the Cancel date on the order detail line. Numeric, 6 positions (in user date format).
Expected ship date	The Due date from the next purchase order you expect to be able to fulfill the order. The system writes this date to the Backorder Cancellation Pending table at the time you generate backorder cards; it is not updated if you run Batch PO Layering afterward. In this situation, the Expected ship date that appears on the order detail line in standard or streamlined order inquiry may differ from the date that appears here. Numeric, 6 positions (in user date format).
Printed	Indicates whether the backorder notice has been generated (printed, emailed, or sent through the *Outbound Email XML Message (CWEmailOut)*). For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Valid values are: • *selected* = The backorder notice has been generated. • *unselected* = The backorder notice has not been generated.
Print date	The date when the notice was generated. This field is blank if you have not yet generated the notice. Numeric, 6 positions (in user date format).
Suppress notice	Indicates whether the notice is eligible for generation when you select *Print Notices*. In order for notices to be eligible for generation, the *FTC--Second Notice Output (E68)* system control value must be set to *FILE*. Valid values are: • *selected* = Generation is suppressed; the notice is not eligible for generation. • *unselected* = Generation is not suppressed; the notice is eligible for generation.

Suppressing and Unsuppressing Notices

Purpose: The system creates each backorder pending cancellation record with the Sup (Suppress?) flag *selected*, so that generating backorder notices is suppressed. If the *FTC--Second Notice Output (E68)* system control value is set to *FILE*, you have the option of unsuppressing notice generation for these records, either individually or by group, and generating these notices.

Why are notices suppressed? The notices are created in a suppressed status so that you can avoid generating notices unnecessarily. For instance, you might generate backorder cancellation records in advance of their backorder dates so that you can review and work with backorder notices before generation (based on the *FTC--Number of Days Prior to Next Backorder Date to Generate Second Notice (E67)* system control value).

If you determine that you will actually be able to fulfill orders in a reasonable time, you can use the accept delay option for an individual order or for a group of orders. Accepting the delay allows you to reserve and fulfill the order. See *Accepting the Delay*.

Unsuppress a notice individually: To unsuppress an individual notice for generation, select *Suppress/Unsuppress Notice* for the item at the *Work with Backorders Pending Cancellation Screen*. The Sup flag changes from *Y* to *N*.

You can also unsuppress notices by group through the *Unsuppress Notices Window*.

Suppress a notice: Similarly, you can suppress a notice that has been unsuppressed by select *Suppress/Unsuppress Notice* for the item at the *Work with Backorders Pending Cancellation Screen*. The Sup flag changes from *N* to *Y*.

You cannot suppress notices by group.

Unsuppress Notices Window

Select *Unsuppress Group* at the *Work with Backorders Pending Cancellation Screen* to unsuppress a group of notices for generation.

Field	Description
Generation date range	The beginning and ending dates to include when unsuppressing backorder notifications for generation. Each backorder pending cancellation record created on or between these dates is unsuppressed. Two fields, numeric, 6 positions (in user date format); optional.
Item	The code representing the item whose backorder notifications you want to unsuppress for generation. If the item has SKUs, all SKUs are unsuppressed. Alphanumeric, 12 positions; optional.

Completing this screen: Select *Accept* to submit the unsuppress. A message indicates that the notices have been unsuppressed based on date range or item (if you selected both, the messages specifies unsuppressing by item). Optionally, select *Exit* to cancel.

The Sup flag for each selected backorder record changes to *N*.

If you completed both the generation date range fields and the Item field, only backorder records that meet *both* criteria are unsuppressed. In other words, if you select a range of dates between July 1 and August 1, and the item AB100, only backorder records for AB100 between those dates is unsuppressed; a backorder record for AB100 generated on August 2 remains suppressed.

Accepting the Delay

Purpose: You can remove an order line from a cancellation pending status through the *Work with Backorders Pending Cancellation Screen*. You might want to do so if a customer has communicated a willingness to accept the delay for the item, or if you determine that you will receive the item and be able to fulfill orders within a reasonable amount of time. You can accept delay for an individual order or for all order containing a specific item.

What happens when you accept the delay? The system:

- deletes the backorder record from the Backorder Cancellation Pending table (and the line disappears from the *Work with Backorders Pending Cancellation Screen*);
- deletes the cancellation date from the order detail line (visible by selecting *Display* for the item in standard order inquiry, *Detail* for the item in streamlined order inquiry, or *Change* for the item in order maintenance)
- writes an order transaction history message indicating that the customer has accepted the delay for the item (visible by selecting *Messages* in standard or streamlined order inquiry)
- adds the amount of days specified in the *Number of Days to Add for Accepted Delays (E69)* system control value to the next backorder date visible by selecting *Display* for the item in standard order inquiry, *Detail* for the item in streamlined order inquiry, or *Change* for the item in order maintenance). The order line will be eligible for pending backorder cancellation again if you are not able to fulfill the order by that date.

The order line is then eligible for reservation and fulfillment when you receive a purchase order containing the item.

Accepting the delay for a single order: Select *Customer Accepts Delay* for an item at the *Work with Backorders Pending Cancellation Screen* to accept the delay for the item on that order only. Select *OK* at the confirmation window to confirm the acceptance. If you accept, the system performs the updates described above for the order.

Accept Delay for All Customers Pop-Up Window

Select *Accept Delay* at the *Work with Backorders Pending Cancellation Screen* to accept the delay for all orders containing a specific item and SKU.

Instructions:

- Enter the item code for which you are accepting the delay and any SKU codes.
- Select *Accept* to accept the delay, or select *Exit* to cancel. If you accept, a message indicates:

Accept delay for all customers processed.

If you select *Accept*, the system performs the updates described under *Accepting the Delay* for each backorder pending cancellation for this item and SKU.

Cancel Backordered Lines Window

Purpose: Use this window to cancel order lines if you do not expect to receive the items in time to fulfill the orders. Using this option may be more efficient than canceling the order lines individually through order maintenance.

To cancel: Select *Cancel Group* at the *Work with Backorders Pending Cancellation Screen*.

> **Note:**
>
> You cannot cancel an item that is reserved through this pop-up window; you need to use order maintenance.

Field	Description
Select orders... (Number of days past cancellation date)	Indicates how many days it must be past the order line's cancellation date for the order line to be included in the cancellation request. This field defaults to *0* (any order whose cancellation date is earlier than or the same as the current date will be canceled). Numeric, 3 positions; required.
Item	Indicates the item to select for cancellation. If the item has SKUs, you must also enter SKU information. Item: alphanumeric, 12 positions; required. SKU: three 4-position fields; required if the item has SKUs.
Cancel reason	The cancel reason to use when canceling the orders containing this backordered item. Cancel reason codes are defined in and validated against the Cancel Reason Code table. If the cancel reason you enter is set to reduce demand, the order status will be *X* (closed) when the order is canceled; otherwise, the order status will be *C* (canceled). See *Establishing Cancel Reason Codes (WCNR)*. Numeric, 2 positions; required.
Recalculate freight?	Indicates whether to reduce the freight charge on the orders to reflect the item cancellation. Valid values are: • *Selected* (default) = Recalculate freight. • *Unselected* = Do not recalculate freight. The *Recalculate Freight Default (F62)* system control value controls the default setting of this field, but you can override this default.

Completing this window: Complete each field and select *Accept Cancel Request* to process the cancel request; otherwise, select *Exit* to cancel. A message displays informing you that the cancellation was processed. You can enter information for an additional cancel request, or select *Exit* to return to the *Work with Backorders Pending Cancellation Screen*.

The system cancels each order line (or the entire order, if the backordered item was the last open line on the order) using the cancel reason selected, and produces the *Orders Canceled After Second Notice Report*.

In addition, if a stored value card payment with an open, unused authorization amount exists on the order, the system generates a stored value card authorization reversal; see *Stored Value Card Authorization Reversal*.

Pick slip preparation: When you cancel an order, the system removes any pick slip preparation that has been applied to the order. When you cancel order lines, the system removes any pick slip preparation that has been applied to the order and then reevaluates the order for pick slip preparation; see *Preparing Orders for Pick Slip Generation*.

Printing the Order Cancellation List (PBRI)

Purpose: Use the *Order Cancellation List by Item* to review the order lines flagged for cancellation due to backorder.

You can select one of the fields on this screen, or leave these fields blank to include all orders pending cancellation for backorder on the report.

Select Items for B/O Cancellation Report Screen

How to display this screen: Select *Print Report* at the *Work with Backorders Pending Cancellation Screen*, enter *PBRI* in the Fast path field at the top of any menu, or select Print Backorder Cancellation Report from a menu.

Field	Description
Select vendor	The vendor whose purchase order was open when the item(s) first became backordered. Vendor codes are defined in and validated against the Vendor table; see *Working with Vendors (WVEN)*. Numeric, 7 positions; optional.
Select buyer	The buyer associated with the purchase order(s) that were open when the item(s) first became backordered. Buyer codes are defined in and validated against the Buyer table; see *Working with Buyers (WBUY)*. Alphanumeric, 3 positions; optional.
Select item	The item that is backordered. You need to enter only the base item code for SKUed items. Item codes are defined in and validated against the Item table; see *Performing Initial Item Entry (MITM)*. Alphanumeric, 12 positions; optional.

Completing this screen: After completing any desired fields, select *Accept* to generate the report. The job *BO_CN_LIST* produces the *Order Cancellation List by Item*.

Processing Item Substitutions (PSUB)

Purpose: Use the Process Substitute Items menu option to cancel any order lines for a given item and add a substitute item to each order.

Overview: When you use this menu option, you specify the item to cancel, the item to add, and the cancel reason to use for the substitution. Only open, unreserved order lines are eligible for item substitution. Items that reserve automatically, such as membership items, are not eligible. Also, order lines that have been submitted to Order Orchestration for fulfillment are not eligible; see *Order Orchestration Integration* for more information.

Optionally, you can also:

- select only orders with certain shippers
- set a maximum number of units to substitute
- use a different price for the substitute item or add it at no charge
- recalculate freight
- add pick slip messages for the orders

This menu option generates a batch job which processes the item substitution and produces a report listing each affected order.

Quotes: Order lines that are on quotes are not eligible for item substitution; see *Entering Pre-Order Quotes* for an overview and required setup.

Retail pickup or delivery orders: Order lines are not eligible for item substitution if they are on retail pickup or delivery orders from Order Orchestration. See the *Order Orchestration Integration* for more information.

Cancellation email: The system generates an order or order line cancellation email or *Outbound Email XML Message (CWEmailOut)* to the customer if:

- you have specified an *Order Line Cancellation Email Program (K79)*, and
- the cancel reason code you use does not match the *Cancel Reason Code to Suppress Email (L08)*, and
- the customer is eligible to receive email notifications; see *When Does the System Generate an Email Notification?*

For more information, see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

See the *Order Cancellation Confirmation Email Sample and Contents* and *Order Line Cancellation Confirmation Email Sample and Contents* for more information.

In this topic:

- *Process Substitute Items Screen*
- *Order Updates*
- *Substitute Item Processing List*

Process Substitute Items Screen

How to display this screen: Enter *PSUB* in the Fast path field at the top of any menu or select Process Substitute Items from a menu.

Field	Description
Item/SKU (Item/SKU to be canceled)	Enter the item and SKU that should be canceled by the batch job. Only open or held, unreserved order lines are eligible for cancellation; if the line is partially reserved and partially backordered, or if it is sold out, the batch job will not cancel it. If the item you select for cancellation has a ship via override, the system will not add the substitute item with the same ship via override, unless the override ship via is specified in the Item table. If you do not enter a valid item code and SKU (if the item has SKUs), the screen displays an error message. See *Performing Initial Item Entry (MITM)* for more information on creating and working with items. **Note:** Substituting a set item will not cancel its component items. Item: 12 positions, alphanumeric; required. SKU: three 4-position fields; required if the item has SKUs.

Field	Description
Cancel reason code	Enter the cancel reason code to use when canceling the item. Cancel reason codes control whether you update demand for cancellations. If the cancel reason code reduces demand, the canceled order line will have a status of *X* (closed); otherwise, the line will have a status of *C* (canceled). Cancel reason codes are defined in and validated against the Cancel Reason Code table. See *Establishing Cancel Reason Codes (WCNR)*. Numeric, 2 positions; required.
Substitute item/SKU	Enter the item and SKU that should be added to the order as a substitute for the canceled item. The system does not validate that the substitute item you enter is available in sufficient quantity to fulfill the orders updated by the batch job. You can substitute a non-SKU'ed item with a SKU'ed item, or a SKU'ed item with a non-SKU'ed item, if necessary. If you do not enter a valid item code and SKU (if the item has SKUs), the screen displays an error message. See *Performing Initial Item Entry (MITM)* for more information on creating and working with items. If the substitute item is restricted from shipment to a country or state, the substitution will not be performed on orders with ship to addresses in the restricted area(s). See *Entering Additional Item Information* for more information on item country/state restrictions. **Note:** If you enter a substitute item that has restricted SKUs (the Restrict field at the *Create SKU 1 of 2 (With Overrides) Screen* is *selected*), the system displays an error message: `Cannot take orders for this item/SKU (xxxxxx xxxx).` Item: 12 positions, alphanumeric; required. SKU: hree 4-position fields; required if the item has SKUs.
Used canceled item's price	Indicates whether to apply the unit price of the canceled item to the substitute item. Valid values are: 1. *Selected* (default) = Use the canceled item's price for the substitute item. (Note: If the canceled item's price was zero, the substitute item will be added at no charge also.) 2. *Unselected* = Use a different price. If you *deselect* this field, you will need to *select* the Add item at no charge field or enter a price in the Substitute item price field.

Field	Description
Add item at no charge	Indicates whether to add the substitute item to the order at no charge. Valid values are: 1. *Selected* = Add the substitute item to the order at no charge. The Use canceled item's price field cannot be *selected* if this field is also *selected*. 2. *Unselected* (default) = Do not add the substitute item at no charge. You must either *select* the Use canceled item's price field, or complete the Substitute item price field.
Substitute item price	The unit price to use for the substitute item, if you are not simply using the canceled item's price or offering the substitute item at no charge. You cannot enter a substitute item price unless both the Use canceled item's price field and the Add item at no charge field are *unselected*; in this situation, the substitute item price is required. If the order total changes, the order will be subject to a credit check and may go on hold if, for instance, the customer paid by check and there is now a balance due for the new total. Numeric, 13 positions with a 2-place decimal; required if not using the canceled item price or no charge.
Price override (Price override reason code)	Enter the price override reason code to use when adding the substitute item to the order. Price override reason codes are defined in and validated against the Price Override Reason table; see *Establishing Price Override Reason Codes (WPOR)*. Alphanumeric, 1 position; required.
Recalculate freight	Indicates whether to recalculate freight on the order based on the item substitution. Valid values are: • *Selected* = Recalculate freight based on the new merchandise total after making the item substitution. • *Unselected* (default) = Do not recalculate freight. The *Recalculate Freight Default (F62)* system control value controls the default setting of this field, but you can override this default. **Tax:** The system recalculates tax regardless of the setting of this field.
Maximum number of substitute items to process	Enter the total number of units of the original item to cancel and replace with the substitute item. The system will cancel each complete order line for the item in chronological order by order date until it reaches this maximum. If the system cannot cancel a complete order line quantity on an order without exceeding the maximum you enter here, it skips that order line and selects the next available order line that will not exceed the maximum. For example, if there are two units remaining to cancel before exceeding the maximum, and the next order line is for five units, the system skips this order line and cancels the next order line for the item for a quantity of two or fewer. If each open order line for the original item exceeds the maximum number you specify here, the system does not cancel any of the order lines. Numeric, 5 positions; optional.

Field	Description
Pick message line 1 and 2	Up to two lines of messages to appear on pick slips for shipment of the substitute item. These messages are added to the order line messages for each updated order. You can review order line messages by selecting *Messages* for an item in order inquiry; see *Work with Order Line Messages Screen*. Alphanumeric, 40 positions each; optional.

Completing this screen: If you select *Accept* to submit the item substitution batch job, the system submits the job *MASS_SUB*. This job cancels each order line with the original item and adds the substitute item using the settings you entered on this screen. This job also produces the *Substitute Item Processing List*.

Order Updates

In addition to canceling the original item and adding the substitute item, the batch job updates each affected order as follows:

Order history: An order history message displays on the *Display Order History Screen*:

LINE 003 SUBSTITUTED FOR LINE 002

The user ID of the person who ran the item substitution batch job displays next to the message.

If the order goes on hold as a result of the new item price, order history messages will be available for review:

```
3/05/06 H SYS HLD---BALANCE DUE HOLD - SYSTEM HOLD HTRUMAN
```

```
3/05/06 W User price override - Order line 11 100.00 HTRUMAN
```

```
3/05/06 M Order was maintained 341.00 HTRUMAN
```

Order line history: The *ADD* and *CANCEL* transactions for each affected line display on the *Display Order Line History Screen*. The user ID of the person who ran the item substitution batch job displays next to the transaction.

Order line messages: Any pick slips messages you entered at the Process Substitute Items screen display on the Work with Order Line Messages screen. You can display this screen by selecting *Messages* for an item in order inquiry; see *Work with Order Line Messages Screen*.

Pick slip preparation: The system removes any pick slip preparation from the order and once the item substitution updates are complete, reevaluates the order for pick slip preparation; see *Preparing Orders for Pick Slip Generation*.

Stored value card authorization reversal: If a stored value card payment with an open, unused authorization amount exists on the order, the system may generate a stored value card authorization reversal; see *Stored Value Card Authorization Reversal*.

Processing and Purging Subscriptions

In this part:

- *Generating the Subscription Extract Table (WGSE)* describes the process of identifying the issue number of the subscriptions you want to send and creating a file of customers who should receive this issue.

- *Purging Subscriptions (MPCS)* describes how to purge closed (expired) or canceled subscriptions from the Customer Subscription table.

Generating the Subscription Extract Table (WGSE)

Purpose: The Generate Subscription Extract file function creates a table of customers who should be sent an issue of a subscription.

A record is created in the Customer Subscription table when you generate pick slips for a customer order containing a subscription item. See *Displaying More Options in OIOM* for more information on working with customer subscriptions.

Before you can sell subscriptions, you must first define a subscription item in the Item table and in the Item Subscription table. See *Working with Item Subscriptions (WISB)* for more information on working with subscription items.

When you generate the *Subscription Extract Table (CSSBEX)*, you have the option of selecting all open subscriptions, or you can select specific subscription items by issue number.

In this topic:

- *First Generate Subscription Extract File Screen*
- *Generate All Open Subscriptions*
- *Second Generate Subscription Extract File Screen (Selecting Issue Numbers)*
- *Subscription Extract Table (CSSBEX)*

First Generate Subscription Extract File Screen

Purpose: At this screen you have the option of writing all open Customer Subscription records to the Subscription Extract table, or selecting subscription items by issue number.

How to display this screen: Enter *WGSE* in the Fast path field at the top of any menu or select Generate Subscription Extract File from a menu.

Screen Option	Procedure
Select issue numbers for subscription generation	Select *By Item* for the Selected subscription items or all open? field to advance to the *Second Generate Subscription Extract File Screen (Selecting Issue Numbers)*
Generate all open subscriptions	Select *All open* for the Selected subscription items or all open? field. See *Generate All Open Subscriptions*.
Accept your entries and generate all open subscriptions	Select *Submit*. See *Generate All Open Subscriptions*.

Generate All Open Subscriptions

Follow these steps to select all open Customer Subscription records. To select specific issues of subscription items, see *Second Generate Subscription Extract File Screen (Selecting Issue Numbers)*.

1. Select *All open* for the Selected subscription items or all open? field at the *First Generate Subscription Extract File Screen*.
2. Select *Submit*. If records currently exist in the *Subscription Extract Table (CSSBEX)*, this window prompts you to confirm the reset.
3. *deselect* if you would like to clear all previous records from the *Subscription Extract Table (CSSBEX)*. *Select* if you would like to append new records to the end of the Subscription Extract table without clearing the table.
4. Select *OK* to continue with the extract. The system submits the job *SUBSCR_EXT* by selecting all open records from the Customer Subscription table (status = *O*). It then writes these records to the Subscription Extract table.

> **Note:**
>
> If you use *All Open* to select all open subscriptions, the system will change the status of the record in the Customer Subscription table to *X* (Closed) and will not record the first or last issue numbers or dates as they display at the *Work with Subscriptions Screen*. You might choose this option if you are turning over the Subscription Extract table to another service provider rather maintaining the subscription using Order Administration. If would like the record status to remain open and want to track first and last issue numbers and dates, you must use *By Item* to select subscriptions by issue number; see *Second Generate Subscription Extract File Screen (Selecting Issue Numbers)*.

Second Generate Subscription Extract File Screen (Selecting Issue Numbers)

Purpose: Use this screen to select issue numbers of subscription items to include in the Subscription Extract table.

How to display this screen: Select *By Item* for the Select subscription items or all open? field at the *First Generate Subscription Extract File Screen*.

Once you have selected a Customer Subscription record using *All Open* for all open items, the system changes the status of the record to *X* (Closed). This means that the record will no longer be selected when you generate the Subscription Extract table.

Field	Description
Iss (Issue)	The issue of the subscription you want to include in the Subscription Extract table. Numeric, 3 positions.
Item	The item code of the subscription item. Items are defined in and validated against the Item table. Subscription items have a *selected* Subscription and Non/inv (non-inventory) fields in the Item and Item/SKU tables. See *Performing Initial Item Entry (MITM)*. Alphanumeric, 12 positions; display-only.
SKU	The unique characteristics associated with the item, such as its color, size, width, etc. SKUs are defined in and validated against the Item/SKU table. Alphanumeric, three 4-position fields; display-only.

Field	Description
Description	The description of the subscription item, as defined in the Item records. **Note:** Extracting a subscription with a description longer than 40 positions is not currently implemented. Alphanumeric, 120 positions; display-only.
Sel (Selected?)	This field identifies whether you requested an issue of the subscription item. An asterisk (*) appears in the Sel column to the right of the selected subscription items. Alphanumeric, 1 position; display-only.

Instructions:

1. Enter the issue number next to a subscription item you want to select for the Subscription Extract table. An asterisk (*) appears in the Sel column to the right of the subscription item, and the subscription item moves to the top of the screen.
2. Repeat the above step for each subscription item you want to select by issue number. Selected subscription items appear in alphanumeric order at the top of the screen.
3. To reset your selections, select *Reject*. A pop-up window prompts you to confirm the reset.

Select *OK* to remove the issue number from each subscription item.

1. When you have entered all the issue numbers you would like to select, select *Accept*. If records currently exist in the *Subscription Extract Table (CSSBEX)*, a pop-up window prompts you confirm the reset.
2. *Deselect* if you would like to clear all previous records from the Subscription Extract table. *Select* if you would like to append new records to the end of the Subscription Extract table without clearing the table.
3. Select *OK* to continue with the extract. The system submits the job *SUBSCR_EXT* by selecting all records in the Customer Subscription table that match your selections. It then writes these records to the *Subscription Extract Table (CSSBEX)*.

Subscription Extract Table (CSSBEX)

For more information on individual fields, see *Creating and Updating Sold-to Customers (WCST)* and *Working with Item Subscriptions (WISB)*.

Field	Attributes	Comments
Company code	3 positions, numeric	
Order date	7 positions, numeric	
Sequence number	7 positions, numeric	

Field	Attributes	Comments
Customer sold to number	9 positions, numeric	
Sold to prefix	3 positions, alphanumeric	
Sold to first name	15 positions, alphanumeric	
Sold to initial	1 position, alphanumeric	
Sold to last name	25 positions, alphanumeric	
Sold to company name	30 positions, alphanumeric	
Sold to street address	32 positions, alphanumeric	
Sold to apartment number	10 positions, alphanumeric	
Sold to address line 2	32 positions, alphanumeric	
Sold to address line 3	32 positions, alphanumeric	
Sold to address line 4	32 positions, alphanumeric	
Sold to city	25 positions, alphanumeric	
Sold to state	2 positions, alphanumeric	
Sold to zip code	10 positions, alphanumeric	
Sold to PO Box	1 position, alphanumeric	*Y* or *N*
Sold to delivery code	1 position, alphanumeric	*B* (business), *R* (residential), or *N* (no distinction)
Sold to suffix	3 positions, alphanumeric	
Recipient customer number	9 positions, numeric	The recipient on an order can be a sold to address, customer ship to address, or order ship to address.
Recipient prefix	3 positions, alphanumeric	
Recipient first name	15 positions, alphanumeric	
Recipient initial	1 position, alphanumeric	
Recipient last name	25 positions, alphanumeric	
Recipient company name	30 positions, alphanumeric	
Recipient street address	32 positions, alphanumeric	
Recipient apartment number	10 positions, alphanumeric	
Recipient address line 2	32 positions, alphanumeric	
Recipient address line 3	32 positions, alphanumeric	
Recipient city	25 positions, alphanumeric	
Recipient state	2 positions, alphanumeric	
Recipient zip code	10 positions, alphanumeric	
Subscription start date	7 positions, numeric	Default start date is the order date
Date sent to service	7 positions, numeric	Set to zero
Source code	6 positions, alphanumeric	
Quantity	5 positions, numeric	The quantity is always *1*

Field	Attributes	Comments
Price	13 positions with a 2-place decimal; numeric	
Item code	12 positions, alphanumeric	
Item description	120 positions, alphanumeric	Extracting a subscription with a description longer than 40 positions is not currently implemented.
SKU	14 positions, alphanumeric	
Subscription status	1 position, alphanumeric	
Number of intervals	3 positions, numeric	
Rent name?	1 position, alphanumeric	*Y* or *N*
Mail name?	1 position, alphanumeric	*Y* or *N*
Issue number	3 positions, numeric	
Expiring issue number	3 position, numeric	
Option taken at Subscription Extract screen	5 positions, numeric	Valid values: *1* or *2*

Purging Subscriptions (MPCS)

Purpose: The Purge Customer Subscriptions is a “housekeeping” routine that you can use to delete any expired or canceled subscription records from the Customer Subscription table. This is necessary because these records remain on file until they are purged.

Purge Customer Subscriptions Screen

How to display this screen: Enter *MPCS* in the Fast path field at the top of any menu or select this option from a menu.

Instructions:

1. Enter the date through which you want to cancel subscriptions.
2. *Select* the Confirm prompt (that appears in the lower right of your screen). The system submits the *PURGE_SUBS* job and generates the *Purge Customer Subscription List*.

Memberships

In this part:

- *Membership Overview* provides a high-level overview of creating membership programs, assigning them to customers, and generating membership orders.
- *Working with Membership Types (WWMT)* describes the menu option you use to set up membership types for tracking, sorting, and revision control.
- *Working with Membership Programs (WWMP)* describes the menu option you use to set up membership programs in which you can enroll customers.

- *Working with Customer Memberships (WWCM)* describes the menu option you use to work with customer memberships, including creating, changing, working with included items, and changing status.
- *Generating Membership Orders (EGMO)* describes the menu options you use to create orders for customer memberships.
- *Printing the Expected Membership Orders Report (PEMO)* describes the menu option you use to generate this report and provides a sample.
- *Update Customer Memberships (MMCM)* describes how to update the source code and replace an item on existing customer memberships and, optionally, membership programs.

Working with Membership Types (WWMT)

Purpose: Use the Work with Membership Type menu option to define membership type codes. You can use these codes to group and identify membership programs for informational or reporting purposes, or as selection criteria when you are generating membership orders. See *Membership Overview*.

Loyalty memberships? The membership type also controls whether a membership program is a standard membership that you sell or create, or a loyalty membership, in which the system automatically evaluates whether each customer placing an order qualifies for the loyalty program based on order history.

You use different screens in *Working with Membership Programs (WWMP)* and *Working with Customer Memberships (WWCM)* for loyalty membership programs vs. standard programs.

Allow changes? For standard membership programs, the membership type also controls whether you can change any of the default settings from the membership program for individual customer memberships.

Which information cannot be changed? The information controlled by this setting includes the items included on generated orders, any discount, and the criteria the system uses to determine shipment intervals. If the membership program is assigned to a type that does not permit changes, this information is display-only for customer memberships you create and cannot be changed.

> **Note:**
>
> If a membership program is flagged to not allow changes, then it is important to specify a ship via code at the *Membership Program Screen* to default to customer memberships; otherwise, you will not be able to create customer memberships in *Working with Customer Memberships (WWCM)*, because there will be no ship via code, and the ship via code is a required field.

Which information can be changed? You will be able to change only:

- the customer membership's status
- the next release date for orders
- the alternate shipping address or recipient customer
- pay type information

> **Note:**
>
> Even if a membership program is flagged not to allow changes, you can still process updates through the *Update Customer Memberships (MMCM)* option.

In this topic:

- *Work with Membership Type Screen*
- *Membership Type Screen*

Work with Membership Type Screen

How to display this screen: Enter *WWMT* in the Fast path field at the top of any menu or select Work with Membership Type from a menu.

Field	Description
Type	A code representing a type of membership program. Alphanumeric, 2 positions; optional.
Description	The description of the membership type. Alphanumeric, 30 positions; optional.
Loyalty	Valid values: • *selected* = indicates a loyalty membership program type, which the system assigns automatically to customers based on the customer's order history. • *unselected* = you can sell membership programs of this type in order entry or create them through *Working with Customer Memberships (WWCM)*. Standard memberships can be used to generate membership orders, or they can be discount-only memberships. See *Loyalty Memberships* for an overview.

Screen Option	Procedure
Create a new membership type	Select *Create* to advance to the *Membership Type Screen* in Create mode.
Change a membership type	Select *Change* for a membership type to advance to the Membership Type screen in Change mode. At this screen, you can change the description or the Change customer membership flag, but not the type code itself. See *Membership Type Screen* for field descriptions.
Delete a membership type	Select *Delete* for a membership type to delete it. You cannot delete a membership type if it is assigned to any membership programs.

Screen Option	Procedure
Display a membership type	Select *Display* for a membership type to advance to the Membership Type screen in Display mode. You cannot change any information on this screen. See Membership Type Screen for field descriptions.

Membership Type Screen

Purpose: Use this screen in Create mode to create a new membership type.

How to display this screen: Select *Create* at the *Work with Membership Type Screen*.

Field	Description
Membership type	A code to identify a type of membership program. You can use these codes to group and identify membership programs for informational or reporting purposes, or as selection criteria when you are generating membership orders. Also, you use the membership type to distinguish standard membership programs from loyalty programs. Alphanumeric, 2 positions. Create mode: required. Change mode: display-only.
Description	The description of the membership program. Alphanumeric, 30 positions; required.
Change customer membership	Indicates whether the settings that default from a membership program of this type to each customer membership you create can be changed on an individual customer membership. Valid values are: • *Selected* = You can change the settings on a customer membership • *Unselected* = You cannot change the settings on a customer membership See *Working with Membership Types (WWMT)* for a discussion of the type of information you can or cannot change for a customer membership, depending on the setting of this field. • This setting applies only to standard membership programs, not to loyalty membership programs. • If a membership program is flagged to not allow changes, then it is important to specify a ship via code at the *Membership Program Screen* to default to customer memberships; otherwise, you will not be able to create customer memberships in *Working with Customer Memberships (WWCM)*, because there will be no ship via code, and the ship via code is a required field.

Field	Description
Loyalty	Indicates whether membership programs of this type are standard membership programs or loyalty memberships. Valid values are: • *Selected* = Membership programs of this type are loyalty memberships: the system automatically evaluates whether each customer who places an order qualifies for the loyalty program based on order history. • *Unselected* = You can sell membership programs of this type in order entry or create them through *Working with Customer Memberships (WWCM)*. Standard memberships can be used to generate membership orders, or they can be discount-only memberships. See *Loyalty Memberships* for an overview.

Working with Membership Programs (WWMP)

Purpose: Use the Work with Membership Programs menu option to create, review, or work with the templates for customer memberships.

Loyalty programs or standard memberships programs: The membership program Type assigned to a membership program identifies whether it is a loyalty program or a standard membership. In the case of loyalty memberships, the background jobs automatically evaluate whether each customer placing an order qualifies for the loyalty program based on order history and customer class. In the case of a standard membership program, you can create customer memberships by selling a membership item in order entry, or creating the customer membership one manually using the *Working with Customer Memberships (WWCM)* menu option. Standard membership programs can generate new orders for the customer on a periodic basis, or they can be discount-only.

You use different screens in Work with Membership Programs and *Working with Customer Memberships (WWCM)* for loyalty membership programs vs. standard programs.

Standard membership programs: The membership program specifies settings such as:

- **Order creation and/or discount:** You can set up membership programs in order to create orders periodically for participating customers, and/or to apply a discount to all orders for participating customers. A membership program can include either or both functions.
- **Template for customer membership:** The information you define for a membership program defaults when you create a new customer membership. This information can include shipment intervals, source code, ship via, and any specific items to include on the generated membership orders.
- **Ability to change customer membership:** If you assign a membership program to a membership type that permits changes, you can override the defaults for specific customer memberships. If the membership type does not permit changes, all of the membership program settings default and cannot be overridden. These settings include shipment interval or date, discount, and included items. See *Working with Customer Memberships (WWCM)*, for descriptions of each field.

Loyalty membership programs: The membership program specifies settings such as:

- **Date range:** Use the Effective start date to indicate how far back to go when evaluating a customer's order or sales totals for loyalty membership qualification. For example, you can set the start date to January 1 if you would like to include order or sales dollars for the current calendar year only.
- **Dollar value requirement:** You can set up loyalty membership based on total merchandise dollars ordered or total dollars sold (that is, shipped), and specify the required dollar value. You can also specify whether to subtract additional order activity, such as returns, cancellations, and soldouts, from the total merchandise dollar value. Depending on the type of dollar totals (order, sales, external) used to evaluate customers for loyalty membership, the evaluation takes place at during ORDR_ASYNC processing or BILL_ASYNC processing.
- **Customer class:** You can set up a customer class as a qualification for a loyalty program, either alone or in combination with a total dollar value.
- **Discount percentage and other benefits:** In addition to indicating a discount percentage to apply to the customer's orders, you can specify additional benefits, such as free freight, assignment of a special customer class, or a backorder priority. You can also enter a special message line to print on pick slips for customers in the loyalty program.

For more information: See *Membership Overview* for more information on how loyalty programs and standard membership programs work, and about required setup.

In this topic:

Work with Memberships Screen

Purpose: Use this screen to review the membership programs in your company, to create a new membership program, or to work with an existing membership program.

How to display this screen: Enter *WWMP* in the Fast path field at the top of any menu or select Work with Membership Program from a menu.

Field	Description
Membership ID	A code representing the membership program. Alphanumeric, 12 positions; optional.
Description	The description of the membership program. Alphanumeric, 30 positions; optional.
Start dt (Start date)	The first date when you can begin creating customer memberships for this membership program, or to include when calculating the customer's total order or sales to date in order to determine whether the customer qualifies for this loyalty program. Numeric, 6 positions (in user date format); optional.
End dt (End date)	The last date when you can create new customer memberships for this membership program. Numeric, 6 positions (in user date format); optional.

Field	Description
Type	The code representing the membership type of a program. You can use the membership type to identify loyalty programs, to further identify or group membership programs, or to indicate that membership settings are compulsory and cannot be changed for specific customers. See *Working with Membership Types (WWMT)* for an overview. Alphanumeric, 2 positions; optional.

Screen Option	Procedure
Create a new membership program	Select *Create* to advance to the *Enter Membership Program Window*.
Change header information for a membership program	Select *Change* for a membership program to advance to: 1. the Membership Program Screen (Change Mode) if it is a standard membership program type. You can change any information on this screen except the membership ID or type. See the *Membership Program Screen* for field descriptions. **Note:** Changing a membership program does not update any existing customer memberships or their generated orders. 1. the Loyalty Membership Program Screen (Change Mode) if it is a loyalty membership program type. You can change any information on this screen except the membership ID or type. See the *Loyalty Membership Program Screen* for field descriptions. **Note:** Changing a membership program does not update any existing customer loyalty memberships.

Screen Option	Procedure
Delete a membership program	Select *Delete* for a membership program to delete it. **Note:** You cannot delete a membership program associated with any active customer memberships. Instead, the system displays a message: `Active Customer Memberships exist - cannot delete.`
Display a membership program	Select *Display* for a membership program to advance to: 1. the Membership Program Screen (Display Mode) if it is a standard membership program type. You cannot change any information on this screen. See the *Membership Program Screen* for field descriptions. 2. the Loyalty Membership Program Screen (Display Mode) if it is a loyalty membership program type. You cannot change any information on this screen. See the *Loyalty Membership Program Screen* for field descriptions.
Work with items for a membership program	Select *Work with details* for a membership program to advance to the *Work with Membership Program Detail Screen*. **Note:** This option is not available for a loyalty membership program type.

Enter Membership Program Window

Purpose: Use this window to specify the name, description, and type of the membership program you are creating. Based on the membership type you select, the system determines whether to advance next to the *Membership Program Screen* if it is a standard membership program type, or the *Loyalty Membership Program Screen*, if it is a loyalty membership program type.

Differences between standard and loyalty membership programs: The background jobs assign loyalty memberships automatically to customers based on the customer's order history, while you can sell standard membership programs in order entry or through the *Working with Customer Memberships (WWCM)*. Standard memberships can be used to generate membership orders, or they can be discount-only memberships.

How to display this screen: Select *Create* at the *Work with Memberships Screen*.

Field	Description
Membership ID	Enter the unique code to identify a membership program. The code you enter cannot be assigned to an existing membership program. *Matching a membership program with an item for order entry:* You can create standard customer memberships through order entry by adding an item whose Membership flag is *selected* to the order. When you add the membership item to an order, the system displays a pop-up window for you to enter the membership ID. You can save a step in order entry by assigning the same name to both the membership program and the item; if there is a membership program whose name matches the membership item, this name defaults in the window. *Example:* You can create a membership program with an ID of *MEMB01* and also create a membership item named *MEMB01*. When you enter the item *MEMB01* in order entry, the correct membership ID defaults into the pop-up window. Alphanumeric, 12 positions; required.
Description	Enter the description of the membership program. You can change the description, if needed, on the next screen. Alphanumeric, 30 positions; required.

Field	Description
Type	Enter the membership type code that identifies: • *Loyalty membership program or standard program?* The membership type distinguishes a loyalty program, in which the background job automatically assigns customers to the program based on order history, from a standard membership program, which you can sell or create and use to generate membership orders and/or apply discounts. If the type indicates a loyalty program, you advance to the *Loyalty Membership Program Screen*; otherwise, you advance to the *Membership Program Screen*. • *Allow overrides?* The membership type indicates whether you can override program defaults for specific customer memberships. If the Change customer membership field for the membership type is *unselected*, the information that defaults from the membership program to the customer membership is compulsory and cannot be changed for specific customers. Related to standard membership programs only. • *Grouping and tracking:* You can also use the membership program type to group different membership programs. When you use the *Generating Membership Orders (EGMO)* menu option, you can specify one or more membership types for order generation (standard membership programs only). Membership types are defined in and validated against the Membership Type table; see *Working with Membership Types (WWMT)*. Alphanumeric, 2 positions; required.

Completing this screen: Complete each of the fields as described above and click *OK* to advance to the *Membership Program Screen* (for standard membership programs) or the *Loyalty Membership Program Screen* (for loyalty membership programs).

Membership Program Screen

Purpose: Use this screen in Create mode to create a new standard membership program, which you sell or create in order to generate periodic membership orders and/or to provide a discount. See *Membership Overview* for more information, including the difference between standard and loyalty membership programs.

If the membership type you specify at the *Enter Membership Program Window* is flagged as a loyalty type, you advance instead to the *Loyalty Membership Program Screen*. See *Membership Overview* for more information on different types of membership programs.

How to display this screen: Click *OK* at the *Enter Membership Program Window* after specifying a membership program type that does not have the Loyalty flag set. See *Membership Program Screen* for the screen you use to create a loyalty membership program.

Field	Description
Membership ID	A unique program to identify a membership program. See the *Enter Membership Program Window* for more information. Change screen: display-only.

Field	Description
Description	The description of the membership program. Your entry from the *Enter Membership Program Window* defaults, but you can override it. Alphanumeric, 30 positions; required.
Type	The type of membership program. You can use the membership type code to further identify or group membership programs. See the *Enter Membership Program Window* for more information. Alphanumeric, 2 positions; display-only.
Effective start date	The first date when you can begin creating customer memberships for this membership program. If you enter a start date, you must also specify an end date. Numeric, 6 positions (in user date format); optional.
Effective end date	The last date when you can create a new customer membership for this membership program. This field does not control the duration of customer memberships you create for the membership program. If you enter an end date, you must also specify an start date. Numeric, 6 positions (in user date format); optional.
Delay initial shipment	Indicates whether to delay the Next release date for customer memberships by the Shipment interval, or to use the current date as the Next release date. The Next release date indicates when to start generating membership orders for the customer through *Generating Membership Orders (EGMO)*. *Example:* You create a customer membership on June 28, and the Shipment interval is set to 30 days. If the Delay initial shipment flag is *selected*, the Next release date for the customer membership is set to July 28, and the membership generation program will not generate an order for the membership until then. If the Delay initial shipment flag is *unselected*, the Next release date for the customer membership is set to June 28, and you can generate an order for the membership the next time you use the membership generation program. Valid values: • *selected* = When creating a regular (non-loyalty) customer membership that specifies a Shipment interval, set the Next release date to the current date plus the Shipment interval • *unselected* = When creating a regular (non-loyalty) customer membership that specifies a Shipment interval, set the Next release date to the current date **Note:** This flag applies only to regular (non-loyalty) membership programs that generate orders, and only if the membership program specifies a Shipment interval rather than a Fixed shipment day.

Field	Description
Shipment interval	The minimum interval, in number of days, that the Generate Customer Membership Orders program should wait between generating orders for active customer memberships. The system uses this value to determine the Next release date to assign a customer membership after generating a new order. *Example:* If a customer membership's shipment interval is set to *30*, the Release date will be set to 30 days in the future after you generate an order. You cannot specify both a shipment interval and a fixed shipment day for a membership program. Numeric, 3 positions; required if you do not specify a Fixed shipment day.
Fixed shipment day	The day of the month when the *Generating Membership Orders (EGMO)* program should consider active customer memberships eligible for order generation. *Example:* If you set a membership program's fixed shipment day to *15*, the system initially sets a new customer membership's release date as follows: • if the current day of the month is 14 or earlier, the next Release date is set to the 15th of the current month. • if the current day of the month is 15 or later, the next Release date is set to the 15th of the following month. Each time you generate a new order for the customer membership, the Generate Customer Membership Orders program resets its Release date. You cannot specify both a shipment interval and a fixed shipment day for a membership program. **Note:** Your entry cannot be greater than *28*, to make sure that the customer memberships will be eligible for order generation during each month of the year. Numeric, 2 positions; required if you do not specify a shipment interval.

Field	Description
Discount percent	The percentage discount to apply to all orders for the customer who purchased the membership. The membership status must be active, and the Discount end date must not have been reached yet for the discount to apply (see *Discount duration*). This discount percentage defaults to the order header each time you enter a new order for the customer. If you create the customer membership by adding a membership item in order entry, this discount percentage applies to the price of the membership item itself, unless you flag the item as nondiscountable (*select* the Discountable flag for the item). See *Membership Overview* for a discussion of how membership discounts apply to orders. Also, see *Working with Customer Memberships (WWCM)* for more information on discounts. Numeric, 5 positions with a 2-place decimal; optional.
Discount duration	The number of months that the discount percentage will apply to customer orders. The system calculates the discount end date when you create a customer membership based on the current date. *Applies to active memberships only:* Regardless of the discount start and end dates on a customer membership, the system applies a discount to orders only if the customer membership is currently active. Numeric, 2 positions; optional.
Default source code	The source code to default onto orders created from customer memberships. The source code you enter here defaults onto customer memberships you create, but you can override it there if the membership type allows it. You can also update the source code for existing customer memberships and the membership program itself through the *Update Customer Memberships (MMCM)* option. If this source code matches the source code in the *Default Unknown Source Code (I58)* system control value, the system updates the source code on the order header to the source code associated with the offer on the first order detail line; see *Default Unknown Source Code Logic*. Source codes are defined in and validated against the Source Code table. See *Working with Source Codes (WSRC)*. Alphanumeric, 9 positions; required.

Field	Description
Ship via	The ship via to default onto orders you create through customer memberships. The ship via code you enter here defaults onto customer memberships you create, but you can override it there if the membership type allows it. **If you do not specify a ship via code here:** • When you create a customer membership in order entry: The system uses the ship via code currently on the order header as the ship via for the customer membership. • When you create a customer membership in *Working with Customer Memberships (WWCM)*: You will need to specify a ship via for the customer membership. **Note:** If you do not specify a ship via code here and if you use a membership type that does not allow changes, then you will not be able to create customer memberships in *Working with Customer Memberships (WWCM)*, because there will be no way to specify the ship via to use. *Auto-selection of best way ship via:* If the ship via for the customer membership matches the *Best Way Ship Via for Auto-Assignment (J67)*, the system automatically selects the "best way" ship via with the lowest overall shipping costs when you generate a membership order. However, in this situation, the *Order Total Window (Reviewing the First Order Total)* displayed in order entry or in *Working with Customer Memberships (WWCM)* does not include any shipping charges. See the *Best Way Ship Via for Auto-Assignment (J67)* system control value for a discussion on auto-assignment. Ship via codes are defined in and validated against the Ship Via table. See *Working with Ship Via Codes (WVIA)*. Numeric, 2 positions; optional.
Order type	The order type to default onto orders you create through customer memberships. The Generate Customer Membership Orders program will use the order type specified in the *Default Order Type (B28)* system control value if you do not enter an order type code here. You cannot override the order type for specific customer memberships. Order type codes are defined in and validated against the Order Type table. See *Establishing Order Types (WOTY)*. Alphanumeric, 1 position; optional.

Field	Description
Ship complete	Identifies whether all items on an order you create through a customer membership must ship together. Valid values are: • *Selected* = Order must ship complete; available items will be held until each item is available and the entire order can ship together. • *Unselected* = Items can be shipped as they become available; backordered items will be shipped at a later date. The Default ship complete flag system control value does not control the default setting of this field.

> **Note:**
>
> If you select *Exit* at this screen, you do not create the new membership program.

Loyalty Membership Program Screen

Purpose: Use this screen to create a loyalty membership. The system uses the information you enter at this screen to determine whether to automatically assign a customer to a loyalty membership; also, your entries here determine the benefits of the loyalty program. See *Membership Overview* for more information, including the difference between standard and loyalty membership programs.

How to display this screen: Click *OK* at the *Enter Membership Program Window* after specifying a membership program type that has the Loyalty flag set. See *Membership Program Screen* for the screen you use to create a standard membership program.

Field	Description
Membership ID	The membership ID you entered at the *Enter Membership Program Window*. Alphanumeric, 12 positions; display-only.
Description	The description of the program. Your entry from the *Enter Membership Program Window* defaults, but you can override it. Alphanumeric, 30 positions; required.
Type	The membership type code you entered at the *Enter Membership Program Window*. The description is to the right. Alphanumeric, 2 positions; display-only.

Field	Description
Effective start date	Indicates the earliest date to include when determining whether the customer has a sufficient order or sales dollar total to qualify for the loyalty membership for a loyalty program. *Evaluating order or sales history:* • *O (Orders)* program: the system adds the total merchandise dollar value of all orders from the effective start date to the current date, and compares this amount with the LTD dollars specified at this screen. Evaluation takes place during the Order Async. • *S (Sales)* program: the evaluation takes place the same way as an *O (Orders)* program, except that it is based on total dollars sold rather than dollars ordered. Evaluation takes place during the Billing Async. • *E (External)* program: the evaluation takes place the same way as an O (Orders) program, except that the evaluation takes place during the Order Async and Billing Async. *Adding dollar totals:* The system bases its evaluation on the records of order activity in the Order Billing History table. See the *Order Billing History Detail Screen* for more information on how the system updates this table. Also, see *Loyalty Memberships* for an overview of how customers are evaluated for loyalty membership. If you leave this field blank, the system does not restrict its evaluation by an effective start date; all order activity in the Order Billing History table is considered. Numeric, 6 positions (in user date format); optional.
Effective end date	The last date when the system should evaluate customers for loyalty memberships. If you leave this field blank, the system does not automatically stop evaluating customers for the loyalty program. Numeric, 6 positions (in user date format); optional.
Qualifying Values	
Customer class	The customer class, if any, that qualifies a customer for the loyalty program. If the customer is already assigned to this class and has exceeded the LTD dollars, if any, specified for the loyalty program, the system creates a loyalty membership for the customer. Customer classes are defined in and validated against the Customer Class table; see *Setting Up the Customer Class Table (WCCL)* for more information. Also, see the *First Create Sold To Customer Screen* for more information on assigning a customer class to a customer. • Not to be confused with the Customer class, if any, to assign to the customer as one of the *Benefits* of the loyalty membership. • You can specify either a qualifying Customer class, a qualifying LTD dollars, or both. If you specify both, the customer must meet both requirements in order to qualify for the loyalty program. Alphanumeric, 2 positions; optional (required if no LTD dollars amount is specified).

Field	Description
LTD dollars (life-to-date dollars)	The total merchandise dollar value of all orders or all shipments (based on the setting of the Orders/Sales/External field at this screen) required to qualify for the loyalty membership. If the Net returns/exchanges, Net cancels, or Net soldouts flags are *selected*, the total merchandise dollar value of these activities are subtracted from the total merchandise order or sales dollars when evaluating the customer. *Start date for qualifying dollar value:* The system uses the Effective start date for the loyalty program to determine the order activity to include in the qualifying dollar total. See *Loyalty Memberships* for a complete discussion. *Merchandise only:* The system includes the merchandise value, based on the actual selling price, when calculating the total order or sales dollar value. Additional charges, freight, tax, additional freight, and special handling are not included. Numeric, 13 positions with a 2-place decimal; optional (required if there is not a qualifying Customer class).
Orders/Sales/External	Indicates the evaluation method to use in order to determine whether a customer qualifies for the loyalty membership program. Valid values are: • *External* = Use total merchandise ordered since the Effective start date to evaluate whether a customer qualifies for a loyalty membership. If there is no Effective start date, include all of the customer's order dollars. Evaluated during the Order Async and Billing Async. • *Orders* = Use total merchandise ordered since the Effective start date to evaluate whether a customer qualifies for a loyalty membership. If there is no Effective start date, include all of the customer's order dollars. Evaluated during the Order Async. • *Sales* = Use total merchandise sold (that is, shipped) since the Effective start date to evaluate whether a customer qualifies for a loyalty membership. If there is no Effective start date, include all of the customer's sales dollars. Evaluated during the Billing Async. **Note:** See *Loyalty Memberships* for a discussion of loyalty program evaluation and examples. Typically, you would use only one evaluation method for all loyalty programs in effect within a company. Required.

Field	Description
Net returns/ exchanges	Indicates whether to subtract the total merchandise dollar value of returns or exchanges from the total order or sales merchandise total when evaluating whether a customer qualifies for a loyalty membership. Valid values are: • *Selected* = The system subtracts the total merchandise dollars returned or exchanged from the merchandise total (based on the setting of the Orders/Sales/External flag) in order to evaluate whether a customer qualifies for a loyalty membership. For example, the loyalty program requires $500 in merchandise sales. The customer's total sales since the Effective start date are $525. The customer's total returns since the Effective start date are $50. The result is that the customer is not qualified for the loyalty program ($525 - $50 = $475). • *Unselected* = The system does not consider the total merchandise dollar value of returns or exchanges when evaluating whether a customer qualifies for a loyalty membership. In the above example, the customer still qualifies for the loyalty membership based on the total sales of $525 since the Effective start date, regardless of any returns processed. *Return activity against orders before the Effective start date:* Return or exchange activity is evaluated based on the date of the return or the exchange itself, rather than the date of the original order. For example, you process a return of $50 in merchandise on January 31 against an order that was entered on December 30. The system is evaluating the customer for a loyalty program with an effective start date of January 1. The value of the $50 return is subtracted from the total dollar value since January 1, even though the order was originally entered before that date. *Exchange activity:* If this value is *unselected* and you process an exchange, the dollar value of the exchange, or replacement, item is included in the calculation of loyalty eligibility. For example, if the customer exchanges an item with a selling price of $50 for an item with the same selling price, this activity effectively increases the customer's total merchandise value to date by $50 if you do not net returns and cancellations.

Field	Description
Net cancels	Indicates whether to subtract the total merchandise dollar value of cancellations from the total order or sales merchandise total when evaluating whether a customer qualifies for a loyalty membership. Valid values are: • *Selected* = The system subtracts the total merchandise dollars canceled from the order or sales merchandise total (based on the setting of the Orders/Sales/External flag) in order to evaluate whether a customer qualifies for a loyalty membership. For example, the loyalty program requires $500 in merchandise sales. The customer's total sales since the Effective start date are $525. The customer's total cancellations since the Effective start date are $50. The result is that the customer is not qualified for the loyalty program ($525 - $50 = $475). • *Unselected* = The system does not consider the total merchandise dollar value of cancellations when evaluating whether a customer qualifies for a loyalty membership. In the above example, the customer still qualifies for the loyalty membership based on the total sales of $525 since the Effective start date, regardless of any cancellations processed. *Cancellation activity against orders before the Effective start date:* Cancellation activity is evaluated based on the date of the cancellation itself, rather than the date of the original order. For example, you process a cancellation of $50 in merchandise on January 31 against an order that was entered on December 30. The system is evaluating the customer for a loyalty program with an effective start date of January 1. The value of the $50 cancellation is subtracted from the total dollar value since January 1, even though the order was originally entered before that date. *Update demand flag:* A cancellation always reduces the total order merchandise amount if you use a cancel reason code whose Update demand? flag is *selected*. The result of this type of cancellation might be to make a customer ineligible for a particular loyalty program if it is based on the order total. *Update demand for order maintenance transactions?* If the Update Demand for Order Maintenance Transactions (C72) system control value is *unselected*, it is possible to understate the customer's total merchandise order dollars. Because the order dollar total in this situation does not increase if, for example, you add an item in order maintenance, processing a cancellation can have the effect of "double dipping" when the system subtracts the cancellation dollars from the order total. For example, a customer's total dollars ordered is $500.00. You add a $100.00 item in order maintenance, and then cancel it. Because the total dollars ordered was never increased by the $100.00 in order maintenance, the cancellation effectively reduces the customer's total dollars ordered to $400.00. For this reason, you might want to leave this flag unselected if the *Update Demand for Order Maintenance Transactions (C72)* system control value is *Unselected*.

Field	Description
Net soldouts	Indicates whether to subtract the total merchandise dollar value of soldouts from the total order or sales merchandise total when evaluating whether a customer qualifies for a loyalty membership. Valid values are: • *Selected* = The system subtracts the merchandise dollars sold out from the total order or sales merchandise total (based on the setting of the Orders/Sales/External flag) in order to evaluate whether a customer qualifies for a loyalty membership. For example, the loyalty program requires $500 in merchandise sales. The customer's total sales since the Effective start date are $525. The customer's total soldouts since the Effective start date are $50. The result is that the customer is not qualified for the loyalty program ($525 - $50 = $475). • *Unselected* = The system does not consider the total merchandise dollar value of soldouts when evaluating whether a customer qualifies for a loyalty membership. In the above example, the customer still qualifies for the loyalty membership based on the total sales of $525 since the Effective start date, regardless of any soldouts processed. *Soldout activity against orders before the Effective start date:* Soldout activity is evaluated based on the date of the soldout cancellation itself, rather than the date of the original order. For example, you sell out $50 in merchandise on January 31 against an order that was entered on December 30. The system is evaluating the customer for a loyalty program with an effective start date of January 1. The value of the $50 soldout is subtracted from the total dollar value since January 1, even though the order was originally entered before that date. *Update demand for order maintenance transactions?* If the *Update Demand for Order Maintenance Transactions (C72)* system control value is *unselected*, it is possible to understate the customer's total merchandise order dollars. Because the order dollar total in this situation does not increase if, for example, you add an item in order maintenance, selling out an item can have the effect of "double dipping" when the system subtracts the soldout dollars from the order total. For example, a customer's total dollars ordered is $500.00. You add a $100.00 item in order maintenance, and then sell it out. Because the total dollars ordered was never increased by the $100.00 in order maintenance, the sellout effectively reduces the customer's total dollars ordered to $400.00. For this reason, you might want to leave this flag *unselected* if the *Update Demand for Order Maintenance Transactions (C72)* system control value is *unselected*.
Benefits	
Discount percent	The discount percentage that a member of the loyalty program qualifies for. The system sets this percentage when it creates the customer loyalty membership, and it defaults to the order header each time you enter a new order for the customer. The discount percentage for a customer loyalty membership is displayed at the Loyalty Customer Membership Screen. Numeric, 5 positions with a 2-place decimal; optional.

Field	Description
Discount duration	The number of months that the discount specified for the customer membership should be applied automatically to the customer's orders. The system adds this number of months to the current date in order to set the Discount end date for the customer loyalty membership, displayed at the *Loyalty Customer Membership Screen*. Even if the customer membership status is *Active*, the discount does not automatically apply after this date. If you leave this field blank, the system does not stop applying the discount automatically. Numeric, 2 positions; optional.
Free freight	Indicates whether to provide free freight to customer who are assigned to the loyalty membership. If this flag is *selected*, the Calc freight flag is *unselected* when you enter an order for the customer. The free freight flag for a customer loyalty membership is displayed at the *Loyalty Customer Membership Screen*. **Note:** It is still possible for the customer to be charged additional freight even if freight is free.
Customer class	Indicates the customer class, if any, to assign to customers who are assigned to the loyalty membership. This customer class replaces the current class assignment, if any, for the customer. When you deactivate a loyalty membership, or the system deactivates one, the system does not automatically update the customer class currently assigned to the customer. The update occurs only at the time of activating a customer loyalty membership. Customer classes are defined in and validated against the Customer Class table; see *Setting Up the Customer Class Table (WCCL)* for more information. Also, see the *First Create Sold To Customer Screen* for more information on assigning a customer class to a customer. **Note:** Not to be confused with the Customer class, if any, to use as one of the *Qualifying Values* for the loyalty membership. Alphanumeric, 2 positions; optional.

Field	Description
Priority	The priority in which the system should evaluate this loyalty program compared to other current loyalty programs, where a lower number indicates a higher priority. If you are setting up multiple, graduated loyalty programs, you should assign a higher priority (lower number) to the ones with the higher dollar value requirement in order to ensure that the customer is assigned the highest-level loyalty program that he qualifies for. *Example:* You are setting up two loyalty programs: *PROGRAM2*, with a discount of 5%, requires a total order value of $1000; and *PROGRAM1*, with a discount of 10%, requires a total order value of $2000. You assign a priority of *1* to *PROGRAM1*, and a priority of *2* to *PROGRAM2*. Each time you process an order from a customer, the system first evaluates whether the customer qualifies for *PROGRAM1* with the higher discount percentage (priority *1*). If the customer does not qualify for *PROGRAM1*, the system then evaluates whether the customer qualifies for *PROGRAM2* and the lower discount percentage (priority *2*). If there are two current loyalty programs assigned the same priority, the system evaluates them in alphanumeric order based on Membership ID. Numeric, 3 positions; required.
Priority B/O	Indicates the default Priority, if any, that the system should set on the order header when you enter an order for a customer in this loyalty program. *9* indicates the highest priority, while *0* is the lowest priority. You can override this default in order entry. The Evaluate Backorders program uses the priority to determine which backorders to reserve first when inventory becomes available. See *Working with the EBO_ASYNC Job* for more information. Numeric, 1 position; optional.
Pick msg (pick message)	Enter the message, if any, to print on the pick slip for customers who are members of this loyalty program. This message prints in addition to any other messages selected for the pick slip. See *Performing Pick Slip Generation* for more information on generating pick slips. Alphanumeric, 60 positions; optional.

Work with Membership Program Detail Screen

Purpose: Use this screen to work with the items that default onto customer membership orders.

How to display this screen: Select *Work with Details* for a membership program at the *Work with Memberships Screen*.

> **Note:**
>
> This option is not valid for loyalty memberships. See *Membership Overview* for more information.

Field	Description
Membership ID	The code representing the membership program. Alphanumeric, 12 positions; display-only.
Description (Unlabeled field to the right of the membership ID)	The description of the membership program. Alphanumeric, 30 positions; display-only.
Item	An item to include on orders you create for customer memberships. **Note:** You can replace an item for existing customer memberships and the membership program itself through the *Update Customer Memberships (MMCM)* option. Alphanumeric, 12 positions; optional.
SKU	The item's unique characteristics, such as its color and size. Alphanumeric, three 4-position fields; display-only.
Order quantity	The quantity of the item to include on each order you create for customer memberships. Numeric, 5 positions; display-only.
Rot (Rotation)	The interval when the item should be included in an order. A rotation of *1* indicates that the item should be included on the first order you generate, and will always be included if there are no items with a rotation higher than *1*. A rotation of *2* indicates that the item should be included on the second order, and so on. A rotation of *0* indicates that the item should be included on every order. If the *Generating Membership Orders (EGMO)* program attempts to generate an order for a customer membership and there are no eligible rotations (either the current rotation number or a rotation of zero), then the program does not generate the order, and the customer membership is listed on the *Memberships in Error Report*. Numeric, 3 positions; display-only.
# of times (Number of times to include)	The total number of times to include the item on an order. If this field is blank, there is no limit to the number of times to include the item. Numeric, 3 positions; display-only.
N/C (No charge)	Indicates whether the item should be free of charge on orders you generate. Valid values are: • *Selected* = The item will be added to orders you generate free of charge • *Unselected* = The item will not be free of charge

Field	Description
Ovr rsn (Price override reason code)	The price override reason code for the system to use when adding the item to the order at no charge, or with an override price. Alphanumeric, 1 position; display-only.
Ovr price (Price override)	The price to charge for the item on orders you generate for customer memberships. You would specify a price override if you do not want the system to use the regular pricing hierarchy for membership orders. Numeric, 13 positions with a 2-place decimal; display-only.

Screen Option	Procedure
Enter a new item to include in the membership program	Select *Create* to advance to the *Membership Program Screen*.
Change an item included in the membership program	Select *Change* for an item to advance to the Membership Program Screen (Change Mode). At this screen, you can change anything but the membership ID. See *Membership Program Detail Screen*. **Note:** Changing an item on a membership program does not update any existing customer memberships or their generated orders.
Delete an item from a membership program	Select *Delete* for an item to delete it from the membership program. **Note:** Deleting an item on a membership program does not update any existing customer memberships or their generated orders.
Display an item	Select *Display* for an item to advance to the Membership Program Detail Screen (Display Mode). You cannot change any information on this screen. See the *Membership Program Detail Screen* for a field descriptions.

Membership Program Detail Screen

Purpose: Use this screen in Add mode to add an item to a membership program.

How to display this screen: Select *Create* at the *Work with Membership Program Detail Screen*.

Field	Description
Membership ID	The code representing the membership program. Alphanumeric, 12 positions; display-only.
Item	The item to include on orders you create for customer memberships. Item codes are defined in and validated against the Item table. See *Performing Initial Item Entry (MITM)*. Alphanumeric, 12 positions; required.
SKU	The item's unique characteristics, such as its color and size. Alphanumeric, three 4-position fields; required if the item has SKUs.
Order quantity	The quantity of the item to include on each order you create for a customer membership. Numeric, 5 positions; required.
Rotation	The interval when the item should be included in an order. A rotation of *1* or zero indicates that the item should be included on the first order you generate. A rotation of *2* indicates that the item should be included on the second order, and so on. Once you have generated as many orders as the highest rotation number assigned to an item, items on rotation *1* are selected and the cycle begins again. The default rotation is *1*. A rotation of *0* indicates that the item should be included on every order you generate. If each item on the membership has a rotation of *1*, they will all be included on each generated order. If the *Generating Membership Orders (EGMO)* program attempts to generate an order for a customer membership and there are no eligible rotations (either the current rotation number or a rotation of zero), then the program does not generate the order, and the customer membership is listed on the *Memberships in Error Report*. Numeric, 3 positions; optional.
# of times to include	The total number of times to include the item on an order. If this field is blank, there is no limit to the number of times to include the item. Numeric, 3 positions; optional.
No charge	Indicates whether the item should be added free of charge to an order you generate. Valid values are: • *No Charge* = The item will be added to orders you generate free of charge • *Priced* = The item will not be free of charge; use a price override or use the regular pricing hierarchy If you select *No Charge* for this field, you need to complete the price override reason code, below.

Field	Description
Price override code	The price override reason code for the system to use when adding the item to the order at no charge, or with an override price. Price override reason codes are defined in and validated against the Price Override Reason Code table. See *Establishing Price Override Reason Codes (WPOR)*. Alphanumeric, 1 position; required if the item is flagged as "no charge" or if you enter a price override.
Price override	The price to charge for the item on orders you generate for customer memberships. You would specify a price override if you do not want the system to use the regular pricing hierarchy for membership orders. Numeric, 13 positions with a 2-place decimal; optional.

Note:

Adding an item to a membership program does not update any existing customer memberships or their generated orders.

Working with Customer Memberships (WWCM)

Purpose: Use the Work with Customer Memberships menu option to review or change customer memberships. Available options for standard membership programs include:

- creating a new customer membership
- changing the terms of the membership, including dates and payment information
- working with items for the membership
- activating, deactivating, or canceling a membership
- advancing to standard order inquiry for the customer membership

Settings default from membership program: The settings you have defined for the standard membership program default for each new customer membership you create. These settings include dates, frequency of shipments, discount, and included items. However, you can override these defaults for standard membership programs as long as the membership type permits it. See *Working with Membership Programs (WWMP)*.

You can also update the source code and replace an item on existing customer memberships through the *Update Customer Memberships (MMCM)* option.

Create through quote or order entry: You can also use quote or order entry to create a standard customer membership. See *Membership Overview* for general information, *Entering Customer Memberships in Order Entry* for detailed information, and *Entering Customer Memberships in Order Entry* for information on the differences between quote an order entry.

Deleting memberships on quotes: If you delete a membership item on a quote in entry or maintenance, the system also deletes the customer membership.

Canceling memberships through order maintenance: When you cancel a membership item in order maintenance or cancel the order or quote that contains the membership item, the system cancels the customer membership created by the membership item if possible.

However, the system cannot cancel the membership if the customer membership is currently in *In process* status. A customer membership is in *In process* status if:

- The membership order generation process is currently running and the customer membership is eligible for order generation, or
- A generated order is currently suspended in an order batch.

In either situation, you will need to:

- Cancel the customer membership through the process described under Canceling a Customer Membership.
- Cancel any generated membership orders that you do not want to ship to the customer.

See *Canceling a Membership Item* for more information on the process of canceling a membership item.

Loyalty memberships: Unlike standard customer memberships, customer loyalty memberships are created automatically based on the customer's order history, sales history, or customer class. You cannot create a customer loyalty membership through this menu option. See *Loyalty Memberships* for an overview.

In this topic:

– *Change or Create Options for a Membership Recipient*

Work with Customer Memberships Screen

How to display this screen: Enter *WWCM* in the Fast path field at the top of any menu or select Work with Customer Memberships from a menu.

Field	Description
Customer #	A unique number to represent the sold-to customer who ordered the membership. **Ghost customers:** If you enter the customer number of a ghost customer, the scan screen does not display any memberships; this is because a merge/purge has assigned any memberships using that customer number to the "target" customer. You can identify a ghost customer by the setting of the *Ghost* flag. Numeric, 9 positions; optional.
Membershp ID (Membership ID)	A code that identifies the membership program in which the customer is enrolled. Alphanumeric, 12 positions; optional.
Type	A code that identifies the type of membership program. You can use membership types to group membership programs, to indicate whether any of the settings for the membership program can be overridden for specific customer memberships, or to identify a membership program as a loyalty program. See *Working with Membership Types (WWMT)* for more information. Alphanumeric, 2 positions; display-only.
Status	The current status of the customer membership. Valid values are: • *Active* = The customer membership is active; the system creates new membership orders and/or applies any discount if the Discount end date has not been reached. **Note:** Customer memberships associated with a quote display in an active status; however, the system does not generate a membership order until the quote is converted to an order; see *Entering Customer Memberships in Quote Entry* and *Converting Quotes to Orders*. • *Inactive* = The customer membership is associated with a quote that has not been converted to an order or the customer membership has been deactivated; however, you can reactivate it. The system does not generate membership orders for an inactive membership, and any discount does not apply. • *In process* = The membership order generation process is currently processing and this customer membership is eligible for order generation, or the membership order is currently in a suspended order batch. You need to correct the errors or delete the order and then accept the order batch to change the status of the customer membership. See *Working with an Order Batch* for more information on batch order entry. **Note:** This status does not apply to loyalty memberships.

Field	Description
	• *Canceled* = The customer membership has been canceled before it was completed. You can cancel a customer membership by selecting *Cancel* for it at this screen. You can also cancel a standard or discount-only membership by canceling the originating membership item or order in order maintenance; see *Canceling a Membership Item* for more information. **Note:** Canceling the items for a customer membership changes the status to Complete, not Canceled. • *Complete* = The number of specified rotations for the customer membership has been reached, or all items on the customer membership have been canceled. If you do not specify the number of times to include for each item on the customer membership, the system does not consider the membership complete. **Note:** This status does not apply to loyalty memberships. See Changing Customer Membership Status, Rotation or Release Date. Optional.
Shp int (Shipment interval)	The minimum interval, in number of days, that the *Generating Membership Orders (EGMO)* program should wait between generating orders for this customer membership. Standard membership programs only. Numeric, 3 positions; display-only.
Int day (Interval day of the month)	The day of the month when the *Generating Membership Orders (EGMO)* program should consider the customer membership eligible for order generation. Standard membership programs only. Numeric, 2 positions; display-only.
# shp (Number of shipments)	The number of membership orders that have been generated to date for the customer membership. Standard membership programs only. Numeric, 3 positions; display-only.

Field	Description
Next rot (Next rotation)	The next rotation due to be included when you generate membership orders. You assign a rotation to an item on a customer membership to indicate when it should be included in an order. Standard membership programs only. **Note:** If the membership does not have differing rotations (that is, each order includes the same item(s)), the next rotation is always *1*. Numeric, 3 positions; display-only.
Next rel date (Next release date)	The next date when the *Generating Membership Orders (EGMO)* program should consider the customer membership eligible for order generation. The system calculates this date based on the schedule defined for the membership. Also, you can change the next release date by selecting *Change release date/rotation* for a customer membership; see Changing Customer Membership Status, Rotation or Release Date. Standard membership programs only. Numeric, 6 positions (in user date format); display-only.
Last ord date (Last order date)	The last date when an order was generated for the customer membership. Standard membership programs only. Numeric, 6 positions (in user date format); display-only.
Customer name (Unlabeled field below the customer number)	The name of the customer who ordered the membership, or qualified for the loyalty membership. Alphanumeric, 41 positions; display-only.

Field	Description
Recipient (Unlabeled field to the right of the sold-to customer name) or program description	This field displays: • The name of the customer to receive the membership orders, if different from the customer who ordered the membership. Standard membership programs only. The company name is displayed if there is no first and last name; or, • The description of the membership program if there is not a separate shipping address, or if the customer membership is for a loyalty membership program. You can set up these types of recipients for standard memberships: • *Alternate address* = A different shipping address to use for orders you generate for all or part of the term of the membership, such as a vacation address. See *Alternate Shipping Address Screen (Change Mode)*. • *Recipient customer* = A separate customer in your customer table who receives the membership, perhaps through a gift. See Customer Membership Recipient Screen (Change Mode). You can also create a recipient for a customer membership when you create the membership in order entry and select a recipient customer for the order. • *Customer ship-to* = An additional shipping address associated with the sold-to customer who placed the order. Unlike the alternate address, the customer ship-to is permanently associated with the sold-to customer, and is not restricted to a particular order or membership. To send the membership orders to a customer ship-to address, you must complete the Recipient and Ship to # fields at the *Customer Membership Screen (Change Mode)*. You can also create a ship-to when you create the membership in order entry by selecting a shipping address from the address book Alphanumeric, 30 positions; display-only.

Screen Option	Procedure
Create a new customer membership	Select *Create* to advance to the *Create Customer Membership Window*. **Note:** This option is not available for loyalty customer memberships. See *Loyalty Memberships* for an overview.

Screen Option	Procedure
Change a customer membership	Select *Change* for a membership to advance to the *Customer Membership Screen (Change Mode)* in Change mode for standard memberships, or the *Customer Membership Detail Screen (Change Mode)* for loyalty memberships. **Note:** You cannot change any information for a customer membership if the program type does not have the Change customer membership flag *selected*; in this situation, you advance to the same screen whether you select *Change* for or select *Display* for a customer membership.
Cancel an active customer membership	Select *Cancel* for an active membership to display the Confirm Cancel Request pop-up window. See Canceling a Customer Membership. **Note:** Once you cancel a customer loyalty membership, you cannot change its status or create a new loyalty membership. Only the system can create customer loyalty memberships.
Delete a customer membership	Select *Change* for a membership to advance to the *Customer Membership Screen (Change Mode)* in Change mode; then, select *Delete*. See *Deleting a Customer Membership*. **Note:** This option is not available for loyalty customer memberships.

Screen Option	Procedure
Display a customer membership	Select *Display* for a standard customer membership to advance to the Customer Membership Screen in Display mode for standard memberships or the *Customer Membership Detail Screen (Change Mode)* for loyalty memberships. You cannot change any information on these screens. You can advance to these screens regardless of the membership's status. See *Customer Membership Screen (Change Mode)* for field descriptions for the Customer Membership Screen in Display mode.
Reactivate an inactive customer membership	Select *Activate* for an inactive membership to display the Override Release Date pop-up window (standard membership programs only) and change the membership's status to Active. See *Activating a Customer Membership*.
Change the next release date or rotation for a customer membership	Select *Change release date/rotation* for a membership to display the Override Release Date pop-up window. See *Changing Release Date or Rotation for a Customer Membership*. **Note:** This option is not available for loyalty customer memberships.
Deactivate an active customer membership	Select *Deactivate* for an active membership to change its status to Inactive. See *Deactivating a Customer Membership*.
Work with items for a customer membership	Select *Details* for a standard membership to advance to the *Customer Membership Details Screen*. **Note:** This option is not available for loyalty customer memberships.
Review orders generated for the customer membership	Select *Orders for customer* for a membership to advance to the *Display Membership Orders Screen*. **Note:** This option is not available for loyalty customer memberships.

Create Customer Membership Window

Purpose: Use this window to indicate the customer and membership program when you are creating a new customer membership.

> **Note:**
>
> - This option is not available for loyalty customer memberships. See *Loyalty Memberships* for an overview.
> - You cannot create a standard customer membership from the *Work with Customer Memberships Screen* if the membership type does not allow changes and there is no default ship via specified for the membership program, because the ship via code is a required field. See Working with Membership Programs (WWMP) for more information on setting up membership programs.

How to display this screen: Select *Create* at the *Work with Customer Memberships Screen*.

Field	Description
Customer #	The number that identifies the customer sold-to who is ordering the membership. You can select the *Customer#* box to advance to: • the Select Customer Sold To pop-up window if the *ORCE Customer Integration (L37)* system control value is blank; this window supports scanning on various types of information, such as postal code, name, telephone number and email address. • the *Customer Scan Screen* if the *ORCE Customer Integration (L37)* system control value is set to *INTERACT*; see that screen for more information. Customer sold-to numbers are defined in and validated against the Customer Sold To table. See *Creating and Updating Sold-to Customers (WCST)*. If you enter the number of a ghost customer, the system displays the *Ghost Customer Warning Pop-up Window*. Numeric, 9 positions; required.
Membership ID	The code that identifies a membership program. The settings you have defined for the membership program default to the new customer membership program. You can override these defaults unless the membership program's type is flagged to prohibit changes. Membership programs are defined in and validated against the Membership table. See *Working with Membership Programs (WWMP)*. You cannot enter a membership ID whose membership type is flagged as a loyalty program. See *Loyalty Memberships* for an overview. Alphanumeric, 12 positions; required.

Completing this window: You advance to the *Customer Membership Screen (Change Mode)*.

Ghost Customer Warning Pop-up Window

A ghost customer is a customer whose records have been merged with the records of a matching customer when you performed a Merge/Purge. The ghost customer was the source customer in the merge; records for this customer were merged with the records for a matching target customer. When performing the merge you can elect to flag a source customer as a Ghost on the *Work with Source Customers Screen*. Ghost customer records are retained in the Customer Sold To table for informational purposes, but they do not represent the most recent customer order information from the merged (target customer) records.

When you enter the number of a ghost customer, the pop-up Warning Window displays information on the ghost customer.

Select *Continue* to return to the *Create Customer Membership Window* with the target customer number entered on the screen. For example, if you enter *202*, a ghost customer, the system will display the warning window informing you that customer *202* has been merged into customer *137*. When you continue with the create customer membership process, customer *137* will default on the Create Customer Membership Window.

See *Working with Merge/Purge Sold-to Names (MMCS)* for more information on the merge/purge function.

> **Note:**
>
> The system displays a message such as `Cannot manually create cust.` if the membership ID you enter specifies a loyalty program. You cannot create a customer loyalty membership. See *Loyalty Memberships* for an overview.

Customer Membership Screen (Change Mode)

Purpose: Use this screen to review or override the settings for the standard membership program that have defaulted for a customer membership.

- If the membership program's type prohibits changes, you will not be able to override any of the settings that have defaulted from the membership program.
- You cannot create a standard customer membership at this screen if the membership type does not allow changes and there is no default ship via specified for the membership program, because the ship via code is a required field. See *Working with Membership Programs (WWMP)* for more information on setting up membership programs.

How to display this screen: Complete the *Create Customer Membership Window*, specifying a standard membership program as the Membership ID.

Change a membership: You can also advance to this screen by selecting *Change* for a standard customer membership at the *Work with Customer Memberships Screen*. You can change a membership only if the membership status is Active (*A*) or Inactive (*I*). You cannot change memberships that are Canceled (*C*) or Complete (*X*), or if the membership type prohibits changes.

Field	Description
Customer #	A unique number to identify the customer who ordered the membership. Numeric, 9 positions; display-only.
Customer name	The name of the customer who ordered the membership. Alphanumeric, 41 positions; display-only.
Order#	The order on which the customer ordered the customer membership. This field does not appear if you created the customer membership through the *Working with Customer Memberships (WWCM)* menu option. Numeric, 8 positions; display-only.
Membership ID	A code to identify the membership program. Alphanumeric, 12 positions; display-only.
Description (Unlabeled field to the right of the membership ID)	The description of the membership program. Alphanumeric, 30 positions; display-only.
Membership type	A code to identify the type of membership program. You can use membership types to group membership programs, to control whether it is possible to override membership program defaults for specific customer memberships, or to flag loyalty membership programs. See Working with Membership Types (WWMT) for more information. Alphanumeric, 2 positions; display-only.
Status	The status of the customer membership. Valid values are: • *Active* = The customer membership is active; the system will create new membership orders and apply any discount if the Discount end date has not been reached. • *Inactive* = The customer membership is associated with a quote or has been deactivated, but you can reactivate it. The system does not generate membership orders for an inactive membership, and any discount does not apply to orders you enter for the customer. • *In Process* = A membership order is currently in a suspended order batch. You need to correct the errors or delete the order and then accept the order batch to change the status of the customer membership. • *Cancelled* = The customer membership has been canceled before it was completed. You can cancel a standard customer membership by selecting *Cancel* at the Work with Customer Memberships Screen or by Canceling a Membership Item in order maintenance. (*Note:* Canceling the items for a customer membership changes the status to Complete, not Canceled.) • *Complete* = The number of shipments specified rotations for the customer membership are complete, or all items on the customer membership have been canceled. If you do not specify the number of times to include for each item on the customer membership, the system will not consider the membership complete. See Changing Customer Membership Status, Rotation or Release Date. Display-only.

Field	Description
Created on	The date when you created the customer membership. Numeric, 6 positions (in user date format); display-only.
Changed on	The most recent date when you entered a change for the customer membership. Numeric, 6 positions (in user date format); display-only.
Cancel reason	The reason code you used when canceling the customer membership or the membership item (see *Canceling a Membership Item* for information). Included only for canceled memberships. Cancel reason codes are defined in and validated against the Cancel Reason Code table. See *Establishing Cancel Reason Codes (WCNR)*. Alphanumeric, 2 positions; display-only.
Description (Unlabeled field to the right of the cancel reason code)	The description of the cancel reason code. Included only for canceled memberships. Alphanumeric, 30 positions; display-only.
Cancelled on	The date when you canceled the customer membership. Included only for canceled memberships. Numeric, 6 positions (in user date format); display-only.
Shipment interval	The minimum interval, in number of days, that the Generate Customer Membership Orders program should wait between generating orders for this membership. If a shipment interval was specified for the membership program, it defaults here. *Example:* If a customer membership's shipment interval is set to *30*, the Generate Customer Membership Orders program will consider the membership eligible for a new order if 30 days have passed since the last order was generated. You cannot specify both a shipment interval and a fixed shipment day for a membership program. You can override the shipment interval only if the membership program's type allows changes. See *Working with Membership Programs (WWMP)*. Numeric, 3 positions; required if you don't specify a fixed shipment day, or display-only.
Fixed shipment day	The day of the month when the *Generating Membership Orders (EGMO)* program should consider the customer membership eligible for order generation. If a fixed shipment day was specified for the membership program, it defaults here. *Example:* If you set the membership's fixed shipment day to *15*, the system initially sets a release date as follows: • if the current day of the month is 14 or earlier, the next release date is set to the 15th of the current month. • if the current day of the month is 15 or later, the next release date is set to the 15th of the following month. The system recalculates the Next release date if you change the Fixed shipment day. *Order generation:* Each time you generate a new order for the customer membership, the Generate Customer Membership Orders program resets its release date as described above.

Field	Description
	Validation: You cannot specify both a shipment interval and a fixed shipment day for a customer membership. Also, your entry cannot be greater than *28*, to make sure that the customer membership will be eligible for order generation during each month of the year. You can override the fixed shipment day only if the membership program's type allows changes. See Working with Membership Programs (WWMP). Numeric, 2 positions; required if you don't specify a shipment interval, or display-only.
Next release date	The next date when the Generating Membership Orders (EGMO) program should consider the customer membership eligible for order generation. When you create the customer membership or generate a new order, the system calculates this date based on the Shipment interval or Fixed shipment day. *To change:* Select *Release Date*. See Changing Release Date or Rotation for a Customer Membership. The system updates the next release date if you change the Fixed shipment day. Numeric, 6 positions (in user date format); display-only.
Last order date	The last date when you generated a new order for the customer membership. Numeric, 6 positions (in user date format); display-only.
Next rot (Next rotation)	The rotation number for the next order to be generated for the customer membership. If the membership does not have differing rotations, this number will be *1*. You can change the next rotation for a membership by selecting *Release Date*. See Changing Release Date or Rotation for a Customer Membership. Numeric, 3 positions; display-only.
Discount start date	The date when any discount percentage for the membership begins applying to orders for the customer. The current date defaults if you set up a Discount duration for the membership program. *Validation:* If the customer membership includes a discount start date, it also requires a discount end date; otherwise, both fields must be blank. *Membership status:* Regardless of the discount start and end dates, the system applies a discount to orders only if the customer membership is in an active, in process or error status. You can override the discount start date only if the membership program's type allows changes. See Working with Membership Programs (WWMP). Numeric, 6 positions (in user date format); optional.

Field	Description
Discount end date	The last date when any discount percentage for the membership applies to orders for the customer. If you set up a Discount duration for the membership program, the system calculates this date when you create a customer membership by adding the number of months for the discount duration to the current date. *Validation:* If the customer membership includes a discount start date, it also requires a discount end date, it also requires a discount end date; otherwise, both fields must be blank *Membership status:* Regardless of the discount start and end dates, the system applies a discount to orders only if the customer membership is in an active, in process or error status. You can override the discount end date only if the membership program's type allows changes. See *Working with Membership Programs (WWMP)*. Numeric, 6 positions (in user date format); optional.
Disc% (Discount percentage)	The percentage discount to apply to orders for the customer as long as the status of the customer membership is active, in process or error and the current date is within the discount start and end dates, if defined. *Discount hierarchy:* If the customer has more than one eligible membership that carries a discount percentage, the highest discount percentage applies. Additionally, if an additional discount percentage, such as a customer discount or a promotional discount, applies to the order, the system applies this discount after subtracting the membership discount from the merchandise total. *Discount-only memberships:* If the membership is for discounting purposes only (that is, you will not be generating orders), the membership will never close automatically. Even after the discount end date passes, the membership will remain active, although the discount will no longer apply to new orders. You can override the discount percentage only if the membership program's type allows changes. See *Working with Membership Programs (WWMP)*. Numeric, 5 positions with a 2-place decimal; optional.

Field	Description
Pay type	The pay type to apply to orders generated for the customer membership. Pay type codes are defined in and validated against the Pay Type table. See *Working with Pay Types (WPAY)*. *Required for order generation:* A customer membership requires payment information unless it is for discounts only. If the customer membership does not have payment information when you generate orders, it will not be selected for order generation,; instead, it will appear on the *Memberships in Error Report*, produced when you generate membership orders. *Validation:* You can enter only the following payment categories for a customer membership: • prepaid • credit card Changes you make to a customer membership do not affect any orders you have already generated for the membership. *Tokenization:* If a customer membership is purchased with a credit card, the cardToken and customerToken captured on the payment in the Original/Parent order is stored with the Customer Membership (WWCM) record. When the child membership order is generated (EGMO), it stores those same tokens with the Order Payment Method. Numeric, 2 positions; optional.
Cash amount	The amount of cash to apply to the customer membership. You can enter a cash amount for a prepaid payment type only. *When you generate an order:* The system updates the cash amount available for the membership each time you generate an order against it. For example, if there is a $100.00 prepayment against the membership, and you generate an order for $20.00, the system reduces the cash amount for the membership to $80.00. *Updating the cash amount:* Your entry should represent the actual amount now available for the membership. *Example:* A customer prepays with two $50.00 checks for a total of $100.00. You generate an order for $20.00, and the system reduces the cash amount for the membership to $80.00. Subsequently, a $50.00 check from the customer is returned for insufficient funds. You need to enter a cash amount of $30.00 ($80.00 - $50.00) to update the cash amount correctly. Any cash amount you enter for a customer membership does not apply to existing orders you have already generated. See *About Entering Cash Amounts for a Customer Membership*. Numeric, 13 positions with a 2-place decimal; required if you enter a prepaid payment type.
CC Last 4	The last four digits of the credit card number. From the CC Last 4 field in the Customer Membership table. If you use credit card encryption, the system does not encrypt the value in this field. Alphanumeric, 4 positions; display-only.

Field	Description
Expiration date	The last date when the credit card number is valid. An expiration date is required if you enter a credit card pay type; otherwise, entry is prohibited. *Validation:* The system validates that the expiration date has not already passed when you select *OK* at this screen. Additionally, the system checks the expiration date as part of the authorization process when you generate a pick slip for a membership order. Numeric, 4 positions (in user date format); required for a credit card pay type.
Default source	The source code to use when generating orders for the membership. If a source code was specified for the membership program it defaults here, but you can override it. The system validates that the source code you enter is current, valid and not restricted. The source code you enter here defaults to the Original source field if you are creating the membership through the Work with Customer Memberships menu option. If this source code matches the source code in the *Default Unknown Source Code (I58)* system control value, the system updates the source code on the order header to the source code associated with the offer on the first order detail line; see *Default Unknown Source Code Logic*. Changes you make to a customer membership do not affect any orders you have already generated for the membership. Source codes are defined in and validated against the Source Code table; see *Working with Source Codes (WSRC)*. You can override the default source only if the membership program's type allows changes. See *Working with Membership Programs (WWMP)*. Alphanumeric, 9 positions; required.
Original source	The original source code associated with the customer membership. If you create the customer membership through *Working with Customer Memberships (WWCM)*, the source code assigned to the membership program defaults. If you create the customer membership through order entry, the source code from the order header defaults. This code is used for reporting and tracking purposes only. Changes you make to a customer membership do not affect any orders you have already generated for the membership. You can override the original source only if the membership program's type allows changes. See *Working with Customer Memberships (WWCM)*. Alphanumeric, 9 positions; required.

Field	Description
Ship via	The ship via to use for orders you generate for the membership program. The ship via specified for the membership program (if any) defaults here, but you can override it. *Invalid SCF/ship via combination:* If the ship via for the customer membership is not valid for the shipping address on the order, the order will appear on the Print Phone Errors listing report when you generate orders and will remain in error status (*E*) until you correct the error in batch order entry; also, the customer membership will be in-process (*I*) status. Changes you make to a customer membership do not affect any orders you have already generated for the membership. You can override the ship via only if the membership program's type allows changes. See *Working with Customer Memberships (WWCM)*. Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA). *Auto-selection of best way ship via:* If the ship via for the customer membership matches the Best Way Ship Via for Auto-Assignment (J67), the system automatically selects the “best way” ship via with the lowest overall shipping costs when you generate a membership order. However, in this situation, the Order Total Window (Reviewing the First Order Total) displayed in order entry or in *Working with Customer Memberships (WWCM)* does not include any shipping charges. See the *Best Way Ship Via for Auto-Assignment (J67)* system control value for a discussion on auto-assignment. **Note:** You cannot create a standard customer membership at this screen if the membership type does not allow changes and there is no default ship via specified for the membership program, because the ship via code is a required field. See *Working with Customer Memberships (WWCM)* for more information on setting up membership programs. Numeric, 2 positions; required.

Field	Description
Ship complete	Controls whether all items on each order you generate for the customer membership must ship together. Valid values are: • *selected* = Order must ship complete; available items will be held until each item is available and the entire order can ship together. • *unselected* = Items can be shipped as they become available, or backordered and shipped at a later date. The setting from the membership program defaults, but you can override it. Changes you make to a customer membership do not affect any orders you have already generated for the membership. You can override the ship complete flag only if the membership program's type allows changes. See *Working with Customer Memberships (WWCM)*.
Recip (Recipient)	The customer sold-to number identifying the recipient for the customer membership. You can select the *Customer#* box to advance to the Select Customer Sold To pop-up window; this window permits scanning on various types of information, such as postal code, name, telephone number and email address. If you do not select a customer through this window, you advance to the *Customer Membership Recipient Screen (Change Mode)*. Changes you make to a customer membership do not affect any orders you have already generated for the membership. Customer sold-to numbers are defined in and validated against the Customer Sold To table. See *Creating and Updating Sold-to Customers (WCST)*. Numeric, 9 positions; optional.
Ship to #	A number to identify a permanent ship-to customer associated with the Recipient customer for the membership. See *Creating and Updating Ship-to Customers (WCST)*. The system validates your entry against the ship-to customers associated with the membership recipient. To select a ship-to customer associated with the customer who ordered the membership, you should enter that same customer sold-to number in the Recipient field. Changes you make to a customer membership do not affect any orders you have already generated for the membership. Numeric, 3 positions; optional.
Recipient name	The name of the recipient of the customer membership, or the recipient's ship-to, if selected; this is the customer who will actually receive the order(s) for the membership. Alphanumeric, 41 positions; display-only.

Field	Description
Gift	Indicates whether the order is flagged as a gift. Valid values are: • *Selected* = This customer membership generates gift orders. • *Unselected* = This customer membership does not generate gift orders. Flagging an order as a gift can control: • how pick slips sort and break into documents • whether prices print on pick slips • printing of gift acknowledgments See *Performing Pick Slip Generation*. Changes you make to a customer membership do not affect any orders you have already generated for the membership. The *Default "Gift Order" Flag (D14)* system control value does not affect the default setting for this field.
Shipments	The total number of orders generated for this customer membership. If a generated order fails the edit and is in error status, this total is not updated until you correct the error(s) and reprocess the order batch. Numeric, 3 positions; display-only.
Shipment $	The total dollar value of all orders generated for the membership, including merchandise, tax, and all related charges. If a generated order fails the edit and is in error status, this total is not updated until you correct the error(s) and reprocess the order batch. Numeric, 20 positions with a 2-place decimal; display-only.
Gift message	A message to print on the pick slip for gift orders you generate for the membership. This message prints only if your unique printing program supports it. Changes you make to a customer membership do not affect any orders you have already generated for the membership. The message will print on the pick slip for the next order you generate; once the message prints, the system deletes the message from the customer membership. Alphanumeric, three 60-position fields; optional.

Screen Option	Procedure
Create a customer membership recipient	Select *Recipient* to advance to the *Customer Membership Recipient Screen (Change Mode)*.
Work with an alternate shipping address for the customer membership	Select *Alt Ship* to advance to the *Alternate Shipping Address Screen (Change Mode)*. You would use an alternate address if the customer wants the membership orders sent to a different address, such as a vacation home, for a limited period of time.
Create a new customer as a recipient for the membership, or work with an existing membership recipient	Select *Alt Ship* to advance to the *Customer Membership Recipient Screen (Change Mode)*. A recipient customer has a separate customer sold-to record in your company.
Work with items for the customer membership	Select *Details* to advance to the *Customer Membership Details Screen*.

Screen Option	Procedure
Delete the customer membership	Select *Delete*. You can delete a customer membership only if you have not already generated any orders; otherwise, you must cancel the membership. See *Deleting a Customer Membership*.
Change the next release date for the membership	Select *Release Date* to display the Override Release Date pop-up window. See *Changing Release Date or Rotation for a Customer Membership*.

About Entering Cash Amounts for a Customer Membership

Overview: You can enter cash amounts for standard customer memberships in order to use the cash as a payment method on generated customer orders.

Update to cash amount: When you generate an order for the customer membership, the system reduces the total cash amount to reflect the amount allocated to the new order. For example, if the total cash amount is $100.00, and you generate an order for $20.00, the system reduces the cash amount for the customer membership to $80.00.

You can update the cash amount after you have begun to generate orders for the customer membership; however, your reset to the cash amount total should reflect the total amount that has already been allocated to generated orders. Your entry should be equal to the new total cash amount available for the customer membership.

Example: A customer prepays with two $50.00 checks for a total of $100.00. You generate an order for $20.00, and the system reduces the cash amount for the membership to $80.00. Subsequently, a $50.00 check from the customer is returned for insufficient funds. You need to enter a cash amount of $30.00 ($80.00 - $50.00) to update the cash amount correctly.

When the cash amount is exhausted: The system will continue to generate orders for the membership; however, these orders will be put on hold because of the balance due. You must use order maintenance to apply cash to these orders and change their status to open.

About existing orders: Any cash amount you enter does not apply to existing orders that have been generated for the membership. You must use order maintenance to enter payment information for these orders.

Canceling a prepaid membership: The system does not generate a refund for the remaining cash amount for the membership. You will need to create and generate the refund separately.

Refund when membership closes: When you generate the last order for a prepaid membership, the system creates a refund for any remaining prepayment amount. The system closes a membership when all items have been included on generated orders the number of times specified in the Number of times to include field.

Customer Membership Details Screen

Purpose: Use this screen to enter or review items to include on a standard customer membership. This option is not available for loyalty customer memberships.

How to display this screen: Select *Details* at the *Customer Membership Screen (Change Mode)*, or select *Details* for a standard customer membership at the *Work with Customer Memberships Screen*.

> **Note:**
>
> You can change information on this screen only if the membership program's type allows changes; otherwise, each field is display-only. See *Working with Membership Programs (WWMP)* Additionally, if you advanced to this screen from the Customer Membership Screen in Display mode, each field on this screen is display-only and cannot be changed.

Field	Description
Membership header information	
Customer #	The number that identifies the customer who ordered the customer membership. The customer's name appears to the right. Number: numeric, 9 positions; display-only. Name: alphanumeric, 41 positions; display-only.
Membership ID	The code representing the membership program. The description of the program appears to the right. ID: alphanumeric, 12 positions; display-only. Description: alphanumeric, 30 positions; display-only.
Type	A code that identifies the type of membership program. Alphanumeric, 2 positions; display-only.
Last order date	The last date when an order was generated for the customer membership. Numeric, 6 positions (in user date format); display-only.
Next release date	The next date when the *Generating Membership Orders (EGMO)* program should consider the customer membership eligible for order generation. Numeric, 6 positions (in user date format); display-only.
Next rot (Next rotation)	The next rotation due to be included when you generate membership orders. You assign a rotation to an item on a customer membership to indicate when it should be included in an order. A rotation of *1* indicates that the item should be included on the first order you generate. A rotation of *2* indicates that the item should be included on every other order, and so on. A rotation of *0* indicates that the item should be included on every order. If the membership does not have differing rotations (that is, each order includes the same item(s), the next rotation will always be *1*. Numeric, 3 positions; display-only.
Membership detail information	

Field	Description
Item	An item to include on membership orders you generate. Items that are currently included in the membership, including items that defaulted from the membership program, appear below. If you have not already generated an order that includes the item, you can change the item code itself by selecting *Change* for the item to advance to the *Customer Membership Detail Screen (Change Mode)*. You cannot delete an item from a customer membership. To cancel an item, select *Cancel* for the item; see *Canceling an Item on a Customer Membership*. Item codes are defined in and validated against the Item table. See *Performing Initial Item Entry (MITM)*. Alphanumeric, 12 positions; optional.
SKU	The item's additional characteristics, such as its color and size. If you have not already generated an order that includes the item, you can change the SKU by selecting *Change* for the item to advance to the *Customer Membership Detail Screen (Change Mode)*. Alphanumeric, three 4-position fields; required if the item has SKUs.
Qty ord (Quantity ordered)	The quantity of the item to include in an order you generate for the membership. *Entering a new item:* This field is required if you are entering a new item for the customer membership. *Default from membership program:* The quantity defaults from the membership program if the item itself defaulted; however, you can override the quantity by selecting *Change* for the item to advance to the *Customer Membership Detail Screen (Change Mode)*. Numeric, 5 positions; required.
Rot (Rotation)	The rotation in which to include the item when you generate orders. Items with a rotation of *1* will be included in the first order you generate, while items with a rotation of *2* will be included in the second order, and so on. Items with a rotation of *0* will be included in each order you generate. After creating a number of orders that is a multiple of the highest rotation assigned to an item, the cycle repeats. *For example:* A membership includes these items and rotations: AB100: rotation = *0* CD200: rotation = *1* EF300: rotation = *2* The items will be included in the following pattern: First order: AB100, CD200 Second order: AB100, EF300 Third order: AB100, CD200 (cycle repeats) *Entering an item:* This field defaults to *1*, but you can override it. Set the rotation to *0* to include the item in every order you generate. *Default from membership program:* The rotation defaults from the membership program if the item itself defaulted; however, you can override the rotation by selecting *Change* for the item to advance to the *Customer Membership Detail Screen (Change Mode)*. Numeric, 3 positions; required.

Field	Description
Tms inc (Number of times to include)	The total number of times to include the item on an order. If this field is blank or *0*, there is no limit to the number of times to include the item. *Entering an item:* Leave this field blank to include the item indefinitely. *Default from membership program:* The number of times to include defaults from the membership program if the item itself defaulted; however, you can override the number of times to include by selecting *Change* for the item to advance to the *Customer Membership Detail Screen (Change Mode)*. Numeric, 3 positions; optional.
N/C (No charge)	Indicates whether the item is to be included free of charge. Valid values are: • *Selected* = The item is included free of charge • *Unselected* = The item has a price *Entering an item:* Leave this field blank if the item should have a price. Otherwise, *select* this field; you will also need to specify a price override reason code, below. *Default from membership program:* If an item was flagged as “no charge” for the membership program, it defaults here; however, you can override this flag by selecting *Change* for the item to advance to the *Customer Membership Detail Screen (Change Mode)*.
Override price	The price to charge for the item on orders you generate for customer memberships. You would specify a price override if you do not want the system to use the regular pricing hierarchy for membership orders. *Entering an item:* Leave this field blank to have the system use its normal pricing hierarchy to determine the price of the item when you generate orders. Otherwise, enter an override price; you will also need to specify a price override reason code. *Default from membership program:* The price override, if any, defaults from the membership program if the item itself defaulted; however, you can change or delete the price override by selecting *Change* for the item to advance to the *Customer Membership Detail Screen (Change Mode)*. Numeric, 13 positions with a 2-place decimal; optional.
Ovr rsn (Price override reason code)	The price override reason code for the system to use when adding the item to the order at no charge, or with an override price. *Entering an item:* Enter a price override reason code if you have flagged the item as "no charge" or entered an override price. *Default from membership program:* The price override reason code, if any, defaults from the membership program if the item itself defaulted; however, you can change this information by selecting *Change* for the item to advance to the *Customer Membership Detail Screen (Change Mode)*. Price override reason codes are defined in and validated against the Price Override Reason Code table. See *Establishing Price Override Reason Codes (WPOR)*. Alphanumeric, 1 position; required if the item is flagged as "no charge" or if you enter a price override.

Field	Description
Sts	The status of the item on the customer membership. Valid values are: • *X* = Closed. The item has been included on orders as many times as the number of times to include. • *C* = Canceled. The item or the entire membership have been canceled. • *A* = Active. The item is eligible to be included in future orders. Alphanumeric, 1 position; display-only.
Tms shp (Times shipped)	The total number of times the item has been included on an order you have generated for the membership. The system updates this number when you generate orders. If the order is in error when you first generate, the system does not update this number until you correct the error(s) and reprocess the order batch. Numeric, 3 positions; display-only.
Qty shp (Quantity shipped)	The total number of units of the item that has been included on orders you have generated for the membership. The system updates this number when you generate orders. If the order is in error when you first generate, the system does not update this number until you correct the error(s) and reprocess the order batch. Numeric, 5 positions; display-only.
Description	The description of the item (*not* the SKU, even if the item has SKUs). Alphanumeric, 120 positions; display-only.
Avail (Quantity available)	This is the quantity of this item that is available to sell across all shippable warehouses. A negative quantity indicates that the SKU is unavailable in your inventory and is backordered. The system displays this information only if the status of the item on the membership is active. Numeric, 7 positions; display-only, updated by the system.
Exp (Expected date)	The next date when a delivery of this SKU is expected, based on an open purchase order. No date displays if there are no open purchase orders for this SKU. This date is displayed for drop ship items only if the *Assign Drop Ship Expected Ship Date (I59)* system control value is *selected*. See that system control value for more information. The system displays this information only if the status of the item on the membership is active. Numeric, 6 positions (in user date format); display-only.

Adding an item to a customer membership:

1. Complete the Item and Quantity ordered fields and any optional fields.
2. The system validates your entry and highlights any fields you need to correct. Correct any fields and select *OK* again.
3. The system clears your entries from the enterable fields, and displays the item you have added at the *end* of the listing of items for the customer membership.

Screen Option	Procedure
Change an item on the customer membership	Select *Change* for an item to advance to the *Customer Membership Detail Screen (Change Mode)*.
Cancel an item on the customer membership	Select *Cancel* for an item to cancel it. See *Canceling an Item on a Customer Membership*.
Display an item on the customer membership	Select *Display* for an item to advance to the Customer Membership Detail screen (Display mode0. You cannot change any information in this mode. See *Customer Membership Detail Screen (Change Mode)* for field descriptions.
Review current pricing for an item	Select *Pricing* for an item to advance to the Display Quantity Pricing pop-up window. See *Working with Items on the Order*.
Review open purchase orders for an item	Select *Open POs* for an item to advance to the Display Open Purchase Orders Screen. See *Working with Items on the Order*.
Work with header information for the customer membership	Select *Header* to advance to the *Customer Membership Screen (Change Mode)*.
Review the dollar total for the next order to be generated	Select *Next order total* to display the *Order Total Pop-Up Window (Reviewing the Next Order Total)*.

Customer Membership Detail Screen (Change Mode)

Purpose: Use this screen to change an item on a standard customer membership.

> **Note:**
>
> You can change an item on a membership only if the membership program's type allows changes, the membership is Active (*A*), and the item's status is also Active (*A*). See *Customer Membership Details Screen*.

How to display this screen: Select *Change* for an active item at the *Customer Membership Details Screen*.

Field	Description
Customer#	A unique number to represent the sold-to customer who ordered the membership. Numeric, 9 positions; display-only.
Membership ID	A code that identifies the membership program in which the customer is enrolled. Alphanumeric, 12 positions; display-only.

Field	Description
Status	The status of the item on the customer membership. Valid values are: • *Closed* = The item has been included on orders as many times as the number of times specified. • *Cancelled* = The item or the entire membership have been canceled. • *Active* = The item is eligible to be included in future orders. Display-only.
Item	The item on the customer membership. If you have not already generated an order that includes the item, you can change the item code itself; otherwise, the item field is display-only. Item codes are defined in and validated against the Item table. See *Performing Initial Item Entry (MITM)*. Alphanumeric, 12 positions; required or display-only.
SKU	The item's additional characteristics, such as its color and size. If you have not already generated an order that includes the item, you can change the SKU; otherwise, the SKU field is display-only. See *Canceling an Item on a Customer Membership*. Alphanumeric, three 4-position fields; required if the item has SKUs or display-only.
Order quantity	The quantity of the item to include in an order you generate for the membership. Numeric, 5 positions; required.
Rotation	The rotation in which to include the item when you generate orders. Items with a rotation of *1* will be included in the first order you generate, while items with a rotation of *2* will be included in the second order, and so on. A rotation of *0* indicates that the item will be included in every order. If all items on the membership are assigned a rotation of *1* (the default), they will all be included on every order. Numeric, 3 positions; required.
# of times to include	The total number of times to include the item on orders you generate for the membership. Once the item has been included in this number of orders, the system changes its status to closed (*X*). If you do not define a number of times to include, the item will be included in generated orders until you cancel the item, or the membership itself is closed. If a number of times to include was defined for the item on the membership program, it defaults for the customer membership. You can change this number at the *Customer Membership Detail Screen (Change Mode)*. Numeric, 3 positions; display-only.
No charge	Indicates whether the item is to be included free of charge. Valid values are: • *No Charge* = The item is included free of charge • *Priced* = The item has a price If an item is to be included at no charge, you must also specify a price override reason code.

Field	Description
Price override code	The price override reason code for the system to use when adding the item to the order at no charge, or with an override price. Enter a price override reason code if you have flagged the item as "no charge" or entered an override price. Price override reason codes are defined in and validated against the Price Override Reason Code table. See *Establishing Price Override Reason Codes (WPOR)*. Alphanumeric, 1 position; required if the item is flagged as "no charge" or if you enter a price override.
Price override	The price to charge for the item on orders you generate for customer memberships. You would specify a price override if you do not want the system to use the regular pricing hierarchy for membership orders. Leave this field blank to have the system use its normal pricing hierarchy to determine the price of the item when you generate orders. Numeric, 13 positions with a 2-place decimal; optional.
# of shipments	The number of times the item has been included on orders generated to date for the customer membership. Numeric, 3 positions; display-only.
Date of last shipment	The last date when an order that included the item was generated for the membership. Numeric, 6 positions (in user date format); display-only.
Quantity shipped	The total number of units of the item that has been included on orders you have generated for the membership. Numeric, 5 positions; display-only.

Note:

Changes you make to an item on a membership do not affect any open, unshipped orders you have already generated for the membership.

Canceling an Item on a Customer Membership

Purpose: When you cancel an item from a standard customer membership, the item will not be included in any more orders that you generate for the membership, and the item's status on the membership changes to *Canceled* (*C*).

Note:

If there are any open, unshipped orders that were generated for the customer membership that include the item, the status of the item on the open order(s) remains open. You must use order maintenance to cancel the item and prevent it from shipping to the customer.

How to cancel: Select *Cancel* for an item at the *Customer Membership Details Screen* to exclude the item from orders you will generate for the membership in the future. The system displays the Confirm Cancel Request pop-up window.

Enter cancel reason: If you select *OK* at the Confirm Cancel Request pop-up window, the Enter Cancel Reason window opens. This window indicates the item you are canceling from the membership and requires a cancel reason code. The cancel reason code is a 2-position, numeric code, defined in and validated against the Cancel Reason Code table; see *Establishing Cancel Reason Codes (WCNR)*.

The system stores the cancel reason code for the item in the Customer Membership Detail table.

Canceling an item on a membership does not affect any open, unshipped orders you have already generated for the membership.

Last item? If you cancel the last remaining item on a customer membership, the membership's status changes to *Complete*. In this situation, the system does not send the membership cancellation email.

Order Total Pop-Up Window (Reviewing the Next Order Total)

Purpose: Use this window to review the projected dollar total for the next order due to be generated for a standard customer membership.

How to display this screen: Select *Display next order total* at the *Customer Membership Details Screen*.

About this window: This window indicates the next rotation eligible for order generation.

Order total an estimate: The order total that appears in this window includes merchandise and tax. It also includes projected freight charges if the ship via on the order does not match the *Best Way Ship Via for Auto-Assignment (J67)*. This order total is an estimate only. The actual order total when you generate the first order may vary, depending on changes to pricing, using various freight methods, including special charges, and so on.

Loyalty Customer Membership Screen

Purpose: Use this screen to review or change the information on a customer loyalty membership. The system creates customer loyalty memberships automatically based on the customer's order history, sales history, or customer class. See *Loyalty Memberships* for an overview.

How to display this screen: Select *Change* or *Display* for a customer loyalty membership.

> **Note:**
>
> Regardless of whether you select *Change* or *Display* for the membership, you cannot change any information at this screen if the *Change customer membership* flag for the membership type is *unselected*.

Field	Description
Customer #	A unique number to identify the customer who qualified for the loyalty membership. The customer's name or company name is displayed to the right. Number: numeric, 9 positions; display-only. Name: alphanumeric, 41 positions; display-only.
Membership ID	A code that identifies the loyalty membership program in which the customer is enrolled. The description displays to the right. ID: alphanumeric, 12 positions; display-only. Description: alphanumeric, 30 positions; display-only.
Type	A code that identifies the type of membership program. See *Working with Membership Types (WWMT)* for more information. Alphanumeric, 2 positions; display-only.
Status	The current status of the loyalty membership. Possible statuses are: • *Active* = The customer loyalty membership is active; the system will apply the discount, free freight, or backorder priority on new orders if the Discount end date has not been reached. • *Inactive* = The customer loyalty membership has been deactivated, but you can reactivate it. The system does not apply the discount, free freight, or backorder priority on new orders. • *Canceled* = The customer loyalty membership has been canceled. You can cancel a customer membership by selecting *Cancel* at the *Work with Customer Memberships Screen*. Display-only.
Created on	The date when the system created the customer loyalty membership. The background jobs create customer loyalty memberships based on order activity that affects the customer's order history, external sales dollars, or customer class. Numeric, 6 positions (in user date format); display-only.
Changed on	The most recent date when the customer loyalty membership was updated. Numeric, 6 positions (in user date format); display-only.
Cancel reason	The cancel reason you used when canceling the customer loyalty membership. The description is to the right. Displayed only for loyalty memberships in *Canceled* status. Reason: numeric, 2 positions; display-only. Description: alphanumeric, 30 positions; display-only.
Cancelled on	The date when the customer loyalty membership was canceled. Displayed only for loyalty memberships in *Canceled* status. Numeric, 6 positions (in user date format); display-only.
Discount start date	The date when the loyalty discount and other options (free freight, backorder priority) become effective. The same as the Created on date. Numeric, 6 positions (in user date format); display-only unless the *Change customer membership* flag for the loyalty membership type is selected.

Field	Description
Discount end date	The last date to apply the loyalty discounts and other options (free freight, backorder priority). Calculated by the system when it creates the customer loyalty membership, based on the Discount duration specified for the loyalty program. See *Working with Membership Programs (WWMP)* for more information. Numeric, 6 positions (in user date format); display-only unless the *Change customer membership* flag for the loyalty membership type is selected.
Discount %	The discount percentage that defaults to the customer's orders based on membership in the loyalty program. The percentage defaults from the Discount percent specified for the loyalty program. See *Working with Membership Programs (WWMP)* for more information. Numeric, 5 positions with a two-place decimal; display-only unless the *Change customer membership* flag for the loyalty membership type is selected.
Free freight	Selecting this field indicates that free freight defaults on the customer's orders. This setting defaults from the Free freight setting for the loyalty program. See *Working with Membership Programs (WWMP)* for more information. Display-only unless the *Change customer membership* flag for the loyalty membership type is *selected*.
Priority B/O	Indicates the backorder priority, if any, that defaults to the customer's orders. *9* indicates the highest priority, while *0* is the lowest priority. This setting defaults from the Priority B/O field for the loyalty program. See *Working with Membership Programs (WWMP)* for more information. Numeric, 1 position; display-only unless the *Change customer membership* flag for the loyalty membership type is *selected*.

Changing Customer Membership Status, Rotation or Release Date

Canceling a Customer Membership

Select *Cancel* for a membership at the *Work with Customer Memberships Screen* to display the Confirm Cancel Request pop-up window. If you select *OK* at this window, the system displays the Enter Cancel Reason pop-up window, where you must enter a cancel reason.

Cancel reason code: This window requires a cancel reason code. The cancel reason code is a 2-position, numeric code, defined in and validated against the Cancel Reason Code table; see *Establishing Cancel Reason Codes (WCNR)*.

The system stores the cancel reason code for the item in the Customer Membership table.

You can cancel a membership only if its status is Active (*A*) or Inactive (*I*).

Cautions: Canceling a membership does *not*:

- affect any open, unshipped orders you have already generated for the membership.
- delete the membership; it remains on the system. See *Deleting a Customer Membership* on how to remove a membership you created in error.

- delete the membership item from the quote or order where it originated.
- generate a refund for the remaining cash amount for a prepaid membership. You will need to create and generate the refund separately.

> **Note:**
>
> Canceling a loyalty membership does not prevent the background jobs from creating a new loyalty membership for the customer the next time there is order activity.

Email notification: If the *Membership Cancellation Email Program (K77)* system control value specifies a valid program name, the system generates the membership cancellation email or *Outbound Email XML Message (CWEmailOut)* when you cancel a membership as described above. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). And see *Membership Cancellations* for a discussion.

Canceling through order maintenance: You can also cancel a standard customer membership in order maintenance by canceling the order or membership item that created the customer membership. See *Canceling a Membership Item*.

Canceling a membership in order maintenance does not generate the email notification.

You cannot cancel a loyalty membership in order maintenance, since loyalty memberships are created by the system and not by adding a membership item to an order.

Deactivating a Customer Membership

Select *Deactivate* for a membership at the *Work with Customer Memberships Screen* to change the membership's status from Active (*A*) to Inactive (*I*). The system will not generate any new orders for an inactive membership, and any discount will not apply to any orders the customer places.

You can deactivate a membership only if its current status is *Active*.

> **Note:**
>
> The system does not send a deactivation notification email to the customer if you deactivate a loyalty membership using this method. See *Loyalty Memberships* for more information.

Activating a Customer Membership

Select *Activate* for a membership at the *Work with Customer Memberships Screen* to change the membership's status from Inactive (*I*) to Active (*A*).

The system displays the Override Release Date pop-up window.

You can activate a membership only if its current status is *Inactive*.

Changing Release Date or Rotation for a Customer Membership

Select *Change release date/rotation* for a standard customer membership at the *Work with Customer Memberships Screen* to display the Override Release Date pop-up window.

Release date: Enter the next date when the order should be eligible for release. The next release date must be later than the current date and the Last order date.

Note:

- *Eligible for release date change?* You can change the release date only for a standard customer membership that includes items that are scheduled for shipment on the next rotation. You can review the items on the customer membership by selecting *Details*.
- *No automatic customer notification:* If you change the release date, there is no mechanism to automatically notify the customer of the new date or change the order message that was written as a result of the *Write Order Messages for Membership Rotation (K04)* system control value.

Rotation: Enter the next rotation to use when you generate an order for the membership. The current setting to the Next rotation field defaults. The system will select items based on the rotation you enter. You cannot enter a rotation number if there are no items for the membership assigned to that rotation.

You can display this window only if the membership is currently in Active (*A*) or Inactive (*I*) status. This option is not available for loyalty customer memberships.

> **Note:**
>
> You can also display this window by selecting *Release Date* at the *Customer Membership Screen (Change Mode)*.

Summary of Status Change Options for Customer Memberships

The options available for changing a membership's status or release date at the *Work with Customer Memberships Screen* are:

If current status is...	Then you can...				
	Cancel	Activate	Deactivate	Change Release Date	Change Rotation
				Note: Standard customer memberships only. Not available for loyalty membersh	

If current status is...	Then you can...				
	Cancel	Activate	Deactivate	Change Release Date	Change Rotation
				ip s	
Active	Yes	No	Yes	Yes	Yes
Inactive	Yes	Yes	No	Yes	Yes
Canceled	No	No	No	No	No
Completea	No	No	No	No	No
In Processa	No	No	No	No	No

Display Membership Orders Screen

Purpose: Use this screen to review the orders that have been generated for a standard customer membership and to select an order for inquiry. Only orders that have been generated through the selected customer membership appear on this screen.

How to display this screen: Select *Orders for customers* for a membership at the *Work with Customer Memberships Screen*.

> **Note:**
>
> This option is not available for loyalty customer memberships.

Field	Description
Customer #	A unique number to represent the sold-to customer who ordered the membership. The name of the customer appears to the right. Number: numeric, 9 positions; display-only. Name: alphanumeric 41 positions; display-only.
Membership ID	A code that identifies the membership program in which the customer is enrolled. Alphanumeric, 12 positions; optional.
Sequence number (Unlabeled field to the right of the membership ID)	A unique number to identify the membership program for this customer. The sequence number is separated from the membership ID by a hyphen (-). If there is only one customer membership for the same customer and membership program, the sequence number will be *1*. Numeric, 3 positions; display-only.
Date	The date the order was generated. Numeric, 6 positions (in user date format); optional.
Order# (Order number)	A unique number to identify the order. Numeric, 8 positions; optional.

Field	Description
Sts (Status)	The status of the order. Valid values are: • *Open* = one or more items have not yet been shipped. • *Archived* • *Backordered* • *Drop Ship* • *Held* = the order will not be eligible for shipment until you resolve the hold reason, which may be due to credit check or fraud. • *Suspended* = the order is in an unprocessed order batch. • *Error* = the order did not pass the phone order edit; you must correct all errors and resubmit the order batch to the edit process. • *Canceled* = all items have been canceled. • *Closed* = each item has been shipped. • *Sold Out* • *Purged* Optional.
Rcp (Recipient)	The number of recipients for the order. Normally, this number will be *1* unless you added a recipient in order maintenance. Numeric, 3 positions; display-only.
Order total	The total dollar value of the order. Numeric, 20 positions with a 2-place decimal; display-only.
Ent (Entity)	A code representing the entity associated with the source code on the order header. See Working with Entities (WENT). Numeric, 3 positions; display-only.
Activity	Codes that indicate whether any of the items on the order have been returned, exchanged, or backordered. Each of these valid values may appear: • *RT* = There has been one or more returns against the order • *EX* = There has been one or more exchange against the order • *BO* = One or more of the items on the order is currently backordered. Alphanumeric, three 2-position fields; display-only.
R/E date (Return/ exchange date)	The date when you last received a returned item against the order. Numeric, 6 positions (in user date format); display-only.

Screen Option	Procedure
Select an order for inquiry	*Select* an order. You advance to either the standard order inquiry header or detail screen, depending on the setting of the Default Version for Order Inquiry (C34) system control value.

Deleting a Customer Membership

Purpose: To delete a standard customer membership, you must advance to the *Customer Membership Screen (Change Mode)* and select *Delete*.

You can delete a standard customer membership only if its status is *Active* or *Inactive*, and you have not generated any orders for the membership. If you have already generated one or more orders, you will need to cancel the membership; see *Canceling a Customer Membership*.

To delete: Select *Delete* to delete the customer membership. The system displays the Confirm Delete pop-up window.

Prepaid memberships: If you have entered a cash prepayment amount, the system does not generate a refund when you delete the membership; you must do so separately.

> **Note:**
>
> This option is not available for loyalty customer memberships.

Alternate Shipping Address Screen (Change Mode)

Purpose: Use this screen to define an alternate shipping address to use for orders you generate for the standard customer membership. For example, you would use this screen to enter a vacation or summer address.

> **Note:**
>
> Your entries on this screen do not update any open, unshipped orders you have already generated for the membership.

How to display this screen: Select *Alt Ship* at the *Customer Membership Screen (Change Mode)*.

> **Note:**
>
> This option is not available for loyalty customer memberships.

When you select *Alt Ship* at the Customer Membership Screen in Display mode, the Alternate Shipping Address screen is also in Display mode. You cannot change any information in this mode.

Field	Description
Customer#	A unique number to represent the sold-to customer who ordered the membership. Numeric, 9 positions; display-only.

Field	Description
Customer name (Unlabeled field to the right of the customer number	The name of the customer who ordered the membership. Alphanumeric, 41 positions; display-only.
Order#	The order on which the customer ordered the customer membership. This field does not appear if you created the customer membership through *Working with Customer Memberships (WWCM)* Numeric, 8 positions; display-only.
Membership ID	A code that identifies the membership program in which the customer is enrolled. Alphanumeric, 12 positions; display-only.
Description (Unlabeled field to the right of the membership ID)	The description of the membership program. Alphanumeric, 30 positions; display-only.
Type	A code that identifies the type of membership program. You can use membership types to group membership programs, to control whether any of the settings for the membership program can be overridden for specific customer memberships, or to identify loyalty membership programs. Alphanumeric, 2 positions; display-only.
Name	The following 5 fields are available for you to enter the customer's full name: *Prefix* A title (such as "Mrs." or "Dr.") that precedes the customer's name. Alphanumeric, 3 positions; optional. *First Name* The customer's first name Alphanumeric, 15 positions; optional. *Initial* The initial of the customer's middle name. Alphanumeric, 1 position; optional. *Last Name* The customer's last name. Alphanumeric, 25 positions; required if company name is not present. *Suffix* An addition to the customer's full name (such as "M.D.," "Fr.," or "III"). The suffix will print on labels, reports, etc., but is not accessible to scans. Alphanumeric, 3 positions, optional.
Company	The name of the company. Alphanumeric, 30 positions; required if last name is not present.
Address	The customer's street address. This is the primary delivery address. Alphanumeric, 32 positions; required.

Field	Description
Apt./suite (Apartment/suite)	The apartment number or suite number associated with the customer's delivery address. Follow these steps to enter an apartment or suite address: 1. Enter *APT* to indicate an apartment or *STE* to indicate a suite. 2. Insert a space and enter the number of the apartment or suite, for example: *APT 4* or *STE 116*. Addresses must conform to United States Parcel Service (USPS) address formatting field description standards. For example, always precede the apartment or suite number with the appropriate abbreviation (for example, APT or STE). Alphanumeric, 10 positions; optional.
Additional address (Unlabeled fields below the street address)	Three additional lines of the customer's delivery address. If the address represents a post office box, you must enter *P.O. Box* on the first line to meet USPS delivery regulations. Alphanumeric, three 30-position lines; optional.
Postal code	The postal or zip code for this customer. This code represents a delivery area. Required only if the Require postal code? flag is selected for the country; see *Setting Up the Country Table (WCTY)*. If a postal code is required, it is validated against the Zip/City/State (Postal Code) table; see *Setting Up the Zip/City/State (Postal Code) Table (WZIP)*. **Note:** The system fills in the City and State fields appropriately if you set up the Postal Code/City/State table and you enter a valid postal code. Alphanumeric, 10 positions; required or optional based on country.
City	The city where the customer lives or receives mail or shipments. Alphanumeric, 25 positions; required.
State	The state or province where the customer lives or receives mail or shipments. State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). Required only if the Require state? flag is selected for the country. The system validates that the state you enter is assigned to the SCF for the postal code. Alphanumeric, 2 positions; required or optional based on country.
Country	The code for the customer's country. Country codes are defined in and validated against the Country table. See *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; required.

Field	Description
Delivery	Identifies a business (commercial) or residential address, and is used to calculate shipping charges for shippers that use rate tables (such as U.P.S.). The value in the *Default Delivery Code for New Order Entry Customers (D13)* system control value defaults here; however, you can override this default. If you clear this field and select *OK*, the system assigns the default delivery code to the shipping address. • *Business* = Business rate table determines shipping charges. • *Residential* = Residential rate table determines shipping charges. • *No Distinction* = No distinction between business and residence. Only *Business* and *Residential* are valid values for U.P.S. The system defines the shipper on an order as U.P.S. if the Type field in the Ship Via table = U; see *Working with Ship Via Codes (WVIA)*. Required.
Start date	The first date when orders should be shipped to the alternate address. You can leave both the Start date and Stop date blank to use the alternate address indefinitely. You can also enter a Start date and leave the Stop date blank; the system displays a message requiring you to select *OK* to confirm. You cannot complete both this field and the Start with shipment field. Numeric, 6 positions (in user date format); required if you enter a stop date.
Stop date	The last date when orders should be shipped to the alternate address. You can leave both the Start date and Stop date blank to use the alternate address indefinitely; however, the Start date or the Start with shipment field is required if you enter a Stop date. You can also enter a Start date and leave the Stop date blank; the system displays a message requiring you to select *OK* to confirm. Numeric, 6 positions (in user date format); optional.
Start with shipment	Indicates the first shipment to use the alternate shipping address. For example, if you enter *5* in this field, the fifth order and subsequent orders for the membership will be shipped to the alternate address. You cannot complete both the Start date and this field. Numeric, 3 positions; optional.
End with shipment	Indicates the last shipment to use the alternate shipping address. For example, if you enter *10* in this field, the system will use the alternate shipping address up to the tenth order, then stop. Numeric, 3 positions; optional.

Note:

You must advance to this screen from the *Customer Membership Screen (Change Mode)*, not Display mode, to enter or change an alternate address.

Your entries on this screen do not update any orders you have already created for the membership.

Screen Option	Procedure
Delete the alternate shipping address	Select *Delete*. **Note:** Deleting the alternate address from the membership will not update any open, unshipped orders for the membership.

Customer Membership Recipient Screen (Change Mode)

Purpose: Use this screen to enter information on a customer who will receive shipments on orders you generate for a standard customer membership.

Unlike the alternate shipping address, the recipient customer refers to a separate customer in the Customer Sold To table.

Note:

This option is not available for loyalty customer memberships.

Change or Create Options for a Membership Recipient

If a recipient customer is not already assigned:

- *Select a customer to assign to the membership: Click* on the arrow in the first enterable field on the screen to advance to the Select Customer Sold To pop-up window. You can use this window to select an existing sold-to customer, who will be assigned to any future orders you generate for the membership. Existing open, unshipped orders for the membership will not be updated. However, if you make any changes to the customer's name and address information at the time you are assigning the customer to the membership, both the customer's record in the Customer Sold To table and any existing orders will be updated with the new information.
- *Create a new customer to assign to the membership:* Complete the fields on this screen to create a new customer sold-to, who will be assigned to any future orders

you generate for the membership. Existing open, unshipped orders will not be updated.

If a recipient customer has already been assigned:

- *Change the assigned customer's name and address information:* Any changes you make to the customer's name and address information update both the customer's record in the Customer Sold To table and any existing orders.
- *Assign a different customer as a recipient for the membership: Click* on the arrow in the first enterable field on the screen to advance to the Select Customer Sold To pop-up window. You can use this window to select an existing sold-to customer, who will be assigned to any future orders you generate for the membership. Existing open, unshipped orders for the membership will not be updated.
- *Remove the recipient customer from the membership:* Return to the *Customer Membership Screen (Change Mode)* and *delete* the Recipient field to clear it. Any future orders you generate for the membership will not include the recipient customer; however, existing open, unshipped orders for the membership will not be updated.

How to display this screen: You can display this screen by selecting *Alt Ship* at the *Customer Membership Screen (Change Mode)*. You can also display this screen by:

- *clicking* on the arrow in the Recip field on the *Customer Membership Screen (Change Mode)*, then selecting *Exit* at the Select Customer Sold To pop-up window.
- Selecting *Recipient* at the *Customer Membership Screen (Change Mode)*.

When you select *Alt Ship* at the Customer Membership Screen in Display mode, the Customer Membership Recipient screen is also in Display mode. You cannot change any information in this mode.

Field	Description
Sold to (Sold-to customer number)	A unique number to represent the sold-to customer who ordered the membership. Numeric, 9 positions; display-only.
Customer name (Unlabeled field to the right of the customer number)	The name of the customer who ordered the membership. Alphanumeric, 41 positions; display-only.
Customer name (Unlabeled field to the right of the customer number)	The name of the customer who ordered the membership. Alphanumeric, 41 positions; display-only.
Membership ID	A code that identifies the membership program in which the customer is enrolled. Alphanumeric, 12 positions; display-only.
Description (Unlabeled field to the right of the membership ID)	The description of the membership program. Alphanumeric, 30 positions; display-only.
Type	A code that identifies the type of membership program. You can use membership types to group membership programs, or to indicate whether any of the settings for the membership program can be overridden for specific customer memberships. Alphanumeric, 2 positions; display-only.

Field	Description
Recipient#	The sold-to customer number of the recipient assigned to the customer membership. To change the recipient number, select *Exit* to return to the *Customer Membership Screen (Change Mode)*, where you can enter a different number or select *Header* to create a new sold-to customer as a recipient for the membership. This field is blank if you have not yet assigned a recipient customer to the membership. If you complete the information on this screen, the system creates a new sold-to customer and assigns that customer as the recipient for the membership. Numeric, 9 positions; display-only.
Name	The following 5 fields are available for you to enter the customer's full name: *Prefix* A title (such as "Mrs." or "Dr.") that precedes the customer's name. Alphanumeric, 3 positions; optional. *First Name* The customer's first name Alphanumeric, 15 positions; optional. *Initial* The initial of the customer's middle name. Alphanumeric, 1 position; optional. *Last Name* The customer's last name. Alphanumeric, 25 positions; required if company name is not present. *Suffix* An addition to the customer's full name (such as "M.D.," "Fr.," or "III"). The suffix will print on labels, reports, etc., but is not accessible to scans. Alphanumeric, 3 positions, optional.
Company	The name of the company. Alphanumeric, 30 positions; required if last name is not present.
Address	The customer's street address. This is the primary delivery address. Alphanumeric, 32 positions; required.
Apt./suite (Apartment/suite)	The apartment number or suite number associated with the customer's delivery address. Follow these steps to enter an apartment or suite address: 1. Enter *APT* to indicate an apartment or *STE* to indicate a suite. 2. Insert a space and enter the number of the apartment or suite, for example: *APT 4* or *STE 116.* Addresses must conform to United States Parcel Service (USPS) address formatting field description standards. For example, always precede the apartment or suite number with the appropriate abbreviation (for example, APT or STE). Alphanumeric, 10 positions; optional.
Additional address (Unlabeled fields below the street address)	Three additional lines of the customer's delivery address. If the address represents a post office box, you must enter *P.O. Box* on the first line to meet USPS delivery regulations. Alphanumeric, three 30-position lines; optional.

Field	Description
Postal code	The postal or zip code for this customer. This code represents a delivery area. If a postal code is required, it is validated against the Zip/City/State (Postal Code) table; see *Setting Up the Zip/City/State (Postal Code) Table (WZIP)*. **Note:** The system fills in the City and State fields appropriately if you set up the Postal Code/City/State table and you enter a valid postal code. Alphanumeric, 10 positions; required or optional based on country.
City	The city where the customer lives or receives mail or shipments. Alphanumeric, 25 positions; required.
State	The state or province where the customer lives or receives mail or shipments. State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). Required only if the Require state? flag is selected for the country. The system validates that the state you enter is assigned to the SCF for the postal code. Alphanumeric, 2 positions; required or optional based on country.
Country	The code for the customer's country. The value in the *Default Country for Customer Address (B17)* system control value defaults, but you can override it. Country codes are defined in and validated against the Country table. See *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; required or optional, based on country.
Delivery	Identifies a business (commercial) or residential address, and is used to calculate shipping charges for shippers that use rate tables (such as U.P.S.). The value in the *Default Delivery Code for New Order Entry Customers (D13)*system control value defaults here; however, you can override this default. If you clear this field and select *OK*, the system assigns the default delivery code to the shipping address. • *Business* = Business rate table determines shipping charges. • *Residential* = Residential rate table determines shipping charges. • *No Distinction* = No distinction between business and residence. Only *Business* and *Residential* are valid values for U.P.S. The system defines the shipper on an order as U.P.S. if the Type field in the Ship Via table = U; see *Working with Ship Via Codes (WVIA)*. Required.

Field	Description
Gift	Indicates whether the order is flagged as a gift. Valid values are: • *Selected* = This customer membership generates gift orders. • *Unselected* = This customer membership does not generate gift orders. Flagging an order as a gift can control: • how pick slips sort and break into documents • whether prices print on pick slips • printing of gift acknowledgments See *Performing Pick Slip Generation*. The *Default "Gift Order" Flag (D14)* system control value does not affect the default setting for this field.
Day	The customer's daytime phone number. Alphanumeric, 14 positions; optional.
Eve	The customer's evening phone number. Alphanumeric, 14 positions; optional.
Fax or Mobile	The customer's fax machine or mobile phone number. The *Third Phone Number Type (L53)* system control value determines the label for this field. Alphanumeric, 14 positions; optional.
Email address	The customer's email address. See *Email Address Validation* for an overview of how the system verifies that the email address you enter is formatted correctly. *Primary email address:* A plus sign (+) next to the email address indicates that there are additional email addresses on file for the customer; the email address on this screen is the customer's primary email address, which displays on screens that include the customer email address and defaults in order entry. If you enter a new email address, the address you enter becomes the customer's current primary email address, although the existing email addresses for the customer remain in the Customer Sold To Email table. *Entering a new email address:* If you overwrite the existing email address in this field, the system flags your entry as the primary email address for the customer, but retains the previous email address in the Customer Sold To Email table. In order to delete the previous email address, you need to prompt (by clicking on the right-facing arrow) to display the *Select Customer Email Address Screen* and delete the previous email address there. See *Working with Customer Email Addresses* for an overview. *Deleting the email address:* Similar to entering a new email address, if you delete the email address at this screen, the system removes the primary email flag for the address but retains the address in the Customer Sold To Email table. Alphanumeric, 50 positions; optional.

Generating Membership Orders (EGMO)

Purpose: Use the Generate Customer Membership Orders menu option to generate orders for standard customer memberships.

In this topic:

- *Generate Membership Orders Screen*
- *Membership Order Generation Process*
- *Release Membership Orders (RMEM)*
- *Memberships in Error Report*
- *Active Procedure Log*

Generate Membership Orders Screen

How to display this screen: Enter *EGMO* in the Fast path field at the top of any menu or select Generate Membership Orders from a menu.

Field	Description
Up to release date	The latest release date for the system to consider when evaluating customer memberships for order generation. Only standard memberships whose next release date is on this date or earlier are eligible to generate orders. The current date defaults, but you can override it. Numeric, 6 positions (in user date format); required.
Order date	The system assigns the date you enter here as the Order date and Entered date for each generated membership order; however, demand updates (such as Order Billing History) use the actual system date. The current date defaults, but you can override it to a future date. **Note:** The order date you enter here is included in the order confirmation email, even if you enter a future date. If the order is eligible for an order confirmation email and the order is in open or held status, the background job generates the order confirmation immediately, regardless of whether the order date is in the future. See *Updates During Background Processing* for a listing of tables updated by the ORDR_ASYNC job, including demand updates. Numeric, 6 positions (in user date format); required.

Field	Description
Select membership types	The membership type(s) for the system to consider when evaluating customer memberships for order generation. You can enter up to five membership types, or leave all these fields blank to evaluate all memberships regardless of type. Membership types are defined in and validated against the Membership Type table; see *Working with Membership Types (WWMT)*. *Discount-only memberships:* If you sell memberships for the purpose of applying a discount to customer orders, but that do not generate orders, you can use these fields to select other membership types and exclude the discount-only type. Otherwise, any discount-only memberships will appear on the memberships in error report because they do not include any items. **Note:** The system does not evaluate loyalty membership types for order generation. Alphanumeric, five 2-position fields; optional.

Instructions: Follow these steps at the *Generate Membership Orders Screen* to start the *Membership Order Generation Process*:

1. Complete the required fields and any optional fields as described above.
2. Select *OK*. The system validates your entries and highlights any fields you need to correct. Correct any fields and select *OK* again.
3. Select *Generate Orders*.

For more information: See *Membership Overview*.

Membership Order Generation Process

Process overview: You can choose to generate membership orders based on the membership type and release date. When you begin the generation process, the system starts the *GEN_ORDERS* job, which:

#	Step
1.	Selects each customer membership that is eligible to generate an order, based on the membership's status (which must be active) and next release date (which must be on or earlier than the selection date). If you specify one or more membership types, the membership must be one of the specified types, as well.
2.	Evaluates the customer membership for errors, and includes these memberships on the *Memberships in Error Report*. Errors are: • Incomplete or incorrect payment information • No items for the current rotation
3.	Selects each item to include on generated orders, based on the item's status (which must be active) and the rotation number (which must be the same as the current rotation for the membership header or the rotation must be 1 or zero, indicating to always include the item).

#	Step
4.	Creates orders, which it then evaluates in the same way as orders you create through the generic order API; this edit flags errors such as a missing item price or invalid SCF/ship via combination.
5.	Automatically assigns the “best way” ship via with the lowest overall shipping charges to the order if the ship via for the customer membership matches the *Best Way Ship Via for Auto-Assignment (J67)*; see that system control value for more information.
6.	When creating the order payment method for the order, uses the CIT Transaction ID and the original authorization amount from the customer membership, if they are populated, identifying the order as a subsequent card-holder initiated transaction with credentials on file. These fields would be populated through the integration with CyberSource or through the External Payment Service, either through the order originating the customer membership, or through a generated order that was authorized through CyberSource or the External Payment Service. Otherwise, these fields on the payment method for the generated order are updated when the order is authorized through CyberSource or the External Payment Service, and in this case the customer membership is also updated with these fields. **For more information:** See: • *CyberSource:* *Subsequent Authorizations to CyberSource for Membership Orders* and *Subsequent Authorization Requests to CyberSource*. • *External Payment Service:* *Subsequent Authorizations through the External Payment Service for Membership Orders* and *Subsequent Authorization Requests through the External Payment Service*.
7.	Updates the customer membership: • Changes the Last order date to the Order date specified at the *Generate Membership Orders Screen*. • Changes the Next release date to the next date when the customer membership will be eligible for order generation, based on the order date and the Shipment interval or Fixed shipment day. • Increments the Next rotation if the customer membership includes items that are assigned to different rotations; otherwise the Next rotation remains *1* or *0*. • Increments the Shipments (# Shp) total. • Changes the customer membership status to *Complete* if the total number of rotations has been met.
8.	Writes an order message to the generated order indicating the name of the membership program and the Next release date if the *Write Order Messages for Membership Rotation (K04)* system control value is selected. This order message is flagged to print on the pick slip, and the user ID identifies the user who submitted the membership generation job. See the system control value for more information.
9.	Assigns the suspended membership orders to an order batch. The batch is assigned to the user ID of the user who submitted the membership generation job.
10.	Puts orders with errors in *Error* status.
11.	Puts orders that are error-free in *Open* or *Held* status, removes the batch number from the order header, and applies pick slip preparation to the eligible orders; see *Applying Pick Slip Preparation to an Order*.

#	Step
12.	Updates the customer membership with the next release date, shipment number, and rotation; also, changes the status if the current order completes the membership.

> **Note:**
>
> The *GEN_ORDERS* job runs in the *QSYSNOMAX* job queue rather than the default *QBATCH* job queue in order to reduce conflicts with other submitted jobs.

Generated reports: The *GEN_ORDERS* job produces:

- *Memberships in Error Report*
- Order Batch Listing. See *Accepting or Rejecting the Order Batch* for more information on this report.

Orders in error: Any membership orders that have any errors remain suspended in the generated batch. Use the *Edit/Accept* option on the *Work with Error Orders Batches Screen* to submit the batch to edit so that you can review the errors and then advance to an individual order in error so that you can correct it. See *Accepting or Rejecting the Order Batch* for more information.

Which order date to use? The system uses the *Order date* you enter at the *Generate Membership Orders Screen* as the Order date and Enter date for generated membership orders; however, all other updates are posted using the current date. For example, records in the Order Billing History table are created using the current date.

Active procedure check: Before the order accept process runs, the system checks to see whether there is already an order generation (*GEN_ORDERS*) job that is active in your company. If there is currently an active order generation job, the system stops the newly submitted job and generates the *Active Procedure Log*.

Loyalty memberships: The program ignores any loyalty memberships when generating membership orders. See *Loyalty Memberships* for an overview.

Tokenization: If a customer membership is purchased with a credit card, the cardToken and customerToken captured on the payment in the Original/Parent order is stored with the Customer Membership (WWCM) record. When the child membership order is generated (EGMO), it stores those same tokens with the Order Payment Method.

Email address? If the customer sold-to has a primary email address, this address defaults as the order-level email address; otherwise, there is no order-level email address assigned. See *Generating Membership Orders (EGMO)* for more information.

Membership orders without existing customer memberships: It is possible for the system to generate a membership order for which you cannot find the associated customer membership in the following situation:

1. You receive an order that includes a membership item and that is in error for some reason. For example, you receive an order through the order API, and the order includes both a membership item and another order detail line that is in error status because it failed an edit related to order line quantity. In this situation, the

system creates the customer membership even though the order is in suspended status.

2. You run *Generating Membership Orders (EGMO)* and generate the membership order for the customer membership created through the suspended order.
3. You then reject the order or the order batch, removing the suspended order that originated the customer membership.

Because the customer membership no longer exists, the system does not generate any additional membership orders for the customer.

Cancelling the membership item: If you cancel the membership item on the order that originated the customer membership after you have used the membership generation process, a pop-up window opens:

1. *If a membership order has already been generated:* The *Order Warning Message Window* indicates that one or more membership orders have already been generated for the customer membership, and that you need to cancel the generated orders manually; however, canceling the membership item results in canceling the remainder of the customer membership, so the program will not generate any additional orders.
2. *If the membership generation program is currently running, or if it has generated an order but the order is still suspended in batch:* The *Membership in Process Window* indicates that the membership is currently being processed. You will need to cancel the generated order and the customer membership to prevent additional orders from being generated.

See *Canceling a Membership Item* for more information.

Release Membership Orders (RMEM)

Purpose: This option is not currently implemented.

Printing the Expected Membership Orders Report (PEMO)

Purpose: Use the Expected Membership Orders report to review the total number of membership orders that will be available for generation for a range of dates. The system uses the Next release date from the customer membership to calculate these totals. This report provides a summary of total quantity by date only, and does not include detail information on the membership programs, membership types, customers, or items.

For more information: See *Membership Overview* for an explanation of how membership programs work, or see *Generating Membership Orders (EGMO)* for information on how to generate orders for membership programs.

Loyalty memberships: This report does not consider loyalty memberships, which do not generate orders. See *Loyalty Memberships* for an overview.

In this topic:

- *Print Expected Membership Orders Screen*
- *Expected Membership Orders Report*

Print Expected Membership Orders Screen

How to display this screen: Enter *PEMO* in the Fast path field at the top of any menu or select Print Expected Membership Orders from a menu.

Field	Description
Starting with release date	The first release date to include on the *Expected Membership Orders Report*. The system includes customer memberships whose Next release date is on this date or later. The current date defaults. Numeric, 6 positions (in user date format); required.
Ending with release date	The last release date to include on the *Expected Membership Orders Report*. The system includes customer memberships whose Next release date is on this date or earlier. The current date defaults. Numeric, 6 positions (in user date format); required.

Completing this screen: Select *Submit* to generate the report. You return to a menu, and the system submits the *EXP_ORDERS* job.

Update Customer Memberships (MMCM)

Purpose: Use this option to update the source code and/or any one item on customer memberships and, optionally, the membership program itself.

For more information: See:

- *Membership Overview*
- *Working with Membership Programs (WWMP)*
- *Working with Customer Memberships (WWCM)*
- *Generating Membership Orders (EGMO)*

> **Note:**
>
> Even if a membership program is flagged not to allow changes based on the membership type, you can still process updates through the this menu option.

Update Customer Memberships Screen

How to display this screen: Select Update Customer Memberships from a menu or enter *MMCM* in the Fast path field on any menu.

Field	Description
Membership ID	Enter the codes identifying the membership program(s) for which you would like to update the source codes and/or items on customer memberships. You can enter up to four membership programs. Entry of at least one membership program is required. **Restrictions:** The system does not verify whether there are any active customer memberships for the program(s) you enter, whether the membership program is currently active, or whether you are entering a type of membership program that actually generates orders. However, you cannot enter an Item to be Replaced and a New Item unless there is at least one customer membership for at least one of the membership program(s) you enter here. Alphanumeric, four 12-position fields; entry of the first field required.
Source Code	Optionally, enter the source code to assign to existing customer memberships. You can assign this source code to each selected membership program by selecting the Update Membership Program flag. You can enter a source code only if it is not restricted. **Effects of update:** • Updating the customer memberships means that all newly-generated membership orders for the selected membership program(s) will use that source code. Existing membership orders that were previously generated are not affected. *Example:* You enter the membership ID's of MEMB01 and MEMB02 and enter a Source Code of MBS23. When you select *OK*, the system changes the source code for all MEMB01 and MEMB02 customer memberships to MBS23. If you generate membership orders tomorrow, the generated orders will have source code MBS23. However, orders you generated yesterday are still assigned to the source code(s) previously assigned to the MEMB01 and MEMB02 customer memberships. • Updating the membership program(s) means that all newly-created customer memberships will be assigned to that source code, so that all generated membership orders for the selected membership program(s) will also use that source code. *Example:* To continue the example above, you also update the MEMB01 and MEMB02 membership programs themselves. The next time you create a customer membership, it will be assigned to the MBS23 source code by default. Alphanumeric, 9 positions; optional (required if you do not enter an Item to be Replaced and a New Item).

Field	Description
Item to be Replaced	Optionally, enter the item (and SKU, if the item has SKUs) to remove from existing customer memberships and replace with the New Item. You can also remove this item and SKU from each selected membership program and replace it with the New Item by selecting the Update Membership Program flag. **Restrictions:** You cannot perform an item update on just membership programs if the Item to be Replaced is not on at least one customer membership for one of the selected programs. To update just the membership programs, use *Working with Membership Programs (WWMP)*. However, once you attempt to enter an Item to be Replaced, you cannot clear the item fields and submit just a source code update; instead, you need to exit the screen and re-enter. **Effects of update:** • Updating the customer memberships means that all newly-generated membership orders for the selected membership program(s) will not include this item/SKU. Existing membership orders that were previously generated are not affected. *Example:* You enter the membership ID's of MEMB01 and MEMB02, enter an Item to be Replaced of AB0101 SMLL, and enter a New Item of BC0202. When you select *OK*, the system removes the item AB0101 SMLL for all MEMB01 and MEMB02 customer memberships, and adds BC0202. If you generate membership orders tomorrow, the generated orders will include BC0202. However, orders you generated yesterday still include AB0101 SMLL. *Example:* To continue the example above, you also update the MEMB01 and MEMB02 membership programs themselves. The next time you create a customer membership, it will include BC0202 (but not AB0101 SMLL) by default. **Note:** The system adds the New Item to the customer membership (and, optionally, membership program) only if the Item to be Replaced was already on the customer membership or membership program. For example, if you entered membership programs MEMB01, MEMB02, and MEMB03, but only customer memberships for MEMB01 included the Item to be Replaced, then customer memberships for MEMB02 and MEMB03 are not updated when you select *OK*. Alphanumeric, 12 positions with three four-position SKUs; optional (required if you do not enter a Source Code).

Field	Description
New Item	Enter the item (and SKU, if the item has SKUs) to add to existing customer memberships when removing the Item to be Replaced. You can also add this item and SKU to each selected membership program by selecting the Update Membership Program flag. See the Item to be Replaced field, above, for a discussion. **Restrictions:** You cannot enter a New Item unless you are replacing an item that is already on customer memberships (and, optionally, the selected membership program(s)). Alphanumeric, 12 positions with three four-position SKUs; required if you enter an Item to be Replaced.
Update Membership Program	Indicates whether to update the selected membership program(s) in addition to the existing customer memberships with the indicated source code and/or item replacement: *Selected* (default) = Update each selected membership program with the source code; also, if the Item to be Replaced is on the membership program, replace it with the New Item *Unselected* = Do not update any of the membership programs

Completing this screen:

1. Complete each field as described above.
2. Select *OK* to validate your entries. See the field descriptions above for more information.
3. Once you have completed each required field, select *OK* to update each eligible customer membership and membership program, if applicable. The update takes place interactively.

Email Repository

In this part:

- *Working with Email Category (WEMC)* provides information on setting up categories for tracking and grouping emails.
- *Working with Email (WEML)* provides information on reviewing unrouted emails and assigning them to customers and orders.
- *Purging Email History (MPCH)* provides information on purging emails earlier than a given date.
- *Updating Email Domains (MUEE)* provides information on making universal updates to the domain name for all matching email addresses in your company.
- *Printing the Email Error Report (PEME)* provides information on printing a report listing all email addresses in your company that do not conform to formatting requirements.

Working with Email Category (WEMC)

Purpose: Use email categories to group email correspondence for scanning or informational purposes. You can assign an email category to an email at various screens where you work with email correspondence.

Notification category: The system uses the *NTF* category for any email notification generated by the system. For example, when you use the *Generate Backorder Notices*

(GBOC) menu option, the system assigns an email category of *NTF* to each backorder notification email generated. The system automatically creates the *NTF* category the first time that you advance to the Work with Email Category Screen.

> **Note:**
>
> The system saves outbound notification emails only if the *Write Outbound Email to Email Repository (H99)* system control value is *selected*.

For more information see the *Email Repository Overview* in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

In this topic:

- *Work with Email Category Screen*
- *Create Email Category Screen*

Work with Email Category Screen

How to display this screen: Enter *WEMC* in the Fast path field at the top of any menu, or select Work with Email Category from a menu.

Field	Description
Category	The category that you use to group email correspondence between you and your customers. Enter a full or partial category to display email categories in alphanumeric order, starting with your entry. Alphanumeric, 3 positions; optional.
Description	The description of the category. Enter a full or partial description to display email categories in alphanumeric order that contain your entry. Alphanumeric, 40 positions; optional.

Option	Procedure
Create an email category	Select *Create* to advance to the Create Email Category Screen.
Change an email category	Select *Change* for a category to advance to the Change Email Category screen. You can change the Description. See Create Email Category Screen for field descriptions.

Option	Procedure
Delete an email category	Select *Delete* for a category to delete it. **Note:** The system does not prevent you from deleting a category that is currently assigned to one or more emails.
Display an email category	Select *Display* for a category to advance to the Display Email Category screen. See Create Email Category Screen for field descriptions. You cannot change any information on this screen.

Create Email Category Screen

Purpose: Use this screen to create a new email category.

How to display this screen: Select *Create* at the Work with Email Category Screen.

Field	Description
Category	The category that you use to group email correspondence between you and your customers. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Description	The description of the category. Alphanumeric, 40 positions; required.

Working with Email (WEML)

Purpose: Use Work with Email to review and work with emails that have been forwarded into Correspondence History and that are in error. **For more information:** See *Email Repository Overview* the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for more information on how the system processes forwarded emails.

Possible error reasons include:

- the email did not include sufficient information to assign it to a customer
- the email included conflicting information: for example, it specified a customer number and an order number, but the order number is not valid for that customer
- the email included invalid information, such as an email category that does not exist
- the email address in the email does not match an existing customer

- there is more than one customer with the email address in the email (**Note:** This condition produces an error only if the *Assign Unreferenced Email (H93)* system control value is set to **DUPE*)

In this topic:

- *Work with Unrouted Email Screen*
- *Change Email Screen*
  - *Identifying an Unrouted Email*
- *Display Email Screen*
- *Display Email Detail Screen*
- *Symbol and Special Character Conversion in Emails*

Work with Unrouted Email Screen

How to display this screen: Enter *WEML* in the Fast path field at the top of any menu, or select Work with Unrouted Email from a menu.

Field	Description
Date	The date when the email was forwarded into the system. You can select *Sort by email date* to display the date when an email was originally sent (the *Email sent* date) rather than the date when it was forwarded into the system and the Correspondence History record was created (the Created on date). Similarly, after you have selected to display the Email sent date, you can select *Sort by create date* to switch the displayed date back to the Created on date. Numeric, 6 positions (in user date format); optional.
Src (Source)	Indicates whether the email was inbound or outbound. Valid values are: • *EXT* = the email was forwarded into Order Administration • *INT* = the email originated in Order Administration and was sent to a customer. A user-supplied code indicating the email's source is not currently implemented. Normally, only inbound (*EXT*) emails are listed on this screen as unrouted. Alphanumeric, 3 positions; optional.

Field	Description
Rsn (Reason)	The reason why the system did not assign the email. Possible reasons are: • *Duplicate* = The email address for the forwarded email matched more than one customer (**Note:** This condition produces an error only if the Assign Unreferenced Email (H93) system control value is set to **DUPE*). The system searches the Customer Sold To Email and Customer Ship To tables, and if the system finds more than once occurrence of the email address in all of these tables, it puts the email in *Duplicate* status. • *Invalid value* = The email was flagged with identifiers that include invalid information. Possible reasons include: • The email Category is not valid • The ship-to customer does not exist for the sold-to customer • The customer cross-reference code does not match the customer number indicated • The Order cross reference or Customer cross reference are not valid • *Mismatch* = The email was flagged with identifiers that are inconsistent. Possible reasons include: • The order number indicated is invalid for the sold-to customer • The order cross-reference code does not match the order number indicated • *Undeterminable* = The email did not include enough information to assign it to a customer. To determine the specific error(s) for an email, select *Change* for an email to advance to the Change Email Screen, where the system displays an error message. See *Email Repository Overview* for general information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Optional.
Cat (Category)	A category that you use to group email correspondence between you and your customers. A category of *NTF* indicates that the email was a notification generated by the system and sent to the customer. Alphanumeric, 3 positions; optional.
Email address	The email address of the person who originated the email. Alphanumeric, 50 positions; display-only.

Option	Procedure
Change an unrouted email	Select *Change* for an email to advance to the Change Email Screen.
Delete an unrouted email	Select *Delete* for an email to delete it.
Display an unrouted email	Select *Display* for an email to advance to the Display Email Screen.

Option	Procedure
Create a tickler for the *MN* (manually created) tickler event	Select *Create tickler* for an email to advance to the *Create Tickler Screen*.
Display email subject and text	Select *Display detail* for an email to advance to the Display Email Detail Screen.
Change display sequence by date	Select *FIFO* to display emails in ascending chronological order (earliest to latest). Similarly, once *FIFO* is selected, Select *LIFO* to display emails in descending chronological order (latest to earliest).
Change displayed date to the date email was originally sent	Select *Sort by email date* to display the date when an email was originally sent (the *Email sent* date) rather than the date when it was forwarded into the system and the Correspondence History record created (the Created on date). Similarly, after you have selected to display the Email sent date, you can select *Sort by create date* to switch the displayed date back to the Created on date. You can use this option together with selecting *FIFO* to display emails in ascending or descending chronological order based on Created on date or Email sent date. The four possible sort options are: • LIFO by Create Date • FIFO by Create Date • LIFO by Email Date • FIFO by Email Date The current sort is indicated in the upper left corner of the screen.

Change Email Screen

Purpose:

- *Unrouted email:* An unrouted inbound email is an email that originated from a customer but has not been assigned to a customer because of insufficient or invalid identifying information. Use this screen to review the specific errors and other detail information, correct any errors, and assign the email. Any fields that are in error are highlighted when you advance to this screen, and an error message indicates the nature of the error.
- *Routed email:* A routed email is an inbound email or outbound email notification that is assigned to an customer and, potentially, additional records such as an order, bill-to customer, or purchase order. Use this screen to review detail information or to reassign the email differently if you have the proper authority; the *Changed Routed Email (B08)* secured feature controls access to this screen for routed (assigned) emails. If you do not have authority to change a routed email, you can use the *Display Email Screen* to review all of this information.

How to display this screen: Select *Change* for an email at the:

- *Work with Unrouted Email Screen*
- *Work with Email by Order Number Screen*
- *Work with Email by Customer Sold To Number Screen*

- *Work with Email by Customer Ship To Number Screen*
- *Work with Email by Customer Bill To Number Screen*

Field	Description
Created on	The date and time that the email was received into Order Administration and the Correspondence History record was created. Date: numeric, 6 positions (in user date format); display-only. Time: numeric, 6 positions (HH:MM:SS format); display-only.
Email sent	The date and time when the email originated. This is not the date and time when you forwarded an external email into Order Administration, but the date and time when a forwarded email was originally sent. Because the date and time on an external systems can be set differently, it is possible for there to be discrepancies between this date and the date when the email record was created in Order Administration. In the case of an email notification generated by the system, the dates created and sent should be identical. Date: numeric, 6 positions (in user date format); display-only. Time: numeric, 6 positions (HH:MM:SS format); display-only.
Subject	The subject line of the email. • *Inbound emails:* Things to note: • Depending on the setup at the email site, when you forward an email into Order Administration, the system typically deletes `FW:` from the beginning of the subject line; however, if the email has been forwarded multiple times, only the first occurrence will be deleted. • The system renders the text of the subject line in all capital letters. • The subject line is truncated if it exceeds the maximum length of this field. • The system converts certain special characters. See *Symbol and Special Character Conversion in Emails*. • The system deletes the email identifiers from the subject line if translation is successful. For example, a subject line reading `FW: COMPANY=27;CUSTOMER=613;ATTACHMENT=N; Where is my order?` would be translated to `WHERE IS MY ORDER?` Even if translation is successful, however, it does not necessarily mean that the email is assigned to a customer; it is possible for the email identifiers to be formatted correctly, but for the values specified to be incorrect or inconsistent. • *Outbound emails:* Possible subject lines for outbound email notifications are: • ORDER CONFIRMATION • Credit Card Credit Acknowledge • SOLD OUT NOTIFICATION • Shipment Confirmation • BACKORDER NOTIFICATION • Return Confirmation • ORDER UPDATE CONFIRMATION Alphanumeric, 78 positions; display-only.
Email address	The email address of the person who originated the email. Alphanumeric, 50 positions; display-only.

Field	Description
Display name	The name associated with the email address. Depending on the original email application, a forwarded message might include either the display name or the actual email address: *Uses actual email address:* `-----Original Message-----` `From: lak@example.com` `Sent: 08/09/2006 10:33:38 AM` *Uses display name:* `-----Original Message-----` `From: Harry Truman` `Sent: 08/09/2006 10:33:38 AM` Alphanumeric, 50 positions; display-only.
CC	The email addresses that were sent copies of the email. This field is truncated if the original information exceeded the maximum length in Order Administration. Alphanumeric, 50 positions; display-only.
Source	Indicates whether the email was inbound or outbound. Valid values are: • *EXT* = the email was forwarded into Order Administration • *INT* = the email originated in Order Administration and was sent to a customer. A user-supplied code indicating the email's source is not currently implemented. Alphanumeric, 3 positions; display-only.
Routed	Indicates whether the email has been assigned to a customer. Valid values are: • *selected* = The email has been assigned to a customer and information such as an order, vendor, bill-to customer, and ship-to customer, if applicable. • *unselected* = The email has not yet been assigned.
Attachment	Indicates if there was a file attached to the email. Attachments to emails forwarded into Order Administration are discarded; however, if you forward the email using the Outlook form, the form adds a flag to the subject line indicating that the email originally had an attachment. An attachment could be any sort of file that is sent along with the email, such as a document, image, script, or program. Valid values are: • *selected* = The email had an attachment that was discarded. • *unselected* = The email did not have an attachment.

Field	Description
Error reason	The reason why the system did not assign the email. This field is set only for unrouted emails. Possible reasons are: • *Duplicate* = The email address for the forwarded email matched more than one customer (**Note:** This condition produces an error only if the *Assign Unreferenced Email (H93)* system control value is set to **DUPE*). The system searches the Customer Sold To Email, and Customer Ship To tables, and if the system finds more than once occurrence of the email address in all of these tables, it puts the email in *Duplicate* status. • *Invalid value* = The email was flagged with identifiers that include invalid information. Possible reasons include: • The email Category is not valid • The ship-to customer does not exist for the sold-to customer • The customer cross-reference code does not match the customer number indicated • The Order cross reference or Customer cross reference are not valid • *Mismatch* = The email was flagged with identifiers that are inconsistent. Possible reasons include: • The order number indicated is invalid for the sold-to customer • The order cross-reference code does not match the order number indicated • *Undeterminable* = The email did not include enough information to assign it to a customer. See *Email Repository Overview* for general information. For more information see the Web Services Guide on My Oracle Support (ID 2953017.1). Alphanumeric, 1 position; display-only.
Category	A category that you use to group email correspondence between you and your customers. A category of *NTF* indicates that the email was a notification generated by the system and sent to the customer. Category codes are defined in and validated against the Correspondence Category table; see *Working with Email Category (WEMC)*. Alphanumeric, 3 positions; optional.
Order number	The order number and order ship-to number, if any, related to the email. The order ship-to number is separated from the order number by a hyphen (-). See *Identifying an Unrouted Email* for information on completing or correcting these fields for an unrouted email. Order number: numeric, 8 positions; optional. Order ship-to number: numeric, 3 positions; optional.

Field	Description
Customer reference number	A cross-reference code available to identify the customer with a record in another system. Validated against the Alt customer # field at the second Create Customer screen in customer maintenance, or an Alternate customer # cross reference from the Alternate Customer # Cross Reference table (see *Working with Alternate Customer Number Cross-References*). **Note:** If the *Display Alternate Customer Cross Reference Window (I84)* system control value is *selected*, the system selects the last customer numerically (that is, the most recently created customer) who matches based on the primary Alt customer # from the Customer Sold To table, if any; otherwise, it selects the last customer numerically who matches based on the Alternate customer # cross reference. If the *Display Alternate Customer Cross Reference Window (I84)* system control value is *unselected*, the system selects the last customer numerically who matches based on the Alternate customer # cross reference, regardless of whether there is also a match based on the Alt customer #. See *Identifying an Unrouted Email* for information on completing or correcting this field for an unrouted email. Alphanumeric, 15 positions; optional.
Order reference number	A cross-reference code available to identify the order with a record on another system. Validated against the E-commerce order number field in the Order Header Extended table; this field is displayed as the Alternate order field at the *Display Order Properties Screen*. See *Identifying an Unrouted Email* for information on completing or correcting this field for an unrouted email. Alphanumeric, 35 positions; optional.
Customer sold to	A number identifying the sold-to customer associated with the email. Validated against the Customer Sold To table. If a sold-to number is identified, the customer's company name, if any, and name appear to the right. See *Identifying an Unrouted Email* for information completing or on correcting this field for an unrouted email. Customer number: numeric, 9 positions; optional. Customer name: alphanumeric, 41 positions; display-only.
Customer ship to	A number identifying a permanent shipping address associated with a sold-to customer. See *Identifying an Unrouted Email* for information on completing or correcting this field for an unrouted email. Numeric, 3 positions; optional.

Field	Description
User code 1	A field available to enter a one-position code or flag. Not validated against any table. Alphanumeric, 1 position; optional.
Customer bill to	A number identifying a customer responsible for payment on an order. Validated against the Customer Bill To table. See *Identifying an Unrouted Email* for information on completing or correcting this field for an unrouted email. Numeric, 7 positions; optional.
User code 2	A field available to enter a 10-position code. Not validated against any table. Alphanumeric, 10 positions; optional.
Invoice number	A number identifying the invoice with which an order was billed or credited. Validated against the Invoice Header table. See *Identifying an Unrouted Email* for information on completing or correcting this field for an unrouted email. Numeric, 7 positions; optional.
User code 3	A field available to enter a 20-position code. Not validated against any table. Alphanumeric, 20 positions; optional.
Vendor number	A number identifying a vendor who supplies you with merchandise. Validated against the Vendor table. Ordinarily used here only for drop shop purchase orders associated with an order. See *Identifying an Unrouted Email* for information on completing or correcting this field for an unrouted email. Numeric, 7 positions; optional.
User number	A field available to enter a 13-position number. Not validated against any table. Numeric, 13 positions; optional.
Purchase order number	A number identifying a purchase order. Validated against the PO Header table. Ordinarily used here only for drop ship purchase orders associated with an order. See *Identifying an Unrouted Email* for information on completing or correcting this field for an unrouted email. Numeric, 7 positions; optional.
User date	A field available to enter a date. Numeric, 6 positions (in user date format); optional.

Option	Procedure
Display the text of the email	Select *Display email detail* to advance to the Display Email Detail Screen.

Option	Procedure
Advance to standard order inquiry	Select *Order inquiry*. If the email is associated with an order number, you advance to the Order Inquiry Header Screen or the Order Inquiry Detail Screen, depending on the setting of the *Default Version for Order Inquiry (C34)* system control value. If the email is not associated with an order number, you advance to the *Order Inquiry Scan Screen*. **Note:** This option is not available when you are working with a routed email in standard order inquiry.
Accept your entries and assign the email	After you have identified the email, select *Accept*. See Identifying an Unrouted Email below for more information. **Note:** This option is available only if you have the proper authority, based on the *Changed Routed Email (B08)* secured feature.

Identifying an Unrouted Email

You can associate an email with any of the following:

- order-related information:
  - *Order number* and order ship-to number
  - *Customer sold to* number
  - *Customer ship to* number
  - *Customer bill to* number
  - *Invoice number*
  - *Purchase order number* (for drop shipments)
  - *Vendor number* (for drop ship purchase orders)
  - *Order reference number*
- customer-related information:
  - *Customer sold to* number
  - *Customer ship to* number
  - *Customer reference number*
- *Vendor number* and *Purchase order number*

To associate an email with any of the above types of information, complete the field or prompt for a list of valid values.

When you complete a field, the system:

- *Fills in the related fields if it can positively identify them.* For example, when you enter an order-related field such as the order number, the system fills in the customer sold-to number and the following related fields if they exist on the order:
  - Customer ship-to number
  - Customer bill-to number
  - Order reference number
- *Confirms that all entries on the screen are consistent.* For example, if you complete the order number and the customer reference number, but the customer reference number is not correct for the customer sold-to on the order indicated, the system displays an error message.

Things to note: The system does *not*:

- Fill in a field if more than one possible relationship exists. For example, when you enter the order number, the system does not fill in the invoice number, because it is possible for an order to have more than one invoice.
- Confirm a relationship between a vendor number and order-related or customer-related information; however, the system does confirm that a purchase order number is consistent with a vendor number if you enter both, and fills in the vendor number if you enter just the purchase order number. The exception is drop ship purchase orders, in which the vendor number and purchase order number are validated as order-related information.
- Confirm a relationship between customer-related information and a bill-to number, unless order-related information is also identified.
- Assign the email if you specify just a bill-to customer without specifying a sold-to customer. The system accepts your entry, but leaves the email in unrouted status.

Selecting the correct customer or order: Select *Order inquiry*. If you have selected an order number, you advance to the Order Inquiry Header Screen or the Order Inquiry Detail Screen, depending on the setting of the *Default Version for Order Inquiry (C34)* system control value. You can review the order and customer information at these screens to see if they are consistent with what you know about the email.

If you have not selected an order number, you advance to the *Order Inquiry Scan Screen*. At these screens, you can scan on customer name or email address to help you identify the originator of the email and the related order, if appropriate.

When you have completed your inquiry, select *Exit* to return to the Change Email screen, where you can enter the appropriate information.

Accepting your entries: If there are no errors, select *Accept* to accept your entries and assign the email.

Rejecting your entries: Select *Exit* to exit the screen without accepting your entries. If you advanced to this screen from the Work with Unrouted Email Screen, a pop-up window prompts you to confirm that you are exiting.

Click *Accept changes* to accept your changes, *OK* to exit the screen without saving your changes, or *Exit* to return to the Change Email screen.

Display Email Screen

Purpose: Use this screen to review detailed information about an email. You cannot change any information at this screen. See *Change Email Screen* for field descriptions.

How to display this screen: Select *Display* for an email at the:

- *Work with Unrouted Email Screen*
- *Work with Email by Order Number Screen*
- *Work with Email by Customer Sold To Number Screen*
- *Work with Email by Customer Ship To Number Screen*
- *Work with Email by Customer Bill To Number Screen*

Display Email Detail Screen

Purpose: Use this screen to review the content of an email.

> **Note:**
>
> The system does not save the text of outbound email notifications, which are identified by a *Src (Source)* of *INT* (internal) and a Cat (Category) of *NTF* notification; however, you can review the subject line at the *Change Email Screen* or the *Display Email Screen* to determine the type of notification that was sent. The system saves a record of email notifications only if the *Write Outbound Email to Email Repository (H99)* system control value is *selected*.

How to display this screen:

- Select *Display detail* for an email at the:
  - Work with Unrouted Email Screen
- *Work with Email by Order Number Screen*
- *Work with Email by Customer Sold To Number Screen*
- *Work with Email by Customer Ship To Number Screen*
- *Work with Email by Customer Bill To Number Screen*
- Select *Display email detail* at the:
  - *Change Email Screen*
  - *Display Email Screen*

Email text: The contents of the email are presented on this screen. The *Email Presentation (I01)* system control value controls the extent to which blank line spaces in the email are consolidated.

Field descriptions: See the *Change Email Screen* for a description of the remaining fields on this screen.

Symbol and Special Character Conversion in Emails

Emails are stored in the Correspondence History table in plain text. The table below describes how some commonly used symbols and special characters are rendered.

Symbol/character appearance	Description	Converted to:
<	left angle bracket	`<`
—	em dash	– (hyphen)
–	en dash	– (hyphen
	non-breaking space	space
©	copyright symbol	¤
®	registration symbol	«
™	trademark	`(tm)`
¼	1/4	Ê
½	1/2	Ë
§	section symbol	°
¶	paragraph symbol	Ã
abcde	symbol font	`abcde` (regular text)

The following characters are deleted from the email:

- ~ (tilda)
- | (pipe)
- optional hyphen
- em space
- en space

Purging Email History (MPCH)

Purpose: Use this menu option to purge email correspondence history created before a specific date. You might want to use this menu option to conserve disk space if the Correspondence History and Correspondence History Detail tables are large.

The system uses the creation date to determine the age of the email rather than the sent date.

Correspondence history related to open or held orders is not purged, regardless of date.

Purge Correspondence History Screen

The Date field on this screen defaults to blank; you must enter the earliest date for which you want to retain email correspondence history.

How to display this screen: Enter *MPCH* in the Fast path field at the top of any menu or select Purge Correspondence History from a menu.

Completing this screen: Enter the earliest date for which you want to retain email correspondence history and click *Accept*.

Updating Email Domains (MUEE)

Purpose: Use this function to universally update email addresses for a domain name. For example, you would use this function if ABC Corp. changed its name to XYZ Corp., and as a result all of its employees' email addresses now end with *@xyz.com* instead of *@abc.com*.

Components of an email address: For the purposes of this menu option, the system searches for and replaces the domain name and/or the extension. For example, in *direct@example.com*, *example* is the domain name and *com* is the extension. These are the only components of an email address that you can update through this menu option. The entire domain name and extension must be an exact match; for example, *@mail.com* is not a match for *@123mail.com*.

When you use this function, the system updates the domain name for all matching email addresses in the following tables:

- Customer Sold To
- Customer Sold To Email
- Customer Ship To
- Customer Bill To
- Vendor (both vendor email and remittance email addresses)
- Vendor Contact
- Order Ship To Address
- OM Batch Header
- Soldout Notification
- Threshold Value

Update Email Address Domain Screen

How to display this screen: Enter *MUEE* in the Fast path field at the top of any menu, or select Update Email Address Domain from a menu.

Completing this screen: Enter the domain name that you want to change and the domain name you want to change it to. Your entry must include the correct position of the @ sign and the period: the domain name must begin with the @ sign, and the period must be followed by an extension, such as *com* or *gov*, of one or more characters. For example, the following are correctly formatted domain names for this menu option:

- @example.com
- @mailcity.org
- @university.edu

The system rejects any domain names formatted like:

- oracle.com
- @example

> **Important:**
>
> The system does not verify that your entry is actually a valid, existing domain name.

Once you have entered the original and new domain names, Select *Accept* to submit. The system starts the *UPDEMLDOM* job and displays the following messages:

```
The update email address domain job has been submitted.
```

Printing the Email Error Report (PEME)

Purpose: Use this screen to generate a list of email addresses that are formatted incorrectly in the following tables:

- Customer Sold To
- Customer Sold To Email
- Customer Ship To
- Customer Bill To
- Vendor (both vendor email and remittance email addresses)
- Vendor Contact
- Order Ship To Address
- OM Batch Header
- Soldout Notification
- Threshold Value

In this topic:

- *When is an Email Address in Error?*
- *Email Errors Report Screen*
- *Email Errors Report*

When is an Email Address in Error?

An email address is considered in error if:

- there is not an @ sign and a period (.)
- there is no text:
- before the @ sign
- between the @ sign and the period
- after the period

For example, the following email addresses would appear on the error report:

- @example.com
- sbrown@example
- sbrown@.org
- www.example.com

Any additional validation? The system does not confirm that an entry represents a valid email address, or that the domain name (such as "company" in company.com) even exists.

Email Errors Report Screen

How to display this screen: Enter *PEME* in the Fast path field at the top of any menu, or select Email Error Report from a menu.

Completing this screen: Click *Accept* to submit the *Email Errors Report*.

Customer Service Appendices

Purpose: These topics provide reference information for use throughout the system.

- Displaying More Options in OIOM describes several options related to Order Inquiry, Order Maintenance and Order Entry that are not available on the regular screens.
- Work with Customer Action Notes (WCAN): Use this menu option when you want to view or work with a list of all customer action issues for a company
- *Loading Address Updates* describes how to load and process a table containing Sold To Customer address updates, and how to review changed and unchanged customer information.
- Process Address Changes Screen (PACS): Use this screen to process address changes when the ACS Tape or the MBS Tape tables are already loaded with address change information.
- Work with Changed Customers Screen (MBSI): Use this screen to review the customer's name and address before and after the address updates
- Work with Unchanged Customers Screen (MBSF)

Work with Customer Action Notes (WCAN)

Purpose: Use this menu option when you want to view or work with a list of all customer action issues for a company. Using this menu option, you can delete, display, resolve, update the status of an issue, or attach detail notes for a customer action issue, by using options similar to those on the *Edit Customer Actions Window*. At the Work with Customer Actions menu option, you can also:

- View a list of all unresolved customer action issues for your company
- View the ID of the user who initially entered the customer action issue, as well as the ID of the user assigned to the customer action issue when it was created, or the most recent user to work with this customer action issue
- Scan for an action issue by reason code, status and date
- Advance to the Scan Orders by Customer screen (*Order Inq*)
- Advance to *Order Inquiry Scan Screen*
- Select another company
- Customer action issues that have been resolved do not display on this screen.
- You cannot create a note for a new customer action issue at this screen. Use the *Edit Customer Actions Window* to create a customer action note.

- You can print a report listing customer action notes by date or by the person who entered them. See *Printing the Customer Exposure Report (PCER)*.

In this topic:

- *Work with Customer Action Notes Screen*
- *Change Customer Action Screen*
- *Resolving or Deleting an Action Issue*
- *Customer Action Note Details Screen*

For more information: See *About Customer Action Notes*.

Work with Customer Action Notes Screen

How to display this screen: Enter *WCAN* in the Fast path field at the top of any menu or select Work with Customer Action Notes from a menu.

Field	Description
Rn (Reason Code)	The code representing the reason for the customer action issue. See *Working with Customer Action Reason Codes (WCAR)*. Alphanumeric, 2 positions; optional.
S (Status)	The status of the customer action issue. Valid values: • *Open* • *Work in Process* • *Resolved* Optional.
Entry date	The date the customer action issue was entered. Numeric, 6 positions; optional.
Customer #	A number which identifies the customer. Numeric, 9 positions; display-only.
Ent user (Entered user)	The user who initially entered the customer action issue Alphanumeric, 10 positions; display-only.
Worked on user	The user who has most recently worked on the customer action issue. This field automatically updates when a user selects *Work in process* to update the status of an issue and enter details of its investigation; if the status of an issue has not been updated, this field displays the ID of the user initially assigned to investigate the issue. Alphanumeric, 10 positions; display-only.
Worked on date	The most recent date that the issue was investigated and "work in process" details were entered. This field automatically updates when a user selects *Work in process* to update the status of the issue and enter details of its investigation. If no action has been taken on the issue, its status remains *O* (open) and this field is blank. Numeric, 6 positions; display-only.
Dtl (Details)	The code indicating whether detail notes have been entered for this issue. *D* indicates detail notes have been entered; otherwise, the field remains blank. Alphanumeric; 1 position; display-only.

Field	Description
Description (Unlabeled field)	A brief description of the customer action issue. Alphanumeric, 40 positions; display-only.

Screen Option	Procedure
Change a customer action note	Select *Change* for a customer action note to advance to the *Change Customer Action Screen*.
Delete a customer action note	Select *Delete* for a customer action note to delete it. See *Resolving or Deleting an Action Issue*.
Display a customer action note	Select *Display* for a customer action note to advance to the Display Customer Action screen. You cannot change any information on this screen. See the *Change Customer Action Screen* for more information.
Enter detailed notes for a customer action issue	Select *Detail notes* for a customer action note to advance to the *Customer Action Note Details Screen*, where you can enter details of the action issue. This option will not update the status of the issue.
Update the status of a customer action issue to indicate that the issue has been investigated but not yet resolved	Select *Work in process* for a customer action note to advance to the *Customer Action Note Details Screen*, where you can detail any actions that have been taken on the customer issue. This option automatically updates the Status and Worked on user fields of the issue.
Resolve the issue	Select *Resolve* for a customer action note to resolve the issue and clear it from this screen.
Advance to the Scan Orders by Customer screen	Select *Order Inq* for a customer action note to advance to the Scan Orders by Customer screen. See *Using the Order Inquiry Scan Screens (OIOM)*.
Advance to the standard Order Inquiry screen	Select *Order Inquiry* to advance to the *Order Inquiry Scan Screen*.

Change Customer Action Screen

Purpose: Use this screen to change the description of the action issue, the reason code, and the user assigned to follow up on the issue.

> **Note:**
>
> You can also change a customer action note at the *Edit Customer Actions Window* by entering over the previous entries.

How to display this screen: Select *Change* for a customer action issue at the *Work with Customer Action Notes Screen*.

> **Note:**
>
> If you do not have authority to the *Change Customer Action Notes Description (A93)* secured feature, you cannot change the description of an action note on the *Edit Customer Actions Window*, and when you try to advance to the *Change Customer Action Screen* from the *Work with Customer Action Notes Screen*, the system displays a message:

Not authorized to change

Field	Description
Customer (Sold-to customer number)	A number assigned by the system to identify the customer. Numeric, 9 positions; display-only, assigned by the system.
Customer name (Unlabeled field to the right of the customer field)	The customer's last name, first name and middle initial. Last name: alphanumeric, 25 positions; display-only. First name: alphanumeric, 15 positions; display-only. Initial: alphanumeric, 1 position; display-only.
Action	A brief sentence describing the customer action issue. Alphanumeric, 40 positions.
Status	The current status of the customer action issue. Valid values are: • *Open* = this is a new issue. • *Work in Process* = the issue has been investigated but not yet resolved. • *Resolved* = the issue has been investigated and closed using *Resolve*. Display-only, updated by the system.
For user	The user ID of the person who should follow up on or resolve the action issue. Alphanumeric, 10 positions.
Reason	The reason code and description behind the customer action note. Reason code: alphanumeric, 2 positions. Reason description: alphanumeric, 30 positions; display-only.
Entered	The date the customer action issue was entered. This field defaults to the current date when you create the customer action note. Numeric, 6 positions (in user date format); display-only.
Entered user name (Unlabeled field next to the Entered field)	The user ID and name of the person who entered the action issue. User ID: alphanumeric, 10 positions; display-only. User name: alphanumeric, 30 positions; display-only.
Resolved (Date resolved)	The date the customer action issue was resolved. This field defaults to the current date when you use option 23 to resolve the issue. Numeric, 6 positions (in user date format); display-only.
Resolved user name (Unlabeled field next to the Resolved field)	The user ID and name of the person who resolved the action issue. User ID: alphanumeric, 10 positions; display-only. User name: alphanumeric, 30 positions; display-only.

How to use this screen: To change the action description, the user, or the reason code, enter over the information already entered in these fields to return to the *Work with Customer Action Notes Screen*.

Resolving or Deleting an Action Issue

Purpose: There are two ways to close a customer action issue at the *Edit Customer Actions Window*: deleting it or resolving it.

> **Note:**
>
> Similarly, you can also resolve or delete a customer action issue at the *Work with Customer Action Notes Screen*.

To delete: Select *Delete* for the issue you want to delete.

> **Note:**
>
> The action issue is deleted immediately from the screen; there is no Confirm Delete pop-up window.

The deleted issue no longer displays automatically for the customer.

To resolve: Select *Resolve* for the issue you want to identify as "resolved."

The resolved issue will no longer display on the *Work with Customer Action Notes Screen*; however, a resolved issue will continue to appear on the *Edit Customer Actions Window* in a status of resolved until it is deleted. This may be useful if, for example, the action has been resolved but you still need to notify the customer.

Optionally, you can select *Detail notes* for a resolved issue to advance to the *Customer Action Note Details Screen*, where you can enter notes about how you resolved the issue.

> **Note:**
>
> If you do not have authority to the *Delete Customer Action Notes (A96)* secured feature, a message indicates when you try to delete a customer action issue: Not authorized to delete. If you do not have authority to the *Change Customer Action Notes Status/Resolve (A98)* secured feature, a message indicates when you try to resolve a customer action issue: Not authorized to this option.

Customer Action Note Details Screen

Purpose: Use this screen to add additional information about a customer action issue. The comments you enter on this screen are attached to the short description of the customer issue that appears on the *Edit Customer Actions Window*. You can also use this screen to enter information about what steps you have taken toward resolving the issue, and to update the status from *O* (open) to *W* (work in process).

How to display this screen: Select *Detail notes* for an action issue at the *Edit Customer Actions Window* and the *Work with Customer Action Notes Screen*. You can also display this screen by selecting *Work in process* for an action issue; in this situation, the status of the issue changes from *O* (open) to *W* (work in process).

User override: If you are not the assigned user, the Confirm User Override pop-up window opens. Select *Accept* at this window to advance to the *Customer Action Note Details Screen*. The status of the customer action issue will automatically change from *O* (open) to *W* (work in process), indicating that the issue has been investigated, and the user ID will automatically update to the current user.

Field	Description
Customer# (Sold-to customer number)	A number assigned by the system to identify the customer. Numeric, 9 positions; display-only, assigned by the system.
Status	The current status of the customer action issue. Valid values are: • *Open* = this is a new issue. • *Work in Process* = the issue is being worked on. • *Resolved* = the issue has been investigated and closed. Display-only.
Entry date	The date the customer action issue was entered. This field defaults to the current date when the issue is entered. Numeric, 6 positions (in user date format); display-only.
User	The user ID of the person who entered the action issue. This is not necessarily the same as the user assigned to follow up on the issue, or the most recent user to work on the issue. Alphanumeric, 10 positions.
Description	A short description of the customer action issue, which was entered on the Edit Customer Actions screen. Alphanumeric, 40 positions
Note	Entry fields for you to enter as much information as necessary to fully describe the customer action issue. If you need extra space, use *Scroll* or *Page Down* to display more entry fields. The notes you enter on this screen are attached to the short description of the customer action issue. Alphanumeric, 60 positions per line.

About this screen: Enter as much information as necessary to fully describe the customer action issue. If you need additional space, press *Scroll* or *Page Down* to display extra entry fields. Select *OK* when you are through entering notes.

If you do not have authority to the *Add Customer Action Detail Notes (A94)* secured feature, you cannot add extra lines of detail notes to this screen. If you do not have authority to the *Change Customer Action Detail Notes (A95)* secured feature, you cannot change the notes already entered; the notes are display-only.

Process Address Changes Screen (PACS)

Purpose: Use this screen to process address changes when the ACS Tape or the MBS Tape tables are already loaded with address change information.

For more information: See *Process Address Changes Screen (PACS)* for background.

How to display this screen: Enter *PACS* in the Fast path field at the top of any menu, or select Process Address Changes from a menu.

Field	Description
Process deliverable addresses only	Indicates whether to process only those names and addresses identified as deliverable. Valid values are: • *Selected* = Process only deliverable addresses • *Unselected* = (default): Process all received records, including those identified as undeliverable. When processing the records for non-deliverable addresses, the system updates the values in the Mail and Rent fields to *unselected*. This ensures that you do not send any more catalogs to this address or sell the customer's name to another company.
Change date	The date when the address changes become effective. The system compares this date against the change date in the Customer Sold To table. If the change date you specify here is: • later than the change date in the Sold To Customer table: the system applies the name and address change • earlier than the change date in the Customer Sold To table: the system does not apply the name and address change; instead, the system creates a record in the MBS Address Change table for you to review. Use the *Work with Unchanged Customers Screen (MBSF)*. Numeric, 6 positions (in user date format); required.
Input file type	Indicates where the address changes are located. Valid values are: • *ACS* = The system checks the ACS Tape table for address changes. • *MBS* = The system checks the MBS Tape table. Alphanumeric, 3 positions; required.

Completing this screen: Complete each field as indicated above and select *Submit* to submit address updates. See *Process Overview* for more information.

MBS and ACS Table Formats

Purpose: This table describes the format of the MBS and ACS Tape tables. The *Process Address Changes Screen (PACS)* and *MBS and ACS Table Formats* require tables in one of the formats described below.

	MBS Tape table (CSMBST)		ACS Tape table (CSACST)		
Field	**Position (From-To)**	**Length**	**Position (From-To)**	**Length**	**Valid values**
Customer #			17-25	9	

	MBS Tape table (CSMBST)		ACS Tape table (CSACST)		
Field	**Position (From-To)**	**Length**	**Position (From-To)**	**Length**	**Valid values**
First name	1-20	20	64-78	15	If the ACS move type (position 39) is set to *B* (business), then positions 44-87 are not parsed into name components, but are treated as a single 41-character business name field.
Last name	21-40	20	44-63	20	
Prefix code	41	1	79-81	3	The MBS format uses a single-position code, whereas the ACS format uses the literal value. • *1* = MR • *2* = MRS • *3* = MIS • *4* = DR • *5* = REV • *6* = SR • *7* = MS • *8* = FR • *9* = CO • *** = MR & MRS • *&* = DR & MRS
Suffix code	42	1	85-87	3	The MBS format uses a single-position code, whereas the ACS format uses the literal value. • *A* = JR • *B* = SR • *C* = MD • *D* = DDS • *E* = II • *F* = III
Address 1	43-72	30	118-177	60	The components of the ACS old address field are parsed as follows: Field/Position/Size Primary No./118-127/10 Pre-directional/128-129/2 • Street name/130-157/28 • Street suffix/158-161/4 • Post-directional/162-163/2 • Unit designator/164-167/4 • Secondary no./168-177/10 • If the literal *APT*, *#*, *SUITE*, *STE*, or *UNIT* displays after the street address, the system moves this information from Address line 1 to the Apartment field, retaining the literal and any text that follows it. *Example:* If the street address is `123 MAIN ST SUITE`

	MBS Tape table (CSMBST)		ACS Tape table (CSACST)		
Field	**Position (From-To)**	**Length**	**Position (From-To)**	**Length**	**Valid values**
Address 2	73-102	30			`15`, the street address is `123 MAIN ST` and the apartment is `SUITE 15`.
City	103-122	20	178-205	28	The first 20 positions of the ACS city maps to the MBS city code.
Filler	123-127	5			
State	128-129	2	206-207	2	
Zip	130-134	5	208-212	5	
Zip+4	135-138	4			ACS does not provide old ZIP+4.
Filler	139-150	12			
Dwelling code	151	1	40	1	Valid MBS codes: • *U* = Unknown • *S* = Single • *B* = Business • *A* = Multi with Apartment • *M* = Multi, with no Apartment. The ACS record does not have a matching field, but a code may derive from the ACS Move type. Valid move types: • *F* = Family move (equals *U* in MBS layout) • *I* = Individual move (equals *U* in MBS layout) • *B* = Business (equals *B* in MBS layout)
Filler	152-158	7			
Priority	159-161	3			No matching ACS field.
Key	162-169	8			No matching ACS field.
Multi-buyer Code	170	1			No matching ACS field.
Filler	171-185	15			
Zip Level	186-188	3			No matching ACS field.
Carrier Route	191-194	4			No matching ACS field.
NCOA Indicator	195	1	37	1	• *F* = Family Move • *I* = Individual Move • *B* = Business (ACS code) If *F* or *I*, new address at position 491
Filler	196-198	3			

	MBS Tape table (CSMBST)		ACS Tape table (CSACST)		
Field	**Position (From-To)**	**Length**	**Position (From-To)**	**Length**	**Valid values**
Zap Indicator	199	1	1	1	Valid MBS codes: • *X* = Undeliverable • *Z* = Zip Change If *Z*, new zip at position 130 If ACS position 38 is set to one of the following values, then this is a “Nixie” record (undeliverable) and the MBS Zap indicator are loaded with a value of *X*: • *A* = attempted, not known • *B* = returned for better address • *C* = not deliverable as addressed • *D* = outside delivery limits • *E* = in dispute • *G* = PO box closed • *I* = insufficient address • *K* = moved, left no address • *L* = illegible • *M* = no mail receptacle • *N* = no such number • *P* = returned for postage • *Q* = not deliverable as addressed • *R* = refused • *S* = no such street • *U* = unclaimed • *V* = vacant • *W* = temporarily away • *X* = no such office The MBS table will not contain COA records reflecting changes only to the ZIP code. A postal customer would not submit a COA form if the zip code changed but he/she did not move, so there would be no COA request to trigger a record in this table. *Note:* The first record on the ACS Tape table has an *H* in this field, indicating that this is a header record and should not be used.
Tier Code	200	1			No matching ACS field.
Filler	201-233	33			
Old Zip Code	234-238	5	208-212	5	

	MBS Tape table (CSMBST)		ACS Tape table (CSACST)		
Field	**Position (From-To)**	**Length**	**Position (From-To)**	**Length**	**Valid values**
NCOA Move Date	239-242	4	33-36	4	
Filler	243-275	33			
DT Dwelling Code	276	1			No matching ACS field.
Old DMT Dwelling Code	277	1			No matching ACS field.
Old Finalist Dwelling Code	278	1			No matching ACS field.
Filler	279-364	86			
Address Reverse Indicator	365	1			No matching ACS field.
Filler	366-381	16			
String	382-383	2			No matching ACS field.
Standard Addr1	384-413	30			No matching ACS field.
Standard Addr2	414-443	30			No matching ACS field.
Standard City	444-456	13			No matching ACS field.
Standard State	457-458	2			No matching ACS field.
Filler	459-478	20			
Delivery Point Barcode	479-481	3	342-344	3	
Filler	482-490	9			
New Addr1	491-520	30	244-303	60	The components of the ACS new address field are parsed as follows: Field/Position/Size Primary No./244-253/10 Pre-directional/254-255/2 Street name/256-283/28 Street suffix/284-287/4 Post-directional/288-289/2 Unit designator/290-293/4

	MBS Tape table (CSMBST)		ACS Tape table (CSACST)		
Field	**Position (From-To)**	**Length**	**Position (From-To)**	**Length**	**Valid values**
New Addr2	521-550	30			Secondary no./294-303/10
New City	551-565	15	304-328	25	
New State	566-567	2	332-333	2	
New 9-digit Zip	568-576	9	334-343	10	
New Carrier Route	577-580	4			No matching ACS field.
Move Type	581	1	39	1	• *I* = Individual Move • *F* = Family Move • *C* = Company Move • *B* = Business Move
Undeliverable Type	582	1	38	1	• *C* = Not Deliverable • *G* = Box Closed • *K* = Moved, Left No Address • *F* = Moved to Foreign Address • *Z* = Invalid Postal Record • *F* = Moved to foreign address If *' '*, zip code or address change If ACS position 38 is set to one of the following values, then this is a “Nixie” record (undeliverable), and the MBS Zap indicator will be loaded with a value of *X*: • *A* = attempted, not known • *B* = returned for better address • *C* = not deliverable as addressed • *D* = outside delivery limits • *E* = in dispute • *G* = PO box closed

	MBS Tape table (CSMBST)		ACS Tape table (CSACST)		
Field	**Position (From-To)**	**Length**	**Position (From-To)**	**Length**	**Valid values**
					• *I* = insufficient address • *K* = moved, left no address • *L* = illegible • *M* = no mail receptacle • *N* = no such number • *P* = returned for postage • *Q* = not deliverable as addressed • *R* = refused • *S* = no such street • *U* = unclaimed • *V* = vacant • *W* = temporarily away • *X* = no such office
Filler	583-592				
Customer code	593-601	9	17-25	9	
	602-772				Not used by Order Administration.

Work with Changed Customers Screen (MBSI)

Purpose: Use this screen to review the customer's name and address before and after the address updates. You can also use this screen to delete a change, purge all name and address changes or print a list of changes.

The system creates these updates after you use the *MBS and ACS Table Formats* or the *Work with Changed Customers Screen (MBSI)*.

You can review name and address updates that did not take effect through the *Work with Unchanged Customers Screen (MBSF)*. Customers may be unchanged because the updates were not processed, the customer was not found, the customer has open orders, or the change date for the customer was later than the change date on the received file.

For more information: See *Work with Changed Customers Screen (MBSI)* for background.

How to display this screen: Enter *MBSI* in the Fast path field at the top of any menu or select the Work with MBS Before and After Images option from the menu.

Field	Description
Customer #	A number to identify a customer. The customer record must exist on the system for any address updates to be performed. Numeric, 9 positions; display-only, assigned by the system.
Customer name	The customer's name. Alphanumeric, 25 positions; display-only.

Field	Description
City	The city where the customer lived before the address update (if the address update resulted from a move). Alphanumeric, 25 positions; display-only.
State	The code for the state or province where the customer lived before the address update (if the address update resulted from a move). Alphanumeric, 2 positions; display-only.

Screen Option	Procedure
Remove a record from the screen	Select *Delete* for a record to delete it. **Note:** This does not undo the address update; it simply purges the record from the MBS Changed Customers table.
Review the address before and after the update	Select *Display* for a record to advance to the *Display Changed Customers Screen (Reviewing the Address Before and After the Update)*.
Purge all address updates from the MBS Changed Customers table	Select *Purge*. **Note:** To maintain job performance, you should backup and purge this table prior to loading any new address updates.
Print a report listing the customer addresses before and after the update	Select *Print* to print the *Changed Customers Report*.

Display Changed Customers Screen (Reviewing the Address Before and After the Update)

Purpose: Use this screen to review the changes to a customer's name and address before and after the update.

How to display this screen: Select *Display* for a customer number at the *Work with Changed Customers Screen (MBSI)*.

The BEFORE information represents the customer's name and address prior to the update. The AFTER information represents the customer's current name and address, resulting from the update.

Field	Description
Customer #	A number to identify a customer. The customer record must exist on the system for any address updates to be performed. Numeric, 9 positions; display-only, assigned by the system.
PO box?	Indicates whether the address is a post office box. Valid values are: • *selected* = PO box. • *unselected* = Not a PO box.
Delivery code	Indicates whether the address is a *business* or *residence*. This information is used by shippers who charge different rates for shipping a package to a business or home. Display-only, updated by the system.
Address	The customer's old and new addresses.

Work with Unchanged Customers Screen (MBSF)

Purpose: Use this option to:

- review the unprocessed records in the MBS Work table
- remove a record from the table
- review the type of name and address change
- purge all records in the table
- process the records in the table

For more information: See Loading Address Updates for background.

Selecting this option: Enter MBSF in theFast path field at the top of any menu or select the Work with MBS Address Change File option from the menu.

Field	Description
Customer #	A number to identify a customer. The customer record must exist on the system for any address updates to be performed. Numeric, 9 positions; display-only, assigned by the system.
Change status	The status of the record, which may indicate reason that the customer name and address was not updated. Valid values are: • Not Processed • Open Orders Exist • Last Change Date Greater Than • Customer Does Not Exist
Change type	Identifies the reason for the name and address change. • Valid values are: • Zip Code Change • Family Move • Individual Move *Display-only, updated by the system.*

Field	Description
Deliverable address	Indicates whether the address is a valid, deliverable address. Valid values are: • **YES** • **NO** If NO, the system changes the values in the Mail and Rent fields in the Sold To Customer table to unselected so that you do not send any more catalogs to the customer or sell the customer's address to other companies. *Display-only, updated by the system.*

Screen Options	Procedures
Update the status of a record to Not Processed	Select Reset for a record to update its status to Not Processed.
Remove a record from the work table	Select Delete for a record to delete it.
Review the change	Select Display for a record to display the Work with Customer Changes Screen (Reviewing Unapplied Address Changes).
Purge all records in the work table after you process or review them	Select Purge.
Process the updates	Select Process.
Print a report of the unchanged customers that identifies the customer number, change condition, change type, whether it is a deliverable address, the address, the delivery code, and whether the address is a P.O. box	Select Print to print the Unchanged Customers Report

Work with Customer Changes Screen (Reviewing Unapplied Address Changes)

Purpose: Use this screen to review an unapplied address change.
How to display this screen: Select Display for a customer number at the Work with Unchanged Customers Screen (MBSF).

Field	Description
Customer #	A number to identify a customer. The customer record must exist on the system for any address updates to be performed. Numeric, 9 positions; display-only, assigned by the system.

Field	Description
Change status	The status of the record, which may indicate the reason that the customer address was not updated. Valid values are: • Not Processed • Open Orders Exist • Last Change Date Greater Than • Customer Does Not Exist Alphanumeric, 25 positions; display-only, updated by the system.
Change type	Identifies the reason for the change. Valid values are: • Zip Code Change • Family Move • Individual Move Alphanumeric, 15 positions; display-only, updated by the system.
Deliverable	Indicates whether the address is a valid, deliverable address. Valid values are: • **YES** • **NO** If NO, the system changes the values in the Mail and Rent fields in the Sold To Customer table to unselected so that you do not send any more catalogs to the customer or sell the customer's address to other companies. Alphanumeric, 3 positions; display-only, updated by the system.
PO box?	Indicates whether the address is a post office box. Valid values are: • selected = PO box. • unselected = Not a PO box.
Delivery code	Indicates whether the address is a business or residence. This information is used by shippers who charge different rates for shipping a package to a business or home. Display-only, updated by the system.
Address	The customer's address BEFORE the address update.

Process Changes Screen

Purpose: Use this screen to process name and address updates.
How to display this screen: Select Process at the Work with Unchanged Customers Screen (MBSF).

Field	Description
Change Date	The date when the changes become effective. The system compares this date against the change date in the Customer Sold To table. If the change date for the received record is later than the change date in the Sold To Customer table, the system applies the address change. If the change date for the received record is earlier than the change date in the Customer Sold To table, the system does not apply the address change; instead, the system creates a record in the MBS Address Change table for you to review. Numeric, 6 positions (in user date format); required.
Source of Update	Indicates the table from which the system uploads changes. Valid values are: • ACS = The USPS ACS (address change service) format. The system converts the ACS table to MBS format to process the information. • MBS = The MBS format. Alphanumeric, 4 positions; required.

7 Fulfillment

Reserving Inventory and Generating Pick Slips

Topics in this part:

- Reviewing Reservation Types describes the three types of reservations: Immediate, Batch, and Interactive.
- Reviewing Other Reservation Conditions discusses other reservation conditions, such as: Coordinate grouping, drop ship reservations, special handling reservations, and reserving inventory for sets and variable sets.
- Working with Interactive Reservation (MIRV) discusses creating, changing, deleting, and displaying order information using this reservation type.
- Preparing Orders for Pick Slip Generation provides an overview on preparing an order for pick slip generation.
- Performing Pick Slip Generation includes locating the pick slip generation function, printing pick slips, performing cubing, selecting pick locations, replenishing stock, and using cart/bin picking.
- Selecting Vendors for Drop Ship Processing (MDSP) includes creating, changing, deleting, and displaying vendors for drop ship processing.
- Displaying Pick Slip Generation Inquiry (DPSI) describes this management tool.
- Working with Pick Slip Messages (WPSM) describes creating, changing, deleting, and displaying pick slip messages.
- Processing Drop Ship Orders by Batch (MDSB) describes how to generate drop ship picks by batch for selected vendors.
- Printing the Carryover Report (PCOR) describes how to generate the Carryover reports.
- Generic Pick Out API describes how to generate the outbound pick slip message for integration with another system.
- Pick Message from Order Administration (CWPickOut) describes the Pick Message from the Order Administration.
  For more information see the Order Administration Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).
- Streamlined Pick Slip Generation (WSPS) describes a streamlined version of the pick slip generation option.

- Pick Print Eligibility (WPPE) determines whether the system will include picks for a specified order in the next pick slip generation run for the selected pick slip generation template.
- Unlock Pick Slip (MUPI) allows you to unlock a pick slip.

Working with Interactive Reservation (MIRV)

Purpose: Use this option to reserve stock for specific orders, customer classes, or items via an interactive entry program. You can use interactive reservation in conjunction with Immediate Reservation. Interactive reservation enables you to selectively distribute stock over many orders, or to manually select preferred customers to receive inventory.

You can also use the interactive reservation program to reserve any backordered zone-reservation-coded items not reserved through the zone reservation process. Zone-reservation-coded items are excluded from normal backorder processing.

Quotes: Inventory on quotes is not eligible for interactive reservation; see Entering Pre-Order Quotes for an overview and required setup.

In this topic:

- Scanning for Orders
- Interactive Reservation Screen
- Work with Order Detail Reservations Screen
  - Display Order Detail Reserve Information Screen
  - Work with Reservations by Warehouse Screen
  - Display On Hand by Warehouse Screen
  - Display Item Warehouse Screen (Displaying Item Warehouse Details)
  - Display Reserved Order Lines Screen
- Scan Orders by Customer Class Screen
- Work with Reservations by Item/SKU Screen

Scanning for Orders

Use the Interactive Reservation Screen to select an order number, customer class, or item/SKU for reservation.

- Order numbers are unique numbers assigned by the system to identify an order.
- Customer class codes are used to restrict certain customers who order in large quantities from immediate reservation in order entry.
- Item/SKU codes represent units of inventory.

When you enter information in any of these fields, you advance to the next screen based on the first field that has an entry. For example, if you enter an order number and a customer class, you first advance to the Work with Order Detail Reservations Screen, and then to the Scan Orders by Customer Class Screen.

Pick slip preparation: The system removes any pick slip preparation from an order when you:

- scan by order number.

- scan by customer class and select an order.
- scan by item/SKU and perform an action against an item on the order.

When you exit Interactive Reservation, the system determines if the order qualifies for pick slip preparation, and if so, applies it to the order. See Preparing Orders for Pick Slip Generation.

Interactive Reservation Screen

How to display this screen: Enter MIRV in the *Fast path* field at the top of any menu or select Interactive Reservation from a menu.

Field	Description
Order #	A unique number assigned by the system to identify an order. Enter a valid order number to advance to the Work with Order Detail Reservations Screen. If you enter an invalid order number, you advance to the Scan by Order Number screen. Inventory on quotes is not eligible for interactive reservation: `Quotes cannot be reserved`. *Numeric, 8 positions; optional.*
Customer class	A code to identify a group of customers. You can direct offers to specific classes of customers or generate lists by customer class code. Enter a valid code to advance to the Scan Orders by Customer Class Screen. Customer class codes are defined in and validated against the Customer Class table; see Setting Up the Customer Class Table (WCCL). *Alphanumeric, 2 positions; optional.*
Item/SKU	The code that represents the item/SKU. Enter a valid code (both item and SKU) to advance to the Work with Reservations by Item/SKU Screen. *Item: alphanumeric, 12 positions; optional.* *SKU: alphanumeric, three 4-position fields; optional.*

Work with Order Detail Reservations Screen

Purpose: Use this screen to select items for review, or to work with reservations by warehouse.

How to display this screen: Complete the Order # field on the Interactive Reservation Screen.

Field	Description
Shp (Ship to number)	A system-assigned number that represents the number of shipping addresses for the order. *Numeric, 3 positions; display-only.*
Ln# (Line number)	A system-assigned detail line number on the order. *Numeric, 3 positions; display-only.*
Item	A code used to identify a unit of inventory. *Alphanumeric, 12 positions; display-only.*

Field	Description
COLR SIZE OTHR	A code used to further define the item. *Alphanumeric, three 4-position fields; display-only.*
Qty avail	The quantity of the item that is available to sell in this warehouse. A negative number indicates the item is backordered. The calculation for availability is: `On hand quantity - Quantity reserved - Quantity protected - Pending transfers - Backordered quantity` Takes into account only reservable locations. *Numeric, 7 positions; display-only.*
Qty prot (Quantity protected)	The quantity of the item that can be reserved only through Interactive Reservation where inventory is dispersed manually, as in the case of large wholesale orders or preferred mail order customers. *Numeric, 5 positions; display-only.*
Qty open (Quantity open)	The total number of units that have not shipped. *Numeric, 5 positions; optional.*
Qty rsrvd (Quantity reserved)	The quantity of the item that is set aside for existing orders. Increases by immediate and interactive reservation and decreases by confirmation or pick void/reprint. *Numeric, 5 positions; optional.*
Qty to reserve	The number of units of the item that you want to reserve for this order. *Numeric, 5 positions; required.*

Screen Option	Procedure
Display order details	Select Order detail for an order detail line to advance to the Display Order Detail Reserve Information Screen.
Display reserve by warehouse details	Select Reserve by Warehouse for an order detail line to advance to the Work with Reservations by Warehouse Screen.
Display reserved order lines	Select Reserved Order Lines for an order detail line to advance to the Display Reserved Order Lines Screen.

Display Order Detail Reserve Information Screen

Purpose: Use this screen to review reservation information for an order detail line.

How to display this screen: Select Order detail for an order detail line on the Work with Order Detail Reservations Screen.

Field	Description
Order	A unique number assigned by the system to identify an order. Every order on the system is assigned an order number. *Numeric, 8 positions; display-only.*

Field	Description
Ship-to number (Unlabeled field to the right of the order number)	A hyphen (-) separates this field from the *Order #* field. Indicates the number of shipping addresses for the order. The system assigns a sequential ship-to number to every order. The first ship-to address is assigned the number 1. *Numeric, 3 positions; display-only.*
Line number (Unlabeled field to the right of the ship-to number)	A hyphen (-) separates this field from the *Ship-to* field. The line number on the order. Up to 999 detail lines may be entered on an order. Order lines are presented in descending sequence so that the most recent order line displays first. *Numeric, 3 positions; display-only.*
Status	The status of the order detail line. Valid values: • B = Express Bill • C = Canceled • E = Error • H = Held • S = Sold out • X = Closed • Blank = Open *Alphanumeric, 1 position; display-only.*
Item	A code and description of the unit of inventory on an order detail line. If a SKUed item is displayed, the SKU information will also appear. *Alphanumeric, 12 positions; display-only.*
Override warehouse	The code and description of the warehouse that supersedes the default warehouse, defined in the System Control table. *Numeric, 3 positions; display-only.*
Backorder warehouse	The code and description of the warehouse that the order detail line was backordered from. *Numeric, 3 positions; display-only.*
Backorder date	The date when the order detail line was printed on the backorder notification form. This form is sent to a customer when an order detail line is delayed in shipping. *Numeric, 6 positions; display-only.*
Backorder reason	The reason an order detail line was backordered. *Alphanumeric, 25 positions; display-only.*

Field	Description
Bypass reservation	A code which indicates whether the item is flagged to bypass reservation in order entry. • Selected = The item is flagged to bypass reservation in order entry. • Unselected = The item is not flagged to bypass reservation in order entry. **Note:** If the Use OROB for Fulfillment Assignment (M31) system control value is selected, the system uses the *Bypass reservation* flag to send orders to Order Orchestration for fulfillment assignment.
Drop ship flag	Indicates whether this item is an item that you typically do not stock in inventory; drop ship items must be ordered and shipped from your supplier (vendor). These types of items are not generally available for Reservation. The system creates a separate pre-generated pick for drop ship items to print and forward to the vendor. Additionally, drop ship items must be billed via a special drop ship billing program (because the vendor must notify you when the items have shipped so that you do not bill the customer before the merchandise is received). Valid values: • Drop Ship = Drop ship item • Regular = Regular item *Display-only.*

Field	Description
Future order	Valid values: • Selected = Indicates that this is a future order. • Unselected = Indicates that this is a current order. How the system evaluates future orders: 1) The system adds today's date and the Reservation Lead Days (B27) and compares this value against the Arrival date on the order. If the result is greater than the Arrival Date, the system: • Considers the order to be a future order and inventory will not be reserved. • Flags each detail line on a future order for future reservation. 2) Typically, you run the Evaluate Future Orders program each evening to evaluate each order detail line marked as a “future order.” The system adds today's date to the Reservation Lead Days value and compares the result against the order's Arrival Date. This comparison determines when inventory can be reserved for a future order. When the result is less than or equal to the Arrival Date, the “future order” flag will be removed from each detail line on the order and each line will be eligible for reservation.
Expected ship date	The date on which a purchase order that can fulfill this order line is expected. This date takes into account PO layering, where previously-backordered items will be fulfilled from new PO receipts, prior to new backordered lines. This means that the next purchase order due to be received may not be the purchase order to fulfill this line. *Numeric, 6 positions (in user date format); display-only.*
Reserve date/time	The date and time that inventory was matched to this order detail line. *Numeric, 6 positions (in user date format, HHMMSS format); display-only.*
Ordered	The number of units of this item on the order detail line. *Numeric, 5 positions; display-only.*
Reserved	The number of units of the item reserved during the Reservation program. This program reserves stock for specific orders. Quantities may or may not have picks created for them. *Numeric, 5 positions; display-only.*
Printed	The number of units of the item, on this order detail line, for which pick slips have been printed. *Numeric, 5 positions; display-only.*
Shipped	The quantity on this order detail line that has been shipped. *Numeric, 5 positions; display-only.*
Canceled	The quantity on this order detail line that has been canceled. *Numeric, 5 positions; display-only.*
Returned	The quantity on this order detail line that has been returned. *Numeric, 5 positions; display-only.*

Field	Description
Sold out	The quantity on this order detail line that has been sold out. *Numeric, 5 positions; display-only.*

Work with Reservations by Warehouse Screen

Purpose: Use this screen to review reservation information by warehouse. This information is listed according to the item's quantity available to sell, the item's quantity that cannot be reserved except through interactive reservation, and the number of units of this item that will be reserved.

How to display this screen: Select Reserve by Warehouse for a detail line on the Work with Order Detail Reservations Screen.

Field	Description
Order	A unique number assigned by the system to identify an order. Every order on the system is assigned an order number. *Numeric, 8 positions; display-only.*
Ship-to number (Unlabeled field to the right of the order number)	A hyphen (-) separates this field from the *Order #* field. Indicates the number of shipping addresses for the order. The system assigns a sequential ship-to number to every order. The first ship-to address is assigned the number **1**. *Numeric, 3 positions; display-only.*
Line number (Unlabeled field to the right of the ship-to number)	A hyphen (-) separates this field from the *Ship-to* number. The line number on the order. Up to 999 detail lines may be entered on an order. Order lines are presented in descending sequence so that the most recent order line displays first. *Numeric, 3 positions; display-only.*
Qty open (Quantity open)	The total number of units that have not been shipped. This includes quantity on backorder and quantity held. Future shipments and drop ships are not included in this number. *Numeric, 5 positions; display-only.*
Qty rsrved (Quantity reserved)	The quantity of the item that is set aside for existing orders. Increases by immediate and interactive reservation and decreases by confirmation or pick void/reprint. *Numeric, 5 positions; display-only.*
Sold to	The name of the customer who placed the order. Validated against the Customer Sold-to table. *Alphanumeric, 15 positions (first name), 1 position (initial), 25 positions (last name); display-only.*
Item	A code and description of the unit of inventory on an order detail line. If a SKUed item is displayed, the SKU information will also appear. Validated against the Item table. *Alphanumeric, 12 positions; display-only.*
Whs (Warehouse)	A code that represents the default warehouse. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions; optional.*

Field	Description
Warehouse name	A description of the default warehouse. *Alphanumeric, 12 positions; display-only.*
Quantity available	The quantity of the item that is available to sell. A negative number indicates the item is backordered. *Numeric, 7 positions; display-only.*
Quantity protected	The quantity of the item that can be reserved only through Interactive Reservation where inventory is dispersed manually, as in the case of large wholesale orders or preferred mail order customers. *Numeric, 5 positions; display-only.*
Qty to reserve (Quantity to reserve)	The number of units of this item to reserve for this order. *Numeric, 5 positions; required.*

Screen Option	Procedure
Display locations	Select Display Locs for a warehouse to advance to the Display On Hand by Warehouse Screen.
Review warehouse details	Select Warehouse details for a warehouse to advance to the Display Item Warehouse Screen (Displaying Item Warehouse Details)
Review order details	Select Order Detail to advance to the Display Order Detail Reserve Information Screen.
Review reserved lines	Select Reserved Lines to advance to the Display Reserved Order Lines Screen.

Display On Hand by Warehouse Screen

Purpose: This screen displays on-hand inventory for items in a particular warehouse location.

How to display this screen: At the Work with Reservations by Warehouse Screen, select Display Locs for the warehouse you want to view.

Field	Description
Warehouse	A code that represents the default warehouse. *Numeric, 3 positions; display-only.*
Item	A code and description of the unit of inventory on the order detail line. If a SKUed item is displayed, the SKU information will also appear. *Item: alphanumeric, 12 positions; display-only.* *SKU: alphanumeric, three 4-position fields; display-only.* *Description: Alphanumeric, 30 positions, display-only.*

Field	Description
Location	A user-defined code that represents a warehouse location where merchandise is stored. The warehouse location code can consists of a zone/aisle/shelf/bin combination, or it can be any user-defined code. The location code prints on picks slips and reports. Example: The location A010201 indicates: `Zone Aisle Shelf Bin` `A 01 02 01` See Creating and Maintaining Locations (WLOC). *Alphanumeric, 7 positions; display-only.*
On hand	The actual on-hand quantity for the item in this warehouse location. *Numeric, 7 positions; display-only.*
Printed	The number of units currently “allocated” for this item in this warehouse location, determined by the number of picks generated for this location. When determining locations to reserve during Reservation, the system subtracts the printed quantity from the on-hand quantity in this location to determine the quantity available for Reservation. *Numeric, 7 positions; display-only.*

Display Item Warehouse Screen (Displaying Item Warehouse Details)

Purpose: This screen displays detail information for items in a specified Item/SKU Warehouse.

How to display this screen: At the Work with Reservations by Warehouse Screen, select Warehouse details for the warehouse you want to view. All fields on this screen are display-only.

Field	Description
Item	The item code. *Alphanumeric, 12 positions; display-only.*
SKU	A code that further identifies the item. *Alphanumeric, three 4-position fields; display-only.*
Warehouse	The code and description of the default warehouse. *Numeric, 3 positions; display-only.*
Reservation freeze	Indicates whether the item or SKU in this warehouse is frozen. Valid values are: • Selected = The item/SKU warehouse is frozen. • Unselected = The item/SKU warehouse is not frozen. If an item or SKU warehouse is frozen: • Pick Slip Generation will ignore the item warehouse when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. • Inventory will not reserve during Order Entry. See Reviewing Reservation Types.

Field	Description
Economic order qty	The optimum ordering quantity for this item/SKU, based on a set of criteria such as: quantity, cost, etc. Used for inventory reporting purposes and by Purchasing. *Numeric, 7 positions; display-only.*
Backorder qty	The quantity of the item needed to fill existing orders, which must be fulfilled through PO receipts. *Numeric, 7 positions; display-only.*
Protected qty	The quantity of the item that can be reserved only through Interactive Reservation where inventory is dispersed manually, as in the case of large wholesale orders or preferred mail order customers. *Numeric, 5 positions; display-only.*
Min qty	The minimum on-hand quantity for the item/SKU in this warehouse. *Numeric, 7 positions; display-only.*
Reorder qty	The quantity of the item that should be ordered when inventory reaches the minimum stock level (defined in the *Min Qty* field). *Numeric, 7 positions; display-only.*
Max qty	The maximum on-hand quantity for the item/SKU in this warehouse. *Numeric, 7 positions; display-only.*
Reserve qty	The quantity of the item/SKU that is set aside for existing orders. Increases by immediate, batch, or interactive reservation and decreases by confirmation or pick void/reprint. *Numeric, 7 positions; display-only.*
On hand qty	The actual on-hand quantity for the item in this warehouse location. *Numeric, 7 positions; display-only.*
S/H reserve qty	The quantity of this item in this warehouse that has been reserved and is undergoing some type of special handling, such as monogramming, hemming, etc. Increased by the Reservation program. Items that are flagged with a special handling code in Order Entry or Order Maintenance increment this field following reservation. Decreased by Confirmation or Pick Void/Reprint. *Numeric, 7 positions; display-only.*
On order qty	The quantity of this item due to be received in this warehouse through purchase orders. This information helps the customer decide whether to order now or to cancel the order because of inventory unavailability. *Numeric, 7 positions; display-only.*
Reserve transfer quantity	The quantity of the item that is earmarked for an inventory transfer. This quantity cannot be used by the Reservation program to match inventory to new orders. *Numeric, 7 positions; display-only.*

Field	Description
Protect min/max	This field is not currently implemented. Included only if the Use Store File (G15) system control value is selected.
Cost of goods	Represents the vendor cost at which this item in this warehouse was purchased. The cost of the item is updated when the item is confirmed for shipment. Used in item profitability analyses. **Note:** The Display Cost in Inventory (A38) secured feature controls the display of this field. *Numeric, 20 positions with a 2-place decimal; display-only.*
Picks generated	The total number of pick slips generated for this item in this warehouse, life-to-date. *Numeric, 7 positions; display-only.*
Dollars returned	The dollar value of all returns that have been entered to date for this item in this warehouse. Updated by the Return Authorization process when the return is accepted. Updated with the actual dollars returned based on the amount charged when the item was shipped. *Numeric, 20 positions with a 2-place decimal; display-only.*
Units returned	The number of units of this item in this warehouse returned to date. Updated by the Return Authorization process when returns are entered and updated. *Numeric, 7 positions; display-only.*
Dollars sold	The actual amount sold (shipped and billed) for this item/SKU to date. Updated with the actual merchandise amount billed on the shipment, during Billing. *Numeric, 20 positions with a 2-place decimal; display-only.*
Units sold	The number of sales for this item/SKU in this warehouse to date. Updated during Billing. *Numeric, 7 positions; display-only.*
Protect price	This field is not currently implemented. Included only if the Use Store File (G15) system control value is selected. An error message indicates if you try to change this value and you do not have authority to the Maintain Item Warehouse Retail Price (A91) secured feature: `Not authorized to change`.

Display Reserved Order Lines Screen

Purpose: This screen displays order line information. This information is listed according to company; warehouse; quantity reserved, quantity printed, and quantity remaining; and reservation date and time.

How to display this screen: At the Work with Reservations by Warehouse Screen, select Reserved Lines.

Field	Description
Order	A unique number assigned by the system to identify an order. Every order on the system is assigned an order number. *Numeric, 8 positions; display-only.*
Ship-to number (Unlabeled field to the right of the order number)	A hyphen (-) separates this field from the *Order #* field. Indicates the number of shipping addresses for the order. The system assigns a sequential ship-to number to every order. The first ship-to address is assigned the number 1. *Numeric, 3 positions; display-only.*
Line number (Unlabeled field to the right of the ship-to number	A hyphen (-) separates this field from the *Ship-to* field. The line number on the order. Up to 999 detail lines may be entered on an order. Order lines are presented in descending sequence so that the most recent order line displays first. *Numeric, 3 positions; display-only.*
Qty ordered	The number of units of this item ordered on this order line. *Numeric, 5 positions; display-only.*
Qty reserved	The quantity of the item/SKU that is set aside for this order. *Numeric, 7 positions; display-only.*
Cmp (Company)	The company for which you are viewing records. *Numeric, 3 positions; display-only.*
Whs (Warehouse)	A code that represents the warehouse from which the order line was reserved. Validated against the Warehouse table. *Numeric, 3 positions; display-only.*
Quantity reserved	The quantity of the item/SKU that is set aside for this order. *Numeric, 7 positions; display-only.*
Quantity printed	The number of units for which a pick slip has been printed. The system updates this field when it creates a pre-generated pick for the order line, incrementing this number by the quantity on the Pick Control Detail; see Applying Pick Slip Preparation to an Order. *Numeric, 5 positions; display-only.*
Quantity remaining	The difference between the quantity reserved and the quantity printed. The system updates this field when it creates a pre-generated pick for the order line, decreasing this number by the quantity on the Pick Control Detail; see Applying Pick Slip Preparation to an Order. Only records with a remaining quantity greater than zero will be selected. *Numeric, 5 positions; display-only.*
Reservation date	The date the item on the order detail line was reserved. *Numeric, 6 positions (in user date format); display-only.*
Reservation time	The time the item on the order detail line was reserved. *Numeric, 6 positions (HHMMSS format); display-only.*

Scan Orders by Customer Class Screen

Purpose: Use this screen to display the customer(s) that you want to work with. Customer classes restrict certain customers from immediate reservation. For example, there may be some customers who should not be included in immediate reservation due to the volume of merchandise ordered, or the type of items ordered.

How to display this screen: On the Interactive Reservation Screen, enter the customer class you wish to work with, or prompt click on the arrow in the *Customer class* field to display a list of customer classes.

Field	Description
Order #	A system-assigned code that represents a customer order number. *Numeric, 8 positions; optional.*
Order date	The order processing date. Defaults to the current date. *Numeric, 6 positions (in user date format); optional.*
Status	The status of the order detail line. Valid values: • **Open** • **Cancelled** • **Closed** • **Error** • **Held** • **Purged** • **Suspended** *Optional.*
Type	A user-defined code that indicates how the order was received, such as mail order, telephone order, retail, etc. *Alphanumeric, 1 position; optional.*

Select Work with detail for an order to advance to the Work with Order Detail Reservations Screen.

Work with Reservations by Item/SKU Screen

Purpose: Use this screen to display the order information for a particular item that you want to work with.

How to display this screen: On the Interactive Reservation Screen, enter an item/SKU, or prompt click on the arrow in this field to display a list of items and then a list of SKUs associated with an item.

Field	Description
Item	A code and description for a unit of inventory on an order detail line. If a SKUed item is displayed, the SKU information will also appear. *Alphanumeric, 12 positions; display-only.*
COLR SIZE OTHR	The SKU code; a code that further defines the item. The three elements are defined in the System Control table and validated against the SKU Element (1, 2, 3) tables. *Alphanumeric, three 4-position fields; display-only.*

Field	Description
Qty avail (Quantity available)	The quantity of the item that is available to sell in all warehouses. A negative number indicates the item is backordered. The calculation for availability is: `On hand quantity - Quantity reserved - Quantity protected - Pending transfers - Backordered quantity` Takes into account only reservable locations. *Numeric, 7 positions; display-only.*
Qty prot (Quantity protected)	The quantity of the item that can be reserved only through Interactive Reservation where inventory is dispersed manually, as in the case of large wholesale orders or preferred mail order customers. *Numeric, 5 positions; display-only.*
Order #	A unique number assigned by the system to identify an order. *Numeric, 8 positions; optional.*
Shp (Ship-to number)	This system-assigned number represents the number of shipping addresses for the order. *Numeric, 3 positions; optional.*
Ln # (Line number)	A system-assigned detail line number on the order. *Numeric, 3 positions; optional.*
Sold-to name	The name of the customer who placed the order. Validated against the Customer Sold-to table. *Alphanumeric, 15 positions (first name), 1 position (initial), 25 positions (last name); display-only.*
Qty open	The number of units of this item that have not shipped.
Qty rsrvd (Quantity reserved)	The number of units of the item that are set aside for existing orders. Increases by immediate and interactive reservation and decreases by confirmation or pick void/reprint. *Numeric, 5 positions; optional.*
Qty to reserve	The number of units of this item that are to be reserved for this order. *Numeric, 5 positions; required.*

Screen Option	Procedure
Display order detail information	Select Display order detail for an order to advance to the Display Order Detail Reserve Information Screen.
Display reservations by warehouse details information	Select Reserve by warehouse for an order to advance to the Work with Reservations by Warehouse Screen.
Display reserved order lines	Select Reserved order lines for an order to advance to the Display Reserved Order Lines Screen.

Selecting Vendors for Drop Ship Processing (MDSP)

Overview: Use Select Vendors for Drop Ship Processing to select one, several, or all vendors for processing drop ship purchase orders or picks. Each vendor code entered on the screen is validated against Working with Vendors (WVEN). If you do not select any vendors, all vendors are eligible for drop ship processing. Completing this screen automatically generates drop ship purchase orders, pick slips,the *Pick Message from Order Administration (CWPickOut)*, or invoices; also, if the vendor is flagged to use the Order Orchestration Drop Ship Integration, the drop ship purchase order is automatically sent to Order Orchestration. See Drop Ship Processing for a process overview.

Drop ship items are items that you do not stock in inventory. When a customer places an order for a drop ship item, you order the item from your supplier (vendor). The vendor ships the item directly to your customer.

Generating drop ship pick slips by batch: You can generate drop ship pick slips by batch for selected vendors using Processing Drop Ship Orders by Batch (MDSB); however, you cannot generate drop ship purchase orders through that menu option. Batch processing of drop ship pick slips is available only for vendors whose Drop ship output field is set to Drop Ship Pick.

Scheduling drop ship orders: You can use the Drop Ship Processing DSHPROC periodic function (program name FLRDSHP) to schedule drop ship order processing for all drop ship purchase orders or pick slips. See Scheduling Jobs for more information.

Quotes: Drop ship items on quotes are not eligible for drop ship processing until the quote is converted to an order; see Entering Pre-Order Quotes for an overview and required setup.

Emailing drop ship purchase orders not available: Regardless of the setting of the Email Purchase Order (K80) system control value, sending drop ship purchase orders by email is not supported. See that system control value for more information.

Bypassing printable pick slips not available: Even if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected, the Select Vendors for Drop Ship Processing option still creates printable pick slips for eligible vendors. This system control value controls the generation of printable pick slips only when you use the Streamlined Pick Slip Generation (WSPS) option.

Submitting ship-for-pickup orders to Order Orchestration: If an order originating in Order Administration that is selected for drop ship processing is flagged to ship to a store location for customer pickup, the process sends a Submit Order request to Order Orchestration. See Ship-for-Pickup Orders for an overview.

Checking status for retail pickup or delivery orders: If a retail pickup or delivery order from Order Orchestration is selected for drop ship processing, the process sends a status inquiry request to Order Orchestration to confirm that the order has not been canceled since the last update on its status was received. See Retail Pickup (including Ship-for-Pickup) or Delivery Orders for an overview.

Drop ship authorization records in W status? Pick slip generation displays an error message if there are drop ship authorizations in W status. See DROPSHIP Authorization Records in W Status for a discussion.

Select Vendors for Drop Ship Screen

Purpose: Use this screen to select vendors for drop ship processing and also to select whether to print drop ship purchase orders or generate the Pick Message from Order Administration (CWPickOut).

How to display this screen: Enter MDSP in the *Fast path* field at the top of any menu, or select Select Vendors for Drop Ship Picks from a menu.

Field	Description
Vendors	A code that defines the supplier of an item. Validated against the Vendor table; see Working with Vendors (WVEN). To select one or more vendors, enter the vendor number(s); otherwise, to select all vendors, leave the vendor fields blank. *Numeric, 7 positions; optional.*
Print drop ship purchase orders	Indicates whether the system prints drop ship purchase orders for the vendors specified in the *Vendor* field. You can select the sort sequence in which the drop ship purchase orders print. The sort option used previously defaults. Valid values are: • Blank = The system does not print drop ship purchase orders. • Purchase order print = The system prints drop ship purchase orders in purchase order number sequence. The system uses the PO Print Program for PO Print in PO Sequence (C76) system control value to print drop ship purchase orders in purchase order number sequence. • Vendor print = The system prints drop ship purchase orders in vendor number sequence. The system uses the PO Print Program (C64) system control value to print drop ship purchase orders in vendor number sequence. **Setup:** Drop ship purchase orders print only for vendors whose Drop ship output field on the second Vendor screen is set to Drop ship purchase order . **Drop ship pick slip/invoice:** When you print a drop ship purchase order, the system also prints a Drop Ship Pick Slip/ Invoice. If a vendor's *Drop ship output* field is set to Drop ship pick , the system prints a drop ship pick slip/invoice instead of a drop ship purchase order. **To print:** See Possible Drop Ship Output for information on how to print drop ship purchase orders or pick slips/invoices. **PO download trigger:** The system creates a purchase order download Add trigger record when the purchase order is printed. *Alphanumeric, 1 position; required.*
Fax invoices/picks to vendors	Indicates whether the drop ship pick slips/invoices should be faxed to the vendor instead of, or in addition to, printing. *This option is not currently implemented.*

Screen Option	Procedure
Continue to process drop ships, even if there is a pick slip generation error	Select Accept. The system sends all records in the CC Authorization Transaction table to the Authorization Service, including the authorization associated with the non-drop ship order. See Drop Ship Processing for an overview of how to handle any errors.
Return to Drop Ship Processing without processing drop ships	Select Reject. You return to the Select Vendors for Drop Ship Screen so you can correct any pick slip generation error before processing drop ships. See Drop Ship Processing for an overview of how to handle any errors.

Drop Ship Processing

The system performs the following procedures during drop ship processing:

#	Step
1.	An order is flagged as "Drop Ship" in order entry because it includes a drop ship item.
2.	The system checks the Item/SKU to determine the primary vendor assigned to the item/SKU that was ordered.
3.	The system processes credit card authorizations on the drop ship orders, if needed. The setting of the Authorize Only Merchandise for Drop Ship (C92) system control value determines the amount to authorize. Any orders whose credit cards are declined for authorization are not included in the drop ship process; see Using the Credit Card Authorization Interface.

> **Note:**
>
> If you process drop ships for all vendors, the system requests a single authorization for an order; however, if you process drop ships for selected vendors, the system requests a separate authorization for each vendor associated with a drop ship item on an order.

#	Step
4.	The system then checks the Vendor table to see if the Drop ship output field on the second Vendor screen is set to Drop ship pick, Drop ship purchase order, or OROB drop shipping (Order Orchestration's Supplier Direct Fulfillment module). If the *Drop ship output* field for the vendor is set to: Drop ship purchase order , the system generates a Purchase Order AND a Drop Ship Pick Slip/Invoice. Once the vendor confirms the order, you can confirm the shipment manually, using the Purchase Order Receipts menu option. Drop ship pick, the system generates a Drop Ship Pick Slip/Invoice or the Pick Message from Order Administration (CWPickOut). Once the vendor confirms the order, you can confirm the shipment manually, using the Manually Confirming Shipments (MCON) menu option. The system then produces the Drop Ship Batch Confirmation Report, which allows you to review the total costs of items on the drop ship pick slips. See Possible Drop Ship Output for an overview of output options. OROB drop shipping , the system automatically sends the drop ship purchase orders to Order Orchestration's Supplier Direct Fulfillment module for processing. See Interface with Order Orchestration's Supplier Direct Fulfillment Module: Overview and Setup for background. The system also: • generates a drop ship pick slip/invoice when sending the drop ship purchase order to Order Orchestration based on the settings described under Possible Drop Ship Output. • creates a pick download trigger (*File code* of PCH) in the IL Outbound Trigger table when generating a drop ship pick slip/invoice if the Create Generic Pick Download Triggers (I31) system control value is selected. The PICK_OUT process in Working with Integration Layer Processes (IJCT) generates the Pick Message from Order Administration (CWPickOut) for each of these trigger records.
5.	The system produces several reports related to drop ship processing; see Reports.

> **Note:**
>
> A drop ship order line is not eligible for processing until the current date plus the number of Lead days on the Create Vendor Item Screen equals or exceeds the Arrival date for the order line.

Example: On October 1, you enter an order for a drop ship item supplied to your customers by vendor 789. At the customer's request, you enter an *Arrival date* of December 15 . The vendor item's specified number of *Lead days* is 10. The order line is not eligible for processing until December 5.

PICKGEN auth records in W status: A pop-up window opens when you process drop ships if the system finds a pick control header record with a pick status of W (waiting for authorization) for a non-drop ship order paid with a credit card was not authorized during a previous pick slip generation process due to transmission failure.

The system creates a record in the Pick Control Header table when you generate pick slips. The pick control header record remains in a W pick status until the corresponding authorization transaction in the CC Authorization Transaction table receives an approved authorization. A pick slip is not produced until the credit card on the order receives an approved authorization.

When you see this pop-up window during drop ship processing, you can either:

- select Accept to generate drop ship orders without first re-sending the authorization transaction associated with the pick control header record in a W pick status for authorization. When you perform drop ship processing, the system sends all authorization records in the CC Authorization Transaction table to the authorization service for authorization, including the authorization transaction associated with the pick control header record in a W status. If you do this, a record remains in the Pick Control Header table for the non-drop ship order, but the corresponding authorization record no longer exists in the CC Authorization Transaction table. To generate a pick slip for the order, you need to delete the record from the Pick Control Header table and generate pick slips again.

  > **Note:**
  >
  > When you generate pick slips again, the system sends an authorization transaction to the authorization service for the order that was stranded in the Pick Control Header table. You need to make sure that you do not receive a double authorization for the order since the authorization transaction associated with the order was sent to the authorization service when you performed drop ship processing.

  > **Note:**
  >
  > You will continue to see this pop-up window when you process drop ships until you delete the record in the Pick Control Header table.

- select Reject to return to the Select Vendors for Drop Ship Screen without processing drop ships. You can verify with the authorization service whether the authorization associated with the pick control header record in a W status was received.
  - If the authorization was received by the authorization service, use the Reprocess Authorizations Screen (RPAA) to receive the authorization response. If the order receives an approved authorization, the system generates the pick slip and updates the record in the Pick Control Header table to a Z (authorized) status.
  - If the authorization was not received by the authorization service, check the CC Authorization Transaction table to verify that only the authorization transaction for the order exists. Then, use the Reprocess Authorizations Screen (RPAA) to resend the authorization transaction for authorization. If the order receives an approved authorization, the system generates the pick slip and updates the record in the Pick Control Header table to a Z (authorize) status.

> **Note:**
>
> If authorization transactions exist in the CC Authorization Transaction table for drop ship orders, the system sends the authorization transactions to the authorization service when you reprocess authorizations.

Possible Drop Ship Output

Depending on setup, the system can generate a printed copy of a Purchase Order, a Drop Ship Pick Slip/Invoice, or the Pick Message from Order Administration (CWPickOut), or various combinations. The conditions required to produce each type of output are described below. Also, if the vendor meets the conditions for more than one type of output, the system produces all qualifying output types. For example, if the vendor meets the conditions to print both drop ship purchase orders and pick slips/invoices, then all four outputs are produced.

The system prints a drop ship PO when:

- the vendor's *Drop ship output* field is Drop ship purchase order , and
- the vendor's *Print PO* field is selected , and
- the Print drop ship purchase orders field at the Select Vendors for Drop Ship Screen is set to Vendor print or Purchase order print.

The system prints a drop ship pick slip/invoice when:

- the system prints a drop ship PO (see above for the requirements).
- the vendor's *Drop ship output* field is Drop ship pick or OROB drop shipping .

A separate drop ship pick slip/invoice prints for each ship-alone item if the Print One Drop Ship Invoice per Ship Alone Item (E38) system control value is selected ; however, this system control value does not apply to drop ship purchase orders sent to Order Orchestration.

The system also creates pick download triggers (*File code* of PCH) in the IL Outbound Trigger table when you generate a drop ship pick slip/invoice if the Create Generic Pick Download Triggers (I31) system control value is selected . The PICK_OUT process in Working with Integration Layer Processes (IJCT) generates the Pick Message from Order Administration (CWPickOut) for each of these trigger records.

> **Note:**
>
> The system deletes the drop ship pick slip/invoice once the associated drop ship purchase order is closed or cancelled and all IL Outbound Trigger records (WOIT) for the purchase order and drop ship pick slip/invoice are in an X Closed status.

Multiple items? The Allow Only Single Line on Drop Ship Pick (C82) system control value controls whether to include multiple items on a drop ship pick slip, or to generate separate pick slips; similarly, the Allow Only Single Line on Drop Ship PO (M13) controls whether to include multiple items on a drop ship purchase order, or to generate multiple purchase orders. See each system control value for more information.

Reports

The system produces the following reports during drop ship processing:

- Vendor Drop Ship Worksheet: Generated whenever you run drop ship processing.
- Drop Ship Purchase Order List: Generated when you process drop ship purchase orders. This list does not include drop ship pick slips.
- Drop Ship Pick Slip/Invoice: Generated when you process drop ship pick slips. The system also generates a drop ship pick slip/invoice when you generate drop ship purchase orders.
- Purchase Order: Generated for drop ship purchase orders when you enter Purchase order print or Vendor print in the Print drop ship purchase orders field on the Select Vendors for Drop Ship screen.
- Declined Drop Ships: Generated whenever you run drop ship processing.
- Credit Card Authorization Listing: Generated for drop ship orders requiring credit card authorization.
- Address Verification Response List: Generated for drop ship orders requiring credit card authorization and AVS verification.

Print program: The system uses the Drop Ship Pick Print Program (E92). If this system control value is blank, the system uses the Pick Printing Program (C37). The standard pick slip printing program name is PICKG (graphical form).

Active procedure: When you accept you entries at this screen, the system creates an active procedure so that another user cannot process drop ship orders while the program is already running. A second batch job will be aborted if it is submitted while the first batch job is active.

Displaying Pick Slip Generation Inquiry (DPSI)

Purpose: Display Pick Slip Generation Inquiry is a management tool that allows you to monitor warehouse performance and pick slip generations. This option provides a detailed listing of the picks that have been generated and their current status.

Pre-printed pick slips: Display Pick Slip Generation Inquiry does not include pick slips in a pre-printed status (G Generated No Authorization or H Generated Has Authorization); see Creating Pre-Generated Picks.

Display Pick Slip Generation Inquiry Screen

How to display this screen: Enter DPSI in the *Fast path* field at the top of any menu or select Display Pick Slip Generation Inquiry from a menu.

Field	Description
Date	The date the pick slip was printed. This is the date for the first pick slip in the batch sorted in cart batch number, pick control number sequence. *Numeric, 6 positions (in user date format); display-only.*
Time	The time the pick slip was printed. This is the time for the first pick slip in the batch sorted in cart batch number, pick control number sequence. *Numeric, 6 positions (HHMMSS format); display-only.*
Billing batch	A system-generated batch number that is assigned to each pick slip run. *Numeric, 7 positions; optional.*
Pick # range	Each pick slip is assigned a number; this field displays the range of pick slip numbers that were picked. *Numeric, 3 positions; display-only.*
Total printed	The total number of pick slips that were printed, for each date. *Numeric, 3 positions; display-only.*
Cnfrm (Confirmed)	The total number of pick slips that were shipped and billed, for each date. This is the number of pick slips that are in a Confirmed (C) status. *Numeric, 3 positions; display-only.*
Packd (Packed)	The total number of pick slips that were packed. This is the number of pick slips that are a Packed (P) status. *Numeric, 3 positions; display-only.*
Void	The total number of pick slips that were voided. This is the number of pick slips that are in Void (V) status. *Numeric, 3 positions; display-only.*
Suspd (Suspended)	The total number of pick slips that have been suspended. This is the number of pick slips that are in a Suspended (S) status. *Numeric, 3 positions; display-only.*
Outsd (Outstanding)	The total number of pick slips that have been printed, but not yet confirmed. This is the number of pick slips that are in a Manifest (M) or Carryover (O) status. *Numeric, 3 positions; display-only.*

Screen Option	Procedure
Display picks	Select Display Picks for a pick to advance to the Display Picks for Batch Screen.

Display Picks for Batch Screen

Purpose: Use this screen to review pick information including the batch number, pick number, printed/confirmed date, and the status of the pick.

How to display this screen: Select Display Picks for a pick at the Display Pick Slip Generation Inquiry Screen.

Field	Description
Billing batch #	A system-generated batch number that is assigned to each pick slip run. *Numeric, 7 positions; display-only.*
Pick #	The system-assigned control number for this pick. *Numeric, 7 positions; display-only.*
Printed	The date the pick was printed. *Numeric, 6 positions (in user date format); display-only.*
Confirmed	The date the pick was shipped and billed. *Numeric, 6 positions (in user date format); display-only.*
Status	The status of this pick. Valid values: • Open • Submitted to async • Billing pending • Confirmed • Declined authorization • Async processing error • Manifest submission • CarryOver • Packed • Reprinted • Suspended • Void • Waiting for Authorization • Authorized *Optional.*
Reprint	The pick control number that has been reprinted. *Numeric, 7 positions; display-only.*

Screen Option	Procedure
Display pick control header information	Select Display for a pick to advance to the First Display Pick Control Header Screen.
Work with pick details	Select Details for a pick to advance to the Work with Pick Details Screen.

First Display Pick Control Header Screen

Purpose: Use this screen to review complete pick information including the control and billing batch numbers, pick status, generation type, date/time for last update, confirmation, printing, number of labels, cartons, zones, warehouse, and drop points.

Select OK at this screen to advance to the Second Display Pick Control Header Screen, where you can review additional pick control header information.

How to display this screen: Select Display for a pick at the Display Picks for Batch Screen.

Field	Description
Control #	The control number assigned to a batch of picks. *Numeric, 7 positions; display-only.*
Billing batch #	A system-generated batch number that is assigned to each pick slip run. *Numeric, 7 positions; display-only.*
Pick status	The description of the pick's status. Valid values: • Open • Submitted to async • Billing pending • Confirmed • Declined authorization • Async processing error • Manifest submission • CarryOver • Packed • Reprinted • Suspended • Void • Waiting for Authorization • Authorized *Display-only.*
Generation type	The type of pick slip being generated. Valid values: • Regular = no special requirements • Drop/Ship = requires drop ship processing • Special/Handling = includes special handling items • Master = includes all items in the pick slip run. *Display-only.*
Date/time last update	The date and time this pick was last changed. Printing the pick is considered to be a change. *Numeric, 6 positions (in user date format, HHMMSS format); display-only.*
By	The process that created the Pick Control Header record. From the *Last update by user* field in the Pick Control Header table. See Creating Pre-Generated Picks for a list of processes. *Alphanumeric, 10 positions; display-only.*
Date/time printed	The date and time this pick was printed. *Numeric, 6 positions (in user date format, HHMMSS format); display-only.*
# of labels	The total number of labels printed for this pick slip. Used in the following situations: • If you decide to print multiple labels for this pick slip manually. • If the system divides an order into multiple pick slips, each one will get a unique control number. *Numeric, 3 positions; display-only.*

Field	Description
# of labels scanned	The total number of shipping labels scanned, or wanded, for this pick. *Numeric, 3 positions; display-only.*
Cart batch #	The system-assigned number that represents the batch pick slip list for each cart. If the system determines that there is not enough bins in the cart to accommodate the batch, a new cart/batch number is created. *Numeric, 3 positions; display-only.*
# of cartons	The number of cartons required to ship each order. Determined by the Cubing feature. *Numeric, 3 positions; display-only.*
Pick zones (1-6)	The warehouse zone(s) on this pick slip. The System Control table value, Maximum Number of Zones (B41), defines the maximum number of zones (up to 6) on a pick slip. Example of how pick zones are used: A pick slip with items to be picked in zones A, B, and D will not be included in the same batch as a pick slip with items to be picked in zones A, B, and R. However, a pick slip with items to be picked in zones A, B, and D will be included in the same batch as a pick slip with items to be picked in zones A and D. *Numeric, 3 positions; display-only.*
Include on S/J	• Selected = Indicates that this pick slip should be included on the Sales Journal report. • Unselected = Indicates that this pick should not be included on the Sales Journal report.
# of lines	The number of items on the pick slip. *Numeric, 3 positions; display-only.*
Ship via	The code that represents the carrier for this order. Validated against the Ship Via table. *Numeric, 2 positions; display-only.*
Hazard code	A user-defined code used to categorize an item as a hazardous material that requires special storage and/or handling. Validated against the Item Hazard table; see Working with Hazardous Item Codes (WHAZ). This information is passed to TanData. *Numeric, 2 positions; display-only.*
Warehouse	A code that represents the default warehouse. Validated against the Warehouse table. *Numeric, 3 positions; display-only.*
Drop point	A code that represents a location to which merchandise will be shipped from your warehouse. • Drop points are UPS facilities, typically. • Drop points print as the return address on the pick slip and are the destination to which undeliverable packages are returned. • Drop points are used in zone skipping. *Numeric, 3 positions; display-only.*

Second Display Pick Control Header Screen

Purpose: Use this screen to review additional pick information, such as the order number and customer information.

How to display this screen: Select OK at the First Display Pick Control Header Screen.

Field	Description
Control #	The control number assigned to this batch of picks. *Numeric, 7 positions; display-only.*
Reprinted control #	The control number assigned to the batch of picks that have been reprinted. *Numeric, 7 positions; display-only.*
Merch	The total value of merchandise. A total of the item price multiplied by the quantity ordered and does not include freight, additional charges, tax, or handling. *Numeric, 20 positions with a 2-place decimal; display-only.*
Freight	The total charge for shipping an order. Does not include any additional charges associated with shipping the order. Based on the freight method defined for the source code on the order. The total may depend on the quantity or weight of items ordered, or on the dollar value of the order as a whole. *Numeric, 20 positions with a 2-place decimal; display-only.*
Add'l freight	The total dollar value for additional freight charges, above the order's regular shipping charges. The total of the additional freight charges defined for the shipper(s). Additional freight charges are defined in the Ship Via table. *Numeric, 20 positions with a 2-place decimal; display-only.*
Add'l chgs	The total extra charges added to the order. Additional charges can be: • Service charges, based on the dollar value of the merchandise, • Additional shipping charges, or • Guaranteed service charges. *Numeric, 20 positions with a 2-place decimal; display-only.*
Handling	The total charge for special handling or gift wrapping. The full total of the handling charges for each item multiplied by the quantity ordered. The SKU/Offer table controls whether the item is eligible for special handling and the charge for special handling. *Numeric, 20 positions with a 2-place decimal; display-only.*
Tax	The total sales tax on the order. Based on the merchandise value. The system calculates sales tax for the order by multiplying the merchandise amount by the tax rate for the shipping destination. See Entering Orders for additional information. *Numeric, 20 positions with a 2-place decimal; display-only.*
GST	Canadian Goods and Services tax. A tax method is defined for each postal code to accommodate the varying tax requirements in each province, when shipping from Canada. *Numeric, 20 positions with a 2-place decimal; display-only.*
PST	Provincial Services tax. A tax method is defined for each postal code to accommodate the varying tax requirements in each province, when shipping from Canada. *Numeric, 20 positions with a 2-place decimal; display-only.*

Field	Description
Paid	The amount paid by the customer. *Numeric, 20 positions with a 2-place decimal; display-only.*
Total order	The sum of all charges including merchandise, freight, additional freight, tax, handling, and additional charges. *Numeric, 20 positions with a 2-place decimal; display-only.*
Due	The balance due. If this is a credit, the system displays the amount with CR beside the value. The amount due is calculated by subtracting the Paid amount from the Total Order amount. *Numeric, 20 positions with a 2-place decimal; display-only.*
PO #	The customer's purchase order number. *Alphanumeric, 15 positions; display-only.*
Order #	A unique number assigned by the system to identify an order. Every order on the system is assigned an order number. *Numeric, 8 positions; display-only.*
Customer #	A unique number assigned by the system to identify a customer. Every customer on the system is assigned a customer number. *Numeric, 9 positions; display-only.*
Name	The name of the customer who placed the order. *Alphanumeric, 15 positions (first name), 1 position (initial), 25 positions (last name); display-only.*
Company name	The name of the company that placed the order. *Alphanumeric, 30 positions; display-only.*
Address	The customer's street address. *Alphanumeric, 32 positions; display-only.*
Apartment	The customer's apartment, suite, rural route, or floor number. *Alphanumeric, 10 positions; display-only.*
City/St/Postal/ Cntry	The city, state, postal zip code, and country where the customer receives mail or shipping. State codes are defined in and validated against the State table, which is accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). *Alphanumeric, 25 positions (city), 2 positions (state), 10 positions (postal code), 3 positions (country); display-only.*
Delivery code	Identifies whether the customer is Business or Residential. Used to determine shipping charges. Valid values: • Business • Residential *Display-only.*
PO box?	Indicates whether the shipper will deliver packages to a post office (P.O.) box. Any address in which P.O. Box or APO/FPO appears must be delivered to a post office box. • Selected = the shipper delivers packages to post office boxes. • Unselected = the shipper does not deliver packages to post office boxes.

Screen Option	Procedure
Display detail lines	Select Display Detail Lines to advance to the Work with Pick Details Screen.

Work with Pick Details Screen

Purpose: Use this screen to review the line number, item and SKU information, and the quantity printed.

How to display this screen: Select Detail Lines at the First Display Pick Control Header Screen or the Second Display Pick Control Header Screen.

Field	Description
Line #	A system-assigned detail line number on the order. Up to 999 detail lines may be entered on an order. Order lines are presented in descending sequence so that the most recent order line displays first. *Numeric, 3 positions; display-only.*
Item	A code that represents a unit of inventory on an order detail line. *Alphanumeric, 12 positions; display-only.*
SKU	A code that further identifies the item. *Alphanumeric, three 4-position fields; display-only.*
Quantity printed	The number of units of the item printed and the quantity which should be shipped. *Numeric, 5 positions; display-only.*

Screen Option	Procedure
Display pick control details	Select Display for a line to advance to the Display Pick Control Details Screen.
Display pick locations	Select Locations for a line to advance to the Display Pick Locations Screen.

Display Pick Control Details Screen

Purpose: Use this screen to review the pick control details for each order line.

How to display this screen: Select Display for an order line on the Work with Pick Details Screen.

Field	Description
Order #	A unique number assigned by the system to identify an order. Every order on the system is assigned an order number. *Numeric, 8 positions; display-only.*
Ship-to #	Indicates the number of shipping addresses for the order. The system assigns a sequential ship-to number to every order. The first ship-to address is assigned the number 1. *Numeric, 3 positions; display-only.*

Field	Description
Seq # (Sequence number)	A number assigned to a warehouse location and used to verify the location number that is either entered, scanned, or system-loaded. *Numeric, 3 positions; display-only.*
Control #	The control number assigned to a pick slip. *Numeric, 7 positions; display-only.*
Line #	The line number on the order. Up to 999 detail lines may be entered on an order. Order lines are presented in descending sequence so that the most recent order line displays first. *Numeric, 3 positions; display-only (assigned by the system).*
Item	A code that represents a unit of inventory on the order detail line. *Alphanumeric, 12 positions; display-only.*
SKU	A code that further identifies the item. *Alphanumeric, three 4-position fields; display-only.*
Original print qty	The original quantity that was printed on the pick. This becomes important if the quantity on the pick is changed. *Numeric, 5 positions; display-only.*
Qty printed	The number of units of the item printed and the quantity which should be shipped. *Numeric, 5 positions; display-only.*
Qty packed	The number of units of the item packed and the quantity which should be shipped. *Numeric, 5 positions; display-only.*
Qty ordered	The number of units of the item ordered. *Numeric, 3 positions; display-only.*
Qty B/O (Quantity backordered)	The number of units of the item backordered. *Numeric, 3 positions; display-only.*
Price	The system price of a single unit of the item. The price is assigned by the system, but may be overridden in Order Entry. *Numeric, 13 positions with a 2-place decimal; display-only.*
Extension	The total price of the order. Calculated by multiplying the Unit Price by the Quantity Shipped. *Numeric, 11 20 with a 2-place decimal; display-only.*
Special handling	The charge for special handling a single unit of the item. The SKU/ Offer table controls whether the item is eligible for special handling and the charge for special handling. *Numeric, 13 positions with a 2-place decimal; display-only.*
Extension	The total special handling charges for the order. Calculated by multiplying the Special Handling charge by the Quantity Shipped. *Numeric, 20 positions with a 2-place decimal; display-only.*
Gift wrap	The charge for gift wrapping a single unit of the item. The SKU/ Offer table controls whether the item is eligible for gift wrapping and the charge for gift wrapping. *Numeric, 13 positions with a 2-place decimal; display-only.*
Extension	The total gift wrapping charges for the order. Calculated by multiplying the Gift Wrap charge by the Quantity Shipped. *Numeric, 20 positions with a 2-place decimal; display-only.*

Field	Description
Freight	The total charge for shipping an order. Does not include any additional charges associated with shipping the order. The system performs this calculation based on the freight method defined for the source code on the order. The total may depend on the quantity or weight of items ordered, or on the dollar value of the order as a whole. *Numeric, 20 positions with a 2-place decimal; display-only.*
Tax	The total sales tax on the order. Based on the merchandise value. The system calculates sales tax for the order by multiplying the merchandise amount by the tax rate for the shipping destination. See Setting Up the Zip/City/State (Postal Code) Table (WZIP) and Working with Customer Tax Status. *Numeric, 20 positions with a 2-place decimal; display-only.*
GST (Canadian Goods and Services tax)	A federal-level tax that may apply to orders within Canada. *Numeric, 20 positions with a 2-place decimal; display-only.*
PST (Provincial Services tax)	A province-level tax that may apply to orders within Canada. *Numeric, 20 positions with a 2-place decimal; display-only.*
Line status	The status of the order detail line. Valid values: • C = Cancel • H = Hold • Blank = Open *Alphanumeric, 1 position; display-only.*
Backorder control	Specifies what action should be taken for this line. Valid values: • C = Ship and cancel remainder • X = Backorder and cancel order • Blank = Ship and backorder the remainder. *Alphanumeric, 1 position; display-only.*
Effect inventory (Effect on inventory)	Indicates whether this order detail line affects the inventory count. For example, you may not want a mailer that is included in each shipment to be reflected in your actual inventory count. • selected = This order detail line affects inventory count. • unselected = This order detail line does not affect inventory count.
Carton #	The number assigned to the carton by the system. *Numeric, 3 positions; display-only.*
Cart bin #	The number assigned to the cart/bin by the system. *Numeric, 3 positions; display-only.*
Requires special (Requires special handling)	Indicates whether or not this order detail line requires special handling. • selected = This order detail line requires special handling. • unselected = This order detail line does not require special handling.

Display Pick Locations Screen

Purpose: Use this screen to review the warehouse, zone, location, quantity picked and cart batch information.

How to display this screen: Select Locations for an order line at the Work with Pick Details Screen.

Field	Description
Whs	A code that represents the primary warehouse. Validated against the Warehouse table. *Numeric, 3 positions; display only.*
Zone	The zone(s) in the warehouse that is used for this pick slip. You can have up to 6 zones on a pick slip. The Maximum Number of Zones (B41) system control value defines the maximum number of zones on a pick slip. *Numeric, 3 positions; display only.*
Location	A code that represents a warehouse location where merchandise is stored. The warehouse location code can consist of a zone/aisle/shelf/bin combination, or it can be any user-defined code. The location code prints on picks slips and reports. Example: The location A010201 indicates: `Zone Aisle Shelf Bin` `A 01 02 01` *Alphanumeric, 7 positions; display only.*
Qty picked	The quantity of the item that has been picked from this warehouse. *Numeric, 3 positions; display only.*
Cart batch	The batch pick slip list that is assigned to each cart. *Numeric, 3 positions; display only.*

Working with Pick Slip Messages (WPSM)

Purpose: The Work with Pick Slip Messages screen is used to create, change, delete, or display messages. Messages to be included on pick slips can be customer service messages, warehouse messages, gift messages, etc. The format of the message determines where the message will print.

In this topic:

- Work with Pick Slip Messages Screen
- Create Pick Slip Message Pop-up Window

Work with Pick Slip Messages Screen

How to display this screen: Enter WPSM in the *Fast Path* field at the top of any menu.

Field	Description
Message	A code that represents the message. *Alphanumeric, 2 positions; optional.*

Screen Option	Procedure
Create a new pick slip message	Select Create to advance to the Create Pick Slip Message Pop-up Window.
Change a pick slip message	Select Change for the *Opt* field to advance to the Change Pick Slip Message window. At the Change window you can change any information except the Message number. See Create Pick Slip Message Pop-up Window for field descriptions.

Create Pick Slip Message Pop-up Window

To create a pick slip message: At the Work With Pick Slip Message screen, select Create.

Field	Description
Message	A code that represents the pick slip message. *Numeric, 2 positions.* *Create screen: required.* *Change screen: display-only.*
Message text	You can enter up to 3 lines of message text. This free-form message text will print on each pick slip. *Alphanumeric, 40 positions (each line); required.*

Streamlined Pick Slip Generation (WSPS)

Purpose: Use streamlined pick slip generation to:

- Create and work with pick slip generation templates that determine the pre-generated picks to select for pick slip generation.
- To advance to the Display Operations Control Summary Screen.
- Generate pick slips for a selected pick slip generation template.

Pick slip generation options: Pick slip generation options define the criteria to use when selecting pre-generated picks for pick slip generation. You can select pre-generated picks for generation based on a specified:

- warehouse
- source category
- ship via
- pay type
- item
- status (H Generated Has Authorization status)
- order
- line of business
- location class
- arrival date range
- sold to customer

- state
- postal code range
- number of pick lines

In addition, you can select pre-generated picks for generation based on whether the associated order is flagged as a gift order, the pick contains a single line, or an item on the pick contains a special handling code, requires gift wrapping, or is flagged as oversized.

Generating pick slips: The system uses the pick slip generation options, system control values, and order information to create the pick slip. When you select Generate Picks for a pick slip generation template, the system submits a batch job (PICK_GEN) to perform batch authorization, allocate stock, sort the pick slips, and print the picking documents. See Performing Pick Slip Generation for an overview and processing details.

Bypass printable pick slips? You can expedite the pick slip generation process even further by omitting the generation of printable pick slips. To do so, select the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value. For example, you might select this option if you use the *Generic Pick Out API* to communicate with your warehouse management system and do not need to print pick slips. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Also see the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value for a discussion of the differences in processing and print output when you omit printable pick slip generation.

Scheduling pick slip generation: You can schedule when pick slip generation runs for a particular pick slip generation template using a periodic function whose *Program name* is PFR0107 and whose *Parameter* matches the pick slip generation template's *Description*. See Scheduling Pick Slip Generation for instructions.

Picks not included? If you run pick slip generation and the system does not include the picks you were expecting, you can use Pick Print Eligibility (WPPE) to determine the reason why the picks for an order were not included.

About Zones

The term *Zone* is used in three specific contexts in pick generation:

- UPS or Parcel Post Shipping zones: These shippers have divided the country into zones, which are used to determine shipping charges. UPS and Parcel Post shipping zones are defined in and validated against the SCF Ship Via table. See Working with SCF/Ship Via Values (WSHV).
- Geographic zones: Geographic zones are regions of the country which relate to weather conditions. Geographic zones are used in zone reservation processing to control shipping dates for weather-sensitive (zone reservation coded) inventory such as plant stock. Geographic zones are defined in and validated against the Geographic Zone table. See Shipping Zone Reservation Overview.
- Warehouse zones: A warehouse zone is the major subdivision within a warehouse. Typically, a warehouse location is identified by zone, aisle, shelf and bin. For example, the location A010203 typically indicates Zone A, Aisle 01, Shelf 02, and Bin 03. Warehouse zone is a criterion for sorting pick slips as they are printed. In addition, you can specify warehouse zones and/or a range of aisles for replenishing your pickable locations. See Creating and Maintaining Locations (WLOC).

For more information: See Preparing Orders for Pick Slip Generation and Performing Pick Slip Generation.

In this topic:

Work with Streamlined Pick Slip Generation Screen

Purpose: Use this screen to review the streamlined pick slip generation options in your company, to create or change an option, and to generate pick slips or the Pick Message from Order Administration (CWPickOut).

For more information see the Order Administration Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).

How to display this screen: Select Work with Streamlined Pick Slip Generation from a menu or enter WSPS in the *Fast path* field at the top of any menu.

Pick slip generation option description: The only field displayed on this screen is the *Description* of the pick slip generation option. This is a 50-position, alphanumeric field. You can edit the description at the Streamlined Pick Slip Generation Screen.

Screen Option	Procedure
Create a new pick slip generation option	Select Create to advance to the Streamlined Pick Slip Generation Screen, where you can create a new pick slip generation template.

Screen Option	Procedure
Delete a pick slip generation option	Select Delete for a pick slip generation template to delete it. **Note:** When you delete a pick slip generation template, the system does not delete its associated periodic function used to schedule when pick slip generation runs for the template; you must use Working with Periodic Functions (WPER) to delete the periodic function. See Scheduling Pick Slip Generation for more information.
Review or change a pick slip generation option	Select Options for a pick slip generation template to advance to the Streamlined Pick Slip Generation Screen, where you can review the current settings and change them if needed.
Generate pick slips	Select Gen Picks for a pick slip generation template to submit the PICK_GEN job. By default, this job is submitted to the PICKGEN job queue at the Job Management Screen rather than the QBATCH job queue. **Note:** In order to avoid errors during pick slip generation, DO NOT route the PICK_GEN job away from the PICKGEN job queue. The PICKGEN job queue processes one job at a time. If a PICKGEN job is running and another job is submitted, the job remains in a RDY status until the PICKGEN job queue is available to process it.

Streamlined Pick Slip Generation Screen

Purpose: Use this screen to create a new streamlined pick slip generation template, or to review or modify an existing template.

How to display this screen: Select Create at the Work with Streamlined Pick Slip Generation Screen to create a new option, or select Options at that screen for an existing option.

Field	Description
Description	A description of the pick slip generation option. **Scheduling pick slip generation:** The system automatically creates a periodic function for the pick slip generation template if you select the Create Periodic Function flag and the template's *Description* is 7 characters or less. **Note:** The *Description* must be 7 characters or less because the maximum length for the periodic function name is 7 positions. Also, in order to create a periodic function for the template, the description cannot contain a single quote ('). See Scheduling Pick Slip Generation for further instructions. **If you use multiple companies:** If you create a periodic function for a pick slip generation template and you use more than one company, you must make sure the *Description* for each pick slip generation template is unique across companies. *Alphanumeric, 50 positions; display-only if a periodic function for the pick slip generation template exists, otherwise, required.*
Max # of picks	The maximum number of picks to pick. This is the number of pre-generated picks (picks in a G Generated No Authorization or H Generated Has Authorization status) in the Pick Control Header table to select for pick slip generation. 0 = No limit. If you enter a number in this field, the system selects pre-generated picks, starting with the lowest order number. **Note:** If an order is split into multiple picks, the system may select some of the pick for the order for generation and leave the others for another pick slip generation run. See Splitting an Order Across Multiple Picks. *Numeric, 5 positions; optional.*
Gift orders only	Allows you to select pre-generated picks for pick slip generation based on the setting of the *Gift order* field for the Order Ship To (displayed on the Display Order Properties Screen in Order Inquiry). • selected = The system prints pick slips for orders whose *Gift order* field is selected. • unselected = The system prints pick slips for gift and non-gift orders.

Field	Description
Selected warehouses	Allows you to select pre-generated picks for pick slip generation based on selected warehouse(s). • selected = You advance to the Select Warehouse for Pick Slip Screen, where you can select warehouses for pick slip generation. The system performs pick slip generation for pre-generated picks that contain the specified warehouse(s). • unselected = The system prints pick slips for all valid warehouses.
Selected source categories	Allows you to select pre-generated picks for pick slip generation based on selected source categories. • selected = You advance to the Select Source Categories for Pick Slip Screen, where you can select source categories for pick slip generation. The system performs pick slip generation for pre-generated picks whose source code at the order header level is associated with a source code category selected for pick slip generation. If a pre-generated pick includes items that are not associated with the selected source category, the system includes these items on the printed pick slip. • unselected = The system prints pick slips for all valid source code categories.
Selected shippers	Allows you to select pre-generated picks for pick slip generation based on selected ship vias. • selected = You advance to the Select Shipper for Pick Slip Screen, where you can select ship vias for pick slip generation. The system performs pick slip generation for pre-generated picks that contain the specified ship via(s). • unselected = The system prints picks for all valid ship vias.
Selected payment types	Allows you to select pre-generated picks for pick slip generation based on selected pay types. • selected = You advance to the Select Pay Type for Pick Slip Screen, where you can select pay types for pick slip generation. The system performs pick slip generation for pre-generated picks that contain the specified pay type(s). • unselected = The system prints pick slips for all valid pay types.
Selected/excluded items	Allows you to select pre-generated picks for pick slip generation based on selected items. • selected = You advance to the Select Items for Pick Slip Screen, where you can select to include or exclude items for pick slip generation. – For items to include, the system performs pick slip generation for pre-generated picks that contain the specified item(s). If a pre-generated pick includes other items, the system includes these items on the printed pick slip as well. – For items to exclude, the system does not perform pick slip generation for pre-generated picks that contain the specified item(s). If a pre-generated pick includes other items, the system excludes these items from printing until the item that is flagged to exclude has been removed from the pre-generated pick. • unselected = The system prints pick slips for all valid items.

Field	Description
Preauthorized orders only	Allows you to select pre-generated picks for pick slip generation that are in an H Generated Has Authorization status. Valid values: • selected = The system performs pick slip generation for pre-generated picks in an H Generated Has Authorization status. **Note:** When Selecting Pre-Generated Picks for Pick Slip Generation, the system looks at Authorization History to determine if any picks in an H Generated Has Authorization status are associated with an expired authorization, and if so, the system changes the status of the pick to G Generated No Authorization. • unselected (default) = The system does not consider the status of the pre-generated pick when generating pick slips, and sends credit cards up for authorization during pick slip generation if they have not already received an authorization response; see Authorizations During Pick Slip Generation. **Note:** If *Preauthorized orders only* is unselected, the system does not generate pick slips for orders that contain a credit card payment method if the authorization service defined for the pay type is set up as online authorization only (the *Batch/online* field is set to I). See Performing Online Credit Card Authorizations for an overview of the online credit card authorization process.
Selected orders	Allows you to select up to 100 individual orders for pick slip generation. • selected = You advance to the Select Orders for Pick Slip Screen, where you can select orders for pick slip generation. The system performs pick slip generation for pre-generated picks that are associated with the specified order(s). • unselected = The system prints pick slips for all valid orders.
Selected lines of business	Allows you to select pre-generated picks for pick slip generation based on selected lines of business. • selected = You advance to the Select Lines of Business for Pick Slip Screen, where you can select lines of business for pick slip generation. The system performs pick slip generation for pre-generated picks that are associated with the specified line(s) of business. • unselected (default) = The system prints pick slips for all lines of business.

Field	Description
Selected location classes	Allows you to select pre-generated picks for pick slip generation based on selected location classes. • selected = You advance to the Select Location Class for Pick Slip Screen, where you can select location classes for pick slip generation. The system performs pick slip generation for pre-generated picks that contain an item associated with the specified location class. • unselected = The system prints pick slips for all valid location classes.
Excluded postal codes	Allows you to exclude specified postal codes from pick slip generation. • selected = You advance to the Select Postal Codes to be Excluded Screen, where you can specify the postal codes you wish to exclude from pick slip generation. **Note:** – If you define a Postal code range and also exclude specific postal codes within that range, the system includes all orders that are being shipped to the postal code range minus the specified postal codes that are excluded. For example, if you enter a postal code range of 01701 - 01999 and then exclude 01801 and 01581, the system would exclude 01801 from the postal code range. Postal code 01581 would be excluded regardless since it is outside the specified postal code range. – If you exclude a "zip plus 4" postal code, only postal codes that specify the extra 4 digits are excluded; for example, if you exclude 01468-1556, only postal code 01468-1556 is excluded and any postal code that does not specify the extra 4 digits is not excluded. If you exclude a postal code and do not specify the extra 4 digits, then that postal code, regardless of the extra 4 digits is excluded. • unselected = The system prints pick slips for all valid postal codes.

Field	Description
Arrival date range	Allows you to select pre-generated picks for pick slip generation based on a specified arrival date range. The arrival date is the date when the customer wants to receive the order. To determine the arrival dates to include, the system uses the following calculation: `Arrival Date from Order Ship To - (Pick Processing Days (B37) + Ship Via Lead Days in WSHV) < or = Today's Date` The system generates pick slips if the system-calculated date on the pre-generated pick is equal to or earlier than today's date; otherwise, the system holds printing the picks until the date is within the allotted time frame (the arrival date range). The starting (first) date you enter must be earlier than the ending (second) date. Also, an ending date is required if you enter a starting date; however, the starting date is always optional. **Note:** The system selects pre-generated picks for pick slip generation based on the arrival date defined for the order ship to; the system does not look at the arrival date defined for an order line. *Numeric, two 6-position fields; optional.*
Override all orders to via	Allows you to supersede the ship via code on the pick and to ship all orders via the designated shipper whose code you enter here. Ship Via codes are defined in and validated against the Ship Via table. *Numeric, 2 positions; optional.*
Pick message code	A code that represents the pick slip message. See Working with Pick Slip Messages (WPSM). *Alphanumeric, 2 positions; optional.*
Pick message text	The text of the message. This free-form message will print on each pick slip. See Working with Pick Slip Messages (WPSM). *Alphanumeric, 50 positions (each line); display-only.*
Selected sold-to customers	Allows you to select pre-generated picks for pick slip generation based on selected sold-to customers. • selected = You advance to the Select Customers for Pick Slip Screen, where you can select sold to customers for pick slip generation. The system performs pick slip generation for pre-generated picks that contain the specified sold to customer. • unselected = The system prints pick slips for all valid sold-to customers.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Selected states</td><td>Allows you to select pre-generated picks for pick slip generation based on selected or excluded states.
selected = You advance to the Select State for Pick Slip Screen, where you can select states to include or exclude for pick slip generation.
unselected = The system prints pick slips for all states.</td></tr>
<tr><td>Special Handling</td><td>Allows you to select pre-generated picks for pick slip generation based on the presence of a special handling code for an item.
Include = Generate pick slips for pre-generated picks regardless of the presence of a special handling code for an item.
Only = Generate pick slips for pre-generated picks that contain an item that requires special handling. If the pre-generated pick contains other items that do not require special handling, the system includes these items on the printed pick slip.
Exclude = Generate pick slips for pre-generated picks that do not contain an item that requires special handling.
Note:
If the Split Special Handling Picks (L44) system control value is selected, the system creates a separate pre-generated pick for items on an order that contain a special handling code; otherwise, pre-generated picks contain items with and without special handling. See this system control value for examples.</td></tr>
<tr><td>Single line picks only</td><td>Allows you to select pre-generated picks for pick slip generation based on the number of pick control detail records.
selected = Generate pick slips for pre-generated picks that have only one pick control detail. If you select this option, you cannot use the Picks with...X lines or less/more option.
unselected = Generate pick slips for pre-generated picks regardless of the number of pick control details.</td></tr>
<tr><td>Gift wrap picks only</td><td>Allows you to select pre-generated picks for pick slip generation that contain an item that requires gift wrap (the Gift wrap field for one or more of the items on the pre-generated pick is selected).
selected = Generate pick slips only for pre-generated picks that contain a gift wrap item. If the pre-generated pick contains other items that do not require gift wrap, the system includes these items on the printed pick slip.
unselected = Generate pick slips for pre-generated picks regardless of whether a gift wrap item is on the pre-generated pick.</td></tr>
</table>

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Bulk picks only</td><td>Allows you to select pre-generated picks for pick slip generation that contain a bulk item (the Oversized field for the one or more of the items on the pre-generated pick is selected).
selected = Generate pick slips only for pre-generated picks that contain a bulk item. If the pre-generated pick contains other items that are not flagged as oversized, the system includes these items on the printed pick slip.
unselected = Generate pick slips for pre-generated picks regardless of whether a bulk item is on the pre-generated pick.</td></tr>
<tr><td>Postal code range</td><td>Allows you to select pre-generated picks for pick slip generation based on a specified range of zip codes (up to 10 positions, including numbers and letters).
The From postal code cannot be greater than the To postal code. Letters are considered lower than numbers.
If you enter a 5 digit postal code, the system includes any 9 digit postal codes that fall within the range; for example, if you enter 01701 to 01901, the system includes pre-generated picks that contain zip code 01880-9999.
If you enter a 9 digit postal code, such as 01468-0000 to 01469-0000, the system does not include pre-generated picks that contain zip code 01468 since this zip code is less than 01468-0000. To include 01468 in the postal code range, you must define the range as 01468-01469.
If you define a postal code range and also Excluded postal codes within that range, the system includes all orders that are being shipped to the postal code range minus the specified postal codes that are excluded. For example, if you enter a postal code range of 01701 - 01999 and then exclude 01801 and 01581, the system would exclude 01801 from the postal code range. Postal code 01581 would be excluded regardless since it is outside the specified postal code range.
Postal codes are defined in and validated against the Postal Code table (WZIP); however, your entries in this field are not validated.
Numeric, 10 positions; optional.</td></tr>
</table>

Field	Description
Minimum amount to include backorders	The total value of all reserved but not printed lines on an order that contains at least one backordered unit, the amount must exceed the value entered in this field, then generate the pick slip. If there are no backorders on the order, the pick slip gets generated and this process is not evaluated. In other words, if you have a backorder and the items to ship is under a certain dollar amount, you may decide to wait for the backorder items before generating a pick slip to save on shipping costs. Backorder is the line status (open, held, or error) and the ordered qty minus shipped, canceled and sold out and not equal to reserved AND the drop ship indicator on the order detail line is blank. Reserved lines are any lines that have a reserved quantity and do not include lines that have a drop ship indicator on the line, order detail lines that have a reserved quantity but the line is in a H status, brokered items in a printed status (because they have a drop ship indicator on the order detail line), or lines that have a reserved quantity but the reserved quantity equals the printed quantity (which means those items are already in the middle of being shipped). Ship alone items or any items that will eventually split to a separate pick document are STILL considered when summing the reserved value as long as they are not already printed on previous pick. The system considers all pre-picks for the order when determining the reserved value and not just pre-picks that are being selected as part of that order. For example: • Item 1 b/o, item 2 has qty of 3 and is reserved with an unit price of $20.00. So the total reserved value is $60.00. If I entered $100.00 in this field, I won't generate a pick slip for item 2 because $60.00 does not exceed $100.00. If I entered $50 in this field, I would generate a pick slip because the total reserved for that order exceeds $50.00. • Item 1 b/o, item 2 has qty 1 with an unit price is 10.00 and is reserved, item 3 has qty 5 with an unit price of $7.00 and is reserved, item 4 is a drop ship item with price of $100.00. The total reserved value is (1 x $10.00 = $10.00) and (5 x 7.00 = $35.00) =$ 45.00. We ignore the drop ship item. So in this field if we enter a value of $30.00, we will select this order but if we enter a value of $45.00 or more we won't select this order. • Item 1 qty 2 reserved, item 2 qty 3 reserved, no backorders. It doesn't matter what is entered in this field, we will select this pick because it has no backorders so we don't perform any calculations. As long as the order qualifies based on other selection criteria, it will be included. *Numeric, 11,2 optional.*

Field	Description
Create Periodic Function	Defines whether a periodic function for the pick slip generation template exists so that you can schedule when pick slip generation runs for this template. • selected = A periodic function exists for the pick slip generation template. The system selects this flag if a periodic function exists whose *Function name* and *Parameter* is an exact match to the *Description* of the pick slip generation template. • unselected = A periodic function does not exist for the pick slip generation template. The system automatically creates a periodic function for the pick slip generation template if you select the *Create Periodic Function* flag and the template's *Description* is 7 characters or less. **Note:** The *Description* must be 7 characters or less because the maximum length for the periodic function name is 7 positions. Also, in order to create a periodic function for the template, the description cannot contain a single quote ('). See Scheduling Pick Slip Generation for further instructions. **Note:** This flag is display-only if a periodic function for the pick slip generation template already exists. **If you use multiple companies:** If you create a periodic function for a pick slip generation template and you use more than one company, you must make sure the *Description* for each pick slip generation template is unique across companies.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Picks with...X lines or less/ more</td><td>
Allows you to select pre-generated picks for pick slip generation that contain a specified number of pick lines. You can select to generate picks with X number of pick lines or less or X number of pick lines or more.
To generate: Enter the number of pick lines for the picks you wish to include in the pick slip generation run.

Select lines or less to include only picks that contain the specified number of pick lines or less. Example: If you enter 5 and select lines or less, the system includes picks that contain 5 pick lines or less.
Select lines or more to include only picks that contain the specified number of pick lines or more. Example: If you enter 5 and select lines or more, the system includes picks that contain 5 pick lines or more.

If you use this option, the Single line picks only option must be unselected.
Leave the Picks with number blank to generate pick slips for pre-generated picks regardless of the number of pick lines on the pre-generated pick.
The system uses the Pick Control Detail table to determine the number of lines associated with a pick. See:

Applying Pick Slip Preparation to an Order for more information on how the system creates records in the Pick Control Header table and Pick Control Detail table during pick slip preparation.
Splitting an Order Across Multiple Picks for more information on the reasons the system may split an order into several pre-generated picks.
Creating Pre-Generated Picks for more information on the updates the system makes to the Pick Control Header table and Pick Control Detail table during pick slip preparation.

Note:
Generating picks based on a specified number of pick lines does not guarantee that the pick will print on a specified number of pages. For example, line messages, special handling, gift wrap, and item comments can affect the number of lines that print on a single page of a pick form; see Pick Slip for more information on its contents.
Numeric, 5 positions; optional.
</td></tr>
</table>

Select this field...	To display the...
Selected warehouses	Select Warehouse for Pick Slip Screen.

Select this field...	To display the...
Selected source categories	Select Source Categories for Pick Slip Screen.
Selected shippers	Select Shipper for Pick Slip Screen.
Selected payment types	Select Pay Type for Pick Slip Screen.
Selected/Excluded items	Select Items for Pick Slip Screen.
Selected orders	Select Orders for Pick Slip Screen.
Selected line of business	Select Lines of Business for Pick Slip Screen
Selected location class	Select Location Class for Pick Slip Screen
Excluded postal codes	Select Postal Codes to be Excluded
Selected sold to customers	Select Customers for Pick Slip Screen
Selected states	Select State for Pick Slip Screen

Screen Option	Procedure
Review operations control summary information	Select Dsp Flash Rpt to advance to the flash report screens. See Reviewing Operations Control Summary (FLSH).
Review and change existing selection criteria	Select Review to review the options currently selected at the Streamlined Pick Generation screen and to make any changes. If multiple criteria are selected at the Streamlined Pick Generation screen, you advance to the related screen for each selected criterion.
Set selection criteria for this pick slip generation option	Select each desired criterion as described above, and click OK to advance to the related selection screen(s).
Accept your selections	Select Accept to save your selections and return to the Work with Streamlined Pick Slip Generation Screen. If you selected the Create Periodic Function flag, the system creates a periodic function for the pick slip generation template that you can use to schedule when pick slip generation runs for the template; see Scheduling Pick Slip Generation for more information.
Exit the screen without making changes	Select Exit.

Select Warehouse for Pick Slip Screen

Purpose: Use this screen to perform pick slip generation for pre-generated picks that contain the selected warehouses.

How to display this screen: Select the *Selected warehouses* field on the Streamlined Pick Slip Generation Screen.

Field	Description
Whs (Warehouse)	A code that represents a warehouse. Warehouses are defined and validated against the Warehouse table (WWHS); see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions; optional.*
Description	The description of the warehouse. *Alphanumeric, 30 positions; optional.*
Orders avail (Orders available)	The number of orders available for pick slips. Not currently implemented. *Numeric, 7 positions; display-only.*
Sel (Selected)	Defines whether the system selects pre-generated picks for pick slip generation based on warehouse. • Yes = Perform pick slip generation for pre-generated picks that contain this warehouse. • No = Do not perform pick slip generation for pre-generated picks that contain this warehouse.

Screen Option	Procedure
Select a single warehouse	Select a warehouse to select it for pick generation. The system selects the *Sel* field.
Cancel a warehouse selection	Select Cancel for a warehouse to cancel the selection. The system unselects the *Sel* field.
Select all warehouses	Select Select All. The system selects the *Sel* field for all warehouses.

Select Source Categories for Pick Slip Screen

Purpose: Use this screen to perform pick slip generation for pre-generated picks associated with the selected source category.

> **Note:**
>
> - The system selects pre-generated picks whose source code at the order header level is associated with a source code category selected for pick slip generation.
> - If a pre-generated pick includes other items that are not associated with the selected source categories, the system includes these items on the printed pick slip.

How to display this screen: Select the *Selected source categories* field at the Streamlined Pick Slip Generation Screen.

Field	Description
Src (Source code category)	A category assigned to a group of source codes. Source code categories are assigned in the Source Code table and defined in and validated against the Source Code Category table. See Generating Forecasting Reports. *Alphanumeric, 2 positions; optional.*
Category	The description associated with the source code category. *Alphanumeric, 40 characters; display-only.*
Sel (Selected)	Defines whether the system selects pre-generated picks for pick slip generation based on source category. • Yes = Perform pick slip generation for pre-generated picks that contain this source category. • No = Do not perform pick slip generation for pre-generated picks that contain this source category.

Screen Option	Procedure
Select a single source code category	Select a source code category. The system selects the *Sel* field.
Cancel a source code category selection	Select Cancel for a source code category to cancel the selection. The system does not select the *Sel* field.
Select all source code categories	Select Select All. The system selects the *Sel* field for all pay types.

Select Shipper for Pick Slip Screen

Purpose: Use this screen to perform pick slip generation for pre-generated picks that contain the selected ship via. This screen displays a list of ship via codes that are available for selection.

How to display this screen: Select the *Selected shippers* field on the Streamlined Pick Slip Generation Screen.

Field	Description
Via (Ship via)	A code that represents the carrier for the pre-generated pick. Ship via codes are defined in and validated against the Ship Via table; see Working with Ship Via Codes (WVIA). *Numeric, 2 positions; optional.*
Description	The description of the shipper. *Alphanumeric, 30 positions; optional.*
Via pty (Ship via priority)	The ship via priority assigned to this ship via. Ship via priority controls how the system allocates inventory to backorders and sorts pick slips. Ship via priority ranges from 0 - 9 where 0 is the lowest priority and 9 is the highest priority. *Numeric, 1 position; optional.*

Field	Description
Sel (Selected)	Defines whether the system selects pre-generated picks for pick slip generation based on ship via. • Yes = Perform pick slip generation for pre-generated picks that contain this ship via. • No = Do not perform pick slip generation for pre-generated picks that contain this ship via.

Screen Option	Procedure
Select a single ship via	Select a shipper to select it. The system selects the *Sel* field.
Cancel a ship via selection	Select Cancel for a shipper to cancel the selection. The system does not select the *Sel* field.
Select all ship vias	Select Select All. The system selects the *Sel* field for all shippers.

Select Pay Type for Pick Slip Screen

Purpose: Use this screen to perform pick slip generation for pre-generated picks that contain the specified pay type.

How to display this screen: Select the *Selected payment types* field on the Streamlined Pick Slip Generation Screen.

Field	Description
Pay type	A user-defined code that represents the method of payment on the order. Each payment type must conform to one of the following categories: • Cash/check • Credit card Pay types are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY). *Numeric, 2 positions; optional.*
Description	The description of the payment type. *Alphanumeric, 30 positions; optional.*
Orders avail (Orders available)	The quantity of orders that are available to pick. Not currently implemented. *Numeric, 7 positions; display-only.*
Sel (Selected)	Defines whether the system selects pre-generated picks for pick slip generation based on pay type. • Yes = Perform pick slip generation for pre-generated picks that contain this pay type. • No = Do not perform pick slip generation for pre-generated picks that contain this pay type.

Screen Option	Procedure
Select a single payment type	Select a payment. The system selects the *Sel* field.

Screen Option	Procedure
Cancel a payment type selection	Select Cancel for a payment type to cancel the selection. The system does not select the *Sel* field.
Select all pay types	Select Select All. The system selects the *Sel* field for all pay types.

Select Items for Pick Slip Screen

Purpose: Use this screen to include or exclude specified items during pick slip generation.

- For items to include, the system performs pick slip generation for pre-generated picks that contain the specified item(s). If a pre-generated pick includes other items, the system includes these items on the printed pick slip as well.
- For items to exclude, the system does not perform pick slip generation for pre-generated picks that contain the specified item(s). If a pre-generated pick includes other items, the system excludes these items from printing until the item that is flagged to exclude has been removed from the pre-generated pick.

> **Note:**
>
> You can specify up to 500 items at this screen. Although the system does not display an error message, it does not accept more than 500 items.

How to display this screen: Select the *Selected/Excluded Items* field at the Streamlined Pick Slip Generation Screen.

Field	Description
Item to... Include/Exclude	Defines whether you wish to include or exclude the specified items during pick slip generation. • Include = the system performs pick slip generation for pre-generated picks that contain the specified item(s). If a pre-generated pick includes other items, the system includes these items on the printed pick slip as well. • Exclude = the system does not perform pick slip generation for pre-generated picks that contain the specified item(s). If a pre-generated pick includes other items, the system excludes these items from printing until the item that is flagged to exclude has been removed from the pre-generated pick.
Item	A code that represents an item. You can specify up to 500 items at this screen. Although the system does not display an error message, it does not accept more than 500 items. *Alphanumeric, 12 positions; optional.*
SKU	The SKU code that further identifies the item. The three elements are defined in the System Control table and validated against the SKU Element (1, 2, 3) tables. If you do not define a SKU for a SKUed item, all SKUs for the item are either included or excluded during pick slip generation, based on the setting of the Item to... Include/Exclude field. *Alphanumeric, three 4-position fields; optional.*

Field	Description
Description	A description of the item. *Alphanumeric, 30 positions; display-only.*
Ord avail (Orders available)	The quantity of the item that is available to sell. Not currently implemented. *Numeric, 7 positions; display-only.*

Screen Option	Procedure
Define items to include or exclude from pick slip generation	Select Add or Change to enter items you wish to include or exclude from pick slip generation. Use the Item to... Include/ Exclude field to select whether you wish to Include or Exclude the specified item(s).Select OK to save your changes.
Delete an item from the list	Select Delete for an item to advance to the Confirm Delete window; at this window, select Delete to remove it from the list; otherwise, select Exit to cancel.

Select Orders for Pick Slip Screen

Purpose: Use this screen to perform pick slip generation for pre-generated picks associated with the specified order. You can specify up to 100 orders at a time.

A message indicates if an order you enter is on hold:

Order (14) is not open. Cannot be selected for Pick Slip.

You can release orders from hold through Release Held Orders. See Selecting Held Orders (ERHO).

How to display this screen: Select the *Selected Orders* field at the Streamlined Pick Slip Generation Screen.

Field	Description
Order #	A unique number assigned by the system to identify an order. An error message similar to the following indicates if the order is on hold: `Order (14) is not open. Cannot be selected for Pick Slip.` You can release orders from hold through Release Held Orders. See Selecting Held Orders (ERHO). Maximum number of orders: You can select up to 100 orders at a time for pick slip generation. If you attempt to enter more than 100 orders, the system displays an error message such as: `The number of orders selected (121) exceeds the maximum allowed (100).` *Numeric, 8 positions; optional.*

Field	Description
Name	The name of the customer who placed the order. Customer names are defined in and validated against the Customer Sold-to table. *Alphanumeric, 15 positions (first name), 1 position (initial), 25 positions (last name); display-only.*

Screen Option	Procedure
Add orders	Select Add.
Change selected orders	Select Change. The system displays the orders that you previously entered so that you can review your entries. **Note:** You cannot change an order number if you are in change mode. You must delete the order and then return to "add" mode and re-enter the order. The system displays a message if you attempt to enter a duplicate order number.

Select Lines of Business for Pick Slip Screen

Purpose: Use this screen to perform pick slip generation for pre-generated picks associated with the selected lines of business.

The system automatically assigns an order to a line of business in order entry or order maintenance if the order meets the requirements for a specific line of business assignment. See Working with Lines of Business (WLOB).

How to display this screen: Select the Selected lines of business field at the Streamlined Pick Slip Generation Screen.

Field	Description
Lines selected	The number of lines of business selected to print pick slips. Updated whenever you select or deselect a line of business. *Numeric, 2 positions; display-only.*
LOB code	A code used to identify a line of business. Line of business codes are defined in and validated against the Line of Business table. *Alphanumeric, 3 positions; optional.*
Description	A description of the line of business. *Alphanumeric, 40 positions; optional.*

Field	Description
Sel	Defines whether the system selects pre-generated picks for pick slip generation based on line of business. • Yes = Perform pick slip generation for pre-generated picks associated with this line of business. • No = Do not perform pick slip generation for pre-generated picks associated with this line of business.
Maximum (Maximum line count)	The maximum number of lines of business you can select to print pick slips. You can select up to 100 lines of business. *Numeric, 3 positions; optional.*

Screen Option	Procedure
Select a line of business	Select the line of business. The system updates the *Selected* field to selected.
Deselect a line of business	Select Cancel for the line of business to deselect it. The system updates the *Selected* field to unselected.
Select all lines of business	Select Select All. The system updates the *Selected* field for all lines of business to selected.

Select Location Class for Pick Slip Screen

Purpose: Use this screen to perform pick slip generation for pre-generated picks that contain an item associated with the selected location class.

Location classes represent a warehouse location, such as caged area or fragile area. Items, SKUs, and locations can be assigned location classes; however, this pick slip option evaluates the location class assigned to an item at the item level only.

You can assign a location class:

- to a location at the Create Location Screen.
- to an item at the Create Item Screen.

Splitting an order by location class: Order Management System uses the location class defined at the item level to determine if an order should split into several picks; see Splitting an Order Across Multiple Picks.

How to display this screen: Select the Selected Location Classes field at the Streamlined Pick Slip Generation Screen.

Field	Description
Loc class (Location class	A code that represents a location type, such as caged area or fragile area. Location classes are defined in and validated against the Location Class table; see Creating and Maintaining Location Classes (WLCL). *Alphanumeric, 2 positions; optional.*
Description	The description of the location class. *Alphanumeric, 30 positions; optional.*

Field	Description
Orders avail (Orders available	The quantity of orders that are available to pick. Not currently implemented. *Numeric, 7 positions; display-only.*
Sel (Selected)	Defines whether the system selects pre-generated picks for pick slip generation based on location class. • Yes = Perform pick slip generation for pre-generated picks that contain an item associated with this location class. • No = Do not perform pick slip generation for pre-generated picks that contain an item associated with this location class.

Screen Option	Procedure
Select a single location class	Select a location class to select it. The system selects the *Sel* field.
Cancel a location class selection	Select Cancel for a location class to cancel the selection. The system does not select the *Sel* field.
Select all location classes	Select Select All. The system selects the *Sel* field for all location classes.

Select Postal Codes to be Excluded Screen

Purpose: Use this screen to exclude specified postal codes from pick slip generation.

How to display this screen: Select the Excluded postal codes field at the Streamlined Pick Slip Generation Screen.

Field	Description
Postal code	A postal code you wish to exclude from pick slip generation. • If you define a Postal code range and also exclude specific postal codes within that range, the system includes all orders that are being shipped to the postal code range minus the specified postal codes that are excluded. For example, if you enter a postal code range of 01701 - 01999 and then exclude 01801 and 01581, the system would exclude 01801 from the postal code range. Postal code 01581 would be excluded regardless since it is outside the specified postal code range. • If you exclude a "zip plus 4" postal code, only postal codes that specify the extra 4 digits are excluded; for example, if you exclude 01468-1556, only postal code 01468-1556 is excluded and any postal code that does not specify the extra 4 digits is not excluded. If you exclude a postal code and do not specify the extra 4 digits, then that postal code, regardless of the extra 4 digits is excluded. Postal codes are defined in and validated against the Postal Code table (WZIP); however, your entries in this field are not validated. *Numeric, 10 positions; optional.*

Screen Option	Procedure
Exclude a postal code	Select Add or Change to enter postal codes you wish to exclude from pick slip generation. Select OK to save your changes.
Delete a postal code from the exclusion list	Select Delete for a postal code to advance to the Confirm Delete window; at this window, select Delete to remove it from the exclusion list; otherwise, select Exit to cancel.

Select Customers for Pick Slip Screen

Purpose: Use this screen to perform pick slip generation for pre-generated picks associated with the select sold to customer.

How to display this screen: Select the *Selected sold-to customers* field on the Work with Streamlined Pick Slip Generation Screen.

Field	Description
Customer #	A unique number assigned by the system to identify a customer who places an order. Customers are defined in and validated against the Customer Sold-to table; see Creating and Updating Sold-to Customers (WCST). *Numeric, 9 positions; optional.*
Name	The name of the customer who placed the order. Defined in and validated against the Customer Sold-to table. *Alphanumeric, 15 positions (first name), 1 position (initial), 25 positions (last name); display-only.*

Screen Option	Procedure
Add a customer selection	Select Add to add sold to customers to the requirements for pick slip generation. The system displays a message if you attempt to enter a duplicate customer number.
Change a customer selection	Select Change. The system displays the customers that you previously entered so that you can review your entries, and optionally delete any entries.

Select State for Pick Slip Screen

Purpose: Use this screen to:

- Perform pick slip generation for pre-generated picks that ship to the specified state(s), or
- Exclude pre-generated picks from pick slip generation that ship to the specified state(s).

> **Note:**
>
> A single pick slip template can have either the *Selected* field set to Yes (perform pick slip generation for the specified states) or Excl (exclude pick slip generation for the specified states). To use both settings, you must create a pick slip template that *includes* specified states and create a separate pick slip template the *excludes* specified states.

How to display this screen: Select the *Selected States* field at the Work with Streamlined Pick Slip Generation Screen.

Field	Description
Cty (Country)	A code which identifies a country. Countries are defined in and validated against the Country table. See Setting Up the Country Table (WCTY). *Alphanumeric, 3 positions; optional.*
State	A code which identifies a state. States are defined in Work with Countries. See Setting Up the Country Table (WCTY). *Alphanumeric, 2 positions; optional.*
Description	A description of the state. *Alphanumeric, 25 positions; display-only.*
Sel (Selected)	Indicates whether to perform pick slip generation for pre-generated picks that ship to this state. Yes = Perform pick slip generation for pre-generated picks that ship to this state. No (default) = The specified state has not been selected or excluded from pick slip generation. Excl = Do not perform pick slip generation for pre-generated picks that ship to this state. *Optional.*

Screen Option	Procedure
Select a state	Select a state. The system updates the *Selected* field to Y.
Deselect a state	Select Cancel for a state to deselect it. The system updates the *Selected* field to N.
Exclude a state	Select Exclude for a state to exclude the state from pick slip generation. The system updates the *Selected* field to X.
Select all states	Select Select All. The system updates the *Selected* field for all states to selected.

Pick Print Eligibility (WPPE)

Purpose: Use this menu option to determine whether the system will include picks for a specified order in the next pick slip generation run for the selected pick slip generation template.

The system determines which pre-generated picks to include in the pick slip generation run, based on the pick slip selection criteria specified on the Streamlined Pick Slip Generation Screen for the selected pick slip generation template.

In this topic:

- Pick Print Eligibility Screen
- Pick Print Eligibility Error Reasons

For more information: See:

- Preparing Orders for Pick Slip Generation for more information on when the system creates pre-generated picks for an order.
- Streamlined Pick Slip Generation (WSPS) for more information on generating pick slips based on the criteria defined for a pick slip generation template.

Pick Print Eligibility Screen

Use this screen to enter the order and ship to number you wish the system to evaluate for pick print eligibility when running Streamlined Pick Slip Generation (WSPS) for the selected pick slip generation template.

How to display this screen: Enter WPPE in the *Fast path* field at the top of any menu or select Pick Print Eligibility from a menu.

Field	Description
Order #	The order number and ship to number the system will evaluate for pick print eligibility. The order number is validated against the Order Header table. The order ship to number is validated against the Order Ship To table. To be eligible for pick print, the order and order ship to must be in an Open status and not locked by a user. *Order #: Numeric, 8 positions; required.* *Ship to #: Numeric, 3 positions; required.*
Pick Gen Template	The pick slip generation template from Streamlined Pick Slip Generation (WSPS) the system will use to determine if the pre-generated picks for the specified order will print. *Required.*

Instructions:

1. Enter the order number and order ship to number you wish to evaluate for pick print eligibility. If you leave the *Ship to* blank, the system defaults a ship to number of 1.
2. Select the pick slip generation template you wish to use to print picks for the order.
3. Select OK.

The system:

- If a pick exists for the order that is in a status other than G Generated No Authorization, H Generated Has Authorization, or V Void, the system displays the error `Pick already printed for order`.

> **Note:**
>
> The system displays this error even if other picks exist for the order that ARE in a G, H, or V status which could be eligible for pick slip generation. You must process the printed pick through Billing before the system evaluates the other picks for the order.

- If picks do not exist for the order, the system determines if the order is eligible for pick slip preparation.
  - If the order is not eligible for pick slip preparation, the system displays an error message indicating the order is not eligible for Streamlined Pick Slip Generation (WSPS) because a pre-generated pick does not exist for the order; see Pick Slip Preparation Errors.
  - If the order is eligible for pick slip preparation, the system submits the Pick Gen Refresh periodic function to create pre-generated picks for the order and continues to the next step. See Selecting Order Lines for Pick Slip Preparation and Applying Pick Slip Preparation to an Order for more information on when an order is eligible for pick slip preparation and the updates that occur.
- If a pre-generated pick exists for the order, the system determines if the pick will print using the selected pick slip generation template.
  - If picks for the order will not print using the selected pick slip generation template, the system displays an error message indicating the order is not eligible for Streamlined Pick Slip Generation (WSPS) because it does not meet the criteria defined for the selected pick slip generation template; see Pick Errors.
  - If at least one of the picks for the order will print using the selected pick slip generation template, the system displays the message `Order meets criteria`. However, if a *Maximum number of picks* has been defined for the pick slip generation template which could prevent the pick from being selected for print, the system displays the message `Pick eligible but Max # of Picks limit exists`.

> **Note:**
>
> - The system displays the first error encountered for the order; other errors may exist on the order which could prevent the order from being included in the pick slip generation run. Correct the error and run Pick Print Eligibility again to determine if there are any other reasons the order would not be included in the pick slip generation run.
> - If one of the picks for the order is eligible for Streamlined Pick Slip Generation (WSPS) using the selected pick slip generation template, the system considers the order eligible for pick slip generation, even if other picks for the order will not print. Run pick slip generation for the eligible pick and then run Pick Print Eligibility again to determine why other picks for the order are not eligible for pick slip generation.

Pick Print Eligibility Error Reasons

> **Note:**
>
> The pick print eligibility error reasons are system delivered data that displays in the default language selected during installation of Order Administration; see Regional Settings.

Error Message	Reason for Error
General Errors	
Pick already printed for order	A pick exists for the order that is in a status other than: • G Generated No Authorization • H Generated Has Authorization • V Void
Reason could not be determined	A reason other than the reasons listed in this chart is preventing the system from printing a pick for the selected order using the selected pick slip generation template. Contact your Order Administration representative to determine the reason for the error.
Pick Slip Preparation Errors	The system displays one of the error reasons below if pre-generated picks do not exist for the order and the order is not eligible for pick slip preparation.
Order Header is in wrong status	Pre-generated picks do not exist for the order because the Order Header is not in an Open status.
Order on hold	Pre-generated picks do not exist for the order because the status of the Order Header is H Held.
Order Header is quote	Pre-generated picks do not exist for the order because the status of the Order Header is Q Quote.
Order Header is currently locked by X	Pre-generated picks do not exist for the order because the order is locked by the specified user ID.
Order Ship To is in wrong status	Pre-generated picks do not exist for the order because the Order Ship To is not in an Open status.
Order Ship To on hold	Pre-generated picks do not exist for the order because the status of the Order Ship To is H Held.
Order is flagged as ship complete	Pre-generated picks do not exist for the order because the order is flagged as a ship complete order; see Selecting Order Lines for Pick Slip Preparation for more information on when an order is eligible for pick slip preparation.
Order does not have any open order details	Pre-generated picks do not exist for the order because the order does not have any order detail lines that are in an Open status; see Selecting Order Lines for Pick Slip Preparation for more information on when an order is eligible for pick slip preparation.
Order has a future arrival date	Pre-generated picks do not exist for the order because the *Arrival date* for the reserved, open order line(s) is a future arrival date. The system uses the arrival date defined for the order line or the order ship to if not defined at the line level; see Arrival Date Calculation.
Cancel date has been exceeded	Pre-generated picks do not exist for the order because the cancel date defined for the Order Ship To falls within the time it takes to process and fulfill the pick slip; see Cancel Date Calculation.

Error Message	Reason for Error
Order contains back ordered line(s)	Pre-generated picks do not exist for the order because the lines on the order are backordered; see Selecting Order Lines for Pick Slip Preparation for more information on when an order is eligible for pick slip preparation.
Order is coordinate grouped	Pre-generated picks do not exist for the order because the lines on the order are coordinate grouped together and one or more of the lines is not eligible for pick slip preparation; see Selecting Order Lines for Pick Slip Preparation for more information on when an order is eligible for pick slip preparation.
Line # 999 has a quantity remaining of 0	Pre-generated picks do not exist for the order because it contains a reserved order line with a quantity remaining equal to or less than 0.
Line # 999 has a quantity remaining that is > the quantity reserved	Pre-generated picks do not exist for the order because it contains a reserved order line with a quantity remaining that is greater than the quantity reserved.
Line # 999 has a quantity printed on reserved order line that is > the order detail reserved	Pre-generated picks do not exist for the order because it contains a reserved order line with a quantity printed that is greater than the quantity reserved on the order detail line.
Pick Errors	The system displays one of the error reasons below if a pre-generated pick exists for the order, but it will not print using the selected pick slip generation template.
Cancel date has been exceeded	A pre-generated pick exists for the order, but the cancel date defined for the Order Ship To falls within the time it takes to process and fulfill the pick slip; see Cancel Date Calculation.
Order does not meet criteria	A pre-generated pick exists for the order, but the pre-generated pick does not meet the criteria defined for the selected pick slip generation template.

Unlock Pick Slip (MUPI)

Purpose: Use this option to unlock a pick slip. A pick slip is locked if the *In Use By User* field in the Pick Control Header table is not blank. This situation might occur if, for example, a user's browser window closed during pick slip maintenance. Until you unlock the pick slip, you cannot work with it.

Unlock Pick Slip Screen

How to display this screen: Enter MUPI in the *Fast path* field at the top of any menu, or select Unlock Pick Slip from a menu.

Field	Description
Pick Number	Enter a valid pick control number identifying a pick slip that is currently locked. You cannot prompt on this field. *Numeric, 7 positions; required.* **When you enter the number of a locked pick slip, the screen displays the following information:**

Field	Description
Status	The pick slip's current status. Valid statuses are: • M = Manifest Submission • blank = Open • R = Reprinted *Alphanumeric, 1 position; display-only.*
Entered by	The ID that identifies the user who generated the pick slip. *Alphanumeric, 10 positions; display-only.*
Customer	The name of the customer associated with the pick slip. *Alphanumeric, 30 positions; display-only.*

Completing this screen:

1. Enter a number identifying a pick slip that is currently locked. If your entry is valid, the remaining fields on the screen display information about the pick slip, and a message indicates the pick slip will be unlocked.
2. Select OK. The system:
   - clears the *In Use By User* field in the Pick Control Header table for the pick slip.
   - deletes any records in the Carton Content table associated with the pick slip.

Processing Drop Ship Orders by Batch (MDSB)

Overview: Use Process Drop Ship Orders by Batch to review the number of drop ship orders available for processing for each vendor and to limit the number of drop ship orders that are processed for each vendor. Process Drop Ship Orders by Batch provides an alternative method for generating drop ship picks in addition to the Selecting Vendors for Drop Ship Processing (MDSP) menu option.

> **Note:**
>
> You can use Process Drop Ship Orders by Batch to generate drop ship pick slips only; this menu option does not generate drop ship purchase orders. See Selecting Vendors for Drop Ship Processing (MDSP) for information on generating drop ship purchase orders.

The Process Drop Ship Orders by Batch screen displays vendors and the number of drop ship picks that are available to generate for each vendor. At this screen, you can define how many picks you wish to print for a vendor and the batch size for the picks that you print.

To review the number of drop ship orders available for processing for each vendor, you must run the Update Available Picks Batch Program.

In this topic:

- Update Available Picks Batch Program
- Generate Drop Ship Picks by Batch Program

- Process Drop Ship Orders by Batch Screen

Update Available Picks Batch Program

Select Update Avail Picks at the Process Drop Ship Orders by Batch Screen to submit a batch program that updates the number of available picks for drop ship pick generation.

The Update Available Picks batch program evaluates the number of open drop ship orders and updates the Avail picks field and the Last update field for the vendor.

> **Note:**
>
> An open drop ship order is an order that is in open status and includes a drop ship order detail line in open status. An order that is on hold, or an order that is open but includes a drop ship order detail line that is on hold, is not included by the Update Available Picks batch program.

The Update Available Picks batch program:

- reviews each open order detail line to determine if the item on the line is a drop ship item.
- if the item is a drop ship item, identifies the vendor associated with the item.
- uses the Allow Only Single Line on Drop Ship Picks (C82) system control value to determine the number of picks eligible for generation for the vendor.
- updates the Avail picks field and the Last update field for the vendor, and displays the values on the Process Drop Ship Orders by Batch Screen.
- updates the # picks to release field with the value in the Avail picks field.

The Process Drop Ship Orders by Batch Screen continues to display the calculated number of available picks until you run the Update Available Picks batch program again, or you run the Generate Drop Ship Picks by Batch Program.

Example: The Allow Only Single Line on Drop Ship Pick (C82) system control value controls whether drop ship pick slips are limited to printing one detail line (item) per pick slip. The program uses this system control value to determine the number of picks that are available to generate for the vendor.

Allow Only Single Line on Drop Ship Pick (C82) **system control value is unselected**

Question	Answer
More than 1 drop ship item on the order?	Each drop ship item on an order that is associated with the same vendor represents 1 pick for that vendor. Example: You order 3 drop ship items and they are all associated with vendor 2398. Results: 1 drop ship pick prints.
Different vendors for the drop ship items on the order?	Each drop ship item on an order that is associated with a different vendor represents 1 pick for each vendor. Example: You order 6 drop ship items: 3 of drop ship item 1 (vendor 2398), 2 of drop ship item 2 (vendor 2499), and 1 of drop ship item 3 (vendor 2501). Results: 1 pick prints for vendor 2398, 1 pick prints for vendor 2499, and 1 pick prints for vendor 2501.

Question	Answer
Different ship to customers for the drop ship items on the order?	Each drop ship item on the order that is shipping to a different ship-to customer represents a separate pick for each vendor. Example: You order 6 drop ship items for ship-to customer 1: 3 of drop ship item 1 (vendor 2398), 2 of drop ship item 2 (vendor 2499), and 1 of drop ship item 3 (vendor 2501) and you also order 3 drop ship items for ship-to customer 2: 2 of drop ship item 1 (vendor 2398) and 1 of drop ship item 2 (vendor 2499). Results: 2 picks print for vendor 2398, 2 picks print for vendor 2499, and 1 pick prints for vendor 2501.

Allow Only Single Line on Drop Ship Pick (C82) **system control value is selected**

Question	Answer
More than 1 drop ship item on the order?	Each drop ship item on an order that is associated with the same vendor represents a separate pick for that vendor. Example: You order 3 drop ship items and they are all associated with vendor 2398. Results: 3 drop ship picks print.
Different vendors for the drop ship items on the order?	Each drop ship item on an order that is associated with a different vendor represents 1 pick for each vendor. Example: You order 6 drop ship items: 3 of drop ship item 1 (vendor 2398), 2 of drop ship item 2 (vendor 2499), and 1 of drop ship item 3 (vendor 2501). Results: 3 picks print for vendor 2398, 2 picks print for vendor 2499, and 1 pick prints for vendor 2501.
Different ship to customers for the drop ship items on the order?	Each drop ship item on the order that is shipping to a different ship to customer represents a separate pick for each vendor. Example: You order 6 drop ship items for ship to customer 1: 3 of drop ship item 1 (vendor 2398), 2 of drop ship item 2 (vendor 2499), and 1 of drop ship item 3 (vendor 2501) and you also order 3 drop ship items for ship to customer 2: 2 of drop ship item 1 (vendor 2398) and 1 of drop ship item 2 (vendor 2499). Results: 5 picks print for vendor 2398, 3 picks print for vendor 2499, and 1 pick prints for vendor 2501.

Generate Drop Ship Picks by Batch Program

Select Submit at the Process Drop Ship Orders by Batch Screen to submit a batch program that generates drop ship picks based on the number of picks to release and the batch size you defined for each vendor.

The Generate Drop Ship Picks by Batch program:

- reviews each open order detail line to determine if the item on the order line is a drop ship item.
- if the item is a drop ship item, identifies the vendor associated with the item.
- uses the # picks to release field for each vendor to determine how many picks to generate.

- processes credit card authorizations on the drop ship orders, if needed. Any orders that are declined for authorization are not used in the batch size calculation, and picks are not generated for the orders; see Using the Credit Card Authorization Interface.
- creates a batch of picks based on the Batch size and the # picks to release fields defined for the vendor. If the # picks to release is greater than the Avail picks, the program uses the Avail picks to determine the total number of picks to generate.
- runs the Update Available Picks Batch Program to refresh the Process Drop Ship Orders by Batch Screen with updated available drop ship pick information. If all picks are generated, the screen will be blank.

Print program: The system uses the Drop Ship Pick Print Program (E92). If this system control value is blank, the system uses the Pick Printing Program (C37). If the Create Generic Pick Download Triggers (I31) system control value is selected, the system also generates the Pick Message from Order Administration (CWPickOut).

For more information see the Order Administration Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).

Example:

Vendor	Available Picks	# Picks to Release	Batch Size	Drop Ship Batches Generated
2398	98	20	5	4 drop ship batches are generated containing 5 picks each.
2499	24	28	5	5 drop ship batches are generated: 4 batches containing 5 picks each, and 1 batch containing 4 picks.
2501	9	blank	5	No picks are generated since the # of picks to release is 0.
2603	25	10	15	1 drop ship batch is generated containing 10 picks.

Reports generated:

- Vendor Drop Ship Worksheet (Produced whenever you run drop ship processing.)
- Drop Ship Pick Slip/Invoice (Always produced for drop ship pick slips.)
- Declined Drop Ships (Produced whenever you run drop ship processing.)
- Credit Card Authorization Listing (Produced for drop ship orders requiring credit card authorization.)
- Address Verification Response List (Produced for drop ship orders requiring credit card authorization and AVS verification.)

Bypassing printable pick slips not available: Even if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected, the Process Drop Ship Orders by Batch option still creates printable pick slips for eligible vendors. This system control value controls the generation of printable pick slips only when you use the Streamlined Pick Slip Generation (WSPS) option.

Process Drop Ship Orders by Batch Screen

Purpose: This screen displays vendors that have open, unshipped drop ship orders available for processing. At this screen, you can define the batch size of the picks processed for each vendor and the number of drop ship orders you would like to release for processing.

> **Note:**
>
> No information displays when you first advance to the Process Drop Ship Orders by Batch screen. To display vendors that have drop ship orders that are available for processing, you must select Update Avail Picks to run the Update Available Picks Batch Program.

How to display this screen: Enter MDSB in the *Fast path* field at the top of any menu or select Drop Ship Orders by Batch from a menu.

Field	Description
Fax picks to vendors	Indicates whether to fax the drop ship pick slips. This option is not currently implemented.
Last update	The last date when you submitted the Update Available Picks Batch Program. *Numeric, 6 positions (in user date format); display-only.*
Vendor #	A unique number to identify a vendor that has drop ship orders available for processing. The system displays vendors on this screen only if they have open drop ship orders and have the *Drop ship pick* field selected. Vendor codes are defined in and validated against the Vendor table; see Working with Vendors (WVEN). *Numeric, 7 positions; optional.*
Name	The name of the vendor that has open drop ship orders. *Alphanumeric, 30 positions; optional.*
Avail picks	The number of available drop ship picks that can be generated for the vendor. Calculated when you submit the Update Available Picks Batch Program. The system clears this field when you submit the Generate Drop Ship Picks by Batch Program. *Numeric, 9 positions; display-only.*
# picks to release	The number of available picks to release for drop ship pick batch generation. Leave this field blank if you do not wish to generate drop ship picks for the vendor. *Numeric, 9 positions; optional.*

Field	Description
Batch size	The number of picks to include in a drop ship batch for a specified vendor before creating a new batch. Example: Batch size = 2 # of picks to release = 5 In this situation, the system generates 3 batches: Batch 1 has 2 picks Batch 2 has 2 picks Batch 3 has 1 pick The vendor's *Drop ship batch size* defaults, but you can override it. If you override the batch size on this screen, the system does not update the *Drop ship batch size* field for the vendor. *Numeric, 7 positions; required.*

Screen Option	Procedure
Submit a batch program to update the number of available picks	Select Update Avail Picks to submit the Update Available Picks Batch Program. A message indicates that the batch program has been submitted: `Job 431745/UPD_#PCK submitted.`
Submit a batch program to generate the drop ship picks	Select Submit to submit the Generate Drop Ship Picks by Batch Program. A message indicates that the batch program has been submitted: `Job 431746/DROP_SHIP submitted.`

Printing the Carryover Report (PCOR)

Purpose: Use this screen to generate the Carryover Report.

The Carryover report lists unconfirmed pick slips generated on or before a specified date. Picks with a status of Open, Manifest Submission, CarryOver, Packed (packed), or Reprinted are included.

Print Carryover Report Screen

Use this screen to generate the Carryover Report.

How to display this screen: Enter PCOR in the *Fast path* field or select Print Carryover Report from a menu.

Field	Description
Pick printed on or before...	The latest print date to include on the Carryover Report. The report lists pick slips printed on or before this date. The current date defaults, but you can override it. *Numeric, 6 positions (in user date format); required.*

Screen Option	Procedure
Submit the CARRYOVER job to generate the Carryover reports	Select Submit. The system generates the Carryover Report.

Confirming and Billing Shipments

Topics in this part:

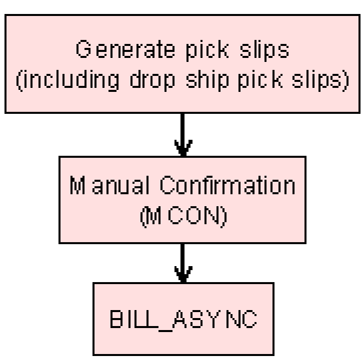
- Manually Confirming Shipments (MCON) describes how to confirm shipments manually, or interactively, using the pick control number, billing batch number (without exceptions), and billing batch number (with exceptions).
- Reprinting and Voiding Pick Slips (WVRP or WSVP) explains how to reprint and void a single pick slip or a range of pick slips.
- Void Pick Batch (WSVP)
- Printing the Fill Rate Reports (PFRR) provides report samples and descriptions of the Fill Rate, Shipment Summary, and Backorder Summary reports.

Manually Confirming Shipments (MCON)

Purpose: Use the Confirm Shipments menu option to confirm the shipment of items on pick slips or drop ship pick slips by pick control number or by billing batch number. You might use manual confirmation for international shipments.

Overview: Confirmation is the process of identifying packages or items as shipped and recording essential information for reporting and tracking purposes. The manual confirmation function is used for manual billing and drop ship items.

This topic describes manual confirmation. Manual confirmation provides the opportunity to confirm shipments interactively or by batch. Interactive confirmation is driven by the pick control number, whereas batch confirmation is driven by the billing batch number (with or without exceptions).



Confirming drop ship pick slips: You can also use this menu option to confirm drop ship pick slips, once your drop ship vendor has informed you that the orders have been shipped. You can confirm drop ship pick slips either by billing batch number or by pick control number.

When you process drop ship pick slips using the Selecting Vendors for Drop Ship Processing (MDSP) menu option, the system produces a pick slip/invoice which lists the billing batch number. If you want to confirm by pick control number, you must display picks through standard order inquiry (Select Options/Display picks), and note the pick control number for each order.

Confirming pick slips containing a stored value card item: When you confirm a pick slip containing a stored value card item, the system verifies that the stored value card is assigned a number. If the stored value card is not assigned a number, the system does not allow you to confirm the pick slip or change the status of the pick to carryover and displays an error message: `All stored value card numbers must be entered before accepting`. You must assign a number to the stored value card before you can confirm the associated pick slip. See Assigning Numbers to Physical Stored Value Cards.

In this topic:

Interactive Confirmation Screen

Purpose: Use this screen to specify the shipping warehouse, current billing date, and whether you are going to confirm shipments by the pick control number or by the billing batch number.

How to display this screen: Enter MCON in the *Fast path* field at the top of any menu or select Confirm Shipment from a menu.

Field	Description
Shipping warehouse	A code that represents the warehouse from which you are shipping the merchandise. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions; required.*
Current billing date	The date that you want to confirm this billing run. The current date defaults, but you can override it. *Numeric, 6 positions (in user date format); required.*

Field	Description
Bill by batch #	Indicates whether you want to bill by batch or pick control number. Valid values are: • Selected = Bill by the batch number assigned by the system when you generated pick slips or drop ship pick slips. • Unselected (default) = Bill by the pick control number assigned by the system when you generated pick slips or drop ship pick slips.

Completing this screen: If you selected the *Bill by batch number* field, you advance to the Confirm by Pick Batch Number Screen. If you left the *Bill by batch number* field blank, you advance to the Confirm by Pick Control Number Screen.

Confirm by Pick Control Number Screen

Purpose: The system assigns a pick control number to each pick slip. Use this screen to confirm a shipment by the pick control number.

How to display this screen: Complete the Interactive Confirmation Screen without selecting the *Bill by batch number* field.

Field	Description
Warehouse	A code that represents the shipping warehouse. Warehouse codes are defined in and validated against the Warehouse table. *Numeric, 3 positions; display-only.*
Billing date	The date reflects when the order is shipped. The value defaults from the previous screen. *Numeric, 6 positions (in user date format); display-only.*
Control # (Pick control number)	Enter the pick control number that you are confirming. **Note:** You cannot confirm a pick control number that is in a pre-printed status (G Generated No Authorization or H Generated Has Authorization); see Creating Pre-Generated Picks. *Numeric, 7 positions; required.*
The following fields are displayed when you enter a valid pick control number in an eligible status.	

Field	Description
Pick status	The description of the pick slip's status. Possible statuses are: • Open • Submitted to async • Billing pending • Confirmed • Declined authorization • Async processing error • Manifest submission • CarryOver • Packed • Reprinted • Suspended • Void • Waiting for authorization • Authorized *Display-only.*
Order #	The order number you wish to confirm. *Numeric, 8 positions; display-only, assigned by the system.*
Ship-to number (Unlabeled field)	A hyphen (-) separates this field from the Order # field. Indicates the number of shipping addresses on the order. *Numeric, 3 positions; display-only.*
Ship to	The name and address of the customer to receive the order. *Alphanumeric, 41 positions (name), 32 positions (address), 10 positions (apartment), 40 positions (city/st/postal/cntry); display-only.*
Ship via	A code that represents the shipper. Ship via codes are defined in and validated against the Ship Via table; see Working with Ship Via Codes (WVIA). The system writes an S (shipment) order transaction history message (Order History in order maintenance and inquiry) if the ship via is changed. *Numeric, 2 positions; required.*
Meter charges	The freight charges associated with shipping this order. The system writes an S (shipment) order transaction history message (Order History in order maintenance and inquiry) if the meter charge is changed. If you enter multiple tracking numbers, the meter charges are associated with the first tracking number entered. *Numeric, 8 positions; optional.*

Field	Description
Tracking #	The shipment tracking number, if any, to save in the Manifest Upload Audit table. The number is then eligible to include in the: • *Outbound Email XML Message (CWEmailOut)* or shipment confirmation email • *Detailed Order Inquiry Response XML Message (CWORDEROUT)* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Also, this number is displayed on the: • Display Package Information Screen • Third Streamlined Order Inquiry Screen (Order Summary) **Note:** The two screens above can provide a link to the shipper's web site to review tracking history. • Select Orders For Return Authorization Screen • Display Order History Screen **Multiple tracking numbers?** Optionally, you can select Add'l Tracking #s to open the Enter Additional Tracking Numbers window. You can enter up to 10 tracking numbers at this window, plus the tracking number at the Confirm by Pick Control Number Screen, for a maximum of 11 numbers, regardless of the number of pick control labels that were originally generated. **Note:** Once you confirm shipment as described below, you cannot enter any additional tracking numbers for the pick slip. *Alphanumeric, 30 positions; optional.*

Screen Option	Procedure
Change the date	Select Change Date to activate the date field. Enter the new date.
Carry over	Select Carry over to change the status of the pick slip to carryover.

Screen Option	Procedure
Enter additional tracking numbers	Select Add'l Tracking #s to open the Enter Additional Tracking Numbers window. You can enter up to 10 tracking numbers at this window, plus the tracking number at the Confirm by Pick Control Number Screen, for a maximum of 11 numbers, regardless of the number of pick control labels that were originally generated. **Note:** This option is available only after you have entered a valid pick control number.
Work with details	Select Work with Details to advance to the Confirm Pick Control Details Screen. This option is available only after entering a pick control number.

Instructions: To confirm shipment by pick control number.

1. Enter the pick control number is the one you want to confirm in the Control # (Pick control number) field. The additional fields, described above, are displayed in the bottom portion of the screen.
2. Optionally, change the Ship via.
3. Optionally, enter Meter charges.
4. Optionally, enter a Tracking #. You can also select Add'l Tracking #s to open the Enter Additional Tracking Numbers window, where you can enter up to 10 tracking numbers, for a maximum of 11 numbers, regardless of the number of pick control labels that were originally generated.
5. Select OK to confirm the pick control number. A confirmation window opens. Select Accept to accept the confirmation; otherwise, select Reject.
6. When you confirm the shipment, the screen displays a message: `Pick submitted to async job!`

> **Note:**
>
> When you confirm the shipment, all labels associated with the pick control number are confirmed. You cannot confirm any additional shipments for the pick control number.

For more information: See Updates During Background Processing.

Confirm Pick Control Details Screen

Purpose: This screen allows you to display pick control details at the line level.

How to display this screen: Select Work with details at the Confirm by Pick Control Number Screen.

Field	Description
Control # (Pick control number)	The control number assigned to a pick slip. *Numeric, 7 positions; display-only.*
Pick status (Unlabeled field to the left of the Control number field)	The description of the pick slip's status. Status options: • Open • Submitted to async • Billing pending • Confirmed • Declined authorization • Async processing error • Manifest submission • CarryOver • Packed • Reprinted • Suspended • Void • Waiting for authorization • Authorized *Display-only.*
Order #	A unique number to identify an order. *Numeric, 8 positions; display-only, assigned by the system.*
Ship-to number (Unlabeled field to the right of the order number)	The number of the shipping address on the order. *Numeric, 3 positions; display-only.*
Ship to	The name of the customer to receive the order. *Alphanumeric, 41 positions (name); display-only.*
Line #	The line number on the pick slip. *Numeric, 3 positions; display-only.*
Item	A code that represents a unit of inventory. Item codes are defined in and validated against the Item table. *Alphanumeric, 12 positions; display-only.*
SKU	The unique characteristics of an item, such as its color and size. *Alphanumeric, three 4-position fields; display-only.*
Printed	The quantity of the item printed on the pick slip. *Numeric, 5 positions; display-only.*
Packed	The quantity of the item packed and shipping. Not currently implemented. *Numeric, 5 positions; display-only.*
Sts (Status)	The status of the item. Valid values are: • C = Cancel • H = Hold • Blank = Open *Alphanumeric, 1 position; display-only.*

Confirm by Pick Batch Number Screen

Purpose: Use this screen to confirm an entire batch of picks in a single entry. The system assigns the billing batch number when you generate pick slips.

How to display this screen: Select the *Bill by batch number* field on the Interactive Confirmation Screen.

Field	Description
Billing batch #	The billing batch number containing the pick slips you are confirming. *Numeric, 7 positions; required.*
Exceptions	Indicates if there are pick slips in the batch that are not shipping at this time. Valid values are: • Selected = Exclude exceptions from the billing run. You advance to the Work with Batch Exceptions screen. • Unselected = There are no exceptions in the billing run. You advance to the Batch Confirmation pop-up window.
Ship via	The shipper assigned to this batch of pick slips. Ship via codes are defined in and validated against the Ship Via table. The system writes an S (shipment) order transaction history message (Order History in order maintenance and inquiry) if you enter a ship via in this field. *Numeric, 2 positions; required.*

Field	Description
Meter charge	The total freight charges associated with shipping all pick slips in this batch. The system writes an S (shipment) order transaction history message (Order History in order maintenance and inquiry) if you enter a meter charge in this field. The system uses the following calculation to determine the meter charge for each unit in the batch: `meter charge / total units in batch = meter charge per unit` The system uses the following calculation to determine the meter charge for each pick slip in the batch: `unit meter charge x number of units on pick = meter charge for each pick slip` Example: batch 203 includes 25 pick slips the total meter charge for the batch is 150.00 the total units in the batch is 50 units per pick slip is 2 `150.00 (meter charge) / 50 (total units in batch) = 3.00 (meter charge per unit)` `3.00 (unit meter charge) x 2 (units per pick slip) = 6.00 (meter charge for each pick slip)` Example: batch 204 includes 25 pick slips the total meter charge for the batch is 150.00 the total units in the batch is 50 units for pick slips 1-24 is 1 units for pick slip 25 is 26 `150.00 (meter charge) / 50 (total units in batch) = 3.00 (meter charge per unit)` `3.00 (unit meter charge) x 1 (number of units on pick slip) = 3.00 (meter charge for pick slips 1-24)` `3.00 (unit meter charge) x 26 (number of units on pick slip) = 78.00 (meter charge for pick slip 25)` You can review summary information for a batch of pick slips such as per unit meter charge and total picks confirmed on the Batch Confirmed Report. *Numeric, 8 positions; optional.*

Completing this screen: If you selected the *Exceptions* field, you advance to the Work with Batch Exceptions Screen (Confirming by Billing Batch Number with Exceptions).If you unselected the *Exceptions* field, you advance to the Batch Confirmation pop-up window. See Confirming by Billing Batch Number (without Exceptions).

Work with Batch Exceptions Screen (Confirming by Billing Batch Number with Exceptions)

Purpose: Exceptions are pick control numbers in the batch that did not ship or that you wish to exclude from the batch (for example, the pick slip includes a different ship via than the rest of the pick slips in the batch). Use this screen to exclude these control numbers from the billing run.

How to display this screen: Select the *Exceptions* field on the Confirm by Pick Batch Number Screen.

Field	Description
Billing batch #	A number to identify a batch of pick slips. *Numeric, 7 positions; display-only, assigned by the system.*
Billing date	The billing date for this batch of picks. *Numeric, 6 positions (in user date format); display-only.*
Cntrl # (Pick control number)	The control number assigned to a pick slip. Type a control number to display pick slips in that batch in numeric sequence beginning with your entry. *Numeric, 7 positions; required.*
Ship to	The name of the customer to receive the order. *Alphanumeric, 41 positions; display-only.*
Pick status	The description of the pick slip's status. Valid values are: • Open • Submitted to async • Billing pending • Confirmed • Declined authorization • Async processing error • Manifest submission • CarryOver • Packed • Reprinted • Suspended • Void • Waiting for authorization • Authorized *Display-only.*
Whs (Warehouse)	A code to identify the warehouse confirming the shipment. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions; display-only.*

Screen Option	Procedure
Void the pick	Select Void Pick for a pick slip to advance to the Reprint/Void Pick Slips Screen (Reprinting/Voiding by Pick Control Number).

Screen Option	Procedure
Confirm the pick	Select Confirm for a pick slip to confirm the pick slip. **Note:** If the pick is a carryover its status changes to Open when you select this option.
Carry over	Select Carryover for a pick slip to change the status of the pick to Carryover.
Work with details	Select Work with Details for a pick slip to advance to the Confirm Pick Control Details Screen.
Accept the batch	Select Accept to accept the batch. See Accepting and Rejecting Batches (with Exceptions).
Reject the batch	Select Reject to reject the batch. The system displays the Confirm Reject Request pop-up window. See Accepting and Rejecting Batches (with Exceptions).

Accepting and Rejecting Batches (with Exceptions)

Purpose: To complete confirming by billing batch number (with exceptions), you must accept or reject the batch.

To accept a batch: You can accept a batch by selecting Accept at the Work with Batch Exceptions Screen (Confirming by Billing Batch Number with Exceptions). The system displays the Batch Confirmation pop-up window.

Batch Confirmation Pop-up Window

This window indicates that you are about to submit the batch for confirmation. Select OK to accept the batch confirmation and exit the screen; otherwise, select Exit to cancel the batch confirmation and return to the previous screen.

Confirming the batch causes the system to submit the batch job (BCH_CONFRM) for processing, and create the Batch Confirmed Report. Any pick slip that you marked for void or carry over is excluded from the billing run.

To reject a batch: You can reject a batch by selecting Reject at the Work with Batch Exceptions Screen (Confirming by Billing Batch Number with Exceptions). The Confirm Delete pop-up window displays.

Select OK to confirm the delete or select Exit to cancel and return to the previous screen.

Important:

If you confirm the rejection, any changes that you indicated on the Work with Batch Exceptions Screen (Confirming by Billing Batch Number with Exceptions) are not executed by the system. Pick slips remain in the status they were in when you entered the Work with Batch Exceptions screen.

Confirming by Billing Batch Number (without Exceptions)

Purpose: Use this window to confirm a batch of pick control numbers for billing without exceptions.

How to display this window: Deselect the Exceptions field at the Confirm by Pick Batch Number Screen.

To confirm the batch: Select OK to confirm at the confirmation window to confirm the batch; otherwise, select Exit to cancel the confirmation and return to the Confirm by Pick Batch Number screen.

Confirming the batch causes the system to return to the previous screen and to submit the batch job (BCH_CONFRM) for processing, and to create the Batch Confirmed Report.

Reprinting and Voiding Pick Slips (WVRP or WSVP)

Purpose: A pick might need to be voided because:

- the original pick was destroyed
- you need to change a shipper
- you found an error on the original pick slip
- the customer cancels the order
- you need to de-allocate or unreserve stock

Options when voiding: Your options include voiding the pick slip and:

- leaving the order line(s) reserved
- unreserving the order line(s)
- automatically reprinting
- putting the order on hold
- canceling the order

Not all options are available through all screens.

Secured features: The ability to reprint and void pick slips through the Void/Reprint Picks (WVRP) menu option is controlled by the Change Pick Slips (A32) and Reprint Pick Slips (A33) secured features; however, these features do not control the Void Pick Batch (WSVP) menu option.

Drop ship pick slip/invoices: You cannot use this menu option to void or reprint a Drop Ship Pick Slip/Invoice. The system deletes a drop ship pick slip/invoice once the associated drop ship purchase order is closed or canceled and all IL Outbound Trigger records (WOIT) for the purchase order and drop ship pick slip/invoice are in an X Closed status.

If an invoice number is assigned: The Generate Invoice Number at Pick Gen (H80) and Generate Invoice # at Pick Gen without Address Match (K81) system control value controls whether to assign a pending invoice number at pick slip generation. If you reprint a pick slip that has a pending invoice number assigned, the system assigns a new pending invoice number for the new pick control number.

> **Note:**
>
> If you are using pick label tracking, you void all labels for a pick slip at once. You cannot void a pick slip if any of its labels have been confirmed.

Pick In API: You can also use the generic Pick In API to void or reprint pick slips. See the *Generic Pick In API (Shipments, Voids, and Backorders)* in the Web Services Guide on My Oracle Support (ID 2953017.1).for more information.

Status update to Order Orchestration? If the Create Separate Picks for Ship for Pickup Orders (L89) system control value is:

- unselected: Voiding a pick slip for a ship-for-pickup, retail pickup, or delivery order does not generate a status update to Order Orchestration and neither does reprinting the pick slip. Once you have created the order in Order Orchestration by initially generating the pick slip, Order Administration does not send another status update until you confirm shipment or cancel the order.
- selected: Voiding a pick slip for a regular (not special) ship-for-pickup order generates a status update to Order Orchestration to cancel the original order in Order Orchestration, and reprinting the pick slip generates a new order submission to Order Orchestration. However, regardless of the Create Separate Picks for Ship for Pickup Orders (L89) system control value, voiding a pick slip for a retail pickup or delivery order does not generate another status update until you confirm shipment or cancel the order.

See Ship-for-Pickup Orders and Retail Pickup (including Ship-for-Pickup) or Delivery Orders for overviews.

Bypassing printable pick slips not available: Even if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected, voiding and reprinting a pick slip still creates a printable pick slip. This system control value controls the generation of printable pick slips only when you use the Streamlined Pick Slip Generation (WSPS) option.

  - Reprint/Void Pick Slips by Order Screen
- Display Pick Control Header (1 of 2) Screen
- Reprinting Pick Slips
- Voiding Pick Slips
- Work with Pick Control Detail Screen
  - Pick Control Details Screen (Displaying Pick Control Details)
- Freezing an Item
- Select a New Pick Location Screen
  - Select Item Location Screen

For more information: See Void Pick Batch (WSVP).

Reprint/Void Pick Slips Screen (Selecting Reprint/Void Criteria) (WVRP)

Purpose: Use this screen to enter the information about the pick slip(s) that controls which screen you advance to next. For example, enter:

- Pick control number or range of pick control numbers to advance to the Reprint/Void Pick Slips Screen (Reprinting/Voiding by Pick Control Number).
- Batch number and, optionally, Cart number to advance to the Reprint/Void Pick Slips by Batch Screen.
- Order number and, optionally, the Ship-to number or Order line number to advance to the Reprint/Void Pick Slips by Order Screen.

How to display this screen: Enter WVRP in the *Fast path* field at the top of any menu or select Reprint/Void Pick Slips from a menu.

Field	Description
Pick control # range	Optionally, enter a range of pick control numbers to advance to the Reprint/Void Pick Slips Screen (Reprinting/Voiding by Pick Control Number). *Numeric, 7 positions; optional.*
Batch #	Optionally, enter a batch number to display all pick slips in that billing batch. You advance to the Reprint/Void Pick Slips by Batch Screen. *Numeric, 7 positions; optional.*
Cart #	Optionally, enter a cart number if you also entered a *Batch #*. You advance to the Reprint/Void Pick Slips by Batch Screen, displaying all pick slips in that billing batch and cart. *Numeric, 7 positions; optional.*
Order #	Optionally, enter an order number to display all pick slips for that order. You advance to the Reprint/Void Pick Slips by Order Screen. *Numeric, 8 positions; optional.*
Order ship to #	Optionally, enter an order ship-to number if you also entered an *Order #*. You advance to the Reprint/Void Pick Slips by Order Screen, displaying all pick slips for that order and order ship-to. *Numeric, 3 positions; optional.*

Reprint/Void Pick Slips Screen (Reprinting/Voiding by Pick Control Number)

Purpose: This screen lists the pick slip information for a specific control number or a range of pick control numbers. You have the option to:

- for all displayed pick slips:
  - void and reprint all
  - void and optionally unreserve all, or leave the order line(s) reserved
- for individual pick slips:
  - work with pick control details
  - display pick control header information
  - void and leave the order line(s) reserved
  - void and reprint

- void and unreserve

How to display this screen: At the Reprint/Void Pick Slips Screen (Selecting Reprint/Void Criteria) (WVRP), enter a pick control number or range of pick control numbers.

Field	Description
Selected control # (Selected control number range)	The control number information that you entered at the previous screen. *Numeric, 7 positions; display-only.*
Fax drop ship picks	Indicates whether you want to fax drop ship picks to the vendor. This option is not currently implemented.
Control # (Pick control number)	A number to identify a pick slip. Enter a pick control number to display existing pick control numbers, beginning with your entry. *Numeric, 7 positions; optional.*
Batch # (Billing batch number)	A number to identify a batch of pick slips. *Numeric, 3 positions; display-only.*
Cart #	A number to identify the batch pick slip list assigned to a cart. *Numeric, 3 positions; display-only.*
Order #	A unique number to identify an order. *Numeric, 8 positions; display-only, assigned by the system.*
Printed (date/time)	The date and time that the pick slip was printed. *Date: numeric, 6 positions (in user date format); display-only.* *Time: numeric, 6 positions (HHMMSS format); display-only.*
Confirmed (date/time)	The date and time that the pick slip was confirmed. *Date: numeric, 6 positions (in user date format); display-only.* *Time: numeric, 6 positions (HHMMSS format); display-only.*
Status	The status of the pick slip. Valid values are: • Open • Submitted to async • Billing pending • Confirmed • Declined authorization • Async processing error • Manifest submission • CarryOver • Packed • Reprinted • Suspended • Void • Waiting for authorization • Authorized *Display-only.*

Screen Option	Procedure
Work with pick control details	Select Work with for a pick control number to advance to the Display Pick Control Header (1 of 2) Screen.
Void pick slips	Select Void for a pick control number to void the pick slip. See Voiding Pick Slips.
Display pick control header information	Select Display for a pick control number to advance to the Display Pick Control Header (1 of 2) Screen.
Reprint pick slips	Select Reprint for a pick control number to reprint the pick slip. See Reprinting Pick Slips.
Void/unreserve pick slips	Select Void/Unreserve to void the pick slip and unreserve the items. See Voiding Pick Slips.
Reprint all pick slips	Select Reprint All to reprint all pick slips. See Reprinting Pick Slips.
Void all pick slips	Select Void All to void all pick slips. See Voiding Pick Slips.

Reprint/Void Pick Slips by Batch Screen

Purpose: This screen lists the pick slip information for a specific batch number and cart number. You have the option to:

- for all displayed pick slips:
  - void and reprint all
  - void and optionally unreserve all, or leave the order line(s) reserved
- for individual pick slips:
  - work with pick control details
  - display pick control header information
  - void and leave the order line(s) reserved
  - void and reprint
  - void and unreserve

How to display this screen: At the Reprint/Void Pick Slips Screen (Selecting Reprint/Void Criteria) (WVRP), enter a Batch number and Cart number (or leave this field blank to select all cart numbers).

Field	Description
Selected batch #	The batch number that is carried over from the previous screen. *Numeric, 7 positions; display-only.*
Cart #	A number that represents the batch pick slip list that is assigned to each cart. *Numeric, 3 positions; display-only.*
Control # (Pick control number)	The pick control number. Enter a cart/control number to display pick slips beginning with the control number you entered. *Numeric, 7 positions; optional.*
Order #	A unique number assigned by the system to identify an order. Every order on the system is assigned an order number. *Numeric, 8 positions; display-only.*

Field	Description
Shp # (Ship-to number)	The number of shipping addresses for the order. The system assigns a sequential ship-to number to every order. The first ship-to address is assigned the number one. *Numeric, 3 positions; display-only.*
Printed (date/time)	The date and time that the pick slip was printed. *Date: numeric, 6 positions (in user date format); display-only.* *Time: numeric, 6 positions (HHMMSS format); display-only.*
Confirmed (date/time)	The date and time that the pick slip was confirmed. *Date: numeric, 6 positions (in user date format); display-only.* *Time: numeric, 6 positions (HHMMSS format); display-only.*
Status	The status of the pick slip. Valid values are: • Open • Submitted to async • Billing pending • Confirmed • Declined authorization • Async processing error • Manifest submission • CarryOver • Packed • Reprinted • Suspended • Void • Waiting for authorization • Authorized *Display-only.*

Screen Option	Procedure
Work with pick control details	Select Work with for a pick slip to advance to the Display Pick Control Header (1 of 2) Screen.
Void pick slips	Select Void for a pick control number to void the pick slip. See Voiding Pick Slips.
Display pick control header information	Select Display for a pick slip to advance to the Display Pick Control Header (1 of 2) Screen.
Reprint pick slips	Select Reprint for a pick slip to reprint the pick slip. See Reprinting Pick Slips.
Void/unreserve pick slips	Select Void/Unreserve to void the pick slip and unreserve the items. See Voiding Pick Slips.
Reprint all pick slips	Select Reprint All to reprint all pick slips. See Reprinting Pick Slips.
Void all pick slips	Select Void All to void all pick slips. See Voiding Pick Slips.

Reprint/Void Pick Slips by Order Screen

Purpose: Use this screen to work with, display, reprint, or void pick slips for a specific order number, order Ship-to number and order line number. You have the option to:

- for all displayed pick slips:
  - void and reprint all
  - void all and put the order(s) on hold
  - void all and cancel the order(s)
- for individual pick slips:
  - work with pick control details
  - display pick control header information
  - void and leave the order line(s) reserved
  - void and reprint
  - void and unreserve

How to display this screen:

- At the Reprint/Void Pick Slips Screen (Selecting Reprint/Void Criteria) (WVRP), enter an Order number, Order Ship-to number (or leave this field blank to select all ship-to numbers) and order line number (or leave this field blank to select all line numbers).
- Select Void/Reprint at the Picks Pending Window in order maintenance. This window opens in order maintenance when you attempt to cancel an order that has printed pick slips.

Field	Description
Ship # (Ship to number)	Indicates the number of shipping addresses for the order. *Numeric, 3 positions; optional.*
Control # (Pick control number)	Indicates the pick control numbers that you want to reprint or void pick slips for. *Numeric, 7 positions; optional.*
Batch # (Billing batch number)	A number that is assigned to each pick slip run. *Numeric, 3 positions; display-only.*
Cart #	A number that represents the batch pick slip list that is assigned to each cart. *Numeric, 3 positions; display-only.*
Printed (date/time)	The date and time that the pick slip was printed. *Date: numeric, 6 positions (in user date format); display-only.* *Time: numeric, 6 positions (HHMMSS format); display-only.*
Confirmed (date/time)	The date and time that the pick slip was confirmed. *Date: numeric, 6 positions (in user date format); display-only.* *Time: numeric, 6 positions (HHMMSS format); display-only.*

Field	Description
Status	The status of the pick slip. Valid values are: • Open • Submitted to async • Billing pending • Confirmed • Declined authorization • Async processing error • Manifest submission • CarryOver • Packed • Reprinted • Suspended • Void • Waiting for authorization • Authorized *Display-only.*

Screen Option	Procedure
Work with pick control details	Select Work with for a pick slip to advance to the Display Pick Control Header (1 of 2) Screen.
Void pick slips	Select Void for a pick slip to void the pick slip. See Voiding Pick Slips.
Display pick control header information	Select Display for a pick slip to advance to the Display Pick Control Header (1 of 2) Screen.
Reprint pick slips	Select Reprint for a pick slip to reprint the pick slip. See Reprinting Pick Slips.
Void/unreserve pick slips	Select Void/Unreserve to void the pick slip and unreserve the items. See Voiding Pick Slips.
Reprint all pick slips	Select Reprint All to reprint all pick slips. See Reprinting Pick Slips.
Void all pick slips and hold the order(s).	Select Void All/Hold Order to void all pick slips and hold the order(s). This option is available only if pick slips exist. See Voiding Pick Slips.
Void all pick slips and cancel the order(s).	Select Void All/Cancel Order. The system voids all pick slips and cancels the order(s). The system displays a pop-up window to confirm the cancellation. This option is available only if pick slips exist. See Voiding Pick Slips.

Display Pick Control Header (1 of 2) Screen

Purpose: Use this screen to review pick information including the control and billing batch numbers, pick status, generation type, date/time for last update, confirmation, printing, assigned to number of labels, cartons, zones, warehouse, and drop points.

How to display this screen: Select Display for a pick slip at any Reprint/Void Pick Slips screen or at the Display Pick Tickets for Order Screen.

Additional pick control header information: Select OK to advance to the Second Display Pick Control Header Screen.

For more information: See Displaying Pick Slip Generation Inquiry (DPSI) for more information on this screen and the additional screens available.

Reprinting Pick Slips

Purpose: Use the Reprint Pick Slips function to void the original pick slip and reprint another pick slip. You might want to use this feature if the quantity listed on the pick slip cannot be picked for one reason or another, or if the original pick slip was destroyed somehow.

The system automatically voids the original pick slip and reprints the pick slip with a new number. If the Generate Invoice Number at Pick Gen (H80) or Generate Invoice # at Pick Gen without Address Match (K81) system control value was selected, and an invoice number was assigned at pick slip generation, the system also assigns a new invoice number at this time. However, the system does not evaluate the order and customer to see if they meet the criteria that govern invoice number assignment at pick slip generation; a new invoice number is assigned only if there was already an invoice number in the table.

> **Note:**
>
> This option does not automatically reprint the Gift Acknowledgement for a gift order. See the Automatic Generation of Gift Acknowledgement (B92) system control value for more information.

How to reprint a single pick slip: Select Reprint for a pick slip at any Reprint/Void Pick Slip screen.

Error messages:

The system displays an error message similar to the following when you select Reprint for a pick slip that is in a billing pending status:

```
Pick cannot by voided/reprinted/changed in this status.
```

The system displays an error message similar to the following if a user is currently maintaining this pick slip:

```
Pick Control # 9999 is in use by user KLETENDRE.
```

How to reprint all pick slips: You can reprint all pick slips by selecting Reprint All at any Reprint/Void Pick Slip screen. The system reprints all the picks in the batch, except pick slips that are in a billing pending status.

Authorization error: The screen displays an error message similar to the following when you select Reprint All to reprint all pick slips if the Access to Void/Reprint All (A76) secured feature is set to *EXCLUDE:

```
User Not Authorized to Function.

=
```

When this secured feature is set to *EXCLUDE, the system still allows you to select Reprint for a specific pick slip in order to reprint it.

Sorting pick slips into separate PDF files:

- If you select the Reprint option for a pick slip, the system creates a separate pick slip PDF document based on warehouse, ship via priority, the Split Special Handling Picks (L44) system control value, and the `PICKS_IN_SPOOL_FILE` property in Working with Customer Properties (PROP).
- If you select the Reprint All option, the system does not create a separate pick slip PDF document based on warehouse, ship via priority, or the Split Special Handling Picks (L44) system control value. The system will create a separate pick slip PDF document based only on the `PICKS_IN_SPOOL_FILE` property in Working with Customer Properties (PROP).

See Sorting Pick Slips into Separate PDF Documents for more information.

Voiding Pick Slips

Purpose: The Void Pick Slips function in Reprinting and Voiding Pick Slips (WVRP or WSVP) enables you to void the original pick slip, which is similar to ripping up the pick slip. The system automatically voids the original pick slip and decreases the quantity printed.

You can also use the Void Pick Batch (WSVP) menu option to void an entire batch of pick slips if, for example, they were generated by mistake. This menu option simply voids the pick slips in the batch, without the option to reprint or unreserve the order lines or to hold or cancel the order.

Which pick statuses are eligible? Voiding a pick slip or a group of pick slips through any of the options available through Reprinting and Voiding Pick Slips (WVRP or WSVP) is possible only for pick slips that are not in a G Generated No Authorization, H Generated Has Authorization, A Submitted to Async or B Billing Pending status. The Void Pick Batch (WSVP) option also omits pick slips in these statuses, as well as those in C Confirmed and V Void statuses.

OROB unavailable error: The screen displays an error message such as `Cannot void pick - OROB unavailable` if:

- the order is a regular (not special) ship-for-pickup order, and
- the Create Separate Picks for Ship for Pickup Orders (L89) system control value is selected, and
- the system cannot communicate with Order Orchestration (for instance, the Order Orchestration application is not currently running)

This error message occurs because, in this situation, the system needs to send a cancellation status update when you void a pick slip. See Ship-for-Pickup Orders for background.

Updates at void: When you void a pick slip, the system updates the following tables based on the quantity on the voided pick slip:

- Item Location: subtracts the printed quantity
- Reserved Order Line: subtracts the printed quantity and updates the quantity remaining
- Order Detail: subtracts the printed quantity

It deletes the related records in the following tables:

- Pick Control Header

- Pick Control Detail
- Pick Control Header Extended
- Pick Control Label
- Pick Location

Pick slip preparation: When you void a pick slip, the system removes any pick slip preparation from the order and then reevaluates the order for pick slip preparation; see Preparing Orders for Pick Slip Generation.

Credit card payments: If the pick slip is associated with a credit card payment, it creates a record in the Void Auths table for the amount on the voided pick slip.

Order transaction history: The system writes an Order Transaction History message indicating that the pick slip was voided.

Pick download trigger: If the Create Generic Pick Download Triggers (I31) system control value is selected, the system also creates a PCH trigger record to generate a void request through the *Generic Pick Out API.*

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Tickler: If the Use Workflow Management (H96) system control value is selected, the system creates a VP tickler when you void pick slips subject to the criteria you have set up for the tickler event; however, voiding a batch of pick slips through the Void Pick Batch (WSVP) menu option does not create ticklers.

Notify Order Orchestration: If the order is a regular (not special) ship-for-pickup order, and the Create Separate Picks for Ship for Pickup Orders (L89) system control value is selected, the system sends a cancellation status update to Order Orchestration. See Ship-for-Pickup Orders for an overview.

Void and Unreserve a Single Pick Slip

Select Void/Unreserve for a pick slip record at any Reprint/Void Pick Slip screen.

Error message: The system displays an error message similar to the following if you select Void/Unreserve a pick slip that is in a billing pending status:

```
Pick cannot be voided/reprinted/changed in this status.
```

> **Note:**
>
> If you void a pick slip and all of the other pick slips for that order are in a billing pending status, the system automatically submits the picks to Billing.

See Voiding Pick Slips for information on the `Cannot void pick - OROB unavailable` error message.

Partial void? If you void a pick slip for a partial shipment on an order when one or more items is not available, the system tracks the amount of the void in the Void Auths table. Then, when the item is available and you generate a new pick slip, it will not be necessary to obtain a new authorization.

Void All Pick Slips (With or Without Unreserving)

Select Void All at the Reprint/Void Pick Slips Screen (Reprinting/Voiding by Pick Control Number) or the Reprint/Void Pick Slips by Batch Screen.

Error messages:

The screen displays an error message similar to the following when you select Void All to void all pick slips if a pick slip is in a billing pending status and other pick slips for that order still exist:

```
Pick 2146 is in Billing Hold status. Void not processed.
```

The system voids all of the pick slips listed on the screen except those pick slips in a billing pending status. However, if you select Void All to void all pick slips and any of the other pick slips for that order are in a billing pending status, the system automatically submits the picks to Billing.

The screen displays an error message similar to the following when you select Void All to reprint all pick slips if the Access to Void/Reprint All (A76) secured feature is set to *EXCLUDE:

```
User Not Authorized to Function.
```

When this secured feature is set to *EXCLUDE, the system still allows you to select Void/Unreserve a specific pick slip in order to void it.

See Voiding Pick Slips for information on the `Cannot void pick - OROB unavailable error message`.

Void All Pick Slips and Hold Order

At the Reprint/Void Pick Slips by Order Screen, you can void all lines on the pick slip and hold the order by selecting Void All/Hold Order.

The system changes the status on the pick slip to Void and changes the order status to Hold, using a system hold reason of VD (Pick was Voided).

Error messages:

The screen displays an error message similar to the following if you select Void All/Hold Order if a pick slip is in a billing pending status and other pick slips for that order still exist:

```
Pick 2146 is in Billing Hold status. Void not processed.
```

See Voiding Pick Slips for information on the `Cannot void pick - OROB unavailable error message`.

The system voids all of the pick slips displayed on the screen except those pick slips in a billing pending status. However, if you select Void All/Hold Order to void all pick slips and all of the other pick slips for that order are in a billing pending status, the system automatically submits the picks to Billing.

The screen displays an error message similar to the following when you select Void All/Hold Order to void and hold all lines on the pick slip if the Access to Void/Reprint All (A76) secured feature is set to *EXCLUDE:

```
User Not Authorized to Function.
```

Void All Pick Slips and Cancel Order

At the Reprint/Void Pick Slips by Order Screen, you can void all lines on the pick slip and cancel the order by selecting Void All/Cancel Order.

Void/cancel process: You advance through a series of windows to void and cancel an order:

- Confirm Void window: Click OK to continue with the void/cancel, or click Exit if you do not want to void the pick slip and cancel the order.
- Confirm Unreserve window:
  - If you are canceling the order, your actions at this window do not affect the outcome. You can click OK or Exit to continue; otherwise,
  - To void the pick slip and unreserve the order lines but not cancel the order, select the *Unreserve* field; otherwise, leave the *Unreserve* field unselected to void the pick slip and leave the order line(s) reserved; then, click OK.
- Enter Cancel Reason window: To void the pick slips without canceling the order, do not enter a *Cancel* reason and click Exit; otherwise:
  - Enter a *Cancel* reason to proceed with canceling the order.
  - If there are multiple ship-to's on the order, use the *Cancel all ship to's* field to indicate whether to cancel just the first ship-to; otherwise, this selection does not matter.
  - Select the *Recalculate frt* field to refund freight to the customer; otherwise, leave it unselected.
  - Click OK when you are done.
- If the order includes unbilled membership items: You might proceed through additional windows related to membership cancellations if there are any unbilled membership items on the order. This situation can occur only if your pick slip generation criteria excluded membership items, since otherwise the membership item would have billed at the time you generated the pick slips. See Canceling a Membership Item for more information on the membership item cancellation process and related windows.

> **Note:**
>
> You cannot complete the cancellation of an order through the Void/Cancel option for a retail pickup or delivery order if you do not have authority under the Cancel Order Broker Lines (B19) secured feature. In this situation, the system voids the pick slip but does not cancel the order.

Once you complete the above series of windows, the system changes the status on the pick slip to Void and changes the order status to Canceled.

In addition, if a stored value card payment with an open, unused authorization amount exists on the order, the system generates a stored value card authorization reversal; see Stored Value Card Authorization Reversal.

Error messages:

The system displays an error message similar to the following if you select Void All/Cancel Order and a pick slip is in a billing pending status:

```
Pick Control # 2070 cannot be voided.
```

The system voids all of the pick slips displayed on the screen except those picks slips in a billing pending status. If you select Void All/Cancel Order and all of the other pick slips for that pick generation run are in a billing pending status, the system automatically submits the picks to Billing.

The screen displays the following error message if you select Void All/Cancel Order to void and cancel all lines on the pick slip and the Access to Void/Reprint All (A76) secured feature is set to *EXCLUDE:

`User Not Authorized to Function.`

See Voiding Pick Slips for information on the `Cannot void pick - OROB unavailable` error message.

Work with Pick Control Detail Screen

Purpose: Use this screen to cancel an order detail line, display the Pick Control Detail screen, freeze an item on the order detail line, override locations, display the Work With Order screen, and accept or reject your entries.

How to display this screen: Select Work with for a pick slip at Reprint/Void Pick Slips Screen (Reprinting/Voiding by Pick Control Number), Reprint/Void Pick Slips by Batch Screen, or Reprint/Void Pick Slips by Order Screen.

Error messages: When you select Work with for a pick slip:

The system displays an error message similar to the following when you select Work with for a pick slip that is in a billing pending status:

`Pick cannot by voided/reprinted/changed in this status.`

The system displays an error message similar to the following if a user is currently maintaining this pick slip:

`Pick Control # 9999 is in use by user KLETENDRE.`

Field	Description
Control # (Pick control number)	The control number assigned to a batch of picks. *Numeric, 7 positions; display-only.*
Billing batch # (Billing batch number)	A system-generated batch number that is assigned to each pick slip run. *Numeric, 7 positions; display-only.*
Order #	A unique number assigned by the system to identify an order. Every order on the system is assigned an order number. *Numeric, 8 positions; display-only.*
Ship-to number (Unlabeled field)	A hyphen (-) separates this field from the *Order #* field. Indicates the number of shipping addresses for the order. The system assigns a sequential ship-to number to every order. The first ship-to address is assigned the number one. *Numeric, 3 positions; display-only.*
Ship to name (Ship to name and address)	The name and address of the customer who placed the order. Validated against the Customer Sold-to table. *Alphanumeric, 41 positions (name), 32 positions (address), 10 positions (apartment), 40 positions (city/st/postal/country); display-only.*
Ship via	A code that represents the carrier for this order. Validated against the Ship Via table. *Numeric, 2 positions; display-only.*

Field	Description
Line #	Indicates the line number on the order. Up to 999 detail lines may be entered on an order. Enter a line number to display records starting with the number you entered. *Numeric, 3 positions; optional.*
Item	A code that represents a unit of inventory. *Alphanumeric, 12 positions; display-only.*
SKU	A code that further defines the item. *Alphanumeric, three 4-position fields; display-only.*
Description	The description of the item/SKU. *Alphanumeric, 30 positions; display-only.*
Print (Printed)	The number of units of the item printed and the quantity which should be shipped. *Numeric, 5 positions; display-only.*
Alloc (Allocated)	The number of units of the item allocated and the quantity which should be shipped. This number can be decreased, but never increased. **Note:** If you decrease the allocated quantity and the pick slip is associated with a credit card payment, the system creates a record in the Void Auths table for the amount placed on backorder. *Numeric, 5 positions; display-only.*
Packd (Packed)	The number of units of the item packed and the quantity which is being shipped. Not currently implemented. *Numeric, 5 positions; display-only.*

Screen Option	Procedure
Display an order detail line	Select Display for a detail line to advance to the Pick Control Details Screen (Displaying Pick Control Details).
Freeze an item	Select Freeze Item for a detail line to freeze an item.
Override a location	Select Override Location for a detail line to display the Select a New Pick Location Screen.
Accept the pick control details	Select Accept.
Reject the pick control details	Select Reject.

Pick Control Details Screen (Displaying Pick Control Details)

Purpose: Use this screen to review the pick slip, including the control and line number, the item/SKU and description, the original printed quantity, the actual quantity printed, and the override quantity, if applicable.

How to display this screen: Select Display for a detail line at the Work with Pick Control Detail Screen.

Field	Description
Control # (Pick control number)	The number that you are viewing pick control details for. *Numeric, 7 positions; display-only.*
Line #	Indicates the line number on the order. Up to 999 detail lines can be entered on an order. *Numeric, 3 positions; optional.*
Item/SKU	The unit of inventory that you are viewing pick control details for. *Alphanumeric, 12 positions (item), three 4-position fields (SKU); display-only.*
Description	The description of the item/SKU that you are viewing pick control details for. *Alphanumeric, 30 positions; display-only.*
Original qty printed	The original quantity that was printed on the pick. This becomes important if the quantity on the pick is changed. *Numeric, 5 positions; display-only.*
Qty printed	The number of units of the item printed and the quantity which should be shipped. *Numeric, 5 positions; display-only.*
Override qty	The number of units that supersede the original quantity. *Numeric, 5 positions; display-only.*

Freezing an Item

Purpose: You freeze an item or SKU in a location to prevent picks slips from printing. For example, you might choose to freeze an item/SKU that has been damaged while in the warehouse so that it will not ship to a customer.

If you select the Reservation freeze flag in the Item Location table, the system does not generate pick slips. However, all other inventory transaction are allowed.

How to freeze an item: Select Freeze Item for an item on the Work with Pick Control Detail Screen.

Results: A batch program runs in the background and flags the item as frozen in the Item Location table.

Select a New Pick Location Screen

Purpose: Use this screen to override the location for picking an order detail line.

How to display this screen: Select Override Location for an item at the Display Pick Control Header (1 of 2) Screen.

Field	Description
Control # (Pick control number)	The number that you are viewing pick control details for. *Numeric, 7 positions; display-only.*
Line #	Indicates the line number that you are viewing pick control details for. Up to 999 detail lines may be entered on an order. *Numeric, 3 positions; optional.*
W/H (Warehouse)	The warehouse code. Validated against the Warehouse table. *Numeric, 3 positions; display-only.*
Location	A code that represents an area within the warehouse that contains the item/SKU. Typically the location code is composed of a single alphanumeric character for Zone, and two numbers each for Aisle, Shelf, and Bin. For instance, the location A010201 indicates: `Zone Aisle Shelf Bin` `A 01 02 01` *Alphanumeric, 7 positions; display-only.*
Quantity	The quantity allocated to this pick slip from the warehouse location. You can enter a quantity at this field . *Numeric, 3 positions; display-only.*

Screen Option	Procedure
Select a location	Select Select Loc to advance to the Select Item Location Screen.

Select Item Location Screen

Purpose: Use this screen to select a new location for this pick control detail.

How to display this screen: Select Select Loc at the Select a New Pick Location Screen.

Field	Description
Item	A code that represents a unit of inventory. *Alphanumeric, 12 positions; display-only.*
SKU	A code that further defines the item. *Alphanumeric, three 4-position fields; display-only.*
Whs (Warehouse)	The code for this warehouse. Validated against the Warehouse table. *Numeric, 3 positions; display-only.*

Field	Description
Location	A code that represents an area within the warehouse that contains the item/SKU. Typically the location code is composed of a single alphanumeric character for Zone, and two numbers each for Aisle, Shelf, and Bin. For instance, the location A010201 indicates: Zone: A Aisle: 01 Shelf: 02 Bin: 01 You can enter a different location at this field. *Alphanumeric, 7 positions; optional.*
Location	Displays the location code that you want to pick from. *Alphanumeric, 7 positions; display-only.*
Pickable	• Selected = Indicates that inventory can be picked from the location. • Unselected = Indicates that inventory cannot be picked from the location.
Zone	Identifies the warehouse zone where the location is situated. *Alphanumeric, 1 position; display-only.*
Aisle	Identifies the warehouse aisle of the location. *Alphanumeric, 2 positions; display-only.*
Shelf	Identifies the location's shelf number within the aisle. *Alphanumeric, 2 positions; display-only.*
Bin #	Identifies the location's bin number on the shelf. *Alphanumeric, 2 positions; display-only.*
Freeze (Freeze flag)	Indicates whether the item location or SKU location is frozen. Valid values are: • Selected = The item/SKU location is frozen. • Unselected = The item/SKU location is not frozen. If a location is frozen, Pick Slip Generation does not print picks. See Performing Pick Slip Generation. **Note:** Even though a pick slip does not print for an item from a frozen item location, the system still reserves the item on the Order Lines Fields in Order Entry.
Available	The number of items that are available at this location. *Alphanumeric, 1 position; display-only.*

Screen Option	Procedure
Select the item location	Select Select Request for a location to return to the Select a New Pick Location Screen. The system automatically enters any information that you entered at the Select Item Location Screen.

Void Pick Batch (WSVP)

Purpose: Use this option to void a batch of picks without unreserving, canceling, reprinting, or holding the related orders or order lines. You might use this option when you have printed a batch of pick slips incorrectly and need to reprint them.

Void Pick Batch Screen

How to display this screen: Enter WSVP in the *Fast path* field at the top of any menu, or select Void Pick Batch from a menu.

Completing this screen: Enter the 7-position billing batch number in the *Billing batch #* field and select Void Batch.

> **Note:**
>
> You cannot use this screen to void pick slips if pick slip generation is currently active. Instead, the screen displays an error: `Pick Slip Generation is active`.

Updates: See Voiding Pick Slips for information on the updates performed when you void a batch of pick slips.

Printing the Fill Rate Reports (PFRR)

Purpose: Use the fill rate, shipment summary, and backorder summary reports to quickly evaluate your stock status for fulfilling orders. These reports help you identify how much you have to handle each order before the order is completely shipped.

What these reports can help you determine is if you are able to ship an order completely immediately or if there are typically lines backordered on the majority of your orders. If so, you have to make more than one shipment on the order -- which costs you money and customer satisfaction.

The information on these reports might indicate that you have a problem with your purchasing department or your vendors, because you don't have enough stock on-hand to fulfill your orders.

In this topic:

- Submit Fill Rate Reports Screen
- Fill Rate Report
- Shipment Summary Report
- Backorder Summary Report

Submit Fill Rate Reports Screen

How to display this screen: Enter PFRR in the *Fast path* field at the top of any menu screen or select the Print Fill Rate Reports option from the menu.

You can attach this option to the CONFIRM menu (which you use to confirm and bill orders for shipment) or to a periodic process, such as on the NIGHTLY menu, so you can keep on top of your order fulfillment status.

At this screen, you may specify the offer you want to run the report for, the date range for the report, and which report(s) you want to print.

Field	Description
Offer	Enter the code for the catalog, space or television advertisement you want to report on. The report will reflect the backorder/fulfillment status for this offer only. Offer codes are defined in and validated against the Offer table; see Working with Offers (WOFR). You must specify an offer or a date range for this report. *Alphanumeric, 3 positions; optional.*
Date range	The dates through which you want to report on your backorder/fulfillment status. This date range is associated with the effective dates for the offer, as defined in the *Offer date range* fields in the Offer table. Only offers effective during this date range will be included on these reports. You must specify an offer or a date range for this report. *Numeric, 6 positions (in user date format); optional.*
Reports to print	Use this area of the screen to select which reports you want to print. Choices are: • Fill Rate Report, which gives you a view of your in stock rate for fulfilling orders. • Shipment Summary Report, which shows the number and percentage of single and multiple shipments. • Backorder Summary Report, which ages single and multiple shipments on your orders, using predefined aging buckets. Valid values are: • Selected = (Default): Run the report. • Unselected = Do not run the report.

Setting Up the Fulfillment Tables

Topics in this part:

- Working with Ship Via Codes (WVIA) describes creating, changing, deleting, and displaying shipper records. Additionally, you will find displaying ship via history; working with, creating, changing, and deleting shipper items; and working with SCF ship via values.
- Working with SCF Codes (WSCF) describes creating Sectional Center Facility (SCF) codes.
- Working with SCF/Ship Via Values (WSHV) explains how to create, change, delete, and display these codes.

- Working with Shipping Rates (WSHR) includes creating, changing, deleting, and displaying shipping rates.
- Working with Drop Points (WDPT) describes creating, changing, deleting, and displaying these codes.
- Editing Warehouse Drop Points (EWDP) describes creating, changing, and deleting warehouse drop point information.
- Editing SCF Ship Via (ESSV) describes how to create, change, or delete multiple SCF/ship via values quickly.
- Working with Dunnage Weight (WDUN) describes creating dunnage weights based on the cube of the items on a pick slip, and changing and deleting dunnage weights.
- Working with Zip/Ship Via (WZSV) describes how to cross-reference default shippers for specific destinations based on zip code; this allows you to assign carriers automatically.
- Working with Tax Jurisdiction (WTXJ) describes how to create and work with special tax jurisdiction areas, defined by zip code.
- Working with Weight Tables for Order Weight (WFTB) describes how to create and work with freight tables for the Freight by Order Weight freight method defined for a source code.
- Working with Offer Ship Via Assignment (WSVA) describes how to create and work with ship via overrides based on offer or source code, order or merchandise dollar total, and geographical area.
- Working with Lines of Business (WLOB) describes how to create and work with line of business codes and assignments and explains how the system assigns a line of business to an order.
- Displaying the Line of Business Order Queue Summary (DLOQ) describes the statistics on the Display Line of Business Order Queue Summary screen and explains how the system updates the information on this screen.
- Creating SCF Ship Vias by SCF Range (MSSV) describes how to create SCF ship via information for a selected SCF range, rather then entering this information for each SCF or drop point.
- Load USPS Zip Code File (LZPS) describes how to upload current postal code information from a CD provided by the U.S. Postal Service.

Working with Ship Via Codes (WVIA)

Purpose: Ship via codes represent the carrier or service that delivers merchandise from you to your customers.

Each order must be assigned a valid shipper code in Order Entry.

In this topic:

- Ship Via Defaults
- Ship Via Override Hierarchy
- Work with Ship Via Screen
- Create Ship Via (1 of 2) Screen
- Create Ship Via (2 of 2) Screen
- Display Ship Via History Screen

- Work with Ship Via/Item Screen
  - Create Ship Via/Item Screen
- Working with Best Way Ship Vias
  - Best Way Ship Via Pop-up Window
- Work with Ship Via Indicia Screen
  - Create Ship Via Indicia Screen (Entering the Carrier's Indicia Information)
- Work with Dollar Chart by Ship Via Screen (Ship Via Service Charges)
  - Create Dollar Chart by Ship Via Screen (Service Charge Dollar Chart)
- Work with Weight Charges by Ship Via Screen
  - Create Weight Charges by Ship Via Screen (Order Weight Charges)

Ship Via Defaults

The ship via code defaults in Order Entry, based on:

- a default ship via defined in the Default Ship Via (A77) system control value or at the Default Values for Orders screen.
- a preferred ship via, based on the SCF (first three positions of the destination postal code) to which the order is shipping.
- a ship via code defined for an item.

Order Orchestration orders: If you receive retail pickup or delivery orders from Order Orchestration, you also need to define the Order Broker Ship Via (K94) to use if the fulfillment response message from Order Orchestration does not specify a ship via. See Order Orchestration Integration for a discussion.

Ship Via Override Hierarchy

There are several ways the system can override the shipper specified on the order with another shipper. This table displays the ship via overrides that can apply to an order in the hierarchy in which the overrides apply. For example, the Promotion override is listed first, indicating that it overrides any other ship via substitution on an order.

Ship Via Overrides

Table	Results
Ship via overrides at the order header level	
Promotion	If an order, or shipping address on an order, qualifies for a promotion with a ship via override, the system changes the ship via on the order header when you select Accept or select Add Recipient to accept the order. This is the last ship via substitution that the system makes during order entry, and it overrides any previous ship via substitutions. See Working with Promotions (WPRO) for more information on defining a ship via override for a promotion.

Table	Results
Zip/Ship Via	If the ship via on the order header allows auto-assignment of carrier (the ship via's *Allow auto assignment* field is selected) and a default ship via is defined for the postal code on the order, the system changes the ship via for the ship to customer to the default ship via for the postal code. See Working with Zip/Ship Via (WZSV).
Offer Ship Via	If an order, or shipping address on an order, qualifies for an offer ship via override, the system changes the ship via on the order header when you select Accept or Add Recipient to accept the order. See Working with Offer Ship Via Assignment (WSVA).
Preferred Ship Via for SCF	If you define a *Preferred ship via* or the SCF and the *Allow auto assignment* field for this ship via is selected, the system changes the *Ship via* on the order header to the preferred ship via. See Working with SCF Codes (WSCF).
Best Way Ship Via	If you select a best way ship via from the Alternate Shipping Charges by Via Window in order entry, or the system assigns a best way ship via automatically, it changes the ship via on the order header to the best way ship via. See Working with Best Way Ship Vias.
Default Ship Via	If a ship via is defined in the Default Ship Via (A77) system control value, the system assigns this ship via to the order by default.
Ship via overrides at the order line level	These ship via overrides do not apply to the order header.
Item Ship Via Override	Item ship via overrides define the shippers that are eligible to ship an item to its destination. If you define item ship via overrides for an item, the system verifies that the ship via on the order header is an eligible shipper for each item on the order whose *Ship via* field is blank. If the shipper on the order header is not valid for an item on an order line, the system displays the Ship Via Overrides for Item Window, requiring you to select an eligible shipper for the item. The ship via you select is assigned to the item on the order line, however, the system does not override the ship via on the order header. See Working with Item Ship Via Overrides.
Item	If you define a ship via code in the *Ship via* field for an item, the system defaults this ship via code to the order line.

Work with Ship Via Screen

Purpose: Use this screen to create, change, delete, or display ship vias. This screen also provides access to the Ship Via History table where the system captures life-to-date and current information for packages delivered and freight collected, summarized by year and period.

How to display this screen: Enter WVIA in the *Fast path* field at the top of any menu or select Work with Ship Via from a menu.

Field	Description
Code	A code that represents the shipper. *Numeric, 2 positions; optional.*
Description	The description associated with the ship via code. *Alphanumeric, 30 positions; optional.*

Screen Option	Procedure
Create a ship via code	Select Create. See Create Ship Via (1 of 2) Screen and Create Ship Via (2 of 2) Screen.
Change a ship via code	Select Change for a shipper to advance to the Change Ship Via screen. At this screen you can change any information except the shipper code. See Create Ship Via (1 of 2) Screen for field descriptions.
Delete a ship via code	Select Delete for a shipper to delete it. If a record of this ship via exists anywhere on the system, an error message indicates that you have a record of the ship via in another table; for example, in the SCF/Ship Via table. **Note:** You cannot delete a ship via code if it is used on an order.
Display a ship via code	Select Display for a shipper to advance to the Display Ship Via screen. You cannot change any information on this screen. See Create Ship Via (1 of 2) Screen and Create Ship Via (2 of 2) Screen for field descriptions.
Display ship via history	Select History for a shipper to advance to the Display Ship Via History Screen.
Work with shipper item charges	Select Item Charges for a shipper to advance to the Work with Ship Via/Item Screen.
Define alternate shippers for a ship via	Select Best Way for a shipper to advance to the Best Way Ship Via Pop-up Window. See Working with Best Way Ship Vias for a discussion.
Identify the distribution center (warehouse or drop point) in order to calculate shipping charges	Select Indicia for a shipper to advance to the Work with Ship Via Indicia Screen.
Define service charges for a ship via	Select Service Charges for a shipper to advance to the Work with Dollar Chart by Ship Via Screen (Ship Via Service Charges).
Define weight charges for a ship via	Select Weight Charges for a shipper to advance to the Work with Weight Charges by Ship Via Screen.
Work with user fields for a ship via	Select User Field for a shipper. See Work with User Fields Screen.

Screen Option	Procedure
Work with SCF Ship Via codes	Select W/W SCF Ship Via. See Working with SCF/Ship Via Values (WSHV).

Create Ship Via (1 of 2) Screen

Purpose: Use the Create Ship Via screens to create a ship via code.

Select OK at this screen to advance to the Create Ship Via (2 of 2) Screen, where you can enter additional ship via code information.

How to display this screen: At the Work with Ship Via Screen, select Create to display the first Create Ship Via screen.

Field	Description
Ship via	A code for the shipper that delivers merchandise to the customer, such as 01 for UPS. You can use any value from 01 to 98. *Numeric, 2 positions.* *Create screen: required.* *Change screen: display-only.*
Ship via description	The description associated with the ship via code, such as United Parcel Service, Parcel Post, Federal Express, etc. *Alphanumeric, 30 positions; required.*

Field	Description
Type	A code that identifies the type of shipper for this ship via code. This information is used during pick slip generation to sort all similar shippers together. Additionally, the system validates that, for example, you specify whether an address is a business or a residence, which is required for UPS (U) shippers. Depending on the pick slip printing program you use, you can customize the format and information that prints for certain types of ship vias. Valid values are: • **DHL** • **Federal Express** • **Parcel Post** • **Parcel Post Class 1** • **Parcel Post Class 2** • **Parcel Post Class 3** • **Parcel Post Class 4** • **UPS** **Note:** Tracking shipment history through live links at the Display Package Information Screen is supported only for Federal Express, UPS, and Parcel Post (not Parcel Post Class 1, 2, 3, or 4) ship via types. *Optional.*
Freight percent	Used in the Percentage/Ship Via freight method. With this freight method, the merchandise amount on the order is multiplied by the percentage in the *Freight percent* field in the Ship Via record to calculate shipping charges. The calculated freight charge cannot be less than/greater than the value in the Freight (min/max) field. The system uses the freight fee in the *Frt min* field of the Ship Via record if the result of the freight calculation is less than the minimum freight fee. Otherwise, the system uses the freight fee in the *Frt max* field of the Ship Via record if the result of the freight calculation is greater than the maximum freight fee. *Numeric, 5 positions with a 2-place decimal; optional.*
Priority (Ship via priority)	Controls how the system allocates inventory to backorders or reserves inventory during Batch Reservation. Valid values range from 0 to 9, where: • 0 = Lowest priority • 9 = Highest priority The Immediate Reservation program that reserves inventory during Order Entry does not use the priority defined at the ship via level or the source code level. *Numeric, 1 position; required.*

Field	Description
Carrier	A short description of the ship via. This code prints on pick slips and reports. Example: UPSB (for “UPS Blue”) *Alphanumeric, 4 positions; optional.*
Billing	This code indicates how orders being delivered by this shipper are processed and billed. This code only applies to the ship via on the name and address screen of Order Entry (known as the “Order Header” screen). Valid values are: • Regular = Indicates that orders for this shipper are processed through “regular” processing which produces pick slips after reservation and must be confirmed (manifested) or billed manually. • Express = orders for this shipper bypass reservation, confirmation, and pick slip generation and are billed immediately after the order is accepted. For example, an express ship via code may be used to record the sale of a mis-shipped item. When an express bill ship via is used in Order Entry, a pop-up window appears where you may indicate whether inventory should be reduced and identify the warehouse and location from which the item was taken. *Optional.*
Freight (min/max)	These two fields identify the minimum and maximum freight charge for this ship via when using the Percentage/Ship Via freight method. This method multiplies the merchandise amount of the order by the percentage in the Freight percent field in the ship via record. The system uses the value in the *Freight min* field as the freight charge if the calculated freight charge is less than this value. The system uses the value in the *Freight max* field as the freight charge if the calculated freight charge is greater than this value. *Numeric, 13 positions with a 2-place decimal; optional.*
Use delivery codes	Indicates whether this shipper charges freight based on rate tables. For example, UPS charges different rates when shipping to someone's home or office. Valid values are: • Selected = the system uses a rate table to calculate shipping charges for this shipper • Unselected = the system does not use a rate table to calculate shipping charges for this shipper
PO box delivery	Indicates whether this shipper delivers to post office (P.O.) boxes. Any address that includes P.O. Box or APO/FPO must be delivered to a post office box. Valid values are: • Selected = the shipper delivers to post office boxes. You can enter P.O. Box or APO/FPO information in the Street field during Order Entry. • Unselected = the shipper does not deliver to post office boxes. The system displays a message during Order Entry that the shipper cannot deliver to a P.O. box.

Field	Description
Add'l freight only	Indicates whether the freight fee defined in the *Add'l freight charge* field is used as the shipping charge for orders delivered by this shipper. Valid values are: • Selected = The system applies the *Add'l freight charge* field as the shipping charge to the order if the merchandise amount is less than or equal to the amount in the *$ limit* field. The system does not calculate freight for the order based on the freight method defined for the source code on the order header. • Unselected = The system calculates freight for the order based on the freight method defined for the source code on the order header. In addition, the system applies the *Add'l freight charge* to the order if the merchandise amount is less than or equal to the amount in the *$ limit* field.
Add'l freight charge	An additional charge for packages delivered by this shipper. For example, you may add additional freight charges for express delivery services such as UPS Next Day or Federal Express. • If the *Add'l freight only* field is selected, the system uses the additional freight charge as the shipping charge on the order; no other freight charges are applied to the order. • If the *Add'l freight only* field is unselected, the system adds the additional freight charge to the order in addition to the freight calculated for the order based on the freight method defined for the source code on the order header. If the merchandise amount on the order is greater than the amount in the *$ limit* field, the system does not add the *Add'l freight charge* to the order, regardless of the setting of the *Add'l freight only* field. • During Order Entry, the Freight+ field is calculated and updated with the *Add'l freight charges* value only if the ship via for which you have defined additional charges is on the order header. • The additional freight charges are included in the *Charges* field at the Alternate Shipping Charges by Via Window for the purposes of allowing the customer to select a best way shipper in order entry. *Numeric, 13 positions with a 2-place decimal; optional.*
$ limit	The merchandise dollar amount required to add the additional freight charge to the order. • If the merchandise dollar amount is equal to or below this value, the system adds the additional freight charge to the order. • If the merchandise dollar amount is greater than this value, the system does not add the additional freight charge to the order. *Alphanumeric, 1 position; required if you define an add'l freight charge.*

Field	Description
Allow auto assignment	Indicates whether the system can change the shipper on an order if there is a Ship via defined for the destination postal code in the Zip/Ship Via table, or if there is a Preferred ship via defined for the SCF code. Valid values are: • Selected = the system checks the Zip/Ship Via table and the SCF table when you accept a new order (using Accept or Accept/Add Rcp.) and changes the shipper code if a default shipper is found for the postal code to which the order is shipping. **Note:** This process occurs only if you are using the Order Recap screen, as specified by the Display Order Recap (A75) system control value. • Unselected = (default) the shipper code will not be changed.
Maximum carton weight	Defines the carton weight for the system to use when calculating freight using the *Freight by order weight* freight method. See Working with Weight Tables for Order Weight (WFTB) for more information on setting up freight tables and using this method. **Note:** The system does not use this value in any other calculation or validation. *Numeric, 13 positions with a 3-place decimal; optional.*
Exempt duty charges	Indicates whether the system should add duty charges to orders this shipper delivers, or whether the shipper is exempt. Valid values are: • selected = Do not add duty charges to orders this shipper delivers. • unselected = Add duty charges to orders for this shipper where applicable. The system determines whether to add duty charges to an order by comparing an item's harmonize code with the harmonize codes defined for a country's duty rates. See Setting Up the Country Table (WCTY).

Field	Description
Telephone #	The phone number for this ship via. You can define a telephone number format to map to the phone numbers operators enter into the system. The system defaults the telephone number formats for the country defined in the Default Country for Customer Address (B17) system control value for any phone number entered on this screen. See Setting Up the Country Table (WCTY). *Alphanumeric, 14 positions; optional.*
Download to e-commerce	Indicates whether to make the shipper available to customers on the web storefront. Valid values are: • Selected = Download ship via code to the web storefront. • Unselected = Do not download ship via code to the web storefront. When you deselect this field, the SCF/Ship Via download program does not download the SCF/Ship Via record since the ship via is not valid for the web storefront. See Working with SCF/Ship Via Values (WSHV).

Create Ship Via (2 of 2) Screen

How to display this screen: Select OK at the Create Ship Via (1 of 2) Screen to display the second Create Ship Via screen.

Field	Description
Alternate ship via 1	A code for the shipper to use in place of the primary shipper, if the values in the # of days since 1st shipment field or the# of shipments are met. Example: If the primary shipper is an overnight carrier and the order includes backordered items, you may want to ship the backordered items by an alternate shipper to save on shipping charges. The system uses this ship via code for all items on the order during pick slip generation and displays a message in Order Information. The ship via code entered here is defined in and validated against the Ship Via table. *Numeric, 2 positions; optional.*
# of days since 1st shipment	The number of days since the first shipment after which the Alternate ship via 1 will be used. *Numeric, 3 positions; optional.*
# of shipments	The number of shipments after which the Alternate ship via 1 will be used. Example: If the primary shipper is an overnight shipper and there have been 2 shipments on the order, you may switch to an alternate shipper to save shipping charges. *Numeric, 2 positions; optional.*

Field	Description
Alternate ship via 2	The shipper to use in place of the primary shipper if the weight or dollar value of the carton is less than the value in the Minimum weight or Minimum value fields. *Numeric, 2 positions; optional.*
Minimum weight	The minimum weight of a package to be delivered by the primary shipper; if the package weighs less than this minimum, alternate shipper 2 is used instead. **Note:** The system uses the item's Ship wgt. (Shipping weight) to evaluate minimum weight. *Numeric, 13 positions with a 3-place decimal; optional.*
Minimum value	The minimum dollar value of a carton being delivered by the shipper defined in the Alternate ship via 2 field. If the value of items in the carton is low, you may want to send the shipment by a uninsured carrier. *Numeric, 13 positions with a 2-place decimal; optional.*
Alternate ship via 3	This code represents a shipper to use in place of the primary shipper, if the weight or dollar value of the carton is greater than the value in the Maximum weight or Maximum value fields. *Numeric, 2 positions; optional.*
Maximum weight	The maximum weight of a carton being delivered by the shipper defined in the Alternate ship via 3 field. *Numeric, 13 positions with a 3-place decimal; optional.*
Maximum value	The maximum dollar value of a carton being delivered by the shipper defined in the Alternate ship via 3 field. If the value of the carton is high, you may want to send the shipment by an insured carrier. *Numeric, 13 positions with a 2-place decimal; optional.*

Field	Description
Decision Manager Service Level	Informational field to identify the service level assigned to the ship via. If you are using CyberSource Decision Manager Fraud Scoring, Order Administration maps the *Service Level* for the ship via to the shipTo *ShippingMethod* in the CyberSource Authorization Request (ccAuthService) XML Message. Service levels defined in CyberSource Decision Manager are: • sameday: Courier or same day service. • oneday: Next day or overnight service. • twoday: Two day service. • threeday: Three day service. • lowcost: Lowest cost service • pickup: Store pickup • other: Other shipping method. • none: No shipping method because product is a service or subscription. When a *ShippingMethod* is defined for a ship to in the ccAuthService message, the shipping address is not automatically added to the Decision Manager negative list. You can add a shipping address to the negative list using the Transaction Marking Tool; see *Marking Order Data During Order Review* in the Case Management section of the Decision Manager User Guide. **Note:** To use a custom value, create a Decision Manager custom rule with the shipping method order element. *Alphanumeric, 20 positions; optional.*
ChannelAdvisor carrier	Together with the *Channel Advisor Service Class*, serves as a cross reference to the carrier passed through ChannelAdvisor. See ChannelAdvisor Integration Overview and ChannelAdvisor Setup for background. *Alphanumeric, 60 positions; optional.*
ChannelAdvisor Service Class	Together with the *ChannelAdvisor Carrier*, serves as a cross reference to the carrier passed through ChannelAdvisor. See ChannelAdvisor Integration Overview and ChannelAdvisor Setup for background. *Alphanumeric, 60 positions; optional.*
Narvar Carrier Name	The name identifying the carrier to Narvar. Passed to Narvar as the `carrier`. If not populated with a valid carrier line, `OTHER` is passed to Narvar, as the carrier and tracking number links do not work correctly. The list of valid carrier names and service codes are provided by Narvar. See Narvar Integration for background. Case-insensitive. *Alphanumeric, 60 positions; optional.*

Field	Description
Narvar Carrier Service Code	The service code identifying the carrier's level of service to Narvar. Passed to Narvar as the `carrier_service`. Optional for the Narvar shipment notification. The list of valid carrier names and service codes are provided by Narvar. See Narvar Integration for background. Case-insensitive. *Alphanumeric, 60 positions; optional.*

Display Ship Via History Screen

Purpose: Use this screen to review historical and current information for this shipper. Billing updates this information and sequences it by period, within the year.

How to display this screen:

- At the Work with Ship Via Screen, select History for a ship via code.
- At the Change Ship Via screen or Display Ship Via screen, select Ship Via History.

Field	Description
Ship via	The code and description for the shipper. *Numeric, 2 positions; display-only.*
Packages (to date)	The number of packages delivered by this shipper life-to-date. The Billing program updates this field. *Numeric, 7 positions; display-only.*
Freight collected (Freight collected to date)	The estimated dollar amount charged to date by the shipper to deliver the packages, not including additional freight charges. The Billing program increases this value for sales and decreases this value for returns whose *Refund freight* is selected. *Numeric, 11 positions with 2-place decimal; display-only.*
Packages (today)	The number of packages delivered by this shipper today. The Billing program updates this value with the number of picks produced and the associated shipping charges. This number is not updated if the transaction is a return or exchange. *Numeric, 7 positions; display-only.*
Freight collected (Freight collected today)	The estimated dollar amount charged today by the shipper to deliver the package, not including additional freight charges. The Billing program increases this value for sales and decreases this value for returns whose *Refund freight* is selected. *Numeric, 11 positions with 2-place decimal; display-only.*
Year	The last two digits of the year associated with the accounting period. Enter a year to display history for that year. *Numeric, 2 positions; optional.*
Period	The accounting period within the specified year. Typically, accounting periods equate to months. *Numeric, 2 positions; optional.*
Packages	The number of packages delivered by this ship via during the specified year and/or period. *Numeric, 7 positions; display-only.*

Field	Description
Freight collected (Freight collected for year, period)	The estimated dollar amount charged for the year and period by the shipper for deliveries, not including additional freight charges. The Billing program increases this value for sales and decreases this value for returns whose *Refund freight* is selected. *Numeric, 11 positions with 2-place decimal; display-only.*

Work with Ship Via/Item Screen

Purpose: Use this screen to define an extra freight charge for shipping a particular item by this shipper. For example, you may want to charge an extra $20.00 for shipping a piece of furniture. The additional shipper/item freight charge is included in the *Freight +* field in Order Entry, and listed as the *Add'l frt* charge for the order detail line in order inquiry.

> **Note:**
>
> The shipper/item charges are included in the *Charges* field at the Alternate Shipping Charges by Via Window for the purposes of allowing the customer to select a best way shipper in order entry.

How to display this screen: From the Work with Ship Via Screen, select Item Charges for a ship via code.

Field	Description
Item	The code for an item you sell. *Alphanumeric, 12 positions; optional.*
Extra charge	The extra charge that is added to orders for this item. *Numeric, 13 positions with a 2-place decimal; display-only.*

Screen Option	Procedure
Create a new shipper/ item	Select Create to advance to the Create Ship Via/Item Screen.
Change shipper/items	Select Change for an item to advance to the Change Ship Via/ Item screen. At this screen you can change any information except the item number. See Create Ship Via/Item Screen for field descriptions.
Delete shipper/items	Select Delete for an item to delete it.

Create Ship Via/Item Screen

Purpose: Use this screen to create a shipper/item charge.

How to display this screen: At the Work with Ship Via/Item Screen, select Create.

Field	Description
Ship via	The shipper that delivers the order to the customer. Ship via codes are defined in and validated against the Ship Via table. **Note:** If this ship via is entered in the Ship via field for the item record, the ship via will default on the order line in order entry, and the shipper/item charge will be added to the order, regardless of whether this is the ship via defined on the order header. See Performing Initial Item Entry (MITM). *Numeric, 2 positions; display only.*
Item	The code for an item you sell. Item codes are defined in and validated against the Item table. *Alphanumeric, 12 positions.* *Create screen: required.* *Change screen: display-only.*
Extra charge	The extra charge that is added to orders for shipping this item. *Numeric, 13 positions with a 2-place decimal; required.*

Working with Best Way Ship Vias

Purpose: Use the Best Way Ship Via table to define alternate shippers for a particular ship via to use the best way shipping feature.

Best way shipping in order entry can either display a window enabling the order entry operator to offer a choice of shipment options to the customer, or have the system automatically select the ship via with the lowest overall shipping charges.

If you display the Alternate Shipping Charges by Via Window, the customer can select a less expensive shipper, or choose a shipper who can deliver the order sooner. The window lists each of the alternate shippers identified with a *Type* of O in the Best Way Ship Via table. The operator can select a different shipper for the order, or accept the current ship via. To have the system automatically apply the best way shipper with the lowest charges, you use the Best Way Ship Via for Auto-Assignment (J67) system control value. In this situation, the Alternate Shipping Charges by Via Window does not open automatically in order entry, and the ship via assignment takes place “behind the scenes.”

What factors affect the freight charges? While the freight method specified for the source code on the order header controls the basic freight charges on an order, there are other factors that can make one ship via more or less expensive than another, including:

- Add'l freight charge
- shipper/item charges (see Work with Ship Via/Item Screen)
- service charges (see Work with Dollar Chart by Ship Via Screen (Ship Via Service Charges))
- weight charges (see Work with Weight Charges by Ship Via Screen)

- handling charges (if the Include Special Handling in Alternate Shipping Charges by Via (I03) system control value is selected)

Additionally, based on the information displayed at the Alternate Shipping Charges by Via Window, a customer can select a shipper that is not the least expensive, but offers a quicker delivery date.

Preventing the customer's selection from being overridden: If you are using best way shipping in order entry, you should set up the shipper so that no subsequent ship via overrides will take place. Additional ship via overrides include:

- freight promotions (see Working with Promotions (WPRO))
- item ship via overrides (see Working with Item Ship Via Overrides)
- default ship via defined for item

Also, you can leave the Allow auto assignment field to unselected to prevent the following ship via overrides from taking place:

- zip/ship via default (see Working with Zip/Ship Via (WZSV))
- a *Preferred ship via* for the SCF (see Working with SCF Codes (WSCF))

See Ship Via Override Hierarchy for a list of ways the system can override the shipper specified on the order with another shipper and the hierarchy in which the ship via overrides take precedence.

Related system control values: Use the following system control values to control the function of the best way shipping window in order entry:

- Best Way Ship Via for Auto-Assignment (J67)
- Display Alternate Shipping Charges by Via Window in OM (I02)
- Include Special Handling in Alternate Shipping Charges by Via (I03)
- Use Business Days When Calculating Expected Delivery Date (K38)
- Warehouse Cutoff Time (K39)

Summary of best way shipping types: The ways in which best way shipping at order entry vary are summarized in the following table:

	In Order Entry (with Pop-up Window)	In Order Entry (Automatic)
Purpose:	The Alternate Shipping Charges by Via Window in order entry lets you offer the customer the option to select a ship via based on freight charges or expected delivery date.	The system automatically selects the best way ship via with the lowest overall shipping charges
Shippers identified by:	*Type* = O	

	In Order Entry (with Pop-up Window)	In Order Entry (Automatic)
Additional required setup:	Leave the Best Way Ship Via for Auto-Assignment (J67) system control value unselected Optionally: • use the Display Alternate Shipping Charges by Via Window in OM (I02), Include Special Handling in Alternate Shipping Charges by Via (I03), Use Business Days When Calculating Expected Delivery Date (K38), and Warehouse Cutoff Time (K39) system control values • leave the Allow auto assignment field to unselected	Select the Best Way Ship Via for Auto-Assignment (J67) system control value; see that system control value for additional setup requirements

Best Way Ship Via Pop-up Window

How to display this window: Select Best Way for a ship via code at the Work with Ship Via Screen.

Field	Description
Best way ship via	The code for the alternate shipper you want to evaluate for best way shipping. **Note:** In order to add a best way ship via to an order, it needs to have a valid SCF/ ship via records for the shipping address. *Numeric, 2 positions; required.*
Type	The type of best way shipping. Valid values are: • O = order entry: You can select the best way shipper at the Alternate Shipping Charges by Via Window in order entry to provide the customer a choice of shippers for the order, or have the system automatically select the best way shipper with the lowest overall charges if the Best Way Ship Via for Auto-Assignment (J67) system control value is selected. See above for more information. • P = pick slip: *This value is not currently implemented.* *Alphanumeric, 1 position; required.*

Adding a best way ship via: Complete the *Via* and *Type* field and click OK to add a new alternate shipper for the primary ship via. Your entry “drops down” to the list of best way shippers.

To delete: Select Delete for a shipper to remove it as a best way shipper.

To display: Select Display Ship Via for a shipper to advance to the Display Ship Via History Screen.

Work with Ship Via Indicia Screen

Indicia messages are messages you enter to print on the pick slip, such as shipping instructions or notes to the carrier. The indicia message that displays is determined by the drop point associated with the ship via for an order. The drop point associated with the ship via for an order depends on whether or not you are using the *Zone skipping* feature in Pick Slip Generation.

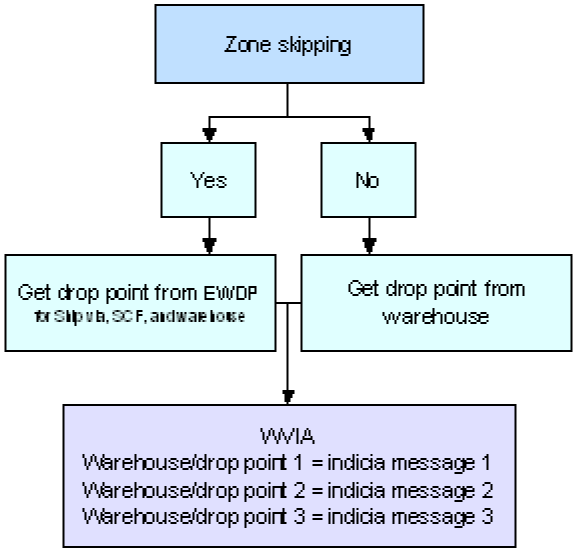
Drop points represent locations to which merchandise will be shipped from your warehouse. Typically, a drop point represents the address of a UPS facility. This drop point prints as the return address on the pick slip and is the destination to which undeliverable packages are returned.

You must specify drop points for shipping in two ways: you set up a drop point for each warehouse when you enter warehouse information using Work with Warehouses (see Creating and Maintaining Warehouses (WWHS)); the system uses this drop point in Pick Slip generation if you are not using the *Zone skipping* feature, or you can optionally specify drop points for each warehouse, ship via, and SCF combination using the Editing Warehouse Drop Points (EWDP) menu option; the system uses the drop points you specify in this menu option when you select the *Zone skipping* feature in Pick Slip Generation.

Setting up indicia messages: Each drop point/ship via combination for a pick slip identifies a unique indicia message. You set up indicia messages for each ship via/ drop point combination using the Work with Ship Via menu option. Each ship via can have multiple indicia messages, one message for each drop point.

Zone skipping is a method of reducing freight charges by shipping inventory via one carrier to a central drop point, where it is picked up by another carrier and delivered to its final destination. For example, if you are shipping from a Massachusetts warehouse to destinations in California, you might use one carrier to deliver all packages to a UPS center in California, from which they will be shipped to their California destinations. Whether or not you are using zone skipping determines which table the system uses to identify the drop point.

The following table explains which indicia message prints on the pick slip.



For more information:

- About Zones
- Performing Pick Slip Generation
- Working with Drop Points (WDPT)
- Editing Warehouse Drop Points (EWDP)

How to display this screen: Select Indicia for a ship via code on the Work with Ship Via Screen.

Field	Description
Drop point	A code that identifies a location to which you ship packages. Drop points are used with the Zone Skipping feature. This feature enables you to ship a package by one carrier to a designated drop point, at which point another carrier picks up the package and delivers it to its final destination. With this method, the ultimate shipper crosses fewer zones. As a result, you reduce shipping charges because the charge is based on the number of zones crossed within the country. Drop point codes are defined in and validated against the Drop Point table; see Working with Drop Points (WDPT). *Numeric, 3 positions; optional.*
Description	The description associated with the indicia code. *Alphanumeric, 20 positions; optional.*
Number	The indicia code for the drop point, as defined by the carrier. *Alphanumeric, 20 positions; optional.*

Screen Option	Procedure
Enter the carrier's code for a drop point	Select Create to advance to the Create Ship Via Indicia Screen (Entering the Carrier's Indicia Information).

Screen Option	Procedure
Delete the carrier's code for a drop point	Select Delete for a record to advance to delete it.
Display the carrier's code for a drop point	Select Display for a record to advance to the Display Ship Via Indicia screen. You cannot change any information on this screen. See the Create Ship Via Indicia Screen (Entering the Carrier's Indicia Information) for field descriptions.

Create Ship Via Indicia Screen (Entering the Carrier's Indicia Information)

Purpose: Use this screen to create a ship via indicia.

How to display this screen: At the Work with Ship Via Indicia Screen, select Create

Field	Description
Ship via	The code for a shipper. Ship via codes are defined in and validated against the Ship Via table. *Numeric, 2 positions; required.*
Drop point	A code that identifies a location where you ship an item by one carrier and to be picked up by another carrier and shipped to its final destination. This is known as zone skipping. With this method, you reduce the number of zones crossed. As a result, you reduce the shipping charges. Drop point codes are defined in and validated against the Drop Point table; see Working with Drop Points (WDPT). *Numeric, 2 positions; required.*
Indicia description	The description of the indicia code, as defined by the carrier. *Alphanumeric, three lines of 20 positions each. First line required; remaining lines optional.*
Indicia number	The carrier's own code for the drop point specified. *Alphanumeric, 20 positions; required.*

Work with Dollar Chart by Ship Via Screen (Ship Via Service Charges)

Purpose: Use this screen to establish a chart for service charges to add to orders that use this shipper. The system bases the amount of the service charge on the merchandise total of the order, and calculates the service charge for each shipping address on the order. If the Include Handling in Freight Charge Calculation (D77) system control value is selected, the system also includes handling in the order total subject to service charges.

> **Note:**
>
> If the order uses the By Offer Price freight method, the system calculates the total merchandise value by adding the extended single-unit offer price for each item/SKU, disregarding any discounts, associate pricing, price overrides, quantity break pricing, etc. This merchandise value is used for both the freight and the ship via service charges.

Included in freight total: The system adds service charges by ship via to the *Freight* bucket on the order, and in general treats service charges the same way as freight, for example:

- overriding freight in Order Entry by selecting Charges also overrides service charges
- unselecting the *Calculate freight* field also prevents the system from calculating service charges

> **Note:**
>
> The service charges are included in the *Charges* field at the Alternate Shipping Charges by Via Window for the purposes of allowing the customer to select a best way shipper in order entry.

Source code requirements: To use service charges by ship via on an order, you must have the following defined for in Working with Source Codes (WSRC):

- the *Exclude service charges* field unselected
- an order level freight method:
  - $ Chart by Ofr = Freight by dollar chart/offer
  - $ Chart by Src = Freight by dollar chart/source
  - % Source = Freight by source code percentage
  - % Ship Via = Freight by ship via percentage
  - Recipient = Freight by recipient
  - Flat Rt/Ship To = Flat rate by ship-to
  - Order Weight = Freight by order weight
  - By Offer Price = Freight by offer price

How to display this screen: Select Service Charges for a ship via at the Work with Ship Via Screen.

Field	Description
Ship via	A code for the shipper. *Numeric, 2 positions; display-only.*
Description (Unlabeled field to the right of the ship via)	The name of the shipper. *Alphanumeric, 30 positions; display-only.*
Dollar amount	The merchandise total of the order required to add this service charge to the order. The system will also include handling in the total subject to service charges if the Include Handling in Freight Charge Calculation (D77) Control value is selected. The system adds the service charge dollar amount or percentage to orders whose totals are at least this amount, but less than the next larger dollar amount you have defined. *Numeric, 13 positions with a 2-place decimal; optional.*
Service charge	The amount of service charge to add to an order for the associated dollar amount. *Numeric, 13 positions with a 2-place decimal; optional.*

Field	Description
Pct (Percentage)	The percentage to use when calculating the service charge to add to an order for the associated dollar amount. *Numeric, 5 positions with a 2-place decimal; optional.*
Maximum charge	The maximum service charge to add to an order. *Numeric, 13 positions with a 2-place decimal; optional.*

Screen Option	Procedure
Create a service charge	Select Create to advance to the Create Dollar Chart by Ship Via Screen (Service Charge Dollar Chart).
Change a service charge	Select Change for a service charge record to advance to the Change Dollar Chart by Ship Via screen. You can change any information except the dollar amount. See Create Dollar Chart by Ship Via Screen (Service Charge Dollar Chart) for field descriptions.
Delete a service charge	Select Delete for a service charge record to delete it. You can delete a service charge dollar chart record even if the charge has been added to orders.
Display a service charge	Select Display for a service charge record to advance to the Display Dollar Chart by Ship Via screen. You cannot change any information on this screen. See Create Dollar Chart by Ship Via Screen (Service Charge Dollar Chart) for field descriptions.

Create Dollar Chart by Ship Via Screen (Service Charge Dollar Chart)

Purpose: Use this screen to create a service charge by dollar chart record. Each record defines the amount or percentage service charge to add to an order whose merchandise total is at least as large as the dollar amount, but not as large as the next higher dollar amount on the chart. See Work with Dollar Chart by Ship Via Screen (Ship Via Service Charges) for more information on how the system applies service charges to orders.

How to display this screen: Select Create at the Work with Dollar Chart by Ship Via Screen (Ship Via Service Charges).

Field	Description
Ship via	The code representing a shipper. *Numeric, 2 positions; display-only.*
Description (Unlabeled field to the right of the ship via code)	The name of the shipper. *Alphanumeric, 30 positions; display-only.*

Field	Description
Dollar amount	The required amount of the order subject to the service charge. The system adds the service charge amount or calculates the service charge percentage to orders whose merchandise totals are at least this dollar amount, but less than the next higher dollar amount defined in the dollar chart. The system will also include handling in the total subject to service charges if the Include Handling in Freight Charge Calculation (D77) field in the System Control table is selected. *Numeric, 13 positions with a 2-place decimal.* *Create screen: required.* *Change screen: display-only.*
Service charge	The total service charge to add to an order for this dollar amount. You must define either a service charge dollar amount here, or a service charge percentage, but not both. *Numeric, 13 positions with a 2-place decimal; required if not entering a service charge percentage.*
Service charge % (Service charge percentage)	The percentage to use for calculating the service charge to add to an order. The system bases the percentage on the dollar amount subject to freight on the order (generally the merchandise amount; see the *Dollar amount* field description above). Example: If the service charge percentage for a dollar amount of $100.00 is 5.00, and the dollar amount on the order is also $100.00, the system adds a $5.00 service charge to the order (5% of 100). *Numeric, 5 positions with a 2-place decimal; required if not entering a service charge amount.*
Maximum charge	The maximum service charge to add to an order. Typically, you would define a maximum for the highest record on your dollar chart. Example: If the highest dollar amount were $200.00 with a service charge percentage of 4%, you might define a maximum charge of $10.00. *Numeric, 13 positions with a 2-place decimal; optional.*

Work with Weight Charges by Ship Via Screen

Purpose: Use this screen to create a chart for weight charges to add to orders that use this shipper. The system bases the amount of the weight charge on the total weight of the merchandise on the order, and calculates the weight charge for each shipping address on the order.

Determining the order weight: The system uses the weight defined in the *Sell weight* field for each item on the order to determine the order weight. For example, if the first item on the order weighed 2 pounds and the second item on the order weighed 6 pounds, the order weight would be 8 pounds. The system adds the weight of items for each ship to customer separately.

Determining the weight charge: Once the system determines the weight of the items on the order, the system looks at the order weight charge table set up for the ship via defined for the order ship to. The system finds the order weight defined in the order weight charge table that is at least this order weight, but less than the next larger order weight you have defined.

Included in freight total: The system adds weight charges by ship via to the Freight bucket on the order, and treats the weight charges the same way as freight, for example:

- overriding freight in order entry by selecting Charges also overrides weight charges
- unselecting the Calculate freight field also prevents the system from calculating weight charges

> **Note:**
>
> The weight charges are included in the *Charges* field at the Alternate Shipping Charges by Via Window for the purposes of allowing the customer to select a best way shipper in order entry.

Source code requirements: To use weight charges by ship via on an order, you must have an order level freight method defined for the source code. Order level freight methods are:

- $ Chart by Ofr = Freight by dollar chart/offer
- $ Chart by Src = Freight by dollar chart/source
- % Source = Freight by source code percentage
- % Ship Via = Freight by ship via percentage
- Recipient = Freight by recipient
- Flat Rt/Ship To = Flat rate by ship-to
- Order Weight = Freight by order weight
- By Offer Price = Freight by offer price

See Working with Source Codes (WSRC), for more information on order level freight methods.

Example:

You enter an order with 2 ship-to customers. Ship-to customer 1 uses ship via 3, and ship-to customer 2 uses ship via 4. The order weight for ship-to customer 1 is 9 lbs. and the order weight for ship to customer 2 is 13 lbs.

Ship Via 3 Weight Charges Table		**Ship Via 4 Weight Charges Table**	
Order Weight	**Weight Charge**	**Order Weight**	**Weight Charge**
5 lbs.	0.50	5 lbs.	1.00
10 lbs.	1.00	10 lbs.	2.00
15 lbs.	1.50	15 lbs.	3.00

Results:

Order #	Ship to #	Ship Via	Order Weight	Weight Charge	Freight Charges	Order Ship To Freight
3557	1	3	9 lbs.	.50	1.00	1.50
3557	2	4	13 lbs.	2.00	1.50	3.50

How to display this screen: On the Work with Ship Via Screen, select Weight Charges for a ship via code.

Field	Description
Ship via	The code and description of the shipper you selected on the Work with Ship Via Screen. This is the shipper for which you wish to add a charge to an order based on the weight of the merchandise. *Ship via code: Numeric, 2 positions; display-only.* *Ship via description: Alphanumeric, 30 positions; display-only.*
Order weight	The total weight to the items on the order. The system looks at the *Sell weight* field for an item to determine the item's weight. The system adds the weight charge to orders whose order weight is at least this weight, but less than the next larger order weight you have defined. *Numeric, 13 positions with a 2-place decimal; optional.*
Weight charge	The charge you apply to the order based on the weight of the items on the order. *Numeric, 13 positions with a 2-place decimal; optional.*

Screen Option	Procedure
Create an order weight charge	Select Create to advance to the Create Weight Charges by Ship Via Screen (Order Weight Charges).
Change an order weight charge	Select Change for an order weight charge to advance to the Change Weight Charges by Ship Via screen. At this screen you can change the *Weight charge* field. See Create Weight Charges by Ship Via Screen (Order Weight Charges) for a description of the fields on this screen.
Delete an order weight charge	Select Delete for an order weight charge to delete it.
Display an order weight charge	Select Display for an order weight charge to advance to the Display Weight Charges by Ship Via screen. You cannot make any changes on this screen. See Create Weight Charges by Ship Via Screen (Order Weight Charges) for field descriptions.

Create Weight Charges by Ship Via Screen (Order Weight Charges)

Purpose: Use this screen to create a weight charge you can add to an order based on the weight of the items on the order.

How to display this screen: On the Work with Weight Charges by Ship Via Screen, select Create.

Field	Description
Ship via	The code and description of the shipper for which you are creating an order weight charge. *Ship via code: Numeric, 2 positions; display-only.* *Ship via description: Alphanumeric, 30 positions; display-only.*
Order weight	The weight of all of the items on the order. The system chooses the order weight in the table that is at least the order weight, but less than the next larger order weight defined. *Numeric, 13 positions with a 2-place decimal.* *Create screen: required.* *Change screen: display-only.*
Weight charge	The charge you wish to add to the order based on the order weight. The 13 adds the order weight charge to the Freight field on the order. *Numeric, 8 positions with a 2-place decimal; required.*

Working with SCF Codes (WSCF)

Sectional Center Facility (SCF) codes represent the first 3 digits of the destination postal (zip) code. The Work with SCF function allows you to enter information specific to the SCF, including the valid states, the preferred method of shipping to this area, and a warehouse list which defines a hierarchy for reserving merchandise in warehouses.

Shipping address validation: The system uses the SCF table to validate that the customer's postal code and state are consistent. For example, if you set up an SCF of 011 for the state of MA, but no other states, the system prevents you from entering a customer address with a postal code that starts with 011, but a state of CT. This validation occurs in order entry, customer maintenance, and other functions where you enter name and address information. However, there are a few functions where this validation does not occur, including Working with Customer Fraud Tables (WCFD), Working with Vendors (WVEN) (except for working with vendor FOB), and Working with Companies (WCMP).

> **Note:**
>
> SCF validation occurs only if the customer's address include a postal code and state. These fields are optional if the *Require postal code?* or *Require state?* flags for the country are unselected.

Tax information: An important function of the SCF Tax Rate table, accessible through the Work with SCF function, is to define the tax rate that applies to orders shipped to this SCF. For Canadian SCFs, you can define GST and/or PST rates, and a calculation method.

You can also define tax information at the postal code level. See Setting Up the Zip/City/State (Postal Code) Table (WZIP) for more information and flow charts depicting the tax hierarchy.

The steps in which the system determines a customer's tax rate vary, depending on the setting of the Tax Included in Price (E70) system control value:

- unselected = The system first checks the VAT % defined for the country where the order is being shipped. If there is no rate defined for the country, the system checks the rate for the postal code. If there is no postal code tax information, the system checks the SCF Tax Rate table.
- selected = If the state is exempt from VAT, the system checks the postal code rate first. If there is no tax information for the postal code, the system checks the SCF Tax Rate table. If the order is subject to VAT, tax-inclusive prices are used on the order and a hidden tax is included in the order line detail.

You can also define tax exemptions or exceptions for certain items in particular states in the United States, or in Canadian provinces. See Working with Item Tax Exemptions (WITX) and Working with GST Tax Exemption Status (MGTX). Additionally, a customer can be tax- or VAT-exempt; see Working with Customer Tax Status. Also, you can exempt special handling from tax by setting the S/H exclude tax? field for the additional charge code; see Establishing Additional Charge Codes (WADC).

Geographic zone information: The SCF table can be used to identify the geographic zone of a shipping address. Geographic zones are used to divide the country into shipping regions for the purpose of restricting the shipment of weather-sensitive inventory such as plant stock. See Shipping Zone Reservation Overview.

The SCF information you enter through this menu option is unique to a particular company, unlike the information in the Zip/City/State table. Information entered through Setting Up the Zip/City/State (Postal Code) Table (WZIP) applies to all companies on your system; information entered through Work with SCF Codes applies only to the company for which it is set up.

If the postal code is optional for a country: If the *Require postal code?* flag for a country is unselected, it is not necessary to specify a postal or zip code for a customer address; however, if the country has the *Perform ship via edit?* flag selected, the system still needs to validate the SCF/ship via combination for an order. See If the Postal Code is Optional for a Country for a discussion, and see Setting Up the Country Table (WCTY) for more information about the address validation settings available for countries.

In this topic:

- Work with SCF Codes Screen
  - Create SCF Screen
- Work with SCF Tax Rates Screen (Change Mode)

Work with SCF Codes Screen

How to display this screen: Enter WSCF in the *Fast path* field at the top of any menu or select Work with SCF Codes from a menu.

Field	Description
Country	A code for the country associated with this SCF. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY). *Alphanumeric, 3 positions; optional.*
SCF (Sectional Center Facility)	A code that represents the first 3 digits of a postal code. *Alphanumeric, 3 positions; optional.*

Field	Description
State # 1	The primary state or province associated with this SCF. *Alphanumeric, 2 positions; optional.*
State # 2	The second state or province associated with this SCF. *Alphanumeric, 2 positions; optional.*
State # 3	The third state or province associated with this SCF. *Alphanumeric, 2 positions; optional.*
State # 4	The fourth state or province associated with this SCF. *Alphanumeric, 2 positions; optional.*
State # 5	The fifth state or province associated with this SCF. *Alphanumeric, 2 positions; optional.*
Warehouse list	The warehouse list to use for orders to this SCF. If the Ship Complete from 1 Warehouse (B16) system control value is selected, the system searches warehouses in the sequence specified in the list for inventory to fulfill an order. You can set up warehouse lists to make fulfillment more efficient and save on shipping costs. See Working with Warehouse Lists (WWHL) for an explanation of warehouse list logic. *Numeric, 2 positions; optional.*
Ship via	The preferred ship via for this SCF. The system changes the ship via on the order header to this ship via unless another override takes precedence; however, the *Allow auto assignment* flag for the ship via controls whether this automatic assignment takes place. See Ship Via Override Hierarchy for a list of ways the system can override the shipper specified on the order with another shipper and the hierarchy in which the ship via overrides take precedence. *Numeric, 2 positions; optional.*
Geographic zone	A code representing a region of the country. Geographic zones are used to divide the country into shipping regions for the purpose of restricting the shipment of weather-sensitive inventory such as plant stock. Geographic zones are used in conjunction with zone reservation codes, assigned to items or SKUs, to control item reservation in order entry. Zone reservation coded items/SKUs are not reserved during order entry; instead they are reserved during pick generation, at an optimal time for shipping. Zone reservation logic requires: • The item/SKU must be assigned a zone reservation code • The offer associated with the order must be assigned a season code • The shipping address for the order must be assigned to a geographic zone, using either the postal zip code of the ship to address, or the SCF code of the ship to address. • For each zone reservation code, you must define zone date windows for all geographic zones in the country See Shipping Zone Reservation Overview. *Alphanumeric, 3 positions; optional.*

Field	Description
Store tax code	The cross-reference to the corresponding tax code in a point-of-sale system. This field is available only if the Default Location for ORCE Integration (K69) system control value is populated. *Alphanumeric, 8 positions; optional.*

Screen Option	Procedure
Create a new SCF code	Select Create to advance to the Create SCF Screen.
Change an SCF code	Select Change for an SCF code to advance to the Change SCF screen. At the Change screen you can change any information except the SCF code. See Create SCF Screen for field descriptions.
Delete an SCF code	Select Delete for an SCF code to delete it.
Display an SCF code	Select Display for an SCF code to advance to the Display SCF screen. You cannot change any information on this screen. See Create SCF Screen for field descriptions.
Work with tax rates	Select Work with tax rates for an SCF to advance to the Work with SCF Tax Rates Screen (Change Mode).

Create SCF Screen

Purpose: Use this screen to create an SCF code.

How to display this screen: At the Work with SCF Codes Screen, select Create.

Field	Description
Country code	A code for the country associated with this SCF code. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY). *Alphanumeric, 3 positions; required.*
SCF	The first 3 digits of the destination postal code. *Alphanumeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Valid state 1	The primary state or province associated with this SCF. If you are defining an SCF for a country that does not require state or province codes, you can enter ** in this field. *Alphanumeric, 2 positions; required.*
Valid state 2	The second state or province associated with this SCF. *Alphanumeric, 2 positions; optional.*

Field	Description
Valid state 3	The third state or province associated with this SCF. **Note:** The system does not validate that your entries for the first and second states are different from the third, fourth and fifth states. *Alphanumeric, 2 positions; optional.*
Valid state 4	The fourth state or province associated with this SCF. *Alphanumeric, 2 positions; optional.*
Valid state 5	The fifth state or province associated with this SCF. *Alphanumeric, 2 positions; optional.*
Preferred ship via	A code that represents a carrier for an order, such as UPS or USPS. This Ship Via defaults in Order Entry if the ship-to address on the order is for this SCF and a default ship via has not been defined on the Default Values for Orders screen. This default may be overridden by another ship via override; however, the preferred ship via for the SCF does not override the current ship via on the order if the current ship via's Allow auto assignment field is unselected. See Ship Via Override Hierarchy for a list of ways the system can override the shipper specified on the order with another shipper and the hierarchy in which the ship via overrides take precedence. Ship via codes are defined in and validated against the Ship Via table; see Working with Ship Via Codes (WVIA). *Numeric, 2 positions; optional.*
Warehouse list	A code that represents a warehouse list used to specify the sequence in which reservation warehouses should be searched for inventory, based on the SCF where the order will be shipped. The system refers to the warehouse list during Batch and Immediate Reservation and when evaluating backorders if the Ship Complete from 1 Warehouse (B16) system control value is selected. If this system control value is unselected, the system first reserves stock from the primary warehouse in the item table, and, if there is not enough available stock in the item's primary warehouse, reserves stock from the warehouses on the list. See Working with Warehouse Lists (WWHL) for an explanation of the logic the system uses in assigning warehouses from warehouse lists, and for information on defining warehouse lists. *Alphanumeric, 2 positions; optional.*

Field	Description
Geographic zone	A code representing a region of the country. Geographic zones are used to divide the country into shipping regions for the purpose of restricting the shipment of weather-sensitive inventory such as plant stock. Geographic zones are used in conjunction with zone reservation codes, assigned to items or SKUs, to control item reservation in order entry. Zone reservation coded items/SKUs are not reserved during order entry; instead they are reserved during pick generation, at an optimal time for shipping. Zone reservation logic requires: • The item/SKU must be assigned a zone reservation code • The offer associated with the order must be assigned a season code • The shipping address for the order must be assigned to a geographic zone, using either the postal ZIP code of the ship to address, or the SCF code of the ship to address. • For each zone reservation code, you must define zone date windows for all geographic zones in the country See Shipping Zone Reservation Overview. *Alphanumeric, 3 positions; optional.*
Store tax code	The cross-reference to the corresponding tax code in a point-of-sale system. This field is available only if the Default Location for ORCE Integration (K69) system control value is populated. *Alphanumeric, 8 positions; optional.*

Work with SCF Tax Rates Screen (Change Mode)

Purpose: Use this screen to review or work with tax rate information for an SCF. This screen includes historical information regarding when tax rules became effective for the SCF; however, only the most current SCF tax rate record, which displays at the top of the list, is currently in effect.

> **Note:**
>
> The system does not consider the settings at this screen if you use an external tax system unless the Use Standard Tax Calc if Tax Interface Communication Fails (J13) system control value is selected and the integration with the tax system fails.

How to display this screen: Select Work with tax rates for an SCF at the Work with SCF Codes Screen

Field	Description
Effect date (Effective date)	The date that this tax rate became effective. *Numeric, 6 positions (in user date format); display-only.*

Field	Description
Tax rate %	The default tax rate for this SCF. You can also define a tax rate for a postal code or for a country; for a description of the way that the system determines the tax rate that applies to an order see Working with SCF Codes (WSCF). If you are using an external tax system to calculate tax, you would enter a tax rate of 100%. *Numeric, 5 positions with a 2-place decimal; optional.*
GST rate %	The default Canadian Goods and Services Tax (GST) rate for this SCF. You can also define a GST rate at the postal code level; the way that the system determines the tax rate that applies to an order is described earlier in this topic. If you are using an external tax system to calculate tax, you would enter a tax rate of 100%. If this field is blank but the SCF tax rates would normally apply to the order, the system uses the default GST Rate (A90) in the System Control table. *Numeric, 5 positions with a 2-place decimal; optional.*
PST rate %	The default Canadian Provincial Services Tax (PST) rate for this SCF. You can also define a PST rate at the postal code level; the way that the system determines the tax rate that applies to an order is described earlier in this topic. If you are using an external tax system to calculate tax, you would enter a tax rate of 100%. *Numeric, 5 positions with a 2-place decimal; optional.*
GST/PST method	Determines the sequence in which the Canadian Goods and Services Tax (GST) and the Provincial Services Tax (PST) are calculated. If you do not define a calculation method, the system does not charge either GST or PST on orders to this SCF even if you have defined GST or PST rates. Valid GST/PST tax calculation methods: • blank = none • **GST** • **PST** • **Separate** *Optional.*

Field	Description

Tax method	System calculation	Result
GST	GST is calculated first, then PST, as follows: GST taxable amount includes merchandise and freight, if applicable. PST taxable amount includes merchandise and freight, if applicable PLUS the GST amount from the first calculation.	GST is subject to PST.
PST	PST is calculated first, then GST, as follows: PST taxable amount includes merchandise and freight, if applicable. GST taxable amount includes merchandise and freight, if applicable PLUS the PST amount from the first calculation.	PST is subject to GST.
Blank	GST and PST will not be calculated for this postal code.	---

Tax freight

Indicates whether there is a tax on freight in this SCF. This is controlled by state or province regulations in each jurisdiction.

Valid values:

Yes = Any dollar amount in the *Freight* and *Freight +* fields on the order is taxed.

No = Any dollar amount in the *Freight* and *Freight +* fields on the order is not taxed.

Note:

Acts as an override to the Tax on Freight (B14) field in the System Control table if the system control value is selected. If the order uses the tax rate for the postal code, but the *Tax freight* field is unselected, the system uses the value from the System Control table. If the system control value is unselected, you cannot override this value by selecting it here.

Field	Description
Tax handling	The value indicates whether there is a tax on handling in this SCF. This is controlled by state or province regulations in each jurisdiction. Valid values: Yes = Any dollar amount in the *Handling* field on the order, with the exception of duty, is taxed. No = Any dollar amount in the *Handling* field on the order is not taxed. • Acts as an override to the Tax on Handling (B15) field in the System Control table if the system control value is selected. If the order uses the tax rate for the SCF, but the *Tax handling* field is blank, the system uses the value from the System Control table. If the system control value is unselected, you cannot override this value by selecting it here. • If the S/H exclude tax? field for the special handling code is selected, the handling charge is not evaluated for tax. • You can override this setting by a setting at the zip code level; see Setting Up the Zip/City/State (Postal Code) Table (WZIP).

Screen Option	Procedure
Change existing tax rate information	Use the Tab key to advance to the tax information you want to change and type over it. Select Update when you are done.
Add new tax rate detail	Select Add to advance to the Work with SCF Tax Rates screen in Add mode. Use this screen to add a new SCF tax record. See above for field descriptions.
Delete a tax rate record	Select Delete for the tax rate record you want to delete. The system deletes the record immediately without displaying a confirmation message.

Working with SCF/Ship Via Values (WSHV)

Purpose: A Sectional Center Facility (SCF) code represents the first 3 digits of the destination postal code. A Ship Via code is used to indicate the areas (postal codes) where shippers deliver merchandise.

Ship via edit? The system uses this information in order entry, order maintenance, and the order API to ensure that the shipper assigned to the order can deliver to the shipping address on the order. If the *Perform ship via edit?* flag is selected for a country, you must create a record for every valid Ship Via/SCF combination. In this situation, if a record does not exist for the ship via on an order and the SCF of the shipping address, Order Entry displays a message such as: `Ship via (11) is not valid with ship to zip code (088).`

Use the Work with SCF Ship Via Values screen to work with SCF/ship via values. You can also create SCF/ship via values using Creating SCF Ship Vias by SCF Range (MSSV) or Editing SCF Ship Via (ESSV).

> **Note:**
>
> If the *Perform ship via edit?* flag is unselected for a country, it is not necessary to create SCF Ship Via values for that country. See Setting Up the Country Table (WCTY) for more information.

In this topic:

- If the Postal Code is Optional for a Country
- Work with SCF Ship Via Values Screen
- Create SCF Ship Via Screen

If the Postal Code is Optional for a Country

If the *Require postal code?* flag for a country is unselected, you do not need to specify a postal or zip code for a customer address; however, if the country has the *Perform ship via edit?* flag selected, the system still validates the SCF/ship via combination for an order even when the address does not include a postal code. To do so, the system uses a default SCF code of # as a "wild card" SCF for SCF/ship via validation.

Example: You create an order for a customer from Ireland, where the postal code is optional. The customer's address does not include a postal code. If you select the *Perform ship via edit?* flag for Ireland and enter a ship via code of 22, the system validates that there is an SCF/ship via record for an SCF of # and a ship via code of 22.

Setup: If you will create orders for customers in a country that does not require a postal code, use Working with SCF Codes (WSCF) to make sure that there is an SCF record for the country with an SCF code of #. You can then create SCF/ship via records for the # (wild card) SCF and each valid ship via for the country. It is not necessary to create a postal code record for the # SCF, or assign it to customer addresses.

See Setting Up the Country Table (WCTY) for more information about the address validation settings available for countries.

Work with SCF Ship Via Values Screen

How to display this screen: Enter WSHV in the *Fast Path* field at the top of any menu, or select this option from a menu.

Field	Description
SCF code (Sectional Center Facility)	A code that represents the first 3 digits of a postal code. An SCF code of # serves as a "wild card" for countries where a postal code is optional. See If the Postal Code is Optional for a Country for more information. *Alphanumeric, 3 positions; optional.*
Ship via	A code that represents the shipper; see Working with Ship Via Codes (WVIA). *Numeric, 2 positions; optional.*
Drop point	A code that represents one of your shipping warehouses or a central location to ship merchandise for consolidation; see Working with Drop Points (WDPT). *Numeric, 3 positions; optional.*

Field	Description
Ship zone	The zone within the country where the package is being shipped in relation to the drop point. *Numeric, 2 positions; optional.*
Shipping lead days	The number of days it takes the shipper to deliver merchandise to this SCF. **Calculation for pick slip preparation:** The system uses this number in conjunction with your internal lead days to determine when to generate pick slips for an order. The calculation is: `Arrival Date from Order Line (or Order Ship To) - (Pick Processing Days (B37) + Ship Via Lead Days in WSHV) < or = Today's Date` The system does not exclude weekends/holidays in its calculation. See Selecting Order Lines for Pick Slip Preparation. **Calculation for Alternate Shipping Charges by Via window:** The system also uses this setting to calculate the Ship lead days and Expected delivery date to display at the Alternate Shipping Charges by Via Window in order entry, and this window uses a different calculation than the one described above. See the description of the Alternate Shipping Charges by Via Window for more information. *Numeric, 3 positions; optional.*

Screen Option	Procedure
Create a new SCF ship via value	Select Create to advance to the Create SCF Ship Via Screen.
Change an SCF ship via value	Select Change for an SCF/ship via value to advance to the Change SCF Ship Via screen. You can change only the *Shipping zone* and *Shipping lead days* fields on this screen. See Create SCF Ship Via Screen for field descriptions.
Delete an SCF ship via value	Select Delete for an SCF/ship via value to delete it.
Display an SCF ship via value	Select Display for an SCF/ship via value to advance to the Display SCF Ship Via screen. You cannot change any information on this screen. See Create SCF Ship Via Screen for field descriptions.

Create SCF Ship Via Screen

To create an SCF ship via value: At the Work with SCF Ship Via Values Screen, select Create.

Field	Description
SCF code	The first 3 positions of the destination postal code. An SCF code of # serves as a “wild card” for countries where a postal code is optional. See If the Postal Code is Optional for a Country for more information. Validated against the SCF table; see Working with SCF Codes (WSCF). *Alphanumeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Ship via code	The shipper to deliver merchandise to the customer, such as 01 (UPS). Validated against the Ship Via table; see Working with Ship Via Codes (WVIA). *Numeric, 2 position.* *Create screen: required.* *Change screen: display-only.*
Drop point	A code that represents one of your shipping warehouses or a central location to which merchandise will be shipped for consolidation. Drop points are used in zone skipping, which enables you to ship a carton by one carrier to a drop point, where another carrier picks up the carton and delivers it to its final destination. **Note:** If you are using the freight by order weight freight method, the drop point you define here must match the drop point you define in the Warehouse table. See Working with Weight Tables for Order Weight (WFTB). *Numeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Shipping zone	The zone within the country where the carton is being shipped in relation to the drop point. Shipping zones are sections of the country that are defined by UPS. See About Zones. *Numeric, 2 positions; required.*

Field	Description
Shipping lead days	The number of days it takes the shipper to deliver merchandise to this SCF. **Calculation for pick slip preparation:** The system uses this number in conjunction with your internal lead days to determine when to generate pick slips for an order. The calculation is: `Arrival Date from Order Line (or Order Ship To) - (Pick Processing Days (B37) + Ship Via Lead Days in WSHV) < or = Today's Date` The system does not exclude weekends/holidays in its calculation. See Selecting Order Lines for Pick Slip Preparation. **Calculation for Alternate Shipping Charges by Via window:** The system also uses this setting to calculate the Ship lead days and Expected delivery date to display at the Alternate Shipping Charges by Via Window in order entry, and this window uses a different calculation than the one described above. See the description of the Alternate Shipping Charges by Via Window for more information. *Numeric, 3 positions; optional.*

Creating additional SCF/ship vias: After creating an SCF/ship via combination, select Duplicate Create to create the next. To make creating the next SCF/ship via easier, the screen retains all of the values from the previous SCF/ship via except the *Ship via code* and the *Drop point*.

Working with Shipping Rates (WSHR)

Purpose: You can use the Work with Shipping Rates menu option to set shipping rates for:

- charges you pay to a shipper for shipping a package to a customer; used when calculating best way shipping during pick slip generation
- charges to add to orders that use the Freight by Weight method (W), as defined in the source code on the order header; used during order entry and maintenance (

> **Note:**
>
> You do not use this menu option to work with rates for the Freight by Order Weight method (OW); see Working with Weight Tables for Order Weight (WFTB).

)

Each is described in this topic.

Shipping rate definition includes the ship via, delivery code (residential, business, or neither), shipping zone, and weight.

Round up or down? The system rounds the total weight of the order or pick slip up or down to the next whole pound. For best way shipping at pick slip generation, the system always rounds the total weight up. However, for Freight by Weight, the system rounds up if the weight ends in .50 or greater; the system rounds down if the weight ends in .49 or less.

> **Note:**
>
> The shipping rate must match the ship via, delivery code, zone and rounded-up weight exactly to apply to the order or pick slip. For example, if the total order weight is 11.5 pounds, and there is not a matching shipping rate for 12 pounds, the shipping rate will not apply for either best way shipping or Freight by Weight. When you are using Freight by Weight, no shipping rate will apply for shipments weighing .49 of a pound or less.

In this topic:

- Freight by Weight
- Work with Shipping Rates Screen
  - Create Shipping Rate Screen

Freight by Weight

Freight by weight is a freight method using the charges a customer pays you for shipping an order based on the total selling weight of the items. Evaluation for this freight method takes place during order entry or order maintenance.

To use freight by weight:

- set the freight method for a source code to Freight by Weight (W); see Working with Source Codes (WSRC)
- create shipping rates for each ship via; see Work with Shipping Rates Screen
- set the Sell weight for the item in Work with Item/SKUs; see Performing Initial Item Entry (MITM).

The total weight is rounded up for the purposes of freight by weight if the partial pound is .50 or more; otherwise, the total weight is rounded down. For example, if the total weight is 3.51 pounds, the 4 pound rate is used; if the total weight is 3.49 pounds, the 3 pound rate is used. Because partial pounds of .49 or lower are rounded down, no freight will be added to the order if the total weight is under a half pound.

Example: You are shipping an order to a business address in zip code 01760. The ship via on the order is 01, and the total weight of the shipment is 4.5 pounds. The shipping rate for ship via 01, zone 01 (for 01760), and 5 pounds is $2.00.

If the total shipping weight in the above example were 4.4 pounds, the system would round this total down and use the 4 pound shipping rate.

Work with Shipping Rates Screen

Purpose: Use this screen to work with shipping rates for freight by weight or best way shipping.

How to display this screen: Enter WSHR in the *fast path* field at the top of any menu, or select Work with Shipping Rates from a menu.

Field	Description
Ship via	A code that represents the shipper. *Numeric, 2 positions; optional.*
Delivery Code	A code that indicates the type of address for delivery. Valid values are: • **Business** • **Residential** • No Distinction **Note:** Not a valid delivery code for UPS Certain shippers use the delivery code to determine shipping rates, charging a different rate for a delivery to a business address. *Optional.*
Weight	The weight of the shipment. *Numeric, 13 positions with a 3-place decimal; optional.*
Zone	The shipping zone within the country where the shipping rate applies. See About Zones. *Numeric, 2 positions; optional.*
Rate	The charge to ship the package. *Numeric, 13 positions with a 2-place decimal; optional.*

Screen Option	Procedure
Create a new shipping rate	Select Create to advance to the Create Shipping Rate Screen.
Change a shipping rate	Select Change for a shipping rate to advance to the Change Shipping Rate screen. At this screen, you can change only the rate. See Create Shipping Rate Screen for field descriptions.
Delete a shipping rate	Select Delete for a shipping rate and select OK to delete it.
Display a shipping rate	Select Display for a shipping rate to advance to the Display Shipping Rate screen. You cannot change any information on this screen. See Create Shipping Rate Screen for field descriptions.

Create Shipping Rate Screen

How to display this screen: At the Work with Shipping Rates Screen, select Create.

Field	Description
Ship via	The shipper that will deliver merchandise to the customer. Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA). *Numeric, 2 positions.* *Create screen: required.* *Change screen: display-only.*
Delivery code	This code identifies a business (commercial) or residential address. Used when shipping an order by a carrier that uses business or consumer rate tables (e.g., UPS). A code that indicates the type of address for delivery. Valid values are: • **Business** • **Residential** • No Distinction **Note:** Not a valid delivery code for UPS Certain shippers use the delivery code to determine shipping rates, charging a different rate for a delivery to a business address. *Create screen: required.* *Change screen: display-only.*
Weight	The total weight of the shipment. The system uses the *Sell weight* (for Freight by Weight) defined in the Item table to calculate the total shipping weight for all units of each item included in the shipment. The system may round the total weight up or down to find a match in the shipping rate table; see the description Freight by Weight. You must define a shipping rate for each whole pound to have the system use the shipping rate. For example, if the total weight of the items is 3.75 pounds, the system uses the shipping rate defined for 4 pounds. If there is no matching shipping rate record for 4 pounds, then best way shipping or freight by weight will not apply. When you are using Freight by Weight, no shipping rate will apply for shipments weighing .49 of a pound or less. *Numeric, 13 positions with a 3-place decimal.* *Create screen: required.* *Change screen: display-only.*
Zone	The geographic zone where the merchandise is being shipped in relation to the drop point. See About Zones. *Numeric, 2 positions.* *Create screen: required.* *Change screen: display-only.*
Rate	The shipping charge for this weight. In the case of freight by weight, this is the freight charge to add to the order. *Numeric, 13 positions with a 2-place decimal; required.*

Working with Drop Points (WDPT)

Drop points represent locations to which merchandise will be shipped from your warehouse. Typically, a drop point represents the address of a UPS facility. This drop point prints as the return address on the pick slip and is the destination to which undeliverable packages are returned. Drop points are also used to indicate the warehouse from which the merchandise was shipped. This is necessary in a multi-warehouse environment to determine the shipping zone. Each warehouse is assigned a drop point in the Warehouse table.

In this topic:

Zone Skipping

Drop points are used in zone skipping. Zone skipping is used to deliver packages to a pre-assigned drop point by one carrier and picked up by another carrier who will deliver it to its final destination. Shipping charges are determined by the number of zones crossed; therefore, using zone skipping reduces delivery charges because less zones within the country are crossed.

Work with Drop Point Screen

Purpose: Use this screen to create, change, delete, or display drop points.

How to display this screen: Enter WDPT in the *Fast Path* field at the top of any menu.

Field	Description
Drop point	A code that represents a drop point. *Numeric, 3 positions; optional.*
Description	The description of the drop point. *Alphanumeric, 30 positions; optional.*

Screen Option	Procedure
Create a new drop point	Select Create to advance to the Create Drop Point Screen.
Change a drop point	Select Change for a drop point to advance to the Change Drop Point screen. At the Change screen you can change any information except the Drop Point code. See Create Drop Point Screen for field descriptions.
Delete a drop point	Select Delete for a drop point to delete it.
Display a drop point	Select Display for a drop point to advance to the Display Drop Point screen. You cannot change any information on this screen. See Create Drop Point Screen for field descriptions.

Create Drop Point Screen

Purpose: Use this screen to create a drop point.

How to display this screen: At the Work with Drop Point Screen, select Create.

Field	Description
Drop point	A code that represents a location to which merchandise will be shipped from your warehouse, and a unique code assigned to each warehouse to indicate that merchandise is shipped directly from the warehouse to its final destination. • Each warehouse must be assigned to a drop point. • Drop points can be UPS facilities. • Drop points print as the return address on the pick slip and are the destination to which undeliverable packages are returned. • Drop points are used in zone skipping. *Numeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Description	The description of the drop point. *Alphanumeric, 30 positions; required.*
Address	The delivery address for this drop point, which may represent the shipping address to a UPS facility. This text prints as part of the return address on the pick slip. *Alphanumeric, 30 positions; required.*
City	The city name for this drop point, which may represent the city in which a UPS facility is located. This text prints as part of the return address on the pick slip. *Alphanumeric, 25 positions; required.*
State/zip/country	The state, zip code, and country in which this drop point is located. The state/zip/country may represent a UPS location. This text prints as part of the return address on the pick slip. *Alphanumeric, 2 positions (state), 9 positions (zip), and 3 positions (country); required.*

Editing Warehouse Drop Points (EWDP)

Purpose: Editing warehouse drop points is used to update warehouse, ship via, SCF, and drop point information all at once, rather than entering this information for each warehouse, drop point, etc.

This function is used only in zone skipping. If you do not use zone skipping in your organization, you should not be concerned with editing warehouse drop points. See Work with Ship Via Indicia Screen.

Drop points represent locations to which merchandise will be shipped from your warehouse. Typically, a drop point represents the address of a UPS facility. Drop points are used in zone skipping. You use zone skipping when you instruct one carrier to deliver packages to a pre-assigned drop point and another carrier to pick them up and deliver them to their final destinations. Shipping charges are determined by the number of zones crossed; therefore, using zone skipping reduces delivery charges because less zones within the country are crossed. See Work with Ship Via Indicia Screen.

In this topic:

- Edit Warehouse Drop Point Screen (Enter Mode)
- Edit Warehouse Drop Point Screen (Change Mode)
- Edit Warehouse Drop Point Screen (Add Mode)
  - Enter SCF Range Pop-up Window
  - Copy Warehouse Drop Point Pop-up Window

Edit Warehouse Drop Point Screen (Enter Mode)

Purpose: This is the first screen used to change and copy warehouse drop points.

How to display this screen: Enter EWDP in the *Fast Path* field at the top of any menu.

Field	Description
Warehouse	A code that represents the warehouse. Validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions; required.*
Ship via	A code that represents the carrier of this shipment. Validated against the Ship Via table; see Working with Ship Via Codes (WVIA). *Numeric, 3 positions; required.*

Screen Option	Procedure
Copy a warehouse drop point	Enter the Warehouse and Ship via codes and select Copy to advance to the Copy Warehouse Drop Point Pop-up Window.

Edit Warehouse Drop Point Screen (Change Mode)

Purpose: Use this screen to change or create a drop point, and to enter the SCF range for a drop point.

How to display this screen: Complete the Edit Warehouse Drop Point Screen (Enter Mode).

Field	Description
Warehouse	The warehouse code and description which are carried over from the previous screen. *Alphanumeric, 3 positions; display-only.*
Ship via code	The ship via code and description which are carried over from the previous screen. *Alphanumeric, 2 positions; display-only.*
SCF	A code that represents the first 3 positions of a postal code. Validated against the SCF table; see Working with SCF Codes (WSCF). *Alphanumeric, 3 positions; required.*

Field	Description
States	The primary states or provinces associated with this SCF. The system displays this information based on the SCF selected. State codes are defined in and validated against the state table, which is accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). *Alphanumeric, 2 positions; display-only.*
Transfer days	The number of days it takes to transfer the order from the warehouse to the drop point. This may be a centralized warehouse (in which you must ship from one warehouse to another) or a drop point (which is a place where another shipper picks up the package and delivers it to its final destination to save shipping charges). Used by the system to calculate when to print pick slips. *Numeric, 3 positions; required.*
Drop point	A code that represents the drop point. Validated against the Drop Point table; see Working with Drop Points (WDPT). *Numeric, 3 positions; required.*

Screen Option	Procedure
Create a warehouse drop point	Select Create to advance to the Edit Warehouse Drop Point Screen (Add Mode).
Delete a warehouse drop point	Select Delete for a drop point to delete it.
Define an SCF range	Select Create Range to advance to the Enter SCF Range Pop-up Window.

Edit Warehouse Drop Point Screen (Add Mode)

Purpose: Use this screen to create a warehouse drop point.

How to display this screen: Select Create at the Edit Warehouse Drop Point Screen (Change Mode).

Field	Description
Warehouse	The warehouse code and description which are carried over from the previous screen. *Alphanumeric, 3 positions; display-only.*
Ship via code	The ship via code and description which are carried over from the previous screen. *Alphanumeric, 2 positions; display-only.*
SCF	A code that represents the first 3 positions of the destination postal code. Validated against the SCF table; see Working with SCF Codes (WSCF). *Alphanumeric, 3 positions; display-only.*
States	Not implemented on this screen.

Field	Description
Transfer days	The number of days it takes to transfer the order from the warehouse to the drop point. This may be • a centralized warehouse (in which you must ship from one warehouse to another), or • a drop point (which is a place where another shipper picks up the package and delivers it to its final destination to save shipping charges). Used to determine when to print pick slips. *Numeric, 3 positions; required.*
Drop point	A code that represents the drop point. Validated against the Drop Point table; see Working with Drop Points (WDPT). *Numeric, 3 positions; required.*

Screen Option	Procedure
Enter an SCF range for a drop point	Select Create Range to advance to the Enter SCF Range Pop-up Window.
Change an SCF code	Select Change to return to the Edit Warehouse Drop Point Screen (Change Mode).

Enter SCF Range Pop-up Window

Purpose: Use this window to set up drop point information for a range of SCF codes.

How to display this window: Select Create Range at the Edit Warehouse Drop Point Screen (Add Mode) or at the Edit Warehouse Drop Point Screen (Change Mode).

Field	Description
Country	The country for which you are entering an SCF range.
SCF Range	The range of SCF numbers included in this drop point.
Transfer Days	The number of days it takes to transfer the order from the warehouse to the drop point. See Transfer days. *Numeric, 3 positions; required.*
Drop Point	A code that represents the drop point. Validated against the Drop Point table. *Numeric, 3 positions; required.*

Copy Warehouse Drop Point Pop-up Window

To copy a warehouse drop point: Enter the Warehouse and Ship Via codes, then select Create Range to display the Copy Warehouse Drop Point pop-up window.

Field	Description
Copy to warehouse	The new warehouse. The system will use the warehouse code entered at the Edit Warehouse Drop Point Screen (Add Mode) or (Change Mode) and copy it to the new warehouse. *Alphanumeric, 3 positions; required.*

Field	Description
Copy to ship via	The new ship via. The system will use the ship via code entered at the Edit Warehouse Drop Point Screen (Add Mode) or (Change Mode) and copy it to the new ship via. *Alphanumeric, 2 positions; required.*

Editing SCF Ship Via (ESSV)

Purpose: Editing SCF ship via is used to update SCF and drop point information all at once, rather than entering this information for each SCF or drop point.

Drop points represent locations to which merchandise will be shipped from your warehouse. Typically, a drop point represents the address of a UPS facility. Drop points are used in zone skipping. You use zone skipping when you instruct one carrier to deliver packages to a pre-assigned drop point and another carrier to pick them up and deliver them to their final destinations. Shipping charges are determined by the number of zones crossed; therefore, using zone skipping reduces delivery charges because less zones within the country are crossed. See Work with Ship Via Indicia Screen for more information on zone skipping.

In this topic:

- Edit SCF Ship Via Screen (Enter Mode)
- Edit SCF Ship Via Screen (Change Mode)
- Edit SCF Ship Via Screen (Add Mode)
- Copy SCF Ship Via Pop-up Window

Edit SCF Ship Via Screen (Enter Mode)

Purpose: Use this screen to change and copy SCF ship via information.

How to display this screen: Enter ESSV in the *Fast Path* field at the top of any menu.

Field	Description
Drop point	A code that represents the drop point; see Working with Drop Points (WDPT). *Numeric, 3 positions; required.*
Ship via	A code that represents a carrier for this shipment. Validated against the Ship Via table; see Working with Ship Via Codes (WVIA). *Numeric, 3 positions; required.*

Screen Option	Procedure
Copy a ship via	Enter the Drop Point and Ship via codes and select Copy to advance to the Copy SCF Ship Via Pop-up Window.

Edit SCF Ship Via Screen (Change Mode)

Purpose: Use this screen to edit SCF ship via information.

How to display this screen: Enter a drop point and ship via code at the Edit SCF Ship Via Screen (Enter Mode), or select Create at the Edit SCF Ship Via Screen (Add Mode).

Field	Description
Drop point	The drop point code and description which are carried over from the previous screen. *Alphanumeric, 3 positions; display-only.*
Ship via code	The ship via code and description which are carried over from the previous screen. *Alphanumeric, 2 positions; display-only.*
Country	The country where the SCF is located. Validated against the Country table; see Setting Up the Country Table (WCTY). *Alphanumeric, 3 positions; optional.*
SCF	A code that represents the first 3 positions of a postal code. Validated against the SCF table; see Working with SCF Codes (WSCF). *Alphanumeric, 3 positions; required.*
States	The primary states or provinces associated with this SCF. The system displays this information based on the SCF selected. There can be up to five states associated with an SCF. State codes are defined in and validated against the state table, which is accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). *Alphanumeric, 2 positions; display-only.*
Zone	The zone within the country to which the carton is being shipped in relation to the drop point. Zones are geographical sections of the country that are defined by UPS. See About Zones. *Numeric, 2 positions; required.*
Lead days	The number of days it takes the shipper to deliver merchandise to this SCF. **Calculation for pick slip generation:** The system uses this number in conjunction with your internal lead days to determine when to generate pick slips for an order. The calculation is: `Arrival date - Shipping lead days < or = Today's date.` The system does not exclude weekends/holidays in its calculation. **Calculation for Alternate Shipping Charges by Via window:** The system also uses this setting to calculate the Ship lead days and Expected delivery date to display at the Alternate Shipping Charges by Via Window in order entry, and this window uses a different calculation than the one described above. See the description of the Alternate Shipping Charges by Via Window for more information. *Numeric, 3 positions; required.*

Screen Option	Procedure
Create an SCF ship via	Select Create to advance to the Edit SCF Ship Via Screen (Add Mode).
Delete an SCF ship via	Select Delete for an SCF ship via to delete it.

Edit SCF Ship Via Screen (Add Mode)

Purpose: Use this screen to enter new SCF/ship via information. When you select OK, your entries are created and disappear from the screen.

To create an SCF ship via: At the Edit SCF Ship Via Screen (Change Mode), select Create.

Field	Description
Drop point	The drop point code and description, which are carried over from the previous screen. *Alphanumeric, 3 positions; display-only.*
Ship via code	The ship via code and description, which are carried over from the previous screen. *Alphanumeric, 2 positions; display-only.*
Country	The country where the SCF is located. Validated against the Country table; see Setting Up the Country Table (WCTY). *Alphanumeric, 3 positions; required.*
SCF	A code that represents the first 3 positions of a postal code. Validated against the SCF table; see Working with SCF Codes (WSCF). *Alphanumeric, 3 positions; required.*
States	These fields are not implemented on the screen in ADD mode.
Zone	The zone within the country to which the carton is being shipped in relation to the drop point. Zones are geographical sections of the country that are defined by UPS. See About Zones. *Numeric, 2 positions; required.*
Lead days	The number of days it takes the shipper to deliver merchandise to this SCF. **Calculation for pick slip generation:** The system uses this number in conjunction with your internal lead days to determine when to generate pick slips for an order. The calculation is: `Arrival date - Shipping lead days < or = Today's date.` The system does not exclude weekends/holidays in its calculation. **Calculation for Alternate Shipping Charges by Via window:** The system also uses this setting to calculate the Ship lead days and Expected delivery date to display at the Alternate Shipping Charges by Via Window in order entry, and this window uses a different calculation than the one described above. See the description of the Alternate Shipping Charges by Via Window for more information. *Numeric, 3 positions; required.*

Screen Option	Procedure
Change an SCF ship via	Select Change to display the Edit SCF Ship Via Screen (Change Mode). At this screen you can change any information except the Drop Point and Ship Via codes.

Copy SCF Ship Via Pop-up Window

To copy an SCF ship via: At the Edit SCF Ship Via Screen (Enter Mode), enter the Drop Point and Ship Via codes, then select Copy.

Field	Description
Copy to drop point	The new drop point. The system will use the drop point code entered at the Edit SCF Ship Via Screen (Add Mode) or (Change Mode) and copy it to the new drop point. *Alphanumeric, 3 positions; required.*
Copy to ship via	The new ship via. The system will use the ship via code entered at the Edit SCF Ship Via Screen (Add Mode) or (Change Mode) and copy it to the new ship via. *Alphanumeric, 2 positions; required.*

Working with Dunnage Weight (WDUN)

Dunnage weight is the weight of packing materials. Use the Work with Dunnage Weight menu option to define the weight of dunnage based on the cube of the items on a pick slip.

As pick slips are created during pick slip generation, the cube of the pick is used to determine the extra weight to be added to the pick slip for the packing materials. The extra weight is added to the weight of the pick and the total weight is rounded up to the next pound. This total weight is included in the calculation for best way shipping; see Working with Shipping Rates (WSHR).

In this topic:

- Work with Dunnage Weight Screen
- Create Dunnage Weight Pop-up Window

Work with Dunnage Weight Screen

How to display this screen: Enter WDUN in the *Fast Path* field at the top of any menu or select Work with Dunnage Weight from a menu.

Field	Description
Ship via	A code that represents the shipper; see Working with Ship Via Codes (WVIA). *Numeric, 2 positions; optional.*
Carton cube	A code that represents the total cubic volume of the carton. *Numeric, 10 positions; optional.*
Dunnage weight	The amount of weight to add to the total carton weight when calculating the total shipping weight. *Numeric, 13 positions with a 3-place decimal; display-only.*

Screen Option	Procedure
Create a dunnage weight	Select Create to advance to the display the Create Dunnage Weight Pop-up Window.
Change a dunnage weight	Select Change for a dunnage weight to display the Change Dunnage Weight window. At this window, you can change only the weight itself. See Create Dunnage Weight Pop-up Window for field descriptions.

Screen Option	Procedure
Delete a dunnage weight	Select Delete for a dunnage weight to delete it. **Note:** The dunnage weight is deleted immediately; the system does not display a confirmation pop-up window.

Create Dunnage Weight Pop-up Window

To create a dunnage weight: At the Work with Dunnage Weight Screen, select Create.

Field	Description
Ship via	The ship via code for this carrier. Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA). *Numeric, 2 positions.* *Create window: required.* *Change window: display-only.*
Maximum cube	The maximum cubic value for a carton. You cannot create more than one dunnage weight for the same ship via/cube number combination. *Numeric, 10 positions.* *Create window: required.* *Change window: display-only.*
Dunnage weight	The weight of the packing materials. This weight is added to the total weight of the pick slip in pick generation before before evaluating pick slips for best way shipping. Leave this field blank to indicate that the dunnage weight is zero. *Numeric, 13 positions with a 3-place decimal; optional.*

Working with Zip/Ship Via (WZSV)

Purpose: Use the Zip/Ship Via table to cross-reference default shippers for specific destinations, based on postal code. You can also use this option to indicate that a best way shipping surcharge applies to the ship via.

Ship via override: When you accept an order in order entry, the system checks the Zip/Ship Via table for a default shipper if the shipper specified on the order allows auto-assignment of carrier (the ship via's*Allow auto assignment* = Selected). If auto-assignment is allowed and there is a default ship via defined for the postal code, the system substitutes the original ship via with the default ship via automatically.

> **Note:**
>
> The shipper substitution occurs only if:

- you are using the Order/Recap screen, as defined by the Display Order Recap (A75) system control value, and
- the Allow auto assignment field for the ship via currently on the order is selected.
- another ship via override does not take precedence; see Ship Via Override Hierarchy for a list of ways the system can override the shipper specified on the order with another shipper and the hierarchy in which the ship via overrides take precedence.

In this topic:

- Work with Zip Ship Via Screen
  - Create Zip/Ship Via Screen

Work with Zip Ship Via Screen

How to display this screen: Enter WZSV in the *Fast path* field at the top of any menu or select the Work with Zip/Ship Via option from a menu.

Field	Description
Zip code	A code for a geographical delivery area, as defined by the United States Postal Service or other federal office. See Setting Up the Zip/City/State (Postal Code) Table (WZIP). *Alphanumeric, 5 positions; optional.*
Ship via	The code for the carrier that will deliver the package to the customer. Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA). *Numeric, 2 positions; optional.*
Status	A code that controls if (and how) this shipper can be used to deliver packages to the postal code. Valid values are: • Allow = The shipper is allowed to ship to this postal code. • Exclude = The shipper cannot ship to this postal code. • Default = This ship via will be substituted automatically when you accept a new order if the ship via on the order is set up to allow automatic assignment of carrier and another ship via override does not take precedence. • Surcharge = A surcharge applies to deliveries in this postal code by this shipper for the purposes of calculating best way shipping at pick slip generation. You define the amount of the surcharge in the Ship Via table. *This setting is not currently implemented.* *Optional.*

Screen Option	Procedure
Create a zip/ship via	Select Create to advance to the Create Zip/Ship Via Screen.

Screen Option	Procedure
Change a zip/ship via	Select Change for a zip/ship via to advance to the Change Zip/ Ship Via screen. At this screen, you can change only the *Status* field. See Create Zip/Ship Via Screen for field descriptions.
Delete a zip/ship via	Select Delete for a zip/ship via to delete it.
Display a zip/ship via	Select Display for a zip/ship via to advance to the Display Zip/ Ship Via screen. You cannot change any information on this screen. See Create Zip/Ship Via Screen for field descriptions.

Create Zip/Ship Via Screen

Purpose: Use this screen to create a zip/ship via combination.

How to display this screen: At the Work with Zip Ship Via Screen, select Create.

Field	Description
Zip code	A code for a geographical delivery area, as defined by the United States Postal Service or other federal office. Zip, or postal, codes are defined in and validated against the Zip/ City/State table. See Setting Up the Zip/City/State (Postal Code) Table (WZIP). *Alphanumeric, 5 positions.* *Create screen: required.* *Change screen: display-only.*
Ship via	The code for the carrier that will deliver the package to the customer. Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA). *Numeric, 2 positions.* *Create screen: required.* *Change screen: display-only.*

Field	Description
Status	A code that controls if (and how) this shipper can be used to deliver packages to the postal code. Valid values are: • Allow = The shipper is allowed to ship to this postal code. • Exclude = The shipper cannot ship to this postal code. The system issues a message similar to the following during Order Entry if you use a shipper that is excluded from shipping to the destination postal code: `Ship via (3) is not valid with ship to zip code (017).` • Default = This ship via will be substituted automatically when you accept the new order; this substitution occurs only if: – you are using the Order/Recap screen, as defined by the Display Order Recap (A75) system control value, *and* – the Allow auto assignment field for the ship via currently on the order is selected, *and* – another ship via override does not take precedence; see Ship Via Override Hierarchy • Surcharge = A surcharge applies to deliveries in this postal code by this shipper for the purposes of calculating best way shipping at pick slip generation, in which the system selects the least expensive ship via for a pick slip. You define the amount of the surcharge through Working with Shipping Rates (WSHR). This surcharge is not considered as part of best way shipping evaluation in order entry; see Working with Best Way Ship Vias. *This setting is not currently implemented.* *Required.*

Working with Tax Jurisdiction (WTXJ)

Tax Jurisdictions define postal code ranges for an area where a special tax structure exists. For example, tax jurisdictions exist for some counties in New York and New Jersey. Standard tax reporting does not identify taxes collected at the jurisdiction level.

Taxes are calculated from tax rates set up for an SCF, postal code, or for the country itself. The system calculates tax differently depending on whether you use VAT and tax-inclusive pricing, as controlled by the Tax Included in Price (E70) system control values.

Alternatively, you can use an external tax system to calculate sales tax on your orders and to maintain the tax rates appropriately. See Vertex Interface and Avalara AvaTax Interface.

> **Note:**
>
> You can use this menu option to define tax jurisdictions within the United States only.

Tax jurisdiction report: The Tax Jurisdiction Report identifies the dollars collected and dollars credited for each tax jurisdiction for a specified invoice date range; see Printing the Tax Jurisdiction Report (PTXJ) for more information on this report.

In this topic:

Work with Tax Jurisdiction Screen

How to display this screen: Enter WTXJ in the *Fast path* field at the top of any menu or select Work with Tax Jurisdiction from a menu.

Field	Description
Tax jurisdiction	The area for which a special tax structure exists. *Alphanumeric, 10 positions; optional.*
Description	The description associated with the tax jurisdiction. *Alphanumeric, 30 positions; optional.*
From postal code	The lowest postal code in the range of postal codes for this tax jurisdiction. A special tax structure exists for the entire area included in this range of postal codes. *Alphanumeric, 10 positions; optional.*
To postal code	The highest postal code in the range of postal codes for this tax jurisdiction. A special tax structure exists for the entire area included in this range of postal codes. *Alphanumeric, 10 positions; optional.*

Screen Option	Procedure
Create a tax jurisdiction	Select Create to advance to the Create Tax Jurisdiction Screen.
Change a tax jurisdiction	Select Change for a jurisdiction to advance to the Change Tax Jurisdiction screen. At the Change screen you can change the *Description* field. See Create Tax Jurisdiction Screen for field descriptions.
Delete a tax jurisdiction	Select Delete for a jurisdiction to delete it. If there has been any order activity within the tax jurisdiction area, a message similar to the following displays: `WARNING - DEPENDENT RECORDS EXIST` The message tells you that history exists for the tax jurisdiction in the Tax Jurisdiction History table, including information on the amount of tax charged and credited. You will lose this history if you delete the jurisdiction.
Display a tax jurisdiction	Select Display for a jurisdiction to advance to the Display Tax Jurisdiction screen. You cannot change any information on this screen. See Create Tax Jurisdiction Screen for field descriptions.

Create Tax Jurisdiction Screen

Purpose: Use this screen to create a tax jurisdiction.

How to display this screen: At the Work with Tax Jurisdiction Screen, select Create.

Field	Description
Tax jurisdiction	The area for which a special tax structure exists. *Alphanumeric, 10 positions.* *Create screen: required.* *Change screen: display-only.*
Description	The description associated with the tax jurisdiction. *Alphanumeric, 30 positions; required.*
From postal code	The lowest postal code in the range of postal codes for this tax jurisdiction. A special tax structure exists for the entire area included in this range of postal codes. Your entry is validated against the SCF table. An SCF is a geographic location identified by the first 3 characters of the postal code. In the SCF table, you define the states or provinces included in the SCF and specify the associated tax and freight structure. **Note:** The system does not allow you to set up tax jurisdictions with overlapping postal codes. *Alphanumeric, 10 positions.* *Create screen: required.* *Change screen: display-only.*
To postal code	The highest postal code in the range of postal codes for this tax jurisdiction. A special tax structure exists for the entire area included in this range of postal codes. Your entry is validated against the SCF table. An SCF is a geographic location identified by the first 3 characters of the postal code. In the SCF table, you define the states or provinces included in the SCF and specify the associated tax and freight structure. *Alphanumeric, 10 positions.* *Create screen: required.* *Change screen: display-only.*

Working with Weight Tables for Order Weight (WFTB)

Purpose: Use Work with Freight Tables to create and maintain freight tables for use with the order weight freight method, defined in the Source Code table.

Freight by order weight involves calculating the freight charges for an order by evaluating the number of cartons you expect the order will require to ship, and the weight of each carton. The tables you create with this function define the freight charges to add to an order based on the weight of each carton.

When calculated: In order entry, the system calculates freight by order weight during repricing, the initial and final order accept, and when you select to change the last line on the order if you do not change its order quantity. The *Freight* field on the order does not include order weight freight charges as you add lines to the order; however, the system does display ship via service charges and ship via weight charges immediately. When the system calculates freight by order weight, the system updates the *Freight* field for the order with the complete freight amount.

In order maintenance, the system calculates freight by order weight as you add or change each line on the order. The *Freight* field on the order includes all freight charges as changes to freight are made to the order.

Setup: In order to use this freight method, you must set up information correctly in several additional tables. See Freight by Order Weight Setup for instructions on setting up the order weight freight method.

Logic and examples: See Freight by Order Weight Calculation Logic and Examples for the logic that the system uses to calculate freight by order weight.

Removing additional charges: During Order Entry, if you remove additional charges from the order when using the freight by order weight freight method, the system adds the additional charges back to the order when it calls repricing during the final order accept.

In this topic:

- Freight by Order Weight Calculation Logic and Examples
- Freight by Order Weight Setup
- Work with Freight Table Header Screen
  - Create Freight Table Screen
- Work with Freight Table Details Screen
  - Create Freight Table Details Screen
- Copy Freight Table Details Screen

Freight by Order Weight Calculation Logic and Examples

Calculation: The system uses the following steps in calculating freight by order weight:

During order entry, the system calculates freight by order weight during repricing, the initial and final order accept, and when you change the last line on the order if you do not change its order quantity. The system adds together the weight of all non-ship alone items that have the same shipper and arrival date. The system calculates freight on ship-alone items separately (as defined by the field in the Item table).

Order lines for a negative quantity: The system does not include order lines with a negative quantity in the freight by order weight calculation.

Freight by Order Weight in Order Maintenance: During Order Maintenance, the system calculates freight by order weight each time you add or change an item on the order.

Example: An order includes the following non-ship alone items with the same ship via and arrival date:

Item	Weight	Quantity	Total Weight
1234	10 lbs.	1	10 lbs.
5678	20 lbs.	2	40 lbs.
9123	30 lbs.	1	30 lbs.
		Total	80 lbs.

The system determines how many pounds to allocate to each carton, based on the Maximum carton weight defined for the ship via on the order and the value defined in the Extra Weight for Order Weight Freight Method (D85) system control value.

Example:

Maximum carton weight = 30 lbs.

Extra carton weight = 1 lb.

Pounds to allocate per carton = 29 lbs. (30 - 1)

The system then determines how many cartons the items would require to ship.

> **Note:**
>
> The actual number of cartons you use to ship these items may differ; these calculations are used for assigning a freight amount to the order only.

Example: 80 lbs. (step 1) divided by 29 lbs. (step 2) = 2 full cartons with a remainder of 22 lbs. in a partial carton

The system then consults the freight table for each full carton, and the final, partial carton, adding the freight amount from the table defined for that weight to the order for each carton. The system includes the extra weight defined in the Extra Weight for Order Weight Freight Method (D85) system control value in each carton weight.

> **Note:**
>
> In order to assign a freight amount to the order, the system must find a record on the freight table with the correct ship via, business/residence flag, shipping zone and weight. See Freight by Order Weight Setup.

Example: The freight table contains the following matching records:

Weight	Freight Amount
10 lbs.	$5.00
15 lbs.	$6.00
20 lbs.	$7.00
25 lbs.	$8.00
30 lbs.	$9.00

The system adds the following freight amounts to the order:

Carton	Calculation	Result
first carton (30 lbs.)	=	$9.00
second carton (30 lbs.)	=	$9.00
third carton (22 + 1 lbs.)	=	$8.00
Total freight	=	$26.00

> **Note:**
>
> The freight table is an "up to" table, meaning that the system selects the lowest freight amount from the table that is greater than or equal to the order weight.

The system repeats the above steps for each different ship via/arrival date combination on the order.

Ship-alone items: The system consults the freight table separately for each ship-alone item on the order.

Example: The order in the above example included the following ship-alone items

Item	Quantity	Weight
ABCD	2	10 lbs.

The system consults the freight table separately for each item as follows:

10 lbs. + 1 lb. carton weight from the System Control table = 11 lbs. per carton

The system adds an additional $6.00 to the order for each carton.

Include Weight of all Items in Freight by Order Weight: If the Include Weight of all Items in Freight by Order Weight (G05) system control value is selected, the system adds together the weight of all non-ship alone items and ship alone items, regardless of the item's shipper or arrival date. This way the system consults the freight table once for all of the items on the order.

Calculate Freight by Order Weight for N/C Orders: If the Calculate Freight by Order Weight for N/C Orders (G68) system control value is selected, the system calculates freight by order weight for an order whose merchandise total is zero. You might wish to calculate freight for an order whose merchandise total is zero if the order includes a warranty item.

Excluding an item from the freight calculation: You can set up an item to be excluded from the total weight for freight calculation purposes by creating an exemption through Working with Freight Exempt Items (WFEI). Additionally, you must have the Use Item Freight Exemption File (E73) system control value selected. See Freight by Order Weight Setup for more information on required setup.

Freight by Order Weight Setup

Purpose: A freight table used to calculate freight for a given source code must contain a record for every combination of shipper, business or residence flag, geographical zone and weight possible for orders using that source code. If the system does not find a matching record on the freight table, freight by order weight will not be added to the order. Instructions for setting up freight tables are provided later in this topic. In addition, you must set up the following fields:

Table	Field Name	Valid Value
Working with Source Codes (WSRC)	Freight method	**Order Weight**
	Freight table	code representing the freight table defined through Work with Freight Tables

Table	Field Name	Valid Value
	Price method	**Regular Plus Reprice**
Working with Ship Via Codes (WVIA)	Maximum carton weight	weight for the system to use when calculating how many items can fit in each carton
Performing Initial Item Entry (MITM)	Sell wgt. (Selling weight)	weight of the item
	Ship alone	blank (' ') for non-ship alone items or **Ship Alone**
System Control (WSYS)	Extra Weight for Order Weight Freight Method (D85)	extra weight to subtract from each carton's capacity when calculating how many items can fit in the carton, and to add to the order weight for each carton

Table	Field Name	Valid Value
	Include Weight of all Items in Freight by Order Weight (G05)	selected, if you wish the system to add together the weight of all non-ship alone items and ship alone items, regardless of the item's shipper or arrival date

Note: Set this value to unselected if you are using

Table	Field Name	Valid Value
		an item freight exemption; see below.
	Calculate Freight by Order Weight for N/C Orders (G68)	selected, if you wish the system to calculate freight by order weight for orders whose merchandise total is zero Set this value to unselected if you are using an item freight exemption; see below.
	Default Warehouse (A04)	a warehouse code
Creating and Maintaining Warehouses (WWHS) Working with SCF/Ship Via Values (WSHV)	Drop point	both drop points must be the same

Additional required setup to have item freight exemptions in freight by order weight calculation:

- Use Item Freight Exemption File (E73) system control value must be selected

- Include Weight of all Items in Freight by Order Weight (G05) must be unselected
- Calculate Freight by Order Weight for N/C Orders (G68) must be unselected

Troubleshooting: Any of the following conditions will cause the system to fail to calculate freight by order weight correctly:

- no Sell wgt. (Selling weight) defined for an item
- no Maximum carton weight defined for the ship via
- an order dollar total of zero if the Calculate Freight by Order Weight for N/C Orders (G68) system control value is unselected
- a carton weight defined for the Ship Via that exceeds the highest related freight table record
- *Additional freight only* selected for the Ship Via
- *Ship via* on the order header not found on the freight table
- *Delivery code* on the order header not found on the freight table
- *Shipping zone* for the SCF/Ship Via on the order not the same as the *Shipping zone* on the freight table
- the customer has a loyalty membership that provides free freight

> **Note:**
>
> If you use the Best Way Ship Via for Auto-Assignment (J67) and there are no freight table records for the "dummy" ship via, there will not be any freight charges on the order until the system overrides the ship via on the order to the actual ship via with the lowest shipping charges.

Work with Freight Table Header Screen

Purpose: Use this screen to review existing freight table headers, to create, change, copy or delete a freight table, or to advance to the Work with Freight Table Detail screen.

How to display this screen: Enter WFTB in the *Fast path* field at the top of a menu, or select Work with Freight Tables from a menu.

Field	Description
Freight table	The code defining a freight table to use for order weight freight. *Alphanumeric, 3 positions; optional.*
Description	The description associated with the freight table. *Alphanumeric, 30 positions; optional.*

Screen Option	Procedure
Create a new freight table	Select Create to advance to the Create Freight Table Screen.
Change a freight table	Select Change for a freight table to advance to the Change Freight Table screen. See Create Freight Table Screen for field descriptions. At the Change screen you can change only the *Description* field.

Screen Option	Procedure
Copy freight table details	Select Copy for a freight table to advance to the Copy Freight Table Details Screen.
Delete a freight table	Select Delete for a freight table to delete it.
Work with freight table details	Select Work with Details for a freight table to advance to the Work with Freight Table Details Screen.

Create Freight Table Screen

Purpose: Use this screen to create a new freight table header. The header consists of the freight table code and description; in order to use the freight table, you must create both the header and detail. See Work with Freight Table Details Screen.

How to display this screen: Select Create at the Work with Freight Table Header Screen.

Field	Description
Freight table	The code defining a freight table for use with the order weight freight method. You enter this code in the Source code field of the Source Code table for any source code to use this freight table. *Alphanumeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Description	The description associated with the freight table. *Alphanumeric, 30 positions; required.*

Completing this screen: You advance to the Work with Freight Table Details Screen, where you can create freight table detail. You return to the Create Freight Table screen.

Work with Freight Table Details Screen

Purpose: Use this screen to create, change, delete or display freight table detail associated with the freight table header. The system consults this table when you enter an order whose source code points to this freight table.

How to display this screen: Select Work with Details for a freight table at the Work with Freight Table Header Screen. You also advance to this screen when you select OK to accept a new freight table header at the Create Freight Table Screen.

Field	Description
Freight table	A code representing the freight table. *Alphanumeric, 3 positions; display-only.*
Ship via	A code representing the shipper to deliver merchandise to your customers. Validated against the Ship Via table. *Numeric, 2 positions; optional.*

Field	Description
Del cde (Delivery code)	A code representing the type of delivery address on an order. Valid values are: • Business • Residential • **No Distinction** *Optional.*
Zone	The geographical region where the shipper delivers packages. UPS uses zones to calculate rates. *Numeric, 3 positions; optional.*
Weight	The maximum amount that a carton can weigh for the dollar amount defined for the freight table to apply. This is an "up to" field; the system selects the lowest freight table record whose weight is equal to or greater than the carton weight. *Numeric, 13 positions with a 3-place decimal; optional.*
Rate	The dollar amount to charge for a carton whose weight matches this freight table record. *Numeric, 13 positions with a 2-place decimal; optional.*

Screen Option	Procedure
Create a freight table record	Select Create to advance to the Create Freight Table Details Screen.
Change a freight table record	Select Change for a record to advance to the Change Freight Table Details screen. See Create Freight Table Details Screen for field descriptions. At the Change screen you can change the *Rate* field. To change any other information, you must delete the record and create a new one.
Delete a freight table record	Select Delete for a record to delete it.
Display a freight table record	Select Display for a record to advance to the Display Freight Table Details screen. You cannot change any information on this screen. See Create Freight Table Details Screen for field descriptions.

Create Freight Table Details Screen

Purpose: Use this screen to create freight table details.

How to display this screen: At the Work with Freight Table Details Screen, select Create. See Freight by Order Weight Setup for more information on setting up a freight table.

Field	Description
Freight table	The code representing a table that the system consults to calculate freight on orders using the order weight freight method. *Alphanumeric, 3 positions; display-only.*

Field	Description
Ship via	The code representing a shipper who delivers merchandise to your customers. Validated against the Ship Via table; see Working with Ship Via Codes (WVIA). *Numeric, 2 positions.* *Create screen: required.* *Change screen: display-only.*
Delivery code	A code representing the type of delivery address on an order. Valid values are: • **Business** • Residential • No Distinction Some shippers, such as UPS, charge different rates based on the type of delivery address. Only Business and Residential are valid delivery codes for a UPS ship via; see Working with Ship Via Codes (WVIA). *Create screen: optional.* *Change screen: display-only.*
Zone	The geographical region where the shipper delivers packages. UPS uses relative geographic zones, defined by SCF, to calculate shipping rates. See About Zones. *Numeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Weight	The maximum amount that a carton can weigh for the dollar amount defined for this freight table record to apply. This is an “up to” field; the system selects the first freight table record whose weight is equal to or greater than the carton weight. Example: If you have records in your freight table for 10, 20 and 30 pounds, a carton weighing 11 pounds will match the 20-pound record. *Numeric, 13 positions with a 3-place decimal.* *Create screen: required.* *Change screen: display-only.*
Rate	The amount to charge for shipping a carton that matches the freight table record. *Numeric, 13 positions with a 2-place decimal; required.*

> **Note:**
>
> In order to match the freight table record, the order must have the same Ship via and Delivery code as the freight table record. In addition, the Shipping zone defined for the SCF/Ship Via on the order must match the Zone defined for the freight table record, and the carton weight must be less than or equal to the Weight defined for the freight table record. See Freight by Order Weight Setup.

Copy Freight Table Details Screen

Purpose: Use this screen to copy freight table detail records from an existing freight table to another freight table header.

How to display this screen: Select Copy for an existing freight table at the Work with Freight Table Header Screen.

How to use this screen: Enter an existing freight table code in the *To freight table* field. If the freight table you select as the destination for copying already has detail records, the following message displays:

```
Freight Table Details already exist for To Freight Table
```

If you enter a valid freight table code without existing detail records as your destination table, the *Confirm* prompt field displays. Select this field to copy the detail records to the destination freight table, or select OK to cancel the copy.

Working with Offer Ship Via Assignment (WSVA)

Purpose: Use the Offer Ship Via table to define ship via overrides for qualifying orders based on offer or source code, dollar total, and, optionally, SCF.

If an order, or any shipping address on an order, qualifies for a ship via override based on the information you define in this table, the system will change the ship via when you select Accept or Accept/Add Recip. to accept the order. If you use the Order Recap screen, the new ship via code will appear there; otherwise, the ship via override will be transparent to the operator.

You use the Dollar Method Used to Evaluate Offer Ship Via Override (E50) system control value to specify whether the system uses the order or merchandise total to determine whether an order qualifies for ship via override.

In this topic:

- Ship Via Override Logic
- Work with Offer Ship Via Screen
  - Create Offer Ship Via Screen (Creating a Ship Via Override)
- Copy Offer Ship Via Screen

Ship Via Override Logic

The system uses the following guidelines in determining when and how to override the ship via on an order based on the Offer Ship Via table.

When does the override take place? The system evaluates each shipping address on an order for ship via override only once: when you select Accept or Accept/Add Recip. to accept the order or shipping address. If you make additional changes to the order in either Order Entry or Order Maintenance, the system will not reevaluate the order.

What items count toward the total? The system does not evaluate an order for ship via override unless there is at least one reserved item on the order. However, the system does include item prices from held and backordered lines in the qualifying order totals for ship via override.

How does the system calculate the qualifying total? The system checks the Dollar Method Used to Evaluate Offer Ship Via Override (E50) field in the System Control table. If you set this field to MERCH, the system compares the merchandise total, including any discounts, on the order with the dollar amount specified for the ship via override. If you set this field to ORDER TOTL, the system compares the order total, including the net of all positive or negative charges. If you leave this field blank, the system does not evaluate the order for the ship via override.

What if you override the source code on an order line? The system uses the source code on the order header to determine whether an order is eligible for a ship via override. If you override the source code or offer on an individual order line, the system does not consider this information when evaluating the order for ship via override; additionally, the dollar total for that line still counts toward the qualifying order dollar total. Similarly, if you specify a ship via for an item by entering the ship via in the Item table, the system still counts that item price toward the qualifying total for ship via override. The header-level ship via override would still occur, even if this item is the only item on the order.

What if the order qualifies for more than one offer/source code override? If the order qualifies for a ship via override based on both offer and source code, the system selects the override based on source code. If the order qualifies for more than one ship via override within source code or offer, the system selects the override with the highest dollar total for which the order qualifies. For example, an order meets the criteria for the following ship via overrides:

Offer or Source?	Dollar Total
offer	200.00
source	100.00
source	150.00

The system uses the ship via associated with the third override presented above.

What if the operator overrides the ship via on the order? The ship via on the order header must be the same one specified in the Default Ship Via (A77) field in the System Control table for the system to evaluate the order for ship via override. This means that if you change the default ship via on the Default Values for Orders screen or at the order header, the system does not evaluate the order for an offer ship via override. The same logic holds true if there is no Default Ship Via (A77) specified in the System Control table; if the ship via on the order header does not match the system control value (that is, it is not blank), the system does not evaluate the order for ship via override. The rule of thumb is this: the system compares the ship via on the order header with the ship via in the Default Ship Via (A77) field to determine whether to override, regardless of how the ship via came to be on the order header.

Are there other ship via overrides that might apply to the order? There are several other ways you can apply a ship via override to an order. See Ship Via Override Hierarchy for a table listing ship via overrides and the hierarchy in which the overrides apply.

Ship via override examples: If you want to offer an automatic upgrade to overnight delivery for a source code, you could set up an override for the source code with a dollar total of $.01. If you want to offer free or reduced-price Federal Express delivery for orders over a certain dollar total, you would create an additional ship via, identical to your regular Federal Express ship via but with different freight charge information. As with any ship via, you must be sure that you have created the ship via/SCF combination in the SCF Ship Via table, or order entry displays an error message.

For more information:

- Default Ship Via (A77)*or* Dollar Method Used to Evaluate Offer Ship Via Override (E50) system control values

-
- ship via codes: Working with Ship Via Codes (WVIA)
- entering orders: Order Entry Entering Orders
- setting up a default ship via for an item: Performing Initial Item Entry (MITM)
- working with zip/ship via: Working with Zip/Ship Via (WZSV)
- working with default ship via by SCF: Working with SCF Codes (WSCF)
- setting up SCF/ship via combinations: Working with SCF/Ship Via Values (WSHV) and Editing SCF Ship Via (ESSV).

Work with Offer Ship Via Screen

How to display this screen: Enter WSVA in the *Fast path* field at the top of any menu or select Work with Offer Ship Via Assignment from a menu.

Field	Description
Ofr	The offer associated with a ship via override. Orders whose source codes point to this offer are eligible for the override if they also have a qualifying dollar amount. See Working with Offers (WOFR). *Alphanumeric, 3 positions; optional.*
Source	The source code associated with a ship via override. Orders with this source code are eligible for the override if they also have a qualifying dollar amount. See Working with Source Codes (WSRC). *Alphanumeric, 9 positions; optional.*
Order total	The order total required to be eligible for the ship via override. The system checks the Dollar Method Used to Evaluate Offer Ship Via Override (E50) field in the System Control table to determine whether to use the merchandise total or order dollar total, including all other charges. *Numeric, 13 positions with a 2-place decimal; optional.*
From SCF	The lowest SCF in the range of SCFs to qualify for the ship via override. See Working with SCF Codes (WSCF). *Alphanumeric, 3 positions; optional.*
To SCF	The highest SCF in the range of SCFs to qualify for the ship via override. *Alphanumeric, 3 positions; optional.*
Via (Ship via)	The code representing a shipper who delivers merchandise to your customers. An order that meets the criteria defined for the override is eligible to have its shipper changed to this ship via. See Working with Ship Via Codes (WVIA). *Numeric, 2 positions; optional.*

Screen Option	Procedure
Create a ship via override	Select Create to advance to the Create Offer Ship Via Screen (Creating a Ship Via Override).

Screen Option	Procedure
Change a ship via override	Select Change for a ship via override to advance to the Change Offer Ship Via screen. You can change any of the fields at this screen. See Create Offer Ship Via Screen (Creating a Ship Via Override) for field descriptions.
Delete a ship via override	Select Delete for a ship via override to delete it.
Display a ship via override	Select Display for a ship via override to advance to the Display Offer Ship Via screen. You cannot change any information on this screen. See Create Offer Ship Via Screen (Creating a Ship Via Override) for field descriptions.
Copy a ship via override information for an offer or source	Select Copy to advance to the Copy Offer Ship Via Screen.

Create Offer Ship Via Screen (Creating a Ship Via Override)

Purpose: Use this screen to create a ship via override.

How to display this screen: At the Work with Offer Ship Via Screen, select Create.

Field	Description
Offer	The offer associated with the ship via override. Orders whose header-level source codes point to this offer will be eligible for the override. If the order would be eligible for both a source code-related and an offer-related override, the system uses the source code-related override record. You must specify either an offer or a source code for the override, but not both. Offer codes are defined in and validated against the Offer table; see Working with Offers (WOFR). *Alphanumeric, 3 positions; required if you do not enter a source code.*
Source	The source code associated with the ship via override. Orders with this source code at the header will be eligible for the override. If the order would be eligible for both a source code-related and an offer-related override, the system uses the source code-related override record. You must specify either an offer or a source code for the override, but not both. Source codes are defined in and validated against the Source Code table; see Working with Source Codes (WSRC). *Alphanumeric, 9 positions; required if you do not enter an offer code.*

Field	Description
Total	The dollar total of the order required to be eligible for the override. The system checks the Dollar Method Used to Evaluate Offer Ship Via Override (E50) field in the System Control table to determine whether to use the merchandise total or order dollar total, including all other charges. If an order would be eligible for more than one override for a source code or offer, the system uses the override with the highest dollar value for which the order qualifies. You can set this field to .01 to create an automatic ship via override for an offer or source code. *Numeric, 13 positions with a 2-place decimal; required.*
From SCF	The lowest SCF in the series to be eligible for the override. You can use this field and the next to restrict qualifying orders by geographical location. If only one SCF is eligible, you would enter it in both the From and To SCF fields. SCF codes are defined in and validated against the SCF Code table. See Working with SCF Codes (WSCF). *Alphanumeric, 3 positions; optional.*
To SCF	The highest SCF in the series to be eligible for the override. The system does not validate that every SCF between the From and To SCF you enter exists. For example, if you enter 011 in the From SCF field and 020 in the To SCF field, the system accepts this range even if 019 is not a valid SCF in your company. *Alphanumeric, 3 positions; required if you enter a From SCF.*
Ship via	The code representing the shipper to use on qualifying orders. Ship vias are defined in and validated against the Ship Via table; see Working with Ship Via Codes (WVIA). *Numeric, 2 positions; required.*

Copy Offer Ship Via Screen

Purpose: Use this screen to copy the ship via overrides from one offer or source code to a different offer or source code. You can copy overrides only to a source code or offer that currently does not have any ship via override information set up.

How to display this screen: Select Copy at the Work with Offer Ship Via Screen.

How to complete this screen: Each field on the Copy Offer Ship Via screen has been described at the Create Offer Ship Via Screen (Creating a Ship Via Override). To complete this screen and copy ship via override information:

1. Enter the offer or source code to use as the source of information in the *Copy from* area of the screen. You can specify only one source of information, either an offer or a source code
2. Enter each offer or source code to use as the target of information in the *Copy to* area of the screen. You can enter as many targets as you like, and there is no restriction on copying an offer to source codes or vice versa.
3. The system validates your entries and highlights any fields you need to correct. If any of the "to" offers or source codes currently have ship via overrides set up, the screen displays an error message. Correct any fields as necessary; or select Exit to exit the screen.

4. Select Accept to submit the copy. The Confirm Accept pop-up window displays; confirm the copy, or cancel it.
5. The system submits the job `OFR_SVAC`. This job copies each ship via override for the “from” offer or source to the “to” offers or sources.

Working with Lines of Business (WLOB)

Lines of business represent clients, or business units, in Order Administration. Each line of business contains assignments that represent a specific entity, division, or offer, or a combination of these three values.

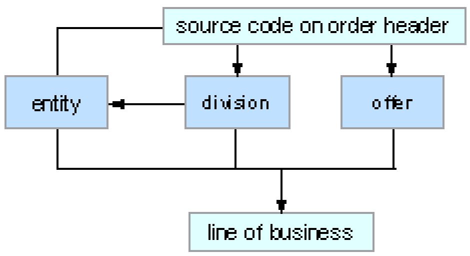
When an operator enters an order in order entry the system assigns each ship to customer to a line of business based on the entity, division, and offer associated with the order. The system uses the source code defined on the order header to determine which line of business to assign to an order based on the assignments defined for the line of business.

The system uses the line of business associated with each order to group all orders that contain a specific line of business together. You can then generate pick slips for the orders by line of business.

The system uses the following hierarchy to assign a line of business to an order ship to in order entry:

- the entity, division, and offer associated with the source code on the order header matches a specific line of business
- the offer and division associated with the source code on the order header matches a specific line of business
- the offer and entity associated with the source code on the order header matches a specific line of business
- the division and entity associated with the source code on the order header matches a specific line of business
- the offer associated with the source code on the order header matches a specific line of business
- the division associated with the source code on the order header matches a specific line of business
- the entity associated with the source code on the order header matches a specific line of business

Selecting the line of business for an order: The system uses the source code on the order header to determine the related division and offer. The related entity is determined based on the division associated with the source code on the order header.



Line of business order queue: You can review shippable orders based on the line of business assigned to each order. The system further defines orders assigned to a specific line of business by:

- orders containing one reserved and unprinted open order line
- orders containing more than one reserved and unprinted open order line
- whether the order includes a bulk item
- whether the order includes a gift-wrapped item
- the ship via priority defined for the ship via on the order header

> **Note:**
>
> You must select Update Statistics in Displaying the Line of Business Order Queue Summary (DLOQ) or submit the LOBSTATS periodic function to view the most current line of business order queue.

For more information:

- reviewing the line of business order queue for each line of business and generating pick slips by line of business, gift wrap orders, bulk orders, or ship via priority: Displaying the Line of Business Order Queue Summary (DLOQ)
- processing credits by line of business and dollar amount: Processing Credits by Line of Business (MCLB)

In this topic:

- Work with Line of Business Screen
  - Create Line of Business Screen
  - Display Line of Business Screen (Displaying Line of Business Order Queue)
- Work with Line of Business Assignment Screen
  - Create Line of Business Assignment Screen

Work with Line of Business Screen

How to display this screen: Enter WLOB in the *Fast path* field at the top of any menu or select Work with Line of Business from a menu.

Field	Description
LOB code (Line of business code)	A code that represents a line of business. *Alphanumeric, 3 positions; optional.*
Description	A description of the line of business code. *Alphanumeric, 40 positions; optional.*

Screen Option	Procedure
Change a line of business description	Select Change for a line of business to advance to the Change Line of Business screen. At this screen, you can change the line of business description only. See Create Line of Business Screen for a description of the fields on this screen.
Delete a line of business	Select Delete for a line of business to delete it. **Note:** The following error message indicates if you try to delete a line of business that is assigned to an open order: `Cannot delete LOB, Order Exists`
Display a line of business order queue	Select Display for a line of business to advance to the Display Line of Business Screen (Displaying Line of Business Order Queue).
Work with line of business assignment	Select Assignments for a line of business to advance to the Work with Line of Business Assignment Screen.
Create a line of business code	Select Create to advance to the Create Line of Business Screen.

Create Line of Business Screen

Purpose: Use this screen to create a line of business code.

How to display this screen: On the Work with Line of Business Screen, select Create.

Field	Description
Line of business	A code that represents a line of business. **Note:** The system cannot assign a line of business to an order unless at least one line of business assignment exists for the line of business code. See Work with Line of Business Assignment Screen. *Alphanumeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Line of business description	A description of the line of business. *Alphanumeric, 40 positions; required.*

Completing this screen: You advance to the Create Line of Business Assignment Screen, where you can create an assignment for the line of business you just created.

Display Line of Business Screen (Displaying Line of Business Order Queue)

Purpose: Use this screen to review the line of business order queue. You can use the line of business order queue to review statistics for orders that are associated with a specific line of business, such as:

- the total number of orders that contain only one reserved and unprinted open order line
- the total number of orders that contain more than one reserved and unprinted open order line
- the number of single line and multiple line gift wrap orders
- the number of single line and multiple line bulk orders
- the number of orders for each ship via priority

> **Note:**
>
> You must select Update Statistics in Displaying the Line of Business Order Queue Summary (DLOQ) or submit the LOBSTATS periodic function to view the most current line of business order queue.

How to display this screen: On the Work with Line of Business Screen, select Display for a line of business.

Field	Description
LOB (Line of business code)	The code representing the line of business you are reviewing. *Alphanumeric, 3 positions; display-only.*
Description	The description of the line of business you are reviewing. *Alphanumeric, 40 positions; display-only.*
Last update	The date and time the information on this screen was last updated. You can update the line of business order queue by selecting Update Statistics in Displaying the Line of Business Order Queue Summary (DLOQ) or by submitting the LOBSTATS periodic function. *Numeric, 6 positions (in user date format); display-only.*
Single total orders	The total number of orders that have only one reserved and unprinted line in an open status for a specific line of business. *Numeric, 6 positions; display-only.*
Multi total orders	The total number of orders that have more than one reserved and unprinted line in an open status for a specific line of business. *Numeric, 6 positions; display-only.*
Single gift wrap orders	The total number of gift wrap orders that have one reserved and unprinted line in an open status for a specific line of business. This line must represent a gift wrap line (the Gift wrap field for this item is selected). *Numeric, 5 positions; display-only.*

Field	Description
Multi gift wrap orders	The total number of gift wrap orders that have more than one reserved and unprinted line in an open status for a specific line of business. *Numeric, 5 positions; display-only.*
Single bulk orders	The total number of bulk orders that have only one reserved and unprinted line in an open status for a specific line of business. This line must represent a bulk item (the Oversize field for the item is selected). *Numeric, 5 positions; display-only.*
Multi bulk orders	The total number of bulk orders that have more than one reserved and unprinted line in an open status, where one of the lines is for a bulk item, for a specific line of business. *Numeric, 5 positions; display-only.*
Single ship via priority 1	The total number of orders that contain only one reserved and unprinted line in an open status that is also defined as ship via priority 1 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Multi ship via priority 1	The total number of orders that contain more than one reserved and unprinted line in an open status that is also defined as ship via priority 1 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Single ship via priority 2	The total number of orders that contain only one reserved and unprinted line in an open status that is also defined as ship via priority 2 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Multi ship via priority 2	The total number of orders that contain more than one reserved and unprinted line in an open status that is also defined as ship via priority 2 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Single ship via priority 3	The total number of orders that contain only one reserved and unprinted line in an open status that is also defined as ship via priority 3 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Multi ship via priority 3	The total number of orders that contain more than one reserved and unprinted line in an open status that is also defined as ship via priority 3 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*

Field	Description
Single ship via priority 4	The total number of orders that contain only one reserved and unprinted line in an open status that is also defined as ship via priority 4 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Multi ship via priority 4	The total number of orders that contain more than one reserved and unprinted line in an open status that is also defined as ship via priority 4 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Single ship via priority 5	The total number of orders that contain only one reserved and unprinted line in an open status that is also defined as ship via priority 5 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Multi ship via priority 5	The total number of orders that contain more than one reserved and unprinted line in an open status that is also defined as ship via priority 5 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Single ship via priority 6	The total number of orders that contain only one reserved and unprinted line in an open status that is also defined as ship via priority 6 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Multi ship via priority 6	The total number of orders that contain more than one reserved and unprinted line in an open status that is also defined as ship via priority 6 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Single ship via priority 7	The total number of orders that contain only one reserved and unprinted line in an open status that is also defined as ship via priority 7 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Multi ship via priority 7	The total number of orders that contain more than one reserved and unprinted line in an open status that is also defined as ship via priority 7 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*

Field	Description
Single ship via priority 8	The total number of orders that contain only one reserved and unprinted line in an open status that is also defined as ship via priority 8 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Multi ship via priority 8	The total number of orders that contain more than one reserved and unprinted line in an open status that is also defined as ship via priority 8 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Single ship via priority 9	The total number of orders that contain only one reserved and unprinted line in an open status that is also defined as ship via priority 9 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Multi ship via priority 9	The total number of orders that contain more than one reserved and unprinted line in an open status that is also defined as ship via priority 9 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*

Work with Line of Business Assignment Screen

Purpose: Use this screen to set up the assignment combinations that will identify a particular line of business.

Line of business assignments represent the entity, division, or offer, or combination of these three values assigned to a line of business. The assignment determines which line of business the system assigns to an order in order entry. The system uses a line of business assignment to group all orders associated with a specific line of business together.

> **Note:**
>
> The system cannot assign a line of business to an order unless there is at least one line of business assignment for the line of business code.

How to display this screen: On the Work with Line of Business Screen, select Assignments for a line of business.

Field	Description
LOB (Line of business code)	The line of business code for which you are working with the line of business assignments. *Alphanumeric, 3 positions; display-only.*

Field	Description
Description	The line of business description for which you are working with the line of business assignments. *Alphanumeric, 40 positions; display-only.*
Entity	A code that represents an entity. Entities can represent the business units within your company (for example, mail order, retail, wholesale). Every sale, return, exchange, discount, and write-off is attributed to an entity. Entities should represent any organization within your company that is held accountable for sales performance. See Working with Entities (WENT). *Numeric, 3 positions; optional.*
Division	A code representing a division of your business. Divisions can represent groups within business units (for example, winter, spring, summer, fall, and holiday). See Working with Divisions (WDIV). *Alphanumeric, 2 positions; optional.*
Offer	A code representing a catalog, space, or advertisement used to present merchandise to your customers. See Working with Offers (WOFR). *Alphanumeric, 3 positions; optional.*

Screen Option	Procedure
Change a line of business assignment	Select Change for a line of business assignment to advance to the Change Line of Business Assignment screen. You can change any information on this screen. See Create Line of Business Assignment Screen for a description of the fields on this screen.
Delete a line of business assignment	Select Delete for a line of business assignment to delete it.
Display a line of business assignment	Select Display for a line of business assignment to advance to the Display Line of Business Assignment screen. You cannot change any information on this screen. See Create Line of Business Assignment Screen for a description of the fields on this screen.
Create a line of business assignment	Select Create to advance to the Create Line of Business Assignment Screen.

Create Line of Business Assignment Screen

Purpose: Use this screen to create an assignment for a specific line of business. Each assignment you create must be unique across all lines of business or the screen displays an error message similar to the following:

```
Combination of Ent/Div/Off Exists for LOB (4) (LOB 555)
```

How to display this screen: On the Work with Line of Business Assignment Screen, select Create. The system automatically advances you to this screen when you complete the Create Line of Business Screen.

Field	Description
LOB (Line of business code)	The line of business code for which you are creating an assignment. *Alphanumeric, 3 positions; display-only.*
Description	The line of business description for which you are creating an assignment. *Alphanumeric, 40 positions; display-only.*
Entity	A code that represents an entity. Entities can represent the business units within your company (for example, mail order, retail, wholesale). Every sale, return, exchange, discount, and write-off is attributed to an entity. Entities should represent any organization within your company that is held accountable for sales performance. Entity codes are defined in and validated against the Entity table. See Working with Entities (WENT). The following message displays if you enter an invalid entity in this field: `Entity does not exist.` *Numeric, 3 positions; optional.*
Division	A code representing a division of your business. Divisions can represent groups within business units (for example, winter, spring, summer, fall, and holiday). Division codes are defined in and validated against the Division table. See Working with Divisions (WDIV). The following message displays if you enter an invalid division code in this field: `Division does not exist.` The following message displays if you enter a division that does not relate to the entity you defined: `Division does not belong to the above Entity.` *Alphanumeric, 2 positions; optional.*
Offer	A code representing a catalog, space, or advertisement used to present merchandise to your customers. Offer codes are defined in and validated against the Offer table. See Working with Offers (WOFR). The following message displays if you enter an invalid offer code in this field: `Offer does not exist.` *Alphanumeric, 3 positions; optional.*

Displaying the Line of Business Order Queue Summary (DLOQ)

Purpose: Use the Display Line of Business Order Queue Summary to review statistics for orders that are associated with a line of business.

You can use the line of business order queue summary to review orders ready for shipment by line of business and then generate pick slips for the orders.

> **Note:**
>
> The number of orders displayed in the line of business order queue does not directly match the number of pick tickets the system can produce during pick slip generation.

Across all lines of business, the system provides a total of the number of orders that contain:

- only one reserved and unprinted open order line
- more than one reserved and unprinted open order line

For each line of business, the system also provides a total of the number of orders that contain:

- only one reserved and unprinted open order line
- more than one reserved and unprinted open order line

The system then breaks the total of the single and multiple line orders into buckets:

- gift wrap orders (the system defines a gift wrap order as an order that includes an item with the *Gift wrap* field selected).
- bulk orders (the system defines a bulk order as an order that includes an item with the *Oversized* field selected).
- ship via priority 1-9 (the system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order).

For more information: See Working with Lines of Business (WLOB), for more information on how to create a line of business and how the system assigns a line of business to an order.

In this topic:

- Line of Business Order Queue Summary Screen
- Updating the Line of Business Order Queue Statistics

Line of Business Order Queue Summary Screen

Purpose: Use this screen to review the statistics for each line of business.

> **Note:**
>
> The information on this screen is only as current as the last time the LOBSTAT batch program was run. See Updating the Line of Business Order Queue Statistics.

How to display this screen: Enter DLOQ in the *Fast path* field at the top of any menu, or select Display LOB Order Queue Summary from a menu.

Field	Description
Last update	The date and time when the system last refreshed the information on this screen. The system refreshes the information on this screen when you select Update Statistics to submit the LOB_STATS batch job or when you execute the LOBSTAT periodic function. See Updating the Line of Business Order Queue Statistics. *Date: Numeric, 6 positions (in user date format); display-only.* *Time: Numeric, 6 positions (HHMMSS format); display-only.*
Total single line orders	The total number of orders that contain one reserved and unprinted open order line across all lines of business. This number represents the total of all single line total order buckets for each line of business. *Numeric, 6 positions; display-only.*
Total multi line orders	The total number of orders that contain more than one reserved and unprinted open order line across all lines of business. This number represents the total of all multiple line total order buckets for each line of business. *Numeric, 6 positions; display-only.*
LOB	The code and description of a line of business. Line of business codes are defined in and validated against the Line of Business table. See Working with Lines of Business (WLOB). *LOB code: Alphanumeric, 3 positions; display-only.* *LOB description: Alphanumeric, 40 positions; display-only.*
Total ord singl (Total number of single line orders)	The total number of orders that contain one reserved and unprinted open order line for a specific line of business. This number represents the total of all single line ship via priority buckets for this line of business. *Numeric, 6 positions; display-only.*
G/W ord singl (Number of single line gift wrap orders)	The total number of orders that contain one reserved and unprinted open order line that is also defined as gift wrap (the *Gift wrap* field on the order detail line is selected) for a specific line of business. **Note:** The system includes each single line gift wrap order in a single line ship via priority bucket, based on the ship via priority for each order. *Numeric, 5 positions; display-only.*

Field	Description
Bulk ord singl (Number of single line bulk orders)	The total number of orders that contain one reserved and unprinted open order line that is also defined as bulk (the *Oversized* field for the item is selected) for a specific line of business. **Note:** The system includes each single line bulk order in a single line ship via priority bucket, based on the ship via priority for each order. *Numeric, 5 positions; display-only.*
Ship via priority 1 (Number of single line orders defined as ship via single priority 1)	The total number of orders that contain one reserved and unprinted open order line that is also defined as ship via priority 1 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 2 (Number of single line orders defined as ship via single priority 2)	The total number of orders that contain one reserved and unprinted open order line that is also defined as ship via priority 2 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 3 (Number of single line orders defined as ship via single priority 3)	The total number of orders that contain one reserved and unprinted open order line that is also defined as ship via priority 3 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 4 (Number of single line orders defined as ship via single priority 4)	The total number of orders that contain one reserved and unprinted open order line that is also defined as ship via priority 4 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 5 (Number of single line orders defined as ship via single priority 5)	The total number of orders that contain one reserved and unprinted open order line that is also defined as ship via priority 5 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 6 (Number of single line orders defined as ship via single priority 6)	The total number of orders that contain one reserved and unprinted open order line that is also defined as ship via priority 6 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*

Field	Description
Ship via priority 7 (Number of single line orders defined as ship via single priority 7)	The total number of orders that contain one reserved and unprinted open order line that is also defined as ship via priority 7 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 8 (Number of single line orders defined as ship via single priority 8)	The total number of orders that contain one reserved and unprinted open order line that is also defined as ship via priority 8 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 9 (Number of single line orders defined as ship via single priority 9)	The total number of orders that contain one reserved and unprinted open order line that is also defined as ship via priority 9 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. **Note:** Ship via priority 9 represents rush orders. *Numeric, 5 positions; display-only.*
Total ord multi (Total number of multiple line orders)	The total number of orders that contain more than one reserved and unprinted open order line for a specific line of business. This number represents the total of all multiple line ship via priority buckets for this line of business. *Numeric, 6 positions; display-only.*
G/W ord multi (Number of multiple line gift wrap orders)	The total number of orders that contain more than one reserved and unprinted open order line that also includes an order line defined as gift wrap (the *Gift wrap* field on the order detail line is selected) for a specific line of business. **Note:** The system includes each single line gift wrap order in a single line ship via priority bucket, based on the ship via priority for each order. *Numeric, 5 positions; display-only.*

Field	Description
Bulk ord multi (Number of multiple line bulk orders)	The total number of orders that include more than one reserved and unprinted open order line that also include an order line defined as bulk (the *Oversized* field for the item is selected) for a specific line of business. **Note:** The system includes each single line gift wrap order in a single line ship via priority bucket, based on the ship via priority for each order. *Numeric, 5 positions; display-only.*
Ship via priority 1 (Number of multiple line orders defined as ship multi via priority 1)	The total number of orders that contain more than one reserved and unprinted open order line that is also defined as ship via priority 1 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 2 (Number of multiple line orders defined as ship multi via priority 2)	The total number of orders that contain more than one reserved and unprinted open order line that is also defined as ship via priority 2 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 3 (Number of multiple line orders defined as ship multi via priority 3)	The total number of orders that contain more than one reserved and unprinted open order line that is also defined as ship via priority 3 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 4 (Number of multiple line orders defined as ship multi via priority 4)	The total number of orders that contain more than one reserved and unprinted open order line that is also defined as ship via priority 4 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 5 (Number of multiple line orders defined as ship multi via priority 5)	The total number of orders that contain more than one reserved and unprinted open order line that is also defined as ship via priority 5 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*

Field	Description
Ship via priority 6 (Number of multiple line orders defined as ship multi via priority 6)	The total number of orders that contain more than one reserved and unprinted open order line that is also defined as ship via priority 6 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 7 (Number of multiple line orders defined as ship multi via priority 7)	The total number of orders that contain more than one reserved and unprinted open order line that is also defined as ship via priority 7 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 8 (Number of multiple line orders defined as ship multi via priority 8)	The total number of orders that contain more than one reserved and unprinted open order line that is also defined as ship via priority 8 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. *Numeric, 5 positions; display-only.*
Ship via priority 9 (Number of multiple line orders defined as ship multi via priority 9)	The total number of orders that contain more than one reserved and unprinted open order line that is also defined as ship via priority 9 for a specific line of business. The system uses the ship via priority defined for the ship via on the order header to determine the ship via priority for the order. **Note:** Ship via priority 9 represents rush orders. *Numeric, 5 positions; display-only.*

Updating the Line of Business Order Queue Statistics

You can update the information on the Line of Business Order Queue Summary Screen and on the Display Line of Business Screen (Displaying Line of Business Order Queue) by selecting Update Statistics.

> **Note:**
>
> You can also process this batch program by running the PFR0034 periodic function.

The LOBSTAT batch program uses the following steps to update the information in the line of business order queue:

1. The system identifies all open orders that reference a line of business and updates the statistics for each line of business alphanumerically.
2. The system determines which of the open orders that contain a line of business are single line orders (the order includes only one open, reserved, and unprinted line). For each single line order, the system:
   - identifies the ship via priority using the ship via defined on the order header and updates the ship via priority buckets with the results.
   - adds up the quantity in each single line ship via priority bucket and defaults the total in the single line total orders bucket.
   - identifies all single line orders that contain a gift wrap item (the *Gift wrap* field for the line is selected).
   - defaults the total number of single line orders that contain a gift wrap item in the single line gift wrap orders bucket.
   - identifies all single line orders that contain a bulk item (the *Oversized* field for the item is selected).
   - defaults the total number of single line orders that contain a bulk item to the single line bulk orders bucket.
3. The system determines which of the open orders that contain a line of business are multiple line orders (the order includes more than one open, reserved, and unprinted line). For each multiple line order, the system:
   - identifies the ship via priority, using the ship via defined on the order header and updates the ship via priority buckets with the results.
   - adds up the quantity in each multiple line ship via priority bucket and defaults the total in the multiple line total orders bucket.
   - identifies all multiple line orders that contain a gift wrap item (the *Gift wrap* field for one or more of the lines on the order is selected).
   - defaults the total number of multiple line orders that contain a gift wrap item in the multiple line gift wrap orders bucket.
   - identifies all multiple line orders that contain a bulk item (the *Oversized* field for one or more of the items on the order is selected).
   - defaults the total number of multiple line orders that contain a bulk item to the multiple line bulk orders bucket.
4. The system performs the same steps to the next line of business in alphanumeric order.
5. The system updates the *Last update date and Last update time* fields with the date and time this batch program was performed.

> **Note:**
>
> When you submit the LOBSTAT batch program, the system checks to see if an active procedure for the company you are currently in is present. If an active procedure is present, the system displays the error message:
> `Cannot Run The Submit Job.`

You must wait until the batch job currently running has completed before submitting another batch job.

Screen Option	Procedure
Select the criteria you wish to use to generate a pick slip	Select Select Picks to advance to the Work with Streamlined Pick Slip Generation Screen.
Update statistics on this screen	Select Update Statistics to submit the LOBSTAT batch program that updates the information on this screen and on the Display Line of Business Screen (Displaying Line of Business Order Queue).

Creating SCF Ship Vias by SCF Range (MSSV)

Purpose: Use this menu option to create SCF ship via information for a selected SCF range, rather then entering this information for each SCF or drop point.

A Sectional Center Facility (SCF) code represents the first 3 digits of the destination postal code. A Ship Via code is used to indicate the areas (postal codes) where shippers deliver merchandise.

The system uses this information in order entry and order maintenance to ensure that the shipper assigned to the order can deliver to the shipping address on the order. You must create a record for every valid Ship Via/SCF combination. If a record does not exist for the ship via on an order and the SCF of the shipping address, order entry displays an error message: `Ship via is not valid with ship to zip code`.

You can also create SCF/ship via information using the following menu options:

- Working with SCF/Ship Via Values (WSHV)
- Editing SCF Ship Via (ESSV)

Create SCF Ship Vias by SCF Range Screen

Use this screen to create SCF ship via information for a selected SCF range.

To create:

1. Enter valid information in the *Country*, *SCF code range*, *Ship via code*, *Drop point*, *Shipping zone*, and optionally, *Shipping lead days* fields.
2. Select Accept. The system submits a job to create an SCF ship via value for each SCF in the range you defined.

You can review the SCF ship via information in the Working with SCF/Ship Via Values (WSHV) menu option.

How to display this screen: Enter MSSV in the *Fast path* field or select Create SCF Ship Via by SCF Range from a menu.

Field	Description
Country	The country where the SCF is located. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY). *Alphanumeric, 3 positions; optional.*

Field	Description
SCF code range	The range of SCF codes for which you wish to create SCF ship via values. An SCF code represents the first 3 positions of the destination postal code. SCF codes are defined in and validated against the SCF table; see Working with SCF Codes (WSCF). *Alphanumeric, 3 positions; required.*
Ship via code	The shipper to deliver merchandise to the customer, such as 01 (UPS). Ship via codes are defined in and validated against the Ship Via table; see Working with Ship Via Codes (WVIA). *Numeric, 2 positions; required.*
Drop point	A code that represents one of your shipping warehouses or a central location to which merchandise will be shipped for consolidation. Drop points are used in zone skipping, which enables you to ship a carton by one carrier to a drop point, where another carrier picks up the carton and delivers it to its final destination. **Note:** If you are using the freight by order weight freight method, the drop point you define here must match the drop point you define in the Warehouse table. See Working with Weight Tables for Order Weight (WFTB). *Numeric, 3 positions; required.*
Shipping zone	The zone within the country where the carton is being shipped in relation to the drop point. Shipping zones are sections of the country that are defined by UPS. See About Zones. *Numeric, 2 positions; required.*

Field	Description
Shipping lead days	The number of days it takes the shipper to deliver merchandise to this SCF. **Calculation for pick slip preparation:** The system checks the arrival date for each line on an order to determine when to create a pre-generated pick. `Arrival Date from Order Line (or Order Ship To) - (Pick Processing Days (B37) + Ship Via Lead Days in WSHV) < or = Today's Date` The system creates a pre-generated pick for the order line if this system-calculated date is less than or equal to today's date; otherwise, the system does not create a pre-generated pick for the order line until the date is within the allotted time frame. See Selecting Order Lines for Pick Slip Preparation for additional details. **Calculation for Alternate Shipping Charges by Via window:** The system also uses this setting to calculate the Ship lead days and Expected delivery date to display at the Alternate Shipping Charges by Via Window in order entry, and this window uses a different calculation than the one described above. See the description of the Alternate Shipping Charges by Via Window for more information. *Numeric, 3 positions; optional.*

Shipping Zone Reservation

Topics in this part:

- Shipping Zone Reservation Overview provides a brief overview of the shipping zone reservation process, and provides a flow chart of the process of order entry for zone reservation items.
- Creating and Maintaining Geographic Zones (WGZN) describes how to set up and maintain geographic zones using zip codes or SCF codes.
- Creating and Maintaining Zone Reservation Codes (WZRC) shows you how to set up and maintain the zone reservation codes that will be assigned to weather-sensitive items to insure that they will ship at an optimal time for planting in the regions to which they are going.
- Creating and Maintaining Zone Reservation Dates (WZRD) describes zone reservation date windows and shows you how to set up and maintain zone reservation dates.

Creating and Maintaining Geographic Zones (WGZN)

Purpose: Use this menu option to create, change, delete, or display geographic zone information.

Use of geographic zones: Geographic zones are regions of the country which relate to relative weather conditions. Geographic zones are used by the zone reservation process to restrict shipping of weather-sensitive inventory such as plant stock. Each geographic zone will have a different date window during which particular kinds of stock can be shipped. See Shipping Zone Reservation Overview.

In this topic:

- Work with Geographic Zones Screen
  - Create Geographic Zones Screen

Work with Geographic Zones Screen

How to display this screen: Enter WGZN in the *Fast path* field at the top of any menu or select Work with Geographic Zones from a menu.

Field	Description
Geographic zone	A code that identifies the geographic zone. *Alphanumeric, 3 positions; display-only.*
Description	A description of the geographic zone. *Alphanumeric, 30 positions; display-only.*

Screen Option	Procedure
Create a geographic zone	Select Create to advance to the Create Geographic Zones Screen.
Change a geographic zone description	Select Change for a geographic zone to advance to the Change Geographic Zones screen. At this screen, you can change the description of the geographic zone. See Create Geographic Zones Screen for field descriptions.
Delete a geographic zone	Select Delete for a geographic zone to delete it.
Display a geographic zone description	Select Display for a geographic zone to advance to the Display Geographic Zones screen. You cannot change any information on this screen. See Create Geographic Zones Screen for field descriptions.

Create Geographic Zones Screen

Purpose: Use this screen to create a geographic zone.

How to display this screen: Select Create on the Work with Geographic Zones Screen.

Field	Description
Geographic zone code	A code that identifies the geographic zone. Geographic zones are used to divide the country into shipping regions for the purpose of restricting the shipment of climate-sensitive plant stock. *Alphanumeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Description	A description of the geographic zone. *Alphanumeric, 30 positions; required.*

Creating and Maintaining Zone Reservation Dates (WZRD)

Purpose: Use the Work with Zone Reservation Dates menu option to create, change, delete, or display shipping zone date windows for each category of zone reservation coded items you have defined using Creating and Maintaining Zone Reservation Codes (WZRC).

About zone reservation dates: Zone reservation dates are the time windows you set up for shipping weather-sensitive inventory to different geographic zones in the country. For each zone reservation code, which identifies a category of weather-sensitive inventory stock such as bulbs, bare root plants, or potted plants, you specify the season in which it will be sold, then define a set of zone date windows corresponding to the geographic zones of the country. For example, potted plants would have a zone date window for each geographic zone in the country.

Each zone date window defines the following dates:

- Start date: the date you start shipping an item with this code.
- Deferred cutoff date: the backorder cutoff date. On or after this date you will not take orders for this item if the item is not available in your warehouse.

> **Note:**
>
> The Deferred cutoff date is not considered if you use alternate zone reservation rules, as controlled by the Use Alternate Zone Reservation Logic (I52) system control value. See Alternate Zone Reservation Rules for a discussion.

- Cutoff date: the cutoff date for taking orders, whether or not stock is available in your warehouse.
- End date: the last date for shipping the item.
- Next season open date: the start date of the next season for items with this code.

About season dates: Some zone reservation coded items may be sold in more than one season. You must set up a group of zone date windows for each season in which you plan to ship items with this zone reservation code. For example, a bare root plant from a spring catalog may have 10 zone date windows, corresponding to 10 geographic zones you have set up for the country. The same bare root plant offered in a fall catalog would have a different set of 10 zone date windows corresponding to the same 10 geographic zones.

For more information: See Shipping Zone Reservation Overview for an explanation of the zone reservation process.

In this topic:

- Work with Zone Reservation Dates Screen (Zone Date Windows)
  - Create Zone Reservation Dates Screen (Creating a Zone Date Window)

Work with Zone Reservation Dates Screen (Zone Date Windows)

Purpose: Use this screen to change, delete, display, or create information about the zone reservation date windows associated with each zone reservation code and season.

How to display this screen: Enter WZRD in the *Fast path* field at the top of any menu or select Work with Zone Reservation Dates from a menu.

Field	Description
Zone reservation	The zone reservation code. A code that identifies a type of weather-sensitive inventory item for which you have set up shipping restrictions by zone. See Creating and Maintaining Zone Reservation Codes (WZRC) for information on setting up and maintaining zone reservation codes. *Alphanumeric, 4 positions; optional.*
Season	A code which identifies the season to which the date window applies. See Working with Season Codes (WSEA). *Alphanumeric, 3 positions; optional.*
Geo. zone (Geographic zone)	A code which identifies the geographic zone to which the date window applies. See Creating and Maintaining Geographic Zones (WGZN). *Alphanumeric, 3 positions; optional.*
Start date	The shipping start date for the zone date window. *Numeric, 6 positions, in user date format; display-only.*
End date	The shipping end date for the zone window. *Numeric, 6 positions, in user date format; display-only.*

Screen Option	Procedure
Create a zone reservation date window	Select Create to advance to the Create Zone Reservation Dates Screen (Creating a Zone Date Window).
Change a zone reservation date window	Select Change for a zone reservation date window to advance to the Change Zone Reservation Dates screen. You can change any information except the zone reservation code, the season, and the geographic zone of the date window. See Create Zone Reservation Dates Screen (Creating a Zone Date Window) for field descriptions.
Delete a zone reservation date window	Select Delete for a zone reservation date window to delete it.
Display a zone reservation date window	Select Display for a zone reservation date window to advance to the Display Zone Reservation Dates screen. You cannot change any information on this screen. See Create Zone Reservation Dates Screen (Creating a Zone Date Window) for field descriptions.

Create Zone Reservation Dates Screen (Creating a Zone Date Window)

Purpose: Use this screen to define the Start date, Deferred cutoff date, Cutoff date, End date, and Next season open dates for a zone reservation date window.

How to display this screen: Select Create on the Work with Zone Reservation Dates Screen (Zone Date Windows).

Field	Description
Zone reservation	A code that identifies a type of weather-sensitive inventory item such as bare root plants, or hardy bulbs. Zone reservation codes are defined in and validated against the Zone Reservation Code table, and assigned in the Item table. See Creating and Maintaining Zone Reservation Codes (WZRC). *Alphanumeric, 4 positions.* *Create screen: required.* *Change screen: display-only.*
Season	A code which identifies the season to which the zone reservation date window applies. See Working with Season Codes (WSEA) for information on defining seasons. *Alphanumeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Geographic zone	A code which identifies the geographic zone to which the date window applies. See Creating and Maintaining Geographic Zones (WGZN). *Alphanumeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Description	A description of the zone date window. *Alphanumeric, 40 positions; required.*

Field	Description
Start date	The zone window start date, which is the date you plan to start shipping items tied to this zone date window. If using Standard Zone Reservation Rules: • For order lines taken prior to the season start date as well as prior to the zone window start date, the zone window Start date is set as the Arrival date for the order line, and the order line has a backorder status of Future order. See Shipping Zone Reservation Overview for information about Season dates and future orders. • For order types flagged to display *Zone Date Windows*, if an item tied to this zone date window is ordered before the zone window start date, the Display Zone Reservation Dates Window displays shipping start date information. If using Alternate Zone Reservation Rules: • For order lines taken prior to the season start date as well as prior to the zone window start date, provided there is an available quantity or open PO quantity for the item: – the zone window Start date is set as the Arrival date for the order line, and the order line has a backorder status of Future order. See Shipping Zone Reservation Overview for information about Season dates and future orders. – for order types flagged to display *Zone Date Windows*, if an item tied to this zone date window is ordered before the zone window start date, the Display Zone Reservation Dates Window displays shipping start date information. • For order lines taken prior to the season start date as well as prior to the zone window start date, if there is no available quantity or open PO quantity for the item, the Select Order Line Option Window provides the choice to either sell out the order line, or take the order line as a future order with the zone window's *Next season open date* as the order line's *Arrival date*. *Numeric, 6 positions, in user date format; required.*

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Deferred cutoff date (Backorder cutoff date)</td><td>On or after this date, backorders for items tied to this zone window will not be taken if you are using Standard Zone Reservation Rules. Under these rules:
if stock is available for an order tied to this zone window, orders taken on or after this date, but prior to the cutoff date, will be created with a backorder status of Zone Reservation, and will be reserved and shipped during pick generation.
if stock is unavailable for an item ordered on or after this date, the Select Order Line Option Window allows the operator to either sell out the order line, or take the order line as a future order with the zone window's Next season open date as the order line's Arrival date.
Note:
This date is not considered as part of Alternate Zone Reservation Rules,

This date cannot be prior to the start date. If you enter a date in this field which is prior to the start date, the screen displays the following error message:
<code>Deferred cutoff date cannot be prior to the start date.</code>
Numeric, 6 positions, in user date format; required.</td></tr>
<tr><td>Cutoff date</td><td>On or after this date, new orders will not be taken for items tied to this zone window, regardless of item availability. The Select Order Line Option Window provides the choice to either sell out the order line, or take the order line as a future order with the zone window's Next season open date as the order line's Arrival date. See Shipping Zone Reservation Overview.
This date cannot be prior to the deferred cutoff date. If you enter a date in this field which is prior to the deferred cutoff date, the screen displays the following error message when you select OK:
Cutoff date cannot be prior to deferred cutoff date.
Numeric, 6 positions, in user date format; required.</td></tr>
<tr><td>End date</td><td>The last date of the zone date shipping window; the date you plan to stop shipping items tied to this zone date window.
This date cannot be prior to the Cutoff date. If you enter a date in this field which is prior to the cutoff date, the screen displays the following error message when you select OK:
<code>End date cannot be prior to cutoff date.</code>
Numeric, 6 positions, in user date format; required.</td></tr>
</table>

Field	Description
Next season open date	The open date of the next season for items tied to this zone date window. This is the date displayed at the Select Order Line Option Window and loaded as the *Arrival date* for the order line if the order line is taken as a future order. See Shipping Zone Reservation Overview. This date cannot be prior to the End date. If you enter a date in this field which is prior to the End date, the screen displays the following error message when you select OK: `Next season open date cannot be prior to the current end date.` *Numeric, 6 positions, in user date format; required.*

Creating and Maintaining Zone Reservation Codes (WZRC)

Purpose: Use this menu option to create, change, delete, or display zone reservation code information.

Use of zone reservation codes: Zone reservation codes are used to identify weather-sensitive inventory, such as plant stock, for which you want to restrict shipping dates. Plant stock such as bulbs, bare root plants, or potted plants can be assigned zone reservation codes that will identify the date windows for shipping them to different regions of the country. Each zone reservation code will have a different set of restrictions. For example, hardy bulbs may have a longer shipping window than bare root plants. In this case, you would assign a different zone reservation code to hardy bulbs than to bare root plants. For each zone reservation code, you can set up date windows to restrict shipping to each geographic zone in the country. See Shipping Zone Reservation Overview, for a summary of the zone reservation process.

When do shipping zone reservation rules apply? Zone reservation processing requires the following information in order to process an order line under zone reservation rules:

- The item/SKU must be assigned a Zone reservation code to identify it as a zone reservation item.
- The offer associated with the order must be linked to a Season.
- The shipping address must be assigned to a geographic zone. The system uses zip codes or SCF codes to identify geographic zones. See Setting Up the Zip/City/State (Postal Code) Table (WZIP) for more information on zip codes and geographic zones. See Working with SCF Codes (WSCF), for more information on SCF codes and geographic zones.
- For each zone reservation code, you must define zone reservation date windows for all geographic zones in the country. See Creating and Maintaining Zone Reservation Dates (WZRD).

In this topic:

- Work with Zone Reservations Screen
- Create Zone Reservation Screen (Creating a Zone Reservation Code)

Work with Zone Reservations Screen

How to display this screen: Enter WZRC in the *Fast path* field at the top of any menu or select Work with Zone Reservation Codes from a menu.

Field	Description
Zone reservation	A code that identifies a type of climate-sensitive inventory item for which you want to set up shipping restrictions by zone. *Alphanumeric, 4 positions; display-only.*
Description	A description of the zone reservation code. *Alphanumeric, 30 positions; display-only.*

Screen Option	Procedure
Create a zone reservation code	Select Create to advance to the Create Zone Reservation Screen (Creating a Zone Reservation Code).
Change a zone reservation code description	Select Change for a zone reservation code to advance to the Change Zone Reservation screen. At this screen, you can change the description of the zone reservation code. See Create Zone Reservation Screen (Creating a Zone Reservation Code) for field descriptions.
Delete a zone reservation code	Select Delete for a zone reservation code to delete it.
Display a zone reservation code	Select Display for a zone reservation code to advance to the Display Zone Reservation screen. You cannot change any information on this screen. See Create Zone Reservation Screen (Creating a Zone Reservation Code) for field descriptions.

Create Zone Reservation Screen (Creating a Zone Reservation Code)

Purpose: Use this screen to create a zone reservation code.

How to display this screen: Select Create on the Work with Zone Reservations Screen.

Field	Description
Zone reservation	The zone reservation code. This code identifies a category of climate-sensitive inventory items for which you set up shipping restrictions by zone. *Alphanumeric, 4 positions.* *Create screen: required.* *Change screen: display-only.*
Description	The description of the zone reservation code. *Alphanumeric, 30 positions; required.*

Order Orchestration Drop Ship Integration

Chapters in this part: The following options are related to integration with Order Orchestration's Drop Ship Manager module.

- Interface with Order Orchestration's Supplier Direct Fulfillment Module: Overview and Setup describes the setup required for integration with Order Orchestration's Drop Ship Manager module.
- Supplier Direct Fulfillment Processing provides details on process flows and the communication between Order Administration and Order Orchestration's Drop Ship Manager.
- Downloading Drop Ship Vendors (ECSV) explains how to download initial vendor information for vendors using the Order Orchestration's Drop Ship Manager.
- Working with Retail Brands (WRBD) explains how to create and maintain retail brands for use with the Order Orchestration's Drop Ship Manager.
- Displaying Unprocessed Drop Ship Items (DUDS) describes the menu option you use to review all unprocessed drop ship items, including items fulfilled through integration with Order Orchestration's Drop Ship Manager.
- Printing Drop Ship Reports (PDSR) describes the reports you can use to print information related to orders fulfilled through integration with Order Orchestration's Drop Ship Manager.
- Working with Drop Ship Background Jobs (WPBJ) describes how to start, stop, and troubleshoot the CDC async job.
- Working with Drop Ship Errors (WDSE) describes the screen you use to review or delete records which went into error status when they were transferred between Order Orchestration's Drop Ship Manager and Order Administration.

Downloading Drop Ship Vendors (ECSV)

Purpose: Use this menu option to send vendors to Order Orchestration for drop ship fulfillment.

In this topic:

- Downloading Vendors to Order Orchestration
- Download Drop Ship Vendors Screen

Downloading Vendors to Order Orchestration

This option sends new or updated vendor information to Order Orchestration's Supplier Direct Fulfillment module through the CreateDSVendor message. Only vendors whose *Drop ship output* field on the Second Create Vendor Screen is set to OROB Drop Shipping are eligible to be sent to Order Orchestration.

The information sent to Order Orchestration includes:

- vendor code and description
- contact name and email address
- vendor address

Afterward, you can use the Order Orchestration screens to set vendor preferences, change carrier assignments, and set up vendor users.

Order Orchestration creates each new vendor in active status, and automatically assigns the vendor to all active carriers.

Other ways to create vendors in Oracle Retail Order Orchestration: You can create a new vendor in the Order Orchestration database by using the **Create Vendor** screen. You can also create a vendor by sending a purchase order for the vendor; however, when you create a new vendor this way, the only information sent from Order Administration about the vendor is the vendor code, name, and email address. You will need to complete the remaining setup for the vendor through the Order Orchestration **Edit Vendor** screen.

Transferred vendor information: The vendor information transferred to Order Orchestration through this menu option is from the Vendor table, with the exception of Vendor e-mail address, which is from in the Vendor Contact Table.

Updating an existing vendor: If the vendor record already exists in Order Orchestration and you or the vendor have updated the record there, processing the vendor download overwrites the existing information in Order Orchestration.

For more information: See the Order Orchestration Web Services Guide on My Oracle Support (ID 2953017.1) for more information on the contents of the CreateDSVendor message, and see the Order Orchestration online help for more information on completing vendor setup in Order Orchestration.

Download Drop Ship Vendors Screen

How to display this screen: Enter ECSV in the *Fast path* field at the top of any menu or select Download Drop Ship Vendors from a menu.

Screen Option	Procedure
Send vendor information to Order Orchestration	Select Submit to submit the batch job which transfers vendor information to Order Orchestration.

Displaying Unprocessed Drop Ship Items (DUDS)

Purpose: Use this menu option to review all of the drop ship order detail lines that have been entered but not yet processed through the Selecting Vendors for Drop Ship Processing (MDSP) menu option, including drop ship orders which you will process automatically using the Order Orchestration Drop Ship Integration.

Quotes: Drop ship items on quotes are not included in this menu option; see *Entering Pre-Order Quotes* for an overview and required setup.

Reviewing special handling instructions: This menu option allows you to review the special handling instructions associated with a drop ship item before you send the drop ship purchase order or pick slip to the vendor, and to access Order Maintenance, if you have secured feature authority to order maintenance. Additionally, when you advance to the Display Special Handling Screen or Display Custom Special Handling Screen using this menu option, you can access Order Maintenance to change the special handling instructions, if you have secured feature authority to order maintenance. See Working with User Records (WUSR) for information about user authority.

> **Note:**
>
> Drop ship order lines can be processed as drop ship pick slips, or drop ship purchase orders. Drop ship purchase orders, including drop ship purchase orders processed through Order Orchestration's Supplier Direct Fulfillment module support only custom special handling, not free-form special handling.

Display Unprocessed Drop Ship Items Screen

How to display this screen: Enter DUDS in the *Fast path* field at the top of any menu or select Display Unprocessed Drop Ship Items from a menu.

Field	Description
Item	The code you use to identify the item. Items are validated against the Item table. *Alphanumeric, 12 positions; display-only.*
SKU	The code that further identifies the item. SKUs are validated against the SKU table. *Alphanumeric, three 4-position fields; display-only.*
Description	A description of the item (not the SKU). *Alphanumeric, 30 positions; display-only.*
Order # - Ship-to #	The order number and ship-to suffix number of the drop ship item. *Order number: 8 positions, numeric; display-only.* *Ship-to number: 3 positions; numeric; display-only.*
Vendor #	The code which identifies the vendor for the drop ship item. Vendor codes are defined in and validated against the Vendor table. See Working with Vendors (WVEN). *Numeric, 7 positions; display-only.*
SH (Special Handling)	The special handling code associated with the drop ship item. Not displayed if no special handling is associated with the item. Special handling codes are defined in and validated against the Additional Charges table. See Work with Additional Charges Screen. *Alphanumeric, 2 positions; display-only.*

Screen Option	Procedure
Update the order	Select Maintenance for a drop ship item to advance to the Work with Order Screen in Order Maintenance. In order to access this screen, you must have secured feature authority to order maintenance. See Working with User Records (WUSR) for information about user authority.
Review order details	Select Display for a drop ship item to advance to the Display Order Detail Screen (Reviewing Order Line Detail).
Review special handling information	Select Special Handling for a drop ship item to advance to the Display Special Handling Screen or the Display Custom Special Handling Screen, if the item is associated with standard or custom special handling. When you advance to the Display Custom Special Handling screen or the Display Special Handling screen from this screen, you will be able to select the option to access Order Maintenance, if you have authority to Order Maintenance. See Working with User Records (WUSR) for information about user authority. If you Select Special Handling for a drop ship item that does not require special handling, the following message will display: `The selected line has no special handling instructions.`

Working with Retail Brands (WRBD)

Purpose: Use this menu option to create, change, delete, or display retail brand (retail division) information used by the integration with Order Orchestration's Drop Ship Manager module for internet-based drop ship processing.

Retail brands and descriptions associated with the source code on an order header are passed to Order Orchestration's Supplier Direct Fulfillment module each time purchase orders are sent. *Retail brands* appear on Order Orchestration screens as *Brands*.

Use in Order Orchestration's Supplier Direct Fulfillment module: In Order Orchestration, you can use retail divisions to:

- Restrict the display of information to the selected brand.
- Specify a logo, packing slip messages, pack slip form, and pull sheet form.
- Enable the vendor to restrict pack slip generation to a single brand.

Required setup for Order Orchestration's Supplier Direct Fulfillment module: In order to use Order Orchestration's Supplier Direct Fulfillment module, you must set up one or more retail brands and associate each retail brand with at least one entity in Order Management System; however, several entities (in one or more companies) could share the same retail brand. The source code on the drop ship order must point to a division associated with one of the entities for which you have defined a retail brand.

> **Note:**
>
> A retail brand is not necessarily associated with a single company; one company can have several retail brands, or several companies could share the same retail brand; however the Retailer ID is specific to a company. The *Retailer ID* is not necessary for integration with Order Orchestration's Supplier Direct Fulfillment module.

Work with Retail Brands Screen

How to display this screen: Enter WRBD in the *Fast path* field at the top of any menu or select Work with Retail Brands from a menu.

Field	Description
ID	A code that identifies the retail brand. *Numeric, 3 positions; display-only.*
Description	A description of the retail brand. *Alphanumeric, 30 positions; display-only.*

Screen Option	Procedure
Create a retail brand	Select Create to advance to the Create Retail Brand Screen.

Screen Option	Procedure
Change a retail brand description	Select Change for a retail brand to advance to the Change Retail Brand screen, where you can change the description. See the Create Retail Brand Screen for more information.
Delete a retail brand	Select Delete for a retail brand to delete it.
Display a retail brand description	Select Display for a retail brand to advance to the Display Retail Brand screen. You cannot change any information on this screen. See the Create Retail Brand Screen for field descriptions.

Create Retail Brand Screen

Purpose: Use this screen to create a retail brand.

How to display this screen: Select Create on the Work with Retail Brands Screen.

Field	Description
Brand ID	A code that identifies the retail brand. See Working with Retail Brands (WRBD) for a discussion. *Numeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Description	A description of the retail brand. *Alphanumeric, 30 positions; required.*

Printing Drop Ship Reports (PDSR)

Purpose: Use this menu option to print one of three reports related to the Order Orchestration Drop Ship Integration.

Drop Ship Integration Reports Screen

How to display this screen: Enter PDSR in the *Fast path* field at the top of any menu or select Print Drop Ship Reports from a menu.

At this screen you can select any of the following reports:

- Drop Ship Integration Items on Hold from Vendor Report
- Drop Ship Integration Items with Revised Due Date Report
- Drop Ship Integration Items Pending Cancellation Report
- Drop Ship Integration Items Confirmed Cancellation Report
- Drop Ship Integration Items Sent to Integrated System Report
- Drop Ship Integration Items Pending Shipment Report
- Drop Ship Integration Items Shipped Report

Additionally, you can specify a date range for each report. Enter *From* and *To* dates in the user date format.

Periodic Process to Generate Drop Ship Reports

You can generate the first three reports through a periodic process which includes periodic functions which will generate the reports. The programs needed to create the periodic functions are:

- Drop Ship Items on Hold from Vendor: PFR0063
- Drop Ship Items with Revised Due Date: PFR0064
- Drop Ship Items Pending Cancellation: PFR0065

For more information: For information on creating periodic processes and functions, see Working with Periodic Functions (WPER).

Working with Drop Ship Background Jobs (WPBJ)

Purpose: Use this menu option to work with the CDC Async job used to process transactions between Order Orchestration's Supplier Direct Fulfillment module and Order Administration for each company that has the Use OROB Drop Shipping (H13) system control value selected.

Starting and stopping the job: If you are using Order Orchestration's Supplier Direct Fulfillment integration, the CDC async job should be stopped and started each day. If the CDC async job does not have the current date, returns which are sent from Order Orchestration's Supplier Direct Fulfillment module do show the current date. See Fulfillment (FUL) Periodic Functions under Scheduling Jobs for information on scheduling the job to start and stop on a daily basis.

Async status: The status of the async indicates whether it can process any information it receives.

- STARTED = The async is starting, but is not yet ACTIVE.
- ACTIVE = The async is up and running. In order to process information, the async must be in ACTIVE status.
- ENDING = The async is in the process of ending, but it not yet INACTIVE.
- INACTIVE = The async is not running.

When does the async look for records to process? The *Delay time* controls when the async looks for new records to process. This time determines the amount of time, in seconds, the async waits before looking for new records to process.

In this topic:

- Work with Drop Ship Background Jobs Screen
- Change Delay Time Screen
- Troubleshooting the CDC Async Job

Work with Drop Ship Background Jobs Screen

Use this screen to work with the CDC Async job.

How to display this screen: Enter WPBJ in the *Fast path* field or select Work with Drop Ship Background Jobs from a menu.

Field	Description
Job	The name of the async job. *Alphanumeric, 10 positions; optional.*

Field	Description
Status	The status of the async job. Valid status codes are: • STARTED = The async is starting, but is not yet ACTIVE. • ACTIVE = The async is up and running. In order to process information, the async must be in ACTIVE status. • ENDING = The async is in the process of ending, but is not yet INACTIVE. • INACTIVE = The async is not running. See Troubleshooting the CDC Async Job for information on correcting the status if necessary. *Alphanumeric, 10 positions; display-only.*
Start Date	The date the async was last started. *Numeric, 6 positions in user date format; display-only.*
Start Time	The time the async job was last started. *Numeric, 6 positions; display-only.*
Started By	The user ID of the person who last started the async job. *Alphanumeric, 10 positions; display-only.*
Ended By	The user ID of the person who last ended the async job. *Alphanumeric, 10 positions; display-only.*
Dly (Delay)	The number of seconds the async job waits for another record to process. *Numeric, 3 positions; display-only.*

Screen Option	Procedure
Change the delay time for the async job	Select Change for the async job to advance to the Change Delay Time Screen.

Screen Option	Procedure
Start the async job	Select Start for the async job to start it if it is inactive and not currently running on any server. **Periodic function:** You can also use the STRCSTD periodic function to start the CDC job. If the job is currently active, or the other conditions described below under *Troubleshooting* are met, an error in the APP.log might indicate: `IX_CDC Job not submitted - Previous job not ended`. See Logs for background. **Troubleshooting:** In order to start the async job, either at the screen or through a periodic function: • The Use OROB Drop Shipping (H13) system control value must be selected for at least one company in your Order Administration environment. • The async job must be in INACTIVE status and must not actually be running on any server. • There cannot be a Job History record for the IX_CDC job without an end date and time. You can review the records in the Job History table through Display Job History (DJHY). If the job does not end correctly (if, for example, the service stops while the job is running), you might need to update the Job History record in the database. • There cannot be an active procedure record for the FLX0976 program. You can review and, optionally, delete active procedures through Purge Active Procedures Across Users (MACX). See Troubleshooting the CDC Async Job for more information.
End the async job	Select End for the async job to end it. **Periodic function:** You can also use the ENDCDC periodic function to end the CDC job. **Note:** You can end the async job only if it is in ACTIVE status and is actually running on any server. See Troubleshooting the CDC Async Job for more information.
Work with background jobs	Select Background Jobs to advance to the Work with Background Jobs Screen.
Work with integration layer jobs	Select Integration Layer to advance to the Work with Integration Layer Process Screen.

Change Delay Time Screen

Purpose: Use this screen to change the *Delay time* for the CDC async job. The *Delay time* is the number of seconds that the async waits before looking for new records to process.

How to display this screen: Select Change for the CDC async at the Work with Drop Ship Background Jobs Screen.

> **Note:**
>
> You can display this screen for the CDC async job only if the Use OROB Drop Shipping (H13) system control value is selected for at least one company in your Order Administration environment.

Troubleshooting the CDC Async Job

There may be a problem with the CDC async job if transactions sent from Order Administration to Order Orchestration's Supplier Direct Fulfillment module, such as that new POs, are being processed, but transactions sent from Order Orchestration's Supplier Direct Fulfillment module to Order Administration, such as PO updates, are not being processed.

To solve the problem, stop and restart the CDC async.

If the CDC async job does not end when you use the End option: If the CDC async job does not end correctly, use the JOBCLN periodic function. This periodic function updates the CDC async job as follows:

If the IX_CDC is currently running on any server, the JOBCLN function does the following:

- If the status is INACTIVE, change it to ACTIVE.
- If there is not an active procedure, create it.
- If the status is STARTED or ENDING, do not change the status.
- If the job is in END, FINISHED or MSG at the Job Management (My Jobs) screen, update it to RUN and update Job History (Display Job History (DJHY)).

If the IX_CDC job is not currently running on any server, the JOBCLN function does the following:

- If the status is ACTIVE, STARTED, OR ENDING, update it to INACTIVE.
- If there is an active procedure, delete it.
- If the job is in any status other than END and FINISHED at the Job Management screen, update it to END and update Job History.

After the JOBCLN function ends, you can restart the job.

See Using the JOBCLN Function to Resolve Job Status Across Servers for more background.

Working with Drop Ship Errors (WDSE)

Purpose: Use this menu option to review drop ship transaction records passed to or received from Order Orchestration's Supplier Direct Fulfillment module that are in error in the CSF Transaction table (FLCSFT).

A drop ship transaction record received through the Order Orchestration Drop Ship Integration is in error status if the system cannot identify the record, for example:

- A shipment confirmation for a purchase order or purchase order line which does not exist.
- A status update such as a revised expected delivery date or a hold on a purchase order or purchase order line which does not exist.

- A return for an invalid return authorization, purchase order, or purchase order line number.

Purging Drop Ship Transaction records: You can use this menu option to delete records in error status from the CSF Transaction table (FLCSFT).

The screen sorts by date, time, type of error message, PO number, and PO sequence number. You can search for a record by entering the date and time it was created in the CSF Transaction table.

How to display this screen: Enter WDSE in the *Fast path* field at the top of any menu or select Work with CDC Drop Ship Errors from a menu.

Field	Description
Date	The date the record was created in the CSF Transaction table (FLCSFT). Enter a date in the*Date* search field to display records created on that date or later. *Numeric, 6 positions, in user date format.*
Time	The time the record was created in the CSF Transaction table. Enter a time in the *Time* search field to display records created at that time or later. *Numeric, 6 positions, HH:MM:SS format.*
Transaction type	The type of CSF Transaction record. Valid record types are: • Drop Ship PO Confirmed • Drop Ship PO Updated • Cancel Request Sent • Cancel Response Received • Cost Change • Drop Ship PO Modified (Address change) • Return Update Received • Return Authorization Cancelled *Alphanumeric, 25 positions, display-only.*
Error message	A brief description of the reason for the error. Possible error descriptions include: • Order detail not shipped • PODTDS record not found • Invalid transaction type • Invalid Vendor Item • Invalid RA header • Invalid RA detail • RA header completed • Invalid return quantity • Invalid return reason • RA cancel transfer failed • Missing Return Disposition • Receive/Confirm Error *Alphanumeric, 25 positions, display-only.*
PO Number	The purchase order number assigned by the system when you process drop ship purchase orders. *Numeric, 7 positions; display-only.*

Field	Description
Ln #	The purchase order detail line number. Up to 999 detail lines can be entered on a purchase order. *Numeric, 3 positions; display-only.*

Screen option	Procedure
Delete an error record from the CSF Transaction table (FLCSFT)	Select Delete for an error record. The record is deleted from the CSF Transaction table and no longer displayed on the screen.

Load USPS Zip Code File (LZPS)

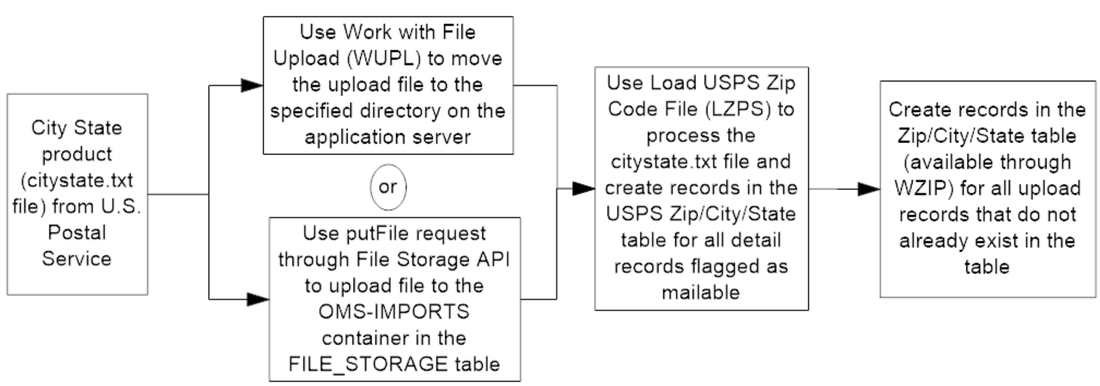
Purpose: Use this menu option to upload city/state/zip data from the U.S. Postal Service into the City/State/Zip (postal code) table.

Overview: The City State product, available from the U.S. Postal Service, provides a comprehensive list of ZIP codes with corresponding city and county names. Updates are available on a periodic basis. Uploading this information to Order Administration provides an automated means to create records in your City/State/Zip table and keep the data in the table complete and accurate.

In this topic:

- Upload Process
- Load USPS File Screen
- Fields in the USPS Zip/City/State Table
- Fields in the Zip/City/State Table
- Troubleshooting the Zip/City/State Upload

Upload Process



1. Download the City State Product from the USPS web site.
2. When you receive the City State product:

- Use the putFile request message in the File Storage API to upload the file to the OMS-IMPORTS container in the FILE_STORAGE table; otherwise,
- Use the Work with File Uploads (WUPL) menu option to copy the data file to the location on your application server specified in the CWDIRECTCP_USPS_UPLOAD_ FILE property. The file name matching is case-sensitive.

3. Use the Load USPS File Screen to submit the LZPS job, which uses the contents of the `ctystate.txt` data file to create records in the Zip/City/State table if these records do not already exist. The job performs the following steps:
   - Deletes any existing records in the USPS Zip/City/State work table and creates a record in this table for each eligible entry from the `ctystate.txt` data file. A record in the data file is eligible for upload if it is flagged with a D (detail) and is also flagged as mailable. See the Fields in the USPS Zip/City/State Table for mapping details.
   - Compares the data in the USPS Zip/City/State work table with the existing records in the Zip/City/State table. If a record in the work table does not exist in the Zip/City/State table, the job creates it.
   - If your current logging level supports it, the job uses the Application Log to track data such as the total number of records found in the data file and the total number of new records created in the.Zip/City/State table.

> **Note:**
>
> - The `ctystate.txt` data file as delivered by the U.S. Postal Service does not include delimiters between records, but the U.S. Postal Service does provide a utility to insert line breaks to make the data more readable.
>
>   > **Important:**
>   >
>   > **Do not use this utility to transform the presentation of the records in the data file; if you do, the Load USPS File job will not work.**
>
> - The job does not create City/State/Zip Tax records. To create tax records at the postal code level if needed, use Setting Up the Zip/City/State (Postal Code) Table (WZIP).
> - The entire process can take several minutes to a half hour to run. You can expect the job to take longer to run if you are creating records in the City/State/Zip table for the first time.
> - The job deletes the file after processing it successfully.
> - The job does not perform a partial update. If there are any errors, processing fails for the entire file, and the process moves the entire file in the OMS-ERRORS container of the FILE_STORAGE table.

For more information: See Troubleshooting the Zip/City/State Upload.

Load USPS File Screen

Before you start: Before you advance to this screen, confirm that you have used either the File Storage API or the Work with File Uploads (WUPL) menu option to upload the file. See the Upload Process for details.

How to display this screen: Select Load USPS Zip Code FIle from a menu, or enter LZPS in the *Fast path* field at the top of any menu.

City State data file found? When you select this menu option, the screen indicates whether there is a data file with the correct name in the location indicated by the properties file:

Message	Explanation
*****ERROR: File cannot be located.**	Indicates that there is no file with the correct name in either the FILE_STORAGE table if you used the File Storage API, or the CWDIRECTCP_ USPS_UPLOAD_ FILE folder if you did not use the file storage API. See Upload Process for details. Note that file name matching is case-sensitive.
*****ERROR: File is empty.**	Indicates that there is a file using the correct name in the directory or container indicated, but it contains no data.
File has been found and is ready to be loaded. Click Accept to submit.	Indicates that you can proceed with the upload process. **Note:** This message indicates that the system has located a file with the correct name and location, based on whether the file storage API is in use, and that it contains data. It does not indicate whether the file includes postal code data or whether it is in the correct format. See Troubleshooting the Zip/City/State Upload for possible problems and steps to correct.

Completing this screen: If the file has been found and is ready to be loaded:

1. Optionally, deselect the *Submit on hold* option if you would like the job to run immediately; otherwise, you will need to select Release for the LZPS job at the Job Management Screen when you are ready to run it.
2. Click Accept to begin the upload process and launch the LZPS job. You might expect the job to take several minutes to a half hour to complete, depending on how many new postal code records you are loading.

Updates: See the Upload Process for an overview of the processing steps.

Fields in the USPS Zip/City/State Table

Purpose: The LZPS job reads each record in the file in the FILE_STORAGE table or specified by the CWDIRECTCP_ USPS_UPLOAD_ FILE property (the City State product file from the U.S. Postal Service) that is:

- flagged with a detail code of D
- identified as mailable by a setting of N at byte 56

The job clears the previous contents of the USPS Zip/City/State work table and then writes the selected records from the City State data file into the USPS Zip/City/State work table as follows:

USPS Zip/City/State work table	City State data file from U.S. Postal Service
Copyright detail code	D
Zip code	Bytes 2-6
City state key	Bytes 7-12
City state name	Bytes 14-39 (last 3 bytes are truncated)
City st mail name ind	Byte 56
State abbrev	Bytes 100-101

The remaining fields in the USPS City/State/Zip work table are left blank.

Fields in the Zip/City/State Table

After creating the records in the USPS City/State/Zip table, the LZPS job creates new records in the City/State/Zip table if they do not already exist, mapping the data from the USPS City/State/Zip table as follows:

City/State/Zip table	Source
Zip	*Zip code* from USPS Zip/City/State work table
State	*State abbrev* from USPS Zip/City/State work table
City	*City state name* from USPS Zip/City/State work table
Company	The company number where you ran the LZPS job
Country	The Default Country for Customer Address (B17) in the company where you ran the LZPS job

The remaining fields in the City/State/Zip table are left blank.

Troubleshooting the Zip/City/State Upload

Question	Answer
How long does it take to upload postal codes?	It can take several minutes to a half hour to upload postal codes for the first time.
Where can I obtain the postal code data?	The U.S. Postal Service can provide the City State product, which includes a comprehensive list of ZIP codes and related cities and states.
Where does the LZPS job look for the City State data file I obtained from the U.S. Postal Service?	The temporary location on the Order Administration application server where the system should look for the City State data file when you use the Load USPS File Screen to update postal code data. This property is set by Oracle and cannot be changed. **Note:** If you are using multiple application servers, you need to update this setting on each server where you plan to use theLoad USPS File Screen to update postal code data.

Question	Answer
How can I check on whether the postal codes were uploaded successfully?	If you are uploading the information for the first time, you can select the Setting Up the Zip/City/State (Postal Code) Table (WZIP) option to see if records have been created. If you are performing a periodic update, you can check the application log, provided your logging level supports it; see below for more information.
What do log entries look like for a successful upload?	Sample log entries indicating a successful upload: `10:41:44,267 INFO APP - LZPS total records in delivered file = 466079` `10:41:44,267 INFO APP - LZPS total detail records = 80174` `10:41:44,267 INFO APP - LZPS total detail records flagged as Do Not Mail = 25035` `10:41:44,267 INFO APP - LZPS total detail records flagged as Mail =55139` `10:41:44,267 INFO APP - LZPS total detail records written to USPS file = 55139` **Note:** The total number of detail records written reflects those detail records in the data file that were eligible for selection as described in the Upload Process, and were created in the USPS City/State/Zip work file. This number might not be the same as the total number of records added to the City/State/Zip table, since the job does not add a record to the City/State/Zip table if the record already exists. The trace, app, and CWDirect log files contain entries if the upload was not successful, depending on the current logging level.

Question	Answer
What is the importance of the total number of records noted in the application log?	`total records in delivered file`: the total number of records in the data file located at the file name and directory specified in the CWDIRECTCP_ USPS_UPLOAD_ FILE property or in the FILE_STORAGE table. `total detail records`: the total number of records in the data file flagged with a D (detail). `total detail records flagged as Do Not Mail`: the total number of records in the data file flagged with a D (detail) but also flagged as Do Not Mail (not mailable), and so are not eligible for selection. `total detail records flagged as Mail`: the total number of records in the data file flagged as mailable and that were also flagged with a D (detail). **Note:** Only records in the data file that are flagged with a D and are also flagged as mailable are eligible for selection. `total detail records written to USPS file`: the total number of records in the data file that were eligible for selection and were added to the USPS City/State/Zip work table. This total may differ from the number of records added to the City/State/Zip table, since some or all of the records written to the USPS City/State/Zip work table might already exist in the City/State/Zip table.
I uploaded the `ctystate.txt` file from the U.S. Postal Service. Why didn't it create any records?	Possible explanations: • The U.S. Postal Service provides a utility to add delimiters between each record in the data file and make the file more readable. If you ran this utility against the data file, the LZPS job will not be able to read any records in the file. Re-copy the data file from the CD and start the upload process again. • If you have recently run an upload and are attempting to upload the same data again, there will be no new records eligible to be copied to the City/State/Zip table.
How often do I need to upload new postal code data?	The U.S. Postal Service provides updated data files on a periodic basis. See their web site for more information.
Does the postal code data upload also create tax rate information?	The LZPS job does not create Zip/City/State Tax records. You can use the Setting Up the Zip/City/State (Postal Code) Table (WZIP) option to create tax records at the postal code level if needed; however, you might not need these records at the postal code level if you set tax rates at the SCF level, or if you use the generic tax integration to calculate tax.
There are still records in the USPS City/State/Zip work table. Does this indicate a problem?	This does not indicate a problem. The LZPS job does not clear the records in the work table after processing an upload; instead, it clears the records when it begins a new upload.

Installation Setup

- Establishing Security
- Using the Menu Driver
- System Control Values and Number Assignments
- Setting Up Secured Features

Work with System Values/Features (WSYS)

For information on:	See:
The System Control table, including how to set up and change values	System Control Table Components
A particular system control value	System Control Values
Secured features	Setting Up Secured Features

Establishing Security

Topics in this part:

- Security Shell Components provides an overview of the security features on the system.
- Working with Companies (WCMP) describes how to create a company and control security by company.
- Setting Up User Classes (WUCL) describes how to create user classes and control access to menus and menu options by groups of users. This topic also describes how to assign authority to companies, menu options, secured features and user-defined functions for a user class.
- Working with User Records (WUSR) describes how to create user profiles and control access to menus and menu options by individual user. This topic also describes how to assign authority to companies, menu options, secured features and user-defined functions for an user individual user.
- Working with Threshold Values (WTHR) describes how to create threshold values for defined functions in the system.

Working with Companies (WCMP)

Purpose: Use Work with Companies to work with a company on your system.

You must define at least one company in order to use Order Administration. Information throughout Order Administration is segregated by company.

Companies are single, isolated sets of tables and data: an organization of financial information, inventory, and customers. Essentially a company has a completely separate database from other companies.

When should you create more than one company? You must create another company when you do not want data, for example sales analysis figures, items, and customers, to mix with another company's data. If you only want to separate sales analysis, you can handle that through entities and divisions.

Creating a company: You can use the COPYCMP Copy Company periodic function to create a company based on the data defined for an existing company.

> **Note:**
>
> COPYCMP will not run if the “from” company has any EFTConnect configured merchant accounts. That is, having any merchant account record in the Payment Configuration screen.
>
> The copy company (COPYCMP) should only be done from 49 or 51 where EFTConnect is not enabled in the "from" company.
>
> If EFTConnect is enabled, the Copy Company periodic function cannot be run for copy or delete processes.

This periodic function uses the following parameters to create a company:

- the From company number whose data you wish to copy.
- the To company number.
- Y or N setting indicating whether the system should delete the data in the To company before copying. Note: Unless you can verify that you are not copying over any records that already exist in the target company, this setting should be set to N.

Separate each parameter setting with a single space. For example, enter the following in the Parameter field, where 1 is the From company number, 2 is the To company number, and N is the Delete To company parameter: DB 1 2 N

Using the copy company periodic function to delete a company: To use the Copy Company periodic function to delete a company, enter the company you wish to delete in the From and To company parameters and set the Delete parameter to Y. For example, enter the following in the Parameter field, where 1 is the company you wish to delete, and Y is the Delete parameter: 1 1 Y

Copy Company Parameters	If Destination Company Exists	If Destination Company Does Not Exist
98 99 Y	Deletes destination company and copies all data from source company	Creates destination company and copies all data from source company
98 99 N	Does not copy any data, since destination company already exists	Creates destination company and copies all data from source company

Copy Company Parameters	If Destination Company Exists	If Destination Company Does Not Exist
